Chapter 1. Preamble

Copyright 2014-2024 The Khronos Group Inc.

This Specification is protected by copyright laws and contains material proprietary to Khronos. Except as described by these terms, it or any components may not be reproduced, republished, distributed, transmitted, displayed, broadcast or otherwise exploited in any manner without the express prior written permission of Khronos.

Khronos grants a conditional copyright license to use and reproduce the unmodified Specification for any purpose, without fee or royalty, EXCEPT no licenses to any patent, trademark or other intellectual property rights are granted under these terms.

Khronos makes no, and expressly disclaims any, representations or warranties, express or implied, regarding this Specification, including, without limitation: merchantability, fitness for a particular purpose, non-infringement of any intellectual property, correctness, accuracy, completeness, timeliness, and reliability. Under no circumstances will Khronos, or any of its Promoters, Contributors or Members, or their respective partners, officers, directors, employees, agents or representatives be liable for any damages, whether direct, indirect, special or consequential damages for lost revenues, lost profits, or otherwise, arising from or in connection with these materials.

This document contains extensions which are not ratified by Khronos, and as such is not a ratified Specification, though it contains text from (and is a superset of) the ratified Vulkan Specification. The ratified versions of the Vulkan Specification can be found at https://registry.khronos.org/vulkan/specs/1.3/html/vkspec.html (core only) and https://registry.khronos.org/vulkan/specs/1.3-khr-extensions/html/vkspec.html (core with all ratified extensions).

This Specification contains substantially unmodified functionality from, and is a successor to, Khronos specifications including OpenGL, OpenGL ES and OpenCL.

The Khronos Intellectual Property Rights Policy defines the terms 'Scope', 'Compliant Portion', and 'Necessary Patent Claims'.

Some parts of this Specification are purely informative and so are EXCLUDED the Scope of this Specification. The Document Conventions section of the Introduction defines how these parts of the Specification are identified.

Where this Specification uses technical terminology, defined in the Glossary or otherwise, that refer to enabling technologies that are not expressly set forth in this Specification, those enabling technologies are EXCLUDED from the Scope of this Specification. For clarity, enabling technologies not disclosed with particularity in this Specification (e.g. semiconductor manufacturing technology, hardware architecture, processor architecture or microarchitecture, memory architecture, compiler technology, object oriented technology, basic operating system technology, compression technology, algorithms, and so on) are NOT to be considered expressly set forth; only those application program interfaces and data structures disclosed with particularity are included in the Scope of this Specification.

For purposes of the Khronos Intellectual Property Rights Policy as it relates to the definition of...
Necessary Patent Claims, all recommended or optional features, behaviors and functionality set forth in this Specification, if implemented, are considered to be included as Compliant Portions.

Where this Specification identifies specific sections of external references, only those specifically identified sections define normative functionality. The Khronos Intellectual Property Rights Policy excludes external references to materials and associated enabling technology not created by Khronos from the Scope of this Specification, and any licenses that may be required to implement such referenced materials and associated technologies must be obtained separately and may involve royalty payments.

Khronos and Vulkan are registered trademarks, and SPIR-V is a trademark of The Khronos Group Inc. OpenCL is a trademark of Apple Inc., used under license by Khronos. OpenGL is a registered trademark and the OpenGL ES logo is a trademark of Hewlett Packard Enterprise, used under license by Khronos. ASTC is a trademark of ARM Holdings PLC. All other product names, trademarks, and/or company names are used solely for identification and belong to their respective owners.
Chapter 2. Introduction

This document, referred to as the “Vulkan Specification” or just the “Specification” hereafter, describes the Vulkan Application Programming Interface (API). Vulkan is a C99 API designed for explicit control of low-level graphics and compute functionality.

The canonical version of the Specification is available in the official Vulkan Registry (https://registry.khronos.org/vulkan/). The source files used to generate the Vulkan specification are stored in the Vulkan Documentation Repository (https://github.com/KhronosGroup/Vulkan-Docs).

The source repository additionally has a public issue tracker and allows the submission of pull requests that improve the specification.

2.1. Document Conventions

The Vulkan specification is intended for use by both implementors of the API and application developers seeking to make use of the API, forming a contract between these parties. Specification text may address either party; typically the intended audience can be inferred from context, though some sections are defined to address only one of these parties. (For example, Valid Usage sections only address application developers). Any requirements, prohibitions, recommendations or options defined by normative terminology are imposed only on the audience of that text.

**NOTE**

Structure and enumerated types defined in extensions that were promoted to core in a later version of Vulkan are now defined in terms of the equivalent Vulkan core interfaces. This affects the Vulkan Specification, the Vulkan header files, and the corresponding XML Registry.

2.1.1. Ratification

*Ratification* of a Vulkan core version or extension is a status conferred by vote of the Khronos Board of Promoters, bringing that core version or extension under the umbrella of the Khronos IP Policy.

All Vulkan core versions and KHR extensions (including provisional specifications) are ratified, as are some multi-vendor EXT extensions. Ratification status of extensions is described in the Layers & Extensions (Informative) appendix.

**NOTE**

Ratification status is primarily of interest to IHVs developing GPU hardware and Vulkan implementations.

For developers, ratification does not necessarily mean that an extension is “better”; has a more stable API; or is more widely supported than alternative ways of achieving that functionality.

Interactions between ratified and non-ratified extensions are not themselves ratified.
2.1.2. Informative Language

Some language in the specification is purely informative, intended to give background or suggestions to implementors or developers.

If an entire chapter or section contains only informative language, its title will be suffixed with “(Informative)”.

All NOTEs are implicitly informative.

2.1.3. Normative Terminology

Within this specification, the key words **must**, **required**, **should**, **recommended**, **may**, and **optional** are to be interpreted as described in RFC 2119 - Key words for use in RFCs to Indicate Requirement Levels (https://www.ietf.org/rfc/rfc2119.txt). The additional key word **optionally** is an alternate form of **optional**, for use where grammatically appropriate.

These key words are highlighted in the specification for clarity. In text addressing application developers, their use expresses requirements that apply to application behavior. In text addressing implementors, their use expresses requirements that apply to implementations.

In text addressing application developers, the additional key words **can** and **cannot** are to be interpreted as describing the capabilities of an application, as follows:

- **can**
  
  This word means that the application is able to perform the action described.

- **cannot**
  
  This word means that the API and/or the execution environment provide no mechanism through which the application can express or accomplish the action described.

These key words are never used in text addressing implementors.

**NOTE**

There is an important distinction between **cannot** and **must not**, as used in this Specification. **Cannot** means something the application literally is unable to express or accomplish through the API, while **must not** means something that the application is capable of expressing through the API, but that the consequences of doing so are undefined and potentially unrecoverable for the implementation (see **Valid Usage**).

Unless otherwise noted in the section heading, all sections and appendices in this document are normative.

2.1.4. Technical Terminology

The Vulkan Specification makes use of common engineering and graphics terms such as **Pipeline**, **Shader**, and **Host** to identify and describe Vulkan API constructs and their attributes, states, and behaviors. The **Glossary** defines the basic meanings of these terms in the context of the Specification. The Specification text provides fuller definitions of the terms and may elaborate,
extend, or clarify the Glossary definitions. When a term defined in the Glossary is used in normative language within the Specification, the definitions within the Specification govern and supersede any meanings the terms may have in other technical contexts (i.e. outside the Specification).

2.1.5. Normative References

References to external documents are considered normative references if the Specification uses any of the normative terms defined in Normative Terminology to refer to them or their requirements, either as a whole or in part.

The following documents are referenced by normative sections of the specification:

Chapter 3. Fundamentals

This chapter introduces fundamental concepts including the Vulkan architecture and execution model, API syntax, queues, pipeline configurations, numeric representation, state and state queries, and the different types of objects and shaders. It provides a framework for interpreting more specific descriptions of commands and behavior in the remainder of the Specification.

3.1. Host and Device Environment

The Vulkan Specification assumes and requires: the following properties of the host environment with respect to Vulkan implementations:

- The host must have runtime support for 8, 16, 32 and 64-bit signed and unsigned twos-complement integers, all addressable at the granularity of their size in bytes.
- The host must have runtime support for 32- and 64-bit floating-point types satisfying the range and precision constraints in the Floating-Point Computation section.
- The representation and endianness of these types on the host must match the representation and endianness of the same types on every physical device supported.

NOTE
Since a variety of data types and structures in Vulkan may be accessible by both host and physical device operations, the implementation should be able to access such data efficiently in both paths in order to facilitate writing portable and performant applications.

3.2. Execution Model

This section outlines the execution model of a Vulkan system.

Vulkan exposes one or more devices, each of which exposes one or more queues which may process work asynchronously to one another. The set of queues supported by a device is partitioned into families. Each family supports one or more types of functionality and may contain multiple queues with similar characteristics. Queues within a single family are considered compatible with one another, and work produced for a family of queues can be executed on any queue within that family. This specification defines the following types of functionality that queues may support: graphics, compute, video decode, video encode, protected memory management, sparse memory management, and transfer.

NOTE
A single device may report multiple similar queue families rather than, or as well as, reporting multiple members of one or more of those families. This indicates that while members of those families have similar capabilities, they are not directly compatible with one another.

Device memory is explicitly managed by the application. Each device may advertise one or more heaps, representing different areas of memory. Memory heaps are either device-local or host-local, but are always visible to the device. Further detail about memory heaps is exposed via memory types available on that heap. Examples of memory areas that may be available on an
implementation include:

- **device-local** is memory that is physically connected to the device.
- **device-local, host visible** is device-local memory that is visible to the host.
- **host-local, host visible** is memory that is local to the host and visible to the device and host.

On other architectures, there may only be a single heap that can be used for any purpose.

### 3.2.1. Queue Operation

Vulkan queues provide an interface to the execution engines of a device. Commands for these execution engines are recorded into command buffers ahead of execution time, and then submitted to a queue for execution. Once submitted to a queue, command buffers will begin and complete execution without further application intervention, though the order of this execution is dependent on a number of implicit and explicit ordering constraints.

Work is submitted to queues using *queue submission commands* that typically take the form `vkQueue*` (e.g. `vkQueueSubmit`, `vkQueueBindSparse`), and can take a list of semaphores upon which to wait before work begins and a list of semaphores to signal once work has completed. The work itself, as well as signaling and waiting on the semaphores are all *queue operations*. Queue submission commands return control to the application once queue operations have been submitted - they do not wait for completion.

There are no implicit ordering constraints between queue operations on different queues, or between queues and the host, so these may operate in any order with respect to each other. Explicit ordering constraints between different queues or with the host can be expressed with semaphores and fences.

Command buffer submissions to a single queue respect submission order and other implicit ordering guarantees, but otherwise may overlap or execute out of order. Other types of batches and queue submissions against a single queue (e.g. sparse memory binding) have no implicit ordering constraints with any other queue submission or batch. Additional explicit ordering constraints between queue submissions and individual batches can be expressed with semaphores and fences.

Before a fence or semaphore is signaled, it is guaranteed that any previously submitted queue operations have completed execution, and that memory writes from those queue operations are available to future queue operations. Waiting on a signaled semaphore or fence guarantees that previous writes that are available are also visible to subsequent commands.

Command buffer boundaries, both between primary command buffers of the same or different batches or submissions as well as between primary and secondary command buffers, do not introduce any additional ordering constraints. In other words, submitting the set of command buffers (which can include executing secondary command buffers) between any semaphore or fence operations execute the recorded commands as if they had all been recorded into a single primary command buffer, except that the current state is reset on each boundary. Explicit ordering constraints can be expressed with explicit synchronization primitives.

There are a few implicit ordering guarantees between commands within a command buffer, but only covering a subset of execution. Additional explicit ordering constraints can be expressed with...
the various explicit synchronization primitives.

NOTE

Implementations have significant freedom to overlap execution of work submitted to a queue, and this is common due to deep pipelining and parallelism in Vulkan devices.

Commands recorded in command buffers can perform actions, set state that persists across commands, synchronize other commands, or indirectly launch other commands, with some commands fulfilling several of these roles. The “Command Properties” section for each such command lists which of these roles the command takes:

Action

*Action commands* perform operations that can update values in memory. E.g. draw commands, dispatch commands.

State

*State setting commands* update the current state of a command buffer, affecting the operation of future action commands.

Synchronization

*Synchronization commands* impose ordering constraints on action commands, by introducing explicit execution and memory dependencies.

Indirection

*Indirection commands* execute other commands which were not directly recorded in the same command buffer.

NOTE

In the absence of explicit synchronization or implicit ordering guarantees, action commands may overlap execution or execute out of order, potentially leading to data races. However, such reordering does not affect the current state observed by any action command. Each action command uses the state in effect at the point where the command occurs in the command buffer, regardless of when it is executed.

3.3. Object Model

The devices, queues, and other entities in Vulkan are represented by Vulkan objects. At the API level, all objects are referred to by handles. There are two classes of handles, dispatchable and non-dispatchable. *Dispatchable* handle types are a pointer to an opaque type. This pointer *may* be used by layers as part of intercepting API commands, and thus each API command takes a dispatchable type as its first parameter. Each object of a dispatchable type *must* have a unique handle value during its lifetime.

*Non-dispatchable* handle types are a 64-bit integer type whose meaning is implementation-dependent. If the `privateData` feature is enabled for a *VkDevice*, each object of a non-dispatchable type created on that device *must* have a handle value that is unique among objects created on that device, for the duration of the object's lifetime. Otherwise, non-dispatchable handles *may* encode
object information directly in the handle rather than acting as a reference to an underlying object, and thus may not have unique handle values. If handle values are not unique, then destroying one such handle must not cause identical handles of other types to become invalid, and must not cause identical handles of the same type to become invalid if that handle value has been created more times than it has been destroyed.

All objects created or allocated from a VkDevice (i.e. with a VkDevice as the first parameter) are private to that device, and must not be used on other devices.

### 3.3.1. Object Lifetime

Objects are created or allocated by vkCreate* and vkAllocate* commands, respectively. Once an object is created or allocated, its “structure” is considered to be immutable, though the contents of certain object types is still free to change. Objects are destroyed or freed by vkDestroy* and vkFree* commands, respectively.

Objects that are allocated (rather than created) take resources from an existing pool object or memory heap, and when freed return resources to that pool or heap. While object creation and destruction are generally expected to be low-frequency occurrences during runtime, allocating and freeing objects can occur at high frequency. Pool objects help accommodate improved performance of the allocations and frees.

It is an application’s responsibility to track the lifetime of Vulkan objects, and not to destroy them while they are still in use.

The ownership of application-owned memory is immediately acquired by any Vulkan command it is passed into. Ownership of such memory must be released back to the application at the end of the duration of the command, unless that command was deferred, so that the application can alter or free this memory as soon as all the commands that acquired it have returned. If the command was deferred, ownership of such memory is released back to the application when the deferred operation is complete.

The following object types are consumed when they are passed into a Vulkan command and not further accessed by the objects they are used to create. They must not be destroyed in the duration of any API command they are passed into:

- VkShaderModule
- VkPipelineCache
- VkValidationCacheEXT

A VkRenderPass or VkPipelineLayout object passed as a parameter to create another object is not further accessed by that object after the duration of the command it is passed into. A VkRenderPass used in a command buffer follows the rules described below.

VkDescriptorsetLayout objects may be accessed by commands that operate on descriptor sets allocated using that layout, and those descriptor sets must not be updated with vkUpdateDescriptorSets after the descriptor set layout has been destroyed. Otherwise, a VkDescriptorsetLayout object is no longer referenced by an API command it is passed into once host execution of that command completes.
The application **must** not destroy any other type of Vulkan object until all uses of that object by the device (such as via command buffer execution) have completed.

The following Vulkan objects **must** not be destroyed while any command buffers using the object are in the **pending state**:

- VkEvent
- VkQueryPool
- VkBuffer
- VkBufferView
- VkImage
- VkImageView
- VkPipeline
- VkSampler
- VkSamplerYcbcrConversion
- VkDescriptorPool
- VkFramebuffer
- VkRenderPass
- VkCommandBuffer
- VkCommandPool
- VkDeviceMemory
- VkDescriptorSet
- VkIndirectCommandsLayoutNV
- VkAccelerationStructureNV
- VkAccelerationStructureKHR
- VkVideoSessionKHR
- VkVideoSessionParametersKHR

Destroying these objects will move any command buffers that are in the **recording or executable state**, and are using those objects, to the **invalid state**.

The following Vulkan objects **must** not be destroyed while any queue is executing commands that use the object:

- VkFence
- VkSemaphore
- VkCommandBuffer
- VkCommandPool

In general, objects **can** be destroyed or freed in any order, even if the object being freed is involved
in the use of another object (e.g. use of a resource in a view, use of a view in a descriptor set, use of a pipeline library in another pipeline, use of a referenced pipeline for additional graphics shader groups in another pipeline, use of a bottom level acceleration structure in an instance referenced by a top level acceleration structure, use of an object in a command buffer, binding of a memory allocation to a resource), as long as any object that uses the freed object is not further used in any way except to be destroyed or to be reset in such a way that it no longer uses the other object (such as resetting a command buffer). If the object has been reset, then it can be used as if it never used the freed object. An exception to this is when there is a parent/child relationship between objects. In this case, the application must not destroy a parent object before its children, except when the parent is explicitly defined to free its children when it is destroyed (e.g. for pool objects, as defined below).

VkCommandPool objects are parents of VkCommandBuffer objects. VkDescriptorPool objects are parents of VkDescriptorSet objects. VkDevice objects are parents of many object types (all that take a VkDevice as a parameter to their creation).

The following Vulkan objects have specific restrictions for when they can be destroyed:

- VkQueue objects cannot be explicitly destroyed. Instead, they are implicitly destroyed when the VkDevice object they are retrieved from is destroyed.
- Destroying a pool object implicitly frees all objects allocated from that pool. Specifically, destroying VkCommandPool frees all VkCommandBuffer objects that were allocated from it, and destroying VkDescriptorPool frees all VkDescriptorSet objects that were allocated from it.
- VkDevice objects can be destroyed when all VkQueue objects retrieved from them are idle, and all objects created from them have been destroyed.
  - This includes the following objects:
    - VkFence
    - VkSemaphore
    - VkEvent
    - VkQueryPool
    - VkBuffer
    - VkBufferView
    - VkImage
    - VkImageView
    - VkShaderModule
    - VkPipelineCache
    - VkPipeline
    - VkPipelineLayout
    - VkSampler
    - VkSamplerYcbcrConversion
    - VkDescriptorSetLayout
• `VkPhysicalDevice` objects cannot be explicitly destroyed. Instead, they are implicitly destroyed when the `VkInstance` object they are retrieved from is destroyed.

• `VkInstance` objects can be destroyed once all `VkDevice` objects created from any of its `VkPhysicalDevice` objects have been destroyed.

### 3.3.2. External Object Handles

As defined above, the scope of object handles created or allocated from a `VkDevice` is limited to that logical device. Objects which are not in scope are said to be external. To bring an external object into scope, an external handle must be exported from the object in the source scope and imported into the destination scope.

**NOTE**
The scope of external handles and their associated resources may vary according to their type, but they can generally be shared across process and API boundaries.

### 3.4. Application Binary Interface

The mechanism by which Vulkan is made available to applications is platform- or implementation-defined. On many platforms the C interface described in this Specification is provided by a shared library. Since shared libraries can be changed independently of the applications that use them, they present particular compatibility challenges, and this Specification places some requirements on them.

Shared library implementations must use the default Application Binary Interface (ABI) of the standard C compiler for the platform, or provide customized API headers that cause application code to use the implementation’s non-default ABI. An ABI in this context means the size, alignment, and layout of C data types; the procedure calling convention; and the naming convention for shared library symbols corresponding to C functions. Customizing the calling convention for a platform is usually accomplished by defining calling convention macros appropriately in `vk_platform.h`.

On platforms where Vulkan is provided as a shared library, library symbols beginning with “vk” and followed by a digit or uppercase letter are reserved for use by the implementation.
Applications which use Vulkan must not provide definitions of these symbols. This allows the Vulkan shared library to be updated with additional symbols for new API versions or extensions without causing symbol conflicts with existing applications.

Shared library implementations should provide library symbols for commands in the highest version of this Specification they support, and for Window System Integration extensions relevant to the platform. They may also provide library symbols for commands defined by additional extensions.

NOTE

These requirements and recommendations are intended to allow implementors to take advantage of platform-specific conventions for SDKs, ABIs, library versioning mechanisms, etc. while still minimizing the code changes necessary to port applications or libraries between platforms. Platform vendors, or providers of the de facto standard Vulkan shared library for a platform, are encouraged to document what symbols the shared library provides and how it will be versioned when new symbols are added.

Applications should only rely on shared library symbols for commands in the minimum core version required by the application. vkGetInstanceProcAddr and vkGetDeviceProcAddr should be used to obtain function pointers for commands in core versions beyond the application’s minimum required version.

3.5. Command Syntax and Duration

The Specification describes Vulkan commands as functions or procedures using C99 syntax. Language bindings for other languages such as C++ and JavaScript may allow for stricter parameter passing, or object-oriented interfaces.

Vulkan uses the standard C types for the base type of scalar parameters (e.g. types from `<stdint.h>`), with exceptions described below, or elsewhere in the text when appropriate:

VkBool32 represents boolean True and False values, since C does not have a sufficiently portable built-in boolean type:

```c
// Provided by VK_VERSION_1_0
typedef uint32_t VkBool32;
```

VK_TRUE represents a boolean True (unsigned integer 1) value, and VK_FALSE a boolean False (unsigned integer 0) value.

All values returned from a Vulkan implementation in a VkBool32 will be either VK_TRUE or VK_FALSE.

Applications must not pass any other values than VK_TRUE or VK_FALSE into a Vulkan implementation where a VkBool32 is expected.

VK_TRUE is a constant representing a VkBool32 True value.
`VK_TRUE` is a constant representing a `VkBool32 False` value.

```c
#define VK_TRUE                           1U

#define VK_FALSE                          0U
```

`VkDeviceSize` represents device memory size and offset values:

```c
// Provided by VK_VERSION_1_0
typedef uint64_t VkDeviceSize;
```

`VkDeviceAddress` represents device buffer address values:

```c
// Provided by VK_VERSION_1_0
typedef uint64_t VkDeviceAddress;
```

Commands that create Vulkan objects are of the form `vkCreate*` and take `Vk*CreateInfo` structures with the parameters needed to create the object. These Vulkan objects are destroyed with commands of the form `vkDestroy*`.

The last in-parameter to each command that creates or destroys a Vulkan object is `pAllocator`. The `pAllocator` parameter can be set to a non-NULL value such that allocations for the given object are delegated to an application provided callback; refer to the Memory Allocation chapter for further details.

Commands that allocate Vulkan objects owned by pool objects are of the form `vkAllocate*`, and take `Vk*AllocateInfo` structures. These Vulkan objects are freed with commands of the form `vkFree*`. These objects do not take allocators; if host memory is needed, they will use the allocator that was specified when their parent pool was created.

Commands are recorded into a command buffer by calling API commands of the form `vkCmd*`. Each such command may have different restrictions on where it can be used: in a primary and/or secondary command buffer, inside and/or outside a render pass, and in one or more of the supported queue types. These restrictions are documented together with the definition of each such command.

The `duration` of a Vulkan command refers to the interval between calling the command and its return to the caller.

### 3.5.1. Lifetime of Retrieved Results

Information is retrieved from the implementation with commands of the form `vkGet*` and `vkEnumerate*`.

Unless otherwise specified for an individual command, the results are `invariant`; that is, they will
remain unchanged when retrieved again by calling the same command with the same parameters, so long as those parameters themselves all remain valid.

### 3.5.2. Array Results

Some query commands of the form `vkGet*` and `vkEnumerate*` enable retrieving multiple results in the form of a return array. Such commands typically have two pointer arguments as follows:

- An element count pointer pointing to an integer variable, conventionally named as `p*Count` where * is the capitalized singular form of the name of the retrieved values.
- A pointer to an array where the result array is retrieved, conventionally named as `p*` where * is the capitalized plural form of the name of the retrieved values.

If such commands are called with the array pointer set to `NULL`, then the number of retrievable elements is returned in the variable pointed to by the element count pointer. Otherwise, the element count pointer must point to a variable set by the application to the number of elements in the return array, and on return the variable is overwritten with the number of elements actually written to the return array. If the input element count is less than the number of retrievable array elements, the query will write only as many elements to the return array as specified by the element count variable set by the application, and the command will return `VK_INCOMPLETE` instead of `VK_SUCCESS`, to indicate that not all retrievable array elements were returned.

**NOTE**

In practice, this means that applications will typically call such query commands twice:

- First, with the array pointer set to `NULL`, to retrieve the number of retrievable elements.
- Second, with the array pointer pointing to an application allocated storage for at least as many elements as indicated by the variable pointed to by the element count pointer, to retrieve at most as many of the retrievable elements.

Query commands that return one or more structures, regardless of whether they return a single or an array of structures with or without a `pNext` chain, may also contain arrays within those structures. Such return arrays are typically defined in the form of two members as follows:

- An integer value specifying the element count, conventionally named as `*Count` where * is the singular form of the name of the retrieved values.
- A pointer to an array where the result array is retrieved, conventionally named as `p*` where * is the capitalized plural form of the name of the retrieved values.

Analogously to query commands that return multiple results, if the command is called with the array pointer member of the output structure in question set to `NULL`, then the number of retrievable elements is returned in the element count member of that output structure. Otherwise, the element count must specify the number of elements in the return array, and on return the element count member is overwritten with the number of elements actually written to the return array. If the input element count is less than the number of retrievable array elements, the query will write only as many elements to the return array as specified by the input element count, and the command will return `VK_INCOMPLETE` instead of `VK_SUCCESS`, if the query command has a `VkResult`
Applications need to separately track the value they provided as the input element count member for such arrays and compare those with the returned element counts in order to determine whether the actually returned element count is smaller than the size of the return array. Another side effect of this is that it is impossible for the application to determine if the number of retrievable elements has increased beyond the provided input element count so using return arrays in output structures should be limited to invariant array results. In practice, this means that applications will typically call such query commands multiple times:

- First, with the array pointer member(s) set to NULL, to retrieve the number(s) of retrievable elements.
- Second, with the array pointer(s) pointing to an application allocated storage for at least as many elements as indicated by the element count member(s), to retrieve at most as many of the retrievable elements.
- Then the process may need to be repeated for all other newly introduced return arrays in any nested output structures indirectly specified through the previously retrieved result arrays.

Regardless of the type of query command, any array pointer member of an output structure must either be NULL, or point to an application-allocated array. Query commands must not return a pointer to implementation allocated storage in any output structure.

### 3.6. Threading Behavior

Vulkan is intended to provide scalable performance when used on multiple host threads. All commands support being called concurrently from multiple threads, but certain parameters, or components of parameters are defined to be externally synchronized. This means that the caller must guarantee that no more than one thread is using such a parameter at a given time.

More precisely, Vulkan commands use simple stores to update the state of Vulkan objects. A parameter declared as externally synchronized may have its contents updated at any time during the host execution of the command. If two commands operate on the same object and at least one of the commands declares the object to be externally synchronized, then the caller must guarantee not only that the commands do not execute simultaneously, but also that the two commands are separated by an appropriate memory barrier (if needed).

Memory barriers are particularly relevant for hosts based on the ARM CPU architecture, which is more weakly ordered than many developers are accustomed to from x86/x64 programming. Fortunately, most higher-level synchronization primitives (like the pthread library) perform memory barriers as a part of mutual exclusion, so mutexing Vulkan objects via these primitives will have the desired effect.

Similarly the application must avoid any potential data hazard of application-owned memory that has its ownership temporarily acquired by a Vulkan command. While the ownership of application-
owned memory remains acquired by a command the implementation may read the memory at any point, and it may write non-\texttt{const} qualified memory at any point. Parameters referring to non-\texttt{const} qualified application-owned memory are not marked explicitly as \texttt{externally synchronized} in the Specification.

If an application is using \texttt{deferred host operations} in a command, and that operation is successfully deferred, object parameters and application-owned memory passed to that command may be accessed at any time until the deferred operation is complete.

Many object types are \textit{immutable}, meaning the objects cannot change once they have been created. These types of objects never need external synchronization, except that they must not be destroyed while they are in use on another thread. In certain special cases mutable object parameters are internally synchronized, making external synchronization unnecessary. Any command parameters that are not labeled as externally synchronized are either not mutated by the command or are internally synchronized. Additionally, certain objects related to a command's parameters (e.g. command pools and descriptor pools) may be affected by a command, and must also be externally synchronized. These implicit parameters are documented as described below.

Parameters of commands that are externally synchronized are listed below.

### Externally Synchronized Parameters

- The \texttt{instance} parameter in \texttt{vkDestroyInstance}
- The \texttt{device} parameter in \texttt{vkDestroyDevice}
- The \texttt{queue} parameter in \texttt{vkQueueSubmit}
- The \texttt{fence} parameter in \texttt{vkQueueSubmit}
- The \texttt{queue} parameter in \texttt{vkQueueWaitIdle}
- The \texttt{memory} parameter in \texttt{vkFreeMemory}
- The \texttt{memory} parameter in \texttt{vkMapMemory}
- The \texttt{memory} parameter in \texttt{vkUnmapMemory}
- The \texttt{buffer} parameter in \texttt{vkBindBufferMemory}
- The \texttt{image} parameter in \texttt{vkBindImageMemory}
- The \texttt{queue} parameter in \texttt{vkQueueBindSparse}
- The \texttt{fence} parameter in \texttt{vkQueueBindSparse}
- The \texttt{fence} parameter in \texttt{vkDestroyFence}
- The \texttt{semaphore} parameter in \texttt{vkDestroySemaphore}
- The \texttt{event} parameter in \texttt{vkDestroyEvent}
- The \texttt{event} parameter in \texttt{vkSetEvent}
- The \texttt{event} parameter in \texttt{vkResetEvent}
- The \texttt{queryPool} parameter in \texttt{vkDestroyQueryPool}
- The \texttt{buffer} parameter in \texttt{vkDestroyBuffer}
- The `bufferView` parameter in `vkDestroyBufferView`
- The `image` parameter in `vkDestroyImage`
- The `imageView` parameter in `vkDestroyImageView`
- The `shaderModule` parameter in `vkDestroyShaderModule`
- The `pipelineCache` parameter in `vkDestroyPipelineCache`
- The `dstCache` parameter in `vkMergePipelineCaches`
- The `pipeline` parameter in `vkDestroyPipeline`
- The `pipelineLayout` parameter in `vkDestroyPipelineLayout`
- The `sampler` parameter in `vkDestroySampler`
- The `descriptorSetLayout` parameter in `vkDestroyDescriptorSetLayout`
- The `descriptorPool` parameter in `vkDestroyDescriptorPool`
- The `descriptorPool` parameter in `vkResetDescriptorPool`
- The `descriptorPool` member of the `pAllocateInfo` parameter in `vkAllocateDescriptorSets`
- The `descriptorPool` parameter in `vkFreeDescriptorSets`
- The `framebuffer` parameter in `vkDestroyFramebuffer`
- The `renderPass` parameter in `vkDestroyRenderPass`
- The `commandPool` parameter in `vkDestroyCommandPool`
- The `commandPool` parameter in `vkResetCommandPool`
- The `commandPool` member of the `pAllocateInfo` parameter in `vkAllocateCommandBuffers`
- The `commandPool` parameter in `vkFreeCommandBuffers`
- The `commandBuffer` parameter in `vkBeginCommandBuffer`
- The `commandBuffer` parameter in `vkEndCommandBuffer`
- The `commandBuffer` parameter in `vkResetCommandBuffer`
- The `commandBuffer` parameter in `vkCmdBindPipeline`
- The `commandBuffer` parameter in `vkCmdSetViewport`
- The `commandBuffer` parameter in `vkCmdSetScissor`
- The `commandBuffer` parameter in `vkCmdSetLineWidth`
- The `commandBuffer` parameter in `vkCmdSetDepthBias`
- The `commandBuffer` parameter in `vkCmdSetBlendConstants`
- The `commandBuffer` parameter in `vkCmdSetDepthBounds`
- The `commandBuffer` parameter in `vkCmdSetStencilCompareMask`
- The `commandBuffer` parameter in `vkCmdSetStencilWriteMask`
- The `commandBuffer` parameter in `vkCmdSetStencilReference`
- The `commandBuffer` parameter in `vkCmdBindDescriptorSets`
- The `commandBuffer` parameter in `vkCmdBindIndexBuffer`
• The `commandBuffer` parameter in `vkCmdBindVertexBuffers`
• The `commandBuffer` parameter in `vkCmdDraw`
• The `commandBuffer` parameter in `vkCmdDrawIndexed`
• The `commandBuffer` parameter in `vkCmdDrawIndirect`
• The `commandBuffer` parameter in `vkCmdDrawIndexedIndirect`
• The `commandBuffer` parameter in `vkCmdDispatch`
• The `commandBuffer` parameter in `vkCmdDispatchIndirect`
• The `commandBuffer` parameter in `vkCmdCopyBuffer`
• The `commandBuffer` parameter in `vkCmdCopyImage`
• The `commandBuffer` parameter in `vkCmdBlitImage`
• The `commandBuffer` parameter in `vkCmdCopyBufferToImage`
• The `commandBuffer` parameter in `vkCmdCopyImageToBuffer`
• The `commandBuffer` parameter in `vkCmdUpdateBuffer`
• The `commandBuffer` parameter in `vkCmdFillBuffer`
• The `commandBuffer` parameter in `vkCmdClearColorImage`
• The `commandBuffer` parameter in `vkCmdClearDepthStencilImage`
• The `commandBuffer` parameter in `vkCmdClearAttachments`
• The `commandBuffer` parameter in `vkCmdResolveImage`
• The `commandBuffer` parameter in `vkCmdSetEvent`
• The `commandBuffer` parameter in `vkCmdResetEvent`
• The `commandBuffer` parameter in `vkCmdWaitEvents`
• The `commandBuffer` parameter in `vkCmdPipelineBarrier`
• The `commandBuffer` parameter in `vkCmdBeginQuery`
• The `commandBuffer` parameter in `vkCmdEndQuery`
• The `commandBuffer` parameter in `vkCmdResetQueryPool`
• The `commandBuffer` parameter in `vkCmdWriteTimestamp`
• The `commandBuffer` parameter in `vkCmdCopyQueryPoolResults`
• The `commandBuffer` parameter in `vkCmdPushConstants`
• The `commandBuffer` parameter in `vkCmdBeginRenderPass`
• The `commandBuffer` parameter in `vkCmdNextSubpass`
• The `commandBuffer` parameter in `vkCmdEndRenderPass`
• The `commandBuffer` parameter in `vkCmdExecuteCommands`
• The `commandBuffer` parameter in `vkCmdSetDeviceMask`
• The `commandBuffer` parameter in `vkCmdDispatchBase`
• The `commandPool` parameter in `vkTrimCommandPool`
• The ycbcrConversion parameter in vkDestroySamplerYcbcrConversion
• The descriptorUpdateTemplate parameter in vkDestroyDescriptorUpdateTemplate
• The commandBuffer parameter in vkCmdDrawIndirectCount
• The commandBuffer parameter in vkCmdDrawIndexedIndirectCount
• The commandBuffer parameter in vkCmdBeginRenderPass2
• The commandBuffer parameter in vkCmdNextSubpass2
• The commandBuffer parameter in vkCmdEndRenderPass2
• The privateDataSlot parameter in vkDestroyPrivateDataSlot
• The commandBuffer parameter in vkCmdSetEvent2
• The commandBuffer parameter in vkCmdResetEvent2
• The commandBuffer parameter in vkCmdWaitEvents2
• The commandBuffer parameter in vkCmdPipelineBarrier2
• The commandBuffer parameter in vkCmdWriteTimestamp2
• The queue parameter in vkQueueSubmit2
• The fence parameter in vkQueueSubmit2
• The commandBuffer parameter in vkCmdCopyBuffer2
• The commandBuffer parameter in vkCmdCopyImage2
• The commandBuffer parameter in vkCmdCopyBufferToImage2
• The commandBuffer parameter in vkCmdCopyImageToBuffer2
• The commandBuffer parameter in vkCmdBlitImage2
• The commandBuffer parameter in vkCmdResolveImage2
• The commandBuffer parameter in vkCmdBeginRendering
• The commandBuffer parameter in vkCmdEndRendering
• The commandBuffer parameter in vkCmdSetCullMode
• The commandBuffer parameter in vkCmdSetFrontFace
• The commandBuffer parameter in vkCmdSetPrimitiveTopology
• The commandBuffer parameter in vkCmdSetViewportWithCount
• The commandBuffer parameter in vkCmdSetScissorWithCount
• The commandBuffer parameter in vkCmdBindVertexBuffers2
• The commandBuffer parameter in vkCmdSetDepthTestEnable
• The commandBuffer parameter in vkCmdSetDepthWriteEnable
• The commandBuffer parameter in vkCmdSetDepthCompareOp
• The commandBuffer parameter in vkCmdSetDepthBoundsTestEnable
• The commandBuffer parameter in vkCmdSetStencilTestEnable
• The commandBuffer parameter in vkCmdSetStencilOp
The `commandBuffer` parameter in `vkCmdSetRasterizerDiscardEnable`

The `commandBuffer` parameter in `vkCmdSetDepthBiasEnable`

The `commandBuffer` parameter in `vkCmdSetPrimitiveRestartEnable`

The `surface` parameter in `vkDestroySurfaceKHR`

The `surface` member of the `pCreateInfo` parameter in `vkCreateSwapchainKHR`

The `oldSwapchain` member of the `pCreateInfo` parameter in `vkCreateSwapchainKHR`

The `swapchain` parameter in `vkDestroySwapchainKHR`

The `swapchain` parameter in `vkAcquireNextImageKHR`

The `semaphore` parameter in `vkAcquireNextImageKHR`

The `fence` parameter in `vkAcquireNextImageKHR`

The `queue` parameter in `vkQueuePresentKHR`

The `surface` parameter in `vkGetDeviceGroupSurfacePresentModesKHR`

The `surface` parameter in `vkGetPhysicalDevicePresentRectanglesKHR`

The `display` parameter in `vkCreateDisplayModeKHR`

The `mode` parameter in `vkGetDisplayPlaneCapabilitiesKHR`

The `videoSession` parameter in `vkDestroyVideoSessionKHR`

The `videoSession` parameter in `vkBindVideoSessionMemoryKHR`

The `videoSessionParameters` parameter in `vkDestroyVideoSessionParametersKHR`

The `commandBuffer` parameter in `vkCmdBeginVideoCodingKHR`

The `commandBuffer` parameter in `vkCmdEndVideoCodingKHR`

The `commandBuffer` parameter in `vkCmdControlVideoCodingKHR`

The `commandBuffer` parameter in `vkCmdDecodeVideoKHR`

The `commandBuffer` parameter in `vkCmdBeginRenderingKHR`

The `commandBuffer` parameter in `vkCmdEndRenderingKHR`

The `commandBuffer` parameter in `vkCmdSetDeviceMaskKHR`

The `commandPool` parameter in `vkTrimCommandPoolKHR`

The `commandBuffer` parameter in `vkCmdPushDescriptorSetKHR`

The `commandBuffer` parameter in `vkCmdPushDescriptorSetWithTemplateKHR`

The `descriptorUpdateTemplate` parameter in `vkDestroyDescriptorUpdateTemplateKHR`

The `commandBuffer` parameter in `vkCmdBeginRenderPass2KHR`

The `commandBuffer` parameter in `vkCmdNextSubpass2KHR`

The `commandBuffer` parameter in `vkCmdEndRenderPass2KHR`

The `swapchain` parameter in `vkGetSwapchainStatusKHR`

The `ycbcrConversion` parameter in `vkDestroySamplerYcbcrConversionKHR`
• The `commandBuffer` parameter in `vkCmdDrawIndirectCountKHR`
• The `commandBuffer` parameter in `vkCmdDrawIndexedIndirectCountKHR`
• The `commandBuffer` parameter in `vkCmdSetFragmentShadingRateKHR`
• The `commandBuffer` parameter in `vkCmdSetRenderingAttachmentLocationsKHR`
• The `commandBuffer` parameter in `vkCmdSetRenderingInputAttachmentIndicesKHR`
• The `swapchain` parameter in `vkWaitForPresentKHR`
• The `operation` parameter in `vkDestroyDeferredOperationKHR`
• The `commandBuffer` parameter in `vkCmdEncodeVideoKHR`
• The `commandBuffer` parameter in `vkCmdSetEvent2KHR`
• The `commandBuffer` parameter in `vkCmdResetEvent2KHR`
• The `commandBuffer` parameter in `vkCmdWaitEvents2KHR`
• The `commandBuffer` parameter in `vkCmdPipelineBarrier2KHR`
• The `commandBuffer` parameter in `vkCmdWriteTimestamp2KHR`
• The `queue` parameter in `vkQueueSubmit2KHR`
• The `fence` parameter in `vkQueueSubmit2KHR`
• The `commandBuffer` parameter in `vkCmdWriteBufferMarker2AMD`
• The `commandBuffer` parameter in `vkCmdCopyBuffer2KHR`
• The `commandBuffer` parameter in `vkCmdCopyImage2KHR`
• The `commandBuffer` parameter in `vkCmdCopyBufferToImage2KHR`
• The `commandBuffer` parameter in `vkCmdCopyImageToBuffer2KHR`
• The `commandBuffer` parameter in `vkCmdBlitImage2KHR`
• The `commandBuffer` parameter in `vkCmdResolveImage2KHR`
• The `commandBuffer` parameter in `vkCmdTraceRaysIndirect2KHR`
• The `commandBuffer` parameter in `vkCmdBindIndexBuffer2KHR`
• The `commandBuffer` parameter in `vkCmdSetLineStippleKHR`
• The `commandBuffer` parameter in `vkCmdBindDescriptorSets2KHR`
• The `commandBuffer` parameter in `vkCmdPushConstants2KHR`
• The `commandBuffer` parameter in `vkCmdPushDescriptorSet2KHR`
• The `commandBuffer` parameter in `vkCmdPushDescriptorSetWithTemplate2KHR`
• The `commandBuffer` parameter in `vkCmdSetDescriptorBufferOffsets2EXT`
• The `commandBuffer` parameter in `vkCmdBindDescriptorBufferEmbeddedSamplers2EXT`
• The `callback` parameter in `vkDestroyDebugReportCallbackEXT`
• The `object` member of the `pTagInfo` parameter in `vkDebugMarkerSetObjectTagEXT`
• The `object` member of the `pNameInfo` parameter in `vkDebugMarkerSetObjectNameEXT`
• The `commandBuffer` parameter in `vkCmdDebugMarkerBeginEXT`
• The `commandBuffer` parameter in `vkCmdDebugMarkerEndEXT`
• The `commandBuffer` parameter in `vkCmdDebugMarkerInsertEXT`

• The `commandBuffer` parameter in `vkCmdSetCoverageReductionModeNV`.
• The `commandBuffer` parameter in `vkDestroyShaderEXT`.
• The `commandBuffer` parameter in `vkCmdBindShadersEXT`.
• The `commandBuffer` parameter in `vkCmdSetAttachmentFeedbackLoopEnableEXT`.
• The `accelerationStructure` parameter in `vkDestroyAccelerationStructureKHR`.
• The `commandBuffer` parameter in `vkCmdBuildAccelerationStructuresKHR`.
• The `commandBuffer` parameter in `vkCmdBuildAccelerationStructuresIndirectKHR`.
• The `commandBuffer` parameter in `vkCmdCopyAccelerationStructureKHR`.
• The `commandBuffer` parameter in `vkCmdCopyAccelerationStructureToMemoryKHR`.
• The `commandBuffer` parameter in `vkCmdWriteAccelerationStructuresPropertiesKHR`.
• The `commandBuffer` parameter in `vkCmdTraceRaysKHR`.
• The `commandBuffer` parameter in `vkCmdTraceRaysIndirectKHR`.
• The `commandBuffer` parameter in `vkCmdSetRayTracingPipelineStackSizeKHR`.
• The `commandBuffer` parameter in `vkCmdDrawMeshTasksEXT`.
• The `commandBuffer` parameter in `vkCmdDrawMeshTasksIndirectEXT`.
• The `commandBuffer` parameter in `vkCmdDrawMeshTasksIndirectCountEXT`.
For VkPipelineCache objects created with flags containing VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT, the above table is extended with the pipelineCache parameter to vkCreate*Pipelines being externally synchronized.

There are also a few instances where a command can take in an application-allocated list whose contents are externally synchronized parameters. In these cases, the caller must guarantee that at most one thread is using a given element within the list at a given time. These parameters are listed below.

### Externally Synchronized Parameter Lists

- Each element of the pFences parameter in vkResetFences
- Each element of the pDescriptorSets parameter in vkFreeDescriptorSets
- Each element of the pCommandBuffers parameter in vkFreeCommandBuffers
- Each element of the pWaitSemaphores member of the pPresentInfo parameter in vkQueuePresentKHR
- Each element of the pSwapchains member of the pPresentInfo parameter in vkQueuePresentKHR
- The surface member of each element of the pCreateInfos parameter in vkCreateSharedSwapchainsKHR
- The oldSwapchain member of each element of the pCreateInfos parameter in vkCreateSharedSwapchainsKHR

In addition, there are some implicit parameters that need to be externally synchronized. For example, when a commandBuffer parameter needs to be externally synchronized, it implies that the commandPool from which that command buffer was allocated also needs to be externally synchronized. The implicit parameters and their associated object are listed below.

### Implicit Externally Synchronized Parameters

- All VkPhysicalDevice objects enumerated from instance in vkDestroyInstance
- All VkQueue objects created from device in vkDestroyDevice
- All VkQueue objects created from device in vkDeviceWaitIdle
- Any VkDescriptorSet objects allocated from descriptorPool in vkResetDescriptorPool
- The VkCommandPool that commandBuffer was allocated from in vkBeginCommandBuffer
- The VkCommandPool that commandBuffer was allocated from in vkEndCommandBuffer
- The VkCommandPool that commandBuffer was allocated from in vkResetCommandBuffer
- The VkCommandPool that commandBuffer was allocated from, in vkCmdBindPipeline
- The VkCommandPool that commandBuffer was allocated from, in vkCmdSetViewport
- The VkCommandPool that commandBuffer was allocated from, in vkCmdSetScissor
- The VkCommandPool that commandBuffer was allocated from, in vkCmdSetLineWidth
The VkCommandPool that commandBuffer was allocated from, in vkCmdSetDepthBias
The VkCommandPool that commandBuffer was allocated from, in vkCmdSetBlendConstants
The VkCommandPool that commandBuffer was allocated from, in vkCmdSetDepthBounds
The VkCommandPool that commandBuffer was allocated from, in vkCmdSetStencilCompareMask
The VkCommandPool that commandBuffer was allocated from, in vkCmdSetStencilWriteMask
The VkCommandPool that commandBuffer was allocated from, in vkCmdSetStencilReference
The VkCommandPool that commandBuffer was allocated from, in vkCmdBindDescriptorSets
The VkCommandPool that commandBuffer was allocated from, in vkCmdBindIndexBuffer
The VkCommandPool that commandBuffer was allocated from, in vkCmdBindVertexBuffers
The VkCommandPool that commandBuffer was allocated from, in vkCmdDraw
The VkCommandPool that commandBuffer was allocated from, in vkCmdDrawIndexed
The VkCommandPool that commandBuffer was allocated from, in vkCmdDrawIndirect
The VkCommandPool that commandBuffer was allocated from, in vkCmdDrawIndexedIndirect
The VkCommandPool that commandBuffer was allocated from, in vkCmdDispatch
The VkCommandPool that commandBuffer was allocated from, in vkCmdDispatchIndirect
The VkCommandPool that commandBuffer was allocated from, in vkCmdCopyBuffer
The VkCommandPool that commandBuffer was allocated from, in vkCmdCopyImage
The VkCommandPool that commandBuffer was allocated from, in vkCmdBlitImage

Valid usage defines a set of conditions which must be met in order to achieve well-defined runtime behavior in an application. These conditions depend only on Vulkan state, and the parameters or objects whose usage is constrained by the condition.

The core layer assumes applications are using the API correctly. Except as documented elsewhere in
the Specification, the behavior of the core layer to an application using the API incorrectly is undefined, and may include program termination. However, implementations must ensure that incorrect usage by an application does not affect the integrity of the operating system, the Vulkan implementation, or other applications in the system using Vulkan. In particular, any guarantees made by an operating system about whether memory from one process can be visible to another process or not must not be violated by a Vulkan implementation for any memory allocation. Vulkan implementations are not required to make additional security or integrity guarantees beyond those provided by the OS unless explicitly directed by the application’s use of a particular feature or extension.

NOTE

For instance, if an operating system guarantees that data in all its memory allocations are set to zero when newly allocated, the Vulkan implementation must make the same guarantees for any allocations it controls (e.g. VkDeviceMemory).

Similarly, if an operating system guarantees that use-after-free of host allocations will not result in values written by another process becoming visible, the same guarantees must be made by the Vulkan implementation for device memory.

If the protectedMemory feature is supported, the implementation provides additional guarantees when invalid usage occurs to prevent values in protected memory from being accessed or inferred outside of protected operations, as described in Protected Memory Access Rules.

Some valid usage conditions have dependencies on runtime limits or feature availability. It is possible to validate these conditions against Vulkan’s minimum supported values for these limits and features, or some subset of other known values.

Valid usage conditions do not cover conditions where well-defined behavior (including returning an error code) exists.

Valid usage conditions should apply to the command or structure where complete information about the condition would be known during execution of an application. This is such that a validation layer or linter can be written directly against these statements at the point they are specified.

NOTE

This does lead to some non-obvious places for valid usage statements. For instance, the valid values for a structure might depend on a separate value in the calling command. In this case, the structure itself will not reference this valid usage as it is impossible to determine validity from the structure that it is invalid - instead this valid usage would be attached to the calling command.

Another example is draw state - the state setters are independent, and can cause a legitimately invalid state configuration between draw calls; so the valid usage statements are attached to the place where all state needs to be valid - at the drawing command.

Valid usage conditions are described in a block labeled “Valid Usage” following each command or structure they apply to.
3.7.1. Usage Validation

Vulkan is a layered API. The lowest layer is the core Vulkan layer, as defined by this Specification. The application can use additional layers above the core for debugging, validation, and other purposes.

One of the core principles of Vulkan is that building and submitting command buffers should be highly efficient. Thus error checking and validation of state in the core layer is minimal, although more rigorous validation can be enabled through the use of layers.

Validation of correct API usage is left to validation layers. Applications should be developed with validation layers enabled, to help catch and eliminate errors. Once validated, released applications should not enable validation layers by default.

3.7.2. Implicit Valid Usage

Some valid usage conditions apply to all commands and structures in the API, unless explicitly denoted otherwise for a specific command or structure. These conditions are considered implicit, and are described in a block labeled “Valid Usage (Implicit)” following each command or structure they apply to. Implicit valid usage conditions are described in detail below.

Valid Usage for Object Handles

Any input parameter to a command that is an object handle must be a valid object handle, unless otherwise specified. An object handle is valid if:

- It has been created or allocated by a previous, successful call to the API. Such calls are noted in the Specification.
- It has not been deleted or freed by a previous call to the API. Such calls are noted in the Specification.
- Any objects used by that object, either as part of creation or execution, must also be valid.

The reserved values VK_NULL_HANDLE and NULL can be used in place of valid non-dispatchable handles and dispatchable handles, respectively, when explicitly called out in the Specification. Any command that creates an object successfully must not return these values. It is valid to pass these values to vkDestroy* or vkFree* commands, which will silently ignore these values.

Valid Usage for Pointers

Any parameter that is a pointer must be a valid pointer only if it is explicitly called out by a Valid Usage statement.

A pointer is “valid” if it points at memory containing values of the number and type(s) expected by the command, and all fundamental types accessed through the pointer (e.g. as elements of an array or as members of a structure) satisfy the alignment requirements of the host processor.

Valid Usage for Strings

Any parameter that is a pointer to char must be a finite sequence of values terminated by a null
character, or if explicitly called out in the Specification, can be NULL.

Strings specified as UTF-8 encoded must not contain invalid UTF-8 sequences. See String Representation for additional information about strings.

Valid Usage for Enumerated Types

Any parameter of an enumerated type must be a valid enumerant for that type. Use of an enumerant is valid if the following conditions are true:

- The enumerant is defined as part of the enumerated type.
- The enumerant is not a value suffixed with \_MAX\_ENUM.
  - This value exists only to ensure that C enum types are 32 bits in size and must not be used by applications.
- If the enumerant is used in a function that has a VkInstance as its first parameter and either:
  - it was added by a core version that is supported (as reported by vkEnumerateInstanceVersion) and the value of VkApplicationInfo::apiVersion is greater than or equal to the version that added it; or
  - it was added by an instance extension that was enabled for the instance.
- If the enumerant is used in a function that has a VkPhysicalDevice object as its first parameter and either:
  - it was added by a core version that is supported by that device (as reported by VkPhysicalDeviceProperties::apiVersion);
  - it was added by an instance extension that was enabled for the instance; or
  - it was added by a device extension that is supported by that device.
- If the enumerant is used in a function that has any other dispatchable object as its first parameter and either:
  - it was added by a core version that is supported for the device (as reported by VkPhysicalDeviceProperties::apiVersion); or
  - it was added by a device extension that was enabled for the device.

Additionally, if maintenance is supported, any integer value representable in the range valid for the defined type is valid when used in a function that has a VkPhysicalDevice object as its first parameter. Physical device queries will either return results indicating lack of support, or ignore unsupported values when used as a bit flag in a Vk*Flags* parameter.

Any enumerated type returned from a query command or otherwise output from Vulkan to the application must not have a reserved value. Reserved values are values not defined by any extension for that enumerated type.

**NOTE**

In some special cases, an enumerant is only meaningful if a feature defined by an extension is also enabled, as well as the extension itself. The global “valid enumerant” rule described here does not address such cases.
This language is intended to accommodate cases such as “hidden” extensions known only to driver internals, or layers enabling extensions without knowledge of the application, without allowing return of values not defined by any extension.

Application developers are encouraged to be careful when using switch statements with Vulkan API enums. This is because new extensions can add new values to existing enums. Using a default: statement within a switch may avoid future compilation issues.

This is particularly true for enums such as VkDriverId, which may have values added that do not belong to a corresponding new extension.

Valid Usage for Flags

A collection of flags is represented by a bitmask using the type VkFlags:

```c
// Provided by VK_VERSION_1_0
typedef uint32_t VkFlags;
```

Bitmasks are passed to many commands and structures to compactly represent options, but VkFlags is not used directly in the API. Instead, a Vk*Flags type which is an alias of VkFlags, and whose name matches the corresponding Vk*FlagBits that are valid for that type, is used.

Any Vk*Flags member or parameter used in the API as an input must be a valid combination of bit flags. A valid combination is either zero or the bitwise OR of valid bit flags.

An individual bit flag is valid for a Vk*Flags type if it would be a valid enumerant when used with the equivalent Vk*FlagBits type, where the bits type is obtained by taking the flag type and replacing the trailing Flags with FlagBits. For example, a flag value of type VkColorComponentFlags must contain only bit flags defined by VkColorComponentFlagBits.

Any Vk*Flags member or parameter returned from a query command or otherwise output from Vulkan to the application may contain bit flags undefined in its corresponding Vk*FlagBits type. An application cannot rely on the state of these unspecified bits.

Only the low-order 31 bits (bit positions zero through 30) are available for use as flag bits.

This restriction is due to poorly defined behavior by C compilers given a C enumerant value of 0x80000000. In some cases adding this enumerant value may increase the size of the underlying Vk*FlagBits type, breaking the ABI.

A collection of 64-bit flags is represented by a bitmask using the type VkFlags64:

```c
// Provided by VK_VERSION_1_3, VK_KHR_synchronization2
typedef uint64_t VkFlags64;
```

When the 31 bits available in VkFlags are insufficient, the VkFlags64 type can be passed to
commands and structures to represent up to 64 options. VkFlags64 is not used directly in the API. Instead, a Vk*Flags2 type which is an alias of VkFlags64, and whose name matches the corresponding Vk*FlagBits2 that are valid for that type, is used.

Any Vk*Flags2 member or parameter used in the API as an input must be a valid combination of bit flags. A valid combination is either zero or the bitwise OR of valid bit flags.

An individual bit flag is valid for a Vk*Flags2 type if it would be a valid enumerant when used with the equivalent Vk*FlagBits2 type, where the bits type is obtained by taking the flag type and replacing the trailing Flags2 with FlagBits2. For example, a flag value of type VkAccessFlags2KHR must contain only bit flags defined by VkAccessFlagBits2KHR.

Any Vk*Flags2 member or parameter returned from a query command or otherwise output from Vulkan to the application may contain bit flags undefined in its corresponding Vk*FlagBits2 type. An application cannot rely on the state of these unspecified bits.

Both the Vk*FlagBits2 type, and the individual bits defined for that type, are defined as uint64_t integers in the C API. This is in contrast to the 32-bit types, where the Vk*FlagBits type is defined as a C enum and the individual bits as enumerants belonging to that enum. As a result, there is less compile time type checking possible for the 64-bit types. This is unavoidable since there is no sufficiently portable way to define a 64-bit enum type in C99.

Valid Usage for Structure Types

Any parameter that is a structure containing a sType member must have a value of sType which is a valid VkStructureType value matching the type of the structure.

Valid Usage for Structure Pointer Chains

Any parameter that is a structure containing a void* pNext member must have a value of pNext that is either NULL, or is a pointer to a valid extending structure, containing sType and pNext members as described in the Vulkan Documentation and Extensions document in the section “Extending Structures”. The set of structures connected by pNext pointers is referred to as a pNext chain.

Each structure included in the pNext chain must be defined at runtime by either:

- a core version which is supported
- an extension which is enabled
- a supported device extension in the case of physical-device-level functionality added by the device extension

Each type of extending structure must not appear more than once in a pNext chain, including any aliases. This general rule may be explicitly overridden for specific structures.

Any component of the implementation (the loader, any enabled layers, and drivers) must skip over, without processing (other than reading the sType and pNext members) any extending structures in the chain not defined by core versions or extensions supported by that component.
As a convenience to implementations and layers needing to iterate through a structure pointer chain, the Vulkan API provides two base structures. These structures allow for some type safety, and can be used by Vulkan API functions that operate on generic inputs and outputs.

The `VkBaseInStructure` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBaseInStructure {
    VkStructureType sType;
    const struct VkBaseInStructure* pNext;
} VkBaseInStructure;
```

- `sType` is the structure type of the structure being iterated through.
- `pNext` is `NULL` or a pointer to the next structure in a structure chain.

`VkBaseInStructure` can be used to facilitate iterating through a read-only structure pointer chain.

The `VkBaseOutStructure` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBaseOutStructure {
    VkStructureType sType;
    struct VkBaseOutStructure* pNext;
} VkBaseOutStructure;
```

- `sType` is the structure type of the structure being iterated through.
- `pNext` is `NULL` or a pointer to the next structure in a structure chain.

`VkBaseOutStructure` can be used to facilitate iterating through a structure pointer chain that returns data back to the application.

Valid Usage for Nested Structures

The above conditions also apply recursively to members of structures provided as input to a command, either as a direct argument to the command, or themselves a member of another structure.

Specifics on valid usage of each command are covered in their individual sections.

Valid Usage for Extensions

Instance-level functionality or behavior added by an instance extension to the API must not be used unless that extension is supported by the instance as determined by `vkEnumerateInstanceExtensionProperties`, and that extension is enabled in `VkInstanceCreateInfo`.

Physical-device-level functionality or behavior added by an instance extension to the API must not be used unless that extension is supported by the instance as determined by `vkEnumerateInstanceExtensionProperties`, and that extension is enabled in `VkInstanceCreateInfo`. 
Physical-device-level functionality or behavior added by a device extension to the API must not be used unless the conditions described in Extending Physical Device From Device Extensions are met.

Device-level functionality added by a device extension that is dispatched from a VkDevice, or from a child object of a VkDevice must not be used unless that extension is supported by the device as determined by vkEnumerateDeviceExtensionProperties, and that extension is enabled in VkDeviceCreateInfo.

Valid Usage for Newer Core Versions

Instance-level functionality or behavior added by a new core version of the API must not be used unless it is supported by the instance as determined by vkEnumerateInstanceVersion and the specified version of VkApplicationInfo::apiVersion.

Physical-device-level functionality or behavior added by a new core version of the API must not be used unless it is supported by the physical device as determined by VkPhysicalDeviceProperties::apiVersion and the specified version of VkApplicationInfo::apiVersion.

Device-level functionality or behavior added by a new core version of the API must not be used unless it is supported by the device as determined by VkPhysicalDeviceProperties::apiVersion and the specified version of VkApplicationInfo::apiVersion.

3.8. VkResult Return Codes

While the core Vulkan API is not designed to capture incorrect usage, some circumstances still require return codes. Commands in Vulkan return their status via return codes that are in one of two categories:

- Successful completion codes are returned when a command needs to communicate success or status information. All successful completion codes are non-negative values.
- Runtime error codes are returned when a command needs to communicate a failure that could only be detected at runtime. All runtime error codes are negative values.

All return codes in Vulkan are reported via VkResult return values. The possible codes are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkResult {
    VK_SUCCESS = 0,
    VK_NOT_READY = 1,
    VK_TIMEOUT = 2,
    VK_EVENT_SET = 3,
    VK_EVENT_RESET = 4,
    VK_INCOMPLETE = 5,
    VK_ERROR_OUT_OF_HOST_MEMORY = -1,
    VK_ERROR_OUT_OF_DEVICE_MEMORY = -2,
    VK_ERROR_INITIALIZATION_FAILED = -3,
    VK_ERROR_DEVICE_LOST = -4,
    VK_ERROR_MEMORY_MAP_FAILED = -5,
    VK_ERROR_LAYER_NOT_PRESENT = -6,
};
```
VK_ERROR_EXTENSION_NOT_PRESENT = -7,
VK_ERROR_FEATURE_NOT_PRESENT = -8,
VK_ERROR_INCOMPATIBLE_DRIVER = -9,
VK_ERROR_TOO_MANY_OBJECTS = -10,
VK_ERROR_FORMAT_NOT_SUPPORTED = -11,
VK_ERROR_FRAGMENTED_POOL = -12,
VK_ERROR_UNKNOWN = -13,
// Provided by VK_VERSION_1_1
VK_ERROR_OUT_OF_POOL_MEMORY = -100069000,
// Provided by VK_VERSION_1_1
VK_ERROR_INVALID_EXTERNAL_HANDLE = -100072003,
// Provided by VK_VERSION_1_2
VK_ERROR_FRAGMENTATION = -1000161000,
// Provided by VK_VERSION_1_2
VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS = -1000257000,
// Provided by VK_VERSION_1_3
VK_PIPELINE_COMPILE_REQUIRED = 1000297000,
// Provided by VK_KHR_surface
VK_ERROR_SURFACE_LOST_KHR = -1000000000,
// Provided by VK_KHR_surface
VK_ERROR_NATIVE_WINDOW_IN_USE_KHR = -1000000001,
// Provided by VK_KHR_swapchain
VK_SUBOPTIMAL_KHR = 1000001003,
// Provided by VK_KHR_swapchain
VK_ERROR_OUT_OF_DATE_KHR = -1000001004,
// Provided by VK_KHR_display_swapchain
VK_ERROR_INCOMPATIBLE_DISPLAY_KHR = -1000003001,
// Provided by VK_EXT_debug_report
VK_ERROR_VALIDATION_FAILED_EXT = -1000011001,
// Provided by VK_NV_glsl_shader
VK_ERROR_INVALID_SHADER_NV = -1000012000,
// Provided by VK_KHR_video_queue
VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR = -1000023000,
// Provided by VK_KHR_video_queue
VK_ERROR_VIDEO_PICTURE_LAYOUT_NOT_SUPPORTED_KHR = -1000023001,
// Provided by VK_KHR_video_queue
VK_ERROR_VIDEO_PROFILE_OPERATION_NOT_SUPPORTED_KHR = -1000023002,
// Provided by VK_KHR_video_queue
VK_ERROR_VIDEO_PROFILE_FORMAT_NOT_SUPPORTED_KHR = -1000023003,
// Provided by VK_KHR_video_queue
VK_ERROR_VIDEO_STD_VERSION_NOT_SUPPORTED_KHR = -1000023005,
// Provided by VK_EXT_image_drm_format_modifier
VK_ERROR_INVALID_DRM_FORMAT_MODIFIER_PLANE_LAYOUT_EXT = -1000158000,
// Provided by VK_KHR_global_priority
VK_ERROR_NOT_PERMITTED_KHR = -1000174001,
// Provided by VK_EXT_full_screen_exclusive
VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT = -1000255000,
// Provided by VK_KHR_deferred_host_operations
VK_THREAD_IDLE_KHR = 1000268000,
Success Codes

- **VK_SUCCESS** Command successfully completed
- **VK_NOT_READY** A fence or query has not yet completed
- **VK_TIMEOUT** A wait operation has not completed in the specified time
- **VK_EVENT_SET** An event is signaled
- **VK_EVENT_RESET** An event is unsignaled
- **VK_INCOMPLETE** A return array was too small for the result
- **VK_SUBOPTIMAL_KHR** A swapchain no longer matches the surface properties exactly, but can still be used to present to the surface successfully.
- **VK_THREAD_IDLE_KHR** A deferred operation is not complete but there is currently no work for this thread to do at the time of this call.
- **VK_THREAD_DONE_KHR** A deferred operation is not complete but there is no work remaining to
assign to additional threads.

- **VK_OPERATION_DEFERRED_KHR** A deferred operation was requested and at least some of the work was deferred.

- **VK_OPERATION_NOT_DEFERRED_KHR** A deferred operation was requested and no operations were deferred.

- **VK_PIPELINE_COMPILE_REQUIRED** A requested pipeline creation would have required compilation, but the application requested compilation to not be performed.

- **VK_INCOMPATIBLE_SHADER_BINARY_EXT** The provided binary shader code is not compatible with this device.

**NOTE**

In the initial version of the VK_EXT_shader_object extension, this return code was named **VK_ERROR_INCOMPATIBLE_SHADER_BINARY_EXT** and improperly described as an error code. The name has been changed, but the old name is retained as an alias for compatibility with old code.

**Error codes**

- **VK_ERROR_OUT_OF_HOST_MEMORY** A host memory allocation has failed.

- **VK_ERROR_OUT_OF_DEVICE_MEMORY** A device memory allocation has failed.

- **VK_ERROR_INITIALIZATION_FAILED** Initialization of an object could not be completed for implementation-specific reasons.

- **VK_ERROR_DEVICE_LOST** The logical or physical device has been lost. See Lost Device

- **VK_ERROR_MEMORY_MAP_FAILED** Mapping of a memory object has failed.

- **VK_ERROR_LAYER_NOT_PRESENT** A requested layer is not present or could not be loaded.

- **VK_ERROR_EXTENSION_NOT_PRESENT** A requested extension is not supported.

- **VK_ERROR_FEATURE_NOT_PRESENT** A requested feature is not supported.

- **VK_ERROR_INCOMPATIBLE_DRIVER** The requested version of Vulkan is not supported by the driver or is otherwise incompatible for implementation-specific reasons.

- **VK_ERROR_TOO_MANY_OBJECTS** Too many objects of the type have already been created.

- **VK_ERROR_FORMAT_NOT_SUPPORTED** A requested format is not supported on this device.

- **VK_ERROR_FRAGMENTED_POOL** A pool allocation has failed due to fragmentation of the pool’s memory. This **must** only be returned if no attempt to allocate host or device memory was made to accommodate the new allocation. This **should** be returned in preference to **VK_ERROR_OUT_OF_POOL_MEMORY**, but only if the implementation is certain that the pool allocation failure was due to fragmentation.

- **VK_ERROR_SURFACE_LOST_KHR** A surface is no longer available.

- **VK_ERROR_NATIVE_WINDOW_IN_USE_KHR** The requested window is already in use by Vulkan or another API in a manner which prevents it from being used again.

- **VK_ERROR_OUT_OF_DATE_KHR** A surface has changed in such a way that it is no longer compatible with the swapchain, and further presentation requests using the swapchain will fail. Applications **must** query the new surface properties and recreate their swapchain if they wish...
to continue presenting to the surface.

- **VK_ERROR_INCOMPATIBLE_DISPLAY_KHR** The display used by a swapchain does not use the same presentable image layout, or is incompatible in a way that prevents sharing an image.

- **VK_ERROR_INVALID_SHADER_NV** One or more shaders failed to compile or link. More details are reported back to the application via `VK_EXT_debug_report` if enabled.

- **VK_ERROR_OUT_OF_POOL_MEMORY** A pool memory allocation has failed. This **must** only be returned if no attempt to allocate host or device memory was made to accommodate the new allocation. If the failure was definitely due to fragmentation of the pool, `VK_ERROR_FRAGMENTED_POOL` **should** be returned instead.

- **VK_ERROR_INVALID_EXTERNAL_HANDLE** An external handle is not a valid handle of the specified type.

- **VK_ERROR_FRAGMENTATION** A descriptor pool creation has failed due to fragmentation.

- **VK_ERROR_INVALID_DEVICE_ADDRESS_EXT** A buffer creation failed because the requested address is not available.

- **VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS** A buffer creation or memory allocation failed because the requested address is not available. A shader group handle assignment failed because the requested shader group handle information is no longer valid.

- **VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT** An operation on a swapchain created with `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT` failed as it did not have exclusive full-screen access. This may occur due to implementation-dependent reasons, outside of the application’s control.

- **VK_ERROR_VALIDATION_FAILED_EXT** A command failed because invalid usage was detected by the implementation or a validation-layer.

- **VK_ERROR_COMPRESSION_EXHAUSTED_EXT** An image creation failed because internal resources required for compression are exhausted. This **must** only be returned when fixed-rate compression is requested.

- **VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR** The requested `VkImageUsageFlags` are not supported.

- **VK_ERROR_VIDEO_PICTURE_LAYOUT_NOT_SUPPORTED_KHR** The requested video picture layout is not supported.

- **VK_ERROR_VIDEO_PROFILE_OPERATION_NOT_SUPPORTED_KHR** A video profile operation specified via `VkVideoProfileInfoKHR::videoCodecOperation` is not supported.

- **VK_ERROR_VIDEO_PROFILE_FORMAT_NOT_SUPPORTED_KHR** Format parameters in a requested `VkVideoProfileInfoKHR` chain are not supported.

- **VK_ERROR_VIDEO_PROFILE_CODEC_NOT_SUPPORTED_KHR** Codec-specific parameters in a requested `VkVideoProfileInfoKHR` chain are not supported.

- **VK_ERROR_VIDEO_STD_VERSION_NOT_SUPPORTED_KHR** The specified video Std header version is not supported.

- **VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR** The specified Video Std parameters do not adhere to the syntactic or semantic requirements of the used video compression standard, or values derived from parameters according to the rules defined by the used video compression standard do not adhere to the capabilities of the video compression standard or the implementation.
• **VK_ERROR_NOT_PERMITTED_KHR** The driver implementation has denied a request to acquire a priority above the default priority (VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_EXT) because the application does not have sufficient privileges.

• **VK_ERROR_UNKNOWN** An unknown error has occurred; either the application has provided invalid input, or an implementation failure has occurred.

If a command returns a runtime error, unless otherwise specified any output parameters will have undefined contents, except that if the output parameter is a structure with sType and pNext fields, those fields will be unmodified. Any structures chained from pNext will also have undefined contents, except that sType and pNext will be unmodified.

**VK_ERROR_OUT_OF_\*_MEMORY** errors do not modify any currently existing Vulkan objects. Objects that have already been successfully created can still be used by the application.

**NOTE**
As a general rule, Free, Release, and Reset commands do not return VK_ERROR_OUT_OF_HOST_MEMORY, while any other command with a return code may return it. Any exceptions from this rule are described for those commands.

**VK_ERROR_UNKNOWN** will be returned by an implementation when an unexpected error occurs that cannot be attributed to valid behavior of the application and implementation. Under these conditions, it may be returned from any command returning a VkResult.

**NOTE**
**VK_ERROR_UNKNOWN** is not expected to ever be returned if the application behavior is valid, and if the implementation is bug-free. If **VK_ERROR_UNKNOWN** is received, the application should be checked against the latest validation layers to verify correct behavior as much as possible. If no issues are identified it could be an implementation issue, and the implementor should be contacted for support.

Any command returning a VkResult may return VK_ERROR_VALIDATION_FAILED_EXT if a violation of valid usage is detected, even though commands do not explicitly list this as a possible return code.

Performance-critical commands generally do not have return codes. If a runtime error occurs in such commands, the implementation will defer reporting the error until a specified point. For commands that record into command buffers (vkCmd*) runtime errors are reported by vkEndCommandBuffer.

### 3.9. Numeric Representation and Computation

Implementations normally perform computations in floating-point, and must meet the range and precision requirements defined under “Floating-Point Computation” below.

These requirements only apply to computations performed in Vulkan operations outside of shader execution, such as texture image specification and sampling, and per-fragment operations. Range and precision requirements during shader execution differ and are specified by the Precision and Operation of SPIR-V Instructions section.

In some cases, the representation and/or precision of operations is implicitly limited by the specified format of vertex or texel data consumed by Vulkan. Specific floating-point formats are
described later in this section.

### 3.9.1. Floating-Point Computation

Most floating-point computation is performed in SPIR-V shader modules. The properties of computation within shaders are constrained as defined by the [Precision and Operation of SPIR-V Instructions](#) section.

Some floating-point computation is performed outside of shaders, such as viewport and depth range calculations. For these computations, we do not specify how floating-point numbers are to be represented, or the details of how operations on them are performed, but only place minimal requirements on representation and precision as described in the remainder of this section.

We require simply that numbers' floating-point parts contain enough bits and that their exponent fields are large enough so that individual results of floating-point operations are accurate to about 1 part in $10^5$. The maximum representable magnitude for all floating-point values must be at least $2^{32}$.

$x \times 0 = 0 \times x = 0$ for any non-infinite and non-NaN $x$.

$1 \times x = x \times 1 = x$.

$x + 0 = 0 + x = x$.

$0^0 = 1$.

Occasionally, further requirements will be specified. Most single-precision floating-point formats meet these requirements.

The special values Inf and -Inf encode values with magnitudes too large to be represented; the special value NaN encodes “Not A Number” values resulting from undefined arithmetic operations such as $0 / 0$. Implementations may support Inf and NaN in their floating-point computations. Any computation which does not support either Inf or NaN, for which that value is an input or output will yield an undefined value.

### 3.9.2. Floating-Point Format Conversions

When a value is converted to a defined floating-point representation, finite values falling between two representable finite values are rounded to one or the other. The rounding mode is not defined. Finite values whose magnitude is larger than that of any representable finite value may be rounded either to the closest representable finite value or to the appropriately signed infinity. For unsigned destination formats any negative values are converted to zero. Positive infinity is converted to positive infinity; negative infinity is converted to negative infinity in signed formats and to zero in unsigned formats; and any NaN is converted to a NaN.
3.9.3. 16-Bit Floating-Point Numbers

16-bit floating-point numbers are defined in the “16-bit floating-point numbers” section of the Khronos Data Format Specification.

3.9.4. Unsigned 11-Bit Floating-Point Numbers

Unsigned 11-bit floating-point numbers are defined in the “Unsigned 11-bit floating-point numbers” section of the Khronos Data Format Specification.

3.9.5. Unsigned 10-Bit Floating-Point Numbers

Unsigned 10-bit floating-point numbers are defined in the “Unsigned 10-bit floating-point numbers” section of the Khronos Data Format Specification.

3.9.6. General Requirements

Any representable floating-point value in the appropriate format is legal as input to a Vulkan command that requires floating-point data. The result of providing a value that is not a floating-point number to such a command is unspecified, but must not lead to Vulkan interruption or termination. For example, providing a negative zero (where applicable) or a denormalized number to a Vulkan command must yield deterministic results, while providing a NaN or Inf yields unspecified results.

Some calculations require division. In such cases (including implied divisions performed by vector normalization), division by zero produces an unspecified result but must not lead to Vulkan interruption or termination.

3.10. Fixed-Point Data Conversions

When generic vertex attributes and pixel color or depth components are represented as integers, they are often (but not always) considered to be normalized. Normalized integer values are treated specially when being converted to and from floating-point values, and are usually referred to as normalized fixed-point.

In the remainder of this section, b denotes the bit width of the fixed-point integer representation. When the integer is one of the types defined by the API, b is the bit width of that type. When the integer comes from an image containing color or depth component texels, b is the number of bits allocated to that component in its specified image format.

The signed and unsigned fixed-point representations are assumed to be b-bit binary two’s-complement integers and binary unsigned integers, respectively.

3.10.1. Conversion From Normalized Fixed-Point to Floating-Point

Unsigned normalized fixed-point integers represent numbers in the range [0,1]. The conversion from an unsigned normalized fixed-point value c to the corresponding floating-point value f is defined as
Signed normalized fixed-point integers represent numbers in the range \([-1,1]\). The conversion from a signed normalized fixed-point value \(c\) to the corresponding floating-point value \(f\) is performed using

\[
f = \frac{c}{2^b - 1}
\]

Only the range \([-2^{b-1} + 1, 2^{b-1} - 1]\) is used to represent signed fixed-point values in the range \([-1,1]\). For example, if \(b = 8\), then the integer value -127 corresponds to -1.0 and the value 127 corresponds to 1.0. This equation is used everywhere that signed normalized fixed-point values are converted to floating-point.

Note that while zero is exactly expressible in this representation, one value (-128 in the example) is outside the representable range, and implementations must clamp it to -1.0. Where the value is subject to further processing by the implementation, e.g. during texture filtering, values less than -1.0 may be used but the result must be clamped before the value is returned to shaders.

### 3.10.2. Conversion From Floating-Point to Normalized Fixed-Point

The conversion from a floating-point value \(f\) to the corresponding unsigned normalized fixed-point value \(c\) is defined by first clamping \(f\) to the range \([0,1]\), then computing

\[
c = \text{convertFloatToUint}(f \times (2^b - 1), b)
\]

where \(\text{convertFloatToUint}(r,b)\) returns one of the two unsigned binary integer values with exactly \(b\) bits which are closest to the floating-point value \(r\). Implementations should round to nearest. If \(r\) is equal to an integer, then that integer value must be returned. In particular, if \(f\) is equal to 0.0 or 1.0, then \(c\) must be assigned 0 or \(2^b - 1\), respectively.

The conversion from a floating-point value \(f\) to the corresponding signed normalized fixed-point value \(c\) is performed by clamping \(f\) to the range \([-1,1]\), then computing

\[
c = \text{convertFloatToInt}(f \times (2^{b-1} - 1), b)
\]

where \(\text{convertFloatToInt}(r,b)\) returns one of the two signed two’s-complement binary integer values with exactly \(b\) bits which are closest to the floating-point value \(r\). Implementations should round to nearest. If \(r\) is equal to an integer, then that integer value must be returned. In particular, if \(f\) is equal to -1.0, 0.0, or 1.0, then \(c\) must be assigned \(-2^{b-1} - 1\), 0, or \(2^{b-1} - 1\), respectively.

This equation is used everywhere that floating-point values are converted to signed normalized fixed-point.

### 3.11. String Representation

Strings passed into and returned from Vulkan API commands are usually defined to be null-
terminated and UTF-8 encoded.

Exceptions to this rule exist only when strings are defined or used by operating system APIs where that OS has a different convention. For example, `VkExportMemoryWin32HandleInfoKHR::name` is a null-terminated UTF-16 encoded string used in conjunction with Windows handles.

When a UTF-8 string is returned from a Vulkan API query, it is returned in a fixed-length buffer of C `char`. For example, a string returned in `VkPhysicalDeviceProperties::deviceName` has maximum length `VK_MAX_PHYSICAL_DEVICE_NAME_SIZE`, and a string returned in `VkExtensionProperties::extensionName` has maximum length `VK_MAX_EXTENSION_NAME_SIZE`. The string, including its null terminator, will always fit completely within this buffer. If the string is shorter than the buffer size, the contents of `char` in the buffer following the null terminator are undefined.

When a UTF-8 string is passed into a Vulkan API, such as `VkDeviceCreateInfo::ppEnabledExtensionNames`, there is no explicit limit on the length of that string. However, the string must contain a valid UTF-8 encoded string and must be null-terminated.

### 3.12. Common Object Types

Some types of Vulkan objects are used in many different structures and command parameters, and are described here. These types include offsets, extents, and rectangles.

#### 3.12.1. Offsets

Offsets are used to describe a pixel location within an image or framebuffer, as an (x,y) location for two-dimensional images, or an (x,y,z) location for three-dimensional images.

A two-dimensional offset is defined by the structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkOffset2D {
    int32_t x;
    int32_t y;
} VkOffset2D;
```

- `x` is the x offset.
- `y` is the y offset.

A three-dimensional offset is defined by the structure:
• x is the x offset.
• y is the y offset.
• z is the z offset.

### 3.12.2. Extents

Extents are used to describe the size of a rectangular region of pixels within an image or framebuffer, as (width,height) for two-dimensional images, or as (width,height,depth) for three-dimensional images.

A two-dimensional extent is defined by the structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkExtent2D {
    uint32_t width;
    uint32_t height;
} VkExtent2D;
```

• width is the width of the extent.
• height is the height of the extent.

A three-dimensional extent is defined by the structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkExtent3D {
    uint32_t width;
    uint32_t height;
    uint32_t depth;
} VkExtent3D;
```

• width is the width of the extent.
• height is the height of the extent.
• depth is the depth of the extent.

### 3.12.3. Rectangles

Rectangles are used to describe a specified rectangular region of pixels within an image or framebuffer. Rectangles include both an offset and an extent of the same dimensionality, as
Two-dimensional rectangles are defined by the structure:

```c
typedef struct VkRect2D {
    VkOffset2D offset;
    VkExtent2D extent;
} VkRect2D;
```

- `offset` is a `VkOffset2D` specifying the rectangle offset.
- `extent` is a `VkExtent2D` specifying the rectangle extent.

### 3.12.4. Structure Types

Each value corresponds to a particular structure with a `sType` member with a matching name. As a general rule, the name of each `VkStructureType` value is obtained by taking the name of the structure, stripping the leading `Vk`, prefixing each capital letter with `_`, converting the entire resulting string to upper case, and prefixing it with `VK_STRUCTURE_TYPE_`. For example, structures of type `VkImageCreateInfo` correspond to a `VkStructureType` value of `VK_STRUCTURE_TYPE_IMAGE_CREATE_INFO`, and thus a structure of this type must have its `sType` member set to this value before it is passed to the API.

The values `VK_STRUCTURE_TYPE_LOADER_INSTANCE_CREATE_INFO` and `VK_STRUCTURE_TYPE_LOADER_DEVICE_CREATE_INFO` are reserved for internal use by the loader, and do not have corresponding Vulkan structures in this Specification.

Structure types supported by the Vulkan API include:

```c
typedef enum VK_VERSION_1_0
    VkStructureType {
        VK_STRUCTURE_TYPE_APPLICATION_INFO = 0,
        VK_STRUCTURE_TYPE_INSTANCE_CREATE_INFO = 1,
        VK_STRUCTURE_TYPE_DEVICE_QUEUE_CREATE_INFO = 2,
        VK_STRUCTURE_TYPE_DEVICE_CREATE_INFO = 3,
        VK_STRUCTURE_TYPE_SUBMIT_INFO = 4,
        VK_STRUCTURE_TYPE_MEMORY_ALLOCATE_INFO = 5,
        VK_STRUCTURE_TYPE_MAPPED_MEMORY_RANGE = 6,
        VK_STRUCTURE_TYPE_BIND_SPARSE_INFO = 7,
        VK_STRUCTURE_TYPE_FENCE_CREATE_INFO = 8,
        VK_STRUCTURE_TYPE_SEMAPHORE_CREATE_INFO = 9,
        VK_STRUCTURE_TYPE_QUERY_POOL_CREATE_INFO = 10,
        VK_STRUCTURE_TYPE_BUFFER_CREATE_INFO = 11,
        VK_STRUCTURE_TYPE_BUFFER_VIEW_CREATE_INFO = 12,
        VK_STRUCTURE_TYPE_IMAGE_CREATE_INFO = 13,
        VK_STRUCTURE_TYPE_IMAGE_VIEW_CREATE_INFO = 14,
        VK_STRUCTURE_TYPE_SHADER_MODULE_CREATE_INFO = 15,
        VK_STRUCTURE_TYPE_PIPELINE_CACHE_CREATE_INFO = 16,
        VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_CREATE_INFO = 17,
        VK_STRUCTURE_TYPE_PIPELINE_CREATE_INFO = 18,
    } VkStructureType;
```
VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_STATE_CREATE_INFO = 19,
VK_STRUCTURE_TYPE_PIPELINE_INPUT_ASSEMBLY_STATE_CREATE_INFO = 20,
VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_STATE_CREATE_INFO = 21,
VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_STATE_CREATE_INFO = 22,
VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_STATE_CREATE_INFO = 23,
VK_STRUCTURE_TYPE_PIPELINE_MULTISAMPLE_STATE_CREATE_INFO = 24,
VK_STRUCTURE_TYPE_PIPELINE_DEPTH_STENCIL_STATE_CREATE_INFO = 25,
VK_STRUCTURE_TYPE_PIPELINE_COLOR_BLEND_STATE_CREATE_INFO = 26,
VK_STRUCTURE_TYPE_PIPELINE_DYNAMIC_STATE_CREATE_INFO = 27,
VK_STRUCTURE_TYPE_GRAPHICS_PIPELINE_CREATE_INFO = 28,
VK_STRUCTURE_TYPE_COMPUTE_PIPELINE_CREATE_INFO = 29,
VK_STRUCTURE_TYPE_PIPELINE_LAYOUT_CREATE_INFO = 30,
VK_STRUCTURE_TYPE_SAMPLER_CREATE_INFO = 31,
VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_CREATE_INFO = 32,
VK_STRUCTURE_TYPE_DESCRIPTOR_POOL_CREATE_INFO = 33,
VK_STRUCTURE_TYPE_DESCRIPTOR_SET_ALLOCATE_INFO = 34,
VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET = 35,
VK_STRUCTURE_TYPE_COPY_DESCRIPTOR_SET = 36,
VK_STRUCTURE_TYPE_FRAMEBUFFER_CREATE_INFO = 37,
VK_STRUCTURE_TYPE_RENDER_PASS_CREATE_INFO = 38,
VK_STRUCTURE_TYPE_COMMAND_POOL_CREATE_INFO = 39,
VK_STRUCTURE_TYPE_COMMAND_BUFFER_ALLOCATE_INFO = 40,
VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_INFO = 41,
VK_STRUCTURE_TYPE_COMMAND_BUFFER_BEGIN_INFO = 42,
VK_STRUCTURE_TYPE_RENDER_PASS_BEGIN_INFO = 43,
VK_STRUCTURE_TYPE_BUFFER_MEMORY_BARRIER = 44,
VK_STRUCTURE_TYPE_IMAGE_MEMORY_BARRIER = 45,
VK_STRUCTURE_TYPE_MEMORY_BARRIER = 46,
VK_STRUCTURE_TYPE_LOADER_INSTANCE_CREATE_INFO = 47,
VK_STRUCTURE_TYPE_LOADER_DEVICE_CREATE_INFO = 48,

// Provided by VK_VERSION_1_1
VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SUBGROUP_PROPERTIES = 1000094000,

// Provided by VK_VERSION_1_1
VK_STRUCTURE_TYPE_BIND_BUFFER_MEMORY_INFO = 1000157000,

// Provided by VK_VERSION_1_1
VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_INFO = 1000157001,

// Provided by VK_VERSION_1_1

### 3.13. API Name Aliases

A small number of APIs did not follow the naming conventions when initially defined. For consistency, when we discover an API name that violates the naming conventions, we rename it in the Specification, XML, and header files. For backwards compatibility, the original (incorrect) name is retained as a “typo alias”. The alias is deprecated and should not be used, but will be retained indefinitely.

**NOTE**

VK_STENCIL_FRONT_AND_BACK is an example of a typo alias. It was initially defined as part of VkStencilFaceFlagBits. Once the naming inconsistency was noticed, it was renamed to VK_STENCIL_FACE_FRONT_AND_BACK, and the old name was aliased to the correct name.
Chapter 4. Initialization

Before using Vulkan, an application must initialize it by loading the Vulkan commands, and creating a VkInstance object.

4.1. Command Function Pointers

Vulkan commands are not necessarily exposed by static linking on a platform. Commands to query function pointers for Vulkan commands are described below.

When extensions are promoted or otherwise incorporated into another extension or Vulkan core version, command aliases may be included. Whilst the behavior of each command alias is identical, the behavior of retrieving each alias's function pointer is not. A function pointer for a given alias can only be retrieved if the extension or version that introduced that alias is supported and enabled, irrespective of whether any other alias is available.

Function pointers for all Vulkan commands can be obtained by calling:

```c
// Provided by VK_VERSION_1_0
PFN_vkVoidFunction vkGetInstanceProcAddr(
    VkInstance instance,
    const char* pName);
```

- `instance` is the instance that the function pointer will be compatible with, or NULL for commands not dependent on any instance.
- `pName` is the name of the command to obtain.

vkGetInstanceProcAddr itself is obtained in a platform- and loader- specific manner. Typically, the loader library will export this command as a function symbol, so applications can link against the loader library, or load it dynamically and look up the symbol using platform-specific APIs.

The table below defines the various use cases for vkGetInstanceProcAddr and expected return value (“fp” is “function pointer”) for each case. A valid returned function pointer (“fp”) must not be NULL.

The returned function pointer is of type PFN_vkVoidFunction, and must be cast to the type of the command being queried before use.

<table>
<thead>
<tr>
<th>instance</th>
<th>pName</th>
<th>return value</th>
</tr>
</thead>
<tbody>
<tr>
<td>NULL</td>
<td>NULL</td>
<td>undefined</td>
</tr>
<tr>
<td>invalid non-NULl</td>
<td>*1</td>
<td>undefined</td>
</tr>
<tr>
<td>non-NULL instance</td>
<td>*1</td>
<td>undefined</td>
</tr>
<tr>
<td>global command</td>
<td>*2</td>
<td>fp</td>
</tr>
<tr>
<td></td>
<td>vkGetInstanceProcAddr</td>
<td>fp³</td>
</tr>
<tr>
<td>instance</td>
<td>pName</td>
<td>return value</td>
</tr>
<tr>
<td>----------</td>
<td>-------</td>
<td>--------------</td>
</tr>
<tr>
<td>instance</td>
<td>vkGetInstanceProcAddr</td>
<td>fp</td>
</tr>
<tr>
<td>instance</td>
<td>core dispatchable command</td>
<td>fp³</td>
</tr>
<tr>
<td>instance</td>
<td>enabled instance extension dispatchable command for instance</td>
<td>fp³</td>
</tr>
<tr>
<td>instance</td>
<td>available device extension dispatchable command for instance</td>
<td>fp³</td>
</tr>
<tr>
<td>any other case, not covered above</td>
<td></td>
<td>NULL</td>
</tr>
</tbody>
</table>

1

"*" means any representable value for the parameter (including valid values, invalid values, and NULL).

2

The global commands are: vkEnumerateInstanceVersion, vkEnumerateInstanceExtensionProperties, vkEnumerateInstanceLayerProperties, and vkCreateInstance. Dispatchable commands are all other commands which are not global.

3

The returned function pointer must only be called with a dispatchable object (the first parameter) that is instance or a child of instance, e.g. VkInstance, VkPhysicalDevice, VkDevice, VkQueue, or VkCommandBuffer.

4

An “available device extension” is a device extension supported by any physical device enumerated by instance.

5

Starting with Vulkan 1.2, vkGetInstanceProcAddr can resolve itself with a NULL instance pointer.

Valid Usage (Implicit)

- VUID-vkGetInstanceProcAddr-instance-parameter
  If instance is not NULL, instance must be a valid VkInstance handle
- VUID-vkGetInstanceProcAddr-pName-parameter
  pName must be a null-terminated UTF-8 string

In order to support systems with multiple Vulkan implementations, the function pointers returned by vkGetInstanceProcAddr may point to dispatch code that calls a different real implementation for different VkDevice objects or their child objects. The overhead of the internal dispatch for VkDevice objects can be avoided by obtaining device-specific function pointers for any commands that use a
device or device-child object as their dispatchable object. Such function pointers can be obtained by calling:

```c
// Provided by VK_VERSION_1_0
PFN_vkVoidFunction vkGetDeviceProcAddr(
    VkDevice device,
    const char* pName);
```

The table below defines the various use cases for `vkGetDeviceProcAddr` and expected return value (“fp” is “function pointer”) for each case. A valid returned function pointer (“fp”) must not be `NULL`.

The returned function pointer is of type `PFN_vkVoidFunction`, and must be cast to the type of the command being queried before use. The function pointer must only be called with a dispatchable object (the first parameter) that is device or a child of device.

<table>
<thead>
<tr>
<th>device</th>
<th>pName</th>
<th>return value</th>
</tr>
</thead>
<tbody>
<tr>
<td>NULL</td>
<td>*1</td>
<td>undefined</td>
</tr>
<tr>
<td>invalid device</td>
<td>*1</td>
<td>undefined</td>
</tr>
<tr>
<td>device</td>
<td>NULL</td>
<td>undefined</td>
</tr>
<tr>
<td>device</td>
<td>requested core version</td>
<td>fp4</td>
</tr>
<tr>
<td>device</td>
<td>device-level dispatchable command</td>
<td>fp4</td>
</tr>
<tr>
<td>device</td>
<td>enabled extension</td>
<td>device-level dispatchable command</td>
</tr>
<tr>
<td>any other case, not covered above</td>
<td></td>
<td>NULL</td>
</tr>
</tbody>
</table>

1. “*” means any representable value for the parameter (including valid values, invalid values, and `NULL`).

2. Device-level commands which are part of the core version specified by `VkApplicationInfo::apiVersion` when creating the instance will always return a valid function pointer. If the `maintenance` feature is enabled, core commands beyond that version which are supported by the implementation will return `NULL`, otherwise the implementation may either return `NULL` or a function pointer. If a function pointer is returned, it must not be called.

3. In this function, device-level excludes all physical-device-level commands.

4. The returned function pointer must only be called with a dispatchable object (the first parameter) that is device or a child of device e.g. `VkDevice`, `VkQueue`, or `VkCommandBuffer`. 
Valid Usage (Implicit)

- VUID-vkGetDeviceProcAddr-device-parameter
  
  device must be a valid VkDevice handle

- VUID-vkGetDeviceProcAddr-pName-parameter
  
  pName must be a null-terminated UTF-8 string

The definition of PFN_vkVoidFunction is:

```c
// Provided by VK_VERSION_1_0
typedef void (VKAPI_PTR *PFN_vkVoidFunction)(void);
```

This type is returned from command function pointer queries, and must be cast to an actual command function pointer before use.

### 4.1.1. Extending Physical Device Core Functionality

New core physical-device-level functionality can be used when both VkPhysicalDeviceProperties::apiVersion and VkApplicationInfo::apiVersion are greater than or equal to the version of Vulkan that added the new functionality. The Vulkan version supported by a physical device can be obtained by calling vkGetPhysicalDeviceProperties.

### 4.1.2. Extending Physical Device From Device Extensions

When the VK_KHR_get_physical_device_properties2 extension is enabled, or when both the instance and the physical-device versions are at least 1.1, physical-device-level functionality of a device extension can be used with a physical device if the corresponding extension is enumerated by vkEnumerateDeviceExtensionProperties for that physical device, even before a logical device has been created.

To obtain a function pointer for a physical-device-level command from a device extension, an application can use vkGetInstanceProcAddr. This function pointer may point to dispatch code, which calls a different real implementation for different VkPhysicalDevice objects. Applications must not use a VkPhysicalDevice in any command added by an extension or core version that is not supported by that physical device.

Device extensions may define structures that can be added to the pNext chain of physical-device-level commands.

### 4.2. Instances

There is no global state in Vulkan and all per-application state is stored in a VkInstance object. Creating a VkInstance object initializes the Vulkan library and allows the application to pass information about itself to the implementation.

Instances are represented by VkInstance handles:
To query the version of instance-level functionality supported by the implementation, call:

```c
// Provided by VK_VERSION_1_1
VkResult vkEnumerateInstanceVersion(
    uint32_t* pApiVersion);
```

- `pApiVersion` is a pointer to a `uint32_t`, which is the version of Vulkan supported by instance-level functionality, encoded as described in Version Numbers.

NOTE

The intended behavior of `vkEnumerateInstanceVersion` is that an implementation **should** not need to perform memory allocations and **should** unconditionally return `VK_SUCCESS`. The loader, and any enabled layers, **may** return `VK_ERROR_OUT_OF_HOST_MEMORY` in the case of a failed memory allocation.

Valid Usage (Implicit)

- VUID-vkEnumerateInstanceVersion-pApiVersion-parameter
  `pApiVersion` must be a valid pointer to a `uint32_t` value

Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`

To create an instance object, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateInstance(
    const VkInstanceCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkInstance* pInstance);
```

- `pCreateInfo` is a pointer to a `VkInstanceCreateInfo` structure controlling creation of the instance.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pInstance` points a `VkInstance` handle in which the resulting instance is returned.

`vkCreateInstance` verifies that the requested layers exist. If not, `vkCreateInstance` will return
Next `vkCreateInstance` verifies that the requested extensions are supported (e.g. in the implementation or in any enabled instance layer) and if any requested extension is not supported, `vkCreateInstance` must return `VK_ERROR_EXTENSION_NOT_PRESENT`. After verifying and enabling the instance layers and extensions the `VkInstance` object is created and returned to the application. If a requested extension is only supported by a layer, both the layer and the extension need to be specified at `vkCreateInstance` time for the creation to succeed.

### Valid Usage

- **VUID-vkCreateInstance-ppEnabledExtensionNames-01388**
  All required extensions for each extension in the `VkInstanceCreateInfo::ppEnabledExtensionNames` list must also be present in that list

### Valid Usage (Implicit)

- **VUID-vkCreateInstance-pCreateInfo-parameter**
  `pCreateInfo` must be a valid pointer to a valid `VkInstanceCreateInfo` structure
- **VUID-vkCreateInstance-pAllocator-parameter**
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- **VUID-vkCreateInstance-pInstance-parameter**
  `pInstance` must be a valid pointer to a `VkInstance` handle

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_LAYER_NOT_PRESENT`
- `VK_ERROR_EXTENSION_NOT_PRESENT`
- `VK_ERROR_INCOMPATIBLE_DRIVER`

The `VkInstanceCreateInfo` structure is defined as:
typedef struct VkInstanceCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkInstanceCreateFlags flags;
    const VkApplicationInfo* pApplicationInfo;
    uint32_t enabledLayerCount;
    const char* const* ppEnabledLayerNames;
    uint32_t enabledExtensionCount;
    const char* const* ppEnabledExtensionNames;
} VkInstanceCreateInfo;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is a bitmask of `VkInstanceCreateFlagBits` indicating the behavior of the instance.
- **pApplicationInfo** is `NULL` or a pointer to a `VkApplicationInfo` structure. If not `NULL`, this information helps implementations recognize behavior inherent to classes of applications. `VkApplicationInfo` is defined in detail below.
- **enabledLayerCount** is the number of global layers to enable.
- **ppEnabledLayerNames** is a pointer to an array of `enabledLayerCount` null-terminated UTF-8 strings containing the names of layers to enable for the created instance. The layers are loaded in the order they are listed in this array, with the first array element being the closest to the application, and the last array element being the closest to the driver. See the Layers section for further details.
- **enabledExtensionCount** is the number of global extensions to enable.
- **ppEnabledExtensionNames** is a pointer to an array of `enabledExtensionCount` null-terminated UTF-8 strings containing the names of extensions to enable.

To capture events that occur while creating or destroying an instance, an application can link a `VkDebugReportCallbackCreateInfoEXT` structure or a `VkDebugUtilsMessengerCreateInfoEXT` structure to the `pNext` element of the `VkInstanceCreateInfo` structure given to `vkCreateInstance`. This callback is only valid for the duration of the `vkCreateInstance` and the `vkDestroyInstance` call. Use `vkCreateDebugReportCallbackEXT` or `vkCreateDebugUtilsMessengerEXT` to create persistent callback objects.

An application can add additional drivers by including the `VkDirectDriverLoadingListLUNARG` struct to the `pNext` element of the `VkInstanceCreateInfo` structure given to `vkCreateInstance`.

**NOTE** `VkDirectDriverLoadingListLUNARG` allows applications to ship drivers with themselves. Only drivers that are designed to work with it should be used, such as drivers that implement Vulkan in software or that implement Vulkan by translating it to a different API. Any driver that requires installation should not be used, such as hardware drivers.
Valid Usage

• VUID-VkInstanceCreateInfo-pNext-04925
  If the pNext chain of VkInstanceCreateInfo includes a VkDebugReportCallbackCreateInfoEXT structure, the list of enabled extensions in ppEnabledExtensionNames must contain VK_EXT_debug_report

• VUID-VkInstanceCreateInfo-pNext-04926
  If the pNext chain of VkInstanceCreateInfo includes a VkDebugUtilsMessengerCreateInfoEXT structure, the list of enabled extensions in ppEnabledExtensionNames must contain VK_EXT_debug_utils

• VUID-VkInstanceCreateInfo-pNext-06779
  If the pNext chain includes a VkExportMetalObjectCreateInfoEXT structure, its exportObjectType member must be either VK_EXPORT_METAL_OBJECT_TYPE_METAL_DEVICE_BIT_EXT or VK_EXPORT_METAL_OBJECT_TYPE_METAL_COMMAND_QUEUE_BIT_EXT

• VUID-VkInstanceCreateInfo-flags-06559
  If flags has the VK_INSTANCE_CREATE_ENUMERATE_PORTABILITY_BIT_KHR bit set, the list of enabled extensions in ppEnabledExtensionNames must contain VK_KHR_portability_enumeration

• VUID-VkInstanceCreateInfo-pNext-09400
  If the pNext chain of VkInstanceCreateInfo includes a VkDirectDriverLoadingListLUNARG structure, the list of enabled extensions in ppEnabledExtensionNames must contain VK_LUNARG_direct_driver_loading

Valid Usage (Implicit)

• VUID-VkInstanceCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_INSTANCE_CREATE_INFO

• VUID-VkInstanceCreateInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkDebugReportCallbackCreateInfoEXT, VkDebugUtilsMessengerCreateInfoEXT, VkExportMetalObjectCreateInfoEXT, VkLayerSettingsCreateInfoEXT, VkValidationFeaturesEXT, or VkValidationFlagsEXT

• VUID-VkInstanceCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique, with the exception of structures of type VkDebugUtilsMessengerCreateInfoEXT, VkExportMetalObjectCreateInfoEXT, or VkLayerSettingsCreateInfoEXT

• VUID-VkInstanceCreateInfo-flags-parameter
  flags must be a valid combination of VkInstanceCreateFlagBits values

• VUID-VkInstanceCreateInfo-pApplicationInfo-parameter
  If pApplicationInfo is not NULL, pApplicationInfo must be a valid pointer to a valid VkApplicationInfo structure
- **VUID-VkInstanceCreateInfo-ppEnabledLayerNames-parameter**
  If `enabledLayerCount` is not 0, `ppEnabledLayerNames` must be a valid pointer to an array of `enabledLayerCount` null-terminated UTF-8 strings.

- **VUID-VkInstanceCreateInfo-ppEnabledExtensionNames-parameter**
  If `enabledExtensionCount` is not 0, `ppEnabledExtensionNames` must be a valid pointer to an array of `enabledExtensionCount` null-terminated UTF-8 strings.

```c
// Provided by VK_VERSION_1_0
typedef enum VkInstanceCreateFlagBits {
  // Provided by VK_KHR_portability_enumeration
  VK_INSTANCE_CREATE_ENUMERATE_PORTABILITY_BIT_KHR = 0x00000001,
} VkInstanceCreateFlagBits;
```

- `VK_INSTANCE_CREATE_ENUMERATE_PORTABILITY_BIT_KHR` specifies that the instance will enumerate available Vulkan Portability-compliant physical devices and groups in addition to the Vulkan physical devices and groups that are enumerated by default.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkInstanceCreateFlags;
```

`VkInstanceCreateFlags` is a bitmask type for setting a mask of zero or more `VkInstanceCreateFlagBits`.

When creating a Vulkan instance for which you wish to disable validation checks, add a `VkValidationFlagsEXT` structure to the `pNext` chain of the `VkInstanceCreateInfo` structure, specifying the checks to be disabled.

```c
// Provided by VK_EXT_validation_flags
typedef struct VkValidationFlagsEXT {
  VkStructureType sType;
  const void* pNext;
  uint32_t disabledValidationCheckCount;
  const VkValidationCheckEXT* pDisabledValidationChecks;
} VkValidationFlagsEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `disabledValidationCheckCount` is the number of checks to disable.
- `pDisabledValidationChecks` is a pointer to an array of `VkValidationCheckEXT` values specifying the validation checks to be disabled.
**Valid Usage (Implicit)**

- **VUID-VkValidationFlagsEXT-sType-sType**
  
  The `sType` must be `VK_STRUCTURE_TYPE_VALIDATION_FLAGS_EXT`.

- **VUID-VkValidationFlagsEXT-pDisabledValidationChecks-parameter**
  
  The `pDisabledValidationChecks` must be a valid pointer to an array of `disabledValidationCheckCount` valid `VkValidationCheckEXT` values.

- **VUID-VkValidationFlagsEXT-disabledValidationCheckCount-arraylength**
  
  The `disabledValidationCheckCount` must be greater than 0.

Possible values of elements of the `VkValidationFlagsEXT::pDisabledValidationChecks` array, specifying validation checks to be disabled, are:

```c
// Provided by VK_EXT_validation_flags
typedef enum VkValidationCheckEXT {
    VK_VALIDATION_CHECK_ALL_EXT = 0,
    VK_VALIDATION_CHECK_SHADERS_EXT = 1,
} VkValidationCheckEXT;
```

- `VK_VALIDATION_CHECK_ALL_EXT` specifies that all validation checks are disabled.
- `VK_VALIDATION_CHECK_SHADERS_EXT` specifies that shader validation is disabled.

When creating a Vulkan instance for which you wish to enable or disable specific validation features, add a `VkValidationFeaturesEXT` structure to the `pNext` chain of the `VkInstanceCreateInfo` structure, specifying the features to be enabled or disabled.

```c
// Provided by VK_EXT_validation_features
typedef struct VkValidationFeaturesEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t enabledValidationFeatureCount;
    const VkValidationFeatureEnableEXT* pEnabledValidationFeatures;
    uint32_t disabledValidationFeatureCount;
    const VkValidationFeatureDisableEXT* pDisabledValidationFeatures;
} VkValidationFeaturesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `enabledValidationFeatureCount` is the number of features to enable.
- `pEnabledValidationFeatures` is a pointer to an array of `VkValidationFeatureEnableEXT` values specifying the validation features to be enabled.
- `disabledValidationFeatureCount` is the number of features to disable.
- `pDisabledValidationFeatures` is a pointer to an array of `VkValidationFeatureDisableEXT` values
specifying the validation features to be disabled.

Valid Usage

- **VUID-VkValidationFeaturesEXT-pEnabledValidationFeatures-02967**
  
  If the `pEnabledValidationFeatures` array contains `VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_EXT`, then it must also contain `VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_RESERVE_BINDING_SLOT_EXT` or `VK_VALIDATION_FEATURE_ENABLE_DEBUG_PRINTF_EXT`.

- **VUID-VkValidationFeaturesEXT-pEnabledValidationFeatures-02968**
  
  If the `pEnabledValidationFeatures` array contains `VK_VALIDATION_FEATURE_ENABLE_DEBUG_PRINTF_EXT`, then it must not contain `VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_EXT`.

Valid Usage (Implicit)

- **VUID-VkValidationFeaturesEXT-sType-sType**

  `sType` must be `VK_STRUCTURE_TYPE_VALIDATION_FEATURES_EXT`.

- **VUID-VkValidationFeaturesEXT-pEnabledValidationFeatures-parameter**

  If `enabledValidationFeatureCount` is not 0, `pEnabledValidationFeatures` must be a valid pointer to an array of `enabledValidationFeatureCount` valid `VkValidationFeatureEnableEXT` values.

- **VUID-VkValidationFeaturesEXT-pDisabledValidationFeatures-parameter**

  If `disabledValidationFeatureCount` is not 0, `pDisabledValidationFeatures` must be a valid pointer to an array of `disabledValidationFeatureCount` valid `VkValidationFeatureDisableEXT` values.

Possible values of elements of the `VkValidationFeaturesEXT::pEnabledValidationFeatures` array, specifying validation features to be enabled, are:

```c
// Provided by VK_EXT_validation_features
typedef enum VkValidationFeatureEnableEXT {
    VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_EXT = 0,
    VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_RESERVE_BINDING_SLOT_EXT = 1,
    VK_VALIDATION_FEATURE_ENABLE_BEST_PRACTICES_EXT = 2,
    VK_VALIDATION_FEATURE_ENABLE_DEBUG_PRINTF_EXT = 3,
    VK_VALIDATION_FEATURE_ENABLE_SYNCHRONIZATION_VALIDATION_EXT = 4,
} VkValidationFeatureEnableEXT;
```

- **VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_EXT** specifies that GPU-assisted validation is enabled. Activating this feature instruments shader programs to generate additional diagnostic data. This feature is disabled by default.

- **VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_RESERVE_BINDING_SLOT_EXT** specifies that the validation layers reserve a descriptor set binding slot for their own use. The layer reports a
value for `VkPhysicalDeviceLimits::maxBoundDescriptorSets` that is one less than the value reported by the device. If the device supports the binding of only one descriptor set, the validation layer does not perform GPU-assisted validation. This feature is disabled by default.

- `VK_VALIDATION_FEATURE_ENABLE_BEST_PRACTICES_EXT` specifies that Vulkan best-practices validation is enabled. Activating this feature enables the output of warnings related to common misuse of the API, but which are not explicitly prohibited by the specification. This feature is disabled by default.

- `VK_VALIDATION_FEATURE_ENABLE_DEBUG_PRINTF_EXT` specifies that the layers will process `debugPrintfEXT` operations in shaders and send the resulting output to the debug callback. This feature is disabled by default.

- `VK_VALIDATION_FEATURE_ENABLE_SYNCHRONIZATION_VALIDATION_EXT` specifies that Vulkan synchronization validation is enabled. This feature reports resource access conflicts due to missing or incorrect synchronization operations between actions (Draw, Copy, Dispatch, Blit) reading or writing the same regions of memory. This feature is disabled by default.

Possible values of elements of the `VkValidationFeaturesEXT::pDisabledValidationFeatures` array, specifying validation features to be disabled, are:

```c
// Provided by VK_EXT_validation_features
typedef enum VkValidationFeatureDisableEXT {
    VK_VALIDATION_FEATURE_DISABLE_ALL_EXT = 0,
    VK_VALIDATION_FEATURE_DISABLE_SHADERS_EXT = 1,
    VK_VALIDATION_FEATURE_DISABLE_THREAD_SAFETY_EXT = 2,
    VK_VALIDATION_FEATURE_DISABLE_API_PARAMETERS_EXT = 3,
    VK_VALIDATION_FEATURE_DISABLE_OBJECT_LIFETIMES_EXT = 4,
    VK_VALIDATION_FEATURE_DISABLE_CORE_CHECKS_EXT = 5,
    VK_VALIDATION_FEATURE_DISABLE_UNIQUE_HANDLES_EXT = 6,
    VK_VALIDATION_FEATURE_DISABLE_SHADER_VALIDATION_CACHE_EXT = 7,
} VkValidationFeatureDisableEXT;
```

- `VK_VALIDATION_FEATURE_DISABLE_ALL_EXT` specifies that all validation checks are disabled.
- `VK_VALIDATION_FEATURE_DISABLE_SHADERS_EXT` specifies that shader validation is disabled. This feature is enabled by default.
- `VK_VALIDATION_FEATURE_DISABLE_THREAD_SAFETY_EXT` specifies that thread safety validation is disabled. This feature is enabled by default.
- `VK_VALIDATION_FEATURE_DISABLE_API_PARAMETERS_EXT` specifies that stateless parameter validation is disabled. This feature is enabled by default.
- `VK_VALIDATION_FEATURE_DISABLE_OBJECT_LIFETIMES_EXT` specifies that object lifetime validation is disabled. This feature is enabled by default.
- `VK_VALIDATION_FEATURE_DISABLE_CORE_CHECKS_EXT` specifies that core validation checks are disabled. This feature is enabled by default. If this feature is disabled, the shader validation and GPU-assisted validation features are also disabled.
- `VK_VALIDATION_FEATURE_DISABLE_UNIQUE_HANDLES_EXT` specifies that protection against duplicate non-dispatchable object handles is disabled. This feature is enabled by default.
• `VK_VALIDATION_FEATURE_DISABLE_SHADER_VALIDATION_CACHE_EXT` specifies that there will be no caching of shader validation results and every shader will be validated on every application execution. Shader validation caching is enabled by default.

**NOTE**
Disabling checks such as parameter validation and object lifetime validation prevents the reporting of error conditions that can cause other validation checks to behave incorrectly or crash. Some validation checks assume that their inputs are already valid and do not always revalidate them.

**NOTE**
The `VK_EXT_validation_features` extension subsumes all the functionality provided in the `VK_EXT_validation_flags` extension.

To create a Vulkan instance with a specific configuration of layer settings, add `VkLayerSettingsCreateInfoEXT` structures to the `pNext` chain of the `VkInstanceCreateInfo` structure, specifying the settings to be configured.

```c
// Provided by VK_EXT_layer_settings
typedef struct VkLayerSettingsCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t settingCount;
    const VkLayerSettingEXT* pSettings;
} VkLayerSettingsCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `settingCount` is the number of settings to configure.
- `pSettings` is a pointer to an array of `settingCount` `VkLayerSettingEXT` values specifying the setting to be configured.

**Valid Usage (Implicit)**

- `VUID-VkLayerSettingsCreateInfoEXT-sType-sType`  
  `sType` **must** be `VK_STRUCTURE_TYPE_LAYER_SETTINGS_CREATE_INFO_EXT`

- `VUID-VkLayerSettingsCreateInfoEXT-pSettings-parameter`  
  If `settingCount` is not 0, `pSettings` **must** be a valid pointer to an array of `settingCount` valid `VkLayerSettingEXT` structures

The values of elements of the `VkLayerSettingsCreateInfoEXT::pSettings` array, specifying layer settings to be configured, are:
```c
// Provided by VK_EXT_layer_settings
typedef struct VkLayerSettingEXT {
    const char* pLayerName;
    const char* pSettingName;
    VkLayerSettingTypeEXT type;
    uint32_t valueCount;
    const void* pValues;
} VkLayerSettingEXT;
```

- `pLayerName` is a pointer to a null-terminated UTF-8 string naming the layer to configure the setting from.
- `pSettingName` is a pointer to a null-terminated UTF-8 string naming the setting to configure. Unknown `pSettingName` by the layer are ignored.
- `type` is a `VkLayerSettingTypeEXT` value specifying the type of the `pValues` values.
- `count` is the number of values used to configure the layer setting.
- `pValues` is a pointer to an array of `count` values of the type indicated by `type` to configure the layer setting.

When multiple `VkLayerSettingsCreateInfoEXT` structures are chained and the same `pSettingName` is referenced for the same `pLayerName`, the value of the first reference of the layer setting is used.

**Valid Usage (Implicit)**

- VUID-VkLayerSettingEXT-pLayerName-parameter
  `pLayerName` must be a null-terminated UTF-8 string
- VUID-VkLayerSettingEXT-pSettingName-parameter
  `pSettingName` must be a null-terminated UTF-8 string
- VUID-VkLayerSettingEXT-type-parameter
  `type` must be a valid `VkLayerSettingTypeEXT` value
- VUID-VkLayerSettingEXT-pValues-parameter
  If `valueCount` is not 0, `pValues` must be a valid pointer to an array of `valueCount` bytes

Possible values of `VkLayerSettingEXT::type`, specifying the type of the data returned in `VkLayerSettingEXT::pValues`, are:
typedef enum VkLayerSettingTypeEXT {
    VK_LAYER_SETTING_TYPE_BOOL32_EXT = 0,
    VK_LAYER_SETTING_TYPE_INT32_EXT = 1,
    VK_LAYER_SETTING_TYPE_INT64_EXT = 2,
    VK_LAYER_SETTING_TYPE_UINT32_EXT = 3,
    VK_LAYER_SETTING_TYPE_UINT64_EXT = 4,
    VK_LAYER_SETTING_TYPE_FLOAT32_EXT = 5,
    VK_LAYER_SETTING_TYPE_FLOAT64_EXT = 6,
    VK_LAYER_SETTING_TYPE_STRING_EXT = 7,
} VkLayerSettingTypeEXT;

- **VK_LAYER_SETTING_TYPE_BOOL32_EXT** specifies that the layer setting's type is `VkBool32`.
- **VK_LAYER_SETTING_TYPE_INT32_EXT** specifies that the layer setting's type is signed 32-bit integer.
- **VK_LAYER_SETTING_TYPE_INT64_EXT** specifies that the layer setting's type is signed 64-bit integer.
- **VK_LAYER_SETTING_TYPE_UINT32_EXT** specifies that the layer setting's type is unsigned 32-bit integer.
- **VK_LAYER_SETTING_TYPE_UINT64_EXT** specifies that the layer setting's type is unsigned 64-bit integer.
- **VK_LAYER_SETTING_TYPE_FLOAT32_EXT** specifies that the layer setting's type is 32-bit floating-point.
- **VK_LAYER_SETTING_TYPE_FLOAT64_EXT** specifies that the layer setting's type is 64-bit floating-point.
- **VK_LAYER_SETTING_TYPE_STRING_EXT** specifies that the layer setting's type is a pointer to a null-terminated UTF-8 string.

The `VkDirectDriverLoadingListLUNARG` structure is defined as:

```c
// Provided by VK_LUNARG_direct_driver_loading
typedef struct VkDirectDriverLoadingListLUNARG {
    VkStructureType sType;
    const void* pNext;
    VkDirectDriverLoadingModeLUNARG mode;
    uint32_t driverCount;
    const VkDirectDriverLoadingInfoLUNARG* pDrivers;
} VkDirectDriverLoadingListLUNARG;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **mode** controls the mode in which to load the provided drivers.
- **driverCount** is the number of driver manifest paths.
- **pDrivers** is a pointer to an array of `driverCount` `VkDirectDriverLoadingInfoLUNARG` structures.

When creating a Vulkan instance for which additional drivers are to be included, add a `VkDirectDriverLoadingListLUNARG` structure to the `pNext` chain of the `VkInstanceCreateInfo`.
structure, and include in it the list of `VkDirectDriverLoadingInfoLUNARG` structures which contain the information necessary to load additional drivers.

### Valid Usage (Implicit)

- **VUID-VkDirectDriverLoadingListLUNARG-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_DIRECT_DRIVER_LOADING_LIST_LUNARG`

- **VUID-VkDirectDriverLoadingListLUNARG-mode-parameter**
  - `mode` must be a valid `VkDirectDriverLoadingModeLUNARG` value

- **VUID-VkDirectDriverLoadingListLUNARG-pDrivers-parameter**
  - `pDrivers` must be a valid pointer to an array of `driverCount` valid `VkDirectDriverLoadingInfoLUNARG` structures

- **VUID-VkDirectDriverLoadingListLUNARG-driverCount-arraylength**
  - `driverCount` must be greater than 0

The `VkDirectDriverLoadingInfoLUNARG` structure is defined as:

```c
// Provided by VK_LUNARG_direct_driver_loading
typedef struct VkDirectDriverLoadingInfoLUNARG {
    VkStructureType     sType;
    void*               pNext;
    VkDirectDriverLoadingFlagsLUNARG flags;
    PFN_vkGetInstanceProcAddrLUNARG pfnGetInstanceProcAddr;
} VkDirectDriverLoadingInfoLUNARG;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `pfnGetInstanceProcAddr` is a `PFN_vkGetInstanceProcAddrLUNARG` pointer to the driver `vkGetInstanceProcAddr` function.

### Valid Usage (Implicit)

- **VUID-VkDirectDriverLoadingInfoLUNARG-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_DIRECT_DRIVER_LOADING_INFO_LUNARG`

- **VUID-VkDirectDriverLoadingInfoLUNARG-flags-zerobitmask**
  - `flags` must be 0

Possible values of `VkDirectDriverLoadingListLUNARG::mode`, specifying the mode in which drivers are used, are:
typedef enum VkDirectDriverLoadingModeLUNARG {
  VK_DIRECT_DRIVER_LOADING_MODE_EXCLUSIVE_LUNARG = 0,
  VK_DIRECT_DRIVER>Loading_MODE_INCLUSIVE_LUNARG = 1,
} VkDirectDriverLoadingModeLUNARG;

• VK_DIRECT_DRIVER_LOADING_MODE_EXCLUSIVE_LUNARG specifies that the provided drivers are used instead of the system-loaded drivers.
• VK_DIRECT_DRIVER_LOADING_MODE_INCLUSIVE_LUNARG specifies that the provided drivers are used in addition to the system-loaded drivers.

typedef VkFlags VkDirectDriverLoadingFlagsLUNARG;

VkDirectDriverLoadingFlagsLUNARG is a bitmask type for setting a mask, but is currently reserved for future use.

The type of PFN_vkGetInstanceProcAddrLUNARG is:

typedef PFN_vkVoidFunction (VKAPI_PTR *PFN_vkGetInstanceProcAddrLUNARG)(
  VkInstance instance, const char* pName);

• instance is a VkInstance handle.
• pName is the name of a Vulkan command.

This type is compatible with the type of a pointer to the vkGetInstanceProcAddr command, but is used only to specify device driver addresses in VkDirectDriverLoadingInfoLUNARG ::PFNGetInstanceProcAddr.

NOTE This type exists only because of limitations in the XML schema and processing scripts, and its name may change in the future. Ideally we would use the PFN_vkGetInstanceProcAddr type generated in the vulkan_core.h header.

The VkApplicationInfo structure is defined as:
typedef struct VkApplicationInfo {
    VkStructureType sType;
    const void* pNext;
    const char* pApplicationName;
    uint32_t applicationVersion;
    const char* pEngineName;
    uint32_t engineVersion;
    uint32_t apiVersion;
} VkApplicationInfo;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **pApplicationName** is NULL or is a pointer to a null-terminated UTF-8 string containing the name of the application.
- **applicationVersion** is an unsigned integer variable containing the developer-supplied version number of the application.
- **pEngineName** is NULL or is a pointer to a null-terminated UTF-8 string containing the name of the engine (if any) used to create the application.
- **engineVersion** is an unsigned integer variable containing the developer-supplied version number of the engine used to create the application.
- **apiVersion** **must** be the highest version of Vulkan that the application is designed to use, encoded as described in Version Numbers. The patch version number specified in **apiVersion** is ignored when creating an instance object. The variant version of the instance **must** match that requested in **apiVersion**.

Vulkan 1.0 implementations were required to return VK_ERROR_INCOMPATIBLE_DRIVER if **apiVersion** was larger than 1.0. Implementations that support Vulkan 1.1 or later **must** not return VK_ERROR_INCOMPATIBLE_DRIVER for any value of **apiVersion**.

Because Vulkan 1.0 implementations may fail with VK_ERROR_INCOMPATIBLE_DRIVER, applications **should** determine the version of Vulkan available before calling vkCreateInstance. If the vkGetInstanceProcAddr returns NULL for vkEnumerateInstanceVersion, it is a Vulkan 1.0 implementation. Otherwise, the application **can** call vkEnumerateInstanceVersion to determine the version of Vulkan.

As long as the instance supports at least Vulkan 1.1, an application **can** use different versions of Vulkan with an instance than it does with a device or physical device.

The Khronos validation layers will treat **apiVersion** as the highest API version the application targets, and will validate API usage against the minimum of that version and the implementation version (instance or device, depending on context). If an application tries to use functionality from a greater version than this, a validation error will be triggered.
For example, if the instance supports Vulkan 1.1 and three physical devices support Vulkan 1.0, Vulkan 1.1, and Vulkan 1.2, respectively, and if the application sets apiVersion to 1.2, the application can use the following versions of Vulkan:

• Vulkan 1.0 can be used with the instance and with all physical devices.
• Vulkan 1.1 can be used with the instance and with the physical devices that support Vulkan 1.1 and Vulkan 1.2.
• Vulkan 1.2 can be used with the physical device that supports Vulkan 1.2.

If we modify the above example so that the application sets apiVersion to 1.1, then the application must not use Vulkan 1.2 functionality on the physical device that supports Vulkan 1.2.

NOTE
Providing a NULL VkInstanceCreateInfo::pApplicationInfo or providing an apiVersion of 0 is equivalent to providing an apiVersion of VK_MAKE_API_VERSION(0,1,0,0).

Valid Usage

• VUID-VkApplicationInfo-apiVersion-04010
  If apiVersion is not 0, then it must be greater than or equal to VK_API_VERSION_1_0

Valid Usage (Implicit)

• VUID-VkApplicationInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_APPLICATION_INFO
• VUID-VkApplicationInfo-pNext-pNext
  pNext must be NULL
• VUID-VkApplicationInfo-pApplicationName-parameter
  If pApplicationName is not NULL, pApplicationName must be a null-terminated UTF-8 string
• VUID-VkApplicationInfo-pEngineName-parameter
  If pEngineName is not NULL, pEngineName must be a null-terminated UTF-8 string

To destroy an instance, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyInstance(
    VkInstance instance,
    const VkAllocationCallbacks* pAllocator);
```

• instance is the handle of the instance to destroy.
• pAllocator controls host memory allocation as described in the Memory Allocation chapter.
Valid Usage

- VUID-vkDestroyInstance-instance-00629
  All child objects created using \texttt{instance must} have been destroyed prior to destroying \texttt{instance}

- VUID-vkDestroyInstance-instance-00630
  If \texttt{VkAllocationCallbacks} were provided when \texttt{instance} was created, a compatible set of callbacks \texttt{must} be provided here

- VUID-vkDestroyInstance-instance-00631
  If no \texttt{VkAllocationCallbacks} were provided when \texttt{instance} was created, \texttt{pAllocator must} be \texttt{NULL}

Valid Usage (Implicit)

- VUID-vkDestroyInstance-instance-parameter
  If \texttt{instance} is not \texttt{NULL}, \texttt{instance must} be a valid \texttt{VkInstance} handle

- VUID-vkDestroyInstance-pAllocator-parameter
  If \texttt{pAllocator} is not \texttt{NULL}, \texttt{pAllocator must} be a valid pointer to a valid \texttt{VkAllocationCallbacks} structure

Host Synchronization

- Host access to \texttt{instance} \textbf{must} be externally synchronized

- Host access to all \texttt{VkPhysicalDevice} objects enumerated from \texttt{instance} \textbf{must} be externally synchronized
Chapter 5. Devices and Queues

Once Vulkan is initialized, devices and queues are the primary objects used to interact with a Vulkan implementation.

Vulkan separates the concept of physical and logical devices. A physical device usually represents a single complete implementation of Vulkan (excluding instance-level functionality) available to the host, of which there are a finite number. A logical device represents an instance of that implementation with its own state and resources independent of other logical devices.

Physical devices are represented by VkPhysicalDevice handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkPhysicalDevice)
```

5.1. Physical Devices

To retrieve a list of physical device objects representing the physical devices installed in the system, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkEnumeratePhysicalDevices(
    VkInstance instance,
    uint32_t* pPhysicalDeviceCount,
    VkPhysicalDevice* pPhysicalDevices);
```

- `instance` is a handle to a Vulkan instance previously created with `vkCreateInstance`.
- `pPhysicalDeviceCount` is a pointer to an integer related to the number of physical devices available or queried, as described below.
- `pPhysicalDevices` is either NULL or a pointer to an array of VkPhysicalDevice handles.

If `pPhysicalDevices` is NULL, then the number of physical devices available is returned in `pPhysicalDeviceCount`. Otherwise, `pPhysicalDeviceCount` must point to a variable set by the application to the number of elements in the `pPhysicalDevices` array, and on return the variable is overwritten with the number of handles actually written to `pPhysicalDevices`. If `pPhysicalDeviceCount` is less than the number of physical devices available, at most `pPhysicalDeviceCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available physical devices were returned.

Valid Usage (Implicit)

- VUID-vkEnumeratePhysicalDevices-instance-parameter
  `instance` must be a valid `VkInstance` handle
- VUID-vkEnumeratePhysicalDevices-pPhysicalDeviceCount-parameter
**pPhysicalDeviceCount** must be a valid pointer to a `uint32_t` value

- VUID-vkEnumeratePhysicalDevices-pPhysicalDevices-parameter

  If the value referenced by **pPhysicalDeviceCount** is not 0, and **pPhysicalDevices** is not NULL, **pPhysicalDevices** must be a valid pointer to an array of **pPhysicalDeviceCount** `VkPhysicalDevice` handles

---

**Return Codes**

**Success**
- VK_SUCCESS
- VK_INCOMPLETE

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INITIALIZATION_FAILED

To query general properties of physical devices once enumerated, call:

```c
// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceProperties(
    VkPhysicalDevice physicalDevice,
    VkPhysicalDeviceProperties* pProperties);
```

- **physicalDevice** is the handle to the physical device whose properties will be queried.
- **pProperties** is a pointer to a `VkPhysicalDeviceProperties` structure in which properties are returned.

---

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceProperties-physicalDevice-parameter
  **physicalDevice** must be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDeviceProperties-pProperties-parameter
  **pProperties** must be a valid pointer to a `VkPhysicalDeviceProperties` structure

The `VkPhysicalDeviceProperties` structure is defined as:
typedef struct VkPhysicalDeviceProperties {
    uint32_t apiVersion;
    uint32_t driverVersion;
    uint32_t vendorID;
    uint32_t deviceID;
    VkPhysicalDeviceType deviceType;
    char deviceName[VK_MAX_PHYSICAL_DEVICE_NAME_SIZE];
    uint8_t pipelineCacheUUID[VK_UUID_SIZE];
    VkPhysicalDeviceLimits limits;
    VkPhysicalDeviceSparseProperties sparseProperties;
} VkPhysicalDeviceProperties;

• **apiVersion** is the version of Vulkan supported by the device, encoded as described in Version Numbers.

• **driverVersion** is the vendor-specified version of the driver.

• **vendorID** is a unique identifier for the vendor (see below) of the physical device.

• **deviceID** is a unique identifier for the physical device among devices available from the vendor.

• **deviceType** is a VkPhysicalDeviceType specifying the type of device.

• **deviceName** is an array of VK_MAX_PHYSICAL_DEVICE_NAME_SIZE char containing a null-terminated UTF-8 string which is the name of the device.

• **pipelineCacheUUID** is an array of VK_UUID_SIZE uint8_t values representing a universally unique identifier for the device.

• **limits** is the VkPhysicalDeviceLimits structure specifying device-specific limits of the physical device. See Limits for details.

• **sparseProperties** is the VkPhysicalDeviceSparseProperties structure specifying various sparse related properties of the physical device. See Sparse Properties for details.

**NOTE**
The value of **apiVersion** may be different than the version returned by vkEnumerateInstanceVersion; either higher or lower. In such cases, the application must not use functionality that exceeds the version of Vulkan associated with a given object. The pApiVersion parameter returned by vkEnumerateInstanceVersion is the version associated with a VkInstance and its children, except for a VkPhysicalDevice and its children. VkPhysicalDeviceProperties::apiVersion is the version associated with a VkPhysicalDevice and its children.

**NOTE**
The encoding of **driverVersion** is implementation-defined. It may not use the same encoding as **apiVersion**. Applications should follow information from the vendor on how to extract the version information from **driverVersion**.

On implementations that claim support for the Roadmap 2022 profile, the major and minor version expressed by **apiVersion** must be at least Vulkan 1.3.

The **vendorID** and **deviceID** fields are provided to allow applications to adapt to device
characteristics that are not adequately exposed by other Vulkan queries.

**NOTE** These *may* include performance profiles, hardware errata, or other characteristics.

The *vendor* identified by `vendorID` is the entity responsible for the most salient characteristics of the underlying implementation of the `VkPhysicalDevice` being queried.

**NOTE** For example, in the case of a discrete GPU implementation, this *should* be the GPU chipset vendor. In the case of a hardware accelerator integrated into a system-on-chip (SoC), this *should* be the supplier of the silicon IP used to create the accelerator.

If the vendor has a *PCI vendor ID*, the low 16 bits of `vendorID` *must* contain that PCI vendor ID, and the remaining bits *must* be set to zero. Otherwise, the value returned *must* be a valid Khronos vendor ID, obtained as described in the Vulkan Documentation and Extensions: Procedures and Conventions document in the section “Registering a Vendor ID with Khronos”. Khronos vendor IDs are allocated starting at 0x10000, to distinguish them from the PCI vendor ID namespace. Khronos vendor IDs are symbolically defined in the `VkVendorId` type.

The vendor is also responsible for the value returned in `deviceID`. If the implementation is driven primarily by a *PCI device* with a *PCI device ID*, the low 16 bits of `deviceID` *must* contain that PCI device ID, and the remaining bits *must* be set to zero. Otherwise, the choice of what values to return *may* be dictated by operating system or platform policies - but *should* uniquely identify both the device version and any major configuration options (for example, core count in the case of multicores).

**NOTE** The same device ID *should* be used for all physical implementations of that device version and configuration. For example, all uses of a specific silicon IP GPU version and configuration *should* use the same device ID, even if those uses occur in different SoCs.

Khronos vendor IDs which *may* be returned in `VkPhysicalDeviceProperties::vendorID` are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkVendorId {
    VK_VENDOR_ID_KHRONOS = 0x10000,
    VK_VENDOR_ID_VIV = 0x10001,
    VK_VENDOR_ID_VSI = 0x10002,
    VK_VENDOR_ID_KAZAN = 0x10003,
    VK_VENDOR_ID_CODEPLAY = 0x10004,
    VK_VENDOR_ID_MESA = 0x10005,
    VK_VENDOR_ID_POCL = 0x10006,
    VK_VENDOR_ID_MOBILEYE = 0x10007,
} VkVendorId;
```

**NOTE** Khronos vendor IDs may be allocated by vendors at any time. Only the latest canonical versions of this Specification, of the corresponding `vk.xml` API Registry,
and of the corresponding `vulkan_core.h` header file **must** contain all reserved Khronos vendor IDs.

Only Khronos vendor IDs are given symbolic names at present. PCI vendor IDs returned by the implementation can be looked up in the PCI-SIG database.

`VK_MAX_PHYSICAL_DEVICE_NAME_SIZE` is the length in `char` values of an array containing a physical device name string, as returned in `VkPhysicalDeviceProperties::deviceName`.

```c
#define VK_MAX_PHYSICAL_DEVICE_NAME_SIZE  256U
```

The physical device types which **may** be returned in `VkPhysicalDeviceProperties::deviceType` are:

```c
// Provided by VK_VERSION_1.0
typedef enum VkPhysicalDeviceType {
    VK_PHYSICAL_DEVICE_TYPE_OTHER = 0,
    VK_PHYSICAL_DEVICE_TYPE_INTEGRATED_GPU = 1,
    VK_PHYSICAL_DEVICE_TYPE_DISCRETE_GPU = 2,
    VK_PHYSICAL_DEVICE_TYPE_VIRTUAL_GPU = 3,
    VK_PHYSICAL_DEVICE_TYPE_CPU = 4,
} VkPhysicalDeviceType;
```

- **VK_PHYSICAL_DEVICE_TYPE_OTHER** - the device does not match any other available types.
- **VK_PHYSICAL_DEVICE_TYPE_INTEGRATED_GPU** - the device is typically one embedded in or tightly coupled with the host.
- **VK_PHYSICAL_DEVICE_TYPE_DISCRETE_GPU** - the device is typically a separate processor connected to the host via an interlink.
- **VK_PHYSICAL_DEVICE_TYPE_VIRTUAL_GPU** - the device is typically a virtual node in a virtualization environment.
- **VK_PHYSICAL_DEVICE_TYPE_CPU** - the device is typically running on the same processors as the host.

The physical device type is advertised for informational purposes only, and does not directly affect the operation of the system. However, the device type **may** correlate with other advertised properties or capabilities of the system, such as how many memory heaps there are.

To query general properties of physical devices once enumerated, call:

```c
// Provided by VK_VERSION_1.1
void vkGetPhysicalDeviceProperties2(
    VkPhysicalDevice physicalDevice,
    VkPhysicalDeviceProperties2* pProperties);
```

or the equivalent command
void vkGetPhysicalDeviceProperties2KHR(VkPhysicalDevice physicalDevice, VkPhysicalDeviceProperties2* pProperties);

- **physicalDevice** is the handle to the physical device whose properties will be queried.
- **pProperties** is a pointer to a `VkPhysicalDeviceProperties2` structure in which properties are returned.

Each structure in **pProperties** and its **pNext** chain contains members corresponding to implementation-dependent properties, behaviors, or limits. `vkGetPhysicalDeviceProperties2` fills in each member to specify the corresponding value for the implementation.

### Valid Usage (Implicit)

- **VUID-vkGetPhysicalDeviceProperties2-physicalDevice-parameter**
  - **physicalDevice** must be a valid `VkPhysicalDevice` handle
- **VUID-vkGetPhysicalDeviceProperties2-pProperties-parameter**
  - **pProperties** must be a valid pointer to a `VkPhysicalDeviceProperties2` structure

The `VkPhysicalDeviceProperties2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceProperties2 {
    VkStructureType sType;
    void* pNext;
    VkPhysicalDeviceProperties properties;
} VkPhysicalDeviceProperties2;
```

or the equivalent

```c
// Provided by VK_KHR_get_physical_device_properties2
typedef VkPhysicalDeviceProperties2 VkPhysicalDeviceProperties2KHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **properties** is a `VkPhysicalDeviceProperties` structure describing properties of the physical device. This structure is written with the same values as if it were written by `vkGetPhysicalDeviceProperties`.

The **pNext** chain of this structure is used to extend the structure with properties defined by extensions.
Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceProperties2-sType-sType**
  
  *sType* must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PROPERTIES_2**

- **VUID-VkPhysicalDeviceProperties2-pNext-pNext**
  
  Each *pNext* member of any structure (including this one) in the *pNext* chain must be either **NULL** or a pointer to a valid instance of

• VUID-VkPhysicalDeviceProperties2-sType-unique
The `sType` value of each struct in the `pNext` chain **must** be unique.

The `VkPhysicalDeviceVulkan11Properties` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceVulkan11Properties {
    VkStructureType sType;
    void* pNext;
    uint8_t deviceUUID[VK_UUID_SIZE];
    uint8_t driverUUID[VK_UUID_SIZE];
    uint8_t deviceLUID[VK_LUID_SIZE];
    VkBool32 deviceLUIDValid;
    uint32_t subgroupSize;
    VkShaderStageFlags subgroupSupportedStages;
    VkSubgroupFeatureFlags subgroupSupportedOperations;
    VkBool32 subgroupQuadOperationsInAllStages;
    VkPointClippingBehavior pointClippingBehavior;
    uint32_t maxMultiviewViewCount;
    uint32_t maxMultiviewInstanceIndex;
    VkBool32 protectedNoFault;
    uint32_t maxPerSetDescriptors;
    VkDeviceSize maxMemoryAllocationSize;
} VkPhysicalDeviceVulkan11Properties;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **deviceUUID** is an array of `VK_UUID_SIZE` uint8_t values representing a universally unique identifier for the device.
- **driverUUID** is an array of `VK_UUID_SIZE` uint8_t values representing a universally unique identifier for the driver build in use by the device.
- **deviceLUID** is an array of `VK_LUID_SIZE` uint8_t values representing a locally unique identifier for the device.
- **deviceNodeMask** is a uint32_t bitfield identifying the node within a linked device adapter corresponding to the device.
- **deviceLUIDValid** is a boolean value that will be `VK_TRUE` if `deviceLUID` contains a valid LUID and `deviceNodeMask` contains a valid node mask, and `VK_FALSE` if they do not.
- **subgroupSize** is the default number of invocations in each subgroup. `subgroupSize` is at least 1 if any of the physical device’s queues support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`. `subgroupSize` is a power-of-two.
- **subgroupSupportedStages** is a bitfield of `VkShaderStageFlagBits` describing the shader stages that group operations with subgroup scope are supported in. `subgroupSupportedStages` will have the `VK_SHADER_STAGE_COMPUTE_BIT` bit set if any of the physical device’s queues support `VK_QUEUE_COMPUTE_BIT`. 

---

133
• **subgroupSupportedOperations** is a bitmask of **VkSubgroupFeatureFlagBits** specifying the sets of group operations with subgroup scope supported on this device. **subgroupSupportedOperations** will have the **VK_SUBGROUP_FEATURE_BASIC_BIT** bit set if any of the physical device’s queues support **VK_QUEUE_GRAPHICS_BIT** or **VK_QUEUE_COMPUTE_BIT**.

• **subgroupQuadOperationsInAllStages** is a boolean specifying whether quad group operations are available in all stages, or are restricted to fragment and compute stages.

• **pointClippingBehavior** is a **VkPointClippingBehavior** value specifying the point clipping behavior supported by the implementation.

• **maxMultiviewViewCount** is one greater than the maximum view index that can be used in a subpass.

• **maxMultiviewInstanceIndex** is the maximum valid value of instance index allowed to be generated by a drawing command recorded within a subpass of a multiview render pass instance.

• **protectedNoFault** specifies how an implementation behaves when an application attempts to write to unprotected memory in a protected queue operation, read from protected memory in an unprotected queue operation, or perform a query in a protected queue operation. If this limit is **VK_TRUE**, such writes will be discarded or have undefined values written, reads and queries will return undefined values. If this limit is **VK_FALSE**, applications must not perform these operations. See **Protected Memory Access Rules** for more information.

• **maxPerSetDescriptors** is a maximum number of descriptors (summed over all descriptor types) in a single descriptor set that is guaranteed to satisfy any implementation-dependent constraints on the size of a descriptor set itself. Applications can query whether a descriptor set that goes beyond this limit is supported using **vkGetDescriptorSetLayoutSupport**.

• **maxMemoryAllocationSize** is the maximum size of a memory allocation that can be created, even if there is more space available in the heap.

If the **VkPhysicalDeviceVulkan11Properties** structure is included in the **pNext** chain of the **VkPhysicalDeviceProperties2** structure passed to **vkGetPhysicalDeviceProperties2**, it is filled in with each corresponding implementation-dependent property.

These properties correspond to Vulkan 1.1 functionality.

The members of **VkPhysicalDeviceVulkan11Properties** have the same values as the corresponding members of **VkPhysicalDeviceIDProperties**, **VkPhysicalDeviceSubgroupProperties**, **VkPhysicalDevicePointClippingProperties**, **VkPhysicalDeviceMultiviewProperties**, **VkPhysicalDeviceProtectedMemoryProperties**, and **VkPhysicalDeviceMaintenance3Properties**.

NOTE: The **subgroupSupportedStages**, **subgroupSupportedOperations**, and **subgroupQuadOperationsInAllStages** members of this structure correspond respectively to the **VkPhysicalDeviceSubgroupProperties::supportedStages**, **VkPhysicalDeviceSubgroupProperties::supportedOperations**, and **VkPhysicalDeviceSubgroupProperties::quadOperationsInAllStages** members, but add the **subgroup** prefix to the member name.
Valid Usage (Implicit)

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **driverID** is a unique identifier for the driver of the physical device.
- **driverName** is an array of VK_MAX_DRIVER_NAME_SIZE char containing a null-terminated UTF-8 string which is the name of the driver.
- **driverInfo** is an array of VK_MAX_DRIVER_INFO_SIZE char containing a null-terminated UTF-8 string with additional information about the driver.
- **conformanceVersion** is the latest version of the Vulkan conformance test that the implementor has successfully tested this driver against prior to release (see *VkConformanceVersion*).
- **denormBehaviorIndependence** is a *VkShaderFloatControlsIndependence* value indicating whether, and how, denorm behavior can be set independently for different bit widths.
- **roundingModeIndependence** is a *VkShaderFloatControlsIndependence* value indicating whether, and how, rounding modes can be set independently for different bit widths.
- **shaderSignedZeroInfNanPreserveFloat16** is a boolean value indicating whether sign of a zero, Nans and ±∞ can be preserved in 16-bit floating-point computations. It also indicates whether
the SignedZeroInfNanPreserve execution mode can be used for 16-bit floating-point types.

- shaderSignedZeroInfNanPreserveFloat32 is a boolean value indicating whether sign of a zero, Nans and ±∞ can be preserved in 32-bit floating-point computations. It also indicates whether the SignedZeroInfNanPreserve execution mode can be used for 32-bit floating-point types.

- shaderSignedZeroInfNanPreserveFloat64 is a boolean value indicating whether sign of a zero, Nans and ±∞ can be preserved in 64-bit floating-point computations. It also indicates whether the SignedZeroInfNanPreserve execution mode can be used for 64-bit floating-point types.

- shaderDenormPreserveFloat16 is a boolean value indicating whether denormals can be preserved in 16-bit floating-point computations. It also indicates whether the DenormPreserve execution mode can be used for 16-bit floating-point types.

- shaderDenormPreserveFloat32 is a boolean value indicating whether denormals can be preserved in 32-bit floating-point computations. It also indicates whether the DenormPreserve execution mode can be used for 32-bit floating-point types.

- shaderDenormPreserveFloat64 is a boolean value indicating whether denormals can be preserved in 64-bit floating-point computations. It also indicates whether the DenormPreserve execution mode can be used for 64-bit floating-point types.

- shaderDenormFlushToZeroFloat16 is a boolean value indicating whether denormals can be flushed to zero in 16-bit floating-point computations. It also indicates whether the DenormFlushToZero execution mode can be used for 16-bit floating-point types.

- shaderDenormFlushToZeroFloat32 is a boolean value indicating whether denormals can be flushed to zero in 32-bit floating-point computations. It also indicates whether the DenormFlushToZero execution mode can be used for 32-bit floating-point types.

- shaderDenormFlushToZeroFloat64 is a boolean value indicating whether denormals can be flushed to zero in 64-bit floating-point computations. It also indicates whether the DenormFlushToZero execution mode can be used for 64-bit floating-point types.

- shaderRoundingModeRTEFloat16 is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 16-bit floating-point arithmetic and conversion instructions. It also indicates whether the RoundingModeRTE execution mode can be used for 16-bit floating-point types.

- shaderRoundingModeRTEFloat32 is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 32-bit floating-point arithmetic and conversion instructions. It also indicates whether the RoundingModeRTE execution mode can be used for 32-bit floating-point types.

- shaderRoundingModeRTEFloat64 is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 64-bit floating-point arithmetic and conversion instructions. It also indicates whether the RoundingModeRTE execution mode can be used for 64-bit floating-point types.

- shaderRoundingModeRTZFloat16 is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 16-bit floating-point arithmetic and conversion instructions. It also indicates whether the RoundingModeRTZ execution mode can be used for 16-bit floating-point types.

- shaderRoundingModeRTZFloat32 is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 32-bit floating-point arithmetic and conversion instructions. It also indicates whether the RoundingModeRTZ execution mode can be used for 32-bit floating-point types.

- shaderRoundingModeRTZFloat64 is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 64-bit floating-point arithmetic and conversion instructions. It also indicates whether the RoundingModeRTZ execution mode can be used for 64-bit floating-point types.
conversion instructions. It also indicates whether the \texttt{RoundingModeRTZ} execution mode \textbf{can} be used for 32-bit floating-point types.

- \texttt{shaderRoundingModeRTZFloat64} is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 64-bit floating-point arithmetic and conversion instructions. It also indicates whether the \texttt{RoundingModeRTZ} execution mode \textbf{can} be used for 64-bit floating-point types.

- \texttt{maxUpdateAfterBindDescriptorsInAllPools} is the maximum number of descriptors (summed over all descriptor types) that \textbf{can} be created across all pools that are created with the \texttt{VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT} bit set. Pool creation \textbf{may} fail when this limit is exceeded, or when the space this limit represents is unable to satisfy a pool creation due to fragmentation.

- \texttt{shaderUniformBufferArrayNonUniformIndexingNative} is a boolean value indicating whether uniform buffer descriptors natively support nonuniform indexing. If this is \texttt{VK_FALSE}, then a single dynamic instance of an instruction that nonuniformly indexes an array of uniform buffers \textbf{may} execute multiple times in order to access all the descriptors.

- \texttt{shaderSampledImageArrayNonUniformIndexingNative} is a boolean value indicating whether sampler and image descriptors natively support nonuniform indexing. If this is \texttt{VK_FALSE}, then a single dynamic instance of an instruction that nonuniformly indexes an array of samplers or images \textbf{may} execute multiple times in order to access all the descriptors.

- \texttt{shaderStorageBufferArrayNonUniformIndexingNative} is a boolean value indicating whether storage buffer descriptors natively support nonuniform indexing. If this is \texttt{VK_FALSE}, then a single dynamic instance of an instruction that nonuniformly indexes an array of storage buffers \textbf{may} execute multiple times in order to access all the descriptors.

- \texttt{shaderStorageImageArrayNonUniformIndexingNative} is a boolean value indicating whether storage image descriptors natively support nonuniform indexing. If this is \texttt{VK_FALSE}, then a single dynamic instance of an instruction that nonuniformly indexes an array of storage images \textbf{may} execute multiple times in order to access all the descriptors.

- \texttt{shaderInputAttachmentArrayNonUniformIndexingNative} is a boolean value indicating whether input attachment descriptors natively support nonuniform indexing. If this is \texttt{VK_FALSE}, then a single dynamic instance of an instruction that nonuniformly indexes an array of input attachments \textbf{may} execute multiple times in order to access all the descriptors.

- \texttt{robustBufferAccessUpdateAfterBind} is a boolean value indicating whether \texttt{robustBufferAccess} \textbf{can} be enabled on a device simultaneously with \texttt{descriptorBindingUniformBufferUpdateAfterBind}, \texttt{descriptorBindingStorageBufferUpdateAfterBind}, \texttt{descriptorBindingUniformTexelBufferUpdateAfterBind}, and/or \texttt{descriptorBindingStorageTexelBufferUpdateAfterBind}. If this is \texttt{VK_FALSE}, then either \texttt{robustBufferAccess} \textbf{must} be disabled or all of these update-after-bind features \textbf{must} be disabled.

- \texttt{quadDivergentImplicitLod} is a boolean value indicating whether implicit LOD calculations for image operations have well-defined results when the image and/or sampler objects used for the instruction are not uniform within a quad. See \texttt{Derivative Image Operations}.

- \texttt{maxPerStageDescriptorUpdateAfterBindSamplers} is similar to \texttt{maxPerStageDescriptorSamplers} but counts descriptors from descriptor sets created with or without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set.
• `maxPerStageDescriptorUpdateAfterBindUniformBuffers` is similar to `maxPerStageDescriptorUniformBuffers` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

• `maxPerStageDescriptorUpdateAfterBindStorageBuffers` is similar to `maxPerStageDescriptorStorageBuffers` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

• `maxPerStageDescriptorUpdateAfterBindSampledImages` is similar to `maxPerStageDescriptorSampledImages` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

• `maxPerStageDescriptorUpdateAfterBindStorageImages` is similar to `maxPerStageDescriptorStorageImages` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

• `maxPerStageDescriptorUpdateAfterBindInputAttachments` is similar to `maxPerStageDescriptorInputAttachments` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

• `maxPerStageDescriptorUpdateAfterBindResources` is similar to `maxPerStageResources` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

• `maxDescriptorSetUpdateAfterBindSamplers` is similar to `maxDescriptorSetSamplers` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

• `maxDescriptorSetUpdateAfterBindUniformBuffers` is similar to `maxDescriptorSetUniformBuffers` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

• `maxDescriptorSetUpdateAfterBindUniformBuffersDynamic` is similar to `maxDescriptorSetUniformBuffersDynamic` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set. While an application can allocate dynamic uniform buffer descriptors from a pool created with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT`, bindings for these descriptors must not be present in any descriptor set layout that includes bindings created with `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`.

• `maxDescriptorSetUpdateAfterBindStorageBuffers` is similar to `maxDescriptorSetStorageBuffers` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

• `maxDescriptorSetUpdateAfterBindStorageBuffersDynamic` is similar to `maxDescriptorSetStorageBuffersDynamic` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set. While an application can allocate dynamic storage buffer descriptors from a pool created with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT`, bindings for these descriptors must not be present in any descriptor set layout that includes bindings created with `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`.

• `maxDescriptorSetUpdateAfterBindSampledImages` is similar to `maxDescriptorSetSampledImages` but counts descriptors from descriptor sets created with or without the
- **maxDescriptorSetUpdateAfterBindStorageImages** is similar to **maxDescriptorSetStorageImages** but counts descriptors from descriptor sets created with or without the **VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT** bit set.

- **maxDescriptorSetUpdateAfterBindInputAttachments** is similar to **maxDescriptorSetInputAttachments** but counts descriptors from descriptor sets created with or without the **VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT** bit set.

- **supportedDepthResolveModes** is a bitmask of **VkResolveModeFlagBits** indicating the set of supported depth resolve modes. **VK_RESOLVE_MODE_SAMPLE_ZERO_BIT** must be included in the set but implementations may support additional modes.

- **supportedStencilResolveModes** is a bitmask of **VkResolveModeFlagBits** indicating the set of supported stencil resolve modes. **VK_RESOLVE_MODE_SAMPLE_ZERO_BIT** must be included in the set but implementations may support additional modes. **VK_RESOLVE_MODE_AVERAGE_BIT** must not be included in the set.

- **independentResolveNone** is **VK_TRUE** if the implementation supports setting the depth and stencil resolve modes to different values when one of those modes is **VK_RESOLVE_MODE_NONE**. Otherwise the implementation only supports setting both modes to the same value.

- **independentResolve** is **VK_TRUE** if the implementation supports all combinations of the supported depth and stencil resolve modes, including setting either depth or stencil resolve mode to **VK_RESOLVE_MODE_NONE**. An implementation that supports **independentResolve** must also support **independentResolveNone**.

- **filterMinmaxSingleComponentFormats** is a boolean value indicating whether a minimum set of required formats support min/max filtering.

- **filterMinmaxImageComponentMapping** is a boolean value indicating whether the implementation supports non-identity component mapping of the image when doing min/max filtering.

- **maxTimelineSemaphoreValueDifference** indicates the maximum difference allowed by the implementation between the current value of a timeline semaphore and any pending signal or wait operations.

- **framebufferIntegerColorSampleCounts** is a bitmask of **VkSampleCountFlagBits** indicating the color sample counts that are supported for all framebuffer color attachments with integer formats.

If the **VkPhysicalDeviceVulkan12Properties** structure is included in the **pNext** chain of the **VkPhysicalDeviceProperties2** structure passed to **vkGetPhysicalDeviceProperties2**, it is filled in with each corresponding implementation-dependent property.

These properties correspond to Vulkan 1.2 functionality.

The members of **VkPhysicalDeviceVulkan12Properties** must have the same values as the corresponding members of **VkPhysicalDeviceDriverProperties**, **VkPhysicalDeviceFloatControlsProperties**, **VkPhysicalDeviceDescriptorIndexingProperties**, **VkPhysicalDeviceDepthStencilResolveProperties**, **VkPhysicalDeviceSamplerFilterMinmaxProperties**, and **VkPhysicalDeviceTimelineSemaphoreProperties**.
Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceVulkan12Properties-sType-sType**
  
  *sType* must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_1_2_PROPERTIES`

The `VkPhysicalDeviceVulkan13Properties` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceVulkan13Properties {
    VkStructureType sType;
    void* pNext;
    uint32_t minSubgroupSize;

    VkBool32 integerDotProductAccumulatingSaturating4x8BitPackedUnsignedAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating4x8BitPackedSignedAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating4x8BitPackedMixedSignednessAccelerated;
} VkPhysicalDeviceVulkan13Properties;
```
sType is a VkStructureType value identifying this structure.

pNext is NULL or a pointer to a structure extending this structure.

minSubgroupSize is the minimum subgroup size supported by this device. minSubgroupSize is at least one if any of the physical device’s queues support VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT. minSubgroupSize is a power-of-two. minSubgroupSize is less than or equal to maxSubgroupSize. minSubgroupSize is less than or equal to subgroupSize.

maxSubgroupSize is the maximum subgroup size supported by this device. maxSubgroupSize is at least one if any of the physical device’s queues support VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT. maxSubgroupSize is a power-of-two. maxSubgroupSize is greater than or equal to minSubgroupSize. maxSubgroupSize is greater than or equal to subgroupSize.

maxComputeWorkgroupSubgroups is the maximum number of subgroups supported by the implementation within a workgroup.

requiredSubgroupSizeStages is a bitfield of what shader stages support having a required subgroup size specified.

maxInlineUniformBlockSize is the maximum size in bytes of an inline uniform block binding.

maxPerStageDescriptorInlineUniformBlocks is the maximum number of inline uniform block bindings that can be accessible to a single shader stage in a pipeline layout. Descriptor bindings with a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK count against this limit. Only descriptor bindings in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set count against this limit.

maxPerStageDescriptorUpdateAfterBindInlineUniformBlocks is similar to
maxPerStageDescriptorInlineUniformBlocks but counts descriptor bindings from descriptor sets created with or without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set.

- maxDescriptorSetInlineUniformBlocks is the maximum number of inline uniform block bindings that can be included in descriptor bindings in a pipeline layout across all pipeline shader stages and descriptor set numbers. Descriptor bindings with a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK count against this limit. Only descriptor bindings in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set count against this limit.

- maxDescriptorSetUpdateAfterBindInlineUniformBlocks is similar to maxDescriptorSetInlineUniformBlocks but counts descriptor bindings from descriptor sets created with or without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set.

- maxInlineUniformTotalSize is the maximum total size in bytes of all inline uniform block bindings, across all pipeline shader stages and descriptor set numbers, that can be included in a pipeline layout. Descriptor bindings with a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK count against this limit.

- integerDotProduct8BitUnsignedAccelerated is a boolean that will be VK_TRUE if the support for 8-bit unsigned dot product operations using the OpUDotKHR SPIR-V instruction is accelerated as defined below.

- integerDotProduct8BitSignedAccelerated is a boolean that will be VK_TRUE if the support for 8-bit signed dot product operations using the OpSDotKHR SPIR-V instruction is accelerated as defined below.

- integerDotProduct8BitMixedSignednessAccelerated is a boolean that will be VK_TRUE if the support for 8-bit mixed signedness dot product operations using the OpSUDotKHR SPIR-V instruction is accelerated as defined below.

- integerDotProduct4x8BitPackedUnsignedAccelerated is a boolean that will be VK_TRUE if the support for 8-bit unsigned dot product operations from operands packed into 32-bit integers using the OpUDotKHR SPIR-V instruction is accelerated as defined below.

- integerDotProduct4x8BitPackedSignedAccelerated is a boolean that will be VK_TRUE if the support for 8-bit signed dot product operations from operands packed into 32-bit integers using the OpSDotKHR SPIR-V instruction is accelerated as defined below.

- integerDotProduct4x8BitPackedMixedSignednessAccelerated is a boolean that will be VK_TRUE if the support for 8-bit mixed signedness dot product operations from operands packed into 32-bit integers using the OpSUDotKHR SPIR-V instruction is accelerated as defined below.

- integerDotProduct16BitUnsignedAccelerated is a boolean that will be VK_TRUE if the support for 16-bit unsigned dot product operations using the OpUDotKHR SPIR-V instruction is accelerated as defined below.

- integerDotProduct16BitSignedAccelerated is a boolean that will be VK_TRUE if the support for 16-bit signed dot product operations using the OpSDotKHR SPIR-V instruction is accelerated as defined below.

- integerDotProduct16BitMixedSignednessAccelerated is a boolean that will be VK_TRUE if the support for 16-bit mixed signedness dot product operations using the OpSUDotKHR SPIR-V instruction is accelerated as defined below.

- integerDotProduct32BitUnsignedAccelerated is a boolean that will be VK_TRUE if the support for...
32-bit unsigned dot product operations using the \texttt{OpUDotKHR} SPIR-V instruction is accelerated as defined below.

- \texttt{integerDotProduct32BitSignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 32-bit signed dot product operations using the \texttt{OpSDotKHR} SPIR-V instruction is accelerated as defined below.

- \texttt{integerDotProduct32BitMixedSignednessAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 32-bit mixed signedness dot product operations using the \texttt{OpSUDotKHR} SPIR-V instruction is accelerated as defined below.

- \texttt{integerDotProduct64BitUnsignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 64-bit unsigned dot product operations using the \texttt{OpUDotKHR} SPIR-V instruction is accelerated as defined below.

- \texttt{integerDotProduct64BitSignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 64-bit signed dot product operations using the \texttt{OpSDotKHR} SPIR-V instruction is accelerated as defined below.

- \texttt{integerDotProduct64BitMixedSignednessAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 64-bit mixed signedness dot product operations using the \texttt{OpSUDotKHR} SPIR-V instruction is accelerated as defined below.

- \texttt{integerDotProductAccumulatingSaturating8BitUnsignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 8-bit unsigned accumulating saturating dot product operations using the \texttt{OpUDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

- \texttt{integerDotProductAccumulatingSaturating8BitSignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 8-bit signed accumulating saturating dot product operations using the \texttt{OpSDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

- \texttt{integerDotProductAccumulatingSaturating8BitMixedSignednessAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 8-bit mixed signedness accumulating saturating dot product operations using the \texttt{OpSUDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

- \texttt{integerDotProductAccumulatingSaturating4x8BitPackedUnsignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 8-bit unsigned accumulating saturating dot product operations from operands packed into 32-bit integers using the \texttt{OpUDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

- \texttt{integerDotProductAccumulatingSaturating4x8BitPackedSignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 8-bit signed accumulating saturating dot product operations from operands packed into 32-bit integers using the \texttt{OpSDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

- \texttt{integerDotProductAccumulatingSaturating4x8BitPackedMixedSignednessAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 8-bit mixed signedness accumulating saturating dot product operations from operands packed into 32-bit integers using the \texttt{OpSUDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

- \texttt{integerDotProductAccumulatingSaturating16BitUnsignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 16-bit unsigned accumulating saturating dot product operations using the \texttt{OpUDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

- \texttt{integerDotProductAccumulatingSaturating16BitSignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 16-bit signed accumulating saturating dot product operations using
the OpSDotAccSatKHR SPIR-V instruction is accelerated as defined below.

- `integerDotProductAccumulatingSaturating16BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 16-bit mixed signedness accumulating saturating dot product operations using the OpSDotAccSatKHR SPIR-V instruction is accelerated as defined below.

- `integerDotProductAccumulatingSaturating32BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 32-bit unsigned accumulating saturating dot product operations using the OpSUDotAccSatKHR SPIR-V instruction is accelerated as defined below.

- `integerDotProductAccumulatingSaturating32BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 32-bit signed accumulating saturating dot product operations using the OpSDotAccSatKHR SPIR-V instruction is accelerated as defined below.

- `integerDotProductAccumulatingSaturating32BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 32-bit mixed signedness accumulating saturating dot product operations using the OpSUDotAccSatKHR SPIR-V instruction is accelerated as defined below.

- `integerDotProductAccumulatingSaturating64BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit unsigned accumulating saturating dot product operations using the OpSUDotAccSatKHR SPIR-V instruction is accelerated as defined below.

- `integerDotProductAccumulatingSaturating64BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit signed accumulating saturating dot product operations using the OpSDotAccSatKHR SPIR-V instruction is accelerated as defined below.

- `integerDotProductAccumulatingSaturating64BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit mixed signedness accumulating saturating dot product operations using the OpSUDotAccSatKHR SPIR-V instruction is accelerated as defined below.

- `storageTexelBufferOffsetAlignmentBytes` is a byte alignment that is sufficient for a storage texel buffer of any format. The value must be a power of two.

- `storageTexelBufferOffsetSingleTexelAlignment` indicates whether single texel alignment is sufficient for a storage texel buffer of any format.

- `uniformTexelBufferOffsetAlignmentBytes` is a byte alignment that is sufficient for a uniform texel buffer of any format. The value must be a power of two.

- `uniformTexelBufferOffsetSingleTexelAlignment` indicates whether single texel alignment is sufficient for a uniform texel buffer of any format.

- `maxBufferSize` is the maximum size `VkBuffer` that can be created.

If the `VkPhysicalDeviceVulkan13Properties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These properties correspond to Vulkan 1.3 functionality.

The members of `VkPhysicalDeviceVulkan13Properties` must have the same values as the corresponding members of `VkPhysicalDeviceInlineUniformBlockProperties` and `VkPhysicalDeviceSubgroupSizeControlProperties`. 
Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceVulkan13Properties-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_1_3_PROPERTIES`

The `VkPhysicalDeviceIDProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceIDProperties {
    VkStructureType sType;
    void* pNext;
    uint8_t deviceUUID[VK_UUID_SIZE];
    uint8_t driverUUID[VK_UUID_SIZE];
    uint8_t deviceLUID[VK_LUID_SIZE];
    uint32_t deviceNodeMask;
    VkBool32 deviceLUIDValid;
} VkPhysicalDeviceIDProperties;
```

or the equivalent

```c
// Provided by VK_KHR_external_fence_capabilities, VK_KHR_external_memory_capabilities, VK_KHR_external_semaphore_capabilities
typedef VkPhysicalDeviceIDProperties VkPhysicalDeviceIDPropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `deviceUUID` is an array of `VK_UUID_SIZE` `uint8_t` values representing a universally unique identifier for the device.
- `driverUUID` is an array of `VK_UUID_SIZE` `uint8_t` values representing a universally unique identifier for the driver build in use by the device.
- `deviceLUID` is an array of `VK_LUID_SIZE` `uint8_t` values representing a locally unique identifier for the device.
- `deviceNodeMask` is a `uint32_t` bitfield identifying the node within a linked device adapter corresponding to the device.
- `deviceLUIDValid` is a boolean value that will be `VK_TRUE` if `deviceLUID` contains a valid LUID and `deviceNodeMask` contains a valid node mask, and `VK_FALSE` if they do not.

If the `VkPhysicalDeviceIDProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

`deviceUUID` must be immutable for a given device across instances, processes, driver APIs, driver versions, and system reboots.
Applications can compare the driverUUID value across instance and process boundaries, and can make similar queries in external APIs to determine whether they are capable of sharing memory objects and resources using them with the device.

deviceUUID and/or driverUUID must be used to determine whether a particular external object can be shared between driver components, where such a restriction exists as defined in the compatibility table for the particular object type:

- External memory handle types compatibility
- External semaphore handle types compatibility
- External fence handle types compatibility

If deviceLUIDValid is VK_FALSE, the values of deviceLUID and deviceNodeMask are undefined. If deviceLUIDValid is VK_TRUE and Vulkan is running on the Windows operating system, the contents of deviceLUID can be cast to an LUID object and must be equal to the locally unique identifier of a IDXGIAdapter1 object that corresponds to physicalDevice. If deviceLUIDValid is VK_TRUE, deviceNodeMask must contain exactly one bit. If Vulkan is running on an operating system that supports the Direct3D 12 API and physicalDevice corresponds to an individual device in a linked device adapter, deviceNodeMask identifies the Direct3D 12 node corresponding to physicalDevice. Otherwise, deviceNodeMask must be 1.

Although they have identical descriptions, VkPhysicalDeviceIDProperties::deviceUUID may differ from VkPhysicalDeviceProperties2::pipelineCacheUUID. The former is intended to identify and correlate devices across API and driver boundaries, while the latter is used to identify a compatible device and driver combination to use when serializing and de-serializing pipeline state.

Implementations should return deviceUUID values which are likely to be unique even in the presence of multiple Vulkan implementations (such as a GPU driver and a software renderer; two drivers for different GPUs; or the same Vulkan driver running on two logically different devices).

Khronos’ conformance testing is unable to guarantee that deviceUUID values are actually unique, so implementors should make their own best efforts to ensure this. In particular, hard-coded deviceUUID values, especially all-0 bits, should never be used.

A combination of values unique to the vendor, the driver, and the hardware environment can be used to provide a deviceUUID which is unique to a high degree of certainty. Some possible inputs to such a computation are:

- Information reported by vkGetPhysicalDeviceProperties
- PCI device ID (if defined)
- PCI bus ID, or similar system configuration information.
- Driver binary checksums.

While VkPhysicalDeviceIDProperties::deviceUUID is specified to remain consistent
across driver versions and system reboots, it is not intended to be usable as a serializable persistent identifier for a device. It may change when a device is physically added to, removed from, or moved to a different connector in a system while that system is powered down. Further, there is no reasonable way to verify with conformance testing that a given device retains the same UUID in a given system across all driver versions supported in that system. While implementations should make every effort to report consistent device UUIDs across driver versions, applications should avoid relying on the persistence of this value for uses other than identifying compatible devices for external object sharing purposes.

Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceIDProperties-sType-sType**
  - *sType* must be *VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ID_PROPERTIES*

**VK_UUID_SIZE** is the length in *uint8_t* values of an array containing a universally unique device or driver build identifier, as returned in *VkPhysicalDeviceIDProperties::deviceUUID* and *VkPhysicalDeviceIDProperties::driverUUID*.

```c
#define VK_UUID_SIZE                      16U
```

**VK_LUID_SIZE** is the length in *uint8_t* values of an array containing a locally unique device identifier, as returned in *VkPhysicalDeviceIDProperties::deviceLUID*.

```c
#define VK_LUID_SIZE                      8U
```

or the equivalent

```c
#define VK_LUID_SIZE_KHR                  VK_LUID_SIZE
```

The *VkPhysicalDeviceDriverProperties* structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceDriverProperties {
    VkStructureType sType;
    void* pNext;
    VkDriverId driverID;
    char driverName[VK_MAX_DRIVER_NAME_SIZE];
    char driverInfo[VK_MAX_DRIVER_INFO_SIZE];
    VkConformanceVersion conformanceVersion;
} VkPhysicalDeviceDriverProperties;
```

or the equivalent
typedef VkPhysicalDeviceDriverProperties VkPhysicalDeviceDriverPropertiesKHR;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `driverID` is a unique identifier for the driver of the physical device.
- `driverName` is an array of `VK_MAX_DRIVER_NAME_SIZE` char containing a null-terminated UTF-8 string which is the name of the driver.
- `driverInfo` is an array of `VK_MAX_DRIVER_INFO_SIZE` char containing a null-terminated UTF-8 string with additional information about the driver.
- `conformanceVersion` is the latest version of the Vulkan conformance test that the implementor has successfully tested this driver against prior to release (see `VkConformanceVersion`).

If the `VkPhysicalDeviceDriverProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These are properties of the driver corresponding to a physical device.

`driverID` must be immutable for a given driver across instances, processes, driver versions, and system reboots.

**Valid Usage (Implicit)**

- `VUID-VkPhysicalDeviceDriverProperties-sType-sType`
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICALDEVICE_DRIVER_PROPERTIES`

Khronos driver IDs which may be returned in `VkPhysicalDeviceDriverProperties::driverID` are:

```c
// Provided by VK_VERSION_1_2
typedef enum VkDriverId {
    VK_DRIVER_ID_AMD_PROPRIETARY = 1,
    VK_DRIVER_ID_AMD_OPEN_SOURCE = 2,
    VK_DRIVER_ID_MESA_RADV = 3,
    VK_DRIVER_ID_NVIDIA_PROPRIETARY = 4,
    VK_DRIVER_ID_INTEL_PROPRIETARY_WINDOWS = 5,
    VK_DRIVER_ID_INTEL_OPEN_SOURCE_MESA = 6,
    VK_DRIVER_ID_IMAGINATION_PROPRIETARY = 7,
    VK_DRIVER_ID_QUALCOMM_PROPRIETARY = 8,
    VK_DRIVER_ID_ARM_PROPRIETARY = 9,
    VK_DRIVER_ID_GOOGLE_SWIFTSHADER = 10,
    VK_DRIVER_ID_GGP_PROPRIETARY = 11,
    VK_DRIVER_ID_BROADCOM_PROPRIETARY = 12,
    VK_DRIVER_ID_MESA_LLVMPIPE = 13,
    VK_DRIVER_ID_MOLTENVK = 14,
};
```
VK_DRIVER_ID_COREAVI_PROPRIETARY = 15,
VK_DRIVER_ID_JUICE_PROPRIETARY = 16,
VK_DRIVER_ID_VERISILICON_PROPRIETARY = 17,
VK_DRIVER_ID_MESA_TURNIP = 18,
VK_DRIVER_ID_MESA_V3DV = 19,
VK_DRIVER_ID_MESA_PANVK = 20,
VK_DRIVER_ID_SAMSUNG_PROPRIETARY = 21,
VK_DRIVER_ID_MESA_VENUS = 22,
VK_DRIVER_ID_MESA_DOZEN = 23,
VK_DRIVER_ID_MESA_NVK = 24,
VK_DRIVER_ID_IMAGINATION_OPEN_SOURCE_MESA = 25,
VK_DRIVER_ID_MESA_HONEYKRISP = 26,
VK_DRIVER_ID_RESERVED_27 = 27,
// Provided by VK_KHR_driver_properties
VK_DRIVER_ID_AMD_PROPRIETARY_KHR = VK_DRIVER_ID_AMD_PROPRIETARY,
// Provided by VK_KHR_driver_properties
VK_DRIVER_ID_AMD_OPEN_SOURCE_KHR = VK_DRIVER_ID_AMD_OPEN_SOURCE,
// Provided by VK_KHR_driver_properties
VK_DRIVER_ID_MESA_RADV_KHR = VK_DRIVER_ID_MESA_RADV,
// Provided by VK_KHR_driver_properties
VK_DRIVER_ID_NVIDIA_PROPRIETARY_KHR = VK_DRIVER_ID_NVIDIA_PROPRIETARY,
// Provided by VK_KHR_driver_properties
VK_DRIVER_ID_INTEL_PROPRIETARY_WINDOWS_KHR = VK_DRIVER_ID_INTEL_PROPRIETARY_WINDOWS,
// Provided by VK_KHR_driver_properties
VK_DRIVER_ID_INTEL_OPEN_SOURCE_MESA_KHR = VK_DRIVER_ID_INTEL_OPEN_SOURCE_MESA,
// Provided by VK_KHR_driver_properties
VK_DRIVER_ID_IMAGINATION_PROPRIETARY_KHR = VK_DRIVER_ID_IMAGINATION_PROPRIETARY,
// Provided by VK_KHR_driver_properties
VK_DRIVER_ID_QUALCOMM_PROPRIETARY_KHR = VK_DRIVER_ID_QUALCOMM_PROPRIETARY,
// Provided by VK_KHR_driver_properties
VK_DRIVER_ID_ARM_PROPRIETARY_KHR = VK_DRIVER_ID_ARM_PROPRIETARY,
// Provided by VK_KHR_driver_properties
VK_DRIVER_ID_GOOGLE_SWIFTSHADER_KHR = VK_DRIVER_ID_GOOGLE_SWIFTSHADER,
// Provided by VK_KHR_driver_properties
VK_DRIVER_ID_GGP_PROPRIETARY_KHR = VK_DRIVER_ID_GGP_PROPRIETARY,
// Provided by VK_KHR_driver_properties
VK_DRIVER_ID_BROADCOM_PROPRIETARY_KHR = VK_DRIVER_ID_BROADCOM_PROPRIETARY,
} VkDriverId;

or the equivalent

// Provided by VK_KHR_driver_properties
typedef VkDriverId VkDriverIdKHR;

**NOTE**
Khronos driver IDs may be allocated by vendors at any time. There may be multiple driver IDs for the same vendor, representing different drivers (for e.g. different platforms, proprietary or open source, etc.). Only the latest canonical versions of this Specification, of the corresponding [vk.xml](https://github.com/KhronosGroup/vk.xml) API Registry, and of the
The corresponding `vulkan_core.h` header file must contain all reserved Khronos driver IDs.

Only driver IDs registered with Khronos are given symbolic names. There may be unregistered driver IDs returned.

**VK_MAX_DRIVER_NAME_SIZE** is the length in `char` values of an array containing a driver name string, as returned in `VkPhysicalDeviceDriverProperties::driverName`.

```c
#define VK_MAX_DRIVER_NAME_SIZE 256U
```

or the equivalent

```c
#define VK_MAX_DRIVER_NAME_SIZE_KHR VK_MAX_DRIVER_NAME_SIZE
```

**VK_MAX_DRIVER_INFO_SIZE** is the length in `char` values of an array containing a driver information string, as returned in `VkPhysicalDeviceDriverProperties::driverInfo`.

```c
#define VK_MAX_DRIVER_INFO_SIZE 256U
```

or the equivalent

```c
#define VK_MAX_DRIVER_INFO_SIZE_KHR VK_MAX_DRIVER_INFO_SIZE
```

The conformance test suite version an implementation is compliant with is described with the `VkConformanceVersion` structure:

```c
// Provided by VK_VERSION_1_2
typedef struct VkConformanceVersion {
    uint8_t  major;
    uint8_t  minor;
    uint8_t  subminor;
    uint8_t  patch;
} VkConformanceVersion;
```

or the equivalent

```c
// Provided by VK_KHR_driver_properties
typedef VkConformanceVersion VkConformanceVersionKHR;
```

- **major** is the major version number of the conformance test suite.
- **minor** is the minor version number of the conformance test suite.
• *subminor* is the subminor version number of the conformance test suite.
• *patch* is the patch version number of the conformance test suite.

The *VkPhysicalDevicePCIBusInfoPropertiesEXT* structure is defined as:

```c
// Provided by VK_EXT_pci_bus_info
typedef struct VkPhysicalDevicePCIBusInfoPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    uint32_t pciDomain;
    uint32_t pciBus;
    uint32_t pciDevice;
    uint32_t pciFunction;
} VkPhysicalDevicePCIBusInfoPropertiesEXT;
```

• *sType* is a *VkStructureType* value identifying this structure.
• *pNext* is *NULL* or a pointer to a structure extending this structure.
• *pciDomain* is the PCI bus domain.
• *pciBus* is the PCI bus identifier.
• *pciDevice* is the PCI device identifier.
• *pciFunction* is the PCI device function identifier.

If the *VkPhysicalDevicePCIBusInfoPropertiesEXT* structure is included in the *pNext* chain of the *VkPhysicalDeviceProperties2* structure passed to *vkGetPhysicalDeviceProperties2*, it is filled in with each corresponding implementation-dependent property.

These are properties of the PCI bus information of a physical device.

**Valid Usage (Implicit)**

• VUID-VkPhysicalDevicePCIBusInfoPropertiesEXT-sType-sType
  
  *sType* must be *VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PCI_BUS_INFO_PROPERTIES_EXT*

The *VkPhysicalDeviceDrmPropertiesEXT* structure is defined as:
typedef struct VkPhysicalDeviceDrmPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 hasPrimary;
    VkBool32 hasRender;
    int64_t primaryMajor;
    int64_t primaryMinor;
    int64_t renderMajor;
    int64_t renderMinor;
} VkPhysicalDeviceDrmPropertiesEXT;

• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **hasPrimary** is a boolean indicating whether the physical device has a DRM primary node.
• **hasRender** is a boolean indicating whether the physical device has a DRM render node.
• **primaryMajor** is the DRM primary node major number, if any.
• **primaryMinor** is the DRM primary node minor number, if any.
• **renderMajor** is the DRM render node major number, if any.
• **renderMinor** is the DRM render node minor number, if any.

If the `VkPhysicalDeviceDrmPropertiesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These are properties of the DRM information of a physical device.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceDrmPropertiesEXT-sType-sType
  sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DRM_PROPERTIES_EXT`

The `VkPhysicalDeviceShaderIntegerDotProductProperties` structure is defined as:
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceShaderIntegerDotProductProperties {
    VkStructureType sType;
    void* pNext;
    VkBool32 integerDotProduct8BitUnsignedAccelerated;
    VkBool32 integerDotProduct8BitSignedAccelerated;
    VkBool32 integerDotProduct8BitMixedSignednessAccelerated;
    VkBool32 integerDotProduct4x8BitPackedUnsignedAccelerated;
    VkBool32 integerDotProduct4x8BitPackedSignedAccelerated;
    VkBool32 integerDotProduct4x8BitPackedMixedSignednessAccelerated;
    VkBool32 integerDotProduct16BitUnsignedAccelerated;
    VkBool32 integerDotProduct16BitSignedAccelerated;
    VkBool32 integerDotProduct16BitMixedSignednessAccelerated;
    VkBool32 integerDotProduct32BitUnsignedAccelerated;
    VkBool32 integerDotProduct32BitSignedAccelerated;
    VkBool32 integerDotProduct32BitMixedSignednessAccelerated;
    VkBool32 integerDotProduct64BitUnsignedAccelerated;
    VkBool32 integerDotProduct64BitSignedAccelerated;
    VkBool32 integerDotProduct64BitMixedSignednessAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating8BitUnsignedAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating8BitSignedAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating8BitMixedSignednessAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating4x8BitPackedUnsignedAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating4x8BitPackedSignedAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating4x8BitPackedMixedSignednessAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating16BitUnsignedAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating16BitSignedAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating16BitMixedSignednessAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating32BitUnsignedAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating32BitSignedAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating32BitMixedSignednessAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating64BitUnsignedAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating64BitSignedAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating64BitMixedSignednessAccelerated;
} VkPhysicalDeviceShaderIntegerDotProductProperties;
typedef VkPhysicalDeviceShaderIntegerDotProductProperties
VkPhysicalDeviceShaderIntegerDotProductPropertiesKHR;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.

• integerDotProduct8BitUnsignedAccelerated is a boolean that will be VK_TRUE if the support for 8-bit unsigned dot product operations using the OpUDotKHR SPIR-V instruction is accelerated as defined below.

• integerDotProduct8BitSignedAccelerated is a boolean that will be VK_TRUE if the support for 8-bit signed dot product operations using the OpSDotKHR SPIR-V instruction is accelerated as defined below.

• integerDotProduct8BitMixedSignednessAccelerated is a boolean that will be VK_TRUE if the support for 8-bit mixed signedness dot product operations using the OpSUDotKHR SPIR-V instruction is accelerated as defined below.

• integerDotProduct4x8BitPackedUnsignedAccelerated is a boolean that will be VK_TRUE if the support for 8-bit unsigned dot product operations from operands packed into 32-bit integers using the OpUDotKHR SPIR-V instruction is accelerated as defined below.

• integerDotProduct4x8BitPackedSignedAccelerated is a boolean that will be VK_TRUE if the support for 8-bit signed dot product operations from operands packed into 32-bit integers using the OpSDotKHR SPIR-V instruction is accelerated as defined below.

• integerDotProduct4x8BitPackedMixedSignednessAccelerated is a boolean that will be VK_TRUE if the support for 8-bit mixed signedness dot product operations from operands packed into 32-bit integers using the OpSUDotKHR SPIR-V instruction is accelerated as defined below.

• integerDotProduct16BitUnsignedAccelerated is a boolean that will be VK_TRUE if the support for 16-bit unsigned dot product operations using the OpUDotKHR SPIR-V instruction is accelerated as defined below.

• integerDotProduct16BitSignedAccelerated is a boolean that will be VK_TRUE if the support for 16-bit signed dot product operations using the OpSDotKHR SPIR-V instruction is accelerated as defined below.

• integerDotProduct16BitMixedSignednessAccelerated is a boolean that will be VK_TRUE if the support for 16-bit mixed signedness dot product operations using the OpSUDotKHR SPIR-V instruction is accelerated as defined below.

• integerDotProduct32BitUnsignedAccelerated is a boolean that will be VK_TRUE if the support for 32-bit unsigned dot product operations using the OpUDotKHR SPIR-V instruction is accelerated as defined below.

• integerDotProduct32BitSignedAccelerated is a boolean that will be VK_TRUE if the support for 32-bit signed dot product operations using the OpSDotKHR SPIR-V instruction is accelerated as defined below.

• integerDotProduct32BitMixedSignednessAccelerated is a boolean that will be VK_TRUE if the support for 32-bit mixed signedness dot product operations using the OpSUDotKHR SPIR-V instruction is accelerated as defined below.
instruction is accelerated as defined below.

- \texttt{integerDotProduct64BitUnsignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 64-bit unsigned dot product operations using the \texttt{OpUDotKHR} SPIR-V instruction is accelerated as defined below.

- \texttt{integerDotProduct64BitSignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 64-bit signed dot product operations using the \texttt{OpSDotKHR} SPIR-V instruction is accelerated as defined below.

- \texttt{integerDotProduct64BitMixedSignednessAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 64-bit mixed signedness dot product operations using the \texttt{OpSUDotKHR} SPIR-V instruction is accelerated as defined below.

- \texttt{integerDotProductAccumulatingSaturating8BitUnsignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 8-bit unsigned accumulating saturating dot product operations using the \texttt{OpUDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

- \texttt{integerDotProductAccumulatingSaturating8BitSignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 8-bit signed accumulating saturating dot product operations using the \texttt{OpSDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

- \texttt{integerDotProductAccumulatingSaturating8BitMixedSignednessAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 8-bit mixed signedness accumulating saturating dot product operations using the \texttt{OpSUDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

- \texttt{integerDotProductAccumulatingSaturating4x8BitPackedUnsignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 8-bit unsigned accumulating saturating dot product operations from operands packed into 32-bit integers using the \texttt{OpUDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

- \texttt{integerDotProductAccumulatingSaturating4x8BitPackedSignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 8-bit signed accumulating saturating dot product operations from operands packed into 32-bit integers using the \texttt{OpSDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

- \texttt{integerDotProductAccumulatingSaturating4x8BitPackedMixedSignednessAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 8-bit mixed signedness accumulating saturating dot product operations from operands packed into 32-bit integers using the \texttt{OpSUDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

- \texttt{integerDotProductAccumulatingSaturating16BitUnsignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 16-bit unsigned accumulating saturating dot product operations using the \texttt{OpUDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

- \texttt{integerDotProductAccumulatingSaturating16BitSignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 16-bit signed accumulating saturating dot product operations using the \texttt{OpSDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

- \texttt{integerDotProductAccumulatingSaturating16BitMixedSignednessAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 16-bit mixed signedness accumulating saturating dot product operations using the \texttt{OpSUDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

- \texttt{integerDotProductAccumulatingSaturating32BitUnsignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 32-bit unsigned accumulating saturating dot product operations using the \texttt{OpUDotAccSatKHR} SPIR-V instruction is accelerated as defined below.
• \texttt{integerDotProductAccumulatingSaturating32BitSignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 32-bit signed accumulating saturating dot product operations using the \texttt{OpSDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

• \texttt{integerDotProductAccumulatingSaturating32BitMixedSignednessAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 32-bit mixed signedness accumulating saturating dot product operations using the \texttt{OpSUDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

• \texttt{integerDotProductAccumulatingSaturating64BitUnsignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 64-bit unsigned accumulating saturating dot product operations using the \texttt{OpUDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

• \texttt{integerDotProductAccumulatingSaturating64BitSignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 64-bit signed accumulating saturating dot product operations using the \texttt{OpSDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

• \texttt{integerDotProductAccumulatingSaturating64BitMixedSignednessAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 64-bit mixed signedness accumulating saturating dot product operations using the \texttt{OpSUDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

If the \texttt{VkPhysicalDeviceShaderIntegerDotProductProperties} structure is included in the \texttt{pNext} chain of the \texttt{VkPhysicalDeviceProperties2} structure passed to \texttt{vkGetPhysicalDeviceProperties2}, it is filled in with each corresponding implementation-dependent property.

These are properties of the integer dot product acceleration information of a physical device.

\textbf{NOTE} A dot product operation is deemed accelerated if its implementation provides a performance advantage over application-provided code composed from elementary instructions and/or other dot product instructions, either because the implementation uses optimized machine code sequences whose generation from application-provided code cannot be guaranteed or because it uses hardware features that cannot otherwise be targeted from application-provided code.

\textbf{Valid Usage (Implicit)}

• \texttt{VUID-VkPhysicalDeviceShaderIntegerDotProductProperties-sType-sType} \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_INTEGER_DOT_PRODUCT_PROPERTIES}

The \texttt{VkPhysicalDeviceImageProcessingPropertiesQCOM} structure is defined as:

```c
// Provided by VK_QCOM_image_processing
typedef struct VkPhysicalDeviceImageProcessingPropertiesQCOM {
    VkStructureType     sType;
    void*                pNext;
    uint32_t             maxWeightFilterPhases;
    VkExtent2D           maxWeightFilterDimension;
    VkExtent2D           maxBlockMatchRegion;
    VkExtent2D           maxBoxFilterBlockSize;
} VkPhysicalDeviceImageProcessingPropertiesQCOM;
```
• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is `NULL` or a pointer to a structure extending this structure.

• **maxWeightFilterPhases** is the maximum value that can be specified for `VkImageViewSampleWeightCreateInfoQCOM::numPhases` in weight image sampling operations.

• **maxWeightFilterDimension** is a `VkExtent2D` describing the largest dimensions (width and height) that can be specified for `VkImageViewSampleWeightCreateInfoQCOM::filterSize`.

• **maxBlockMatchRegion** is a `VkExtent2D` describing the largest dimensions (width and height) that can be specified for `blockSize` in block matching operations.

• **maxBoxFilterBlockSize** is a `VkExtent2D` describing the maximum dimensions (width and height) that can be specified for `blockSize` in box filter sampling operations.

If the `VkPhysicalDeviceImageProcessingPropertiesQCOM` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These are properties of the image processing information of a physical device.

---

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceImageProcessingPropertiesQCOM-sType-sType
  - **sType** must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_PROCESSING_PROPERTIES_QCOM`
**VkPhysicalDeviceProperties2** structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These are properties of the tile image information of a physical device.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceShaderTileImagePropertiesEXT-sType-sType
  
  **sType must be** `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_TILE_IMAGE_PROPERTIES_EXT`

The **VkPhysicalDeviceImageProcessing2PropertiesQCOM** structure is defined as:

```c
// Provided by VK_QCOM_image_processing2
typedef struct VkPhysicalDeviceImageProcessing2PropertiesQCOM {
    VkStructureType   sType;
    void*             pNext;
    VkExtent2D        maxBlockMatchWindow;
} VkPhysicalDeviceImageProcessing2PropertiesQCOM;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **maxBlockMatchWindow** is a **VkExtent2D** describing the largest dimensions (width and height) that can be specified for the block match window.

If the **VkPhysicalDeviceImageProcessing2PropertiesQCOM** structure is included in the **pNext** chain of the **VkPhysicalDeviceProperties2** structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These are properties of the image processing2 information of a physical device.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceImageProcessing2PropertiesQCOM-sType-sType
  
  **sType must be** `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_PROCESSING_2_PROPERTIES_QCOM`

The **VkPhysicalDeviceLayeredDriverPropertiesMSFT** structure is defined as:

```c
// Provided by VK_MSFT_layered_driver
typedef struct VkPhysicalDeviceLayeredDriverPropertiesMSFT {
    VkStructureType   sType;
    void*             pNext;
    VkLayeredDriverUnderlyingApiMSFT underlyingAPI;
} VkPhysicalDeviceLayeredDriverPropertiesMSFT;
```

- **sType** is a **VkStructureType** value identifying this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.

• `underlyingAPI` is a `VkLayeredDriverUnderlyingApiMSFT` value indicating which underlying API is used to implement the layered driver, or `VK_LAYERED_DRIVER_UNDERLYING_API_NONE_MSFT` if the driver is not layered.

These are properties of the driver layering information of a physical device.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceLayeredDriverPropertiesMSFT-sType-sType
  
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LAYERED_DRIVER_PROPERTIES_MSFT`

Underlying APIs which **may** be returned in `VkPhysicalDeviceLayeredDriverPropertiesMSFT`::`underlyingAPI` are:

```c
// Provided by VK_MSFT_layered_driver
typedef enum VkLayeredDriverUnderlyingApiMSFT {
    VK_LAYERED_DRIVER_UNDERLYING_API_NONE_MSFT = 0,
    VK_LAYERED_DRIVER_UNDERLYING_API_D3D12_MSFT = 1,
} VkLayeredDriverUnderlyingApiMSFT;
```

The `VkPhysicalDeviceSchedulingControlsPropertiesARM` structure is defined as:

```c
// Provided by VK_ARM_scheduling_controls
typedef struct VkPhysicalDeviceSchedulingControlsPropertiesARM {
    VkStructureType   sType;
    void*             pNext;
    VkPhysicalDeviceSchedulingControlsFlagsARM schedulingControlsFlags;
} VkPhysicalDeviceSchedulingControlsPropertiesARM;
```

• `schedulingControlsFlags` specifies the specific scheduling controls that a physical device supports.

If the `VkPhysicalDeviceSchedulingControlsPropertiesARM` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSchedulingControlsPropertiesARM-sType-sType
  
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SCHEDULING_CONTROLS_PROPERTIES_ARM`

- VUID-VkPhysicalDeviceSchedulingControlsPropertiesARM-schedulingControlsFlags-parameter
  
  `schedulingControlsFlags` **must** be a valid combination of `VkPhysicalDeviceSchedulingControlsFlagBitsARM` values
Bits which can be set in `VkPhysicalDeviceSchedulingControlsPropertiesARM::schedulingControlsFlags`, specifying supported scheduling controls, are:

```c
// Provided by VK_ARM_scheduling_controls
// Flag bits for VkPhysicalDeviceSchedulingControlsFlagBitsARM
typedef VkFlags64 VkPhysicalDeviceSchedulingControlsFlagBitsARM;
static const VkPhysicalDeviceSchedulingControlsFlagBitsARM VK_PHYSICAL_DEVICE_SCHEDULING_CONTROLS_SHADER_CORE_COUNT_ARM = 0x00000001ULL;
```

- `VK_PHYSICAL_DEVICE_SCHEDULING_CONTROLS_SHADER_CORE_COUNT_ARM` indicates that a `VkDeviceQueueShaderCoreControlCreateInfoARM` structure may be included in the `pNext` chain of a `VkDeviceQueueCreateInfo` or `VkDeviceCreateInfo` structure.

`VkPhysicalDeviceSchedulingControlsFlagsARM` is a bitmask type for setting a mask of zero or more `VkPhysicalDeviceSchedulingControlsFlagBitsARM`.

To query properties of queues available on a physical device, call:

```c
// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceQueueFamilyProperties(    
    VkPhysicalDevice physicalDevice,    
    uint32_t* pQueueFamilyPropertyCount,    
    VkQueueFamilyProperties* pQueueFamilyProperties);
```

- `physicalDevice` is the handle to the physical device whose properties will be queried.
- `pQueueFamilyPropertyCount` is a pointer to an integer related to the number of queue families available or queried, as described below.
- `pQueueFamilyProperties` is either `NULL` or a pointer to an array of `VkQueueFamilyProperties` structures.

If `pQueueFamilyProperties` is `NULL`, then the number of queue families available is returned in `pQueueFamilyPropertyCount`. Implementations must support at least one queue family. Otherwise, `pQueueFamilyPropertyCount` must point to a variable set by the application to the number of elements in the `pQueueFamilyProperties` array, and on return the variable is overwritten with the number of structures actually written to `pQueueFamilyProperties`. If `pQueueFamilyPropertyCount` is less than the number of queue families available, at most `pQueueFamilyPropertyCount` structures will be written.
Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceQueueFamilyProperties-physicalDevice-parameter physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceQueueFamilyProperties-pQueueFamilyPropertyCount-parameter pQueueFamilyPropertyCount must be a valid pointer to a uint32_t value
- VUID-vkGetPhysicalDeviceQueueFamilyProperties-pQueueFamilyProperties-parameter If the value referenced by pQueueFamilyPropertyCount is not 0, and pQueueFamilyProperties is not NULL, pQueueFamilyProperties must be a valid pointer to an array of pQueueFamilyPropertyCount VkQueueFamilyProperties structures

The VkQueueFamilyProperties structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkQueueFamilyProperties {
    VkQueueFlags queueFlags;
    uint32_t queueCount;
    uint32_t timestampValidBits;
    VkExtent3D minImageTransferGranularity;
} VkQueueFamilyProperties;
```

- queueFlags is a bitmask of VkQueueFlagBits indicating capabilities of the queues in this queue family.
- queueCount is the unsigned integer count of queues in this queue family. Each queue family must support at least one queue.
- timestampValidBits is the unsigned integer count of meaningful bits in the timestamps written via vkCmdWriteTimestamp2 or vkCmdWriteTimestamp. The valid range for the count is 36 to 64 bits, or a value of 0, indicating no support for timestamps. Bits outside the valid range are guaranteed to be zeros.
- minImageTransferGranularity is the minimum granularity supported for image transfer operations on the queues in this queue family.

The value returned in minImageTransferGranularity has a unit of compressed texel blocks for images having a block-compressed format, and a unit of texels otherwise.

Possible values of minImageTransferGranularity are:

- (0,0,0) specifies that only whole mip levels must be transferred using the image transfer operations on the corresponding queues. In this case, the following restrictions apply to all offset and extent parameters of image transfer operations:
  - The x, y, and z members of a VkOffset3D parameter must always be zero.
  - The width, height, and depth members of a VkExtent3D parameter must always match the width, height, and depth of the image subresource corresponding to the parameter,
respectively.

- \( (A_x, A_y, A_z) \) where \( A_x, A_y, \) and \( A_z \) are all integer powers of two. In this case the following restrictions apply to all image transfer operations:

  - \( x, y, \) and \( z \) of a \texttt{VkOffset3D} parameter \textbf{must} be integer multiples of \( A_x, A_y, \) and \( A_z \), respectively.

  - \textit{width} of a \texttt{VkExtent3D} parameter \textbf{must} be an integer multiple of \( A_x \), or else \( x + \text{width} \) \textbf{must} equal the width of the image subresource corresponding to the parameter.

  - \textit{height} of a \texttt{VkExtent3D} parameter \textbf{must} be an integer multiple of \( A_y \), or else \( y + \text{height} \) \textbf{must} equal the height of the image subresource corresponding to the parameter.

  - \textit{depth} of a \texttt{VkExtent3D} parameter \textbf{must} be an integer multiple of \( A_z \), or else \( z + \text{depth} \) \textbf{must} equal the depth of the image subresource corresponding to the parameter.

  - If the format of the image corresponding to the parameters is one of the block-compressed formats then for the purposes of the above calculations the granularity \textbf{must} be scaled up by the compressed texel block dimensions.

Queues supporting graphics and/or compute operations \textbf{must} report \((1,1,1)\) in \texttt{minImageTransferGranularity}, meaning that there are no additional restrictions on the granularity of image transfer operations for these queues. Other queues supporting image transfer operations are only \textbf{required} to support whole mip level transfers, thus \texttt{minImageTransferGranularity} for queues belonging to such queue families \textbf{may} be \((0,0,0)\).

The \textbf{Device Memory} section describes memory properties queried from the physical device.

For physical device feature queries see the \textbf{Features} chapter.

Bits which \textbf{may} be set in \texttt{VkQueueFamilyProperties::queueFlags}, indicating capabilities of queues in a queue family are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkQueueFlagBits {
    VK_QUEUE_GRAPHICS_BIT = 0x00000001,
    VK_QUEUE_COMPUTE_BIT = 0x00000002,
    VK_QUEUE_TRANSFER_BIT = 0x00000004,
    VK_QUEUE_SPARSE_BINDING_BIT = 0x00000008,

    // Provided by VK_VERSION_1_1
    VK_QUEUE_PROTECTED_BIT = 0x00000010,
    // Provided by VK_KHR_video_decode_queue
    VK_QUEUE_VIDEO_DECODER_BIT_KHR = 0x00000020,
    // Provided by VK_KHR_video_encode_queue
    VK_QUEUE_VIDEO_ENCODER_BIT_KHR = 0x00000040,
    // Provided by VK_NV_optical_flow
    VK_QUEUE_OPTICAL_FLOW_BIT_NV = 0x00000100,
} VkQueueFlagBits;
```

- \texttt{VK_QUEUE_GRAPHICS_BIT} specifies that queues in this queue family support graphics operations.
- \texttt{VK_QUEUE_COMPUTE_BIT} specifies that queues in this queue family support compute operations.
• **VK_QUEUE_TRANSFER_BIT** specifies that queues in this queue family support transfer operations.

• **VK_QUEUE_SPARSE_BINDING_BIT** specifies that queues in this queue family support sparse memory management operations (see Sparse Resources). If any of the sparse resource features are enabled, then at least one queue family **must** support this bit.

• **VK_QUEUE_VIDEO_DECODE_BIT_KHR** specifies that queues in this queue family support video decode operations.

• **VK_QUEUE_VIDEO_ENCODE_BIT_KHR** specifies that queues in this queue family support video encode operations.

• **VK_QUEUE_VIDEO_OCTAL_FLOW_BIT_NV** specifies that queues in this queue family support optical flow operations.

• **VK_QUEUE_PROTECTED_BIT** specifies that queues in this queue family support the **VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT** bit. (see Protected Memory). If the physical device supports the protectedMemory feature, at least one of its queue families **must** support this bit.

If an implementation exposes any queue family that supports graphics operations, at least one queue family of at least one physical device exposed by the implementation **must** support both graphics and compute operations.

Furthermore, if the protectedMemory physical device feature is supported, then at least one queue family of at least one physical device exposed by the implementation **must** support graphics operations, compute operations, and protected memory operations.

**NOTE**

All commands that are allowed on a queue that supports transfer operations are also allowed on a queue that supports either graphics or compute operations. Thus, if the capabilities of a queue family include **VK_QUEUE_GRAPHICS_BIT** or **VK_QUEUE_COMPUTE_BIT**, then reporting the **VK_QUEUE_TRANSFER_BIT** capability separately for that queue family is **optional**.

For further details see Queues.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkQueueFlags;
```

**VkQueueFlags** is a bitmask type for setting a mask of zero or more **VkQueueFlagBits**.

To query properties of queues available on a physical device, call:

```c
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceQueueFamilyProperties2(
    VkPhysicalDevice physicalDevice,
    uint32_t* pQueueFamilyPropertyCount,
    VkQueueFamilyProperties2* pQueueFamilyProperties);
```

or the equivalent command
void vkGetPhysicalDeviceQueueFamilyProperties2KHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pQueueFamilyPropertyCount,
    VkQueueFamilyProperties2* pQueueFamilyProperties);

- **physicalDevice** is the handle to the physical device whose properties will be queried.
- **pQueueFamilyPropertyCount** is a pointer to an integer related to the number of queue families available or queried, as described in `vkGetPhysicalDeviceQueueFamilyProperties`.
- **pQueueFamilyProperties** is either `NULL` or a pointer to an array of `VkQueueFamilyProperties2` structures.

`vkGetPhysicalDeviceQueueFamilyProperties2` behaves similarly to `vkGetPhysicalDeviceQueueFamilyProperties`, with the ability to return extended information in a `pNext` chain of output structures.

### Valid Usage (Implicit)

- **VUID-vkGetPhysicalDeviceQueueFamilyProperties2-physicalDevice-parameter**
  - `physicalDevice` must be a valid `VkPhysicalDevice` handle
- **VUID-vkGetPhysicalDeviceQueueFamilyProperties2-pQueueFamilyPropertyCount-parameter**
  - `pQueueFamilyPropertyCount` must be a valid pointer to a `uint32_t` value
- **VUID-vkGetPhysicalDeviceQueueFamilyProperties2-pQueueFamilyProperties-parameter**
  - If the value referenced by `pQueueFamilyPropertyCount` is not 0, and `pQueueFamilyProperties` is not `NULL`, `pQueueFamilyProperties` must be a valid pointer to an array of `VkQueueFamilyProperties2` structures

The `VkQueueFamilyProperties2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkQueueFamilyProperties2 {
    VkStructureType sType;
    void* pNext;
    VkQueueFamilyProperties queueFamilyProperties;
} VkQueueFamilyProperties2;
```

or the equivalent

```c
// Provided by VK_KHR_get_physical_device_properties2
typedef VkQueueFamilyProperties2 VkQueueFamilyProperties2KHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.

• queueFamilyProperties is a VkQueueFamilyProperties structure which is populated with the same values as in vkGetPhysicalDeviceQueueFamilyProperties.

### Valid Usage (Implicit)

- VUID-VkQueueFamilyProperties2-sType-sType
  sType must be VK_STRUCTURE_TYPE_QUEUE_FAMILY_PROPERTIES_2

- VUID-VkQueueFamilyProperties2-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkQueueFamilyCheckpointProperties2NV, VkQueueFamilyCheckpointPropertiesNV, VkQueueFamilyGlobalPriorityPropertiesKHR, VkQueueFamilyQueryResultStatusPropertiesKHR, or VkQueueFamilyVideoPropertiesKHR

- VUID-VkQueueFamilyProperties2-sType-unique
  The sType value of each struct in the pNext chain must be unique

The VkQueueFamilyGlobalPriorityPropertiesKHR structure is defined as:

```c
// Provided by VK_KHR_global_priority
typedef struct VkQueueFamilyGlobalPriorityPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    uint32_t priorityCount;
    VkQueueGlobalPriorityKHR priorities[VK_MAX_GLOBAL_PRIORITY_SIZE_KHR];
} VkQueueFamilyGlobalPriorityPropertiesKHR;
```

or the equivalent

```c
// Provided by VK_EXT_global_priority_query
typedef VkQueueFamilyGlobalPriorityPropertiesKHR
VkQueueFamilyGlobalPriorityPropertiesEXT;
```

- sType is a VkStructureType value identifying this structure.

- pNext is NULL or a pointer to a structure extending this structure.

- priorityCount is the number of supported global queue priorities in this queue family, and it must be greater than 0.

- priorities is an array of VK_MAX_GLOBAL_PRIORITY_SIZE_KHR VkQueueGlobalPriorityKHR enums representing all supported global queue priorities in this queue family. The first priorityCount elements of the array will be valid.

If the VkQueueFamilyGlobalPriorityPropertiesKHR structure is included in the pNext chain of the VkQueueFamilyProperties2 structure passed to vkGetPhysicalDeviceQueueFamilyProperties2, it is filled in with the list of supported global queue priorities for the indicated family.
The valid elements of priorities must not contain any duplicate values.

The valid elements of priorities must be a continuous sequence of VkQueueGlobalPriorityKHR enums in the ascending order.

NOTE

For example, returning priorityCount as 3 with supported priorities as VK_QUEUE_GLOBAL_PRIORITY_LOW_KHR, VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR and VK_QUEUE_GLOBAL_PRIORITY_REALTIME_KHR is not allowed.

Valid Usage (Implicit)

• VUID-VkQueueFamilyGlobalPriorityPropertiesKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_QUEUE_FAMILY_GLOBAL_PRIORITY_PROPERTIES_KHR

VK_MAX_GLOBAL_PRIORITY_SIZE_KHR is the length of an array of VkQueueGlobalPriorityKHR enumerants representing supported queue priorities, as returned in VkQueueFamilyGlobalPriorityPropertiesKHR::priorities.

#define VK_MAX_GLOBAL_PRIORITY_SIZE_KHR   16U

or the equivalent

#define VK_MAX_GLOBAL_PRIORITY_SIZE_EXT   VK_MAX_GLOBAL_PRIORITY_SIZE_KHR

The VkQueueFamilyCheckpointProperties2NV structure is defined as:

```c
typedef struct VkQueueFamilyCheckpointProperties2NV {
    VkStructureType       sType;
    void*                  pNext;
    VkPipelineStageFlags2  checkpointExecutionStageMask;
} VkQueueFamilyCheckpointProperties2NV;
```

• sType is a VkStructureType value identifying this structure.

• pNext is NULL or a pointer to a structure extending this structure.

• checkpointExecutionStageMask is a mask indicating which pipeline stages the implementation can execute checkpoint markers in.

Additional queue family information can be queried by setting VkQueueFamilyProperties2::pNext to point to a VkQueueFamilyCheckpointProperties2NV structure.

Valid Usage (Implicit)

• VUID-VkQueueFamilyCheckpointProperties2NV-sType-sType
The **VkQueueFamilyCheckpointPropertiesNV** structure is defined as:

```c
// Provided by VK_NV_device_diagnostic_checkpoints
typedef struct VkQueueFamilyCheckpointPropertiesNV {
    VkStructureType sType;
    void* pNext;
    VkPipelineStageFlags checkpointExecutionStageMask;
} VkQueueFamilyCheckpointPropertiesNV;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **checkpointExecutionStageMask** is a mask indicating which pipeline stages the implementation can execute checkpoint markers in.

Additional queue family information can be queried by setting **VkQueueFamilyProperties2::pNext** to point to a **VkQueueFamilyCheckpointPropertiesNV** structure.

**Valid Usage (Implicit)**

- **VUID-VkQueueFamilyCheckpointPropertiesNV-sType-sType**
  - **sType** must be **VK_STRUCTURE_TYPE_QUEUE_FAMILY_CHECKPOINT_PROPERTIES_2_NV**

The **VkQueueFamilyVideoPropertiesKHR** structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkQueueFamilyVideoPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    VkVideoCodecOperationFlagsKHR videoCodecOperations;
} VkQueueFamilyVideoPropertiesKHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **videoCodecOperations** is a bitmask of **VkVideoCodecOperationFlagBitsKHR** that indicates the set of video codec operations supported by the queue family.

If this structure is included in the **pNext** chain of the **VkQueueFamilyProperties2** structure passed to **vkGetPhysicalDeviceQueueFamilyProperties2**), then it is filled with the set of video codec operations supported by the specified queue family.
The `VkQueueFamilyQueryResultStatusPropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkQueueFamilyQueryResultStatusPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 queryResultStatusSupport;
} VkQueueFamilyQueryResultStatusPropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `queryResultStatusSupport` reports `VK_TRUE` if query type `VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR` and use of `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR` are supported.

If this structure is included in the `pNext` chain of the `VkQueueFamilyProperties2` structure passed to `vkGetPhysicalDeviceQueueFamilyProperties2`, then it is filled with information about whether result status queries are supported by the specified queue family.

To enumerate the performance query counters available on a queue family of a physical device, call:

```c
// Provided by VK_KHR_performance_query
VkResult vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR(
    VkPhysicalDevice physicalDevice, uint32_t queueFamilyIndex,
    uint32_t* pCounterCount, VkPerformanceCounterKHR* pCounters,
    VkPerformanceCounterDescriptionKHR* pCounterDescriptions);
```

- `physicalDevice` is the handle to the physical device whose queue family performance query counter properties will be queried.
- `queueFamilyIndex` is the index into the queue family of the physical device we want to get properties for.
• **pCounterCount** is a pointer to an integer related to the number of counters available or queried, as described below.

• **pCounters** is either **NULL** or a pointer to an array of **VkPerformanceCounterKHR** structures.

• **pCounterDescriptions** is either **NULL** or a pointer to an array of **VkPerformanceCounterDescriptionKHR** structures.

If **pCounters** is **NULL** and **pCounterDescriptions** is **NULL**, then the number of counters available is returned in **pCounterCount**. Otherwise, **pCounterCount** must point to a variable set by the application to the number of elements in the **pCounters**, **pCounterDescriptions**, or both arrays and on return the variable is overwritten with the number of structures actually written out. If **pCounterCount** is less than the number of counters available, at most **pCounterCount** structures will be written, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available counters were returned.

---

**Valid Usage (Implicit)**

- VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR-physicalDevice-parameter
  - **physicalDevice** must be a valid **VkPhysicalDevice** handle

- VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR-pCounterCount-parameter
  - **pCounterCount** must be a valid pointer to a **uint32_t** value

- VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR-pCounters-parameter
  - If the value referenced by **pCounterCount** is not 0, and **pCounters** is not **NULL**, **pCounters** must be a valid pointer to an array of **pCounterCount** **VkPerformanceCounterKHR** structures

- VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR-pCounterDescriptions-parameter
  - If the value referenced by **pCounterCount** is not 0, and **pCounterDescriptions** is not **NULL**, **pCounterDescriptions** must be a valid pointer to an array of **pCounterCount** **VkPerformanceCounterDescriptionKHR** structures

---

**Return Codes**

**Success**
- **VK_SUCCESS**
- **VK_INCOMPLETE**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_INITIALIZATION_FAILED**
The `VkPerformanceCounterKHR` structure is defined as:

```c
// Provided by VK_KHR_performance_query
typedef struct VkPerformanceCounterKHR {
    VkStructureType sType;
    void* pNext;
    VkPerformanceCounterUnitKHR unit;
    VkPerformanceCounterScopeKHR scope;
    VkPerformanceCounterStorageKHR storage;
    uint8_t uuid[VK_UUID_SIZE];
} VkPerformanceCounterKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `unit` is a `VkPerformanceCounterUnitKHR` specifying the unit that the counter data will record.
- `scope` is a `VkPerformanceCounterScopeKHR` specifying the scope that the counter belongs to.
- `storage` is a `VkPerformanceCounterStorageKHR` specifying the storage type that the counter’s data uses.
- `uuid` is an array of size `VK_UUID_SIZE`, containing 8-bit values that represent a universally unique identifier for the counter of the physical device.

### Valid Usage (Implicit)

- `VUID-VkPerformanceCounterKHR-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_PERFORMANCE_COUNTER_KHR`
- `VUID-VkPerformanceCounterKHR-pNext-pNext`  
  `pNext` must be `NULL`

Performance counters have an associated unit. This unit describes how to interpret the performance counter result.

The performance counter unit types which **may** be returned in `VkPerformanceCounterKHR::unit` are:
// Provided by VK_KHR_performance_query
typedef enum VkPerformanceCounterUnitKHR {
    VK_PERFORMANCE_COUNTER_UNIT_GENERIC_KHR = 0,
    VK_PERFORMANCE_COUNTER_UNIT_PERCENTAGE_KHR = 1,
    VK_PERFORMANCE_COUNTER_UNIT_NANOSECONDS_KHR = 2,
    VK_PERFORMANCE_COUNTER_UNIT_BYTES_KHR = 3,
    VK_PERFORMANCE_COUNTER_UNIT_BYTES_PER_SECOND_KHR = 4,
    VK_PERFORMANCE_COUNTER_UNIT_KELVIN_KHR = 5,
    VK_PERFORMANCE_COUNTER_UNIT_WATTS_KHR = 6,
    VK_PERFORMANCE_COUNTER_UNIT_VOLTS_KHR = 7,
    VK_PERFORMANCE_COUNTER_UNIT_AMPS_KHR = 8,
    VK_PERFORMANCE_COUNTER_UNIT_HERTZ_KHR = 9,
    VK_PERFORMANCE_COUNTER_UNIT_CYCLES_KHR = 10,
} VkPerformanceCounterUnitKHR;

• VK_PERFORMANCE_COUNTER_UNIT_GENERIC_KHR - the performance counter unit is a generic data point.
• VK_PERFORMANCE_COUNTER_UNIT_PERCENTAGE_KHR - the performance counter unit is a percentage (%).
• VK_PERFORMANCE_COUNTER_UNIT_NANOSECONDS_KHR - the performance counter unit is a value of nanoseconds (ns).
• VK_PERFORMANCE_COUNTER_UNIT_BYTES_KHR - the performance counter unit is a value of bytes.
• VK_PERFORMANCE_COUNTER_UNIT_BYTES_PER_SECOND_KHR - the performance counter unit is a value of bytes/s.
• VK_PERFORMANCE_COUNTER_UNIT_KELVIN_KHR - the performance counter unit is a temperature reported in Kelvin.
• VK_PERFORMANCE_COUNTER_UNIT_WATTS_KHR - the performance counter unit is a value of watts (W).
• VK_PERFORMANCE_COUNTER_UNIT_VOLTS_KHR - the performance counter unit is a value of volts (V).
• VK_PERFORMANCE_COUNTER_UNIT_AMPS_KHR - the performance counter unit is a value of amps (A).
• VK_PERFORMANCE_COUNTER_UNIT_HERTZ_KHR - the performance counter unit is a value of hertz (Hz).
• VK_PERFORMANCE_COUNTER_UNIT_CYCLES_KHR - the performance counter unit is a value of cycles.

Performance counters have an associated scope. This scope describes the granularity of a performance counter.

The performance counter scope types which may be returned in VkPerformanceCounterKHR::scope are:
typedef enum VkPerformanceCounterScopeKHR {
    VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR = 0,
    VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR = 1,
    VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_KHR = 2,
}

VkPerformanceCounterScopeKHR;

• **VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR** - the performance counter scope is a single complete command buffer.

• **VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR** - the performance counter scope is zero or more complete render passes. The performance query containing the performance counter **must** begin and end outside a render pass instance.

• **VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_KHR** - the performance counter scope is zero or more commands.

Performance counters have an associated storage. This storage describes the payload of a counter result.

The performance counter storage types which **may** be returned in `VkPerformanceCounterKHR::storage` are:

typedef enum VkPerformanceCounterStorageKHR {
    VK_PERFORMANCE_COUNTER_STORAGE_INT32_KHR = 0,
    VK_PERFORMANCE_COUNTER_STORAGE_INT64_KHR = 1,
    VK_PERFORMANCE_COUNTER_STORAGE_UINT32_KHR = 2,
    VK_PERFORMANCE_COUNTER_STORAGE_UINT64_KHR = 3,
    VK_PERFORMANCE_COUNTER_STORAGE_FLOAT32_KHR = 4,
    VK_PERFORMANCE_COUNTER_STORAGE_FLOAT64_KHR = 5,
}

VkPerformanceCounterStorageKHR;

• **VK_PERFORMANCE_COUNTER_STORAGE_INT32_KHR** - the performance counter storage is a 32-bit signed integer.

• **VK_PERFORMANCE_COUNTER_STORAGE_INT64_KHR** - the performance counter storage is a 64-bit signed integer.

• **VK_PERFORMANCE_COUNTER_STORAGE_UINT32_KHR** - the performance counter storage is a 32-bit unsigned integer.

• **VK_PERFORMANCE_COUNTER_STORAGE_UINT64_KHR** - the performance counter storage is a 64-bit unsigned integer.
VK_PERFORMANCE_COUNTER_STORAGE_FLOAT32_KHR - the performance counter storage is a 32-bit floating-point.

VK_PERFORMANCE_COUNTER_STORAGE_FLOAT64_KHR - the performance counter storage is a 64-bit floating-point.

The VkPerformanceCounterDescriptionKHR structure is defined as:

```c
// Provided by VK_KHR_performance_query
typedef struct VkPerformanceCounterDescriptionKHR {
    VkStructureType sType;
    void* pNext;
    VkPerformanceCounterDescriptionFlagsKHR flags;
    char name[VK_MAX_DESCRIPTION_SIZE];
    char category[VK_MAX_DESCRIPTION_SIZE];
    char description[VK_MAX_DESCRIPTION_SIZE];
} VkPerformanceCounterDescriptionKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkPerformanceCounterDescriptionFlagBitsKHR indicating the usage behavior for the counter.
- `name` is an array of size VK_MAX_DESCRIPTION_SIZE, containing a null-terminated UTF-8 string specifying the name of the counter.
- `category` is an array of size VK_MAX_DESCRIPTION_SIZE, containing a null-terminated UTF-8 string specifying the category of the counter.
- `description` is an array of size VK_MAX_DESCRIPTION_SIZE, containing a null-terminated UTF-8 string specifying the description of the counter.

Valid Usage (Implicit)

- VUID-VkPerformanceCounterDescriptionKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_PERFORMANCE_COUNTER_DESCRIPTION_KHR

- VUID-VkPerformanceCounterDescriptionKHR-pNext-pNext
  pNext must be NULL

Bits which can be set in VkPerformanceCounterDescriptionKHR::flags, specifying usage behavior of a performance counter, are:
• **VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_BIT_KHR** specifies that recording the counter *may* have a noticeable performance impact.

• **VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_BIT_KHR** specifies that concurrently recording the counter while other submitted command buffers are running *may* impact the accuracy of the recording.

---

**5.2. Devices**

Device objects represent logical connections to physical devices. Each device exposes a number of queue families each having one or more queues. All queues in a queue family support the same operations.

As described in Physical Devices, a Vulkan application will first query for all physical devices in a system. Each physical device *can* then be queried for its capabilities, including its queue and queue family properties. Once an acceptable physical device is identified, an application will create a corresponding logical device. The created logical device is then the primary interface to the physical device.

How to enumerate the physical devices in a system and query those physical devices for their queue family properties is described in the Physical Device Enumeration section above.

A single logical device *can* be created from multiple physical devices, if those physical devices belong to the same device group. A device group is a set of physical devices that support accessing each other’s memory and recording a single command buffer that *can* be executed on all the physical devices. Device groups are enumerated by calling `vkEnumeratePhysicalDeviceGroups`, and a logical device is created from a subset of the physical devices in a device group by passing the physical devices through `VkDeviceGroupDeviceCreateInfo`. For two physical devices to be in the
same device group, they must support identical extensions, features, and properties.

Note

Physical devices in the same device group must be so similar because there are no rules for how different features/properties would interact. They must return the same values for nearly every invariant `vkGetPhysicalDevice*` feature, property, capability, etc., but could potentially differ for certain queries based on things like having a different display connected, or a different compositor. The specification does not attempt to enumerate which state is in each category, because such a list would quickly become out of date.

To retrieve a list of the device groups present in the system, call:

```c
// Provided by VK_VERSION_1_1
VkResult vkEnumeratePhysicalDeviceGroups(
    VkInstance instance,
    uint32_t* pPhysicalDeviceGroupCount,
    VkPhysicalDeviceGroupProperties* pPhysicalDeviceGroupProperties);
```

or the equivalent command

```c
// Provided by VK_KHR_device_group_creation
VkResult vkEnumeratePhysicalDeviceGroupsKHR(
    VkInstance instance,
    uint32_t* pPhysicalDeviceGroupCount,
    VkPhysicalDeviceGroupProperties* pPhysicalDeviceGroupProperties);
```

- `instance` is a handle to a Vulkan instance previously created with `vkCreateInstance`.
- `pPhysicalDeviceGroupCount` is a pointer to an integer related to the number of device groups available or queried, as described below.
- `pPhysicalDeviceGroupProperties` is either `NULL` or a pointer to an array of `VkPhysicalDeviceGroupProperties` structures.

If `pPhysicalDeviceGroupProperties` is `NULL`, then the number of device groups available is returned in `pPhysicalDeviceGroupCount`. Otherwise, `pPhysicalDeviceGroupCount` must point to a variable set by the application to the number of elements in the `pPhysicalDeviceGroupProperties` array, and on return the variable is overwritten with the number of structures actually written to `pPhysicalDeviceGroupProperties`. If `pPhysicalDeviceGroupCount` is less than the number of device groups available, at most `pPhysicalDeviceGroupCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available device groups were returned.

Every physical device must be in exactly one device group.

Valid Usage (Implicit)

- `VUID-vkEnumeratePhysicalDeviceGroups-instance-parameter`
instance must be a valid VkInstance handle

- VUID-vkEnumeratePhysicalDeviceGroups-pPhysicalDeviceGroupCount-parameter
  pPhysicalDeviceGroupCount must be a valid pointer to a uint32_t value

- VUID-vkEnumeratePhysicalDeviceGroups-pPhysicalDeviceGroupProperties-parameter
  If the value referenced by pPhysicalDeviceGroupCount is not 0, and
  pPhysicalDeviceGroupProperties is not NULL, pPhysicalDeviceGroupProperties must be a
  valid pointer to an array of pPhysicalDeviceGroupCount VkPhysicalDeviceGroupProperties
  structures

Return Codes

Success

- VK_SUCCESS
- VK_INCOMPLETE

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INITIALIZATION_FAILED

The VkPhysicalDeviceGroupProperties structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceGroupProperties {
    VkStructureType sType;
    void* pNext;
    uint32_t physicalDeviceCount;
    VkPhysicalDevice physicalDevices[VK_MAX_DEVICE_GROUP_SIZE];
    VkBool32 subsetAllocation;
} VkPhysicalDeviceGroupProperties;
```

or the equivalent

```c
// Provided by VK_KHR_device_group_creation
typedef VkPhysicalDeviceGroupProperties VkPhysicalDeviceGroupPropertiesKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- physicalDeviceCount is the number of physical devices in the group.
- physicalDevices is an array of VK_MAX_DEVICE_GROUP_SIZE VkPhysicalDevice handles representing
  all physical devices in the group. The first physicalDeviceCount elements of the array will be
  valid.
subsetAllocation specifies whether logical devices created from the group support allocating device memory on a subset of devices, via the deviceMask member of the VkMemoryAllocateFlagsInfo. If this is VK_FALSE, then all device memory allocations are made across all physical devices in the group. If physicalDeviceCount is 1, then subsetAllocation must be VK_FALSE.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceGroupProperties-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_GROUP_PROPERTIES
- VUID-VkPhysicalDeviceGroupProperties-pNext-pNext
  pNext must be NULL

VK_MAX_DEVICE_GROUP_SIZE is the length of an array containing VkPhysicalDevice handle values representing all physical devices in a group, as returned in VkPhysicalDeviceGroupProperties::physicalDevices.

#define VK_MAX_DEVICE_GROUP_SIZE 32U

or the equivalent

#define VK_MAX_DEVICE_GROUP_SIZE_KHR VK_MAX_DEVICE_GROUP_SIZE

5.2.1. Device Creation

Logical devices are represented by VkDevice handles:

// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkDevice)

A logical device is created as a connection to a physical device. To create a logical device, call:

// Provided by VK_VERSION_1_0
VkResult vkCreateDevice(
    VkPhysicalDevice physicalDevice,
    const VkDeviceCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkDevice* pDevice);

- physicalDevice must be one of the device handles returned from a call to vkEnumeratePhysicalDevices (see Physical Device Enumeration).
- pCreateInfo is a pointer to a VkDeviceCreateInfo structure containing information about how to create the device.
pAllocator controls host memory allocation as described in the Memory Allocation chapter.

pDevice is a pointer to a handle in which the created VkDevice is returned.

vkCreateDevice verifies that extensions and features requested in the ppEnabledExtensionNames and pEnabledFeatures members of pCreateInfo, respectively, are supported by the implementation. If any requested extension is not supported, vkCreateDevice must return VK_ERROR_EXTENSION_NOT_PRESENT. If any requested feature is not supported, vkCreateDevice must return VK_ERROR_FEATURE_NOT_PRESENT. Support for extensions can be checked before creating a device by querying vkEnumerateDeviceExtensionProperties. Support for features can similarly be checked by querying vkGetPhysicalDeviceFeatures.

After verifying and enabling the extensions the VkDevice object is created and returned to the application.

Multiple logical devices can be created from the same physical device. Logical device creation may fail due to lack of device-specific resources (in addition to other errors). If that occurs, vkCreateDevice will return VK_ERROR_TOO_MANY_OBJECTS.

### Valid Usage

- VUID-vkCreateDevice-ppEnabledExtensionNames-01387
  All required device extensions for each extension in the VkDeviceCreateInfo::ppEnabledExtensionNames list must also be present in that list

### Valid Usage (Implicit)

- VUID-vkCreateDevice-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

- VUID-vkCreateDevice-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkDeviceCreateInfo structure

- VUID-vkCreateDevice-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateDevice-pDevice-parameter
  pDevice must be a valid pointer to a VkDevice handle

### Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
The VkDeviceCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDeviceCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkDeviceCreateFlags flags;
    uint32_t queueCreateInfoCount;
    const VkDeviceQueueCreateInfo* pQueueCreateInfos;
    // enabledLayerCount is deprecated and should not be used
    uint32_t enabledLayerCount;
    // ppEnabledLayerNames is deprecated and should not be used
    const char* const* ppEnabledLayerNames;
    uint32_t enabledExtensionCount;
    const char* const* ppEnabledExtensionNames;
    const VkPhysicalDeviceFeatures* pEnabledFeatures;
} VkDeviceCreateInfo;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `queueCreateInfoCount` is the unsigned integer size of the `pQueueCreateInfos` array. Refer to the Queue Creation section below for further details.
- `pQueueCreateInfos` is a pointer to an array of VkDeviceQueueCreateInfo structures describing the queues that are requested to be created along with the logical device. Refer to the Queue Creation section below for further details.
- `enabledLayerCount` is deprecated and ignored.
- `ppEnabledLayerNames` is deprecated and ignored. See Device Layer Deprecation.
- `enabledExtensionCount` is the number of device extensions to enable.
- `ppEnabledExtensionNames` is a pointer to an array of `enabledExtensionCount` null-terminated UTF-8 strings containing the names of extensions to enable for the created device. See the Extensions section for further details.
- `pEnabledFeatures` is NULL or a pointer to a VkPhysicalDeviceFeatures structure containing boolean indicators of all the features to be enabled. Refer to the Features section for further details.
Valid Usage

- **VUID-VkDeviceCreateInfo-queueFamilyIndex-02802**
  The `queueFamilyIndex` member of each element of `pQueueCreateInfos` must be unique within `pQueueCreateInfos`, except that two members can share the same `queueFamilyIndex` if one describes protected-capable queues and one describes queues that are not protected-capable.

- **VUID-VkDeviceCreateInfo-pQueueCreateInfos-06755**
  If multiple elements of `pQueueCreateInfos` share the same `queueFamilyIndex`, the sum of their `queueCount` members must be less than or equal to the `queueCount` member of the `VkQueueFamilyProperties` structure, as returned by `vkGetPhysicalDeviceQueueFamilyProperties` in the `pQueueFamilyProperties[queueFamilyIndex]`.

- **VUID-VkDeviceCreateInfo-pQueueCreateInfos-06654**
  If multiple elements of `pQueueCreateInfos` share the same `queueFamilyIndex`, then all of such elements must have the same global priority level, which can be specified explicitly by the including a `VkDeviceQueueGlobalPriorityCreateInfoKHR` structure in the `pNext` chain, or by the implicit default value.

- **VUID-VkDeviceCreateInfo-pNext-00373**
  If the `pNext` chain includes a `VkPhysicalDeviceFeatures2` structure, then `pEnabledFeatures` must be `NULL`.

- **VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-01840**
  If `VkPhysicalDeviceProperties::apiVersion` advertises Vulkan 1.1 or later, `ppEnabledExtensionNames` must not contain `VK_AMD_negative_viewport_height`.

- **VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-00374**
  `ppEnabledExtensionNames` must not contain both `VK_KHR_maintenance1` and `VK_AMD_negative_viewport_height`.

- **VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-03328**
  `ppEnabledExtensionNames` must not contain both `VK_KHR_buffer_device_address` and `VK_EXT_buffer_device_address`.

- **VUID-VkDeviceCreateInfo-pNext-04748**
  If the `pNext` chain includes a `VkPhysicalDeviceVulkan12Features` structure and `VkPhysicalDeviceVulkan12Features::bufferDeviceAddress` is `VK_TRUE`, `ppEnabledExtensionNames` must not contain `VK_EXT_buffer_device_address`.

- **VUID-VkDeviceCreateInfo-pNext-02829**
  If the `pNext` chain includes a `VkPhysicalDeviceVulkan11Features` structure and it must not include a `VkPhysicalDevice16BitStorageFeatures`, `VkPhysicalDeviceMultiviewFeatures`, `VkPhysicalDeviceVariablePointersFeatures`, `VkPhysicalDeviceProtectedMemoryFeatures`, `VkPhysicalDeviceSamplerYcbcrConversionFeatures`, or `VkPhysicalDeviceShaderDrawParametersFeatures` structure.

- **VUID-VkDeviceCreateInfo-pNext-02830**
  If the `pNext` chain includes a `VkPhysicalDeviceVulkan12Features` structure, then it must not include a `VkPhysicalDevice8BitStorageFeatures` structure.
VkPhysicalDeviceShaderAtomicInt64Features,
VkPhysicalDeviceShaderFloat16Int8Features,
VkPhysicalDeviceDescriptorIndexingFeatures,
VkPhysicalDeviceScalarBlockLayoutFeatures,
VkPhysicalDeviceImagelessFramebufferFeatures,
VkPhysicalDeviceUniformBufferStandardLayoutFeatures,
VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures,
VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures,
VkPhysicalDeviceHostQueryResetFeatures,
VkPhysicalDeviceTimelineSemaphoreFeatures,
VkPhysicalDeviceBufferDeviceAddressFeatures, or
VkPhysicalDeviceVulkanMemoryModelFeatures structure

- **VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-04476**
  If `ppEnabledExtensionNames` contains "VK_KHR_shader_draw_parameters" and the `pNext` chain includes a `VkPhysicalDeviceVulkan11Features` structure, then `VkPhysicalDeviceVulkan11Features::shaderDrawParameters` must be VK_TRUE.

- **VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-02831**
  If `ppEnabledExtensionNames` contains "VK_KHR_draw_indirect_count" and the `pNext` chain includes a `VkPhysicalDeviceVulkan12Features` structure, then `VkPhysicalDeviceVulkan12Features::drawIndirectCount` must be VK_TRUE.

- **VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-02832**
  If `ppEnabledExtensionNames` contains "VK_KHR_sampler_mirror_clamp_to_edge" and the `pNext` chain includes a `VkPhysicalDeviceVulkan12Features` structure, then `VkPhysicalDeviceVulkan12Features::samplerMirrorClampToEdge` must be VK_TRUE.

- **VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-02833**
  If `ppEnabledExtensionNames` contains "VK_EXT_descriptor_indexing" and the `pNext` chain includes a `VkPhysicalDeviceVulkan12Features` structure, then `VkPhysicalDeviceVulkan12Features::descriptorIndexing` must be VK_TRUE.

- **VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-02834**
  If `ppEnabledExtensionNames` contains "VK_EXT_sampler_filter_minmax" and the `pNext` chain includes a `VkPhysicalDeviceVulkan12Features` structure, then `VkPhysicalDeviceVulkan12Features::samplerFilterMinmax` must be VK_TRUE.

- **VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-02835**
  If `ppEnabledExtensionNames` contains "VK_EXT_shader_viewport_index_layer" and the `pNext` chain includes a `VkPhysicalDeviceVulkan12Features` structure, then `VkPhysicalDeviceVulkan12Features::shaderOutputViewportIndex` and `VkPhysicalDeviceVulkan12Features::shaderOutputLayer` must both be VK_TRUE.

- **VUID-VkDeviceCreateInfo-pNext-06532**
  If the `pNext` chain includes a `VkPhysicalDeviceVulkan13Features` structure, then it must not include a `VkPhysicalDeviceDynamicRenderingFeatures`, `VkPhysicalDeviceImageRobustnessFeatures`, `VkPhysicalDeviceInlineUniformBlockFeatures`, `VkPhysicalDeviceMaintenance4Features`, `VkPhysicalDevicePipelineCreationCacheControlFeatures`, `VkPhysicalDevicePrivateDataFeatures`, `VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures`, ...
VkPhysicalDeviceShaderIntegerDotProductFeatures, VkPhysicalDeviceShaderTerminateInvocationFeatures, VkPhysicalDeviceSubgroupSizeControlFeatures, VkPhysicalDeviceSynchronization2Features, VkPhysicalDeviceTextureCompressionASTCHDRFeatures, or VkPhysicalDeviceZeroInitializeWorkgroupMemoryFeatures structure

- VUID-VkDeviceCreateInfo-pProperties-04451
  If the VK_KHR_portability_subset extension is included in pProperties of vkEnumerateDeviceExtensionProperties, ppEnabledExtensionNames must include "VK_KHR_portability_subset"

- VUID-VkDeviceCreateInfo-shadingRateImage-04478
  If the shadingRateImage feature is enabled, the pipelineFragmentShadingRate feature must not be enabled

- VUID-VkDeviceCreateInfo-shadingRateImage-04479
  If the shadingRateImage feature is enabled, the primitiveFragmentShadingRate feature must not be enabled

- VUID-VkDeviceCreateInfo-shadingRateImage-04480
  If the shadingRateImage feature is enabled, the attachmentFragmentShadingRate feature must not be enabled

- VUID-VkDeviceCreateInfo-fragmentDensityMap-04481
  If the fragmentDensityMap feature is enabled, the pipelineFragmentShadingRate feature must not be enabled

- VUID-VkDeviceCreateInfo-fragmentDensityMap-04482
  If the fragmentDensityMap feature is enabled, the primitiveFragmentShadingRate feature must not be enabled

- VUID-VkDeviceCreateInfo-fragmentDensityMap-04483
  If the fragmentDensityMap feature is enabled, the attachmentFragmentShadingRate feature must not be enabled

- VUID-VkDeviceCreateInfo-None-04896
  If sparseImageInt64Atomics is enabled, shaderImageInt64Atomics must be enabled

- VUID-VkDeviceCreateInfo-None-04897
  If sparseImageFloat32Atomics is enabled, shaderImageFloat32Atomics must be enabled

- VUID-VkDeviceCreateInfo-None-04898
  If sparseImageFloat32AtomicAdd is enabled, shaderImageFloat32AtomicAdd must be enabled

- VUID-VkDeviceCreateInfo-sparseImageFloat32AtomicMinMax-04975
  If sparseImageFloat32AtomicMinMax is enabled, shaderImageFloat32AtomicMinMax must be enabled

- VUID-VkDeviceCreateInfo-None-08095
  If descriptorBuffer is enabled, ppEnabledExtensionNames must not contain VK_AMD_shader_fragment_mask

- VUID-VkDeviceCreateInfo-pNext-09396
  If the pNext chain includes a VkDeviceQueueShaderCoreControlCreateInfoARM structure, then it must not be included in the pNext chain of any of the VkDeviceQueueCreateInfo
structures in \texttt{pQueueCreateInfos}

- \texttt{VUID-VkDeviceCreateInfo-pNext-09397}
  
  If the \texttt{pNext} chain includes a \texttt{VkDeviceQueueShaderCoreControlCreateInfoARM} structure then \texttt{VkPhysicalDeviceSchedulingControlsPropertiesARM::schedulingControlsFlags} must contain \texttt{VK_PHYSICAL_DEVICE_SCHEDULING_CONTROLS_SHADER_CORE_COUNT_ARM}.

\section*{Valid Usage (Implicit)}

- \texttt{VUID-VkDeviceCreateInfo-sType-sType}\n  
  \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_DEVICE_CREATE_INFO}.

- \texttt{VUID-VkDeviceCreateInfo-pNext-pNext}\n  
  Each \texttt{pNext} member of any structure (including this one) in the \texttt{pNext} chain must be either \texttt{NULL} or a pointer to a valid instance of \texttt{VkDeviceDeviceMemoryReportCreateInfoEXT}, \texttt{VkDeviceDiagnosticsConfigCreateInfoNV}, \texttt{VkDeviceGroupDeviceCreateInfo}, \texttt{VkPhysicalDeviceSchedulingControlsPropertiesARM}, \texttt{VkPhysicalDevice16BitStorageFeatures}, \texttt{VkPhysicalDevice4444FormatsFeaturesEXT}, \texttt{VkPhysicalDevice8BitStorageFeatures}, \texttt{VkPhysicalDeviceASTCDecodeFeaturesEXT}, \texttt{VkPhysicalDeviceAccelerationStructureFeaturesKHR}, \texttt{VkPhysicalDeviceAddressBindingReportFeaturesEXT}, \texttt{VkPhysicalDeviceAmigoProfilingFeaturesSEC}, \texttt{VkPhysicalDeviceAntiLagFeaturesAMD}, \texttt{VkPhysicalDeviceAttachmentFeedbackLoopDynamicStateFeaturesEXT}, \texttt{VkPhysicalDeviceAttachmentFeedbackLoopLayoutFeaturesEXT}, \texttt{VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT}, \texttt{VkPhysicalDeviceBorderColorSwizzleFeaturesEXT}, \texttt{VkPhysicalDeviceBufferDeviceAddressFeatures}, \texttt{VkPhysicalDeviceBufferDeviceAddressFeaturesEXT}, \texttt{VkPhysicalDeviceClusterCullingShaderFeaturesHUAWEI}, \texttt{VkPhysicalDeviceCoherentMemoryFeaturesAMD}, \texttt{VkPhysicalDeviceColorWriteEnableFeaturesEXT}, \texttt{VkPhysicalDeviceComputeShaderDerivativesFeaturesNV}, \texttt{VkPhysicalDeviceConditionalRenderingFeaturesEXT}, \texttt{VkPhysicalDeviceCooperativeMatrixFeaturesKHR}, \texttt{VkPhysicalDeviceCooperativeMatrixFeaturesNV}, \texttt{VkPhysicalDeviceCopyMemoryIndirectFeaturesNV}, \texttt{VkPhysicalDeviceCornerSampledImageFeaturesNV}, \texttt{VkPhysicalDeviceCoverageReductionModeFeaturesNV}, \texttt{VkPhysicalDeviceCudaKernelLaunchFeaturesNV}, \texttt{VkPhysicalDeviceCustomBorderColorFeaturesEXT}, \texttt{VkPhysicalDeviceDedicatedAllocationImageAliasingFeaturesNV}, \texttt{VkPhysicalDeviceDepthBiasControlFeaturesEXT}, \texttt{VkPhysicalDeviceDepthClipZeroOneFeaturesEXT}, \texttt{VkPhysicalDeviceDepthClipEnableFeaturesEXT}.\n

A logical device can be created that connects to one or more physical devices by adding a `VkDeviceGroupDeviceCreateInfo` structure to the `pNext` chain of `VkDeviceCreateInfo`. The `VkDeviceGroupDeviceCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkDeviceCreateFlags;
```

`VkDeviceCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.
typedef struct VkDeviceGroupDeviceCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t physicalDeviceCount;
    const VkPhysicalDevice* pPhysicalDevices;
} VkDeviceGroupDeviceCreateInfo;

or the equivalent

// Provided by VK_KHR_device_group_creation
typedef VkDeviceGroupDeviceCreateInfo VkDeviceGroupDeviceCreateInfoKHR;

• **sType** is a VkStructureType value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **physicalDeviceCount** is the number of elements in the pPhysicalDevices array.
• **pPhysicalDevices** is a pointer to an array of physical device handles belonging to the same device group.

The elements of the pPhysicalDevices array are an ordered list of the physical devices that the logical device represents. These must be a subset of a single device group, and need not be in the same order as they were enumerated. The order of the physical devices in the pPhysicalDevices array determines the device index of each physical device, with element i being assigned a device index of i. Certain commands and structures refer to one or more physical devices by using device indices or device masks formed using device indices.

A logical device created without using VkDeviceGroupDeviceCreateInfo, or with physicalDeviceCount equal to zero, is equivalent to a physicalDeviceCount of one and pPhysicalDevices pointing to the physicalDevice parameter to vkCreateDevice. In particular, the device index of that physical device is zero.

### Valid Usage

- VUID-VkDeviceGroupDeviceCreateInfo-pPhysicalDevices-00375
  Each element of pPhysicalDevices must be unique
- VUID-VkDeviceGroupDeviceCreateInfo-pPhysicalDevices-00376
  All elements of pPhysicalDevices must be in the same device group as enumerated by vkEnumeratePhysicalDeviceGroups
- VUID-VkDeviceGroupDeviceCreateInfo-physicalDeviceCount-00377
  If physicalDeviceCount is not 0, the physicalDevice parameter of vkCreateDevice must be an element of pPhysicalDevices
Valid Usage (Implicit)

- VUID-VkDeviceGroupDeviceCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEVICE_GROUP_DEVICE_CREATE_INFO

- VUID-VkDeviceGroupDeviceCreateInfo-pPhysicalDevices-parameter
  If physicalDeviceCount is not 0, pPhysicalDevices must be a valid pointer to an array of physicalDeviceCount valid VkPhysicalDevice handles

To specify whether device memory allocation is allowed beyond the size reported by VkPhysicalDeviceMemoryProperties, add a VkDeviceMemoryOverallocationCreateInfoAMD structure to the pNext chain of the VkDeviceCreateInfo structure. If this structure is not specified, it is as if the VK_MEMORY_OVERALLOCATION_BEHAVIOR_DEFAULT_AMD value is used.

```c
// Provided by VK_AMD_memory_overallocation_behavior
typedef struct VkDeviceMemoryOverallocationCreateInfoAMD {
    VkStructureType sType;
    const void* pNext;
    VkMemoryOverallocationBehaviorAMD overallocationBehavior;
} VkDeviceMemoryOverallocationCreateInfoAMD;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- overallocationBehavior is the desired overallocation behavior.

Valid Usage (Implicit)

- VUID-VkDeviceMemoryOverallocationCreateInfoAMD-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEVICE_MEMORY_OVERALLOCATION_CREATE_INFO_AMD

- VUID-VkDeviceMemoryOverallocationCreateInfoAMD-overallocationBehavior-parameter
  overallocationBehavior must be a valid VkMemoryOverallocationBehaviorAMD value

Possible values for VkDeviceMemoryOverallocationCreateInfoAMD::overallocationBehavior include:

```c
// Provided by VK_AMD_memory_overallocation_behavior
typedef enum VkMemoryOverallocationBehaviorAMD {
    VK_MEMORY_OVERALLOCATION_BEHAVIOR_DEFAULT_AMD = 0,
    VK_MEMORY_OVERALLOCATION_BEHAVIOR_ALLOWED_AMD = 1,
    VK_MEMORY_OVERALLOCATION_BEHAVIOR_DISALLOWED_AMD = 2,
} VkMemoryOverallocationBehaviorAMD;
```

- VK_MEMORY_OVERALLOCATION_BEHAVIOR_DEFAULT_AMD lets the implementation decide if overallocation is allowed.
• **VK_MEMORY_OVERALLOCATION_BEHAVIOR_ALLOWED_AMD** specifies overallocation is allowed if platform permits.

• **VK_MEMORY_OVERALLOCATION_BEHAVIOR_DISALLOWED_AMD** specifies the application is not allowed to allocate device memory beyond the heap sizes reported by `VkPhysicalDeviceMemoryProperties`. Allocations that are not explicitly made by the application within the scope of the Vulkan instance are not accounted for.

When using the Nsight™ Aftermath SDK, to configure how device crash dumps are created, add a `VkDeviceDiagnosticsConfigCreateInfoNV` structure to the `pNext` chain of the `VkDeviceCreateInfo` structure.

```c
// Provided by VK_NV_device_diagnostics_config
typedef struct VkDeviceDiagnosticsConfigCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkDeviceDiagnosticsConfigFlagsNV flags;
} VkDeviceDiagnosticsConfigCreateInfoNV;
```

• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is `NULL` or a pointer to a structure extending this structure.

• **flags** is a bitmask of `VkDeviceDiagnosticsConfigFlagBitsNV` specifying additional parameters for configuring diagnostic tools.

### Valid Usage (Implicit)

- **VUID-VkDeviceDiagnosticsConfigCreateInfoNV-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_DEVICE_DIAGNOSTICS_CONFIG_CREATE_INFO_NV`

- **VUID-VkDeviceDiagnosticsConfigCreateInfoNV-flags-parameter**
  
  `flags` must be a valid combination of `VkDeviceDiagnosticsConfigFlagBitsNV` values

Bits which can be set in `VkDeviceDiagnosticsConfigCreateInfoNV::flags` include:

```c
// Provided by VK_NV_device_diagnostics_config
typedef enum VkDeviceDiagnosticsConfigFlagBitsNV {
    VK_DEVICE_DIAGNOSTICS_CONFIG_ENABLE_SHADER_DEBUG_INFO_BIT_NV = 0x00000001,
    VK_DEVICE_DIAGNOSTICS_CONFIG_ENABLE_RESOURCE_TRACKING_BIT_NV = 0x00000002,
    VK_DEVICE_DIAGNOSTICS_CONFIG_ENABLE_AUTOMATIC_CHECKPOINTS_BIT_NV = 0x00000004,
    VK_DEVICE_DIAGNOSTICS_CONFIG_ENABLE_SHADER_ERROR_REPORTING_BIT_NV = 0x00000008,
} VkDeviceDiagnosticsConfigFlagBitsNV;
```

- **VK_DEVICE_DIAGNOSTICS_CONFIG_ENABLE_SHADER_DEBUG_INFO_BIT_NV** enables the generation of debug information for shaders.

- **VK_DEVICE_DIAGNOSTICS_CONFIG_ENABLE_RESOURCE_TRACKING_BIT_NV** enables driver side tracking of resources (images, buffers, etc.) used to augment the device fault information.
• `VK_DEVICE_DIAGNOSTICS_CONFIG_ENABLE_AUTOMATIC_CHECKPOINTS_BIT_NV` enables automatic insertion of diagnostic checkpoints for draw calls, dispatches, trace rays, and copies. The CPU call stack at the time of the command will be associated as the marker data for the automatically inserted checkpoints.

• `VK_DEVICE_DIAGNOSTICS_CONFIG_ENABLE_SHADER_ERROR_REPORTING_BIT_NV` enables shader error reporting.

```c
// Provided by VK_NV_device_diagnostics_config
typedef VkFlags VkDeviceDiagnosticsConfigFlagsNV;
```

`VkDeviceDiagnosticsConfigFlagsNV` is a bitmask type for setting a mask of zero or more `VkDeviceDiagnosticsConfigFlagBitsNV`.

To register callbacks for underlying device memory events of type `VkDeviceMemoryReportEventTypeEXT`, add one or multiple `VkDeviceMemoryReportCreateInfoEXT` structures to the `pNext` chain of the `VkDeviceCreateInfo` structure.

```c
// Provided by VK_EXT_device_memory_report
typedef struct VkDeviceDeviceMemoryReportCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDeviceMemoryReportFlagsEXT flags;
    PFN_vkDeviceMemoryReportCallbackEXT pfnUserCallback;
    void* pUserData;
} VkDeviceDeviceMemoryReportCreateInfoEXT;
```

• `sType` is a `VkStructureType` value identifying this structure.

• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `flags` is 0 and reserved for future use.

• `pfnUserCallback` is the application callback function to call.

• `pUserData` is user data to be passed to the callback.

The callback may be called from multiple threads simultaneously.

The callback must be called only once by the implementation when a `VkDeviceMemoryReportEventTypeEXT` event occurs.

```
NOTE
```

The callback could be called from a background thread other than the thread calling the Vulkan commands.

```
Valid Usage (Implicit)
```

• `VUID-VkDeviceDeviceMemoryReportCreateInfoEXT-sType-sType` `sType` must be `VK_STRUCTURE_TYPE_DEVICE_DEVICE_MEMORY_REPORT_CREATE_INFO_EXT`
• VUID-VkDeviceDeviceMemoryReportCreateInfoEXT-flags-zero bitmask
  flags must be 0

• VUID-VkDeviceDeviceMemoryReportCreateInfoEXT-pfnUserCallback-parameter
  pfnUserCallback must be a valid PFN_vkDeviceMemoryReportCallbackEXT value

• VUID-VkDeviceDeviceMemoryReportCreateInfoEXT-pUserData-parameter
  pUserData must be a pointer value

The prototype for the VkDeviceDeviceMemoryReportCreateInfoEXT::pfnUserCallback function implemented by the application is:

```c
// Provided by VK_EXT_device_memory_report
typedef void (VKAPI_PTR *PFN_vkDeviceMemoryReportCallbackEXT)(
    const VkDeviceMemoryReportCallbackDataEXT* pCallbackData,
    void* pUserData);
```

• pCallbackData contains all the callback related data in the
  VkDeviceMemoryReportCallbackDataEXT structure.

• pUserData is the user data provided when the VkDeviceDeviceMemoryReportCreateInfoEXT was
  created.

The callback must not make calls to any Vulkan commands.

The definition of VkDeviceMemoryReportCallbackDataEXT is:

```c
// Provided by VK_EXT_device_memory_report
typedef struct VkDeviceMemoryReportCallbackDataEXT {
    VkStructureType sType;
    void* pNext;
    VkDeviceMemoryReportFlagsEXT flags;
    VkDeviceMemoryReportEventTypeEXT type;
    uint64_t memoryObjectId;
    VkDeviceSize size;
    VkObjectType objectType;
    uint64_t objectHandle;
    uint32_t heapIndex;
} VkDeviceMemoryReportCallbackDataEXT;
```

• sType is a VkStructureType value identifying this structure.

• pNext is NULL or a pointer to a structure extending this structure.

• flags is 0 and reserved for future use.

• type is a VkDeviceMemoryReportEventTypeEXT type specifying the type of event reported in
  this VkDeviceMemoryReportCallbackDataEXT structure.

• memoryObjectId is the unique id for the underlying memory object as described below.

• size is the size of the memory object in bytes. If type is
VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT,
VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_FREE_EXT,
VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT,
VKDEVICE_MEMORY_REPORT_EVENT_TYPE_UNIMPORT_EXT,
or
VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATION_FAILED_EXT, size is a valid VkDeviceSize value.
Otherwise, size is undefined.

- **objectType** is a VkObjectType value specifying the type of the object associated with this device memory report event. If type is VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT, VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_FREE_EXT, VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT, VKDEVICE_MEMORY_REPORT_EVENT_TYPE_UNIMPORT_EXT or VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATION_FAILED_EXT, objectType is a valid VkObjectType enum. Otherwise, objectType is undefined.

- **objectHandle** is the object this device memory report event is attributed to. If type is VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT, VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_FREE_EXT, VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT or VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_UNIMPORT_EXT, objectHandle is a valid Vulkan handle of the type associated with objectType as defined in the VkObjectType and Vulkan Handle Relationship table. Otherwise, objectHandle is undefined.

- **heapIndex** describes which memory heap this device memory allocation is made from. If type is VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT or VKDEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATION_FAILED_EXT, heapIndex corresponds to one of the valid heaps from the VkPhysicalDeviceMemoryProperties structure. Otherwise, heapIndex is undefined.

memoryObjectId is used to avoid double-counting on the same memory object.

If an internally-allocated device memory object or a VkDeviceMemory cannot be exported, memoryObjectId must be unique in the VkDevice.

If an internally-allocated device memory object or a VkDeviceMemory supports being exported, memoryObjectId must be unique system wide.

If an internal device memory object or a VkDeviceMemory is backed by an imported external memory object, memoryObjectId must be unique system wide.

**Implementor’s Note**

If the heap backing an internally-allocated device memory cannot be used to back VkDeviceMemory, implementations can advertise that heap with no types.

**NOTE**

This structure should only be considered valid during the lifetime of the triggered callback.

For VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT and VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT events, objectHandle usually will not yet exist when the application or tool receives the callback. objectHandle will only exist when the create or allocate call that triggered the event returns, and if the allocation or import ends up failing objectHandle will not ever exist.
Valid Usage (Implicit)

• VUID-VkDeviceMemoryReportCallbackDataEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEVICE_MEMORY_REPORT_CALLBACK_DATA_EXT

• VUID-VkDeviceMemoryReportCallbackDataEXT-pNext-pNext
  pNext must be NULL

// Provided by VK_EXT_device_memory_report
typedef VkFlags VkDeviceMemoryReportFlagsEXT;

VkDeviceMemoryReportFlagsEXT is a bitmask type for setting a mask, but is currently reserved for future use.

Possible values of VkDeviceMemoryReportCallbackDataEXT::type, specifying event types which cause the device driver to call the callback, are:

// Provided by VK_EXT_device_memory_report
typedef enum VkDeviceMemoryReportEventTypeEXT {
  VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT = 0,
  VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_FREE_EXT = 1,
  VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT = 2,
  VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_UNIMPORT_EXT = 3,
  VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATION_FAILED_EXT = 4,
} VkDeviceMemoryReportEventTypeEXT;

• VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT specifies this event corresponds to the allocation of an internal device memory object or a VkDeviceMemory.

• VKDEVICE_MEMORY_REPORT_EVENT_TYPE_FREE_EXT specifies this event corresponds to the deallocation of an internally-allocated device memory object or a VkDeviceMemory.

• VKDEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT specifies this event corresponds to the import of an external memory object.

• VKDEVICE_MEMORY_REPORT_EVENT_TYPE_UNIMPORT_EXT specifies this event is the release of an imported external memory object.

• VKDEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATION_FAILED_EXT specifies this event corresponds to the failed allocation of an internal device memory object or a VkDeviceMemory.

To reserve private data storage slots, add a VkDevicePrivateDataCreateInfo structure to the pNext chain of the VkDeviceCreateInfo structure. Reserving slots in this manner is not strictly necessary, but doing so may improve performance.
or the equivalent

```c
// Provided by VK_EXT_private_data
typedef VkDevicePrivateDataCreateInfo VkDevicePrivateDataCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `privateDataSlotRequestCount` is the amount of slots to reserve.

**Valid Usage (Implicit)**

- `VUID-VkDevicePrivateDataCreateInfo-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_DEVICE_PRIVATE_DATA_CREATE_INFO`  

The number of shader cores used by all the queues of a device can be controlled by adding a `VkDeviceQueueShaderCoreControlCreateInfoARM` structure to the `pNext` chain of the `VkDeviceCreateInfo` structure.

### 5.2.2. Device Use

The following is a high-level list of `VkDevice` uses along with references on where to find more information:

- Creation of queues. See the Queues section below for further details.
- Creation and tracking of various synchronization constructs. See Synchronization and Cache Control for further details.
- Allocating, freeing, and managing memory. See Memory Allocation and Resource Creation for further details.
- Creation and destruction of command buffers and command buffer pools. See Command Buffers for further details.
- Creation, destruction, and management of graphics state. See Pipelines and Resource Descriptors, among others, for further details.

### 5.2.3. Lost Device

A logical device may become lost for a number of implementation-specific reasons, indicating that
pending and future command execution may fail and cause resources and backing memory to become undefined.

Typical reasons for device loss will include things like execution timing out (to prevent denial of service), power management events, platform resource management, implementation errors.

Applications not adhering to valid usage may also result in device loss being reported, however this is not guaranteed. Even if device loss is reported, the system may be in an unrecoverable state, and further usage of the API is still considered invalid.

When this happens, certain commands will return VK_ERROR_DEVICE_LOST. After any such event, the logical device is considered lost. It is not possible to reset the logical device to a non-lost state, however the lost state is specific to a logical device (VkDevice), and the corresponding physical device (VkPhysicalDevice) may be otherwise unaffected.

In some cases, the physical device may also be lost, and attempting to create a new logical device will fail, returning VK_ERROR_DEVICE_LOST. This is usually indicative of a problem with the underlying implementation, or its connection to the host. If the physical device has not been lost, and a new logical device is successfully created from that physical device, it must be in the non-lost state.

Whilst logical device loss may be recoverable, in the case of physical device loss, it is unlikely that an application will be able to recover unless additional, unaffected physical devices exist on the system. The error is largely informational and intended only to inform the application that a platform issue has occurred, and should be investigated further. For example, underlying hardware may have developed a fault or become physically disconnected from the rest of the system. In many cases, physical device loss may cause other more serious issues such as the operating system crashing; in which case it may not be reported via the Vulkan API.

When a device is lost, its child objects are not implicitly destroyed and their handles are still valid. Those objects must still be destroyed before their parents or the device can be destroyed (see the Object Lifetime section). The host address space corresponding to device memory mapped using vkMapMemory is still valid, and host memory accesses to these mapped regions are still valid, but the contents are undefined. It is still legal to call any API command on the device and child objects.

Once a device is lost, command execution may fail, and certain commands that return a VkResult may return VK_ERROR_DEVICE_LOST. These commands can be identified by the inclusion of VK_ERROR_DEVICE_LOST in the Return Codes section for each command. Commands that do not allow runtime errors must still operate correctly for valid usage and, if applicable, return valid data.

Commands that wait indefinitely for device execution (namely vkDeviceWaitIdle, vkQueueWaitIdle, vkWaitForFences or vkAcquireNextImageKHR with a maximum timeout, and vkGetQueryPoolResults with the VK_QUERY_RESULT_WAIT_BIT bit set in flags) must return in finite time even in the case of a lost device, and return either VK_SUCCESS or VK_ERROR_DEVICE_LOST. For any command that may return VK_ERROR_DEVICE_LOST, for the purpose of determining whether a command buffer is in the pending state, or whether resources are considered in-use by the device,
a return value of VK_ERROR_DEVICE_LOST is equivalent to VK_SUCCESS.

If a device was created with the maintenance5 feature enabled, and any device command returns VK_ERROR_DEVICE_LOST, then all device commands for which VK_ERROR_DEVICE_LOST is a valid return value and which happen-after it on the same host thread must return VK_ERROR_DEVICE_LOST.

Device commands executing on other threads must begin returning VK_ERROR_DEVICE_LOST within finite time.

The content of any external memory objects that have been exported from or imported to a lost device become undefined. Objects on other logical devices or in other APIs which are associated with the same underlying memory resource as the external memory objects on the lost device are unaffected other than their content becoming undefined. The layout of subresources of images on other logical devices that are bound to VkDeviceMemory objects associated with the same underlying memory resources as external memory objects on the lost device becomes VK_IMAGE_LAYOUT_UNDEFINED.

The state of VkSemaphore objects on other logical devices created by importing a semaphore payload with temporary permanence which was exported from the lost device is undefined. The state of VkSemaphore objects on other logical devices that permanently share a semaphore payload with a VkSemaphore object on the lost device is undefined, and remains undefined following any subsequent signal operations. Implementations must ensure pending and subsequently submitted wait operations on such semaphores behave as defined in Semaphore State Requirements For Wait Operations for external semaphores not in a valid state for a wait operation.

5.2.4. Device Destruction

To destroy a device, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyDevice(
    VkDevice device,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

To ensure that no work is active on the device, `vkDeviceWaitIdle` can be used to gate the destruction of the device. Prior to destroying a device, an application is responsible for destroying/freeing any Vulkan objects that were created using that device as the first parameter of the corresponding `vkCreate*` or `vkAllocate*` command.

**NOTE**

The lifetime of each of these objects is bound by the lifetime of the VkDevice object. Therefore, to avoid resource leaks, it is critical that an application explicitly free all of these resources prior to calling `vkDestroyDevice`. 
Valid Usage

- VUID-vkDestroyDevice-device-05137
  All child objects created on device must have been destroyed prior to destroying device

- VUID-vkDestroyDevice-device-00379
  If VkAllocationCallbacks were provided when device was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyDevice-device-00380
  If no VkAllocationCallbacks were provided when device was created, pAllocator must be NULL

Valid Usage (Implicit)

- VUID-vkDestroyDevice-device-parameter
  If device is not NULL, device must be a valid VkDevice handle

- VUID-vkDestroyDevice-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

Host Synchronization

- Host access to device must be externally synchronized
- Host access to all VkQueue objects created from device must be externally synchronized

5.3. Queues

5.3.1. Queue Family Properties

As discussed in the Physical Device Enumeration section above, the vkGetPhysicalDeviceQueueFamilyProperties command is used to retrieve details about the queue families and queues supported by a device.

Each index in the pQueueFamilyProperties array returned by vkGetPhysicalDeviceQueueFamilyProperties describes a unique queue family on that physical device. These indices are used when creating queues, and they correspond directly with the queueFamilyIndex that is passed to the vkCreateDevice command via the VkDeviceQueueCreateInfo structure as described in the Queue Creation section below.

Grouping of queue families within a physical device is implementation-dependent.

**NOTE**  The general expectation is that a physical device groups all queues of matching capabilities into a single family. However, while implementations should do this, it is possible that a physical device may return two separate queue families with the
Once an application has identified a physical device with the queue(s) that it desires to use, it will create those queues in conjunction with a logical device. This is described in the following section.

### 5.3.2. Queue Creation

Creating a logical device also creates the queues associated with that device. The queues to create are described by a set of `VkDeviceQueueCreateInfo` structures that are passed to `vkCreateDevice` in `pQueueCreateInfos`.

Queues are represented by `VkQueue` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkQueue)
```

The `VkDeviceQueueCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDeviceQueueCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkDeviceQueueCreateFlags flags;
    uint32_t queueFamilyIndex;
    uint32_t queueCount;
    const float* pQueuePriorities;
} VkDeviceQueueCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask indicating behavior of the queues.
- `queueFamilyIndex` is an unsigned integer indicating the index of the queue family in which to create the queues on this device. This index corresponds to the index of an element of the `pQueueFamilyProperties` array that was returned by `vkGetPhysicalDeviceQueueFamilyProperties`.
- `queueCount` is an unsigned integer specifying the number of queues to create in the queue family indicated by `queueFamilyIndex`, and with the behavior specified by `flags`.
- `pQueuePriorities` is a pointer to an array of `queueCount` normalized floating-point values, specifying priorities of work that will be submitted to each created queue. See Queue Priority for more information.

### Valid Usage

- **VUID-VkDeviceQueueCreateInfo-queueFamilyIndex-00381**
  ```
  queueFamilyIndex must be less than pQueueFamilyPropertyCount returned by vkGetPhysicalDeviceQueueFamilyProperties
  ```
• VUID-VkDeviceQueueCreateInfo-queueCount-00382
queueCount must be less than or equal to the queueCount member of the VkQueueFamilyProperties structure, as returned by vkGetPhysicalDeviceQueueFamilyProperties in the pQueueFamilyProperties[queueFamilyIndex]

• VUID-VkDeviceQueueCreateInfo-pQueuePriorities-00383
Each element of pQueuePriorities must be between 0.0 and 1.0 inclusive

• VUID-VkDeviceQueueCreateInfo-flags-02861
If the protectedMemory feature is not enabled, the VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT bit of flags must not be set

• VUID-VkDeviceQueueCreateInfo-flags-06449
If flags includes VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT, queueFamilyIndex must be the index of a queue family that includes the VK_QUEUE_PROTECTED_BIT capability

• VUID-VkDeviceQueueCreateInfo-pNext-09398
If the pNext chain includes a VkDeviceQueueShaderCoreControlCreateInfoARM structure then VkPhysicalDeviceSchedulingControlsPropertiesARM::schedulingControlsFlags must contain VK_PHYSICAL_DEVICE_SCHEDULING_CONTROLS_SHADER_CORE_COUNT_ARM

Valid Usage (Implicit)

• VUID-VkDeviceQueueCreateInfo-sType-sType
sType must be VK_STRUCTURE_TYPE_DEVICE_QUEUE_CREATE_INFO

• VUID-VkDeviceQueueCreateInfo-pNext-pNext
Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkDeviceQueueGlobalPriorityCreateInfoKHR or VkDeviceQueueShaderCoreControlCreateInfoARM

• VUID-VkDeviceQueueCreateInfo-sType-unique
The sType value of each struct in the pNext chain must be unique

• VUID-VkDeviceQueueCreateInfo-flags-parameter
flags must be a valid combination of VkDeviceQueueCreateFlagBits values

• VUID-VkDeviceQueueCreateInfo-pQueuePriorities-parameter
pQueuePriorities must be a valid pointer to an array of queueCount float values

• VUID-VkDeviceQueueCreateInfo-queueCount-arraylength
queueCount must be greater than 0

Bits which can be set in VkDeviceQueueCreateInfo::flags, specifying usage behavior of a queue, are:
```
// Provided by VK_VERSION_1_1
typedef enum VkDeviceQueueCreateFlagBits {
    // Provided by VK_VERSION_1_1
    VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT = 0x00000001,
} VkDeviceQueueCreateFlagBits;
```

- **VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT** specifies that the device queue is a protected-capable queue.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkDeviceQueueCreateFlags;
```

`VkDeviceQueueCreateFlags` is a bitmask type for setting a mask of zero or more `VkDeviceQueueCreateFlagBits`.

Queues can be created with a system-wide priority by adding a `VkDeviceQueueGlobalPriorityCreateInfoKHR` structure to the `pNext` chain of `VkDeviceQueueCreateInfo`.

The `VkDeviceQueueGlobalPriorityCreateInfoKHR` structure is defined as:

```
// Provided by VK_KHR_global_priority
typedef struct VkDeviceQueueGlobalPriorityCreateInfoKHR {
    VkStructureType          sType;
    const void*              pNext;
    VkQueueGlobalPriorityKHR globalPriority;
} VkDeviceQueueGlobalPriorityCreateInfoKHR;
```

or the equivalent

```
// Provided by VK_EXT_global_priority
typedef VkDeviceQueueGlobalPriorityCreateInfoKHR
    VkDeviceQueueGlobalPriorityCreateInfoEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **globalPriority** is the system-wide priority associated to these queues as specified by `VkQueueGlobalPriorityKHR`.

Queues created without specifying `VkDeviceQueueGlobalPriorityCreateInfoKHR` will default to `VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR`. 
Valid Usage (Implicit)

- VUID-VkDeviceQueueGlobalPriorityCreateInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_DEVICE_QUEUE_GLOBAL_PRIORITY_CREATE_INFO_KHR`

- VUID-VkDeviceQueueGlobalPriorityCreateInfoKHR-globalPriority-parameter
  `globalPriority` must be a valid `VkQueueGlobalPriorityKHR` value

Possible values of `VkDeviceQueueGlobalPriorityCreateInfoKHR::globalPriority`, specifying a system-wide priority level are:

```c
// Provided by VK_KHR_global_priority
typedef enum VkQueueGlobalPriorityKHR {
    VK_QUEUE_GLOBAL_PRIORITY_LOW_KHR = 128,
    VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR = 256,
    VK_QUEUE_GLOBAL_PRIORITY_HIGH_KHR = 512,
    VK_QUEUE_GLOBAL_PRIORITY_REALTIME_KHR = 1024,
    VK_QUEUE_GLOBAL_PRIORITY_LOW_EXT = VK_QUEUE_GLOBAL_PRIORITY_LOW_KHR,
    VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_EXT = VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR,
    VK_QUEUE_GLOBAL_PRIORITY_HIGH_EXT = VK_QUEUE_GLOBAL_PRIORITY_HIGH_KHR,
    VK_QUEUE_GLOBAL_PRIORITY_REALTIME_EXT = VK_QUEUE_GLOBAL_PRIORITY_REALTIME_KHR,
} VkQueueGlobalPriorityKHR;
```

or the equivalent

```c
// Provided by VK_EXT_global_priority
typedef VkQueueGlobalPriorityKHR VkQueueGlobalPriorityEXT;
```

Priority values are sorted in ascending order. A comparison operation on the enum values can be used to determine the priority order.

- `VK_QUEUEGLOBAL_PRIORITY_LOW_KHR` is below the system default. Useful for non-interactive tasks.
- `VK_QUEUEGLOBAL_PRIORITY_MEDIUM_KHR` is the system default priority.
- `VK_QUEUEGLOBAL_PRIORITY_HIGH_KHR` is above the system default.
- `VK_QUEUEGLOBAL_PRIORITY_REALTIME_KHR` is the highest priority. Useful for critical tasks.

Queues with higher system priority may be allotted more processing time than queues with lower priority. An implementation may allow a higher-priority queue to starve a lower-priority queue until the higher-priority queue has no further commands to execute.

Priorities imply no ordering or scheduling constraints.

No specific guarantees are made about higher priority queues receiving more processing time or better quality of service than lower priority queues.

The global priority level of a queue takes precedence over the per-process queue priority
Abuse of this feature may result in starving the rest of the system of implementation resources. Therefore, the driver implementation may deny requests to acquire a priority above the default priority (VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR) if the caller does not have sufficient privileges. In this scenario VK_ERROR_NOT_PERMITTED_KHR is returned.

The driver implementation may fail the queue allocation request if resources required to complete the operation have been exhausted (either by the same process or a different process). In this scenario VK_ERROR_INITIALIZATION_FAILED is returned.

If the globalPriorityQuery feature is enabled and the requested global priority is not reported via VkQueueFamilyGlobalPriorityPropertiesKHR, the driver implementation must fail the queue creation. In this scenario, VK_ERROR_INITIALIZATION_FAILED is returned.

The number of shader cores used by a queue can be controlled by adding a VkDeviceQueueShaderCoreControlCreateInfoARM structure to the pNext chain of VkDeviceQueueCreateInfo structures.

The VkDeviceQueueShaderCoreControlCreateInfoARM structure is defined as:

```c
// Provided by VK_ARM_scheduling_controls
typedef struct VkDeviceQueueShaderCoreControlCreateInfoARM {
    VkStructureType sType;
    void* pNext;
    uint32_t shaderCoreCount;
} VkDeviceQueueShaderCoreControlCreateInfoARM;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **shaderCoreCount** is the number of shader cores this queue uses.

Queues created without specifying VkDeviceQueueShaderCoreControlCreateInfoARM will default to using all the shader cores available.

### Valid Usage

- VUID-VkDeviceQueueShaderCoreControlCreateInfoARM-shaderCoreCount-09399
  shaderCoreCount **must** be greater than 0 and less than or equal to the total number of shader cores as reported via VkPhysicalDeviceShaderCoreBuiltinsPropertiesARM ::shaderCoreCount

### Valid Usage (Implicit)

- VUID-VkDeviceQueueShaderCoreControlCreateInfoARM-sType-sType
  sType **must** be VK_STRUCTURE_TYPEDEVICE_QUEUE_SHADER_CORE_CONTROL_CREATE_INFO_ARM
To retrieve a handle to a `VkQueue` object, call:

```c
void vkGetDeviceQueue(
    VkDevice device,
    uint32_t queueFamilyIndex,
    uint32_t queueIndex,
    VkQueue* pQueue);
```

- `device` is the logical device that owns the queue.
- `queueFamilyIndex` is the index of the queue family to which the queue belongs.
- `queueIndex` is the index within this queue family of the queue to retrieve.
- `pQueue` is a pointer to a `VkQueue` object that will be filled with the handle for the requested queue.

`vkGetDeviceQueue` must only be used to get queues that were created with the `flags` parameter of `VkDeviceQueueCreateInfo` set to zero. To get queues that were created with a non-zero `flags` parameter use `vkGetDeviceQueue2`.

**Valid Usage**

- VUID-vkGetDeviceQueue-queueFamilyIndex-00384 `queueFamilyIndex` must be one of the queue family indices specified when `device` was created, via the `VkDeviceQueueCreateInfo` structure
- VUID-vkGetDeviceQueue-queueIndex-00385 `queueIndex` must be less than the value of `VkDeviceQueueCreateInfo::queueCount` for the queue family indicated by `queueFamilyIndex` when `device` was created
- VUID-vkGetDeviceQueue-flags-01841 `VkDeviceQueueCreateInfo::flags` must have been set to zero when `device` was created

**Valid Usage (Implicit)**

- VUID-vkGetDeviceQueue-device-parameter `device` must be a valid `VkDevice` handle
- VUID-vkGetDeviceQueue-pQueue-parameter `pQueue` must be a valid pointer to a `VkQueue` handle

To retrieve a handle to a `VkQueue` object with specific `VkDeviceQueueCreateFlags` creation flags, call:
void vkGetDeviceQueue2(
    VkDevice device, 
    const VkDeviceQueueInfo2* pQueueInfo, 
    VkQueue* pQueue);

• device is the logical device that owns the queue.
• pQueueInfo is a pointer to a VkDeviceQueueInfo2 structure, describing parameters of the device queue to be retrieved.
• pQueue is a pointer to a VkQueue object that will be filled with the handle for the requested queue.

Valid Usage (Implicit)

• VUID-vkGetDeviceQueue2-device-parameter
device must be a valid VkDevice handle
• VUID-vkGetDeviceQueue2-pQueueInfo-parameter
pQueueInfo must be a valid pointer to a valid VkDeviceQueueInfo2 structure
• VUID-vkGetDeviceQueue2-pQueue-parameter
pQueue must be a valid pointer to a VkQueue handle

The VkDeviceQueueInfo2 structure is defined as:

typedef struct VkDeviceQueueInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkDeviceQueueCreateFlags flags;
    uint32_t queueFamilyIndex;
    uint32_t queueIndex;
} VkDeviceQueueInfo2;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure. The pNext chain of VkDeviceQueueInfo2 can be used to provide additional device queue parameters to vkGetDeviceQueue2.
• flags is a VkDeviceQueueCreateFlags value indicating the flags used to create the device queue.
• queueFamilyIndex is the index of the queue family to which the queue belongs.
• queueIndex is the index of the queue to retrieve from within the set of queues that share both the queue family and flags specified.

The queue returned by vkGetDeviceQueue2 must have the same flags value from this structure as that used at device creation time in a VkDeviceQueueCreateInfo structure.
Normally, if you create both protected-capable and non-protected-capable queues with the same family, they are treated as separate lists of queues and queueIndex is relative to the start of the list of queues specified by both queueFamilyIndex and flags. However, for historical reasons, some implementations may exhibit different behavior. These divergent implementations instead concatenate the lists of queues and treat queueIndex as relative to the start of the first list of queues with the given queueFamilyIndex. This only matters in cases where an application has created both protected-capable and non-protected-capable queues from the same queue family.

For such divergent implementations, the maximum value of queueIndex is equal to the sum of VkDeviceQueueCreateInfo::queueCount minus one, for all VkDeviceQueueCreateInfo structures that share a common queueFamilyIndex.

Such implementations will return NULL for either the protected or unprotected queues when calling vkGetDeviceQueue2 with queueIndex in the range zero to VkDeviceQueueCreateInfo::queueCount minus one. In cases where these implementations returned NULL, the corresponding queues are instead located in the extended range described in the preceding two paragraphs.

This behavior will not be observed on any driver that has passed Vulkan conformance test suite version 1.3.3.0, or any subsequent version. This information can be found by querying VkPhysicalDeviceDriverProperties::conformanceVersion.

Valid Usage

- VUID-VkDeviceQueueInfo2-queueFamilyIndex-01842
  queueFamilyIndex must be one of the queue family indices specified when device was created, via the VkDeviceQueueCreateInfo structure

- VUID-VkDeviceQueueInfo2-flags-06225
  flags must be equal to VkDeviceQueueCreateInfo::flags for a VkDeviceQueueCreateInfo structure for the queue family indicated by queueFamilyIndex when device was created

- VUID-VkDeviceQueueInfo2-queueIndex-01843
  queueIndex must be less than VkDeviceQueueCreateInfo::queueCount for the corresponding queue family and flags indicated by queueFamilyIndex and flags when device was created

Valid Usage (Implicit)

- VUID-VkDeviceQueueInfo2-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEVICE_QUEUE_INFO_2

- VUID-VkDeviceQueueInfo2-pNext-pNext
  pNext must be NULL

- VUID-VkDeviceQueueInfo2-flags-parameter
  flags must be a valid combination of VkDeviceQueueCreateFlagBits values
5.3.3. Queue Family Index

The queue family index is used in multiple places in Vulkan in order to tie operations to a specific family of queues.

When retrieving a handle to the queue via `vkGetDeviceQueue`, the queue family index is used to select which queue family to retrieve the `VkQueue` handle from as described in the previous section.

When creating a `VkCommandPool` object (see Command Pools), a queue family index is specified in the `VkCommandPoolCreateInfo` structure. Command buffers from this pool can only be submitted on queues corresponding to this queue family.

When creating `VkImage` (see Images) and `VkBuffer` (see Buffers) resources, a set of queue families is included in the `VkImageCreateInfo` and `VkBufferCreateInfo` structures to specify the queue families that can access the resource.

When inserting a `VkBufferMemoryBarrier` or `VkImageMemoryBarrier` (see Pipeline Barriers), a source and destination queue family index is specified to allow the ownership of a buffer or image to be transferred from one queue family to another. See the Resource Sharing section for details.

5.3.4. Queue Priority

Each queue is assigned a priority, as set in the `VkDeviceQueueCreateInfo` structures when creating the device. The priority of each queue is a normalized floating-point value between 0.0 and 1.0, which is then translated to a discrete priority level by the implementation. Higher values indicate a higher priority, with 0.0 being the lowest priority and 1.0 being the highest.

Within the same device, queues with higher priority may be allotted more processing time than queues with lower priority. The implementation makes no guarantees with regards to ordering or scheduling among queues with the same priority, other than the constraints defined by any explicit synchronization primitives. The implementation makes no guarantees with regards to queues across different devices.

An implementation may allow a higher-priority queue to starve a lower-priority queue on the same `VkDevice` until the higher-priority queue has no further commands to execute. The relationship of queue priorities must not cause queues on one `VkDevice` to starve queues on another `VkDevice`.

No specific guarantees are made about higher priority queues receiving more processing time or better quality of service than lower priority queues.

5.3.5. Queue Submission

Work is submitted to a queue via queue submission commands such as `vkQueueSubmit2` or `vkQueueSubmit`. Queue submission commands define a set of queue operations to be executed by the underlying physical device, including synchronization with semaphores and fences.

Submission commands take as parameters a target queue, zero or more batches of work, and an optional fence to signal upon completion. Each batch consists of three distinct parts:

1. Zero or more semaphores to wait on before execution of the rest of the batch.
If present, these describe a semaphore wait operation.

2. Zero or more work items to execute.
   - If present, these describe a queue operation matching the work described.

3. Zero or more semaphores to signal upon completion of the work items.
   - If present, these describe a semaphore signal operation.

If a fence is present in a queue submission, it describes a fence signal operation.

All work described by a queue submission command must be submitted to the queue before the command returns.

Sparse Memory Binding

In Vulkan it is possible to sparsely bind memory to buffers and images as described in the Sparse Resource chapter. Sparse memory binding is a queue operation. A queue whose flags include the VK_QUEUE_SPARSE_BINDING_BIT must be able to support the mapping of a virtual address to a physical address on the device. This causes an update to the page table mappings on the device. This update must be synchronized on a queue to avoid corrupting page table mappings during execution of graphics commands. By binding the sparse memory resources on queues, all commands that are dependent on the updated bindings are synchronized to only execute after the binding is updated. See the Synchronization and Cache Control chapter for how this synchronization is accomplished.

5.3.6. Queue Destruction

Queues are created along with a logical device during vkCreateDevice. All queues associated with a logical device are destroyed when vkDestroyDevice is called on that device.
Chapter 6. Command Buffers

Command buffers are objects used to record commands which can be subsequently submitted to a device queue for execution. There are two levels of command buffers - primary command buffers, which can execute secondary command buffers, and which are submitted to queues, and secondary command buffers, which can be executed by primary command buffers, and which are not directly submitted to queues.

Command buffers are represented by VkCommandBuffer handles:

```// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkCommandBuffer)```

Recorded commands include commands to bind pipelines and descriptor sets to the command buffer, commands to modify dynamic state, commands to draw (for graphics rendering), commands to dispatch (for compute), commands to execute secondary command buffers (for primary command buffers only), commands to copy buffers and images, and other commands.

Each command buffer manages state independently of other command buffers. There is no inheritance of state across primary and secondary command buffers, or between secondary command buffers. When a command buffer begins recording, all state in that command buffer is undefined. When secondary command buffer(s) are recorded to execute on a primary command buffer, the secondary command buffer inherits no state from the primary command buffer, and all state of the primary command buffer is undefined after an execute secondary command buffer command is recorded. There is one exception to this rule - if the primary command buffer is inside a render pass instance, then the render pass and subpass state is not disturbed by executing secondary command buffers. For state dependent commands (such as draws and dispatches), any state consumed by those commands must not be undefined.

VkCommandBufferInheritanceViewportScissorInfoNV defines an exception allowing limited inheritance of dynamic viewport and scissor state.

Unless otherwise specified, and without explicit synchronization, the various commands submitted to a queue via command buffers may execute in arbitrary order relative to each other, and/or concurrently. Also, the memory side effects of those commands may not be directly visible to other commands without explicit memory dependencies. This is true within a command buffer, and across command buffers submitted to a given queue. See the synchronization chapter for information on implicit and explicit synchronization between commands.

6.1. Command Buffer Lifecycle

Each command buffer is always in one of the following states:

Initial
When a command buffer is allocated, it is in the initial state. Some commands are able to reset a command buffer (or a set of command buffers) back to this state from any of the executable, recording or invalid state. Command buffers in the initial state can only be moved to the
recording state, or freed.

**Recording**

vkBeginCommandBuffer changes the state of a command buffer from the initial state to the *recording state*. Once a command buffer is in the recording state, vkCmd* commands can be used to record to the command buffer.

**Executable**

vkEndCommandBuffer ends the recording of a command buffer, and moves it from the recording state to the *executable state*. Executable command buffers can be submitted, reset, or recorded to another command buffer.

**Pending**

Queue submission of a command buffer changes the state of a command buffer from the executable state to the *pending state*. Whilst in the pending state, applications must not attempt to modify the command buffer in any way - as the device may be processing the commands recorded to it. Once execution of a command buffer completes, the command buffer either reverts back to the *executable state*, or if it was recorded with VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT, it moves to the *invalid state*. A synchronization command should be used to detect when this occurs.

**Invalid**

Some operations, such as modifying or deleting a resource that was used in a command recorded to a command buffer, will transition the state of that command buffer into the *invalid state*. Command buffers in the invalid state can only be reset or freed.

Any given command that operates on a command buffer has its own requirements on what state a command buffer must be in, which are detailed in the valid usage constraints for that command.

Resetting a command buffer is an operation that discards any previously recorded commands and puts a command buffer in the *initial state*. Resetting occurs as a result of vkResetCommandBuffer or vkResetCommandPool, or as part of vkBeginCommandBuffer (which additionally puts the command buffer in the *recording state*).
Secondary command buffers can be recorded to a primary command buffer via \texttt{vkCmdExecuteCommands}. This partially ties the lifecycle of the two command buffers together - if the primary is submitted to a queue, both the primary and any secondaries recorded to it move to the \textit{pending state}. Once execution of the primary completes, so it does for any secondary recorded within it. After all executions of each command buffer complete, they each move to their appropriate completion state (either to the \textit{executable state} or the \textit{invalid state}, as specified above).

If a secondary moves to the \textit{invalid state} or the \textit{initial state}, then all primary buffers it is recorded in move to the \textit{invalid state}. A primary moving to any other state does not affect the state of a secondary recorded in it.

\textbf{NOTE} Resetting or freeing a primary command buffer removes the lifecycle linkage to all secondary command buffers that were recorded into it.

\section*{6.2. Command Pools}

Command pools are opaque objects that command buffer memory is allocated from, and which allow the implementation to amortize the cost of resource creation across multiple command buffers. Command pools are externally synchronized, meaning that a command pool must not be used concurrently in multiple threads. That includes use via recording commands on any command buffers allocated from the pool, as well as operations that allocate, free, and reset command buffers or the pool itself.

Command pools are represented by \texttt{VkCommandPool} handles:

\begin{verbatim}
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkCommandPool)
\end{verbatim}

To create a command pool, call:

\begin{verbatim}
// Provided by VK_VERSION_1_0
VkResult vkCreateCommandPool(
    VkDevice device,
    const VkCommandPoolCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkCommandPool* pCommandPool);
\end{verbatim}

- \texttt{device} is the logical device that creates the command pool.
- \texttt{pCreateInfo} is a pointer to a \texttt{VkCommandPoolCreateInfo} structure specifying the state of the command pool object.
- \texttt{pAllocator} controls host memory allocation as described in the Memory Allocation chapter.
- \texttt{pCommandPool} is a pointer to a \texttt{VkCommandPool} handle in which the created pool is returned.
Valid Usage

- VUID-vkCreateCommandPool-queueFamilyIndex-01937
  
pCreateInfo->queueFamilyIndex must be the index of a queue family available in the logical device device

Valid Usage (Implicit)

- VUID-vkCreateCommandPool-device-parameter
device must be a valid VkDevice handle

- VUID-vkCreateCommandPool-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkCommandPoolCreateInfo structure

- VUID-vkCreateCommandPool-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateCommandPool-pCommandPool-parameter
  pCommandPool must be a valid pointer to a VkCommandPool handle

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkCommandPoolCreateInfo structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkCommandPoolCreateInfo {
    VkStructureType     sType;
    const void*         pNext;
    VkCommandPoolCreateFlags flags;
    uint32_t            queueFamilyIndex;
} VkCommandPoolCreateInfo;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is a bitmask of VkCommandPoolCreateFlagBits indicating usage behavior for the pool and command buffers allocated from it.
• `queueFamilyIndex` designates a queue family as described in section Queue Family Properties. All command buffers allocated from this command pool must be submitted on queues from the same queue family.

**Valid Usage**

- VUID-VkCommandPoolCreateInfo-flags-02860
  
  If the `protectedMemory` feature is not enabled, the `VK_COMMAND_POOL_CREATE_PROTECTED_BIT` bit of `flags` must not be set.

**Valid Usage (Implicit)**

- VUID-VkCommandPoolCreateInfo-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_COMMAND_POOL_CREATE_INFO`.

- VUID-VkCommandPoolCreateInfo-pNext-pNext
  
  `pNext` must be `NULL`.

- VUID-VkCommandPoolCreateInfo-flags-parameter
  
  `flags` must be a valid combination of `VkCommandPoolCreateFlagBits` values.

Bits which can be set in `VkCommandPoolCreateInfo::flags`, specifying usage behavior for a command pool, are:

```c
typedef enum VkCommandPoolCreateFlagBits {
    VK_COMMAND_POOL_CREATE_TRANSIENT_BIT = 0x00000001,
    VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT = 0x00000002,
    // Provided by VK_VERSION_1_1
    VK_COMMAND_POOL_CREATE_PROTECTED_BIT = 0x00000004,
} VkCommandPoolCreateFlagBits;
```

- `VK_COMMAND_POOL_CREATE_TRANSIENT_BIT` specifies that command buffers allocated from the pool will be short-lived, meaning that they will be reset or freed in a relatively short timeframe. This flag may be used by the implementation to control memory allocation behavior within the pool.

- `VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT` allows any command buffer allocated from a pool to be individually reset to the initial state; either by calling `vkResetCommandBuffer`, or via the implicit reset when calling `vkBeginCommandBuffer`. If this flag is not set on a pool, then `vkResetCommandBuffer` must not be called for any command buffer allocated from that pool.

- `VK_COMMAND_POOL_CREATE_PROTECTED_BIT` specifies that command buffers allocated from the pool are protected command buffers.

```c
typedef VkFlags VkCommandPoolCreateFlags;
```
VkCommandPoolCreateFlags is a bitmask type for setting a mask of zero or more VkCommandPoolCreateFlagBits.

To trim a command pool, call:

```c
// Provided by VK_VERSION_1_1
void vkTrimCommandPool(
    VkDevice      device,
    VkCommandPool commandPool,
    VkCommandPoolTrimFlags flags);
```

or the equivalent command

```c
// Provided by VK_KHR_maintenance1
void vkTrimCommandPoolKHR(
    VkDevice      device,
    VkCommandPool commandPool,
    VkCommandPoolTrimFlags flags);
```

• **device** is the logical device that owns the command pool.

• **commandPool** is the command pool to trim.

• **flags** is reserved for future use.

Trimming a command pool recycles unused memory from the command pool back to the system. Command buffers allocated from the pool are not affected by the command.

This command provides applications with some control over the internal memory allocations used by command pools.

Unused memory normally arises from command buffers that have been recorded and later reset, such that they are no longer using the memory. On reset, a command buffer can return memory to its command pool, but the only way to release memory from a command pool to the system requires calling `vkResetCommandPool`, which cannot be executed while any command buffers from that pool are still in use. Subsequent recording operations into command buffers will reuse this memory but since total memory requirements fluctuate over time, unused memory can accumulate.

**NOTE**

In this situation, trimming a command pool may be useful to return unused memory back to the system, returning the total outstanding memory allocated by the pool back to a more “average” value.

Implementations utilize many internal allocation strategies that make it impossible to guarantee that all unused memory is released back to the system. For instance, an implementation of a command pool may involve allocating memory in bulk from the system and sub-allocating from that memory. In such an implementation any live command buffer that holds a reference to a bulk allocation would prevent...
that allocation from being freed, even if only a small proportion of the bulk allocation is in use.

In most cases trimming will result in a reduction in allocated but unused memory, but it does not guarantee the “ideal” behavior.

Trimming **may** be an expensive operation, and **should** not be called frequently. Trimming **should** be treated as a way to relieve memory pressure after application-known points when there exists enough unused memory that the cost of trimming is “worth” it.

**Valid Usage (Implicit)**

- **VUID-vkTrimCommandPool-device-parameter**
  
  *device* must be a valid `VkDevice` handle

- **VUID-vkTrimCommandPool-commandPool-parameter**
  
  *commandPool* must be a valid `VkCommandPool` handle

- **VUID-vkTrimCommandPool-flags-zerobitmask**
  
  *flags* must be 0

- **VUID-vkTrimCommandPool-commandPool-parent**
  
  *commandPool* must have been created, allocated, or retrieved from `device`

**Host Synchronization**

- Host access to *commandPool* must be externally synchronized

```c
// Provided by VK_VERSION_1_1
typedef VkFlags VkCommandPoolTrimFlags;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance1
typedef VkCommandPoolTrimFlags VkCommandPoolTrimFlagsKHR;
```

`VkCommandPoolTrimFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

To reset a command pool, call:
VkResult vkResetCommandPool(
    VkDevice device,
    VkCommandPool commandPool,
    VkCommandPoolResetFlags flags);

- `device` is the logical device that owns the command pool.
- `commandPool` is the command pool to reset.
- `flags` is a bitmask of `VkCommandPoolResetFlagBits` controlling the reset operation.

Resetting a command pool recycles all of the resources from all of the command buffers allocated from the command pool back to the command pool. All command buffers that have been allocated from the command pool are put in the initial state.

Any primary command buffer allocated from another `VkCommandPool` that is in the recording or executable state and has a secondary command buffer allocated from `commandPool` recorded into it, becomes invalid.

**Valid Usage**

- VUID-vkResetCommandPool-commandPool-00040
  All `VkCommandBuffer` objects allocated from `commandPool` must not be in the pending state

**Valid Usage (Implicit)**

- VUID-vkResetCommandPool-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkResetCommandPool-commandPool-parameter
  `commandPool` must be a valid `VkCommandPool` handle

- VUID-vkResetCommandPool-flags-parameter
  `flags` must be a valid combination of `VkCommandPoolResetFlagBits` values

- VUID-vkResetCommandPool-commandPool-parent
  `commandPool` must have been created, allocated, or retrieved from `device`

**Host Synchronization**

- Host access to `commandPool` must be externally synchronized
Return Codes

Success

• VK_SUCCESS

Failure

• VK_ERROR_OUT_OF_DEVICE_MEMORY

Bits which can be set in vkResetCommandPool::flags, controlling the reset operation, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCommandPoolResetFlagBits {
    VK_COMMAND_POOL_RESET_RELEASE_RESOURCES_BIT = 0x00000001,
} VkCommandPoolResetFlagBits;
```

• **VK_COMMAND_POOL_RESET_RELEASE_RESOURCES_BIT** specifies that resetting a command pool recycles all of the resources from the command pool back to the system.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkCommandPoolResetFlags;
```

**VkCommandPoolResetFlags** is a bitmask type for setting a mask of zero or more **VkCommandPoolResetFlagBits**.

To destroy a command pool, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyCommandPool(
    VkDevice device,
    VkCommandPool commandPool,
    const VkAllocationCallbacks* pAllocator);
```

• **device** is the logical device that destroys the command pool.

• **commandPool** is the handle of the command pool to destroy.

• **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

When a pool is destroyed, all command buffers allocated from the pool are **freed**.

Any primary command buffer allocated from another **VkCommandPool** that is in the recording or executable state and has a secondary command buffer allocated from **commandPool** recorded into it, becomes **invalid**.
Valid Usage

- VUID-vkDestroyCommandPool-commandPool-00041
  All VkCommandBuffer objects allocated from commandPool must not be in the pending state

- VUID-vkDestroyCommandPool-commandPool-00042
  If VkAllocationCallbacks were provided when commandPool was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyCommandPool-commandPool-00043
  If no VkAllocationCallbacks were provided when commandPool was created, pAllocator must be NULL

Valid Usage (Implicit)

- VUID-vkDestroyCommandPool-device-parameter
  device must be a valid VkDevice handle

- VUID-vkDestroyCommandPool-commandPool-parameter
  If commandPool is not VK_NULL_HANDLE, commandPool must be a valid VkCommandPool handle

- VUID-vkDestroyCommandPool-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroyCommandPool-commandPool-parent
  If commandPool is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to commandPool must be externally synchronized

6.3. Command Buffer Allocation and Management

To allocate command buffers, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkAllocateCommandBuffers(
    VkDevice device, 
    const VkCommandBufferAllocateInfo* pAllocateInfo, 
    VkCommandBuffer* pCommandBuffers);
```

- device is the logical device that owns the command pool.
- pAllocateInfo is a pointer to a VkCommandBufferAllocateInfo structure describing parameters
of the allocation.

- **pCommandBuffers** is a pointer to an array of `VkCommandBuffer` handles in which the resulting command buffer objects are returned. The array **must** be at least the length specified by the `commandBufferCount` member of `pAllocateInfo`. Each allocated command buffer begins in the initial state.

`vkAllocateCommandBuffers` **can** be used to allocate multiple command buffers. If the allocation of any of those command buffers fails, the implementation **must** free all successfully allocated command buffer objects from this command, set all entries of the `pCommandBuffers` array to `NULL` and return the error.

**NOTE**

Filling `pCommandBuffers` with `NULL` values on failure is an exception to the default error behavior that output parameters will have undefined contents.

When command buffers are first allocated, they are in the **initial state**.

### Valid Usage (Implicit)

- VUID-vkAllocateCommandBuffers-device-parameter
  - `device` **must** be a valid `VkDevice` handle

- VUID-vkAllocateCommandBuffers-pAllocateInfo-parameter
  - `pAllocateInfo` **must** be a valid pointer to a valid `VkCommandBufferAllocateInfo` structure

- VUID-vkAllocateCommandBuffers-pCommandBuffers-parameter
  - `pCommandBuffers` **must** be a valid pointer to an array of `pAllocateInfo->commandBufferCount` `VkCommandBuffer` handles

- VUID-vkAllocateCommandBuffers-pAllocateInfo::commandBufferCount-arraylength
  - `pAllocateInfo->commandBufferCount` **must** be greater than 0

### Host Synchronization

- Host access to `pAllocateInfo->commandPool` **must** be externally synchronized

### Return Codes

#### Success

- **VK_SUCCESS**

#### Failure

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

The `VkCommandBufferAllocateInfo` structure is defined as:
typedef struct VkCommandBufferAllocateInfo {
    VkStructureType sType;
    const void* pNext;
    VkCommandPool commandPool;
    VkCommandBufferLevel level;
    uint32_t commandBufferCount;
} VkCommandBufferAllocateInfo;

• **sType** is a VkStructureType value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **commandPool** is the command pool from which the command buffers are allocated.
• **level** is a VkCommandBufferLevel value specifying the command buffer level.
• **commandBufferCount** is the number of command buffers to allocate from the pool.

### Valid Usage (Implicit)

- VUID-VkCommandBufferAllocateInfo-sType-sType
  
  sType **must** be VK_STRUCTURE_TYPE_COMMAND_BUFFER_ALLOCATE_INFO

- VUID-VkCommandBufferAllocateInfo-pNext-pNext
  
  pNext **must** be NULL

- VUID-VkCommandBufferAllocateInfo-commandPool-parameter
  
  commandPool **must** be a valid VkCommandPool handle

- VUID-VkCommandBufferAllocateInfo-level-parameter
  
  level **must** be a valid VkCommandBufferLevel value

Possible values of VkCommandBufferAllocateInfo::level, specifying the command buffer level, are:

typedef enum VkCommandBufferLevel {
    VK_COMMAND_BUFFER_LEVEL_PRIMARY = 0,
    VK_COMMAND_BUFFER_LEVEL_SECONDARY = 1,
} VkCommandBufferLevel;

• **VK_COMMAND_BUFFER_LEVEL_PRIMARY** specifies a primary command buffer.
• **VK_COMMAND_BUFFER_LEVEL_SECONDARY** specifies a secondary command buffer.

To reset a command buffer, call:
// Provided by VK_VERSION_1_0
VkResult vkResetCommandBuffer(
    VkCommandBuffer commandBuffer,
    VkCommandBufferResetFlags flags);

- `commandBuffer` is the command buffer to reset. The command buffer can be in any state other than `pending`, and is moved into the initial state.

- `flags` is a bitmask of `VkCommandBufferResetFlagBits` controlling the reset operation.

Any primary command buffer that is in the recording or executable state and has `commandBuffer` recorded into it, becomes invalid.

### Valid Usage

- VUID-vkResetCommandBuffer-commandBuffer-00045
  `commandBuffer` must not be in the pending state

- VUID-vkResetCommandBuffer-commandBuffer-00046
  `commandBuffer` must have been allocated from a pool that was created with the `VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT`

### Valid Usage (Implicit)

- VUID-vkResetCommandBuffer-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkResetCommandBuffer-flags-parameter
  `flags` must be a valid combination of `VkCommandBufferResetFlagBits` values

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Bits which can be set in `vkResetCommandBuffer::flags`, controlling the reset operation, are:
typedef enum VkCommandBufferResetFlagBits {
    VK_COMMAND_BUFFER_RESET_RELEASE_RESOURCES_BIT = 0x00000001,
} VkCommandBufferResetFlagBits;

- **VK_COMMAND_BUFFER_RESET_RELEASE_RESOURCES_BIT** specifies that most or all memory resources currently owned by the command buffer should be returned to the parent command pool. If this flag is not set, then the command buffer may hold onto memory resources and reuse them when recording commands. commandBuffer is moved to the initial state.

typedef VkFlags VkCommandBufferResetFlags;

VkCommandBufferResetFlags is a bitmask type for setting a mask of zero or more VkCommandBufferResetFlagBits.

To free command buffers, call:

```
// Provided by VK_VERSION_1_0
void vkFreeCommandBuffers(
    VkDevice device,  // the logical device that owns the command pool.
    VkCommandPool commandPool,  // the command pool from which the command buffers were allocated.
    uint32_t commandBufferCount,  // the length of the pCommandBuffers array.
    const VkCommandBuffer* pCommandBuffers);  // a pointer to an array of handles of command buffers to free.
```

Any primary command buffer that is in the recording or executable state and has any element of pCommandBuffers recorded into it, becomes invalid.

Valid Usage

- VUID-vkFreeCommandBuffers-pCommandBuffers-00047
  All elements of pCommandBuffers must not be in the pending state
- VUID-vkFreeCommandBuffers-pCommandBuffers-00048
  pCommandBuffers must be a valid pointer to an array of commandBufferCount VkCommandBuffer handles, each element of which must either be a valid handle or NULL
Valid Usage (Implicit)

- VUID-vkFreeCommandBuffers-device-parameter
  device must be a valid VkDevice handle
- VUID-vkFreeCommandBuffers-commandPool-parameter
  commandPool must be a valid VkCommandPool handle
- VUID-vkFreeCommandBuffers-commandBufferCount-arraylength
  commandBufferCount must be greater than 0
- VUID-vkFreeCommandBuffers-commandPool-parent
  commandPool must have been created, allocated, or retrieved from device
- VUID-vkFreeCommandBuffers-pCommandBuffers-parent
  Each element of pCommandBuffers that is a valid handle must have been created, allocated, or retrieved from commandPool

Host Synchronization

- Host access to commandPool must be externally synchronized
- Host access to each member of pCommandBuffers must be externally synchronized

6.4. Command Buffer Recording

To begin recording a command buffer, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkBeginCommandBuffer(
    VkCommandBuffer commandBuffer, 
    const VkCommandBufferBeginInfo* pBeginInfo);
```

- commandBuffer is the handle of the command buffer which is to be put in the recording state.
- pBeginInfo is a pointer to a VkCommandBufferBeginInfo structure defining additional information about how the command buffer begins recording.

Valid Usage

- VUID-vkBeginCommandBuffer-commandBuffer-00049
  commandBuffer must not be in the recording or pending state
- VUID-vkBeginCommandBuffer-commandBuffer-00050
  If commandBuffer was allocated from a VkCommandPool which did not have the VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT flag set, commandBuffer must be in the initial state
- VUID-vkBeginCommandBuffer-commandBuffer-00051
If `commandBuffer` is a secondary command buffer, the `pInheritanceInfo` member of `pBeginInfo` must be a valid `VkCommandBufferInheritanceInfo` structure.

- **VUID-vkBeginCommandBuffer-commandBuffer-00052**
  If `commandBuffer` is a secondary command buffer and either the `occlusionQueryEnable` member of the `pInheritanceInfo` member of `pBeginInfo` is `VK_FALSE`, or the `occlusionQueryPrecise` feature is not enabled, then `pBeginInfo->pInheritanceInfo->queryFlags` must not contain `VK_QUERY_CONTROL_PRECISE_BIT`.

- **VUID-vkBeginCommandBuffer-commandBuffer-02840**
  If `commandBuffer` is a primary command buffer, then `pBeginInfo->flags` must not set both the `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT` and the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flags.

### Valid Usage (Implicit)

- **VUID-vkBeginCommandBuffer-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkBeginCommandBuffer-pBeginInfo-parameter**
  `pBeginInfo` must be a valid pointer to a valid `VkCommandBufferBeginInfo` structure.

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkCommandBufferBeginInfo` structure is defined as:
// Provided by VK_VERSION_1_0
typedef struct VkCommandBufferBeginInfo {
    VkStructureType sType;
    const void* pNext;
    VkCommandBufferUsageFlags flags;
    const VkCommandBufferInheritanceInfo* pInheritanceInfo;
} VkCommandBufferBeginInfo;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is a bitmask of `VkCommandBufferUsageFlagBits` specifying usage behavior for the command buffer.
- **pInheritanceInfo** is a pointer to a `VkCommandBufferInheritanceInfo` structure, used if `commandBuffer` is a secondary command buffer. If this is a primary command buffer, then this value is ignored.

### Valid Usage

- **VUID-VkCommandBufferBeginInfo-flags-09123**
  If `flags` contains `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`, the `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- **VUID-VkCommandBufferBeginInfo-flags-00055**
  If `flags` contains `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`, the framebuffer member of `pInheritanceInfo` must be either `VK_NULL_HANDLE`, or a valid `VkFramebuffer` that is compatible with the `renderPass` member of `pInheritanceInfo`.

- **VUID-VkCommandBufferBeginInfo-flags-09240**
  If `flags` contains `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT` and the `dynamicRendering` feature is not enabled, the `renderPass` member of `pInheritanceInfo` must not be `VK_NULL_HANDLE`.

- **VUID-VkCommandBufferBeginInfo-flags-06002**
  If `flags` contains `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT` and the `renderPass` member of `pInheritanceInfo` is `VK_NULL_HANDLE`, the `pNext` chain of `pInheritanceInfo` must include a `VkCommandBufferInheritanceRenderingInfo` structure.

- **VUID-VkCommandBufferBeginInfo-flags-06003**
  If `flags` contains `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`, the `renderPass` member of `pInheritanceInfo` is `VK_NULL_HANDLE`, and the `pNext` chain of `pInheritanceInfo` includes a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, the `colorAttachmentCount` member of that structure must be equal to the value of `VkCommandBufferInheritanceRenderingInfo::{colorAttachmentCount}`.

- **VUID-VkCommandBufferBeginInfo-flags-06000**
  If `flags` contains `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT` and the `renderPass` member of `pInheritanceInfo` is not `VK_NULL_HANDLE`, the `renderPass` member of `pInheritanceInfo` must be a valid `VkRenderPass`.
If flags contains VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT and the renderPass member of pInheritanceInfo is not VK_NULL_HANDLE, the subpass member of pInheritanceInfo must be a valid subpass index within the renderPass member of pInheritanceInfo.

Valid Usage (Implicit)

- **VUID-VkCommandBufferBeginInfo-sType-sType**
  
sType must be VK_STRUCTURE_TYPE_COMMAND_BUFFER_BEGIN_INFO

- **VUID-VkCommandBufferBeginInfo-pNext-pNext**
  
pNext must be NULL or a pointer to a valid instance of VkDeviceGroupCommandBufferBeginInfo

- **VUID-VkCommandBufferBeginInfo-sType-unique**
  
The sType value of each struct in the pNext chain must be unique

- **VUID-VkCommandBufferBeginInfo-flags-parameter**
  
flags must be a valid combination of VkCommandBufferUsageFlagBits values

Bits which can be set in VkCommandBufferBeginInfo::flags, specifying usage behavior for a command buffer, are:

```cpp
// Provided by VK_VERSION_1_0
typedef enum VkCommandBufferUsageFlagBits {    VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT = 0x00000001,
    VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT = 0x00000002,
    VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT = 0x00000004,
} VkCommandBufferUsageFlagBits;
```

- **VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT** specifies that each recording of the command buffer will only be submitted once, and the command buffer will be reset and recorded again between each submission.

- **VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT** specifies that a secondary command buffer is considered to be entirely inside a render pass. If this is a primary command buffer, then this bit is ignored.

- **VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT** specifies that a command buffer can be resubmitted to any queue of the same queue family while it is in the pending state, and recorded into multiple primary command buffers.

```cpp
// Provided by VK_VERSION_1_0
typedef VkFlags VkCommandBufferUsageFlags;
```

VkCommandBufferUsageFlags is a bitmask type for setting a mask of zero or more VkCommandBufferUsageFlagBits.
If the command buffer is a secondary command buffer, then the `VkCommandBufferInheritanceInfo` structure defines any state that will be inherited from the primary command buffer:

```
// Provided by VK_VERSION_1_0
typedef struct VkCommandBufferInheritanceInfo {
    VkStructureType sType;
    const void* pNext;
    VkRenderPass renderPass;
    uint32_t subpass;
    VkFramebuffer framebuffer;
    VkBool32 occlusionQueryEnable;
    VkQueryControlFlags queryFlags;
    VkQueryPipelineStatisticFlags pipelineStatistics;
} VkCommandBufferInheritanceInfo;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **renderPass** is a `VkRenderPass` object defining which render passes the `VkCommandBuffer` will be compatible with and can be executed within.
- **subpass** is the index of the subpass within the render pass instance that the `VkCommandBuffer` will be executed within.
- **framebuffer** can refer to the `VkFramebuffer` object that the `VkCommandBuffer` will be rendering to if it is executed within a render pass instance. It can be `VK_NULL_HANDLE` if the framebuffer is not known.

**NOTE** Specifying the exact framebuffer that the secondary command buffer will be executed with may result in better performance at command buffer execution time.

- **occlusionQueryEnable** specifies whether the command buffer can be executed while an occlusion query is active in the primary command buffer. If this is `VK_TRUE`, then this command buffer can be executed whether the primary command buffer has an occlusion query active or not. If this is `VK_FALSE`, then the primary command buffer must not have an occlusion query active.
- **queryFlags** specifies the query flags that can be used by an active occlusion query in the primary command buffer when this secondary command buffer is executed. If this value includes the `VK_QUERY_CONTROL_PRECISE_BIT` bit, then the active query can return boolean results or actual sample counts. If this bit is not set, then the active query must not use the `VK_QUERY_CONTROL_PRECISE_BIT` bit.
- **pipelineStatistics** is a bitmask of `VkQueryPipelineStatisticFlagBits` specifying the set of pipeline statistics that can be counted by an active query in the primary command buffer when this secondary command buffer is executed. If this value includes a given bit, then this command buffer can be executed whether the primary command buffer has a pipeline statistics query active that includes this bit or not. If this value excludes a given bit, then the active pipeline statistics query must not be from a query pool that counts that statistic.
If the `VkCommandBuffer` will not be executed within a render pass instance, or if the render pass instance was begun with `vkCmdBeginRendering`, `renderPass`, `subpass`, and `framebuffer` are ignored.

### Valid Usage

- **VUID-VkCommandBufferInheritanceInfo-occlusionQueryEnable-00056**
  If the `inheritedQueries` feature is not enabled, `occlusionQueryEnable` must be `VK_FALSE`

- **VUID-VkCommandBufferInheritanceInfo-queryFlags-00057**
  If the `inheritedQueries` feature is enabled, `queryFlags` must be a valid combination of `VkQueryControlFlagBits` values

- **VUID-VkCommandBufferInheritanceInfo-queryFlags-02788**
  If the `inheritedQueries` feature is not enabled, `queryFlags` must be `0`

- **VUID-VkCommandBufferInheritanceInfo-pipelineStatistics-02789**
  If the `pipelineStatisticsQuery` feature is enabled, `pipelineStatistics` must be a valid combination of `VkQueryPipelineStatisticFlagBits` values

- **VUID-VkCommandBufferInheritanceInfo-pipelineStatistics-00058**
  If the `pipelineStatisticsQuery` feature is not enabled, `pipelineStatistics` must be `0`

### Valid Usage (Implicit)

- **VUID-VkCommandBufferInheritanceInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_INFO`

- **VUID-VkCommandBufferInheritanceInfo-pNext-pNext**
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkAttachmentSampleCountInfoAMD`, `VkCommandBufferInheritanceConditionalRenderingInfoEXT`, `VkCommandBufferInheritanceRenderPassTransformInfoQCOM`, `VkCommandBufferInheritanceRenderInfo`, `VkCommandBufferInheritanceViewportScissorInfoNV`, `VkExternalFormatANDROID`, `VkMultiviewPerViewAttributesInfoNVX`, `VkRenderingAttachmentLocationInfoKHR`, or `VkRenderingInputAttachmentIndexInfoKHR`

- **VUID-VkCommandBufferInheritanceInfo-sType-unique**
  The `sType` value of each struct in the `pNext` chain must be unique

- **VUID-VkCommandBufferInheritanceInfo-commonparent**
  Both of `framebuffer`, and `renderPass` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

### NOTE

On some implementations, not using the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` bit enables command buffers to be patched in-place if needed, rather than creating a copy of the command buffer.

If a command buffer is in the `invalid`, or `executable` state, and the command buffer was allocated from a command pool with the `VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT` flag set, then
vkBeginCommandBuffer implicitly resets the command buffer, behaving as if vkResetCommandBuffer had been called with VK_COMMAND_BUFFER_RESET_RELEASE_RESOURCES_BIT not set. After the implicit reset, commandBuffer is moved to the recording state.

If the pNext chain of VkCommandBufferInheritanceInfo includes a VkCommandBufferInheritanceConditionalRenderingInfoEXT structure, then that structure controls whether a command buffer can be executed while conditional rendering is active in the primary command buffer.

The VkCommandBufferInheritanceConditionalRenderingInfoEXT structure is defined as:

```
// Provided by VK_EXT_conditional_rendering
typedef struct VkCommandBufferInheritanceConditionalRenderingInfoEXT {
    VkStructureType sType;  
    const void* pNext;   
    VkBool32 conditionalRenderingEnable; 
} VkCommandBufferInheritanceConditionalRenderingInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- conditionalRenderingEnable specifies whether the command buffer can be executed while conditional rendering is active in the primary command buffer. If this is VK_TRUE, then this command buffer can be executed whether the primary command buffer has active conditional rendering or not. If this is VK_FALSE, then the primary command buffer must not have conditional rendering active.

If this structure is not present, the behavior is as if conditionalRenderingEnable is VK_FALSE.

**Valid Usage**

- VUID-VkCommandBufferInheritanceConditionalRenderingInfoEXT-conditionalRenderingEnable-01977
  If the inheritedConditionalRendering feature is not enabled, conditionalRenderingEnable must be VK_FALSE

**Valid Usage (Implicit)**

- VUID-VkCommandBufferInheritanceConditionalRenderingInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_CONDITIONAL_RENDERING_INFO_EXT

To begin recording a secondary command buffer compatible with execution inside a render pass using render pass transform, add the VkCommandBufferInheritanceRenderPassTransformInfoQCOM to the pNext chain of VkCommandBufferInheritanceInfo structure passed to the vkBeginCommandBuffer command.
specifying the parameters for transformed rasterization.

The `VkCommandBufferInheritanceRenderPassTransformInfoQCOM` structure is defined as:

```c
// Provided by VK_QCOM_render_pass_transform
typedef struct VkCommandBufferInheritanceRenderPassTransformInfoQCOM {
    VkStructureType sType;
    void* pNext;
    VkSurfaceTransformFlagBitsKHR transform;
    VkRect2D renderArea;
} VkCommandBufferInheritanceRenderPassTransformInfoQCOM;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **transform** is a `VkSurfaceTransformFlagBitsKHR` value describing the transform to be applied to the render pass.
- **renderArea** is the render area that is affected by the command buffer.

When the secondary is recorded to execute within a render pass instance using `vkCmdExecuteCommands`, the render pass transform parameters of the secondary command buffer must be consistent with the render pass transform parameters specified for the render pass instance. In particular, the `transform` and `renderArea` for command buffer must be identical to the `transform` and `renderArea` of the render pass instance.

### Valid Usage

- VUID-VkCommandBufferInheritanceRenderPassTransformInfoQCOM-transform-02864
  
  ```
  transform must be
  VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR,
  VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR,  
  VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR,  
  VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR
  ```

### Valid Usage (Implicit)

- VUID-VkCommandBufferInheritanceRenderPassTransformInfoQCOM-sType-sType
  
  ```
  sType must be
  VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_RENDER_PASS_TRANSFORM_INFO_QCOM
  ```

The `VkCommandBufferInheritanceViewportScissorInfoNV` structure is defined as:
typedef struct VkCommandBufferInheritanceViewportScissorInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkBool32 viewportScissor2D;
    uint32_t viewportDepthCount;
    const VkViewport* pViewportDepths;
} VkCommandBufferInheritanceViewportScissorInfoNV;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **viewportScissor2D** specifies whether the listed dynamic state is inherited.
- **viewportDepthCount** specifies the maximum number of viewports to inherit. When **viewportScissor2D** is `VK_FALSE`, the behavior is as if this value is zero.
- **pViewportDepths** is a pointer to a `VkViewport` structure specifying the expected depth range for each inherited viewport.

If the **pNext** chain of `VkCommandBufferInheritanceInfo` includes a ` VkCommandBufferInheritanceViewportScissorInfoNV` structure, then that structure controls whether a command buffer can inherit the following state from other command buffers:

- **VK_DYNAMIC_STATE_SCISSOR**
- **VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT**
- **VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT**
- **VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT**
- **VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT**

as well as the following state, with restrictions on inherited depth values and viewport count:

- **VK_DYNAMIC_STATE_VIEWPORT**
- **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT**

If **viewportScissor2D** is `VK_FALSE`, then the command buffer does not inherit the listed dynamic state, and should set this state itself. If this structure is not present, the behavior is as if **viewportScissor2D** is `VK_FALSE`.

If **viewportScissor2D** is `VK_TRUE`, then the listed dynamic state is inherited, and the command buffer must not set this state, except that the viewport and scissor count may be set by binding a graphics pipeline that does not specify this state as dynamic.

**NOTE** Due to this restriction, applications should ensure either all or none of the graphics pipelines bound in this secondary command buffer use dynamic viewport/scissor counts.

When the command buffer is executed as part of a the execution of a `vkCmdExecuteCommands`
command, the inherited state (if enabled) is determined by the following procedure, performed separately for each dynamic state, and separately for each value for dynamic state that consists of multiple values (e.g. multiple viewports).

- With \( i \) being the index of the executed command buffer in the \( p\text{CommandBuffers} \) array of \( \text{vkCmdExecuteCommands} \), if \( i > 0 \) and any secondary command buffer from index 0 to \( i-1 \) modifies the state, the inherited state is provisionally set to the final value set by the last such secondary command buffer. Binding a graphics pipeline defining the state statically is equivalent to setting the state to an undefined value.

- Otherwise, the tentative inherited state is that of the primary command buffer at the point the \( \text{vkCmdExecuteCommands} \) command was recorded; if the state is undefined, then so is the provisional inherited state.

- If the provisional inherited state is an undefined value, then the state is not inherited.

- If the provisional inherited state is a viewport, with \( n \) being its viewport index, then if \( n \geq \text{viewportDepthCount} \), or if either \( \text{VkViewport}::\text{minDepth} \) or \( \text{VkViewport}::\text{maxDepth} \) are not equal to the respective values of the \( n \)th element of \( p\text{ViewportDepths} \), then the state is not inherited.

- If the provisional inherited state passes both checks, then it becomes the actual inherited state.

**NOTE** There is no support for inheriting dynamic state from a secondary command buffer executed as part of a different \( \text{vkCmdExecuteCommands} \) command.

### Valid Usage

- **VUID-VkCommandBufferInheritanceViewportScissorInfoNV-viewportScissor2D-04782**
  If the \( \text{inheritedViewportScissor2D} \) feature is not enabled, \( \text{viewportScissor2D} \) must be \( \text{VK_FALSE} \)

- **VUID-VkCommandBufferInheritanceViewportScissorInfoNV-viewportScissor2D-04783**
  If the \( \text{multiViewport} \) feature is not enabled and \( \text{viewportScissor2D} \) is \( \text{VK_TRUE} \), then \( \text{viewportDepthCount} \) must be 1

- **VUID-VkCommandBufferInheritanceViewportScissorInfoNV-viewportScissor2D-04784**
  If \( \text{viewportScissor2D} \) is \( \text{VK_TRUE} \), then \( \text{viewportDepthCount} \) must be greater than 0

- **VUID-VkCommandBufferInheritanceViewportScissorInfoNV-viewportScissor2D-04785**
  If \( \text{viewportScissor2D} \) is \( \text{VK_TRUE} \), then \( p\text{ViewportDepths} \) must be a valid pointer to an array of \( \text{viewportDepthCount} \) valid \( \text{VkViewport} \) structures, except any requirements on \( x, y, \text{width}, \text{and height} \) do not apply

- **VUID-VkCommandBufferInheritanceViewportScissorInfoNV-viewportScissor2D-04786**
  If \( \text{viewportScissor2D} \) is \( \text{VK_TRUE} \), then the command buffer must be recorded with the \( \text{VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT} \)

### Valid Usage (Implicit)

- **VUID-VkCommandBufferInheritanceViewportScissorInfoNV-sType-sType**
  \( s\text{Type} \) must be \( \text{VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_VIEWPORT_SCISSOR_INFO_NV} \)
The `VkCommandBufferInheritanceRenderingInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkCommandBufferInheritanceRenderingInfo {
    VkStructureType     sType;
    const void*          pNext;
    VkRenderingFlags     flags;
    uint32_t             viewMask;
    uint32_t             colorAttachmentCount;
    const VkFormat*      pColorAttachmentFormats;
    VkFormat              depthAttachmentFormat;
    VkFormat              stencilAttachmentFormat;
    VkSampleCountFlagBits rasterizationSamples;
} VkCommandBufferInheritanceRenderingInfo;
```

or the equivalent

```c
// Provided by VK_KHR_dynamic_rendering
typedef VkCommandBufferInheritanceRenderingInfo
    VkCommandBufferInheritanceRenderingInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkRenderingFlagBits` used by the render pass instance.
- `viewMask` is the view mask used for rendering.
- `colorAttachmentCount` is the number of color attachments specified in the render pass instance.
- `pColorAttachmentFormats` is a pointer to an array of `VkFormat` values defining the format of color attachments.
- `depthAttachmentFormat` is a `VkFormat` value defining the format of the depth attachment.
- `stencilAttachmentFormat` is a `VkFormat` value defining the format of the stencil attachment.
- `rasterizationSamples` is a `VkSampleCountFlagBits` specifying the number of samples used in rasterization.

If the `pNext` chain of `VkCommandBufferInheritanceInfo` includes a `VkCommandBufferInheritanceRenderingInfo` structure, then that structure controls parameters of dynamic render pass instances that the `VkCommandBuffer` can be executed within. If `VkCommandBufferInheritanceInfo::renderPass` is not `VK_NULL_HANDLE`, or `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT` is not specified in `VkCommandBufferBeginInfo::flags`, parameters of this structure are ignored.

If `colorAttachmentCount` is 0 and the `variableMultisampleRate` feature is enabled, `rasterizationSamples` is ignored.

If `depthAttachmentFormat`, `stencilAttachmentFormat`, or any element of `pColorAttachmentFormats` is
VK_FORMAT_UNDEFINED, it indicates that the corresponding attachment is unused within the render pass and writes to those attachments are discarded.

### Valid Usage

- **VUID-VkCommandBufferInheritanceRenderingInfo-colorAttachmentCount-06004**
  If `colorAttachmentCount` is not 0, `rasterizationSamples` must be a valid `VkSampleCountFlagBits` value

- **VUID-VkCommandBufferInheritanceRenderingInfo-variableMultisampleRate-06005**
  If the `variableMultisampleRate` feature is not enabled, `rasterizationSamples` must be a valid `VkSampleCountFlagBits` value

- **VUID-VkCommandBufferInheritanceRenderingInfo-depthAttachmentFormat-06540**
  If `depthAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, it must be a format that includes a depth component

- **VUID-VkCommandBufferInheritanceRenderingInfo-depthAttachmentFormat-06007**
  If `depthAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, it must be a format with potential format features that include `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`

- **VUID-VkCommandBufferInheritanceRenderingInfo-pColorAttachmentFormats-06492**
  If any element of `pColorAttachmentFormats` is not `VK_FORMAT_UNDEFINED`, it must be a format with potential format features that include `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT`, or `VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV` if the `linearColorAttachment` feature is enabled

- **VUID-VkCommandBufferInheritanceRenderingInfo-stencilAttachmentFormat-06541**
  If `stencilAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, it must be a format that includes a stencil aspect

- **VUID-VkCommandBufferInheritanceRenderingInfo-stencilAttachmentFormat-06199**
  If `stencilAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, it must be a format with potential format features that include `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`

- **VUID-VkCommandBufferInheritanceRenderingInfo-depthAttachmentFormat-06200**
  If `depthAttachmentFormat` is not `VK_FORMAT_UNDEFINED` and `stencilAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, `depthAttachmentFormat` must equal `stencilAttachmentFormat`

- **VUID-VkCommandBufferInheritanceRenderingInfo-multiview-06008**
  If the `multiview` feature is not enabled, `viewMask` must be 0

- **VUID-VkCommandBufferInheritanceRenderingInfo-viewMask-06009**
  The index of the most significant bit in `viewMask` must be less than `maxMultiviewViewCount`

### Valid Usage (Implicit)

- **VUID-VkCommandBufferInheritanceRenderingInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_RENDERING_INFO`

- **VUID-VkCommandBufferInheritanceRenderingInfo-flags-parameter**
  `flags` must be a valid combination of `VkRenderingFlagBits` values
If `colorAttachmentCount` is not 0, `pColorAttachmentFormats` must be a valid pointer to an array of `colorAttachmentCount` valid `VkFormat` values.

The `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure is defined as:

```c
typedef struct VkAttachmentSampleCountInfoAMD {
    VkStructureType          sType;
    const void*              pNext;
    uint32_t                 colorAttachmentCount;
    const VkSampleCountFlagBits* pColorAttachmentSamples;
    VkSampleCountFlagBits    depthStencilAttachmentSamples;
} VkAttachmentSampleCountInfoAMD;
```

or the equivalent

```c
typedef VkAttachmentSampleCountInfoAMD VkAttachmentSampleCountInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `colorAttachmentCount` is the number of color attachments specified in a render pass instance.
- `pColorAttachmentSamples` is a pointer to an array of `VkSampleCountFlagBits` values defining the sample count of color attachments.
- `depthStencilAttachmentSamples` is a `VkSampleCountFlagBits` value defining the sample count of a depth/stencil attachment.

If `VkCommandBufferInheritanceInfo::renderPass` is `VK_NULL_HANDLE`, `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT` is specified in `VkCommandBufferBeginInfo::flags`, and the `pNext` chain of `VkCommandBufferInheritanceInfo` includes `VkAttachmentSampleCountInfoAMD`, then this structure defines the sample counts of each attachment within the render pass instance. If `VkAttachmentSampleCountInfoAMD` is not included, the value of `VkAttachmentSampleCountInfoAMD` is not used as the sample count for each attachment. If `VkCommandBufferInheritanceInfo::renderPass` is not `VK_NULL_HANDLE`, or `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT` is not specified in `VkCommandBufferBeginInfo::flags`, the sample counts of each attachment are defined by `rasterizationSamples` and `colorAttachmentSamples` in `VkCommandBufferInheritanceRenderingInfo`.
::flags, parameters of this structure are ignored.

`VkAttachmentSampleCountInfoAMD` can also be included in the `pNext` chain of `VkGraphicsPipelineCreateInfo`. When a graphics pipeline is created without a `VkRenderPass`, if this structure is included in the `pNext` chain of `VkGraphicsPipelineCreateInfo`, it specifies the sample count of attachments used for rendering. If this structure is not specified, and the pipeline does not include a `VkRenderPass`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` is used as the sample count for each attachment. If a graphics pipeline is created with a valid `VkRenderPass`, parameters of this structure are ignored.

### Valid Usage (Implicit)

- VUID-VkAttachmentSampleCountInfoAMD-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_ATTACHMENT_SAMPLE_COUNT_INFO_AMD`

Once recording starts, an application records a sequence of commands (`vkCmd*`) to set state in the command buffer, draw, dispatch, and other commands.

Several commands can also be recorded indirectly from `VkBuffer` content, see Device-Generated Commands.

To complete recording of a command buffer, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkEndCommandBuffer(
    VkCommandBuffer commandBuffer);
```

- `commandBuffer` is the command buffer to complete recording.

The command buffer must have been in the recording state, and, if successful, is moved to the executable state.

If there was an error during recording, the application will be notified by an unsuccessful return code returned by `vkEndCommandBuffer`, and the command buffer will be moved to the invalid state.

In case the application recorded one or more video encode operations into the command buffer, implementations may return the `VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR` error if any of the specified Video Std parameters do not adhere to the syntactic or semantic requirements of the used video compression standard, or if values derived from parameters according to the rules defined by the used video compression standard do not adhere to the capabilities of the video compression standard or the implementation.

**NOTE** Applications should not rely on the `VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR` error being returned by any command as a means to verify Video Std parameters, as implementations are not required to report the error in any specific set of cases.
Valid Usage

- VUID-vkEndCommandBuffer-commandBuffer-00059
  \texttt{commandBuffer} \textbf{must} be in the \textit{recording state}

- VUID-vkEndCommandBuffer-commandBuffer-00060
  If \texttt{commandBuffer} is a primary command buffer, there \textbf{must} not be an active render pass instance

- VUID-vkEndCommandBuffer-commandBuffer-00061
  All queries made \textit{active} during the recording of \texttt{commandBuffer} \textbf{must} have been made inactive

- VUID-vkEndCommandBuffer-None-01978
  Conditional rendering \textbf{must} not be \textit{active}

- VUID-vkEndCommandBuffer-None-06991
  There \textbf{must} be no video session object bound

- VUID-vkEndCommandBuffer-commandBuffer-01815
  If \texttt{commandBuffer} is a secondary command buffer, there \textbf{must} not be an outstanding \texttt{vkCmdBeginDebugUtilsLabelEXT} command recorded to \texttt{commandBuffer} that has not previously been ended by a call to \texttt{vkCmdEndDebugUtilsLabelEXT}

- VUID-vkEndCommandBuffer-commandBuffer-00062
  If \texttt{commandBuffer} is a secondary command buffer, there \textbf{must} not be an outstanding \texttt{vkCmdDebugMarkerBeginEXT} command recorded to \texttt{commandBuffer} that has not previously been ended by a call to \texttt{vkCmdDebugMarkerEndEXT}

Valid Usage (Implicit)

- VUID-vkEndCommandBuffer-commandBuffer-parameter
  \texttt{commandBuffer} \textbf{must} be a valid \texttt{VkCommandBuffer} handle

Host Synchronization

- Host access to \texttt{commandBuffer} \textbf{must} be externally synchronized
- Host access to the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \textbf{must} be externally synchronized

Return Codes

\textbf{Success}
- \texttt{VK_SUCCESS}

\textbf{Failure}
- \texttt{VK_ERROR_OUT_OF_HOST_MEMORY}
When a command buffer is in the executable state, it can be submitted to a queue for execution.

### 6.5. Command Buffer Submission

**NOTE** Submission can be a high overhead operation, and applications should attempt to batch work together into as few calls to `vkQueueSubmit` or `vkQueueSubmit2` as possible.

To submit command buffers to a queue, call:

```c
// Provided by VK_VERSION_1_3
VkResult vkQueueSubmit2(
    VkQueue queue,
    uint32_t submitCount,
    const VkSubmitInfo2* pSubmits,
    VkFence fence);
```

or the equivalent command

```c
// Provided by VK_KHR_synchronization2
VkResult vkQueueSubmit2KHR(
    VkQueue queue,
    uint32_t submitCount,
    const VkSubmitInfo2* pSubmits,
    VkFence fence);
```

- **queue** is the queue that the command buffers will be submitted to.
- **submitCount** is the number of elements in the **pSubmits** array.
- **pSubmits** is a pointer to an array of **VkSubmitInfo2** structures, each specifying a command buffer submission batch.
- **fence** is an optional handle to a fence to be signaled once all submitted command buffers have completed execution. If **fence** is not **VK_NULL_HANDLE**, it defines a fence signal operation.

`vkQueueSubmit2` is a queue submission command, with each batch defined by an element of **pSubmits**.

Semaphore operations submitted with `vkQueueSubmit2` have additional ordering constraints compared to other submission commands, with dependencies involving previous and subsequent queue operations. Information about these additional constraints can be found in the semaphore section of the synchronization chapter.

If any command buffer submitted to this queue is in the executable state, it is moved to the pending state. Once execution of all submissions of a command buffer complete, it moves from the pending state, back to the executable state. If a command buffer was recorded with the
VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT flag, it instead moves back to the invalid state.

If vkQueueSubmit2 fails, it may return VK_ERROR_OUT_OF_HOST_MEMORY or VK_ERROR_OUT_OF_DEVICE_MEMORY. If it does, the implementation must ensure that the state and contents of any resources or synchronization primitives referenced by the submitted command buffers and any semaphores referenced by pSubmits is unaffected by the call or its failure. If vkQueueSubmit2 fails in such a way that the implementation is unable to make that guarantee, the implementation must return VK_ERROR_DEVICE_LOST. See Lost Device.

Valid Usage

- VUID-vkQueueSubmit2-fence-04894
  If fence is not VK_NULL_HANDLE, fence must be unsignaled
- VUID-vkQueueSubmit2-fence-04895
  If fence is not VK_NULL_HANDLE, fence must not be associated with any other queue command that has not yet completed execution on that queue
- VUID-vkQueueSubmit2-synchronization2-03866
  The synchronization2 feature must be enabled
- VUID-vkQueueSubmit2-commandBuffer-03867
  If a command recorded into the commandBuffer member of any element of the pCommandBufferInfos member of any element of pSubmits referenced a VkEvent, that event must not be referenced by a command that has been submitted to another queue and is still in the pending state
- VUID-vkQueueSubmit2-semaphore-03868
  The semaphore member of any binary semaphore element of the pSignalSemaphoreInfos member of any element of pSubmits must be unsignaled when the semaphore signal operation it defines is executed on the device
- VUID-vkQueueSubmit2-stageMask-03869
  The stageMask member of any element of the pSignalSemaphoreInfos member of any element of pSubmits must only include pipeline stages that are supported by the queue family which queue belongs to
- VUID-vkQueueSubmit2-stageMask-03870
  The stageMask member of any element of the pWaitSemaphoreInfos member of any element of pSubmits must only include pipeline stages that are supported by the queue family which queue belongs to
- VUID-vkQueueSubmit2-semaphore-03871
  When a semaphore wait operation for a binary semaphore is executed, as defined by the semaphore member of any element of the pWaitSemaphoreInfos member of any element of pSubmits, there must be no other queues waiting on the same semaphore
- VUID-vkQueueSubmit2-semaphore-03873
  The semaphore member of any element of the pWaitSemaphoreInfos member of any element of pSubmits that was created with a VkSemaphoreTypeKHR of VK_SEMAPHORE_TYPE_BINARY_KHR must reference a semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends must...
have also been submitted for execution

- VUID-vkQueueSubmit2-commandBuffer-03874
  The commandBuffer member of any element of the pCommandBufferInfos member of any element of pSubmits must be in the pending or executable state

- VUID-vkQueueSubmit2-commandBuffer-03875
  If a command recorded into the commandBuffer member of any element of the pCommandBufferInfos member of any element of pSubmits was not recorded with the VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT, it must not be in the pending state

- VUID-vkQueueSubmit2-commandBuffer-03876
  Any secondary command buffers recorded into the commandBuffer member of any element of the pCommandBufferInfos member of any element of pSubmits must be in the pending or executable state

- VUID-vkQueueSubmit2-commandBuffer-03877
  If any secondary command buffers recorded into the commandBuffer member of any element of the pCommandBufferInfos member of any element of pSubmits was not recorded with the VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT, it must not be in the pending state

- VUID-vkQueueSubmit2-commandBuffer-03878
  Any secondary command buffers recorded into the commandBuffer member of any element of the pCommandBufferInfos member of any element of pSubmits must have been allocated from a VkCommandPool that was created for the same queue family queue belongs to

- VUID-vkQueueSubmit2-commandBuffer-03879
  If a command recorded into the commandBuffer member of any element of the pCommandBufferInfos member of any element of pSubmits includes a Queue Family Ownership Transfer Acquire Operation, there must exist a previously submitted Queue Family Ownership Transfer Release Operation on a queue in the queue family identified by the acquire operation, with parameters matching the acquire operation as defined in the definition of such acquire operations, and which happens before the acquire operation

- VUID-vkQueueSubmit2-commandBuffer-03880
  If a command recorded into the commandBuffer member of any element of the pCommandBufferInfos member of any element of pSubmits was a vkCmdBeginQuery whose queryPool was created with a queryType of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, the profiling lock must have been held continuously on the VkDevice that queue was retrieved from, throughout recording of those command buffers

- VUID-vkQueueSubmit2-queue-06447
  If queue was not created with VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT, the flags member of any element of pSubmits must not include VK_SUBMIT_PROTECTED_BIT_KHR

### Valid Usage (Implicit)

- VUID-vkQueueSubmit2-queue-parameter
  queue must be a valid VkQueue handle
• **VUID-vkQueueSubmit2-pSubmits-parameter**
  If `submitCount` is not 0, `pSubmits` must be a valid pointer to an array of `submitCount` valid `VkSubmitInfo2` structures

• **VUID-vkQueueSubmit2-fence-parameter**
  If `fence` is not `VK_NULL_HANDLE`, `fence` must be a valid `VkFence` handle

• **VUID-vkQueueSubmit2-commonparent**
  Both of `fence`, and `queue` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

### Host Synchronization

- Host access to `queue` must be externally synchronized
- Host access to `fence` must be externally synchronized

### Command Properties

</tbody>
</table>

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`

The `VkSubmitInfo2` structure is defined as:
// Provided by VK_VERSION_1_3
typedef struct VkSubmitInfo2 { 
    VkStructureType sType; 
    const void* pNext; 
    VkSubmitFlags flags; 
    uint32_t waitSemaphoreInfoCount; 
    const VkSemaphoreSubmitInfo* pWaitSemaphoreInfos; 
    uint32_t commandBufferInfoCount; 
    const VkCommandBufferSubmitInfo* pCommandBufferInfos; 
    uint32_t signalSemaphoreInfoCount; 
    const VkSemaphoreSubmitInfo* pSignalSemaphoreInfos; 
} VkSubmitInfo2;

or the equivalent

// Provided by VK_KHR_synchronization2
typedef VkSubmitInfo2 VkSubmitInfo2KHR;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• flags is a bitmask of VkSubmitFlagBits.
• waitSemaphoreInfoCount is the number of elements in pWaitSemaphoreInfos.
• pWaitSemaphoreInfos is a pointer to an array of VkSemaphoreSubmitInfo structures defining semaphore wait operations.
• commandBufferInfoCount is the number of elements in pCommandBufferInfos and the number of command buffers to execute in the batch.
• pCommandBufferInfos is a pointer to an array of VkCommandBufferSubmitInfo structures describing command buffers to execute in the batch.
• signalSemaphoreInfoCount is the number of elements in pSignalSemaphoreInfos.
• pSignalSemaphoreInfos is a pointer to an array of VkSemaphoreSubmitInfo describing semaphore signal operations.

Valid Usage

• VUID-VkSubmitInfo2-semaphore-03881
  If the same semaphore is used as the semaphore member of both an element of pSignalSemaphoreInfos and pWaitSemaphoreInfos, and that semaphore is a timeline semaphore, the value member of the pSignalSemaphoreInfos element must be greater than the value member of the pWaitSemaphoreInfos element

• VUID-VkSubmitInfo2-semaphore-03882
  If the semaphore member of any element of pSignalSemaphoreInfos is a timeline semaphore, the value member of that element must have a value greater than the current value of the semaphore when the semaphore signal operation is executed
If the semaphore member of any element of pSignalSemaphoreInfos is a timeline semaphore, the value member of that element must have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on that semaphore by more than maxTimelineSemaphoreValueDifference

If the semaphore member of any element of pWaitSemaphoreInfos is a timeline semaphore, the value member of that element must have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on that semaphore by more than maxTimelineSemaphoreValueDifference

If flags includes VK_SUBMIT_PROTECTED_BIT, all elements of pCommandBuffers must be protected command buffers

If flags does not include VK_SUBMIT_PROTECTED_BIT, each element of pCommandBuffers must not be a protected command buffer

If any commandBuffer member of an element of pCommandBufferInfos contains any resumed render pass instances, they must be suspended by a render pass instance earlier in submission order within pCommandBufferInfos

If any commandBuffer member of an element of pCommandBufferInfos contains any suspended render pass instances, they must be resumed by a render pass instance later in submission order within pCommandBufferInfos

If any commandBuffer member of an element of pCommandBufferInfos contains any suspended render pass instances, there must be no action or synchronization commands between that render pass instance and the render pass instance that resumes it

If any commandBuffer member of an element of pCommandBufferInfos contains any suspended render pass instances, there must be no render pass instances between that render pass instance and the render pass instance that resumes it

If the variableSampleLocations limit is not supported, and any commandBuffer member of an element of pCommandBufferInfos contains any suspended render pass instances, where a graphics pipeline has been bound, any pipelines bound in the render pass instance that resumes it, or any subsequent render pass instances that resume from that one and so on, must use the same sample locations

Valid Usage (Implicit)

sType must be VK_STRUCTURE_TYPE_SUBMIT_INFO_2
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkFrameBoundaryEXT`, `VkLatencySubmissionPresentIdNV`, `VkPerformanceQuerySubmitInfoKHR`, `VkWin32KeyedMutexAcquireReleaseInfoKHR`, or `VkWin32KeyedMutexAcquireReleaseInfoNV`.

The `sType` value of each struct in the `pNext` chain **must** be unique.

`flags` **must** be a valid combination of `VkSubmitFlagBits` values.

If `waitSemaphoreInfoCount` is not 0, `pWaitSemaphoreInfos` **must** be a valid pointer to an array of `waitSemaphoreInfoCount` valid `VkSemaphoreSubmitInfo` structures.

If `commandBufferInfoCount` is not 0, `pCommandBufferInfos` **must** be a valid pointer to an array of `commandBufferInfoCount` valid `VkCommandBufferSubmitInfo` structures.

If `signalSemaphoreInfoCount` is not 0, `pSignalSemaphoreInfos` **must** be a valid pointer to an array of `signalSemaphoreInfoCount` valid `VkSemaphoreSubmitInfo` structures.

Bits which **can** be set in `VkSubmitInfo2::flags`, specifying submission behavior, are:

```c
// Provided by VK_VERSION_1_3
typedef enum VkSubmitFlagBits {
    VK_SUBMIT_PROTECTED_BIT = 0x00000001,
    VK_SUBMIT_PROTECTED_BIT_KHR = VK_SUBMIT_PROTECTED_BIT,
} VkSubmitFlagBits;
```

**VK_SUBMIT_PROTECTED_BIT** specifies that this batch is a protected submission.

```c
// Provided by VK_KHR_synchronization2
typedef VkSubmitFlagBits VkSubmitFlagBitsKHR;
```

```c
// Provided by VK_VERSION_1_3
typedef VkFlags VkSubmitFlags;
```

**or the equivalent**

```c
// Provided by VK_KHR_synchronization2
typedef VkSubmitFlags VkSubmitFlagsKHR;
```
VkSubmitFlags is a bitmask type for setting a mask of zero or more VkSubmitFlagBits.

The VkSemaphoreSubmitInfo structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkSemaphoreSubmitInfo {
    VkStructureType sType;
    const void*pNext;
    VkSemaphore semaphore;
    uint64_t value;
    VkPipelineStageFlags2 stageMask;
    uint32_t deviceIndex;
} VkSemaphoreSubmitInfo;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkSemaphoreSubmitInfo VkSemaphoreSubmitInfoKHR;
```

• **sType** is a VkStructureType value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **semaphore** is a VkSemaphore affected by this operation.

• **value** is either the value used to signal semaphore or the value waited on by semaphore, if semaphore is a timeline semaphore. Otherwise it is ignored.

• **stageMask** is a VkPipelineStageFlags2 mask of pipeline stages which limit the first synchronization scope of a semaphore signal operation, or second synchronization scope of a semaphore wait operation as described in the semaphore wait operation and semaphore signal operation sections of the synchronization chapter.

• **deviceIndex** is the index of the device within a device group that executes the semaphore wait or signal operation.

Whether this structure defines a semaphore wait or signal operation is defined by how it is used.

**Valid Usage**

- **VUID-VkSemaphoreSubmitInfo-stageMask-03929**
  If the geometryShader feature is not enabled, stageMask must not contain VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT

- **VUID-VkSemaphoreSubmitInfo-stageMask-03930**
  If the tessellationShader feature is not enabled, stageMask must not contain VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT or VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT

- **VUID-VkSemaphoreSubmitInfo-stageMask-03931**
  If the conditionalRendering feature is not enabled, stageMask must not contain
If the `fragmentDensityMap` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT`.

If the `transformFeedback` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`.

If the `meshShader` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT`.

If the `taskShader` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT`.

If neither the `shadingRateImage` or `attachmentFragmentShadingRate` are enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

If the `subpassShading` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI`.

If the `invocationMask` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI`.

If neither the `VK_NV_ray_tracing` extension or `rayTracingPipeline` feature are enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`.

If the `device` that semaphore was created on is not a device group, `deviceIndex` must be 0.

If the `device` that semaphore was created on is a device group, `deviceIndex` must be a valid device index.

---

**Valid Usage (Implicit)**

- `sType` must be `VK_STRUCTURE_TYPE_SEMAPHORE_SUBMIT_INFO`.
- `pNext` must be `NULL`.
- `semaphore` must be a valid `VkSemaphore` handle.
- `stageMask` must be a valid combination of `VkPipelineStageFlagBits2` values.
The `VkCommandBufferSubmitInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkCommandBufferSubmitInfo {
    VkStructureType sType;
    const void* pNext;
    VkCommandBuffer commandBuffer;
    uint32_t deviceMask;
} VkCommandBufferSubmitInfo;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkCommandBufferSubmitInfo VkCommandBufferSubmitInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `commandBuffer` is a `VkCommandBuffer` to be submitted for execution.
- `deviceMask` is a bitmask indicating which devices in a device group execute the command buffer. A `deviceMask` of `0` is equivalent to setting all bits corresponding to valid devices in the group to `1`.

### Valid Usage

- **VUID-VkCommandBufferSubmitInfo-commandBuffer-03890**
  
  `commandBuffer` **must** not have been allocated with `VK_COMMAND_BUFFER_LEVEL_SECONDARY`

- **VUID-VkCommandBufferSubmitInfo-deviceMask-03891**
  
  If `deviceMask` is not `0`, it **must** be a valid device mask

- **VUID-VkCommandBufferSubmitInfo-commandBuffer-09445**
  
  If any render pass instance in `commandBuffer` was recorded with a `VkRenderPassStripeBeginInfoARM` structure in its `pNext` chain and did not specify the `VK_RENDERING_RESUMING_BIT` flag, a `VkRenderPassStripeSubmitInfoARM` **must** be included in the `pNext` chain

- **VUID-VkCommandBufferSubmitInfo-pNext-09446**
  
  If a `VkRenderPassStripeSubmitInfoARM` is included in the `pNext` chain, the value of `VkRenderPassStripeSubmitInfoARM::stripeSemaphoreInfoCount` **must** be equal to the sum of the `VkRenderPassStripeBeginInfoARM::stripeInfoCount` parameters provided to render pass instances recorded in `commandBuffer` that did not specify the `VK_RENDERING_RESUMING_BIT` flag

### Valid Usage (Implicit)

- **VUID-VkCommandBufferSubmitInfo-sType-sType**
  
  `sType` **must** be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_SUBMIT_INFO`
• **VUID-VkCommandBufferSubmitInfo-pNext-pNext**
  `pNext` **must** be `NULL` or a pointer to a valid instance of `VkRenderPassStripeSubmitInfoARM`.

• **VUID-VkCommandBufferSubmitInfo-sType-unique**
  The `sType` value of each struct in the `pNext` chain **must** be unique.

• **VUID-VkCommandBufferSubmitInfo-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle.

The `VkRenderPassStripeSubmitInfoARM` structure is defined as:

```c
// Provided by VK_ARM_render_pass_striped
typedef struct VkRenderPassStripeSubmitInfoARM {
    VkStructureType sType;
    const void* pNext;
    uint32_t stripeSemaphoreInfoCount;
    const VkSemaphoreSubmitInfo* pStripeSemaphoreInfos;
} VkRenderPassStripeSubmitInfoARM;
```

• `sType` is a `VkStructureType` value identifying this structure.

• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `stripeSemaphoreInfoCount` is the number of semaphores used to signal stripe completion in the render pass instances in the submitted command buffer.

• `pStripeSemaphoreInfos` is a pointer to an array of `stripeSemaphoreInfoCount` `VkSemaphoreSubmitInfo` structures describing the semaphores used to signal stripe completion.

This structure can be included in the `pNext` chain of `VkCommandBufferSubmitInfo` to provide a set of semaphores to be signaled for each striped render pass instance.

The elements of `pStripeSemaphoreInfos` are mapped to render pass instances in `VkCommandBufferSubmitInfo::commandBuffer` in submission order and in stripe order within each render pass instance. Each semaphore in `pStripeSemaphoreInfos` is signaled when the implementation has completed execution of the associated stripe. In a render pass instance that has multiview enabled, the stripe includes all views in the view mask. In a render pass instance with `layerCount` greater than 1, the stripe includes all layers.

Render pass instances that specify the `VK_RENDERING_RESUMING_BIT` will not have any elements of `pStripeSemaphoreInfos` mapped to them. Instead, for suspending and resuming render pass instances, this mapping is done for the first suspending render pass instance, and the per-stripe semaphores are only signaled for the last resuming render pass instance.

**Valid Usage**

• **VUID-VkRenderPassStripeSubmitInfoARM-semaphore-09447**
  The `semaphore` member of each element of `pStripeSemaphoreInfos` **must** have been created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY`
Valid Usage (Implicit)

- VUID-VkRenderPassStripeSubmitInfoARM-sType-sType
  
  *must* be `VK_STRUCTURE_TYPE_RENDER_PASS_STRIPE_SUBMIT_INFO_ARM`

- VUID-VkRenderPassStripeSubmitInfoARM-pStripeSemaphoreInfos-parameter
  
  `pStripeSemaphoreInfos` *must* be a valid pointer to an array of `stripeSemaphoreInfoCount` valid `VkSemaphoreSubmitInfo` structures

- VUID-VkRenderPassStripeSubmitInfoARM-stripeSemaphoreInfoCount-arraylength
  
  `stripeSemaphoreInfoCount` *must* be greater than 0

To submit command buffers to a queue, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkQueueSubmit(
    VkQueue queue,
    uint32_t submitCount,
    const VkSubmitInfo* pSubmits,
    VkFence fence);
```

- `queue` is the queue that the command buffers will be submitted to.
- `submitCount` is the number of elements in the `pSubmits` array.
- `pSubmits` is a pointer to an array of `VkSubmitInfo` structures, each specifying a command buffer submission batch.
- `fence` is an optional handle to a fence to be signaled once all submitted command buffers have completed execution. If `fence` is not `VK_NULL_HANDLE`, it defines a fence signal operation.

`vkQueueSubmit` is a queue submission command, with each batch defined by an element of `pSubmits`. Batches begin execution in the order they appear in `pSubmits`, but may complete out of order.

Fence and semaphore operations submitted with `vkQueueSubmit` have additional ordering constraints compared to other submission commands, with dependencies involving previous and subsequent queue operations. Information about these additional constraints can be found in the semaphore and fence sections of the synchronization chapter.

Details on the interaction of `pWaitDstStageMask` with synchronization are described in the semaphore wait operation section of the synchronization chapter.

The order that batches appear in `pSubmits` is used to determine submission order, and thus all the implicit ordering guarantees that respect it. Other than these implicit ordering guarantees and any explicit synchronization primitives, these batches may overlap or otherwise execute out of order.

If any command buffer submitted to this queue is in the executable state, it is moved to the pending state. Once execution of all submissions of a command buffer complete, it moves from the pending state, back to the executable state. If a command buffer was recorded with the `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT` flag, it instead moves to the invalid state.
If `vkQueueSubmit` fails, it may return `VK_ERROR_OUT_OF_HOST_MEMORY` or `VK_ERROR_OUT_OF_DEVICE_MEMORY`. If it does, the implementation must ensure that the state and contents of any resources or synchronization primitives referenced by the submitted command buffers and any semaphores referenced by `pSubmits` is unaffected by the call or its failure. If `vkQueueSubmit` fails in such a way that the implementation is unable to make that guarantee, the implementation must return `VK_ERROR_DEVICE_LOST`. See Lost Device.

### Valid Usage

- **VUID-vkQueueSubmit-fence-00063**
  If `fence` is not `VK_NULL_HANDLE`, `fence` must be unsignaled

- **VUID-vkQueueSubmit-fence-00064**
  If `fence` is not `VK_NULL_HANDLE`, `fence` must not be associated with any other queue command that has not yet completed execution on that queue

- **VUID-vkQueueSubmit-pCommandBuffers-00065**
  Any calls to `vkCmdSetEvent`, `vkCmdResetEvent` or `vkCmdWaitEvents` that have been recorded into any of the command buffer elements of the `pCommandBuffers` member of any element of `pSubmits`, must not reference any `VkEvent` that is referenced by any of those commands in a command buffer that has been submitted to another queue and is still in the pending state

- **VUID-vkQueueSubmit-pWaitDstStageMask-00066**
  Any stage flag included in any element of the `pWaitDstStageMask` member of any element of `pSubmits` must be a pipeline stage supported by one of the capabilities of `queue`, as specified in the table of supported pipeline stages

- **VUID-vkQueueSubmit-pSignalSemaphores-00067**
  Each binary semaphore element of the `pSignalSemaphores` member of any element of `pSubmits` must be unsignaled when the semaphore signal operation it defines is executed on the device

- **VUID-vkQueueSubmit-pWaitSemaphores-00068**
  When a semaphore wait operation referring to a binary semaphore defined by any element of the `pWaitSemaphores` member of any element of `pSubmits` executes on `queue`, there must be no other queues waiting on the same semaphore

- **VUID-vkQueueSubmit-pWaitSemaphores-03238**
  All elements of the `pWaitSemaphores` member of all elements of `pSubmits` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY` must reference a semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends must have also been submitted for execution

- **VUID-vkQueueSubmit-pCommandBuffers-00070**
  Each element of the `pCommandBuffers` member of each element of `pSubmits` must be in the pending or executable state

- **VUID-vkQueueSubmit-pCommandBuffers-00071**
  If any element of the `pCommandBuffers` member of any element of `pSubmits` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT`, it must not be in the pending state
• VUID-vkQueueSubmit-pCommandBuffers-00072
Any secondary command buffers recorded into any element of the pCommandBuffers member of any element of pSubmits must be in the pending or executable state.

• VUID-vkQueueSubmit-pCommandBuffers-00073
If any secondary command buffers recorded into any element of the pCommandBuffers member of any element of pSubmits was not recorded with the VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT, it must not be in the pending state.

• VUID-vkQueueSubmit-pCommandBuffers-00074
Each element of the pCommandBuffers member of each element of pSubmits must have been allocated from a VkCommandPool that was created for the same queue family queue belongs to.

• VUID-vkQueueSubmit-pSubmits-02207
If any element of pSubmits->pCommandBuffers includes a Queue Family Ownership Transfer Acquire Operation, there must exist a previously submitted Queue Family Ownership Transfer Release Operation on a queue in the queue family identified by the acquire operation, with parameters matching the acquire operation as defined in the definition of such acquire operations, and which happens-before the acquire operation.

• VUID-vkQueueSubmit-pCommandBuffers-03220
If a command recorded into any element of pCommandBuffers was a vkCmdBeginQuery whose queryPool was created with a queryType of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, the profiling lock must have been held continuously on the VkDevice that queue was retrieved from, throughout recording of those command buffers.

• VUID-vkQueueSubmit-pSubmits-02808
Any resource created with VK_SHARING_MODE_EXCLUSIVE that is read by an operation specified by pSubmits must not be owned by any queue family other than the one which queue belongs to, at the time it is executed.

• VUID-vkQueueSubmit-pSubmits-04626
Any resource created with VK_SHARING_MODE_CONCURRENT that is accessed by an operation specified by pSubmits must have included the queue family of queue at resource creation time.

• VUID-vkQueueSubmit-queue-06448
If queue was not created with VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT, there must be no element of pSubmits that includes a VkProtectedSubmitInfo structure in its pNext chain with protectedSubmit equal to VK_TRUE.

Valid Usage (Implicit)

• VUID-vkQueueSubmit-queue-parameter
queue must be a valid VkQueue handle.

• VUID-vkQueueSubmit-pSubmits-parameter
If submitCount is not 0, pSubmits must be a valid pointer to an array of submitCount valid VkSubmitInfo structures.

• VUID-vkQueueSubmit-fence-parameter
If fence is not VK_NULL_HANDLE, fence must be a valid VkFence handle

- VUID-vkQueueSubmit-commonparent
  Both of fence, and queue that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

**Host Synchronization**

- Host access to queue must be externally synchronized
- Host access to fence must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>Any</td>
<td>-</td>
</tr>
</tbody>
</table>

**Return Codes**

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST

The VkSubmitInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSubmitInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreCount;
    const VkSemaphore* pWaitSemaphores;
    const VkPipelineStageFlags* pWaitDstStageMask;
    uint32_t commandBufferCount;
    const VkCommandBuffer* pCommandBuffers;
    uint32_t signalSemaphoreCount;
    const VkSemaphore* pSignalSemaphores;
} VkSubmitInfo;
```

- sType is a VkStructureType value identifying this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.

• `waitSemaphoreCount` is the number of semaphores upon which to wait before executing the
command buffers for the batch.

• `pWaitSemaphores` is a pointer to an array of `VkSemaphore` handles upon which to wait before the
command buffers for this batch begin execution. If semaphores to wait on are provided, they
define a semaphore wait operation.

• `pWaitDstStageMask` is a pointer to an array of pipeline stages at which each corresponding
semaphore wait will occur.

• `commandBufferCount` is the number of command buffers to execute in the batch.

• `pCommandBuffers` is a pointer to an array of `VkCommandBuffer` handles to execute in the batch.

• `signalSemaphoreCount` is the number of semaphores to be signaled once the commands specified
in `pCommandBuffers` have completed execution.

• `pSignalSemaphores` is a pointer to an array of `VkSemaphore` handles which will be signaled when
the command buffers for this batch have completed execution. If semaphores to be signaled are
provided, they define a semaphore signal operation.

The order that command buffers appear in `pCommandBuffers` is used to determine submission order,
and thus all the implicit ordering guarantees that respect it. Other than these implicit ordering
 guarantees and any explicit synchronization primitives, these command buffers may overlap or
otherwise execute out of order.

---

**Valid Usage**

- **VUID-VkSubmitInfo-pWaitDstStageMask-04090**
  If the `geometryShader` feature is not enabled, `pWaitDstStageMask` must not contain
  `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`

- **VUID-VkSubmitInfo-pWaitDstStageMask-04091**
  If the `tessellationShader` feature is not enabled, `pWaitDstStageMask` must not contain
  `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or
  `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`

- **VUID-VkSubmitInfo-pWaitDstStageMask-04092**
  If the `conditionalRendering` feature is not enabled, `pWaitDstStageMask` must not contain
  `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`

- **VUID-VkSubmitInfo-pWaitDstStageMask-04093**
  If the `fragmentDensityMap` feature is not enabled, `pWaitDstStageMask` must not contain
  `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

- **VUID-VkSubmitInfo-pWaitDstStageMask-04094**
  If the `transformFeedback` feature is not enabled, `pWaitDstStageMask` must not contain
  `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`

- **VUID-VkSubmitInfo-pWaitDstStageMask-04095**
  If the `meshShader` feature is not enabled, `pWaitDstStageMask` must not contain
  `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT`

- **VUID-VkSubmitInfo-pWaitDstStageMask-04096**
If the `taskShader` feature is not enabled, `pWaitDstStageMask` must not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT`.

- **VUID-VkSubmitInfo-pWaitDstStageMask-07318**
  If neither the `shadingRateImage` or `attachmentFragmentShadingRate` feature are enabled, `pWaitDstStageMask` must not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- **VUID-VkSubmitInfo-pWaitDstStageMask-03937**
  If the `synchronization2` feature is not enabled, `pWaitDstStageMask` must not be 0.

- **VUID-VkSubmitInfo-pWaitDstStageMask-07949**
  If neither the `VK_NV_ray_tracing` extension or `rayTracingPipeline` feature are enabled, `pWaitDstStageMask` must not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`.

- **VUID-VkSubmitInfo-pCommandBuffers-00075**
  Each element of `pCommandBuffers` must not have been allocated with `VK_COMMAND_BUFFER_LEVEL_SECONDARY`.

- **VUID-VkSubmitInfo-pWaitDstStageMask-00078**
  Each element of `pWaitDstStageMask` must not include `VK_PIPELINE_STAGE_HOST_BIT`.

- **VUID-VkSubmitInfo-pWaitSemaphores-03239**
  If any element of `pWaitSemaphores` or `pSignalSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`, then the `pNext` chain must include a `VkTimelineSemaphoreSubmitInfo` structure.

- **VUID-VkSubmitInfo-pNext-03240**
  If the `pNext` chain of this structure includes a `VkTimelineSemaphoreSubmitInfo` structure and any element of `pWaitSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`, then its `waitSemaphoreValueCount` member must equal `waitSemaphoreCount`.

- **VUID-VkSubmitInfo-pNext-03241**
  If the `pNext` chain of this structure includes a `VkTimelineSemaphoreSubmitInfo` structure and any element of `pSignalSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`, then its `signalSemaphoreValueCount` member must equal `signalSemaphoreCount`.

- **VUID-VkSubmitInfo-pSignalSemaphores-03242**
  For each element of `pSignalSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`, the corresponding element of `VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues` must have a value greater than the current value of the semaphore when the semaphore signal operation is executed.

- **VUID-VkSubmitInfo-pWaitSemaphores-03243**
  For each element of `pWaitSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`, the corresponding element of `VkTimelineSemaphoreSubmitInfo::pWaitSemaphoreValues` must have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on that semaphore by more than `maxTimelineSemaphoreValueDifference`. 
For each element of `pSignalSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the corresponding element of `VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues` must have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on that semaphore by more than `maxTimelineSemaphoreValueDifference`.

If the `pNext` chain of this structure does not include a `VkProtectedSubmitInfo` structure with `protectedSubmit` set to `VK_TRUE`, then each element of the `pCommandBuffers` array must be an unprotected command buffer.

If the `pNext` chain of this structure includes a `VkProtectedSubmitInfo` structure with `protectedSubmit` set to `VK_TRUE`, then each element of the `pCommandBuffers` array must be a protected command buffer.

If `pCommandBuffers` contains any resumed render pass instances, they must be suspended by a render pass instance earlier in submission order within `pCommandBuffers`.

If `pCommandBuffers` contains any suspended render pass instances, they must be resumed by a render pass instance later in submission order within `pCommandBuffers`.

If `pCommandBuffers` contains any suspended render pass instances, there must be no action or synchronization commands executed in a primary or secondary command buffer between that render pass instance and the render pass instance that resumes it.

If `pCommandBuffers` contains any suspended render pass instances, there must be no render pass instances between that render pass instance and the render pass instance that resumes it.

If the `variableSampleLocations` limit is not supported, and any element of `pCommandBuffers` contains any suspended render pass instances, where a graphics pipeline has been bound, any pipelines bound in the render pass instance that resumes it, or any subsequent render pass instances that resume from that one and so on, must use the same sample locations.

Valid Usage (Implicit)

- **VUID-VkSubmitInfo-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_SUBMIT_INFO`.

- **VUID-VkSubmitInfo-pNext-pNext**
  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkAmigoProfilingSubmitInfoSEC`.  

---

256
To specify the values to use when waiting for and signaling semaphores created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE, add a VkTimelineSemaphoreSubmitInfo structure to the pNext chain of the VkSubmitInfo structure when using vkQueueSubmit or the VkBindSparseInfo structure when using vkQueueBindSparse. The VkTimelineSemaphoreSubmitInfo structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkTimelineSemaphoreSubmitInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreValueCount;
    const uint64_t* pWaitSemaphoreValues;
    uint32_t signalSemaphoreValueCount;
    const uint64_t* pSignalSemaphoreValues;
} VkTimelineSemaphoreSubmitInfo;
```

or the equivalent
typedef VkTimelineSemaphoreSubmitInfo VkTimelineSemaphoreSubmitInfoKHR;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `waitSemaphoreValueCount` is the number of semaphore wait values specified in `pWaitSemaphoreValues`.
- `pWaitSemaphoreValues` is a pointer to an array of `waitSemaphoreValueCount` values for the corresponding semaphores in `VkSubmitInfo::pWaitSemaphores` to wait for.
- `signalSemaphoreValueCount` is the number of semaphore signal values specified in `pSignalSemaphoreValues`.
- `pSignalSemaphoreValues` is a pointer to an array of `signalSemaphoreValueCount` values for the corresponding semaphores in `VkSubmitInfo::pSignalSemaphores` to set when signaled.

If the semaphore in `VkSubmitInfo::pWaitSemaphores` or `VkSubmitInfo::pSignalSemaphores` corresponding to an entry in `pWaitSemaphoreValues` or `pSignalSemaphoreValues` respectively was not created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`, the implementation must ignore the value in the `pWaitSemaphoreValues` or `pSignalSemaphoreValues` entry.

**Valid Usage (Implicit)**

- VUID-VkTimelineSemaphoreSubmitInfo-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_TIMELINE_SEMAPHORE_SUBMIT_INFO`

- VUID-VkTimelineSemaphoreSubmitInfo-pWaitSemaphoreValues-parameter
  
  If `waitSemaphoreValueCount` is not 0, and `pWaitSemaphoreValues` is not `NULL`, `pWaitSemaphoreValues` must be a valid pointer to an array of `waitSemaphoreValueCount` `uint64_t` values

- VUID-VkTimelineSemaphoreSubmitInfo-pSignalSemaphoreValues-parameter
  
  If `signalSemaphoreValueCount` is not 0, and `pSignalSemaphoreValues` is not `NULL`, `pSignalSemaphoreValues` must be a valid pointer to an array of `signalSemaphoreValueCount` `uint64_t` values

To specify the values to use when waiting for and signaling semaphores whose current payload refers to a Direct3D 12 fence, add a `VkD3D12FenceSubmitInfoKHR` structure to the `pNext` chain of the `VkSubmitInfo` structure. The `VkD3D12FenceSubmitInfoKHR` structure is defined as:
typedef struct VkD3D12FenceSubmitInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreValuesCount;
    const uint64_t* pWaitSemaphoreValues;
    uint32_t signalSemaphoreValuesCount;
    const uint64_t* pSignalSemaphoreValues;
} VkD3D12FenceSubmitInfoKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **waitSemaphoreValuesCount** is the number of semaphore wait values specified in `pWaitSemaphoreValues`.
- **pWaitSemaphoreValues** is a pointer to an array of `waitSemaphoreValuesCount` values for the corresponding semaphores in `VkSubmitInfo::pWaitSemaphores` to wait for.
- **signalSemaphoreValuesCount** is the number of semaphore signal values specified in `pSignalSemaphoreValues`.
- **pSignalSemaphoreValues** is a pointer to an array of `signalSemaphoreValuesCount` values for the corresponding semaphores in `VkSubmitInfo::pSignalSemaphores` to set when signaled.

If the semaphore in `VkSubmitInfo::pWaitSemaphores` or `VkSubmitInfo::pSignalSemaphores` corresponding to an entry in `pWaitSemaphoreValues` or `pSignalSemaphoreValues` respectively does not currently have a **payload** referring to a Direct3D 12 fence, the implementation **must** ignore the value in the `pWaitSemaphoreValues` or `pSignalSemaphoreValues` entry.

**NOTE**
As the introduction of the external semaphore handle type `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT` predates that of timeline semaphores, support for importing semaphore payloads from external handles of that type into semaphores created (implicitly or explicitly) with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY` is preserved for backwards compatibility. However, applications **should** prefer importing such handle types into semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`, and use the `VkTimelineSemaphoreSubmitInfo` structure instead of the `VkD3D12FenceSubmitInfoKHR` structure to specify the values to use when waiting for and signaling such semaphores.

**Valid Usage**
- VUID-VkD3D12FenceSubmitInfoKHR-waitSemaphoreValuesCount-00079
  `waitSemaphoreValuesCount` **must** be the same value as `VkSubmitInfo::waitSemaphoreCount`, where this structure is in the `pNext` chain of a `VkSubmitInfo` structure

- VUID-VkD3D12FenceSubmitInfoKHR-signalSemaphoreValuesCount-00080
  `signalSemaphoreValuesCount` **must** be the same value as `VkSubmitInfo::`
signalSemaphoreCount, where this structure is in the pNext chain of a VkSubmitInfo structure

Valid Usage (Implicit)

- VUID-VkD3D12FenceSubmitInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_D3D12_FENCE_SUBMIT_INFO_KHR

- VUID-VkD3D12FenceSubmitInfoKHR-pWaitSemaphoreValues-parameter
  If waitSemaphoreValuesCount is not 0, and pWaitSemaphoreValues is not NULL, pWaitSemaphoreValues must be a valid pointer to an array of waitSemaphoreValuesCount uint64_t values

- VUID-VkD3D12FenceSubmitInfoKHR-pSignalSemaphoreValues-parameter
  If signalSemaphoreValuesCount is not 0, and pSignalSemaphoreValues is not NULL, pSignalSemaphoreValues must be a valid pointer to an array of signalSemaphoreValuesCount uint64_t values

When submitting work that operates on memory imported from a Direct3D 11 resource to a queue, the keyed mutex mechanism may be used in addition to Vulkan semaphores to synchronize the work. Keyed mutexes are a property of a properly created shareable Direct3D 11 resource. They can only be used if the imported resource was created with the D3D11_RESOURCE_MISC_SHARED_KEYEDMUTEX flag.

To acquire keyed mutexes before submitted work and/or release them after, add a VkWin32KeyedMutexAcquireReleaseInfoKHR structure to the pNext chain of the VkSubmitInfo structure.

The VkWin32KeyedMutexAcquireReleaseInfoKHR structure is defined as:

```c
// Provided by VK_KHR_win32_keyed_mutex
typedef struct VkWin32KeyedMutexAcquireReleaseInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t acquireCount;
    const VkDeviceMemory* pAcquireSyncs;
    const uint64_t* pAcquireKeys;
    const uint32_t* pAcquireTimeouts;
    uint32_t releaseCount;
    const VkDeviceMemory* pReleaseSyncs;
    const uint64_t* pReleaseKeys;
} VkWin32KeyedMutexAcquireReleaseInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- acquireCount is the number of entries in the pAcquireSyncs, pAcquireKeys, and pAcquireTimeouts arrays.
• **pAcquireSyncs** is a pointer to an array of **VkDeviceMemory** objects which were imported from Direct3D 11 resources.

• **pAcquireKeys** is a pointer to an array of mutex key values to wait for prior to beginning the submitted work. Entries refer to the keyed mutex associated with the corresponding entries in **pAcquireSyncs**.

• **pAcquireTimeouts** is a pointer to an array of timeout values, in millisecond units, for each acquire specified in **pAcquireKeys**.

• **releaseCount** is the number of entries in the **pReleaseSyncs** and **pReleaseKeys** arrays.

• **pReleaseSyncs** is a pointer to an array of **VkDeviceMemory** objects which were imported from Direct3D 11 resources.

• **pReleaseKeys** is a pointer to an array of mutex key values to set when the submitted work has completed. Entries refer to the keyed mutex associated with the corresponding entries in **pReleaseSyncs**.

**Valid Usage**

- **VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pAcquireSyncs-00081**  
  Each member of **pAcquireSyncs** and **pReleaseSyncs** must be a device memory object imported by setting **VkImportMemoryWin32HandleInfoKHR::handleType** to **VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT** or **VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT**

**Valid Usage (Implicit)**

- **VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-sType-sType**  
  **sType** must be **VK_STRUCTURE_TYPE_WIN32_KEYED_MUTEX_ACQUIRE_RELEASE_INFO_KHR**

- **VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pAcquireSyncs-parameter**  
  If **acquireCount** is not 0, **pAcquireSyncs** must be a valid pointer to an array of **acquireCount** valid **VkDeviceMemory** handles

- **VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pAcquireKeys-parameter**  
  If **acquireCount** is not 0, **pAcquireKeys** must be a valid pointer to an array of **acquireCount** **uint64_t** values

- **VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pAcquireTimeouts-parameter**  
  If **acquireCount** is not 0, **pAcquireTimeouts** must be a valid pointer to an array of **acquireCount** **uint32_t** values

- **VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pReleaseSyncs-parameter**  
  If **releaseCount** is not 0, **pReleaseSyncs** must be a valid pointer to an array of **releaseCount** valid **VkDeviceMemory** handles

- **VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pReleaseKeys-parameter**  
  If **releaseCount** is not 0, **pReleaseKeys** must be a valid pointer to an array of **releaseCount** **uint64_t** values

- **VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-commonparent**
Both of the elements of `pAcquireSyncs`, and the elements of `pReleaseSyncs` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`.

When submitting work that operates on memory imported from a Direct3D 11 resource to a queue, the keyed mutex mechanism **may** be used in addition to Vulkan semaphores to synchronize the work. Keyed mutexes are a property of a properly created shareable Direct3D 11 resource. They **can** only be used if the imported resource was created with the `D3D11_RESOURCE_MISC_SHARED_KEYED_MUTEX` flag.

To acquire keyed mutexes before submitted work and/or release them after, add a `VkWin32KeyedMutexAcquireReleaseInfoNV` structure to the `pNext` chain of the `VkSubmitInfo` structure.

The `VkWin32KeyedMutexAcquireReleaseInfoNV` structure is defined as:

```c
typedef struct VkWin32KeyedMutexAcquireReleaseInfoNV {
    VkStructureType sType;
    const void* pNext;
    uint32_t acquireCount;
    const VkDeviceMemory* pAcquireSyncs;
    const uint64_t* pAcquireKeys;
    const uint32_t* pAcquireTimeoutMilliseconds;
    uint32_t releaseCount;
    const VkDeviceMemory* pReleaseSyncs;
    const uint64_t* pReleaseKeys;
} VkWin32KeyedMutexAcquireReleaseInfoNV;
```

- `acquireCount` is the number of entries in the `pAcquireSyncs`, `pAcquireKeys`, and `pAcquireTimeoutMilliseconds` arrays.
- `pAcquireSyncs` is a pointer to an array of `VkDeviceMemory` objects which were imported from Direct3D 11 resources.
- `pAcquireKeys` is a pointer to an array of mutex key values to wait for prior to beginning the submitted work. Entries refer to the keyed mutex associated with the corresponding entries in `pAcquireSyncs`.
- `pAcquireTimeoutMilliseconds` is a pointer to an array of timeout values, in millisecond units, for each acquire specified in `pAcquireKeys`.
- `releaseCount` is the number of entries in the `pReleaseSyncs` and `pReleaseKeys` arrays.
- `pReleaseSyncs` is a pointer to an array of `VkDeviceMemory` objects which were imported from Direct3D 11 resources.
- `pReleaseKeys` is a pointer to an array of mutex key values to set when the submitted work has completed. Entries refer to the keyed mutex associated with the corresponding entries in `pReleaseSyncs`.

```c
// Provided by VK_NV_win32_keyed_mutex
```
Valid Usage (Implicit)

- VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_WIN32_KEYED_MUTEX_ACQUIRE_RELEASE_INFO_NV

- VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-pAcquireSyncs-parameter
  If acquireCount is not 0, pAcquireSyncs must be a valid pointer to an array of acquireCount
  valid VkDeviceMemory handles

- VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-pAcquireKeys-parameter
  If acquireCount is not 0, pAcquireKeys must be a valid pointer to an array of acquireCount
  uint64_t values

- VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-pAcquireTimeoutMilliseconds-parameter
  If acquireCount is not 0, pAcquireTimeoutMilliseconds must be a valid pointer to an array of
  acquireCount uint32_t values

- VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-pReleaseSyncs-parameter
  If releaseCount is not 0, pReleaseSyncs must be a valid pointer to an array of releaseCount
  valid VkDeviceMemory handles

- VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-pReleaseKeys-parameter
  If releaseCount is not 0, pReleaseKeys must be a valid pointer to an array of releaseCount
  uint64_t values

- VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-commonparent
  Both of the elements of pAcquireSyncs, and the elements of pReleaseSyncs that are valid
  handles of non-ignored parameters must have been created, allocated, or retrieved from
  the same VkDevice

If the pNext chain of VkSubmitInfo includes a VkProtectedSubmitInfo structure, then the structure
indicates whether the batch is protected. The VkProtectedSubmitInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkProtectedSubmitInfo {
    VkStructureType sType;
    const void* pNext;
    VkBool32 protectedSubmit;
} VkProtectedSubmitInfo;
```

- protectedSubmit specifies whether the batch is protected. If protectedSubmit is VK_TRUE, the batch
  is protected. If protectedSubmit is VK_FALSE, the batch is unprotected. If the VkSubmitInfo::pNext
  chain does not include this structure, the batch is unprotected.

Valid Usage (Implicit)

- VUID-VkProtectedSubmitInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_PROTECTED_SUBMIT_INFO
If the `pNext` chain of `VkSubmitInfo` includes a `VkDeviceGroupSubmitInfo` structure, then that structure includes device indices and masks specifying which physical devices execute semaphore operations and command buffers.

The `VkDeviceGroupSubmitInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupSubmitInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreCount;
    const uint32_t* pWaitSemaphoreDeviceIndices;
    uint32_t commandBufferCount;
    const uint32_t* pCommandBufferDeviceMasks;
    uint32_t signalSemaphoreCount;
    const uint32_t* pSignalSemaphoreDeviceIndices;
} VkDeviceGroupSubmitInfo;
```

or the equivalent

```c
// Provided by VK_KHR_device_group
typedef VkDeviceGroupSubmitInfo VkDeviceGroupSubmitInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `waitSemaphoreCount` is the number of elements in the `pWaitSemaphoreDeviceIndices` array.
- `pWaitSemaphoreDeviceIndices` is a pointer to an array of `waitSemaphoreCount` device indices indicating which physical device executes the semaphore wait operation in the corresponding element of `VkSubmitInfo::pWaitSemaphores`.
- `commandBufferCount` is the number of elements in the `pCommandBufferDeviceMasks` array.
- `pCommandBufferDeviceMasks` is a pointer to an array of `commandBufferCount` device masks indicating which physical devices execute the command buffer in the corresponding element of `VkSubmitInfo::pCommandBuffers`. A physical device executes the command buffer if the corresponding bit is set in the mask.
- `signalSemaphoreCount` is the number of elements in the `pSignalSemaphoreDeviceIndices` array.
- `pSignalSemaphoreDeviceIndices` is a pointer to an array of `signalSemaphoreCount` device indices indicating which physical device executes the semaphore signal operation in the corresponding element of `VkSubmitInfo::pSignalSemaphores`.

If this structure is not present, semaphore operations and command buffers execute on device index zero.
Valid Usage

- VUID-VkDeviceGroupSubmitInfo-waitSemaphoreCount-00082
  \text{waitSemaphoreCount} \text{ must equal } \text{VkSubmitInfo::waitSemaphoreCount}

- VUID-VkDeviceGroupSubmitInfo-commandBufferCount-00083
  \text{commandBufferCount} \text{ must equal } \text{VkSubmitInfo::commandBufferCount}

- VUID-VkDeviceGroupSubmitInfo-signalSemaphoreCount-00084
  \text{signalSemaphoreCount} \text{ must equal } \text{VkSubmitInfo::signalSemaphoreCount}

- VUID-VkDeviceGroupSubmitInfo-pWaitSemaphoreDeviceIndices-00085
  All elements of \text{pWaitSemaphoreDeviceIndices} and \text{pSignalSemaphoreDeviceIndices} \text{ must be}
  valid device indices

- VUID-VkDeviceGroupSubmitInfo-pCommandBufferDeviceMasks-00086
  All elements of \text{pCommandBufferDeviceMasks} \text{ must be valid device masks}

Valid Usage (Implicit)

- VUID-VkDeviceGroupSubmitInfo-sType-sType
  \text{sType} \text{ must be } VK\_STRUCTURE\_TYPE\_DEVICE\_GROUP\_SUBMIT\_INFO

- VUID-VkDeviceGroupSubmitInfo-pWaitSemaphoreDeviceIndices-parameter
  If \text{waitSemaphoreCount} is not 0, \text{pWaitSemaphoreDeviceIndices} \text{ must be a valid pointer to an}
  array of \text{waitSemaphoreCount} uint32_t values

- VUID-VkDeviceGroupSubmitInfo-pCommandBufferDeviceMasks-parameter
  If \text{commandBufferCount} is not 0, \text{pCommandBufferDeviceMasks} \text{ must be a valid pointer to an}
  array of \text{commandBufferCount} uint32_t values

- VUID-VkDeviceGroupSubmitInfo-pSignalSemaphoreDeviceIndices-parameter
  If \text{signalSemaphoreCount} is not 0, \text{pSignalSemaphoreDeviceIndices} \text{ must be a valid pointer to}
  an array of \text{signalSemaphoreCount} uint32_t values

If the \text{pNext} chain of \text{VkSubmitInfo} includes a \text{VkPerformanceQuerySubmitInfoKHR} structure, then
the structure indicates which counter pass is active for the batch in that submit.

The \text{VkPerformanceQuerySubmitInfoKHR} structure is defined as:

```c
// Provided by VK_KHR_performance_query
typedef struct VkPerformanceQuerySubmitInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t counterPassIndex;
} VkPerformanceQuerySubmitInfoKHR;
```

- \text{sType} is a \text{VkStructureType} value identifying this structure.
- \text{pNext} is \text{NULL} or a pointer to a structure extending this structure.
• `counterPassIndex` specifies which counter pass index is active.

If the `VkSubmitInfo::pNext` chain does not include this structure, the batch defaults to use counter pass index 0.

### Valid Usage

- **VUID-VkPerformanceQuerySubmitInfoKHR-counterPassIndex-03221**
  
  `counterPassIndex` must be less than the number of counter passes required by any queries within the batch. The required number of counter passes for a performance query is obtained by calling `vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR`.

### Valid Usage (Implicit)

- **VUID-VkPerformanceQuerySubmitInfoKHR-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_PERFORMANCE_QUERY_SUBMIT_INFO_KHR`.

### 6.6. Queue Forward Progress

When using binary semaphores, the application **must** ensure that command buffer submissions will be able to complete without any subsequent operations by the application on any queue. After any call to `vkQueueSubmit` (or other queue operation), for every queued wait on a semaphore created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY` there **must** be a prior signal of that semaphore that will not be consumed by a different wait on the semaphore.

When using timeline semaphores, wait-before-signal behavior is well-defined and applications **can** submit work via `vkQueueSubmit` defining a **timeline semaphore wait operation** before submitting a corresponding **semaphore signal operation**. For each **timeline semaphore wait operation** defined by a call to `vkQueueSubmit`, the application **must** ensure that a corresponding **semaphore signal operation** is executed before forward progress can be made.

If a command buffer submission waits for any events to be signaled, the application **must** ensure that command buffer submissions will be able to complete without any subsequent operations by the application. Events signaled by the host **must** be signaled before the command buffer waits on those events.

### NOTE

The ability for commands to wait on the host to set an events was originally added to allow low-latency updates to resources between host and device. However, to ensure quality of service, implementations would necessarily detect extended stalls in execution and timeout after a short period. As this period is not defined in the Vulkan specification, it is impossible to correctly validate any application with any wait period. Since the original users of this functionality were highly limited and platform-specific, this functionality is now considered defunct and should not be used.
6.7. Secondary Command Buffer Execution

Secondary command buffers must not be directly submitted to a queue. To record a secondary command buffer to execute as part of a primary command buffer, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdExecuteCommands(
    VkCommandBuffer commandBuffer,
    uint32_t commandBufferCount,
    const VkCommandBuffer* pCommandBuffers);
```

- `commandBuffer` is a handle to a primary command buffer that the secondary command buffers are executed in.
- `commandBufferCount` is the length of the `pCommandBuffers` array.
- `pCommandBuffers` is a pointer to an array of `commandBufferCount` secondary command buffer handles, which are recorded to execute in the primary command buffer in the order they are listed in the array.

If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, and it was recorded into any other primary command buffer which is currently in the executable or recording state, that primary command buffer becomes invalid.

If the `nestedCommandBuffer` feature is enabled it is valid usage for `vkCmdExecuteCommands` to also be recorded to a secondary command buffer.

### Valid Usage

- VUID-vkCmdExecuteCommands-pCommandBuffers-00088
  Each element of `pCommandBuffers` must have been allocated with a level of `VK_COMMAND_BUFFER_LEVEL_SECONDARY`

- VUID-vkCmdExecuteCommands-pCommandBuffers-00089
  Each element of `pCommandBuffers` must be in the pending or executable state

- VUID-vkCmdExecuteCommands-pCommandBuffers-00091
  If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, it must not be in the pending state

- VUID-vkCmdExecuteCommands-pCommandBuffers-00092
  If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, it must not have already been recorded to `commandBuffer`

- VUID-vkCmdExecuteCommands-pCommandBuffers-00093
  If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, it must not appear more than once in `pCommandBuffers`
Each element of `pCommandBuffers` must have been allocated from a `VkCommandPool` that was created for the same queue family as the `VkCommandPool` from which `commandBuffer` was allocated.

If `vkCmdExecuteCommands` is being called within a render pass instance, each element of `pCommandBuffers` must have been recorded with the `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`.

If `vkCmdExecuteCommands` is being called within a render pass instance, and any element of `pCommandBuffers` was recorded with `VkCommandBufferInheritanceInfo::framebuffer` not equal to `VK_NULL_HANDLE`, that `VkFramebuffer` must match the `VkFramebuffer` used in the current render pass instance.

If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRenderPass`, and `vkCmdNextSubpass` has not been called in the current render pass instance, the `contents` parameter of the last call to `vkCmdNextSubpass` must have been set to `VK_SUBPASS_CONTENTS_SECONDARY_COMMAND_BUFFERS`, or `VK_SUBPASS_CONTENTS_INLINE_AND_SECONDARY_COMMAND_BUFFERS_EXT`.

If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRenderPass`, and `vkCmdNextSubpass` has been called in the current render pass instance, the `contents` parameter of the last call to `vkCmdNextSubpass` must have been set to `VK_SUBPASS_CONTENTS_SECONDARY_COMMAND_BUFFERS`, or `VK_SUBPASS_CONTENTS_INLINE_AND_SECONDARY_COMMAND_BUFFERS_KHR`.

If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRenderPass`, each element of `pCommandBuffers` must have been recorded with `VkCommandBufferInheritanceInfo::subpass` set to the index of the subpass which the given command buffer will be executed in.

If `vkCmdExecuteCommands` is being called within a render pass instance that included `VkRenderPassTransformBeginInfoQCOM` in the `pNext` chain of `VkRenderPassBeginInfo`, then each element of `pCommandBuffers` must be compatible with the current render pass.

If `vkCmdExecuteCommands` is being called within a render pass instance that included `VkRenderPassTransformBeginInfoQCOM` in the `pNext` chain of `VkRenderPassBeginInfo`, then each element of `pCommandBuffers` must have been recorded with `VkCommandBufferInheritanceRenderPassTransformInfoQCOM` in the `pNext` chain of `VkCommandBufferBeginInfo`.

If `vkCmdExecuteCommands` is being called within a render pass instance that included `VkRenderPassTransformBeginInfoQCOM` in the `pNext` chain of `VkRenderPassBeginInfo`, then each element of `pCommandBuffers` must have been recorded with...
VKCommandBufferInheritanceRenderPassTransformInfoQCOM::transform identical to
VKRenderPassTransformBeginInfoQCOM::transform

• VUID-vkCmdExecuteCommands-pNext-02867
  If vkCmdExecuteCommands is being called within a render pass instance that included
  VKRenderPassTransformBeginInfoQCOM in the pNext chain of VKRenderPassBeginInfo,
  then each element of pCommandBuffers must have been recorded with
  VKCommandBufferInheritanceRenderPassTransformInfoQCOM::renderArea identical to
  VKRenderPassBeginInfo::renderArea

• VUID-vkCmdExecuteCommands-pCommandBuffers-00100
  If vkCmdExecuteCommands is not being called within a render pass instance, each element of
  pCommandBuffers must not have been recorded with the
  VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT

• VUID-vkCmdExecuteCommands-commandBuffer-00101
  If the inheritedQueries feature is not enabled, commandBuffer must not have any queries
  active

• VUID-vkCmdExecuteCommands-commandBuffer-00102
  If commandBuffer has a VK_QUERY_TYPE_OCCLUSION query active, then each element of
  pCommandBuffers must have been recorded with VKCommandBufferInheritanceInfo
  ::occlusionQueryEnable set to VK_TRUE

• VUID-vkCmdExecuteCommands-commandBuffer-00103
  If commandBuffer has a VK_QUERY_TYPE_PIPELINE_STATISTICS query active, then each element
  of pCommandBuffers must have been recorded with VKCommandBufferInheritanceInfo
  ::pipelineStatistics having all bits set that are set for the query

• VUID-vkCmdExecuteCommands-pCommandBuffers-00105
  Each element of pCommandBuffers must not begin any query types that are active in
  commandBuffer

• VUID-vkCmdExecuteCommands-commandBuffer-07594
  commandBuffer must not have any queries other than VK_QUERY_TYPE_OCCLUSION and
  VK_QUERY_TYPE_PIPELINE_STATISTICS active

• VUID-vkCmdExecuteCommands-commandBuffer-01820
  If commandBuffer is a protected command buffer and protectedNoFault is not supported,
  each element of pCommandBuffers must be a protected command buffer

• VUID-vkCmdExecuteCommands-commandBuffer-01821
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported,
  each element of pCommandBuffers must be an unprotected command buffer

• VUID-vkCmdExecuteCommands-None-02286
  This command must not be recorded when transform feedback is active

• VUID-vkCmdExecuteCommands-commandBuffer-06533
  If vkCmdExecuteCommands is being called within a render pass instance and any recorded
command in `commandBuffer` in the current subpass will write to an image subresource as an attachment, commands recorded in elements of `pCommandBuffers` must not read from the memory backing that image subresource in any other way

- **VUID-vkCmdExecuteCommands-commandBuffer-06534**
  If `vkCmdExecuteCommands` is being called within a render pass instance and any recorded command in `commandBuffer` in the current subpass will write from an image subresource used as an attachment in any way other than as an attachment, commands recorded in elements of `pCommandBuffers` must not write to that image subresource as an attachment

- **VUID-vkCmdExecuteCommands-pCommandBuffers-06535**
  If `vkCmdExecuteCommands` is being called within a render pass instance and any recorded command in a given element of `pCommandBuffers` will write to an image subresource as an attachment, commands recorded in elements of `pCommandBuffers` at a higher index must not write to that image subresource as an attachment

- **VUID-vkCmdExecuteCommands-pCommandBuffers-06536**
  If `vkCmdExecuteCommands` is being called within a render pass instance and any recorded command in a given element of `pCommandBuffers` will read from an image subresource used as an attachment in any way other than as an attachment, commands recorded in elements of `pCommandBuffers` at a higher index must not write to that image subresource as an attachment

- **VUID-vkCmdExecuteCommands-pCommandBuffers-06021**
  If `pCommandBuffers` contains any suspended render pass instances, there must be no action or synchronization commands between that render pass instance and any render pass instance that resumes it

- **VUID-vkCmdExecuteCommands-pCommandBuffers-06022**
  If `pCommandBuffers` contains any suspended render pass instances, there must be no render pass instances between that render pass instance and any render pass instance that resumes it

- **VUID-vkCmdExecuteCommands-variableSampleLocations-06023**
  If the `variableSampleLocations` limit is not supported, and any element of `pCommandBuffers` contains any suspended render pass instances, where a graphics pipeline has been bound, any pipelines bound in the render pass instance that resumes it, or any subsequent render pass instances that resume from that one and so on, must use the same sample locations

- **VUID-vkCmdExecuteCommands-flags-06024**
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, its `VkRenderingInfo::flags` parameter must have included `VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT`

- **VUID-vkCmdExecuteCommands-pBeginInfo-06025**
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, the render passes specified in the `pBeginInfo->pInheritanceInfo->renderPass` members of the `vkBeginCommandBuffer` commands used to begin recording each element of `pCommandBuffers` must be `VK_NULL_HANDLE`

- **VUID-vkCmdExecuteCommands-flags-06026**
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with...
vkCmdBeginRendering, the flags member of the VkCommandBufferInheritanceRenderingInfo structure included in the pNext chain of VkCommandBufferBeginInfo::pInheritanceInfo used to begin recording each element of pCommandBuffers must be equal to the VkRenderingInfo::flags parameter to vkCmdBeginRendering, excluding VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT

• VUID-vkCmdExecuteCommands-colorAttachmentCount-06027
  If vkCmdExecuteCommands is being called within a render pass instance begun with vkCmdBeginRendering, the colorAttachmentCount member of the VkCommandBufferInheritanceRenderingInfo structure included in the pNext chain of VkCommandBufferBeginInfo::pInheritanceInfo used to begin recording each element of pCommandBuffers must be equal to the VkRenderingInfo::colorAttachmentCount parameter to vkCmdBeginRendering

• VUID-vkCmdExecuteCommands-imageView-06028
  If vkCmdExecuteCommands is being called within a render pass instance begun with vkCmdBeginRendering, if the imageView member of an element of the VkRenderingInfo::pColorAttachments parameter to vkCmdBeginRendering is not VK_NULL_HANDLE, the corresponding element of the pColorAttachmentFormats member of the VkCommandBufferInheritanceRenderingInfo structure included in the pNext chain of VkCommandBufferBeginInfo::pInheritanceInfo used to begin recording each element of pCommandBuffers must be equal to the format used to create that image view

• VUID-vkCmdExecuteCommands-imageView-07606
  If vkCmdExecuteCommands is being called within a render pass instance begun with vkCmdBeginRendering, if the imageView member of an element of the VkRenderingInfo::pColorAttachments parameter to vkCmdBeginRendering is VK_NULL_HANDLE, the corresponding element of the pColorAttachmentFormats member of the VkCommandBufferInheritanceRenderingInfo structure included in the pNext chain of VkCommandBufferBeginInfo::pInheritanceInfo used to begin recording each element of pCommandBuffers must be equal to VK_FORMAT_UNDEFINED

• VUID-vkCmdExecuteCommands-pDepthAttachment-06029
  If vkCmdExecuteCommands is being called within a render pass instance begun with vkCmdBeginRendering, if the VkRenderingInfo::pDepthAttachment->imageView parameter to vkCmdBeginRendering is not VK_NULL_HANDLE, the value of the depthAttachmentFormat member of the VkCommandBufferInheritanceRenderingInfo structure included in the pNext chain of VkCommandBufferBeginInfo::pInheritanceInfo used to begin recording each element of pCommandBuffers must be equal to the format used to create that image view

• VUID-vkCmdExecuteCommands-pStencilAttachment-06030
  If vkCmdExecuteCommands is being called within a render pass instance begun with vkCmdBeginRendering, if the VkRenderingInfo::pStencilAttachment->imageView parameter to vkCmdBeginRendering is not VK_NULL_HANDLE, the value of the stencilAttachmentFormat member of the VkCommandBufferInheritanceRenderingInfo structure included in the pNext chain of VkCommandBufferBeginInfo::pInheritanceInfo used to begin recording each element of pCommandBuffers must be equal to the format used to create that image view

• VUID-vkCmdExecuteCommands-pDepthAttachment-06774
If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering` and the `VkRenderingInfo::pDepthAttachment->imageView` parameter to `vkCmdBeginRendering` was `VK_NULL_HANDLE`, the value of the `depthAttachmentFormat` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` must be `VK_FORMAT_UNDEFINED`.

- **VUID-vkCmdExecuteCommands-pStencilAttachment-06775**
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering` and the `VkRenderingInfo::pStencilAttachment->imageView` parameter to `vkCmdBeginRendering` was `VK_NULL_HANDLE`, the value of the `stencilAttachmentFormat` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` must be `VK_FORMAT_UNDEFINED`.

- **VUID-vkCmdExecuteCommands-viewMask-06031**
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, the `viewMask` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` must be equal to the `VkRenderingInfo::viewMask` parameter to `vkCmdBeginRendering`.

- **VUID-vkCmdExecuteCommands-pNext-06032**
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering` and the `pNext` chain of `VkCommandBufferInheritanceInfo` includes a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, if the `imageView` member of an element of the `VkRenderingInfo::pColorAttachments` parameter to `vkCmdBeginRendering` is not `VK_NULL_HANDLE`, the corresponding element of the `pColorAttachmentSamples` member of the `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` must be equal to the sample count used to create that image view.

- **VUID-vkCmdExecuteCommands-pNext-06033**
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering` and the `pNext` chain of `VkCommandBufferInheritanceInfo` includes a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, if the `VkRenderingInfo::pDepthAttachment->imageView` parameter to `vkCmdBeginRendering` is not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of the `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` must be equal to the sample count used to create that image view.

- **VUID-vkCmdExecuteCommands-pNext-06034**
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering` and the `pNext` chain of `VkCommandBufferInheritanceInfo` includes a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, if the `VkRenderingInfo::pStencilAttachment->imageView` parameter to `vkCmdBeginRendering`
is not VK_NULL_HANDLE, the value of the depthStencilAttachmentSamples member of the VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure included in the pNext chain of VkCommandBufferBeginInfo::pInheritanceInfo used to begin recording each element of pCommandBuffers must be equal to the sample count used to create that image view

• VUID-vkCmdExecuteCommands-pNext-06035
  If vkCmdExecuteCommands is being called within a render pass instance begun with vkCmdBeginRendering and the pNext chain of VkCommandBufferInheritanceInfo does not include a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, if the imageView member of an element of the VkRenderingInfo::pColorAttachments parameter to vkCmdBeginRendering is not VK_NULL_HANDLE, the value of VkCommandBufferInheritanceRenderingInfo::rasterizationSamples must be equal to the sample count used to create that image view

• VUID-vkCmdExecuteCommands-pNext-06036
  If vkCmdExecuteCommands is being called within a render pass instance begun with vkCmdBeginRendering and the pNext chain of VkCommandBufferInheritanceInfo does not include a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, if the VkRenderingInfo::pDepthAttachment->imageView parameter to vkCmdBeginRendering is not VK_NULL_HANDLE, the value of VkCommandBufferInheritanceRenderingInfo::rasterizationSamples must be equal to the sample count used to create that image view

• VUID-vkCmdExecuteCommands-pNext-06037
  If vkCmdExecuteCommands is being called within a render pass instance begun with vkCmdBeginRendering and the pNext chain of VkCommandBufferInheritanceInfo does not include a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, if the VkRenderingInfo::pStencilAttachment->imageView parameter to vkCmdBeginRendering is not VK_NULL_HANDLE, the value of VkCommandBufferInheritanceRenderingInfo::rasterizationSamples must be equal to the sample count used to create that image view

• VUID-vkCmdExecuteCommands-pNext-09299
  If vkCmdExecuteCommands is being called within a render pass instance begun with vkCmdBeginRendering, with any color attachment using a resolve mode of VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID, the pNext chain of VkCommandBufferInheritanceInfo used to create each element of pCommandBuffers must include a VkExternalFormatANDROID structure with an externalFormat matching that used to create the resolve attachment in the render pass

• VUID-vkCmdExecuteCommands-pNext-09300
  If vkCmdExecuteCommands is being called within a render pass instance begun with vkCmdBeginRendering with any color attachment using a resolve mode of VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID, and the pNext chain of VkCommandBufferInheritanceInfo does not include a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, the value of VkCommandBufferInheritanceRenderingInfo::rasterizationSamples must be VK_SAMPLE_COUNT_1_BIT

• VUID-vkCmdExecuteCommands-commandBuffer-09375
commandBuffer must not be a secondary command buffer unless the nestedCommandBuffer feature is enabled

- VUID-vkCmdExecuteCommands-nestedCommandBuffer-09376
  If the nestedCommandBuffer feature is enabled, the command buffer nesting level of each element of pCommandBuffers must be less than maxCommandBufferNestingLevel.

- VUID-vkCmdExecuteCommands-nestedCommandBufferRendering-09377
  If the nestedCommandBufferRendering feature is not enabled, and commandBuffer is a secondary command buffer, commandBuffer must not have been recorded with VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT.

- VUID-vkCmdExecuteCommands-nestedCommandBufferSimultaneousUse-09378
  If the nestedCommandBufferSimultaneousUse feature is not enabled, and commandBuffer is a secondary command buffer, each element of pCommandBuffers must not have been recorded with VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT.

- VUID-vkCmdExecuteCommands-pCommandBuffers-09504
  If vkCmdExecuteCommands is being called within a render pass instance begun with vkCmdBeginRendering, the color attachment mapping state specified by VkRenderingAttachmentLocationInfoKHR in the inheritance info of each element of pCommandBuffers and in the current state of commandBuffer must match.

- VUID-vkCmdExecuteCommands-pCommandBuffers-09505
  If vkCmdExecuteCommands is being called within a render pass instance begun with vkCmdBeginRendering, the input attachment mapping state specified by VkRenderingInputAttachmentIndexInfoKHR in the inheritance info of each element of pCommandBuffers and in the current state of commandBuffer must match.

Valid Usage (Implicit)

- VUID-vkCmdExecuteCommands-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle.

- VUID-vkCmdExecuteCommands-pCommandBuffers-parameter
  pCommandBuffers must be a valid pointer to an array of commandBufferCount valid VkCommandBuffer handles.

- VUID-vkCmdExecuteCommands-commandBuffer-recording
  commandBuffer must be in the recording state.

- VUID-vkCmdExecuteCommands-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support transfer, graphics, or compute operations.

- VUID-vkCmdExecuteCommands-videocoding
  This command must only be called outside of a video coding scope.

- VUID-vkCmdExecuteCommands-commandBufferCount-arraylength
  commandBufferCount must be greater than 0.

- VUID-vkCmdExecuteCommands-commonparent
  Both of commandBuffer, and the elements of pCommandBuffers must have been created,
allocated, or retrieved from the same \texttt{VkDevice}

\section*{Host Synchronization}

- Host access to \texttt{commandBuffer} \textbf{must} be externally synchronized
- Host access to the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \textbf{must} be externally synchronized

\section*{Command Properties}

\begin{tabular}{|c|c|c|c|}

\end{tabular}

\section*{6.8. Nested Command Buffers}

In addition to secondary command buffer execution from primary command buffers, an implementation \textbf{may} support \texttt{nested command buffers}, which enable secondary command buffers to be executed from other secondary command buffers. If the \texttt{nestedCommandBuffer} feature is enabled, the implementation supports \texttt{nested command buffers}.

Nested command buffer execution works the same as primary-to-secondary execution, except that it is subject to some additional implementation-defined limits.

Each secondary command buffer has a \texttt{command buffer nesting level}, which is determined at \texttt{vkEndCommandBuffer} time and evaluated at \texttt{vkCmdExecuteCommands} time. A secondary command buffer that executes no other secondary command buffers has a \texttt{command buffer nesting level} of zero. Otherwise, the \texttt{command buffer nesting level} of a secondary command buffer is equal to the maximum nesting level of all secondary command buffers executed by that command buffer plus one. Some implementations \textbf{may} have a limit on the maximum nesting level of secondary command buffers that \textbf{can} be recorded. This limit is advertised in \texttt{maxCommandBufferNestingLevel}.

If the \texttt{nestedCommandBufferRendering} feature is enabled, the implementation supports calling \texttt{vkCmdExecuteCommands} inside secondary command buffers recorded with \texttt{VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT}. If the \texttt{nestedCommandBufferSimultaneousUse} feature is enabled, the implementation supports calling \texttt{vkCmdExecuteCommands} with secondary command buffers recorded with \texttt{VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT}.

Whenever \texttt{vkCmdExecuteCommands} is recorded inside a secondary command buffer recorded with \texttt{VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT}, each member of \texttt{pCommandBuffers} \textbf{must} have been recorded with a \texttt{VkCommandBufferBeginInfo} with \texttt{VkCommandBufferInheritanceInfo}...
compatible with the `VkCommandBufferInheritanceInfo` of the command buffer into which the `vkCmdExecuteCommands` call is being recorded. The `VkCommandBufferInheritanceRenderingInfo` structures are compatible when the `VkCommandBufferInheritanceRenderingInfo::renderpass` are compatible, or if they are `VK_NULL_HANDLE` then the `VkCommandBufferInheritanceRenderingInfo` members match, and all other members of `VkCommandBufferInheritanceRenderingInfo` match. This requirement applies recursively, down to the most nested command buffer and up to the command buffer where the render pass was originally begun.

6.9. Command Buffer Device Mask

Each command buffer has a piece of state storing the current device mask of the command buffer. This mask controls which physical devices within the logical device all subsequent commands will execute on, including state-setting commands, action commands, and synchronization commands.

Scissor, exclusive scissor, and viewport state (excluding the count of each) can be set to different values on each physical device (only when set as dynamic state), and each physical device will render using its local copy of the state. Other state is shared between physical devices, such that all physical devices use the most recently set values for the state. However, when recording an action command that uses a piece of state, the most recent command that set that state must have included all physical devices that execute the action command in its current device mask.

The command buffer's device mask is orthogonal to the `pNext` chain of `VkCommandBufferBeginInfo`. Commands only execute on a physical device if the device index is set in both device masks.

If the `pNext` chain of `VkCommandBufferBeginInfo` includes a `VkDeviceGroupCommandBufferBeginInfo` structure, then that structure includes an initial device mask for the command buffer.

The `VkDeviceGroupCommandBufferBeginInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupCommandBufferBeginInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t deviceMask;
} VkDeviceGroupCommandBufferBeginInfo;
```

or the equivalent

```c
// Provided by VK_KHR_device_group
typedef VkDeviceGroupCommandBufferBeginInfo VkDeviceGroupCommandBufferBeginInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `deviceMask` is the initial value of the command buffer's device mask.
The initial device mask also acts as an upper bound on the set of devices that can ever be in the device mask in the command buffer.

If this structure is not present, the initial value of a command buffer’s device mask is set to include all physical devices in the logical device when the command buffer begins recording.

**Valid Usage**

- VUID-VkDeviceGroupCommandBufferBeginInfo-deviceMask-00106
  deviceMask must be a valid device mask value
- VUID-VkDeviceGroupCommandBufferBeginInfo-deviceMask-00107
  deviceMask must not be zero

**Valid Usage (Implicit)**

- VUID-VkDeviceGroupCommandBufferBeginInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEVICE_GROUP_COMMAND_BUFFER_BEGIN_INFO

To update the current device mask of a command buffer, call:

```c
// Provided by VK_VERSION_1_1
void vkCmdSetDeviceMask(
    VkCommandBuffer commandBuffer,
    uint32_t deviceMask);
```

or the equivalent command

```c
// Provided by VK_KHR_device_group
void vkCmdSetDeviceMaskKHR(
    VkCommandBuffer commandBuffer,
    uint32_t deviceMask);
```

- `commandBuffer` is command buffer whose current device mask is modified.
- `deviceMask` is the new value of the current device mask.

`deviceMask` is used to filter out subsequent commands from executing on all physical devices whose bit indices are not set in the mask, except commands beginning a render pass instance, commands transitioning to the next subpass in the render pass instance, and commands ending a render pass instance, which always execute on the set of physical devices whose bit indices are included in the `deviceMask` member of the `VkDeviceGroupRenderPassBeginInfo` structure passed to the command beginning the corresponding render pass instance.
Valid Usage

- VUID-vkCmdSetDeviceMask-deviceMask-00108
  `deviceMask` must be a valid device mask value

- VUID-vkCmdSetDeviceMask-deviceMask-00109
  `deviceMask` must not be zero

- VUID-vkCmdSetDeviceMask-deviceMask-00110
  `deviceMask` must not include any set bits that were not in the `VkDeviceGroupCommandBufferBeginInfo::deviceMask` value when the command buffer began recording

- VUID-vkCmdSetDeviceMask-deviceMask-00111
  If `vkCmdSetDeviceMask` is called inside a render pass instance, `deviceMask` must not include any set bits that were not in the `VkDeviceGroupRenderPassBeginInfo::deviceMask` value when the render pass instance began recording

Valid Usage (Implicit)

- VUID-vkCmdSetDeviceMask-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetDeviceMask-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetDeviceMask-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, compute, or transfer operations

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Chapter 7. Synchronization and Cache Control

Synchronization of access to resources is primarily the responsibility of the application in Vulkan. The order of execution of commands with respect to the host and other commands on the device has few implicit guarantees, and needs to be explicitly specified. Memory caches and other optimizations are also explicitly managed, requiring that the flow of data through the system is largely under application control.

Whilst some implicit guarantees exist between commands, five explicit synchronization mechanisms are exposed by Vulkan:

Fences
Fences can be used to communicate to the host that execution of some task on the device has completed, controlling resource access between host and device.

Semaphores
Semaphores can be used to control resource access across multiple queues.

Events
Events provide a fine-grained synchronization primitive which can be signaled either within a command buffer or by the host, and can be waited upon within a command buffer or queried on the host. Events can be used to control resource access within a single queue.

Pipeline Barriers
Pipeline barriers also provide synchronization control within a command buffer, but at a single point, rather than with separate signal and wait operations. Pipeline barriers can be used to control resource access within a single queue.

Render Pass Objects
Render pass objects provide a synchronization framework for rendering tasks, built upon the concepts in this chapter. Many cases that would otherwise need an application to use other synchronization primitives can be expressed more efficiently as part of a render pass. Render pass objects can be used to control resource access within a single queue.

7.1. Execution and Memory Dependencies

An operation is an arbitrary amount of work to be executed on the host, a device, or an external entity such as a presentation engine. Synchronization commands introduce explicit execution dependencies, and memory dependencies between two sets of operations defined by the command’s two synchronization scopes.

The synchronization scopes define which other operations a synchronization command is able to create execution dependencies with. Any type of operation that is not in a synchronization command’s synchronization scopes will not be included in the resulting dependency. For example, for many synchronization commands, the synchronization scopes can be limited to just operations executing in specific pipeline stages, which allows other pipeline stages to be excluded from a
dependency. Other scoping options are possible, depending on the particular command.

An execution dependency is a guarantee that for two sets of operations, the first set must happen-before the second set. If an operation happens-before another operation, then the first operation must complete before the second operation is initiated. More precisely:

- Let \( \text{Ops}_1 \) and \( \text{Ops}_2 \) be separate sets of operations.
- Let \( \text{Sync} \) be a synchronization command.
- Let \( \text{Scope}_{\text{1st}} \) and \( \text{Scope}_{\text{2nd}} \) be the synchronization scopes of \( \text{Sync} \).
- Let \( \text{ScopedOps}_1 \) be the intersection of sets \( \text{Ops}_1 \) and \( \text{Scope}_{\text{1st}} \).
- Let \( \text{ScopedOps}_2 \) be the intersection of sets \( \text{Ops}_2 \) and \( \text{Scope}_{\text{2nd}} \).
- Submitting \( \text{Ops}_1 \), \( \text{Sync} \) and \( \text{Ops}_2 \) for execution, in that order, will result in execution dependency \( \text{ExeDep} \) between \( \text{ScopedOps}_1 \) and \( \text{ScopedOps}_2 \).
- Execution dependency \( \text{ExeDep} \) guarantees that \( \text{ScopedOps}_1 \) happen-before \( \text{ScopedOps}_2 \).

An execution dependency chain is a sequence of execution dependencies that form a happens-before relation between the first dependency’s \( \text{ScopedOps}_1 \) and the final dependency’s \( \text{ScopedOps}_2 \). For each consecutive pair of execution dependencies, a chain exists if the intersection of \( \text{Scope}_{\text{2nd}} \) in the first dependency and \( \text{Scope}_{\text{1st}} \) in the second dependency is not an empty set. The formation of a single execution dependency from an execution dependency chain can be described by substituting the following in the description of execution dependencies:

- Let \( \text{Sync} \) be a set of synchronization commands that generate an execution dependency chain.
- Let \( \text{Scope}_{\text{1st}} \) be the first synchronization scope of the first command in \( \text{Sync} \).
- Let \( \text{Scope}_{\text{2nd}} \) be the second synchronization scope of the last command in \( \text{Sync} \).

Execution dependencies alone are not sufficient to guarantee that values resulting from writes in one set of operations can be read from another set of operations.

Three additional types of operations are used to control memory access. Availability operations cause the values generated by specified memory write accesses to become available to a memory domain for future access. Any available value remains available until a subsequent write to the same memory location occurs (whether it is made available or not) or the memory is freed. Memory domain operations cause writes that are available to a source memory domain to become available to a destination memory domain (an example of this is making writes available to the host domain available to the device domain). Visibility operations cause values available to a memory domain to become visible to specified memory accesses.

Availability, visibility, memory domains, and memory domain operations are formally defined in the Availability and Visibility section of the Memory Model chapter. Which API operations perform each of these operations is defined in Availability, Visibility, and Domain Operations.

A memory dependency is an execution dependency which includes availability and visibility operations such that:

- The first set of operations happens-before the availability operation.
• The availability operation happens-before the visibility operation.
• The visibility operation happens-before the second set of operations.

Once written values are made visible to a particular type of memory access, they can be read or written by that type of memory access. Most synchronization commands in Vulkan define a memory dependency.

The specific memory accesses that are made available and visible are defined by the access scopes of a memory dependency. Any type of access that is in a memory dependency’s first access scope and occurs in `ScopedOps_1` is made available. Any type of access that is in a memory dependency’s second access scope and occurs in `ScopedOps_2` has any available writes made visible to it. Any type of operation that is not in a synchronization command’s access scopes will not be included in the resulting dependency.

A memory dependency enforces availability and visibility of memory accesses and execution order between two sets of operations. Adding to the description of execution dependency chains:

- Let `MemOps_1` be the set of memory accesses performed by `ScopedOps_1`.
- Let `MemOps_2` be the set of memory accesses performed by `ScopedOps_2`.
- Let `AccessScope_1st` be the first access scope of the first command in the `Sync` chain.
- Let `AccessScope_2nd` be the second access scope of the last command in the `Sync` chain.
- Let `ScopedMemOps_1` be the intersection of sets `MemOps_1` and `AccessScope_1st`.
- Let `ScopedMemOps_2` be the intersection of sets `MemOps_2` and `AccessScope_2nd`.
- Submitting `Ops_1`, `Sync`, and `Ops_2` for execution, in that order, will result in a memory dependency `MemDep` between `ScopedOps_1` and `ScopedOps_2`.

Memory dependency `MemDep` guarantees that:

- Memory writes in `ScopedMemOps_1` are made available.
- Available memory writes, including those from `ScopedMemOps_1`, are made visible to `ScopedMemOps_2`.

NOTE

Execution and memory dependencies are used to solve data hazards, i.e. to ensure that read and write operations occur in a well-defined order. Write-after-read hazards can be solved with just an execution dependency, but read-after-write and write-after-write hazards need appropriate memory dependencies to be included between them. If an application does not include dependencies to solve these hazards, the results and execution orders of memory accesses are undefined.

7.1.1. Image Layout Transitions

Image subresources can be transitioned from one layout to another as part of a memory dependency (e.g. by using an image memory barrier). When a layout transition is specified in a memory dependency, it happens-after the availability operations in the memory dependency, and happens-before the visibility operations. Image layout transitions may perform read and write accesses on all memory bound to the image subresource range, so applications must ensure that all memory writes have been made available before a layout transition is executed. Available memory
is automatically made visible to a layout transition, and writes performed by a layout transition are automatically made available.

Layout transitions always apply to a particular image subresource range, and specify both an old layout and new layout. The old layout must either be VK_IMAGE_LAYOUT_UNDEFINED, or match the current layout of the image subresource range. If the old layout matches the current layout of the image subresource range, the transition preserves the contents of that range. If the old layout is VK_IMAGE_LAYOUT_UNDEFINED, the contents of that range may be discarded.

NOTE

Image layout transitions with VK_IMAGE_LAYOUT_UNDEFINED allow the implementation to discard the image subresource range, which can provide performance or power benefits. Tile-based architectures may be able to avoid flushing tile data to memory, and immediate style renderers may be able to achieve fast metadata clears to reinitialize frame buffer compression state, or similar.

If the contents of an attachment are not needed after a render pass completes, then applications should use VK_ATTACHMENT_STORE_OP_DONT_CARE.

As image layout transitions may perform read and write accesses on the memory bound to the image, if the image subresource affected by the layout transition is bound to peer memory for any device in the current device mask then the memory heap the bound memory comes from must support the VK_PEER_MEMORY_FEATURE_GENERIC_SRC_BIT and VK_PEER_MEMORY_FEATURE_GENERIC_DST_BIT capabilities as returned by vkGetDeviceGroupPeerMemoryFeatures.

NOTE

Applications must ensure that layout transitions happen-after all operations accessing the image with the old layout, and happen-before any operations that will access the image with the new layout. Layout transitions are potentially read/write operations, so not defining appropriate memory dependencies to guarantee this will result in a data race.

Image layout transitions interact with memory aliasing.

Layout transitions that are performed via image memory barriers execute in their entirety in submission order, relative to other image layout transitions submitted to the same queue, including those performed by render passes. In effect there is an implicit execution dependency from each such layout transition to all layout transitions previously submitted to the same queue.

The image layout of each image subresource of a depth/stencil image created with VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT is dependent on the last sample locations used to render to the image subresource as a depth/stencil attachment, thus when the image member of an image memory barrier is an image created with this flag the application can chain a VkSampleLocationsInfoEXT structure to the pNext chain of VkImageMemoryBarrier2 or VkImageMemoryBarrier to specify the sample locations to use during any image layout transition.

If the VkSampleLocationsInfoEXT structure does not match the sample location state last used to render to the image subresource range specified by subresourceRange, or if no VkSampleLocationsInfoEXT structure is present, then the contents of the given image subresource range becomes undefined as if oldLayout would equal VK_IMAGE_LAYOUT_UNDEFINED.
7.1.2. Pipeline Stages

The work performed by an action command consists of multiple operations, which are performed as a sequence of logically independent steps known as pipeline stages. The exact pipeline stages executed depend on the particular command that is used, and current command buffer state when the command was recorded.

**NOTE**

Operations performed by synchronization commands (e.g. availability and visibility operations) are not executed by a defined pipeline stage. However other commands can still synchronize with them by using the synchronization scopes to create a dependency chain.

Execution of operations across pipeline stages **must** adhere to implicit ordering guarantees, particularly including pipeline stage order. Otherwise, execution across pipeline stages **may** overlap or execute out of order with regards to other stages, unless otherwise enforced by an execution dependency.

Several of the synchronization commands include pipeline stage parameters, restricting the synchronization scopes for that command to just those stages. This allows fine grained control over the exact execution dependencies and accesses performed by action commands. Implementations **should** use these pipeline stages to avoid unnecessary stalls or cache flushing.

Bits which **can** be set in a VkPipelineStageFlags2 mask, specifying stages of execution, are:

```c
// Provided by VK_VERSION_1_3
// Flag bits for VkPipelineStageFlagBits2
typedef VkFlags64 VkPipelineStageFlagBits2;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_NONE = 0ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_NONE_KHR = 0ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_TOP_OF_PIPE_BIT = 0x00000001ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_TOP_OF_PIPE_BIT_KHR = 0x00000001ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT = 0x00000002ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT_KHR = 0x00000002ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT = 0x00000004ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT_KHR = 0x00000004ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT = 0x00000008ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT_KHR = 0x00000008ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT = 0x00000010ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT_KHR = 0x00000010ULL;
```

VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT = 0x00000020ULL;

static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT_KHR = 0x00000020ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT = 0x00000040ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT_KHR = 0x00000040ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT = 0x00000080ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT_KHR = 0x00000080ULL;

// Provided by VK_NV_optical_flow
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV = 0x20000000ULL;

or the equivalent

// Provided by VK_KHR_synchronization2
typedef VkPipelineStageFlagBits2 VkPipelineStageFlagBits2KHR;
• **VK_PIPELINE_STAGE_2_NONE** specifies no stages of execution.

• **VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT** specifies the stage of the pipeline where indirect command parameters are consumed. This stage also includes reading commands written by `vkCmdPreprocessGeneratedCommandsNV`.

• **VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT** specifies the task shader stage.

• **VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT** specifies the mesh shader stage.

• **VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT** specifies the stage of the pipeline where index buffers are consumed.

• **VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT** specifies the stage of the pipeline where vertex buffers are consumed.

• **VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT** is equivalent to the logical OR of:
  - **VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT**
  - **VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT**

• **VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT** specifies the vertex shader stage.

• **VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT** specifies the tessellation control shader stage.

• **VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT** specifies the tessellation evaluation shader stage.

• **VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT** specifies the geometry shader stage.

• **VK_PIPELINE_STAGE_2_PRE_RASTERIZATION_SHADERS_BIT** is equivalent to specifying all supported pre-rasterization shader stages:
  - **VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT**
  - **VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT**
  - **VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT**
  - **VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT**
  - **VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT**
  - **VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT**
  - **VK_PIPELINE_STAGE_2_CLUSTER_CULLING_SHADER_BIT_HUAWEI**

• **VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT** specifies the fragment shader stage.

• **VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT** specifies the stage of the pipeline where early fragment tests (depth and stencil tests before fragment shading) are performed. This stage also includes render pass load operations for framebuffer attachments with a depth/stencil format.

• **VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT** specifies the stage of the pipeline where late fragment tests (depth and stencil tests after fragment shading) are performed. This stage also includes render pass store operations for framebuffer attachments with a depth/stencil format.

• **VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT** specifies the stage of the pipeline where final color values are output from the pipeline. This stage includes blending, logic operations, render pass load and store operations for color attachments, render pass multisample resolve...
operations, and `vkCmdClearAttachments`.

- **VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT** specifies the compute shader stage.
- **VK_PIPELINE_STAGE_2_HOST_BIT** specifies a pseudo-stage indicating execution on the host of reads/writes of device memory. This stage is not invoked by any commands recorded in a command buffer.
- **VK_PIPELINE_STAGE_2_COPY_BIT** specifies the execution of all copy commands, including `vkCmdCopyQueryPoolResults`.
- **VK_PIPELINE_STAGE_2_BLIT_BIT** specifies the execution of `vkCmdBlitImage`.
- **VK_PIPELINE_STAGE_2_RESOLVE_BIT** specifies the execution of `vkCmdResolveImage`.
- **VK_PIPELINE_STAGE_2_CLEAR_BIT** specifies the execution of clear commands, with the exception of `vkCmdClearAttachments`.
- **VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT** is equivalent to specifying all of:
  - **VK_PIPELINE_STAGE_2_COPY_BIT**
  - **VK_PIPELINE_STAGE_2_BLIT_BIT**
  - **VK_PIPELINE_STAGE_2_RESOLVE_BIT**
  - **VK_PIPELINE_STAGE_2_CLEAR_BIT**
  - **VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR**
- **VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR** specifies the execution of the ray tracing shader stages.
- **VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR** specifies the execution of acceleration structure commands or acceleration structure copy commands.
- **VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR** specifies the execution of acceleration structure copy commands.
- **VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT** specifies the execution of all graphics pipeline stages, and is equivalent to the logical OR of:
  - **VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT**
  - **VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT**
  - **VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT**
  - **VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT**
  - **VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT**
  - **VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT**
  - **VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT**
  - **VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT**
  - **VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT**
  - **VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT**
  - **VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT**
  - **VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT**
- **VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT** specifies the stage of the pipeline where the predicate of conditional rendering is consumed.
- **VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT** specifies the stage of the pipeline where vertex attribute output values are written to the transform feedback buffers.
- **VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV** specifies the stage of the pipeline where device-side generation of commands via `vkCmdPreprocessGeneratedCommandsNV` is handled.
- **VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR** specifies the stage of the pipeline where the fragment shading rate attachment or shading rate image is read to determine the fragment shading rate for portions of a rasterized primitive.
- **VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT** specifies the stage of the pipeline where the fragment density map is read to generate the fragment areas.
- **VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI** specifies the stage of the pipeline where the invocation mask image is read by the implementation to optimize the ray dispatch.
- **VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR** specifies the execution of video decode operations.
- **VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR** specifies the execution of video encode operations.
- **VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV** specifies the stage of the pipeline where optical flow operation are performed.
- **VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI** specifies the subpass shading shader stage.
- **VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT** specifies the execution of micromap commands.
- **VK_PIPELINE_STAGE_2_CLUSTER_CULLING_SHADER_BIT_HUAWEI** specifies the cluster culling shader stage.
- **VK_PIPELINE_STAGE_2_TOP_OF_PIPE_BIT** is equivalent to **VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT** with `VkAccessFlags2` set to 0 when specified in the second synchronization scope, but equivalent to **VK_PIPELINE_STAGE_2_NONE** in the first scope.
- **VK_PIPELINE_STAGE_2_BOTTOM_OF_PIPE_BIT** is equivalent to **VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT** with `VkAccessFlags2` set to 0 when specified in the first synchronization scope, but equivalent to **VK_PIPELINE_STAGE_2_NONE** in the second scope.

**NOTE** The **TOP** and **BOTTOM** pipeline stages are deprecated, and applications should prefer **VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT** and **VK_PIPELINE_STAGE_2_NONE**.
The `VkPipelineStageFlags2` bitmask goes beyond the 31 individual bit flags allowable within a C99 enum, which is how `VkPipelineStageFlagBits` is defined. The first 31 values are common to both, and are interchangeable.

`VkPipelineStageFlags2` is a bitmask type for setting a mask of zero or more `VkPipelineStageFlagBits2` flags:

```c
// Provided by VK_VERSION_1_3
typedef VkFlags64 VkPipelineStageFlags2;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkPipelineStageFlags2 VkPipelineStageFlags2KHR;
```

Bits which can be set in a `VkPipelineStageFlags` mask, specifying stages of execution, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPipelineStageFlagBits {
    VK_PIPELINE_STAGE_TOP_OF_PIPE_BIT = 0x00000001,
    VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT = 0x00000002,
    VK_PIPELINE_STAGE_VERTEX_INPUT_BIT = 0x00000004,
    VK_PIPELINE_STAGE_VERTEX_SHADER_BIT = 0x00000008,
    VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT = 0x00000010,
    VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT = 0x00000020,
    VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT = 0x00000040,
    VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT = 0x00000080,
    VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT = 0x00000100,
    VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT = 0x00000200,
    VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT = 0x00000400,
    VK_PIPELINE_STAGE_COMPUTE_SHADER_BIT = 0x00000800,
    VK_PIPELINE_STAGE_TRANSFER_BIT = 0x00001000,
    VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT = 0x00002000,
    VK_PIPELINE_STAGE_HOST_BIT = 0x00004000,
    VK_PIPELINE_STAGE_ALL_GRAPHICS_BIT = 0x00008000,
    VK_PIPELINE_STAGE_ALL_COMMANDS_BIT = 0x00010000,
    // Provided by VK_VERSION_1_3
    VK_PIPELINE_STAGE_NONE = 0,
    // Provided by VK_EXT_transform_feedback
    VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT = 0x01000000,
    // Provided by VK_EXT_conditional_rendering
    VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT = 0x00040000,
    // Provided by VK_KHR_acceleration_structure
    VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR = 0x02000000,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR = 0x00200000,
    // Provided by VK_EXT_fragment_density_map
};
```
These values all have the same meaning as the equivalently named values for VkPipelineStageFlags2.

- **VK_PIPELINE_STAGE_NONE** specifies no stages of execution.
- **VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT** specifies the stage of the pipeline where VkDrawIndirect* / VkDispatchIndirect* / VkTraceRaysIndirect* data structures are consumed. This stage also includes reading commands written by vkCmdExecuteGeneratedCommandsNV.
- **VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT** specifies the task shader stage.
- **VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT** specifies the mesh shader stage.
- **VK_PIPELINE_STAGE_VERTEX_INPUT_BIT** specifies the stage of the pipeline where vertex and index buffers are consumed.
- **VK_PIPELINE_STAGE_VERTEX_SHADER_BIT** specifies the vertex shader stage.
- **VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT** specifies the tessellation control shader stage.
- **VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT** specifies the tessellation evaluation shader stage.
- **VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT** specifies the geometry shader stage.
- **VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT** specifies the fragment shader stage.
- **VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT** specifies the stage of the pipeline where early
fragment tests (depth and stencil tests before fragment shading) are performed. This stage also includes render pass load operations for framebuffer attachments with a depth/stencil format.

- **VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT** specifies the stage of the pipeline where late fragment tests (depth and stencil tests after fragment shading) are performed. This stage also includes render pass store operations for framebuffer attachments with a depth/stencil format.

- **VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT** specifies the stage of the pipeline after blending where the final color values are output from the pipeline. This stage includes blending, logic operations, render pass load and store operations for color attachments, render pass multisample resolve operations, and vkCmdClearAttachments.

- **VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT** specifies the execution of a compute shader.

- **VK_PIPELINE_STAGE_TRANSFER_BIT** specifies the following commands:
  - All copy commands, including vkCmdCopyQueryPoolResults
  - vkCmdBlitImage2 and vkCmdBlitImage
  - vkCmdResolveImage2 and vkCmdResolveImage
  - All clear commands, with the exception of vkCmdClearAttachments

- **VK_PIPELINE_STAGE_HOST_BIT** specifies a pseudo-stage indicating execution on the host of reads/writes of device memory. This stage is not invoked by any commands recorded in a command buffer.

- **VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR** specifies the execution of vkCmdBuildAccelerationStructureNV, vkCmdWriteAccelerationStructuresPropertiesNV, vkCmdBuildAccelerationStructuresIndirectKHR, vkCmdCopyAccelerationStructureNV, vkCmdCopyAccelerationStructureToMemoryKHR, and vkCmdWriteAccelerationStructuresPropertiesKHR.

- **VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR** specifies the execution of the ray tracing shader stages, via vkCmdTraceRaysNV, vkCmdTraceRaysKHR, or vkCmdTraceRaysIndirectKHR.

- **VK_PIPELINE_STAGE_ALL_GRAPHICS_BIT** specifies the execution of all graphics pipeline stages, and is equivalent to the logical OR of:
  - **VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT**
  - **VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT**
  - **VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT**
  - **VK_PIPELINE_STAGE_VERTEX_INPUT_BIT**
  - **VK_PIPELINE_STAGE_VERTEX_SHADER_BIT**
  - **VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT**
  - **VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT**
  - **VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT**
  - **VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT**
  - **VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT**
VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT
VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT
VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT
VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT
VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR
VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT

VK_PIPELINE_STAGE_ALL_COMMANDS_BIT specifies all operations performed by all commands supported on the queue it is used with.

VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT specifies the stage of the pipeline where the predicate of conditional rendering is consumed.

VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT specifies the stage of the pipeline where vertex attribute output values are written to the transform feedback buffers.

VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_NV specifies the stage of the pipeline where device-side preprocessing for generated commands via \texttt{vkCmdPreprocessGeneratedCommandsNV} is handled.

VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR specifies the stage of the pipeline where the fragment shading rate attachment or shading rate image is read to determine the fragment shading rate for portions of a rasterized primitive.

VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT specifies the stage of the pipeline where the fragment density map is read to generate the fragment areas.

VK_PIPELINE_STAGE_TOP_OF_PIPE_BIT is equivalent to VK_PIPELINE_STAGE_ALL_COMMANDS_BIT with \texttt{VkAccessFlags} set to 0 when specified in the second synchronization scope, but specifies no stage of execution when specified in the first scope.

VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT is equivalent to VK_PIPELINE_STAGE_ALL_COMMANDS_BIT with \texttt{VkAccessFlags} set to 0 when specified in the first synchronization scope, but specifies no stage of execution when specified in the second scope.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineStageFlags;
```

\texttt{VkPipelineStageFlags} is a bitmask type for setting a mask of zero or more \texttt{VkPipelineStageFlagBits}.

If a synchronization command includes a source stage mask, its first \textit{synchronization scope} only includes execution of the pipeline stages specified in that mask and any \textit{logically earlier} stages. Its first \textit{access scope} only includes memory accesses performed by pipeline stages explicitly specified in the source stage mask.

If a synchronization command includes a destination stage mask, its second \textit{synchronization scope} only includes execution of the pipeline stages specified in that mask and any \textit{logically later} stages. Its second \textit{access scope} only includes memory accesses performed by pipeline stages explicitly specified in the destination stage mask.
Note that access scopes do not interact with the logically earlier or later stages for either scope - only the stages the application specifies are considered part of each access scope.

Certain pipeline stages are only available on queues that support a particular set of operations. The following table lists, for each pipeline stage flag, which queue capability flag must be supported by the queue. When multiple flags are enumerated in the second column of the table, it means that the pipeline stage is supported on the queue if it supports any of the listed capability flags. For further details on queue capabilities see Physical Device Enumeration and Queues.

Table 3. Supported pipeline stage flags

</tbody>
</table>

Pipeline stages that execute as a result of a command logically complete execution in a specific order, such that completion of a logically later pipeline stage must not happen-before completion of a logically earlier stage. This means that including any stage in the source stage mask for a particular synchronization command also implies that any logically earlier stages are included in Scope for that command.

Similarly, initiation of a logically earlier pipeline stage must not happen-after initiation of a logically later pipeline stage. Including any given stage in the destination stage mask for a
particular synchronization command also implies that any logically later stages are included in Scope_{2nd} for that command.

Implementations may not support synchronization at every pipeline stage for every synchronization operation. If a pipeline stage that an implementation does not support synchronization for appears in a source stage mask, it may substitute any logically later stage in its place for the first synchronization scope. If a pipeline stage that an implementation does not support synchronization for appears in a destination stage mask, it may substitute any logically earlier stage in its place for the second synchronization scope.

For example, if an implementation is unable to signal an event immediately after vertex shader execution is complete, it may instead signal the event after color attachment output has completed.

If an implementation makes such a substitution, it must not affect the semantics of execution or memory dependencies or image and buffer memory barriers.

**Graphics pipelines** are executable on queues supporting `VK_QUEUE_GRAPHICS_BIT`. Stages executed by graphics pipelines can only be specified in commands recorded for queues supporting `VK_QUEUE_GRAPHICS_BIT`.

The graphics primitive pipeline executes the following stages, with the logical ordering of the stages matching the order specified here:

- `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT`
- `VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT`
- `VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT`
- `VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT`
- `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT`
- `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`
- `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`
- `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`
- `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`
- `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT`
- `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`
- `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT`

The graphics mesh pipeline executes the following stages, with the logical ordering of the stages matching the order specified here:

- `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT`
- `VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT`
For the compute pipeline, the following stages occur in this order:

- VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT
- VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT

For the subpass shading pipeline, the following stages occur in this order:

- VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI

For graphics pipeline commands executing in a render pass with a fragment density map attachment, the following pipeline stage where the fragment density map read happens has no particular order relative to the other stages, except that it is logically earlier than VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT:

- VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT
- VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT

The conditional rendering stage is formally part of both the graphics, and the compute pipeline. The pipeline stage where the predicate read happens has unspecified order relative to other stages of these pipelines:

- VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT

For the transfer pipeline, the following stages occur in this order:

- VK_PIPELINE_STAGE_2_TRANSFER_BIT

For host operations, only one pipeline stage occurs, so no order is guaranteed:

- VK_PIPELINE_STAGE_2_HOST_BIT

For the command preprocessing pipeline, the following stages occur in this order:

- VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV

For acceleration structure build operations, only one pipeline stage occurs, so no order is guaranteed:

- VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR

For acceleration structure copy operations, only one pipeline stage occurs, so no order is guaranteed:
For opacity micromap build operations, only one pipeline stage occurs, so no order is guaranteed:

- **VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT**

For the ray tracing pipeline, the following stages occur in this order:

- **VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT**
- **VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR**

For the video decode pipeline, the following stages occur in this order:

- **VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR**

For the video encode pipeline, the following stages occur in this order:

- **VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR**

### 7.1.3. Access Types

Memory in Vulkan can be accessed from within shader invocations and via some fixed-function stages of the pipeline. The access type is a function of the descriptor type used, or how a fixed-function stage accesses memory.

Some synchronization commands take sets of access types as parameters to define the access scopes of a memory dependency. If a synchronization command includes a source access mask, its first access scope only includes accesses via the access types specified in that mask. Similarly, if a synchronization command includes a destination access mask, its second access scope only includes accesses via the access types specified in that mask.

Bits which can be set in the srcAccessMask and dstAccessMask members of VkMemoryBarrier2KHR, VkImageMemoryBarrier2KHR, and VkBufferMemoryBarrier2KHR, specifying access behavior, are:

```c
// Provided by VK_VERSION_1_3
// Flag bits for VkAccessFlagBits2
typedef VkFlags64 VkAccessFlagBits2;
static const VkAccessFlagBits2 VK_ACCESS_2_NONE = 0ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_NONE_KHR = 0ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT = 0x00000001ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_INDEX_READ_BIT = 0x00000002ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_INDEX_READ_BIT_KHR = 0x00000002ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT = 0x00000004ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT_KHR = 0x00000004ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_UNIFORM_READ_BIT = 0x00000008ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_UNIFORM_READ_BIT_KHR = 0x00000008ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT = 0x00000010ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT_KHR = 0x00000010ULL;
```
static const VkAccessFlagBits2 VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT_KHR = 0x00000010ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_SHADER_READ_BIT = 0x00000020ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_SHADER_READ_BIT_KHR = 0x00000020ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_SHADER_WRITE_BIT = 0x00000040ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_SHADER_WRITE_BIT_KHR = 0x00000040ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT = 0x00000080ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT_KHR = 0x00000080ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT = 0x00000100ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT_KHR = 0x00000100ULL;

```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkAccessFlagBits2 VkAccessFlagBits2KHR;
```

- **VK_ACCESS_2_NONE** specifies no accesses.
- **VK_ACCESS_2_MEMORY_READ_BIT** specifies all read accesses. It is always valid in any access mask, and is treated as equivalent to setting all READ access flags that are valid where it is used.
- **VK_ACCESS_2_MEMORY_WRITE_BIT** specifies all write accesses. It is always valid in any access mask, and is treated as equivalent to setting all WRITE access flags that are valid where it is used.
- **VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT** specifies read access to command data read from indirect buffers as part of an indirect build, trace, drawing or dispatch command. Such access occurs in the `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT` pipeline stage.
- **VK_ACCESS_2_INDEX_READ_BIT** specifies read access to an index buffer as part of an indexed drawing command, bound by `vkCmdBindIndexBuffer2KHR` and `vkCmdBindIndexBuffer`. Such access occurs in the `VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT` pipeline stage.
- **VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT** specifies read access to a vertex buffer as part of a drawing command, bound by `vkCmdBindVertexBuffers`. Such access occurs in the `VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT` pipeline stage.
- **VK_ACCESS_2_UNIFORM_READ_BIT** specifies read access to a uniform buffer in any shader pipeline stage.
- **VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT** specifies read access to an input attachment within a render pass during subpass shading or fragment shading. Such access occurs in the `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI` or `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT` pipeline stage.
- **VK_ACCESS_2_SHADER_SAMPLED_READ_BIT** specifies read access to a uniform texel buffer or sampled image in any shader pipeline stage.
- **VK_ACCESS_2_SHADER_STORAGE_READ_BIT** specifies read access to a storage buffer, physical storage buffer, storage texel buffer, or storage image in any shader pipeline stage.
- **VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR** specifies read access to a shader binding table.
in any shader pipeline stage.

- **VK_ACCESS_2_SHADER_READ_BIT** is equivalent to the logical OR of:
  - **VK_ACCESS_2_SHADER_SAMPLED_READ_BIT**
  - **VK_ACCESS_2_SHADER_STORAGE_READ_BIT**

- **VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT** specifies write access to a storage buffer, physical storage buffer, storage texel buffer, or storage image in any shader pipeline stage.

- **VK_ACCESS_2_SHADER_WRITE_BIT** is equivalent to **VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT**.

- **VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT** specifies read access to a color attachment, such as via blending (other than advanced blend operations), logic operations or certain render pass load operations in the VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT pipeline stage or via fragment shader tile image reads in the VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT pipeline stage.

- **VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT** specifies write access to a color attachment during a render pass or via certain render pass load, store, and multisample resolve operations. Such access occurs in the VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT pipeline stage.

- **VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT** specifies read access to a depth/stencil attachment, via depth or stencil operations or certain render pass load operations in the VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT or VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT pipeline stages or via fragment shader tile image reads in the VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT pipeline stage.

- **VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT** specifies write access to a depth/stencil attachment, via depth or stencil operations or certain render pass load and store operations. Such access occurs in the VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT or VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT pipeline stages.

- **VK_ACCESS_2_TRANSFER_READ_BIT** specifies read access to an image or buffer in a copy operation. Such access occurs in the VK_PIPELINE_STAGE_2_COPY_BIT, VK_PIPELINE_STAGE_2_BLIT_BIT, or VK_PIPELINE_STAGE_2_RESOLVE_BIT pipeline stages.

- **VK_ACCESS_2_TRANSFER_WRITE_BIT** specifies write access to an image or buffer in a clear or copy operation. Such access occurs in the VK_PIPELINE_STAGE_2_COPY_BIT, VK_PIPELINE_STAGE_2_BLIT_BIT, or VK_PIPELINE_STAGE_2_RESOLVE_BIT pipeline stages.

- **VK_ACCESS_2_HOST_READ_BIT** specifies read access by a host operation. Accesses of this type are not performed through a resource, but directly on memory. Such access occurs in the VK_PIPELINE_STAGE_2_HOST_BIT pipeline stage.

- **VK_ACCESS_2_HOST_WRITE_BIT** specifies write access by a host operation. Accesses of this type are not performed through a resource, but directly on memory. Such access occurs in the VK_PIPELINE_STAGE_2_HOST_BIT pipeline stage.

- **VK_ACCESS_2_CONDITIONAL_RENDERING_READ_BIT_EXT** specifies read access to a predicate as part of conditional rendering. Such access occurs in the VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT pipeline stage.

- **VK_ACCESS_2_TRANSFORM_FEEDBACK_WRITE_BIT_EXT** specifies write access to a transform feedback buffer made when transform feedback is active. Such access occurs in the VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT pipeline stage.
• **VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT** specifies read access to a transform feedback counter buffer which is read when `vkCmdBeginTransformFeedbackEXT` executes. Such access occurs in the **VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT** pipeline stage.

• **VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT** specifies write access to a transform feedback counter buffer which is written when `vkCmdEndTransformFeedbackEXT` executes. Such access occurs in the **VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT** pipeline stage.

• **VK_ACCESS_2_COMMAND_PREPROCESS_READ_BIT_NV** specifies reads from buffer inputs to `vkCmdPreprocessGeneratedCommandsNV`. Such access occurs in the **VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV** pipeline stage.

• **VK_ACCESS_2_COMMAND_PREPROCESS_WRITE_BIT_NV** specifies writes to the target command buffer preprocess outputs. Such access occurs in the **VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV** pipeline stage.

• **VK_ACCESS_2_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT** specifies read access to color attachments, including advanced blend operations. Such access occurs in the **VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT** pipeline stage.

• **VK_ACCESS_2_INVOCATION_MASK_READ_BIT_HUAWEI** specifies read access to an invocation mask image in the **VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI** pipeline stage.

• **VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR** specifies read access to an acceleration structure as part of a trace, build, or copy command, or to an acceleration structure scratch buffer as part of a build command. Such access occurs in the **VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR** or **VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR** pipeline stage.

• **VK_ACCESS_2_ACCELERATION_STRUCTURE_WRITE_BIT_KHR** specifies write access to an acceleration structure or acceleration structure scratch buffer as part of a build or copy command. Such access occurs in the **VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR** pipeline stage.

• **VK_ACCESS_2_FRAGMENT_DENSITY_MAP_READ_BIT_EXT** specifies read access to a fragment density map attachment during dynamic fragment density map operations. Such access occurs in the **VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT** pipeline stage.

• **VK_ACCESS_2_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR** specifies read access to a fragment shading rate attachment during rasterization. Such access occurs in the **VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR** pipeline stage.

• **VK_ACCESS_2_SHADING_RATE_IMAGE_READ_BIT_NV** specifies read access to a shading rate image during rasterization. Such access occurs in the **VK_PIPELINE_STAGE_2_SHADING_RATE_IMAGE_BIT_NV** pipeline stage. It is equivalent to **VK_ACCESS_2_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR**.

• **VK_ACCESS_2_VIDEO_DECODE_READ_BIT_KHR** specifies read access to an image or buffer resource in a video decode operation. Such access occurs in the **VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR** pipeline stage.

• **VK_ACCESS_2_VIDEO_DECODE_WRITE_BIT_KHR** specifies write access to an image or buffer resource in a video decode operation. Such access occurs in the **VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR** pipeline stage.

• **VK_ACCESS_2_VIDEO.Encode_READ_BIT_KHR** specifies read access to an image or buffer resource in a video encode operation. Such access occurs in the **VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR** pipeline stage.

- **VK_ACCESS_2_VIDEO_ENCODE_WRITE_BIT_KHR** specifies write access to an image or buffer resource in a video encode operation. Such access occurs in the **VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR** pipeline stage.

- **VK_ACCESS_2_DESCRIPTOR_BUFFER_READ_BIT_EXT** specifies read access to a descriptor buffer in any shader pipeline stage.

- **VK_ACCESS_2_OPTICAL_FLOW_READ_BIT_NV** specifies read access to an image or buffer resource as part of a optical flow operation. Such access occurs in the **VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV** pipeline stage.

- **VK_ACCESS_2_OPTICAL_FLOW_WRITE_BIT_NV** specifies write access to an image or buffer resource as part of a optical flow operation. Such access occurs in the **VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV** pipeline stage.

- **VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT** specifies write access to a micromap object. Such access occurs in the **VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT** pipeline stage.

- **VK_ACCESS_2_MICROMAP_READ_BIT_EXT** specifies read access to a micromap object. Such access occurs in the **VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT** and **VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR** pipeline stages.

**NOTE**

In situations where an application wishes to select all access types for a given set of pipeline stages, **VK_ACCESS_2_MEMORY_READ_BIT** or **VK_ACCESS_2_MEMORY_WRITE_BIT** can be used. This is particularly useful when specifying stages that only have a single access type.

**NOTE**

The **VkAccessFlags2** bitmask goes beyond the 31 individual bit flags allowable within a C99 enum, which is how **VkAccessFlagBits** is defined. The first 31 values are common to both, and are interchangeable.

**VkAccessFlags2** is a bitmask type for setting a mask of zero or more **VkAccessFlagBits**:

```c
// Provided by VK_VERSION_1_3
typedef VkFlags64 VkAccessFlags2;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkAccessFlags2 VkAccessFlags2KHR;
```

Bits which **can** be set in the **srcAccessMask** and **dstAccessMask** members of **VkSubpassDependency**, **VkSubpassDependency2**, **VkMemoryBarrier**, **VkBufferMemoryBarrier**, and **VkImageMemoryBarrier**, specifying access behavior, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkVersion_1_0 AccessFlagBits {
    VK_ACCESS_INDIRECT_COMMAND_READ_BIT = 0x00000001,
    VK_ACCESS_INDEX_READ_BIT = 0x00000002,
};
```
VK_ACCESS_VERTEX_ATTRIBUTE_READ_BIT = 0x00000004,
VK_ACCESS_UNIFORM_READ_BIT = 0x00000008,
VK_ACCESS_INPUT_ATTACHMENT_READ_BIT = 0x00000010,
VK_ACCESS_SHADER_READ_BIT = 0x00000020,
VK_ACCESS_SHADER_WRITE_BIT = 0x00000040,
VK_ACCESS_COLOR_ATTACHMENT_READ_BIT = 0x00000080,
VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT = 0x00000100,
VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT = 0x00000200,
VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT = 0x00000400,
VK_ACCESS_TRANSFER_READ_BIT = 0x00000800,
VK_ACCESS_TRANSFER_WRITE_BIT = 0x00001000,
VK_ACCESS_HOST_READ_BIT = 0x00002000,
VK_ACCESS_HOST_WRITE_BIT = 0x00004000,
VK_ACCESS_MEMORY_READ_BIT = 0x00008000,
VK_ACCESS_MEMORY_WRITE_BIT = 0x00010000,

// Provided by VK_VERSION_1_3
VK_ACCESS_NONE = 0,

// Provided by VK_EXT_transform_feedback
VK_ACCESS_TRANSFORM_FEEDBACK_WRITE_BIT_EXT = 0x02000000,

// Provided by VK_EXT_transform_feedback
VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT = 0x04000000,

// Provided by VK_EXT_transform_feedback
VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT = 0x08000000,

// Provided by VK_EXT_conditional_rendering
VK_ACCESS_CONDITIONAL_RENDERING_READ_BIT_EXT = 0x00100000,

// Provided by VK_KHR.acceleration_structure
VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR = 0x00200000,

// Provided by VK_KHR.acceleration_structure
VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR = 0x00400000,

// Provided by VK_NV_device_generated_commands
VK_ACCESS_COMMAND_PREPROCESS_WRITE_BIT_NV = 0x00040000,

// Provided by VK_NV_shading_rate_image
VK_ACCESS_SHADING_RATE_IMAGE_READ_BIT_NV =

// Provided by VK_NV_shading_rate_image
VK_ACCESS_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR =

// Provided by VK_NV_ray_tracing
VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_NV =

// Provided by VK_NV_ray_tracing
VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_NV =

// Provided by VK_KHR_synchronization2
VK_ACCESS_NONE_KHR = VK_ACCESS_NONE,
These values all have the same meaning as the equivalently named values for `VkAccessFlags2`.

- `VK_ACCESS_NONE` specifies no accesses.
- `VK_ACCESS_MEMORY_READ_BIT` specifies all read accesses. It is always valid in any access mask, and is treated as equivalent to setting all `READ` access flags that are valid where it is used.
- `VK_ACCESS_MEMORY_WRITE_BIT` specifies all write accesses. It is always valid in any access mask, and is treated as equivalent to setting all `WRITE` access flags that are valid where it is used.
- `VK_ACCESS_INDIRECT_COMMAND_READ_BIT` specifies read access to indirect command data read as part of an indirect build, trace, drawing or dispatching command. Such access occurs in the `VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT` pipeline stage.
- `VK_ACCESS_INDEX_READ_BIT` specifies read access to an index buffer as part of an indexed drawing command, bound by `vkCmdBindIndexBuffer2KHR` and `vkCmdBindIndexBuffer`. Such access occurs in the `VK_PIPELINE_STAGE_VERTEX_INPUT_BIT` pipeline stage.
- `VK_ACCESS_VERTEX_ATTRIBUTE_READ_BIT` specifies read access to a vertex buffer as part of a drawing command, bound by `vkCmdBindVertexBuffers`. Such access occurs in the `VK_PIPELINE_STAGE_VERTEX_INPUT_BIT` pipeline stage.
- `VK_ACCESS_UNIFORM_READ_BIT` specifies read access to a `uniform buffer` in any shader pipeline stage.
- `VK_ACCESS_INPUT_ATTACHMENT_READ_BIT` specifies read access to an `input attachment` within a render pass during subpass shading or fragment shading. Such access occurs in the `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI` or `VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT` pipeline stage.
- `VK_ACCESS_SHADER_READ_BIT` specifies read access to a `uniform texel buffer`, a `sampled image`, a `storage buffer`, a `physical storage buffer`, a shader binding table, a `storage texel buffer`, or a `storage image` in any shader pipeline stage.
- `VK_ACCESS_SHADER_WRITE_BIT` specifies write access to a `storage buffer`, a `physical storage buffer`, a `storage texel buffer`, or a `storage image` in any shader pipeline stage.
- `VK_ACCESS_COLOR_ATTACHMENT_READ_BIT` specifies read access to a `color attachment`, such as via `blending` (other than `advanced blend operations`), `logic operations` or certain `render pass load operations` in the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage or via fragment shader tile image reads in the `VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT` pipeline stage.
- `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT` specifies write access to a `color`, a `resolve`, or a `depth/stencil resolve attachment` during a `render pass` or via certain `render pass load` and `store` operations. Such access occurs in the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage.
- `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT` specifies read access to a `depth/stencil attachment`, via `depth` or `stencil operations` or certain `render pass load operations` in the `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT` or `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT` pipeline stages or via fragment shader tile image reads in the `VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT` pipeline stage.
- `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT` specifies write access to a `depth/stencil...
attachment, via depth or stencil operations or certain render pass load and store operations. Such access occurs in the VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT or VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT pipeline stages.

- **VK_ACCESS_TRANSFER_READ_BIT** specifies read access to an image or buffer in a copy operation. Such access occurs in the VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT pipeline stage.

- **VK_ACCESS_TRANSFER_WRITE_BIT** specifies write access to an image or buffer in a clear or copy operation. Such access occurs in the VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT pipeline stage.

- **VK_ACCESS_HOST_READ_BIT** specifies read access by a host operation. Accesses of this type are not performed through a resource, but directly on memory. Such access occurs in the VK_PIPELINE_STAGE_HOST_BIT pipeline stage.

- **VK_ACCESS_HOST_WRITE_BIT** specifies write access by a host operation. Accesses of this type are not performed through a resource, but directly on memory. Such access occurs in the VK_PIPELINE_STAGE_HOST_BIT pipeline stage.

- **VK_ACCESS_CONDITIONAL_RENDERING_READ_BIT_EXT** specifies read access to a predicate as part of conditional rendering. Such access occurs in the VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT pipeline stage.

- **VK_ACCESS_TRANSFORM_FEEDBACK_WRITE_BIT_EXT** specifies write access to a transform feedback buffer made when transform feedback is active. Such access occurs in the VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT pipeline stage.

- **VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT** specifies read access to a transform feedback counter buffer which is read when vkCmdBeginTransformFeedbackEXT executes. Such access occurs in the VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT pipeline stage.

- **VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT** specifies write access to a transform feedback counter buffer which is written when vkCmdEndTransformFeedbackEXT executes. Such access occurs in the VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT pipeline stage.

- **VK_ACCESS_COMMAND_PREPROCESS_READ_BIT_NV** specifies reads from buffer inputs to vkCmdPreprocessGeneratedCommandsNV. Such access occurs in the VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_NV pipeline stage.

- **VK_ACCESS_COMMAND_PREPROCESS_WRITE_BIT_NV** specifies writes to the target command buffer preprocess outputs in vkCmdPreprocessGeneratedCommandsNV. Such access occurs in the VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_NV pipeline stage.

- **VK_ACCESS_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT** specifies read access to color attachments, including advanced blend operations. Such access occurs in the VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT pipeline stage.

- **VK_ACCESS_2_INVOCATION_MASK_READ_BIT_HUAWEI** specifies read access to an invocation mask image in the VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI pipeline stage.

- **VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR** specifies read access to an acceleration structure as part of a trace, build, or copy command, or to an acceleration structure scratch buffer as part of a build command. Such access occurs in the VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR or VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage.

- **VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR** specifies write access to an acceleration
structure or acceleration structure scratch buffer as part of a build or copy command. Such access occurs in the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage.

- **VK_ACCESS_FRAGMENT_DENSITY_MAP_READ_BIT_EXT** specifies read access to a fragment density map attachment during dynamic fragment density map operations. Such access occurs in the `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT` pipeline stage.

- **VK_ACCESS_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR** specifies read access to a fragment shading rate attachment during rasterization. Such access occurs in the `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` pipeline stage.

- **VK_ACCESS_SHADING_RATE_IMAGE_READ_BIT_NV** specifies read access to a shading rate image during rasterization. Such access occurs in the `VK_PIPELINE_STAGE_SHADING_RATE_IMAGE_BIT_NV` pipeline stage. It is equivalent to `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

Certain access types are only performed by a subset of pipeline stages. Any synchronization command that takes both stage masks and access masks uses both to define the access scopes - only the specified access types performed by the specified stages are included in the access scope. An application **must** not specify an access flag in a synchronization command if it does not include a pipeline stage in the corresponding stage mask that is able to perform accesses of that type. The following table lists, for each access flag, which pipeline stages can perform that type of access.

**Table 4. Supported access types**

<table>
<thead>

VkAccessFlags is a bitmask type for setting a mask of zero or more VkAccessFlagBits.

If a memory object does not have the VK_MEMORY_PROPERTY_HOST_COHERENT_BIT property, then vkFlushMappedMemoryRanges must be called in order to guarantee that writes to the memory object from the host are made available to the host domain, where they can be further made available to the device domain via a domain operation. Similarly, vkInvalidateMappedMemoryRanges must be called to guarantee that writes which are available to the host domain are made visible to host operations.

If the memory object does have the VK_MEMORY_PROPERTY_HOST_COHERENT_BIT property flag, writes to the memory object from the host are automatically made available to the host domain. Similarly, writes made available to the host domain are automatically made visible to the host.

NOTE Queue submission commands automatically perform a domain operation from host to device for all writes performed before the command executes, so in most cases an explicit memory barrier is not needed for this case. In the few circumstances where a submit does not occur between the host write and the device read access, writes can be made available by using an explicit memory barrier.

7.1.4. Framebuffer Region Dependencies

Pipeline stages that operate on, or with respect to, the framebuffer are collectively the framebuffer-space pipeline stages. These stages are:

- VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT
- VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT
- VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT
- VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT

For these pipeline stages, an execution or memory dependency from the first set of operations to the second set can either be a single framebuffer-global dependency, or split into multiple framebuffer-local dependencies. A dependency with non-framebuffer-space pipeline stages is neither framebuffer-global nor framebuffer-local.

A framebuffer region is a subset of the entire framebuffer, and can either be:

- A sample region, which is set of sample (x, y, layer, sample) coordinates that is a subset of the entire framebuffer, or
- A fragment region, which is a set of fragment (x, y, layer) coordinates that is a subset of the entire framebuffer.

Both synchronization scopes of a framebuffer-local dependency include only the operations performed within corresponding framebuffer regions (as defined below). No ordering guarantees are made between different framebuffer regions for a framebuffer-local dependency.
Both synchronization scopes of a framebuffer-global dependency include operations on all framebuffer-regions.

If the first synchronization scope includes operations on pixels/fragments with N samples and the second synchronization scope includes operations on pixels/fragments with M samples, where N does not equal M, then a framebuffer region containing all samples at a given (x, y, layer) coordinate in the first synchronization scope corresponds to a region containing all samples at the same coordinate in the second synchronization scope. In other words, the framebuffer region is a fragment region and it is a pixel granularity dependency. If N equals M, and if the VkSubpassDescription::flags does not specify the VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM flag, then a framebuffer region containing a single (x, y, layer, sample) coordinate in the first synchronization scope corresponds to a region containing the same sample at the same coordinate in the second synchronization scope. In other words, the framebuffer region is a sample region and it is a sample granularity dependency.

If the pipeline performing the operation was created with VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT, VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT, or VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT, the framebuffer region is a fragment region and it is a pixel granularity dependency. Since fragment shader invocations are not specified to run in any particular groupings, the size of a framebuffer region is implementation-dependent, not known to the application, and must be assumed to be no larger than specified above.

Practically, the pixel vs. sample granularity dependency means that if an input attachment has a different number of samples than the pipeline’s rasterizationSamples, then a fragment can access any sample in the input attachment’s pixel even if it only uses framebuffer-local dependencies. If the input attachment has the same number of samples, then the fragment can only access the covered samples in its input SampleMask (i.e. the fragment operations happen-after a framebuffer-local dependency for each sample the fragment covers). To access samples that are not covered, either the VkSubpassDescription::flags VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM flag is required, or a framebuffer-global dependency is required.

If a synchronization command includes a dependencyFlags parameter, and specifies the VK_DEPENDENCY_BY_REGION_BIT flag, then it defines framebuffer-local dependencies for the framebuffer-space pipeline stages in that synchronization command, for all framebuffer regions. If no dependencyFlags parameter is included, or the VK_DEPENDENCY_BY_REGION_BIT flag is not specified, then a framebuffer-global dependency is specified for those stages. The VK_DEPENDENCY_BY_REGION_BIT flag does not affect the dependencies between non-framebuffer-space pipeline stages, nor does it affect the dependencies between framebuffer-space and non-framebuffer-space pipeline stages.

Framebuffer-local dependencies are more efficient for most architectures; particularly tile-based architectures - which can keep framebuffer-regions entirely...
in on-chip registers and thus avoid external bandwidth across such a dependency. Including a framebuffer-global dependency in your rendering will usually force all implementations to flush data to memory, or to a higher level cache, breaking any potential locality optimizations.

7.1.5. View-Local Dependencies

In a render pass instance that has multiview enabled, dependencies can be either view-local or view-global.

A view-local dependency only includes operations from a single source view from the source subpass in the first synchronization scope, and only includes operations from a single destination view from the destination subpass in the second synchronization scope. A view-global dependency includes all views in the view mask of the source and destination subpasses in the corresponding synchronization scopes.

If a synchronization command includes a dependencyFlags parameter and specifies the VK_DEPENDENCY_VIEW_LOCAL_BIT flag, then it defines view-local dependencies for that synchronization command, for all views. If no dependencyFlags parameter is included or the VK_DEPENDENCY_VIEW_LOCAL_BIT flag is not specified, then a view-global dependency is specified.

7.1.6. Device-Local Dependencies

Dependencies can be either device-local or non-device-local. A device-local dependency acts as multiple separate dependencies, one for each physical device that executes the synchronization command, where each dependency only includes operations from that physical device in both synchronization scopes. A non-device-local dependency is a single dependency where both synchronization scopes include operations from all physical devices that participate in the synchronization command. For subpass dependencies, all physical devices in the VkDeviceGroupRenderPassBeginInfo::deviceMask participate in the dependency, and for pipeline barriers all physical devices that are set in the command buffer's current device mask participate in the dependency.

If a synchronization command includes a dependencyFlags parameter and specifies the VK_DEPENDENCY_DEVICE_GROUP_BIT flag, then it defines a non-device-local dependency for that synchronization command. If no dependencyFlags parameter is included or the VK_DEPENDENCY_DEVICE_GROUP_BIT flag is not specified, then it defines device-local dependencies for that synchronization command, for all participating physical devices.

Semaphore and event dependencies are device-local and only execute on the one physical device that performs the dependency.

7.2. Implicit Synchronization Guarantees

A small number of implicit ordering guarantees are provided by Vulkan, ensuring that the order in which commands are submitted is meaningful, and avoiding unnecessary complexity in common operations.
Submission order is a fundamental ordering in Vulkan, giving meaning to the order in which action and synchronization commands are recorded and submitted to a single queue. Explicit and implicit ordering guarantees between commands in Vulkan all work on the premise that this ordering is meaningful. This order does not itself define any execution or memory dependencies; synchronization commands and other orderings within the API use this ordering to define their scopes.

Submission order for any given set of commands is based on the order in which they were recorded to command buffers and then submitted. This order is determined as follows:

1. The initial order is determined by the order in which `vkQueueSubmit` and `vkQueueSubmit2` commands are executed on the host, for a single queue, from first to last.
2. The order in which `VkSubmitInfo` structures are specified in the `pSubmits` parameter of `vkQueueSubmit`, or in which `VkSubmitInfo2` structures are specified in the `pSubmits` parameter of `vkQueueSubmit2`, from lowest index to highest.
3. The order in which command buffers are specified in the `pCommandBuffers` member of `VkSubmitInfo` or ` VkSubmitInfo2` from lowest index to highest.
4. The order in which commands outside of a render pass were recorded to a command buffer on the host, from first to last.
5. The order in which commands inside a single subpass were recorded to a command buffer on the host, from first to last.

**NOTE** When using a render pass object with multiple subpasses, commands in different subpasses have no defined submission order relative to each other, regardless of the order in which the subpasses were recorded. Commands within a subpass are still ordered relative to other commands in the same subpass, and those outside of the render pass.

State commands do not execute any operations on the device, instead they set the state of the command buffer when they execute on the host, in the order that they are recorded. Action commands consume the current state of the command buffer when they are recorded, and will execute state changes on the device as required to match the recorded state.

The order of primitives passing through the graphics pipeline and image layout transitions as part of an image memory barrier provide additional guarantees based on submission order.

Execution of pipeline stages within a given command also has a loose ordering, dependent only on a single command.

Signal operation order is a fundamental ordering in Vulkan, giving meaning to the order in which semaphore and fence signal operations occur when submitted to a single queue. The signal operation order for queue operations is determined as follows:

1. The initial order is determined by the order in which `vkQueueSubmit` and `vkQueueSubmit2` commands are executed on the host, for a single queue, from first to last.
2. The order in which `VkSubmitInfo` structures are specified in the `pSubmits` parameter of `vkQueueSubmit`, or in which `VkSubmitInfo2` structures are specified in the `pSubmits` parameter
of \texttt{vkQueueSubmit2}, from lowest index to highest.

3. The fence signal operation defined by the \texttt{fence} parameter of a \texttt{vkQueueSubmit} or \texttt{vkQueueSubmit2} or \texttt{vkQueueBindSparse} command is ordered after all semaphore signal operations defined by that command.

Semaphore signal operations defined by a single \texttt{VkSubmitInfo} or \texttt{VkSubmitInfo2} or \texttt{VkBindSparseInfo} structure are unordered with respect to other semaphore signal operations defined within the same structure.

The \texttt{vkSignalSemaphore} command does not execute on a queue but instead performs the signal operation from the host. The semaphore signal operation defined by executing a \texttt{vkSignalSemaphore} command happens-after the \texttt{vkSignalSemaphore} command is invoked and happens-before the command returns.

\begin{itemize}
\item When signaling timeline semaphores, it is the responsibility of the application to ensure that they are ordered such that the semaphore value is strictly increasing. Because the first synchronization scope for a semaphore signal operation contains all semaphore signal operations which occur earlier in submission order, all semaphore signal operations contained in any given batch are guaranteed to happen-after all semaphore signal operations contained in any previous batches. However, no ordering guarantee is provided between the semaphore signal operations defined within a single batch. This, combined with the requirement that timeline semaphore values strictly increase, means that it is invalid to signal the same timeline semaphore twice within a single batch.

\item If an application wishes to ensure that some semaphore signal operation happens-after some other semaphore signal operation, it can submit a separate batch containing only semaphore signal operations, which will happen-after the semaphore signal operations in any earlier batches.
\end{itemize}

**NOTE**

When signaling a semaphore from the host, the only ordering guarantee is that the signal operation happens-after when \texttt{vkSignalSemaphore} is called and happens-before it returns. Therefore, it is invalid to call \texttt{vkSignalSemaphore} while there are any outstanding signal operations on that semaphore from any queue submissions unless those queue submissions have some dependency which ensures that they happen-after the host signal operation. One example of this would be if the pending signal operation is, itself, waiting on the same semaphore at a lower value and the call to \texttt{vkSignalSemaphore} signals that lower value. Furthermore, if there are two or more processes or threads signaling the same timeline semaphore from the host, the application must ensure that the \texttt{vkSignalSemaphore} with the lower semaphore value returns before \texttt{vkSignalSemaphore} is called with the higher value.

### 7.3. Fences

Fences are a synchronization primitive that \texttt{can} be used to insert a dependency from a queue to the host. Fences have two states - signaled and unsignaled. A fence \texttt{can} be signaled as part of the execution of a queue submission command. Fences \texttt{can} be unsignaled on the host with \texttt{vkResetFences}. Fences \texttt{can} be waited on by the host with the \texttt{vkWaitForFences} command, and the
current state can be queried with vkGetFenceStatus.

The internal data of a fence may include a reference to any resources and pending work associated with signal or unsignal operations performed on that fence object, collectively referred to as the fence’s payload. Mechanisms to import and export that internal data to and from fences are provided below. These mechanisms indirectly enable applications to share fence state between two or more fences and other synchronization primitives across process and API boundaries.

Fences are represented by VkFence handles:

// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkFence)

To create a fence, call:

// Provided by VK_VERSION_1_0
VkResult vkCreateFence(
    VkDevice device,                   // device is the logical device that creates the fence.
    const VkFenceCreateInfo* pCreateInfo, // pCreateInfo is a pointer to a VkFenceCreateInfo structure containing information about how the fence is to be created.
    const VkAllocationCallbacks* pAllocator,  // pAllocator controls host memory allocation as described in the Memory Allocation chapter.
    VkFence* pFence);                    // pFence is a pointer to a handle in which the resulting fence object is returned.

Valid Usage (Implicit)

- VUID-vkCreateFence-device-parameter device must be a valid VkDevice handle
- VUID-vkCreateFence-pCreateInfo-parameter pCreateInfo must be a valid pointer to a valid VkFenceCreateInfo structure
- VUID-vkCreateFence-pAllocator-parameter If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateFence-pFence-parameter pFence must be a valid pointer to a VkFence handle
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkFenceCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkFenceCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkFenceCreateFlags flags;
} VkFenceCreateInfo;
```

• `sType` is a VkStructureType value identifying this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.
• `flags` is a bitmask of VkFenceCreateFlagBits specifying the initial state and behavior of the fence.

Valid Usage (Implicit)

• VUID-VkFenceCreateInfo-sType-sType
  `sType` must be VK_STRUCTURE_TYPE_FENCE_CREATE_INFO

• VUID-VkFenceCreateInfo-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either NULL or a pointer to a valid instance of VkExportFenceCreateInfo or VkExportFenceWin32HandleInfoKHR

• VUID-VkFenceCreateInfo-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique

• VUID-VkFenceCreateInfo-flags-parameter
  `flags` must be a valid combination of VkFenceCreateFlagBits values

```c
// Provided by VK_VERSION_1_0
typedef enum VkFenceCreateFlagBits {
    VK_FENCE_CREATE_SIGNALED_BIT = 0x00000001,
} VkFenceCreateFlagBits;
```

• VK_FENCE_CREATE_SIGNALED_BIT specifies that the fence object is created in the signaled state.
Otherwise, it is created in the unsignaled state.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkFenceCreateFlags;
```

`VkFenceCreateFlags` is a bitmask type for setting a mask of zero or more `VkFenceCreateFlagBits`.

To create a fence whose payload can be exported to external handles, add a `VkExportFenceCreateInfo` structure to the `pNext` chain of the `VkFenceCreateInfo` structure. The `VkExportFenceCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VK_VERSION_1_1
    typedef struct VkExportFenceCreateInfo {
        VkStructureType sType;
        const void* pNext;
        VkExternalFenceHandleTypeFlags handleTypes;
    } VkExportFenceCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_external_fence
typedef VkExportFenceCreateInfo VkExportFenceCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleTypes` is a bitmask of `VkExternalFenceHandleTypeFlagBits` specifying one or more fence handle types the application can export from the resulting fence. The application can request multiple handle types for the same fence.

### Valid Usage

- VUID-VkExportFenceCreateInfo-handleTypes-01446
  > The bits in `handleTypes` must be supported and compatible, as reported by `VkExternalFenceProperties`

### Valid Usage (Implicit)

- VUID-VkExportFenceCreateInfo-sType-sType
  > `sType` must be `VK_STRUCTURE_TYPE_EXPORT_FENCE_CREATE_INFO`

- VUID-VkExportFenceCreateInfo-handleTypes-parameter
  > `handleTypes` must be a valid combination of `VkExternalFenceHandleTypeFlagBits` values

To specify additional attributes of NT handles exported from a fence, add a
VkExportFenceWin32HandleInfoKHR structure to the pNext chain of the VkFenceCreateInfo structure. The VkExportFenceWin32HandleInfoKHR structure is defined as:

```c
// Provided by VK_KHR_external_fence_win32
typedef struct VkExportFenceWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const SECURITY_ATTRIBUTES* pAttributes;
    DWORD dwAccess;
    LPCWSTR name;
} VkExportFenceWin32HandleInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **pAttributes** is a pointer to a Windows SECURITY_ATTRIBUTES structure specifying security attributes of the handle.
- **dwAccess** is a DWORD specifying access rights of the handle.
- **name** is a null-terminated UTF-16 string to associate with the underlying synchronization primitive referenced by NT handles exported from the created fence.

If VkExportFenceCreateInfo is not included in the same pNext chain, this structure is ignored.

If VkExportFenceCreateInfo is included in the pNext chain of VkFenceCreateInfo with a Windows handleType, but either VkExportFenceWin32HandleInfoKHR is not included in the pNext chain, or it is included but pAttributes is set to NULL, default security descriptor values will be used, and child processes created by the application will not inherit the handle, as described in the MSDN documentation for “Synchronization Object Security and Access Rights”. Further, if the structure is not present, the access rights will be

```
DXGI_SHARED_RESOURCE_READ | DXGI_SHARED_RESOURCE_WRITE
```

for handles of the following types:

**VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT**

1

### Valid Usage

- **VUID-VkExportFenceWin32HandleInfoKHR-handleTypes-01447**
  
  If VkExportFenceCreateInfo::handleTypes does not include VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT, a VkExportFenceWin32HandleInfoKHR structure must not be included in the pNext chain of VkFenceCreateInfo
Valid Usage (Implicit)

- VUID-VkExportFenceWin32HandleInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_EXPORT_FENCE_WIN32_HANDLE_INFO_KHR

- VUID-VkExportFenceWin32HandleInfoKHR-pAttributes-parameter
  If pAttributes is not NULL, pAttributes must be a valid pointer to a valid SECURITY_ATTRIBUTES value

To export a Windows handle representing the state of a fence, call:

```c
// Provided by VK_KHR_external_fence_win32
VkResult vkGetFenceWin32HandleKHR(
    VkDevice device,
    const VkFenceGetWin32HandleInfoKHR* pGetWin32HandleInfo,
    HANDLE* pHandle);
```

- device is the logical device that created the fence being exported.
- pGetWin32HandleInfo is a pointer to a VkFenceGetWin32HandleInfoKHR structure containing parameters of the export operation.
- pHandle will return the Windows handle representing the fence state.

For handle types defined as NT handles, the handles returned by vkGetFenceWin32HandleKHR are owned by the application. To avoid leaking resources, the application must release ownership of them using the CloseHandle system call when they are no longer needed.

Exporting a Windows handle from a fence may have side effects depending on the transference of the specified handle type, as described in Importing Fence Payloads.

Valid Usage (Implicit)

- VUID-vkGetFenceWin32HandleKHR-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetFenceWin32HandleKHR-pGetWin32HandleInfo-parameter
  pGetWin32HandleInfo must be a valid pointer to a valid VkFenceGetWin32HandleInfoKHR structure

- VUID-vkGetFenceWin32HandleKHR-pHandle-parameter
  pHandle must be a valid pointer to a HANDLE value

Return Codes

**Success**

- VK_SUCCESS
The `VkFenceGetWin32HandleInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_fence_win32
typedef struct VkFenceGetWin32HandleInfoKHR {
  VkStructureType sType;
  const void* pNext;
  VkFence fence;
  VkExternalFenceHandleTypeFlagBits handleType;
} VkFenceGetWin32HandleInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `fence` is the fence from which state will be exported.
- `handleType` is a `VkExternalFenceHandleTypeFlagBits` value specifying the type of handle requested.

The properties of the handle returned depend on the value of `handleType`. See `VkExternalFenceHandleTypeFlagBits` for a description of the properties of the defined external fence handle types.

**Valid Usage**

- VUID-VkFenceGetWin32HandleInfoKHR-handleType-01448
  `handleType must` have been included in `VkExportFenceCreateInfo::handleTypes` when the `fence`'s current payload was created

- VUID-VkFenceGetWin32HandleInfoKHR-handkeType-01449
  If `handleType` is defined as an NT handle, `vkGetFenceWin32HandleKHR must` be called no more than once for each valid unique combination of `fence` and `handleType`

- VUID-VkFenceGetWin32HandleInfoKHR-fence-01450
  `fence must` not currently have its payload replaced by an imported payload as described below in Importing Fence Payloads unless that imported payload's handle type was included in `VkExternalFenceProperties::exportFromImportedHandleTypes` for `handleType`

- VUID-VkFenceGetWin32HandleInfoKHR-handleType-01451
  If `handleType` refers to a handle type with copy payload transference semantics, `fence must` be signaled, or have an associated `fence signal operation` pending execution

- VUID-VkFenceGetWin32HandleInfoKHR-handleType-01452
  `handleType must` be defined as an NT handle or a global share handle
Valid Usage (Implicit)

- VUID-VkFenceGetWin32HandleInfoKHR-sType-sType
  
  `sType` **must** be `VK_STRUCTURE_TYPE_FENCE_GET_WIN32_HANDLE_INFO_KHR`.

- VUID-VkFenceGetWin32HandleInfoKHR-pNext-pNext
  
  `pNext` **must** be `NULL`.

- VUID-VkFenceGetWin32HandleInfoKHR-fence-parameter
  
  `fence` **must** be a valid `VkFence` handle.

- VUID-VkFenceGetWin32HandleInfoKHR-handleType-parameter
  
  `handleType` **must** be a valid `VkExternalFenceHandleTypeFlagBits` value.

To export a POSIX file descriptor representing the payload of a fence, call:

```c
// Provided by VK_KHR_external_fence_fd

VkResult vkGetFenceFdKHR(VkDevice device,
                          const VkFenceGetFdInfoKHR* pGetFdInfo,
                          int* pFd);
```

- `device` is the logical device that created the fence being exported.

- `pGetFdInfo` is a pointer to a `VkFenceGetFdInfoKHR` structure containing parameters of the export operation.

- `pFd` will return the file descriptor representing the fence payload.

Each call to `vkGetFenceFdKHR` **must** create a new file descriptor and transfer ownership of it to the application. To avoid leaking resources, the application **must** release ownership of the file descriptor when it is no longer needed.

**NOTE**

Ownership can be released in many ways. For example, the application can call `close()` on the file descriptor, or transfer ownership back to Vulkan by using the file descriptor to import a fence payload.

If `pGetFdInfo->handleType` is `VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT` and the fence is signaled at the time `vkGetFenceFdKHR` is called, `pFd` **may** return the value `-1` instead of a valid file descriptor.

Where supported by the operating system, the implementation **must** set the file descriptor to be closed automatically when an `execve` system call is made.

Exporting a file descriptor from a fence **may** have side effects depending on the transference of the specified handle type, as described in Importing Fence State.

Valid Usage (Implicit)

- VUID-vkGetFenceFdKHR-device-parameter
device must be a valid VkDevice handle

- VUID-vkGetFenceFdKHR-pGetFdInfo-parameter
  pGetFdInfo must be a valid pointer to a valid VkFenceGetFdInfoKHR structure

- VUID-vkGetFenceFdKHR-pFd-parameter
  pFd must be a valid pointer to an int value

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_OUT_OF_HOST_MEMORY

The VkFenceGetFdInfoKHR structure is defined as:

```c
// Provided by VK_KHR_external_fence_fd
typedef struct VkFenceGetFdInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkFence fence;
    VkExternalFenceHandleTypeFlagBits handleType;
} VkFenceGetFdInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- fence is the fence from which state will be exported.
- handleType is a VkExternalFenceHandleTypeFlagBits value specifying the type of handle requested.

The properties of the file descriptor returned depend on the value of handleType. See VkExternalFenceHandleTypeFlagBits for a description of the properties of the defined external fence handle types.

Valid Usage

- VUID-VkFenceGetFdInfoKHR-handleType-01453
  handleType must have been included in VkExportFenceCreateInfo::handleTypes when fence’s current payload was created

- VUID-VkFenceGetFdInfoKHR-handleType-01454
  If handleType refers to a handle type with copy payload transference semantics, fence must be signaled, or have an associated fence signal operation pending execution
VUID-VkFenceGetFdInfoKHR-fence-01455

_fence must_ not currently have its payload replaced by an imported payload as described below in **Importing Fence Payloads** unless that imported payload’s handle type was included in `VkExternalFenceProperties::exportFromImportedHandleTypes` for `handleType`.

VUID-VkFenceGetFdInfoKHR-handleType-01456

`handleType must` be defined as a POSIX file descriptor handle.

---

**Valid Usage (Implicit)**

- VUID-VkFenceGetFdInfoKHR-sType-sType
  
  `sType must` be `VK_STRUCTURE_TYPE_FENCE_GET_FD_INFO_KHR`.

- VUID-VkFenceGetFdInfoKHR-pNext-pNext
  
  `pNext must` be `NULL`.

- VUID-VkFenceGetFdInfoKHR-fence-parameter
  
  `fence must` be a valid `VkFence` handle.

- VUID-VkFenceGetFdInfoKHR-handleType-parameter
  
  `handleType must` be a valid `VkExternalFenceHandleTypeFlagBits` value.

---

To destroy a fence, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyFence(
    VkDevice device,
    VkFence fence,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the fence.

- `fence` is the handle of the fence to destroy.

- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

---

**Valid Usage**

- VUID-vkDestroyFence-fence-01120

  All _queue submission_ commands that refer to `fence must` have completed execution.

- VUID-vkDestroyFence-fence-01121

  If `VkAllocationCallbacks` were provided when `fence` was created, a compatible set of callbacks _must_ be provided here.

- VUID-vkDestroyFence-fence-01122

  If no `VkAllocationCallbacks` were provided when `fence` was created, `pAllocator must` be `NULL`.
Valid Usage (Implicit)

- VUID-vkDestroyFence-device-parameter
  
  \texttt{device must} be a valid \texttt{VkDevice} handle

- VUID-vkDestroyFence-fence-parameter
  
  If \texttt{fence} is not \texttt{VK_NULL_HANDLE}, \texttt{fence must} be a valid \texttt{VkFence} handle

- VUID-vkDestroyFence-pAllocator-parameter
  
  If \texttt{pAllocator} is not \texttt{NULL}, \texttt{pAllocator must} be a valid pointer to a valid \texttt{VkAllocationCallbacks} structure

- VUID-vkDestroyFence-fence-parent
  
  If \texttt{fence} is a valid handle, it \texttt{must} have been created, allocated, or retrieved from \texttt{device}

Host Synchronization

- Host access to \texttt{fence must} be externally synchronized

To query the status of a fence from the host, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkGetFenceStatus(
    VkDevice device,
    VkFence fence);
```

- \texttt{device} is the logical device that owns the fence.
- \texttt{fence} is the handle of the fence to query.

Upon success, \texttt{vkGetFenceStatus} returns the status of the fence object, with the following return codes:

\textbf{Table 5. Fence Object Status Codes}

<table>
<thead>
<tr>
<th>Status</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_SUCCESS</td>
<td>The fence specified by \texttt{fence} is signaled.</td>
</tr>
<tr>
<td>VK_NOT_READY</td>
<td>The fence specified by \texttt{fence} is unsignaled.</td>
</tr>
<tr>
<td>VK_ERROR_DEVICE_LOST</td>
<td>The device has been lost. See Lost Device.</td>
</tr>
</tbody>
</table>

If a \texttt{queue submission} command is pending execution, then the value returned by this command \texttt{may} immediately be out of date.

If the device has been lost (see Lost Device), \texttt{vkGetFenceStatus may} return any of the above status
codes. If the device has been lost and \texttt{vkGetFenceStatus} is called repeatedly, it will eventually return either \texttt{VK_SUCCESS} or \texttt{VK_ERROR_DEVICE_LOST}.

**Valid Usage (Implicit)**

- VUID-vkGetFenceStatus-device-parameter
  \textit{device} must be a valid \texttt{VkDevice} handle

- VUID-vkGetFenceStatus-fence-parameter
  \textit{fence} must be a valid \texttt{VkFence} handle

- VUID-vkGetFenceStatus-fence-parent
  \textit{fence} must have been created, allocated, or retrieved from \texttt{device}

**Return Codes**

**Success**

- \texttt{VK_SUCCESS}
- \texttt{VK_NOT_READY}

**Failure**

- \texttt{VK_ERROR_OUT_OF_HOST_MEMORY}
- \texttt{VK_ERROR_OUT_OF_DEVICE_MEMORY}
- \texttt{VK_ERROR_DEVICE_LOST}

To set the state of fences to unsignaled from the host, call:

```c
// Provided by VK_VERSION_1_0
VkResult \texttt{vkResetFences}(
    VkDevice device,
    uint32_t fenceCount,
    const VkFence* pFences);
```

- \texttt{device} is the logical device that owns the fences.
- \texttt{fenceCount} is the number of fences to reset.
- \texttt{pFences} is a pointer to an array of fence handles to reset.

If any member of \texttt{pFences} currently has its payload imported with temporary permanence, that fence’s prior permanent payload is first restored. The remaining operations described therefore operate on the restored payload.

When \texttt{vkResetFences} is executed on the host, it defines a \textit{fence unsignal operation} for each fence, which resets the fence to the unsignaled state.

If any member of \texttt{pFences} is already in the unsignaled state when \texttt{vkResetFences} is executed, then
vkResetFences has no effect on that fence.

Valid Usage

- VUID-vkResetFences-pFences-01123
  Each element of pFences must not be currently associated with any queue command that has not yet completed execution on that queue

Valid Usage (Implicit)

- VUID-vkResetFences-device-parameter
device must be a valid VkDevice handle
- VUID-vkResetFences-pFences-parameter
  pFences must be a valid pointer to an array of fenceCount valid VkFence handles
- VUID-vkResetFences-fenceCount-arraylength
  fenceCount must be greater than 0
- VUID-vkResetFences-pFences-parent
  Each element of pFences must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to each member of pFences must be externally synchronized

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY

When a fence is submitted to a queue as part of a queue submission command, it defines a memory dependency on the batches that were submitted as part of that command, and defines a fence signal operation which sets the fence to the signaled state.

The first synchronization scope includes every batch submitted in the same queue submission command. Fence signal operations that are defined by vkQueueSubmit or vkQueueSubmit2 additionally include in the first synchronization scope all commands that occur earlier in submission order. Fence signal operations that are defined by vkQueueSubmit or vkQueueSubmit2 or vkQueueBindSparse additionally include in the first synchronization scope any semaphore and fence signal operations that occur earlier in signal operation order.

The second synchronization scope only includes the fence signal operation.
The first access scope includes all memory access performed by the device.

The second access scope is empty.

To wait for one or more fences to enter the signaled state on the host, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkWaitForFences(
    VkDevice device,
    uint32_t fenceCount,
    const VkFence* pFences,
    VkBool32 waitAll,
    uint64_t timeout);
```

- `device` is the logical device that owns the fences.
- `fenceCount` is the number of fences to wait on.
- `pFences` is a pointer to an array of `fenceCount` fence handles.
- `waitAll` is the condition that must be satisfied to successfully unblock the wait. If `waitAll` is `VK_TRUE`, then the condition is that all fences in `pFences` are signaled. Otherwise, the condition is that at least one fence in `pFences` is signaled.
- `timeout` is the timeout period in units of nanoseconds. `timeout` is adjusted to the closest value allowed by the implementation-dependent timeout accuracy, which may be substantially longer than one nanosecond, and may be longer than the requested period.

If the condition is satisfied when `vkWaitForFences` is called, then `vkWaitForFences` returns immediately. If the condition is not satisfied at the time `vkWaitForFences` is called, then `vkWaitForFences` will block and wait until the condition is satisfied or the `timeout` has expired, whichever is sooner.

If `timeout` is zero, then `vkWaitForFences` does not wait, but simply returns the current state of the fences. `VK_TIMEOUT` will be returned in this case if the condition is not satisfied, even though no actual wait was performed.

If the condition is satisfied before the `timeout` has expired, `vkWaitForFences` returns `VK_SUCCESS`. Otherwise, `vkWaitForFences` returns `VK_TIMEOUT` after the `timeout` has expired.

If device loss occurs (see Lost Device) before the timeout has expired, `vkWaitForFences` must return in finite time with either `VK_SUCCESS` or `VK_ERROR_DEVICE_LOST`.

**NOTE** While we guarantee that `vkWaitForFences` must return in finite time, no guarantees are made that it returns immediately upon device loss. However, the application can reasonably expect that the delay will be on the order of seconds and that calling `vkWaitForFences` will not result in a permanently (or seemingly permanently) dead process.
Valid Usage (Implicit)

- VUID-vkWaitForFences-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkWaitForFences-pFences-parameter
  - `pFences` must be a valid pointer to an array of `fenceCount` valid `VkFence` handles
- VUID-vkWaitForFences-fenceCount-arraylength
  - `fenceCount` must be greater than 0
- VUID-vkWaitForFences-pFences-parent
  - Each element of `pFences` must have been created, allocated, or retrieved from `device`

Return Codes

Success
- `VK_SUCCESS`
- `VK_TIMEOUT`

Failure
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`

An execution dependency is defined by waiting for a fence to become signaled, either via `vkWaitForFences` or by polling on `vkGetFenceStatus`.

The first synchronization scope includes only the fence signal operation.

The second synchronization scope includes the host operations of `vkWaitForFences` or `vkGetFenceStatus` indicating that the fence has become signaled.

**NOTE**

Signaling a fence and waiting on the host does not guarantee that the results of memory accesses will be visible to the host, as the access scope of a memory dependency defined by a fence only includes device access. A memory barrier or other memory dependency must be used to guarantee this. See the description of host access types for more information.

7.3.1. Alternate Methods to Signal Fences

Besides submitting a fence to a queue as part of a queue submission command, a fence may also be signaled when a particular event occurs on a device or display.

To create a fence that will be signaled when an event occurs on a device, call:
```c
// Provided by VK_EXT_display_control
VkResult vkRegisterDeviceEventEXT(
    VkDevice device,
    const VkDeviceEventInfoEXT* pDeviceEventInfo,
    const VkAllocationCallbacks* pAllocator,
    VkFence* pFence);
```

- **device** is a logical device on which the event may occur.
- **pDeviceEventInfo** is a pointer to a `VkDeviceEventInfoEXT` structure describing the event of interest to the application.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pFence** is a pointer to a handle in which the resulting fence object is returned.

### Valid Usage (Implicit)

- VUID-vkRegisterDeviceEventEXT-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkRegisterDeviceEventEXT-pDeviceEventInfo-parameter
  - `pDeviceEventInfo` must be a valid pointer to a valid `VkDeviceEventInfoEXT` structure
- VUID-vkRegisterDeviceEventEXT-pAllocator-parameter
  - If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkRegisterDeviceEventEXT-pFence-parameter
  - `pFence` must be a valid pointer to a `VkFence` handle

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkDeviceEventInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_display_control
typedef struct VkDeviceEventInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDeviceEventTypeEXT deviceEvent;
} VkDeviceEventInfoEXT;
```
• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **device** is a `VkDeviceEventTypeEXT` value specifying when the fence will be signaled.

### Valid Usage (Implicit)

- **VUID-VkDeviceEventInfoEXT-sType-sType**
  
  *sType* must be `VK_STRUCTURE_TYPEDEVICE_EVENT_INFO_EXT`

- **VUID-VkDeviceEventInfoEXT-pNext-pNext**
  
  *pNext* must be NULL

- **VUID-VkDeviceEventInfoEXT-deviceEvent-parameter**
  
  *deviceEvent* must be a valid `VkDeviceEventTypeEXT` value

Possible values of `VkDeviceEventInfoEXT::device`, specifying when a fence will be signaled, are:

```c
// Provided by VK_EXT display_control
typedef enum VkDeviceEventTypeEXT {
    VKDEVICE_EVENT_TYPE_DISPLAY_HOTPLUG_EXT = 0,
} VkDeviceEventTypeEXT;
```

• **VKDEVICE_EVENT_TYPE_DISPLAY_HOTPLUG_EXT** specifies that the fence is signaled when a display is plugged into or unplugged from the specified device. Applications *can* use this notification to determine when they need to re-enumerate the available displays on a device.

To create a fence that will be signaled when an event occurs on a `VkDisplayKHR` object, call:

```c
// Provided by VK_EXT display_control
VkResult vkRegisterDisplayEventEXT(
    VkDevice device,
    VkDisplayKHR display,
    const VkDisplayEventInfoEXT* pDisplayEventInfo,
    const VkAllocationCallbacks* pAllocator,
    VkFence* pFence);
```

• **device** is a logical device associated with `display`

• **display** is the display on which the event *may* occur.

• **pDisplayEventInfo** is a pointer to a `VkDisplayEventInfoEXT` structure describing the event of interest to the application.

• **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

• **pFence** is a pointer to a handle in which the resulting fence object is returned.
Valid Usage (Implicit)

- VUID-vkRegisterDisplayEventEXT-device-parameter
  device must be a valid VkDevice handle
- VUID-vkRegisterDisplayEventEXT-display-parameter
  display must be a valid VkDisplayKHR handle
- VUID-vkRegisterDisplayEventEXT-pDisplayEventInfo-parameter
  pDisplayEventInfo must be a valid pointer to a valid VkDisplayEventInfoEXT structure
- VUID-vkRegisterDisplayEventEXT-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkRegisterDisplayEventEXT-pFence-parameter
  pFence must be a valid pointer to a VkFence handle
- VUID-vkRegisterDisplayEventEXT-commonparent
  Both of device, and display must have been created, allocated, or retrieved from the same VkPhysicalDevice

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY

The VkDisplayEventInfoEXT structure is defined as:

```c
// Provided by VK_EXT_display_control
typedef struct VkDisplayEventInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDisplayEventTypeEXT displayEvent;
} VkDisplayEventInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `displayEvent` is a VkDisplayEventTypeEXT specifying when the fence will be signaled.

Valid Usage (Implicit)

- VUID-VkDisplayEventInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_DISPLAY_EVENT_INFO_EXT
Possible values of VkDisplayEventInfoEXT::displayEvent, specifying when a fence will be signaled, are:

```c
// Provided by VK_EXT_display_control
typedef enum VkDisplayEventTypeEXT {
    VK_DISPLAY_EVENT_TYPE_FIRST_PIXEL_OUT_EXT = 0,
} VkDisplayEventTypeEXT;
```

- **VK_DISPLAY_EVENT_TYPE_FIRST_PIXEL_OUT_EXT** specifies that the fence is signaled when the first pixel of the next display refresh cycle leaves the display engine for the display.

### 7.3.2. Importing Fence Payloads

Applications can import a fence payload into an existing fence using an external fence handle. The effects of the import operation will be either temporary or permanent, as specified by the application. If the import is temporary, the fence will be restored to its permanent state the next time that fence is passed to `vkResetFences`.

**NOTE** Resorting a fence to its prior permanent payload is a distinct operation from resetting a fence payload. See `vkResetFences` for more detail.

Performing a subsequent temporary import on a fence before resetting it has no effect on this requirement; the next unsignal of the fence must still restore its last permanent state. A permanent payload import behaves as if the target fence was destroyed, and a new fence was created with the same handle but the imported payload. Because importing a fence payload temporarily or permanently detaches the existing payload from a fence, similar usage restrictions to those applied to `vkDestroyFence` are applied to any command that imports a fence payload. Which of these import types is used is referred to as the import operation’s permanence. Each handle type supports either one or both types of permanence.

The implementation must perform the import operation by either referencing or copying the payload referred to by the specified external fence handle, depending on the handle’s type. The import method used is referred to as the handle type’s transference. When using handle types with reference transference, importing a payload to a fence adds the fence to the set of all fences sharing that payload. This set includes the fence from which the payload was exported. Fence signaling, waiting, and resetting operations performed on any fence in the set must behave as if the set were a single fence. Importing a payload using handle types with copy transference creates a duplicate copy of the payload at the time of import, but makes no further reference to it. Fence signaling, waiting, and resetting operations performed on the target of copy imports must not affect any other fence or payload.

Export operations have the same transference as the specified handle type’s import operations.
Additionally, exporting a fence payload to a handle with copy transference has the same side effects on the source fence’s payload as executing a fence reset operation. If the fence was using a temporarily imported payload, the fence’s prior permanent payload will be restored.

The tables **Handle Types Supported by VkImportFenceWin32HandleInfoKHR** and **Handle Types Supported by VkImportFenceFdInfoKHR** define the permanence and transference of each handle type.

**External synchronization** allows implementations to modify an object’s internal state, i.e. payload, without internal synchronization. However, for fences sharing a payload across processes, satisfying the external synchronization requirements of VkFence parameters as if all fences in the set were the same object is sometimes infeasible. Satisfying valid usage constraints on the state of a fence would similarly require impractical coordination or levels of trust between processes. Therefore, these constraints only apply to a specific fence handle, not to its payload. For distinct fence objects which share a payload:

- If multiple commands which queue a signal operation, or which unsignal a fence, are called concurrently, behavior will be as if the commands were called in an arbitrary sequential order.

- If a queue submission command is called with a fence that is sharing a payload, and the payload is already associated with another queue command that has not yet completed execution, either one or both of the commands will cause the fence to become signaled when they complete execution.

- If a fence payload is reset while it is associated with a queue command that has not yet completed execution, the payload will become unsignaled, but **may** become signaled again when the command completes execution.

- In the preceding cases, any of the devices associated with the fences sharing the payload **may** be lost, or any of the queue submission or fence reset commands **may** return VK_ERROR_INITIALIZATION_FAILED.

Other than these non-deterministic results, behavior is well defined. In particular:

- The implementation **must** not crash or enter an internally inconsistent state where future valid Vulkan commands might cause undefined results,

- Timeouts on future wait commands on fences sharing the payload **must** be effective.

These rules allow processes to synchronize access to shared memory without trusting each other. However, such processes must still be cautious not to use the shared fence for more than synchronizing access to the shared memory. For example, a process should not use a fence with shared payload to tell when commands it submitted to a queue have completed and objects used by those commands may be destroyed, since the other process can accidentally or maliciously cause the fence to signal before the commands actually complete.

When a fence is using an imported payload, its VkExportFenceCreateInfo::handleTypes value is specified when creating the fence from which the payload was exported, rather than specified when creating the fence. Additionally, VkExternalFenceProperties::exportFromImportedHandleTypes restricts which handle types **can** be exported from such a fence based on the specific handle type.
used to import the current payload. Passing a fence to \texttt{vkAcquireNextImageKHR} is equivalent to temporarily importing a fence payload to that fence.

\begin{note}
Because the exportable handle types of an imported fence correspond to its current imported payload, and \texttt{vkAcquireNextImageKHR} behaves the same as a temporary import operation for which the source fence is opaque to the application, applications have no way of determining whether any external handle types \textit{can} be exported from a fence in this state. Therefore, applications \textbf{must} not attempt to export handles from fences using a temporarily imported payload from \texttt{vkAcquireNextImageKHR}.
\end{note}

When importing a fence payload, it is the responsibility of the application to ensure the external handles meet all valid usage requirements. However, implementations \textbf{must} perform sufficient validation of external handles to ensure that the operation results in a valid fence which will not cause program termination, device loss, queue stalls, host thread stalls, or corruption of other resources when used as allowed according to its import parameters. If the external handle provided does not meet these requirements, the implementation \textbf{must} fail the fence payload import operation with the error code \texttt{VK_ERROR_INVALID_EXTERNAL_HANDLE}.

To import a fence payload from a Windows handle, call:

\begin{verbatim}
// Provided by VK_KHR_external_fence_win32
VkResult vkImportFenceWin32HandleKHR(
    VkDevice device,
    const VkImportFenceWin32HandleInfoKHR* pImportFenceWin32HandleInfo);
\end{verbatim}

• \texttt{device} is the logical device that created the fence.

• \texttt{pImportFenceWin32HandleInfo} is a pointer to a \texttt{VkImportFenceWin32HandleInfoKHR} structure specifying the fence and import parameters.

Importing a fence payload from Windows handles does not transfer ownership of the handle to the Vulkan implementation. For handle types defined as NT handles, the application \textbf{must} release ownership using the \texttt{CloseHandle} system call when the handle is no longer needed.

Applications \textbf{can} import the same fence payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

\begin{validusage}
\begin{itemize}
  \item VUID-vkImportFenceWin32HandleKHR-fence-04448
    \texttt{fence} \textbf{must} not be associated with any queue command that has not yet completed execution on that queue
\end{itemize}
\end{validusage}

\begin{validusageimplicit}
\begin{itemize}
  \item VUID-vkImportFenceWin32HandleKHR-device-parameter
\end{itemize}
\end{validusageimplicit}
device must be a valid VkDevice handle

- VUID-vkImportFenceWin32HandleKHR-pImportFenceWin32HandleInfo-parameter
  pImportFenceWin32HandleInfo must be a valid pointer to a valid VkImportFenceWin32HandleInfoKHR structure

## Return Codes

### Success
- VK_SUCCESS

### Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_INVALID_EXTERNAL_HANDLE

The VkImportFenceWin32HandleInfoKHR structure is defined as:

```c
// Provided by VK_KHR_external_fence_win32
typedef struct VkImportFenceWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkFence fence;
    VkFenceImportFlags flags;
    VkExternalFenceHandleTypeFlagBits handleType;
    HANDLE handle;
    LPCWSTR name;
} VkImportFenceWin32HandleInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `fence` is the fence into which the state will be imported.
- `flags` is a bitmask of VkFenceImportFlagBits specifying additional parameters for the fence payload import operation.
- `handleType` is a VkExternalFenceHandleTypeFlagBits value specifying the type of handle.
- `handle` is NULL or the external handle to import.
- `name` is NULL or a null-terminated UTF-16 string naming the underlying synchronization primitive to import.

The handle types supported by `handleType` are:

<table>
<thead>
<tr>
<th>Handle Type</th>
<th>Transference</th>
<th>Permanence Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT</td>
<td>Reference</td>
<td>Temporary,Permanent</td>
</tr>
</tbody>
</table>

Table 6. Handle Types Supported by VkImportFenceWin32HandleInfoKHR
### Valid Usage

- **VUID-VkImportFenceWin32HandleInfoKHR-handleType-01457**
  
  `handleType` **must** be a value included in the **Handle Types Supported by VkImportFenceWin32HandleInfoKHR** table.

- **VUID-VkImportFenceWin32HandleInfoKHR-handleType-01459**
  
  If `handleType` is not `VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT`, `name` **must** be `NULL`.

- **VUID-VkImportFenceWin32HandleInfoKHR-handleType-01460**
  
  If `handle` is `NULL`, `name` **must** name a valid synchronization primitive of the type specified by `handleType`.

- **VUID-VkImportFenceWin32HandleInfoKHR-handleType-01461**
  
  If `name` is `NULL`, `handle` **must** be a valid handle of the type specified by `handleType`.

- **VUID-VkImportFenceWin32HandleInfoKHR-handleType-01462**
  
  If `handle` is not `NULL`, `name` **must** be `NULL`.

- **VUID-VkImportFenceWin32HandleInfoKHR-handleType-01539**
  
  If `handle` is not `NULL`, it **must** obey any requirements listed for `handleType` in **external fence handle types compatibility**.

- **VUID-VkImportFenceWin32HandleInfoKHR-name-01540**
  
  If `name` is not `NULL`, it **must** obey any requirements listed for `handleType` in **external fence handle types compatibility**.

### Valid Usage (Implicit)

- **VUID-VkImportFenceWin32HandleInfoKHR-sType-sType**
  
  `sType` **must** be `VK_STRUCTURE_TYPE_IMPORT_FENCE_WIN32_HANDLE_INFO_KHR`.

- **VUID-VkImportFenceWin32HandleInfoKHR-pNext-pNext**
  
  `pNext` **must** be `NULL`.

- **VUID-VkImportFenceWin32HandleInfoKHR-fence-parameter**
  
  `fence` **must** be a valid `VkFence` handle.

- **VUID-VkImportFenceWin32HandleInfoKHR-flags-parameter**
  
  `flags` **must** be a valid combination of `VkFenceImportFlagBits` values.

### Host Synchronization

- Host access to `fence` **must** be externally synchronized.
To import a fence payload from a POSIX file descriptor, call:

```c
// Provided by VK_KHR_external_fence_fd
VkResult vkImportFenceFdKHR(
    VkDevice device,
    const VkImportFenceFdInfoKHR* pImportFenceFdInfo);
```

- `device` is the logical device that created the fence.
- `pImportFenceFdInfo` is a pointer to a `VkImportFenceFdInfoKHR` structure specifying the fence and import parameters.

Importing a fence payload from a file descriptor transfers ownership of the file descriptor from the application to the Vulkan implementation. The application **must** not perform any operations on the file descriptor after a successful import.

Applications **can** import the same fence payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

**Valid Usage**

- VUID-vkImportFenceFdKHR-fence-01463
  - fence **must** not be associated with any queue command that has not yet completed execution on that queue

**Valid Usage (Implicit)**

- VUID-vkImportFenceFdKHR-device-parameter
  - `device` **must** be a valid `VkDevice` handle
- VUID-vkImportFenceFdKHR-pImportFenceFdInfo-parameter
  - `pImportFenceFdInfo` **must** be a valid pointer to a valid `VkImportFenceFdInfoKHR` structure

**Return Codes**

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_INVALID_EXTERNAL_HANDLE`

The `VkImportFenceFdInfoKHR` structure is defined as:
```c
// Provided by VK_KHR_external_fence_fd
typedef struct VkImportFenceFdInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkFence fence;
    VkFenceImportFlags flags;
    VkExternalFenceHandleTypeFlagBits handleType;
    int fd;
} VkImportFenceFdInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **fence** is the fence into which the payload will be imported.
- **flags** is a bitmask of `VkFenceImportFlagBits` specifying additional parameters for the fence payload import operation.
- **handleType** is a `VkExternalFenceHandleTypeFlagBits` value specifying the type of **fd**.
- **fd** is the external handle to import.

The handle types supported by **handleType** are:

<table>
<thead>
<tr>
<th>Handle Type</th>
<th>Transference</th>
<th>Permanence Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_FD_BIT</td>
<td>Reference</td>
<td>Temporary, Permanent</td>
</tr>
<tr>
<td>VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT</td>
<td>Copy</td>
<td>Temporary</td>
</tr>
</tbody>
</table>

### Valid Usage

- VUID-VkImportFenceFdInfoKHR-handleType-01464
  - **handleType** must be a value included in the Handle Types Supported by `VkImportFenceFdInfoKHR` table

- VUID-VkImportFenceFdInfoKHR-fd-01541
  - **fd** must obey any requirements listed for **handleType** in external fence handle types compatibility

- VUID-VkImportFenceFdInfoKHR-handleType-07306
  - If **handleType** refers to a handle type with copy payload transference semantics, **flags** must contain `VK_FENCE_IMPORT_TEMPORARY_BIT`

If **handleType** is `VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT`, the special value -1 for **fd** is treated like a valid sync file descriptor referring to an object that has already signaled. The import operation will succeed and the `VkFence` will have a temporarily imported payload as if a valid file descriptor had been provided.
This special behavior for importing an invalid sync file descriptor allows easier interoperability with other system APIs which use the convention that an invalid sync file descriptor represents work that has already completed and does not need to be waited for. It is consistent with the option for implementations to return a -1 file descriptor when exporting a VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT from a VkFence which is signaled.

Valid Usage (Implicit)

- VUID-VkImportFenceFdInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMPORT_FENCE_FD_INFO_KHR
- VUID-VkImportFenceFdInfoKHR-pNext-pNext
  pNext must be NULL
- VUID-VkImportFenceFdInfoKHR-fence-parameter
  fence must be a valid VkFence handle
- VUID-VkImportFenceFdInfoKHR-flags-parameter
  flags must be a valid combination of VkFenceImportFlagBits values
- VUID-VkImportFenceFdInfoKHR-handleType-parameter
  handleType must be a valid VkExternalFenceHandleTypeFlagBits value

Host Synchronization

- Host access to fence must be externally synchronized

Bits which can be set in

- VkImportFenceWin32HandleInfoKHR::flags
- VkImportFenceFdInfoKHR::flags

specifying additional parameters of a fence import operation are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkFenceImportFlagBits {
    VK_FENCE_IMPORT_TEMPORARY_BIT = 0x00000001,
} VkFenceImportFlagBits;
```

or the equivalent

```c
// Provided by VK_KHR_external_fence
typedef VkFenceImportFlagBits VkFenceImportFlagBitsKHR;
```
• **VK_FENCE_IMPORT_TEMPORARY_BIT** specifies that the fence payload will be imported only temporarily, as described in Importing Fence Payloads, regardless of the permanence of `handleType`.

```c
// Provided by VK_VERSION_1_1
typedef VkFlags VkFenceImportFlags;
```

or the equivalent

```c
// Provided by VK_KHR_external_fence
typedef VkFenceImportFlags VkFenceImportFlagsKHR;
```

`VkFenceImportFlags` is a bitmask type for setting a mask of zero or more `VkFenceImportFlagBits`.

## 7.4. Semaphores

Semaphores are a synchronization primitive that **can** be used to insert a dependency between queue operations or between a queue operation and the host. Binary semaphores have two states - signaled and unsignaled. Timeline semaphores have a strictly increasing 64-bit unsigned integer payload and are signaled with respect to a particular reference value. A semaphore **can** be signaled after execution of a queue operation is completed, and a queue operation **can** wait for a semaphore to become signaled before it begins execution. A timeline semaphore **can** additionally be signaled from the host with the `vkSignalSemaphore` command and waited on from the host with the `vkWaitSemaphores` command.

The internal data of a semaphore **may** include a reference to any resources and pending work associated with signal or unsignal operations performed on that semaphore object, collectively referred to as the semaphore's *payload*. Mechanisms to import and export that internal data to and from semaphores are provided below. These mechanisms indirectly enable applications to share semaphore state between two or more semaphores and other synchronization primitives across process and API boundaries.

Semaphores are represented by `VkSemaphore` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSemaphore)
```

To create a semaphore, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateSemaphore(
    VkDevice device,
    const VkSemaphoreCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSemaphore* pSemaphore);
```
• **device** is the logical device that creates the semaphore.
• **pCreateInfo** is a pointer to a `VkSemaphoreCreateInfo` structure containing information about how the semaphore is to be created.
• **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
• **pSemaphore** is a pointer to a handle in which the resulting semaphore object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateSemaphore-device-parameter
  
  `device` must be a valid `VkDevice` handle

- VUID-vkCreateSemaphore-pCreateInfo-parameter
  
  `pCreateInfo` must be a valid pointer to a valid `VkSemaphoreCreateInfo` structure

- VUID-vkCreateSemaphore-pAllocator-parameter
  
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateSemaphore-pSemaphore-parameter
  
  `pSemaphore` must be a valid pointer to a `VkSemaphore` handle

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkSemaphoreCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSemaphoreCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkSemaphoreCreateFlags flags;
} VkSemaphoreCreateInfo;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
Valid Usage

• VUID-VkSemaphoreCreateInfo-pNext-06789
  If the `pNext` chain includes a `VkExportMetalObjectCreateInfoEXT` structure, its `exportObjectType` member must be `VK_EXPORT_METAL_OBJECT_TYPE_METAL_SHARED_EVENT_BIT_EXT`.

Valid Usage (Implicit)

• VUID-VkSemaphoreCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_SEMAPHORE_CREATE_INFO`.

• VUID-VkSemaphoreCreateInfo-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkExportMetalObjectCreateInfoEXT`, `VkExportSemaphoreCreateInfo`, `VkExportSemaphoreWin32HandleInfoKHR`, `VkImportMetalSharedEventInfoEXT`, `VkQueryLowLatencySupportNV`, or `VkSemaphoreTypeCreateInfo`.

• VUID-VkSemaphoreCreateInfo-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique, with the exception of structures of type `VkExportMetalObjectCreateInfoEXT`.

• VUID-VkSemaphoreCreateInfo-flags-zerobitmask
  `flags` must be `0`.

// Provided by VK_VERSION_1_0
typedef VkFlags VkSemaphoreCreateFlags;

`VkSemaphoreCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

The `VkSemaphoreTypeCreateInfo` structure is defined as:

// Provided by VK_VERSION_1_2
typedef struct VkSemaphoreTypeCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkSemaphoreType semaphoreType;
    uint64_t initialValue;
} VkSemaphoreTypeCreateInfo;

or the equivalent

// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreTypeCreateInfo VkSemaphoreTypeCreateInfoKHR;
• **sType** is a *VkStructureType* value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **semaphoreType** is a *VkSemaphoreType* value specifying the type of the semaphore.
• **initialValue** is the initial payload value if **semaphoreType** is *VK_SEMAPHORE_TYPE_TIMELINE*.

To create a semaphore of a specific type, add a *VkSemaphoreTypeCreateInfo* structure to the *VkSemaphoreCreateInfo*::**pNext** chain.

If no *VkSemaphoreTypeCreateInfo* structure is included in the **pNext** chain of *VkSemaphoreCreateInfo*, then the created semaphore will have a default *VkSemaphoreType* of *VK_SEMAPHORE_TYPE_BINARY*.

### Valid Usage

- **VUID-VkSemaphoreTypeCreateInfo-timelineSemaphore-03252**
  If the timelineSemaphore feature is not enabled, **semaphoreType must** not equal *VK_SEMAPHORE_TYPE_TIMELINE*

- **VUID-VkSemaphoreTypeCreateInfo-semaphoreType-03279**
  If **semaphoreType** is *VK_SEMAPHORE_TYPE_BINARY*, **initialValue must** be zero

### Valid Usage (Implicit)

- **VUID-VkSemaphoreTypeCreateInfo-sType-sType**
  **sType must** be *VK_STRUCTURE_TYPE_SEMAPHORE_TYPE_CREATE_INFO*

- **VUID-VkSemaphoreTypeCreateInfo-semaphoreType-parameter**
  **semaphoreType must** be a valid *VkSemaphoreType* value

Possible values of *VkSemaphoreTypeCreateInfo::semaphoreType*, specifying the type of a semaphore, are:

```c
// Provided by VK_VERSION_1_2
typedef enum VkSemaphoreType {
    VK_SEMAPHORE_TYPE_BINARY = 0,
    VK_SEMAPHORE_TYPE_TIMELINE = 1,
    // Provided by VK_KHR_timeline_semaphore
    VK_SEMAPHORE_TYPE_BINARY_KHR = VK_SEMAPHORE_TYPE_BINARY,
    // Provided by VK_KHR_timeline_semaphore
    VK_SEMAPHORE_TYPE_TIMELINE_KHR = VK_SEMAPHORE_TYPE_TIMELINE,
} VkSemaphoreType;
```

or the equivalent

```c
// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreType VkSemaphoreTypeKHR;
```
• **VK_SEMAPHORE_TYPE_BINARY** specifies a *binary semaphore* type that has a boolean payload indicating whether the semaphore is currently signaled or unsignaled. When created, the semaphore is in the unsignaled state.

• **VK_SEMAPHORE_TYPE_TIMELINE** specifies a *timeline semaphore* type that has a strictly increasing 64-bit unsigned integer payload indicating whether the semaphore is signaled with respect to a particular reference value. When created, the semaphore payload has the value given by the *initialValue* field of `VkSemaphoreTypeCreateInfo`.

To create a semaphore whose payload can be exported to external handles, add a `VkExportSemaphoreCreateInfo` structure to the `pNext` chain of the `VkSemaphoreCreateInfo` structure. The `VkExportSemaphoreCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkExportSemaphoreCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkExternalSemaphoreHandleTypeFlags handleTypes;
} VkExportSemaphoreCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_external_semaphore
typedef VkExportSemaphoreCreateInfo VkExportSemaphoreCreateInfoKHR;
```

• *sType* is a `VkStructureType` value identifying this structure.

• *pNext* is `NULL` or a pointer to a structure extending this structure.

• *handleTypes* is a bitmask of `VkExternalSemaphoreHandleTypeFlagBits` specifying one or more semaphore handle types the application can export from the resulting semaphore. The application can request multiple handle types for the same semaphore.

### Valid Usage

- VUID-VkExportSemaphoreCreateInfo-handleTypes-01124
  The bits in *handleTypes* must be supported and compatible, as reported by `VkExternalSemaphoreProperties`.

### Valid Usage (Implicit)

- VUID-VkExportSemaphoreCreateInfo-sType-sType
  *sType* must be `VK_STRUCTURE_TYPE_EXPORT_SEMAPHORE_CREATE_INFO`

- VUID-VkExportSemaphoreCreateInfo-handleTypes-parameter
  *handleTypes* must be a valid combination of `VkExternalSemaphoreHandleTypeFlagBits` values.
To specify additional attributes of NT handles exported from a semaphore, add a `VkExportSemaphoreWin32HandleInfoKHR` structure to the `pNext` chain of the `VkSemaphoreCreateInfo` structure. The `VkExportSemaphoreWin32HandleInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_semaphore_win32
typedef struct VkExportSemaphoreWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const SECURITY_ATTRIBUTES* pAttributes;
    DWORD dwAccess;
    LPCWSTR name;
} VkExportSemaphoreWin32HandleInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pAttributes` is a pointer to a Windows `SECURITY_ATTRIBUTES` structure specifying security attributes of the handle.
- `dwAccess` is a `DWORD` specifying access rights of the handle.
- `name` is a null-terminated UTF-16 string to associate with the underlying synchronization primitive referenced by NT handles exported from the created semaphore.

If `VkExportSemaphoreCreateInfo` is not included in the same `pNext` chain, this structure is ignored.

If `VkExportSemaphoreCreateInfo` is included in the `pNext` chain of `VkSemaphoreCreateInfo` with a Windows `handleType`, but either `VkExportSemaphoreWin32HandleInfoKHR` is not included in the `pNext` chain, or it is included but `pAttributes` is set to `NULL`, default security descriptor values will be used, and child processes created by the application will not inherit the handle, as described in the MSDN documentation for “Synchronization Object Security and Access Rights”. Further, if the structure is not present, the access rights used depend on the handle type.

For handles of the following types:

- `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT`

The implementation must ensure the access rights allow both signal and wait operations on the semaphore.

For handles of the following types:

- `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT`

The access rights must be:

- `GENERIC_ALL`

Valid Usage

- VUID-VkExportSemaphoreWin32HandleInfoKHR-handleTypes-01125
  If `VkExportSemaphoreCreateInfo::handleTypes` does not include `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT` or `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT`, `VkExportSemaphoreWin32HandleInfoKHR` must not be included in the `pNext` chain of `VkSemaphoreCreateInfo`.

Valid Usage (Implicit)

- VUID-VkExportSemaphoreWin32HandleInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_EXPORT_SEMAPHORE_WIN32_HANDLE_INFO_KHR`.

- VUID-VkExportSemaphoreWin32HandleInfoKHR-pAttributes-parameter
  If `pAttributes` is not `NULL`, `pAttributes` must be a valid pointer to a valid `SECURITY_ATTRIBUTES` value.

To export a Windows handle representing the payload of a semaphore, call:

```c
// Provided by VK_KHR_external_semaphore_win32
VkResult vkGetSemaphoreWin32HandleKHR(
    VkDevice device,
    const VkSemaphoreGetWin32HandleInfoKHR* pGetWin32HandleInfo,
    HANDLE* pHandle);
```

- `device` is the logical device that created the semaphore being exported.
- `pGetWin32HandleInfo` is a pointer to a `VkSemaphoreGetWin32HandleInfoKHR` structure containing parameters of the export operation.
- `pHandle` will return the Windows handle representing the semaphore state.

For handle types defined as NT handles, the handles returned by `vkGetSemaphoreWin32HandleKHR` are owned by the application. To avoid leaking resources, the application must release ownership of them using the `CloseHandle` system call when they are no longer needed.

Exporting a Windows handle from a semaphore may have side effects depending on the transference of the specified handle type, as described in Importing Semaphore Payloads.

Valid Usage (Implicit)

- VUID-vkGetSemaphoreWin32HandleKHR-device-parameter
  `device` must be a valid `VkDevice` handle.

- VUID-vkGetSemaphoreWin32HandleKHR-pGetWin32HandleInfo-parameter
  `pGetWin32HandleInfo` must be a valid pointer to a valid `VkSemaphoreGetWin32HandleInfoKHR` structure.
Return Codes

Success
  • VK_SUCCESS

Failure
  • VK_ERROR_TOO_MANY_OBJECTS
  • VK_ERROR_OUT_OF_HOST_MEMORY

The `VkSemaphoreGetWin32HandleInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_semaphore_win32
typedef struct VkSemaphoreGetWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
} VkSemaphoreGetWin32HandleInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `semaphore` is the semaphore from which state will be exported.
- `handleType` is a `VkExternalSemaphoreHandleTypeFlagBits` value specifying the type of handle requested.

The properties of the handle returned depend on the value of `handleType`. See `VkExternalSemaphoreHandleTypeFlagBits` for a description of the properties of the defined external semaphore handle types.

Valid Usage

- VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01126
  `handleType` must have been included in `VkExportSemaphoreCreateInfo::handleTypes` when the `semaphore`'s current payload was created.

- VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01127
  If `handleType` is defined as an NT handle, `vkGetSemaphoreWin32HandleKHR` must be called no more than once for each valid unique combination of `semaphore` and `handleType`.

- VUID-VkSemaphoreGetWin32HandleInfoKHR-semaphore-01128
  `semaphore` must not currently have its payload replaced by an imported payload as described below in Importing Semaphore Payloads unless that imported payload’s handle
type was included in `VkExternalSemaphoreProperties::exportFromImportedHandleTypes` for `handleType`.

- VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01129
  If `handleType` refers to a handle type with copy payload transference semantics, as defined below in `Importing Semaphore Payloads`, there must be no queue waiting on `semaphore`.

- VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01130
  If `handleType` refers to a handle type with copy payload transference semantics, `semaphore` must be signaled, or have an associated `semaphore signal operation` pending execution.

- VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01131
  `handleType` must be defined as an NT handle or a global share handle.

---

### Valid Usage (Implicit)

- VUID-VkSemaphoreGetWin32HandleInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_SEMAPHORE_GET_WIN32_HANDLE_INFO_KHR`.

- VUID-VkSemaphoreGetWin32HandleInfoKHR-pNext-pNext
  `pNext` must be `NULL`.

- VUID-VkSemaphoreGetWin32HandleInfoKHR-semaphore-parameter
  `semaphore` must be a valid `VkSemaphore` handle.

- VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-parameter
  `handleType` must be a valid `VkExternalSemaphoreHandleTypeFlagBits` value.

---

The `VkQueryLowLatencySupportNV` structure is defined as:

```c
// Provided by VK_NV_low_latency
typedef struct VkQueryLowLatencySupportNV {
    VkStructureType sType;
    const void* pNext;
    void* pQueriedLowLatencyData;
} VkQueryLowLatencySupportNV;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pQueriedLowLatencyData` is used for NVIDIA Reflex Support.

---

### Valid Usage (Implicit)

- VUID-VkQueryLowLatencySupportNV-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_QUERY_LOW_LATENCY_SUPPORT_NV`.

- VUID-VkQueryLowLatencySupportNV-pQueriedLowLatencyData-parameter
  This parameter is used for NVIDIA Reflex Support.
To export a POSIX file descriptor representing the payload of a semaphore, call:

```c
// Provided by VK_KHR_external_semaphore_fd
VkResult vkGetSemaphoreFdKHR(
    VkDevice device,
    const VkSemaphoreGetFdInfoKHR* pGetFdInfo,
    int* pFd);
```

- `device` is the logical device that created the semaphore being exported.
- `pGetFdInfo` is a pointer to a `VkSemaphoreGetFdInfoKHR` structure containing parameters of the export operation.
- `pFd` will return the file descriptor representing the semaphore payload.

Each call to `vkGetSemaphoreFdKHR` must create a new file descriptor and transfer ownership of it to the application. To avoid leaking resources, the application must release ownership of the file descriptor when it is no longer needed.

**NOTE**

Ownership can be released in many ways. For example, the application can call `close()` on the file descriptor, or transfer ownership back to Vulkan by using the file descriptor to import a semaphore payload.

Where supported by the operating system, the implementation must set the file descriptor to be closed automatically when an `execve` system call is made.

Exporting a file descriptor from a semaphore may have side effects depending on the transference of the specified handle type, as described in Importing Semaphore State.

### Valid Usage (Implicit)

- VUID-vkGetSemaphoreFdKHR-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkGetSemaphoreFdKHR-pGetFdInfo-parameter
  - `pGetFdInfo` must be a valid pointer to a valid `VkSemaphoreGetFdInfoKHR` structure
- VUID-vkGetSemaphoreFdKHR-pFd-parameter
  - `pFd` must be a valid pointer to an `int` value

### Return Codes

**Success**

- `VK_SUCCESS`
The `VkSemaphoreGetFdInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_semaphore_fd
typedef struct VkSemaphoreGetFdInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
} VkSemaphoreGetFdInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `semaphore` is the semaphore from which state will be exported.
- `handleType` is a `VkExternalSemaphoreHandleTypeFlagBits` value specifying the type of handle requested.

The properties of the file descriptor returned depend on the value of `handleType`. See `VkExternalSemaphoreHandleTypeFlagBits` for a description of the properties of the defined external semaphore handle types.

**Valid Usage**

- VUID-VkSemaphoreGetFdInfoKHR-handleType-01132
  
  `handleType` must have been included in `VkExportSemaphoreCreateInfo::handleTypes` when `semaphore`'s current payload was created.

- VUID-VkSemaphoreGetFdInfoKHR-semaphore-01133
  
  `semaphore` must not currently have its payload replaced by an imported payload as described below in Importing Semaphore Payloads unless that imported payload's handle type was included in `VkExternalSemaphoreProperties::exportFromImportedHandleTypes` for `handleType`.

- VUID-VkSemaphoreGetFdInfoKHR-handleType-01134
  
  If `handleType` refers to a handle type with copy payload transference semantics, as defined below in Importing Semaphore Payloads, there must be no queue waiting on `semaphore`.

- VUID-VkSemaphoreGetFdInfoKHR-handleType-01135
  
  If `handleType` refers to a handle type with copy payload transference semantics, `semaphore` must be signaled, or have an associated semaphore signal operation pending execution.

- VUID-VkSemaphoreGetFdInfoKHR-handleType-01136
  
  `handleType` must be defined as a POSIX file descriptor handle.

- VUID-VkSemaphoreGetFdInfoKHR-handleType-03253
If `handleType` refers to a handle type with copy payload transference semantics, `semaphore` must have been created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY`.

- **VUID-VkSemaphoreGetFdInfoKHR-handleType-03254**
  If `handleType` refers to a handle type with copy payload transference semantics, `semaphore` must have an associated semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends must have also been submitted for execution.

### Valid Usage (Implicit)

- **VUID-VkSemaphoreGetFdInfoKHR-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_SEMAPHORE_GET_FD_INFO_KHR`.

- **VUID-VkSemaphoreGetFdInfoKHR-pNext-pNext**
  `pNext` must be `NULL`.

- **VUID-VkSemaphoreGetFdInfoKHR-semaphore-parameter**
  `semaphore` must be a valid `VkSemaphore` handle.

- **VUID-VkSemaphoreGetFdInfoKHR-handleType-parameter**
  `handleType` must be a valid `VkExternalSemaphoreHandleTypeFlagBits` value.

To export a Zircon event handle representing the payload of a semaphore, call:

```c
// Provided by VK_FUCHSIA_external_semaphore
VkResult vkGetSemaphoreZirconHandleFUCHSIA(
    const VkDevice device,
    const VkSemaphoreGetZirconHandleInfoFUCHSIA* pGetZirconHandleInfo,
    zx_handle_t* pZirconHandle);
```

- `device` is the logical device that created the semaphore being exported.

- `pGetZirconHandleInfo` is a pointer to a `VkSemaphoreGetZirconHandleInfoFUCHSIA` structure containing parameters of the export operation.

- `pZirconHandle` will return the Zircon event handle representing the semaphore payload.

Each call to `vkGetSemaphoreZirconHandleFUCHSIA` must create a Zircon event handle and transfer ownership of it to the application. To avoid leaking resources, the application must release ownership of the Zircon event handle when it is no longer needed.

**NOTE**
Ownership can be released in many ways. For example, the application can call `zx_handle_close()` on the file descriptor, or transfer ownership back to Vulkan by using the file descriptor to import a semaphore payload.

Exporting a Zircon event handle from a semaphore may have side effects depending on the transference of the specified handle type, as described in Importing Semaphore State.
Valid Usage (Implicit)

- VUID-vkGetSemaphoreZirconHandleFUCHSIA-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetSemaphoreZirconHandleFUCHSIA-pGetZirconHandleInfo-parameter
  pGetZirconHandleInfo must be a valid pointer to a valid
  VkSemaphoreGetZirconHandleInfoFUCHSIA structure

- VUID-vkGetSemaphoreZirconHandleFUCHSIA-pZirconHandle-parameter
  pZirconHandle must be a valid pointer to a zx_handle_t value

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_OUT_OF_HOST_MEMORY

The VkSemaphoreGetZirconHandleInfoFUCHSIA structure is defined as:

```c
// Provided by VK_FUCHSIA_external_semaphore
typedef struct VkSemaphoreGetZirconHandleInfoFUCHSIA {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
} VkSemaphoreGetZirconHandleInfoFUCHSIA;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `semaphore` is the semaphore from which state will be exported.
- `handleType` is a VkExternalSemaphoreHandleTypeFlagBits value specifying the type of handle requested.

The properties of the Zircon event handle returned depend on the value of `handleType`. See VkExternalSemaphoreHandleTypeFlagBits for a description of the properties of the defined external semaphore handle types.

Valid Usage

- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-handleType-04758
  handleType must have been included in VkExportSemaphoreCreateInfo::handleTypes when
semaphore’s current payload was created

- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-semaphore-04759
  semaphore must not currently have its payload replaced by an imported payload as described below in Importing Semaphore Payloads unless that imported payload’s handle type was included in VkExternalSemaphoreProperties::exportFromImportedHandleTypes for handleType

- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-handleType-04760
  If handleType refers to a handle type with copy payload transference semantics, as defined below in Importing Semaphore Payloads, there must be no queue waiting on semaphore

- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-handleType-04761
  If handleType refers to a handle type with copy payload transference semantics, semaphore must be signaled, or have an associated semaphore signal operation pending execution

- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-handleType-04762
  handleType must be defined as a Zircon event handle

- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-semaphore-04763
  semaphore must have been created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_BINARY

Valid Usage (Implicit)

- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-sType-sType
  sType must be VK_STRUCTURE_TYPE_SEMAPHORE_GET_ZIRCON_HANDLE_INFO_FUCHSIA

- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-pNext-pNext
  pNext must be NULL

- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-semaphore-parameter
  semaphore must be a valid VkSemaphore handle

- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-handleType-parameter
  handleType must be a valid VkExternalSemaphoreHandleTypeFlagBits value

To destroy a semaphore, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroySemaphore(
    VkDevice device,
    VkSemaphore semaphore,
    const VkAllocationCallbacks* pAllocator);
```

- device is the logical device that destroys the semaphore.
- semaphore is the handle of the semaphore to destroy.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.
Valid Usage

• VUID-vkDestroySemaphore-semaphore-05149
  All submitted batches that refer to semaphore must have completed execution

• VUID-vkDestroySemaphore-semaphore-01138
  If VkAllocationCallbacks were provided when semaphore was created, a compatible set of callbacks must be provided here

• VUID-vkDestroySemaphore-semaphore-01139
  If no VkAllocationCallbacks were provided when semaphore was created, pAllocator must be NULL

Valid Usage (Implicit)

• VUID-vkDestroySemaphore-device-parameter
  device must be a valid VkDevice handle

• VUID-vkDestroySemaphore-semaphore-parameter
  If semaphore is not VK_NULL_HANDLE, semaphore must be a valid VkSemaphore handle

• VUID-vkDestroySemaphore-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkDestroySemaphore-semaphore-parent
  If semaphore is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

• Host access to semaphore must be externally synchronized

7.4.1. Semaphore Signaling

When a batch is submitted to a queue via a queue submission, and it includes semaphores to be signaled, it defines a memory dependency on the batch, and defines semaphore signal operations which set the semaphores to the signaled state.

In case of semaphores created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE the semaphore is considered signaled with respect to the counter value set to be signaled as specified in VkTimelineSemaphoreSubmitInfo or VkSemaphoreSignalInfo.

The first synchronization scope includes every command submitted in the same batch. In the case of vkQueueSubmit2, the first synchronization scope is limited to the pipeline stage specified by VkSemaphoreSubmitInfo::stageMask. Semaphore signal operations that are defined by vkQueueSubmit or vkQueueSubmit2 additionally include all commands that occur earlier in submission order. Semaphore signal operations that are defined by vkQueueSubmit or
vkQueueSubmit2 or vkQueueBindSparse additionally include in the first synchronization scope any semaphore and fence signal operations that occur earlier in signal operation order.

The second synchronization scope includes only the semaphore signal operation.

The first access scope includes all memory access performed by the device.

The second access scope is empty.

### 7.4.2. Semaphore Waiting

When a batch is submitted to a queue via a queue submission, and it includes semaphores to be waited on, it defines a memory dependency between prior semaphore signal operations and the batch, and defines semaphore wait operations.

Such semaphore wait operations set the semaphores created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_BINARY to the unsignaled state. In case of semaphores created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE a prior semaphore signal operation defines a memory dependency with a semaphore wait operation if the value the semaphore is signaled with is greater than or equal to the value the semaphore is waited with, thus the semaphore will continue to be considered signaled with respect to the counter value waited on as specified in VkTimelineSemaphoreSubmitInfo.

The first synchronization scope includes all semaphore signal operations that operate on semaphores waited on in the same batch, and that happen-before the wait completes.

The second synchronization scope includes every command submitted in the same batch. In the case of vkQueueSubmit, the second synchronization scope is limited to operations on the pipeline stages determined by the destination stage mask specified by the corresponding element of pWaitDstStageMask. In the case of vkQueueSubmit2, the second synchronization scope is limited to the pipeline stage specified by VkSemaphoreSubmitInfo::stageMask. Also, in the case of either vkQueueSubmit2 or vkQueueSubmit, the second synchronization scope additionally includes all commands that occur later in submission order.

The first access scope is empty.

The second access scope includes all memory access performed by the device.

The semaphore wait operation happens-after the first set of operations in the execution dependency, and happens-before the second set of operations in the execution dependency.

**NOTE**

Unlike timeline semaphores, fences or events, the act of waiting for a binary semaphore also unsignals that semaphore. Applications **must** ensure that between two such wait operations, the semaphore is signaled again, with execution dependencies used to ensure these occur in order. Binary semaphore waits and signals should thus occur in discrete 1:1 pairs.

**NOTE**

A common scenario for using pWaitDstStageMask with values other than VK_PIPELINE_STAGE_ALL_COMMANDS_BIT is when synchronizing a window system presentation operation against subsequent command buffers which render the next
frame. In this case, a presentation image must not be overwritten until the presentation operation completes, but other pipeline stages can execute without waiting. A mask of `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` prevents subsequent color attachment writes from executing until the semaphore signals. Some implementations may be able to execute transfer operations and/or pre-rasterization work before the semaphore is signaled.

If an image layout transition needs to be performed on a presentable image before it is used in a framebuffer, that can be performed as the first operation submitted to the queue after acquiring the image, and should not prevent other work from overlapping with the presentation operation. For example, a `VkImageMemoryBarrier` could use:

- `srcStageMask = VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT`
- `srcAccessMask = 0`
- `dstStageMask = VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT`
- `dstAccessMask = VK_ACCESS_COLOR_ATTACHMENT_READ_BIT | VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT.``
- `oldLayout = VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`
- `newLayout = VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`

Alternatively, `oldLayout` can be `VK_IMAGE_LAYOUT_UNDEFINED`, if the image’s contents need not be preserved.

This barrier accomplishes a dependency chain between previous presentation operations and subsequent color attachment output operations, with the layout transition performed in between, and does not introduce a dependency between previous work and any pre-rasterization shader stages. More precisely, the semaphore signals after the presentation operation completes, the semaphore wait stalls the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` stage, and there is a dependency from that same stage to itself with the layout transition performed in between.

### 7.4.3. Semaphore State Requirements for Wait Operations

Before waiting on a semaphore, the application must ensure the semaphore is in a valid state for a wait operation. Specifically, when a semaphore wait operation is submitted to a queue:

- A binary semaphore must be signaled, or have an associated semaphore signal operation that is pending execution.
- Any semaphore signal operations on which the pending binary semaphore signal operation depends must also be completed or pending execution.
- There must be no other queue waiting on the same binary semaphore when the operation executes.
7.4.4. Host Operations on Semaphores

In addition to semaphore signal operations and semaphore wait operations submitted to device queues, timeline semaphores support the following host operations:

- Query the current counter value of the semaphore using the vkGetSemaphoreCounterValue command.
- Wait for a set of semaphores to reach particular counter values using the vkWaitSemaphores command.
- Signal the semaphore with a particular counter value from the host using the vkSignalSemaphore command.

To query the current counter value of a semaphore created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE from the host, call:

```c
// Provided by VK_VERSION_1_2
VkResult vkGetSemaphoreCounterValue(
    VkDevice device,
    VkSemaphore semaphore,
    uint64_t* pValue);
```

or the equivalent command

```c
// Provided by VK_KHR_timeline_semaphore
VkResult vkGetSemaphoreCounterValueKHR(
    VkDevice device,
    VkSemaphore semaphore,
    uint64_t* pValue);
```

- **device** is the logical device that owns the semaphore.
- **semaphore** is the handle of the semaphore to query.
- **pValue** is a pointer to a 64-bit integer value in which the current counter value of the semaphore is returned.

**NOTE** If a queue submission command is pending execution, then the value returned by this command **may** immediately be out of date.

**Valid Usage**

- VUID-vkGetSemaphoreCounterValue-semaphore-03255
  semaphore must have been created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE
Valid Usage (Implicit)

- VUID-vkGetSemaphoreCounterValue-device-parameter device must be a valid VkDevice handle
- VUID-vkGetSemaphoreCounterValue-semaphore-parameter semaphore must be a valid VkSemaphore handle
- VUID-vkGetSemaphoreCounterValue-pValue-parameter pValue must be a valid pointer to a uint64_t value
- VUID-vkGetSemaphoreCounterValue-semaphore-parent semaphore must have been created, allocated, or retrieved from device

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST

To wait for a set of semaphores created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE to reach particular counter values on the host, call:

```c
// Provided by VK_VERSION_1_2
VkResult vkWaitSemaphores(
    VkDevice device,
    const VkSemaphoreWaitInfo* pWaitInfo,
    uint64_t timeout);
```
or the equivalent command

```c
// Provided by VK_KHR_timeline_semaphore
VkResult vkWaitSemaphoresKHR(
    VkDevice device,
    const VkSemaphoreWaitInfo* pWaitInfo,
    uint64_t timeout);
```

- device is the logical device that owns the semaphores.
- pWaitInfo is a pointer to a VkSemaphoreWaitInfo structure containing information about the wait condition.
- timeout is the timeout period in units of nanoseconds. timeout is adjusted to the closest value
allowed by the implementation-dependent timeout accuracy, which may be substantially longer than one nanosecond, and may be longer than the requested period.

If the condition is satisfied when `vkWaitSemaphores` is called, then `vkWaitSemaphores` returns immediately. If the condition is not satisfied at the time `vkWaitSemaphores` is called, then `vkWaitSemaphores` will block and wait until the condition is satisfied or the timeout has expired, whichever is sooner.

If `timeout` is zero, then `vkWaitSemaphores` does not wait, but simply returns information about the current state of the semaphores. `VK_TIMEOUT` will be returned in this case if the condition is not satisfied, even though no actual wait was performed.

If the condition is satisfied before the timeout has expired, `vkWaitSemaphores` returns `VK_SUCCESS`. Otherwise, `vkWaitSemaphores` returns `VK_TIMEOUT` after the timeout has expired.

If device loss occurs (see Lost Device) before the timeout has expired, `vkWaitSemaphores` must return in finite time with either `VK_SUCCESS` or `VK_ERROR_DEVICE_LOST`.

### Valid Usage (Implicit)

- VUID-vkWaitSemaphores-device-parameter
  
  - `device` must be a valid `VkDevice` handle

- VUID-vkWaitSemaphores-pWaitInfo-parameter
  
  - `pWaitInfo` must be a valid pointer to a valid `VkSemaphoreWaitInfo` structure

### Return Codes

#### Success

- `VK_SUCCESS`
- `VK_TIMEOUT`

#### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`

The `VkSemaphoreWaitInfo` structure is defined as:

---

---

---
typedef struct VkSemaphoreWaitInfo {
    VkStructureType   sType;
    const void*       pNext;
    VkSemaphoreWaitFlags flags;
    uint32_t           semaphoreCount;
    const VkSemaphore* pSemaphores;
    const uint64_t*    pValues;
} VkSemaphoreWaitInfo;

or the equivalent

typedef VkSemaphoreWaitInfo VKSemaphoreWaitInfoKHR;

• **sType** is a *VkStructureType* value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **flags** is a bitmask of *VkSemaphoreWaitFlagBits* specifying additional parameters for the semaphore wait operation.
• **semaphoreCount** is the number of semaphores to wait on.
• **pSemaphores** is a pointer to an array of **semaphoreCount** semaphore handles to wait on.
• **pValues** is a pointer to an array of **semaphoreCount** timeline semaphore values.

**Valid Usage**

• VUID-VkSemaphoreWaitInfo-pSemaphores-03256
  All of the elements of **pSemaphores** must reference a semaphore that was created with a *VkSemaphoreType* of **VK_SEMAPHORE_TYPE_TIMELINE**

**Valid Usage (Implicit)**

• VUID-VkSemaphoreWaitInfo-sType-sType
  *sType* must be **VK_STRUCTURE_TYPE_SEMAPHORE_WAIT_INFO**

• VUID-VkSemaphoreWaitInfo-pNext-pNext
  *pNext* must be NULL

• VUID-VkSemaphoreWaitInfo-flags-parameter
  *flags* must be a valid combination of *VkSemaphoreWaitFlagBits* values

• VUID-VkSemaphoreWaitInfo-pSemaphores-parameter
  *pSemaphores* must be a valid pointer to an array of **semaphoreCount** valid *VkSemaphore* handles

• VUID-VkSemaphoreWaitInfo-pValues-parameter
**pValues** must be a valid pointer to an array of `semaphoreCount uint64_t` values

- **VUID-VkSemaphoreWaitInfo-semaphoreCount-arraylength**
  
  `semaphoreCount` must be greater than 0

Bits which **can** be set in `VkSemaphoreWaitInfo::flags`, specifying additional parameters of a semaphore wait operation, are:

```c
// Provided by VK_VERSION_1_2
typedef enum VkSemaphoreWaitFlagBits {
    VK_SEMAPHORE_WAIT_ANY_BIT = 0x00000001,
    // Provided by VK_KHR_timeline_semaphore
    VK_SEMAPHORE_WAIT_ANY_BIT_KHR = VK_SEMAPHORE_WAIT_ANY_BIT,
} VkSemaphoreWaitFlagBits;
```

or the equivalent

```c
// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreWaitFlagBits VkSemaphoreWaitFlagBitsKHR;
```

- **VK_SEMAPHORE_WAIT_ANY_BIT** specifies that the semaphore wait condition is that at least one of the semaphores in `VkSemaphoreWaitInfo::pSemaphores` has reached the value specified by the corresponding element of `VkSemaphoreWaitInfo::pValues`. If **VK_SEMAPHORE_WAIT_ANY_BIT** is not set, the semaphore wait condition is that all of the semaphores in `VkSemaphoreWaitInfo::pSemaphores` have reached the value specified by the corresponding element of `VkSemaphoreWaitInfo::pValues`.

```c
// Provided by VK_VERSION_1_2
typedef VkFlags VkSemaphoreWaitFlags;
```

or the equivalent

```c
// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreWaitFlags VkSemaphoreWaitFlagsKHR;
```

`VkSemaphoreWaitFlags` is a bitmask type for setting a mask of zero or more `VkSemaphoreWaitFlagBits`.

To signal a semaphore created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` with a particular counter value, on the host, call:

```c
// Provided by VK_VERSION_1_2
VkResult vkSignalSemaphore(
    VkDevice device,
    const VkSemaphoreSignalInfo* pSignalInfo);
```
or the equivalent command

```c
// Provided by VK_KHR_timeline_semaphore
VkResult vkSignalSemaphoreKHR(
    VkDevice device,
    const VkSemaphoreSignalInfo* pSignalInfo);
```

- `device` is the logical device that owns the semaphore.
- `pSignalInfo` is a pointer to a `VkSemaphoreSignalInfo` structure containing information about the signal operation.

When `vkSignalSemaphore` is executed on the host, it defines and immediately executes a **semaphore signal operation** which sets the timeline semaphore to the given value.

The first synchronization scope is defined by the host execution model, but includes execution of `vkSignalSemaphore` on the host and anything that happened-before it.

The second synchronization scope is empty.

---

### Valid Usage (Implicit)

- **VUID-vkSignalSemaphore-device-parameter**
  `device` must be a valid `VkDevice` handle
- **VUID-vkSignalSemaphore-pSignalInfo-parameter**
  `pSignalInfo` must be a valid pointer to a valid `VkSemaphoreSignalInfo` structure

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkSemaphoreSignalInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkSemaphoreSignalInfo {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    uint64_t value;
} VkSemaphoreSignalInfo;
```
or the equivalent

```c
// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreSignalInfo VkSemaphoreSignalInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `semaphore` is the handle of the semaphore to signal.
- `value` is the value to signal.

### Valid Usage

- VUID-VkSemaphoreSignalInfo-semaphore-03257
  
  `semaphore` must have been created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`

- VUID-VkSemaphoreSignalInfo-value-03258
  
  `value` must have a value greater than the current value of the semaphore

- VUID-VkSemaphoreSignalInfo-value-03259
  
  `value` must be less than the value of any pending semaphore signal operations

- VUID-VkSemaphoreSignalInfo-value-03260
  
  `value` must have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on `semaphore` by more than `maxTimelineSemaphoreValueDifference`

### Valid Usage (Implicit)

- VUID-VkSemaphoreSignalInfo-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_SEMAPHORE_SIGNAL_INFO`

- VUID-VkSemaphoreSignalInfo-pNext-pNext
  
  `pNext` must be `NULL`

- VUID-VkSemaphoreSignalInfo-semaphore-parameter
  
  `semaphore` must be a valid `VkSemaphore` handle

### 7.4.5. Importing Semaphore Payloads

Applications can import a semaphore payload into an existing semaphore using an external semaphore handle. The effects of the import operation will be either temporary or permanent, as specified by the application. If the import is temporary, the implementation must restore the semaphore to its prior permanent state after submitting the next semaphore wait operation. Performing a subsequent temporary import on a semaphore before performing a semaphore wait has no effect on this requirement; the next wait submitted on the semaphore must still restore its last permanent state. A permanent payload import behaves as if the target semaphore was
destroyed, and a new semaphore was created with the same handle but the imported payload. Because importing a semaphore payload temporarily or permanently detaches the existing payload from a semaphore, similar usage restrictions to those applied to `vkDestroySemaphore` are applied to any command that imports a semaphore payload. Which of these import types is used is referred to as the import operation's `permanence`. Each handle type supports either one or both types of permanence.

The implementation **must** perform the import operation by either referencing or copying the payload referred to by the specified external semaphore handle, depending on the handle's type. The import method used is referred to as the handle type's `transference`. When using handle types with reference transference, importing a payload to a semaphore adds the semaphore to the set of all semaphores sharing that payload. This set includes the semaphore from which the payload was exported. Semaphore signaling and waiting operations performed on any semaphore in the set **must** behave as if the set were a single semaphore. Importing a payload using handle types with copy transference creates a duplicate copy of the payload at the time of import, but makes no further reference to it. Semaphore signaling and waiting operations performed on the target of copy imports **must** not affect any other semaphore or payload.

Export operations have the same transference as the specified handle type's import operations. Additionally, exporting a semaphore payload to a handle with copy transference has the same side effects on the source semaphore's payload as executing a semaphore wait operation. If the semaphore was using a temporarily imported payload, the semaphore's prior permanent payload will be restored.

The permanence and transference of handle types can be found in:

- Handle Types Supported by `VkImportSemaphoreWin32HandleInfoKHR`
- Handle Types Supported by `VkImportSemaphoreFdInfoKHR`
- Handle Types Supported by `VkImportSemaphoreZirconHandleInfoFUCHSIA`

External synchronization allows implementations to modify an object's internal state, i.e. payload, without internal synchronization. However, for semaphores sharing a payload across processes, satisfying the external synchronization requirements of `VkSemaphore` parameters as if all semaphores in the set were the same object is sometimes infeasible. Satisfying the wait operation state requirements would similarly require impractical coordination or levels of trust between processes. Therefore, these constraints only apply to a specific semaphore handle, not to its payload. For distinct semaphore objects which share a payload, if the semaphores are passed to separate queue submission commands concurrently, behavior will be as if the commands were called in an arbitrary sequential order. If the wait operation state requirements are violated for the shared payload by a queue submission command, or if a signal operation is queued for a shared payload that is already signaled or has a pending signal operation, effects **must** be limited to one or more of the following:

- Returning `VK_ERROR_INITIALIZATION_FAILED` from the command which resulted in the violation.
- Losing the logical device on which the violation occurred immediately or at a future time, resulting in a `VK_ERROR_DEVICE_LOST` error from subsequent commands, including the one causing the violation.
• Continuing execution of the violating command or operation as if the semaphore wait
completed successfully after an implementation-dependent timeout. In this case, the state of the
payload becomes undefined, and future operations on semaphores sharing the payload will be
subject to these same rules. The semaphore must be destroyed or have its payload replaced by
an import operation to again have a well-defined state.

NOTE

These rules allow processes to synchronize access to shared memory without
trusting each other. However, such processes must still be cautious not to use the
shared semaphore for more than synchronizing access to the shared memory. For
example, a process should not use a shared semaphore as part of an execution
dependency chain that, when complete, leads to objects being destroyed, if it does
not trust other processes sharing the semaphore payload.

When a semaphore is using an imported payload, its VkExportSemaphoreCreateInfo::handleTypes
value is specified when creating the semaphore from which the payload was exported, rather than
specified when creating the semaphore. Additionally, VkExternalSemaphoreProperties::exportFromImportedHandleTypes restricts which handle types can be exported from such a
semaphore based on the specific handle type used to import the current payload. Passing a
semaphore to vkAcquireNextImageKHR is equivalent to temporarily importing a semaphore
payload to that semaphore.

NOTE

Because the exportable handle types of an imported semaphore correspond to its
current imported payload, and vkAcquireNextImageKHR behaves the same as a
temporary import operation for which the source semaphore is opaque to the
application, applications have no way of determining whether any external handle types can be exported from a semaphore in this state. Therefore, applications must
not attempt to export external handles from semaphores using a temporarily
imported payload from vkAcquireNextImageKHR.

When importing a semaphore payload, it is the responsibility of the application to ensure the
external handles meet all valid usage requirements. However, implementations must perform
sufficient validation of external handles to ensure that the operation results in a valid semaphore
which will not cause program termination, device loss, queue stalls, or corruption of other
resources when used as allowed according to its import parameters, and excepting those side
effects allowed for violations of the valid semaphore state for wait operations rules. If the external
handle provided does not meet these requirements, the implementation must fail the semaphore
payload import operation with the error code VK_ERROR_INVALID_EXTERNAL_HANDLE.

In addition, when importing a semaphore payload that is not compatible with the payload type
corresponding to the VkSemaphoreType the semaphore was created with, the implementation may
fail the semaphore payload import operation with the error code VK_ERROR_INVALID_EXTERNAL_HANDLE.

NOTE

As the introduction of the external semaphore handle type
VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT predates that of timeline
semaphores, support for importing semaphore payloads from external handles of
that type into semaphores created (implicitly or explicitly) with a
VkSemaphoreType of VK_SEMAPHORE_TYPE_BINARY is preserved for backwards
compatibility. However, applications should prefer importing such handle types

368
To import a semaphore payload from a Windows handle, call:

```c
// Provided by VK_KHR_external_semaphore_win32
VkResult vkImportSemaphoreWin32HandleKHR(
    VkDevice device,
    const VkImportSemaphoreWin32HandleInfoKHR* pImportSemaphoreWin32HandleInfo);
```

- `device` is the logical device that created the semaphore.
- `pImportSemaphoreWin32HandleInfo` is a pointer to a `VkImportSemaphoreWin32HandleInfoKHR` structure specifying the semaphore and import parameters.

Importing a semaphore payload from Windows handles does not transfer ownership of the handle to the Vulkan implementation. For handle types defined as NT handles, the application must release ownership using the `CloseHandle` system call when the handle is no longer needed.

Applications can import the same semaphore payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

**Valid Usage (Implicit)**

- `VUID-vkImportSemaphoreWin32HandleKHR-device-parameter`  
  `device` must be a valid `VkDevice` handle
- `VUID-vkImportSemaphoreWin32HandleKHR-pImportSemaphoreWin32HandleInfo-parameter`  
  `pImportSemaphoreWin32HandleInfo` must be a valid pointer to a valid `VkImportSemaphoreWin32HandleInfoKHR` structure

**Return Codes**

- **Success**
  - `VK_SUCCESS`
- **Failure**
  - `VK_ERROR_OUT_OF_HOST_MEMORY`
  - `VK_ERROR_INVALID_EXTERNAL_HANDLE`

The `VkImportSemaphoreWin32HandleInfoKHR` structure is defined as:
typedef struct VkImportSemaphoreWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    VkSemaphoreImportFlags flags;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
    HANDLE handle;
    LPCWSTR name;
} VkImportSemaphoreWin32HandleInfoKHR;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `semaphore` is the semaphore into which the payload will be imported.
- `flags` is a bitmask of `VkSemaphoreImportFlagBits` specifying additional parameters for the semaphore payload import operation.
- `handleType` is a `VkExternalSemaphoreHandleTypeFlagBits` value specifying the type of `handle`.
- `handle` is `NULL` or the external handle to import.
- `name` is `NULL` or a null-terminated UTF-16 string naming the underlying synchronization primitive to import.

Table 8. Handle Types Supported by `VkImportSemaphoreWin32HandleInfoKHR`

<table>
<thead>
<tr>
<th>Handle Type</th>
<th>Transference</th>
<th>Permanence Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT</td>
<td>Reference</td>
<td>Temporary,Permanent</td>
</tr>
<tr>
<td>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT</td>
<td>Reference</td>
<td>Temporary,Permanent</td>
</tr>
<tr>
<td>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT</td>
<td>Reference</td>
<td>Temporary,Permanent</td>
</tr>
</tbody>
</table>

Valid Usage

- VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01140 `handleType` must be a value included in the Handle Types Supported by `VkImportSemaphoreWin32HandleInfoKHR` table
- VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01466 If `handleType` is not `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT` or `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT`, `name` must be `NULL`
- VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01467
If `handle` is `NULL`, `name` must name a valid synchronization primitive of the type specified by `handleType`

- VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01468
  If `name` is `NULL`, `handle` must be a valid handle of the type specified by `handleType`

- VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01469
  If `handle` is not `NULL`, `name` must be `NULL`

- VUID-VkImportSemaphoreWin32HandleInfoKHR-handle-01542
  If `handle` is not `NULL`, it must obey any requirements listed for `handleType` in external semaphore handle types compatibility

- VUID-VkImportSemaphoreWin32HandleInfoKHR-name-01543
  If `name` is not `NULL`, it must obey any requirements listed for `handleType` in external semaphore handle types compatibility

- VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-03261
  If `handleType` is `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT` or `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT`, the `VkSemaphoreCreateInfo::flags` field must match that of the semaphore from which `handle` or `name` was exported

- VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-03262
  If `handleType` is `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT` or `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT`, the `VkSemaphoreTypeCreateInfo::semaphoreType` field must match that of the semaphore from which `handle` or `name` was exported

- VUID-VkImportSemaphoreWin32HandleInfoKHR-flags-03322
  If `flags` contains `VK_SEMAPHORE_IMPORT_TEMPORARY_BIT`, the `VkSemaphoreTypeCreateInfo::semaphoreType` field of the semaphore from which `handle` or `name` was exported must not be `VK_SEMAPHORE_TYPE_TIMELINE`

**Valid Usage (Implicit)**

- VUID-VkImportSemaphoreWin32HandleInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_WIN32_HANDLE_INFO_KHR`  

- VUID-VkImportSemaphoreWin32HandleInfoKHR-pNext-pNext
  `pNext` must be `NULL`  

- VUID-VkImportSemaphoreWin32HandleInfoKHR-semaphore-parameter
  `semaphore` must be a valid `VkSemaphore` handle  

- VUID-VkImportSemaphoreWin32HandleInfoKHR-flags-parameter
  `flags` must be a valid combination of `VkSemaphoreImportFlagBits` values

**Host Synchronization**

- Host access to `semaphore` must be externally synchronized
To import a semaphore payload from a POSIX file descriptor, call:

```c
// Provided by VK_KHR_external_semaphore_fd
VkResult vkImportSemaphoreFdKHR(
    VkDevice device,
    const VkImportSemaphoreFdInfoKHR* pImportSemaphoreFdInfo);
```

- `device` is the logical device that created the semaphore.
- `pImportSemaphoreFdInfo` is a pointer to a `VkImportSemaphoreFdInfoKHR` structure specifying the semaphore and import parameters.

Importing a semaphore payload from a file descriptor transfers ownership of the file descriptor from the application to the Vulkan implementation. The application **must** not perform any operations on the file descriptor after a successful import.

Applications **can** import the same semaphore payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

### Valid Usage

- VUID-vkImportSemaphoreFdKHR-semaphore-01142
  - `semaphore` must not be associated with any queue command that has not yet completed execution on that queue

### Valid Usage (Implicit)

- VUID-vkImportSemaphoreFdKHR-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkImportSemaphoreFdKHR-pImportSemaphoreFdInfo-parameter
  - `pImportSemaphoreFdInfo` must be a valid pointer to a valid `VkImportSemaphoreFdInfoKHR` structure

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_INVALID_EXTERNAL_HANDLE`

The `VkImportSemaphoreFdInfoKHR` structure is defined as:
typedef struct VkImportSemaphoreFdInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    VkSemaphoreImportFlags flags;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
    int fd;
} VkImportSemaphoreFdInfoKHR;

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **semaphore** is the semaphore into which the payload will be imported.
- **flags** is a bitmask of **VkSemaphoreImportFlagBits** specifying additional parameters for the semaphore payload import operation.
- **handleType** is a **VkExternalSemaphoreHandleTypeFlagBits** value specifying the type of **fd**.
- **fd** is the external handle to import.

The handle types supported by **handleType** are:

**Table 9. Handle Types Supported by VkImportSemaphoreFdInfoKHR**

<table>
<thead>
<tr>
<th>Handle Type</th>
<th>Transference</th>
<th>Permanence Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT</td>
<td>Reference</td>
<td>Temporary,Permanent</td>
</tr>
<tr>
<td>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT</td>
<td>Copy</td>
<td>Temporary</td>
</tr>
</tbody>
</table>

**Valid Usage**

- **VUID-VkImportSemaphoreFdInfoKHR-handleType-01143**
  
  **handleType** must be a value included in the **Handle Types Supported by VkImportSemaphoreFdInfoKHR** table

- **VUID-VkImportSemaphoreFdInfoKHR-fd-01544**

  **fd** must obey any requirements listed for **handleType** in **external semaphore handle types compatibility**

- **VUID-VkImportSemaphoreFdInfoKHR-handleType-03263**

  If **handleType** is **VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT**, the **VkSemaphoreCreateInfo::flags** field must match that of the semaphore from which **fd** was exported

- **VUID-VkImportSemaphoreFdInfoKHR-handleType-07307**

  If **handleType** refers to a handle type with copy payload transference semantics, **flags** must contain **VK_SEMAPHORE_IMPORT_TEMPORARY_BIT**

- **VUID-VkImportSemaphoreFdInfoKHR-handleType-03264**
If `handleType` is `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT`, the `VkSemaphoreTypeCreateInfo::semaphoreType` field must match that of the semaphore from which `fd` was exported.

- VUID-VkImportSemaphoreFdInfoKHR-flags-03323

If `flags` contains `VK_SEMAPHORE_IMPORT_TEMPORARY_BIT`, the `VkSemaphoreTypeCreateInfo::semaphoreType` field of the semaphore from which `fd` was exported must not be `VK_SEMAPHORE_TYPE_TIMELINE`.

If `handleType` is `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT`, the special value `-1` for `fd` is treated like a valid sync file descriptor referring to an object that has already signaled. The import operation will succeed and the `VkSemaphore` will have a temporarily imported payload as if a valid file descriptor had been provided.

NOTE

This special behavior for importing an invalid sync file descriptor allows easier interoperability with other system APIs which use the convention that an invalid sync file descriptor represents work that has already completed and does not need to be waited for. It is consistent with the option for implementations to return a `-1` file descriptor when exporting a `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT` from a `VkSemaphore` which is signaled.

Valid Usage (Implicit)

- VUID-VkImportSemaphoreFdInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_FD_INFO_KHR`

- VUID-VkImportSemaphoreFdInfoKHR-pNext-pNext
  `pNext` must be `NULL`

- VUID-VkImportSemaphoreFdInfoKHR-semaphore-parameter
  `semaphore` must be a valid `VkSemaphore` handle

- VUID-VkImportSemaphoreFdInfoKHR-flags-parameter
  `flags` must be a valid combination of `VkSemaphoreImportFlagBits` values

- VUID-VkImportSemaphoreFdInfoKHR-handleType-parameter
  `handleType` must be a valid `VkExternalSemaphoreHandleTypeFlagBits` value

Host Synchronization

- Host access to `semaphore` must be externally synchronized

To import a semaphore payload from a Zircon event handle, call:
```c
// Provided by VK_FUCHSIA_external_semaphore
VkResult vkImportSemaphoreZirconHandleFUCHSIA(
    VkDevice device,
    const VkImportSemaphoreZirconHandleInfoFUCHSIA* pImportSemaphoreZirconHandleInfo);
```

- `device` is the logical device that created the semaphore.
- `pImportSemaphoreZirconHandleInfo` is a pointer to a `VkImportSemaphoreZirconHandleInfoFUCHSIA` structure specifying the semaphore and import parameters.

Importing a semaphore payload from a Zircon event handle transfers ownership of the handle from the application to the Vulkan implementation. The application must not perform any operations on the handle after a successful import.

Applications can import the same semaphore payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

### Valid Usage

- VUID-vkImportSemaphoreZirconHandleFUCHSIA-semaphore-04764
  - semaphore must not be associated with any queue command that has not yet completed execution on that queue

### Valid Usage (Implicit)

- VUID-vkImportSemaphoreZirconHandleFUCHSIA-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkImportSemaphoreZirconHandleFUCHSIA-pImportSemaphoreZirconHandleInfo-parameter
  - `pImportSemaphoreZirconHandleInfo` must be a valid pointer to a valid `VkImportSemaphoreZirconHandleInfoFUCHSIA` structure

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_INVALID_EXTERNAL_HANDLE`

The `VkImportSemaphoreZirconHandleInfoFUCHSIA` structure is defined as:
typedef struct VkImportSemaphoreZirconHandleInfoFUCHSIA {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    VkSemaphoreImportFlags flags;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
    zx_handle_t zirconHandle;
} VkImportSemaphoreZirconHandleInfoFUCHSIA;

• **sType** is a **VkStructureType** value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **semaphore** is the semaphore into which the payload will be imported.
• **flags** is a bitmask of **VkSemaphoreImportFlagBits** specifying additional parameters for the semaphore payload import operation.
• **handleType** is a **VkExternalSemaphoreHandleTypeFlagBits** value specifying the type of **zirconHandle**.
• **zirconHandle** is the external handle to import.

The handle types supported by **handleType** are:

<table>
<thead>
<tr>
<th>Handle Type</th>
<th>Transference</th>
<th>Permanence Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_ZIRCON_EVENT_BIT_FUCHSIA</td>
<td>Reference</td>
<td>Temporary, Permanent</td>
</tr>
</tbody>
</table>

**Valid Usage**

• **VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-handleType-04765**
  **handleType** must be a value included in the Handle Types Supported by VkImportSemaphoreZirconHandleInfoFUCHSIA table

• **VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-zirconHandle-04766**
  **zirconHandle** must obey any requirements listed for **handleType** in external semaphore handle types compatibility

• **VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-zirconHandle-04767**
  **zirconHandle** must have ZX_RIGHTS_BASIC and ZX_RIGHTS_SIGNAL rights

• **VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-semaphoreType-04768**
  The **VkSemaphoreTypeCreateInfo::semaphoreType** field must not be **VK_SEMAPHORE_TYPE_TIMELINE**
Valid Usage (Implicit)

- **VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_ZIRCON HANDLE_INFO_FUCHSIA`

- **VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-pNext-pNext**
  - `pNext` must be `NULL`

- **VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-semaphore-parameter**
  - `semaphore` must be a valid `VkSemaphore` handle

- **VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-flags-parameter**
  - `flags` must be a valid combination of `VkSemaphoreImportFlagBits` values

- **VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-handleType-parameter**
  - `handleType` must be a valid `VkExternalSemaphoreHandleTypeFlagBits` value

Host Synchronization

- Host access to `semaphore` must be externally synchronized

Bits which **can** be set in

- `VkImportSemaphoreWin32HandleInfoKHR::flags`
- `VkImportSemaphoreFdInfoKHR::flags`
- `VkImportSemaphoreZirconHandleInfoFUCHSIA::flags`

specifying additional parameters of a semaphore import operation are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkSemaphoreImportFlagBits {
    VK_SEMAPHORE_IMPORT_TEMPORARY_BIT = 0x00000001,
} VkSemaphoreImportFlagBits;
```

or the equivalent

```c
// Provided by VK_KHR_external_semaphore
typedef VkSemaphoreImportFlagBits VkSemaphoreImportFlagBitsKHR;
```

These bits have the following meanings:

- `VK_SEMAPHORE_IMPORT_TEMPORARY_BIT` specifies that the semaphore payload will be imported only temporarily, as described in Importing Semaphore Payloads, regardless of the permanence of `handleType`. 
7.5. Events

Events are a synchronization primitive that can be used to insert a fine-grained dependency between commands submitted to the same queue, or between the host and a queue. Events must not be used to insert a dependency between commands submitted to different queues. Events have two states - signaled and unsignaled. An application can signal or unsignal an event either on the host or on the device. A device can be made to wait for an event to become signaled before executing further operations. No command exists to wait for an event to become signaled on the host, but the current state of an event can be queried.

Events are represented by VkEvent handles:

```
// Provided by VK_VERSION_1.0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkEvent)
```

To create an event, call:

```
// Provided by VK_VERSION_1.0
VkResult vkCreateEvent(
    VkDevice device,
    const VkEventCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkEvent* pEvent);
```

- `device` is the logical device that creates the event.
- `pCreateInfo` is a pointer to a VkEventCreateInfo structure containing information about how the event is to be created.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pEvent` is a pointer to a handle in which the resulting event object is returned.

When created, the event object is in the unsignaled state.
Valid Usage

- VUID-vkCreateEvent-device-09672
  device must support at least one queue family with one of the
  VK_QUEUE_VIDEO_ENCODE_BIT_KHR, VK_QUEUE_VIDEO_DECODE_BIT_KHR, VK_QUEUE_COMPUTE_BIT,
  or VK_QUEUE_GRAPHICS_BIT capabilities

- VUID-vkCreateEvent-events-04468
  If the VK_KHR_portability_subset extension is enabled, and
  VkPhysicalDevicePortabilitySubsetFeaturesKHR::events is VK_FALSE, then the
  implementation does not support events, and vkCreateEvent must not be used

Valid Usage (Implicit)

- VUID-vkCreateEvent-device-parameter
  device must be a valid VkDevice handle

- VUID-vkCreateEvent-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkEventCreateInfo structure

- VUID-vkCreateEvent-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid
  VkAllocationCallbacks structure

- VUID-vkCreateEvent-pEvent-parameter
  pEvent must be a valid pointer to a VkEvent handle

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkEventCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkEventCreateInfo {
  VkStructureType sType;
  const void* pNext;
  VkEventCreateFlags flags;
} VkEventCreateInfo;
```

- sType is a VkStructureType value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `flags` is a bitmask of `VkEventCreateFlagBits` defining additional creation parameters.

**Valid Usage**

- **VUID-VkEventCreateInfo-pNext-06790**
  If the `pNext` chain includes a `VkExportMetalObjectCreateInfoEXT` structure, its `exportObjectType` member must be `VK_EXPORT_METAL_OBJECT_TYPE_METAL_SHARED_EVENT_BIT_EXT`

**Valid Usage (Implicit)**

- **VUID-VkEventCreateInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_EVENT_CREATE_INFO`

- **VUID-VkEventCreateInfo-pNext-pNext**
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkExportMetalObjectCreateInfoEXT` or `VkImportMetalSharedEventInfoEXT`

- **VUID-VkEventCreateInfo-sType-unique**
  The `sType` value of each struct in the `pNext` chain must be unique, with the exception of structures of type `VkExportMetalObjectCreateInfoEXT`

- **VUID-VkEventCreateInfo-flags-parameter**
  `flags` must be a valid combination of `VkEventCreateFlagBits` values

```c
// Provided by VK_VERSION_1_0
typedef enum VkEventCreateFlagBits {
    // Provided by VK_VERSION_1_3
    VK_EVENT_CREATE_DEVICE_ONLY_BIT = 0x00000001,
    // Provided by VK_KHR_synchronization2
    VK_EVENT_CREATE_DEVICE_ONLY_BIT_KHR = VK_EVENT_CREATE_DEVICE_ONLY_BIT,
} VkEventCreateFlagBits;

• `VK_EVENT_CREATE_DEVICE_ONLY_BIT` specifies that host event commands will not be used with this event.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkEventCreateFlags;

VkEventCreateFlags is a bitmask type for setting a mask of `VkEventCreateFlagBits` values.

To destroy an event, call:
void vkDestroyEvent(
    VkDevice   device,
    VkEvent    event,
    const VkAllocationCallbacks* pAllocator);

- device is the logical device that destroys the event.
- event is the handle of the event to destroy.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyEvent-event-01145
  All submitted commands that refer to event must have completed execution

- VUID-vkDestroyEvent-event-01146
  If VkAllocationCallbacks were provided when event was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyEvent-event-01147
  If no VkAllocationCallbacks were provided when event was created, pAllocator must be NULL

Valid Usage (Implicit)

- VUID-vkDestroyEvent-device-parameter
device must be a valid VkDevice handle

- VUID-vkDestroyEvent-event-parameter
  If event is not VK_NULL_HANDLE, event must be a valid VkEvent handle

- VUID-vkDestroyEvent-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroyEvent-event-parent
  If event is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to event must be externally synchronized

To query the state of an event from the host, call:
// Provided by VK_VERSION_1_0
VkResult vkGetEventStatus(
    VkDevice device,
    VkEvent event);

- `device` is the logical device that owns the event.
- `event` is the handle of the event to query.

Upon success, `vkGetEventStatus` returns the state of the event object with the following return codes:

**Table 11. Event Object Status Codes**

<table>
<thead>
<tr>
<th>Status</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_EVENT_SET</td>
<td>The event specified by <code>event</code> is signaled.</td>
</tr>
<tr>
<td>VK_EVENT_RESET</td>
<td>The event specified by <code>event</code> is unsignaled.</td>
</tr>
</tbody>
</table>

If a `vkCmdSetEvent` or `vkCmdResetEvent` command is in a command buffer that is in the pending state, then the value returned by this command may immediately be out of date.

The state of an event can be updated by the host. The state of the event is immediately changed, and subsequent calls to `vkGetEventStatus` will return the new state. If an event is already in the requested state, then updating it to the same state has no effect.

**Valid Usage**

- VUID-vkGetEventStatus-event-03940
  `event` must not have been created with `VK_EVENT_CREATE_DEVICE_ONLY_BIT`

**Valid Usage (Implicit)**

- VUID-vkGetEventStatus-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkGetEventStatus-event-parameter
  `event` must be a valid `VkEvent` handle
- VUID-vkGetEventStatus-event-parent
  `event` must have been created, allocated, or retrieved from `device`

**Return Codes**

**Success**

- VK_EVENT_SET
To set the state of an event to signaled from the host, call:

```cpp
// Provided by VK_VERSION_1_0
VkResult vkSetEvent(VkDevice device, VkEvent event);
```

- `device` is the logical device that owns the event.
- `event` is the event to set.

When `vkSetEvent` is executed on the host, it defines an event signal operation which sets the event to the signaled state.

If `event` is already in the signaled state when `vkSetEvent` is executed, then `vkSetEvent` has no effect, and no event signal operation occurs.

**Note**

If a command buffer is waiting for an event to be signaled from the host, the application must signal the event before submitting the command buffer, as described in the queue forward progress section.

**Valid Usage**

- VUID-vkSetEvent-event-03941
  `event` must not have been created with `VK_EVENT_CREATE_DEVICE_ONLY_BIT`

- VUID-vkSetEvent-event-09543
  `event` must not be waited on by a command buffer in the pending state

**Valid Usage (Implicit)**

- VUID-vkSetEvent-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkSetEvent-event-parameter
  `event` must be a valid `VkEvent` handle

- VUID-vkSetEvent-event-parent
  `event` must have been created, allocated, or retrieved from `device`
Host Synchronization

- Host access to event must be externally synchronized

Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To set the state of an event to unsignaled from the host, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkResetEvent(
    VkDevice device,
    VkEvent event);
```

- `device` is the logical device that owns the event.
- `event` is the event to reset.

When `vkResetEvent` is executed on the host, it defines an event unsignal operation which resets the event to the unsignaled state.

If `event` is already in the unsignaled state when `vkResetEvent` is executed, then `vkResetEvent` has no effect, and no event unsignal operation occurs.

**Valid Usage**

- VUID-vkResetEvent-event-03821
  There must be an execution dependency between `vkResetEvent` and the execution of any `vkCmdWaitEvents` that includes `event` in its `pEvents` parameter

- VUID-vkResetEvent-event-03822
  There must be an execution dependency between `vkResetEvent` and the execution of any `vkCmdWaitEvents2` that includes `event` in its `pEvents` parameter

- VUID-vkResetEvent-event-03823
  `event` must not have been created with `VK_EVENT_CREATE_DEVICE_ONLY_BIT`

**Valid Usage (Implicit)**

- VUID-vkResetEvent-device-parameter
**device** must be a valid *VkDevice* handle

- VUID-vkResetEvent-event-parameter
  - **event** must be a valid *VkEvent* handle

- VUID-vkResetEvent-event-parent
  - **event** must have been created, allocated, or retrieved from **device**

---

**Host Synchronization**

- Host access to **event** must be externally synchronized

---

**Return Codes**

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

The state of an event can also be updated on the device by commands inserted in command buffers.

To signal an event from a device, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetEvent2(
    VkCommandBuffer commandBuffer,   // Provided by VK_VERSION_1_3
    VkEvent event,                   // Provided by VK_VERSION_1_3
    const VkDependencyInfo* pDependencyInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_synchronization2
void vkCmdSetEvent2KHR(
    VkCommandBuffer commandBuffer,   // Provided by VK_KHR_synchronization2
    VkEvent event,                   // Provided by VK_KHR_synchronization2
    const VkDependencyInfo* pDependencyInfo);
```

- **commandBuffer** is the command buffer into which the command is recorded.
- **event** is the event that will be signaled.

- **pDependencyInfo** is a pointer to a *VkDependencyInfo* structure defining the first scopes of this operation.

When **vkCmdSetEvent2** is submitted to a queue, it defines the first half of memory dependencies
defined by \texttt{pDependencyInfo}, as well as an event signal operation which sets the event to the signalled state. A memory dependency is defined between the event signal operation and commands that occur earlier in submission order.

The first \textit{synchronization scope} and \textit{access scope} are defined by the union of all the memory dependencies defined by \texttt{pDependencyInfo}, and are applied to all operations that occur earlier in submission order. Queue family ownership transfers and image layout transitions defined by \texttt{pDependencyInfo} are also included in the first scopes.

The second \textit{synchronization scope} includes only the event signal operation, and any queue family ownership transfers and image layout transitions defined by \texttt{pDependencyInfo}.

The second \textit{access scope} includes only queue family ownership transfers and image layout transitions.

Future \texttt{vkCmdWaitEvents2} commands rely on all values of each element in \texttt{pDependencyInfo} matching exactly with those used to signal the corresponding event. \texttt{vkCmdWaitEvents} must not be used to wait on the result of a signal operation defined by \texttt{vkCmdSetEvent2}.

\textbf{NOTE}

The extra information provided by \texttt{vkCmdSetEvent2} compared to \texttt{vkCmdSetEvent} allows implementations to more efficiently schedule the operations required to satisfy the requested dependencies. With \texttt{vkCmdSetEvent}, the full dependency information is not known until \texttt{vkCmdWaitEvents} is recorded, forcing implementations to insert the required operations at that point and not before.

If \texttt{event} is already in the signalled state when \texttt{vkCmdSetEvent2} is executed on the device, then \texttt{vkCmdSetEvent2} has no effect, no event signal operation occurs, and no dependency is generated.

\begin{tabular}{|p{0.5\textwidth}|p{0.5\textwidth}|}

\textbullet{} VUID-vkCmdSetEvent2-srcStageMask-03827 & The srcStageMask member of any element of the \texttt{pMemoryBarriers}, \texttt{pBufferMemoryBarriers}, or \texttt{pImageMemoryBarriers} members of \texttt{pDependencyInfo} \textbf{must} not include \texttt{VK_PIPELINE_STAGE_2_HOST_BIT}\\
\hline
\end{tabular}
or pImageMemoryBarriers members of pDependencyInfo must only include pipeline stages valid for the queue family that was used to create the command pool that commandBuffer was allocated from

- VUID-vkCmdSetEvent2-dstStageMask-03828
  The dstStageMask member of any element of the pMemoryBarriers, pBufferMemoryBarriers, or pImageMemoryBarriers members of pDependencyInfo must only include pipeline stages valid for the queue family that was used to create the command pool that commandBuffer was allocated from

**Valid Usage (Implicit)**

- VUID-vkCmdSetEvent2-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetEvent2-event-parameter
  event must be a valid VkEvent handle
- VUID-vkCmdSetEvent2-pDependencyInfo-parameter
  pDependencyInfo must be a valid pointer to a valid VkDependencyInfo structure
- VUID-vkCmdSetEvent2-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetEvent2-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, compute, decode, or encode operations
- VUID-vkCmdSetEvent2-renderpass
  This command must only be called outside of a render pass instance
- VUID-vkCmdSetEvent2-commonparent
  Both of commandBuffer, and event must have been created, allocated, or retrieved from the same VkDevice

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
The `VkDependencyInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkDependencyInfo {
    VkStructureType sType;
    const void* pNext;
    VkDependencyFlags dependencyFlags;
    uint32_t memoryBarrierCount;
    const VkMemoryBarrier2* pMemoryBarriers;
    uint32_t bufferMemoryBarrierCount;
    const VkBufferMemoryBarrier2* pBufferMemoryBarriers;
    uint32_t imageMemoryBarrierCount;
    const VkImageMemoryBarrier2* pImageMemoryBarriers;
} VkDependencyInfo;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkDependencyInfo VkDependencyInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `dependencyFlags` is a bitmask of `VkDependencyFlagBits` specifying how execution and memory dependencies are formed.
- `memoryBarrierCount` is the length of the `pMemoryBarriers` array.
- `pMemoryBarriers` is a pointer to an array of `VkMemoryBarrier2` structures defining memory dependencies between any memory accesses.
- `bufferMemoryBarrierCount` is the length of the `pBufferMemoryBarriers` array.
- `pBufferMemoryBarriers` is a pointer to an array of `VkBufferMemoryBarrier2` structures defining memory dependencies between buffer ranges.
- `imageMemoryBarrierCount` is the length of the `pImageMemoryBarriers` array.
- `pImageMemoryBarriers` is a pointer to an array of `VkImageMemoryBarrier2` structures defining memory dependencies between image subresources.
This structure defines a set of memory dependencies, as well as queue family ownership transfer operations and image layout transitions.

Each member of `pMemoryBarriers`, `pBufferMemoryBarriers`, and `pImageMemoryBarriers` defines a separate memory dependency.

### Valid Usage (Implicit)

- **VUID-VkDependencyInfo-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_DEPENDENCY_INFO`

- **VUID-VkDependencyInfo-pNext-pNext**
  
  `pNext` must be `NULL`

- **VUID-VkDependencyInfo-dependencyFlags-parameter**
  
  `dependencyFlags` must be a valid combination of `VkDependencyFlagBits` values

- **VUID-VkDependencyInfo-pMemoryBarriers-parameter**
  
  If `memoryBarrierCount` is not 0, `pMemoryBarriers` must be a valid pointer to an array of `memoryBarrierCount` valid `VkMemoryBarrier2` structures

- **VUID-VkDependencyInfo-pBufferMemoryBarriers-parameter**
  
  If `bufferMemoryBarrierCount` is not 0, `pBufferMemoryBarriers` must be a valid pointer to an array of `bufferMemoryBarrierCount` valid `VkBufferMemoryBarrier2` structures

- **VUID-VkDependencyInfo-pImageMemoryBarriers-parameter**
  
  If `imageMemoryBarrierCount` is not 0, `pImageMemoryBarriers` must be a valid pointer to an array of `imageMemoryBarrierCount` valid `VkImageMemoryBarrier2` structures

To set the state of an event to signaled from a device, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetEvent(
    VkCommandBuffer commandBuffer,  // Provided by VK_VERSION_1_0
    VkEvent event,                  // Provided by VK_VERSION_1_0
    VkPipelineStageFlags stageMask);  // Provided by VK_VERSION_1_0
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `event` is the event that will be signaled.
- `stageMask` specifies the source stage mask used to determine the first synchronization scope.

`vkCmdSetEvent` behaves identically to `vkCmdSetEvent2`, except that it does not define an access scope, and must only be used with `vkCmdWaitEvents`, not `vkCmdWaitEvents2`.

### Valid Usage

- **VUID-vkCmdSetEvent-stageMask-04090**
  
  If the `geometryShader` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
• VUID-vkCmdSetEvent-stageMask-04091
  If the tessellationShader feature is not enabled, stageMask must not contain
  VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT or
  VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT

• VUID-vkCmdSetEvent-stageMask-04092
  If the conditionalRendering feature is not enabled, stageMask must not contain
  VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT

• VUID-vkCmdSetEvent-stageMask-04093
  If the fragmentDensityMap feature is not enabled, stageMask must not contain
  VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT

• VUID-vkCmdSetEvent-stageMask-04094
  If the transformFeedback feature is not enabled, stageMask must not contain
  VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT

• VUID-vkCmdSetEvent-stageMask-04095
  If the meshShader feature is not enabled, stageMask must not contain
  VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT

• VUID-vkCmdSetEvent-stageMask-04096
  If the taskShader feature is not enabled, stageMask must not contain
  VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT

• VUID-vkCmdSetEvent-stageMask-07318
  If neither the shadingRateImage or attachmentFragmentShadingRate are enabled, stageMask must not contain
  VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

• VUID-vkCmdSetEvent-stageMask-03937
  If the synchronization2 feature is not enabled, stageMask must not be 0

• VUID-vkCmdSetEvent-stageMask-07949
  If neither the VK_NV_ray_tracing extension or rayTracingPipeline feature are enabled, stageMask must not contain
  VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR

• VUID-vkCmdSetEvent-stageMask-06457
  Any pipeline stage included in stageMask must be supported by the capabilities of the queue family specified by the queueFamilyIndex member of the VkCommandPoolCreateInfo structure that was used to create the VkCommandPool that commandBuffer was allocated from, as specified in the table of supported pipeline stages

• VUID-vkCmdSetEvent-stageMask-01149
  stageMask must not include VK_PIPELINE_STAGE_HOST_BIT

• VUID-vkCmdSetEvent-commandBuffer-01152
  The current device mask of commandBuffer must include exactly one physical device

---

**Valid Usage (Implicit)**

• VUID-vkCmdSetEvent-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdSetEvent-event-parameter
**event** must be a valid VkEvent handle

- VUID-vkCmdSetEvent-stageMask-parameter
  
  *stageMask* must be a valid combination of VkPipelineStageFlagBits values

- VUID-vkCmdSetEvent-commandBuffer-recording
  
  *commandBuffer* must be in the recording state

- VUID-vkCmdSetEvent-commandBuffer-cmdpool
  
  The VkCommandPool that *commandBuffer* was allocated from must support graphics, compute, decode, or encode operations

- VUID-vkCmdSetEvent-renderpass
  
  This command must only be called outside of a render pass instance

- VUID-vkCmdSetEvent-commonparent
  
  Both of *commandBuffer*, and *event* must have been created, allocated, or retrieved from the same VkDevice

---

**Host Synchronization**

- Host access to *commandBuffer* must be externally synchronized

- Host access to the VkCommandPool that *commandBuffer* was allocated from must be externally synchronized

---

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Both</td>
<td>Graphics Compute</td>
<td>Synchronization</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td>Decode Encode</td>
<td></td>
</tr>
</tbody>
</table>

To unsignal the event from a device, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdResetEvent2(
    VkCommandBuffer commandBuffer,
    VkEvent event,
    VkPipelineStageFlags2 stageMask);
```
// Provided by VK_KHR_synchronization2

void vkCmdResetEvent2KHR(
    VkCommandBuffer commandBuffer,
    VkEvent event,
    VkPipelineStageFlags2 stageMask);

- `commandBuffer` is the command buffer into which the command is recorded.
- `event` is the event that will be unsignaled.
- `stageMask` is a `VkPipelineStageFlags2` mask of pipeline stages used to determine the first synchronization scope.

When `vkCmdResetEvent2` is submitted to a queue, it defines an execution dependency on commands that were submitted before it, and defines an event unsignal operation which resets the event to the unsignaled state.

The first synchronization scope includes all commands that occur earlier in submission order. The synchronization scope is limited to operations by `stageMask` or stages that are logically earlier than `stageMask`.

The second synchronization scope includes only the event unsignal operation.

If `event` is already in the unsignaled state when `vkCmdResetEvent2` is executed on the device, then this command has no effect, no event unsignal operation occurs, and no execution dependency is generated.

### Valid Usage

- **VUID-vkCmdResetEvent2-stageMask-03929**
  If the `geometryShader` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`

- **VUID-vkCmdResetEvent2-stageMask-03930**
  If the `tessellationShader` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`

- **VUID-vkCmdResetEvent2-stageMask-03931**
  If the `conditionalRendering` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT`

- **VUID-vkCmdResetEvent2-stageMask-03932**
  If the `fragmentDensityMap` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

- **VUID-vkCmdResetEvent2-stageMask-03933**
  If the `transformFeedback` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`

- **VUID-vkCmdResetEvent2-stageMask-03934**
  If the `meshShader` feature is not enabled, `stageMask` **must** not contain
If the taskShader feature is not enabled, stageMask must not contain `VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT`

If neither the shadingRateImage or attachmentFragmentShadingRate are enabled, stageMask must not contain `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

If the subpassShading feature is not enabled, stageMask must not contain `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI`

If the invocationMask feature is not enabled, stageMask must not contain `VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI`

If neither the VK_NV_ray_tracing extension or rayTracingPipeline feature are enabled, stageMask must not contain `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`

The synchronization2 feature must be enabled

stageMask must not include `VK_PIPELINE_STAGE_2_HOST_BIT`

There must be an execution dependency between `vkCmdResetEvent2` and the execution of any `vkCmdWaitEvents` that includes event in its pEvents parameter

There must be an execution dependency between `vkCmdResetEvent2` and the execution of any `vkCmdWaitEvents2` that includes event in its pEvents parameter

commandBuffer’s current device mask must include exactly one physical device

Valid Usage (Implicit)

commandBuffer must be a valid VkCommandBuffer handle

event must be a valid VkEvent handle

stageMask must be a valid combination of VkPipelineStageFlagBits2 values

commandBuffer must be in the recording state

The VkCommandPool that commandBuffer was allocated from must support graphics, compute,
decode, or encode operations

- VUID-vkCmdResetEvent2-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdResetEvent2-commonparent
  Both of commandBuffer, and event must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

To set the state of an event to unsignaled from a device, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdResetEvent(
    VkCommandBuffer commandBuffer,
    VkEvent event,
    VkPipelineStageFlags stageMask);
```

- commandBuffer is the command buffer into which the command is recorded.
- event is the event that will be unsignaled.
- stageMask is a bitmask of VkPipelineStageFlagBits specifying the source stage mask used to determine when the event is unsignaled.

vkCmdResetEvent behaves identically to vkCmdResetEvent2.

Valid Usage

- VUID-vkCmdResetEvent-stageMask-04090
  If the geometryShader feature is not enabled, stageMask must not contain VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT
If the tessellationShader feature is not enabled, stageMask must not contain 
VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT  
or  
VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT

</tbody>
</table>

To wait for one or more events to enter the signaled state on a device, call:
// Provided by VK_VERSION_1_3
void vkCmdWaitEvents2(
  VkCommandBuffer commandBuffer,
  uint32_t eventCount,
  const VkEvent* pEvents,
  const VkDependencyInfo* pDependencyInfos);

or the equivalent command

// Provided by VK_KHR_synchronization2
void vkCmdWaitEvents2KHR(
  VkCommandBuffer commandBuffer,
  uint32_t eventCount,
  const VkEvent* pEvents,
  const VkDependencyInfo* pDependencyInfos);

• commandBuffer is the command buffer into which the command is recorded.
• eventCount is the length of the pEvents array.
• pEvents is a pointer to an array of eventCount events to wait on.
• pDependencyInfos is a pointer to an array of eventCount VkDependencyInfo structures, defining the second synchronization scope.

When vkCmdWaitEvents2 is submitted to a queue, it inserts memory dependencies according to the elements of pDependencyInfos and each corresponding element of pEvents. vkCmdWaitEvents2 must not be used to wait on event signal operations occurring on other queues, or signal operations executed by vkCmdSetEvent.

The first synchronization scope and access scope of each memory dependency defined by any element i of pDependencyInfos are applied to operations that occurred earlier in submission order than the last event signal operation on element i of pEvents.

Signal operations for an event at index i are only included if:

• The event was signaled by a vkCmdSetEvent2 command that occurred earlier in submission order with a dependencyInfo parameter exactly equal to the element of pDependencyInfos at index i; or
• The event was created without VK_EVENT_CREATE_DEVICE_ONLY_BIT, and the first synchronization scope defined by the element of pDependencyInfos at index i only includes host operations (VK_PIPELINE_STAGE_2_HOST_BIT).

The second synchronization scope and access scope of each memory dependency defined by any element i of pDependencyInfos are applied to operations that occurred later in submission order than vkCmdWaitEvents2.

NOTE       vkCmdWaitEvents2 is used with vkCmdSetEvent2 to define a memory dependency between two sets of action commands, roughly in the same way as pipeline
barriers, but split into two commands such that work between the two may execute unhindered.

NOTE

Applications should be careful to avoid race conditions when using events. There is no direct ordering guarantee between \texttt{vkCmdSetEvent2} and \texttt{vkCmdResetEvent2}, \texttt{vkCmdResetEvent}, or \texttt{vkCmdSetEvent}. Another execution dependency (e.g. a pipeline barrier or semaphore with \texttt{VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT}) is needed to prevent such a race condition.

Valid Usage

- **VUID-vkCmdWaitEvents2-synchronization2-03836**
  The \texttt{synchronization2} feature must be enabled

- **VUID-vkCmdWaitEvents2-pEvents-03837**
  Members of \texttt{pEvents} must not have been signaled by \texttt{vkCmdSetEvent}

- **VUID-vkCmdWaitEvents2-pEvents-03838**
  For any element \texttt{i} of \texttt{pEvents}, if that event is signaled by \texttt{vkCmdSetEvent2}, that command's \texttt{dependencyInfo} parameter must be exactly equal to the \texttt{i}th element of \texttt{pDependencyInfos}

- **VUID-vkCmdWaitEvents2-pEvents-03839**
  For any element \texttt{i} of \texttt{pEvents}, if that event is signaled by \texttt{vkSetEvent}, barriers in the \texttt{i}th element of \texttt{pDependencyInfos} must include only host operations in their first \texttt{synchronization} scope

- **VUID-vkCmdWaitEvents2-pEvents-03840**
  For any element \texttt{i} of \texttt{pEvents}, if barriers in the \texttt{i}th element of \texttt{pDependencyInfos} include only host operations, the \texttt{i}th element of \texttt{pEvents} must be signaled before \texttt{vkCmdWaitEvents2} is executed

- **VUID-vkCmdWaitEvents2-pEvents-03841**
  For any element \texttt{i} of \texttt{pEvents}, if barriers in the \texttt{i}th element of \texttt{pDependencyInfos} do not include host operations, the \texttt{i}th element of \texttt{pEvents} must be signaled by a corresponding \texttt{vkCmdSetEvent2} that occurred earlier in submission order

- **VUID-vkCmdWaitEvents2-srcStageMask-03842**
  The \texttt{srcStageMask} member of any element of the \texttt{pMemoryBarriers}, \texttt{pBufferMemoryBarriers}, or \texttt{pImageMemoryBarriers} members of \texttt{pDependencyInfos} must only include pipeline stages valid for the queue family that was used to create the command pool that \texttt{commandBuffer} was allocated from

- **VUID-vkCmdWaitEvents2-dstStageMask-03843**
  The \texttt{dstStageMask} member of any element of the \texttt{pMemoryBarriers}, \texttt{pBufferMemoryBarriers}, or \texttt{pImageMemoryBarriers} members of \texttt{pDependencyInfos} must only include pipeline stages valid for the queue family that was used to create the command pool that \texttt{commandBuffer} was allocated from

- **VUID-vkCmdWaitEvents2-dependencyFlags-03844**
  If \texttt{vkCmdWaitEvents2} is being called inside a render pass instance, the \texttt{srcStageMask} member of any element of the \texttt{pMemoryBarriers}, \texttt{pBufferMemoryBarriers}, or \texttt{pImageMemoryBarriers} members of \texttt{pDependencyInfos} must not include \texttt{VK_PIPELINE_STAGE_2_HOST_BIT}
To wait for one or more events to enter the signaled state on a device, call:
void vkCmdWaitEvents(
    VkCommandBuffer commandBuffer,
    uint32_t eventCount,
    const VkEvent* pEvents,
    VkPipelineStageFlags srcStageMask,
    VkPipelineStageFlags dstStageMask,
    uint32_t memoryBarrierCount,
    const VkMemoryBarrier* pMemoryBarriers,
    uint32_t bufferMemoryBarrierCount,
    const VkBufferMemoryBarrier* pBufferMemoryBarriers,
    uint32_t imageMemoryBarrierCount,
    const VkImageMemoryBarrier* pImageMemoryBarriers);

• commandBuffer is the command buffer into which the command is recorded.
• eventCount is the length of the pEvents array.
• pEvents is a pointer to an array of event object handles to wait on.
• srcStageMask is a bitmask of VkPipelineStageFlagBits specifying the source stage mask.
• dstStageMask is a bitmask of VkPipelineStageFlagBits specifying the destination stage mask.
• memoryBarrierCount is the length of the pMemoryBarriers array.
• pMemoryBarriers is a pointer to an array of VkMemoryBarrier structures.
• bufferMemoryBarrierCount is the length of the pBufferMemoryBarriers array.
• pBufferMemoryBarriers is a pointer to an array of VkBufferMemoryBarrier structures.
• imageMemoryBarrierCount is the length of the pImageMemoryBarriers array.
• pImageMemoryBarriers is a pointer to an array of VkImageMemoryBarrier structures.

vkCmdWaitEvents is largely similar to vkCmdWaitEvents2, but can only wait on signal operations defined by vkCmdSetEvent. As vkCmdSetEvent does not define any access scopes, vkCmdWaitEvents defines the first access scope for each event signal operation in addition to its own access scopes.

**NOTE**
Since vkCmdSetEvent does not have any dependency information beyond a stage mask, implementations do not have the same opportunity to perform availability and visibility operations or image layout transitions in advance as they do with vkCmdSetEvent2 and vkCmdWaitEvents2.

When vkCmdWaitEvents is submitted to a queue, it defines a memory dependency between prior event signal operations on the same queue or the host, and subsequent commands. vkCmdWaitEvents must not be used to wait on event signal operations occurring on other queues.

The first synchronization scope only includes event signal operations that operate on members of pEvents, and the operations that happened-before the event signal operations. Event signal operations performed by vkCmdSetEvent that occur earlier in submission order are included in the first synchronization scope, if the logically latest pipeline stage in their stageMask parameter is logically earlier than or equal to the logically latest pipeline stage in srcStageMask. Event signal
operations performed by vkSetEvent are only included in the first synchronization scope if VK_PIPELINE_STAGE_HOST_BIT is included in srcStageMask.

The second synchronization scope includes all commands that occur later in submission order. The second synchronization scope is limited to operations on the pipeline stages determined by the destination stage mask specified by dstStageMask.

The first access scope is limited to accesses in the pipeline stages determined by the source stage mask specified by srcStageMask. Within that, the first access scope only includes the first access scopes defined by elements of the pMemoryBarriers, pBufferMemoryBarriers and pImageMemoryBarriers arrays, which each define a set of memory barriers. If no memory barriers are specified, then the first access scope includes no accesses.

The second access scope is limited to accesses in the pipeline stages determined by the destination stage mask specified by dstStageMask. Within that, the second access scope only includes the second access scopes defined by elements of the pMemoryBarriers, pBufferMemoryBarriers and pImageMemoryBarriers arrays, which each define a set of memory barriers. If no memory barriers are specified, then the second access scope includes no accesses.

Valid Usage

- VUID-vkCmdWaitEvents-srcStageMask-04090
  If the geometryShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT

- VUID-vkCmdWaitEvents-srcStageMask-04091
  If the tessellationShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT or VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT

- VUID-vkCmdWaitEvents-srcStageMask-04092
  If the conditionalRendering feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT

- VUID-vkCmdWaitEvents-srcStageMask-04093
  If the fragmentDensityMap feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT

- VUID-vkCmdWaitEvents-srcStageMask-04094
  If the transformFeedback feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT

- VUID-vkCmdWaitEvents-srcStageMask-04095
  If the meshShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT

- VUID-vkCmdWaitEvents-srcStageMask-04096
  If the taskShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT

- VUID-vkCmdWaitEvents-srcStageMask-07318
  If neither the shadingRateImage or attachmentFragmentShadingRate are enabled,
srcStageMask must not contain
VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-vkCmdWaitEvents-srcStageMask-03937
  If the synchronization2 feature is not enabled, srcStageMask must not be 0

- VUID-vkCmdWaitEvents-srcStageMask-07949
  If neither the VK_NV_ray_tracing extension or rayTracingPipeline feature are enabled, srcStageMask must not contain VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR

- VUID-vkCmdWaitEvents-srcAccessMask-06257
  If the rayQuery feature is not enabled and a memory barrier srcAccessMask includes VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR, srcStageMask must not include any of the VK_PIPELINE_STAGE_*_SHADER_BIT stages except VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR

- VUID-vkCmdWaitEvents-dstStageMask-04090
  If the geometryShader feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT

- VUID-vkCmdWaitEvents-dstStageMask-04091
  If the tessellationShader feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT or VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT

- VUID-vkCmdWaitEvents-dstStageMask-04092
  If the conditionalRendering feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT

- VUID-vkCmdWaitEvents-dstStageMask-04093
  If the fragmentDensityMap feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT

- VUID-vkCmdWaitEvents-dstStageMask-04094
  If the transformFeedback feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT

- VUID-vkCmdWaitEvents-dstStageMask-04095
  If the meshShader feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT

- VUID-vkCmdWaitEvents-dstStageMask-04096
  If the taskShader feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT

- VUID-vkCmdWaitEvents-dstStageMask-07318
  If neither the shadingRateImage or attachmentFragmentShadingRate are enabled, dstStageMask must not contain VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-vkCmdWaitEvents-dstStageMask-03937
  If the synchronization2 feature is not enabled, dstStageMask must not be 0

- VUID-vkCmdWaitEvents-dstStageMask-07949
  If neither the VK_NV_ray_tracing extension or rayTracingPipeline feature are enabled,
**dstStageMask must not contain** VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR

- VUID-vkCmdWaitEvents-dstAccessMask-06257
  If the rayQuery feature is not enabled and a memory barrier dstAccessMask includes VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR, dstStageMask must not include any of the VK_PIPELINE_STAGE_*_SHADER_BIT stages except VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR

- VUID-vkCmdWaitEvents-srcAccessMask-02815
  The srcAccessMask member of each element of pBufferMemoryBarriers must only include access flags that are supported by one or more of the pipeline stages in srcStageMask, as specified in the table of supported access types

- VUID-vkCmdWaitEvents-dstAccessMask-02816
  The dstAccessMask member of each element of pBufferMemoryBarriers must only include access flags that are supported by one or more of the pipeline stages in dstStageMask, as specified in the table of supported access types

- VUID-vkCmdWaitEvents-pBufferMemoryBarriers-02817
  For any element of pBufferMemoryBarriers, if its dstQueueFamilyIndex and dstQueueFamilyIndex members are equal, or if its dstQueueFamilyIndex is the queue family index that was used to create the command pool that commandBuffer was allocated from, then its dstAccessMask member must only contain access flags that are supported by one or more of the pipeline stages in dstStageMask, as specified in the table of supported access types

- VUID-vkCmdWaitEvents-pBufferMemoryBarriers-02818
  For any element of pBufferMemoryBarriers, if its srcQueueFamilyIndex and dstQueueFamilyIndex members are equal, or if its dstQueueFamilyIndex is the queue family index that was used to create the command pool that commandBuffer was allocated from, then its srcAccessMask member must only contain access flags that are supported by one or more of the pipeline stages in srcStageMask, as specified in the table of supported access types

- VUID-vkCmdWaitEvents-pImageMemoryBarriers-02819
  For any element of pImageMemoryBarriers, if its srcQueueFamilyIndex and dstQueueFamilyIndex members are equal, or if its dstQueueFamilyIndex is the queue family index that was used to create the command pool that commandBuffer was allocated from, then its dstAccessMask member must only contain access flags that are supported by one or more of the pipeline stages in dstStageMask, as specified in the table of supported access types

- VUID-vkCmdWaitEvents-pImageMemoryBarriers-02820
  For any element of pImageMemoryBarriers, if its srcQueueFamilyIndex and dstQueueFamilyIndex members are equal, or if its dstQueueFamilyIndex is the queue family index that was used to create the command pool that commandBuffer was allocated from, then its dstAccessMask member must only contain access flags that are supported by one or more of the pipeline stages in dstStageMask, as specified in the table of supported access types

- VUID-vkCmdWaitEvents-srcStageMask-06459
  Any pipeline stage included in srcStageMask must be supported by the capabilities of the
queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the table of supported pipeline stages

- **VUID-vkCmdWaitEvents-dstStageMask-06460**
  Any pipeline stage included in `dstStageMask` must be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the table of supported pipeline stages

- **VUID-vkCmdWaitEvents-srcStageMask-01158**
  `srcStageMask` must be the bitwise OR of the `stageMask` parameter used in previous calls to `vkCmdSetEvent` with any of the elements of `pEvents` and `VK_PIPELINE_STAGE_HOST_BIT` if any of the elements of `pEvents` was set using `vkSetEvent`

- **VUID-vkCmdWaitEvents-srcQueueFamilyIndex-02803**
  If `vkCmdWaitEvents` is being called inside a render pass instance, `srcStageMask` must not include `VK_PIPELINE_STAGE_HOST_BIT`

- **VUID-vkCmdWaitEvents-srcQueueFamilyIndex-02803**
  The `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members of any element of `pBufferMemoryBarriers` or `pImageMemoryBarriers` must be equal

- **VUID-vkCmdWaitEvents-commandBuffer-01167**
  `commandBuffer`’s current device mask must include exactly one physical device

- **VUID-vkCmdWaitEvents-pEvents-03847**
  Elements of `pEvents` must not have been signaled by `vkCmdSetEvent2`

---

**Valid Usage (Implicit)**

- **VUID-vkCmdWaitEvents-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdWaitEvents-pEvents-parameter**
  `pEvents` must be a valid pointer to an array of `eventCount` valid `VkEvent` handles

- **VUID-vkCmdWaitEvents-srcStageMask-parameter**
  `srcStageMask` must be a valid combination of `VkPipelineStageFlagBits` values

- **VUID-vkCmdWaitEvents-dstStageMask-parameter**
  `dstStageMask` must be a valid combination of `VkPipelineStageFlagBits` values

- **VUID-vkCmdWaitEvents-pMemoryBarriers-parameter**
  If `memoryBarrierCount` is not 0, `pMemoryBarriers` must be a valid pointer to an array of `memoryBarrierCount` valid `VkMemoryBarrier` structures

- **VUID-vkCmdWaitEvents-pBufferMemoryBarriers-parameter**
  If `bufferMemoryBarrierCount` is not 0, `pBufferMemoryBarriers` must be a valid pointer to an array of `bufferMemoryBarrierCount` valid `VkBufferMemoryBarrier` structures

- **VUID-vkCmdWaitEvents-pImageMemoryBarriers-parameter**
  If `imageMemoryBarrierCount` is not 0, `pImageMemoryBarriers` must be a valid pointer to an array of `imageMemoryBarrierCount` valid `VkImageMemoryBarrier` structures
- **VUID-vkCmdWaitEvents-commandBuffer-recording**
  commandBuffer must be in the recording state

- **VUID-vkCmdWaitEvents-commandBuffer-cmdpool**
  The VkCommandPool that commandBuffer was allocated from must support graphics, compute, decode, or encode operations

- **VUID-vkCmdWaitEvents-eventCount-arraylength**
  eventCount must be greater than 0

- **VUID-vkCmdWaitEvents-commonparent**
  Both of commandBuffer, and the elements of pEvents must have been created, allocated, or retrieved from the same VkDevice

---

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

---

### 7.6. Pipeline Barriers

To record a pipeline barrier, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdPipelineBarrier2(
    VkCommandBuffer commandBuffer,  
    const VkDependencyInfo* pDependencyInfo);
```

or the equivalent command
// Provided by VK_KHR_synchronization2
void vkCmdPipelineBarrier2KHR(
    VkCommandBuffer commandBuffer,
    const VkDependencyInfo* pDependencyInfo);

• commandBuffer is the command buffer into which the command is recorded.
• pDependencyInfo is a pointer to a VkDependencyInfo structure defining the scopes of this operation.

When vkCmdPipelineBarrier2 is submitted to a queue, it defines memory dependencies between commands that were submitted to the same queue before it, and those submitted to the same queue after it.

The first synchronization scope and access scope of each memory dependency defined by pDependencyInfo are applied to operations that occurred earlier in submission order.

The second synchronization scope and access scope of each memory dependency defined by pDependencyInfo are applied to operations that occurred later in submission order.

If vkCmdPipelineBarrier2 is recorded within a render pass instance, the synchronization scopes are limited to a subset of operations within the same subpass or render pass instance.

Valid Usage

• VUID-vkCmdPipelineBarrier2-None-07889
  If vkCmdPipelineBarrier2 is called within a render pass instance using a VkRenderPass object, the render pass must have been created with at least one subpass dependency that expresses a dependency from the current subpass to itself, does not include VK_DEPENDENCY_BY_REGION_BIT if this command does not, does not include VK_DEPENDENCY_VIEW_LOCAL_BIT if this command does not, and has synchronization scopes and access scopes that are all supersets of the scopes defined in this command

• VUID-vkCmdPipelineBarrier2-bufferMemoryBarrierCount-01178
  If vkCmdPipelineBarrier2 is called within a render pass instance using a VkRenderPass object, it must not include any buffer memory barriers

• VUID-vkCmdPipelineBarrier2-image-04073
  If vkCmdPipelineBarrier2 is called within a render pass instance using a VkRenderPass object, the image member of any image memory barrier included in this command must be an attachment used in the current subpass both as an input attachment, and as either a color, color resolve, or depth/stencil attachment

• VUID-vkCmdPipelineBarrier2-image-09373
  If vkCmdPipelineBarrier2 is called within a render pass instance using a VkRenderPass object, and the image member of any image memory barrier is a color resolve attachment, the corresponding color attachment must be VK_ATTACHMENT_UNUSED

• VUID-vkCmdPipelineBarrier2-image-09374
  If vkCmdPipelineBarrier2 is called within a render pass instance using a VkRenderPass object, and the image member of any image memory barrier is a color resolve attachment, the corresponding color attachment must be VK_ATTACHMENT_UNUSED
object, and the image member of any image memory barrier is a color resolve attachment, it must have been created with a non-zero VkExternalFormatANDROID::externalFormat value.

- VUID-vkCmdPipelineBarrier2-oldLayout-01181
  If vkCmdPipelineBarrier2 is called within a render pass instance, the oldLayout and newLayout members of any image memory barrier included in this command must be equal.

- VUID-vkCmdPipelineBarrier2-srcQueueFamilyIndex-01182
  If vkCmdPipelineBarrier2 is called within a render pass instance, the srcQueueFamilyIndex and dstQueueFamilyIndex members of any memory barrier included in this command must be equal.

- VUID-vkCmdPipelineBarrier2-None-07890
  If vkCmdPipelineBarrier2 is called within a render pass instance, and the source stage masks of any memory barriers include framebuffer-space stages, destination stage masks of all memory barriers must only include framebuffer-space stages.

- VUID-vkCmdPipelineBarrier2-dependencyFlags-07891
  If vkCmdPipelineBarrier2 is called within a render pass instance, and the source stage masks of any memory barriers include framebuffer-space stages, then dependencyFlags must include VK_DEPENDENCY_BY_REGION_BIT.

- VUID-vkCmdPipelineBarrier2-None-07892
  If vkCmdPipelineBarrier2 is called within a render pass instance, and there is more than one view in the current subpass, dependency flags must include VK_DEPENDENCY_VIEW_LOCAL_BIT.

- VUID-vkCmdPipelineBarrier2-None-09553
  If none of the shaderTileImageColorReadAccess, shaderTileImageStencilReadAccess, or shaderTileImageDepthReadAccess features are enabled, and the dynamicRenderingLocalRead feature is not enabled, vkCmdPipelineBarrier2 must not be called within a render pass instance started with vkCmdBeginRendering.

- VUID-vkCmdPipelineBarrier2-None-09554
  If the dynamicRenderingLocalRead feature is not enabled, and vkCmdPipelineBarrier2 is called within a render pass instance started with vkCmdBeginRendering, there must be no buffer or image memory barriers specified by this command.

- VUID-vkCmdPipelineBarrier2-None-09586
  If the dynamicRenderingLocalRead feature is not enabled, and vkCmdPipelineBarrier2 is called within a render pass instance started with vkCmdBeginRendering, memory barriers specified by this command must only include VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT, VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT,
VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT, or VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT in their access masks

- **VUID-vkCmdPipelineBarrier2-image-09555**
  If `vkCmdPipelineBarrier2` is called within a render pass instance started with `vkCmdBeginRendering`, and the `image` member of any image memory barrier is used as an attachment in the current render pass instance, it **must** be in the VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR or VK_IMAGE_LAYOUT_GENERAL layout

- **VUID-vkCmdPipelineBarrier2-srcStageMask-09556**
  If `vkCmdPipelineBarrier2` is called within a render pass instance started with `vkCmdBeginRendering`, this command **must** only specify framebuffer-space stages in `srcStageMask` and `dstStageMask`

- **VUID-vkCmdPipelineBarrier2-synchronization2-03848**
  The **synchronization2** feature **must** be enabled

- **VUID-vkCmdPipelineBarrier2-srcStageMask-09673**
  The `srcStageMask` member of any element of the `pMemoryBarriers` member of `pDependencyInfo` **must** only include pipeline stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from

- **VUID-vkCmdPipelineBarrier2-dstStageMask-09674**
  The `dstStageMask` member of any element of the `pMemoryBarriers` member of `pDependencyInfo` **must** only include pipeline stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from

- **VUID-vkCmdPipelineBarrier2-srcStageMask-09675**
  If a buffer or image memory barrier does not specify an acquire operation, the respective `srcStageMask` member of the element of the ` pBufferMemoryBarriers` or ` pImageMemoryBarriers` members of `pDependencyInfo` **must** only include pipeline stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from

- **VUID-vkCmdPipelineBarrier2-dstStageMask-09676**
  If a buffer or image memory barrier does not specify a release operation, the respective `dstStageMask` member of the element of the ` pBufferMemoryBarriers` or ` pImageMemoryBarriers` members of `pDependencyInfo` **must** only include pipeline stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from

**Valid Usage (Implicit)**

- **VUID-vkCmdPipelineBarrier2-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdPipelineBarrier2-pDependencyInfo-parameter**
  `pDependencyInfo` **must** be a valid pointer to a valid `VkDependencyInfo` structure

- **VUID-vkCmdPipelineBarrier2-commandBuffer-recording**
  `commandBuffer` **must** be in the recording state

- **VUID-vkCmdPipelineBarrier2-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support transfer, graphics, compute, decode, or encode operations
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>

</tbody>
</table>

To record a pipeline barrier, call:

```c
// Provided by VK_VERSION_1_0
define void vkCmdPipelineBarrier(
    VkCommandBuffer commandBuffer,
    VkPipelineStageFlags srcStageMask,
    VkPipelineStageFlags dstStageMask,
    VkDependencyFlags dependencyFlags,
    uint32_t memoryBarrierCount,
    const VkMemoryBarrier* pMemoryBarriers,
    uint32_t bufferMemoryBarrierCount,
    const VkBufferMemoryBarrier* pBufferMemoryBarriers,
    uint32_t imageMemoryBarrierCount,
    const VkImageMemoryBarrier* pImageMemoryBarriers);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `srcStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the source stages.
- `dstStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the destination stages.
- `dependencyFlags` is a bitmask of `VkDependencyFlagBits` specifying how execution and memory dependencies are formed.
- `memoryBarrierCount` is the length of the `pMemoryBarriers` array.
- `pMemoryBarriers` is a pointer to an array of `VkMemoryBarrier` structures.
- `bufferMemoryBarrierCount` is the length of the `pBufferMemoryBarriers` array.
- `pBufferMemoryBarriers` is a pointer to an array of `VkBufferMemoryBarrier` structures.
- `imageMemoryBarrierCount` is the length of the `pImageMemoryBarriers` array.
• `pImageMemoryBarriers` is a pointer to an array of `VkImageMemoryBarrier` structures.

`vkCmdPipelineBarrier` operates almost identically to `vkCmdPipelineBarrier2`, except that the scopes and barriers are defined as direct parameters rather than being defined by a `VkDependencyInfo`.

When `vkCmdPipelineBarrier` is submitted to a queue, it defines a memory dependency between commands that were submitted to the same queue before it, and those submitted to the same queue after it.

If `vkCmdPipelineBarrier` was recorded outside a render pass instance, the first synchronization scope includes all commands that occur earlier in submission order. If `vkCmdPipelineBarrier` was recorded inside a render pass instance, the first synchronization scope includes only commands that occur earlier in submission order within the same subpass. In either case, the first synchronization scope is limited to operations on the pipeline stages determined by the source stage mask specified by `srcStageMask`.

If `vkCmdPipelineBarrier` was recorded outside a render pass instance, the second synchronization scope includes all commands that occur later in submission order. If `vkCmdPipelineBarrier` was recorded inside a render pass instance, the second synchronization scope includes only commands that occur later in submission order within the same subpass. In either case, the second synchronization scope is limited to operations on the pipeline stages determined by the destination stage mask specified by `dstStageMask`.

The first access scope is limited to accesses in the pipeline stages determined by the source stage mask specified by `srcStageMask`. Within that, the first access scope only includes the first access scopes defined by elements of the `pMemoryBarriers`, `pBufferMemoryBarriers` and `pImageMemoryBarriers` arrays, which each define a set of memory barriers. If no memory barriers are specified, then the first access scope includes no accesses.

The second access scope is limited to accesses in the pipeline stages determined by the destination stage mask specified by `dstStageMask`. Within that, the second access scope only includes the second access scopes defined by elements of the `pMemoryBarriers`, `pBufferMemoryBarriers` and `pImageMemoryBarriers` arrays, which each define a set of memory barriers. If no memory barriers are specified, then the second access scope includes no accesses.

If `dependencyFlags` includes `VK_DEPENDENCY_BY_REGION_BIT`, then any dependency between framebuffer-space pipeline stages is framebuffer-local - otherwise it is framebuffer-global.

### Valid Usage

- VUID-vkCmdPipelineBarrier-srcStageMask-04090
  If the geometryShader feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`

- VUID-vkCmdPipelineBarrier-srcStageMask-04091
  If the tessellationShader feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`

- VUID-vkCmdPipelineBarrier-srcStageMask-04092
If the `conditionalRendering` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`.

- VUID-vkCmdPipelineBarrier-srcStageMask-04093
  If the `fragmentDensityMap` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`.

- VUID-vkCmdPipelineBarrier-srcStageMask-04094
  If the `transformFeedback` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`.

- VUID-vkCmdPipelineBarrier-srcStageMask-04095
  If the `meshShader` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT`.

- VUID-vkCmdPipelineBarrier-srcStageMask-04096
  If the `taskShader` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT`.

- VUID-vkCmdPipelineBarrier-srcStageMask-07318
  If neither the `shadingRateImage` or `attachmentFragmentShadingRate` are enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- VUID-vkCmdPipelineBarrier-srcAccessMask-06257
  If the `synchronization2` feature is not enabled, `srcStageMask` must not be `0`.

- VUID-vkCmdPipelineBarrier-srcStageMask-07949
  If neither the `VK_NV_ray_tracing` extension or `rayTracingPipeline` feature are enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`.

- VUID-vkCmdPipelineBarrier-srcAccessMask-06257
  If the `rayQuery` feature is not enabled and a memory barrier `srcAccessMask` includes `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR`, `srcStageMask` must not include any of the stages except `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`.

- VUID-vkCmdPipelineBarrier-dstStageMask-04090
  If the `geometryShader` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`.

- VUID-vkCmdPipelineBarrier-dstStageMask-04091
  If the `tessellationShaders` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`.

- VUID-vkCmdPipelineBarrier-dstStageMask-04092
  If the `conditionalRendering` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`.

- VUID-vkCmdPipelineBarrier-dstStageMask-04093
  If the `fragmentDensityMap` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`.

- VUID-vkCmdPipelineBarrier-dstStageMask-04094
If the `transformFeedback` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`

- VUID-vkCmdPipelineBarrier-dstStageMask-04095
  If the `meshShader` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT`

- VUID-vkCmdPipelineBarrier-dstStageMask-04096
  If the `taskShader` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT`

- VUID-vkCmdPipelineBarrier-dstStageMask-07318
  If neither the `shadingRateImage` or `attachmentFragmentShadingRate` are enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-vkCmdPipelineBarrier-dstStageMask-03937
  If the `synchronization2` feature is not enabled, `dstStageMask` must not be `0`

- VUID-vkCmdPipelineBarrier-dstStageMask-07949
  If neither the `VK_NV_ray_tracing` extension or `rayTracingPipeline` feature are enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`

- VUID-vkCmdPipelineBarrier-dstAccessMask-06257
  If the `rayQuery` feature is not enabled and a memory barrier `dstAccessMask` includes `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR`, `dstStageMask` must not include any of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages except `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`

- VUID-vkCmdPipelineBarrier-srcAccessMask-02815
  The `srcAccessMask` member of each element of `pMemoryBarriers` must only include access flags that are supported by one or more of the pipeline stages in `srcStageMask`, as specified in the table of supported access types

- VUID-vkCmdPipelineBarrier-dstAccessMask-02816
  The `dstAccessMask` member of each element of `pMemoryBarriers` must only include access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the table of supported access types

- VUID-vkCmdPipelineBarrier-pBufferMemoryBarriers-02817
  For any element of `pBufferMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `srcQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `srcAccessMask` member must only contain access flags that are supported by one or more of the pipeline stages in `srcStageMask`, as specified in the table of supported access types

- VUID-vkCmdPipelineBarrier-pBufferMemoryBarriers-02818
  For any element of `pBufferMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `dstQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `dstAccessMask` member must only contain access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the table of supported access types
• VUID-vkCmdPipelineBarrier-pImageMemoryBarriers-02819
For any element of pImageMemoryBarriers, if its srcQueueFamilyIndex and dstQueueFamilyIndex members are equal, or if its srcQueueFamilyIndex is the queue family index that was used to create the command pool that commandBuffer was allocated from, then its srcAccessMask member must only contain access flags that are supported by one or more of the pipeline stages in srcStageMask, as specified in the table of supported access types.

• VUID-vkCmdPipelineBarrier-pImageMemoryBarriers-02820
For any element of pImageMemoryBarriers, if its srcQueueFamilyIndex and dstQueueFamilyIndex members are equal, or if its dstQueueFamilyIndex is the queue family index that was used to create the command pool that commandBuffer was allocated from, then its dstAccessMask member must only contain access flags that are supported by one or more of the pipeline stages in dstStageMask, as specified in the table of supported access types.

• VUID-vkCmdPipelineBarrier-None-07889
If vkCmdPipelineBarrier is called within a render pass instance using a VkRenderPass object, the render pass must have been created with at least one subpass dependency that expresses a dependency from the current subpass to itself, does not include VK_DEPENDENCY_BY_REGION_BIT if this command does not, does not include VK_DEPENDENCY_VIEW_LOCAL_BIT if this command does not, and has synchronization scopes and access scopes that are all supersets of the scopes defined in this command.

• VUID-vkCmdPipelineBarrier-bufferMemoryBarrierCount-01178
If vkCmdPipelineBarrier is called within a render pass instance using a VkRenderPass object, it must not include any buffer memory barriers.

• VUID-vkCmdPipelineBarrier-image-04073
If vkCmdPipelineBarrier is called within a render pass instance using a VkRenderPass object, the image member of any image memory barrier included in this command must be an attachment used in the current subpass both as an input attachment, and as either a color, color resolve, or depth/stencil attachment.

• VUID-vkCmdPipelineBarrier-image-09373
If vkCmdPipelineBarrier is called within a render pass instance using a VkRenderPass object, and the image member of any image memory barrier is a color resolve attachment, the corresponding color attachment must be VK_ATTACHMENT_UNUSED.

• VUID-vkCmdPipelineBarrier-image-09374
If vkCmdPipelineBarrier is called within a render pass instance using a VkRenderPass object, and the image member of any image memory barrier is a color resolve attachment, it must have been created with a non-zero VkExternalFormatANDROID::externalFormat value.

• VUID-vkCmdPipelineBarrier-oldLayout-01181
If vkCmdPipelineBarrier is called within a render pass instance, the oldLayout and newLayout members of any image memory barrier included in this command must be equal.

• VUID-vkCmdPipelineBarrier-srcQueueFamilyIndex-01182
If `vkCmdPipelineBarrier` is called within a render pass instance, the `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members of any memory barrier included in this command must be equal.

- **VUID-vkCmdPipelineBarrier-None-07890**
  If `vkCmdPipelineBarrier` is called within a render pass instance, and the source stage masks of any memory barriers include framebuffer-space stages, destination stage masks of all memory barriers must only include framebuffer-space stages.

- **VUID-vkCmdPipelineBarrier-dependencyFlags-07891**
  If `vkCmdPipelineBarrier` is called within a render pass instance, and the source stage masks of any memory barriers include framebuffer-space stages, then `dependencyFlags` must include `VK_DEPENDENCY_BY_REGION_BIT`.

- **VUID-vkCmdPipelineBarrier-None-07892**
  If `vkCmdPipelineBarrier` is called within a render pass instance, the source and destination stage masks of any memory barriers must only include graphics pipeline stages.

- **VUID-vkCmdPipelineBarrier-dependencyFlags-01186**
  If `vkCmdPipelineBarrier` is called outside of a render pass instance, the dependency flags must not include `VK_DEPENDENCY_VIEW_LOCAL_BIT`.

- **VUID-vkCmdPipelineBarrier-None-07893**
  If `vkCmdPipelineBarrier` is called inside a render pass instance, and there is more than one view in the current subpass, dependency flags must include `VK_DEPENDENCY_VIEW_LOCAL_BIT`.

- **VUID-vkCmdPipelineBarrier-None-09553**
  If none of the `shaderTileImageColorReadAccess`, `shaderTileImageStencilReadAccess`, or `shaderTileImageDepthReadAccess` features are enabled, and the `dynamicRenderingLocalRead` feature is not enabled, `vkCmdPipelineBarrier` must not be called within a render pass instance started with `vkCmdBeginRendering`.

- **VUID-vkCmdPipelineBarrier-None-09554**
  If the `dynamicRenderingLocalRead` feature is not enabled, and `vkCmdPipelineBarrier` is called within a render pass instance started with `vkCmdBeginRendering`, there must be no buffer or image memory barriers specified by this command.

- **VUID-vkCmdPipelineBarrier-None-09556**
  If the `dynamicRenderingLocalRead` feature is not enabled, and `vkCmdPipelineBarrier` is called within a render pass instance started with `vkCmdBeginRendering`, memory barriers specified by this command must only include `VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT`, `VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT`, `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT`, or `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT` in their access masks.

- **VUID-vkCmdPipelineBarrier-image-09555**
  If `vkCmdPipelineBarrier` is called within a render pass instance started with `vkCmdBeginRendering`, and the `image` member of any image memory barrier is used as an attachment in the current render pass instance, it must be in the `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR` or `VK_IMAGE_LAYOUT_GENERAL` layout.

- **VUID-vkCmdPipelineBarrier-srcStageMask-09556**
  If `vkCmdPipelineBarrier` is called within a render pass instance started with `vkCmdBeginRendering`, this command must only specify framebuffer-space stages in `srcStageMask` and `dstStageMask`.

---

414
Any pipeline stage included in `srcStageMask` must be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the table of supported pipeline stages.

Any pipeline stage included in `dstStageMask` must be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the table of supported pipeline stages.

If either `srcStageMask` or `dstStageMask` includes `VK_PIPELINE_STAGE_HOST_BIT`, for any element of `pImageMemoryBarriers`, `srcQueueFamilyIndex` and `dstQueueFamilyIndex` must be equal.

If either `srcStageMask` or `dstStageMask` includes `VK_PIPELINE_STAGE_HOST_BIT`, for any element of `pBufferMemoryBarriers`, `srcQueueFamilyIndex` and `dstQueueFamilyIndex` must be equal.

**Valid Usage (Implicit)**

- **VUID-vkCmdPipelineBarrier-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdPipelineBarrier-srcStageMask-parameter**
  `srcStageMask` must be a valid combination of `VkPipelineStageFlagBits` values.

- **VUID-vkCmdPipelineBarrier-dstStageMask-parameter**
  `dstStageMask` must be a valid combination of `VkPipelineStageFlagBits` values.

- **VUID-vkCmdPipelineBarrier-dependencyFlags-parameter**
  `dependencyFlags` must be a valid combination of `VkDependencyFlagBits` values.

- **VUID-vkCmdPipelineBarrier-pMemoryBarriers-parameter**
  If `memoryBarrierCount` is not 0, `pMemoryBarriers` must be a valid pointer to an array of `memoryBarrierCount` valid `VkMemoryBarrier` structures.

- **VUID-vkCmdPipelineBarrier-pBufferMemoryBarriers-parameter**
  If `bufferMemoryBarrierCount` is not 0, `pBufferMemoryBarriers` must be a valid pointer to an array of `bufferMemoryBarrierCount` valid `VkBufferMemoryBarrier` structures.

- **VUID-vkCmdPipelineBarrier-pImageMemoryBarriers-parameter**
  If `imageMemoryBarrierCount` is not 0, `pImageMemoryBarriers` must be a valid pointer to an array of `imageMemoryBarrierCount` valid `VkImageMemoryBarrier` structures.

- **VUID-vkCmdPipelineBarrier-commandBuffer-recording**
  `commandBuffer` must be in the recording state.

- **VUID-vkCmdPipelineBarrier-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics,
compute, decode, or encode operations

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Bits which can be set in vkCmdPipelineBarrier::dependencyFlags, specifying how execution and memory dependencies are formed, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkDependencyFlagBits {
    VK_DEPENDENCY_BY_REGION_BIT = 0x00000001,
    // Provided by VK_VERSION_1_1
    VK_DEPENDENCY_DEVICE_GROUP_BIT = 0x00000004,
    // Provided by VK_VERSION_1_1
    VK_DEPENDENCY_VIEW_LOCAL_BIT = 0x00000002,
    // Provided by VK_EXT_attachment_feedback_loop_layout
    VK_DEPENDENCY_FEEDBACK_LOOP_BIT_EXT = 0x00000008,
    // Provided by VK_KHR_multiview
    VK_DEPENDENCY_VIEW_LOCAL_BIT_KHR = VK_DEPENDENCY_VIEW_LOCAL_BIT,
    // Provided by VK_KHR_device_group
    VK_DEPENDENCY_DEVICE_GROUP_BIT_KHR = VK_DEPENDENCY_DEVICE_GROUP_BIT,
} VkDependencyFlagBits;
```

- **VK_DEPENDENCY_BY_REGION_BIT** specifies that dependencies will be framebuffer-local.
- **VK_DEPENDENCY_VIEW_LOCAL_BIT** specifies that dependencies will be view-local.
- **VK_DEPENDENCY_DEVICE_GROUP_BIT** specifies that dependencies are non-device-local.
- **VK_DEPENDENCY_FEEDBACK_LOOP_BIT_EXT** specifies that the render pass will write to and read from the same image using the VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT layout.
VkDependencyFlags is a bitmask type for setting a mask of zero or more VkDependencyFlagBits.

### 7.7. Memory Barriers

Memory barriers are used to explicitly control access to buffer and image subresource ranges. Memory barriers are used to transfer ownership between queue families, change image layouts, and define availability and visibility operations. They explicitly define the access types and buffer and image subresource ranges that are included in the access scopes of a memory dependency that is created by a synchronization command that includes them.

#### 7.7.1. Global Memory Barriers

Global memory barriers apply to memory accesses involving all memory objects that exist at the time of its execution.

The VkMemoryBarrier2 structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkMemoryBarrier2 {
    VkStructureType sType;
    const void* pNext;
    VkPipelineStageFlags2 srcStageMask;
    VkAccessFlags2 srcAccessMask;
    VkPipelineStageFlags2 dstStageMask;
    VkAccessFlags2 dstAccessMask;
} VkMemoryBarrier2;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkMemoryBarrier2 VkMemoryBarrier2KHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `srcStageMask` is a VkPipelineStageFlags2 mask of pipeline stages to be included in the first synchronization scope.
- `srcAccessMask` is a VkAccessFlags2 mask of access flags to be included in the first access scope.
- `dstStageMask` is a VkPipelineStageFlags2 mask of pipeline stages to be included in the second synchronization scope.
- `dstAccessMask` is a VkAccessFlags2 mask of access flags to be included in the second access scope.
This structure defines a memory dependency affecting all device memory.

The first synchronization scope and access scope described by this structure include only operations and memory accesses specified by \texttt{srcStageMask} and \texttt{srcAccessMask}.

The second synchronization scope and access scope described by this structure include only operations and memory accesses specified by \texttt{dstStageMask} and \texttt{dstAccessMask}.

### Valid Usage

- **VUID-VkMemoryBarrier2-srcStageMask-03929**
  If the \texttt{geometryShader} feature is not enabled, \texttt{srcStageMask} must not contain \texttt{VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT}

- **VUID-VkMemoryBarrier2-srcStageMask-03930**
  If the \texttt{tessellationShader} feature is not enabled, \texttt{srcStageMask} must not contain \texttt{VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT} or \texttt{VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT}

- **VUID-VkMemoryBarrier2-srcStageMask-03931**
  If the \texttt{conditionalRendering} feature is not enabled, \texttt{srcStageMask} must not contain \texttt{VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT}

- **VUID-VkMemoryBarrier2-srcStageMask-03932**
  If the \texttt{fragmentDensityMap} feature is not enabled, \texttt{srcStageMask} must not contain \texttt{VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT}

- **VUID-VkMemoryBarrier2-srcStageMask-03933**
  If the \texttt{transformFeedback} feature is not enabled, \texttt{srcStageMask} must not contain \texttt{VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT}

- **VUID-VkMemoryBarrier2-srcStageMask-03934**
  If the \texttt{meshShader} feature is not enabled, \texttt{srcStageMask} must not contain \texttt{VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT}

- **VUID-VkMemoryBarrier2-srcStageMask-03935**
  If the \texttt{taskShader} feature is not enabled, \texttt{srcStageMask} must not contain \texttt{VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT}

- **VUID-VkMemoryBarrier2-srcStageMask-07316**
  If neither the \texttt{shadingRateImage} or \texttt{attachmentFragmentShadingRate} are enabled, \texttt{srcStageMask} must not contain \texttt{VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR}

- **VUID-VkMemoryBarrier2-srcStageMask-04957**
  If the \texttt{subpassShading} feature is not enabled, \texttt{srcStageMask} must not contain \texttt{VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI}

- **VUID-VkMemoryBarrier2-srcStageMask-04995**
  If the \texttt{invocationMask} feature is not enabled, \texttt{srcStageMask} must not contain \texttt{VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI}

- **VUID-VkMemoryBarrier2-srcStageMask-07946**
  If neither the \texttt{VK_NV_ray_tracing} extension or \texttt{rayTracingPipeline} feature are enabled,
srcStageMask must not contain VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR

- VUID-VkMemoryBarrier2-srcAccessMask-03900
  If srcAccessMask includes VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR,
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-srcAccessMask-03901
  If srcAccessMask includes VK_ACCESS_2_INDEX_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-srcAccessMask-03902
  If srcAccessMask includes VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-srcAccessMask-03903
  If srcAccessMask includes VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the
  VK_PIPELINE_STAGE_*_SHADER_BIT stages

- VUID-VkMemoryBarrier2-srcAccessMask-03904
  If srcAccessMask includes VK_ACCESS_2_UNIFORM_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the
  VK_PIPELINE_STAGE_*_SHADER_BIT stages

- VUID-VkMemoryBarrier2-srcAccessMask-03905
  If srcAccessMask includes VK_ACCESS_2_SHADER_SAMPLED_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the
  VK_PIPELINE_STAGE_*_SHADER_BIT stages

- VUID-VkMemoryBarrier2-srcAccessMask-03906
  If srcAccessMask includes VK_ACCESS_2_SHADER_STORAGE_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the
  VK_PIPELINE_STAGE_*_SHADER_BIT stages

- VUID-VkMemoryBarrier2-srcAccessMask-03907
  If srcAccessMask includes VK_ACCESS_2_SHADER_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT,
  VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, or one of the
  VK_PIPELINE_STAGE_*_SHADER_BIT stages

- VUID-VkMemoryBarrier2-srcAccessMask-07454
  If srcAccessMask includes VK_ACCESS_2_SHADER_WRITE_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT,
  VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR,
  VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT, or one of the
  VK_PIPELINE_STAGE_*_SHADER_BIT stages
If `srcAccessMask` includes `VK_ACCESS_2_SHADER_WRITE_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkMemoryBarrier2-srcAccessMask-03910
  If `srcAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT` `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-srcAccessMask-03911
  If `srcAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT` `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-srcAccessMask-03912
  If `srcAccessMask` includes `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-srcAccessMask-03913
  If `srcAccessMask` includes `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-srcAccessMask-03914
  If `srcAccessMask` includes `VK_ACCESS_2_TRANSFER_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COPY_BIT`, `VK_PIPELINE_STAGE_2_BLIT_BIT`, `VK_PIPELINE_STAGE_2_RESOLVE_BIT`, `VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-srcAccessMask-03915
  If `srcAccessMask` includes `VK_ACCESS_2_TRANSFER_WRITE_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COPY_BIT`, `VK_PIPELINE_STAGE_2_BLIT_BIT`, `VK_PIPELINE_STAGE_2_RESOLVE_BIT`, `VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-srcAccessMask-03916
  If `srcAccessMask` includes `VK_ACCESS_2_HOST_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_HOST_BIT`

- VUID-VkMemoryBarrier2-srcAccessMask-03917
  If `srcAccessMask` includes `VK_ACCESS_2_HOST_WRITE_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_HOST_BIT`

- VUID-VkMemoryBarrier2-srcAccessMask-03918
  If `srcAccessMask` includes `VK_ACCESS_2_CONDITIONAL_RENDERING_READ_BIT_EXT`, `srcStageMask`
must include VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-srcAccessMask-03919
  If srcAccessMask includes VK_ACCESS_2_FRAGMENT_DENSITY_MAP_READ_BIT_EXT, srcStageMask must include VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_MAP_READ_BIT_EXT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-srcAccessMask-03920
  If srcAccessMask includes VK_ACCESS_2_TRANSFORM_FEEDBACK_WRITE_BIT_EXT, srcStageMask must include VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_WRITE_BIT_EXT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-srcAccessMask-04747
  If srcAccessMask includes VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT, srcStageMask must include VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT, VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-srcAccessMask-03922
  If srcAccessMask includes VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT, srcStageMask must include VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-srcAccessMask-03923
  If srcAccessMask includes VK_ACCESS_2_SHADING_RATE_IMAGE_READ_BIT_NV, srcStageMask must include VK_PIPELINE_STAGE_2_SHADING_RATE_IMAGE_BIT_NV, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-srcAccessMask-04994
  If srcAccessMask includes VK_ACCESS_2_INVOCATION_MASK_READ_BIT_HUAWEI, srcStageMask must include VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI

- VUID-VkMemoryBarrier2-srcAccessMask-03924
  If srcAccessMask includes VK_ACCESS_2_COMMAND_PREPROCESS_READ_BIT_NV, srcStageMask must include VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-srcAccessMask-03925
  If srcAccessMask includes VK_ACCESS_2_COMMAND_PREPROCESS_WRITE_BIT_NV, srcStageMask must include VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-srcAccessMask-03926
  If srcAccessMask includes VK_ACCESS_2_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT, srcStageMask must include VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-srcAccessMask-03927
  If srcAccessMask includes VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR, srcStageMask must include VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages
If `srcAccessMask` includes `VK_ACCESS_2_ACCELERATION_STRUCTURE_WRITE_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

If the `rayQuery` feature is not enabled and `srcAccessMask` includes `VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR`, `srcStageMask` must not include any of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages except `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`.

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT` or `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`.

If `srcAccessMask` includes `VK_ACCESS_2_VIDEO_DECODE_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR`.

If `srcAccessMask` includes `VK_ACCESS_2_VIDEO_DECODE_WRITE_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR`.

If `srcAccessMask` includes `VK_ACCESS_2_VIDEO_ENCODE_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR`.

If `srcAccessMask` includes `VK_ACCESS_2_VIDEO_ENCODE_WRITE_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR`.

If `srcAccessMask` includes `VK_ACCESS_2_OPTICAL_FLOW_READ_BIT_NV`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV`.

If `srcAccessMask` includes `VK_ACCESS_2_OPTICAL_FLOW_WRITE_BIT_NV`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV`.

If `srcAccessMask` includes `VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT`.

If `srcAccessMask` includes `VK_ACCESS_2_MICROMAP_READ_BIT_EXT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` or `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`.

If `srcAccessMask` includes `VK_ACCESS_2_DESCRIPTOR_BUFFER_READ_BIT_EXT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of `VK_PIPELINE_STAGE_*_SHADER_BIT` stages.
• VUID-VkMemoryBarrier2-dstStageMask-03929
   If the geometryShader feature is not enabled, dstStageMask must not contain
   VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT

• VUID-VkMemoryBarrier2-dstStageMask-03930
   If the tessellationShader feature is not enabled, dstStageMask must not contain
   VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT or
   VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT

• VUID-VkMemoryBarrier2-dstStageMask-03931
   If the conditionalRendering feature is not enabled, dstStageMask must not contain
   VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT

• VUID-VkMemoryBarrier2-dstStageMask-03932
   If the fragmentDensityMap feature is not enabled, dstStageMask must not contain
   VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT

• VUID-VkMemoryBarrier2-dstStageMask-03933
   If the transformFeedback feature is not enabled, dstStageMask must not contain
   VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT

• VUID-VkMemoryBarrier2-dstStageMask-03934
   If the meshShader feature is not enabled, dstStageMask must not contain
   VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT

• VUID-VkMemoryBarrier2-dstStageMask-03935
   If the taskShader feature is not enabled, dstStageMask must not contain
   VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT

• VUID-VkMemoryBarrier2-dstStageMask-07316
   If neither the shadingRateImage or attachmentFragmentShadingRate are enabled, dstStageMask must not contain

---

### Valid Usage (Implicit)

- **VUID-VkMemoryBarrier2-sType-sType**
  - \( \text{sType} \) must be \( \text{VK_STRUCTURE_TYPE_MEMORY_BARRIER_2} \)

- **VUID-VkMemoryBarrier2-srcStageMask-parameter**
  - \( \text{srcStageMask} \) must be a valid combination of \( \text{VkPipelineStageFlagBits2} \) values

- **VUID-VkMemoryBarrier2-srcAccessMask-parameter**
  - \( \text{srcAccessMask} \) must be a valid combination of \( \text{VkAccessFlagBits2} \) values
VUID-VkMemoryBarrier2-dstStageMask-parameter

dstStageMask must be a valid combination of VkPipelineStageFlagBits2 values

VUID-VkMemoryBarrier2-dstAccessMask-parameter
dstAccessMask must be a valid combination of VkAccessFlagBits2 values

The VkMemoryBarrier structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkMemoryBarrier {
    VkStructureType sType;
    const void* pNext;
    VkAccessFlags srcAccessMask;
    VkAccessFlags dstAccessMask;
} VkMemoryBarrier;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `srcAccessMask` is a bitmask of VkAccessFlagBits specifying a source access mask.
- `dstAccessMask` is a bitmask of VkAccessFlagBits specifying a destination access mask.

The first access scope is limited to access types in the source access mask specified by `srcAccessMask`.

The second access scope is limited to access types in the destination access mask specified by `dstAccessMask`.

Valid Usage (Implicit)

- VUID-VkMemoryBarrier-sType-sType
  sType must be VK_STRUCTURE_TYPE_MEMORY_BARRIER

- VUID-VkMemoryBarrier-pNext-pNext
  pNext must be NULL

- VUID-VkMemoryBarrier-srcAccessMask-parameter
  srcAccessMask must be a valid combination of VkAccessFlagBits values

- VUID-VkMemoryBarrier-dstAccessMask-parameter
  dstAccessMask must be a valid combination of VkAccessFlagBits values

7.7.2. Buffer Memory Barriers

Buffer memory barriers only apply to memory accesses involving a specific buffer range. That is, a memory dependency formed from a buffer memory barrier is scoped to access via the specified buffer range. Buffer memory barriers can also be used to define a queue family ownership transfer for the specified buffer range.

The VkBufferMemoryBarrier2 structure is defined as:
// Provided by VK_VERSION_1_3
typedef struct VkBufferMemoryBarrier2 {
    VkStructureType sType;
    const void* pNext;
    VkPipelineStageFlags2 srcStageMask;
    VkAccessFlags2 srcAccessMask;
    VkPipelineStageFlags2 dstStageMask;
    VkAccessFlags2 dstAccessMask;
    uint32_t srcQueueFamilyIndex;
    uint32_t dstQueueFamilyIndex;
    VkBuffer buffer;
    VkDeviceSize offset;
    VkDeviceSize size;
} VkBufferMemoryBarrier2;

or the equivalent

// Provided by VK_KHR_synchronization2
typedef VkBufferMemoryBarrier2KHR VkBufferMemoryBarrier2;

• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is `NULL` or a pointer to a structure extending this structure.

• **srcStageMask** is a `VkPipelineStageFlags2` mask of pipeline stages to be included in the first synchronization scope.

• **srcAccessMask** is a `VkAccessFlags2` mask of access flags to be included in the first access scope.

• **dstStageMask** is a `VkPipelineStageFlags2` mask of pipeline stages to be included in the second synchronization scope.

• **dstAccessMask** is a `VkAccessFlags2` mask of access flags to be included in the second access scope.

• **srcQueueFamilyIndex** is the source queue family for a queue family ownership transfer.

• **dstQueueFamilyIndex** is the destination queue family for a queue family ownership transfer.

• **buffer** is a handle to the buffer whose backing memory is affected by the barrier.

• **offset** is an offset in bytes into the backing memory for `buffer`; this is relative to the base offset as bound to the buffer (see `vkBindBufferMemory`).

• **size** is a size in bytes of the affected area of backing memory for `buffer`, or `VK_WHOLE_SIZE` to use the range from `offset` to the end of the buffer.

This structure defines a memory dependency limited to a range of a buffer, and can define a queue family ownership transfer operation for that range.

The first synchronization scope and access scope described by this structure include only operations and memory accesses specified by `srcStageMask` and `srcAccessMask`.

The second synchronization scope and access scope described by this structure include only
operations and memory accesses specified by dstStageMask and dstAccessMask.

Both access scopes are limited to only memory accesses to buffer in the range defined by offset and size.

If buffer was created with VK_SHARING_MODE_EXCLUSIVE, and srcQueueFamilyIndex is not equal to dstQueueFamilyIndex, this memory barrier defines a queue family ownership transfer operation. When executed on a queue in the family identified by srcQueueFamilyIndex, this barrier defines a queue family release operation for the specified buffer range, and the second synchronization scope does not apply to this operation. When executed on a queue in the family identified by dstQueueFamilyIndex, this barrier defines a queue family acquire operation for the specified buffer range, and the first synchronization scope does not apply to this operation.

A queue family ownership transfer operation is also defined if the values are not equal, and either is one of the special queue family values reserved for external memory ownership transfers, as described in Queue Family Ownership Transfer. A queue family release operation is defined when dstQueueFamilyIndex is one of those values, and a queue family acquire operation is defined when srcQueueFamilyIndex is one of those values.

### Valid Usage

- **VUID-VkBufferMemoryBarrier2-srcStageMask-03929**
  If the geometryShader feature is not enabled, srcStageMask must not contain
  \( \text{VK\_PIPELINE\_STAGE\_2\_GEOMETRY\_SHADER\_BIT} \)

- **VUID-VkBufferMemoryBarrier2-srcStageMask-03930**
  If the tessellationShader feature is not enabled, srcStageMask must not contain
  \( \text{VK\_PIPELINE\_STAGE\_2\_TESSELLATION\_CONTROL\_SHADER\_BIT} \)
  or \( \text{VK\_PIPELINE\_STAGE\_2\_TESSELLATION\_EVALUATION\_SHADER\_BIT} \)

- **VUID-VkBufferMemoryBarrier2-srcStageMask-03931**
  If the conditionalRendering feature is not enabled, srcStageMask must not contain
  \( \text{VK\_PIPELINE\_STAGE\_2\_CONDITIONAL\_RENDERING\_BIT\_EXT} \)

- **VUID-VkBufferMemoryBarrier2-srcStageMask-03932**
  If the fragmentDensityMap feature is not enabled, srcStageMask must not contain
  \( \text{VK\_PIPELINE\_STAGE\_2\_FRAGMENT\_DENSITY\_PROCESS\_BIT\_EXT} \)

- **VUID-VkBufferMemoryBarrier2-srcStageMask-03933**
  If the transformFeedback feature is not enabled, srcStageMask must not contain
  \( \text{VK\_PIPELINE\_STAGE\_2\_TRANSFORM\_FEEDBACK\_BIT\_EXT} \)

- **VUID-VkBufferMemoryBarrier2-srcStageMask-03934**
  If the meshShader feature is not enabled, srcStageMask must not contain
  \( \text{VK\_PIPELINE\_STAGE\_2\_MESH\_SHADER\_BIT\_EXT} \)

- **VUID-VkBufferMemoryBarrier2-srcStageMask-03935**
  If the taskShader feature is not enabled, srcStageMask must not contain
  \( \text{VK\_PIPELINE\_STAGE\_2\_TASK\_SHADER\_BIT\_EXT} \)

- **VUID-VkBufferMemoryBarrier2-srcStageMask-07316**
  If neither the shadingRateImage or attachmentFragmentShadingRate are enabled,
If the subpassShading feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI`.

If the invocationMask feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI`.

If neither the `VK_NV_ray_tracing` extension nor the `rayTracingPipeline` feature are enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`.

If `srcAccessMask` includes `VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

If `srcAccessMask` includes `VK_ACCESS_2_INDEX_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

If `srcAccessMask` includes `VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT`, `VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

If `srcAccessMask` includes `VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT`, `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

If `srcAccessMask` includes `VK_ACCESS_2_UNIFORM_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages.

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_SAMPLED_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages.

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages.

If neither the `VK_NV_ray_tracing` extension nor the `rayTracingPipeline` feature are enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`.

If `srcAccessMask` includes `VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

If `srcAccessMask` includes `VK_ACCESS_2_INDEX_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

If `srcAccessMask` includes `VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT`, `VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

If `srcAccessMask` includes `VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT`, `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

If `srcAccessMask` includes `VK_ACCESS_2_UNIFORM_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages.

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_SAMPLED_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages.

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages.
If `srcAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- **VUID-VkBufferMemoryBarrier2-srcAccessMask-07454**
  If `srcAccessMask` includes `VK_ACCESS_2_SHADER_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

  offset must be less than the size of buffer

- **VUID-VkBufferMemoryBarrier2-size-01188**
  If size is not equal to VK_WHOLE_SIZE, size must be greater than 0

- **VUID-VkBufferMemoryBarrier2-size-01189**
  If size is not equal to VK_WHOLE_SIZE, size must be less than or equal to the size of buffer minus offset

- **VUID-VkBufferMemoryBarrier2-buffer-01931**
  If buffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- **VUID-VkBufferMemoryBarrier2-buffer-09095**
  If buffer was created with a sharing mode of VK_SHARING_MODE_EXCLUSIVE, and srcQueueFamilyIndex and dstQueueFamilyIndex are not equal, srcQueueFamilyIndex must be VK_QUEUE_FAMILY_EXTERNAL, VK_QUEUE_FAMILY_FOREIGN_EXT, or a valid queue family

- **VUID-VkBufferMemoryBarrier2-buffer-09096**
  If buffer was created with a sharing mode of VK_SHARING_MODE_EXCLUSIVE, and srcQueueFamilyIndex and dstQueueFamilyIndex are not equal, dstQueueFamilyIndex must be VK_QUEUE_FAMILY_EXTERNAL, VK_QUEUE_FAMILY_FOREIGN_EXT, or a valid queue family

- **VUID-VkBufferMemoryBarrier2-srcQueueFamilyIndex-04087**
  If srcQueueFamilyIndex is not equal to dstQueueFamilyIndex, at least one of srcQueueFamilyIndex or dstQueueFamilyIndex must not be VK_QUEUE_FAMILY_EXTERNAL or VK_QUEUE_FAMILY_FOREIGN_EXT

- **VUID-VkBufferMemoryBarrier2-None-09097**
  If the VK_KHR_external_memory extension is not enabled, and the value of VkApplicationInfo::apiVersion used to create the VkInstance is not greater than or equal to Version 1.1, srcQueueFamilyIndex must not be VK_QUEUE_FAMILY_EXTERNAL

- **VUID-VkBufferMemoryBarrier2-None-09098**
  If the VK_KHR_external_memory extension is not enabled, and the value of VkApplicationInfo::apiVersion used to create the VkInstance is not greater than or equal to Version 1.1, dstQueueFamilyIndex must not be VK_QUEUE_FAMILY_EXTERNAL

- **VUID-VkBufferMemoryBarrier2-srcQueueFamilyIndex-09099**
  If the VK_EXT_queue_family_foreign extension is not enabled srcQueueFamilyIndex must not be VK_QUEUE_FAMILY_FOREIGN_EXT

- **VUID-VkBufferMemoryBarrier2-dstQueueFamilyIndex-09100**
  If the VK_EXT_queue_family_foreign extension is not enabled dstQueueFamilyIndex must not be VK_QUEUE_FAMILY_FOREIGN_EXT

- **VUID-VkBufferMemoryBarrier2-srcStageMask-03851**
  If either srcStageMask or dstStageMask includes VK_PIPELINE_STAGE_2_HOST_BIT, srcQueueFamilyIndex and dstQueueFamilyIndex must be equal
Valid Usage (Implicit)

- **VUID-VkBufferMemoryBarrier2-sType-sType**
  sType must be VK_STRUCTURE_TYPE_BUFFER_MEMORY_BARRIER_2

- **VUID-VkBufferMemoryBarrier2-pNext-pNext**
  pNext must be NULL or a pointer to a valid instance of VkExternalMemoryAcquireUnmodifiedEXT

- **VUID-VkBufferMemoryBarrier2-sType-unique**
  The sType value of each struct in the pNext chain must be unique

- **VUID-VkBufferMemoryBarrier2-srcStageMask-parameter**
  srcStageMask must be a valid combination of VkPipelineStageFlagBits2 values

- **VUID-VkBufferMemoryBarrier2-srcAccessMask-parameter**
  srcAccessMask must be a valid combination of VkAccessFlagBits2 values

- **VUID-VkBufferMemoryBarrier2-dstStageMask-parameter**
  dstStageMask must be a valid combination of VkPipelineStageFlagBits2 values

- **VUID-VkBufferMemoryBarrier2-dstAccessMask-parameter**
  dstAccessMask must be a valid combination of VkAccessFlagBits2 values

- **VUID-VkBufferMemoryBarrier2-buffer-parameter**
  buffer must be a valid VkBuffer handle

The VkBufferMemoryBarrier structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBufferMemoryBarrier {
    VkStructureType sType;
    const void* pNext;
    VkAccessFlags srcAccessMask;
    VkAccessFlags dstAccessMask;
    uint32_t srcQueueFamilyIndex;
    uint32_t dstQueueFamilyIndex;
    VkBuffer buffer;
    VkDeviceSize offset;
    VkDeviceSize size;
} VkBufferMemoryBarrier;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **srcAccessMask** is a bitmask of VkAccessFlagBits specifying a source access mask.
- **dstAccessMask** is a bitmask of VkAccessFlagBits specifying a destination access mask.
- **srcQueueFamilyIndex** is the source queue family for a queue family ownership transfer.
- **dstQueueFamilyIndex** is the destination queue family for a queue family ownership transfer.
• **buffer** is a handle to the buffer whose backing memory is affected by the barrier.
• **offset** is an offset in bytes into the backing memory for **buffer**; this is relative to the base offset as bound to the buffer (see *vkBindBufferMemory*).
• **size** is a size in bytes of the affected area of backing memory for **buffer**, or **VK_WHOLE_SIZE** to use the range from **offset** to the end of the buffer.

The first **access scope** is limited to access to memory through the specified buffer range, via access types in the **source access mask** specified by **srcAccessMask**. If **srcAccessMask** includes **VK_ACCESS_HOST_WRITE_BIT**, a **memory domain operation** is performed where available memory in the host domain is also made available to the device domain.

The second **access scope** is limited to access to memory through the specified buffer range, via access types in the **destination access mask** specified by **dstAccessMask**. If **dstAccessMask** includes **VK_ACCESS_HOST_WRITE_BIT** or **VK_ACCESS_HOST_READ_BIT**, a **memory domain operation** is performed where available memory in the device domain is also made available to the host domain.

**NOTE**

When **VK_MEMORY_PROPERTY_HOST_COHERENT_BIT** is used, available memory in host domain is automatically made visible to host domain, and any host write is automatically made available to host domain.

If **srcQueueFamilyIndex** is not equal to **dstQueueFamilyIndex**, and **srcQueueFamilyIndex** is equal to the current queue family, then the memory barrier defines a **queue family release operation** for the specified buffer range, and the second synchronization scope of the calling command does not apply to this operation.

If **dstQueueFamilyIndex** is not equal to **srcQueueFamilyIndex**, and **dstQueueFamilyIndex** is equal to the current queue family, then the memory barrier defines a **queue family acquire operation** for the specified buffer range, and the first synchronization scope of the calling command does not apply to this operation.

---

### Valid Usage

- **VUID-VkBufferMemoryBarrier-offset-01187**
  - **offset** must be less than the size of **buffer**

- **VUID-VkBufferMemoryBarrier-size-01188**
  - If **size** is not equal to **VK_WHOLE_SIZE**, **size** must be greater than 0

- **VUID-VkBufferMemoryBarrier-size-01189**
  - If **size** is not equal to **VK_WHOLE_SIZE**, **size** must be less than or equal to than the size of **buffer** minus **offset**

- **VUID-VkBufferMemoryBarrier-buffer-01931**
  - If **buffer** is non-sparse then it must be bound completely and contiguously to a single **VkDeviceMemory** object

- **VUID-VkBufferMemoryBarrier-buffer-09095**
  - If **buffer** was created with a sharing mode of **VK_SHARING_MODE_EXCLUSIVE**, and **srcQueueFamilyIndex** and **dstQueueFamilyIndex** are not equal, **srcQueueFamilyIndex** must be **VK_QUEUE_FAMILY_EXTERNAL**, **VK_QUEUE_FAMILY_FOREIGN_EXT**, or a valid queue family
If `buffer` was created with a sharing mode of `VK_SHARING_MODE_EXCLUSIVE`, and `srcQueueFamilyIndex` and `dstQueueFamilyIndex` are not equal, `dstQueueFamilyIndex` must be `VK_QUEUE_FAMILY_EXTERNAL`, `VK_QUEUE_FAMILY_FOREIGN_EXT`, or a valid queue family.

If `srcQueueFamilyIndex` is not equal to `dstQueueFamilyIndex`, at least one of `srcQueueFamilyIndex` or `dstQueueFamilyIndex` must not be `VK_QUEUE_FAMILY_EXTERNAL` or `VK_QUEUE_FAMILY_FOREIGN_EXT`.

If the `VK_KHR_external_memory` extension is not enabled, and the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` is not greater than or equal to Version 1.1, `srcQueueFamilyIndex` must not be `VK_QUEUE_FAMILY_EXTERNAL`.

If the `VK_KHR_external_memory` extension is not enabled, and the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` is not greater than or equal to Version 1.1, `dstQueueFamilyIndex` must not be `VK_QUEUE_FAMILY_EXTERNAL`.

If the `VK_EXT_queue_family_foreign` extension is not enabled, `srcQueueFamilyIndex` must not be `VK_QUEUE_FAMILY_FOREIGN_EXT`.

If the `VK_EXT_queue_family_foreign` extension is not enabled, `dstQueueFamilyIndex` must not be `VK_QUEUE_FAMILY_FOREIGN_EXT`.

If the `synchronization2` feature is not enabled, and `buffer` was created with a sharing mode of `VK_SHARING_MODE_CONCURRENT`, at least one of `srcQueueFamilyIndex` and `dstQueueFamilyIndex` must be `VK_QUEUE_FAMILY_IGNORED`.

If the `synchronization2` feature is not enabled, and `buffer` was created with a sharing mode of `VK_SHARING_MODE_CONCURRENT`, `srcQueueFamilyIndex` must be `VK_QUEUE_FAMILY_IGNORED` or `VK_QUEUE_FAMILY_EXTERNAL`.

If the `synchronization2` feature is not enabled, and `buffer` was created with a sharing mode of `VK_SHARING_MODE_CONCURRENT`, `dstQueueFamilyIndex` must be `VK_QUEUE_FAMILY_IGNORED` or `VK_QUEUE_FAMILY_EXTERNAL`.

Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_BUFFER_MEMORY_BARRIER`.
- `pNext` must be `NULL` or a pointer to a valid instance of `VkExternalMemoryAcquireUnmodifiedEXT`.
- `sType` unique.
The `sType` value of each struct in the `pNext` chain must be unique

- VUID-VkBufferMemoryBarrier-buffer-parameter
  `buffer` must be a valid `VkBuffer` handle

`VK_WHOLE_SIZE` is a special value indicating that the entire remaining length of a buffer following a given `offset` should be used. It can be specified for `VkBufferMemoryBarrier::size` and other structures.

```c
#define VK_WHOLE_SIZE (~0ULL)
```

### 7.7.3. Image Memory Barriers

Image memory barriers only apply to memory accesses involving a specific image subresource range. That is, a memory dependency formed from an image memory barrier is scoped to access via the specified image subresource range. Image memory barriers can also be used to define image layout transitions or a queue family ownership transfer for the specified image subresource range.

The `VkImageMemoryBarrier2` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkImageMemoryBarrier2 {
    VkStructureType sType;
    const void* pNext;
    VkPipelineStageFlags2 srcStageMask;
    VkAccessFlags2 srcAccessMask;
    VkPipelineStageFlags2 dstStageMask;
    VkAccessFlags2 dstAccessMask;
    VkImageLayout oldLayout;
    VkImageLayout newLayout;
    uint32_t srcQueueFamilyIndex;
    uint32_t dstQueueFamilyIndex;
    VkImage image;
    VkImageSubresourceRange subresourceRange;
} VkImageMemoryBarrier2;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkImageMemoryBarrier2 VkImageMemoryBarrier2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcStageMask` is a `VkPipelineStageFlags2` mask of pipeline stages to be included in the first
synchronization scope.

- **srcAccessMask** is a VkAccessFlags2 mask of access flags to be included in the first access scope.
- **dstStageMask** is a VkPipelineStageFlags2 mask of pipeline stages to be included in the second synchronization scope.
- **dstAccessMask** is a VkAccessFlags2 mask of access flags to be included in the second access scope.
- **oldLayout** is the old layout in an image layout transition.
- **newLayout** is the new layout in an image layout transition.
- **srcQueueFamilyIndex** is the source queue family for a queue family ownership transfer.
- **dstQueueFamilyIndex** is the destination queue family for a queue family ownership transfer.
- **image** is a handle to the image affected by this barrier.
- **subresourceRange** describes the image subresource range within image that is affected by this barrier.

This structure defines a memory dependency limited to an image subresource range, and can define a queue family ownership transfer operation and image layout transition for that subresource range.

The first synchronization scope and access scope described by this structure include only operations and memory accesses specified by **srcStageMask** and **srcAccessMask**.

The second synchronization scope and access scope described by this structure include only operations and memory accesses specified by **dstStageMask** and **dstAccessMask**.

Both access scopes are limited to only memory accesses to image in the subresource range defined by **subresourceRange**.

If image was created with VK_SHARING_MODE_EXCLUSIVE, and **srcQueueFamilyIndex** is not equal to **dstQueueFamilyIndex**, this memory barrier defines a queue family ownership transfer operation. When executed on a queue in the family identified by **srcQueueFamilyIndex**, this barrier defines a queue family release operation for the specified image subresource range, and the second synchronization scope does not apply to this operation. When executed on a queue in the family identified by **dstQueueFamilyIndex**, this barrier defines a queue family acquire operation for the specified image subresource range, and the first synchronization, the first synchronization scope does not apply to this operation.

A queue family ownership transfer operation is also defined if the values are not equal, and either is one of the special queue family values reserved for external memory ownership transfers, as described in Queue Family Ownership Transfer. A queue family release operation is defined when **dstQueueFamilyIndex** is one of those values, and a queue family acquire operation is defined when **srcQueueFamilyIndex** is one of those values.

If **oldLayout** is not equal to **newLayout**, then the memory barrier defines an image layout transition for the specified image subresource range. If this memory barrier defines a queue family ownership transfer operation, the layout transition is only executed once between the queues.

**NOTE** When the old and new layout are equal, the layout values are ignored - data is
preserved no matter what values are specified, or what layout the image is currently in.

If `image` has a multi-planar format and the image is disjoint, then including `VK_IMAGE_ASPECT_COLOR_BIT` in the `aspectMask` member of `subresourceRange` is equivalent to including `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, and (for three-plane formats only) `VK_IMAGE_ASPECT_PLANE_2_BIT`.

## Valid Usage

- **VUID-VkImageMemoryBarrier2-srcStageMask-03929**
  If the `geometryShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`

- **VUID-VkImageMemoryBarrier2-srcStageMask-03930**
  If the `tessellationShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`

- **VUID-VkImageMemoryBarrier2-srcStageMask-03931**
  If the `conditionalRendering` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT`

- **VUID-VkImageMemoryBarrier2-srcStageMask-03932**
  If the `fragmentDensityMap` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

- **VUID-VkImageMemoryBarrier2-srcStageMask-03933**
  If the `transformFeedback` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`

- **VUID-VkImageMemoryBarrier2-srcStageMask-03934**
  If the `meshShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT`

- **VUID-VkImageMemoryBarrier2-srcStageMask-03935**
  If the `taskShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT`

- **VUID-VkImageMemoryBarrier2-srcStageMask-07316**
  If neither the `shadingRateImage` or `attachmentFragmentShadingRate` are enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- **VUID-VkImageMemoryBarrier2-srcStageMask-04957**
  If the `subpassShading` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI`

- **VUID-VkImageMemoryBarrier2-srcStageMask-04995**
  If the `invocationMask` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI`
If neither the `VK_NV_ray_tracing` extension or `rayTracingPipeline` feature are enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2RAY_TRACING_SHADER_BIT_KHR`.

**VUID-VkImageMemoryBarrier2-srcAccessMask-03900**
If `srcAccessMask` includes `VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

**VUID-VkImageMemoryBarrier2-srcAccessMask-03901**
If `srcAccessMask` includes `VK_ACCESS_2_INDEX_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT, VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

**VUID-VkImageMemoryBarrier2-srcAccessMask-03902**
If `srcAccessMask` includes `VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT, VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

**VUID-VkImageMemoryBarrier2-srcAccessMask-03903**
If `srcAccessMask` includes `VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT, VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

**VUID-VkImageMemoryBarrier2-srcAccessMask-03904**
If `srcAccessMask` includes `VK_ACCESS_2_UNIFORM_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages`.

**VUID-VkImageMemoryBarrier2-srcAccessMask-03905**
If `srcAccessMask` includes `VK_ACCESS_2_SHADER_SAMPLED_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages`.

**VUID-VkImageMemoryBarrier2-srcAccessMask-03906**
If `srcAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages`.

**VUID-VkImageMemoryBarrier2-srcAccessMask-03907**
If `srcAccessMask` includes `VK_ACCESS_2_SHADER_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages`.
If `srcAccessMask` includes `VK_ACCESS_2_SHADER_WRITE_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_2_SHADER_BIT` stages.

If `srcAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

If `srcAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

If `srcAccessMask` includes `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

If `srcAccessMask` includes `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

If `srcAccessMask` includes `VK_ACCESS_2_TRANSFER_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COPY_BIT`, `VK_PIPELINE_STAGE_2_BLIT_BIT`, `VK_PIPELINE_STAGE_2_RESOLVE_BIT`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

If `srcAccessMask` includes `VK_ACCESS_2_TRANSFER_WRITE_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COPY_BIT`, `VK_PIPELINE_STAGE_2_BLIT_BIT`, `VK_PIPELINE_STAGE_2_RESOLVE_BIT`, `VK_PIPELINE_STAGE_2_CLEAR_BIT`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, or `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

If `srcAccessMask` includes `VK_ACCESS_2_HOST_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_HOST_BIT`.

If `srcAccessMask` includes `VK_ACCESS_2_HOST_WRITE_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_HOST_BIT`.
If `srcAccessMask` includes `VK_ACCESS_2_CONDITIONAL_RENDERING_READ_BIT_EXT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

- **VUID-VkImageMemoryBarrier2-srcAccessMask-03919**
  If `srcAccessMask` includes `VK_ACCESS_2_FRAGMENT_DENSITY_MAP_READ_BIT_EXT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

- **VUID-VkImageMemoryBarrier2-srcAccessMask-03920**
  If `srcAccessMask` includes `VK_ACCESS_2_TRANSFORM_FEEDBACK_WRITE_BIT_EXT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

- **VUID-VkImageMemoryBarrier2-srcAccessMask-04747**
  If `srcAccessMask` includes `VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT`, `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

- **VUID-VkImageMemoryBarrier2-srcAccessMask-03922**
  If `srcAccessMask` includes `VK_ACCESS_2_COMMAND_PREPROCESS_READ_BIT_NV`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV` or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

- **VUID-VkImageMemoryBarrier2-srcAccessMask-03923**
  If `srcAccessMask` includes `VK_ACCESS_2_COMMAND_PREPROCESS_WRITE_BIT_NV`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV` or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

- **VUID-VkImageMemoryBarrier2-srcAccessMask-03924**
  If `srcAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT` `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

- **VUID-VkImageMemoryBarrier2-srcAccessMask-03925**
  If `srcAccessMask` includes `VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT`.
stages

- **VUID-VkImageMemoryBarrier2-srcAccessMask-03928**
  If `srcAccessMask` includes `VK_ACCESS_2_ACCELERATION_STRUCTURE_WRITE_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- **VUID-VkImageMemoryBarrier2-srcAccessMask-06256**
  If the `rayQuery` feature is not enabled and `srcAccessMask` includes `VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR`, `srcStageMask` must not include any of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages except `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`

- **VUID-VkImageMemoryBarrier2-srcAccessMask-07272**
  If `srcAccessMask` includes `VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT` or `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`

- **VUID-VkImageMemoryBarrier2-srcAccessMask-04858**
  If `srcAccessMask` includes `VK_ACCESS_2_VIDEO_DECODE_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR`

- **VUID-VkImageMemoryBarrier2-srcAccessMask-04859**
  If `srcAccessMask` includes `VK_ACCESS_2_VIDEO_DECODE_WRITE_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR`

- **VUID-VkImageMemoryBarrier2-srcAccessMask-04860**
  If `srcAccessMask` includes `VK_ACCESS_2_VIDEO_ENCODE_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR`

- **VUID-VkImageMemoryBarrier2-srcAccessMask-04861**
  If `srcAccessMask` includes `VK_ACCESS_2_VIDEO_ENCODE_WRITE_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR`

- **VUID-VkImageMemoryBarrier2-srcAccessMask-07455**
  If `srcAccessMask` includes `VK_ACCESS_2_OPTICAL_FLOW_READ_BIT_NV`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV`

- **VUID-VkImageMemoryBarrier2-srcAccessMask-07456**
  If `srcAccessMask` includes `VK_ACCESS_2_OPTICAL_FLOW_WRITE_BIT_NV`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV`

- **VUID-VkImageMemoryBarrier2-srcAccessMask-07457**

  If `srcQueueFamilyIndex` is not equal to `dstQueueFamilyIndex`, at least one of `srcQueueFamilyIndex` or `dstQueueFamilyIndex` must not be VK_QUEUE_FAMILY_EXTERNAL or VK_QUEUE_FAMILY_FOREIGN_EXT

- **VUID-VkImageMemoryBarrier2-DstQueueFamilyIndex-09119**
  If the VK_KHR_external_memory extension is not enabled, and the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` is not greater than or equal to Version 1.1, `srcQueueFamilyIndex` must not be VK_QUEUE_FAMILY_EXTERNAL

- **VUID-VkImageMemoryBarrier2-DstQueueFamilyIndex-09120**
  If the VK_KHR_external_memory extension is not enabled, and the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` is not greater than or equal to Version 1.1, `dstQueueFamilyIndex` must not be VK_QUEUE_FAMILY_EXTERNAL

- **VUID-VkImageMemoryBarrier2-SourceQueueFamilyIndex-07120**
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is VK_IMAGE_LAYOUT_VIDEO_DECODE_SRC_KHR then `image` must have been created with VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR

- **VUID-VkImageMemoryBarrier2-SourceQueueFamilyIndex-07121**
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR then `image` must have been created with VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR

- **VUID-VkImageMemoryBarrier2-SourceQueueFamilyIndex-07122**
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR then `image` must have been created with VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR

- **VUID-VkImageMemoryBarrier2-SourceQueueFamilyIndex-07123**
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is VK_IMAGE_LAYOUT_VIDEO_ENCODE_SRC_KHR then `image` must have been created with VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR

458
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_ENCODE_DST_KHR` then image must have been created with `VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR`

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR` then image must have been created with `VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR`

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` then image must have been created with either the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage bits, and the `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_SAMPLED_BIT` usage bits, and the `VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` usage bit

If the `attachmentFeedbackLoopLayout` feature is not enabled, `newLayout` must not be `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT`

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR` then image must have been created with either `VK_IMAGE_USAGE_STORAGE_BIT`, or with both `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` and either `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

If the `dynamicRenderingLocalRead` feature is not enabled, `oldLayout` must not be `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR`

If the `dynamicRenderingLocalRead` feature is not enabled, `newLayout` must not be `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR`

If `subresourceRange.baseMipLevel` must be less than the `mipLevels` specified in `VkImageCreateInfo` when image was created

If `subresourceRange.levelCount` is not `VK_REMAINING_MIP_LEVELS`, `subresourceRange.baseMipLevel + subresourceRange.levelCount` must be less than or equal to the `mipLevels` specified in `VkImageCreateInfo` when image was created

If `subresourceRange.baseArrayLayer` must be less than the `arrayLayers` specified in `VkImageCreateInfo` when image was created
• VUID-VkImageMemoryBarrier2-subresourceRange-01725
  If subresourceRange.layerCount is not \texttt{VK_REMAINING_ARRAY_LAYERS}, subresourceRange.baseArrayLayer + subresourceRange.layerCount must be less than or equal to the arrayLayers specified in \texttt{VkImageCreateInfo} when image was created.

• VUID-VkImageMemoryBarrier2-image-01932
  If image is non-sparse then it must be bound completely and contiguously to a single \texttt{VkDeviceMemory} object.

• VUID-VkImageMemoryBarrier2-image-09241
  If image has a color format that is single-plane, then the aspectMask member of subresourceRange must be \texttt{VK_IMAGE_ASPECT_COLOR_BIT}.

• VUID-VkImageMemoryBarrier2-image-09242
  If image has a color format and is not disjoint, then the aspectMask member of subresourceRange must be \texttt{VK_IMAGE_ASPECT_COLOR_BIT}.

• VUID-VkImageMemoryBarrier2-image-01672
  If image has a multi-planar format and the image is disjoint, then the aspectMask member of subresourceRange must include at least one multi-planar aspect mask bit or \texttt{VK_IMAGE_ASPECT_COLOR_BIT}.

• VUID-VkImageMemoryBarrier2-image-03320
  If image has a depth/stencil format with both depth and stencil and the separateDepthStencilLayouts feature is not enabled, then the aspectMask member of subresourceRange must include both \texttt{VK_IMAGE_ASPECT_DEPTH_BIT} and \texttt{VK_IMAGE_ASPECT_STENCIL_BIT}.

• VUID-VkImageMemoryBarrier2-image-03319
  If image has a depth/stencil format with both depth and stencil and the separateDepthStencilLayouts feature is enabled, then the aspectMask member of subresourceRange must include either or both \texttt{VK_IMAGE_ASPECT_DEPTH_BIT} and \texttt{VK_IMAGE_ASPECT_STENCIL_BIT}.

• VUID-VkImageMemoryBarrier2-aspectMask-08702
  If the aspectMask member of subresourceRange includes \texttt{VK_IMAGE_ASPECT_DEPTH_BIT}, oldLayout and newLayout must not be one of \texttt{VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL} or \texttt{VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL}.

• VUID-VkImageMemoryBarrier2-aspectMask-08703
  If the aspectMask member of subresourceRange includes \texttt{VK_IMAGE_ASPECT_STENCIL_BIT}, oldLayout and newLayout must not be one of \texttt{VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL} or \texttt{VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL}.

• VUID-VkImageMemoryBarrier2-subresourceRange-09601
  subresourceRange.aspectMask must be valid for the format the image was created with.

• VUID-VkImageMemoryBarrier2-srcStageMask-03854
  If either srcStageMask or dstStageMask includes \texttt{VK_PIPELINE_STAGE_2_HOST_BIT}, srcQueueFamilyIndex and dstQueueFamilyIndex must be equal.

• VUID-VkImageMemoryBarrier2-srcStageMask-03855
  If srcStageMask includes \texttt{VK_PIPELINE_STAGE_2_HOST_BIT}, and srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout.
define an image layout transition, oldLayout must be one of VK_IMAGE_LAYOUT_PREINITIALIZED, VK_IMAGE_LAYOUT_UNDEFINED, or VK_IMAGE_LAYOUT_GENERAL

Valid Usage (Implicit)

- VUID-VkImageMemoryBarrier2-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMAGE_MEMORY_BARRIER_2

- VUID-VkImageMemoryBarrier2-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkExternalMemoryAcquireUnmodifiedEXT or VkSampleLocationsInfoEXT

- VUID-VkImageMemoryBarrier2-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkImageMemoryBarrier2-srcStageMask-parameter
  srcStageMask must be a valid combination of VkPipelineStageFlagBits2 values

- VUID-VkImageMemoryBarrier2-srcAccessMask-parameter
  srcAccessMask must be a valid combination of VkAccessFlagBits2 values

- VUID-VkImageMemoryBarrier2-dstStageMask-parameter
  dstStageMask must be a valid combination of VkPipelineStageFlagBits2 values

- VUID-VkImageMemoryBarrier2-dstAccessMask-parameter
  dstAccessMask must be a valid combination of VkAccessFlagBits2 values

- VUID-VkImageMemoryBarrier2-oldLayout-parameter
  oldLayout must be a valid VkImageLayout value

- VUID-VkImageMemoryBarrier2-newLayout-parameter
  newLayout must be a valid VkImageLayout value

- VUID-VkImageMemoryBarrier2-image-parameter
  image must be a valid VkImage handle

- VUID-VkImageMemoryBarrier2-subresourceRange-parameter
  subresourceRange must be a valid VkImageSubresourceRange structure

The VkImageMemoryBarrier structure is defined as:
typedef struct VkImageMemoryBarrier {
  VkStructureType sType;
  const void* pNext;
  VkAccessFlags srcAccessMask;
  VkAccessFlags dstAccessMask;
  VkImageLayout oldLayout;
  VkImageLayout newLayout;
  uint32_t srcQueueFamilyIndex;
  uint32_t dstQueueFamilyIndex;
  VkImage image;
  VkImageSubresourceRange subresourceRange;
} VkImageMemoryBarrier;

• **sType** is a VkStructureType value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **srcAccessMask** is a bitmask of VkAccessFlagBits specifying a source access mask.
• **dstAccessMask** is a bitmask of VkAccessFlagBits specifying a destination access mask.
• **oldLayout** is the old layout in an image layout transition.
• **newLayout** is the new layout in an image layout transition.
• **srcQueueFamilyIndex** is the source queue family for a queue family ownership transfer.
• **dstQueueFamilyIndex** is the destination queue family for a queue family ownership transfer.
• **image** is a handle to the image affected by this barrier.
• **subresourceRange** describes the image subresource range within image that is affected by this barrier.

The first access scope is limited to access to memory through the specified image subresource range, via access types in the source access mask specified by srcAccessMask. If srcAccessMask includes VK_ACCESS_HOST_WRITE_BIT, memory writes performed by that access type are also made visible, as that access type is not performed through a resource.

The second access scope is limited to access to memory through the specified image subresource range, via access types in the destination access mask specified by dstAccessMask. If dstAccessMask includes VK_ACCESS_HOST_WRITE_BIT or VK_ACCESS_HOST_READ_BIT, available memory writes are also made visible to accesses of those types, as those access types are not performed through a resource.

If srcQueueFamilyIndex is not equal to dstQueueFamilyIndex, and srcQueueFamilyIndex is equal to the current queue family, then the memory barrier defines a queue family release operation for the specified image subresource range, and the second synchronization scope of the calling command does not apply to this operation.

If dstQueueFamilyIndex is not equal to srcQueueFamilyIndex, and dstQueueFamilyIndex is equal to the current queue family, then the memory barrier defines a queue family acquire operation for the specified image subresource range, and the first synchronization scope of the calling command does not apply to this operation.
If the synchronization feature is not enabled or oldLayout is not equal to newLayout, oldLayout and newLayout define an image layout transition for the specified image subresource range.

**NOTE**
If the synchronization feature is enabled, when the old and new layout are equal, the layout values are ignored - data is preserved no matter what values are specified, or what layout the image is currently in.

If image has a multi-planar format and the image is disjoint, then including VK_IMAGE_ASPECT_COLOR_BIT in the aspectMask member of subresourceRange is equivalent to including VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, and (for three-plane formats only) VK_IMAGE_ASPECT_PLANE_2_BIT.

### Valid Usage

- **VUID-VkImageMemoryBarrier-oldLayout-01208**
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL then image must have been created with VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT

- **VUID-VkImageMemoryBarrier-oldLayout-01209**
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL then image must have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- **VUID-VkImageMemoryBarrier-oldLayout-01210**
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL then image must have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT or VK_IMAGE_USAGE_SAMPLED_BIT or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

- **VUID-VkImageMemoryBarrier-oldLayout-01211**
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL then image must have been created with VK_IMAGE_USAGE_TRANSFER_SRC_BIT

- **VUID-VkImageMemoryBarrier-oldLayout-01212**
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL then image must have been created with VK_IMAGE_USAGE_TRANSFER_DST_BIT

- **VUID-VkImageMemoryBarrier-oldLayout-01197**

463
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, `oldLayout` must be `VK_IMAGE_LAYOUT_UNDEFINED` or the current layout of the image subresources affected by the barrier.

- **VUID-VkImageMemoryBarrier-newLayout-01198**
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, `newLayout` must not be `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`.

- **VUID-VkImageMemoryBarrier-oldLayout-01658**
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

- **VUID-VkImageMemoryBarrier-oldLayout-01659**
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

- **VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-04065**
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` then image must have been created with at least one of `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_SAMPLED_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`.

- **VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-04066**
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_ATTACHMENT_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` set.

- **VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-04067**
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL` then image must have been created with at least one of `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_SAMPLED_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`.

- **VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-04068**
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` set.

- **VUID-VkImageMemoryBarrier-synchronization2-07793**
  If the `synchronization2` feature is not enabled, `oldLayout` must not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`.

- **VUID-VkImageMemoryBarrier-synchronization2-07794**
If the synchronization feature is not enabled, newLayout must not be VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-03938
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR, image must have been created with VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT or VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-03939
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR, image must have been created with at least one of VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, VK_IMAGE_USAGE_SAMPLED_BIT, or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

- VUID-VkImageMemoryBarrier-oldLayout-02088
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR then image must have been created with VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR set

- VUID-VkImageMemoryBarrier-image-09117
  If image was created with a sharing mode of VK_SHARING_MODE_EXCLUSIVE, and srcQueueFamilyIndex and dstQueueFamilyIndex are not equal, srcQueueFamilyIndex must be VK_QUEUE_FAMILY_EXTERNAL, VK_QUEUE_FAMILY_FOREIGN_EXT, or a valid queue family

- VUID-VkImageMemoryBarrier-image-09118
  If image was created with a sharing mode of VK_SHARING_MODE_EXCLUSIVE, and srcQueueFamilyIndex and dstQueueFamilyIndex are not equal, dstQueueFamilyIndex must be VK_QUEUE_FAMILY_EXTERNAL, VK_QUEUE_FAMILY_FOREIGN_EXT, or a valid queue family

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-04070
  If srcQueueFamilyIndex is not equal to dstQueueFamilyIndex, at least one of srcQueueFamilyIndex or dstQueueFamilyIndex must not be VK_QUEUE_FAMILY_EXTERNAL or VK_QUEUE_FAMILY_FOREIGN_EXT

- VUID-VkImageMemoryBarrier-None-09119
  If the VK_KHR_external_memory extension is not enabled, and the value of VkApplicationInfo::apiVersion used to create the VkInstance is not greater than or equal to Version 1.1, srcQueueFamilyIndex must not be VK_QUEUE_FAMILY_EXTERNAL

- VUID-VkImageMemoryBarrier-None-09120
  If the VK_KHR_external_memory extension is not enabled, and the value of VkApplicationInfo::apiVersion used to create the VkInstance is not greater than or equal to Version 1.1, dstQueueFamilyIndex must not be VK_QUEUE_FAMILY_EXTERNAL

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-09121
  If the VK_EXT_queue_family_foreign extension is not enabled srcQueueFamilyIndex must not be VK_QUEUE_FAMILY_FOREIGN_EXT

- VUID-VkImageMemoryBarrier-dstQueueFamilyIndex-09122
  If the VK_EXT_queue_family_foreign extension is not enabled dstQueueFamilyIndex must not be VK_QUEUE_FAMILY_FOREIGN_EXT
If \( \text{srcQueueFamilyIndex} \) and \( \text{dstQueueFamilyIndex} \) define a queue family ownership transfer or \( \text{oldLayout} \) and \( \text{newLayout} \) define an image layout transition, and \( \text{oldLayout} \) or \( \text{newLayout} \) is \( \text{VK_IMAGE_LAYOUT_VIDEO_DECODE_SRC_KHR} \) then image must have been created with \( \text{VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR} \)

If \( \text{srcQueueFamilyIndex} \) and \( \text{dstQueueFamilyIndex} \) define a queue family ownership transfer or \( \text{oldLayout} \) and \( \text{newLayout} \) define an image layout transition, and \( \text{oldLayout} \) or \( \text{newLayout} \) is \( \text{VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR} \) then image must have been created with \( \text{VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR} \)

If \( \text{srcQueueFamilyIndex} \) and \( \text{dstQueueFamilyIndex} \) define a queue family ownership transfer or \( \text{oldLayout} \) and \( \text{newLayout} \) define an image layout transition, and \( \text{oldLayout} \) or \( \text{newLayout} \) is \( \text{VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR} \) then image must have been created with \( \text{VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR} \)

If \( \text{srcQueueFamilyIndex} \) and \( \text{dstQueueFamilyIndex} \) define a queue family ownership transfer or \( \text{oldLayout} \) and \( \text{newLayout} \) define an image layout transition, and \( \text{oldLayout} \) or \( \text{newLayout} \) is \( \text{VK_IMAGE_LAYOUT_VIDEO_ENCODE_SRC_KHR} \) then image must have been created with \( \text{VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR} \)

If \( \text{srcQueueFamilyIndex} \) and \( \text{dstQueueFamilyIndex} \) define a queue family ownership transfer or \( \text{oldLayout} \) and \( \text{newLayout} \) define an image layout transition, and \( \text{oldLayout} \) or \( \text{newLayout} \) is \( \text{VK_IMAGE_LAYOUT_VIDEO_ENCODE_DST_KHR} \) then image must have been created with \( \text{VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR} \)

If \( \text{srcQueueFamilyIndex} \) and \( \text{dstQueueFamilyIndex} \) define a queue family ownership transfer or \( \text{oldLayout} \) and \( \text{newLayout} \) define an image layout transition, and \( \text{oldLayout} \) or \( \text{newLayout} \) is \( \text{VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR} \) then image must have been created with \( \text{VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR} \)

If \( \text{srcQueueFamilyIndex} \) and \( \text{dstQueueFamilyIndex} \) define a queue family ownership transfer or \( \text{oldLayout} \) and \( \text{newLayout} \) define an image layout transition, and \( \text{oldLayout} \) or \( \text{newLayout} \) is \( \text{VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT} \) then image must have been created with either the \( \text{VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT} \) or \( \text{VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT} \) usage bits, and the \( \text{VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT} \) or \( \text{VK_IMAGE_USAGE_SAMPLED_BIT} \) usage bits, and the \( \text{VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT} \) usage bit

If the \( \text{attachmentFeedbackLoopLayout} \) feature is not enabled, \( \text{newLayout} \) must not be \( \text{VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT} \)

If \( \text{srcQueueFamilyIndex} \) and \( \text{dstQueueFamilyIndex} \) define a queue family ownership transfer or \( \text{oldLayout} \) and \( \text{newLayout} \) define an image layout transition, and \( \text{oldLayout} \) or \( \text{newLayout} \) is \( \text{VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR} \) then image must have been created with either
VK_IMAGE_USAGE_STORAGE_BIT, or with both VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT and either of VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT or VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- **VUID-VkImageMemoryBarrier-dynamicRenderingLocalRead-09551**
  If the dynamicRenderingLocalRead feature is not enabled, oldLayout must not be VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR

- **VUID-VkImageMemoryBarrier-dynamicRenderingLocalRead-09552**
  If the dynamicRenderingLocalRead feature is not enabled, newLayout must not be VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR

- **VUID-VkImageMemoryBarrier-subresourceRange-01486**
  subresourceRange.baseMipLevel must be less than the mipLevels specified in VkImageCreateInfo when image was created

- **VUID-VkImageMemoryBarrier-subresourceRange-01724**
  If subresourceRange.levelCount is not VK_REMAINING_MIP_LEVELS, subresourceRange.baseMipLevel + subresourceRange.levelCount must be less than or equal to the mipLevels specified in VkImageCreateInfo when image was created

- **VUID-VkImageMemoryBarrier-subresourceRange-01488**
  subresourceRange.baseArrayLayer must be less than the arrayLayers specified in VkImageCreateInfo when image was created

  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkExternalMemoryAcquireUnmodifiedEXT or VkSampleLocationsInfoEXT

- VUID-VkImageMemoryBarrier-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkImageMemoryBarrier-oldLayout-parameter
  oldLayout must be a valid VkImageLayout value

- VUID-VkImageMemoryBarrier-newLayout-parameter
  newLayout must be a valid VkImageLayout value

- VUID-VkImageMemoryBarrier-image-parameter
  image must be a valid VkImage handle

- VUID-VkImageMemoryBarrier-subresourceRange-parameter
To facilitate usage of images whose memory is initialized on the host, Vulkan allows image layout transitions to be performed by the host as well, albeit supporting limited layouts.

To perform an image layout transition on the host, call:

```c
// Provided by VK_EXT_host_image_copy
VkResult vkTransitionImageLayoutEXT(
    VkDevice device,           
    uint32_t transitionCount, 
    const VkHostImageLayoutTransitionInfoEXT* pTransitions);
```

- `device` is the device which owns `pTransitions[i].image`.
- `transitionCount` is the number of image layout transitions to perform.
- `pTransitions` is a pointer to an array of `VkHostImageLayoutTransitionInfoEXT` structures specifying the image and `subresource ranges` within them to transition.

### Valid Usage (Implicit)

- VUID-vkTransitionImageLayoutEXT-device-parameter  
  `device` must be a valid `VkDevice` handle

- VUID-vkTransitionImageLayoutEXT-pTransitions-parameter  
  `pTransitions` must be a valid pointer to an array of `transitionCount` valid `VkHostImageLayoutTransitionInfoEXT` structures

- VUID-vkTransitionImageLayoutEXT-transitionCount-arraylength  
  `transitionCount` must be greater than 0

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_MEMORY_MAP_FAILED`

The `VkHostImageLayoutTransitionInfoEXT` structure is defined as:
// Provided by VK_EXT_host_image_copy

typedef struct VkHostImageLayoutTransitionInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkImage image;
    VkImageLayout oldLayout;
    VkImageLayout newLayout;
    VkImageSubresourceRange subresourceRange;
} VkHostImageLayoutTransitionInfoEXT;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **image** is a handle to the image affected by this layout transition.
- **oldLayout** is the old layout in an image layout transition.
- **newLayout** is the new layout in an image layout transition.
- **subresourceRange** describes the image subresource range within image that is affected by this layout transition.

`vkTransitionImageLayoutEXT` does not check whether the device memory associated with an image is currently in use before performing the layout transition. The application must guarantee that any previously submitted command that reads from or writes to this subresource has completed before the host performs the layout transition. The memory of image is accessed by the host as if coherent.

**NOTE**

Image layout transitions performed on the host do not require queue family ownership transfers as the physical layout of the image will not vary between queue families for the layouts supported by this function.

If the device has written to the image memory, it is not automatically made available to the host. Before this command can be called, a memory barrier for this image must have been issued on the device with the second synchronization scope including `VK_PIPELINE_STAGE_HOST_BIT` and `VK_ACCESS_HOST_READ_BIT`.

Because queue submissions automatically make host memory visible to the device, there would not be a need for a memory barrier before using the results of this layout transition on the device.

**Valid Usage**

- VUID-VkHostImageLayoutTransitionInfoEXT-image-09055 `image` must have been created with `VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT`

- VUID-VkHostImageLayoutTransitionInfoEXT-subresourceRange-01486 `subresourceRange.baseMipLevel` must be less than the `mipLevels` specified in `VkImageCreateInfo` when `image` was created

- VUID-VkHostImageLayoutTransitionInfoEXT-subresourceRange-01724
If `subresourceRange.levelCount` is not `VK_REMAINING_MIP_LEVELS`, `subresourceRange.baseMipLevel + subresourceRange.levelCount` must be less than or equal to the `mipLevels` specified in `VkImageCreateInfo` when `image` was created.

- VUID-VkHostImageLayoutTransitionInfoEXT-subresourceRange-01488
  `subresourceRange.baseArrayLayer` must be less than the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created.

- VUID-VkHostImageLayoutTransitionInfoEXT-subresourceRange-01725
  If `subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `subresourceRange.baseArrayLayer + subresourceRange.layerCount` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created.

- VUID-VkHostImageLayoutTransitionInfoEXT-image-01932
  If `image` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- VUID-VkHostImageLayoutTransitionInfoEXT-image-09241
  If `image` has a color format that is single-plane, then the `aspectMask` member of `subresourceRange` must be `VK_IMAGE_ASPECT_COLOR_BIT`.

- VUID-VkHostImageLayoutTransitionInfoEXT-image-09242
  If `image` has a color format and is not disjoint, then the `aspectMask` member of `subresourceRange` must include at least one multi-planar aspect mask bit or `VK_IMAGE_ASPECT_COLOR_BIT`.

- VUID-VkHostImageLayoutTransitionInfoEXT-image-01672
  If `image` has a multi-planar format and the image is disjoint, then the `aspectMask` member of `subresourceRange` must include at least one multi-planar aspect mask bit or `VK_IMAGE_ASPECT_COLOR_BIT`.

- VUID-VkHostImageLayoutTransitionInfoEXT-image-03320
  If `image` has a depth/stencil format with both depth and stencil and the `separateDepthStencilLayouts` feature is not enabled, then the `aspectMask` member of `subresourceRange` must include both `VK_IMAGE_ASPECT_DEPTH_BIT` and `VK_IMAGE_ASPECT_STENCIL_BIT`.

- VUID-VkHostImageLayoutTransitionInfoEXT-image-03319
  If `image` has a depth/stencil format with both depth and stencil and the `separateDepthStencilLayouts` feature is enabled, then the `aspectMask` member of `subresourceRange` must include either or both `VK_IMAGE_ASPECT_DEPTH_BIT` and `VK_IMAGE_ASPECT_STENCIL_BIT`.

- VUID-VkHostImageLayoutTransitionInfoEXT-aspectMask-08702
  If the `aspectMask` member of `subresourceRange` includes `VK_IMAGE_ASPECT_DEPTH_BIT`, `oldLayout` and `newLayout` must not be one of `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`.

- VUID-VkHostImageLayoutTransitionInfoEXT-aspectMask-08703
  If the `aspectMask` member of `subresourceRange` includes `VK_IMAGE_ASPECT_STENCIL_BIT`, `oldLayout` and `newLayout` must not be one of `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`.

- VUID-VkHostImageLayoutTransitionInfoEXT-subresourceRange-09601
  `subresourceRange.aspectMask` must be valid for the format the `image` was created with.
oldLayout must be either VK_IMAGE_LAYOUT_UNDEFINED or the current layout of the image subresources as specified in subresourceRange.

If oldLayout is not VK_IMAGE_LAYOUT_UNDEFINED or VK_IMAGE_LAYOUT_PREINITIALIZED, it must be one of the layouts in VkPhysicalDeviceHostImageCopyPropertiesEXT::pCopySrcLayouts.

newLayout must be one of the layouts in VkPhysicalDeviceHostImageCopyPropertiesEXT::pCopyDstLayouts.

Valid Usage (Implicit)

- sType must be VK_STRUCTURE_TYPE_HOST_IMAGE_LAYOUT_TRANSITION_INFO_EXT
- pNext must be NULL
- image must be a valid VkImage handle
- oldLayout must be a valid VkImageLayout value
- newLayout must be a valid VkImageLayout value
- subresourceRange must be a valid VkImageSubresourceRange structure

7.7.4. Queue Family Ownership Transfer

Resources created with a VkSharingMode of VK_SHARING_MODE_EXCLUSIVE must have their ownership explicitly transferred from one queue family to another in order to access their content in a well-defined manner on a queue in a different queue family.

The special queue family index VK_QUEUE_FAMILY_IGNORED indicates that a queue family parameter or member is ignored.

```c
#define VK_QUEUE_FAMILY_IGNORED (~0U)
```

Resources shared with external APIs or instances using external memory must also explicitly manage ownership transfers between local and external queues (or equivalent constructs in external APIs) regardless of the VkSharingMode specified when creating them.

The special queue family index VK_QUEUE_FAMILY_EXTERNAL represents any queue external to the resource's current Vulkan instance, as long as the queue uses the same underlying device group or physical device, and the same driver version as the resource's VkDevice, as indicated by
VkPhysicalDeviceIDProperties::deviceUUID and VkPhysicalDeviceIDProperties::driverUUID.

```c
#define VK_QUEUE_FAMILY_EXTERNAL          (~1U)
```
or the equivalent

```c
#define VK_QUEUE_FAMILY_EXTERNAL_KHR      VK_QUEUE_FAMILY_EXTERNAL
```

The special queue family index `VK_QUEUE_FAMILY_FOREIGN_EXT` represents any queue external to the resource's current Vulkan instance, regardless of the queue's underlying physical device or driver version. This includes, for example, queues for fixed-function image processing devices, media codec devices, and display devices, as well as all queues that use the same underlying device group or physical device, and the same driver version as the resource's `VkDevice`.

```c
#define VK_QUEUE_FAMILY_FOREIGN_EXT       (~2U)
```

If memory dependencies are correctly expressed between uses of such a resource between two queues in different families, but no ownership transfer is defined, the contents of that resource are undefined for any read accesses performed by the second queue family.

**NOTE**

If an application does not need the contents of a resource to remain valid when transferring from one queue family to another, then the ownership transfer should be skipped.

**NOTE**

Applications should expect transfers to/from `VK_QUEUE_FAMILY_FOREIGN_EXT` to be more expensive than transfers to/from `VK_QUEUE_FAMILY_EXTERNAL_KHR`.

A queue family ownership transfer consists of two distinct parts:

1. Release exclusive ownership from the source queue family
2. Acquire exclusive ownership for the destination queue family

An application **must** ensure that these operations occur in the correct order by defining an execution dependency between them, e.g. using a semaphore.

A **release operation** is used to release exclusive ownership of a range of a buffer or image subresource range. A release operation is defined by executing a buffer memory barrier (for a buffer range) or an image memory barrier (for an image subresource range) using a pipeline barrier command, on a queue from the source queue family. The `srcQueueFamilyIndex` parameter of the barrier must be set to the source queue family index, and the `dstQueueFamilyIndex` parameter to the destination queue family index. `dstAccessMask` is ignored for such a barrier, such that no visibility operation is executed - the value of this mask does not affect the validity of the barrier. The release operation happens-after the availability operation. `dstStageMask` is also ignored for such a barrier as defined by buffer memory ownership transfer and image memory ownership transfer.
An acquire operation is used to acquire exclusive ownership of a range of a buffer or image subresource range. An acquire operation is defined by executing a buffer memory barrier (for a buffer range) or an image memory barrier (for an image subresource range) using a pipeline barrier command, on a queue from the destination queue family. The buffer range or image subresource range specified in an acquire operation must match exactly that of a previous release operation. The srcQueueFamilyIndex parameter of the barrier must be set to the source queue family index, and the dstQueueFamilyIndex parameter to the destination queue family index. srcAccessMask is ignored for such a barrier, such that no availability operation is executed - the value of this mask does not affect the validity of the barrier. The acquire operation happens-before the visibility operation. srcStageMask is also ignored for such a barrier as defined by buffer memory ownership transfer and image memory ownership transfer. As the first synchronization scope for an acquire operation is empty there is no happens-before dependency. Such a dependency can be introduced by using VK_PIPELINE_STAGE_ALL_COMMANDS_BIT.

NOTE

Whilst it is not invalid to provide destination or source access masks for memory barriers used for release or acquire operations, respectively, they have no practical effect. Access after a release operation has undefined results, and so visibility for those accesses has no practical effect. Similarly, write access before an acquire operation will produce undefined results for future access, so availability of those writes has no practical use. In an earlier version of the specification, these were required to match on both sides - but this was subsequently relaxed. These masks should be set to 0.

NOTE

Since a release and acquire operation does not synchronize with second and first scopes respectively, the VK_PIPELINE_STAGE_ALL_COMMANDS_BIT stage must be used to wait for a release operation to complete. Typically, a release and acquire pair is performed by a VkSemaphore signal and wait in their respective queues. Signaling a semaphore with vkQueueSubmit waits for VK_PIPELINE_STAGE_ALL_COMMANDS_BIT. With vkQueueSubmit2, stageMask for the signal semaphore must be VK_PIPELINE_STAGE_ALL_COMMANDS_BIT. Similarly, for the acquire operation, waiting for a semaphore must use VK_PIPELINE_STAGE_ALL_COMMANDS_BIT to make sure the acquire operation is synchronized.

If the transfer is via an image memory barrier, and an image layout transition is desired, then the values of oldLayout and newLayout in the release operation's memory barrier must be equal to values of oldLayout and newLayout in the acquire operation's memory barrier. Although the image layout transition is submitted twice, it will only be executed once. A layout transition specified in this way happens-after the release operation and happens-before the acquire operation.

If the values of srcQueueFamilyIndex and dstQueueFamilyIndex are equal, no ownership transfer is performed, and the barrier operates as if they were both set to VK_QUEUE_FAMILY_IGNORED.

Queue family ownership transfers may perform read and write accesses on all memory bound to the image subresource or buffer range, so applications must ensure that all memory writes have been made available before a queue family ownership transfer is executed. Available memory is automatically made visible to queue family release and acquire operations, and writes performed by those operations are automatically made available.
Once a queue family has acquired ownership of a buffer range or image subresource range of a VK_SHARING_MODE_EXCLUSIVE resource, its contents are undefined to other queue families unless ownership is transferred. The contents of any portion of another resource which aliases memory that is bound to the transferred buffer or image subresource range are undefined after a release or acquire operation.

**NOTE**

Because events cannot be used directly for inter-queue synchronization, and because vkCmdSetEvent does not have the queue family index or memory barrier parameters needed by a release operation, the release and acquire operations of a queue family ownership transfer can only be performed using vkCmdPipelineBarrier.

An acquire operation may have a performance penalty when acquiring ownership of a subresource range from one of the special queue families reserved for external memory ownership transfers described above. The application can reduce the performance penalty in some cases by adding a VkExternalMemoryAcquireUnmodifiedEXT structure to the pNext chain of the acquire operation's memory barrier structure.

The VkExternalMemoryAcquireUnmodifiedEXT structure is defined as:

```c
// Provided by VK_EXT_external_memory_acquire_unmodified
typedef struct VkExternalMemoryAcquireUnmodifiedEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 acquireUnmodifiedMemory;
} VkExternalMemoryAcquireUnmodifiedEXT;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **acquireUnmodifiedMemory** specifies, if VK_TRUE, that no range of VkDeviceMemory bound to the resource of the memory barrier's subresource range was modified at any time since the resource's most recent release of ownership to the queue family specified by the memory barrier's srcQueueFamilyIndex. If VK_FALSE, it specifies nothing.

If the application releases ownership of the subresource range to one of the special queue families reserved for external memory ownership transfers with a memory barrier structure, and later re-acquires ownership from the same queue family with a memory barrier structure, and if no range of VkDeviceMemory bound to the resource was modified at any time between the release operation and the acquire operation, then the application should add a VkExternalMemoryAcquireUnmodifiedEXT structure to the pNext chain of the acquire operation's memory barrier structure because this may reduce the performance penalty.

This struct is ignored if acquireUnmodifiedMemory is VK_FALSE. In particular, VK_FALSE does not specify that memory was modified.

This struct is ignored if the memory barrier's srcQueueFamilyIndex is not a special queue family reserved for external memory ownership transfers.
The method by which the application determines whether memory was modified between the *release operation* and *acquire operation* is outside the scope of Vulkan.

For any Vulkan operation that accesses a resource, the application must not assume the implementation accesses the resource's memory as read-only, even for *apparently* read-only operations such as transfer commands and shader reads.

The validity of `VkExternalMemoryAcquireUnmodifiedEXT::acquireUnmodifiedMemory` is independent of memory ranges outside the ranges of `VkDeviceMemory` bound to the resource. In particular, it is independent of any implementation-private memory associated with the resource.

**Valid Usage**

- **VUID-VkExternalMemoryAcquireUnmodifiedEXT-acquireUnmodifiedMemory-08922**
  If `acquireUnmodifiedMemory` is `VK_TRUE`, and the memory barrier's `srcQueueFamilyIndex` is a special queue family reserved for external memory ownership transfers (as described in Queue Family Ownership Transfer), then each range of `VkDeviceMemory` bound to the resource must have remained unmodified during all time since the resource's most recent release of ownership to the queue family.

**Valid Usage (Implicit)**

- **VUID-VkExternalMemoryAcquireUnmodifiedEXT-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_EXTERNAL_MEMORY_ACQUIRE_UNMODIFIED_EXT`

### 7.8. Wait Idle Operations

To wait on the host for the completion of outstanding queue operations for a given queue, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkQueueWaitIdle(
    VkQueue queue);
```

- `queue` is the queue on which to wait.

`vkQueueWaitIdle` is equivalent to having submitted a valid fence to every previously executed queue submission command that accepts a fence, then waiting for all of those fences to signal using `vkWaitForFences` with an infinite timeout and `waitAll` set to `VK_TRUE`.

**Valid Usage (Implicit)**

- **VUID-vkQueueWaitIdle-queue-parameter**
  `queue` must be a valid `VkQueue` handle

476
Host Synchronization

- Host access to queue must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>Any</td>
<td>-</td>
</tr>
</tbody>
</table>

Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST

To wait on the host for the completion of outstanding queue operations for all queues on a given logical device, call:

```
// Provided by VK_VERSION_1_0
VkResult vkDeviceWaitIdle(
    VkDevice device);
```

- device is the logical device to idle.

vkDeviceWaitIdle is equivalent to calling vkQueueWaitIdle for all queues owned by device.

Valid Usage (Implicit)

- VUID-vkDeviceWaitIdle-device-parameter
  
device must be a valid VkDevice handle

Host Synchronization

- Host access to all VkQueue objects created from device must be externally synchronized
### Return Codes

#### Success
- VK_SUCCESS

#### Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST

## 7.9. Host Write Ordering Guarantees

When batches of command buffers are submitted to a queue via a queue submission command, it defines a memory dependency with prior host operations, and execution of command buffers submitted to the queue.

The first synchronization scope includes execution of vkQueueSubmit on the host and anything that happened-before it, as defined by the host memory model.

**NOTE** Some systems allow writes that do not directly integrate with the host memory model; these have to be synchronized by the application manually. One example of this is non-temporal store instructions on x86; to ensure these happen-before submission, applications should call _mm_sfence().

The second synchronization scope includes all commands submitted in the same queue submission, and all commands that occur later in submission order.

The first access scope includes all host writes to mappable device memory that are available to the host memory domain.

The second access scope includes all memory access performed by the device.

## 7.10. Synchronization and Multiple Physical Devices

If a logical device includes more than one physical device, then fences, semaphores, and events all still have a single instance of the signaled state.

A fence becomes signaled when all physical devices complete the necessary queue operations.

Semaphore wait and signal operations all include a device index that is the sole physical device that performs the operation. These indices are provided in the VkDeviceGroupSubmitInfo and VkDeviceGroupBindSparseInfo structures. Semaphores are not exclusively owned by any physical device. For example, a semaphore can be signaled by one physical device and then waited on by a different physical device.

An event can only be waited on by the same physical device that signaled it (or the host).
7.11. Calibrated Timestamps

In order to be able to correlate the time a particular operation took place at on timelines of different time domains (e.g. a device operation vs. a host operation), Vulkan allows querying calibrated timestamps from multiple time domains.

To query calibrated timestamps from a set of time domains, call:

```c
// Provided by VK_KHR_calibrated_timestamps
VkResult vkGetCalibratedTimestampsKHR(
    VkDevice device,
    uint32_t timestampCount,
    const VkCalibratedTimestampInfoKHR* pTimestampInfos,
    uint64_t* pTimestamps,
    uint64_t* pMaxDeviation);
```

or the equivalent command

```c
// Provided by VK_EXT_calibrated_timestamps
VkResult vkGetCalibratedTimestampsEXT(
    VkDevice device,
    uint32_t timestampCount,
    const VkCalibratedTimestampInfoKHR* pTimestampInfos,
    uint64_t* pTimestamps,
    uint64_t* pMaxDeviation);
```

- **device** is the logical device used to perform the query.
- **timestampCount** is the number of timestamps to query.
- **pTimestampInfos** is a pointer to an array of **timestampCount** `VkCalibratedTimestampInfoKHR` structures, describing the time domains the calibrated timestamps should be captured from.
- **pTimestamps** is a pointer to an array of **timestampCount** 64-bit unsigned integer values in which the requested calibrated timestamp values are returned.
- **pMaxDeviation** is a pointer to a 64-bit unsigned integer value in which the strictly positive maximum deviation, in nanoseconds, of the calibrated timestamp values is returned.

**NOTE**

The maximum deviation may vary between calls to `vkGetCalibratedTimestampsKHR` even for the same set of time domains due to implementation and platform specific reasons. It is the application’s responsibility to assess whether the returned maximum deviation makes the timestamp values suitable for any particular purpose and can choose to re-issue the timestamp calibration call pursuing a lower deviation value.

Calibrated timestamp values can be extrapolated to estimate future coinciding timestamp values, however, depending on the nature of the time domains and other properties of the platform extrapolating values over a sufficiently long period of time may no longer be accurate enough to fit...
any particular purpose, so applications are expected to re-calibrate the timestamps on a regular basis.

Valid Usage

- VUID-vkGetCalibratedTimestampsEXT-timeDomain-09246
  The `timeDomain` value of each `VkCalibratedTimestampInfoKHR` in `pTimestampInfos` must be unique.

Valid Usage (Implicit)

- VUID-vkGetCalibratedTimestampsKHR-device-parameter
device must be a valid `VkDevice` handle
- VUID-vkGetCalibratedTimestampsKHR-pTimestampInfos-parameter
  `pTimestampInfos` must be a valid pointer to an array of `timestampCount` valid `VkCalibratedTimestampInfoKHR` structures
- VUID-vkGetCalibratedTimestampsKHR-pTimestamps-parameter
  `pTimestamps` must be a valid pointer to an array of `timestampCount` `uint64_t` values
- VUID-vkGetCalibratedTimestampsKHR-pMaxDeviation-parameter
  `pMaxDeviation` must be a valid pointer to a `uint64_t` value
- VUID-vkGetCalibratedTimestampsKHR-timestampCount-arraylength
  `timestampCount` must be greater than 0

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkCalibratedTimestampInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_calibrated_timestamps
typedef struct VkCalibratedTimestampInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkTimeDomainKHR timeDomain;
} VkCalibratedTimestampInfoKHR;
```

or the equivalent
typedef VkCalibratedTimestampInfoKHR VkCalibratedTimestampInfoEXT;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `timeDomain` is a `VkTimeDomainKHR` value specifying the time domain from which the calibrated timestamp value should be returned.

**Valid Usage**

- VUID-VkCalibratedTimestampInfoEXT-timeDomain-02354
  
  `timeDomain` must be one of the `VkTimeDomainKHR` values returned by `vkGetPhysicalDeviceCalibrateableTimeDomainsKHR`

**Valid Usage (Implicit)**

- VUID-VkCalibratedTimestampInfoKHR-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_CALIBRATED_TIMESTAMP_INFO_KHR`

- VUID-VkCalibratedTimestampInfoKHR-pNext-pNext
  
  `pNext` must be `NULL`

- VUID-VkCalibratedTimestampInfoKHR-timeDomain-parameter
  
  `timeDomain` must be a valid `VkTimeDomainKHR` value

The set of supported time domains consists of:

```c
// Provided by VK_KHR_calibrated_timestamps
typedef enum VkTimeDomainKHR {
    VK_TIME_DOMAIN_DEVICE_KHR = 0,
    VK_TIME_DOMAIN_CLOCK_MONOTONIC_KHR = 1,
    VK_TIME_DOMAIN_CLOCK_MONOTONIC_RAW_KHR = 2,
    VK_TIME_DOMAIN_QUERY_PERFORMANCE_COUNTER_KHR = 3,
} VkTimeDomainKHR;
```
// Provided by VK_EXT_calibrated_timestamps
typedef VkTimeDomainKHR VkTimeDomainEXT;

- **VK_TIME_DOMAIN_DEVICE_KHR** specifies the device time domain. Timestamp values in this time domain use the same units and are comparable with device timestamp values captured using `vkCmdWriteTimestamp` or `vkCmdWriteTimestamp2` and are defined to be incrementing according to the `timestampPeriod` of the device.

- **VK_TIME_DOMAIN_CLOCK_MONOTONIC_KHR** specifies the CLOCK_MONOTONIC time domain available on POSIX platforms. Timestamp values in this time domain are in units of nanoseconds and are comparable with platform timestamp values captured using the POSIX `clock_gettime` API as computed by this example:

```c
struct timespec tv;
clock_gettime(CLOCK_MONOTONIC, &tv);
return tv.tv_nsec + tv.tv_sec*1000000000ull;
```

- **VK_TIME_DOMAIN_CLOCK_MONOTONIC_RAW_KHR** specifies the CLOCK_MONOTONIC_RAW time domain available on POSIX platforms. Timestamp values in this time domain are in units of nanoseconds and are comparable with platform timestamp values captured using the POSIX `clock_gettime` API as computed by this example:

```c
struct timespec tv;
clock_gettime(CLOCK_MONOTONIC_RAW, &tv);
return tv.tv_nsec + tv.tv_sec*1000000000ull;
```

- **VK_TIME_DOMAIN_QUERY_PERFORMANCE_COUNTER_KHR** specifies the performance counter (QPC) time domain available on Windows. Timestamp values in this time domain are in the same units as those provided by the Windows `QueryPerformanceCounter` API and are comparable with platform timestamp values captured using that API as computed by this example:

```c
LARGE_INTEGER counter;
QueryPerformanceCounter(&counter);
return counter.QuadPart;
```
Chapter 8. Render Pass

Draw commands must be recorded within a render pass instance. Each render pass instance defines a set of image resources, referred to as attachments, used during rendering.

To begin a render pass instance, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdBeginRendering(
    VkCommandBuffer            commandBuffer,
    const VkRenderingInfo*     pRenderingInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_dynamic_rendering
void vkCmdBeginRenderingKHR(
    VkCommandBuffer            commandBuffer,
    const VkRenderingInfo*     pRenderingInfo);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pRenderingInfo` is a pointer to a `VkRenderingInfo` structure specifying details of the render pass instance to begin.

After beginning a render pass instance, the command buffer is ready to record draw commands.

If `pRenderingInfo->flags` includes `VK_RENDERING_RESUMING_BIT` then this render pass is resumed from a render pass instance that has been suspended earlier in submission order.

Valid Usage

- VUID-vkCmdBeginRendering-dynamicRendering-06446
  The dynamicRendering feature must be enabled

- VUID-vkCmdBeginRendering-commandBuffer-06068
  If `commandBuffer` is a secondary command buffer, and the nestedCommandBuffer feature is not enabled, `pRenderingInfo->flags` must not include `VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT`

- VUID-vkCmdBeginRendering-pRenderingInfo-09588
  If `pRenderingInfo->pDepthAttachment` is not NULL and `pRenderingInfo->pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, `pRenderingInfo->pDepthAttachment->imageView` must be in the layout specified by `pRenderingInfo->pDepthAttachment->imageLayout`

- VUID-vkCmdBeginRendering-pRenderingInfo-09589
  If `pRenderingInfo->pDepthAttachment` is not NULL, `pRenderingInfo->pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, `pRenderingInfo->pDepthAttachment->imageResolveMode` is not `VK_RESOLVE_MODE_NONE`, and `pRenderingInfo->pDepthAttachment->resolveImageView` is not `VK_NULL_HANDLE`, `pRenderingInfo->pDepthAttachment->resolveImageView` must be in
the layout specified by \( p\text{RenderingInfo} \rightarrow p\text{DepthAttachment} \rightarrow \text{resolveImageLayout} \)

- **VUID-vkCmdBeginRendering-pRenderingInfo-09590**
  If \( p\text{RenderingInfo} \rightarrow p\text{StencilAttachment} \) is not NULL and \( p\text{RenderingInfo} \rightarrow p\text{StencilAttachment} \rightarrow \text{imageView} \) is not \( \text{VK_NULL_HANDLE} \), \( p\text{RenderingInfo} \rightarrow p\text{StencilAttachment} \rightarrow \text{imageView} \) must be in the layout specified by \( p\text{RenderingInfo} \rightarrow p\text{StencilAttachment} \rightarrow \text{imageLayout} \)

- **VUID-vkCmdBeginRendering-pRenderingInfo-09591**
  If \( p\text{RenderingInfo} \rightarrow p\text{StencilAttachment} \) is not NULL, \( p\text{RenderingInfo} \rightarrow p\text{StencilAttachment} \rightarrow \text{imageView} \) is not \( \text{VK_NULL_HANDLE} \), \( p\text{RenderingInfo} \rightarrow p\text{StencilAttachment} \rightarrow \text{imageResolveMode} \) is not \( \text{VK_RESOLVE_MODE_NONE} \), and \( p\text{RenderingInfo} \rightarrow p\text{StencilAttachment} \rightarrow \text{resolveImageView} \) is not \( \text{VK_NULL_HANDLE} \), \( p\text{RenderingInfo} \rightarrow p\text{StencilAttachment} \rightarrow \text{resolveImageView} \) must be in the layout specified by \( p\text{RenderingInfo} \rightarrow p\text{StencilAttachment} \rightarrow \text{resolveImageLayout} \)

- **VUID-vkCmdBeginRendering-pRenderingInfo-09592**
  For any element of \( p\text{RenderingInfo} \rightarrow p\text{ColorAttachments} \), if \( \text{imageView} \) is not \( \text{VK_NULL_HANDLE} \), that image view must be in the layout specified by \( \text{imageLayout} \)

- **VUID-vkCmdBeginRendering-pRenderingInfo-09593**
  For any element of \( p\text{RenderingInfo} \rightarrow p\text{ColorAttachments} \), if either \( \text{imageResolveMode} \) is \( \text{VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID} \), or \( \text{imageView} \) is not \( \text{VK_NULL_HANDLE} \) and \( \text{resolveMode} \) is not \( \text{VK_RESOLVE_MODE_NONE} \), and \( \text{resolveImageView} \) is not \( \text{VK_NULL_HANDLE} \), \( \text{resolveImageView} \) must be in the layout specified by \( \text{resolveImageLayout} \)

### Valid Usage (Implicit)

- **VUID-vkCmdBeginRendering-commandBuffer-parameter**
  \( \text{commandBuffer} \) must be a valid \( \text{VkCommandBuffer} \) handle

- **VUID-vkCmdBeginRendering-pRenderingInfo-parameter**
  \( \text{pRenderingInfo} \) must be a valid pointer to a valid \( \text{VkRenderingInfo} \) structure

- **VUID-vkCmdBeginRendering-commandBuffer-recording**
  \( \text{commandBuffer} \) must be in the recording state

- **VUID-vkCmdBeginRendering-commandBuffer-cmdpool**
  The \( \text{VkCommandPool} \) that \( \text{commandBuffer} \) was allocated from must support graphics operations

- **VUID-vkCmdBeginRendering-renderpass**
  This command must only be called outside of a render pass instance

- **VUID-vkCmdBeginRendering-videocoding**
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to \( \text{commandBuffer} \) must be externally synchronized
Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

The `VkRenderingInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkRenderingInfo {
    VkStructureType     sType;
    const void*          pNext;
    VkRenderingFlags     flags;
    VkRect2D             renderArea;
    uint32_t             layerCount;
    uint32_t             viewMask;
    uint32_t             colorAttachmentCount;
    const VkRenderingAttachmentInfo* pColorAttachments;
    const VkRenderingAttachmentInfo* pDepthAttachment;
    const VkRenderingAttachmentInfo* pStencilAttachment;
} VkRenderingInfo;
```

or the equivalent

```c
// Provided by VK_KHR_dynamic_rendering, VK_QCOM_tile_properties with
// VK_KHR_dynamic_rendering or VK_VERSION_1_3
typedef VkRenderingInfo VkRenderingInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is a bitmask of `VkRenderingFlagBits`.
- **renderArea** is the render area that is affected by the render pass instance.
- **layerCount** is the number of layers rendered to in each attachment when `viewMask` is 0.
- **viewMask** is the view mask indicating the indices of attachment layers that will be rendered when it is not 0.
- **color Attachment Count** is the number of elements in `pColorAttachments`.
- **pColorAttachments** is a pointer to an array of `colorAttachmentCount` `VkRenderingAttachmentInfo` structures describing any color attachments used.
• **pDepthAttachment** is a pointer to a `VkRenderingAttachmentInfo` structure describing a depth attachment.

• **pStencilAttachment** is a pointer to a `VkRenderingAttachmentInfo` structure describing a stencil attachment.

If `viewMask` is not 0, multiview is enabled.

If there is an instance of `VkDeviceGroupRenderPassBeginInfo` included in the `pNext` chain and its `deviceRenderAreaCount` member is not 0, then `renderArea` is ignored, and the render area is defined per-device by that structure.

If multiview is enabled, and the `multiviewPerViewRenderAreas` feature is enabled, and there is an instance of `VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM` included in the `pNext` chain with `perViewRenderAreaCount` not equal to 0, then the elements of `VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM::pPerViewRenderAreas` override `renderArea` and define a render area for each view. In this case, `renderArea must` be set to an area at least as large as the union of all the per-view render areas.

Each element of the `pColorAttachments` array corresponds to an output location in the shader, i.e. if the shader declares an output variable decorated with a `Location` value of `X`, then it uses the attachment provided in `pColorAttachments[X]`. If the `imageView` member of any element of `pColorAttachments` is `VK_NULL_HANDLE`, and `resolveMode` is not `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`, writes to the corresponding location by a fragment are discarded.

### Valid Usage

- **VUID-VkRenderingInfo-viewMask-06069**
  If `viewMask` is 0, `layerCount` must not be 0

- **VUID-VkRenderingInfo-multisampledRenderToSingleSampled-06857**
  `imageView` members of `pDepthAttachment`, `pStencilAttachment`, and elements of `pColorAttachments` that are not `VK_NULL_HANDLE` must have been created with the same `sampleCount`, if none of the following are enabled:
  - The `VK_AMD_mixed_attachment_samples` extension
  - The `VK_NV_framebuffer_mixed_samples` extension
  - The `multisampledRenderToSingleSampled` feature,

- **VUID-VkRenderingInfo-imageView-09429**
  `imageView` members of elements of `pColorAttachments` that are not `VK_NULL_HANDLE` must have been created with the same `sampleCount`, if the `multisampledRenderToSingleSampled` feature is not enabled

- **VUID-VkRenderingInfo-None-08994**
  If `VkDeviceGroupRenderPassBeginInfo::deviceRenderAreaCount` is 0, `renderArea.extent.width` must be greater than 0

- **VUID-VkRenderingInfo-None-08995**
  If `VkDeviceGroupRenderPassBeginInfo::deviceRenderAreaCount` is 0,
**renderArea.extent.height** must be greater than 0

- **VUID-VkRenderingInfo-imageView-06858**
  If **multisampled-render-to-single-sampled** is enabled, then all attachments referenced by **imageView** members of **pDepthAttachment**, **pStencilAttachment**, and elements of **pColorAttachments** that are not **VK_NULL_HANDLE** must have a sample count that is either **VK_SAMPLE_COUNT_1_BIT** or equal to **VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples**

- **VUID-VkRenderingInfo-imageView-06859**
  If **multisampled-render-to-single-sampled** is enabled, then all attachments referenced by **imageView** members of **pDepthAttachment**, **pStencilAttachment**, and elements of **pColorAttachments** that are not **VK_NULL_HANDLE** and have a sample count of **VK_SAMPLE_COUNT_1_BIT** must have been created with **VK_IMAGE_CREATE_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_BIT_EXT** in their **VkImageCreateInfo::flags**

- **VUID-VkRenderingInfo-pNext-06077**
  If the **pNext** chain does not contain **VkDeviceGroupRenderPassBeginInfo** or its **deviceRenderAreaCount** member is equal to 0, **renderArea.offset.x** must be greater than or equal to 0

- **VUID-VkRenderingInfo-pNext-06078**
  If the **pNext** chain does not contain **VkDeviceGroupRenderPassBeginInfo** or its **deviceRenderAreaCount** member is equal to 0, **renderArea.offset.y** must be greater than or equal to 0

- **VUID-VkRenderingInfo-pNext-07815**
  If the **pNext** chain does not contain **VkDeviceGroupRenderPassBeginInfo** or its **deviceRenderAreaCount** member is equal to 0, the sum of **renderArea.extent.width** and **renderArea.offset.x** must be less than or equal to **maxFramebufferWidth**

- **VUID-VkRenderingInfo-pNext-07816**
  If the **pNext** chain does not contain **VkDeviceGroupRenderPassBeginInfo** or its **deviceRenderAreaCount** member is equal to 0, the sum of **renderArea.extent.height** and **renderArea.offset.y** must be less than or equal to **maxFramebufferHeight**

- **VUID-VkRenderingInfo-pNext-06079**
  If the **pNext** chain does not contain **VkDeviceGroupRenderPassBeginInfo** or its **deviceRenderAreaCount** member is equal to 0, the width of the **imageView** member of any element of **pColorAttachments**, **pDepthAttachment**, or **pStencilAttachment** that is not **VK_NULL_HANDLE** must be greater than or equal to **renderArea.offset.x + renderArea.extent.width**

- **VUID-VkRenderingInfo-pNext-06080**
  If the **pNext** chain does not contain **VkDeviceGroupRenderPassBeginInfo** or its **deviceRenderAreaCount** member is equal to 0, the height of the **imageView** member of any element of **pColorAttachments**, **pDepthAttachment**, or **pStencilAttachment** that is not **VK_NULL_HANDLE** must be greater than or equal to **renderArea.offset.y + renderArea.extent.height**

- **VUID-VkRenderingInfo-pNext-06083**
  If the **pNext** chain contains **VkDeviceGroupRenderPassBeginInfo**, the width of the
imageView member of any element of pColorAttachments, pDepthAttachment, or pStencilAttachment that is not VK_NULL_HANDLE must be greater than or equal to the sum of the offset.x and extent.width members of each element of pDeviceRenderAreas

• VUID-VkRenderingInfo-pNext-06084
If the pNext chain contains VkDeviceGroupRenderPassBeginInfo, the height of the imageView member of any element of pColorAttachments, pDepthAttachment, or pStencilAttachment that is not VK_NULL_HANDLE must be greater than or equal to the sum of the offset.y and extent.height members of each element of pDeviceRenderAreas

• VUID-VkRenderingInfo-pDepthAttachment-06085
If neither pDepthAttachment or pStencilAttachment are NULL and the imageView member of either structure is not VK_NULL_HANDLE, the imageView member of each structure must be the same

• VUID-VkRenderingInfo-pDepthAttachment-06086
If neither pDepthAttachment or pStencilAttachment are NULL, and the resolveMode member of each is not VK_RESOLVE_MODE_NONE, the resolveImageView member of each structure must be the same

• VUID-VkRenderingInfo-colorAttachmentCount-06087
If colorAttachmentCount is not 0 and the imageView member of an element of pColorAttachments is not VK_NULL_HANDLE, that imageView must have been created with VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT

• VUID-VkRenderingInfo-colorAttachmentCount-09476
If colorAttachmentCount is not 0 and there is an element of pColorAttachments with either its resolveMode member set to VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID, or its imageView member not VK_NULL_HANDLE, and its resolveMode member not set to VK_RESOLVE_MODE_NONE, the resolveImageView member of that element of pColorAttachments must have been created with VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT

• VUID-VkRenderingInfo-pDepthAttachment-06547
If pDepthAttachment is not NULL and pDepthAttachment->imageView is not VK_NULL_HANDLE, pDepthAttachment->imageView must have been created with a format that includes a depth component

• VUID-VkRenderingInfo-pDepthAttachment-06088
If pDepthAttachment is not NULL and pDepthAttachment->imageView is not VK_NULL_HANDLE, pDepthAttachment->imageView must have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

• VUID-VkRenderingInfo-pDepthAttachment-09477
If pDepthAttachment is not NULL and pDepthAttachment->resolveMode is not VK_RESOLVE_MODE_NONE, pDepthAttachment->resolveImageView must have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

• VUID-VkRenderingInfo-pStencilAttachment-06548
If pStencilAttachment is not NULL and pStencilAttachment->imageView is not VK_NULL_HANDLE, pStencilAttachment->imageView must have been created with a format that includes a stencil aspect

• VUID-VkRenderingInfo-pStencilAttachment-06089
If pStencilAttachment is not NULL and pStencilAttachment->imageView is not
VK_NULL_HANDLE, pStencilAttachment->imageView must have been created with a stencil usage including VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkRenderingInfo-pStencilAttachment-09478
  If pStencilAttachment is not NULL and pStencilAttachment->resolveMode is not VK_RESOLVE_MODE_NONE, pStencilAttachment->resolveImageView must have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkRenderingInfo-colorAttachmentCount-06090
  If colorAttachmentCount is not 0 and the imageView member of an element of pColorAttachments is not VK_NULL_HANDLE, the layout member of that element of pColorAttachments must not be VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkRenderingInfo-colorAttachmentCount-06091
  If colorAttachmentCount is not 0 and the imageView member of an element of pColorAttachments is not VK_NULL_HANDLE, if the resolveMode member of that element of pColorAttachments is not VK_RESOLVE_MODE_NONE, its resolveImageLayout member must not be VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkRenderingInfo-pDepthAttachment-06092
  If pDepthAttachment is not NULL and pDepthAttachment->imageView is not VK_NULL_HANDLE, pDepthAttachment->layout must not be VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL

- VUID-VkRenderingInfo-pDepthAttachment-06093
  If pDepthAttachment is not NULL, pDepthAttachment->imageView is not VK_NULL_HANDLE, and pDepthAttachment->resolveMode is not VK_RESOLVE_MODE_NONE, pDepthAttachment->resolveImageLayout must not be VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL

- VUID-VkRenderingInfo-pStencilAttachment-06094
  If pStencilAttachment is not NULL and pStencilAttachment->imageView is not VK_NULL_HANDLE, pStencilAttachment->layout must not be VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL

- VUID-VkRenderingInfo-pStencilAttachment-06095
  If pStencilAttachment is not NULL, pStencilAttachment->imageView is not VK_NULL_HANDLE, and pStencilAttachment->resolveMode is not VK_RESOLVE_MODE_NONE, pStencilAttachment->resolveImageLayout must not be VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL

- VUID-VkRenderingInfo-colorAttachmentCount-06096
  If colorAttachmentCount is not 0 and the imageView member of an element of pColorAttachments is not VK_NULL_HANDLE, the layout member of that element of pColorAttachments must not be VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkRenderingInfo-colorAttachmentCount-06097
  If colorAttachmentCount is not 0 and the imageView member of an element of pColorAttachments is not VK_NULL_HANDLE, if the resolveMode member of that element of pColorAttachments is not VK_RESOLVE_MODE_NONE, its resolveImageLayout member must not be VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL
• VUID-VkRenderingInfo-pDepthAttachment-06098
If pDepthAttachment is not NULL, pDepthAttachment->imageView is not VK_NULL_HANDLE, and pDepthAttachment->resolveMode is not VK_RESOLVE_MODE_NONE, pDepthAttachment->resolveImageLayout must not be VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL.

• VUID-VkRenderingInfo-pStencilAttachment-06099
If pStencilAttachment is not NULL, pStencilAttachment->imageView is not VK_NULL_HANDLE, and pStencilAttachment->resolveMode is not VK_RESOLVE_MODE_NONE, pStencilAttachment->resolveImageLayout must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL.

• VUID-VkRenderingInfo-colorAttachmentCount-06100
If colorAttachmentCount is not 0 and the imageView member of an element of pColorAttachments is not VK_NULL_HANDLE, the layout member of that element of pColorAttachments must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL.

• VUID-VkRenderingInfo-colorAttachmentCount-06101
If colorAttachmentCount is not 0 and the imageView member of an element of pColorAttachments is not VK_NULL_HANDLE, if the resolveMode member of that element of pColorAttachments is not VK_RESOLVE_MODE_NONE, its resolveImageLayout member must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL.

• VUID-VkRenderingInfo-pDepthAttachment-07732
If pDepthAttachment is not NULL and pDepthAttachment->imageView is not VK_NULL_HANDLE, pDepthAttachment->layout must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL.

• VUID-VkRenderingInfo-pDepthAttachment-07733
If pDepthAttachment is not NULL and pDepthAttachment->imageView is not VK_NULL_HANDLE, and pDepthAttachment->resolveMode is not VK_RESOLVE_MODE_NONE, pDepthAttachment->resolveImageLayout must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL.

• VUID-VkRenderingInfo-pStencilAttachment-07734
If pStencilAttachment is not NULL and pStencilAttachment->imageView is not VK_NULL_HANDLE, pStencilAttachment->layout must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL.

• VUID-VkRenderingInfo-pStencilAttachment-07735
If pStencilAttachment is not NULL, pStencilAttachment->imageView is not VK_NULL_HANDLE, and pStencilAttachment->resolveMode is not VK_RESOLVE_MODE_NONE, pStencilAttachment->resolveImageLayout must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL.

• VUID-VkRenderingInfo-pDepthAttachment-06102
If pDepthAttachment is not NULL and pDepthAttachment->imageView is not VK_NULL_HANDLE, pDepthAttachment->resolveMode must be one of the bits set in VkPhysicalDeviceDepthStencilResolveProperties::supportedDepthResolveModes.
If `pStencilAttachment` is not NULL and `pStencilAttachment->imageView` is not `VK_NULL_HANDLE`, `pStencilAttachment->resolveMode` must be one of the bits set in `VkPhysicalDeviceDepthStencilResolveProperties::supportedStencilResolveModes`.

If `pDepthAttachment` or `pStencilAttachment` are both not NULL, `pDepthAttachment->imageView` and `pStencilAttachment->imageView` are both not `VK_NULL_HANDLE`, and `VkPhysicalDeviceDepthStencilResolveProperties::independentResolveNone` is `VK_FALSE`, the `resolveMode` of both structures must be the same value.

If `pDepthAttachment` or `pStencilAttachment` are both not NULL, `pDepthAttachment->imageView` and `pStencilAttachment->imageView` are both not `VK_NULL_HANDLE`, `VkPhysicalDeviceDepthStencilResolveProperties::independentResolve` is `VK_FALSE`, and the `resolveMode` of neither structure is `VK_RESOLVE_MODE_NONE`, the `resolveMode` of both structures must be the same value.

`colorAttachmentCount` must be less than or equal to `VkPhysicalDeviceLimits::maxColorAttachments`.

If the `imageView` member of a `VkRenderingFragmentDensityMapAttachmentInfoEXT` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, and the `fragmentDensityMapNonSubsampledImages` feature is not enabled, valid `imageView` and `resolveImageView` members of `pDepthAttachment`, `pStencilAttachment`, and each element of `pColorAttachments` must be a `VkImageView` created with `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`.

If the `imageView` member of a `VkRenderingFragmentDensityMapAttachmentInfoEXT` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, and `viewMask` is not 0, `imageView` must have a `layerCount` greater than or equal to the index of the most significant bit in `viewMask`.

If the `imageView` member of a `VkRenderingFragmentDensityMapAttachmentInfoEXT` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, and `viewMask` is 0, `imageView` must have a `layerCount` equal to 1.

If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0 and the `imageView` member of a `VkRenderingFragmentDensityMapAttachmentInfoEXT` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, `imageView` must have a width greater than or equal to

\[
\text{renderArea} + \text{renderArea} \times \frac{\text{maxFragmentDensityMapTexelSize}}{\text{width}}
\]

If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0 and the `imageView` member of a `VkRenderingFragmentDensityMapAttachmentInfoEXT` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, `imageView` must have a height greater than or equal to
If the `pNext` chain contains a `VkDeviceGroupRenderPassBeginInfo` structure, its `deviceRenderAreaCount` member is not 0, and the `imageView` member of a `VkRenderingFragmentDensityMapAttachmentInfoEXT` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, `imageView` must have a width greater than or equal to:

\[
\text{maxFragmentDensityTexelSize}_{\text{width}} \times \left( \frac{\sum \text{renderArea}_{\text{x}} + \sum \text{renderArea}_{\text{y}}}{\text{maxFragmentDensityTexelSize}_{\text{height}}} \right)
\]

for each element of `pDeviceRenderAreas`.

If the `pNext` chain contains a `VkDeviceGroupRenderPassBeginInfo` structure, its `deviceRenderAreaCount` member is not 0, and the `imageView` member of a `VkRenderingFragmentDensityMapAttachmentInfoEXT` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, `imageView` must have a height greater than or equal to:

\[
\text{maxFragmentDensityTexelSize}_{\text{height}} \times \left( \frac{\sum \text{renderArea}_{\text{x}} + \sum \text{renderArea}_{\text{y}}}{\text{maxFragmentDensityTexelSize}_{\text{width}}} \right)
\]

for each element of `pDeviceRenderAreas`.

If the `imageView` member of a `VkRenderingFragmentDensityMapAttachmentInfoEXT` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, it must not be equal to the `imageView` or `resolveImageView` member of `pDepthAttachment`, `pStencilAttachment`, or any element of `pColorAttachments`.
pDeviceRenderAreas

- **VUID-VkRenderingInfo-pNext-06122**
  If `maintenance` is not enabled or the `robustFragmentShadingRateAttachmentAccess` limit is `VK_FALSE` or the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure was created with `VkImageSubresourceRange::baseMipLevel` greater than 0, the `pNext` chain contains a `VkDeviceGroupRenderPassBeginInfo` structure, its `deviceRenderAreaCount` member is not 0, and the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, `imageView` must have a height greater than or equal to \[rac{\text{shadingRateAttachmentTexelSize}}{	ext{shadingRateAttachmentTexelSize} + \text{pDeviceRenderAreaHeight}}\] for each element of `pDeviceRenderAreas`

- **VUID-VkRenderingInfo-layerCount-07817**
  `layerCount` must be less than or equal to `maxFramebufferLayers`

- **VUID-VkRenderingInfo-imageView-06123**
  If the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, and `viewMask` is 0, `imageView` must have a `layerCount` that is either equal to 1 or greater than or equal to `layerCount`

- **VUID-VkRenderingInfo-imageView-06124**
  If the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, and `viewMask` is not 0, `imageView` must have a `layerCount` that either equal to 1 or greater than or equal to the index of the most significant bit in `viewMask`

- **VUID-VkRenderingInfo-imageView-06125**
  If the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, it must not be equal to the `imageView` or `resolveImageView` member of `pDepthAttachment`, `pStencilAttachment`, or any element of `pColorAttachments`

- **VUID-VkRenderingInfo-weekview-06127**
  If the `multiview` feature is not enabled, `viewMask` must be 0

- **VUID-VkRenderingInfo-viewMask-06128**
  The index of the most significant bit in `viewMask` must be less than `maxMultiviewViewCount`

- **VUID-VkRenderingInfo-perViewRenderAreaCount-07857**
  If the `perViewRenderAreaCount` member of a `VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM` structure included in the `pNext` chain is not 0, then the `multiviewPerViewRenderAreas` feature must be enabled

- **VUID-VkRenderingInfo-perViewRenderAreaCount-07858**
  If the `perViewRenderAreaCount` member of a `VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM` structure included in the
pNext chain is not 0, then renderArea must specify a render area that includes the union of all per view render areas

- VUID-VkRenderingInfo-None-09044
  Valid attachments specified by this structure must not be bound to memory locations that are bound to any other valid attachments specified by this structure

- VUID-VkRenderingInfo-flags-10012
  If flags includes VK_RENDERING_CONTENTS_INLINE_BIT_KHR then at least one of the following features must be enabled
    - maintenance
    - nestedCommandBuffer

- VUID-VkRenderingInfo-pDepthAttachment-09318
  pDepthAttachment->resolveMode must not be
  VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID

- VUID-VkRenderingInfo-pStencilAttachment-09319
  pStencilAttachment->resolveMode must not be
  VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID

- VUID-VkRenderingInfo-colorAttachmentCount-09320
  If colorAttachmentCount is not 1, the resolveMode member of any element of pColorAttachments must not be
  VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID

- VUID-VkRenderingInfo-resolveMode-09321
  If the resolveMode of any element of pColorAttachments is
  VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID,
  VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView must be
  VK_NULL_HANDLE

- VUID-VkRenderingInfo-resolveMode-09322
  If the resolveMode of any element of pColorAttachments is
  VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID,
  VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView must be
  VK_NULL_HANDLE

- VUID-VkRenderingInfo-pNext-09535
  If the pNext chain contains a VkRenderPassStripeBeginInfoARM structure, the union of stripe areas defined by the elements of VkRenderPassStripeInfoARM::pStripeInfos must cover the renderArea

- VUID-VkRenderingInfo-colorAttachmentCount-09479
  If colorAttachmentCount is not 0 and the imageView member of an element of pColorAttachments is not VK_NULL_HANDLE, that imageView must have been created with the identity swizzle

- VUID-VkRenderingInfo-colorAttachmentCount-09480
  If colorAttachmentCount is not 0, and there is an element of pColorAttachments with either its resolveMode member set to VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID, or its imageView member not set to VK_NULL_HANDLE and its resolveMode member not set to VK_RESOLVE_MODE_NONE, the resolveImageView member of that element of pColorAttachments must have been created with the identity swizzle
• VUID-VkRenderingInfo-pDepthAttachment-09481
  If pDepthAttachment is not NULL and pDepthAttachment->imageView is not VK_NULL_HANDLE,
  pDepthAttachment->imageView must have been created with the identity swizzle

• VUID-VkRenderingInfo-pDepthAttachment-09482
  If pDepthAttachment is not NULL, pDepthAttachment->imageView is not VK_NULL_HANDLE, and
  pDepthAttachment->resolveMode is not VK_RESOLVE_MODE_NONE, pDepthAttachment->resolveImageView must have been created with the identity swizzle

• VUID-VkRenderingInfo-pStencilAttachment-09483
  If pStencilAttachment is not NULL and pStencilAttachment->imageView is not VK_NULL_HANDLE,
  pStencilAttachment->imageView must have been created with the identity swizzle

• VUID-VkRenderingInfo-pStencilAttachment-09484
  If pStencilAttachment is not NULL, pStencilAttachment->imageView is not VK_NULL_HANDLE,
  and pStencilAttachment->resolveMode is not VK_RESOLVE_MODE_NONE, pStencilAttachment->resolveImageView must have been created with the identity swizzle

• VUID-VkRenderingInfo-imageView-09485
  If the imageView member of a VkRenderingFragmentShadingRateAttachmentInfoKHR structure included in the pNext chain is not VK_NULL_HANDLE, it must have been created with the identity swizzle

• VUID-VkRenderingInfo-imageView-09486
  If the imageView member of a VkRenderingFragmentDensityMapAttachmentInfoEXT structure included in the pNext chain is not VK_NULL_HANDLE, it must have been created with the identity swizzle

Valid Usage (Implicit)

• VUID-VkRenderingInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_RENDERING_INFO

• VUID-VkRenderingInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkDeviceGroupRenderPassBeginInfo,
  VkMultisampledRenderToSingleSampledInfoEXT,
  VkMultiviewPerViewAttributesInfoNVX,
  VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM,
  VkRenderPassStripeBeginInfoARM,
  VkRenderingFragmentDensityMapAttachmentInfoEXT,
  or
  VkRenderingFragmentShadingRateAttachmentInfoKHR

• VUID-VkRenderingInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

• VUID-VkRenderingInfo-flags-parameter
  flags must be a valid combination of VkRenderingFlagBits values

• VUID-VkRenderingInfo-pColorAttachments-parameter
  If colorAttachmentCount is not 0, pColorAttachments must be a valid pointer to an array of
colorAttachmentCount valid VkRenderingAttachmentInfo structures

- VUID-VkRenderingInfo-pDepthAttachment-parameter
  If pDepthAttachment is not NULL, pDepthAttachment must be a valid pointer to a valid VkRenderingAttachmentInfo structure

- VUID-VkRenderingInfo-pStencilAttachment-parameter
  If pStencilAttachment is not NULL, pStencilAttachment must be a valid pointer to a valid VkRenderingAttachmentInfo structure

Bits which can be set in VkRenderingInfo::flags describing additional properties of the render pass are:

```c
// Provided by VK_VERSION_1_3
typedef enum VkRenderingFlagBits {
    VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT = 0x00000001,
    VK_RENDERING_SUSPENDING_BIT = 0x00000002,
    VK_RENDERING_RESUMING_BIT = 0x00000004,
    // Provided by VK_EXT_legacy_dithering with (VK_KHR_dynamic_rendering or VK_VERSION_1_3) and VK_KHR_maintenance5
    VK_RENDERING_ENABLE_LEGACY_DITHERING_BIT_EXT = 0x00000008,
    // Provided by VK_KHR_maintenance7
    VK_RENDERING_CONTENTS_INLINE_BIT_KHR = 0x00000010,
    VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT_KHR = VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT,
    VK_RENDERING_SUSPENDING_BIT_KHR = VK_RENDERING_SUSPENDING_BIT,
    VK_RENDERING_RESUMING_BIT_KHR = VK_RENDERING_RESUMING_BIT,
    // Provided by VK_EXT_nested_command_buffer
    VK_RENDERING_CONTENTS_INLINE_BIT_EXT = VK_RENDERING_CONTENTS_INLINE_BIT_KHR
} VkRenderingFlagBits;
```

or the equivalent

```c
// Provided by VK_KHR_dynamic_rendering
typedef VkRenderingFlagBits VkRenderingFlagBitsKHR;
```

- `VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT` specifies that draw calls for the render pass instance will be recorded in secondary command buffers. If the nestedCommandBuffer feature is enabled, the draw calls can come from both inline and vkCmdExecuteCommands.
- `VK_RENDERING_RESUMING_BIT` specifies that the render pass instance is resuming an earlier suspended render pass instance.
- `VK_RENDERING_SUSPENDING_BIT` specifies that the render pass instance will be suspended.
- `VK_RENDERING_ENABLE_LEGACY_DITHERING_BIT_EXT` specifies that Legacy Dithering is enabled for the render pass instance.
- `VK_RENDERING_CONTENTS_INLINE_BIT_KHR` specifies that draw calls for the render pass instance can be recorded inline within the current command buffer. This can be combined with the
VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT bit to allow draw calls to be recorded both inline and in secondary command buffers.

The contents of pRendererInfo must match between suspended render pass instances and the render pass instances that resume them, other than the presence or absence of the VK_RENDERING_RESUMING_BIT, VK_RENDERING_SUSPENDING_BIT, and VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT flags. No action or synchronization commands, or other render pass instances, are allowed between suspending and resuming render pass instances.

// Provided by VK_VERSION_1_3
typedef VkFlags VkRenderingFlags;

or the equivalent

// Provided by VK_KHR_dynamic_rendering
typedef VkRenderingFlags VkRenderingFlagsKHR;

VkRenderingFlags is a bitmask type for setting a mask of zero or more VkRenderingFlagBits.

The VkRenderingAttachmentInfo structure is defined as:

// Provided by VK_VERSION_1_3
typedef struct VkRenderingAttachmentInfo {
    VkStructureType sType;
    const void* pNext;
    VkImageView imageView;
    VkImageLayout imageLayout;
    VkResolveModeFlagBits resolveMode;
    VkResolveImageView resolveImageView;
    VkImageLayout resolveImageLayout;
    VkAttachmentLoadOp loadOp;
    VkAttachmentStoreOp storeOp;
    VkClearValue clearValue;
} VkRenderingAttachmentInfo;

or the equivalent

// Provided by VK_KHR_dynamic_rendering
typedef VkRenderingAttachmentInfo VkRenderingAttachmentInfoKHR;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• imageView is the image view that will be used for rendering.
• `imageLayout` is the layout that `imageView` will be in during rendering.

• `resolveMode` is a `VkResolveModeFlagBits` value defining how data written to `imageView` will be resolved into `resolveImageView`.

• `resolveImageView` is an image view used to write resolved data at the end of rendering.

• `resolveImageLayout` is the layout that `resolveImageView` will be in during rendering.

• `loadOp` is a `VkAttachmentLoadOp` value defining the load operation for the attachment.

• `storeOp` is a `VkAttachmentStoreOp` value defining the store operation for the attachment.

• `clearValue` is a `VkClearValue` structure defining values used to clear `imageView` when `loadOp` is `VK_ATTACHMENT_LOAD_OP_CLEAR`.

Values in `imageView` are loaded and stored according to the values of `loadOp` and `storeOp`, within the render area for each device specified in `VkRenderingInfo`. If `imageView` is `VK_NULL_HANDLE`, and `resolveMode` is not `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`, other members of this structure are ignored; writes to this attachment will be discarded, and no load, store, or multisample resolve operations will be performed.

If `resolveMode` is `VK_RESOLVE_MODE_NONE`, then `resolveImageView` is ignored. If `resolveMode` is not `VK_RESOLVE_MODE_NONE`, and `resolveImageView` is not `VK_NULL_HANDLE`, a render pass multisample resolve operation is defined for the attachment subresource. If `resolveMode` is `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`, and the `nullColorAttachmentWithExternalFormatResolve` limit is `VK_TRUE`, values are only undefined once load operations have completed.

**NOTE**

The resolve mode and store operation are independent; it is valid to write both resolved and unresolved values, and equally valid to discard the unresolved values while writing the resolved ones.

Store and resolve operations are only performed at the end of a render pass instance that does not specify the `VK_RENDERING_SUSPENDING_BIT_KHR` flag.

Load operations are only performed at the beginning of a render pass instance that does not specify the `VK_RENDERING_RESUMING_BIT_KHR` flag.

Image contents at the end of a suspended render pass instance remain defined for access by a resuming render pass instance.

If the `nullColorAttachmentWithExternalFormatResolve` limit is `VK_TRUE`, and `resolveMode` is `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`, values in the color attachment will be loaded from the resolve attachment at the start of rendering, and may also be reloaded any time after a resolve occurs or the resolve attachment is written to; if this occurs it must happen-before any writes to the color attachment are performed which happen-after the resolve that triggers this. If any color component in the external format is subsampled, values will be read from the nearest sample in the image when they are loaded.
Valid Usage

- VUID-VkRenderingAttachmentInfo-imageView-06129
  If `imageView` is not `VK_NULL_HANDLE` and has a non-integer color format, `resolveMode` must be `VK_RESOLVE_MODE_NONE` or `VK_RESOLVE_MODE_AVERAGE_BIT`.

- VUID-VkRenderingAttachmentInfo-imageView-06130
  If `imageView` is not `VK_NULL_HANDLE` and has an integer color format, `resolveMode` must be `VK_RESOLVE_MODE_NONE` or `VK_RESOLVE_MODE_SAMPLE_ZERO_BIT`.

- VUID-VkRenderingAttachmentInfo-imageView-06861
  `imageView` must not have a sample count of `VK_SAMPLE_COUNT_1_BIT` if all of the following hold:
  - `imageView` is not `VK_NULL_HANDLE`
  - `resolveMode` is not `VK_RESOLVE_MODE_NONE`
  - the `pNext` chain of `VkRenderingInfo` does not include a `VkMultisampledRenderToSingleSampledInfoEXT` structure with the `multisampledRenderToSingleSampledEnable` field equal to `VK_TRUE`.

- VUID-VkRenderingAttachmentInfo-imageView-06862
  `resolveImageView` must not be `VK_NULL_HANDLE` if all of the following hold:
  - `imageView` is not `VK_NULL_HANDLE`
  - `resolveMode` is not `VK_RESOLVE_MODE_NONE`
  - the `pNext` chain of `VkRenderingInfo` does not include a `VkMultisampledRenderToSingleSampledInfoEXT` structure with the `multisampledRenderToSingleSampledEnable` field equal to `VK_TRUE`.

- VUID-VkRenderingAttachmentInfo-imageView-06863
  If `imageView` is not `VK_NULL_HANDLE`, `resolveMode` is not `VK_RESOLVE_MODE_NONE`, the `pNext` chain of `VkRenderingInfo` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure with the `multisampledRenderToSingleSampledEnable` field equal to `VK_TRUE`, and `imageView` has a sample count of `VK_SAMPLE_COUNT_1_BIT`, `resolveImageView` must be `VK_NULL_HANDLE`.

- VUID-VkRenderingAttachmentInfo-imageView-06864
  If `imageView` is not `VK_NULL_HANDLE`, `resolveImageView` is not `VK_NULL_HANDLE`, and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageView` must have a sample count of `VK_SAMPLE_COUNT_1_BIT`.

- VUID-VkRenderingAttachmentInfo-imageView-06865
  If `imageView` is not `VK_NULL_HANDLE`, `resolveImageView` is not `VK_NULL_HANDLE`, and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `imageView` and `resolveImageView` must have the same `VkFormat`.

- VUID-VkRenderingAttachmentInfo-imageView-06135
  If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` must not be `VK_IMAGE_LAYOUT_UNDEFINED`, `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL`, `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`, or `VK_IMAGE_LAYOUT_PREINITIALIZED`.

- VUID-VkRenderingAttachmentInfo-imageView-06136
If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageLayout` must not be `VK_IMAGE_LAYOUT_UNDEFINED`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL`, or `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`, or `VK_IMAGE_LAYOUT_PREINITIALIZED`

- VUID-VkRenderingAttachmentInfo-imageView-06137
  If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkRenderingAttachmentInfo-imageView-06138
  If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` must not be `VK_IMAGE_LAYOUT_SHADING_RATE_OPTIMAL_NV`

- VUID-VkRenderingAttachmentInfo-imageView-06139
  If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageLayout` must not be `VK_IMAGE_LAYOUT_SHADING_RATE_OPTIMAL_NV`

- VUID-VkRenderingAttachmentInfo-imageView-06140
  If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` must not be `VK_IMAGE_LAYOUT_FRAGMENT_DENSITY_MAP_OPTIMAL_EXT`

- VUID-VkRenderingAttachmentInfo-imageView-06141
  If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageLayout` must not be `VK_IMAGE_LAYOUT_FRAGMENT_DENSITY_MAP_OPTIMAL_EXT`

- VUID-VkRenderingAttachmentInfo-imageView-06142
  If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageLayout` must not be `VK_IMAGE_LAYOUT_FRAGMENT_DENSITY_MAP_OPTIMAL_EXT`

- VUID-VkRenderingAttachmentInfo-imageView-06143
  If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` must not be `VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR`

- VUID-VkRenderingAttachmentInfo-imageView-06144
  If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageLayout` must not be `VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR`

- VUID-VkRenderingAttachmentInfo-imageView-06145
  If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` must not be `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`

- VUID-VkRenderingAttachmentInfo-imageView-06146
  If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageLayout` must not be `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`

- VUID-VkRenderingAttachmentInfo-externalFormatResolve-09323
  If `externalFormatResolve` is not enabled, `resolveMode` must not be `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`

- VUID-VkRenderingAttachmentInfo-resolveMode-09324
  If `resolveMode` is `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`, `resolveImageView` must be a valid image view
If the `nullColorAttachmentWithExternalFormatResolve` property is `VK_TRUE` and `resolveMode` is `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`, `resolveImageView` must have been created with an image with a `samples` value of `VK_SAMPLE_COUNT_1_BIT`.

If `resolveMode` is `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`, `resolveImageView` must have been created with an external format specified by `VkExternalFormatANDROID`.

If `resolveMode` is `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`, `resolveImageView` must have been created with a `subresourceRange.layerCount` of 1.

If `resolveMode` is `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID` and `nullColorAttachmentWithExternalFormatResolve` is `VK_TRUE`, `imageView` must be `VK_NULL_HANDLE`.

If `resolveMode` is `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID` and `nullColorAttachmentWithExternalFormatResolve` is `VK_FALSE`, `imageView` must be a valid `VkImageView`.

If `resolveMode` is `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID` and `nullColorAttachmentWithExternalFormatResolve` is `VK_FALSE`, `imageView` must have a format equal to the value of `VkAndroidHardwareBufferFormatResolvePropertiesANDROID::colorAttachmentFormat` as returned by a call to `vkGetAndroidHardwareBufferPropertiesANDROID` for the Android hardware buffer that was used to create `resolveImageView`.

---

**Valid Usage (Implicit)**

- **VUID-VkRenderingAttachmentInfo-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_RENDERING_ATTACHMENT_INFO`.

- **VUID-VkRenderingAttachmentInfo-pNext-pNext**
  
  `pNext` must be `NULL`.

- **VUID-VkRenderingAttachmentInfo-imageView-parameter**
  
  If `imageView` is not `VK_NULL_HANDLE`, `imageView` must be a valid `VkImageView` handle.

- **VUID-VkRenderingAttachmentInfo-imageLayout-parameter**
  
  `imageLayout` must be a valid `VkImageLayout` value.

- **VUID-VkRenderingAttachmentInfo-resolveMode-parameter**
  
  If `resolveMode` is not `0`, `resolveMode` must be a valid `VkResolveModeFlagBits` value.

- **VUID-VkRenderingAttachmentInfo-resolveImageView-parameter**
  
  If `resolveImageView` is not `VK_NULL_HANDLE`, `resolveImageView` must be a valid `VkImageView` handle.
• VUID-VkRenderingAttachmentInfo-resolveImageLayout-parameter
  resolveImageLayout must be a valid VkImageLayout value

• VUID-VkRenderingAttachmentInfo-loadOp-parameter
  loadOp must be a valid VkAttachmentLoadOp value

• VUID-VkRenderingAttachmentInfo-storeOp-parameter
  storeOp must be a valid VkAttachmentStoreOp value

• VUID-VkRenderingAttachmentInfo-clearValue-parameter
  clearValue must be a valid VkClearValue union

• VUID-VkRenderingAttachmentInfo-commonparent
  Both of imageView, and resolveImageView that are valid handles of non-ignored parameters
  must have been created, allocated, or retrieved from the same VkDevice

The VkRenderingFragmentShadingRateAttachmentInfoKHR structure is defined as:

```
// Provided by VK_KHR_dynamic_rendering with VK_KHR_fragment_shading_rate
typedef struct VkRenderingFragmentShadingRateAttachmentInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkImageView imageView;
    VkImageLayout imageLayout;
    VkExtent2D shadingRateAttachmentTexelSize;
} VkRenderingFragmentShadingRateAttachmentInfoKHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• imageView is the image view that will be used as a fragment shading rate attachment.
• imageLayout is the layout that imageView will be in during rendering.
• shadingRateAttachmentTexelSize specifies the number of pixels corresponding to each texel in imageView.

This structure can be included in the pNext chain of VkRenderingInfo to define a fragment shading rate attachment. If imageView is VK_NULL_HANDLE, or if this structure is not specified, the implementation behaves as if a valid shading rate attachment was specified with all texels specifying a single pixel per fragment.

**Valid Usage**

• VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06147
  If imageView is not VK_NULL_HANDLE, layout must be VK_IMAGE_LAYOUT_GENERAL or
  VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR

• VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06148
  If imageView is not VK_NULL_HANDLE, it must have been created with
  VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR
• **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06149**
  If `imageView` is not `VK_NULL_HANDLE`, `shadingRateAttachmentTexelSize.width` **must** be a power of two value.

• **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06150**
  If `imageView` is not `VK_NULL_HANDLE`, `shadingRateAttachmentTexelSize.width` **must** be less than or equal to `maxFragmentShadingRateAttachmentTexelSize.width`.

• **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06151**
  If `imageView` is not `VK_NULL_HANDLE`, `shadingRateAttachmentTexelSize.width` **must** be greater than or equal to `minFragmentShadingRateAttachmentTexelSize.width`.

• **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06152**
  If `imageView` is not `VK_NULL_HANDLE`, `shadingRateAttachmentTexelSize.height` **must** be a power of two value.

• **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06153**
  If `imageView` is not `VK_NULL_HANDLE`, `shadingRateAttachmentTexelSize.height` **must** be less than or equal to `maxFragmentShadingRateAttachmentTexelSize.height`.

• **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06154**
  If `imageView` is not `VK_NULL_HANDLE`, `shadingRateAttachmentTexelSize.height` **must** be greater than or equal to `minFragmentShadingRateAttachmentTexelSize.height`.

• **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06155**
  If `imageView` is not `VK_NULL_HANDLE`, the quotient of `shadingRateAttachmentTexelSize.width` and `shadingRateAttachmentTexelSize.height` **must** be less than or equal to `maxFragmentShadingRateAttachmentTexelSizeAspectRatio`.

• **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06156**
  If `imageView` is not `VK_NULL_HANDLE`, the quotient of `shadingRateAttachmentTexelSize.height` and `shadingRateAttachmentTexelSize.width` **must** be less than or equal to `maxFragmentShadingRateAttachmentTexelSizeAspectRatio`.

---

**Valid Usage (Implicit)**

• **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-sType-sType**
  `sType` **must** be `VK_STRUCTURE_TYPE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_INFO_KHR`.

• **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-parameter**
  If `imageView` is not `VK_NULL_HANDLE`, `imageView` **must** be a valid `VkImageView` handle.

• **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageLayout-parameter**
  `imageLayout` **must** be a valid `VkImageLayout` value.

The `VkRenderingFragmentDensityMapAttachmentInfoEXT` structure is defined as:
// Provided by VK_KHR_dynamic_rendering with VK_EXT_fragment_density_map

typedef struct VkRenderingFragmentDensityMapAttachmentInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkImageView imageView;
    VkImageLayout imageLayout;
} VkRenderingFragmentDensityMapAttachmentInfoEXT;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **imageView** is the image view that will be used as a fragment density map attachment.
- **imageLayout** is the layout that imageView will be in during rendering.

This structure can be included in the pNext chain of VkRenderingInfo to define a fragment density map. If this structure is not included in the pNext chain, imageView is treated as VK_NULL_HANDLE.

### Valid Usage

- **VUID-VkRenderingFragmentDensityMapAttachmentInfoEXT-imageView-06157**
  If imageView is not VK_NULL_HANDLE, imageLayout must be VK_IMAGE_LAYOUT_GENERAL or VK_IMAGE_LAYOUT_FRAGMENT_DENSITY_MAP_OPTIMAL_EXT

- **VUID-VkRenderingFragmentDensityMapAttachmentInfoEXT-imageView-06158**
  If imageView is not VK_NULL_HANDLE, it must have been created with VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT

- **VUID-VkRenderingFragmentDensityMapAttachmentInfoEXT-imageView-06159**
  If imageView is not VK_NULL_HANDLE, it must not have been created with VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT

- **VUID-VkRenderingFragmentDensityMapAttachmentInfoEXT-apiVersion-07908**
  If the multiview feature is not enabled, VkPhysicalDeviceProperties::apiVersion is less than Vulkan 1.1, and imageView is not VK_NULL_HANDLE, it must have a layerCount equal to 1

### Valid Usage (Implicit)

- **VUID-VkRenderingFragmentDensityMapAttachmentInfoEXT-sType-sType**
  sType must be VK_STRUCTURE_TYPE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_INFO_EXT

- **VUID-VkRenderingFragmentDensityMapAttachmentInfoEXT-imageView-parameter**
  imageView must be a valid VkImageView handle

- **VUID-VkRenderingFragmentDensityMapAttachmentInfoEXT-imageLayout-parameter**
  imageLayout must be a valid VkImageLayout value

To query the render area granularity for a render pass instance, call:
// Provided by VK_KHR_maintenance5
void vkGetRenderingAreaGranularityKHR(
    VkDevice device,
    const VkRenderingAreaInfoKHR* pRenderingAreaInfo,
    VkExtent2D* pGranularity);

- `device` is the logical device that owns the render pass instance.
- `pRenderingAreaInfo` is a pointer to a `VkRenderingAreaInfoKHR` structure specifying details of the render pass instance to query the render area granularity for.
- `pGranularity` is a pointer to a `VkExtent2D` structure in which the granularity is returned.

The conditions leading to an optimal renderArea are:

- the `offset.x` member in `renderArea` is a multiple of the `width` member of the returned `VkExtent2D` (the horizontal granularity).
- the `offset.y` member in `renderArea` is a multiple of the `height` member of the returned `VkExtent2D` (the vertical granularity).
- either the `extent.width` member in `renderArea` is a multiple of the horizontal granularity or `offset.x+extent.width` is equal to the `width` of each attachment used in the render pass instance.
- either the `extent.height` member in `renderArea` is a multiple of the vertical granularity or `offset.y+extent.height` is equal to the `height` of each attachment used in the render pass instance.

**Valid Usage (Implicit)**

- VUID-vkGetRenderingAreaGranularityKHR-device-parameter `device` must be a valid `VkDevice` handle
- VUID-vkGetRenderingAreaGranularityKHR-pRenderingAreaInfo-parameter `pRenderingAreaInfo` must be a valid pointer to a valid `VkRenderingAreaInfoKHR` structure
- VUID-vkGetRenderingAreaGranularityKHR-pGranularity-parameter `pGranularity` must be a valid pointer to a `VkExtent2D` structure

The `VkRenderingAreaInfoKHR` structure is defined as:
typedef struct VkRenderingAreaInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t viewMask;
    uint32_t colorAttachmentCount;
    const VkFormat* pColorAttachmentFormats;
    VkFormat depthAttachmentFormat;
    VkFormat stencilAttachmentFormat;
} VkRenderingAreaInfoKHR;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **viewMask** is the viewMask used for rendering.
- **colorAttachmentCount** is the number of entries in **pColorAttachmentFormats**
- **pColorAttachmentFormats** is a pointer to an array of VkFormat values defining the format of color attachments used in the render pass instance.
- **depthAttachmentFormat** is a VkFormat value defining the format of the depth attachment used in the render pass instance.
- **stencilAttachmentFormat** is a VkFormat value defining the format of the stencil attachment used in the render pass instance.

**Valid Usage (Implicit)**

- VUID-VkRenderingContextAreaInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_RENDERING_AREA_INFO_KHR
- VUID-VkRenderingContextAreaInfoKHR-pNext-pNext
  pNext must be NULL

The VkRenderPassStripeBeginInfoARM structure is defined as:

```
// Provided by VK_ARM_render_pass_striped
typedef struct VkRenderPassStripeBeginInfoARM {
    VkStructureType sType;
    const void* pNext;
    uint32_t stripeInfoCount;
    const VkRenderPassStripeInfoARM* pStripeInfos;
} VkRenderPassStripeBeginInfoARM;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **stripeInfoCount** is the number of stripes in this render pass instance.
• `pStripeInfos` is a pointer to an array of `stripeInfoCount` `VkRenderPassStripeInfoARM` structures describing the stripes used by the render pass instance.

This structure can be included in the `pNext` chain of `VkRenderPassBeginInfo` or `VkRenderingInfo` to define how the render pass instance is split into stripes.

### Valid Usage

- **VUID-VkRenderPassStripeBeginInfoARM-stripeInfoCount-09450**
  `stripeInfoCount` must be less than or equal to `VkPhysicalDeviceRenderPassStripedPropertiesARM::maxRenderPassStripes`

- **VUID-VkRenderPassStripeBeginInfoARM-stripeArea-09451**
  The `stripeArea` defined by each element of `pStripeInfos` must not overlap the `stripeArea` of any other element

### Valid Usage (Implicit)

- **VUID-VkRenderPassStripeBeginInfoARM-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_RENDER_PASS_STRIPED_BEGIN_INFO_ARM`

- **VUID-VkRenderPassStripeBeginInfoARM-pStripeInfos-parameter**
  `pStripeInfos` must be a valid pointer to an array of `stripeInfoCount` valid `VkRenderPassStripeInfoARM` structures

- **VUID-VkRenderPassStripeBeginInfoARM-stripeInfoCount-arraylength**
  `stripeInfoCount` must be greater than 0

The `VkRenderPassStripeInfoARM` structure is defined as:

```c
// Provided by VK_ARM_render_pass_striped
typedef struct VkRenderPassStripeInfoARM {
    VkStructureType sType;
    const void* pNext;
    VkRect2D stripeArea;
} VkRenderPassStripeInfoARM;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stripeArea` is the stripe area, and is described in more detail below.

`stripeArea` is the render area that is affected by this stripe of the render pass instance. It must be a subregion of the `renderArea` of the render pass instance.
Valid Usage

- VUID-VkRenderPassStripeInfoARM-stripeArea-09452
  \[
  \text{stripeArea.offset.x} \quad \text{must} \quad \text{be a multiple of} \quad \text{VkPhysicalDeviceRenderPassStripedPropertiesARM::renderPassStripeGranularity.width}
  \]

- VUID-VkRenderPassStripeInfoARM-stripeArea-09453
  \[
  \text{stripeArea.extent.width} \quad \text{must} \quad \text{be a multiple of} \quad \text{VkPhysicalDeviceRenderPassStripedPropertiesARM::renderPassStripeGranularity.width}, \quad \text{or the sum of} \quad \text{stripeArea.offset.x} \quad \text{and} \quad \text{stripeArea.extent.width} \quad \text{must be equal to the} \quad \text{renderArea.extent.width} \quad \text{of the render pass instance}
  \]

- VUID-VkRenderPassStripeInfoARM-stripeArea-09454
  \[
  \text{stripeArea.offset.y} \quad \text{must} \quad \text{be a multiple of} \quad \text{VkPhysicalDeviceRenderPassStripedPropertiesARM::renderPassStripeGranularity.height}
  \]

- VUID-VkRenderPassStripeInfoARM-stripeArea-09455
  \[
  \text{stripeArea.extent.height} \quad \text{must} \quad \text{be a multiple of} \quad \text{VkPhysicalDeviceRenderPassStripedPropertiesARM::renderPassStripeGranularity.height}, \quad \text{or the sum of} \quad \text{stripeArea.offset.y} \quad \text{and} \quad \text{stripeArea.extent.height} \quad \text{must be equal to the} \quad \text{renderArea.extent.height} \quad \text{of the render pass instance}
  \]

Valid Usage (Implicit)

- VUID-VkRenderPassStripeInfoARM-sType-sType
  \[
  \text{sType must be} \quad \text{VK_STRUCTURE_TYPE_RENDER_PASS_STRIPE_INFO_ARM}
  \]

- VUID-VkRenderPassStripeInfoARM-pNext-pNext
  \[
  \text{pNext must be} \quad \text{NULL}
  \]

To end a render pass instance, call:

```c
// Provided by VK_VERSION_1_3
goOid vkCmdEndRendering(
    VkCommandBuffer commandBuffer);
```

or the equivalent command

```c
// Provided by VK_KHR_dynamic_rendering
goOid vkCmdEndRenderingKHR(
    VkCommandBuffer commandBuffer);
```

- `commandBuffer` is the command buffer in which to record the command.

If the value of `pRenderingInfo->flags` used to begin this render pass instance included `VK_RENDERING_SUSPENDING_BIT`, then this render pass is suspended and will be resumed later in submission order.
Valid Usage

- VUID-vkCmdEndRendering-None-06161
  The current render pass instance must have been begun with vkCmdBeginRendering

- VUID-vkCmdEndRendering-commandBuffer-06162
  The current render pass instance must have been begun in commandBuffer

- VUID-vkCmdEndRendering-None-06781
  This command must not be recorded when transform feedback is active

- VUID-vkCmdEndRendering-None-06999
  If vkCmdBeginQuery* was called within the render pass, the corresponding vkCmdEndQuery* must have been called subsequently within the same subpass

Valid Usage (Implicit)

- VUID-vkCmdEndRendering-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdEndRendering-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdEndRendering-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdEndRendering-renderpass
  This command must only be called inside of a render pass instance

- VUID-vkCmdEndRendering-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>

</tbody>
</table>
For more complex rendering graphs, it is possible to pre-define a static render pass object, which as well as allowing draw commands, allows the definition of framebuffer-local dependencies between multiple subpasses. These objects have a lot of setup cost compared to \texttt{vkCmdBeginRendering}, but use of subpass dependencies can confer important performance benefits on some devices.

The \texttt{VkTilePropertiesQCOM} structure is defined as:

```c
// Provided by VK_QCOM_tile_properties
typedef struct VkTilePropertiesQCOM {
    VkStructureType sType;
    void* pNext;
    VkExtent3D tileSize;
    VkExtent2D apronSize;
    VkOffset2D origin;
} VkTilePropertiesQCOM;
```

- \texttt{sType} is a \texttt{VkStructureType} value identifying this structure.
- \texttt{pNext} is NULL or a pointer to a structure extending this structure.
- \texttt{tileSize} is the dimensions of a tile, with width and height describing the width and height of a tile in pixels, and depth corresponding to the number of slices the tile spans.
- \texttt{apronSize} is the dimension of the apron.
- \texttt{origin} is the top-left corner of the first tile in attachment space.

All tiles will be tightly packed around the first tile, with edges being multiples of tile width and/or height from the origin.

Reported value for \texttt{apronSize} will be zero and its functionality will be described in a future extension.

**Valid Usage (Implicit)**

- \texttt{VUID-VkTilePropertiesQCOM-sType-sType} \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_TILE_PROPERTIES_QCOM}
- \texttt{VUID-VkTilePropertiesQCOM-pNext-pNext} \texttt{pNext} must be NULL

To query the tile properties when using dynamic rendering, call:
// Provided by VK_QCOM_tile_properties

VkResult vkGetDynamicRenderingTilePropertiesQCOM(
    VkDevice device,
    const VkRenderingInfo* pRenderingInfo,
    VkTilePropertiesQCOM* pProperties);

- **device** is a logical device associated with the render pass.
- **pRenderingInfo** is a pointer to the *VkRenderingInfo* structure specifying details of the render pass instance in dynamic rendering.
- **pProperties** is a pointer to a *VkTilePropertiesQCOM* structure in which the properties are returned.

**Valid Usage (Implicit)**

- VUID-vkGetDynamicRenderingTilePropertiesQCOM-device-parameter
  device must be a valid *VkDevice* handle
- VUID-vkGetDynamicRenderingTilePropertiesQCOM-pRenderingInfo-parameter
  pRenderingInfo must be a valid pointer to a valid *VkRenderingInfo* structure
- VUID-vkGetDynamicRenderingTilePropertiesQCOM-pProperties-parameter
  pProperties must be a valid pointer to a *VkTilePropertiesQCOM* structure

**Return Codes**

**Success**
- VK_SUCCESS

**Failure**
- None

### 8.1. Render Pass Objects

A render pass object represents a collection of attachments, subpasses, and dependencies between the subpasses, and describes how the attachments are used over the course of the subpasses.

Render passes are represented by *VkRenderPass* handles:

// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkRenderPass)

An *attachment description* describes the properties of an attachment including its format, sample count, and how its contents are treated at the beginning and end of each render pass instance.

A *subpass* represents a phase of rendering that reads and writes a subset of the attachments in a
render pass. Rendering commands are recorded into a particular subpass of a render pass instance.

A subpass description describes the subset of attachments that is involved in the execution of a subpass. Each subpass can read from some attachments as input attachments, write to some as color attachments or depth/stencil attachments, perform shader resolve operations to color_attachments or depth/stencil_attachments, and perform multisample resolve operations to resolve attachments. A subpass description can also include a set of preserve attachments, which are attachments that are not read or written by the subpass but whose contents must be preserved throughout the subpass.

A subpass uses an attachment if the attachment is a color, depth/stencil, resolve, depth/stencil resolve, fragment shading rate, or input attachment for that subpass (as determined by the pColorAttachments, pDepthStencilAttachment, pResolveAttachments, VkSubpassDescriptionDepthStencilResolve::pDepthStencilResolveAttachment, VkFragmentShadingRateAttachmentInfoKHR::pFragmentShadingRateAttachment->attachment, and pInputAttachments members of VkSubpassDescription, respectively). A subpass does not use an attachment if that attachment is preserved by the subpass. The first use of an attachment is in the lowest numbered subpass that uses that attachment. Similarly, the last use of an attachment is in the highest numbered subpass that uses that attachment.

The subpasses in a render pass all render to the same dimensions, and fragments for pixel (x,y,layer) in one subpass can only read attachment contents written by previous subpasses at that same (x,y,layer) location. For multi-pixel fragments, the pixel read from an input attachment is selected from the pixels covered by that fragment in an implementation-dependent manner. However, this selection must be made consistently for any fragment with the same shading rate for the lifetime of the VkDevice.

By describing a complete set of subpasses in advance, render passes provide the implementation an opportunity to optimize the storage and transfer of attachment data between subpasses.

In practice, this means that subpasses with a simple framebuffer-space dependency may be merged into a single tiled rendering pass, keeping the attachment data on-chip for the duration of a render pass instance. However, it is also quite common for a render pass to only contain a single subpass.

Subpass dependencies describe execution and memory dependencies between subpasses.

A subpass dependency chain is a sequence of subpass dependencies in a render pass, where the source subpass of each subpass dependency (after the first) equals the destination subpass of the previous dependency.

Execution of subpasses may overlap or execute out of order with regards to other subpasses, unless otherwise enforced by an execution dependency. Each subpass only respects submission order for commands recorded in the same subpass, and the vkCmdBeginRenderPass and vkCmdEndRenderPass commands that delimit the render pass - commands within other subpasses are not included. This affects most other implicit ordering guarantees.

A render pass describes the structure of subpasses and attachments independent of any specific
image views for the attachments. The specific image views that will be used for the attachments, and their dimensions, are specified in `VkFramebuffer` objects. Framebuffers are created with respect to a specific render pass that the framebuffer is compatible with (see Render Pass Compatibility). Collectively, a render pass and a framebuffer define the complete render target state for one or more subpasses as well as the algorithmic dependencies between the subpasses.

The various pipeline stages of the drawing commands for a given subpass may execute concurrently and/or out of order, both within and across drawing commands, whilst still respecting pipeline order. However for a given (x,y,layer,sample) sample location, certain per-sample operations are performed in rasterization order.

`VK_ATTACHMENT_UNUSED` is a constant indicating that a render pass attachment is not used.

```c
#define VK_ATTACHMENT_UNUSED (~0U)
```

### 8.2. Render Pass Creation

To create a render pass, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateRenderPass(  
    VkDevice device,  
    const VkRenderPassCreateInfo* pCreateInfo,  
    const VkAllocationCallbacks* pAllocator,  
    VkRenderPass* pRenderPass);
```

- **device** is the logical device that creates the render pass.
- **pCreateInfo** is a pointer to a `VkRenderPassCreateInfo` structure describing the parameters of the render pass.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pRenderPass** is a pointer to a `VkRenderPass` handle in which the resulting render pass object is returned.

**Valid Usage**

- VUID-vkCreateRenderPass-device-10000
  
  `device` must support at least one queue family with the `VK_QUEUE_GRAPHICS_BIT` capability

**Valid Usage (Implicit)**

- VUID-vkCreateRenderPass-device-parameter
  
  `device` must be a valid `VkDevice` handle

- VUID-vkCreateRenderPass-pCreateInfo-parameter
pCreateInfo must be a valid pointer to a valid VkRenderPassCreateInfo structure

- VUID-vkCreateRenderPass-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateRenderPass-pRenderPass-parameter
  pRenderPass must be a valid pointer to a valid VkRenderPass handle

Return Codes

Success
  - VK_SUCCESS

Failure
  - VK_ERROR_OUT_OF_HOST_MEMORY
  - VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkRenderPassCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkRenderPassCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkRenderPassCreateFlags flags;
    uint32_t attachmentCount;
    const VkAttachmentDescription* pAttachments;
    uint32_t subpassCount;
    const VkSubpassDescription* pSubpasses;
    uint32_t dependencyCount;
    const VkSubpassDependency* pDependencies;
} VkRenderPassCreateInfo;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is a bitmask of VkRenderPassCreateFlagBits
- attachmentCount is the number of attachments used by this render pass.
- pAttachments is a pointer to an array of attachmentCount VkAttachmentDescription structures describing the attachments used by the render pass.
- subpassCount is the number of subpasses to create.
- pSubpasses is a pointer to an array of subpassCount VkSubpassDescription structures describing each subpass.
- dependencyCount is the number of memory dependencies between pairs of subpasses.
- pDependencies is a pointer to an array of dependencyCount VkSubpassDependency structures
describing dependencies between pairs of subpasses.

**NOTE**
Care should be taken to avoid a data race here; if any subpasses access attachments with overlapping memory locations, and one of those accesses is a write, a subpass dependency needs to be included between them.

---

### Valid Usage

- **VUID-VkRenderPassCreateInfo-attachment-00834**
  If the attachment member of any element of `pInputAttachments`, `pColorAttachments`, `pResolveAttachments` or `pDepthStencilAttachment`, or any element of `pPreserveAttachments` in any element of `pSubpasses` is not `VK_ATTACHMENT_UNUSED`, then it **must** be less than `attachmentCount`.

- **VUID-VkRenderPassCreateInfo-fragmentDensityMapAttachment-06471**
  If the `pNext` chain includes a `VkRenderPassFragmentDensityMapCreateInfoEXT` structure and the `fragmentDensityMapAttachment` member is not `VK_ATTACHMENT_UNUSED`, then attachment **must** be less than `attachmentCount`.

- **VUID-VkRenderPassCreateInfo-pAttachments-00836**
  For any member of `pAttachments` with a `loadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a layout equal to `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`.

- **VUID-VkRenderPassCreateInfo-pAttachments-02511**
  For any member of `pAttachments` with a `stencilLoadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a layout equal to `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`.

- **VUID-VkRenderPassCreateInfo-pAttachments-01566**
  For any member of `pAttachments` with a `loadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a layout equal to `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`.

- **VUID-VkRenderPassCreateInfo-pAttachments-01567**
  For any member of `pAttachments` with a `stencilLoadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a layout equal to `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`.

- **VUID-VkRenderPassCreateInfo-pNext-01926**
  If the `pNext` chain includes a `VkRenderPassInputAttachmentAspectCreateInfo` structure, the subpass member of each element of its `pAspectReferences` member **must** be less than `subpassCount`.

- **VUID-VkRenderPassCreateInfo-pNext-01927**
  If the `pNext` chain includes a `VkRenderPassInputAttachmentAspectCreateInfo` structure, the `inputAttachmentIndex` member of each element of its `pAspectReferences` member **must** be less than the value of `inputAttachmentCount` in the element of `pSubpasses` identified by its `subpass` member.
If the \texttt{pNext} chain includes a \texttt{VkRenderPassInputAttachmentAspectCreateInfo} structure, for any element of the \texttt{pInputAttachments} member of any element of \texttt{pSubpasses} where the \texttt{attachment} member is not \texttt{VK_ATTACHMENT_UNUSED}, the \texttt{aspectMask} member of the corresponding element of \texttt{VkRenderPassInputAttachmentAspectCreateInfo :: pAspectReferences} must only include aspects that are present in images of the format specified by the element of \texttt{pAttachments} at \texttt{attachment}.

If the \texttt{pNext} chain includes a \texttt{VkRenderPassMultiviewCreateInfo} structure, and its \texttt{subpassCount} member is not zero, that member must be equal to the value of \texttt{subpassCount}.

If the \texttt{pNext} chain includes a \texttt{VkRenderPassMultiviewCreateInfo} structure, if its \texttt{dependencyCount} member is not zero, it must be equal to \texttt{dependencyCount}.

If the \texttt{pNext} chain includes a \texttt{VkRenderPassMultiviewCreateInfo} structure, for each non-zero element of \texttt{pViewOffsets}, the \texttt{srcSubpass} and \texttt{dstSubpass} members of \texttt{pDependencies} at the same index must not be equal.

If the \texttt{pNext} chain includes a \texttt{VkRenderPassMultiviewCreateInfo} structure, for any element of \texttt{pDependencies} with a \texttt{dependencyFlags} member that does not include \texttt{VK_DEPENDENCY_VIEW_LOCAL_BIT}, the corresponding element of the \texttt{pViewOffsets} member of that \texttt{VkRenderPassMultiviewCreateInfo} instance must be 0.

If the \texttt{pNext} chain includes a \texttt{VkRenderPassMultiviewCreateInfo} structure, elements of its \texttt{pViewMasks} member must either all be 0, or all not be 0.

If the \texttt{pNext} chain includes a \texttt{VkRenderPassMultiviewCreateInfo} structure, and each element of its \texttt{pViewMasks} member is 0, its \texttt{correlationMaskCount} member must be 0.

For any element of \texttt{pDependencies}, if the \texttt{srcSubpass} is not \texttt{VK_SUBPASS_EXTERNAL}, all stage flags included in the \texttt{srcStageMask} member of that dependency must be a pipeline stage supported by the pipeline identified by the \texttt{pipelineBindPoint} member of the source subpass.

For any element of \texttt{pDependencies}, if the \texttt{dstSubpass} is not \texttt{VK_SUBPASS_EXTERNAL}, all stage flags included in the \texttt{dstStageMask} member of that dependency must be a pipeline stage supported by the pipeline identified by the \texttt{pipelineBindPoint} member of the destination subpass.

For any element of \texttt{pDependencies}, if its \texttt{srcSubpass} is not \texttt{VK_SUBPASS_EXTERNAL}, it must be
For any element of `pDependencies`, if its `dstSubpass` is not `VK_SUBPASS_EXTERNAL`, it must be less than `subpassCount`.

### Valid Usage (Implicit)

- **VUID-VkRenderPassCreateInfo-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_RENDER_PASS_CREATE_INFO`.

- **VUID-VkRenderPassCreateInfo-pNext-pNext**
  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkRenderPassFragmentDensityMapCreateInfoEXT`, `VkRenderPassInputAttachmentAspectCreateInfo`, or `VkRenderPassMultiviewCreateInfo`.

- **VUID-VkRenderPassCreateInfo-sType-unique**
  
  The `sType` value of each struct in the `pNext` chain must be unique.

- **VUID-VkRenderPassCreateInfo-flags-parameter**
  
  `flags` must be a valid combination of `VkRenderPassCreateFlagBits` values.

- **VUID-VkRenderPassCreateInfo-pAttachments-parameter**
  
  If `attachmentCount` is not `0`, `pAttachments` must be a valid pointer to an array of `attachmentCount` valid `VkAttachmentDescription` structures.

- **VUID-VkRenderPassCreateInfo-pSubpasses-parameter**
  
  `pSubpasses` must be a valid pointer to an array of `subpassCount` valid `VkSubpassDescription` structures.

- **VUID-VkRenderPassCreateInfo-pDependencies-parameter**
  
  If `dependencyCount` is not `0`, `pDependencies` must be a valid pointer to an array of `dependencyCount` valid `VkSubpassDependency` structures.

- **VUID-VkRenderPassCreateInfo-subpassCount-arraylength**
  
  `subpassCount` must be greater than `0`.

Bits which can be set in `VkRenderPassCreateInfo::flags`, describing additional properties of the render pass, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkRenderPassCreateFlagBits {
  // Provided by VK_QCOM_render_pass_transform
  VK_RENDER_PASS_CREATE_TRANSFORM_BIT_QCOM = 0x00000002,
} VkRenderPassCreateFlagBits;
```

- **`VK_RENDER_PASS_CREATE_TRANSFORM_BIT_QCOM`** specifies that the created render pass is compatible with render pass transform.
typedef VkFlags VkRenderPassCreateFlags;

VkRenderPassCreateFlags is a bitmask type for setting a mask of zero or more VkRenderPassCreateFlagBits.

If the VkRenderPassCreateInfo::pNext chain includes a VkRenderPassMultiviewCreateInfo structure, then that structure includes an array of view masks, view offsets, and correlation masks for the render pass.

The VkRenderPassMultiviewCreateInfo structure is defined as:

typedef struct VkRenderPassMultiviewCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t subpassCount;
    const uint32_t* pViewMasks;
    uint32_t dependencyCount;
    const int32_t* pViewOffsets;
    uint32_t correlationMaskCount;
    const uint32_t* pCorrelationMasks;
} VkRenderPassMultiviewCreateInfo;

or the equivalent

typedef VkRenderPassMultiviewCreateInfo VkRenderPassMultiviewCreateInfoKHR;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **subpassCount** is zero or the number of subpasses in the render pass.
- **pViewMasks** is a pointer to an array of subpassCount view masks, where each mask is a bitfield of view indices describing which views rendering is broadcast to in each subpass, when multiview is enabled. If subpassCount is zero, each view mask is treated as zero.
- **dependencyCount** is zero or the number of dependencies in the render pass.
- **pViewOffsets** is a pointer to an array of dependencyCount view offsets, one for each dependency. If dependencyCount is zero, each dependency’s view offset is treated as zero. Each view offset controls which views in the source subpass the views in the destination subpass depend on.
- **correlationMaskCount** is zero or the number of correlation masks.
- **pCorrelationMasks** is a pointer to an array of correlationMaskCount view masks indicating sets of views that may be more efficient to render concurrently.

When a subpass uses a non-zero view mask, multiview functionality is considered to be enabled.
Multiview is all-or-nothing for a render pass - that is, either all subpasses must have a non-zero view mask (though some subpasses may have only one view) or all must be zero. Multiview causes all drawing and clear commands in the subpass to behave as if they were broadcast to each view, where a view is represented by one layer of the framebuffer attachments. All draws and clears are broadcast to each view index whose bit is set in the view mask. The view index is provided in the ViewIndex shader input variable, and color, depth/stencil, and input attachments all read/write the layer of the framebuffer corresponding to the view index.

If the view mask is zero for all subpasses, multiview is considered to be disabled and all drawing commands execute normally, without this additional broadcasting.

Some implementations may not support multiview in conjunction with mesh shaders or tessellation shaders.

When multiview is enabled, the VK_DEPENDENCY_VIEW_LOCAL_BIT bit in a dependency can be used to express a view-local dependency, meaning that each view in the destination subpass depends on a single view in the source subpass. Unlike pipeline barriers, a subpass dependency can potentially have a different view mask in the source subpass and the destination subpass. If the dependency is view-local, then each view (dstView) in the destination subpass depends on the view dstView + pViewOffsets[dependency] in the source subpass. If there is not such a view in the source subpass, then this dependency does not affect that view in the destination subpass. If the dependency is not view-local, then all views in the destination subpass depend on all views in the source subpass, and the view offset is ignored. A non-zero view offset is not allowed in a self-dependency.

The elements of pCorrelationMasks are a set of masks of views indicating that views in the same mask may exhibit spatial coherency between the views, making it more efficient to render them concurrently. Correlation masks must not have a functional effect on the results of the multiview rendering.

When multiview is enabled, at the beginning of each subpass all non-render pass state is undefined. In particular, each time vkCmdBeginRenderPass or vkCmdNextSubpass is called the graphics pipeline must be bound, any relevant descriptor sets or vertex/index buffers must be bound, and any relevant dynamic state or push constants must be set before they are used.

A multiview subpass can declare that its shaders will write per-view attributes for all views in a single invocation, by setting the VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX bit in the subpass description. The only supported per-view attributes are position and viewport mask, and per-view position and viewport masks are written to output array variables decorated with PositionPerViewNV and ViewportMaskPerViewNV, respectively. If VK_NV_viewport_array2 is not supported and enabled, ViewportMaskPerViewNV must not be used. Values written to elements of PositionPerViewNV and ViewportMaskPerViewNV must not depend on the ViewIndex. The shader must also write to an output variable decorated with Position, and the value written to Position must equal the value written to PositionPerViewNV[ViewIndex]. Similarly, if ViewportMaskPerViewNV is written to then the shader must also write to an output variable decorated with ViewportMaskNV, and the value written to ViewportMaskNV must equal the value written to ViewportMaskPerViewNV [ViewIndex]. Implementations will either use values taken from Position and ViewportMaskNV and invoke the shader once for each view, or will use values taken from PositionPerViewNV and ViewportMaskPerViewNV and invoke the shader fewer times. The values written to Position and ViewportMaskNV must not depend on the values written to PositionPerViewNV and.
ViewportMaskPerViewNV, or vice versa (to allow compilers to eliminate the unused outputs). All attributes that do not have *PerViewNV counterparts must not depend on ViewIndex.

Per-view attributes are all-or-nothing for a subpass. That is, all pipelines compiled against a subpass that includes the VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX bit must write per-view attributes to the *PerViewNV[] shader outputs, in addition to the non-per-view (e.g. Position) outputs. Pipelines compiled against a subpass that does not include this bit must not include the *PerViewNV[] outputs in their interfaces.

Valid Usage

- VUID-VkRenderPassMultiviewCreateInfo-pCorrelationMasks-00841
  Each view index must not be set in more than one element of pCorrelationMasks

- VUID-VkRenderPassMultiviewCreateInfo-multiview-06555
  If the multiview feature is not enabled, each element of pViewMasks must be 0

- VUID-VkRenderPassMultiviewCreateInfo-pViewMasks-06697
  The index of the most significant bit in each element of pViewMasks must be less than maxMultiviewViewCount

Valid Usage (Implicit)

- VUID-VkRenderPassMultiviewCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_RENDER_PASS_MULTIVIEW_CREATE_INFO

- VUID-VkRenderPassMultiviewCreateInfo-pViewMasks-parameter
  If subpassCount is not 0, pViewMasks must be a valid pointer to an array of subpassCount uint32_t values

- VUID-VkRenderPassMultiviewCreateInfo-pViewOffsets-parameter
  If dependencyCount is not 0, pViewOffsets must be a valid pointer to an array of dependencyCount int32_t values

- VUID-VkRenderPassMultiviewCreateInfo-pCorrelationMasks-parameter
  If correlationMaskCount is not 0, pCorrelationMasks must be a valid pointer to an array of correlationMaskCount uint32_t values

The VkMultiviewPerViewAttributesInfoNVX structure is defined as:

```c
// Provided by VK_KHR_dynamic_rendering with VK_NVX_multiview_per_view_attributes
typedef struct VkMultiviewPerViewAttributesInfoNVX {
    VkStructureType   sType;
    const void*       pNext;
    VkBool32          perViewAttributes;
    VkBool32          perViewAttributesPositionXOnly;
} VkMultiviewPerViewAttributesInfoNVX;
```

- sType is a VkStructureType value identifying this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.

• `perViewAttributes` specifies that shaders compiled for this pipeline write the attributes for all views in a single invocation of each vertex processing stage. All pipelines executed within a render pass instance that includes this bit must write per-view attributes to the *PerViewNV[]* shader outputs, in addition to the non-per-view (e.g. Position) outputs.

• `perViewAttributesPositionXOnly` specifies that shaders compiled for this pipeline use per-view positions which only differ in value in the x component. Per-view viewport mask can also be used.

When dynamic render pass instances are being used, instead of specifying `VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX` or `VK_SUBPASS_DESCRIPTION_PER_VIEW_POSITION_X_ONLY_BIT_NVX` in the subpass description flags, the per-attribute properties of the render pass instance must be specified by the `VkMultiviewPerViewAttributesInfoNVX` structure. Include the `VkMultiviewPerViewAttributesInfoNVX` structure in the `pNext` chain of `VkGraphicsPipelineCreateInfo` when creating a graphics pipeline for dynamic rendering, `VkRenderingInfo` when starting a dynamic render pass instance, and `VkCommandBufferInheritanceInfo` when specifying the dynamic render pass instance parameters for secondary command buffers.

Valid Usage (Implicit)

• VUID-VkMultiviewPerViewAttributesInfoNVX-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_MULTIVIEW_PER_VIEW_ATTRIBUTES_INFO_NVX`

If the `VkRenderPassCreateInfo::pNext` chain includes a `VkRenderPassFragmentDensityMapCreateInfoEXT` structure, then that structure includes a fragment density map attachment for the render pass.

The `VkRenderPassFragmentDensityMapCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT fragment_density_map
typedef struct VkRenderPassFragmentDensityMapCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkAttachmentReference fragmentDensityMapAttachment;
} VkRenderPassFragmentDensityMapCreateInfoEXT;
```

• `sType` is a `VkStructureType` value identifying this structure.

• `pNext` is NULL or a pointer to a structure extending this structure.

• `fragmentDensityMapAttachment` is the fragment density map to use for the render pass.

The fragment density map is read at an implementation-dependent time with the following constraints determined by the attachment’s image view flags:

• `VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT` specifies that the fragment density map will be read by the device during `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`
• **VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DEFERRED_BIT_EXT** specifies that the fragment density map will be read by the host during `vkEndCommandBuffer` of the primary command buffer that the render pass is recorded into.

• Otherwise the fragment density map will be read by the host during `vkCmdBeginRenderPass`.

The fragment density map **may** additionally be read by the device during **VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT** for any mode.

If this structure is not present, it is as if `fragmentDensityMapAttachment` was given as **VK_ATTACHMENT_UNUSED**.

---

### Valid Usage

- **VUID-VkRenderPassFragmentDensityMapCreateInfoEXT-fragmentDensityMapAttachment-02548**
  If `fragmentDensityMapAttachment` is not **VK_ATTACHMENT_UNUSED**, `fragmentDensityMapAttachment` **must** not be an element of `VkSubpassDescription::pInputAttachments`, `VkSubpassDescription::pColorAttachments`, `VkSubpassDescription::pResolveAttachments`, `VkSubpassDescription::pDepthStencilAttachment`, or `VkSubpassDescription::pPreserveAttachments` for any subpass.

- **VUID-VkRenderPassFragmentDensityMapCreateInfoEXT-fragmentDensityMapAttachment-02549**
  If `fragmentDensityMapAttachment` is not **VK_ATTACHMENT_UNUSED**, layout **must** be equal to **VK_IMAGE_LAYOUT_FRAGMENT_DENSITY_MAP_OPTIMAL_EXT**, or **VK_IMAGE_LAYOUT_GENERAL**.

- **VUID-VkRenderPassFragmentDensityMapCreateInfoEXT-fragmentDensityMapAttachment-02550**
  If `fragmentDensityMapAttachment` is not **VK_ATTACHMENT_UNUSED**, `fragmentDensityMapAttachment` **must** reference an attachment with a `loadOp` equal to **VK_ATTACHMENT_LOAD_OP_LOAD** or **VK_ATTACHMENT_LOAD_OP_DONT_CARE**.

- **VUID-VkRenderPassFragmentDensityMapCreateInfoEXT-fragmentDensityMapAttachment-02551**
  If `fragmentDensityMapAttachment` is not **VK_ATTACHMENT_UNUSED**, `fragmentDensityMapAttachment` **must** reference an attachment with a `storeOp` equal to **VK_ATTACHMENT_STORE_OP_DONT_CARE**.

### Valid Usage (Implicit)

- **VUID-VkRenderPassFragmentDensityMapCreateInfoEXT-sType-sType**
  `sType` **must** be **VK_STRUCTURE_TYPE_RENDER_PASS_FRAGMENT_DENSITY_MAP_CREATE_INFO_EXT**.

- **VUID-VkRenderPassFragmentDensityMapCreateInfoEXT-fragmentDensityMapAttachment-parameter**
  `fragmentDensityMapAttachment` **must** be a valid `VkAttachmentReference` structure.

---

The `VkAttachmentDescription` structure is defined as:
typedef struct VkAttachmentDescription {
    VkAttachmentDescriptionFlags flags;
    VkFormat format;
    VkSampleCountFlagBits samples;
    VkAttachmentLoadOp loadOp;
    VkAttachmentStoreOp storeOp;
    VkAttachmentLoadOp stencilLoadOp;
    VkAttachmentStoreOp stencilStoreOp;
    VkImageLayout initialLayout;
    VkImageLayout finalLayout;
} VkAttachmentDescription;

- **flags** is a bitmask of VkAttachmentDescriptionFlagBits specifying additional properties of the attachment.
- **format** is a VkFormat value specifying the format of the image view that will be used for the attachment.
- **samples** is a VkSampleCountFlagBits value specifying the number of samples of the image.
- **loadOp** is a VkAttachmentLoadOp value specifying how the contents of color and depth components of the attachment are treated at the beginning of the subpass where it is first used.
- **storeOp** is a VkAttachmentStoreOp value specifying how the contents of color and depth components of the attachment are treated at the end of the subpass where it is last used.
- **stencilLoadOp** is a VkAttachmentLoadOp value specifying how the contents of stencil components of the attachment are treated at the beginning of the subpass where it is first used.
- **stencilStoreOp** is a VkAttachmentStoreOp value specifying how the contents of stencil components of the attachment are treated at the end of the last subpass where it is used.
- **initialLayout** is the layout the attachment image subresource will be in when a render pass instance begins.
- **finalLayout** is the layout the attachment image subresource will be transitioned to when a render pass instance ends.

If the attachment uses a color format, then loadOp and storeOp are used, and stencilLoadOp and stencilStoreOp are ignored. If the format has depth and/or stencil components, loadOp and storeOp apply only to the depth data, while stencilLoadOp and stencilStoreOp define how the stencil data is handled. loadOp and stencilLoadOp define the load operations for the attachment. storeOp and stencilStoreOp define the store operations for the attachment. If an attachment is not used by any subpass, loadOp, storeOp, stencilStoreOp, and stencilLoadOp will be ignored for that attachment, and no load or store ops will be performed. However, any transition specified by initialLayout and finalLayout will still be executed.

If flags includes VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT, then the attachment is treated as if it shares physical memory with another attachment in the same render pass. This information limits the ability of the implementation to reorder certain operations (like layout transitions and the loadOp) such that it is not improperly reordered against other uses of the same physical memory via a different attachment. This is described in more detail below.
If a render pass uses multiple attachments that alias the same device memory, those attachments **must** each include the `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` bit in their attachment description flags. Attachments aliasing the same memory occurs in multiple ways:

- Multiple attachments being assigned the same image view as part of framebuffer creation.
- Attachments using distinct image views that correspond to the same image subresource of an image.
- Attachments using views of distinct image subresources which are bound to overlapping memory ranges.

Multiple attachments that alias the same memory **must** not be used in a single subpass. A given attachment index **must** not be used multiple times in a single subpass, with one exception: two subpass attachments **can** use the same attachment index if at least one use is as an input attachment and neither use is as a resolve or preserve attachment. In other words, the same view **can** be used simultaneously as an input and color or depth/stencil attachment, but **must** not be used as multiple color or depth/stencil attachments nor as resolve or preserve attachments.

If a set of attachments alias each other, then all except the first to be used in the render pass **must** use an `initialLayout` of `VK_IMAGE_LAYOUT_UNDEFINED`, since the earlier uses of the other aliases make their contents undefined. Once an alias has been used and a different alias has been used after it, the first alias **must** not be used in any later subpasses. However, an application **can** assign the same image view to multiple aliasing attachment indices, which allows that image view to be used multiple times even if other aliases are used in between.

**Valid Usage**

- **VUID-VkAttachmentDescription-format-06699**
  If `format` includes a color or depth component and `loadOp` is `VK_ATTACHMENT_LOAD_OP_LOAD`, then `initialLayout` **must** not be `VK_IMAGE_LAYOUT_UNDEFINED`

- **VUID-VkAttachmentDescription-finalLayout-00843**
  `finalLayout` **must** not be `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`

- **VUID-VkAttachmentDescription-format-03280**
  If `format` is a color format, `initialLayout` **must** not be
VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL or
VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription-format-03281
  If format is a depth/stencil format, initialLayout must not be
  VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL

• VUID-VkAttachmentDescription-format-03282
  If format is a color format, finalLayout must not be
  VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL or
  VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription-format-03283
  If format is a depth/stencil format, finalLayout must not be
  VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL

• VUID-VkAttachmentDescription-format-06487
  If format is a color format, initialLayout must not be
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL or
  VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

• VUID-VkAttachmentDescription-format-06488
  If format is a color format, finalLayout must not be
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL or
  VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

• VUID-VkAttachmentDescription-separateDepthStencilLayouts-03284
  If the separateDepthStencilLayouts feature is not enabled, initialLayout must not be
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, or
  VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription-separateDepthStencilLayouts-03285
  If the separateDepthStencilLayouts feature is not enabled, finalLayout must not be
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, or
  VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription-format-03286
  If format is a color format, initialLayout must not be
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, or
  VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription-format-03287
  If format is a color format, finalLayout must not be
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, or
  VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription-format-06906
  If format is a depth/stencil format which includes both depth and stencil components,
  initialLayout must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL or
  VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL
If `format` is a depth/stencil format which includes both depth and stencil components, `finalLayout` must not be `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`.

If `format` is a depth/stencil format which includes only the depth component, `initialLayout` must not be `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`.

If `format` is a depth/stencil format which includes only the depth component, `finalLayout` must not be `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`.

If the `synchronization2` feature is not enabled, `initialLayout` must not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`.

If the `synchronization2` feature is not enabled, `finalLayout` must not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`.

If the `attachmentFeedbackLoopLayout` feature is not enabled, `initialLayout` must not be `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT`.

If the `attachmentFeedbackLoopLayout` feature is not enabled, `finalLayout` must not be `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT`.

`samples` must be a valid `VkSampleCountFlagBits` value that is set in `imageCreateSampleCounts` (as defined in Image Creation Limits) for the given `format`.

If the `dynamicRenderingLocalRead` feature is not enabled, `initialLayout` must not be `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR`.

If the `dynamicRenderingLocalRead` feature is not enabled, `finalLayout` must not be `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR`.

`format` must not be `VK_FORMAT_UNDEFINED`.

If `format` includes a stencil component and `stencilLoadOp` is `VK_ATTACHMENT_LOAD_OP_LOAD`, then `initialLayout` must not be `VK_IMAGE_LAYOUT_UNDEFINED`.

If `format` includes a stencil component and `stencilLoadOp` is `VK_ATTACHMENT_LOAD_OP_LOAD`, then `initialLayout` must not be `VK_IMAGE_LAYOUT_UNDEFINED`.

If `format` is a depth/stencil format which includes only the stencil component, `initialLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`.

If `format` is a depth/stencil format which includes only the stencil component, `finalLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`.
If `format` is a depth/stencil format which includes only the stencil component, `finalLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`.

- VUID-VkAttachmentDescription-format-06242
  If `format` is a depth/stencil format which includes both depth and stencil components, `initialLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`.

- VUID-VkAttachmentDescription-format-06243
  If `format` is a depth/stencil format which includes both depth and stencil components, `finalLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`.

**Valid Usage (Implicit)**

- VUID-VkAttachmentDescription-flags-parameter
  `flags` must be a valid combination of `VkAttachmentDescriptionFlagBits` values

- VUID-VkAttachmentDescription-format-parameter
  `format` must be a valid `VkFormat` value

- VUID-VkAttachmentDescription-samples-parameter
  `samples` must be a valid `VkSampleCountFlagBits` value

- VUID-VkAttachmentDescription-loadOp-parameter
  `loadOp` must be a valid `VkAttachmentLoadOp` value

- VUID-VkAttachmentDescription-storeOp-parameter
  `storeOp` must be a valid `VkAttachmentStoreOp` value

- VUID-VkAttachmentDescription-stencilLoadOp-parameter
  `stencilLoadOp` must be a valid `VkAttachmentLoadOp` value

- VUID-VkAttachmentDescription-stencilStoreOp-parameter
  `stencilStoreOp` must be a valid `VkAttachmentStoreOp` value

- VUID-VkAttachmentDescription-initialLayout-parameter
  `initialLayout` must be a valid `VkImageLayout` value

- VUID-VkAttachmentDescription-finalLayout-parameter
  `finalLayout` must be a valid `VkImageLayout` value

Bits which can be set in `VkAttachmentDescription::flags`, describing additional properties of the attachment, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkAttachmentDescriptionFlagBits {
    VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT = 0x00000001,
} VkAttachmentDescriptionFlagBits;
```

- `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` specifies that the attachment aliases the same device
memory as other attachments.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkAttachmentDescriptionFlags;
```

`VkAttachmentDescriptionFlags` is a bitmask type for setting a mask of zero or more `VkAttachmentDescriptionFlagBits`.

The `VkRenderPassInputAttachmentAspectCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkRenderPassInputAttachmentAspectCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t aspectReferenceCount;
    const VkInputAttachmentAspectReference* pAspectReferences;
} VkRenderPassInputAttachmentAspectCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance2
typedef VkRenderPassInputAttachmentAspectCreateInfo
    VkRenderPassInputAttachmentAspectCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `aspectReferenceCount` is the number of elements in the `pAspectReferences` array.
- `pAspectReferences` is a pointer to an array of `aspectReferenceCount` `VkInputAttachmentAspectReference` structures containing a mask describing which aspect(s) can be accessed for a given input attachment within a given subpass.

To specify which aspects of an input attachment can be read, add a `VkRenderPassInputAttachmentAspectCreateInfo` structure to the `pNext` chain of the `VkRenderPassCreateInfo` structure:

An application can access any aspect of an input attachment that does not have a specified aspect mask in the `pAspectReferences` array. Otherwise, an application must not access aspect(s) of an input attachment other than those in its specified aspect mask.

**Valid Usage (Implicit)**

- VUID-VkRenderPassInputAttachmentAspectCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_RENDER_PASS_INPUT_ATTACHMENT_ASPECT_CREATE_INFO`
- VUID-VkRenderPassInputAttachmentAspectCreateInfo-pAspectReferences-parameter
**pAspectReferences** must be a valid pointer to an array of **aspectReferenceCount** valid **VkInputAttachmentAspectReference** structures

- VUID-VkRenderPassInputAttachmentAspectCreateInfo-aspectReferenceCount-arraylength

**aspectReferenceCount** must be greater than 0

The **VkInputAttachmentAspectReference** structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkInputAttachmentAspectReference {
    uint32_t subpass;
    uint32_t inputAttachmentIndex;
    VkImageAspectFlags aspectMask;
} VkInputAttachmentAspectReference;
```

or the equivalent:

```c
// Provided by VK_KHR_maintenance2
typedef VkInputAttachmentAspectReference VkInputAttachmentAspectReferenceKHR;
```

- **subpass** is an index into the **pSubpasses** array of the parent **VkRenderPassCreateInfo** structure.
- **inputAttachmentIndex** is an index into the **pInputAttachments** of the specified subpass.
- **aspectMask** is a mask of which aspect(s) can be accessed within the specified subpass.

This structure specifies an aspect mask for a specific input attachment of a specific subpass in the render pass.

**subpass** and **inputAttachmentIndex** index into the render pass as:

```c
pCreateInfo->pSubpasses[subpass].pInputAttachments[inputAttachmentIndex]
```

**Valid Usage**

- VUID-VkInputAttachmentAspectReference-aspectMask-01964
  **aspectMask** must not include **VK_IMAGE_ASPECT_METADATA_BIT**

- VUID-VkInputAttachmentAspectReference-aspectMask-02250
  **aspectMask** must not include **VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT** for any index i

**Valid Usage (Implicit)**

- VUID-VkInputAttachmentAspectReference-aspectMask-parameter
  **aspectMask** must be a valid combination of **VkImageAspectFlagBits** values

- VUID-VkInputAttachmentAspectReference-aspectMask-requiredbitmask
The `VkSubpassDescription` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSubpassDescription {
    VkSubpassDescriptionFlags flags;
    VkPipelineBindPoint pipelineBindPoint;
    uint32_t inputAttachmentCount;
    const VkAttachmentReference* pInputAttachments;
    uint32_t colorAttachmentCount;
    const VkAttachmentReference* pColorAttachments;
    const VkAttachmentReference* pResolveAttachments;
    const VkAttachmentReference* pDepthStencilAttachment;
    uint32_t preserveAttachmentCount;
    const uint32_t* pPreserveAttachments;
} VkSubpassDescription;
```

- `flags` is a bitmask of `VkSubpassDescriptionFlagBits` specifying usage of the subpass.
- `pipelineBindPoint` is a `VkPipelineBindPoint` value specifying the pipeline type supported for this subpass.
- `inputAttachmentCount` is the number of input attachments.
- `pInputAttachments` is a pointer to an array of `VkAttachmentReference` structures defining the input attachments for this subpass and their layouts.
- `colorAttachmentCount` is the number of color attachments.
- `pColorAttachments` is a pointer to an array of `colorAttachmentCount` `VkAttachmentReference` structures defining the color attachments for this subpass and their layouts.
- `pResolveAttachments` is `NULL` or a pointer to an array of `colorAttachmentCount` `VkAttachmentReference` structures defining the resolve attachments for this subpass and their layouts.
- `pDepthStencilAttachment` is a pointer to a `VkAttachmentReference` structure specifying the depth/stencil attachment for this subpass and its layout.
- `preserveAttachmentCount` is the number of preserved attachments.
- `pPreserveAttachments` is a pointer to an array of `preserveAttachmentCount` render pass attachment indices identifying attachments that are not used by this subpass, but whose contents must be preserved throughout the subpass.

Each element of the `pInputAttachments` array corresponds to an input attachment index in a fragment shader, i.e. if a shader declares an image variable decorated with a `InputAttachmentIndex` value of `X`, then it uses the attachment provided in `pInputAttachments[X]`. Input attachments must also be bound to the pipeline in a descriptor set. If the `attachment` member of any element of `pInputAttachments` is `VK_ATTACHMENT_UNUSED`, the application must not read from the corresponding input attachment index. Fragment shaders can use subpass input variables to access the contents of an input attachment at the fragment’s (x, y, layer) framebuffer coordinates. Input attachments must
not be used by any subpasses within a render pass that enables `render pass transform`.

Each element of the `pColorAttachments` array corresponds to an output location in the shader, i.e. if the shader declares an output variable decorated with a `Location` value of `X`, then it uses the attachment provided in `pColorAttachments[X]`. If the `attachment` member of any element of `pColorAttachments` is `VK_ATTACHMENT_UNUSED`, or if `Color Write Enable` has been disabled for the corresponding attachment index, then writes to the corresponding location by a fragment shader are discarded.

If `flags` does not include `VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM`, and if `pResolveAttachments` is not `NULL`, each of its elements corresponds to a color attachment (the element in `pColorAttachments` at the same index), and a `multisample resolve operation` is defined for each attachment unless the resolve attachment index is `VK_ATTACHMENT_UNUSED`.

Similarly, if `flags` does not include `VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM`, and `VkSubpassDescriptionDepthStencilResolve::pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, it corresponds to the depth/stencil attachment in `pDepthStencilAttachment`, and `multisample resolve operation` for depth and stencil are defined by `VkSubpassDescriptionDepthStencilResolve::depthResolveMode` and `VkSubpassDescriptionDepthStencilResolve::stencilResolveMode`, respectively. If `VkSubpassDescriptionDepthStencilResolve::depthResolveMode` is `VK_RESOLVE_MODE_NONE` or the `pDepthStencilResolveAttachment` does not have a depth aspect, no resolve operation is performed for the depth attachment. If `VkSubpassDescriptionDepthStencilResolve::stencilResolveMode` is `VK_RESOLVE_MODE_NONE` or the `pDepthStencilResolveAttachment` does not have a stencil aspect, no resolve operation is performed for the stencil attachment.

If the image subresource range referenced by the depth/stencil attachment is created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT`, then the `multisample resolve operation` uses the sample locations state specified in the `sampleLocationsInfo` member of the element of the `VkRenderPassSampleLocationsBeginInfoEXT::pPostSubpassSampleLocations` for the subpass.

If `pDepthStencilAttachment` is `NULL`, or if its attachment index is `VK_ATTACHMENT_UNUSED`, it indicates that no depth/stencil attachment will be used in the subpass.

The contents of an attachment within the render area become undefined at the start of a subpass `S` if all of the following conditions are true:

- The attachment is used as a color, depth/stencil, or resolve attachment in any subpass in the render pass.
- There is a subpass `S_i` that uses or preserves the attachment, and a subpass dependency from `S_i` to `S`.
- The attachment is not used or preserved in subpass `S`.

In addition, the contents of an attachment within the render area become undefined at the start of a subpass `S` if all of the following conditions are true:

- `VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM` is set.
- The attachment is used as a color or depth/stencil in the subpass.
Once the contents of an attachment become undefined in subpass $S$, they remain undefined for subpasses in subpass dependency chains starting with subpass $S$ until they are written again. However, they remain valid for subpasses in other subpass dependency chains starting with subpass $S_1$ if those subpasses use or preserve the attachment.

**Valid Usage**

- **VUID-VkSubpassDescription-attachment-06912**
  If the attachment member of an element of $pInputAttachments$ is not $VK_ATTACHMENT_UNUSED$, its layout member must not be $VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL$ or $VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL$.

- **VUID-VkSubpassDescription-attachment-06913**
  If the attachment member of an element of $pColorAttachments$ is not $VK_ATTACHMENT_UNUSED$, its layout member must not be $VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL$ or $VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL$.

- **VUID-VkSubpassDescription-attachment-06914**
  If the attachment member of an element of $pResolveAttachments$ is not $VK_ATTACHMENT_UNUSED$, its layout member must not be $VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL$ or $VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL$.

- **VUID-VkSubpassDescription-attachment-06915**
  If the attachment member of $pDepthStencilAttachment$ is not $VK_ATTACHMENT_UNUSED$, its layout member must not be $VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL$ or $VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL$.

- **VUID-VkSubpassDescription-attachment-06916**
  If the attachment member of an element of $pColorAttachments$ is not $VK_ATTACHMENT_UNUSED$, its layout member must not be $VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL$ or $VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL$.

- **VUID-VkSubpassDescription-attachment-06917**
  If the attachment member of an element of $pResolveAttachments$ is not $VK_ATTACHMENT_UNUSED$, its layout member must not be $VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL$ or $VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL$.

- **VUID-VkSubpassDescription-attachment-06918**
  If the attachment member of an element of $pInputAttachments$ is not $VK_ATTACHMENT_UNUSED$, its layout member must not be $VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_ATTACHMENT_OPTIMAL$ or $VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL$.

- **VUID-VkSubpassDescription-attachment-06919**
  If the attachment member of an element of $pColorAttachments$ is not $VK_ATTACHMENT_UNUSED$, its layout member must not be $VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL$, $VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL$, or $VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL$.

- **VUID-VkSubpassDescription-attachment-06920**
If the attachment member of an element of pResolveAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL.

- VUID-VkSubpassDescription-attachment-06921
  If the attachment member of an element of pInputAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR.

- VUID-VkSubpassDescription-attachment-06922
  If the attachment member of an element of pColorAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR.

- VUID-VkSubpassDescription-attachment-06923
  If the attachment member of an element of pResolveAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR.

- VUID-VkSubpassDescription-pipelineBindPoint-04952
  pipelineBindPoint must be VK_PIPELINE_BIND_POINT_GRAPHICS or VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI.

- VUID-VkSubpassDescription-colorAttachmentCount-00845
  colorAttachmentCount must be less than or equal to VkPhysicalDeviceLimits::maxColorAttachments.

- VUID-VkSubpassDescription-loadOp-00846
  If the first use of an attachment in this render pass is as an input attachment, and the attachment is not also used as a color or depth/stencil attachment in the same subpass, then loadOp must not be VK_ATTACHMENT_LOAD_OP_CLEAR.

- VUID-VkSubpassDescription-pResolveAttachments-00847
  If pResolveAttachments is not NULL, for each resolve attachment that is not VK_ATTACHMENT_UNUSED, the corresponding color attachment must not be VK_ATTACHMENT_UNUSED.

- VUID-VkSubpassDescription-pResolveAttachments-00848
  If pResolveAttachments is not NULL, for each resolve attachment that is not VK_ATTACHMENT_UNUSED, the corresponding color attachment must not have a sample count of VK_SAMPLE_COUNT_1_BIT.

- VUID-VkSubpassDescription-pResolveAttachments-00849
  If pResolveAttachments is not NULL, each resolve attachment that is not VK_ATTACHMENT_UNUSED must have a sample count of VK_SAMPLE_COUNT_1_BIT.

- VUID-VkSubpassDescription-pResolveAttachments-00850
  If pResolveAttachments is not NULL, each resolve attachment that is not VK_ATTACHMENT_UNUSED must have the same VkFormat as its corresponding color attachment.

- VUID-VkSubpassDescription-pColorAttachments-09430
  All attachments in pColorAttachments that are not VK_ATTACHMENT_UNUSED must have the same sample count.
• VUID-VkSubpassDescription-pInputAttachments-02647
  All attachments in pInputAttachments that are not VK_ATTACHMENT_UNUSED must have image formats whose potential format features contain at least
  VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT or
  VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT

• VUID-VkSubpassDescription-pColorAttachments-02648
  All attachments in pColorAttachments that are not VK_ATTACHMENT_UNUSED must have image formats whose potential format features contain
  VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT

• VUID-VkSubpassDescription-pResolveAttachments-02649
  All attachments in pResolveAttachments that are not VK_ATTACHMENT_UNUSED must have image formats whose potential format features contain
  VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT

• VUID-VkSubpassDescription-pDepthStencilAttachment-02650
  If pDepthStencilAttachment is not NULL and the attachment is not VK_ATTACHMENT_UNUSED then it must have an image format whose potential format features contain
  VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT

• VUID-VkSubpassDescription-linearColorAttachment-06496
  If the linearColorAttachment feature is enabled and the image is created with VK_IMAGE_TILING_LINEAR, all attachments in pInputAttachments that are not
  VK_ATTACHMENT_UNUSED must have image formats whose potential format features must contain
  VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV

• VUID-VkSubpassDescription-linearColorAttachment-06497
  If the linearColorAttachment feature is enabled and the image is created with VK_IMAGE_TILING_LINEAR, all attachments in pColorAttachments that are not
  VK_ATTACHMENT_UNUSED must have image formats whose potential format features must contain
  VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV

• VUID-VkSubpassDescription-linearColorAttachment-06498
  If the linearColorAttachment feature is enabled and the image is created with VK_IMAGE_TILING_LINEAR, all attachments in pResolveAttachments that are not
  VK_ATTACHMENT_UNUSED must have image formats whose potential format features must contain
  VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV

• VUID-VkSubpassDescription-None-09431
  If either of the following is enabled:
  • The VK_AMD_mixed_attachment_samples extension
  • The VK_NV_framebuffer_mixed_samples extension
    all attachments in pColorAttachments that are not VK_ATTACHMENT_UNUSED must have a sample count that is smaller than or equal to the sample count of pDepthStencilAttachment if it is not VK_ATTACHMENT_UNUSED

• VUID-VkSubpassDescription-pDepthStencilAttachment-01418
  If pDepthStencilAttachment is not VK_ATTACHMENT_UNUSED and any attachments in pColorAttachments are not VK_ATTACHMENT_UNUSED, they must have the same sample count, if none of the following are enabled:
- The **VK_AMD_mixed_attachment_samples** extension
- The **VK_NV_framebuffer_mixed_samples** extension

- **VUID-VkSubpassDescription-attachment-00853**
  Each element of `pPreserveAttachments` **must** not be `VK_ATTACHMENT_UNUSED`

- **VUID-VkSubpassDescription-pPreserveAttachments-00854**
  Each element of `pPreserveAttachments` **must** not also be an element of any other member of the subpass description

- **VUID-VkSubpassDescription-layout-02519**
  If any attachment is used by more than one `VkAttachmentReference` member, then each use **must use the same** layout

- **VUID-VkSubpassDescription-flags-00856**
  If `flags` includes `VK_SUBPASS_DESCRIPTION_PER_VIEW_POSITION_X_ONLY_BIT_NVX`, it **must also** include `VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX`

- **VUID-VkSubpassDescription-flags-03341**
  If `flags` includes `VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM`, and if `pResolveAttachments` is not `NULL`, then each resolve attachment **must** be `VK_ATTACHMENT_UNUSED`

- **VUID-VkSubpassDescription-flags-03343**
  If `flags` includes `VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM`, then the subpass **must** be the last subpass in a subpass dependency chain

- **VUID-VkSubpassDescription-pInputAttachments-02868**
  If the render pass is created with `VK_RENDER_PASS_CREATE_TRANSFORM_BIT_QCOM` each of the elements of `pInputAttachments` **must** be `VK_ATTACHMENT_UNUSED`

- **VUID-VkSubpassDescription-pColorAttachments-parameter**
  If `colorAttachmentCount` is not `0`, `pColorAttachments` **must** be a valid pointer to an array of `colorAttachmentCount` valid `VkAttachmentReference` structures

- **Valid Usage (Implicit)**

- **VUID-VkSubpassDescription-flags-parameter**
  `flags` **must** be a valid combination of `VkSubpassDescriptionFlagBits` values

- **VUID-VkSubpassDescription-pDepthStencilAttachment-parameter**
  If `depthStencilAttachmentCount` is not `0`, `pDepthStencilAttachment` **must** be a valid pointer to an array of `depthStencilAttachmentCount` valid `VkAttachmentReference` structures

- **VUID-VkSubpassDescription-pResolveAttachments-parameter**
  If `resolveAttachmentCount` is not `0`, and `pResolveAttachments` is not `NULL`, `pResolveAttachments` **must** be a valid pointer to an array of `resolveAttachmentCount` valid `VkAttachmentReference` structures
structures

- VUID-VkSubpassDescription-pDepthStencilAttachment-parameter
  If `pDepthStencilAttachment` is not NULL, `pDepthStencilAttachment` must be a valid pointer to a valid `VkAttachmentReference` structure.

- VUID-VkSubpassDescription-pPreserveAttachments-parameter
  If `preserveAttachmentCount` is not 0, `pPreserveAttachments` must be a valid pointer to an array of `preserveAttachmentCount` uint32_t values.

Bits which can be set in `VkSubpassDescription::flags`, specifying usage of the subpass, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSubpassDescriptionFlagBits {
    // Provided by VK_NVX_multiview_per_view_attributes
    VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX = 0x00000001,
    // Provided by VK_NVX_multiview_per_view_attributes
    VK_SUBPASS_DESCRIPTION_PER_VIEW_POSITION_X_ONLY_BIT_NVX = 0x00000002,
    // Provided by VK_QCOM_render_pass_shader_resolve
    VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM = 0x00000004,
    // Provided by VK_QCOM_render_pass_shader_resolve
    VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM = 0x00000008,
    // Provided by VK_EXT_rasterization_order_attachment_access
    VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_COLOR_ACCESS_BIT_EXT = 0x00000010,
    // Provided by VK_EXT_rasterization_order_attachment_access
    VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT = 0x00000020,
    // Provided by VK_EXT_rasterization_order_attachment_access
    VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT = 0x00000040,
    // Provided by VK_EXT_rasterization_order_attachment_access
    VK_SUBPASS_DESCRIPTION_ENABLE_LEGACY_DITHERING_BIT_EXT = 0x00000080,
    // Provided by VK_ARM_rasterization_order_attachment_access
    VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_COLOR_ACCESS_BIT_ARM = VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_COLOR_ACCESS_BIT_EXT,
    // Provided by VK_ARM_rasterization_order_attachment_access
    VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_ARM = VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT,
    // Provided by VK_ARM_rasterization_order_attachment_access
    VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_ARM = VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT,
} VkSubpassDescriptionFlagBits;
```

- `VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX` specifies that shaders compiled for this subpass write the attributes for all views in a single invocation of each pre-rasterization shader stage. All pipelines compiled against a subpass that includes this bit must write per-view attributes to the *PerViewNV[]* shader outputs, in addition to the non-per-view (e.g. `Position`) outputs.
VK_SUBPASS_DESCRIPTION_PER_VIEW_POSITION_X_ONLY_BIT_NVX specifies that shaders compiled for
this subpass use per-view positions which only differ in value in the x component. Per-view
viewport mask can also be used.

VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM specifies that the framebuffer region is the
fragment region, that is, the minimum region dependencies are by pixel rather than by sample,
such that any fragment shader invocation can access any sample associated with that fragment
shader invocation.

VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM specifies that the subpass performs shader
resolve operations.

VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_COLOR_ACCESS_BIT_EXT specifies that this
subpass supports pipelines created with VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT.

VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT specifies that this
subpass supports pipelines created with VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT.

VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT specifies that
this subpass supports pipelines created with VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT.

VK_SUBPASS_DESCRIPTION_ENABLE_LEGACY_DITHERING_BIT_EXT specifies that Legacy Dithering is
enabled for this subpass.

NOTE
Shader resolve operations allow for custom resolve operations, but overwriting pixels may have a performance and/or power cost. Furthermore, since the content of any depth stencil attachment or color attachment is undefined at the beginning of a shader resolve subpass, any depth testing, stencil testing, or blending operation which sources these undefined values also has undefined result value.

// Provided by VK_VERSION_1_0
typedef VkFlags VkSubpassDescriptionFlags;

VkSubpassDescriptionFlags is a bitmask type for setting a mask of zero or more
VkSubpassDescriptionFlagBits.

The VkAttachmentReference structure is defined as:

// Provided by VK_VERSION_1_0
typedef struct VkAttachmentReference {
    uint32_t attachment;
    VkImageLayout layout;
} VkAttachmentReference;

attachment is either an integer value identifying an attachment at the corresponding index in
 VkRenderPassCreateInfo::pAttachments, or VK_ATTACHMENT_UNUSED to signify that this attachment is
• **layout** is a `VkImageLayout` value specifying the layout the attachment uses during the subpass.

## Valid Usage

- **VUID-VkAttachmentReference-layout-03077**
  
  If attachment is not `VK_ATTACHMENT_UNUSED`, **layout** must not be `VK_IMAGE_LAYOUT_UNDEFINED`, `VK_IMAGE_LAYOUT_PREINITIALIZED`, or `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`.

- **VUID-VkAttachmentReference-separateDepthStencilLayouts-03313**
  
  If the `separateDepthStencilLayouts` feature is not enabled, and attachment is not `VK_ATTACHMENT_UNUSED`, **layout** must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`.

- **VUID-VkAttachmentReference-synchronization2-06910**
  
  If the `synchronization2` feature is not enabled, **layout** must not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`.

- **VUID-VkAttachmentReference-attachmentFeedbackLoopLayout-07311**
  
  If the `attachmentFeedbackLoopLayout` feature is not enabled, **layout** must not be `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT`.

- **VUID-VkAttachmentReference-dynamicRenderingLocalRead-09546**
  
  If the `dynamicRenderingLocalRead` feature is not enabled, **layout** must not be `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR`.

## Valid Usage (Implicit)

- **VUID-VkAttachmentReference-layout-parameter**
  
  **layout** must be a valid `VkImageLayout` value.

**VK_SUBPASS_EXTERNAL** is a special subpass index value expanding synchronization scope outside a subpass. It is described in more detail by `VkSubpassDependency`.

```c
#define VK_SUBPASS_EXTERNAL (~0U)
```

The `VkSubpassDependency` structure is defined as:
typedef struct VkSubpassDependency {
    uint32_t srcSubpass;
    uint32_t dstSubpass;
    VkPipelineStageFlags srcStageMask;
    VkPipelineStageFlags dstStageMask;
    VkAccessFlags srcAccessMask;
    VkAccessFlags dstAccessMask;
    VkDependencyFlags dependencyFlags;
} VkSubpassDependency;

- **srcSubpass** is the subpass index of the first subpass in the dependency, or `VK_SUBPASS_EXTERNAL`.
- **dstSubpass** is the subpass index of the second subpass in the dependency, or `VK_SUBPASS_EXTERNAL`.
- **srcStageMask** is a bitmask of `VkPipelineStageFlagBits` specifying the source stage mask.
- **dstStageMask** is a bitmask of `VkPipelineStageFlagBits` specifying the destination stage mask.
- **srcAccessMask** is a bitmask of `VkAccessFlagBits` specifying a source access mask.
- **dstAccessMask** is a bitmask of `VkAccessFlagBits` specifying a destination access mask.
- **dependencyFlags** is a bitmask of `VkDependencyFlagBits`.

If **srcSubpass** is equal to **dstSubpass** then the **VkSubpassDependency** does not directly define a dependency. Instead, it enables pipeline barriers to be used in a render pass instance within the identified subpass, where the scopes of one pipeline barrier must be a subset of those described by one subpass dependency. Subpass dependencies specified in this way that include framebuffer-space stages in the **srcStageMask** must only include framebuffer-space stages in **dstStageMask**, and must include `VK_DEPENDENCY_BY_REGION_BIT`. When a subpass dependency is specified in this way for a subpass that has more than one view in its view mask, its **dependencyFlags** must include `VK_DEPENDENCY_VIEW_LOCAL_BIT`.

If **srcSubpass** and **dstSubpass** are not equal, when a render pass instance which includes a subpass dependency is submitted to a queue, it defines a dependency between the subpasses identified by **srcSubpass** and **dstSubpass**.

If **srcSubpass** is equal to `VK_SUBPASS_EXTERNAL`, the first synchronization scope includes commands that occur earlier in submission order than the `vkCmdBeginRenderPass` used to begin the render pass instance. Otherwise, the first set of commands includes all commands submitted as part of the subpass instance identified by **srcSubpass** and any load, store, or multisample resolve operations on attachments used in **srcSubpass**. In either case, the first synchronization scope is limited to operations on the pipeline stages determined by the **source stage mask** specified by **srcStageMask**.

If **dstSubpass** is equal to `VK_SUBPASS_EXTERNAL`, the second synchronization scope includes commands that occur later in submission order than the `vkCmdEndRenderPass` used to end the render pass instance. Otherwise, the second set of commands includes all commands submitted as part of the subpass instance identified by **dstSubpass** and any load, store, and multisample resolve operations on attachments used in **dstSubpass**. In either case, the second synchronization scope is limited to operations on the pipeline stages determined by the **destination stage mask** specified by...
The first access scope is limited to accesses in the pipeline stages determined by the source stage mask specified by srcStageMask. It is also limited to access types in the source access mask specified by srcAccessMask.

The second access scope is limited to accesses in the pipeline stages determined by the destination stage mask specified by dstStageMask. It is also limited to access types in the destination access mask specified by dstAccessMask.

The availability and visibility operations defined by a subpass dependency affect the execution of image layout transitions within the render pass.

For non-attachment resources, the memory dependency expressed by subpass dependency is nearly identical to that of a VkMemoryBarrier (with matching srcAccessMask and dstAccessMask parameters) submitted as a part of a vkCmdPipelineBarrier (with matching srcStageMask and dstStageMask parameters). The only difference being that its scopes are limited to the identified subpasses rather than potentially affecting everything before and after.

For attachments however, subpass dependencies work more like a VkImageMemoryBarrier defined similarly to the VkMemoryBarrier above, the queue family indices set to VK_QUEUE_FAMILY_IGNORED, and layouts as follows:

- The equivalent to oldLayout is the attachment’s layout according to the subpass description for srcSubpass.
- The equivalent to newLayout is the attachment’s layout according to the subpass description for dstSubpass.

**Valid Usage**

- VUID-VkSubpassDependency-srcStageMask-04090
  If the geometryShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT

- VUID-VkSubpassDependency-srcStageMask-04091
  If the tessellationShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_TESSellation_CONTROL_SHADER_BIT or VK_PIPELINE_STAGE_TESSellation_EVALUATION_SHADER_BIT

- VUID-VkSubpassDependency-srcStageMask-04092
  If the conditionalRendering feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT

- VUID-VkSubpassDependency-srcStageMask-04093
  If the fragmentDensityMap feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT

- VUID-VkSubpassDependency-srcStageMask-04094
  If the transformFeedback feature is not enabled, srcStageMask must not contain...
If the meshShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT.

If the taskShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT.

If neither the shadingRateImage or attachmentFragmentShadingRate are enabled, srcStageMask must not contain VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR.

If the synchronization2 feature is not enabled, srcStageMask must not be 0.

If neither the VK_NV_ray_tracing extension or rayTracingPipeline feature are enabled, srcStageMask must not contain VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR.

If the geometryShader feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT.

If the tessellationShader feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT or VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT.

If the conditionalRendering feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT.

If the fragmentDensityMap feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT.

If the transformFeedback feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT.

If the meshShader feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT.

If the taskShader feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT.

If neither the shadingRateImage or attachmentFragmentShadingRate are enabled, dstStageMask must not contain VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR.
• VUID-VkSubpassDependency-dstStageMask-03937
  If the synchronization2 feature is not enabled, dstStageMask must not be 0

• VUID-VkSubpassDependency-dstStageMask-07949
  If neither the VK_NV_ray_tracing extension or rayTracingPipeline feature are enabled, dstStageMask must not contain VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR

• VUID-VkSubpassDependency-srcSubpass-00864
  srcSubpass must be less than or equal to dstSubpass, unless one of them is VK_SUBPASS_EXTERNAL, to avoid cyclic dependencies and ensure a valid execution order

• VUID-VkSubpassDependency-srcSubpass-00865
  srcSubpass and dstSubpass must not both be equal to VK_SUBPASS_EXTERNAL

• VUID-VkSubpassDependency-srcSubpass-06809
  If srcSubpass is equal to dstSubpass and srcStageMask includes a framebuffer-space stage, dstStageMask must only contain framebuffer-space stages

• VUID-VkSubpassDependency-srcAccessMask-00868
  Any access flag included in srcAccessMask must be supported by one of the pipeline stages in srcStageMask, as specified in the table of supported access types

• VUID-VkSubpassDependency-dstAccessMask-00869
  Any access flag included in dstAccessMask must be supported by one of the pipeline stages in dstStageMask, as specified in the table of supported access types

• VUID-VkSubpassDependency-srcSubpass-02243
  If srcSubpass equals dstSubpass, and srcStageMask and dstStageMask both include a framebuffer-space stage, then dependencyFlags must include VK_DEPENDENCY_BY_REGION_BIT

• VUID-VkSubpassDependency-dependencyFlags-02520
  If dependencyFlags includes VK_DEPENDENCY_VIEW_LOCAL_BIT, srcSubpass must not be equal to VK_SUBPASS_EXTERNAL

• VUID-VkSubpassDependency-dependencyFlags-02521
  If dependencyFlags includes VK_DEPENDENCY_VIEW_LOCAL_BIT, dstSubpass must not be equal to VK_SUBPASS_EXTERNAL

• VUID-VkSubpassDependency-srcSubpass-00872
  If srcSubpass equals dstSubpass and that subpass has more than one bit set in the view mask, then dependencyFlags must include VK_DEPENDENCY_VIEW_LOCAL_BIT

Valid Usage (Implicit)

• VUID-VkSubpassDependency-srcStageMask-parameter
  srcStageMask must be a valid combination of VkPipelineStageFlagBits values

• VUID-VkSubpassDependency-dstStageMask-parameter
  dstStageMask must be a valid combination of VkPipelineStageFlagBits values

• VUID-VkSubpassDependency-srcAccessMask-parameter
  srcAccessMask must be a valid combination of VkAccessFlagBits values

• VUID-VkSubpassDependency-dstAccessMask-parameter
  dstAccessMask must be a valid combination of VkAccessFlagBits values
When multiview is enabled, the execution of the multiple views of one subpass may not occur simultaneously or even back-to-back, and rather may be interleaved with the execution of other subpasses. The load and store operations apply to attachments on a per-view basis. For example, an attachment using VK_ATTACHMENT_LOAD_OP_CLEAR will have each view cleared on first use, but the first use of one view may be temporally distant from the first use of another view.

A good mental model for multiview is to think of a multiview subpass as if it were a collection of individual (per-view) subpasses that are logically grouped together and described as a single multiview subpass in the API. Similarly, a multiview attachment can be thought of like several individual attachments that happen to be layers in a single image. A view-local dependency between two multiview subpasses acts like a set of one-to-one dependencies between corresponding pairs of per-view subpasses. A view-global dependency between two multiview subpasses acts like a set of $N \times M$ dependencies between all pairs of per-view subpasses in the source and destination. Thus, it is a more compact representation which also makes clear the commonality and reuse that is present between views in a subpass. This interpretation motivates the answers to questions like “when does the load op apply” - it is on the first use of each view of an attachment, as if each view was a separate attachment.

The content of each view follows the description in attachment content behavior. In particular, if an attachment is preserved, all views within the attachment are preserved.

If any two subpasses of a render pass activate transform feedback to the same bound transform feedback buffers, a subpass dependency must be included (either directly or via some intermediate subpasses) between them.

If there is no subpass dependency from VK_SUBPASS_EXTERNAL to the first subpass that uses an attachment, then an implicit subpass dependency exists from VK_SUBPASS_EXTERNAL to the first subpass it is used in. The implicit subpass dependency only exists if there exists an automatic layout transition away from initialLayout. The subpass dependency operates as if defined with the following parameters:

```
VkSubpassDependency implicitDependency = {
    .srcSubpass = VK_SUBPASS_EXTERNAL,
    .dstSubpass = firstSubpass, // First subpass attachment is used in
    .srcStageMask = VK_PIPELINE_STAGE_NONE,
    .dstStageMask = VK_PIPELINE_STAGE_ALL_COMMANDS_BIT,
    .srcAccessMask = 0,
    .dstAccessMask = VK_ACCESS_INPUT_ATTACHMENT_READ_BIT |
                     VK_ACCESS_COLOR_ATTACHMENT_READ_BIT |
                     VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT |
                     VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT |
                     VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT,
```

Similarly, if there is no subpass dependency from the last subpass that uses an attachment to `VK_SUBPASS_EXTERNAL`, then an implicit subpass dependency exists from the last subpass it is used in to `VK_SUBPASS_EXTERNAL`. The implicit subpass dependency only exists if there exists an automatic layout transition into `finalLayout`. The subpass dependency operates as if defined with the following parameters:

```cpp
VkSubpassDependency implicitDependency = {
    .srcSubpass = lastSubpass, // Last subpass attachment is used in
    .dstSubpass = VK_SUBPASS_EXTERNAL,
    .srcStageMask = VK_PIPELINE_STAGE_ALL_COMMANDS_BIT,
    .dstStageMask = VK_PIPELINE_STAGE_NONE,
    .srcAccessMask = VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT |
        VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT,
    .dstAccessMask = 0,
    .dependencyFlags = 0
};
```

As subpasses may overlap or execute out of order with regards to other subpasses unless a subpass dependency chain describes otherwise, the layout transitions required between subpasses cannot be known to an application. Instead, an application provides the layout that each attachment must be in at the start and end of a render pass, and the layout it must be in during each subpass it is used in. The implementation then must execute layout transitions between subpasses in order to guarantee that the images are in the layouts required by each subpass, and in the final layout at the end of the render pass.

Automatic layout transitions apply to the entire image subresource attached to the framebuffer. If multiview is not enabled and the attachment is a view of a 1D or 2D image, the automatic layout transitions apply to the number of layers specified by `VkFramebufferCreateInfo::layers`. If multiview is enabled and the attachment is a view of a 1D or 2D image, the automatic layout transitions apply to the layers corresponding to views which are used by some subpass in the render pass, even if that subpass does not reference the given attachment. If the attachment view is a 2D or 2D array view of a 3D image, even if the attachment view only refers to a subset of the slices of the selected mip level of the 3D image, automatic layout transitions apply to the entire subresource referenced which is the entire mip level in this case.

Automatic layout transitions away from the layout used in a subpass happen-after the availability operations for all dependencies with that subpass as the `srcSubpass`.

Automatic layout transitions into the layout used in a subpass happen-before the visibility operations for all dependencies with that subpass as the `dstSubpass`.

Automatic layout transitions away from `initialLayout` happen-after the availability operations for all dependencies with a `srcSubpass` equal to `VK_SUBPASS_EXTERNAL`, where `dstSubpass` uses the attachment that will be transitioned. For attachments created with `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT`, automatic layout transitions away from `initialLayout`
happen-after the availability operations for all dependencies with a $srcSubpass$ equal to
$VK_SUBPASS_EXTERNAL$, where $dstSubpass$ uses any aliased attachment.

Automatic layout transitions into $finalLayout$ happen-before the visibility operations for all
dependencies with a $dstSubpass$ equal to $VK_SUBPASS_EXTERNAL$, where $srcSubpass$ uses the attachment
that will be transitioned. For attachments created with $VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT$,
automatic layout transitions into $finalLayout$ happen-before the visibility operations for all
dependencies with a $dstSubpass$ equal to $VK_SUBPASS_EXTERNAL$, where $srcSubpass$ uses any aliased
attachment.

The image layout of the depth aspect of a depth/stencil attachment referring to an image created
with $VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT$ is dependent on the last sample
locations used to render to the attachment, thus automatic layout transitions use the sample
locations state specified in $VkRenderPassSampleLocationsBeginInfoEXT$.

Automatic layout transitions of an attachment referring to a depth/stencil image created with
$VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT$ use the sample locations the image
subresource range referenced by the attachment was last rendered with. If the current render pass
does not use the attachment as a depth/stencil attachment in any subpass that happens-before, the
automatic layout transition uses the sample locations state specified in the $sampleLocationsInfo$
member of the element of the $VkRenderPassSampleLocationsBeginInfoEXT$::$pAttachmentInitialSampleLocations$
array for which the $attachmentIndex$ member equals the attachment index of the attachment, if one is specified. Otherwise, the automatic layout transition uses the sample locations state specified in the $sampleLocationsInfo$
member of the element of the $VkRenderPassSampleLocationsBeginInfoEXT$::$pPostSubpassSampleLocations$
array for which the $subpassIndex$ member equals the index of the subpass that last used the attachment as a
depth/stencil attachment, if one is specified.

If no sample locations state has been specified for an automatic layout transition performed on an
attachment referring to a depth/stencil image created with $VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT$ the contents of the depth aspect of the
depth/stencil attachment become undefined as if the layout of the attachment was transitioned
from the $VK_IMAGE_LAYOUT_UNDEFINED$ layout.

If two subpasses use the same attachment, and both subpasses use the attachment in a read-only
layout, no subpass dependency needs to be specified between those subpasses. If an
implementation treats those layouts separately, it $must$ insert an implicit subpass dependency
between those subpasses to separate the uses in each layout. The subpass dependency operates as if
defined with the following parameters:

```
// Used for input attachments
VkPipelineStageFlags inputAttachmentStages = VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT;
VkAccessFlags inputAttachmentDstAccess = VK_ACCESS_INPUT_ATTACHMENT_READ_BIT;

// Used for depth/stencil attachments
VkPipelineStageFlags depthStencilAttachmentStages =
    VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT |
    VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT;
VkAccessFlags depthStencilAttachmentDstAccess =
```
When drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, the application must specify which types of attachments that are written to during a render pass will also be accessed as non-attachments in the render pass.

To dynamically set whether a pipeline can access a resource as a non-attachment while it is also used as an attachment that is written to, call:

```c
// Provided by VK_EXT_attachment_feedback_loop_dynamic_state
void vkCmdSetAttachmentFeedbackLoopEnableEXT(
    VkCommandBuffer commandBuffer,  
    VkImageAspectFlags aspectMask);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `aspectMask` specifies the types of attachments for which feedback loops will be enabled. Attachment types whose aspects are not included in `aspectMask` will have feedback loops disabled.

For attachments that are written to in a render pass, only attachments with the aspects specified in `aspectMask` can be accessed as non-attachments by subsequent drawing commands.

### Valid Usage

- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-attachmentFeedbackLoopDynamicState-08862
  The `attachmentFeedbackLoopDynamicState` feature must be enabled

- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-aspectMask-08863
  `aspectMask` must only include `VK_IMAGE_ASPECT_NONE`, `VK_IMAGE_ASPECT_COLOR_BIT`, `VK_IMAGE_ASPECT_DEPTH_BIT`, and `VK_IMAGE_ASPECT_STENCIL_BIT`

- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-attachmentFeedbackLoopLayout-08864
  If the `attachmentFeedbackLoopLayout` feature is not enabled, `aspectMask` must be `VK_IMAGE_ASPECT_NONE`
Valid Usage (Implicit)

- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-commandBuffer-parameter commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-aspectMask-parameter aspectMask must be a valid combination of VkImageAspectFlagBits values
- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-commandBuffer-recording commandBuffer must be in the recording state
- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-commandBuffer-cmdpool The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-videocoding This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

A more extensible version of render pass creation is also defined below.

To create a render pass, call:

```c
// Provided by VK_VERSION_1_2
VkResult vkCreateRenderPass2(
    VkDevice
    const VkRenderPassCreateInfo2* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkRenderPass* pRenderPass);
```

or the equivalent command
// Provided by VK_KHR_create_renderpass2

VkResult vkCreateRenderPass2KHR(
    VkDevice device,
    const VkRenderPassCreateInfo2* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkRenderPass* pRenderPass);

- `device` is the logical device that creates the render pass.
- `pCreateInfo` is a pointer to a `VkRenderPassCreateInfo2` structure describing the parameters of the render pass.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pRenderPass` is a pointer to a `VkRenderPass` handle in which the resulting render pass object is returned.

This command is functionally identical to `vkCreateRenderPass`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

### Valid Usage

- VUID-vkCreateRenderPass2-device-10001
  
  `device` must support at least one queue family with the `VK_QUEUE_GRAPHICS_BIT` capability

### Valid Usage (Implicit)

- VUID-vkCreateRenderPass2-device-parameter
  
  `device` must be a valid `VkDevice` handle

- VUID-vkCreateRenderPass2-pCreateInfo-parameter
  
  `pCreateInfo` must be a valid pointer to a valid `VkRenderPassCreateInfo2` structure

- VUID-vkCreateRenderPass2-pAllocator-parameter
  
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateRenderPass2-pRenderPass-parameter
  
  `pRenderPass` must be a valid pointer to a `VkRenderPass` handle

### Return Codes

#### Success

- `VK_SUCCESS`

#### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
The `VkRenderPassCreateInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkRenderPassCreateInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkRenderPassCreateFlags flags;
    uint32_t attachmentCount;
    const VkAttachmentDescription2* pAttachments;
    uint32_t subpassCount;
    const VkSubpassDescription2* pSubpasses;
    uint32_t dependencyCount;
    const VkSubpassDependency2* pDependencies;
    uint32_t correlatedViewMaskCount;
    const uint32_t* pCorrelatedViewMasks;
} VkRenderPassCreateInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_create_renderpass2
typedef VkRenderPassCreateInfo2 VkRenderPassCreateInfo2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `attachmentCount` is the number of attachments used by this render pass.
- `pAttachments` is a pointer to an array of `attachmentCount` `VkAttachmentDescription2` structures describing the attachments used by the render pass.
- `subpassCount` is the number of subpasses to create.
- `pSubpasses` is a pointer to an array of `subpassCount` `VkSubpassDescription2` structures describing each subpass.
- `dependencyCount` is the number of dependencies between pairs of subpasses.
- `pDependencies` is a pointer to an array of `dependencyCount` `VkSubpassDependency2` structures describing dependencies between pairs of subpasses.
- `correlatedViewMaskCount` is the number of correlation masks.
- `pCorrelatedViewMasks` is a pointer to an array of view masks indicating sets of views that *may* be more efficient to render concurrently.

Parameters defined by this structure with the same name as those in `VkRenderPassCreateInfo` have the identical effect to those parameters; the child structures are variants of those used in `VkRenderPassCreateInfo` which add `sType` and `pNext` parameters, allowing them to be extended.

If the `VkSubpassDescription2::viewMask` member of any element of `pSubpasses` is not zero, *multiview*
functionality is considered to be enabled for this render pass. 

correlatedViewMaskCount and pCorrelatedViewMasks have the same effect as VkRenderPassMultiviewCreateInfo::correlationMaskCount and VkRenderPassMultiviewCreateInfo ::pCorrelationMasks, respectively.

**Valid Usage**

- VUID-VkRenderPassCreateInfo2-None-03049
  If any two subpasses operate on attachments with overlapping ranges of the same VkDeviceMemory object, and at least one subpass writes to that area of VkDeviceMemory, a subpass dependency **must** be included (either directly or via some intermediate subpasses) between them.

- VUID-VkRenderPassCreateInfo2-attachment-03050
  If the attachment member of any element of pInputAttachments, pColorAttachments, pResolveAttachments or pDepthStencilAttachment, or the attachment indexed by any element of pPreserveAttachments in any element of pSubpasses is bound to a range of a VkDeviceMemory object that overlaps with any other attachment in any subpass (including the same subpass), the VkAttachmentDescription2 structures describing them **must** include VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT in flags.

- VUID-VkRenderPassCreateInfo2-attachment-03051
  If the attachment member of any element of pInputAttachments, pColorAttachments, pResolveAttachments or pDepthStencilAttachment, or any element of pPreserveAttachments in any element of pSubpasses is not VK_ATTACHMENT_UNUSED, then it **must** be less than attachmentCount.

- VUID-VkRenderPassCreateInfo2-fragmentDensityMapAttachment-06472
  If the pNext chain includes a VkRenderPassFragmentDensityMapCreateInfoEXT structure and the fragmentDensityMapAttachment member is not VK_ATTACHMENT_UNUSED, then attachment **must** be less than attachmentCount.

- VUID-VkRenderPassCreateInfo2-pSubpasses-06473
  If the pSubpasses pNext chain includes a VkSubpassDescriptionDepthStencilResolve structure and the pDepthStencilResolveAttachment member is not NULL and does not have the value VK_ATTACHMENT_UNUSED, then attachment **must** be less than attachmentCount.

- VUID-VkRenderPassCreateInfo2-pAttachments-02522
  For any member of pAttachments with a loadOp equal to VK_ATTACHMENT_LOAD_OP_CLEAR, the first use of that attachment **must** not specify a layout equal to VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL.

- VUID-VkRenderPassCreateInfo2-pAttachments-02523
  For any member of pAttachments with a stencilLoadOp equal to VK_ATTACHMENT_LOAD_OP_CLEAR, the first use of that attachment **must** not specify a layout equal to VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, or VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL.
• VUID-VkRenderPassCreateInfo2-pDependencies-03054
   For any element of pDependencies, if the srcSubpass is not VK_SUBPASS_EXTERNAL, all stage flags included in the srcStageMask member of that dependency must be a pipeline stage supported by the pipeline identified by the pipelineBindPoint member of the source subpass.

• VUID-VkRenderPassCreateInfo2-pDependencies-03055
   For any element of pDependencies, if the dstSubpass is not VK_SUBPASS_EXTERNAL, all stage flags included in the dstStageMask member of that dependency must be a pipeline stage supported by the pipeline identified by the pipelineBindPoint member of the destination subpass.

• VUID-VkRenderPassCreateInfo2-pCorrelatedViewMasks-03056
   The set of bits included in any element of pCorrelatedViewMasks must not overlap with the set of bits included in any other element of pCorrelatedViewMasks.

• VUID-VkRenderPassCreateInfo2-viewMask-03057
   If the VkSubpassDescription2::viewMask member of all elements of pSubpasses is 0, correlatedViewMaskCount must be 0.

• VUID-VkRenderPassCreateInfo2-viewMask-03058
   The VkSubpassDescription2::viewMask member of all elements of pSubpasses must either all be 0, or all not be 0.

• VUID-VkRenderPassCreateInfo2-viewMask-03059
   If the VkSubpassDescription2::viewMask member of all elements of pSubpasses is 0, the dependencyFlags member of any element of pDependencies must not include VK_DEPENDENCY_VIEW_LOCAL_BIT.

• VUID-VkRenderPassCreateInfo2-pDependencies-03060
   For any element of pDependencies where its srcSubpass member equals its dstSubpass member, if the viewMask member of the corresponding element of pSubpasses includes more than one bit, its dependencyFlags member must include VK_DEPENDENCY_VIEW_LOCAL_BIT.

• VUID-VkRenderPassCreateInfo2-attachment-02525
   If the attachment member of any element of the pInputAttachments member of any element of pSubpasses is not VK_ATTACHMENT_UNUSED, the aspectMask member of that element of pInputAttachments must only include aspects that are present in images of the format specified by the element of pAttachments specified by attachment.

• VUID-VkRenderPassCreateInfo2-srcSubpass-02526
   The srcSubpass member of each element of pDependencies must be less than subpassCount.

• VUID-VkRenderPassCreateInfo2-dstSubpass-02527
   The dstSubpass member of each element of pDependencies must be less than subpassCount.

• VUID-VkRenderPassCreateInfo2-pAttachments-04585
   If any element of pAttachments is used as a fragment shading rate attachment in any subpass, it must not be used as any other attachment in the render pass.

• VUID-VkRenderPassCreateInfo2-pAttachments-09387
   If any element of pAttachments is used as a fragment shading rate attachment, the loadOp for that attachment must not be VK_ATTACHMENT_LOAD_OP_CLEAR.
• VUID-VkRenderPassCreateInfo2-flags-04521
If flags includes VK_RENDER_PASS_CREATE_TRANSFORM_BIT_QCOM, an element of pSubpasses includes an instance of VkFragmentShadingRateAttachmentInfoKHR in its pNext chain, and the pFragmentShadingRateAttachment member of that structure is not equal to NULL, the attachment member of pFragmentShadingRateAttachment must be VK_ATTACHMENT_UNUSED.

• VUID-VkRenderPassCreateInfo2-pAttachments-04586
If any element of pAttachments is used as a fragment shading rate attachment in any subpass, it must have an image format whose potential format features contain VK_FORMAT_FEATURE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR.

• VUID-VkRenderPassCreateInfo2-rasterizationSamples-04905
If the pipeline is being created with fragment shader state, and the VK_QCOM_render_pass_shader_resolve extension is enabled, and if subpass has any input attachments, and if the subpass description contains VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM, then the sample count of the input attachments must equal rasterizationSamples.

• VUID-VkRenderPassCreateInfo2-sampleShadingEnable-04906
If the pipeline is being created with fragment shader state, and the VK_QCOM_render_pass_shader_resolve extension is enabled, and if the subpass description contains VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM, then sampleShadingEnable must be false.

• VUID-VkRenderPassCreateInfo2-flags-04907
If flags includes VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM, and if pResolveAttachments is not NULL, then each resolve attachment must be VK_ATTACHMENT_UNUSED.

• VUID-VkRenderPassCreateInfo2-flags-04908
If flags includes VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM, and if pDepthStencilResolveAttachment is not NULL, then the depth/stencil resolve attachment must be VK_ATTACHMENT_UNUSED.

• VUID-VkRenderPassCreateInfo2-flags-04909
If flags includes VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM, then the subpass must be the last subpass in a subpass dependency chain.

• VUID-VkRenderPassCreateInfo2-attachment-06244
If the attachment member of the pDepthStencilAttachment member of an element of pSubpasses is not VK_ATTACHMENT_UNUSED, the layout member of that same structure is either VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, and the pNext chain of that structure does not include a VkAttachmentReferenceStencilLayout structure, then the element of pAttachments with an index equal to attachment must not have a format that includes both depth and stencil components.

• VUID-VkRenderPassCreateInfo2-attachment-06245
If the attachment member of the pDepthStencilAttachment member of an element of pSubpasses is not VK_ATTACHMENT_UNUSED and the layout member of that same structure is either VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL, then the element of pAttachments with an index equal to attachment must have a format that includes only a stencil component.
If the attachment member of the pDepthStencilAttachment member of an element of pSubpasses is not VK_ATTACHMENT_UNUSED and the layout member of that same structure is either VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, then the element of pAttachments with an index equal to attachment must not have a format that includes only a stencil component.

If any element of pResolveAttachments of any element of pSubpasses references an attachment description with a format of VK_FORMAT_UNDEFINED, VkRenderPassFragmentDensityMapCreateInfoEXT::fragmentDensityMapAttachment->attachment must be VK_ATTACHMENT_UNUSED.

Valid Usage (Implicit)

- **VUID-VkRenderPassCreateInfo2-sType-sType**: sType must be VK_STRUCTURE_TYPE_RENDER_PASS_CREATE_INFO_2
- **VUID-VkRenderPassCreateInfo2-pNext-pNext**: Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkRenderPassCreationControlEXT, VkRenderPassCreationFeedbackCreateInfoEXT, or VkRenderPassFragmentDensityMapCreateInfoEXT.
- **VUID-VkRenderPassCreateInfo2-sType-unique**: The sType value of each struct in the pNext chain must be unique.
- **VUID-VkRenderPassCreateInfo2-flags-parameter**: flags must be a valid combination of VkRenderPassCreateFlagBits values.
- **VUID-VkRenderPassCreateInfo2-pAttachments-parameter**: If attachmentCount is not 0, pAttachments must be a valid pointer to an array of attachmentCount valid VkAttachmentDescription2 structures.
- **VUID-VkRenderPassCreateInfo2-pSubpasses-parameter**: pSubpasses must be a valid pointer to an array of subpassCount valid VkSubpassDescription2 structures.
- **VUID-VkRenderPassCreateInfo2-pDependencies-parameter**: If dependencyCount is not 0, pDependencies must be a valid pointer to an array of dependencyCount valid VkSubpassDependency2 structures.
- **VUID-VkRenderPassCreateInfo2-pCorrelatedViewMasks-parameter**: If correlatedViewMaskCount is not 0, pCorrelatedViewMasks must be a valid pointer to an array of correlatedViewMaskCount uint32_t values.
- **VUID-VkRenderPassCreateInfo2-subpassCount-arraylength**: subpassCount must be greater than 0.

The VkAttachmentDescription2 structure is defined as:
// Provided by VK_VERSION_1_2
typedef struct VkAttachmentDescription2 {
    VkStructureType sType;
    const void* pNext;
    VkAttachmentDescriptionFlags flags;
    VkFormat format;
    VkSampleCountFlagBits samples;
    VkAttachmentLoadOp loadOp;
    VkAttachmentStoreOp storeOp;
    VkAttachmentLoadOp stencilLoadOp;
    VkAttachmentStoreOp stencilStoreOp;
    VkImageLayout initialLayout;
    VkImageLayout finalLayout;
} VkAttachmentDescription2;

or the equivalent

// Provided by VK_KHR_create_renderpass2
typedef VkAttachmentDescription2 VkAttachmentDescription2KHR;

• **sType** is a VkStructureType value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **flags** is a bitmask of VkAttachmentDescriptionFlagBits specifying additional properties of the attachment.

• **format** is a VkFormat value specifying the format of the image that will be used for the attachment.

• **samples** is a VkSampleCountFlagBits value specifying the number of samples of the image.

• **loadOp** is a VkAttachmentLoadOp value specifying how the contents of color and depth components of the attachment are treated at the beginning of the subpass where it is first used.

• **storeOp** is a VkAttachmentStoreOp value specifying how the contents of color and depth components of the attachment are treated at the end of the subpass where it is last used.

• **stencilLoadOp** is a VkAttachmentLoadOp value specifying how the contents of stencil components of the attachment are treated at the beginning of the subpass where it is first used.

• **stencilStoreOp** is a VkAttachmentStoreOp value specifying how the contents of stencil components of the attachment are treated at the end of the last subpass where it is used.

• **initialLayout** is the layout the attachment image subresource will be in when a render pass instance begins.

• **finalLayout** is the layout the attachment image subresource will be transitioned to when a render pass instance ends.

Parameters defined by this structure with the same name as those in VkAttachmentDescription have the identical effect to those parameters.
If the `separateDepthStencilLayouts` feature is enabled, and `format` is a depth/stencil format, `initialLayout` and `finalLayout` can be set to a layout that only specifies the layout of the depth aspect.

If the `pNext` chain includes a `VkAttachmentDescriptionStencilLayout` structure, then the `stencilInitialLayout` and `stencilFinalLayout` members specify the initial and final layouts of the stencil aspect of a depth/stencil format, and `initialLayout` and `finalLayout` only apply to the depth aspect. For depth-only formats, the `VkAttachmentDescriptionStencilLayout` structure is ignored. For stencil-only formats, the initial and final layouts of the stencil aspect are taken from the `VkAttachmentDescriptionStencilLayout` structure if present, or `initialLayout` and `finalLayout` if not present.

If `format` is a depth/stencil format, and either `initialLayout` or `finalLayout` does not specify a layout for the stencil aspect, then the application must specify the initial and final layouts of the stencil aspect by including a `VkAttachmentDescriptionStencilLayout` structure in the `pNext` chain.

`loadOp` and `storeOp` are ignored for fragment shading rate attachments. No access to the shading rate attachment is performed in `loadOp` and `storeOp`. Instead, access to `VK_ACCESS_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR` is performed as fragments are rasterized.

### Valid Usage

- **VUID-VkAttachmentDescription2-format-06699**
  If `format` includes a color or depth component and `loadOp` is `VK_ATTACHMENT_LOAD_OP_LOAD`, then `initialLayout` must not be `VK_IMAGE_LAYOUT_UNDEFINED`

- **VUID-VkAttachmentDescription2-finalLayout-00843**
  `finalLayout` must not be `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`

- **VUID-VkAttachmentDescription2-format-03280**
  If `format` is a color format, `initialLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`

- **VUID-VkAttachmentDescription2-format-03281**
  If `format` is a depth/stencil format, `initialLayout` must not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`

- **VUID-VkAttachmentDescription2-format-03282**
  If `format` is a color format, `finalLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`

- **VUID-VkAttachmentDescription2-format-03283**
  If `format` is a depth/stencil format, `finalLayout` must not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`

- **VUID-VkAttachmentDescription2-format-06487**
  If `format` is a color format, `initialLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`
• VUID-VkAttachmentDescription2-format-06488
  If format is a color format, finalLayout must not be
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL
  or
  VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

• VUID-VkAttachmentDescription2-separateDepthStencilLayouts-03284
  If the separateDepthStencilLayouts feature is not enabled, initialLayout must not be
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
  VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL,
  or
  VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription2-separateDepthStencilLayouts-03285
  If the separateDepthStencilLayouts feature is not enabled, finalLayout must not be
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
  VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL,
  or
  VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription2-format-03286
  If format is a color format, initialLayout must not be
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL,
  VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
  VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL,
  or
  VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription2-format-03287
  If format is a color format, finalLayout must not be
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL,
  VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
  VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL,
  or
  VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription2-format-06906
  If format is a depth/stencil format which includes both depth and stencil components, initialLayout must not be
  VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or
  VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription2-format-06907
  If format is a depth/stencil format which includes both depth and stencil components, finalLayout must not be
  VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or
  VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription2-format-03290
  If format is a depth/stencil format which includes only the depth component, initialLayout must not be
  VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or
  VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription2-format-03291
  If format is a depth/stencil format which includes only the depth component, finalLayout must not be
  VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or
  VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription2-synchronization2-06908
  If the synchronization2 feature is not enabled, initialLayout must not be
  VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

• VUID-VkAttachmentDescription2-synchronization2-06909
If the synchronization feature is not enabled, finalLayout must not be
VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

- VUID-VkAttachmentDescription2-attachmentFeedbackLoopLayout-07309
  If the attachmentFeedbackLoopLayout feature is not enabled, initialLayout must not be
  VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT

- VUID-VkAttachmentDescription2-attachmentFeedbackLoopLayout-07310
  If the attachmentFeedbackLoopLayout feature is not enabled, finalLayout must not be
  VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT

- VUID-VkAttachmentDescription2-samples-08745
  samples must be a valid VkSampleCountFlagBits value that is set in
  imageCreateSampleCounts (as defined in Image Creation Limits) for the given format

- VUID-VkAttachmentDescription2-dynamicRenderingLocalRead-09544
  If the dynamicRenderingLocalRead feature is not enabled, initialLayout must not be
  VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR

- VUID-VkAttachmentDescription2-dynamicRenderingLocalRead-09545
  If the dynamicRenderingLocalRead feature is not enabled, finalLayout must not be
  VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR

- VUID-VkAttachmentDescription2-pNext-06704
  If the pNext chain does not include a VkAttachmentDescriptionStencilLayout structure,
  format includes a stencil component, and stencilLoadOp is VK_ATTACHMENT_LOAD_OP_LOAD,
  then initialLayout must not be VK_IMAGE_LAYOUT_UNDEFINED

- VUID-VkAttachmentDescription2-pNext-06705
  If the pNext chain includes a VkAttachmentDescriptionStencilLayout structure, format
  includes a stencil component, and stencilLoadOp is VK_ATTACHMENT_LOAD_OP_LOAD, then
  VkAttachmentDescriptionStencilLayout::stencilInitialLayout must not be
  VK_IMAGE_LAYOUT_UNDEFINED

- VUID-VkAttachmentDescription2-format-06249
  If format is a depth/stencil format which includes both depth and stencil components, and
  initialLayout is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or
  VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, the pNext chain must include a
  VkAttachmentDescriptionStencilLayout structure

- VUID-VkAttachmentDescription2-format-06250
  If format is a depth/stencil format which includes both depth and stencil components, and
  finalLayout is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or
  VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, the pNext chain must include a
  VkAttachmentDescriptionStencilLayout structure

- VUID-VkAttachmentDescription2-format-06247
  If the pNext chain does not include a VkAttachmentDescriptionStencilLayout structure and
  format only includes a stencil component, initialLayout must not be
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL

- VUID-VkAttachmentDescription2-format-06248
  If the pNext chain does not include a VkAttachmentDescriptionStencilLayout structure and
  format only includes a stencil component, finalLayout must not be
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL

- VUID-VkAttachmentDescription2-format-09332
  If externalFormatResolve is not enabled, format must not be VK_FORMAT_UNDEFINED

- VUID-VkAttachmentDescription2-format-09334
  If format is VK_FORMAT_UNDEFINED, there must be a VkExternalFormatANDROID structure in
  the pNext chain with a externalFormat that is not equal to 0

Valid Usage (Implicit)

- VUID-VkAttachmentDescription2-sType-sType
  sType must be VK_STRUCTURE_TYPE_ATTACHMENT_DESCRIPTION_2

- VUID-VkAttachmentDescription2-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either
  NULL or a pointer to a valid instance of VkAttachmentDescriptionStencilLayout or
  VkExternalFormatANDROID

- VUID-VkAttachmentDescription2-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkAttachmentDescription2-flags-flags-parameter
  flags must be a valid combination of VkAttachmentDescriptionFlagBits values

- VUID-VkAttachmentDescription2-format-format-parameter
  format must be a valid VkFormat value

- VUID-VkAttachmentDescription2-samples-samples-parameter
  samples must be a valid VkSampleCountFlagBits value

- VUID-VkAttachmentDescription2-loadOp-loadOp-parameter
  loadOp must be a valid VkAttachmentLoadOp value

- VUID-VkAttachmentDescription2-storeOp-storeOp-parameter
  storeOp must be a valid VkAttachmentStoreOp value

- VUID-VkAttachmentDescription2-stencilLoadOp-stencilLoadOp-parameter
  stencilLoadOp must be a valid VkAttachmentLoadOp value

- VUID-VkAttachmentDescription2-stencilStoreOp-stencilStoreOp-parameter
  stencilStoreOp must be a valid VkAttachmentStoreOp value

- VUID-VkAttachmentDescription2-initialLayout-initialLayout-parameter
  initialLayout must be a valid VkImageLayout value

- VUID-VkAttachmentDescription2-finalLayout-finalLayout-parameter
  finalLayout must be a valid VkImageLayout value

The VkAttachmentDescriptionStencilLayout structure is defined as:
```c
typedef struct VkAttachmentDescriptionStencilLayout {
    VkStructureType sType;
    void* pNext;
    VkImageLayout stencilInitialLayout;
    VkImageLayout stencilFinalLayout;
} VkAttachmentDescriptionStencilLayout;
```

or the equivalent

```c
typedef VkAttachmentDescriptionStencilLayout VkAttachmentDescriptionStencilLayoutKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stencilInitialLayout` is the layout the stencil aspect of the attachment image subresource will be in when a render pass instance begins.
- `stencilFinalLayout` is the layout the stencil aspect of the attachment image subresource will be transitioned to when a render pass instance ends.

### Valid Usage

- **VUID-VkAttachmentDescriptionStencilLayout-stencilInitialLayout-03308**
  - `stencilInitialLayout` **must not be** `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`

- **VUID-VkAttachmentDescriptionStencilLayout-stencilFinalLayout-03309**
  - `stencilFinalLayout` **must not be** `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`

- **VUID-VkAttachmentDescriptionStencilLayout-stencilFinalLayout-03310**
  - `stencilFinalLayout` **must not be** `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`

### Valid Usage (Implicit)

- **VUID-VkAttachmentDescriptionStencilLayout-sType-sType**
sType must be VK_STRUCTURE_TYPE_ATTACHMENT_DESCRIPTION_STENCIL_LAYOUT

- VUID-VkAttachmentDescriptionStencilLayout-stencilInitialLayout-parameter
  stencilInitialLayout must be a valid VkImageLayout value

- VUID-VkAttachmentDescriptionStencilLayout-stencilFinalLayout-parameter
  stencilFinalLayout must be a valid VkImageLayout value

The VkSubpassDescription2 structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkSubpassDescription2 {
    VkStructureType sType;
    const void* pNext;
    VkSubpassDescriptionFlags flags;
    VkPipelineBindPoint pipelineBindPoint;
    uint32_t viewMask;
    uint32_t inputAttachmentCount;
    const VkAttachmentReference2* pInputAttachments;
    uint32_t colorAttachmentCount;
    const VkAttachmentReference2* pColorAttachments;
    const VkAttachmentReference2* pResolveAttachments;
    const VkAttachmentReference2* pDepthStencilAttachment;
    uint32_t preserveAttachmentCount;
    const uint32_t* pPreserveAttachments;
} VkSubpassDescription2;
```

or the equivalent

```c
// Provided by VK_KHR_create_renderpass2
typedef VkSubpassDescription2 VkSubpassDescription2KHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is a bitmask of VkSubpassDescriptionFlagBits specifying usage of the subpass.
- pipelineBindPoint is a VkPipelineBindPoint value specifying the pipeline type supported for this subpass.
- viewMask is a bitfield of view indices describing which views rendering is broadcast to in this subpass, when multiview is enabled.
- inputAttachmentCount is the number of input attachments.
- pInputAttachments is a pointer to an array of VkAttachmentReference2 structures defining the input attachments for this subpass and their layouts.
- colorAttachmentCount is the number of color attachments.
- pColorAttachments is a pointer to an array of colorAttachmentCount VkAttachmentReference2 structures defining the color attachments for this subpass and their layouts.
- `pResolveAttachments` is `NULL` or a pointer to an array of `colorAttachmentCount` `VkAttachmentReference2` structures defining the resolve attachments for this subpass and their layouts.

- `pDepthStencilAttachment` is a pointer to a `VkAttachmentReference2` structure specifying the depth/stencil attachment for this subpass and its layout.

- `preserveAttachmentCount` is the number of preserved attachments.

- `pPreserveAttachments` is a pointer to an array of `preserveAttachmentCount` render pass attachment indices identifying attachments that are not used by this subpass, but whose contents must be preserved throughout the subpass.

Parameters defined by this structure with the same name as those in `VkSubpassDescription` have the identical effect to those parameters.

`viewMask` has the same effect for the described subpass as `VkRenderPassMultiviewCreateInfo::pViewMasks` has on each corresponding subpass.

If a `VkFragmentShadingRateAttachmentInfoKHR` structure is included in the `pNext` chain, `pFragmentShadingRateAttachment` is not `NULL`, and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, the identified attachment defines a fragment shading rate attachment for that subpass.

If any element of `pResolveAttachments` is an image specified with an `VkExternalFormatANDROID`, values in the corresponding color attachment will be resolved to the resolve attachment in the same manner as specified for `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`.

If the `nullColorAttachmentWithExternalFormatResolve` limit is `VK_TRUE`, values in the color attachment will be loaded from the resolve attachment at the start of rendering, and may also be reloaded any time after a resolve occurs or the resolve attachment is written to; if this occurs it must happen-before any writes to the color attachment are performed which happen-after the resolve that triggers this. If any color component in the external format is subsampled, values will be read from the nearest sample in the image when they are loaded. If the color attachment is also used as an input attachment, the same behavior applies.

Setting the color attachment to `VK_ATTACHMENT_UNUSED` when an external resolve attachment is used and the `nullColorAttachmentWithExternalFormatResolve` limit is `VK_TRUE` will not result in color attachment writes to be discarded for that attachment.

When `nullColorAttachmentWithExternalFormatResolve` is `VK_TRUE`, the color output from the subpass can still be read via an input attachment; but the application cannot bind an image view for the color attachment as there is no such image view bound. Instead to access the data as an input attachment applications can use the resolve attachment in its place - using the resolve attachment image for the descriptor, and setting the corresponding element of `pInputAttachments` to the index of the resolve attachment.

Loads or input attachment reads from the resolve attachment are performed as if using a `VkSamplerYcbcrConversionCreateInfo` with the following parameters:

```c
VkSamplerYcbcrConversionCreateInfo createInfo = {
    .sType = VK_STRUCTURE_TYPE_SAMPLER_YCBCR_CONVERSION_CREATE_INFO,
    .percentSampled = 1.0f,
    .yCbcrConversion = VK_BORDER_COLOR_EXTENTED_FORMAT_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID,
    .yCbcrSubsample = VK_SUBSAMPLE_444,
    .yCbcrArtifacts = VK ula
};
```
.pNext = NULL,
.format = VK_FORMAT_UNDEFINED,
.ycbcrModel = VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY,
.ycbcrRange = VK_SAMPLER_YCBCR_RANGE_ITU_FULL,
.components = {
    .r = VK_COMPONENT_SWIZZLE_B
    .g = VK_COMPONENT_SWIZZLE_R
    .b = VK_COMPONENT_SWIZZLE_G
    .a = VK_COMPONENT_SWIZZLE_IDENTITY},
.xChromaOffset = properties.chromaOffsetX,
.yChromaOffset = properties.chromaOffsetY,
.chromaFilter = VK_FILTER_NEAREST,
.forceExplicitReconstruction = ...);

where properties is equal to VkPhysicalDeviceExternalFormatResolvePropertiesANDROID returned by the device and forceExplicitReconstruction is effectively ignored as the VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY model is used. The applied swizzle is the same effective swizzle that would be applied by the VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY model, but no range expansion is applied.

Valid Usage

• VUID-VkSubpassDescription2-attachment-06912
  If the attachment member of an element of pInputAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL

• VUID-VkSubpassDescription2-attachment-06913
  If the attachment member of an element of pColorAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL

• VUID-VkSubpassDescription2-attachment-06914
  If the attachment member of an element of pResolveAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL

• VUID-VkSubpassDescription2-attachment-06915
  If the attachment member of pDepthStencilAttachment is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL

• VUID-VkSubpassDescription2-attachment-06916
  If the attachment member of an element of pColorAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

• VUID-VkSubpassDescription2-attachment-06917
  If the attachment member of an element of pResolveAttachments is not
VK_ATTACHMENT_UNUSED, its layout member must not be
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL or
VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

- VUID-VkSubpassDescription2-attachment-06918
  If the attachment member of an element of pInputAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL

- VUID-VkSubpassDescription2-attachment-06919
  If the attachment member of an element of pColorAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkSubpassDescription2-attachment-06920
  If the attachment member of an element of pResolveAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkSubpassDescription2-attachment-06921
  If the attachment member of an element of pInputAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR

- VUID-VkSubpassDescription2-attachment-06922
  If the attachment member of an element of pColorAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

- VUID-VkSubpassDescription2-attachment-06923
  If the attachment member of an element of pResolveAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

- VUID-VkSubpassDescription2-attachment-06251
  If the attachment member of pDepthStencilAttachment is not VK_ATTACHMENT_UNUSED and its pNext chain includes a VkAttachmentReferenceStencilLayout structure, the layout member of pDepthStencilAttachment must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkSubpassDescription2-pipelineBindPoint-04953
  pipelineBindPoint must be VK_PIPELINE_BIND_POINT_GRAPHICS or VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI

- VUID-VkSubpassDescription2-colorAttachmentCount-03063
  colorAttachmentCount must be less than or equal to VkPhysicalDeviceLimits::maxColorAttachments

- VUID-VkSubpassDescription2-loadOp-03064
  If the first use of an attachment in this render pass is as an input attachment, and the attachment is not also used as a color or depth/stencil attachment in the same subpass, then loadOp must not be VK_ATTACHMENT_LOAD_OP_CLEAR
• **VUID-VkSubpassDescription2-pResolveAttachments-03067**
  If `pResolveAttachments` is not `NULL`, each resolve attachment that is not `VK_ATTACHMENT_UNUSED` must have a sample count of `VK_SAMPLE_COUNT_1_BIT`.

• **VUID-VkSubpassDescription2-externalFormatResolve-09335**
  If `externalFormatResolve` is not enabled and `pResolveAttachments` is not `NULL`, for each resolve attachment that does not have the value `VK_ATTACHMENT_UNUSED`, the corresponding color attachment must not have the value `VK_ATTACHMENT_UNUSED`.

• **VUID-VkSubpassDescription2-nullColorAttachmentWithExternalFormatResolve-09336**
  If the `nullColorAttachmentWithExternalFormatResolve` property is `VK_FALSE` and `pResolveAttachments` is not `NULL`, for each resolve attachment that has a format of `VK_FORMAT_UNDEFINED`, the corresponding color attachment must not have the value `VK_ATTACHMENT_UNUSED`.

• **VUID-VkSubpassDescription2-nullColorAttachmentWithExternalFormatResolve-09337**
  If the `nullColorAttachmentWithExternalFormatResolve` property is `VK_TRUE` and `pResolveAttachments` is not `NULL`, for each resolve attachment that has a format of `VK_FORMAT_UNDEFINED`, the corresponding color attachment must have the value `VK_ATTACHMENT_UNUSED`.

• **VUID-VkSubpassDescription2-externalFormatResolve-09338**
  If `externalFormatResolve` is not enabled and `pResolveAttachments` is not `NULL`, for each resolve attachment that is not `VK_ATTACHMENT_UNUSED`, the corresponding color attachment must not have a sample count of `VK_SAMPLE_COUNT_1_BIT`.

• **VUID-VkSubpassDescription2-externalFormatResolve-09339**
  If `externalFormatResolve` is not enabled, each element of `pResolveAttachments` must have the same `VkFormat` as its corresponding color attachment.

• **VUID-VkSubpassDescription2-multisampledRenderToSingleSampled-06869**
  If the `multisampledRenderToSingleSampled` feature is not enabled, all attachments in `pColorAttachments` that are not `VK_ATTACHMENT_UNUSED` must have the same sample count.

• **VUID-VkSubpassDescription2-pInputAttachments-02897**
  All attachments in `pInputAttachments` that are not `VK_ATTACHMENT_UNUSED` must have image formats whose potential format features contain at least `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT` or `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`.

• **VUID-VkSubpassDescription2-pColorAttachments-02898**
  All attachments in `pColorAttachments` that are not `VK_ATTACHMENT_UNUSED` must have image formats whose potential format features contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT`.

• **VUID-VkSubpassDescription2-pResolveAttachments-09343**
  All attachments in `pResolveAttachments` that are not `VK_ATTACHMENT_UNDEFINED` must have image formats whose potential format features contain at least `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT` or `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`.
features contain \texttt{VK\_FORMAT\_FEATURE\_COLOR\_ATTACHMENT\_BIT}

- **VUID-VkSubpassDescription2-pDepthStencilAttachment-02900**
  If \texttt{pDepthStencilAttachment} is not \texttt{NULL} and the attachment is not \texttt{VK\_ATTACHMENT\_UNUSED} then it \textbf{must} have an image format whose potential format features contain \texttt{VK\_FORMAT\_FEATURE\_DEPTH\_STENCIL\_ATTACHMENT\_BIT}

- **VUID-VkSubpassDescription2-linearColorAttachment-06499**
  If the \texttt{linearColorAttachment} feature is enabled and the image is created with \texttt{VK\_IMAGE\_TILING\_LINEAR}, all attachments in \texttt{pInputAttachments} that are not \texttt{VK\_ATTACHMENT\_UNUSED} \textbf{must} have image formats whose potential format features \textbf{must} contain \texttt{VK\_FORMAT\_FEATURE\_2\_LINEAR\_COLOR\_ATTACHMENT\_BIT\_NV}

- **VUID-VkSubpassDescription2-linearColorAttachment-06500**
  If the \texttt{linearColorAttachment} feature is enabled and the image is created with \texttt{VK\_IMAGE\_TILING\_LINEAR}, all attachments in \texttt{pColorAttachments} that are not \texttt{VK\_ATTACHMENT\_UNUSED} \textbf{must} have image formats whose potential format features \textbf{must} contain \texttt{VK\_FORMAT\_FEATURE\_2\_LINEAR\_COLOR\_ATTACHMENT\_BIT\_NV}

- **VUID-VkSubpassDescription2-linearColorAttachment-06501**
  If the \texttt{linearColorAttachment} feature is enabled and the image is created with \texttt{VK\_IMAGE\_TILING\_LINEAR}, all attachments in \texttt{pResolveAttachments} that are not \texttt{VK\_ATTACHMENT\_UNUSED} \textbf{must} have image formats whose potential format features \textbf{must} contain \texttt{VK\_FORMAT\_FEATURE\_2\_LINEAR\_COLOR\_ATTACHMENT\_BIT\_NV}

- **VUID-VkSubpassDescription2-None-09456**
  If either of the following is enabled:
  
  - The \texttt{VK\_AMD\_mixed\_attachment\_samples} extension
  - The \texttt{VK\_NV\_framebuffer\_mixed\_samples} extension
  
  all attachments in \texttt{pColorAttachments} that are not \texttt{VK\_ATTACHMENT\_UNUSED} \textbf{must} have a sample count that is smaller than or equal to the sample count of \texttt{pDepthStencilAttachment} if it is not \texttt{VK\_ATTACHMENT\_UNUSED}

- **VUID-VkSubpassDescription2-pNext-06870**
  If the \texttt{pNext} chain includes a \texttt{VkMultisampledRenderToSingleSampledInfoEXT} structure with \texttt{multisampledRenderToSingleSampledEnable} equal to \texttt{VK\_TRUE}, then all attachments in \texttt{pColorAttachments} and \texttt{pDepthStencilAttachment} that are not \texttt{VK\_ATTACHMENT\_UNUSED} \textbf{must} have a sample count that is either \texttt{VK\_SAMPLE\_COUNT\_1\_BIT} or equal to \texttt{VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples}

- **VUID-VkSubpassDescription2-pNext-06871**
  If the \texttt{pNext} chain includes a \texttt{VkMultisampledRenderToSingleSampledInfoEXT} structure with \texttt{multisampledRenderToSingleSampledEnable} equal to \texttt{VK\_TRUE}, and \texttt{pDepthStencilAttachment} is not \texttt{NULL}, does not have the value \texttt{VK\_ATTACHMENT\_UNUSED}, and has a sample count of \texttt{VK\_SAMPLE\_COUNT\_1\_BIT}, the \texttt{pNext} chain \textbf{must} also include a \texttt{VkSubpassDescriptionDepthStencilResolve} structure with \texttt{pDepthStencilResolveAttachment} that is either \texttt{NULL} or has the value \texttt{VK\_ATTACHMENT\_UNUSED}

- **VUID-VkSubpassDescription2-multisampledRenderToSingleSampled-06872**
  All attachments in \texttt{pDepthStencilAttachment} or \texttt{pColorAttachments} that are not \texttt{VK\_ATTACHMENT\_UNUSED} \textbf{must} have the same sample count, if none of the following are
enabled:
- The \texttt{VK_AMD\_mixed\_attachment\_samples} extension
- The \texttt{VK_NV\_framebuffer\_mixed\_samples} extension
- The \texttt{multisampledRenderToSingleSampled} feature,

- \texttt{VUID-VkSubpassDescription2-attachment-0073}
  Each element of \texttt{pPreserveAttachments} \textbf{must} not be \texttt{VK\_ATTACHMENT\_UNUSED}

- \texttt{VUID-VkSubpassDescription2-pPreserveAttachments-0074}
  Each element of \texttt{pPreserveAttachments} \textbf{must} not also be an element of any other member of the subpass description

- \texttt{VUID-VkSubpassDescription2-layout-00728}
  If any attachment is used by more than one \texttt{VkAttachmentReference2} member, then each use \textbf{must} use the same \texttt{layout}

- \texttt{VUID-VkSubpassDescription2-flags-0076}
  If \texttt{flags} includes \texttt{VK\_SUBPASS\_DESCRIPTION\_PER\_VIEW\_POSITION\_X\_ONLY\_BIT\_NVX}, it \textbf{must} also include \texttt{VK\_SUBPASS\_DESCRIPTION\_PER\_VIEW\_ATTRIBUTES\_BIT\_NVX}

- \texttt{VUID-VkSubpassDescription2-attachment-00799}
  If the \texttt{attachment} member of any element of \texttt{pInputAttachments} is not \texttt{VK\_ATTACHMENT\_UNUSED}, then the \texttt{aspectMask} member \textbf{must} be a valid combination of \texttt{VkImageAspectFlagBits}

- \texttt{VUID-VkSubpassDescription2-attachment-00800}
  If the \texttt{attachment} member of any element of \texttt{pInputAttachments} is not \texttt{VK\_ATTACHMENT\_UNUSED}, then the \texttt{aspectMask} member \textbf{must} not be \texttt{0}

- \texttt{VUID-VkSubpassDescription2-attachment-00801}
  If the \texttt{attachment} member of any element of \texttt{pInputAttachments} is not \texttt{VK\_ATTACHMENT\_UNUSED}, then the \texttt{aspectMask} member \textbf{must} not include \texttt{VK\_IMAGE\_ASPECT\_METADATA\_BIT}

- \texttt{VUID-VkSubpassDescription2-attachment-04563}
  If the \texttt{attachment} member of any element of \texttt{pInputAttachments} is not \texttt{VK\_ATTACHMENT\_UNUSED}, then the \texttt{aspectMask} member \textbf{must} not include \texttt{VK\_IMAGE\_ASPECT\_MEMORY\_PLANE\_i\_BIT\_EXT} for any index \texttt{i}

- \texttt{VUID-VkSubpassDescription2-pDepthStencilAttachment-004440}
  An attachment \textbf{must} not be used in both \texttt{pDepthStencilAttachment} and \texttt{pColorAttachments}

- \texttt{VUID-VkSubpassDescription2-multiview-006558}
  If the \texttt{multiview} feature is not enabled, \texttt{viewMask} \textbf{must} be \texttt{0}

- \texttt{VUID-VkSubpassDescription2-viewMask-00706}
  The index of the most significant bit in \texttt{viewMask} \textbf{must} be less than \texttt{maxMultiviewViewCount}

- \texttt{VUID-VkSubpassDescription2-externalFormatResolve-009344}
  If \texttt{externalFormatResolve} is enabled, \texttt{pResolveAttachments} is not \texttt{NULL}, and \texttt{colorAttachmentCount} is not \texttt{1}, any element of \texttt{pResolveAttachments} that is not \texttt{VK\_ATTACHMENT\_UNUSED}, \textbf{must} not have a format of \texttt{VK\_FORMAT\_UNDEFINED}

- \texttt{VUID-VkSubpassDescription2-externalFormatResolve-009345}
  If \texttt{externalFormatResolve} is enabled, \texttt{pResolveAttachments} is not \texttt{NULL}, any element of \texttt{pResolveAttachments} is not \texttt{VK\_ATTACHMENT\_UNUSED} and has a format of \texttt{VK\_FORMAT\_UNDEFINED},
and the corresponding element of pColorAttachments is not VK_ATTACHMENT_UNUSED, the color attachment must have a samples value of 1

- VUID-VkSubpassDescription2-externalFormatResolve-09346
  If externalFormatResolve is enabled, pResolveAttachments is not NULL, and any element of pResolveAttachments is not VK_ATTACHMENT_UNUSED and has a format of VK_FORMAT_UNDEFINED, viewMask must be 0

- VUID-VkSubpassDescription2-externalFormatResolve-09347
  If externalFormatResolve is enabled, pResolveAttachments is not NULL, and any element of pResolveAttachments is not VK_ATTACHMENT_UNUSED and has a format of VK_FORMAT_UNDEFINED, VkFragmentShadingRateAttachmentInfoKHR::pFragmentShadingRateAttachment must either be NULL or a VkAttachmentReference2 structure with an attachment value of VK_ATTACHMENT_UNUSED

- VUID-VkSubpassDescription2-externalFormatResolve-09348
  If externalFormatResolve is enabled, pResolveAttachments is not NULL, and any element of pResolveAttachments is not VK_ATTACHMENT_UNUSED and has a format of VK_FORMAT_UNDEFINED, elements of pInputAttachments referencing either a color attachment or resolve attachment used in this subpass must not include VK_IMAGE_ASPECT_PLANE_i_BIT for any index i in its aspectMask

Valid Usage (Implicit)

- VUID-VkSubpassDescription2-sType-sType
  sType must be VK_STRUCTURE_TYPE_SUBPASS_DESCRIPTION_2

- VUID-VkSubpassDescription2-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkFragmentShadingRateAttachmentInfoKHR, VkMultisampledRenderToSingleSampledInfoEXT, VkRenderPassCreationControlEXT, VkRenderPassSubpassFeedbackCreateInfoEXT, or VkSubpassDescriptionDepthStencilResolve

- VUID-VkSubpassDescription2-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkSubpassDescription2-flags-parameter
  flags must be a valid combination of VkSubpassDescriptionFlagBits values

- VUID-VkSubpassDescription2-pipelineBindPoint-parameter
  pipelineBindPoint must be a valid VkPipelineBindPoint value

- VUID-VkSubpassDescription2-pInputAttachments-parameter
  If inputAttachmentCount is not 0, pInputAttachments must be a valid pointer to an array of inputAttachmentCount valid VkAttachmentReference2 structures

- VUID-VkSubpassDescription2-pColorAttachments-parameter
  If colorAttachmentCount is not 0, pColorAttachments must be a valid pointer to an array of colorAttachmentCount valid VkAttachmentReference2 structures

- VUID-VkSubpassDescription2-pResolveAttachments-parameter
  If colorAttachmentCount is not 0, and pResolveAttachments is not NULL, pResolveAttachments
must be a valid pointer to an array of colorAttachmentCount valid VkAttachmentReference2 structures

- VUID-VkSubpassDescription2-pDepthStencilAttachment-parameter
  If pDepthStencilAttachment is not NULL, pDepthStencilAttachment must be a valid pointer to a valid VkAttachmentReference2 structure

- VUID-VkSubpassDescription2-pPreserveAttachments-parameter
  If preserveAttachmentCount is not 0, pPreserveAttachments must be a valid pointer to an array of preserveAttachmentCount uint32_t values

The VkSubpassDescriptionDepthStencilResolve structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkSubpassDescriptionDepthStencilResolve {
    VkStructureType sType;
    const void* pNext;
    VkResolveModeFlagBits depthResolveMode;
    VkResolveModeFlagBits stencilResolveMode;
    const VkAttachmentReference2* pDepthStencilResolveAttachment;
} VkSubpassDescriptionDepthStencilResolve;
```

or the equivalent

```c
// Provided by VK_KHR_depth_stencil_resolve
typedef VkSubpassDescriptionDepthStencilResolve VkSubpassDescriptionDepthStencilResolveKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- depthResolveMode is a VkResolveModeFlagBits value describing the depth resolve mode.
- stencilResolveMode is a VkResolveModeFlagBits value describing the stencil resolve mode.
- pDepthStencilResolveAttachment is NULL or a pointer to a VkAttachmentReference2 structure defining the depth/stencil resolve attachment for this subpass and its layout.

If the pNext chain of VkSubpassDescription2 includes a VkSubpassDescriptionDepthStencilResolve structure, then that structure describes multisample resolve operations for the depth/stencil attachment in a subpass. If this structure is not included in the pNext chain of VkSubpassDescription2, or if it is and either pDepthStencilResolveAttachment is NULL or its attachment index is VK_ATTACHMENT_UNUSED, it indicates that no depth/stencil resolve attachment will be used in the subpass.

**Valid Usage**

- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03177
  If pDepthStencilResolveAttachment is not NULL and does not have the value
VK_ATTACHMENT_UNUSED, pDepthStencilAttachment must not be NULL or have the value VK_ATTACHMENT_UNUSED

- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03179
  If pDepthStencilResolveAttachment is not NULL and does not have the value VK_ATTACHMENT_UNUSED, pDepthStencilAttachment must not have a sample count of VK_SAMPLE_COUNT_1_BIT

- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03180
  If pDepthStencilResolveAttachment is not NULL and does not have the value VK_ATTACHMENT_UNUSED, pDepthStencilResolveAttachment must have a sample count of VK_SAMPLE_COUNT_1_BIT

- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-02651
  If pDepthStencilResolveAttachment is not NULL and does not have the value VK_ATTACHMENT_UNUSED then it must have an image format whose potential format features contain VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03181
  If pDepthStencilResolveAttachment is not NULL and does not have the value VK_ATTACHMENT_UNUSED and VkFormat of pDepthStencilResolveAttachment has a depth component, then the VkFormat of pDepthStencilAttachment must have a depth component with the same number of bits and numeric format

- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03182
  If pDepthStencilResolveAttachment is not NULL and does not have the value VK_ATTACHMENT_UNUSED, and VkFormat of pDepthStencilResolveAttachment has a stencil component, then the VkFormat of pDepthStencilAttachment must have a stencil component with the same number of bits and numeric format

- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03178
  If pDepthStencilResolveAttachment is not NULL and does not have the value VK_ATTACHMENT_UNUSED, depthResolveMode and stencilResolveMode must not both be VK_RESOLVE_MODE_NONE

- VUID-VkSubpassDescriptionDepthStencilResolve-depthResolveMode-03183
  If pDepthStencilResolveAttachment is not NULL and does not have the value VK_ATTACHMENT_UNUSED and the VkFormat of pDepthStencilResolveAttachment has a depth component, then the value of depthResolveMode must be one of the bits set in VkPhysicalDeviceDepthStencilResolveProperties::supportedDepthResolveModes or VK_RESOLVE_MODE_NONE

- VUID-VkSubpassDescriptionDepthStencilResolve-stencilResolveMode-03184
  If pDepthStencilResolveAttachment is not NULL and does not have the value VK_ATTACHMENT_UNUSED and the VkFormat of pDepthStencilResolveAttachment has a stencil component, then the value of stencilResolveMode must be one of the bits set in VkPhysicalDeviceDepthStencilResolveProperties::supportedStencilResolveModes or VK_RESOLVE_MODE_NONE

- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03185
  If pDepthStencilResolveAttachment is not NULL and does not have the value VK_ATTACHMENT_UNUSED, the VkFormat of pDepthStencilResolveAttachment has both depth and stencil components, VkPhysicalDeviceDepthStencilResolveProperties::independentResolve

569
is VK_FALSE, and VkPhysicalDeviceDepthStencilResolveProperties::independentResolveNone is VK_FALSE, then the values of depthResolveMode and stencilResolveMode must be identical

- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03186
  If pDepthStencilResolveAttachment is not NULL and does not have the value VK_ATTACHMENT_UNUSED, the VkFormat of pDepthStencilResolveAttachment has both depth and stencil components, VkPhysicalDeviceDepthStencilResolveProperties::independentResolve is VK_FALSE and VkPhysicalDeviceDepthStencilResolveProperties::independentResolveNone is VK_TRUE, then the values of depthResolveMode and stencilResolveMode must be identical or one of them must be VK_RESOLVE_MODE_NONE

- VUID-VkSubpassDescriptionDepthStencilResolve-pNext-06873
  If the pNext chain of VkSubpassDescription2 includes a VkMultisampledRenderToSingleSampledInfoEXT structure, the multisampledRenderToSingleSampledEnable field is VK_TRUE, and pDepthStencilAttachment is not NULL and does not have the value VK_ATTACHMENT_UNUSED, depthResolveMode and stencilResolveMode must not both be VK_RESOLVE_MODE_NONE

- VUID-VkSubpassDescriptionDepthStencilResolve-pNext-06874
  If the pNext chain of VkSubpassDescription2 includes a VkMultisampledRenderToSingleSampledInfoEXT structure whose multisampledRenderToSingleSampledEnable field is VK_TRUE, and pDepthStencilAttachment is not NULL, does not have the value VK_ATTACHMENT_UNUSED, and has a VkFormat that has a depth component, then the value of depthResolveMode must be one of the bits set in VkPhysicalDeviceDepthStencilResolveProperties::supportedDepthResolveModes or VK_RESOLVE_MODE_NONE

- VUID-VkSubpassDescriptionDepthStencilResolve-pNext-06875
  If the pNext chain of VkSubpassDescription2 includes a VkMultisampledRenderToSingleSampledInfoEXT structure whose multisampledRenderToSingleSampledEnable field is VK_TRUE, and pDepthStencilAttachment is not NULL, does not have the value VK_ATTACHMENT_UNUSED, and has a VkFormat with a stencil component, then the value of stencilResolveMode must be one of the bits set in VkPhysicalDeviceDepthStencilResolveProperties::supportedStencilResolveModes or VK_RESOLVE_MODE_NONE

- VUID-VkSubpassDescriptionDepthStencilResolve-pNext-06876
  If the pNext chain of VkSubpassDescription2 includes a VkMultisampledRenderToSingleSampledInfoEXT structure whose multisampledRenderToSingleSampledEnable field is VK_TRUE, pDepthStencilAttachment is not NULL, does not have the value VK_ATTACHMENT_UNUSED, and has a VkFormat with both depth and stencil components, and both VkPhysicalDeviceDepthStencilResolveProperties::independentResolve and VkPhysicalDeviceDepthStencilResolveProperties::independentResolveNone are VK_FALSE, then the values of depthResolveMode and stencilResolveMode must be identical

- VUID-VkSubpassDescriptionDepthStencilResolve-pNext-06877
  If the pNext chain of VkSubpassDescription2 includes a VkMultisampledRenderToSingleSampledInfoEXT structure whose multisampledRenderToSingleSampledEnable field is VK_TRUE, pDepthStencilAttachment is not NULL, does not have the value VK_ATTACHMENT_UNUSED, and has a VkFormat with both depth
and stencil components, \( \text{VkPhysicalDeviceDepthStencilResolveProperties} :: \text{independentResolve} \) is \( \text{VK_FALSE} \), and \( \text{VkPhysicalDeviceDepthStencilResolveProperties} :: \text{independentResolveNone} \) is \( \text{VK_TRUE} \), then the values of \( \text{depthResolveMode} \) and \( \text{stencilResolveMode} \) must be identical or one of them must be \( \text{VK_RESOLVE_MODE_NONE} \).

### Valid Usage (Implicit)

- VUID-VkSubpassDescriptionDepthStencilResolve-sType-sType
  
  \( \text{sType} \) must be \( \text{VK_STRUCTURE_TYPE_SUBPASS_DESCRIPTION_DEPTH_STENCIL_RESOLVE} \).

- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-parameter
  
  If \( \text{pDepthStencilResolveAttachment} \) is not \( \text{NULL} \), \( \text{pDepthStencilResolveAttachment} \) must be a valid pointer to a valid \( \text{VkAttachmentReference2} \) structure.

The \( \text{VkFragmentShadingRateAttachmentInfoKHR} \) structure is defined as:

```c
// Provided by VK_KHR_fragment_shading_rate
typedef struct VkFragmentShadingRateAttachmentInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const VkAttachmentReference2* pFragmentShadingRateAttachment;
    VkExtent2D shadingRateAttachmentTexelSize;
} VkFragmentShadingRateAttachmentInfoKHR;
```

- \( \text{sType} \) is a \( \text{VkStructureType} \) value identifying this structure.
- \( \text{pNext} \) is \( \text{NULL} \) or a pointer to a structure extending this structure.
- \( \text{pFragmentShadingRateAttachment} \) is \( \text{NULL} \) or a pointer to a \( \text{VkAttachmentReference2} \) structure defining the fragment shading rate attachment for this subpass.
- \( \text{shadingRateAttachmentTexelSize} \) specifies the size of the portion of the framebuffer corresponding to each texel in \( \text{pFragmentShadingRateAttachment} \).

If no shading rate attachment is specified, or if this structure is not specified, the implementation behaves as if a valid shading rate attachment was specified with all texels specifying a single pixel per fragment.

### Valid Usage

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04524
  
  If \( \text{pFragmentShadingRateAttachment} \) is not \( \text{NULL} \) and its \( \text{attachment} \) member is not \( \text{VK_ATTACHMENT_UNUSED} \), its \( \text{layout} \) member must be equal to \( \text{VK_IMAGE_LAYOUT_GENERAL} \) or \( \text{VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR} \).

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04525
If pFragmentShadingRateAttachment is not NULL and its attachment member is not VK_ATTACHMENT_UNUSED, shadingRateAttachmentTexelSize.width must be a power of two value

• VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04526
  If pFragmentShadingRateAttachment is not NULL and its attachment member is not VK_ATTACHMENT_UNUSED, shadingRateAttachmentTexelSize.width must be less than or equal to maxFragmentShadingRateAttachmentTexelSize.width

• VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04527
  If pFragmentShadingRateAttachment is not NULL and its attachment member is not VK_ATTACHMENT_UNUSED, shadingRateAttachmentTexelSize.width must be greater than or equal to minFragmentShadingRateAttachmentTexelSize.width

• VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04528
  If pFragmentShadingRateAttachment is not NULL and its attachment member is not VK_ATTACHMENT_UNUSED, shadingRateAttachmentTexelSize.width must be less than or equal to maxFragmentShadingRateAttachmentTexelSize.height

• VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04529
  If pFragmentShadingRateAttachment is not NULL and its attachment member is not VK_ATTACHMENT_UNUSED, shadingRateAttachmentTexelSize.height must be a power of two value

• VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04530
  If pFragmentShadingRateAttachment is not NULL and its attachment member is not VK_ATTACHMENT_UNUSED, shadingRateAttachmentTexelSize.height must be less than or equal to maxFragmentShadingRateAttachmentTexelSize.height

• VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04531
  If pFragmentShadingRateAttachment is not NULL and its attachment member is not VK_ATTACHMENT_UNUSED, the quotient of shadingRateAttachmentTexelSize.width and shadingRateAttachmentTexelSize.height must be less than or equal to maxFragmentShadingRateAttachmentTexelSizeAspectRatio

• VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04532
  If pFragmentShadingRateAttachment is not NULL and its attachment member is not VK_ATTACHMENT_UNUSED, the quotient of shadingRateAttachmentTexelSize.height and shadingRateAttachmentTexelSize.width must be less than or equal to maxFragmentShadingRateAttachmentTexelSizeAspectRatio

Valid Usage (Implicit)

• VUID-VkFragmentShadingRateAttachmentInfoKHR-sType-sType
sType must be VK_STRUCTURE_TYPE_FRAGMENT_SHADING_RATE_ATTACHMENT_INFO_KHR

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-parameter
  If pFragmentShadingRateAttachment is not NULL, pFragmentShadingRateAttachment must be a valid pointer to a valid VkAttachmentReference2 structure.

If the pNext chain of VkSubpassDescription2 or VkRenderingInfo includes a VkMultisampledRenderToSingleSampledInfoEXT structure, then that structure describes how multisampled rendering is performed on single sampled attachments in that subpass.

The VkMultisampledRenderToSingleSampledInfoEXT structure is defined as:

```c
// Provided by VK_EXT_multisampled_render_to_single_sampled
typedef struct VkMultisampledRenderToSingleSampledInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 multisampledRenderToSingleSampledEnable;
    VkSampleCountFlagBits rasterizationSamples;
} VkMultisampledRenderToSingleSampledInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- multisampledRenderToSingleSampledEnable controls whether multisampled rendering to single-sampled attachments is performed as described below.
- rasterizationSamples is a VkSampleCountFlagBits specifying the number of samples used in rasterization.

**Valid Usage**

- VUID-VkMultisampledRenderToSingleSampledInfoEXT-rasterizationSamples-parameter
  rasterizationSamples must be a valid VkSampleCountFlagBits value

**Valid Usage (Implicit)**

- VUID-VkMultisampledRenderToSingleSampledInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_INFO_EXT

- VUID-VkMultisampledRenderToSingleSampledInfoEXT-rasterizationSamples-parameter
  rasterizationSamples must be a valid VkSampleCountFlagBits value
If the `pNext` chain of `VkSubpassDescription2` or `VkRenderingInfo` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure whose `multisampledRenderToSingleSampledEnable` field is `VK_TRUE`, the graphics pipelines **must** have `VkGraphicsPipelineCreateInfo::rasterizationSamples` equal to `VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples`, and the subpass attachments **can** have a sample count of `VK_SAMPLE_COUNT_1_BIT`. For attachments with a sample count of `VK_SAMPLE_COUNT_1_BIT`, multisampled rendering is performed to an intermediate multisampled image with `VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples` samples, implicitly allocated by the implementation for the duration of the subpass. For such attachments:

- If `loadOp` equals to `VK_ATTACHMENT_LOAD_OP_LOAD`, samples of the implicit image are initialized by replicating the value from the corresponding pixel in the attachment.
- If `storeOp` or `stencilStoreOp` is equal to `VK_ATTACHMENT_STORE_OP_STORE`, the implicit image is implicitly resolved prior to storage in the attachment.

Memory constraints due to high primitive counts **may** result in an implicit split of the subpass. This is the equivalent of partial rasterization of geometry in a render pass that ends in `storeOp` and `stencilStoreOp` equal to `VK_ATTACHMENT_STORE_OP_STORE`, followed by another render pass with `loadOp` and `stencilLoadOp` equal to `VK_ATTACHMENT_LOAD_OP_LOAD` with appropriate barriers in between. When `VkMultisampledRenderToSingleSampledInfoEXT` is used, the implementation is allowed to resolve attachments with a sample count of `VK_SAMPLE_COUNT_1_BIT` and lose multisampled data on such splits. The implementation **may** similarly split the render pass at subpass boundaries even if they use the same value for `VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples`.

The `VkAttachmentReference2` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkAttachmentReference2 {
    VkStructureType            sType;
    const void* const         pNext;
    uint32_t                   attachment;
    VkImageLayout              layout;
    VkImageAspectFlags         aspectMask;
} VkAttachmentReference2;
```

or the equivalent

```c
// Provided by VK_KHR_create_renderpass2
typedef VkAttachmentReference2    VkAttachmentReference2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `attachment` is either an integer value identifying an attachment at the corresponding index in `VkRenderPassCreateInfo2::pAttachments`, or `VK_ATTACHMENT_UNUSED` to signify that this attachment is not used.
• layout is a VkImageLayout value specifying the layout the attachment uses during the subpass.
• aspectMask is a mask of which aspect(s) can be accessed within the specified subpass as an input attachment.

Parameters defined by this structure with the same name as those in VkAttachmentReference have the identical effect to those parameters.

aspectMask is ignored when this structure is used to describe anything other than an input attachment reference.

If the separateDepthStencilLayouts feature is enabled, and attachment has a depth/stencil format, layout can be set to a layout that only specifies the layout of the depth aspect.

If layout only specifies the layout of the depth aspect of the attachment, the layout of the stencil aspect is specified by the stencillayout member of a VkAttachmentReferenceStencilLayout structure included in the pNext chain. Otherwise, layout describes the layout for all relevant image aspects.

---

### Valid Usage

- **VUID-VkAttachmentReference2-layout-03077**
  - If attachment is not VK_ATTACHMENT_UNUSED, layout must not be VK_IMAGE_LAYOUT_UNDEFINED, VK_IMAGE_LAYOUT_PREINITIALIZED, or VK_IMAGE_LAYOUT_PRESENT_SRC_KHR

- **VUID-VkAttachmentReference2-separateDepthStencilLayouts-03313**
  - If the separateDepthStencilLayouts feature is not enabled, and attachment is not VK_ATTACHMENT_UNUSED, layout must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL,

- **VUID-VkAttachmentReference2-synchronization2-06910**
  - If the synchronization2 feature is not enabled, layout must not be VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

- **VUID-VkAttachmentReference2-attachmentFeedbackLoopLayout-07311**
  - If the attachmentFeedbackLoopLayout feature is not enabled, layout must not be VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT

- **VUID-VkAttachmentReference2-dynamicRenderingLocalRead-09546**
  - If the dynamicRenderingLocalRead feature is not enabled, layout must not be VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR

---

### Valid Usage (Implicit)

- **VUID-VkAttachmentReference2-sType-sType**
  - sType must be VK_STRUCTURE_TYPE_ATTACHMENT_REFERENCE_2

- **VUID-VkAttachmentReference2-pNext-pNext**
  - pNext must be NULL or a pointer to a valid instance of VkAttachmentReferenceStencilLayout
• VUID-VkAttachmentReference2-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique

• VUID-VkAttachmentReference2-layout-parameter
  `layout` must be a valid `VkImageLayout` value

The `VkAttachmentReferenceStencilLayout` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkAttachmentReferenceStencilLayout {
    VkStructureType sType;
    void* pNext;
    VkImageLayout stencilLayout;
} VkAttachmentReferenceStencilLayout;
```

or the equivalent

```c
// Provided by VK_KHR_separate_depth_stencil_layouts
typedef VkAttachmentReferenceStencilLayout VkAttachmentReferenceStencilLayoutKHR;
```

• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `stencilLayout` is a `VkImageLayout` value specifying the layout the stencil aspect of the attachment uses during the subpass.

**Valid Usage**

• VUID-VkAttachmentReferenceStencilLayout-stencilLayout-03318
  `stencilLayout` must not be `VK_IMAGE_LAYOUT_UNDEFINED`, `VK_IMAGE_LAYOUT_PREINITIALIZED`, `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR` or

**Valid Usage (Implicit)**

• VUID-VkAttachmentReferenceStencilLayout-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_ATTACHMENT_REFERENCE_STENCIL_LAYOUT`

• VUID-VkAttachmentReferenceStencilLayout-stencilLayout-parameter
  `stencilLayout` must be a valid `VkImageLayout` value
The `VkSubpassDependency2` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkSubpassDependency2 {
    VkStructureType sType;
    const void* pNext;
    uint32_t srcSubpass;
    uint32_t dstSubpass;
    VkPipelineStageFlags srcStageMask;
    VkPipelineStageFlags dstStageMask;
    VkAccessFlags srcAccessMask;
    VkAccessFlags dstAccessMask;
    VkDependencyFlags dependencyFlags;
    int32_t viewOffset;
} VkSubpassDependency2;
```

or the equivalent

```c
// Provided by VK_KHR_create_renderpass2
typedef VkSubpassDependency2 VkSubpassDependency2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcSubpass` is the subpass index of the first subpass in the dependency, or `VK_SUBPASS_EXTERNAL`.
- `dstSubpass` is the subpass index of the second subpass in the dependency, or `VK_SUBPASS_EXTERNAL`.
- `srcStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the source stage mask.
- `dstStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the destination stage mask.
- `srcAccessMask` is a bitmask of `VkAccessFlagBits` specifying a source access mask.
- `dstAccessMask` is a bitmask of `VkAccessFlagBits` specifying a destination access mask.
- `dependencyFlags` is a bitmask of `VkDependencyFlagBits`.
- `viewOffset` controls which views in the source subpass the views in the destination subpass depend on.

Parameters defined by this structure with the same name as those in `VkSubpassDependency` have the identical effect to those parameters.

`viewOffset` has the same effect for the described subpass dependency as `VkRenderPassMultiviewCreateInfo::pViewOffsets` has on each corresponding subpass dependency.

If a `VkMemoryBarrier2` is included in the `pNext` chain, `srcStageMask`, `dstStageMask`, `srcAccessMask`, and `dstAccessMask` parameters are ignored. The synchronization and access scopes instead are defined by the parameters of `VkMemoryBarrier2`. 
Valid Usage

- **VUID-VkSubpassDependency2-srcStageMask-04090**
  - If the geometryShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT

- **VUID-VkSubpassDependency2-srcStageMask-04091**
  - If the tessellationShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT or VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT

- **VUID-VkSubpassDependency2-srcStageMask-04092**
  - If the conditionalRendering feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT

- **VUID-VkSubpassDependency2-srcStageMask-04093**
  - If the fragmentDensityMap feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT

- **VUID-VkSubpassDependency2-srcStageMask-04094**
  - If the transformFeedback feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT

- **VUID-VkSubpassDependency2-srcStageMask-04095**
  - If the meshShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT

- **VUID-VkSubpassDependency2-srcStageMask-04096**
  - If the taskShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT

- **VUID-VkSubpassDependency2-srcStageMask-07318**
  - If neither the shadingRateImage or attachmentFragmentShadingRate are enabled, srcStageMask must not contain VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- **VUID-VkSubpassDependency2-srcStageMask-03937**
  - If the synchronization2 feature is not enabled, srcStageMask must not be 0

- **VUID-VkSubpassDependency2-srcStageMask-07949**
  - If neither the VK_NV_ray_tracing extension or rayTracingPipeline feature are enabled, srcStageMask must not contain VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR

- **VUID-VkSubpassDependency2-dstStageMask-04090**
  - If the geometryShader feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT

- **VUID-VkSubpassDependency2-dstStageMask-04091**
  - If the tessellationShader feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT or VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT

- **VUID-VkSubpassDependency2-dstStageMask-04092**
  - If the conditionalRendering feature is not enabled, dstStageMask must not contain
• VUID-VkSubpassDependency2-dstStageMask-04093
  If the fragmentDensityMap feature is not enabled, dstStageMask must not contain
  VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT

• VUID-VkSubpassDependency2-dstStageMask-04094
  If the transformFeedback feature is not enabled, dstStageMask must not contain
  VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT

• VUID-VkSubpassDependency2-dstStageMask-04095
  If the meshShader feature is not enabled, dstStageMask must not contain
  VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT

• VUID-VkSubpassDependency2-dstStageMask-04096
  If the taskShader feature is not enabled, dstStageMask must not contain
  VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT

• VUID-VkSubpassDependency2-dstStageMask-04097
  If neither the shadingRateImage or attachmentFragmentShadingRate are enabled,
  dstStageMask must not contain
  VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

• VUID-VkSubpassDependency2-srcSubpass-03084
  srcSubpass must be less than or equal to dstSubpass, unless one of them is
  VK_SUBPASS_EXTERNAL, to avoid cyclic dependencies and ensure a valid execution order

• VUID-VkSubpassDependency2-srcSubpass-03085
  srcSubpass and dstSubpass must not both be equal to VK_SUBPASS_EXTERNAL

• VUID-VkSubpassDependency2-srcStageMask-06810
  If srcSubpass is equal to dstSubpass and srcStageMask includes a framebuffer-space stage,
  dstStageMask must only contain framebuffer-space stages

• VUID-VkSubpassDependency2-srcAccessMask-03088
  Any access flag included in srcAccessMask must be supported by one of the pipeline stages
  in srcStageMask, as specified in the table of supported access types

• VUID-VkSubpassDependency2-dstAccessMask-03089
  Any access flag included in dstAccessMask must be supported by one of the pipeline stages
  in dstStageMask, as specified in the table of supported access types

• VUID-VkSubpassDependency2-dependencyFlags-03090
  If dependencyFlags includes VK_DEPENDENCY_VIEW_LOCAL_BIT, srcSubpass must not be equal to
  VK_SUBPASS_EXTERNAL

• VUID-VkSubpassDependency2-dependencyFlags-03091
  If dependencyFlags includes VK_DEPENDENCY_VIEW_LOCAL_BIT, dstSubpass must not be equal to
  VK_SUBPASS_EXTERNAL
If `srcSubpass` equals `dstSubpass`, and `srcStageMask` and `dstStageMask` both include a framebuffer-space stage, then `dependencyFlags` must include `VK_DEPENDENCY_BY_REGION_BIT`.

If `viewOffset` is not equal to 0, `srcSubpass` must not be equal to `dstSubpass`.

If `dependencyFlags` does not include `VK_DEPENDENCY_VIEW_LOCAL_BIT`, `viewOffset` must be 0.

**Valid Usage (Implicit)**

- `sType` must be `VK_STRUCTURE_TYPE_SUBPASS_DEPENDENCY_2`.
- `pNext` must be `NULL` or a pointer to a valid instance of `VkMemoryBarrier2`.
- The `sType` value of each struct in the `pNext` chain must be unique.
- `srcStageMask` must be a valid combination of `VkPipelineStageFlagBits` values.
- `dstStageMask` must be a valid combination of `VkPipelineStageFlagBits` values.
- `srcAccessMask` must be a valid combination of `VkAccessFlagBits` values.
- `dstAccessMask` must be a valid combination of `VkAccessFlagBits` values.
- `dependencyFlags` must be a valid combination of `VkDependencyFlagBits` values.

To destroy a render pass, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyRenderPass(
    VkDevice device,
    VkRenderPass renderPass,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the render pass.
- `renderPass` is the handle of the render pass to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
Valid Usage

• VUID-vkDestroyRenderPass-renderPass-00873
  All submitted commands that refer to renderPass must have completed execution

• VUID-vkDestroyRenderPass-renderPass-00874
  If VkAllocationCallbacks were provided when renderPass was created, a compatible set of callbacks must be provided here

• VUID-vkDestroyRenderPass-renderPass-00875
  If no VkAllocationCallbacks were provided when renderPass was created, pAllocator must be NULL

Valid Usage (Implicit)

• VUID-vkDestroyRenderPass-device-parameter
  device must be a validVkDevice handle

• VUID-vkDestroyRenderPass-renderPass-parameter
  If renderPass is not VK_NULL_HANDLE, renderPass must be a valid VkRenderPass handle

• VUID-vkDestroyRenderPass-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkDestroyRenderPass-renderPass-parent
  If renderPass is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

• Host access to renderPass must be externally synchronized

8.3. Render Pass Compatibility

Framebuffers and graphics pipelines are created based on a specific render pass object. They must only be used with that render pass object, or one compatible with it.

Two attachment references are compatible if they have matching format and sample count, or are both VK_ATTACHMENT_UNUSED or the pointer that would contain the reference is NULL.

Two arrays of attachment references are compatible if all corresponding pairs of attachments are compatible. If the arrays are of different lengths, attachment references not present in the smaller array are treated as VK_ATTACHMENT_UNUSED.

Two render passes are compatible if their corresponding color, input, resolve, and depth/stencil attachment references are compatible and if they are otherwise identical except for:
8.4. Framebuffers

Render passes operate in conjunction with framebuffers. Framebuffers represent a collection of specific memory attachments that a render pass instance uses.

Framebuffers are represented by VkFramebuffer handles:

```cpp
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkFramebuffer)
```

To create a framebuffer, call:

```cpp
// Provided by VK_VERSION_1_0
VkResult vkCreateFramebuffer(
    VkDevice device,
    const VkFramebufferCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkFramebuffer* pFramebuffer);
```

- `device` is the logical device that creates the framebuffer.
- `pCreateInfo` is a pointer to a VkFramebufferCreateInfo structure describing additional information about framebuffer creation.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pFramebuffer` is a pointer to a VkFramebuffer handle in which the resulting framebuffer object is returned.

**Valid Usage**

- VUID-vkCreateFramebuffer-device-10002
device must support at least one queue family with the VK_QUEUE_GRAPHICS_BIT capability

- VUID-vkCreateFramebuffer-pCreateInfo-02777
If `pCreateInfo->flags` does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, and `attachmentCount` is not 0, each element of `pCreateInfo->pAttachments` must have been created on `device`
Valid Usage (Implicit)

- **VUID-vkCreateFramebuffer-device-parameter**
  
  `device` must be a valid `VkDevice` handle

- **VUID-vkCreateFramebuffer-pCreateInfo-parameter**
  
  `pCreateInfo` must be a valid pointer to a valid `VkFramebufferCreateInfo` structure

- **VUID-vkCreateFramebuffer-pAllocator-parameter**
  
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkCreateFramebuffer-pFramebuffer-parameter**
  
  `pFramebuffer` must be a valid pointer to a `VkFramebuffer` handle

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

The `VkFramebufferCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkFramebufferCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkFramebufferCreateFlags flags;
    VkRenderPass renderPass;
    uint32_t attachmentCount;
    const VkImageView* pAttachments;
    uint32_t width;
    uint32_t height;
    uint32_t layers;
} VkFramebufferCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkFramebufferCreateFlagBits`
- `renderPass` is a render pass defining what render passes the framebuffer will be compatible with. See `Render Pass Compatibility` for details.
- `attachmentCount` is the number of attachments.
• **pAttachments** is a pointer to an array of **VkImageView** handles, each of which will be used as the corresponding attachment in a render pass instance. If **flags** includes **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, this parameter is ignored.

• The **width**, **height** and **layers** define the dimensions of the framebuffer. If the render pass uses multiview, then **layers must** be one and each attachment requires a number of layers that is greater than the maximum bit index set in the view mask in the subpasses in which it is used.

It is legal for a subpass to use no color or depth/stencil attachments, either because it has no attachment references or because all of them are **VK_ATTACHMENT_UNUSED**. This kind of subpass can use shader side effects such as image stores and atomics to produce an output. In this case, the subpass continues to use the **width**, **height**, and **layers** of the framebuffer to define the dimensions of the rendering area, and the **rasterizationSamples** from each pipeline's **VkPipelineMultisampleStateCreateInfo** to define the number of samples used in rasterization; however, if **VkPhysicalDeviceFeatures::variableMultisampleRate** is **VK_FALSE**, then all pipelines to be bound with the subpass must have the same value for **VkPipelineMultisampleStateCreateInfo::rasterizationSamples**. In all such cases, **rasterizationSamples must** be a valid **VkSampleCountFlagBits** value that is set in **VkPhysicalDeviceLimits::framebufferNoAttachmentsSampleCounts**.

### Valid Usage

- **VUID-VkFramebufferCreateInfo-attachmentCount-00876**
  
  *attachmentCount must* be equal to the attachment count specified in **renderPass**

- **VUID-VkFramebufferCreateInfo-flags-02778**
  
  If **flags** does not include **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT** and **attachmentCount** is not 0, **pAttachments must** be a valid pointer to an array of **attachmentCount valid VkImageView handles**

- **VUID-VkFramebufferCreateInfo-pAttachments-00877**
  
  If **flags** does not include **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, each element of **pAttachments** that is used as a color attachment or resolve attachment by **renderPass** **must** have been created with a **usage** value including **VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT**

- **VUID-VkFramebufferCreateInfo-pAttachments-02633**
  
  If **flags** does not include **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, each element of **pAttachments** that is used as a depth/stencil attachment by **renderPass** **must** have been created with a **usage** value including **VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT**

- **VUID-VkFramebufferCreateInfo-pAttachments-02634**
  
  If **flags** does not include **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, each element of **pAttachments** that is used as a depth/stencil resolve attachment by **renderPass** **must** have been created with a **usage** value including **VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT**

- **VUID-VkFramebufferCreateInfo-pAttachments-00879**
  
  If **renderpass** is not **VK_NULL_HANDLE**, **flags** does not include **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, each element of **pAttachments** that is used as an input attachment by **renderPass** **must** have been created with a **usage** value including **VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT**

- **VUID-VkFramebufferCreateInfo-pAttachments-02552**
Each element of pAttachments that is used as a fragment density map attachment by renderPass must not have been created with a flags value including VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT

- VUID-VkFramebufferCreateInfo-renderPass-02553
  If renderPass has a fragment density map attachment and the fragmentDensityMapNonSubsampledImages feature is not enabled, each element of pAttachments must have been created with a flags value including VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT unless that element is the fragment density map attachment

- VUID-VkFramebufferCreateInfo-renderPass-06502
  If renderPass was created with fragment density map offsets other than (0,0), each element of pAttachments must have been created with a flags value including VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_QCOM

- VUID-VkFramebufferCreateInfo-pAttachments-00880
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments must have been created with a VkFormat value that matches the VkFormat specified by the corresponding VkAttachmentDescription in renderPass

- VUID-VkFramebufferCreateInfo-pAttachments-00881
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments must have been created with a samples value that matches the samples value specified by the corresponding VkAttachmentDescription in renderPass

- VUID-VkFramebufferCreateInfo-flags-04533
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments that is used as an input, color, resolve, or depth/stencil attachment by renderPass must have been created with a VkImageCreateInfo::extent.width greater than or equal to width

- VUID-VkFramebufferCreateInfo-flags-04534
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments that is used as an input, color, resolve, or depth/stencil attachment by renderPass must have been created with a VkImageCreateInfo::extent.height greater than or equal to height

- VUID-VkFramebufferCreateInfo-flags-04535
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments that is used as an input, color, resolve, or depth/stencil attachment by renderPass must have been created with a VkImageViewCreateInfo::subresourceRange.layerCount greater than or equal to layers

- VUID-VkFramebufferCreateInfo-renderPass-04536
  If renderPass was specified with non-zero view masks, each element of pAttachments that is used as an input, color, resolve, or depth/stencil attachment by renderPass must have a layerCount greater than the index of the most significant bit set in any of those view masks

- VUID-VkFramebufferCreateInfo-renderPass-02746
  Each element of pAttachments that is referenced by fragmentDensityMapAttachment must have a layerCount equal to 1 or if renderPass was specified with non-zero view masks, greater than the index of the most significant bit set in any of those view masks
If \( \text{flags} \) does not include \( \text{VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT} \), an element of \( \text{pAttachments} \) that is referenced by \( \text{fragmentDensityMapAttachment} \) must have a width at least as large as \( \left\lceil \frac{\text{width}}{\text{maxFragmentDensityTexelSize.width}} \right\rceil \).

If \( \text{flags} \) does not include \( \text{VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT} \), an element of \( \text{pAttachments} \) that is referenced by \( \text{fragmentDensityMapAttachment} \) must have a height at least as large as \( \left\lceil \frac{\text{height}}{\text{maxFragmentDensityTexelSize.height}} \right\rceil \).

If \( \text{flags} \) does not include \( \text{VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT} \), and \( \text{renderPass} \) was specified with non-zero view masks, each element of \( \text{pAttachments} \) that is used as a fragment shading rate attachment by \( \text{renderPass} \) must have a \text{layerCount} that is either 1, or greater than the index of the most significant bit set in any of those view masks.

If \( \text{flags} \) does not include \( \text{VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT} \), and \( \text{renderPass} \) was not specified with non-zero view masks, each element of \( \text{pAttachments} \) that is used as a fragment shading rate attachment by \( \text{renderPass} \) must have a \text{layerCount} that is either 1, or greater than \text{layers}.

If \( \text{maintenance7} \) is not enabled or the \text{robustFragmentShadingRateAttachmentAccess} limit is \( \text{VK_FALSE} \) or the \text{imageView} member of a \text{VkRenderingFragmentShadingRateAttachmentInfoKHR} structure was created with \text{VkImageSubresourceRange::baseMipLevel} greater than 0, \( \text{flags} \) does not include \( \text{VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT} \), an element of \( \text{pAttachments} \) that is used as a fragment shading rate attachment must have a width at least as large as \( \left\lceil \frac{\text{width}}{\text{texelWidth}} \right\rceil \), where \( \text{texelWidth} \) is the largest value of \text{shadingRateAttachmentTexelSize.width} in a \text{VkFragmentShadingRateAttachmentInfoKHR} which references that attachment.

If \( \text{maintenance7} \) is not enabled or the \text{robustFragmentShadingRateAttachmentAccess} limit is \( \text{VK_FALSE} \) or the \text{imageView} member of a \text{VkRenderingFragmentShadingRateAttachmentInfoKHR} structure was created with \text{VkImageSubresourceRange::baseMipLevel} greater than 0, \( \text{flags} \) does not include \( \text{VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT} \), an element of \( \text{pAttachments} \) that is used as a fragment shading rate attachment must have a height at least as large as \( \left\lceil \frac{\text{height}}{\text{texelHeight}} \right\rceil \), where \( \text{texelHeight} \) is the largest value of \text{shadingRateAttachmentTexelSize.height} in a \text{VkFragmentShadingRateAttachmentInfoKHR} which references that attachment.

If \( \text{flags} \) does not include \( \text{VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT} \), each element of \( \text{pAttachments} \) must only specify a single mip level.

If \( \text{flags} \) does not include \( \text{VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT} \), each element of \( \text{pAttachments} \) must have been created with the identity swizzle.

If \( \text{flags} \) does not include \( \text{VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT} \), each element of \( \text{pAttachments} \) must have a width at least as large as \( \left\lceil \frac{\text{width}}{\text{maxFragmentDensityTexelSize.width}} \right\rceil \).

If \( \text{flags} \) does not include \( \text{VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT} \), each element of \( \text{pAttachments} \) must have a height at least as large as \( \left\lceil \frac{\text{height}}{\text{maxFragmentDensityTexelSize.height}} \right\rceil \).

If \( \text{flags} \) does not include \( \text{VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT} \), each element of \( \text{pAttachments} \) must have a \text{layerCount} that is either 1, or greater than the index of the most significant bit set in any of those view masks.

If \( \text{flags} \) does not include \( \text{VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT} \), and \( \text{renderPass} \) was specified with non-zero view masks, each element of \( \text{pAttachments} \) that is used as a fragment shading rate attachment by \( \text{renderPass} \) must have a \text{layerCount} that is either 1, or greater than \text{layers}.

If \( \text{flags} \) does not include \( \text{VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT} \), and \( \text{renderPass} \) was not specified with non-zero view masks, each element of \( \text{pAttachments} \) that is used as a fragment shading rate attachment by \( \text{renderPass} \) must have a \text{layerCount} that is either 1, or greater than \text{layers}.

If \( \text{maintenance7} \) is not enabled or the \text{robustFragmentShadingRateAttachmentAccess} limit is \( \text{VK_FALSE} \) or the \text{imageView} member of a \text{VkRenderingFragmentShadingRateAttachmentInfoKHR} structure was created with \text{VkImageSubresourceRange::baseMipLevel} greater than 0, \( \text{flags} \) does not include \( \text{VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT} \), an element of \( \text{pAttachments} \) that is used as a fragment shading rate attachment must have a width at least as large as \( \left\lceil \frac{\text{width}}{\text{texelWidth}} \right\rceil \), where \( \text{texelWidth} \) is the largest value of \text{shadingRateAttachmentTexelSize.width} in a \text{VkFragmentShadingRateAttachmentInfoKHR} which references that attachment.

If \( \text{maintenance7} \) is not enabled or the \text{robustFragmentShadingRateAttachmentAccess} limit is \( \text{VK_FALSE} \) or the \text{imageView} member of a \text{VkRenderingFragmentShadingRateAttachmentInfoKHR} structure was created with \text{VkImageSubresourceRange::baseMipLevel} greater than 0, \( \text{flags} \) does not include \( \text{VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT} \), an element of \( \text{pAttachments} \) that is used as a fragment shading rate attachment must have a height at least as large as \( \left\lceil \frac{\text{height}}{\text{texelHeight}} \right\rceil \), where \( \text{texelHeight} \) is the largest value of \text{shadingRateAttachmentTexelSize.height} in a \text{VkFragmentShadingRateAttachmentInfoKHR} which references that attachment.
width must be greater than 0

- VUID-VkFramebufferCreateInfo-width-00886
  width must be less than or equal to maxFramebufferWidth

- VUID-VkFramebufferCreateInfo-height-00887
  height must be greater than 0

- VUID-VkFramebufferCreateInfo-height-00888
  height must be less than or equal to maxFramebufferHeight

- VUID-VkFramebufferCreateInfo-layers-00889
  layers must be greater than 0

- VUID-VkFramebufferCreateInfo-layers-00890
  layers must be less than or equal to maxFramebufferLayers

- VUID-VkFramebufferCreateInfo-renderPass-02531
  If renderPass was specified with non-zero view masks, layers must be 1

- VUID-VkFramebufferCreateInfo-pAttachments-00891
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments that is a 2D or 2D array image view taken from a 3D image must not be a depth/stencil format

- VUID-VkFramebufferCreateInfo-flags-03189
  If the imagelessFramebuffer feature is not enabled, flags must not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT

- VUID-VkFramebufferCreateInfo-flags-03190
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the pNext chain must include a VkFramebufferAttachmentsCreateInfo structure

- VUID-VkFramebufferCreateInfo-flags-03191
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the attachmentImageInfoCount member of a VkFramebufferAttachmentsCreateInfo structure in the pNext chain must be equal to either zero or attachmentCount

- VUID-VkFramebufferCreateInfo-flags-04541
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the width member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure in the pNext chain that is used as an input, color, resolve or depth/stencil attachment in renderPass must be greater than or equal to width

- VUID-VkFramebufferCreateInfo-flags-04542
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the height member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure in the pNext chain that is used as an input, color, resolve or depth/stencil attachment in renderPass must be greater than or equal to height

- VUID-VkFramebufferCreateInfo-flags-03196
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the width member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure in the pNext chain that is referenced by VkRenderPassFragmentDensityMapCreateInfoEXT::fragmentDensityMapAttachment in renderPass must be greater than or equal to \[
  \frac{\text{width}}{\text{maxFragmentDensityTexelSize\textwidth}}
  \]
If flags includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `height` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain that is referenced by `VkRenderPassFragmentDensityMapCreateInfoEXT::fragmentDensityMapAttachment` in `renderPass` must be greater than or equal to \( \lceil \frac{\text{height}}{\max\text{FragmentDensityTexelSize.height}} \rceil \).

If maintenance7 is not enabled or the `robustFragmentShadingRateAttachmentAccess` limit is `VK_FALSE` or the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure was created with `VkImageSubresourceRange::baseMipLevel` greater than 0, and flags includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `width` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure in the `pNext` chain that is used as a fragment shading rate attachment must be greater than or equal to \( \lceil \frac{\text{width}}{\text{texelWidth}} \rceil \), where `texelWidth` is the largest value of `shadingRateAttachmentTexelSize.width` in a `VkFragmentShadingRateAttachmentInfoKHR` which references that attachment.

If flags includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `layerCount` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure in the `pNext` chain used as an input, color, resolve, or depth/stencil attachment in `renderPass` must be greater than the maximum bit index set in the view mask in the subpasses in which it is used in `renderPass`.

If multiview is enabled for `renderPass` and flags includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `layerCount` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain used as an input, color, resolve, or depth/stencil attachment in `renderPass` must be greater than the maximum bit index set in the view mask in the subpasses in which it is used in `renderPass`. 
If multiview is not enabled for `renderPass` and `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `layerCount` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain used as an input, color, resolve, or depth/stencil attachment in `renderPass` must be greater than or equal to `layers`.

If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `usage` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain that refers to an attachment used as a color attachment or resolve attachment by `renderPass` must include `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`.

If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `usage` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain that refers to an attachment used as a depth/stencil attachment by `renderPass` must include `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `usage` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain that refers to an attachment used as a depth/stencil resolve attachment by `renderPass` must include `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `usage` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain that refers to an attachment used as an input attachment by `renderPass` must include `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`.

If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, at least one element of the `pViewFormats` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain must be equal to the corresponding value of `VkAttachmentDescription::format` used to create `renderPass`.

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` must have been created with `VkImageViewCreateInfo::viewType` not equal to `VK_IMAGE_VIEW_TYPE_3D`.

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` that is used as a fragment shading rate attachment by `renderPass` must have been created with a `usage` value including `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `usage` member of any element...
of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure included in the pNext chain that refers to an attachment used as a fragment shading rate attachment by renderPass must include VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

• VUID-VkFramebufferCreateInfo-samples-06881
If multisampled-render-to-single-sampled is enabled for any subpass, all color, depth/stencil and input attachments used in that subpass which have VkAttachmentDescription::samples or VkAttachmentDescription2::samples equal to VK_SAMPLE_COUNT_1_BIT must have been created with VK_IMAGE_CREATE_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_BIT_EXT in their VkImageCreateInfo::flags

• VUID-VkFramebufferCreateInfo-samples-07009
If multisampled-render-to-single-sampled is enabled for any subpass, all color, depth/stencil and input attachments used in that subpass which have VkAttachmentDescription::samples or VkAttachmentDescription2::samples equal to VK_SAMPLE_COUNT_1_BIT must have a format that supports the sample count specified in VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples

• VUID-VkFramebufferCreateInfo-nullColorAttachmentWithExternalFormatResolve-09349
If the nullColorAttachmentWithExternalFormatResolve is VK_FALSE, and flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the format of the color attachment for each subpass in renderPass that includes an external format image as a resolve attachment must have a format equal to the value of VkAndroidHardwareBufferFormatResolvePropertiesANDROID::colorAttachmentFormat as returned by a call to vkGetAndroidHardwareBufferPropertiesANDROID for the Android hardware buffer that was used to create the image view use as its resolve attachment

• VUID-VkFramebufferCreateInfo-pAttachments-09350
If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, then if an element of pAttachments has a format of VK_FORMAT_UNDEFINED, it must have been created with a VkExternalFormatANDROID::externalFormat value identical to that provided in the VkExternalFormatANDROID::externalFormat specified by the corresponding VkAttachmentDescription2 in renderPass

---

Valid Usage (Implicit)

• VUID-VkFramebufferCreateInfo-sType-sType
sType must be VK_STRUCTURE_TYPE_FRAMEBUFFER_CREATE_INFO

• VUID-VkFramebufferCreateInfo-pNext-pNext
pNext must be NULL or a pointer to a valid instance of VkFramebufferAttachmentsCreateInfo

• VUID-VkFramebufferCreateInfo-sType-unique
The sType value of each struct in the pNext chain must be unique

• VUID-VkFramebufferCreateInfo-flags-parameter
flags must be a valid combination of VkFramebufferCreateFlagBits values
• VUID-VkFramebufferCreateInfo-renderPass-parameter
  renderPass must be a valid VkRenderPass handle

• VUID-VkFramebufferCreateInfo-commonparent
  Both of renderPass, and the elements of pAttachments that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

The VkFramebufferAttachmentsCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkFramebufferAttachmentsCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t attachmentImageInfoCount;
    const VkFramebufferAttachmentImageInfo* pAttachmentImageInfos;
} VkFramebufferAttachmentsCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_imageless_framebuffer
typedef VkFramebufferAttachmentsCreateInfo VkFramebufferAttachmentsCreateInfoKHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• attachmentImageInfoCount is the number of attachments being described.
• pAttachmentImageInfos is a pointer to an array of VkFramebufferAttachmentImageInfo structures, each structure describing a number of parameters of the corresponding attachment in a render pass instance.

Valid Usage (Implicit)

• VUID-VkFramebufferAttachmentsCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_FRAMEBUFFER_ATTACHMENTS_CREATE_INFO

• VUID-VkFramebufferAttachmentsCreateInfo-pAttachmentImageInfos-parameter
  If attachmentImageInfoCount is not 0, pAttachmentImageInfos must be a valid pointer to an array of attachmentImageInfoCount valid VkFramebufferAttachmentImageInfo structures

The VkFramebufferAttachmentImageInfo structure is defined as:
typedef struct VkFramebufferAttachmentImageInfo {
    VkStructureType sType;
    const void* pNext;
    VkImageCreateFlags flags;
    VkImageUsageFlags usage;
    uint32_t width;
    uint32_t height;
    uint32_t layerCount;
    uint32_t viewFormatCount;
    const VkFormat* pViewFormats;
} VkFramebufferAttachmentImageInfo;

or the equivalent

// Provided by VK_KHR_imageless_framebuffer
typedef VkFramebufferAttachmentImageInfo VkFramebufferAttachmentImageInfoKHR;

• sType is a VkStructureType value identifying this structure.

• pNext is NULL or a pointer to a structure extending this structure.

• flags is a bitmask of VkImageCreateFlagBits, matching the value of VkImageCreateInfo::flags used to create an image that will be used with this framebuffer.

• usage is a bitmask of VkImageUsageFlagBits, matching the value of VkImageCreateInfo::usage used to create an image used with this framebuffer.

• width is the width of the image view used for rendering.

• height is the height of the image view used for rendering.

• layerCount is the number of array layers of the image view used for rendering.

• viewFormatCount is the number of entries in the pViewFormats array, matching the value of VkImageFormatListCreateInfo::viewFormatCount used to create an image used with this framebuffer.

• pViewFormats is a pointer to an array of VkFormat values specifying all of the formats which can be used when creating views of the image, matching the value of VkImageFormatListCreateInfo::pViewFormats used to create an image used with this framebuffer.

Images that can be used with the framebuffer when beginning a render pass, as specified by VkRenderPassAttachmentBeginInfo, must be created with parameters that are identical to those specified here.

Valid Usage

• VUID-VkFramebufferAttachmentImageInfo-viewFormatCount-09536

If viewFormatCount is not 0, and the render pass is not being used with an external format
resolve attachment, each element of \texttt{pViewFormats} must not be \texttt{VK_FORMAT_UNDEFINED}

### Valid Usage (Implicit)

- \textbf{VUID-VkFramebufferAttachmentImageInfo-sType-sType}  
  \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_FRAMEBUFFER_ATTACHMENT_IMAGE_INFO}

- \textbf{VUID-VkFramebufferAttachmentImageInfo-pNext-pNext}  
  \texttt{pNext} must be \texttt{NULL}

- \textbf{VUID-VkFramebufferAttachmentImageInfo-flags-parameter}  
  \texttt{flags} must be a valid combination of \texttt{VkImageCreateFlagBits} values

- \textbf{VUID-VkFramebufferAttachmentImageInfo-usage-parameter}  
  \texttt{usage} must be a valid combination of \texttt{VkImageUsageFlagBits} values

- \textbf{VUID-VkFramebufferAttachmentImageInfo-usage-required bitmask}  
  \texttt{usage} must not be 0

- \textbf{VUID-VkFramebufferAttachmentImageInfo-pViewFormats-parameter}  
  If \texttt{viewFormatCount} is not 0, \texttt{pViewFormats} must be a valid pointer to an array of \texttt{viewFormatCount} valid \texttt{VkFormat} values

Bits which \textbf{can} be set in \texttt{VkFramebufferCreateInfo::flags}, specifying options for framebuffers, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkFramebufferCreateFlagBits {
    // Provided by VK_VERSION_1_2
    VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT = 0x00000001,
    // Provided by VK_KHR_imageless_framebuffer
    VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR = VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT,
} VkFramebufferCreateFlagBits;
```

- \texttt{VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT} specifies that image views are not specified, and only attachment compatibility information will be provided via a \texttt{VkFramebufferAttachmentImageInfo} structure.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkFramebufferCreateFlags;
```

\texttt{VkFramebufferCreateFlags} is a bitmask type for setting a mask of zero or more \texttt{VkFramebufferCreateFlagBits}.

To destroy a framebuffer, call:
// Provided by VK_VERSION_1_0

void vkDestroyFramebuffer(
    VkDevice           device,
    VkFramebuffer      framebuffer,
    const VkAllocationCallbacks* pAllocator);

- `device` is the logical device that destroys the framebuffer.
- `framebuffer` is the handle of the framebuffer to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

**Valid Usage**

- VUID-vkDestroyFramebuffer-framebuffer-00892
  All submitted commands that refer to `framebuffer` must have completed execution

- VUID-vkDestroyFramebuffer-framebuffer-00893
  If `VkAllocationCallbacks` were provided when `framebuffer` was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyFramebuffer-framebuffer-00894
  If no `VkAllocationCallbacks` were provided when `framebuffer` was created, `pAllocator` must be `NULL`

**Valid Usage (Implicit)**

- VUID-vkDestroyFramebuffer-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkDestroyFramebuffer-framebuffer-parameter
  If `framebuffer` is not `VK_NULL_HANDLE`, `framebuffer` must be a valid `VkFramebuffer` handle

- VUID-vkDestroyFramebuffer-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkDestroyFramebuffer-framebuffer-parent
  If `framebuffer` is a valid handle, it must have been created, allocated, or retrieved from `device`

**Host Synchronization**

- Host access to `framebuffer` must be externally synchronized
8.5. Render Pass Load Operations

Render pass load operations define the initial values of an attachment during a render pass instance.

Load operations for attachments with a depth/stencil format execute in the VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT pipeline stage. Load operations for attachments with a color format execute in the VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT pipeline stage. The load operation for each sample in an attachment happens-before any recorded command which accesses the sample in that render pass instance via that attachment or an alias.

NOTE
Because load operations always happen first, external synchronization with attachment access only needs to synchronize the load operations with previous commands; not the operations within the render pass instance. This does not apply when using VK_ATTACHMENT_LOAD_OP_NONE_KHR.

Load operations only update values within the defined render area for the render pass instance. However, any writes performed by a load operation (as defined by its access masks) to a given attachment may read and write back any memory locations within the image subresource bound for that attachment. For depth/stencil images, if maintenance7 is not enabled on the device or separateDepthStencilAttachmentAccess is VK_FALSE, writes to one aspect may also result in read-modify-write operations for the other aspect. If the subresource is in the VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT layout, implementations must not access pixels outside of the render area.

NOTE
As entire subresources could be accessed by load operations, applications cannot safely access values outside of the render area during a render pass instance when a load operation that modifies values is used.

Load operations that can be used for a render pass are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkAttachmentLoadOp {
    VK_ATTACHMENT_LOAD_OP_LOAD = 0,
    VK_ATTACHMENT_LOAD_OP_CLEAR = 1,
    VK_ATTACHMENT_LOAD_OP_DONT_CARE = 2,
    // Provided by VK_KHR_load_store_op_none
    VK_ATTACHMENT_LOAD_OP_NONE_KHR = 1000400000,
    // Provided by VK_EXT_load_store_op_none
    VK_ATTACHMENT_LOAD_OP_NONE_EXT = VK_ATTACHMENT_LOAD_OP_NONE_KHR,
} VkAttachmentLoadOp;
```

• VK_ATTACHMENT_LOAD_OP_LOAD specifies that the previous contents of the image within the render area will be preserved as the initial values. For attachments with a depth/stencil format, this uses the access type VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT. For attachments with a color format, this uses the access type VK_ACCESS_COLOR_ATTACHMENT_READ_BIT.

• VK_ATTACHMENT_LOAD_OP_CLEAR specifies that the contents within the render area will be cleared to
a uniform value, which is specified when a render pass instance is begun. For attachments with a depth/stencil format, this uses the access type `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`. For attachments with a color format, this uses the access type `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`.

- **VK_ATTACHMENT_LOAD_OP_DONT_CARE** specifies that the previous contents within the area need not be preserved; the contents of the attachment will be undefined inside the render area. For attachments with a depth/stencil format, this uses the access type `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`. For attachments with a color format, this uses the access type `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`.

- **VK_ATTACHMENT_LOAD_OP_NONE_KHR** specifies that the previous contents of the image will be undefined inside the render pass. No access type is used as the image is not accessed.

During a render pass instance, input and color attachments with color formats that have a component size of 8, 16, or 32 bits must be represented in the attachment's format throughout the instance. Attachments with other floating- or fixed-point color formats, or with depth components may be represented in a format with a precision higher than the attachment format, but must be represented with the same range. When such a component is loaded via the `loadOp`, it will be converted into an implementation-dependent format used by the render pass. Such components must be converted from the render pass format, to the format of the attachment, before they are resolved or stored at the end of a render pass instance via `storeOp`. Conversions occur as described in Numeric Representation and Computation and Fixed-Point Data Conversions.

### 8.6. Render Pass Store Operations

Render pass store operations define how values written to an attachment during a render pass instance are stored to memory.

Store operations for attachments with a depth/stencil format execute in the `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT` pipeline stage. Store operations for attachments with a color format execute in the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage. The store operation for each sample in an attachment happens-after any recorded command which accesses the sample via that attachment or an alias.

**NOTE**

Because store operations always happen after other accesses in a render pass instance, external synchronization with attachment access in an earlier render pass only needs to synchronize with the store operations; not the operations within the render pass instance. This does not apply when using `VK_ATTACHMENT_STORE_OP_NONE_KHR`.

Store operations only update values within the defined render area for the render pass instance. However, any writes performed by a store operation (as defined by its access masks) to a given attachment may read and write back any memory locations within the image subresource bound for that attachment. For depth/stencil images, if `separateDepthStencilAttachmentAccess` is `VK_FALSE`, writes to one aspect may also result in read-modify-write operations for the other aspect. If the subresource is in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` layout, implementations must not access pixels outside of the render area.

**NOTE**

As entire subresources could be accessed by store operations, applications cannot
safely access values outside of the render area via aliased resources during a render pass instance when a store operation that modifies values is used.

Possible values of `VkAttachmentDescription::storeOp` and `stencilStoreOp`, specifying how the contents of the attachment are treated, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkAttachmentStoreOp {
    VK_ATTACHMENT_STORE_OP_STORE = 0,
    VK_ATTACHMENT_STORE_OP_DONT_CARE = 1,
    // Provided by VK_VERSION_1_3
    VK_ATTACHMENT_STORE_OP_NONE = 1000301000,
    // Provided by VK_KHR_dynamic_rendering, VK_KHR_load_store_op_none
    VK_ATTACHMENT_STORE_OP_NONE_KHR = VK_ATTACHMENT_STORE_OP_NONE,
    // Provided by VK_QCOM_render_pass_store_ops
    VK_ATTACHMENT_STORE_OP_NONE_QCOM = VK_ATTACHMENT_STORE_OP_NONE,
    // Provided by VK_EXT_load_store_op_none
    VK_ATTACHMENT_STORE_OP_NONE_EXT = VK_ATTACHMENT_STORE_OP_NONE,
} VkAttachmentStoreOp;
```

- **VK_ATTACHMENT_STORE_OP_STORE** specifies the contents generated during the render pass and within the render area are written to memory. For attachments with a depth/stencil format, this uses the access type `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`. For attachments with a color format, this uses the access type `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`.

- **VK_ATTACHMENT_STORE_OP_DONT_CARE** specifies the contents within the render area are not needed after rendering, and may be discarded; the contents of the attachment will be undefined inside the render area. For attachments with a depth/stencil format, this uses the access type `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`. For attachments with a color format, this uses the access type `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`.

- **VK_ATTACHMENT_STORE_OP_NONE** specifies the contents within the render area are not accessed by the store operation as long as no values are written to the attachment during the render pass. If values are written during the render pass, this behaves identically to `VK_ATTACHMENT_STORE_OP_DONT_CARE` and with matching access semantics.

**NOTE** `VK_ATTACHMENT_STORE_OP_DONT_CARE` can cause contents generated during previous render passes to be discarded before reaching memory, even if no write to the attachment occurs during the current render pass.

### 8.7. Render Pass Multisample Resolve Operations

Render pass multisample resolve operations combine sample values from a single pixel in a multisample attachment and store the result to the corresponding pixel in a single sample attachment.

Multisample resolve operations for attachments execute in the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage. A final resolve operation for all
pixels in the render area happens-after any recorded command which writes a pixel via the multisample attachment to be resolved or an explicit alias of it in the subpass that it is specified. Any single sample attachment specified for use in a multisample resolve operation may have its contents modified at any point once rendering begins for the render pass instance. Reads from the multisample attachment can be synchronized with VK_ACCESS_COLOR_ATTACHMENT_READ_BIT. Access to the single sample attachment can be synchronized with VK_ACCESS_COLOR_ATTACHMENT_READ_BIT and VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT. These pipeline stage and access types are used whether the attachments are color or depth/stencil attachments.

When using render pass objects, a subpass dependency specified with the above pipeline stages and access flags will ensure synchronization with multisample resolve operations for any attachments that were last accessed by that subpass. This allows later subpasses to read resolved values as input attachments.

Resolve operations only update values within the defined render area for the render pass instance. However, any writes performed by a resolve operation (as defined by its access masks) to a given attachment may read and write back any memory locations within the image subresource bound for that attachment. For depth/stencil images, if separateDepthStencilAttachmentAccess is VK_FALSE, writes to one aspect may also result in read-modify-write operations for the other aspect. If the subresource is in the VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT layout, implementations must not access pixels outside of the render area.

As entire subresources could be accessed by multisample resolve operations, applications cannot safely access values outside of the render area via aliased resources during a render pass instance when a multisample resolve operation is performed.

Multisample values in a multisample attachment are combined according to the resolve mode used:
typedef enum VkResolveModeFlagBits {
    VK_RESOLVE_MODE_NONE = 0,
    VK_RESOLVE_MODE_SAMPLE_ZERO_BIT = 0x00000001,
    VK_RESOLVE_MODE_AVERAGE_BIT = 0x00000002,
    VK_RESOLVE_MODE_MIN_BIT = 0x00000004,
    VK_RESOLVE_MODE_MAX_BIT = 0x00000008,
    // Provided by VK_ANDROID_external_format_resolve with VK_KHR_dynamic_rendering or
    // VK_VERSION_1_3
    VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID = 0x00000010,
    // Provided by VK_KHR_depth_stencil_resolve
    VK_RESOLVE_MODE_NONE_KHR = VK_RESOLVE_MODE_NONE,
    // Provided by VK_KHR_depth_stencil_resolve
    VK_RESOLVE_MODE_SAMPLE_ZERO_BIT_KHR = VK_RESOLVE_MODE_SAMPLE_ZERO_BIT,
    // Provided by VK_KHR_depth_stencil_resolve
    VK_RESOLVE_MODE_AVERAGE_BIT_KHR = VK_RESOLVE_MODE_AVERAGE_BIT,
    // Provided by VK_KHR_depth_stencil_resolve
    VK_RESOLVE_MODE_MIN_BIT_KHR = VK_RESOLVE_MODE_MIN_BIT,
    // Provided by VK_KHR_depth_stencil_resolve
    VK_RESOLVE_MODE_MAX_BIT_KHR = VK_RESOLVE_MODE_MAX_BIT,
} VkResolveModeFlagBits;

or the equivalent

// Provided by VK_KHR_depth_stencil_resolve
typedef VkResolveModeFlagBits VkResolveModeFlagBitsKHR;

- **VK_RESOLVE_MODE_NONE** indicates that no resolve operation is done.
- **VK_RESOLVE_MODE_SAMPLE_ZERO_BIT** indicates that result of the resolve operation is equal to the value of sample 0.
- **VK_RESOLVE_MODE_AVERAGE_BIT** indicates that result of the resolve operation is the average of the sample values.
- **VK_RESOLVE_MODE_MIN_BIT** indicates that result of the resolve operation is the minimum of the sample values.
- **VK_RESOLVE_MODE_MAX_BIT** indicates that result of the resolve operation is the maximum of the sample values.
- **VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID** indicates that rather than a multisample resolve, a single sampled color attachment will be downsampled into a YCbCr format image specified by an external Android format. Unlike other resolve modes, implementations can resolve multiple times during rendering, or even bypass writing to the color attachment altogether, as long as the final value is resolved to the resolve attachment. Values in the G, B, and R channels of the color attachment will be written to the Y, Cb, and Cr channels of the external format image, respectively. Chroma values are calculated as if sampling with a linear filter from the color attachment at full rate, at the location the chroma values sit according to VkPhysicalDeviceExternalFormatResolvePropertiesANDROID::chromaOffsetX,
VkPhysicalDeviceExternalFormatResolvePropertiesANDROID::chromaOffsetY, and the chroma sample rate of the resolved image.

If no resolve mode is otherwise specified, VK_RESOLVE_MODE_AVERAGE_BIT is used.

**NOTE**

No range compression or $Y'C_bC_r$ model conversion is performed by VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID; applications have to do these conversions themselves. Value outputs are expected to match those that would be read through a $Y'C_bC_r$ sampler using VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY. The color space that the values should be in is defined by the platform and is not exposed via Vulkan.

```
// Provided by VK_VERSION_1_2
typedef VkFlags VkResolveModeFlags;
```

or the equivalent

```
// Provided by VK_KHR_depth_stencil_resolve
typedef VkResolveModeFlags VkResolveModeFlagsKHR;
```

VkResolveModeFlags is a bitmask type for setting a mask of zero or more VkResolveModeFlagBits.

### 8.8. Render Pass Commands

An application records the commands for a render pass instance one subpass at a time, by beginning a render pass instance, iterating over the subpasses to record commands for that subpass, and then ending the render pass instance.

To begin a render pass instance, call:

```
// Provided by VK_VERSION_1_0
void vkCmdBeginRenderPass(
    VkCommandBuffer commandBuffer,
    const VkRenderPassBeginInfo* pRenderPassBegin,
    VkSubpassContents contents);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pRenderPassBegin` is a pointer to a VkRenderPassBeginInfo structure specifying the render pass to begin an instance of, and the framebuffer the instance uses.
- `contents` is a VkSubpassContents value specifying how the commands in the first subpass will be provided.

After beginning a render pass instance, the command buffer is ready to record the commands for the first subpass of that render pass.
Valid Usage

- VUID-vkCmdBeginRenderPass-initialLayout-00895
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a usage value including `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`

- VUID-vkCmdBeginRenderPass-initialLayout-01758
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a usage value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-vkCmdBeginRenderPass-initialLayout-02842
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a usage value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-vkCmdBeginRenderPass-stencilInitialLayout-02843
  If any of the `stencilInitialLayout` or `stencilFinalLayout` member of the `VkAttachmentDescriptionStencilLayout` structures or the `stencilLayout` member of the `VkAttachmentReferenceStencilLayout` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a usage value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-vkCmdBeginRenderPass-initialLayout-00897
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` then the corresponding attachment image view
of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_SAMPLED_BIT or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

- VUID-vkCmdBeginRenderPass-initialLayout-00898
  If any of the initialLayout or finalLayout member of the VkAttachmentDescription structures or the layout member of the VkAttachmentReference structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_TRANSFER_SRC_BIT

- VUID-vkCmdBeginRenderPass-initialLayout-00899
  If any of the initialLayout or finalLayout member of the VkAttachmentDescription structures or the layout member of the VkAttachmentReference structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_TRANSFER_DST_BIT

- VUID-vkCmdBeginRenderPass-initialLayout-00900
  If the initialLayout member of any of the VkAttachmentDescription structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is not VK_IMAGE_LAYOUT_UNDEFINED, then each such initialLayout must be equal to the current layout of the corresponding attachment image subresource of the framebuffer specified in the framebuffer member of pRenderPassBegin

- VUID-vkCmdBeginRenderPass-srcStageMask-06451
  The srcStageMask members of any element of the pDependencies member of VkRenderPassCreateInfo used to create renderPass must be supported by the capabilities of the queue family identified by the queueFamilyIndex member of the VkCommandPoolCreateInfo used to create the command pool which commandBuffer was allocated from

- VUID-vkCmdBeginRenderPass-dstStageMask-06452
  The dstStageMask members of any element of the pDependencies member of VkRenderPassCreateInfo used to create renderPass must be supported by the capabilities of the queue family identified by the queueFamilyIndex member of the VkCommandPoolCreateInfo used to create the command pool which commandBuffer was allocated from

- VUID-vkCmdBeginRenderPass-framebuffer-02532
  For any attachment in framebuffer that is used by renderPass and is bound to memory locations that are also bound to another attachment used by renderPass, and if at least one of those uses causes either attachment to be written to, both attachments must have had the VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT set

- VUID-vkCmdBeginRenderPass-framebuffer-09045
  If any attachments specified in framebuffer are used by renderPass and are bound to overlapping memory locations, there must be only one that is used as a color attachment, depth/stencil, or resolve attachment in any subpass

- VUID-vkCmdBeginRenderPass-initialLayout-07000
If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a usage value including either the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` and either the `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_SAMPLED_BIT` usage bits.

- **VUID-vkCmdBeginRenderPass-initialLayout-07001**
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a usage value the `VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` usage bit.

- **VUID-vkCmdBeginRenderPass-initialLayout-09537**
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a usage value including either `VK_IMAGE_USAGE_STORAGE_BIT`, or both `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` and either of `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

- **VUID-vkCmdBeginRenderPass-contents-09640**
  If `contents` is `VK_SUBPASS_CONTENTS_INLINE_AND_SECONDARY_COMMAND_BUFFERS_KHR`, then at least one of the following features must be enabled:
  - `maintenance7`
  - `nestedCommandBuffer`

### Valid Usage (Implicit)

- **VUID-vkCmdBeginRenderPass-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdBeginRenderPass-pRenderPassBegin-parameter**
  `pRenderPassBegin` must be a valid pointer to a valid `VkRenderPassBeginInfo` structure.

- **VUID-vkCmdBeginRenderPass-contents-parameter**
  `contents` must be a valid `VkSubpassContents` value.

- **VUID-vkCmdBeginRenderPass-commandBuffer-recording**
  `commandBuffer` must be in the recording state.

- **VUID-vkCmdBeginRenderPass-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics
operations

- VUID-vkCmdBeginRenderPass-renderpass
  This command must only be called outside of a render pass instance
- VUID-vkCmdBeginRenderPass-videocoding
  This command must only be called outside of a video coding scope
- VUID-vkCmdBeginRenderPass-bufferlevel
  commandBuffer must be a primary VkCommandBuffer

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>

</tr>
</tbody>
</table>

Alternatively to begin a render pass, call:

```c
// Provided by VK_VERSION_1_2
void vkCmdBeginRenderPass2(
  VkCommandBuffer commandBuffer,
  const VkRenderPassBeginInfo* pRenderPassBegin,
  const VkSubpassBeginInfo* pSubpassBeginInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_create_renderpass2
void vkCmdBeginRenderPass2KHR(
  VkCommandBuffer commandBuffer,
  const VkRenderPassBeginInfo* pRenderPassBegin,
  const VkSubpassBeginInfo* pSubpassBeginInfo);
```

- commandBuffer is the command buffer in which to record the command.
- pRenderPassBegin is a pointer to a VkRenderPassBeginInfo structure specifying the render pass to begin an instance of, and the framebuffer the instance uses.
• **pSubpassBeginInfo** is a pointer to a **VkSubpassBeginInfo** structure containing information about the subpass which is about to begin rendering.

After beginning a render pass instance, the command buffer is ready to record the commands for the first subpass of that render pass.

### Valid Usage

- **VUID-vkCmdBeginRenderPass2-framebuffer-02779**
  Both the **framebuffer** and **renderPass** members of **pRenderPassBegin** must have been created on the same **VkDevice** that **commandBuffer** was allocated on.

- **VUID-vkCmdBeginRenderPass2-initialLayout-03094**
  If any of the **initialLayout** or **finalLayout** member of the **VkAttachmentDescription** structures or the **layout** member of the **VkAttachmentReference** structures specified when creating the render pass specified in the **renderPass** member of **pRenderPassBegin** is **VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL** then the corresponding attachment image view of the framebuffer specified in the **framebuffer** member of **pRenderPassBegin** must have been created with a usage value including **VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT**.

- **VUID-vkCmdBeginRenderPass2-initialLayout-03096**
  If any of the **initialLayout** or **finalLayout** member of the **VkAttachmentDescription** structures or the **layout** member of the **VkAttachmentReference** structures specified when creating the render pass specified in the **renderPass** member of **pRenderPassBegin** is **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL**, **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL**, **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL**, or **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL** then the corresponding attachment image view of the framebuffer specified in the **framebuffer** member of **pRenderPassBegin** must have been created with a usage value including **VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT**.

- **VUID-vkCmdBeginRenderPass2-stencilInitialLayout-02845**
  If any of the **stencilInitialLayout** or **stencilFinalLayout** member of the **VkAttachmentDescriptionStencilLayout** structures or the **stencilLayout** member of the **VkAttachmentReferenceStencilLayout** structures specified when creating the render pass specified in the **renderPass** member of **pRenderPassBegin** is **VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL**, **VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL**, or **VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL** then the corresponding attachment image view of the framebuffer specified in the **framebuffer** member of **pRenderPassBegin** must have been created with a usage value including **VK_IMAGE_USAGE_STENCIL_ATTACHMENT_BIT**.
view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-vkCmdBeginRenderPass2-initialLayout-03097
  If any of the initialLayout or finalLayout member of the VkAttachmentDescription structures or the layout member of the VkAttachmentReference structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_SAMPLED_BIT or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

- VUID-vkCmdBeginRenderPass2-initialLayout-03098
  If any of the initialLayout or finalLayout member of the VkAttachmentDescription structures or the layout member of the VkAttachmentReference structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_TRANSFER_SRC_BIT

- VUID-vkCmdBeginRenderPass2-initialLayout-03099
  If any of the initialLayout or finalLayout member of the VkAttachmentDescription structures or the layout member of the VkAttachmentReference structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is not VK_IMAGE_LAYOUT_UNDEFINED, then each such initialLayout must be equal to the current layout of the corresponding attachment image subresource of the framebuffer specified in the framebuffer member of pRenderPassBegin

- VUID-vkCmdBeginRenderPass2-srcStageMask-06453
  The srcStageMask members of any element of the pDependencies member of VkRenderPassCreateInfo used to create renderPass must be supported by the capabilities of the queue family identified by the queueFamilyIndex member of the VkCommandPoolCreateInfo used to create the command pool which commandBuffer was allocated from

- VUID-vkCmdBeginRenderPass2-dstStageMask-06454
  The dstStageMask members of any element of the pDependencies member of VkRenderPassCreateInfo used to create renderPass must be supported by the capabilities of the queue family identified by the queueFamilyIndex member of the VkCommandPoolCreateInfo used to create the command pool which commandBuffer was allocated from

- VUID-vkCmdBeginRenderPass2-framebuffer-02533
  For any attachment in framebuffer that is used by renderPass and is bound to memory
locations that are also bound to another attachment used by \texttt{renderPass}, and if at least one of those uses causes either attachment to be written to, both attachments \textbf{must} have had the \texttt{VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT} set

- \textbf{VUID-vkCmdBeginRenderPass2-framebuffer-09046}
  If any attachments specified in \texttt{framebuffer} are used by \texttt{renderPass} and are bound to overlapping memory locations, there \textbf{must} be only one that is used as a color attachment, depth/stencil, or resolve attachment in any subpass

- \textbf{VUID-vkCmdBeginRenderPass2-initialLayout-07002}
  If any of the \texttt{initialLayout} or \texttt{finallayout} member of the \texttt{VkAttachmentDescription} structures or the \texttt{layout} member of the \texttt{VkAttachmentReference} structures specified when creating the render pass specified in the \texttt{renderPass} member of \texttt{pRenderPassBegin} is \texttt{VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT} then the corresponding attachment image view of the framebuffer specified in the \texttt{framebuffer} member of \texttt{pRenderPassBegin} \textbf{must} have been created with a \texttt{usage} value including either the \texttt{VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT} or \texttt{VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT} and either the \texttt{VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT} or \texttt{VK_IMAGE_USAGE_SAMPLED_BIT} usage bits

- \textbf{VUID-vkCmdBeginRenderPass2-initialLayout-07003}
  If any of the \texttt{initialLayout} or \texttt{finallayout} member of the \texttt{VkAttachmentDescription} structures or the \texttt{layout} member of the \texttt{VkAttachmentReference} structures specified when creating the render pass specified in the \texttt{renderPass} member of \texttt{pRenderPassBegin} is \texttt{VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT} then the corresponding attachment image view of the framebuffer specified in the \texttt{framebuffer} member of \texttt{pRenderPassBegin} \textbf{must} have been created with a \texttt{usage} value the \texttt{VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT} usage bit

- \textbf{VUID-vkCmdBeginRenderPass2-initialLayout-09538}
  If any of the \texttt{initialLayout} or \texttt{finallayout} member of the \texttt{VkAttachmentDescription} structures or the \texttt{layout} member of the \texttt{VkAttachmentReference} structures specified when creating the render pass specified in the \texttt{renderPass} member of \texttt{pRenderPassBegin} is \texttt{VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR} then the corresponding attachment image view of the framebuffer specified in the \texttt{framebuffer} member of \texttt{pRenderPassBegin} \textbf{must} have been created with a \texttt{usage} value including either \texttt{VK_IMAGE_USAGE_STORAGE_BIT}, or both \texttt{VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT} or \texttt{VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT} or \texttt{VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT}

\textbf{Valid Usage (Implicit)}

- \textbf{VUID-vkCmdBeginRenderPass2-commandBuffer-parameter}
  \texttt{commandBuffer} \textbf{must} be a valid \texttt{VkCommandBuffer} handle

- \textbf{VUID-vkCmdBeginRenderPass2-pRenderPassBegin-parameter}
  \texttt{pRenderPassBegin} \textbf{must} be a valid pointer to a valid \texttt{VkRenderPassBeginInfo} structure

- \textbf{VUID-vkCmdBeginRenderPass2-pSubpassBeginInfo-parameter}
  \texttt{pSubpassBeginInfo} \textbf{must} be a valid pointer to a valid \texttt{VkSubpassBeginInfo} structure

- \textbf{VUID-vkCmdBeginRenderPass2-commandBuffer-recording}
  \texttt{commandBuffer} \textbf{must} be in the \texttt{recording} state
• **VUID-vkCmdBeginRenderPass2-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

• **VUID-vkCmdBeginRenderPass2-renderpass**
  This command must only be called outside of a render pass instance.

• **VUID-vkCmdBeginRenderPass2-videocoding**
  This command must only be called outside of a video coding scope.

• **VUID-vkCmdBeginRenderPass2-bufferlevel**
  `commandBuffer` must be a primary `VkCommandBuffer`.

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

The `VkRenderPassBeginInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkRenderPassBeginInfo {
    VkStructureType sType;
    const void* pNext;
    VkRenderPass renderPass;
    VkFramebuffer framebuffer;
    VkRect2D renderArea;
    uint32_t clearValueCount;
    const VkClearValue* pClearValues;
} VkRenderPassBeginInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `renderPass` is the render pass to begin an instance of.
- `framebuffer` is the framebuffer containing the attachments that are used with the render pass.
• **renderArea** is the render area that is affected by the render pass instance, and is described in more detail below.

• **clearValueCount** is the number of elements in pClearValues.

• **pClearValues** is a pointer to an array of clearValueCount VkClearValue structures containing clear values for each attachment, if the attachment uses a loadOp value of VK_ATTACHMENT_LOAD_OP_CLEAR or if the attachment has a depth/stencil format and uses a stencilLoadOp value of VK_ATTACHMENT_LOAD_OP_CLEAR. The array is indexed by attachment number. Only elements corresponding to cleared attachments are used. Other elements of pClearValues are ignored.

**renderArea** is the render area that is affected by the render pass instance. The effects of attachment load, store and multisample resolve operations are restricted to the pixels whose x and y coordinates fall within the render area on all attachments. The render area extends to all layers of framebuffer. The application must ensure (using scissor if necessary) that all rendering is contained within the render area. The render area, after any transform specified by VkRenderPassTransformBeginInfoQCOM::transform is applied, must be contained within the framebuffer dimensions.

If render pass transform is enabled, then renderArea must equal the framebuffer pre-transformed dimensions. After renderArea has been transformed by VkRenderPassTransformBeginInfoQCOM::transform, the resulting render area must be equal to the framebuffer dimensions.

If multiview is enabled in renderPass, and multiviewPerViewRenderAreas feature is enabled, and there is an instance of VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM included in the pNext chain with perViewRenderAreaCount not equal to 0, then the elements of VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM::pPerViewRenderAreas override renderArea and define a render area for each view. In this case, renderArea must be set to an area at least as large as the union of all the per-view render areas.

If the subpassShading feature is enabled, then renderArea must equal the framebuffer dimensions.

**NOTE** There may be a performance cost for using a render area smaller than the framebuffer, unless it matches the render area granularity for the render pass.

### Valid Usage

- **VUID-VkRenderPassBeginInfo-clearValueCount-00902**
  - clearValueCount must be greater than the largest attachment index in renderPass specifying a loadOp (or stencilLoadOp, if the attachment has a depth/stencil format) of VK_ATTACHMENT_LOAD_OP_CLEAR

- **VUID-VkRenderPassBeginInfo-clearValueCount-04962**
  - If clearValueCount is not 0, pClearValues must be a valid pointer to an array of clearValueCount VkClearValue unions

- **VUID-VkRenderPassBeginInfo-renderPass-00904**
  - renderPass must be compatible with the renderPass member of the VkFramebufferCreateInfo structure specified when creating framebuffer
If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.extent.width` must be greater than 0.

If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.extent.height` must be greater than 0.

If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.x` must be greater than or equal to 0.

If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.y` must be greater than or equal to 0.

If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.x + renderArea.extent.width` must be less than or equal to `VkFramebufferCreateInfo::width` the framebuffer was created with.

If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.y + renderArea.extent.height` must be less than or equal to `VkFramebufferCreateInfo::height` the framebuffer was created with.

If the `pNext` chain contains `VkDeviceGroupRenderPassBeginInfo`, `offset.x + extent.width` of each element of `pDeviceRenderAreas` must be less than or equal to `VkFramebufferCreateInfo::width` the framebuffer was created with.

If the `pNext` chain contains `VkDeviceGroupRenderPassBeginInfo`, `offset.y + extent.height` of each element of `pDeviceRenderAreas` must be less than or equal to `VkFramebufferCreateInfo::height` the framebuffer was created with.

If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that did not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, and the `pNext` chain includes a `VkRenderPassAttachmentBeginInfo` structure, its `attachmentCount` must be zero.

If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `attachmentCount` of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain must be equal to the value of `VkFramebufferAttachmentsCreateInfo::attachmentImageInfoCount` used to create `framebuffer`.
If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must have been created on the same VkDevice as framebuffer and renderPass.

If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a VkImageView of an image created with a value of VkImageCreateInfo::flags equal to the flags member of the corresponding element of VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos used to create framebuffer.

If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a VkImageView with an inherited usage equal to the usage member of the corresponding element of VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos used to create framebuffer.

If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a VkImageView with a width equal to the width member of the corresponding element of VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos used to create framebuffer.

If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a VkImageView with a height equal to the height member of the corresponding element of VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos used to create framebuffer.

If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a VkImageView of an image created with a value of VkImageViewCreateInfo::subresourceRange.layerCount equal to the layerCount member of the corresponding element of VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos used to create framebuffer.

If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a VkImageView of an image created with a value of VkImageFormatListCreateInfo::viewFormatCount equal to the viewFormatCount member of the corresponding element of...
VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos used to create framebuffer

- VUID-VkRenderPassBeginInfo-framebuffer-03215
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a VkImageView of an image created with a set of elements in VkImageFormatListCreateInfo::pViewFormats equal to the set of elements in the pViewFormats member of the corresponding element of VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos used to create framebuffer

- VUID-VkRenderPassBeginInfo-framebuffer-03216
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a VkImageView of an image created with a value of VkImageViewCreateInfo::format equal to the corresponding value of VkAttachmentDescription::format in renderPass

- VUID-VkRenderPassBeginInfo-framebuffer-09353
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, and the nullColorAttachmentWithExternalFormatResolve is VK_FALSE, the format of the color attachment for each subpass that includes an external format image as a resolve attachment must have a format equal to the value of VkAndroidHardwareBufferFormatResolvePropertiesANDROID::colorAttachmentFormat as returned by a call to vkGetAndroidHardwareBufferPropertiesANDROID for the Android hardware buffer that was used to create the image view use as its resolve attachment

- VUID-VkRenderPassBeginInfo-framebuffer-09354
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a VkImageView of an image created with a value of VkExternalFormatANDROID::externalFormat equal to VkExternalFormatANDROID::externalFormat in the pNext chain of the corresponding VkAttachmentDescription2 structure used to create renderPass

- VUID-VkRenderPassBeginInfo-framebuffer-09047
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a VkImageView of an image created with a value of VkImageCreateInfo::samples equal to the corresponding value of VkAttachmentDescription::samples in renderPass, or VK_SAMPLE_COUNT_1_BIT if renderPass was created with VkMultisampledRenderToSingleSampledInfoEXT structure in the pNext chain with multisampledRenderToSingleSampledEnable equal to VK_TRUE

- VUID-VkRenderPassBeginInfo-pNext-02869
  If the pNext chain includes VkRenderPassTransformBeginInfoQCOM, renderArea.offset must equal (0,0)

- VUID-VkRenderPassBeginInfo-pNext-02870
  If the pNext chain includes VkRenderPassTransformBeginInfoQCOM, renderArea.extent
transformed by \texttt{VkRenderPassTransformBeginInfoQCOM::transform} \textbf{must} equal the framebuffer dimensions

- VUID-VkRenderPassBeginInfo-perViewRenderAreaCount-07859
  If the \texttt{perViewRenderAreaCount} member of a \texttt{VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM} structure included in the \texttt{pNext} chain is not 0, then the \texttt{multiviewPerViewRenderAreas} feature \textbf{must} be enabled

- VUID-VkRenderPassBeginInfo-perViewRenderAreaCount-07860
  If the \texttt{perViewRenderAreaCount} member of a \texttt{VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM} structure included in the \texttt{pNext} chain is not 0, then \texttt{renderArea} \textbf{must} specify a render area that includes the union of all per view render areas

- VUID-VkRenderPassBeginInfo-pNext-09539
  If the \texttt{pNext} chain contains a \texttt{VkRenderPassStripeBeginInfoARM} structure, the union of stripe areas defined by the elements of \texttt{VkRenderPassStripeInfoARM::pStripeInfos} \textbf{must} cover the \texttt{renderArea}

**Valid Usage (Implicit)**

- VUID-VkRenderPassBeginInfo-sType-sType
  \texttt{sType} \textbf{must} be \texttt{VK_STRUCTURE_TYPE_RENDER_PASS_BEGIN_INFO}

- VUID-VkRenderPassBeginInfo-pNext-pNext
  Each \texttt{pNext} member of any structure (including this one) in the \texttt{pNext} chain \textbf{must} be either \texttt{NULL} or a pointer to a valid instance of \texttt{VkDeviceGroupRenderPassBeginInfo}, \texttt{VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM}, \texttt{VkRenderPassAttachmentBeginInfo}, \texttt{VkRenderPassSampleLocationsBeginInfoEXT}, \texttt{VkRenderPassStripeBeginInfoARM}, or \texttt{VkRenderPassTransformBeginInfoQCOM}

- VUID-VkRenderPassBeginInfo-sType-unique
  The \texttt{sType} value of each struct in the \texttt{pNext} chain \textbf{must} be unique

- VUID-VkRenderPassBeginInfo-renderPass-parameter
  \texttt{renderPass} \textbf{must} be a valid \texttt{VkRenderPass} handle

- VUID-VkRenderPassBeginInfo-framebuffer-parameter
  \texttt{framebuffer} \textbf{must} be a valid \texttt{VkFramebuffer} handle

- VUID-VkRenderPassBeginInfo-commonparent
  Both of \texttt{framebuffer}, and \texttt{renderPass} \textbf{must} have been created, allocated, or retrieved from the same \texttt{VkDevice}

The image layout of the depth aspect of a depth/stencil attachment referring to an image created with \texttt{VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT} is dependent on the last sample locations used to render to the image subresource, thus preserving the contents of such depth/stencil attachments across subpass boundaries requires the application to specify these sample locations whenever a layout transition of the attachment \textbf{may} occur. This information \textbf{can} be provided by adding a \texttt{VkRenderPassSampleLocationsBeginInfoEXT} structure to the \texttt{pNext} chain of \texttt{VkRenderPassBeginInfo}.
The `VkRenderPassSampleLocationsBeginInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_sample_locations
typedef struct VkRenderPassSampleLocationsBeginInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t attachmentInitialSampleLocationsCount;
    const VkAttachmentSampleLocationsEXT* pAttachmentInitialSampleLocations;
    uint32_t postSubpassSampleLocationsCount;
    const VkSubpassSampleLocationsEXT* pPostSubpassSampleLocations;
} VkRenderPassSampleLocationsBeginInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `attachmentInitialSampleLocationsCount` is the number of elements in the `pAttachmentInitialSampleLocations` array.
- `pAttachmentInitialSampleLocations` is a pointer to an array of `attachmentInitialSampleLocationsCount` `VkAttachmentSampleLocationsEXT` structures specifying the attachment indices and their corresponding sample location state. Each element of `pAttachmentInitialSampleLocations` can specify the sample location state to use in the automatic layout transition performed to transition a depth/stencil attachment from the initial layout of the attachment to the image layout specified for the attachment in the first subpass using it.
- `postSubpassSampleLocationsCount` is the number of elements in the `pPostSubpassSampleLocations` array.
- `pPostSubpassSampleLocations` is a pointer to an array of `postSubpassSampleLocationsCount` `VkSubpassSampleLocationsEXT` structures specifying the subpass indices and their corresponding sample location state. Each element of `pPostSubpassSampleLocations` can specify the sample location state to use in the automatic layout transition performed to transition the depth/stencil attachment used by the specified subpass to the image layout specified in a dependent subpass or to the final layout of the attachment in case the specified subpass is the last subpass using that attachment. In addition, if `VkPhysicalDeviceSampleLocationsPropertiesEXT::variableSampleLocations` is `VK_FALSE`, each element of `pPostSubpassSampleLocations` must specify the sample location state that matches the sample locations used by all pipelines that will be bound to a command buffer during the specified subpass. If `variableSampleLocations` is `VK_TRUE`, the sample locations used for rasterization do not depend on `pPostSubpassSampleLocations`.

**Valid Usage (Implicit)**

- `VUID-VkRenderPassSampleLocationsBeginInfoEXT-sType-sType` sType must be `VK_STRUCTURE_TYPE_RENDER_PASS_SAMPLE_LOCATIONS_BEGIN_INFO_EXT`
- `VUID-VkRenderPassSampleLocationsBeginInfoEXT-pAttachmentInitialSampleLocations-parameter` If `attachmentInitialSampleLocationsCount` is not 0, `pAttachmentInitialSampleLocations` must
be a valid pointer to an array of attachmentInitialSampleLocationsCount valid VkAttachmentSampleLocationsEXT structures

- VUID-VkRenderPassSampleLocationsBeginInfoEXT-pPostSubpassSampleLocations-parameter
  If postSubpassSampleLocationsCount is not 0, pPostSubpassSampleLocations must be a valid pointer to an array of postSubpassSampleLocationsCount valid VkSubpassSampleLocationsEXT structures

The VkAttachmentSampleLocationsEXT structure is defined as:

```c
// Provided by VK_EXT_sample_locations
typedef struct VkAttachmentSampleLocationsEXT {
    uint32_t attachmentIndex;
    VkSampleLocationsInfoEXT sampleLocationsInfo;
} VkAttachmentSampleLocationsEXT;
```

- `attachmentIndex` is the index of the attachment for which the sample locations state is provided.
- `sampleLocationsInfo` is the sample locations state to use for the layout transition of the given attachment from the initial layout of the attachment to the image layout specified for the attachment in the first subpass using it.

If the image referenced by the framebuffer attachment at index `attachmentIndex` was not created with VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT then the values specified in `sampleLocationsInfo` are ignored.

### Valid Usage

- VUID-VkAttachmentSampleLocationsEXT-attachmentIndex-01531
  attachmentIndex must be less than the attachmentCount specified in VkRenderPassCreateInfo the render pass specified by VkRenderPassBeginInfo::renderPass was created with

### Valid Usage (Implicit)

- VUID-VkAttachmentSampleLocationsEXT-sampleLocationsInfo-parameter
  sampleLocationsInfo must be a valid VkSampleLocationsInfoEXT structure

The VkSubpassSampleLocationsEXT structure is defined as:
typedef struct VkSubpassSampleLocationsEXT {
    uint32_t subpassIndex;
    VkSampleLocationsInfoEXT sampleLocationsInfo;
} VkSubpassSampleLocationsEXT;

- `subpassIndex` is the index of the subpass for which the sample locations state is provided.
- `sampleLocationsInfo` is the sample locations state to use for the layout transition of the depth/stencil attachment away from the image layout the attachment is used with in the subpass specified in `subpassIndex`.

If the image referenced by the depth/stencil attachment used in the subpass identified by `subpassIndex` was not created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` or if the subpass does not use a depth/stencil attachment, and `VkPhysicalDeviceSampleLocationsPropertiesEXT::variableSampleLocations` is `VK_TRUE` then the values specified in `sampleLocationsInfo` are ignored.

### Valid Usage

- VUID-VkSubpassSampleLocationsEXT-subpassIndex-01532
  - `subpassIndex` must be less than the `subpassCount` specified in `VkRenderPassCreateInfo` the render pass specified by `VkRenderPassBeginInfo::renderPass` was created with

### Valid Usage (Implicit)

- VUID-VkSubpassSampleLocationsEXT-sampleLocationsInfo-parameter
  - `sampleLocationsInfo` must be a valid `VkSampleLocationsInfoEXT` structure

To begin a render pass instance with render pass transform enabled, add the `VkRenderPassTransformBeginInfoQCOM` to the `pNext` chain of `VkRenderPassBeginInfo` structure passed to the `vkCmdBeginRenderPass` command specifying the render pass transform.

The `VkRenderPassTransformBeginInfoQCOM` structure is defined as:

```c
// Provided by VK_QCOM_render_pass_transform
typedef struct VkRenderPassTransformBeginInfoQCOM {
    VkStructureType sType;
    void* pNext;
    VkSurfaceTransformFlagBitsKHR transform;
} VkRenderPassTransformBeginInfoQCOM;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `transform` is a `VkSurfaceTransformFlagBitsKHR` value describing the transform to be applied to
rasterization.

Valid Usage

- VUID-VkRenderPassTransformBeginInfoQCOM-transform-02871
  transform must be VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR,
  VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR, VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR, or
  VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR

- VUID-VkRenderPassTransformBeginInfoQCOM-flags-02872
  The renderpass must have been created with VkRenderPassCreateInfo::flags containing
  VK_RENDER_PASS_CREATE_TRANSFORM_BIT_QCOM

Valid Usage (Implicit)

- VUID-VkRenderPassTransformBeginInfoQCOM-sType-sType
  sType must be VK_STRUCTURE_TYPE_RENDER_PASS_TRANSFORM_BEGIN_INFO_QCOM

The VkSubpassBeginInfo structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkSubpassBeginInfo {
    VkStructureType sType;
    const void* pNext;
    VkSubpassContents contents;
} VkSubpassBeginInfo;
```

or the equivalent

```c
// Provided by VK_KHR_create_renderpass2
typedef VkSubpassBeginInfo VkSubpassBeginInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- contents is a VkSubpassContents value specifying how the commands in the next subpass will be provided.

Valid Usage

- VUID-VkSubpassBeginInfo-contents-09382
  If contents is VK_SUBPASS CONTENTS_INLINE_AND_SECONDARY_COMMAND_BUFFERS_KHR, then at least
  one of the following features must be enabled:
  - maintenance?
Valid Usage (Implicit)

- **VUID-VkSubpassBeginInfo-sType-sType**
  
  `sType` **must** be `VK_STRUCTURE_TYPE_SUBPASS_BEGIN_INFO`.

- **VUID-VkSubpassBeginInfo-pNext-pNext**
  
  `pNext` **must** be `NULL`.

- **VUID-VkSubpassBeginInfo-contents-parameter**
  
  `contents` **must** be a valid `VkSubpassContents` value.

Possible values of `vkCmdBeginRenderPass::contents`, specifying how the commands in the first subpass will be provided, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSubpassContents {
    VK_SUBPASS_CONTENTS_INLINE = 0,
    VK_SUBPASS_CONTENTS_SECONDARY_COMMAND_BUFFERS = 1,
    // Provided by VK_KHR_maintenance7
    VK_SUBPASS_CONTENTS_INLINE_AND_SECONDARY_COMMAND_BUFFERS_KHR = 1000451000,
    // Provided by VK_EXT_nested_command_buffer
    VK_SUBPASS_CONTENTS_INLINE_AND_SECONDARY_COMMAND_BUFFERS_EXT = VK_SUBPASS_CONTENTS_INLINE_AND_SECONDARY_COMMAND_BUFFERS_KHR,
} VkSubpassContents;
```

- **VK_SUBPASS_CONTENTS_INLINE** specifies that the contents of the subpass will be recorded inline in the primary command buffer, and secondary command buffers **must** not be executed within the subpass.

- **VK_SUBPASS_CONTENTS_SECONDARY_COMMAND_BUFFERS** specifies that the contents are recorded in secondary command buffers that will be called from the primary command buffer, and `vkCmdExecuteCommands` is the only valid command in the command buffer until `vkCmdNextSubpass` or `vkCmdEndRenderPass`.

- **VK_SUBPASS_CONTENTS_INLINE_AND_SECONDARY_COMMAND_BUFFERS_KHR** specifies that the contents of the subpass **can** be recorded both inline and in secondary command buffers executed from this command buffer with `vkCmdExecuteCommands`.

If the `pNext` chain of `VkRenderPassBeginInfo` or `VkRenderingInfo` includes a `VkDeviceGroupRenderPassBeginInfo` structure, then that structure includes a device mask and set of render areas for the render pass instance.

The `VkDeviceGroupRenderPassBeginInfo` structure is defined as:
```c
// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupRenderPassBeginInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t deviceMask;
    uint32_t deviceRenderAreaCount;
    const VkRect2D* pDeviceRenderAreas;
} VkDeviceGroupRenderPassBeginInfo;
```

or the equivalent

```c
// Provided by VK_KHR_device_group
typedef VkDeviceGroupRenderPassBeginInfo VkDeviceGroupRenderPassBeginInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **deviceMask** is the device mask for the render pass instance.
- **deviceRenderAreaCount** is the number of elements in the `pDeviceRenderAreas` array.
- **pDeviceRenderAreas** is a pointer to an array of `VkRect2D` structures defining the render area for each physical device.

The **deviceMask** serves several purposes. It is an upper bound on the set of physical devices that can be used during the render pass instance, and the initial device mask when the render pass instance begins. In addition, commands transitioning to the next subpass in a render pass instance and commands ending the render pass instance, and, accordingly render pass load, store, and multisample resolve operations and subpass dependencies corresponding to the render pass instance, are executed on the physical devices included in the device mask provided here.

If **deviceRenderAreaCount** is not zero, then the elements of `pDeviceRenderAreas` override the value of `VkRenderPassBeginInfo::renderArea`, and provide a render area specific to each physical device. These render areas serve the same purpose as `VkRenderPassBeginInfo::renderArea`, including controlling the region of attachments that are cleared by `VK_ATTACHMENT_LOAD_OP_CLEAR` and that are resolved into resolve attachments.

If this structure is not present, the render pass instance’s device mask is the value of `VkDeviceGroupCommandBufferBeginInfo::deviceMask`. If this structure is not present or if **deviceRenderAreaCount** is zero, `VkRenderPassBeginInfo::renderArea` is used for all physical devices.

---

**Valid Usage**

- VUID-VkDeviceGroupRenderPassBeginInfo-deviceMask-00905
  `deviceMask must` be a valid device mask value

- VUID-VkDeviceGroupRenderPassBeginInfo-deviceMask-00906
  `deviceMask must` not be zero
Valid Usage (Implicit)

- **VUID-VkDeviceGroupRenderPassBeginInfo-sType-sType**
  sType must be `VK_STRUCTURE_TYPE_DEVICE_GROUP_RENDER_PASS_BEGIN_INFO`

- **VUID-VkDeviceGroupRenderPassBeginInfo-pDeviceRenderAreas-parameter**
  If `deviceRenderAreaCount` is not 0, `pDeviceRenderAreas` must be a valid pointer to an array of `deviceRenderAreaCount` `VkRect2D` structures

The `VkRenderPassAttachmentBeginInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkRenderPassAttachmentBeginInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t attachmentCount;
    const VkImageView* pAttachments;
} VkRenderPassAttachmentBeginInfo;
```

or the equivalent
typedef VkRenderPassAttachmentBeginInfo VkRenderPassAttachmentBeginInfoKHR;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• attachmentCount is the number of attachments.
• pAttachments is a pointer to an array of VkImageView handles, each of which will be used as the corresponding attachment in the render pass instance.

Valid Usage

• VUID-VkRenderPassAttachmentBeginInfo-pAttachments-03218 Each element of pAttachments must only specify a single mip level
• VUID-VkRenderPassAttachmentBeginInfo-pAttachments-03219 Each element of pAttachments must have been created with the identity swizzle
• VUID-VkRenderPassAttachmentBeginInfo-pAttachments-04114 Each element of pAttachments must have been created with VkImageViewCreateInfo viewType not equal to VK_IMAGE_VIEW_TYPE_3D
• VUID-VkRenderPassAttachmentBeginInfo-pAttachments-07010 If multisampled-render-to-single-sampled is enabled for any subpass, all element of pAttachments which have a sample count equal to VK_SAMPLE_COUNT_1_BIT must have a format that supports the sample count specified in VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples

Valid Usage (Implicit)

• VUID-VkRenderPassAttachmentBeginInfo-sType-sType sType must be VK_STRUCTURE_TYPE_RENDER_PASS_ATTACHMENT_BEGIN_INFO
• VUID-VkRenderPassAttachmentBeginInfo-pAttachments-parameter If attachmentCount is not 0, pAttachments must be a valid pointer to an array of attachmentCount valid VkImageView handles

If a render pass instance enables multiview and if the multiviewPerViewRenderAreas feature is enabled, the VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM structure can be included in the pNext chain of VkRenderPassBeginInfo or VkRenderingInfo

The VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM structure is defined as:
typedef struct VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM {
    VkStructureType sType;
    const void* pNext;
    uint32_t perViewRenderAreaCount;
    const VkRect2D* pPerViewRenderAreas;
} VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `perViewRenderAreaCount` is the number of elements in the `pPerViewRenderAreas` array.
- `pPerViewRenderAreas` is a pointer to an array of `VkRect2D` structures defining the render area for each view.

If `perViewRenderAreaCount` is not zero, then the elements of `pPerViewRenderAreas` override the value of `VkRenderPassBeginInfo::renderArea` or `VkRenderingInfo::renderArea` and define per-view render areas for the individual views of a multiview render pass. The render area for the view with `view index` `i` is specified by `pPerViewRenderAreas[i]`.

The per-view render areas define per-view regions of attachments that are loaded, stored, and resolved according to the `loadOp`, `storeOp`, and `resolveMode` values of the render pass instance. When per-view render areas are defined, the value of `VkRenderPassBeginInfo::renderArea` or `VkRenderingInfo::renderArea` must be set to a render area that includes the union of all per-view render areas, may be used by the implementation for optimizations, but does not affect loads, stores, or resolves.

If this structure is present and if `perViewRenderAreaCount` is not zero, then `perViewRenderAreaCount` must be at least one greater than the most significant bit set in any element of `VkRenderPassMultiviewCreateInfo::pViewMasks` or `VkRenderingInfo::viewMask`.

If this structure is not present or if `perViewRenderAreaCount` is zero, `VkRenderPassBeginInfo::renderArea` or `VkRenderingInfo::renderArea` is used for all views.

**Valid Usage**

- VUID-VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM-offset-07861
  The `offset.x` member of any element of `pPerViewRenderAreas` must be greater than or equal to 0.

- VUID-VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM-offset-07862
  The `offset.y` member of any element of `pPerViewRenderAreas` must be greater than or equal to 0.

- VUID-VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM-offset-07863
  The sum of the `offset.x` and `extent.width` members of any element of `pPerViewRenderAreas` must be less than or equal to `maxFramebufferWidth`.

- VUID-VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM-offset-07864
The sum of the \texttt{offset.y} and \texttt{extent.height} members of any element of \texttt{pPerViewRenderAreas} must be less than or equal to \texttt{maxFramebufferHeight}

- **VUID-VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM-pNext-07865**
  If this structure is in the \texttt{pNext} chain of \texttt{VkRenderPassBeginInfo} and if the render pass object included an element in \texttt{VkRenderPassMultiviewCreateInfo::pViewMasks} that set bit \texttt{n}, then \texttt{perViewRenderAreaCount} must be at least equal to \texttt{n+1}

- **VUID-VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM-pNext-07866**
  If this structure is in the \texttt{pNext} chain of \texttt{VkRenderingInfo} and if \texttt{VkRenderingInfo::viewMask} set bit \texttt{n}, then \texttt{perViewRenderAreaCount} must be at least equal to \texttt{n+1}

### Valid Usage (Implicit)

- **VUID-VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM-sType-sType**
  \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_MULTIVIEW_PER_VIEW_RENDER AREAS_RENDER_PASS_BEGIN_INFO_QCOM}

- **VUID-VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM-pPerViewRenderAreas-parameter**
  If \texttt{perViewRenderAreaCount} is not 0, \texttt{pPerViewRenderAreas} must be a valid pointer to an array of \texttt{perViewRenderAreaCount} \texttt{VkRect2D} structures

To query the render area granularity, call:

```c
// Provided by VK_VERSION_1_0
void vkGetRenderAreaGranularity(
    VkDevice device,
    VkRenderPass renderPass,
    VkExtent2D* pGranularity);
```

- \texttt{device} is the logical device that owns the render pass.
- \texttt{renderPass} is a handle to a render pass.
- \texttt{pGranularity} is a pointer to a \texttt{VkExtent2D} structure in which the granularity is returned.

The conditions leading to an optimal \texttt{renderArea} are:

- the \texttt{offset.x} member in \texttt{renderArea} is a multiple of the \texttt{width} member of the returned \texttt{VkExtent2D} (the horizontal granularity).

- the \texttt{offset.y} member in \texttt{renderArea} is a multiple of the \texttt{height} member of the returned \texttt{VkExtent2D} (the vertical granularity).

- either the \texttt{extent.width} member in \texttt{renderArea} is a multiple of the horizontal granularity or \texttt{offset.x+extent.width} is equal to the \texttt{width} of the \texttt{framebuffer} in the \texttt{VkRenderPassBeginInfo}.

- either the \texttt{extent.height} member in \texttt{renderArea} is a multiple of the vertical granularity or \texttt{offset.y+extent.height} is equal to the \texttt{height} of the \texttt{framebuffer} in the \texttt{VkRenderPassBeginInfo}.

623
Subpass dependencies are not affected by the render area, and apply to the entire image subresources attached to the framebuffer as specified in the description of automatic layout transitions. Similarly, pipeline barriers are valid even if their effect extends outside the render area.

### Valid Usage (Implicit)

- **VUID-vkGetRenderAreaGranularity-device-parameter**
  
  `device` must be a valid `VkDevice` handle

- **VUID-vkGetRenderAreaGranularity-renderPass-parameter**
  
  `renderPass` must be a valid `VkRenderPass` handle

- **VUID-vkGetRenderAreaGranularity-pGranularity-parameter**
  
  `pGranularity` must be a valid pointer to a `VkExtent2D` structure

- **VUID-vkGetRenderAreaGranularity-renderPass-parent**
  
  `renderPass` must have been created, allocated, or retrieved from `device`

To transition to the next subpass in the render pass instance after recording the commands for a subpass, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdNextSubpass(
    VkCommandBuffer commandBuffer,
    VkSubpassContents contents);
```

- `commandBuffer` is the command buffer in which to record the command.
- `contents` specifies how the commands in the next subpass will be provided, in the same fashion as the corresponding parameter of `vkCmdBeginRenderPass`.

The subpass index for a render pass begins at zero when `vkCmdBeginRenderPass` is recorded, and increments each time `vkCmdNextSubpass` is recorded.

After transitioning to the next subpass, the application can record the commands for that subpass.

### Valid Usage

- **VUID-vkCmdNextSubpass-None-00909**
  
  The current subpass index must be less than the number of subpasses in the render pass minus one

- **VUID-vkCmdNextSubpass-None-02349**
  
  This command must not be recorded when transform feedback is active
Valid Usage (Implicit)

- **VUID-vkCmdNextSubpass-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdNextSubpass-contents-parameter**
  `contents` must be a valid `VkSubpassContents` value

- **VUID-vkCmdNextSubpass-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdNextSubpass-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdNextSubpass-renderpass**
  This command must only be called inside of a render pass instance

- **VUID-vkCmdNextSubpass-videocoding**
  This command must only be called outside of a video coding scope

- **VUID-vkCmdNextSubpass-bufferlevel**
  `commandBuffer` must be a primary `VkCommandBuffer`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Inside</td>
<td>Outside</td>
<td>Graphics</td>
<td>Action State Synchronization</td>
</tr>
</tbody>
</table>

To transition to the next subpass in the render pass instance after recording the commands for a subpass, call:

```c
// Provided by VK_VERSION_1_2
void vkCmdNextSubpass2(
    VkCommandBuffer  commandBuffer,
    const VkSubpassBeginInfo* pSubpassBeginInfo,
    const VkSubpassEndInfo* pSubpassEndInfo);
```
or the equivalent command

```c
// Provided by VK_KHR_create_renderpass2
void vkCmdNextSubpass2KHR(
    VkCommandBuffer commandBuffer,
    const VkSubpassBeginInfo* pSubpassBeginInfo,
    const VkSubpassEndInfo* pSubpassEndInfo);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pSubpassBeginInfo` is a pointer to a `VkSubpassBeginInfo` structure containing information about the subpass which is about to begin rendering.
- `pSubpassEndInfo` is a pointer to a `VkSubpassEndInfo` structure containing information about how the previous subpass will be ended.

`vkCmdNextSubpass2` is semantically identical to `vkCmdNextSubpass`, except that it is extensible, and that `contents` is provided as part of an extensible structure instead of as a flat parameter.

### Valid Usage

- VUID-vkCmdNextSubpass2-None-03102
  The current subpass index **must** be less than the number of subpasses in the render pass minus one
- VUID-vkCmdNextSubpass2-None-02350
  This command **must** not be recorded when transform feedback is active

### Valid Usage (Implicit)

- VUID-vkCmdNextSubpass2-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdNextSubpass2-pSubpassBeginInfo-parameter
  `pSubpassBeginInfo` **must** be a valid pointer to a valid `VkSubpassBeginInfo` structure
- VUID-vkCmdNextSubpass2-pSubpassEndInfo-parameter
  `pSubpassEndInfo` **must** be a valid pointer to a valid `VkSubpassEndInfo` structure
- VUID-vkCmdNextSubpass2-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdNextSubpass2-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdNextSubpass2-renderpass
  This command **must** only be called inside of a render pass instance
- VUID-vkCmdNextSubpass2-videocoding
  This command **must** only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Inside</td>
<td>Outside</td>
<td>Graphics</td>
<td>Action State Synchronization</td>
</tr>
</tbody>
</table>

To record a command to end a render pass instance after recording the commands for the last subpass, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdEndRenderPass(
    VkCommandBuffer commandBuffer);
```

- `commandBuffer` is the command buffer in which to end the current render pass instance.

Ending a render pass instance performs any multisample resolve operations on the final subpass.

Valid Usage

- VUID-vkCmdEndRenderPass-None-00910
  The current subpass index must be equal to the number of subpasses in the render pass minus one
- VUID-vkCmdEndRenderPass-None-02351
  This command must not be recorded when transform feedback is active
- VUID-vkCmdEndRenderPass-None-06170
  The current render pass instance must not have been begun with `vkCmdBeginRendering`
- VUID-vkCmdEndRenderPass-None-07004
  If `vkCmdBeginQuery*` was called within a subpass of the render pass, the corresponding `vkCmdEndQuery*` must have been called subsequently within the same subpass
Valid Usage (Implicit)

- VUID-vkCmdEndRenderPass-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdEndRenderPass-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdEndRenderPass-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdEndRenderPass-renderpass
  This command must only be called inside of a render pass instance
- VUID-vkCmdEndRenderPass-videoencoding
  This command must only be called outside of a video coding scope
- VUID-vkCmdEndRenderPass-bufferlevel
  commandBuffer must be a primary VkCommandBuffer

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Inside</td>
<td>Outside</td>
<td>Graphics</td>
<td>Action State Synchronization</td>
</tr>
</tbody>
</table>

To record a command to end a render pass instance after recording the commands for the last subpass, call:

```c
// Provided by VK_VERSION_1_2
void vkCmdEndRenderPass2(
    VkCommandBuffer
    commandBuffer,
    const VkSubpassEndInfo*
    pSubpassEndInfo);
```
or the equivalent command
// Provided by VK_KHR_create_renderpass2
void vkCmdEndRenderPass2KHR(
    VkCommandBuffer commandBuffer,
    const VkSubpassEndInfo* pSubpassEndInfo);

- `commandBuffer` is the command buffer in which to end the current render pass instance.
- `pSubpassEndInfo` is a pointer to a `VkSubpassEndInfo` structure containing information about how the last subpass will be ended.

`vkCmdEndRenderPass2KHR` is semantically identical to `vkCmdEndRenderPass`, except that it is extensible.

### Valid Usage

- VUID-vkCmdEndRenderPass2-None-03103
  The current subpass index must be equal to the number of subpasses in the render pass minus one

- VUID-vkCmdEndRenderPass2-None-02352
  This command must not be recorded when transform feedback is active

- VUID-vkCmdEndRenderPass2-None-06171
  The current render pass instance must not have been begun with `vkCmdBeginRendering`

- VUID-vkCmdEndRenderPass2-None-07005
  If `vkCmdBeginQuery*` was called within a subpass of the render pass, the corresponding `vkCmdEndQuery*` must have been called subsequently within the same subpass

### Valid Usage (Implicit)

- VUID-vkCmdEndRenderPass2-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdEndRenderPass2-pSubpassEndInfo-parameter
  `pSubpassEndInfo` must be a valid pointer to a valid `VkSubpassEndInfo` structure

- VUID-vkCmdEndRenderPass2-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdEndRenderPass2-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdEndRenderPass2-renderpass
  This command must only be called inside of a render pass instance

- VUID-vkCmdEndRenderPass2-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdEndRenderPass2-bufferlevel
  `commandBuffer` must be a primary `VkCommandBuffer`
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Inside</td>
<td>Outside</td>
<td>Graphics</td>
<td>Action State Synchronization</td>
</tr>
</tbody>
</table>

The `VkSubpassEndInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkSubpassEndInfo {
    VkStructureType sType;
    const void* pNext;
} VkSubpassEndInfo;
```

or the equivalent

```c
// Provided by VK_KHR_create_renderpass2
typedef VkSubpassEndInfo VkSubpassEndInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

Valid Usage (Implicit)

- VUID-VkSubpassEndInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_SUBPASS_END_INFO`.
- VUID-VkSubpassEndInfo-pNext-pNext
  `pNext` must be `NULL` or a pointer to a valid instance of `VkSubpassFragmentDensityMapOffsetEndInfoQCOM`.
- VUID-VkSubpassEndInfo-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique.

If the `VkSubpassEndInfo::pNext` chain includes a `VkSubpassFragmentDensityMapOffsetEndInfoQCOM`.
structure, then that structure includes an array of fragment density map offsets per layer for the render pass.

The VkSubpassFragmentDensityMapOffsetEndInfoQCOM structure is defined as:

```c
// Provided by VK_QCOM_fragment_density_map_offset
typedef struct VkSubpassFragmentDensityMapOffsetEndInfoQCOM {
    VkStructureType sType;
    const void* pNext;
    uint32_t fragmentDensityOffsetCount;
    const VkOffset2D* pFragmentDensityOffsets;
} VkSubpassFragmentDensityMapOffsetEndInfoQCOM;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **fragmentDensityOffsetCount** is the number of offsets being specified.
- **pFragmentDensityOffsets** is a pointer to an array of VkOffset2D structs, each of which describes the offset per layer.

The array elements are given per layer as defined by Fetch Density Value, where index = layer. Each (x,y) offset is in framebuffer pixels and shifts the fetch of the fragment density map by that amount. Offsets can be positive or negative.

Offset values specified for any subpass that is not the last subpass in the render pass are ignored. If the VkSubpassEndInfo::pNext chain for the last subpass of a render pass does not include VkSubpassFragmentDensityMapOffsetEndInfoQCOM, or if fragmentDensityOffsetCount is zero, then the offset (0,0) is used for Fetch Density Value.

### Valid Usage

- **VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-fragmentDensityMapOffsets-06503**
  If the fragmentDensityMapOffset feature is not enabled or fragment density map is not enabled in the render pass, fragmentDensityOffsetCount must equal 0

- **VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-fragmentDensityMapAttachment-06504**
  If VkSubpassDescription::fragmentDensityMapAttachment is not is not VK_ATTACHMENT_UNUSED and was not created with VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_QCOM, fragmentDensityOffsetCount must equal 0

- **VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-pDepthStencilAttachment-06505**
  If VkSubpassDescription::pDepthStencilAttachment is not is not VK_ATTACHMENT_UNUSED and was not created with VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_QCOM, fragmentDensityOffsetCount must equal 0

- **VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-pInputAttachments-06506**
If any element of `VkSubpassDescription::pInputAttachments` is not `VK_ATTACHMENT_UNUSED` and was not created with `VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_QCOM`, `fragmentDensityOffsetCount` must equal 0.

- **VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-pColorAttachments-06507**
  If any element of `VkSubpassDescription::pColorAttachments` is not `VK_ATTACHMENT_UNUSED` and was not created with `VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_QCOM`, `fragmentDensityOffsetCount` must equal 0.

- **VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-pResolveAttachments-06508**
  If any element of `VkSubpassDescription::pResolveAttachments` is not `VK_ATTACHMENT_UNUSED` and was not created with `VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_QCOM`, `fragmentDensityOffsetCount` must equal 0.

- **VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-pPreserveAttachments-06509**
  If any element of `VkSubpassDescription::pPreserveAttachments` is not `VK_ATTACHMENT_UNUSED` and was not created with `VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_QCOM`, `fragmentDensityOffsetCount` must equal 0.

- **VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-fragmentDensityOffsetCount-06510**
  If `fragmentDensityOffsetCount` is not 0 and multiview is enabled for the render pass, `fragmentDensityOffsetCount` must equal the `layerCount` that was specified in creating the fragment density map attachment view.

- **VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-fragmentDensityOffsetCount-06511**
  If `fragmentDensityOffsetCount` is not 0 and multiview is not enabled for the render pass, `fragmentDensityOffsetCount` must equal 1.

- **VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-x-06512**
  The x component of each element of `pFragmentDensityOffsets` must be an integer multiple of `fragmentDensityOffsetGranularity.width`.

- **VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-y-06513**
  The y component of each element of `pFragmentDensityOffsets` must be an integer multiple of `fragmentDensityOffsetGranularity.height`.

---

**Valid Usage (Implicit)**

- **VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_SUBPASS_FRAGMENT_DENSITY_MAP_OFFSET_END_INFO_QCOM`.

- **VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-pFragmentDensityOffsets-parameter**
  If `fragmentDensityOffsetCount` is not 0, `pFragmentDensityOffsets` must be a valid pointer to an array of `fragmentDensityOffsetCount VkOffset2D` structures.
### 8.9. Render Pass Creation Feedback

A `VkRenderPassCreationControlEXT` structure can be included in the `pNext` chain of `VkRenderPassCreateInfo2` or `pNext` chain of `VkSubpassDescription2`. The `VkRenderPassCreationControlEXT` structure is defined as:

```c
// Provided by VK_EXT_subpass_merge_feedback
typedef struct VkRenderPassCreationControlEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 disallowMerging;
} VkRenderPassCreationControlEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **disallowMerging** is a boolean value indicating whether subpass merging will be disabled.

If a `VkRenderPassCreationControlEXT` structure is included in the `pNext` chain of `VkRenderPassCreateInfo2` and its value of `disallowMerging` is `VK_TRUE`, the implementation will disable subpass merging for the entire render pass. If a `VkRenderPassCreationControlEXT` structure is included in the `pNext` chain of `VkSubpassDescription2` and its value of `disallowMerging` is `VK_TRUE`, the implementation will disable merging the described subpass with previous subpasses in the render pass.

### Valid Usage (Implicit)

- `VUID-VkRenderPassCreationControlEXT-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_RENDER_PASS CREATION_CONTROL_EXT`

To obtain feedback about the creation of a render pass, include a `VkRenderPassCreationFeedbackCreateInfoEXT` structure in the `pNext` chain of `VkRenderPassCreateInfo2`. The `VkRenderPassCreationFeedbackCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_subpass_merge_feedback
typedef struct VkRenderPassCreationFeedbackCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkRenderPassCreationFeedbackCreateInfoEXT* pRenderPassFeedback;
} VkRenderPassCreationFeedbackCreateInfoEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **pRenderPassFeedback** is a pointer to a `VkRenderPassCreationFeedbackCreateInfoEXT` structure in which feedback is returned.
Valid Usage (Implicit)

- VUID-VkRenderPassCreationFeedbackCreateInfoEXT-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_RENDER_PASS_CREATION_FEEDBACK_CREATE_INFO_EXT

- VUID-VkRenderPassCreationFeedbackCreateInfoEXT-pRenderPassFeedback-parameter
  
  pRenderPassFeedback must be a valid pointer to a VkRenderPassCreationFeedbackInfoEXT structure

The VkRenderPassCreationFeedbackInfoEXT structure is defined as:

```c
// Provided by VK_EXT_subpass_merge_feedback
typedef struct VkRenderPassCreationFeedbackInfoEXT {
    uint32_t postMergeSubpassCount;
} VkRenderPassCreationFeedbackInfoEXT;
```

- postMergeSubpassCount is the subpass count after merge.

Feedback about the creation of a subpass can be obtained by including a VkRenderPassSubpassFeedbackCreateInfoEXT structure in the pNext chain of VkSubpassDescription2. VkRenderPassSubpassFeedbackCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_subpass_merge_feedback
typedef struct VkRenderPassSubpassFeedbackCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkRenderPassSubpassFeedbackInfoEXT* pSubpassFeedback;
} VkRenderPassSubpassFeedbackCreateInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- pSubpassFeedback is a pointer to a VkRenderPassSubpassFeedbackInfoEXT structure in which feedback is returned.

Valid Usage (Implicit)

- VUID-VkRenderPassSubpassFeedbackCreateInfoEXT-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_RENDER_PASS_SUBPASS_FEEDBACK_CREATE_INFO_EXT

- VUID-VkRenderPassSubpassFeedbackCreateInfoEXT-pSubpassFeedback-parameter
  
  pSubpassFeedback must be a valid pointer to a VkRenderPassSubpassFeedbackInfoEXT structure

The VkRenderPassSubpassFeedbackInfoEXT structure is defined as:
typedef struct VkRenderPassSubpassFeedbackInfoEXT {
    VkSubpassMergeStatusEXT subpassMergeStatus;
    char description[VK_MAX_DESCRIPTION_SIZE];
    uint32_t postMergeIndex;
} VkRenderPassSubpassFeedbackInfoEXT;

• **subpassMergeStatus** is a `VkSubpassMergeStatusEXT` value specifying information about whether the subpass is merged with previous subpass and the reason why it is not merged.

• **description** is an array of `VK_MAX_DESCRIPTION_SIZE` char containing a null-terminated UTF-8 string which provides additional details.

• **postMergeIndex** is the subpass index after the subpass merging.

Possible values of `VkRenderPassSubpassFeedbackInfoEXT::subpassMergeStatus` are:

```c
typedef enum VkSubpassMergeStatusEXT {
    VK_SUBPASS.MergeStatus.MERGED_EXT = 0,
    VK_SUBPASS.MergeStatus.DISALLOWED_EXT = 1,
    VK_SUBPASS.MergeStatus.NOT_MERGED_SIDE_EFFECTS_EXT = 2,
    VK_SUBPASS.MergeStatus.NOT_MERGED_SAMPLES_MISMATCH_EXT = 3,
    VK_SUBPASS.MergeStatus.NOT_MERGED_VIEWS_MISMATCH_EXT = 4,
    VK_SUBPASS.MergeStatus.NOT_MERGED_ALIASING_EXT = 5,
    VK_SUBPASS.MergeStatus.NOT_MERGED_DEPENDENCIES_EXT = 6,
    VK_SUBPASS.MergeStatus.NOT_MERGED_INCOMPATIBLE_INPUT_ATTACHMENT_EXT = 7,
    VK_SUBPASS.MergeStatus.NOT_MERGED_TOO_MANY_ATTACHMENTS_EXT = 8,
    VK_SUBPASS.MergeStatus.NOT_MERGED_INSUFFICIENT_STORAGE_EXT = 9,
    VK_SUBPASS.MergeStatus.NOT_MERGED_DEPTH_STENCIL_COUNT_EXT = 10,
    VK_SUBPASS.MergeStatus.NOT_MERGED_RESOLVE_ATTACHMENT_REUSE_EXT = 11,
    VK_SUBPASS.MergeStatus.NOT_MERGED_SINGLE_SUBPASS_EXT = 12,
    VK_SUBPASS.MergeStatus.NOT_MERGED_UNSPECIFIED_EXT = 13,
} VkSubpassMergeStatusEXT;
```

• **VK_SUBPASS.MergeStatus.MERGED_EXT** specifies the subpass is merged with a previous subpass.

• **VK_SUBPASS.MergeStatus.DISALLOWED_EXT** specifies the subpass is disallowed to merge with previous subpass. If the render pass does not allow subpass merging, then all subpass statuses are set to this value. If a subpass description does not allow subpass merging, then only that subpass’s status is set to this value.

• **VK_SUBPASS.MergeStatus.NOT_MERGED_SIDE_EFFECTS_EXT** specifies the subpass is not merged because it contains side effects.

• **VK_SUBPASS.MergeStatus.NOT_MERGED_SAMPLES_MISMATCH_EXT** specifies the subpass is not merged because sample count is not compatible with previous subpass.

• **VK_SUBPASS.MergeStatus.NOT_MERGED_VIEWS_MISMATCH_EXT** specifies the subpass is not merged because view masks do not match with previous subpass.

• **VK_SUBPASS.MergeStatus.NOT_MERGED_ALIASING_EXT** specifies the subpass is not merged because of
attachments aliasing between them.

- **VK_SUBPASS_MERGE_STATUS_NOT_MERGED_DEPENDENCIES_EXT** specifies the subpass is not merged because subpass dependencies do not allow merging.
- **VK_SUBPASS_MERGE_STATUS_NOT_MERGED_INCOMPATIBLE_INPUT_ATTACHMENT_EXT** specifies the subpass is not merged because input attachment is not a color attachment from previous subpass or the formats are incompatible.
- **VK_SUBPASS_MERGE_STATUS_NOT_MERGED_TOO_MANY_ATTACHMENTS_EXT** specifies the subpass is not merged because of too many attachments.
- **VK_SUBPASS_MERGE_STATUS_NOT_MERGED_INSUFFICIENT_STORAGE_EXT** specifies the subpass is not merged because of insufficient memory.
- **VK_SUBPASS_MERGE_STATUS_NOT_MERGED_DEPTH_STENCIL_COUNT_EXT** specifies the subpass is not merged because of too many depth/stencil attachments.
- **VK_SUBPASS_MERGE_STATUS_NOT_MERGED_RESOLVE_ATTACHMENT_REUSE_EXT** specifies the subpass is not merged because a resolve attachment is reused as an input attachment in a subsequent subpass.
- **VK_SUBPASS_MERGE_STATUS_NOT_MERGED_SINGLE_SUBPASS_EXT** specifies the subpass is not merged because the render pass has only one subpass.
- **VK_SUBPASS_MERGE_STATUS_NOT_MERGED_UNSPECIFIED_EXT** specifies other reasons why subpass is not merged. It is also the recommended default value that should be reported when a subpass is not merged and when no other value is appropriate.

### 8.10. Common Render Pass Data Races (Informative)

Due to the complexity of how rendering is performed, there are several ways an application can accidentally introduce a data race, usually by doing something that may seem benign but actually cannot be supported. This section indicates a number of the more common cases as guidelines to help avoid them.

#### 8.10.1. Sampling From a Read-only Attachment

Vulkan includes read-only layouts for depth/stencil images, that allow the images to be both read during a render pass for the purposes of depth/stencil tests, and read as a non-attachment.

However, because **VK_ATTACHMENT_STORE_OP_STORE** and **VK_ATTACHMENT_STORE_OP_DONT_CARE** may perform write operations, even if no recorded command writes to an attachment, reading from an image while also using it as an attachment with these store operations can result in a data race. If the reads from the non-attachment are performed in a fragment shader where the accessed samples match those covered by the fragment shader, no data race will occur as store operations are guaranteed to operate after fragment shader execution for the set of samples the fragment covers. Notably, input attachments can also be used for this case. Reading other samples or in any other shader stage can result in unexpected behavior due to the potential for a data race, and validation errors should be generated for doing so. In practice, many applications have shipped reading samples outside of the covered fragment without any observable issue, but there is no guarantee that this will always work, and it is not advisable to rely on this in new or re-worked code bases. As **VK_ATTACHMENT_STORE_OP_NONE** is guaranteed to perform no writes, applications wishing to read an image as both an attachment and a non-attachment should make use of this...
store operation, coupled with a load operation that also performs no writes.

8.10.2. Non-overlapping Access Between Resources

When relying on non-overlapping accesses between attachments and other resources, it is important to note that load and store operations have fairly wide alignment requirements - potentially affecting entire subresources and adjacent depth/stencil aspects. This makes it invalid to access a non-attachment subresource that is simultaneously being used as an attachment where either access performs a write operation.

The only exception to this is if a subresource is in the
VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT image layout, in which case the overlap is defined to occur at a per-pixel granularity, and applications can read data from pixels outside the render area without introducing a data race.

8.10.3. Depth/Stencil and Input Attachments

When rendering to only the depth OR stencil aspect of an image, an input attachment accessing the other aspect will not cause a data race only under very specific conditions. To avoid a data race, the aspect not being written must be in a read-only layout, and writes to it must be disabled in the draw state. For example, to read from stencil while writing depth, the attachment must be in
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL (or equivalent), and the stencil write mask must be set to 0. Similarly to read from depth while writing stencil, the attachment must be in
VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL (or equivalent), and depth write enable must be set to VK_FALSE.

8.10.4. Synchronization Options

There are several synchronization options available to synchronize between accesses to resources within a render pass. Some of the options are outlined below:

- A VkSubpassDependency in a render pass object can synchronize attachment writes and multisample resolve operations from a prior subpass for subsequent input attachment reads.

- A vkCmdPipelineBarrier inside a subpass can synchronize prior attachment writes in the subpass with subsequent input attachment reads.

- A vkCmdPipelineBarrier inside a subpass can synchronize prior attachment writes in the subpass with subsequent non-attachment reads if the attachment is in the
VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT image layout.

- If a subresource is used as a color and input attachment, and the pipeline performing the read was created with
VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT

- If a subresource is used as a depth and input attachment, and the pipeline performing the read was created with
VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT

- If a subresource is used as a stencil and input attachment, and the pipeline performing the read was created with
VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT
• If a subresource is used as two separate non-attachment resources, writes to a pixel or individual sample in a fragment shader can be synchronized with access to the same pixel or sample in another fragment shader by using one of the fragment interlock execution modes.
Chapter 9. Shaders

A shader specifies programmable operations that execute for each vertex, control point, tessellated vertex, primitive, fragment, or workgroup in the corresponding stage(s) of the graphics and compute pipelines.

Graphics pipelines include vertex shader execution as a result of primitive assembly, followed, if enabled, by tessellation control and evaluation shaders operating on patches, geometry shaders, if enabled, operating on primitives, and fragment shaders, if present, operating on fragments generated by Rasterization. In this specification, vertex, tessellation control, tessellation evaluation and geometry shaders are collectively referred to as pre-rasterization shader stages and occur in the logical pipeline before rasterization. The fragment shader occurs logically after rasterization.

Only the compute shader stage is included in a compute pipeline. Compute shaders operate on compute invocations in a workgroup.

Shaders can read from input variables, and read from and write to output variables. Input and output variables can be used to transfer data between shader stages, or to allow the shader to interact with values that exist in the execution environment. Similarly, the execution environment provides constants describing capabilities.

Shader variables are associated with execution environment-provided inputs and outputs using built-in decorations in the shader. The available decorations for each stage are documented in the following subsections.

9.1. Shader Objects

Shaders may be compiled and linked into pipeline objects as described in Pipelines chapter, or if the shaderObject feature is enabled they may be compiled into individual per-stage shader objects which can be bound on a command buffer independently from one another. Unlike pipelines, shader objects are not intrinsically tied to any specific set of state. Instead, state is specified dynamically in the command buffer.

Each shader object represents a single compiled shader stage, which may optionally be linked with one or more other stages.

Shader objects are represented by VkShaderEXT handles:

```c
// Provided by VK_EXT_shader_object
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkShaderEXT)
```

9.1.1. Shader Object Creation

Shader objects may be created from shader code provided as SPIR-V, or in an opaque, implementation-defined binary format specific to the physical device.

To create one or more shader objects, call:
// Provided by VK_EXT_shader_object

VkResult vkCreateShadersEXT(
    VkDevice device,  // device is the logical device that creates the shader objects.
    uint32_t createInfoCount,  // createInfoCount is the length of the pCreateInfos and pShaders arrays.
    const VkShaderCreateInfoEXT* pCreateInfos,  // pCreateInfos is a pointer to an array of VkShaderCreateInfoEXT structures.
    const VkAllocationCallbacks* pAllocator,  // pAllocator controls host memory allocation as described in the Memory Allocation chapter.
    VkShaderEXT* pShaders)  // pShaders is a pointer to an array of VkShaderEXT handles in which the resulting shader objects are returned.

When this function returns, whether or not it succeeds, it is guaranteed that every element of pShaders will have been overwritten by either VK_NULL_HANDLE or a valid VkShaderEXT handle.

This means that whenever shader creation fails, the application can determine which shader the returned error pertains to by locating the first VK_NULL_HANDLE element in pShaders. It also means that an application can reliably clean up from a failed call by iterating over the pShaders array and destroying every element that is not VK_NULL_HANDLE.

Valid Usage

- VUID-vkCreateShadersEXT-device-09669
  device must support at least one queue family with one of the VK_QUEUE_COMPUTE_BIT or VK_QUEUE_GRAPHICS_BIT capabilities

- VUID-vkCreateShadersEXT-stage-09670
  If the stage member of any element of pCreateInfos is VK_SHADER_STAGE_COMPUTE_BIT, device must support at least one queue family with the VK_QUEUE_COMPUTE_BIT capability

- VUID-vkCreateShadersEXT-stage-09671
  If the stage member of any element of pCreateInfos is VK_SHADER_STAGE_TASK_BIT_EXT, VK_SHADER_STAGE_MESH_BIT_EXT, VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT, VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, VK_SHADER_STAGE_GEOMETRY_BIT, or VK_SHADER_STAGE_FRAGMENT_BIT, device must support at least one queue family with the VK_QUEUE_GRAPHICS_BIT capability

- VUID-vkCreateShadersEXT-None-08400
  The shaderObject feature must be enabled

- VUID-vkCreateShadersEXT-pCreateInfos-08402
  If the flags member of any element of pCreateInfos includes VK_SHADER_CREATE_LINK_STAGE_BIT_EXT, the flags member of all other elements of pCreateInfos whose stage is VK_SHADER_STAGE_VERTEX_BIT, VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT, VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT,
VK_SHADER_STAGE_GEOMETRY_BIT, or VK_SHADER_STAGE_FRAGMENT_BIT must also include VK_SHADER_CREATE_LINK_STAGE_BIT_EXT

• VUID-vkCreateShadersEXT-pCreateInfos-08403
  If the flags member of any element of pCreateInfos includes VK_SHADER_CREATE_LINK_STAGE_BIT_EXT, the flags member of all other elements of pCreateInfos whose stage is VK_SHADER_STAGE_TASK_BIT_EXT or VK_SHADER_STAGE_MESH_BIT_EXT must also include VK_SHADER_CREATE_LINK_STAGE_BIT_EXT

• VUID-vkCreateShadersEXT-pCreateInfos-08404
  If the flags member of any element of pCreateInfos whose stage is VK_SHADER_STAGE_TASK_BIT_EXT or VK_SHADER_STAGE_MESH_BIT_EXT includes VK_SHADER_CREATE_LINK_STAGE_BIT_EXT, there must be no member of pCreateInfos whose stage is VK_SHADER_STAGE_VERTEX_BIT and whose flags member includes VK_SHADER_CREATE_LINK_STAGE_BIT_EXT

• VUID-vkCreateShadersEXT-pCreateInfos-08405
  If there is any element of pCreateInfos whose stage is VK_SHADER_STAGE_MESH_BIT_EXT and whose flags member includes both VK_SHADER_CREATE_LINK_STAGE_BIT_EXT and VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT, there must be no element of pCreateInfos whose stage is VK_SHADER_STAGE_TASK_BIT_EXT and whose flags member includes VK_SHADER_CREATE_LINK_STAGE_BIT_EXT

• VUID-vkCreateShadersEXT-pCreateInfos-08409
  For each element of pCreateInfos whose flags member includes VK_SHADER_CREATE_LINK_STAGE_BIT_EXT, if there is any other element of pCreateInfos whose stage is logically later than the stage of the former and whose flags member also includes VK_SHADER_CREATE_LINK_STAGE_BIT_EXT, the nextStage of the former must be equal to the stage of the element with the logically earliest stage following the stage of the former whose flags member also includes VK_SHADER_CREATE_LINK_STAGE_BIT_EXT

• VUID-vkCreateShadersEXT-pCreateInfos-08410
  The stage member of each element of pCreateInfos whose flags member includes VK_SHADER_CREATE_LINK_STAGE_BIT_EXT must be unique

• VUID-vkCreateShadersEXT-pCreateInfos-08411
  The codeType member of all elements of pCreateInfos whose flags member includes VK_SHADER_CREATE_LINK_STAGE_BIT_EXT must be the same

• VUID-vkCreateShadersEXT-pCreateInfos-08867
  If pCreateInfos contains elements with both VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT and VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, both elements’ flags include VK_SHADER_CREATE_LINK_STAGE_BIT_EXT, both elements’ codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and the VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT stage’s pCode contains an OpExecutionMode instruction specifying the type of subdivision, it must match the subdivision type specified in the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT stage

• VUID-vkCreateShadersEXT-pCreateInfos-08868
  If pCreateInfos contains elements with both VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT and VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, both elements’ flags include VK_SHADER_CREATE_LINK_STAGE_BIT_EXT, both elements’ codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and the VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT stage’s
pCode contains an OpExecutionMode instruction specifying the orientation of triangles, it must match the triangle orientation specified in the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT stage

• VUID-vkCreateShadersEXT-pCreateInfo-08869
If pCreateInfo contains elements with both VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT and VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, both elements’ flags include VK_SHADER_CREATE_LINK_STAGE_BIT_EXT, both elements’ codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and the VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT stage’s pCode contains an OpExecutionMode instruction specifying PointMode, the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT stage must also contain an OpExecutionMode instruction specifying PointMode

• VUID-vkCreateShadersEXT-pCreateInfo-08870
If pCreateInfo contains elements with both VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT and VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, both elements’ flags include VK_SHADER_CREATE_LINK_STAGE_BIT_EXT, both elements’ codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and the VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT stage’s pCode contains an OpExecutionMode instruction specifying the spacing of segments on the edges of tessellated primitives, it must match the segment spacing specified in the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT stage

• VUID-vkCreateShadersEXT-pCreateInfo-08871
If pCreateInfo contains elements with both VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT and VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, both elements’ flags include VK_SHADER_CREATE_LINK_STAGE_BIT_EXT, both elements’ codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and the VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT stage’s pCode contains an OpExecutionMode instruction specifying the output patch size, it must match the output patch size specified in the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT stage

• VUID-vkCreateShadersEXT-pCreateInfo-09632
If pCreateInfo contains a VK_SHADER_STAGE_MESH_BIT_EXT with codeType of VK_SHADER_CODE_TYPE_SPIRV_EXT and VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT is not set, then the mesh shader’s entry point must not declare a variable with a DrawIndex BuiltIn decoration

Valid Usage (Implicit)

• VUID-vkCreateShadersEXT-device-parameter
device must be a valid VkDevice handle
• VUID-vkCreateShadersEXT-pCreateInfo-parameter
pCreateInfo must be a valid pointer to an array of createInfoCount valid VkShaderCreateInfoEXT structures
• VUID-vkCreateShadersEXT-pAllocator-parameter
If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure
• VUID-vkCreateShadersEXT-pShaders-parameter
**pShaders** must be a valid pointer to an array of createInfoCount VkShaderEXT handles

- VUID-vkCreateShadersEXT-createInfoCount-arraylength
createInfoCount must be greater than 0

## Return Codes

**Success**

- VK_SUCCESS
- VK_INCOMPATIBLE_SHADER_BINARY_EXT

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INITIALIZATION_FAILED

The VkShaderCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_shader_object
typedef struct VkShaderCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkShaderCreateFlagsEXT flags;
    VkShaderStageFlagBits stage;
    VkShaderStageFlags nextStage;
    VkShaderCodeTypeEXT codeType;
    size_t codeSize;
    const void* pCode;
    const char* pName;
    uint32_t setLayoutCount;
    const VkDescriptorSetLayout* pSetLayouts;
    uint32_t pushConstantRangeCount;
    const VkPushConstantRange* pPushConstantRanges;
    const VkSpecializationInfo* pSpecializationInfo;
} VkShaderCreateInfoEXT;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is a bitmask of VkShaderCreateFlagBitsEXT describing additional parameters of the shader.
- **stage** is a VkShaderStageFlagBits value specifying a single shader stage.
- **nextStage** is a bitmask of VkShaderStageFlagBits specifying zero or stages which may be used as a logically next bound stage when drawing with the shader bound.
- **codeType** is a VkShaderCodeTypeEXT value specifying the type of the shader code pointed to be
- **pCode**
  - `codeSize` is the size in bytes of the shader code pointed to by `pCode`.
  - `pCode` is a pointer to the shader code to use to create the shader.
  - `pName` is a pointer to a null-terminated UTF-8 string specifying the entry point name of the shader for this stage.
  - `setLayoutCount` is the number of descriptor set layouts pointed to by `pSetLayouts`.
  - `pSetLayouts` is a pointer to an array of `VkDescriptorSetLayout` objects used by the shader stage.
  - `pushConstantRangeCount` is the number of push constant ranges pointed to by `pPushConstantRanges`.
  - `pPushConstantRanges` is a pointer to an array of `VkPushConstantRange` structures used by the shader stage.
  - `pSpecializationInfo` is a pointer to a `VkSpecializationInfo` structure, as described in Specialization Constants, or `NULL`.

### Valid Usage

- **VUID-VkShaderCreateInfoEXT-codeSize-08735**
  - If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `codeSize` **must** be a multiple of 4

- **VUID-VkShaderCreateInfoEXT-pCode-08736**
  - If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `pCode` **must** point to valid SPIR-V code, formatted and packed as described by the Khronos SPIR-V Specification

- **VUID-VkShaderCreateInfoEXT-pCode-08737**
  - If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `pCode` **must** adhere to the validation rules described by the Validation Rules within a Module section of the SPIR-V Environment appendix

- **VUID-VkShaderCreateInfoEXT-pCode-08738**
  - If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `pCode` **must** declare the Shader capability for SPIR-V code

- **VUID-VkShaderCreateInfoEXT-pCode-08739**
  - If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `pCode` **must** not declare any capability that is not supported by the API, as described by the Capabilities section of the SPIR-V Environment appendix

- **VUID-VkShaderCreateInfoEXT-pCode-08740**
  - If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `pCode` declares any of the capabilities listed in the SPIR-V Environment appendix, one of the corresponding requirements **must** be satisfied

- **VUID-VkShaderCreateInfoEXT-pCode-08741**
  - If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `pCode` **must** not declare any SPIR-V extension that is not supported by the API, as described by the Extension section of the SPIR-V Environment appendix

- **VUID-VkShaderCreateInfoEXT-pCode-08742**
  - If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `pCode` declares any of the SPIR-V...
extensions listed in the SPIR-V Environment appendix, one of the corresponding requirements must be satisfied

- **VUID-VkShaderCreateInfoEXT-flags-08412**
  If stage is not `VK_SHADER_STAGE_TASK_BIT_EXT`, `VK_SHADER_STAGE_MESH_BIT_EXT`, `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSellation_CONTROL_BIT`, `VK_SHADER_STAGE_TESSellation_EVALUATION_BIT`, `VK_SHADER_STAGE_GEOMETRY_BIT`, or `VK_SHADER_STAGE_FRAGMENT_BIT`, flags must not include `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT`

- **VUID-VkShaderCreateInfoEXT-flags-08486**
  If stage is not `VK_SHADER_STAGE_FRAGMENT_BIT`, flags must not include `VK_SHADER_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_EXT`

- **VUID-VkShaderCreateInfoEXT-flags-08487**
  If the attachmentFragmentShadingRate feature is not enabled, flags must not include `VK_SHADER_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_EXT`

- **VUID-VkShaderCreateInfoEXT-flags-08488**
  If stage is not `VK_SHADER_STAGE_FRAGMENT_BIT`, flags must not include `VK_SHADER_CREATE_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT`

- **VUID-VkShaderCreateInfoEXT-flags-08489**
  If the fragmentDensityMap feature is not enabled, flags must not include `VK_SHADER_CREATE_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT`

- **VUID-VkShaderCreateInfoEXT-flags-09404**
  If flags includes `VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT`, the subgroupSizeControl feature must be enabled

- **VUID-VkShaderCreateInfoEXT-flags-08414**
  If stage is not `VK_SHADER_STAGE_MESH_BIT_EXT`, flags must not include `VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT`

- **VUID-VkShaderCreateInfoEXT-flags-08416**
  If flags includes both `VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT` and `VK_SHADER_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT`, the local workgroup size in the X dimension of the shader must be a multiple of `maxSubgroupSize`

- **VUID-VkShaderCreateInfoEXT-flags-08417**
  If flags includes `VK_SHADER_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT` but not `VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT` and no
VkShaderRequiredSubgroupSizeCreateInfoEXT structure is included in the pNext chain, the local workgroup size in the X dimension of the shader **must** be a multiple of subgroupSize

- VUID-VkShaderCreateInfoEXT-stage-08418  
  stage **must** not be VK_SHADER_STAGE_ALL_GRAPHICS or VK_SHADER_STAGE_ALL

- VUID-VkShaderCreateInfoEXT-stage-08419  
  If the tessellationShader feature is not enabled, stage **must** not be VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT or VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT

- VUID-VkShaderCreateInfoEXT-stage-08420  
  If the geometryShader feature is not enabled, stage **must** not be VK_SHADER_STAGE_GEOMETRY_BIT

- VUID-VkShaderCreateInfoEXT-stage-08421  
  If the taskShader feature is not enabled, stage **must** not be VK_SHADER_STAGE_TASK_BIT_EXT

- VUID-VkShaderCreateInfoEXT-stage-08422  
  If the meshShader feature is not enabled, stage **must** not be VK_SHADER_STAGE_MESH_BIT_EXT

- VUID-VkShaderCreateInfoEXT-stage-08425  
  stage **must** not be VK_SHADER_STAGE_SUBPASS_SHADING_BIT_HUAWEI

- VUID-VkShaderCreateInfoEXT-stage-08426  
  stage **must** not be VK_SHADER_STAGE_CLUSTER_CULLING_BIT_HUAWEI

- VUID-VkShaderCreateInfoEXT-nextStage-08427  
  If stage is VK_SHADER_STAGE_VERTEX_BIT, nextStage **must** not include any bits other than VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT, VK_SHADER_STAGE_GEOMETRY_BIT, and VK_SHADER_STAGE_FRAGMENT_BIT

- VUID-VkShaderCreateInfoEXT-nextStage-08428  
  If the tessellationShader feature is not enabled, nextStage **must** not include VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT or VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT

- VUID-VkShaderCreateInfoEXT-nextStage-08429  
  If the geometryShader feature is not enabled, nextStage **must** not include VK_SHADER_STAGE_GEOMETRY_BIT

- VUID-VkShaderCreateInfoEXT-nextStage-08430  
  If stage is VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT, nextStage **must** not include any bits other than VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT

- VUID-VkShaderCreateInfoEXT-nextStage-08431  
  If stage is VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, nextStage **must** not include any bits other than VK_SHADER_STAGE_GEOMETRY_BIT and VK_SHADER_STAGE_FRAGMENT_BIT

- VUID-VkShaderCreateInfoEXT-nextStage-08433  
  If stage is VK_SHADER_STAGE_GEOMETRY_BIT, nextStage **must** not include any bits other than VK_SHADER_STAGE_FRAGMENT_BIT

- VUID-VkShaderCreateInfoEXT-nextStage-08434  
  If stage is VK_SHADER_STAGE_FRAGMENT_BIT or VK_SHADER_STAGE_COMPUTE_BIT, nextStage **must**
• VUID-VkShaderCreateInfoEXT-nextStage-08435
  If stage is VK_SHADER_STAGE_TASK_BIT_EXT, nextStage must not include any bits other than VK_SHADER_STAGE_MESH_BIT_EXT

• VUID-VkShaderCreateInfoEXT-nextStage-08436
  If stage is VK_SHADER_STAGE_MESH_BIT_EXT, nextStage must not include any bits other than VK_SHADER_STAGE_FRAGMENT_BIT

• VUID-VkShaderCreateInfoEXT-pName-08440
  If codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, pName must be the name of an OpEntryPoint in pCode with an execution model that matches stage

• VUID-VkShaderCreateInfoEXT-pCode-08492
  If codeType is VK_SHADER_CODE_TYPE_BINARY_EXT, pCode must be aligned to 16 bytes

• VUID-VkShaderCreateInfoEXT-pCode-08493
  If codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, pCode must be aligned to 4 bytes

• VUID-VkShaderCreateInfoEXT-pCode-08448
  If codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and the identified entry point includes any variable in its interface that is declared with the ClipDistance BuiltIn decoration, that variable must not have an array size greater than VkPhysicalDeviceLimits::maxClipDistances

• VUID-VkShaderCreateInfoEXT-pCode-08449
  If codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and the identified entry point includes any variable in its interface that is declared with the CullDistance BuiltIn decoration, that variable must not have an array size greater than VkPhysicalDeviceLimits::maxCullDistances

• VUID-VkShaderCreateInfoEXT-pCode-08450
  If codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and the identified entry point includes variables in its interface that are declared with the ClipDistance BuiltIn decoration and variables in its interface that are declared with the CullDistance BuiltIn decoration, those variables must not have array sizes which sum to more than VkPhysicalDeviceLimits::maxCombinedClipAndCullDistances

• VUID-VkShaderCreateInfoEXT-pCode-08451
  If codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and the identified entry point includes any variable in its interface that is declared with the SampleMask BuiltIn decoration, that variable must not have an array size greater than VkPhysicalDeviceLimits::maxSampleMaskWords

• VUID-VkShaderCreateInfoEXT-pCode-08452
  If codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and stage is VK_SHADER_STAGE_VERTEX_BIT, the identified entry point must not include any input variable in its interface that is decorated with CullDistance

• VUID-VkShaderCreateInfoEXT-pCode-08453
  If codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and stage is VK_SHADER_STAGE_TESSellation_CONTROL_BIT or VK_SHADER_STAGE_TESSellation_EVALUATION_BIT, and the identified entry point has an
OpExecutionMode instruction specifying a patch size with OutputVertices, the patch size must be greater than 0 and less than or equal to VkPhysicalDeviceLimits maxTessellationPatchSize

• VUID-VkShaderCreateInfoEXT-pCode-08454
  If codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and stage is VK_SHADER_STAGE_GEOMETRY_BIT, the identified entry point must have an OpExecutionMode instruction specifying a maximum output vertex count that is greater than 0 and less than or equal to VkPhysicalDeviceLimits maxGeometryOutputVertices

• VUID-VkShaderCreateInfoEXT-pCode-08455
  If codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and stage is VK_SHADER_STAGE_GEOMETRY_BIT, the identified entry point must have an OpExecutionMode instruction specifying an invocation count that is greater than 0 and less than or equal to VkPhysicalDeviceLimits maxGeometryShaderInvocations

• VUID-VkShaderCreateInfoEXT-pCode-08456
  If codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and stage is a pre-rasterization shader stage, and the identified entry point writes to Layer for any primitive, it must write the same value to Layer for all vertices of a given primitive

• VUID-VkShaderCreateInfoEXT-pCode-08457
  If codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and stage is a pre-rasterization shader stage, and the identified entry point writes to ViewportIndex for any primitive, it must write the same value to ViewportIndex for all vertices of a given primitive

• VUID-VkShaderCreateInfoEXT-pCode-08458
  If codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and stage is VK_SHADER_STAGE_FRAGMENT_BIT, the identified entry point must not include any output variables in its interface decorated with CullDistance

• VUID-VkShaderCreateInfoEXT-pCode-08459
  If codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and stage is VK_SHADER_STAGE_FRAGMENT_BIT, and the identified entry point writes to FragDepth in any execution path, all execution paths that are not exclusive to helper invocations must either discard the fragment, or write or initialize the value of FragDepth

• VUID-VkShaderCreateInfoEXT-codeType-08872
  If codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and stage is VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, pCode must contain an OpExecutionMode instruction specifying the type of subdivision

• VUID-VkShaderCreateInfoEXT-codeType-08873
  If codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and stage is VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, pCode must contain an OpExecutionMode instruction specifying the orientation of triangles generated by the tessellator

• VUID-VkShaderCreateInfoEXT-codeType-08874
If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, `pCode` must contain an `OpExecutionMode` instruction specifying the spacing of segments on the edges of tessellated primitives

- VUID-VkShaderCreateInfoEXT-codeType-08875
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, `pCode` must contain an `OpExecutionMode` instruction specifying the output patch size

- VUID-VkShaderCreateInfoEXT-pPushConstantRanges-10063
  Any two elements of `pPushConstantRanges` must not include the same stage in `stageFlags`

- VUID-VkShaderCreateInfoEXT-codeType-10064
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and if a push constant block is declared in a shader, then an element of `pPushConstantRanges::stageFlags` must match `pname::stage`

- VUID-VkShaderCreateInfoEXT-codeType-10065
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and if a push constant block is declared in a shader, the block must be contained inside the element of `pPushConstantRanges` that matches the stage

---

**Valid Usage (Implicit)**

- VUID-VkShaderCreateInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_SHADER_CREATE_INFO_EXT`

- VUID-VkShaderCreateInfoEXT-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` or `VkValidationFeaturesEXT`

- VUID-VkShaderCreateInfoEXT-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique

- VUID-VkShaderCreateInfoEXT-flags-parameter
  `flags` must be a valid combination of `VkShaderCreateFlagBitsEXT` values

- VUID-VkShaderCreateInfoEXT-stage-parameter
  `stage` must be a valid `VkShaderStageFlagBits` value

- VUID-VkShaderCreateInfoEXT-nextStage-parameter
  `nextStage` must be a valid combination of `VkShaderStageFlagBits` values

- VUID-VkShaderCreateInfoEXT-codeType-parameter
  `codeType` must be a valid `VkShaderCodeTypeEXT` value

- VUID-VkShaderCreateInfoEXT-pCode-parameter
  `pCode` must be a valid pointer to an array of `codeSize` bytes

- VUID-VkShaderCreateInfoEXT-pName-parameter
  If `pName` is not `NULL`, `pName` must be a null-terminated UTF-8 string

- VUID-VkShaderCreateInfoEXT-pSetLayouts-parameter
  If `setLayoutCount` is not `0`, and `pSetLayouts` is not `NULL`, `pSetLayouts` must be a valid pointer to an array of `setLayoutCount` valid `VkDescriptorSetLayout` handles
If `pushConstantRangeCount` is not 0, and `pPushConstantRanges` is not NULL, `pPushConstantRanges` must be a valid pointer to an array of `pushConstantRangeCount` valid `VkPushConstantRange` structures.

If `pSpecializationInfo` is not NULL, `pSpecializationInfo` must be a valid pointer to a valid `VkSpecializationInfo` structure.

`codeSize` must be greater than 0.

```c
// Provided by VK_EXT_shader_object
typedef VkFlags VkShaderCreateFlagsEXT;

VkShaderCreateFlagsEXT is a bitmask type for setting a mask of zero or more `VkShaderCreateFlagBitsEXT`.

Possible values of the `flags` member of `VkShaderCreateInfoEXT` specifying how a shader object is created, are:

```c
// Provided by VK_EXT_shader_object
typedef enum VkShaderCreateFlagBitsEXT {
   VK_SHADER_CREATE_LINK_STAGE_BIT_EXT = 0x00000001,
   // Provided by VK_EXT_shader_object with VK_EXT_subgroup_size_control or
   // Provided by VK_EXT_shader_object with VK_KHR_device_group or VK_VERSION_1_1
   VK_SHADER_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT = 0x00000004,
   // Provided by VK_EXT_shader_object with VK_EXT_mesh_shader or VK_NV_mesh_shader
   VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT = 0x00000008,
   // Provided by VK_KHR_fragment_shading_rate with VK_EXT_shader_object
   VK_SHADER_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_EXT = 0x00000020,
   // Provided by VK_EXT_fragment_density_map with VK_EXT_shader_object
   VK_SHADER_CREATE_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT = 0x00000040,
} VkShaderCreateFlagBitsEXT;
```

- `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` specifies that a shader is linked to all other shaders created in the same `vkCreateShadersEXT` call whose `VkShaderCreateInfoEXT` structures' `flags` include `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT`.
- `VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT` specifies that the `SubgroupSize` may vary in a task, mesh, or compute shader.
- `VK_SHADER_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT` specifies that the subgroup sizes must be launched with all invocations active in a task, mesh, or compute shader.
• **VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT** specifies that a mesh shader **must** only be used without a task shader. Otherwise, the mesh shader **must** only be used with a task shader.

• **VK_SHADER_CREATE_DISPATCH_BASE_BIT_EXT** specifies that a compute shader **can** be used with `vkCmdDispatchBase` with a non-zero base workgroup.

• **VK_SHADER_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_EXT** specifies that a fragment shader **can** be used with a fragment shading rate attachment.

• **VK_SHADER_CREATE_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT** specifies that a fragment shader **can** be used with a fragment density map attachment.

**NOTE**
The behavior of **VK_SHADER_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_EXT** and **VK_SHADER_CREATE_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT** differs subtly from the behavior of **VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR** and **VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT** in that the shader bit allows, but does not require the shader to be used with that type of attachment. This means that the application need not create multiple shaders when it does not know in advance whether the shader will be used with or without the attachment type, or when it needs the same shader to be compatible with usage both with and without. This **may** come at some performance cost on some implementations, so applications **should** still only set bits that are actually necessary.

Shader objects **can** be created using different types of shader code. Possible values of `VkShaderCreateInfoEXT::codeType`, are:

```c
// Provided by VK_EXT_shader_object
typedef enum VkShaderCodeTypeEXT {
    VK_SHADER_CODE_TYPE_BINARY_EXT = 0,
    VK_SHADER_CODE_TYPE_SPIRV_EXT = 1,
} VkShaderCodeTypeEXT;
```

• **VK_SHADER_CODE_TYPE_BINARY_EXT** specifies shader code in an opaque, implementation-defined binary format specific to the physical device.

• **VK_SHADER_CODE_TYPE_SPIRV_EXT** specifies shader code in SPIR-V format.

### 9.1.2. Binary Shader Code

Binary shader code **can** be retrieved from a shader object using the command:

```c
// Provided by VK_EXT_shader_object
VkResult vkGetShaderBinaryDataEXT(
    VkDevice device,
    VkShaderEXT shader,
    size_t* pDataSize,
    void* pData);
```
device is the logical device that shader object was created from.

shader is the shader object to retrieve binary shader code from.

pDataSize is a pointer to a size_t value related to the size of the binary shader code, as described below.

pData is either NULL or a pointer to a buffer.

If pData is NULL, then the size of the binary shader code of the shader object, in bytes, is returned in pDataSize. Otherwise, pDataSize must point to a variable set by the application to the size of the buffer, in bytes, pointed to by pData, and on return the variable is overwritten with the amount of data actually written to pData. If pDataSize is less than the size of the binary shader code, nothing is written to pData, and VK_INCOMPLETE will be returned instead of VK_SUCCESS.

NOTE

The behavior of this command when pDataSize is too small differs from how some other getter-type commands work in Vulkan. Because shader binary data is only usable in its entirety, it would never be useful for the implementation to return partial data. Because of this, nothing is written to pData unlesspDataSize is large enough to fit the data in its entirety.

Binary shader code retrieved using vkGetShaderBinaryDataEXT can be passed to a subsequent call to vkCreateShadersEXT on a compatible physical device by specifying VK_SHADER_CODE_TYPE_BINARY_EXT in the codeType member of VkShaderCreateInfoEXT.

The shader code returned by repeated calls to this function with the same VkShaderEXT is guaranteed to be invariant for the lifetime of the VkShaderEXT object.

Valid Usage

- VUID-vkGetShaderBinaryDataEXT-None-08461
  The shaderObject feature must be enabled

- VUID-vkGetShaderBinaryDataEXT-None-08499
  If pData is not NULL, it must be aligned to 16 bytes

Valid Usage (Implicit)

- VUID-vkGetShaderBinaryDataEXT-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetShaderBinaryDataEXT-shader-parameter
  shader must be a valid VkShaderEXT handle

- VUID-vkGetShaderBinaryDataEXT-pDataSize-parameter
  pDataSize must be a valid pointer to a size_t value

- VUID-vkGetShaderBinaryDataEXT-pData-parameter
  If the value referenced by pDataSize is not 0, and pData is not NULL, pData must be a valid pointer to an array of pDataSize bytes

- VUID-vkGetShaderBinaryDataEXT-shader-parent
shader must have been created, allocated, or retrieved from device

Return Codes

Success
- VK_SUCCESS
- VK_INCOMPLETE

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

9.1.3. Binary Shader Compatibility

Binary shader compatibility means that binary shader code returned from a call to vkGetShaderBinaryDataEXT can be passed to a later call to vkCreateShadersEXT, potentially on a different logical and/or physical device, and that this will result in the successful creation of a shader object functionally equivalent to the shader object that the code was originally queried from.

Binary shader code queried from vkGetShaderBinaryDataEXT is not guaranteed to be compatible across all devices, but implementations are required to provide some compatibility guarantees. Applications may determine binary shader compatibility using either (or both) of two mechanisms.

Guaranteed compatibility of shader binaries is expressed through a combination of the shaderBinaryUUID and shaderBinaryVersion members of the VkPhysicalDeviceShaderObjectPropertiesEXT structure queried from a physical device. Binary shaders retrieved from a physical device with a certain shaderBinaryUUID are guaranteed to be compatible with all other physical devices reporting the same shaderBinaryUUID and the same or higher shaderBinaryVersion.

Whenever a new version of an implementation incorporates any changes that affect the output of vkGetShaderBinaryDataEXT, the implementation should either increment shaderBinaryVersion if binary shader code retrieved from older versions remains compatible with the new implementation, or else replace shaderBinaryUUID with a new value if backward compatibility has been broken. Binary shader code queried from a device with a matching shaderBinaryUUID and lower shaderBinaryVersion relative to the device on which vkCreateShadersEXT is being called may be suboptimal for the new device in ways that do not change shader functionality, but it is still guaranteed to be usable to successfully create the shader object(s).

NOTE
Implementations are encouraged to share shaderBinaryUUID between devices and driver versions to the maximum extent their hardware naturally allows, and are strongly discouraged from ever changing the shaderBinaryUUID for the same hardware except unless absolutely necessary.

In addition to the shader compatibility guarantees described above, it is valid for an application to
call `vkCreateShadersEXT` with binary shader code created on a device with a different or unknown `shaderBinaryUUID` and/or higher `shaderBinaryVersion`. In this case, the implementation may use any unspecified means of its choosing to determine whether the provided binary shader code is usable. If it is, `vkCreateShadersEXT` must return `VK_SUCCESS`, and the created shader object is guaranteed to be valid. Otherwise, in the absence of some error, `vkCreateShadersEXT` must return `VK_INCOMPATIBLE_SHADER_BINARY_EXT` to indicate that the provided binary shader code is not compatible with the device.

### 9.1.4. Binding Shader Objects

Once shader objects have been created, they can be bound to the command buffer using the command:

```c
// Provided by VK_EXT_shader_object
void vkCmdBindShadersEXT(
    VkCommandBuffer commandBuffer,
    uint32_t stageCount,
    const VkShaderStageFlagBits* pStages,
    const VkShaderEXT* pShaders);
```

- `commandBuffer` is the command buffer that the shader object will be bound to.
- `stageCount` is the length of the `pStages` and `pShaders` arrays.
- `pStages` is a pointer to an array of `VkShaderStageFlagBits` values specifying one stage per array index that is affected by the corresponding value in the `pShaders` array.
- `pShaders` is a pointer to an array of `VkShaderEXT` handles and/or `VK_NULL_HANDLE` values describing the shader binding operations to be performed on each stage in `pStages`.

When binding linked shaders, an application may bind them in any combination of one or more calls to `vkCmdBindShadersEXT` (i.e., shaders that were created linked together do not need to be bound in the same `vkCmdBindShadersEXT` call).

Any shader object bound to a particular stage may be unbound by setting its value in `pShaders` to `VK_NULL_HANDLE`. If `pShaders` is NULL, `vkCmdBindShadersEXT` behaves as if `pShaders` was an array of `stageCount` `VK_NULL_HANDLE` values (i.e., any shaders bound to the stages specified in `pStages` are unbound).

### Valid Usage

- VUID-vkCmdBindShadersEXT-None-08462 The shaderObject feature must be enabled
- VUID-vkCmdBindShadersEXT-pStages-08463 Every element of `pStages` must be unique
- VUID-vkCmdBindShadersEXT-pStages-08464 `pStages` must not contain `VK_SHADER_STAGE_ALL_GRAPHICS` or `VK_SHADER_STAGE_ALL`
- VUID-vkCmdBindShadersEXT-pStages-08465
pStages must not contain VK_SHADER_STAGE_RAYGEN_BIT_KHR, VK_SHADER_STAGE_ANY_HIT_BIT_KHR, VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR, VK_SHADER_STAGE_MISS_BIT_KHR, VK_SHADER_STAGE_INTERSECTION_BIT_KHR, or VK_SHADER_STAGE_CALLABLE_BIT_KHR

- VUID-vkCmdBindShadersEXT-pStages-08467  
  pStages must not contain VK_SHADER_STAGE_SUBPASS_SHADING_BIT_HUAWEI

- VUID-vkCmdBindShadersEXT-pStages-08468  
  pStages must not contain VK_SHADER_STAGE_CLUSTER_CULLING_BIT_HUAWEI

- VUID-vkCmdBindShadersEXT-pShaders-08469  
  For each element of pStages, if pShaders is not NULL, and the element of the pShaders array with the same index is not VK_NULL_HANDLE, it must have been created with a stage equal to the corresponding element of pStages

- VUID-vkCmdBindShadersEXT-pShaders-08470  
  If pStages contains both VK_SHADER_STAGE_TASK_BIT_EXT and VK_SHADER_STAGE_VERTEX_BIT, and pShaders is not NULL, and the same index in pShaders as VK_SHADER_STAGE_TASK_BIT_EXT in pStages is not VK_NULL_HANDLE, the same index in pShaders as VK_SHADER_STAGE_VERTEX_BIT in pStages must be VK_NULL_HANDLE

- VUID-vkCmdBindShadersEXT-pShaders-08471  
  If pStages contains both VK_SHADER_STAGE_MESH_BIT_EXT and VK_SHADER_STAGE_VERTEX_BIT, and pShaders is not NULL, and the same index in pShaders as VK_SHADER_STAGE_MESH_BIT_EXT in pStages is not VK_NULL_HANDLE, the same index in pShaders as VK_SHADER_STAGE_VERTEX_BIT in pStages must be VK_NULL_HANDLE

- VUID-vkCmdBindShadersEXT-pShaders-08474  
  If the tessellationShader feature is not enabled, and pStages contains VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT or VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, and pShaders is not NULL, the same index or indices in pShaders must be VK_NULL_HANDLE

- VUID-vkCmdBindShadersEXT-pShaders-08475  
  If the geometryShader feature is not enabled, and pStages contains VK_SHADER_STAGE_GEOMETRY_BIT, and pShaders is not NULL, the same index in pShaders must be VK_NULL_HANDLE

- VUID-vkCmdBindShadersEXT-pShaders-08490  
  If the taskShader feature is not enabled, and pStages contains VK_SHADER_STAGE_TASK_BIT_EXT, and pShaders is not NULL, the same index in pShaders must be VK_NULL_HANDLE

- VUID-vkCmdBindShadersEXT-pShaders-08491  
  If the meshShader feature is not enabled, and pStages contains VK_SHADER_STAGE_MESH_BIT_EXT, and pShaders is not NULL, the same index in pShaders must be VK_NULL_HANDLE

- VUID-vkCmdBindShadersEXT-pShaders-08476  
  If pStages contains VK_SHADER_STAGE_COMPUTE_BIT, the VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdBindShadersEXT-pShaders-08477
If `pStages` contains `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, `VK_SHADER_STAGE_GEOMETRY_BIT`, or `VK_SHADER_STAGE_FRAGMENT_BIT`, the `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- VUID-vkCmdBindShadersEXT-pShaders-08478
  If `pStages` contains `VK_SHADER_STAGE_MESH_BIT_EXT` or `VK_SHADER_STAGE_TASK_BIT_EXT`, the `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

## Valid Usage (Implicit)

- VUID-vkCmdBindShadersEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- VUID-vkCmdBindShadersEXT-pStages-parameter
  `pStages` must be a valid pointer to an array of `stageCount` valid `VkShaderStageFlagBits` values.

- VUID-vkCmdBindShadersEXT-pShaders-parameter
  If `pShaders` is not NULL, `pShaders` must be a valid pointer to an array of `stageCount` valid or `VK_NULL_HANDLE` `VkShaderEXT` handles.

- VUID-vkCmdBindShadersEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state.

- VUID-vkCmdBindShadersEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations.

- VUID-vkCmdBindShadersEXT-videocoding
  This command must only be called outside of a video coding scope.

- VUID-vkCmdBindShadersEXT-stageCount-arraylength
  `stageCount` must be greater than 0.

- VUID-vkCmdBindShadersEXT-commonparent
  Both of `commandBuffer`, and the elements of `pShaders` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.

## Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.
9.1.5. Setting State

Whenever shader objects are used to issue drawing commands, the appropriate dynamic state setting commands must have been called to set the relevant state in the command buffer prior to drawing:

- `vkCmdSetViewportWithCount`
- `vkCmdSetScissorWithCount`
- `vkCmdSetRasterizerDiscardEnable`

If a shader is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage, the following commands must have been called in the command buffer prior to drawing:

- `vkCmdSetVertexInputEXT`
- `vkCmdSetPrimitiveTopology`
- `vkCmdSetPatchControlPointsEXT`, if `primitiveTopology` is `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`
- `vkCmdSetPrimitiveRestartEnable`

If a shader is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` stage, the following command must have been called in the command buffer prior to drawing:

- `vkCmdSetTessellationDomainOriginEXT`

If `rasterizerDiscardEnable` is `VK_FALSE`, the following commands must have been called in the command buffer prior to drawing:

- `vkCmdSetRasterizationSamplesEXT`
- `vkCmdSetSampleMaskEXT`
- `vkCmdSetAlphaToCoverageEnableEXT`
- `vkCmdSetAlphaToOneEnableEXT`, if the `alphaToOne` feature is enabled on the device
- `vkCmdSetPolygonModeEXT`
- `vkCmdSetLineWidth`, if `polygonMode` is `VK_POLYGON_MODE_LINE`, or if a shader is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage and `primitiveTopology` is a line topology, or if a shader which outputs line primitives is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT` stage
- `vkCmdSetCullMode`
- `vkCmdSetFrontFace`
- `vkCmdSetDepthTestEnable`
- `vkCmdSetDepthWriteEnable`
- `vkCmdSetDepthCompareOp`, if `depthTestEnable` is `VK_TRUE`
- `vkCmdSetDepthBoundsTestEnable`, if the `depthBounds` feature is enabled on the device
- `vkCmdSetDepthBounds`, if `depthBoundsTestEnable` is `VK_TRUE`
- `vkCmdSetDepthBiasEnable`
- `vkCmdSetDepthBias` or `vkCmdSetDepthBias2EXT`, if `depthBiasEnable` is `VK_TRUE`
- `vkCmdSetDepthClampEnableEXT`, if the `depthClamp` feature is enabled on the device
- `vkCmdSetStencilTestEnable`
- `vkCmdSetStencilOp`, if `stencilTestEnable` is `VK_TRUE`
- `vkCmdSetStencilCompareMask`, if `stencilTestEnable` is `VK_TRUE`
- `vkCmdSetStencilWriteMask`, if `stencilTestEnable` is `VK_TRUE`
- `vkCmdSetStencilReference`, if `stencilTestEnable` is `VK_TRUE`

If a shader is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and `rasterizerDiscardEnable` is `VK_FALSE`, the following commands **must** have been called in the command buffer prior to drawing:

- `vkCmdSetLogicOpEnableEXT`, if the `logicOp` feature is enabled on the device
- `vkCmdSetLogicOpEXT`, if `logicOpEnable` is `VK_TRUE`
- `vkCmdSetColorBlendEnableEXT` and `vkCmdSetColorWriteMaskEXT`, if color attachments are bound, with values set for every color attachment in the render pass instance active at draw time
- `vkCmdSetColorBlendEquationEXT` or `vkCmdSetColorBlendAdvancedEXT`, if color attachments are bound, for every attachment whose index in `pColorBlendEnables` is a pointer to a value of `VK_TRUE`
- `vkCmdSetBlendConstants`, if any index in `pColorBlendEnables` is `VK_TRUE`, and the same index in `pColorBlendEquations` is a `VkColorBlendEquationEXT` structure with any `VkBlendFactor` member with a value of `VK_BLEND_FACTOR_CONSTANT_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR`, `VK_BLEND_FACTOR_CONSTANT_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA`

If the `pipelineFragmentShadingRate` feature is enabled on the device, and a shader is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and `rasterizerDiscardEnable` is `VK_FALSE`, the following command **must** have been called in the command buffer prior to drawing:

- `vkCmdSetFragmentShadingRateKHR`

If the `geometryStreams` feature is enabled on the device, and a shader is bound to the `VK_SHADER_STAGE_GEOMETRY_BIT` stage, the following command **must** have been called in the command buffer prior to drawing:

- `vkCmdSetRasterizationStreamEXT`
If the VK_EXT_discard_rectangles extension is enabled on the device, and rasterizerDiscardEnable is VK_FALSE, the following commands must have been called in the command buffer prior to drawing:

- vkCmdSetDiscardRectangleEnableEXT
- vkCmdSetDiscardRectangleModeEXT, if discardRectangleEnable is VK_TRUE
- vkCmdSetDiscardRectangleEXT, if discardRectangleEnable is VK_TRUE

If VK_EXT_conservative_rasterization extension is enabled on the device, and rasterizerDiscardEnable is VK_FALSE, the following commands must have been called in the command buffer prior to drawing:

- vkCmdSetConservativeRasterizationModeEXT
- vkCmdSetExtraPrimitiveOverestimationSizeEXT, if conservativeRasterizationMode is VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT

If the depthClipEnable feature is enabled on the device, the following command must have been called in the command buffer prior to drawing:

- vkCmdSetDepthClipEnableEXT

If the VK_EXT_sample_locations extension is enabled on the device, and rasterizerDiscardEnable is VK_FALSE, the following commands must have been called in the command buffer prior to drawing:

- vkCmdSetSampleLocationsEnableEXT
- vkCmdSetSampleLocationsEXT, if sampleLocationsEnable is VK_TRUE

If the depthClipEnable feature is enabled on the device, the following command must have been called in the command buffer prior to drawing:

- vkCmdSetDepthClipEnableEXT

If the VK_EXT_provoking_vertex extension is enabled on the device, and rasterizerDiscardEnable is VK_FALSE, and a shader is bound to the VK_SHADER_STAGE_VERTEX_BIT stage, the following command must have been called in the command buffer prior to drawing:

- vkCmdSetProvokingVertexModeEXT

If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled on the device, and rasterizerDiscardEnable is VK_FALSE, and polygonMode is VK_POLYGON_MODE_LINE or a shader is bound to the VK_SHADER_STAGE_VERTEX_BIT stage and primitiveTopology is a line topology or a shader which outputs line primitives is bound to the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT stage, the following commands must have been called in the command buffer prior to drawing:

- vkCmdSetLineRasterizationModeEXT
- vkCmdSetLineStippleEnableEXT
- vkCmdSetLineStippleKHR, if stippledLineEnable is VK_TRUE

If the depthClipControl feature is enabled on the device, the following command must have been called in the command buffer prior to drawing:

- vkCmdSetDepthClipNegativeOneToOneEXT

If the colorWriteEnable feature is enabled on the device, and a shader is bound to the
VK_SHADER_STAGE_FRAGMENT_BIT stage, and rasterizerDiscardEnable is VK_FALSE, the following command **must** have been called in the command buffer prior to drawing:

- vkCmdSetColorWriteEnableEXT, with values set for every color attachment in the render pass instance active at draw time

If the attachmentFeedbackLoopDynamicState feature is enabled on the device, and a shader is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and rasterizerDiscardEnable is VK_FALSE, the following command **must** have been called in the command buffer prior to drawing:

- vkCmdSetAttachmentFeedbackLoopEnableEXT

If the VK_NV_clip_space_w_scaling extension is enabled on the device, the following commands **must** have been called in the command buffer prior to drawing:

- vkCmdSetViewportWScalingEnableNV
- vkCmdSetViewportWScalingNV, if viewportWScalingEnable is VK_TRUE

If the VK_NV_viewport_swizzle extension is enabled on the device, the following command **must** have been called in the command buffer prior to drawing:

- vkCmdSetViewportSwizzleNV

If the VK_NV_fragment_coverage_to_color extension is enabled on the device, and a shader is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and rasterizerDiscardEnable is VK_FALSE, the following commands **must** have been called in the command buffer prior to drawing:

- vkCmdSetCoverageToColorEnableNV
- vkCmdSetCoverageToColorLocationNV, if coverageToColorEnable is VK_TRUE

If the VK_NV_framebuffer_mixed_samples extension is enabled on the device, and rasterizerDiscardEnable is VK_FALSE, the following commands **must** have been called in the command buffer prior to drawing:

- vkCmdSetCoverageModulationModeNV
- vkCmdSetCoverageModulationTableEnableNV, if coverageModulationMode is not VK_COVERAGE_MODULATION_MODE_NONE_NV
- vkCmdSetCoverageModulationTableNV, if coverageModulationTableEnable is VK_TRUE

If the coverageReductionMode feature is enabled on the device, and rasterizerDiscardEnable is VK_FALSE, the following command **must** have been called in the command buffer prior to drawing:

- vkCmdSetCoverageReductionModeNV

If the representativeFragmentTest feature is enabled on the device, and rasterizerDiscardEnable is VK_FALSE, the following command **must** have been called in the command buffer prior to drawing:

- vkCmdSetRepresentativeFragmentTestEnableNV

If the shadingRateImage feature is enabled on the device, and rasterizerDiscardEnable is VK_FALSE,
the following commands must have been called in the command buffer prior to drawing:

- `vkCmdSetCoarseSampleOrderNV`
- `vkCmdSetShadingRateImageEnableNV`
- `vkCmdSetViewportShadingRatePaletteNV`, if `shadingRateImageEnable` is `VK_TRUE`

If the `exclusiveScissor` feature is enabled on the device, the following commands must have been called in the command buffer prior to drawing:

- `vkCmdSetExclusiveScissorEnableNV`
- `vkCmdSetExclusiveScissorNV`, if any value in `pExclusiveScissorEnables` is `VK_TRUE`

State can be set either at any time before or after shader objects are bound, but all required state must be set prior to issuing drawing commands.

### 9.1.6. Interaction With Pipelines

Calling `vkCmdBindShadersEXT` causes the pipeline bind points corresponding to each stage in `pStages` to be disturbed, meaning that any pipelines that had previously been bound to those pipeline bind points are no longer bound.

If `VK_PIPELINE_BIND_POINT_GRAPHICS` is disturbed (i.e., if `pStages` contains any graphics stage), any graphics pipeline state that the previously bound pipeline did not specify as dynamic becomes undefined, and must be set in the command buffer before issuing drawing commands using shader objects.

Calls to `vkCmdBindPipeline` likewise disturb the shader stage(s) corresponding to `pipelineBindPoint`, meaning that any shaders that had previously been bound to any of those stages are no longer bound, even if the pipeline was created without shaders for some of those stages.

### 9.1.7. Shader Object Destruction

To destroy a shader object, call:

```c
// Provided by VK_EXT_shader_object
void vkDestroyShaderEXT(
    VkDevice device,  // Logical device that destroys the shader object.
    VkShaderEXT shader,  // Handle of the shader object to destroy.
    const VkAllocationCallbacks* pAllocator);  // Controls host memory allocation as described in the Memory Allocation chapter.
```

- `device` is the logical device that destroys the shader object.
- `shader` is the handle of the shader object to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

Destroying a shader object used by one or more command buffers in the recording or executable state causes those command buffers to move into the invalid state.
Valid Usage

- VUID-vkDestroyShaderEXT-None-08481
  The shaderObject feature must be enabled

- VUID-vkDestroyShaderEXT-shader-08482
  All submitted commands that refer to shader must have completed execution

- VUID-vkDestroyShaderEXT-pAllocator-08483
  If VkAllocationCallbacks were provided when shader was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyShaderEXT-pAllocator-08484
  If no VkAllocationCallbacks were provided when shader was created, pAllocator must be NULL

Valid Usage (Implicit)

- VUID-vkDestroyShaderEXT-device-parameter
device must be a valid VkDevice handle

- VUID-vkDestroyShaderEXT-shader-parameter
  If shader is not VK_NULL_HANDLE, shader must be a valid VkShaderEXT handle

- VUID-vkDestroyShaderEXT-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroyShaderEXT-shader-parent
  If shader is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to shader must be externally synchronized

9.2. Shader Modules

Shader modules contain shader code and one or more entry points. Shaders are selected from a shader module by specifying an entry point as part of pipeline creation. The stages of a pipeline can use shaders that come from different modules. The shader code defining a shader module must be in the SPIR-V format, as described by the Vulkan Environment for SPIR-V appendix.

Shader modules are represented by VkShaderModule handles:

// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkShaderModule)
To create a shader module, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateShaderModule(
    VkDevice device,
    const VkShaderModuleCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkShaderModule* pShaderModule);
```

- `device` is the logical device that creates the shader module.
- `pCreateInfo` is a pointer to a `VkShaderModuleCreateInfo` structure.
- `pAllocator` controls host memory allocation as described in the `Memory Allocation` chapter.
- `pShaderModule` is a pointer to a `VkShaderModule` handle in which the resulting shader module object is returned.

Once a shader module has been created, any entry points it contains can be used in pipeline shader stages as described in `Compute Pipelines` and `Graphics Pipelines`.

NOTE

If the `maintenance5` feature is enabled, shader module creation can be omitted entirely. Instead, applications should provide the `VkShaderModuleCreateInfo` structure directly in to pipeline creation by chaining it to `VkPipelineShaderStageCreateInfo`. This avoids the overhead of creating and managing an additional object.

Valid Usage

- VUID-vkCreateShaderModule-pCreateInfo-06904
  If `pCreateInfo` is not `NULL`, `pCreateInfo->pNext must be `NULL` or a pointer to a valid instance of
  - `VkShaderModuleValidationCacheCreateInfoEXT`
  - `VkValidationFeaturesEXT`

Valid Usage (Implicit)

- VUID-vkCreateShaderModule-device-parameter
  `device must be a valid VkDevice` handle
- VUID-vkCreateShaderModule-pCreateInfo-parameter
  `pCreateInfo must be a valid pointer to a valid VkShaderModuleCreateInfo` structure
- VUID-vkCreateShaderModule-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure`
- VUID-vkCreateShaderModule-pShaderModule-parameter
  `pShaderModule must be a valid pointer to a VkShaderModule` handle
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_INVALID_SHADER_NV

The VkShaderModuleCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkShaderModuleCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkShaderModuleCreateFlags flags;
    size_t codeSize;
    const uint32_t* pCode;
} VkShaderModuleCreateInfo;
```

• **sType** is a VkStructureType value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **flags** is reserved for future use.
• **codeSize** is the size, in bytes, of the code pointed to by **pCode**.
• **pCode** is a pointer to code that is used to create the shader module. The type and format of the code is determined from the content of the memory addressed by **pCode**.

Valid Usage

• VUID-VkShaderModuleCreateInfo-codeSize-08735
  If pCode is a pointer to SPIR-V code, **codeSize** must be a multiple of 4

• VUID-VkShaderModuleCreateInfo-pCode-08736
  If pCode is a pointer to SPIR-V code, **pCode** must point to valid SPIR-V code, formatted and packed as described by the Khronos SPIR-V Specification

• VUID-VkShaderModuleCreateInfo-pCode-08737
  If pCode is a pointer to SPIR-V code, **pCode** must adhere to the validation rules described by the Validation Rules within a Module section of the SPIR-V Environment appendix

• VUID-VkShaderModuleCreateInfo-pCode-08738
  If pCode is a pointer to SPIR-V code, **pCode** must declare the Shader capability for SPIR-V code

• VUID-VkShaderModuleCreateInfo-pCode-08739
If pCode is a pointer to SPIR-V code, \texttt{pCode must} not declare any capability that is not supported by the API, as described by the \textit{Capabilities} section of the \textit{SPIR-V Environment} appendix.

- **VUID-VkShaderModuleCreateInfo-pCode-08740**
  If pCode is a pointer to SPIR-V code, and \texttt{pCode} declares any of the capabilities listed in the \textit{SPIR-V Environment} appendix, one of the corresponding requirements \textit{must} be satisfied.

- **VUID-VkShaderModuleCreateInfo-pCode-08741**
  If pCode is a pointer to SPIR-V code, \texttt{pCode must} not declare any SPIR-V extension that is not supported by the API, as described by the \textit{Extension} section of the \textit{SPIR-V Environment} appendix.

- **VUID-VkShaderModuleCreateInfo-pCode-08742**
  If pCode is a pointer to SPIR-V code, and \texttt{pCode} declares any of the SPIR-V extensions listed in the \textit{SPIR-V Environment} appendix, one of the corresponding requirements \textit{must} be satisfied.

- **VUID-VkShaderModuleCreateInfo-pCode-07912**
  If the \texttt{VK_NV_glsl_shader} extension is not enabled, \texttt{pCode must} be a pointer to SPIR-V code.

- **VUID-VkShaderModuleCreateInfo-pCode-01379**
  If \texttt{pCode} is a pointer to GLSL code, it \textit{must} be valid GLSL code written to the \texttt{GL_KHR_vulkan_glsl} GLSL extension specification.

- **VUID-VkShaderModuleCreateInfo-codeSize-01085**
  \texttt{codeSize must} be greater than 0

### Valid Usage (Implicit)

- **VUID-VkShaderModuleCreateInfo-sType-sType**
  \texttt{sType must} be \texttt{VK_STRUCTURE_TYPE_SHADER_MODULE_CREATE_INFO}.

- **VUID-VkShaderModuleCreateInfo-flags-zerobitmask**
  \texttt{flags must} be 0.

- **VUID-VkShaderModuleCreateInfo-pCode-parameter**
  \texttt{pCode must} be a valid pointer to an array of \( \frac{\text{codeSize}}{4} \) \texttt{uint32_t} values.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkShaderModuleCreateFlags;
```

\texttt{VkShaderModuleCreateFlags} is a bitmask type for setting a mask, but is currently reserved for future use.

To use a \texttt{VkValidationCacheEXT} to cache shader validation results, add a \texttt{VkShaderModuleValidationCacheCreateInfoEXT} structure to the \texttt{pNext} chain of the \texttt{VkShaderModuleCreateInfo} structure, specifying the cache object to use.

The \texttt{VkShaderModuleValidationCacheCreateInfoEXT} struct is defined as:
```c
// Provided by VK_EXT_validation_cache
typedef struct VkShaderModuleValidationCacheCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkValidationCacheEXT validationCache;
} VkShaderModuleValidationCacheCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `validationCache` is the validation cache object from which the results of prior validation attempts will be written, and to which new validation results for this `VkShaderModule` will be written (if not already present).

### Valid Usage (Implicit)

- **VUID-VkShaderModuleValidationCacheCreateInfoEXT-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_SHADER_MODULE_VALIDATION_CACHE_CREATE_INFO_EXT`

- **VUID-VkShaderModuleValidationCacheCreateInfoEXT-validationCache-parameter**
  
  `validationCache` must be a valid `VkValidationCacheEXT` handle

To destroy a shader module, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyShaderModule(
    VkDevice device,
    VkShaderModule shaderModule,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the shader module.
- `shaderModule` is the handle of the shader module to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

A shader module can be destroyed while pipelines created using its shaders are still in use.

### Valid Usage

- **VUID-vkDestroyShaderModule-shaderModule-01092**
  
  If `VkAllocationCallbacks` were provided when `shaderModule` was created, a compatible set of callbacks must be provided here

- **VUID-vkDestroyShaderModule-shaderModule-01093**
  
  If no `VkAllocationCallbacks` were provided when `shaderModule` was created, `pAllocator` must be `NULL`
Valid Usage (Implicit)

- VUID-vkDestroyShaderModule-device-parameter
  
  \textbf{device must} be a valid \texttt{VkDevice} handle

- VUID-vkDestroyShaderModule-shaderModule-parameter
  
  If \texttt{shaderModule} is not \texttt{VK_NULL_HANDLE}, \texttt{shaderModule must} be a valid \texttt{VkShaderModule} handle

- VUID-vkDestroyShaderModule-pAllocator-parameter
  
  If \texttt{pAllocator} is not \texttt{NULL}, \texttt{pAllocator must} be a valid pointer to a valid \texttt{VkAllocationCallbacks} structure

- VUID-vkDestroyShaderModule-shaderModule-parent
  
  If \texttt{shaderModule} is a valid handle, it \textbf{must} have been created, allocated, or retrieved from \texttt{device}

Host Synchronization

- \textbf{Host access to shaderModule must} be externally synchronized

9.3. Shader Module Identifiers

Shader modules have unique identifiers associated with them. To query an implementation provided identifier, call:

```c
// Provided by VK_EXT_shader_module_identifier
void vkGetShaderModuleIdentifierEXT(
    VkDevice device,
   VkShaderModule shaderModule,
    VkShaderModuleIdentifierEXT* pIdentifier);
```

- \texttt{device} is the logical device that created the shader module.
- \texttt{shaderModule} is the handle of the shader module.
- \texttt{pIdentifier} is a pointer to the returned \texttt{VkShaderModuleIdentifierEXT}.

The identifier returned by the implementation \textbf{must} only depend on \texttt{shaderIdentifierAlgorithmUUID} and information provided in the \texttt{VkShaderModuleCreateInfo} which created \texttt{shaderModule}. The implementation \textbf{may} return equal identifiers for two different \texttt{VkShaderModuleCreateInfo} structures if the difference does not affect pipeline compilation. Identifiers are only meaningful on different \texttt{VkDevice} objects if the device the identifier was queried from had the same \texttt{shaderModuleIdentifierAlgorithmUUID} as the device consuming the identifier.
Valid Usage

• VUID-vkGetShaderModuleIdentifierEXT-shaderModuleIdentifier-06884
  shaderModuleIdentifier feature must be enabled

Valid Usage (Implicit)

• VUID-vkGetShaderModuleIdentifierEXT-device-parameter
device must be a valid VkDevice handle

• VUID-vkGetShaderModuleIdentifierEXT-shaderModule-parameter
  shaderModule must be a valid VkShaderModule handle

• VUID-vkGetShaderModuleIdentifierEXT-pIdentifier-parameter
  pIdentifier must be a valid pointer to a VkShaderModuleIdentifierEXT structure

• VUID-vkGetShaderModuleIdentifierEXT-shaderModule-parent
  shaderModule must have been created, allocated, or retrieved from device

VkShaderModuleCreateInfo structures have unique identifiers associated with them. To query an implementation provided identifier, call:

```c
// Provided by VK_EXT_shader_module_identifier
void vkGetShaderModuleCreateInfoIdentifierEXT(
  VkDevice device,
  const VkShaderModuleCreateInfo* pCreateInfo,
  VkShaderModuleIdentifierEXT* pIdentifier);
```

- device is the logical device that can create a VkShaderModule from pCreateInfo.
- pCreateInfo is a pointer to a VkShaderModuleCreateInfo structure.
- pIdentifier is a pointer to the returned VkShaderModuleIdentifierEXT.

The identifier returned by implementation must only depend on shaderIdentifierAlgorithmUUID and information provided in the VkShaderModuleCreateInfo. The implementation may return equal identifiers for two different VkShaderModuleCreateInfo structures if the difference does not affect pipeline compilation. Identifiers are only meaningful on different VkDevice objects if the device the identifier was queried from had the same shaderModuleIdentifierAlgorithmUUID as the device consuming the identifier.

The identifier returned by the implementation in vkGetShaderModuleCreateInfoIdentifierEXT must be equal to the identifier returned by vkGetShaderModuleIdentifierEXT given equivalent definitions of VkShaderModuleCreateInfo and any chained pNext structures.

Valid Usage

• VUID-vkGetShaderModuleCreateInfoIdentifierEXT-shaderModuleIdentifier-06885
shaderModuleIdentifier feature must be enabled

Valid Usage (Implicit)

- VUID-vkGetShaderModuleCreateInfoIdentifierEXT-device-parameter
device must be a valid VkDevice handle
- VUID-vkGetShaderModuleCreateInfoIdentifierEXT-pCreateInfo-parameter
pCreateInfo must be a valid pointer to a valid VkShaderModuleCreateInfo structure
- VUID-vkGetShaderModuleCreateInfoIdentifierEXT-pIdentifier-parameter
pIdentifier must be a valid pointer to a VkShaderModuleIdentifierEXT structure

VkShaderModuleIdentifierEXT represents a shader module identifier returned by the implementation.

// Provided by VK_EXT_shader_module_identifier
typedef struct VkShaderModuleIdentifierEXT {
    VkStructureType sType;
    void* pNext;
    uint32_t identifierSize;
    uint8_t identifier[VK_MAX_SHADER_MODULE_IDENTIFIER_SIZE_EXT];
} VkShaderModuleIdentifierEXT;

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- identifierSize is the size, in bytes, of valid data returned in identifier.
- identifier is a buffer of opaque data specifying an identifier.

Any returned values beyond the first identifierSize bytes are undefined. Implementations must return an identifierSize greater than 0, and less-or-equal to VK_MAX_SHADER_MODULE_IDENTIFIER_SIZE_EXT.

Two identifiers are considered equal if identifierSize is equal and the first identifierSize bytes of identifier compare equal.

Implementations may return a different identifierSize for different modules. Implementations should ensure that identifierSize is large enough to uniquely define a shader module.

Valid Usage (Implicit)

- VUID-VkShaderModuleIdentifierEXT-sType-sType
sType must be VK_STRUCTURE_TYPE_SHADER_MODULE_IDENTIFIER_EXT
- VUID-VkShaderModuleIdentifierEXT-pNext-pNext
pNext must be NULL
**9.4. Binding Shaders**

Before a shader can be used it **must** be first bound to the command buffer.

Calling `vkCmdBindPipeline` binds all stages corresponding to the `VkPipelineBindPoint`. Calling `vkCmdBindShadersEXT` binds all stages in `pStages`.

The following table describes the relationship between shader stages and pipeline bind points:

<table>
<thead>
<tr>
<th>Shader stage</th>
<th>Pipeline bind point</th>
<th>behavior controlled</th>
</tr>
</thead>
<tbody>
<tr>
<td>• VK_SHADER_STAGE_VERTEX_BIT</td>
<td>VK_PIPELINE_BIND_POINT_GRAPHICS</td>
<td>all drawing commands</td>
</tr>
<tr>
<td>• VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• VK_SHADER_STAGE_GEOMETRY_BIT</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• VK_SHADER_STAGE_FRAGMENT_BIT</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• VK_SHADER_STAGE_TASK_BIT_EXT</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• VK_SHADER_STAGE_MESH_BIT_EXT</td>
<td></td>
<td></td>
</tr>
<tr>

<tr>
<td>• VK_SHADER_STAGE_INTERSECTION_BIT_KHR</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• VK_SHADER_STAGE_MISS_BIT_KHR</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• VK_SHADER_STAGE_RAYGEN_BIT_KHR</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### 9.5. Shader Execution

At each stage of the pipeline, multiple invocations of a shader may execute simultaneously. Further, invocations of a single shader produced as the result of different commands may execute simultaneously. The relative execution order of invocations of the same shader type is undefined. Shader invocations may complete in a different order than that in which the primitives they originated from were drawn or dispatched by the application. However, fragment shader outputs are written to attachments in **rasterization order**.

The relative execution order of invocations of different shader types is largely undefined. However, when invoking a shader whose inputs are generated from a previous pipeline stage, the shader invocations from the previous stage are guaranteed to have executed far enough to generate input values for all required inputs.

### 9.5.1. Shader Termination

A shader invocation that is **terminated** has finished executing instructions.

Executing **OpReturn** in the entry point, or executing **OpTerminateInvocation** in any function will terminate an invocation. Implementations may also terminate a shader invocation when **OpKill** is executed in any function; otherwise it becomes a **helper invocation**.

In addition to the above conditions, **helper invocations may** be terminated when all non-helper invocations in the same **derivative group** either terminate or become helper invocations.

A shader stage for a given command completes execution when all invocations for that stage have terminated.

**NOTE** **OpKill** will behave the same as either **OpTerminateInvocation** or **OpDemoteToHelperInvocation** depending on the implementation. It is recommended that shader authors use **OpTerminateInvocation** or **OpDemoteToHelperInvocation** instead of **OpKill** whenever possible to produce more predictable behavior.

### 9.6. Shader Memory Access Ordering

The order in which image or buffer memory is read or written by shaders is largely undefined. For some shader types (vertex, tessellation evaluation, and in some cases, fragment), even the number of shader invocations that may perform loads and stores is undefined.

<table>
<thead>
<tr>
<th>Shader stage</th>
<th>Pipeline bind point</th>
<th>behavior controlled</th>
</tr>
</thead>
<tbody>
<tr>
<td>• VK_SHADER_STAGE_SUBPASS_SHADING_BIT_HUAWEI</td>
<td>VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI</td>
<td>vkCmdSubpassShadingHUAWEI</td>
</tr>
<tr>
<td>• VK_SHADER_STAGE_CLUSTER_CLUSTERING_BIT_HUAWEI</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• VK_SHADER_STAGE_COMPUTE_BIT</td>
<td>VK_PIPELINE_BIND_POINT_EXECUTION_GRAPH_AMDX</td>
<td>all execution graph commands</td>
</tr>
</tbody>
</table>
In particular, the following rules apply:

- **Vertex** and **tessellation evaluation** shaders will be invoked at least once for each unique vertex, as defined in those sections.
- **Fragment** shaders will be invoked zero or more times, as defined in that section.
- The relative execution order of invocations of the same shader type is undefined. A store issued by a shader when working on primitive B might complete prior to a store for primitive A, even if primitive A is specified prior to primitive B. This applies even to fragment shaders; while fragment shader outputs are always written to the framebuffer in **rasterization order**, stores executed by fragment shader invocations are not.
- The relative execution order of invocations of different shader types is largely undefined.

The above limitations on shader invocation order make some forms of synchronization between shader invocations within a single set of primitives unimplementable. For example, having one invocation poll memory written by another invocation assumes that the other invocation has been launched and will complete its writes in finite time.

The **Memory Model** appendix defines the terminology and rules for how to correctly communicate between shader invocations, such as when a write is **Visible-To** a read, and what constitutes a **Data Race**.

Applications **must** not cause a data race.

The SPIR-V **SubgroupMemory**, **CrossWorkgroupMemory**, and **AtomicCounterMemory** memory semantics are ignored. Sequentially consistent atomics and barriers are not supported and **SequentiallyConsistent** is treated as **AcquireRelease**. **SequentiallyConsistent** should **not** be used.

### 9.7. Shader Inputs and Outputs

Data is passed into and out of shaders using variables with input or output storage class, respectively. User-defined inputs and outputs are connected between stages by matching their **Location** decorations. Additionally, data **can** be provided by or communicated to special functions provided by the execution environment using **BuiltIn** decorations.

In many cases, the same **BuiltIn** decoration **can** be used in multiple shader stages with similar meaning. The specific behavior of variables decorated as **BuiltIn** is documented in the following sections.

### 9.8. Task Shaders

Task shaders operate in conjunction with the mesh shaders to produce a collection of primitives that will be processed by subsequent stages of the graphics pipeline. Its primary purpose is to create a variable amount of subsequent mesh shader invocations.

Task shaders are invoked via the execution of the **programmable mesh shading** pipeline.
The task shader has no fixed-function inputs other than variables identifying the specific workgroup and invocation. In the TaskNV Execution Model the number of mesh shader workgroups to create is specified via a TaskCountNV decorated output variable. In the TaskEXT Execution Model the number of mesh shader workgroups to create is specified via the OpEmitMeshTasksEXT instruction.

The task shader can write additional outputs to task memory, which can be read by all of the mesh shader workgroups it created.

9.8.1. Task Shader Execution

Task workloads are formed from groups of work items called workgroups and processed by the task shader in the current graphics pipeline. A workgroup is a collection of shader invocations that execute the same shader, potentially in parallel. Task shaders execute in global workgroups which are divided into a number of local workgroups with a size that can be set by assigning a value to the LocalSize or LocalSizeId execution mode or via an object decorated by the WorkgroupSize decoration. An invocation within a local workgroup can share data with other members of the local workgroup through shared variables and issue memory and control flow barriers to synchronize with other members of the local workgroup. If the subpass includes multiple views in its view mask, a Task shader using TaskEXT Execution Model may be invoked separately for each view.

9.9. Mesh Shaders

Mesh shaders operate in workgroups to produce a collection of primitives that will be processed by subsequent stages of the graphics pipeline. Each workgroup emits zero or more output primitives and the group of vertices and their associated data required for each output primitive.

Mesh shaders are invoked via the execution of the programmable mesh shading pipeline.

The only inputs available to the mesh shader are variables identifying the specific workgroup and invocation and, if applicable, any outputs written to task memory by the task shader that spawned the mesh shader's workgroup. The mesh shader can operate without a task shader as well.

The invocations of the mesh shader workgroup write an output mesh, comprising a set of primitives with per-primitive attributes, a set of vertices with per-vertex attributes, and an array of indices identifying the mesh vertices that belong to each primitive. The primitives of this mesh are then processed by subsequent graphics pipeline stages, where the outputs of the mesh shader form an interface with the fragment shader.

9.9.1. Mesh Shader Execution

Mesh workloads are formed from groups of work items called workgroups and processed by the mesh shader in the current graphics pipeline. A workgroup is a collection of shader invocations that execute the same shader, potentially in parallel. Mesh shaders execute in global workgroups which are divided into a number of local workgroups with a size that can be set by assigning a value to the LocalSize or LocalSizeId execution mode or via an object decorated by the WorkgroupSize decoration. An invocation within a local workgroup can share data with other members of the local workgroup through shared variables and issue memory and control flow barriers to synchronize with other members of the local workgroup.
The global workgroups may be generated explicitly via the API, or implicitly through the task shader's work creation mechanism. If the subpass includes multiple views in its view mask, a Mesh shader using MeshEXT Execution Model may be invoked separately for each view.

9.10. Cluster Culling Shaders

Cluster Culling shaders are invoked via the execution of the Programmable Cluster Culling Shading pipeline.

The only inputs available to the cluster culling shader are variables identifying the specific workgroup and invocation.

Cluster Culling shaders operate in workgroups to perform cluster-based culling and produce zero or more cluster drawing command that will be processed by subsequent stages of the graphics pipeline.

The Cluster Drawing Command(CDC) is very similar to the MDI command, invocations in workgroup can emit zero of more CDC to draw zero or more visible cluster.

9.10.1. Cluster Culling Shader Execution

Cluster Culling workloads are formed from groups of work items called workgroups and processed by the cluster culling shader in the current graphics pipeline. A workgroup is a collection of shader invocations that execute the same shader, potentially in parallel. Cluster Culling shaders execute in global workgroups which are divided into a number of local workgroups with a size that can be set by assigning a value to the LocalSize or LocalSizeId execution mode or via an object decorated by the WorkgroupSize decoration. An invocation within a local workgroup can share data with other members of the local workgroup through shared variables and issue memory and control flow barriers to synchronize with other members of the local workgroup.

9.11. Vertex Shaders

Each vertex shader invocation operates on one vertex and its associated vertex attribute data, and outputs one vertex and associated data. Graphics pipelines using primitive shading must include a vertex shader, and the vertex shader stage is always the first shader stage in the graphics pipeline.

9.11.1. Vertex Shader Execution

A vertex shader must be executed at least once for each vertex specified by a drawing command. If the subpass includes multiple views in its view mask, the shader may be invoked separately for each view. During execution, the shader is presented with the index of the vertex and instance for which it has been invoked. Input variables declared in the vertex shader are filled by the implementation with the values of vertex attributes associated with the invocation being executed.

If the same vertex is specified multiple times in a drawing command (e.g. by including the same index value multiple times in an index buffer) the implementation may reuse the results of vertex shading if it can statically determine that the vertex shader invocations will produce identical results.
It is implementation-dependent when and if results of vertex shading are reused, and thus how many times the vertex shader will be executed. This is true also if the vertex shader contains stores or atomic operations (see vertexPipelineStoresAndAtomics).

9.12. Tessellation Control Shaders

The tessellation control shader is used to read an input patch provided by the application and to produce an output patch. Each tessellation control shader invocation operates on an input patch (after all control points in the patch are processed by a vertex shader) and its associated data, and outputs a single control point of the output patch and its associated data, and can also output additional per-patch data. The input patch is sized according to the patchControlPoints member of VkPipelineTessellationStateCreateInfo, as part of input assembly.

The input patch can also be dynamically sized with patchControlPoints parameter of vkCmdSetPatchControlPointsEXT.

To dynamically set the number of control points per patch, call:

```c
// Provided by VK_EXT_extended_dynamic_state2, VK_EXT_shader_object
void vkCmdSetPatchControlPointsEXT(
    VkCommandBuffer commandBuffer,        // Provided by VK_EXT_extended_dynamic_state2, VK_EXT_shader_object
    uint32_t patchControlPoints);         // Provided by VK_EXT_extended_dynamic_state2, VK_EXT_shader_object
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `patchControlPoints` specifies the number of control points per patch.

This command sets the number of control points per patch for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineTessellationStateCreateInfo::patchControlPoints value used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetPatchControlPointsEXT-None-09422
  At least one of the following must be true:
  - The extendedDynamicState2PatchControlPoints feature is enabled
  - The shaderObject feature is enabled
- VUID-vkCmdSetPatchControlPointsEXT-patchControlPoints-04874
  patchControlPoints must be greater than zero and less than or equal to VkPhysicalDeviceLimits::maxTessellationPatchSize
Valid Usage (Implicit)

- VUID-vkCmdSetPatchControlPointsEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetPatchControlPointsEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetPatchControlPointsEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetPatchControlPointsEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

The size of the output patch is controlled by the `OpExecutionMode OutputVertices` specified in the tessellation control or tessellation evaluation shaders, which must be specified in at least one of the shaders. The size of the input and output patches must each be greater than zero and less than or equal to `VkPhysicalDeviceLimits::maxTessellationPatchSize`.

9.12.1. Tessellation Control Shader Execution

A tessellation control shader is invoked at least once for each `output` vertex in a patch. If the subpass includes multiple views in its view mask, the shader may be invoked separately for each view.

Inputs to the tessellation control shader are generated by the vertex shader. Each invocation of the tessellation control shader can read the attributes of any incoming vertices and their associated data. The invocations corresponding to a given patch execute logically in parallel, with undefined relative execution order. However, the `OpControlBarrier` instruction can be used to provide limited control of the execution order by synchronizing invocations within a patch, effectively dividing tessellation control shader execution into a set of phases. Tessellation control shaders will read
undefined values if one invocation reads a per-vertex or per-patch output written by another invocation at any point during the same phase, or if two invocations attempt to write different values to the same per-patch output in a single phase.

9.13. Tessellation Evaluation Shaders

The Tessellation Evaluation Shader operates on an input patch of control points and their associated data, and a single input barycentric coordinate indicating the invocation's relative position within the subdivided patch, and outputs a single vertex and its associated data.

9.13.1. Tessellation Evaluation Shader Execution

A tessellation evaluation shader is invoked at least once for each unique vertex generated by the tessellator. If the subpass includes multiple views in its view mask, the shader may be invoked separately for each view.

The geometry shader operates on a group of vertices and their associated data assembled from a single input primitive, and emits zero or more output primitives and the group of vertices and their associated data required for each output primitive.

A geometry shader is invoked at least once for each primitive produced by the tessellation stages, or at least once for each primitive generated by primitive assembly when tessellation is not in use. A shader can request that the geometry shader runs multiple instances. A geometry shader is invoked at least once for each instance. If the subpass includes multiple views in its view mask, the shader may be invoked separately for each view.

9.15. Fragment Shaders

Fragment shaders are invoked as a fragment operation in a graphics pipeline. Each fragment shader invocation operates on a single fragment and its associated data. With few exceptions, fragment shaders do not have access to any data associated with other fragments and are considered to execute in isolation of fragment shader invocations associated with other fragments.

9.16. Compute Shaders

Compute shaders are invoked via vkCmdDispatch and vkCmdDispatchIndirect commands. In general, they have access to similar resources as shader stages executing as part of a graphics pipeline.

Compute workloads are formed from groups of work items called workgroups and processed by the compute shader in the current compute pipeline. A workgroup is a collection of shader invocations that execute the same shader, potentially in parallel. Compute shaders execute in global workgroups which are divided into a number of local workgroups with a size that can be set by
assigning a value to the `LocalSize` or `LocalSizeId` execution mode or via an object decorated by the `WorkgroupSize` decoration. An invocation within a local workgroup can share data with other members of the local workgroup through shared variables and issue memory and control flow barriers to synchronize with other members of the local workgroup.

9.17. Ray Generation Shaders

A ray generation shader is similar to a compute shader. Its main purpose is to execute ray tracing queries using pipeline trace ray instructions (such as `OpTraceRayKHR`) and process the results.

9.17.1. Ray Generation Shader Execution

One ray generation shader is executed per ray tracing dispatch. Its location in the shader binding table (see Shader Binding Table for details) is passed directly into `vkCmdTraceRaysKHR` using the `pRaygenShaderBindingTable` parameter or `vkCmdTraceRaysNV` using the `raygenShaderBindingTableBuffer` and `raygenShaderBindingOffset` parameters.

9.18. Intersection Shaders

Intersection shaders enable the implementation of arbitrary, application defined geometric primitives. An intersection shader for a primitive is executed whenever its axis-aligned bounding box is hit by a ray.

Like other ray tracing shader domains, an intersection shader operates on a single ray at a time. It also operates on a single primitive at a time. It is therefore the purpose of an intersection shader to compute the ray-primitive intersections and report them. To report an intersection, the shader calls the `OpReportIntersectionKHR` instruction.

An intersection shader communicates with any-hit and closest shaders by generating attribute values that they can read. Intersection shaders cannot read or modify the ray payload.

9.18.1. Intersection Shader Execution

The order in which intersections are found along a ray, and therefore the order in which intersection shaders are executed, is unspecified.

The intersection shader of the closest AABB which intersects the ray is guaranteed to be executed at some point during traversal, unless the ray is forcibly terminated.

9.19. Any-Hit Shaders

The any-hit shader is executed after the intersection shader reports an intersection that lies within the current \([t_{\text{min}}, t_{\text{max}}]\) of the ray. The main use of any-hit shaders is to programmatically decide whether or not an intersection will be accepted. The intersection will be accepted unless the shader calls the `OpIgnoreIntersectionKHR` instruction. Any-hit shaders have read-only access to the attributes generated by the corresponding intersection shader, and can read or modify the ray payload.
9.19.1. Any-Hit Shader Execution

The order in which intersections are found along a ray, and therefore the order in which any-hit shaders are executed, is unspecified.

The any-hit shader of the closest hit is guaranteed to be executed at some point during traversal, unless the ray is forcibly terminated.

9.20. Closest Hit Shaders

Closest hit shaders have read-only access to the attributes generated by the corresponding intersection shader, and can read or modify the ray payload. They also have access to a number of system-generated values. Closest hit shaders can call pipeline trace ray instructions to recursively trace rays.

9.20.1. Closest Hit Shader Execution

Exactly one closest hit shader is executed when traversal is finished and an intersection has been found and accepted.

9.21. Miss Shaders

Miss shaders can access the ray payload and can trace new rays through the pipeline trace ray instructions, but cannot access attributes since they are not associated with an intersection.

9.21.1. Miss Shader Execution

A miss shader is executed instead of a closest hit shader if no intersection was found during traversal.

9.22. Callable Shaders

Callable shaders can access a callable payload that works similarly to ray payloads to do subroutine work.

9.22.1. Callable Shader Execution

A callable shader is executed by calling OpExecuteCallableKHR from an allowed shader stage.

9.23. Interpolation Decorations

Variables in the Input storage class in a fragment shader's interface are interpolated from the values specified by the primitive being rasterized.

NOTE Interpolation decorations can be present on input and output variables in pre-rasterization shaders but have no effect on the interpolation performed.
An undecorated input variable will be interpolated with perspective-correct interpolation according to the primitive type being rasterized. Lines and polygons are interpolated in the same way as the primitive’s clip coordinates. If the NoPerspective decoration is present, linear interpolation is instead used for lines and polygons. For points, as there is only a single vertex, input values are never interpolated and instead take the value written for the single vertex.

If the Flat decoration is present on an input variable, the value is not interpolated, and instead takes its value directly from the provoking vertex. Fragment shader inputs that are signed or unsigned integers, integer vectors, or any double-precision floating-point type must be decorated with Flat.

Interpolation of input variables is performed at an implementation-defined position within the fragment area being shaded. The position is further constrained as follows:

- If the Centroid decoration is used, the interpolation position used for the variable must also fall within the bounds of the primitive being rasterized.
- If the Sample decoration is used, the interpolation position used for the variable must be at the position of the sample being shaded by the current fragment shader invocation.
- If a sample count of 1 is used, the interpolation position must be at the center of the fragment area.

**NOTE** As Centroid restricts the possible interpolation position to the covered area of the primitive, the position can be forced to vary between neighboring fragments when it otherwise would not. Derivatives calculated based on these differing locations can produce inconsistent results compared to undecorated inputs. It is recommended that input variables used in derivative calculations are not decorated with Centroid.

If the PerVertexKHR decoration is present on an input variable, the value is not interpolated, and instead values from all input vertices are available in an array. Each index of the array corresponds to one of the vertices of the primitive that produced the fragment.

If the CustomInterpAMD decoration is present on an input variable, the value cannot be accessed directly; instead the extended instruction InterpolateAtVertexAMD must be used to obtain values from the input vertices.

### 9.24. Static Use

A SPIR-V module declares a global object in memory using the OpVariable instruction, which results in a pointer x to that object. A specific entry point in a SPIR-V module is said to statically use that object if that entry point's call tree contains a function containing a instruction with x as an id operand. A shader entry point also statically uses any variables explicitly declared in its interface.

### 9.25. Scope

A scope describes a set of shader invocations, where each such set is a scope instance. Each invocation belongs to one or more scope instances, but belongs to no more than one scope instance for each scope.
The operations available between invocations in a given scope instance vary, with smaller scopes generally able to perform more operations, and with greater efficiency.

### 9.25.1. Cross Device

All invocations executed in a Vulkan instance fall into a single *cross device scope instance*.

Whilst the `CrossDevice` scope is defined in SPIR-V, it is disallowed in Vulkan. API synchronization commands can be used to communicate between devices.

### 9.25.2. Device

All invocations executed on a single device form a *device scope instance*.

If the `vulkanMemoryModel` and `vulkanMemoryModelDeviceScope` features are enabled, this scope is represented in SPIR-V by the `Device Scope`, which can be used as a `Memory Scope` for barrier and atomic operations.

If both the `shaderDeviceClock` and `vulkanMemoryModelDeviceScope` features are enabled, using the `Device Scope` with the `OpReadClockKHR` instruction will read from a clock that is consistent across invocations in the same device scope instance.

There is no method to synchronize the execution of these invocations within SPIR-V, and this can only be done with API synchronization primitives.

Invocations executing on different devices in a device group operate in separate device scope instances.

### 9.25.3. Queue Family

Invocations executed by queues in a given queue family form a *queue family scope instance*.

This scope is identified in SPIR-V as the `QueueFamily Scope` if the `vulkanMemoryModel` feature is enabled, or if not, the `Device Scope`, which can be used as a `Memory Scope` for barrier and atomic operations.

If the `shaderDeviceClock` feature is enabled, but the `vulkanMemoryModelDeviceScope` feature is not enabled, using the `Device Scope` with the `OpReadClockKHR` instruction will read from a clock that is consistent across invocations in the same queue family scope instance.

There is no method to synchronize the execution of these invocations within SPIR-V, and this can only be done with API synchronization primitives.

Each invocation in a queue family scope instance must be in the same *device scope instance*.

### 9.25.4. Command

Any shader invocations executed as the result of a single command such as `vkCmdDispatch` or `vkCmdDraw` form a *command scope instance*. For indirect drawing commands with `drawCount` greater than one, invocations from separate draws are in separate command scope instances. For
ray tracing shaders, an invocation group is an implementation-dependent subset of the set of shader invocations of a given shader stage which are produced by a single trace rays command.

There is no specific Scope for communication across invocations in a command scope instance. As this has a clear boundary at the API level, coordination here can be performed in the API, rather than in SPIR-V.

Each invocation in a command scope instance must be in the same queue-family scope instance.

For shaders without defined workgroups, this set of invocations forms an invocation group as defined in the SPIR-V specification.

### 9.25.5. Primitive

Any fragment shader invocations executed as the result of rasterization of a single primitive form a primitive scope instance.

There is no specific Scope for communication across invocations in a primitive scope instance.

Any generated helper invocations are included in this scope instance.

Each invocation in a primitive scope instance must be in the same command scope instance.

Any input variables decorated with Flat are uniform within a primitive scope instance.

### 9.25.6. Shader Call

Any shader-call-related invocations that are executed in one or more ray tracing execution models form a shader call scope instance.

The ShaderCallKHR Scope can be used as Memory Scope for barrier and atomic operations.

Each invocation in a shader call scope instance must be in the same queue family scope instance.

### 9.25.7. Workgroup

A local workgroup is a set of invocations that can synchronize and share data with each other using memory in the Workgroup storage class.

The Workgroup Scope can be used as both an Execution Scope and Memory Scope for barrier and atomic operations.

Each invocation in a local workgroup must be in the same command scope instance.

Only task, mesh, and compute shaders have defined workgroups - other shader types cannot use workgroup functionality. For shaders that have defined workgroups, this set of invocations forms an invocation group as defined in the SPIR-V specification.

When variables declared with the Workgroup storage class are explicitly laid out (hence they are also decorated with Block), the amount of storage consumed is the size of the largest Block variable, not counting any padding at the end. The amount of storage consumed by the non-Block variables
declared with the Workgroup storage class is implementation-dependent. However, the amount of storage consumed may not exceed the largest block size that would be obtained if all active non-Block variables declared with Workgroup storage class were assigned offsets in an arbitrary order by successively taking the smallest valid offset according to the Standard Storage Buffer Layout rules, and with Boolean values considered as 32-bit integer values for the purpose of this calculation. (This is equivalent to using the GLSL std430 layout rules.)

### 9.25.8. Subgroup

A **subgroup** (see the subsection “Control Flow” of section 2 of the SPIR-V 1.3 Revision 1 specification) is a set of invocations that can synchronize and share data with each other efficiently.

The **Subgroup Scope** can be used as both an **Execution Scope** and **Memory Scope** for barrier and atomic operations. Other **subgroup features** allow the use of **group operations** with subgroup scope.

If the shaderSubgroupClock feature is enabled, using the Subgroup Scope with the OpReadClockKHR instruction will read from a clock that is consistent across invocations in the same subgroup.

For shaders that have defined workgroups, each invocation in a subgroup **must** be in the same **local workgroup**.

In other shader stages, each invocation in a subgroup **must** be in the same **device scope instance**.

Only shader stages that support subgroup operations have defined subgroups.

In shaders, there are two kinds of uniformity that are of primary interest to applications: uniform within an invocation group (a.k.a. dynamically uniform), and uniform within a subgroup scope.

While one could make the assumption that being uniform in invocation group implies being uniform in subgroup scope, it is not necessarily the case for shader stages without defined workgroups.

For shader stages with defined workgroups however, the relationship between invocation group and subgroup scope is well defined as a subgroup is a subset of the workgroup, and the workgroup is the invocation group. If a value is uniform in invocation group, it is by definition also uniform in subgroup scope. This is important if writing code like:

```glsl
uniform texture2D Textures[];
uint dynamicallyUniformValue = gl_WorkGroupID.x;
vec4 value = texelFetch(Textures[dynamicallyUniformValue], coord, 0);

// subgroupUniformValue is guaranteed to be uniform within the subgroup.
// This value also happens to be dynamically uniform.
vec4 subgroupUniformValue = subgroupBroadcastFirst(dynamicallyUniformValue);
```

In shader stages without defined workgroups, this gets complicated. Due to scoping
rules, there is no guarantee that a subgroup is a subset of the invocation group, which in turn defines the scope for dynamically uniform. In graphics, the invocation group is a single draw command, except for multi-draw situations, and indirect draws with drawCount > 1, where there are multiple invocation groups, one per DrawIndex.

```cpp
// Assume SubgroupSize = 8, where 3 draws are packed together.
// Two subgroups were generated.
uniform texture2D Textures[];

// DrawIndex builtin is dynamically uniform
uint dynamicallyUniformValue = gl_DrawID;
//          | gl_DrawID = 0 | gl_DrawID = 1 |
// Subgroup 0: { 0, 0, 0, 0, 1, 1, 1, 1 }
//          | DrawID = 2 | DrawID = 1 |
// Subgroup 1: { 2, 2, 2, 2, 1, 1, 1, 1 }

uint notActuallyDynamicallyUniformAnymore =
  subgroupBroadcastFirst(dynamicallyUniformValue);
//          | gl_DrawID = 0 | gl_DrawID = 1 |
// Subgroup 0: { 0, 0, 0, 0, 0, 0, 0, 0 }
//          | gl_DrawID = 2 | gl_DrawID = 1 |
// Subgroup 1: { 2, 2, 2, 2, 2, 2, 2, 2 }

// Bug. gl_DrawID = 1's invocation group observes both index 0 and 2.
vec4 value = texelFetch(Textures[notActuallyDynamicallyUniformAnymore], coord, 0);
```

Another problematic scenario is when a shader attempts to help the compiler notice that a value is uniform in subgroup scope to potentially improve performance.

```cpp
layout(location = 0) flat in dynamicallyUniformIndex;
// Vertex shader might have emitted a value that depends only on gl_DrawID,
// making it dynamically uniform.
// Give knowledge to compiler that the flat input is dynamically uniform,
// as this is not a guarantee otherwise.

uint uniformIndex = subgroupBroadcastFirst(dynamicallyUniformIndex);
// Hazard: If different draw commands are packed into one subgroup, the uniformIndex is wrong.

DrawData d = UBO.perDrawData[uniformIndex];
```

For implementations where subgroups are packed across draws, the implementation must make sure to handle descriptor indexing correctly. From the specification’s point of view, a dynamically uniform index does not require
NonUniform decoration, and such an implementation will likely either promote descriptor indexing into NonUniform on its own, or handle non-uniformity implicitly.

9.25.9. Quad

A quad scope instance is formed of four shader invocations.

In a fragment shader, each invocation in a quad scope instance is formed of invocations in neighboring framebuffer locations \((x_i, y_i)\), where:

- \(i\) is the index of the invocation within the scope instance.
- \(w\) and \(h\) are the number of pixels the fragment covers in the \(x\) and \(y\) axes.
- \(w\) and \(h\) are identical for all participating invocations.
- \((x_0) = (x_1 - w) = (x_2) = (x_3 - w)\)
- \((y_0) = (y_1) = (y_2 - h) = (y_3 - h)\)
- Each invocation has the same layer and sample indices.

In a compute shader, if the DerivativeGroupQuadsNV execution mode is specified, each invocation in a quad scope instance is formed of invocations with adjacent local invocation IDs \((x_i, y_i)\), where:

- \(i\) is the index of the invocation within the quad scope instance.
- \((x_0) = (x_1 - 1) = (x_2) = (x_3 - 1)\)
- \((y_0) = (y_1) = (y_2 - 1) = (y_3 - 1)\)
- \(x_0\) and \(y_0\) are integer multiples of 2.
- Each invocation has the same \(z\) coordinate.

In a compute shader, if the DerivativeGroupLinearNV execution mode is specified, each invocation in a quad scope instance is formed of invocations with adjacent local invocation indices \((l_i)\), where:

- \(i\) is the index of the invocation within the quad scope instance.
- \((l_0) = (l_1 - 1) = (l_2 - 2) = (l_3 - 3)\)
- \(l_0\) is an integer multiple of 4.

In all shaders, each invocation in a quad scope instance is formed of invocations in adjacent subgroup invocation indices \((s_i)\), where:

- \(i\) is the index of the invocation within the quad scope instance.
- \((s_0) = (s_1 - 1) = (s_2 - 2) = (s_3 - 3)\)
- \(s_0\) is an integer multiple of 4.

Each invocation in a quad scope instance must be in the same subgroup.

In a fragment shader, each invocation in a quad scope instance must be in the same primitive scope instance.
Fragment and compute shaders have defined quad scope instances. If the `quadOperationsInAllStages` limit is supported, any shader stages that support subgroup operations also have defined quad scope instances.

### 9.25.10. Fragment Interlock

A fragment interlock scope instance is formed of fragment shader invocations based on their framebuffer locations \((x,y,layer,sample)\), executed by commands inside a single subpass.

The specific set of invocations included varies based on the execution mode as follows:

- If the `SampleInterlockOrderedEXT` or `SampleInterlockUnorderedEXT` execution modes are used, only invocations with identical framebuffer locations \((x,y,layer,sample)\) are included.
- If the `PixelInterlockOrderedEXT` or `PixelInterlockUnorderedEXT` execution modes are used, fragments with different sample ids are also included.
- If the `ShadingRateInterlockOrderedEXT` or `ShadingRateInterlockUnorderedEXT` execution modes are used, fragments from neighboring framebuffer locations are also included. The shading rate image or fragment shading rate determines these fragments.

Only fragment shaders with one of the above execution modes have defined fragment interlock scope instances.

There is no specific Scope value for communication across invocations in a fragment interlock scope instance. However, this is implicitly used as a memory scope by `OpBeginInvocationInterlockEXT` and `OpEndInvocationInterlockEXT`.

Each invocation in a fragment interlock scope instance **must** be in the same queue family scope instance.

### 9.25.11. Invocation

The smallest scope is a single invocation; this is represented by the Invocation Scope in SPIR-V.

Fragment shader invocations **must** be in a primitive scope instance.

Invocations in fragment shaders that have a defined fragment interlock scope **must** be in a fragment interlock scope instance.

Invocations in shaders that have defined workgroups **must** be in a local workgroup.

Invocations in shaders that have a defined subgroup scope **must** be in a subgroup.

Invocations in shaders that have a defined quad scope **must** be in a quad scope instance.

All invocations in all stages **must** be in a command scope instance.

*Group operations* are executed by multiple invocations within a scope instance; with each
invocation involved in calculating the result. This provides a mechanism for efficient communication between invocations in a particular scope instance.

Group operations all take a Scope defining the desired scope instance to operate within. Only the Subgroup scope can be used for these operations; the subgroupSupportedOperations limit defines which types of operation can be used.

Basic group operations include the use of OpGroupNonUniformElect, OpControlBarrier, OpMemoryBarrier, and atomic operations.

OpGroupNonUniformElect can be used to choose a single invocation to perform a task for the whole group. Only the invocation with the lowest id in the group will return true.

The Memory Model appendix defines the operation of barriers and atomics.

9.26.2. Vote Group Operations

The vote group operations allow invocations within a group to compare values across a group. The types of votes enabled are:

- Do all active group invocations agree that an expression is true?
- Do any active group invocations evaluate an expression to true?
- Do all active group invocations have the same value of an expression?

NOTE These operations are useful in combination with control flow in that they allow for developers to check whether conditions match across the group and choose potentially faster code-paths in these cases.

9.26.3. Arithmetic Group Operations

The arithmetic group operations allow invocations to perform scans and reductions across a group. The supported operators are add, mul, min, max, and, or, xor.

For reductions, every invocation in a group will obtain the cumulative result of these operators applied to all values in the group. For exclusive scans, each invocation in a group will obtain the cumulative result of these operators applied to all values in invocations with a lower index in the group. Inclusive scans are identical to exclusive scans, except the cumulative result includes the operator applied to the value in the current invocation.

The order in which these operators are applied is implementation-dependent.

The ballot group operations allow invocations to perform more complex votes across the group. The ballot functionality allows all invocations within a group to provide a boolean value and get as a result what each invocation provided as their boolean value. The broadcast functionality allows
values to be broadcast from an invocation to all other invocations within the group.

9.26.5. Shuffle Group Operations

The shuffle group operations allow invocations to read values from other invocations within a group.

The shuffle relative group operations allow invocations to read values from other invocations within the group relative to the current invocation in the group. The relative operations supported allow data to be shifted up and down through the invocations within a group.

9.26.7. Clustered Group Operations

The clustered group operations allow invocations to perform an operation among partitions of a group, such that the operation is only performed within the group invocations within a partition. The partitions for clustered group operations are consecutive power-of-two size groups of invocations and the cluster size must be known at pipeline creation time. The operations supported are add, mul, min, max, and, or, xor.

The rotate group operations allow invocations to read values from other invocations within the group relative to the current invocation and modulo the size of the group. Clustered rotate group operations perform the same operation within individual partitions of a group.

The partitions for clustered rotate group operations are consecutive power-of-two size groups of invocations and the cluster size must be known at pipeline creation time.

9.27. Quad Group Operations

Quad group operations (OpGroupNonUniformQuad*) are a specialized type of group operations that only operate on quad scope instances. Whilst these instructions do include a Scope parameter, this scope is always overridden; only the quad scope instance is included in its execution scope.

Fragment shaders that statically execute either OpGroupNonUniformQuadBroadcast or OpGroupNonUniformQuadSwap must launch sufficient invocations to ensure their correct operation; additional helper invocations are launched for framebuffer locations not covered by rasterized fragments if necessary.

The index used to select participating invocations is i, as described for a quad scope instance, defined as the quad index in the SPIR-V specification.

For OpGroupNonUniformQuadBroadcast this value is equal to Index. For OpGroupNonUniformQuadSwap, it is equal to the implicit Index used by each participating invocation.
9.28. Derivative Operations

Derivative operations calculate the partial derivative for an expression \( P \) as a function of an invocation’s \( x \) and \( y \) coordinates.

Derivative operations operate on a set of invocations known as a derivative group as defined in the SPIR-V specification.

A derivative group in a fragment shader is equivalent to the quad scope instance if the QuadDerivativesKHR execution mode is specified, otherwise it is equivalent to the primitive scope instance. A derivative group in a compute shader is equivalent to the quad scope instance.

Derivatives are calculated assuming that \( P \) is piecewise linear and continuous within the derivative group.

The following control-flow restrictions apply to derivative operations:

- If the QuadDerivativesKHR execution mode is specified, dynamic instances of any derivative operations must be executed in control flow that is uniform within the current quad scope instance.

- If the QuadDerivativesKHR execution mode is not specified:
  - dynamic instances of explicit derivative instructions (OpDPdx*, OpDPdy*, and OpFwidth*) must be executed in control flow that is uniform within a derivative group.
  - dynamic instances of implicit derivative operations can be executed in control flow that is not uniform within the derivative group, but results are undefined.

Fragment shaders that statically execute derivative operations must launch sufficient invocations to ensure their correct operation; additional helper invocations are launched for framebuffer locations not covered by rasterized fragments if necessary.

**NOTE** In a compute shader, it is the application’s responsibility to ensure that sufficient invocations are launched.

Derivative operations calculate their results as the difference between the result of \( P \) across invocations in the quad. For fine derivative operations (OpDPdxFine and OpDPdyFine), the values of \( \text{DPdx}(P) \) are calculated as

\[
\text{DPdx}(P_0) = \text{DPdx}(P_1) = P_1 - P_0
\]

\[
\text{DPdx}(P_2) = \text{DPdx}(P_3) = P_3 - P_2
\]

and the values of \( \text{DPdy}(P) \) are calculated as

\[
\text{DPdy}(P_0) = \text{DPdy}(P_2) = P_2 - P_0
\]
DPdy(P_i) = DPdy(P_j) = P_j - P_i

where i is the index of each invocation as described in Quad.

Coarse derivative operations (OpDPdxCoarse and OpDPdyCoarse), calculate their results in roughly the same manner, but may only calculate two values instead of four (one for each of DPdx and DPdy), reusing the same result no matter the originating invocation. If an implementation does this, it should use the fine derivative calculations described for P_0.

NOTE

Derivative values are calculated between fragments rather than pixels. If the fragment shader invocations involved in the calculation cover multiple pixels, these operations cover a wider area, resulting in larger derivative values. This in turn will result in a coarser LOD being selected for image sampling operations using derivatives.

Applications may want to account for this when using multi-pixel fragments; if pixel derivatives are desired, applications should use explicit derivative operations and divide the results by the size of the fragment in each dimension as follows:

\[
DPdx(P_n)' = \frac{DPdx(P_n)}{w}
\]

\[
DPdy(P_n)' = \frac{DPdy(P_n)}{h}
\]

where w and h are the size of the fragments in the quad, and DPdx(P_n)' and DPdy(P_n)' are the pixel derivatives.

The results for OpDPdx and OpDPdy may be calculated as either fine or coarse derivatives, with implementations favoring the most efficient approach. Implementations must choose coarse or fine consistently between the two.

Executing OpFwidthFine, OpFwidthCoarse, or OpFwidth is equivalent to executing the corresponding OpDPdx* and OpDPdy* instructions, taking the absolute value of the results, and summing them.

Executing an OpImage*Sample*ImplicitLod instruction is equivalent to executing OpDPdx(Coordinate) and OpDPdy(Coordinate), and passing the results as the Grad operands dx and dy.

NOTE

It is expected that using the ImplicitLod variants of sampling functions will be substantially more efficient than using the ExplicitLod variants with explicitly generated derivatives.

9.29. Helper Invocations

When performing derivative or quad group operations in a fragment shader, additional invocations may be spawned in order to ensure correct results. These additional invocations are known as helper invocations and can be identified by a non-zero value in the HelperInvocation
built-in. Stores and atomics performed by helper invocations must not have any effect on memory except for the Function, Private and Output storage classes, and values returned by atomic instructions in helper invocations are undefined.

NOTE While storage to Output storage class has an effect even in helper invocations, it does not mean that helper invocations have an effect on the framebuffer. Output variables in fragment shaders can be read from as well, and they behave more like Private variables for the duration of the shader invocation.

If the MaximallyReconvergesKHR execution mode is applied to the entry point, helper invocations must remain active for all instructions for the lifetime of the quad scope instance they are a part of. If the MaximallyReconvergesKHR execution mode is not applied to the entry point, helper invocations may be considered inactive for group operations other than derivative and quad group operations. All invocations in a quad scope instance may become permanently inactive at any point once the only remaining invocations in that quad scope instance are helper invocations.

9.30. Cooperative Matrices

A cooperative matrix type is a SPIR-V type where the storage for and computations performed on the matrix are spread across the invocations in a scope instance. These types give the implementation freedom in how to optimize matrix multiplies.

SPIR-V defines the types and instructions, but does not specify rules about what sizes/combinations are valid, and it is expected that different implementations may support different sizes.

To enumerate the supported cooperative matrix types and operations, call:

```c
// Provided by VK_KHR_cooperative_matrix
VkResult vkGetPhysicalDeviceCooperativeMatrixPropertiesKHR(
    VkPhysicalDevice physicalDevice,  // physicalDevice is the physical device.
    uint32_t* pPropertyCount,         // pPropertyCount is a pointer to an integer related to the number of cooperative matrix properties available or queried.
    VkCooperativeMatrixPropertiesKHR* pProperties  // pProperties is either NULL or a pointer to an array of VkCooperativeMatrixPropertiesKHR structures.
);
```

If `pProperties` is NULL, then the number of cooperative matrix properties available is returned in `pPropertyCount`. Otherwise, `pPropertyCount` must point to a variable set by the application to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If `pPropertyCount` is less than the number of cooperative matrix properties available, at most `pPropertyCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available cooperative matrix properties were returned.
Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesKHR-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesKHR-pPropertyCount-parameter
  `pPropertyCount` must be a valid pointer to a `uint32_t` value

- VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesKHR-pProperties-parameter
  If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not NULL, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkCooperativeMatrixPropertiesKHR` structures

Return Codes

Success

- VK_SUCCESS
- VK_INCOMPLETE

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To enumerate the supported cooperative matrix types and operations, call:

```c
// Provided by VK_NV_cooperative_matrix
VkResult vkGetPhysicalDeviceCooperativeMatrixPropertiesNV(
    VkPhysicalDevice physicalDevice,
    uint32_t* pPropertyCount,
    VkCooperativeMatrixPropertiesNV* pProperties);
```

- `physicalDevice` is the physical device.
- `pPropertyCount` is a pointer to an integer related to the number of cooperative matrix properties available or queried.
- `pProperties` is either NULL or a pointer to an array of `VkCooperativeMatrixPropertiesNV` structures.

If `pProperties` is NULL, then the number of cooperative matrix properties available is returned in `pPropertyCount`. Otherwise, `pPropertyCount` must point to a variable set by the application to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If `pPropertyCount` is less than the number of cooperative matrix properties available, at most `pPropertyCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available cooperative matrix properties were returned.
Valid Usage (Implicit)

• VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesNV-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

• VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesNV-pPropertyCount-parameter
  pPropertyCount must be a valid pointer to a uint32_t value

• VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesNV-pProperties-parameter
  If the value referenced by pPropertyCount is not 0, and pProperties is not NULL, pProperties must be a valid pointer to an array of pPropertyCount VkCooperativeMatrixPropertiesNV structures

Return Codes

Success

• VK_SUCCESS
• VK_INCOMPLETE

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

Each VkCooperativeMatrixPropertiesKHR or VkCooperativeMatrixPropertiesNV structure describes a single supported combination of types for a matrix multiply/add operation (OpCooperativeMatrixMulAddKHR or OpCooperativeMatrixMulAddNV). The multiply can be described in terms of the following variables and types (in SPIR-V pseudocode):

```
%A is of type OpTypeCooperativeMatrixKHR %AType %scope %MSize %KSize %MatrixAKHR
%B is of type OpTypeCooperativeMatrixKHR %BType %scope %KSize %NSize %MatrixBKHR
%C is of type OpTypeCooperativeMatrixKHR % CType %scope %MSize %NSize
%MatrixAccumulatorKHR
%Result is of type OpTypeCooperativeMatrixKHR %ResultType %scope %MSize %NSize
%MatrixAccumulatorKHR

%Result = %A * %B + %C // using OpCooperativeMatrixMulAddKHR
```

```
%A is of type OpTypeCooperativeMatrixNV %AType %scope %MSize %KSize
%B is of type OpTypeCooperativeMatrixNV %BType %scope %KSize %NSize
%C is of type OpTypeCooperativeMatrixNV % CType %scope %MSize %NSize
%D is of type OpTypeCooperativeMatrixNV % DType %scope %MSize %NSize

%D = %A * %B + %C // using OpCooperativeMatrixMulAddNV
```

A matrix multiply with these dimensions is known as an MxNxK matrix multiply.
The `VkCooperativeMatrixPropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_cooperative_matrix
typedef struct VkCooperativeMatrixPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    uint32_t MSize;
    uint32_t NSize;
    uint32_t KSize;
    VkComponentTypeKHR AType;
    VkComponentTypeKHR BType;
    VkComponentTypeKHR CType;
    VkComponentTypeKHR ResultType;
    VkBool32 saturatingAccumulation;
    VkScopeKHR scope;
} VkCooperativeMatrixPropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `MSize` is the number of rows in matrices `A`, `C`, and `Result`.
- `KSize` is the number of columns in matrix `A` and rows in matrix `B`.
- `NSize` is the number of columns in matrices `B`, `C`, `Result`.
- `AType` is the component type of matrix `A`, of type `VkComponentTypeKHR`.
- `BType` is the component type of matrix `B`, of type `VkComponentTypeKHR`.
- ` CType` is the component type of matrix `C`, of type `VkComponentTypeKHR`.
- `ResultType` is the component type of matrix `Result`, of type `VkComponentTypeKHR`.
- `saturatingAccumulation` indicates whether the `SaturatingAccumulation` operand to `OpCooperativeMatrixMulAddKHR` must be present or not. If it is `VK_TRUE`, the `SaturatingAccumulation` operand must be present. If it is `VK_FALSE`, the `SaturatingAccumulation` operand must not be present.
- `scope` is the scope of all the matrix types, of type `VkScopeKHR`.

If some types are preferred over other types (e.g. for performance), they should appear earlier in the list enumerated by `vkGetPhysicalDeviceCooperativeMatrixPropertiesKHR`.

At least one entry in the list must have power of two values for all of `MSize`, `KSize`, and `NSize`.

`scope` must be `VK_SCOPE_SUBGROUP_KHR`.

**Valid Usage (Implicit)**

- `VUID-VkCooperativeMatrixPropertiesKHR-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_COOPERATIVE_MATRIX_PROPERTIES_KHR`
- `VUID-VkCooperativeMatrixPropertiesKHR-pNext-pNext`
The `VkCooperativeMatrixPropertiesNV` structure is defined as:

```c
// Provided by VK_NV_cooperative_matrix
typedef struct VkCooperativeMatrixPropertiesNV {
    VkStructureType sType;
    void* pNext;
    uint32_t MSize;
    uint32_t NSize;
    uint32_t KSize;
    VkComponentTypeNV AType;
    VkComponentTypeNV BType;
    VkComponentTypeNV CType;
    VkComponentTypeNV DType;
    VkScopeNV scope;
} VkCooperativeMatrixPropertiesNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `MSize` is the number of rows in matrices A, C, and D.
- `KSize` is the number of columns in matrix A and rows in matrix B.
- `NSize` is the number of columns in matrices B, C, D.
- `AType` is the component type of matrix A, of type `VkComponentTypeNV`.
- `BType` is the component type of matrix B, of type `VkComponentTypeNV`.
- ` CType` is the component type of matrix C, of type `VkComponentTypeNV`.
- `DType` is the component type of matrix D, of type `VkComponentTypeNV`.
- `scope` is the scope of all the matrix types, of type `VkScopeNV`.

If some types are preferred over other types (e.g. for performance), they should appear earlier in the list enumerated by `vkGetPhysicalDeviceCooperativeMatrixPropertiesNV`.

At least one entry in the list must have power of two values for all of `MSize`, `KSize`, and `NSize`.

**Valid Usage (Implicit)**

- VUID-VkCooperativeMatrixPropertiesNV-sType-sType `sType` must be `VK_STRUCTURE_TYPE_COOPERATIVE_MATRIX_PROPERTIES_NV`
- VUID-VkCooperativeMatrixPropertiesNV-pNext-pNext `pNext` must be `NULL`

Possible values for `VkScopeKHR` include:
// Provided by VK_KHR_cooperative_matrix
typedef enum VkScopeKHR {
    VK_SCOPE_DEVICE_KHR = 1,
    VK_SCOPE_WORKGROUP_KHR = 2,
    VK_SCOPE_SUBGROUP_KHR = 3,
    VK_SCOPE_QUEUE_FAMILY_KHR = 5,
    // Provided by VK_NV_cooperative_matrix
    VK_SCOPE_DEVICE_NV = VK_SCOPE_DEVICE_KHR,
    // Provided by VK_NV_cooperative_matrix
    VK_SCOPE_WORKGROUP_NV = VK_SCOPE_WORKGROUP_KHR,
    // Provided by VK_NV_cooperative_matrix
    VK_SCOPE_SUBGROUP_NV = VK_SCOPE_SUBGROUP_KHR,
    // Provided by VK_NV_cooperative_matrix
    VK_SCOPE_QUEUE_FAMILY_NV = VK_SCOPE_QUEUE_FAMILY_KHR,
} VkScopeKHR;

or the equivalent

// Provided by VK_NV_cooperative_matrix
typedef VkScopeKHR VkScopeNV;

- VK_SCOPE_DEVICE_KHR corresponds to SPIR-V Device scope.
- VK_SCOPE_WORKGROUP_KHR corresponds to SPIR-V Workgroup scope.
- VK_SCOPE_SUBGROUP_KHR corresponds to SPIR-V Subgroup scope.
- VK_SCOPE_QUEUE_FAMILY_KHR corresponds to SPIR-V QueueFamily scope.

All enum values match the corresponding SPIR-V value.

Possible values for VkComponentTypeKHR include:
// Provided by VK_KHR_cooperative_matrix

typedef enum VkComponentTypeKHR {
    VK_COMPONENT_TYPE_FLOAT16_KHR = 0,
    VK_COMPONENT_TYPE_FLOAT32_KHR = 1,
    VK_COMPONENT_TYPE_FLOAT64_KHR = 2,
    VK_COMPONENT_TYPE_SINT8_KHR = 3,
    VK_COMPONENT_TYPE_SINT16_KHR = 4,
    VK_COMPONENT_TYPE_SINT32_KHR = 5,
    VK_COMPONENT_TYPE_SINT64_KHR = 6,
    VK_COMPONENT_TYPE_UINT8_KHR = 7,
    VK_COMPONENT_TYPE_UINT16_KHR = 8,
    VK_COMPONENT_TYPE_UINT32_KHR = 9,
    VK_COMPONENT_TYPE_UINT64_KHR = 10,
} VkComponentTypeKHR;

// Provided by VK_NV_cooperative_matrix

VkComponentTypeKHR

• VK_COMPONENT_TYPE_FLOAT16_KHR corresponds to SPIR-V OpTypeFloat 16.
• VK_COMPONENT_TYPE_FLOAT32_KHR corresponds to SPIR-V OpTypeFloat 32.
• VK_COMPONENT_TYPE_FLOAT64_KHR corresponds to SPIR-V OpTypeFloat 64.
• VK_COMPONENT_TYPE_SINT8_KHR corresponds to SPIR-V OpTypeInt 8 0/1.

or the equivalent

// Provided by VK_NV_cooperative_matrix

typedef VkComponentTypeKHR VkComponentTypeNV;

• VK_COMPONENT_TYPE_FLOAT16_KHR corresponds to SPIR-V OpTypeFloat 16.
• VK_COMPONENT_TYPE_FLOAT32_KHR corresponds to SPIR-V OpTypeFloat 32.
• VK_COMPONENT_TYPE_FLOAT64_KHR corresponds to SPIR-V OpTypeFloat 64.
• VK_COMPONENT_TYPE_SINT8_KHR corresponds to SPIR-V OpTypeInt 8 0/1.
9.31. Validation Cache

Validation cache objects allow the result of internal validation to be reused, both within a single application run and between multiple runs. Reuse within a single run is achieved by passing the same validation cache object when creating supported Vulkan objects. Reuse across runs of an application is achieved by retrieving validation cache contents in one run of an application, saving the contents, and using them to preinitialize a validation cache on a subsequent run. The contents of the validation cache objects are managed by the validation layers. Applications can manage the host memory consumed by a validation cache object and control the amount of data retrieved from a validation cache object.

Validation cache objects are represented by 

\[ 
\text{VkValidationCacheEXT} 
\]

To create validation cache objects, call:

\[
\begin{align*}
\text{VkResult} & \quad \text{vkCreateValidationCacheEXT}(
\quad \text{VkDevice} & \quad \text{device}, \\
\quad \text{const} & \quad \text{VkValidationCacheCreateInfoEXT} & \quad \text{pCreateInfo}, \\
\quad \text{const} & \quad \text{VkAllocationCallbacks} & \quad \text{pAllocator}, \\
\quad \text{VkValidationCacheEXT} & \quad \text{pValidationCache});
\end{align*}
\]

- \text{device} is the logical device that creates the validation cache object.
- \text{pCreateInfo} is a pointer to a \n\text{VkValidationCacheCreateInfoEXT} structure containing the initial parameters for the validation cache object.
- \text{pAllocator} controls host memory allocation as described in the Memory Allocation chapter.
- \text{pValidationCache} is a pointer to a \n\text{VkValidationCacheEXT} handle in which the resulting validation cache object is returned.

\text{Applications} can track and manage the total host memory size of a validation cache object using the \text{pAllocator}. Applications can limit the amount of data retrieved from a validation cache object in \text{vkGetValidationCacheDataEXT}. Implementations
should not internally limit the total number of entries added to a validation cache object or the total host memory consumed.

Once created, a validation cache can be passed to the `vkCreateShaderModule` command by adding this object to the `VkShaderModuleCreateInfo` structure's `pNext` chain. If a `VkShaderModuleValidationCacheCreateInfoEXT` object is included in the `VkShaderModuleCreateInfo::pNext` chain, and its `validationCache` field is not `VK_NULL_HANDLE`, the implementation will query it for possible reuse opportunities and update it with new content. The use of the validation cache object in these commands is internally synchronized, and the same validation cache object can be used in multiple threads simultaneously.

NOTE Implementations should make every effort to limit any critical sections to the actual accesses to the cache, which is expected to be significantly shorter than the duration of the `vkCreateShaderModule` command.

Valid Usage (Implicit)

- VUID-vkCreateValidationCacheEXT-device-parameter: `device` must be a valid `VkDevice` handle
- VUID-vkCreateValidationCacheEXT-pCreateInfo-parameter: `pCreateInfo` must be a valid pointer to a valid `VkValidationCacheCreateInfoEXT` structure
- VUID-vkCreateValidationCacheEXT-pAllocator-parameter: If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateValidationCacheEXT-pValidationCache-parameter: `pValidationCache` must be a valid pointer to a `VkValidationCacheEXT` handle

Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkValidationCacheCreateInfoEXT` structure is defined as:

---

699
typedef struct VkValidationCacheCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkValidationCacheCreateFlagsEXT flags;
    size_t initialDataSize;
    const void* pInitialData;
} VkValidationCacheCreateInfoEXT;

• **sType** is a VkStructureType value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **flags** is reserved for future use.
• **initialDataSize** is the number of bytes in **pInitialData**. If **initialDataSize** is zero, the validation cache will initially be empty.
• **pInitialData** is a pointer to previously retrieved validation cache data. If the validation cache data is incompatible (as defined below) with the device, the validation cache will be initially empty. If **initialDataSize** is zero, **pInitialData** is ignored.

## Valid Usage

• **VUID-VkValidationCacheCreateInfoEXT-initialDataSize-01534**
  If **initialDataSize** is not 0, it must be equal to the size of **pInitialData**, as returned by **vkGetValidationCacheDataEXT** when **pInitialData** was originally retrieved.

• **VUID-VkValidationCacheCreateInfoEXT-initialDataSize-01535**
  If **initialDataSize** is not 0, **pInitialData** must have been retrieved from a previous call to **vkGetValidationCacheDataEXT**.

## Valid Usage (Implicit)

• **VUID-VkValidationCacheCreateInfoEXT-sType-sType**
  **sType** must be VK_STRUCTURE_TYPE_VALIDATION_CACHE_CREATE_INFO_EXT.

• **VUID-VkValidationCacheCreateInfoEXT-pNext-pNext**
  **pNext** must be NULL.

• **VUID-VkValidationCacheCreateInfoEXT-flags-zerobitmask**
  **flags** must be 0.

• **VUID-VkValidationCacheCreateInfoEXT-pInitialData-parameter**
  If **initialDataSize** is not 0, **pInitialData** must be a valid pointer to an array of **initialDataSize** bytes.

// Provided by VK_EXT_validation_cache
typedef VkFlags VkValidationCacheCreateFlagsEXT;
VkValidationCacheCreateFlagsEXT is a bitmask type for setting a mask, but is currently reserved for future use.

Validation cache objects can be merged using the command:

```c
// Provided by VK_EXT_validation_cache
VkResult vkMergeValidationCachesEXT(
    VkDevice device,                  // Provided by VK_EXT_validation_cache
    VkValidationCacheEXT dstCache,    // Provided by VK_EXT_validation_cache
    uint32_t srcCacheCount,           // Provided by VK_EXT_validation_cache
    constVkValidationCacheEXT* pSrcCaches); // Provided by VK_EXT_validation_cache
```

- `device` is the logical device that owns the validation cache objects.
- `dstCache` is the handle of the validation cache to merge results into.
- `srcCacheCount` is the length of the `pSrcCaches` array.
- `pSrcCaches` is a pointer to an array of validation cache handles, which will be merged into `dstCache`. The previous contents of `dstCache` are included after the merge.

**NOTE**
The details of the merge operation are implementation-dependent, but implementations should merge the contents of the specified validation caches and prune duplicate entries.

**Valid Usage**

- `VUID-vkMergeValidationCachesEXT-dstCache-01536`
  `dstCache` must not appear in the list of source caches

**Valid Usage (Implicit)**

- `VUID-vkMergeValidationCachesEXT-device-parameter`
device must be a valid `VkDevice` handle
- `VUID-vkMergeValidationCachesEXT-dstCache-parameter`
dstCache must be a valid `VkValidationCacheEXT` handle
- `VUID-vkMergeValidationCachesEXT-pSrcCaches-parameter`
pSrcCaches must be a valid pointer to an array of `srcCacheCount` valid `VkValidationCacheEXT` handles
- `VUID-vkMergeValidationCachesEXT-srcCacheCount-arraylength`
  `srcCacheCount` must be greater than 0
- `VUID-vkMergeValidationCachesEXT-dstCache-parent`
dstCache must have been created, allocated, or retrieved from `device`
- `VUID-vkMergeValidationCachesEXT-pSrcCaches-parent`
  Each element of `pSrcCaches` must have been created, allocated, or retrieved from `device`
Host Synchronization

• Host access to dstCache must be externally synchronized

Return Codes

Success

• VK_SUCCESS

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

Data can be retrieved from a validation cache object using the command:

```c
// Provided by VK_EXT_validation_cache
VkResult vkGetValidationCacheDataEXT(
    VkDevice device,
    VkValidationCacheEXT validationCache,
    size_t* pDataSize,
    void* pData);
```

• device is the logical device that owns the validation cache.

• validationCache is the validation cache to retrieve data from.

• pDataSize is a pointer to a value related to the amount of data in the validation cache, as described below.

• pData is either NULL or a pointer to a buffer.

If pData is NULL, then the maximum size of the data that can be retrieved from the validation cache, in bytes, is returned in pDataSize. Otherwise, pDataSize must point to a variable set by the application to the size of the buffer, in bytes, pointed to by pData, and on return the variable is overwritten with the amount of data actually written to pData. If pDataSize is less than the maximum size that can be retrieved by the validation cache, at most pDataSize bytes will be written to pData, and vkGetValidationCacheDataEXT will return VK_INCOMPLETE instead of VK_SUCCESS, to indicate that not all of the validation cache was returned.

Any data written to pData is valid and can be provided as the pInitialData member of the VkValidationCacheCreateInfoEXT structure passed to vkCreateValidationCacheEXT.

Two calls to vkGetValidationCacheDataEXT with the same parameters must retrieve the same data unless a command that modifies the contents of the cache is called between them.

Applications can store the data retrieved from the validation cache, and use these data, possibly in a future run of the application, to populate new validation cache objects. The results of validation, however, may depend on the vendor ID, device ID, driver version, and other details of the device.
To enable applications to detect when previously retrieved data is incompatible with the device, the initial bytes written to `pData` must be a header consisting of the following members:

<table>
<thead>
<tr>
<th>Offset</th>
<th>Size</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>4</td>
<td>length in bytes of the entire validation cache header written as a stream of bytes, with the least significant byte first</td>
</tr>
<tr>
<td>4</td>
<td>4</td>
<td>a <code>VkValidationCacheHeaderVersionEXT</code> value written as a stream of bytes, with the least significant byte first</td>
</tr>
<tr>
<td>8</td>
<td><code>VK_UUID_SIZE</code></td>
<td>a layer commit ID expressed as a UUID, which uniquely identifies the version of the validation layers used to generate these validation results</td>
</tr>
</tbody>
</table>

The first four bytes encode the length of the entire validation cache header, in bytes. This value includes all fields in the header including the validation cache version field and the size of the length field.

The next four bytes encode the validation cache version, as described for `VkValidationCacheHeaderVersionEXT`. A consumer of the validation cache should use the cache version to interpret the remainder of the cache header.

If `pDataSize` is less than what is necessary to store this header, nothing will be written to `pData` and zero will be written to `pDataSize`.

### Valid Usage (Implicit)

- VUID-vkGetValidationCacheDataEXT-device-parameter
  
  `device` must be a valid `VkDevice` handle

- VUID-vkGetValidationCacheDataEXT-validationCache-parameter
  
  `validationCache` must be a valid `VkValidationCacheEXT` handle

- VUID-vkGetValidationCacheDataEXT-pDataSize-parameter
  
  `pDataSize` must be a valid pointer to a `size_t` value

- VUID-vkGetValidationCacheDataEXT-pData-parameter
  
  If the value referenced by `pDataSize` is not 0, and `pData` is not NULL, `pData` must be a valid pointer to an array of `pDataSize` bytes

- VUID-vkGetValidationCacheDataEXT-validationCache-parent
  
  `validationCache` must have been created, allocated, or retrieved from `device`
Return Codes

Success
• VK_SUCCESS
• VK_INCOMPLETE

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

Possible values of the second group of four bytes in the header returned by `vkGetValidationCacheDataEXT`, encoding the validation cache version, are:

```c
// Provided by VK_EXT_validation_cache
typedef enum VkValidationCacheHeaderVersionEXT {
    VK_VALIDATION_CACHE_HEADER_VERSION_ONE_EXT = 1,
} VkValidationCacheHeaderVersionEXT;
```

• `VK_VALIDATION_CACHE_HEADER_VERSION_ONE_EXT` specifies version one of the validation cache.

To destroy a validation cache, call:

```c
// Provided by VK_EXT_validation_cache
void vkDestroyValidationCacheEXT(
    VkDevice device, 
    VkValidationCacheEXT validationCache, 
    const VkAllocationCallbacks* pAllocator);
```

• `device` is the logical device that destroys the validation cache object.
• `validationCache` is the handle of the validation cache to destroy.
• `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

• VUID-vkDestroyValidationCacheEXT-validationCache-01537
If `VkAllocationCallbacks` were provided when `validationCache` was created, a compatible set of callbacks must be provided here

• VUID-vkDestroyValidationCacheEXT-validationCache-01538
If no `VkAllocationCallbacks` were provided when `validationCache` was created, `pAllocator` must be `NULL`
Valid Usage (Implicit)

- VUID-vkDestroyValidationCacheEXT-device-parameter
  device must be a valid VkDevice handle

- VUID-vkDestroyValidationCacheEXT-validationCache-parameter
  If validationCache is not VK_NULL_HANDLE, validationCache must be a valid VkValidationCacheEXT handle

- VUID-vkDestroyValidationCacheEXT-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroyValidationCacheEXT-validationCache-parent
  If validationCache is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to validationCache must be externally synchronized

9.32. CUDA Modules

9.32.1. Creating a CUDA Module

CUDA modules must contain some kernel code and must expose at least one function entry point.

CUDA modules are represented by VkCudaModuleNV handles:

```c
// Provided by VK_NV_cuda_kernel_launch
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkCudaModuleNV)
```

To create a CUDA module, call:

```c
// Provided by VK_NV_cuda_kernel_launch
VkResult vkCreateCudaModuleNV(
    VkDevice device, 
    const VkCudaModuleCreateInfoNV* pCreateInfo, 
    const VkAllocationCallbacks* pAllocator, 
    VkCudaModuleNV* pModule);
```

- device is the logical device that creates the shader module.
- pCreateInfo is a pointer to a VkCudaModuleCreateInfoNV structure.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.
• `pModule` is a pointer to a `VkCudaModuleNV` handle in which the resulting CUDA module object is returned.

Once a CUDA module has been created, the application **may** create the function entry point, which **must** refer to one function in the module.

### Valid Usage (Implicit)

- VUID-vkCreateCudaModuleNV-device-parameter
  
  `device` **must** be a valid `VkDevice` handle

- VUID-vkCreateCudaModuleNV-pCreateInfo-parameter
  
  `pCreateInfo` **must** be a valid pointer to a valid `VkCudaModuleCreateInfoNV` structure

- VUID-vkCreateCudaModuleNV-pAllocator-parameter
  
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateCudaModuleNV-pModule-parameter
  
  `pModule` **must** be a valid pointer to a `VkCudaModuleNV` handle

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkCudaModuleCreateInfoNV` structure is defined as:

```c
// Provided by VK_NV_cuda_kernel_launch
typedef struct VkCudaModuleCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    size_t dataSize;
    const void* pData;
} VkCudaModuleCreateInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` **may** be `NULL` or **may** be a pointer to a structure extending this structure.
- `dataSize` is the length of the `pData` array.
- `pData` is a pointer to CUDA code
Valid Usage

- VUID-VkCudaModuleCreateInfoNV-dataSize-09413
dataSize must be the total size in bytes of the PTX files or binary cache passed to pData

Valid Usage (Implicit)

- VUID-VkCudaModuleCreateInfoNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_CUDA_MODULE_CREATE_INFO_NV
- VUID-VkCudaModuleCreateInfoNV-pNext-pNext
  pNext must be NULL
- VUID-VkCudaModuleCreateInfoNV-pData-parameter
  pData must be a valid pointer to an array of dataSize bytes
- VUID-VkCudaModuleCreateInfoNV-dataSize-arraylength
  dataSize must be greater than 0

9.32.2. Creating a CUDA Function Handle

CUDA functions are represented by VkCudaFunctionNV handles. Handles to global functions may then be used to issue a kernel launch (i.e. dispatch) from a commandbuffer. See Dispatching Command for CUDA PTX kernel.

// Provided by VK_NV_cuda_kernel_launch
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkCudaFunctionNV)

To create a CUDA function, call:

// Provided by VK_NV_cuda_kernel_launch
VkResult vkCreateCudaFunctionNV(
    VkDevice device,
    const VkCudaFunctionCreateInfoNV* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkCudaFunctionNV* pFunction);

- device is the logical device that creates the shader module.
- pCreateInfo is a pointer to a VkCudaFunctionCreateInfoNV structure.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.
- pFunction is a pointer to a VkCudaFunctionNV handle in which the resulting CUDA function object is returned.
Valid Usage (Implicit)

- VUID-vkCreateCudaFunctionNV-device-parameter
device must be a valid VkDevice handle

- VUID-vkCreateCudaFunctionNV-pCreateInfo-parameter
pCreateInfo must be a valid pointer to a valid VkCudaFunctionCreateInfoNV structure

- VUID-vkCreateCudaFunctionNV-pAllocator-parameter
If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateCudaFunctionNV-pFunction-parameter
pFunction must be a valid pointer to a VkCudaFunctionNV handle

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_OUT_OF_HOST_MEMORY

The VkCudaFunctionCreateInfoNV structure is defined as:

```c
// Provided by VK_NV_cuda_kernel_launch
typedef struct VkCudaFunctionCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkCudaModuleNV module;
    const char* pName;
} VkCudaFunctionCreateInfoNV;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `module` is the CUDA VkCudaModuleNV module in which the function resides.
- `pName` is a null-terminated UTF-8 string containing the name of the shader entry point for this stage.

Valid Usage (Implicit)

- VUID-VkCudaFunctionCreateInfoNV-sType-sType
sType must be VK_STRUCTURE_TYPE_CUDA_FUNCTION_CREATE_INFO_NV

- VUID-VkCudaFunctionCreateInfoNV-pNext-pNext
pNext must be NULL

- VUID-VkCudaFunctionCreateInfoNV-module-parameter
  module must be a valid VkCudaModuleNV handle

- VUID-VkCudaFunctionCreateInfoNV-pName-parameter
  pName must be a null-terminated UTF-8 string

9.32.3. Destroying a CUDA Function

To destroy a CUDA function handle, call:

```c
// Provided by VK_NV_cuda_kernel_launch
void vkDestroyCudaFunctionNV(
    VkDevice device,                      
    VkCudaFunctionNV function,            
    const VkAllocationCallbacks* pAllocator);
```

- device is the logical device that destroys the Function.
- function is the handle of the CUDA function to destroy.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage (Implicit)

- VUID-vkDestroyCudaFunctionNV-device-parameter
  device must be a valid VkDevice handle

- VUID-vkDestroyCudaFunctionNV-function-parameter
  function must be a valid VkCudaFunctionNV handle

- VUID-vkDestroyCudaFunctionNV-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroyCudaFunctionNV-function-parent
  function must have been created, allocated, or retrieved from device

9.32.4. Destroying a CUDA Module

To destroy a CUDA shader module, call:

```c
// Provided by VK_NV_cuda_kernel_launch
void vkDestroyCudaModuleNV(
    VkDevice device,                      
    VkCudaModuleNV module,                
    const VkAllocationCallbacks* pAllocator);
```
9.32.5. Reading back CUDA Module Cache

After uploading the PTX kernel code, the module compiles the code to generate a binary cache with all the necessary information for the device to execute it. It is possible to read back this cache for later use, such as accelerating the initialization of further executions.

To get the CUDA module cache call:

```c
// Provided by VK_NV_cuda_kernel_launch
VkResult vkGetCudaModuleCacheNV(
    VkDevice device, 
    VkCudaModuleNV module, 
    size_t* pCacheSize, 
    void* pCacheData);
```

- **device** is the logical device that destroys the Function.
- **module** is the CUDA module.
- **pCacheSize** is a pointer containing the amount of bytes to be copied in **pCacheData**
- **pCacheData** is a pointer to a buffer in which to copy the binary cache

If **pCacheData** is **NULL**, then the size of the binary cache, in bytes, is returned in **pCacheSize**. Otherwise, **pCacheSize must** point to a variable set by the application to the size of the buffer, in bytes, pointed to by **pCacheData**, and on return the variable is overwritten with the amount of data actually written to **pCacheData**. If **pCacheSize** is less than the size of the binary shader code, nothing is written to **pCacheData**, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**.

The returned cache may then be used later for further initialization of the CUDA module, by sending this cache instead of the PTX code when using **vkCreateCudaModuleNV**.
NOTE

Using the binary cache instead of the original PTX code **should** significantly speed up initialization of the CUDA module, given that the whole compilation and validation will not be necessary.

As with VkPipelineCache, the binary cache depends on the specific implementation. The application **must** assume the cache upload might fail in many circumstances and thus **may** have to get ready for falling back to the original PTX code if necessary. Most often, the cache **may** succeed if the same device driver and architecture is used between the cache generation from PTX and the use of this cache. In the event of a new driver version or if using a different device architecture, this cache **may** become invalid.

**Valid Usage (Implicit)**

- **VUID-vkGetCudaModuleCacheNV-device-parameter**
  
  `device` **must** be a valid `VkDevice` handle

- **VUID-vkGetCudaModuleCacheNV-module-parameter**
  
  `module` **must** be a valid `VkCudaModuleNV` handle

- **VUID-vkGetCudaModuleCacheNV-pCacheSize-parameter**
  
  `pCacheSize` **must** be a valid pointer to a `size_t` value

- **VUID-vkGetCudaModuleCacheNV-pCacheData-parameter**
  
  If the value referenced by `pCacheSize` is not 0, and `pCacheData` is not NULL, `pCacheData` **must** be a valid pointer to an array of `pCacheSize` bytes

- **VUID-vkGetCudaModuleCacheNV-module-parent**
  
  `module` **must** have been created, allocated, or retrieved from `device`

**Return Codes**

**Success**

- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**

- `VK_ERROR_INITIALIZATION_FAILED`

**9.32.6. Limitations**

CUDA and Vulkan do not use the device in the same configuration. The following limitations **must** be taken into account:

- It is not possible to read or write global parameters from Vulkan. The only way to share resources or send values to the PTX kernel is to pass them as arguments of the function. See Resources sharing between CUDA Kernel and Vulkan for more details.
• No calls to functions external to the module PTX are supported.
• Vulkan disables some shader/kernel exceptions, which could break CUDA kernels relying on exceptions.
• CUDA kernels submitted to Vulkan are limited to the amount of shared memory, which can be queried from the physical capabilities. It may be less than what CUDA can offer.
• CUDA instruction-level preemption (CILP) does not work.
• CUDA Unified Memory will not work in this extension.
• CUDA Dynamic parallelism is not supported.
• \texttt{vk\_DispatchIndirect} is not available.
Chapter 10. Pipelines

The following figure shows a block diagram of the Vulkan pipelines. Some Vulkan commands specify geometric objects to be drawn or computational work to be performed, while others specify state controlling how objects are handled by the various pipeline stages, or control data transfer between memory organized as images and buffers. Commands are effectively sent through a processing pipeline, either a graphics pipeline, a ray tracing pipeline, or a compute pipeline.

The graphics pipeline can be operated in two modes, as either primitive shading or mesh shading pipeline.

**Primitive Shading**

The first stage of the graphics pipeline (Input Assembler) assembles vertices to form geometric primitives such as points, lines, and triangles, based on a requested primitive topology. In the next stage (Vertex Shader) vertices can be transformed, computing positions and attributes for each vertex. If tessellation and/or geometry shaders are supported, they can then generate multiple primitives from a single input primitive, possibly changing the primitive topology or generating additional attribute data in the process.

**Cluster Culling Shading**

When using the Cluster Culling Shader, a compute-like shader will perform cluster-based culling, a set of new built-in output variables are used to express visible cluster, in addition, a new built-in function is used to emit these variables from the cluster culling shader to the Input Assembler(IA) stage, then IA can use these variables to fetches vertices of visible cluster and drive vertex shader to work.

**Mesh Shading**

When using the mesh shading pipeline input primitives are not assembled implicitly, but explicitly through the (Mesh Shader). The work on the mesh pipeline is initiated by the application drawing a set of mesh tasks.

If an optional (Task Shader) is active, each task triggers the execution of a task shader workgroup that will generate a new set of tasks upon completion. Each of these spawned tasks, or each of the original dispatched tasks if no task shader is present, triggers the execution of a mesh shader workgroup that produces an output mesh with a variable-sized number of primitives assembled from vertices stored in the output mesh.

**Common**

The final resulting primitives are clipped to a clip volume in preparation for the next stage, Rasterization. The rasterizer produces a series of fragments associated with a region of the framebuffer, from a two-dimensional description of a point, line segment, or triangle. These fragments are processed by fragment operations to determine whether generated values will be written to the framebuffer. Fragment shading determines the values to be written to the framebuffer attachments. Framebuffer operations then read and write the color and depth/stencil attachments of the framebuffer for a given subpass of a render pass instance. The attachments can...
be used as input attachments in the fragment shader in a later subpass of the same render pass.

The **compute pipeline** is a separate pipeline from the graphics pipeline, which operates on one-, two-, or three-dimensional workgroups which **can** read from and write to buffer and image memory.

This ordering is meant only as a tool for describing Vulkan, not as a strict rule of how Vulkan is implemented, and we present it only as a means to organize the various operations of the pipelines. Actual ordering guarantees between pipeline stages are explained in detail in the **synchronization chapter**.

![Figure 2. Block diagram of the Vulkan pipeline](image)

Each pipeline is controlled by a monolithic object created from a description of all of the shader stages and any relevant fixed-function stages. **Linking** the whole pipeline together allows the optimization of shaders based on their input/outputs and eliminates expensive draw time state validation.

A pipeline object is bound to the current state using `vkCmdBindPipeline`. Any pipeline object state that is specified as **dynamic** is not applied to the current state when the pipeline object is bound, but is instead set by dynamic state setting commands.

No state, including dynamic state, is inherited from one command buffer to another.

Compute, ray tracing, and graphics pipelines are each represented by `VkPipeline` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPipeline)
```
10.1. Multiple Pipeline Creation

Multiple pipelines can be created in a single call by commands such as `vkCreateExecutionGraphPipelinesAMDX`, `vkCreateRayTracingPipelinesKHR`, `vkCreateRayTracingPipelinesNV`, `vkCreateComputePipelines`, and `vkCreateGraphicsPipelines`.

The creation commands are passed an array `pCreateInfos` of `Vk*PipelineCreateInfo` structures specifying parameters of each pipeline to be created, and return a corresponding array of handles in `pPipelines`. Each element index `i` of `pPipelines` is created based on the corresponding element `i` of `pCreateInfos`.

Applications can group together similar pipelines to be created in a single call, and implementations are encouraged to look for reuse opportunities when creating a group.

When attempting to create many pipelines in a single command, it is possible that creation may fail for a subset of them. In this case, the corresponding elements of `pPipelines` will be set to `VK_NULL_HANDLE`. If creation fails for a pipeline despite valid arguments (for example, due to out of memory errors), the `VkResult` code returned by the pipeline creation command will indicate why. The implementation will attempt to create all pipelines, and only return `VK_NULL_HANDLE` values for those that actually failed.

If creation fails for a pipeline that has the `VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT` set in its `Vk*PipelineCreateInfo`, pipelines at an index in the `pPipelines` array greater than or equal to that of the failing pipeline will be set to `VK_NULL_HANDLE`.

If creation fails for multiple pipelines, the returned `VkResult` must be the return value of any one of the pipelines which did not succeed. An application can reliably clean up from a failed call by iterating over the `pPipelines` array and destroying every element that is not `VK_NULL_HANDLE`.

If the entire command fails and no pipelines are created, all elements of `pPipelines` will be set to `VK_NULL_HANDLE`.

10.2. Compute Pipelines

Compute pipelines consist of a single static compute shader stage and the pipeline layout.

The compute pipeline represents a compute shader and is created by calling `vkCreateComputePipelines` with `module` and `pName` selecting an entry point from a shader module, where that entry point defines a valid compute shader, in the `VkPipelineShaderStageCreateInfo` structure contained within the `VkComputePipelineCreateInfo` structure.

To create compute pipelines, call:
// Provided by VK_VERSION_1_0
VkResult vkCreateComputePipelines(  
    VkDevice device,  
    VkPipelineCache pipelineCache,  
    uint32_t createInfoCount,  
    const VkComputePipelineCreateCreateInfo* pCreateInfos,  
    const VkAllocationCallbacks* pAllocator,  
    VkPipeline* pPipelines);

- **device** is the logical device that creates the compute pipelines.
- **pipelineCache** is either `VK_NULL_HANDLE`, indicating that pipeline caching is disabled; or the handle of a valid pipeline cache object, in which case use of that cache is enabled for the duration of the command.
- **createInfoCount** is the length of the `pCreateInfos` and `pPipelines` arrays.
- **pCreateInfos** is a pointer to an array of `VkComputePipelineCreateInfo` structures.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pPipelines** is a pointer to an array of `VkPipeline` handles in which the resulting compute pipeline objects are returned.

Pipelines are created and returned as described for Multiple Pipeline Creation.

### Valid Usage

- **VUID-vkCreateComputePipelines-device-09661**
  - **device** must support at least one queue family with the `VK_QUEUE_COMPUTE_BIT` capability
- **VUID-vkCreateComputePipelines-flags-00695**
  - If the **flags** member of any element of **pCreateInfos** contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and the **basePipelineIndex** member of that same element is not `-1`, **basePipelineIndex** must be less than the index into **pCreateInfos** that corresponds to that element
- **VUID-vkCreateComputePipelines-flags-00696**
  - If the **flags** member of any element of **pCreateInfos** contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, the base pipeline must have been created with the `VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT` flag set
- **VUID-vkCreateComputePipelines-pipelineCache-02873**
  - If **pipelineCache** was created with `VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT`, host access to **pipelineCache** must be externally synchronized

### Valid Usage (Implicit)

- **VUID-vkCreateComputePipelines-device-parameter**
  - **device** must be a valid `VkDevice` handle
• VUID-vkCreateComputePipelines-pipelineCache-parameter
  If `pipelineCache` is not `VK_NULL_HANDLE`, `pipelineCache` must be a valid `VkPipelineCache` handle

• VUID-vkCreateComputePipelines-pCreateInfos-parameter
  `pCreateInfos` must be a valid pointer to an array of `createInfoCount` valid `VkComputePipelineCreateInfo` structures

• VUID-vkCreateComputePipelines-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

• VUID-vkCreateComputePipelines-pPipelines-parameter
  `pPipelines` must be a valid pointer to an array of `createInfoCount` `VkPipeline` handles

• VUID-vkCreateComputePipelines-createInfoCount-arraylength
  `createInfoCount` must be greater than 0

• VUID-vkCreateComputePipelines-pipelineCache-parent
  If `pipelineCache` is a valid handle, it must have been created, allocated, or retrieved from `device`

### Return Codes

**Success**

• `VK_SUCCESS`
• `VK_PIPELINE_COMPILE_REQUIRED_EXT`

**Failure**

• `VK_ERROR_OUT_OF_HOST_MEMORY`
• `VK_ERROR_OUT_OF_DEVICE_MEMORY`
• `VK_ERROR_INVALID_SHADER_NV`

The `VkComputePipelineCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkComputePipelineCreateInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkPipelineCreateFlags     flags;
    VkPipelineShaderStageCreateInfo stage;
    VkPipelineLayout          layout;
    VkPipeline                basePipelineHandle;
    int32_t                   basePipelineIndex;
} VkComputePipelineCreateInfo;
```

• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• **flags** is a bitmask of `VkPipelineCreateFlagBits` specifying how the pipeline will be generated.
• **stage** is a `VkPipelineShaderStageCreateInfo` structure describing the compute shader.
• **layout** is the description of binding locations used by both the pipeline and descriptor sets used with the pipeline.
• **basePipelineHandle** is a pipeline to derive from.
• **basePipelineIndex** is an index into the `pCreateInfos` parameter to use as a pipeline to derive from.

The parameters `basePipelineHandle` and `basePipelineIndex` are described in more detail in Pipeline Derivatives.

If the `pNext` chain includes a `VkPipelineCreateFlags2CreateInfoKHR` structure, `VkPipelineCreateFlags2CreateInfoKHR::flags` from that structure is used instead of `flags` from this structure.

---

### Valid Usage

- **VUID-VkComputePipelineCreateInfo-None-09497**
  If the `pNext` chain does not include a `VkPipelineCreateFlags2CreateInfoKHR` structure, `flags` must be a valid combination of `VkPipelineCreateFlagBits` values

- **VUID-VkComputePipelineCreateInfo-flags-07984**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineIndex` is -1, `basePipelineHandle` must be a valid compute `VkPipeline` handle

- **VUID-VkComputePipelineCreateInfo-flags-07985**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineHandle` is `VK_NULL_HANDLE`, `basePipelineIndex` must be a valid index into the calling command's `pCreateInfos` parameter

- **VUID-VkComputePipelineCreateInfo-flags-07986**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, `basePipelineIndex` must be -1 or `basePipelineHandle` must be `VK_NULL_HANDLE`

- **VUID-VkComputePipelineCreateInfo-layout-07987**
  If a push constant block is declared in a shader, a push constant range in `layout` must match the shader stage

- **VUID-VkComputePipelineCreateInfo-layout-10069**
  If a push constant block is declared in a shader, the block must be contained inside the push constant range in `layout` that matches the stage

- **VUID-VkComputePipelineCreateInfo-layout-07988**
  If a `resource variables` is declared in a shader, a descriptor slot in `layout` must match the shader stage

- **VUID-VkComputePipelineCreateInfo-layout-07990**
  If a `resource variables` is declared in a shader, and the descriptor type is not `VK_DESCRIPTOR_TYPE_MUTABLE_EXT`, a descriptor slot in `layout` must match the descriptor type
If a resource variables is declared in a shader as an array, a descriptor slot in layout must match the descriptor count.

flags must not include VK_PIPELINE_CREATE_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR.

flags must not include VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR.

flags must not include VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR.

flags must not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR.

flags must not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR.

flags must not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR.

flags must not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR.

flags must not include VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR.

flags must not include VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV.

If the VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV::deviceGeneratedComputePipelines is not enabled, flags must not include VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV.

If flags includes VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV, then the pNext chain must include a pointer to a valid instance of VkComputePipelineIndirectBufferInfoNV specifying the address where the pipeline's metadata will be saved.

If the pipelineCreationCacheControl feature is not enabled, flags must not include VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT or VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT.

The stage member of stage must be VK_SHADER_STAGE_COMPUTE_BIT.

The shader code for the entry point identified by stage and the rest of the state identified by this structure must adhere to the pipeline linking rules described in the Shader Interfaces chapter.

The number of resources in layout accessible to the compute shader stage must be less
than or equal to $\text{VkPhysicalDeviceLimits::maxPerStageResources}$

- **VUID-VkComputePipelineCreateInfo-shaderEnqueue-09177**
  
  If `shaderEnqueue` is not enabled, flags must not include $\text{VK_PIPELINE_CREATE_LIBRARY_BIT_KHR}$

- **VUID-VkComputePipelineCreateInfo-flags-09178**
  
  If flags does not include $\text{VK_PIPELINE_CREATE_LIBRARY_BIT_KHR}$, the shader specified by `stage` must not declare the `ShaderEnqueueAMDX` capability

- **VUID-VkComputePipelineCreateInfo-pipelineStageCreationFeedbackCount-06566**
  
  If `VkPipelineCreationFeedbackCreateInfo::pipelineStageCreationFeedbackCount` is not 0, it must be 1

- **VUID-VkComputePipelineCreateInfo-flags-07367**
  
  flags must not include $\text{VK_PIPELINE_CREATE_CREATE_FLAG_BIT_KHR}$

- **VUID-VkComputePipelineCreateInfo-flags-07996**
  
  flags must not include $\text{VK_PIPELINE_CREATE_RAY_TRACING_OPAQUE_MICROMAP_BIT_EXT}$

**Valid Usage (Implicit)**

- **VUID-VkComputePipelineCreateInfo-sType-sType**
  
  sType must be $\text{VK_STRUCTURE_TYPE_COMPUTE_PIPELINE_CREATE_INFO}$

- **VUID-VkComputePipelineCreateInfo-pNext-pNext**
  
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of `VkComputePipelineIndirectBufferInfoNV`, `VkPipelineCompilerControlCreateInfoAMD`, `VkPipelineCreateFlags2CreateInfoKHR`, `VkPipelineCreationFeedbackCreateInfo`, `VkPipelineRobustnessCreateInfoEXT`, or `VkSubpassShadingPipelineCreateInfoHUAWEI`

- **VUID-VkComputePipelineCreateInfo-sType-unique**
  
  The sType value of each struct in the pNext chain must be unique

- **VUID-VkComputePipelineCreateInfo-stage-parameter**
  
  stage must be a valid `VkPipelineShaderStageCreateInfo` structure

- **VUID-VkComputePipelineCreateInfo-layout-parameter**
  
  layout must be a valid `VkPipelineLayout` handle

- **VUID-VkComputePipelineCreateInfo-commonparent**
  
  Both of `basePipelineHandle`, and `layout` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

The `VkPipelineShaderStageCreateInfo` structure is defined as:
typedef struct VkPipelineShaderStageCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineShaderStageCreateFlags flags;
    VkShaderStageFlagBits stage;
    VkShaderModule module;
    const char* pName;
    const VkSpecializationInfo* pSpecializationInfo;
} VkPipelineShaderStageCreateInfo;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is a bitmask of VkPipelineShaderStageCreateFlagBits specifying how the pipeline shader stage will be generated.
- **stage** is a VkShaderStageFlagBits value specifying a single pipeline stage.
- **module** is optionally a VkShaderModule object containing the shader code for this stage.
- **pName** is a pointer to a null-terminated UTF-8 string specifying the entry point name of the shader for this stage.
- **pSpecializationInfo** is a pointer to a VkSpecializationInfo structure, as described in Specialization Constants, or NULL.

If **module** is not VK_NULL_HANDLE, the shader code used by the pipeline is defined by **module**. If **module** is VK_NULL_HANDLE, the shader code is defined by the chained VkShaderModuleCreateInfo if present.

If the shaderModuleIdentifier feature is enabled, applications can omit shader code for **stage** and instead provide a module identifier. This is done by including a VkPipelineShaderStageModuleIdentifierCreateInfoEXT struct with identifierSize not equal to 0 in the **pNext** chain. A shader stage created in this way is equivalent to one created using a shader module with the same identifier. The identifier allows an implementation to look up a pipeline without consuming a valid SPIR-V module. If a pipeline is not found, pipeline compilation is not possible and the implementation must fail as specified by VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT.

When an identifier is used in lieu of a shader module, implementations may fail pipeline compilation with VK_PIPELINE_COMPILE_REQUIRED for any reason.

**NOTE**

The rationale for the relaxed requirement on implementations to return a pipeline with VkPipelineShaderStageModuleIdentifierCreateInfoEXT is that layers or tools may intercept pipeline creation calls and require the full SPIR-V context to operate correctly. ICDs are not expected to fail pipeline compilation if the pipeline exists in a cache somewhere.

Applications can use identifiers when creating pipelines with VK_PIPELINE_CREATE_LIBRARY_BIT_KHR.
When creating such pipelines, `VK_SUCCESS` may be returned, but subsequently fail when referencing the pipeline in a `VkPipelineLibraryCreateInfoKHR` struct. Applications must allow pipeline compilation to fail during link steps with `VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT` as it may not be possible to determine if a pipeline can be created from identifiers until the link step.

**Valid Usage**

- **VUID-VkPipelineShaderStageCreateInfo-stage-00704**
  If the `geometryShader` feature is not enabled, `stage` must not be `VK_SHADER_STAGE_GEOMETRY_BIT`

- **VUID-VkPipelineShaderStageCreateInfo-stage-00705**
  If the `tessellationShader` feature is not enabled, `stage` must not be `VK_SHADER_STAGE_TESSellation_CONTROL_BIT` or `VK_SHADER_STAGE_TESSellation_EVALUATION_BIT`

- **VUID-VkPipelineShaderStageCreateInfo-stage-02091**
  If the `meshShaders` feature is not enabled, `stage` must not be `VK_SHADER_STAGE_MESH_BIT_EXT`

- **VUID-VkPipelineShaderStageCreateInfo-stage-02092**
  If the `taskShaders` feature is not enabled, `stage` must not be `VK_SHADER_STAGE_TASK_BIT_EXT`

- **VUID-VkPipelineShaderStageCreateInfo-clustercullingShader-07813**
  If the `clustercullingShader` feature is not enabled, `stage` must not be `VK_SHADER_STAGE_CLUSTER_CULLING_BIT_HUAWEI`

- **VUID-VkPipelineShaderStageCreateInfo-stage-00706**
  `stage` must not be `VK_SHADER_STAGE_ALL_GRAPHICS`, or `VK_SHADER_STAGE_ALL`

- **VUID-VkPipelineShaderStageCreateInfo-pName-00707**
  `pName` must be the name of an `OpEntryPoint` in `module` with an execution model that matches `stage`

- **VUID-VkPipelineShaderStageCreateInfo-maxClipDistances-00708**
  If the identified entry point includes any variable in its interface that is declared with the `ClipDistance BuiltIn` decoration, that variable must not have an array size greater than `VkPhysicalDeviceLimits::maxClipDistances`

- **VUID-VkPipelineShaderStageCreateInfo-maxCullDistances-00709**
  If the identified entry point includes any variable in its interface that is declared with the `CullDistance BuiltIn` decoration, that variable must not have an array size greater than `VkPhysicalDeviceLimits::maxCullDistances`

- **VUID-VkPipelineShaderStageCreateInfo-maxCombinedClipAndCullDistances-00710**
  If the identified entry point includes variables in its interface that are declared with the `ClipDistance BuiltIn` decoration and variables in its interface that are declared with the `CullDistance BuiltIn` decoration, those variables must not have array sizes which sum to more than `VkPhysicalDeviceLimits::maxCombinedClipAndCullDistances`

- **VUID-VkPipelineShaderStageCreateInfo-maxSampleMaskWords-00711**
  If the identified entry point includes any variable in its interface that is declared with the `SampleMask BuiltIn` decoration, that variable must not have an array size greater than
• VUID-VkPipelineShaderStageCreateInfo-stage-00713
  If \textit{stage} is \texttt{VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT} or \texttt{VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT}, and the identified entry point has an \texttt{OpExecutionMode} instruction specifying a patch size with \texttt{OutputVertices}, the patch size must be greater than 0 and less than or equal to \texttt{VkPhysicalDeviceLimits::maxTessellationPatchSize}.

• VUID-VkPipelineShaderStageCreateInfo-stage-00714
  If \textit{stage} is \texttt{VK_SHADER_STAGE_GEOMETRY_BIT}, the identified entry point must have an \texttt{OpExecutionMode} instruction specifying a maximum output vertex count that is greater than 0 and less than or equal to \texttt{VkPhysicalDeviceLimits::maxGeometryOutputVertices}.

• VUID-VkPipelineShaderStageCreateInfo-stage-00715
  If \textit{stage} is \texttt{VK_SHADER_STAGE_GEOMETRY_BIT}, the identified entry point must have an \texttt{OpExecutionMode} instruction specifying an invocation count that is greater than 0 and less than or equal to \texttt{VkPhysicalDeviceLimits::maxGeometryShaderInvocations}.

• VUID-VkPipelineShaderStageCreateInfo-stage-02596
  If \textit{stage} is either \texttt{VK_SHADER_STAGE_VERTEX_BIT}, \texttt{VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT}, \texttt{VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT}, or \texttt{VK_SHADER_STAGE_GEOMETRY_BIT}, and the identified entry point writes to \texttt{Layer} for any primitive, it must write the same value to \texttt{Layer} for all vertices of a given primitive.

• VUID-VkPipelineShaderStageCreateInfo-stage-02597
  If \textit{stage} is either \texttt{VK_SHADER_STAGE_VERTEX_BIT}, \texttt{VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT}, \texttt{VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT}, or \texttt{VK_SHADER_STAGE_GEOMETRY_BIT}, and the identified entry point writes to \texttt{ViewportIndex} for any primitive, it must write the same value to \texttt{ViewportIndex} for all vertices of a given primitive.

• VUID-VkPipelineShaderStageCreateInfo-stage-06685
  If \textit{stage} is \texttt{VK_SHADER_STAGE_FRAGMENT_BIT}, and the identified entry point writes to \texttt{FragDepth} in any execution path, all execution paths that are not exclusive to helper invocations must either discard the fragment, or write or initialize the value of \texttt{FragDepth}.

• VUID-VkPipelineShaderStageCreateInfo-stage-06686
  If \textit{stage} is \texttt{VK_SHADER_STAGE_FRAGMENT_BIT}, and the identified entry point writes to \texttt{FragStencilRefEXT} in any execution path, all execution paths that are not exclusive to helper invocations must either discard the fragment, or write or initialize the value of \texttt{FragStencilRefEXT}.

• VUID-VkPipelineShaderStageCreateInfo-flags-02784
  If \textit{flags} has the \texttt{VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT} flag set, the \texttt{subgroupSizeControl} feature must be enabled.

• VUID-VkPipelineShaderStageCreateInfo-flags-02785
  If \textit{flags} has the \texttt{VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT} flag set, the \texttt{computeFullSubgroups} feature must be enabled.

• VUID-VkPipelineShaderStageCreateInfo-flags-08988
  If \textit{flags} includes \texttt{VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT}, \textit{stage} must be one of \texttt{VK_SHADER_STAGE_MESH_BIT_EXT}, \texttt{VK_SHADER_STAGE_TASK_BIT_EXT}, or \texttt{VK_SHADER_STAGE_COMPUTE_BIT}.
If a `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is included in the `pNext` chain, `flags` must not have the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` flag set.

If a `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is included in the `pNext` chain, the `subgroupSizeControl` feature must be enabled, and `stage` must be a valid bit specified in `requiredSubgroupSizeStages`.

If a `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is included in the `pNext` chain and `stage` is `VK_SHADER_STAGE_COMPUTE_BIT`, `VK_SHADER_STAGE_MESH_BIT_EXT`, or `VK_SHADER_STAGE_TASK_BIT_EXT`, the local workgroup size of the shader must be less than or equal to the product of `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo::requiredSubgroupSize` and `maxComputeWorkgroupSubgroups`.

If `flags` has both the `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT` and `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` flags set, the local workgroup size in the X dimension of the pipeline must be a multiple of `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo::requiredSubgroupSize`.

If `flags` has the `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT` flag set and `flags` does not have the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` flag set and no `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is included in the `pNext` chain, the local workgroup size in the X dimension of the pipeline must be a multiple of `subgroupSize`.

If `module` uses the `OpTypeCooperativeMatrixKHR` instruction with a `Scope` equal to `Subgroup`, then the local workgroup size in the X dimension of the pipeline must be a multiple of `subgroupSize`.

If a shader module identifier is not specified for this `stage`, `module` must be a valid `VkShaderModule` if none of the following features are enabled:

- `maintenance5`
- `graphicsPipelineLibrary`

If a shader module identifier is not specified for this `stage`, `module` must be a valid `VkShaderModule`, or there must be a valid `VkShaderModuleCreateInfo` structure in the `pNext` chain.
• VUID-VkPipelineShaderStageCreateInfo-stage-06844
If a shader module identifier is specified for this stage, the pNext chain must not include a VkShaderModuleCreateInfo structure

• VUID-VkPipelineShaderStageCreateInfo-stage-06848
If a shader module identifier is specified for this stage, module must be VK_NULL_HANDLE

• VUID-VkPipelineShaderStageCreateInfo-pSpecializationInfo-06849
If a shader module identifier is not specified, the shader code used by the pipeline must be valid as described by the Khronos SPIR-V Specification after applying the specializations provided in pSpecializationInfo, if any, and then converting all specialization constants into fixed constants

---

Valid Usage (Implicit)

• VUID-VkPipelineShaderStageCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_CREATE_INFO

• VUID-VkPipelineShaderStageCreateInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkDebugUtilsObjectNameInfoEXT, VkPipelineRobustnessCreateInfoEXT, VkPipelineShaderStageModuleIdentifierCreateInfoEXT, VkPipelineShaderStageNodeCreateInfoAMDX, VkPipelineShaderStageRequiredSubgroupSizeCreateInfo, VkShaderModuleCreateInfo, or VkShaderModuleValidationCacheCreateInfoEXT

• VUID-VkPipelineShaderStageCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

• VUID-VkPipelineShaderStageCreateInfo-flags-parameter
  flags must be a valid combination of VkPipelineShaderStageCreateFlagBits values

• VUID-VkPipelineShaderStageCreateInfo-stage-parameter
  stage must be a valid VkShaderStageFlagBits value

• VUID-VkPipelineShaderStageCreateInfo-module-parameter
  If module is not VK_NULL_HANDLE, module must be a valid VkShaderModule handle

• VUID-VkPipelineShaderStageCreateInfo-pName-parameter
  pName must be a null-terminated UTF-8 string

• VUID-VkPipelineShaderStageCreateInfo-pSpecializationInfo-parameter
  If pSpecializationInfo is not NULL, pSpecializationInfo must be a valid pointer to a valid VkSpecializationInfo structure

---

// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineShaderStageCreateFlags;

VkPipelineShaderStageCreateFlags is a bitmask type for setting a mask of zero or more VkPipelineShaderStageCreateFlagBits.
Possible values of the flags member of VkPipelineShaderStageCreateInfo specifying how a pipeline shader stage is created, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPipelineShaderStageCreateFlagBits {
    // Provided by VK_VERSION_1_3
    VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT = 0x00000001,
    // Provided by VK_VERSION_1_3
    VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT = 0x00000002,
    // Provided by VK_EXT_subgroup_size_control
    VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT =
    VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT,
    // Provided by VK_EXT_subgroup_size_control
    VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT =
    VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT,
} VkPipelineShaderStageCreateFlagBits;
```

- **VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT** specifies that the SubgroupSize may vary in the shader stage.

- **VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT** specifies that the subgroup sizes must be launched with all invocations active in the task, mesh, or compute stage.

**NOTE**

If **VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT** and **VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT** are specified and minSubgroupSize does not equal maxSubgroupSize and no required subgroup size is specified, then the only way to guarantee that the 'X' dimension of the local workgroup size is a multiple of SubgroupSize is to make it a multiple of maxSubgroupSize. Under these conditions, you are guaranteed full subgroups but not any particular subgroup size.

Bits which can be set by commands and structures, specifying one or more shader stages, are:
typedef enum VkShaderStageFlagBits {
    VK_SHADER_STAGE_VERTEX_BIT = 0x00000001,
    VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT = 0x00000002,
    VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT = 0x00000004,
    VK_SHADER_STAGE_GEOMETRY_BIT = 0x00000008,
    VK_SHADER_STAGE_FRAGMENT_BIT = 0x00000010,
    VK_SHADER_STAGE_COMPUTE_BIT = 0x00000020,
    VK_SHADER_STAGE_ALL_GRAPHICS = 0x0000001f,
    VK_SHADER_STAGE_ALL = 0x7fffffff,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_RAYGEN_BIT_KHR = 0x00000100,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_ANY_HIT_BIT_KHR = 0x00000200,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR = 0x00000400,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_MISS_BIT_KHR = 0x00000800,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_INTERSECTION_BIT_KHR = 0x00001000,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_CALLABLE_BIT_KHR = 0x00002000,
    // Provided by VK_EXT_mesh_shader
    VK_SHADER_STAGE_TASK_BIT_EXT = 0x00000040,
    // Provided by VK_EXT_mesh_shader
    VK_SHADER_STAGE_MESH_BIT_EXT = 0x00000080,
    // Provided by VK_HUAWEI_subpass_shading
    VK_SHADER_STAGE_SUBPASS_SHADING_BIT_HUAWEI = 0x00004000,
    // Provided by VK_HUAWEI_cluster_culling_shader
    VK_SHADER_STAGE_CLUSTER_CULLING_BIT_HUAWEI = 0x00080000,
    // Provided by VK_NV_ray_tracing
    VK_SHADER_STAGE_RAYGEN_BIT_NV = VK_SHADER_STAGE_RAYGEN_BIT_KHR,
    // Provided by VK_NV_ray_tracing
    VK_SHADER_STAGE_ANY_HIT_BIT_NV = VK_SHADER_STAGE_ANY_HIT_BIT_KHR,
    // Provided by VK_NV_ray_tracing
    VK_SHADER_STAGE_CLOSEST_HIT_BIT_NV = VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR,
    // Provided by VK_NV_ray_tracing
    VK_SHADER_STAGE_MISS_BIT_NV = VK_SHADER_STAGE_MISS_BIT_KHR,
    // Provided by VK_NV_ray_tracing
    VK_SHADER_STAGE_INTERSECTION_BIT_NV = VK_SHADER_STAGE_INTERSECTION_BIT_KHR,
    // Provided by VK_NV_ray_tracing
    VK_SHADER_STAGE_CALLABLE_BIT_NV = VK_SHADER_STAGE_CALLABLE_BIT_KHR,
    // Provided by VK_NV_mesh_shader
    VK_SHADER_STAGE_TASK_BIT_NV = VK_SHADER_STAGE_TASK_BIT_EXT,
    // Provided by VK_NV_mesh_shader
    VK_SHADER_STAGE_MESH_BIT_NV = VK_SHADER_STAGE_MESH_BIT_EXT,
    // Provided by VK_NV_mesh_shader
    VK_SHADER_STAGE_MESH_BIT_NV = VK_SHADER_STAGE_MESH_BIT_EXT,
    // Provided by VK_NV_mesh_shader
    VK_SHADER_STAGE_MESH_BIT_NV = VK_SHADER_STAGE_MESH_BIT_EXT,
    VKShaderStageFlagBits;

• **VK_SHADER_STAGE_VERTEX_BIT** specifies the vertex stage.
• VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT specifies the tessellation control stage.
• VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT specifies the tessellation evaluation stage.
• VK_SHADER_STAGE_GEOMETRY_BIT specifies the geometry stage.
• VK_SHADER_STAGE_FRAGMENT_BIT specifies the fragment stage.
• VK_SHADER_STAGE_COMPUTE_BIT specifies the compute stage.
• VK_SHADER_STAGE_ALL_GRAPHICS is a combination of bits used as shorthand to specify all graphics stages defined above (excluding the compute stage).
• VK_SHADER_STAGE_ALL is a combination of bits used as shorthand to specify all shader stages supported by the device, including all additional stages which are introduced by extensions.
• VK_SHADER_STAGE_TASK_BIT_EXT specifies the task stage.
• VK_SHADER_STAGE_MESH_BIT_EXT specifies the mesh stage.
• VK_SHADER_STAGE_CLUSTER_CULLING_BIT_HUAWEI specifies the cluster culling stage.
• VK_SHADER_STAGE_RAYGEN_BIT_KHR specifies the ray generation stage.
• VK_SHADER_STAGE_ANY_HIT_BIT_KHR specifies the any-hit stage.
• VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR specifies the closest hit stage.
• VK_SHADER_STAGE_MISS_BIT_KHR specifies the miss stage.
• VK_SHADER_STAGE_INTERSECTION_BIT_KHR specifies the intersection stage.
• VK_SHADER_STAGE_CALLABLE_BIT_KHR specifies the callable stage.

**NOTE**

VK_SHADER_STAGE_ALL_GRAPHICS only includes the original five graphics stages included in Vulkan 1.0, and not any stages added by extensions. Thus, it may not have the desired effect in all cases.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkShaderStageFlags;
```

VkShaderStageFlags is a bitmask type for setting a mask of zero or more VkShaderStageFlagBits.

The VkPipelineShaderStageRequiredSubgroupSizeCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPipelineShaderStageRequiredSubgroupSizeCreateInfo {
    VkStructureType sType;
    void* pNext;
    uint32_t requiredSubgroupSize;
} VkPipelineShaderStageRequiredSubgroupSizeCreateInfo;
```

or the equivalent
// Provided by VK_EXT_subgroup_size_control
typedef VkPipelineShaderStageRequiredSubgroupSizeCreateInfo
VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT;

or the equivalent

// Provided by VK_EXT_shader_object
typedef VkPipelineShaderStageRequiredSubgroupSizeCreateInfo
VkShaderRequiredSubgroupSizeCreateInfoEXT;

• \textit{sType} is a \texttt{VkStructureType} value identifying this structure.
• \textit{pNext} is NULL or a pointer to a structure extending this structure.
• \textit{requiredSubgroupSize} is an unsigned integer value specifying the required subgroup size for the newly created pipeline shader stage.

If a \texttt{VkPipelineShaderStageRequiredSubgroupSizeCreateInfo} structure is included in the \textit{pNext} chain of \texttt{VkPipelineShaderStageCreateInfo}, it specifies that the pipeline shader stage being compiled has a required subgroup size.

If a \texttt{VkShaderRequiredSubgroupSizeCreateInfoEXT} structure is included in the \textit{pNext} chain of \texttt{VkShaderCreateInfoEXT}, it specifies that the shader being compiled has a required subgroup size.

**Valid Usage**

- VUID-VkPipelineShaderStageRequiredSubgroupSizeCreateInfo-requiredSubgroupSize-02760
  \texttt{requiredSubgroupSize} \textbf{must} be a power-of-two integer
- VUID-VkPipelineShaderStageRequiredSubgroupSizeCreateInfo-requiredSubgroupSize-02761
  \texttt{requiredSubgroupSize} \textbf{must} be greater or equal to \texttt{minSubgroupSize}
- VUID-VkPipelineShaderStageRequiredSubgroupSizeCreateInfo-requiredSubgroupSize-02762
  \texttt{requiredSubgroupSize} \textbf{must} be less than or equal to \texttt{maxSubgroupSize}

**Valid Usage (Implicit)**

- VUID-VkPipelineShaderStageRequiredSubgroupSizeCreateInfo-sType-sType
  \texttt{sType} \textbf{must} be \texttt{VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_REQUIRED_SUBGROUP_SIZE_CREATE_INFO}

A subpass shading pipeline is a compute pipeline which \textbf{must} be called only in a subpass of a render pass with work dimensions specified by render area size. The subpass shading pipeline shader is a compute shader allowed to access input attachments specified in the calling subpass. To
create a subpass shading pipeline, call `vkCreateComputePipelines` with `VkSubpassShadingPipelineCreateInfoHUAWEI` in the `pNext` chain of `VkComputePipelineCreateInfo`.

The `VkSubpassShadingPipelineCreateInfoHUAWEI` structure is defined as:

```c
// Provided by VK_HUAWEI_subpass_shading
typedef struct VkSubpassShadingPipelineCreateInfoHUAWEI {
    VkStructureType sType;
    void* pNext;
    VkRenderPass renderPass;
    uint32_t subpass;
} VkSubpassShadingPipelineCreateInfoHUAWEI;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `renderPass` is a handle to a render pass object describing the environment in which the pipeline will be used. The pipeline must only be used with a render pass instance compatible with the one provided. See Render Pass Compatibility for more information.
- `subpass` is the index of the subpass in the render pass where this pipeline will be used.

### Valid Usage

- VUID-VkSubpassShadingPipelineCreateInfoHUAWEI-subpass-04946
  - `subpass` must be created with `VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI` bind point

### Valid Usage (Implicit)

- VUID-VkSubpassShadingPipelineCreateInfoHUAWEI-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_SUBPASS_SHADING_PIPELINE_CREATE_INFO_HUAWEI`
- VUID-VkSubpassShadingPipelineCreateInfoHUAWEI-renderPass-parameter
  - `renderPass` must be a valid `VkRenderPass` handle

A subpass shading pipeline’s workgroup size is a 2D vector with number of power-of-two in width and height. The maximum number of width and height is implementation-dependent, and may vary for different formats and sample counts of attachments in a render pass.

To query the maximum workgroup size, call:

```c
// Provided by VK_HUAWEI_subpass_shading
VkResult vkGetDeviceSubpassShadingMaxWorkgroupSizeHUAWEI(
    VkDevice device,
    VkRenderPass renderpass,
    VkExtent2D* pMaxWorkgroupSize);
```
• **device** is a handle to a local device object that was used to create the given render pass.

• **renderPass** is a handle to a render pass object describing the environment in which the pipeline will be used. The pipeline **must** only be used with a render pass instance compatible with the one provided. See **Render Pass Compatibility** for more information.

• **pMaxWorkgroupSize** is a pointer to a **VkExtent2D** structure.

---

**Valid Usage (Implicit)**

- VUID-vkGetDeviceSubpassShadingMaxWorkgroupSizeHUAWEI-device-parameter
  - **device** **must** be a valid **VkDevice** handle

- VUID-vkGetDeviceSubpassShadingMaxWorkgroupSizeHUAWEI-renderpass-parameter
  - **renderPass** **must** be a valid **VkRenderPass** handle

- VUID-vkGetDeviceSubpassShadingMaxWorkgroupSizeHUAWEI-pMaxWorkgroupSize-parameter
  - **pMaxWorkgroupSize** **must** be a valid pointer to **VkExtent2D** structures

- VUID-vkGetDeviceSubpassShadingMaxWorkgroupSizeHUAWEI-renderpass-parent
  - **renderPass** **must** have been created, allocated, or retrieved from **device**

---

**Return Codes**

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_SURFACE_LOST_KHR**

The **VkPipelineRobustnessCreateInfoEXT** structure is defined as:

```c
// Provided by VK_EXT_pipeline_robustness
typedef struct VkPipelineRobustnessCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkPipelineRobustnessBufferBehaviorEXT storageBuffers;
    VkPipelineRobustnessBufferBehaviorEXT uniformBuffers;
    VkPipelineRobustnessBufferBehaviorEXT vertexInputs;
    VkPipelineRobustnessImageBehaviorEXT images;
} VkPipelineRobustnessCreateInfoEXT;
```

- **sType** is a **VkStructureType** value identifying this structure.

- **pNext** is **NULL** or a pointer to a structure extending this structure.
• **storageBuffers** sets the behavior of out of bounds accesses made to resources bound as:
  - VK_DESCRIPTOR_TYPE_STORAGE_BUFFER
  - VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER
  - VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC

• **uniformBuffers** describes the behavior of out of bounds accesses made to resources bound as:
  - VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER
  - VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER
  - VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC
  - VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK

• **vertexInputs** describes the behavior of out of bounds accesses made to vertex input attributes

• **images** describes the behavior of out of bounds accesses made to resources bound as:
  - VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE
  - VK_DESCRIPTOR_TYPE_STORAGE_IMAGE

Resources bound as VK_DESCRIPTOR_TYPE_MUTABLE_EXT will have the robustness behavior that covers its active descriptor type.

The scope of the effect of VkPipelineRobustnessCreateInfoEXT depends on which structure's pNext chain it is included in.

• VkGraphicsPipelineCreateInfo, VkRayTracingPipelineCreateInfoKHR, VkComputePipelineCreateInfo:
  The robustness behavior described by VkPipelineRobustnessCreateInfoEXT applies to all accesses through this pipeline

• VkPipelineShaderStageCreateInfo:
  The robustness behavior described by VkPipelineRobustnessCreateInfoEXT applies to all accesses emanating from the shader code of this shader stage

If VkPipelineRobustnessCreateInfoEXT is specified for both a pipeline and a pipeline stage, the VkPipelineRobustnessCreateInfoEXT specified for the pipeline stage will take precedence.

When VkPipelineRobustnessCreateInfoEXT is specified for a pipeline, it only affects the subset of the pipeline that is specified by the create info, as opposed to subsets linked from pipeline libraries. For VkGraphicsPipelineCreateInfo, that subset is specified by VkGraphicsPipelineLibraryCreateInfoEXT::flags. For VkRayTracingPipelineCreateInfoKHR, that subset is specified by the specific stages in VkRayTracingPipelineCreateInfoKHR::pStages.

---

**Valid Usage**

- VUID-VkPipelineRobustnessCreateInfoEXT-pipelineRobustness-06926
  If the pipelineRobustness feature is not enabled, storageBuffers must be VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DEVICE_DEFAULT_EXT

- VUID-VkPipelineRobustnessCreateInfoEXT-pipelineRobustness-06927
  If the pipelineRobustness feature is not enabled, uniformBuffers must be
If the `pipelineRobustness` feature is not enabled, **vertexInputs** must be `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DEVICE_DEFAULT_EXT`

If the `pipelineRobustness` feature is not enabled, **images** must be `VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_DEVICE_DEFAULT_EXT`

If the `robustImageAccess` feature is not supported, **images** must not be `VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_ROBUST_IMAGE_ACCESS_EXT`

If the `robustBufferAccess2` feature is not supported, **storageBuffers** must not be `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT`

If the `robustBufferAccess2` feature is not supported, **uniformBuffers** must not be `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT`

If the `robustBufferAccess2` feature is not supported, **vertexInputs** must not be `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT`

If the `robustImageAccess2` feature is not supported, **images** must not be `VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_ROBUST_IMAGE_ACCESS_2_EXT`

**Valid Usage (Implicit)**

- **sType** must be `VK_STRUCTURE_TYPE_PIPELINE_ROBUSTNESS_CREATE_INFO_EXT`
- **storageBuffers** must be a valid `VkPipelineRobustnessBufferBehaviorEXT` value
- **uniformBuffers** must be a valid `VkPipelineRobustnessBufferBehaviorEXT` value
- **vertexInputs** must be a valid `VkPipelineRobustnessBufferBehaviorEXT` value
- **images** must be a valid `VkPipelineRobustnessImageBehaviorEXT` value

Possible values of the **storageBuffers**, **uniformBuffers**, and **vertexInputs** members of `VkPipelineRobustnessCreateInfoEXT` are:
typedef enum VkPipelineRobustnessBufferBehaviorEXT {
    VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DEVICE_DEFAULT_EXT = 0,
    VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DISABLED_EXT = 1,
    VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT = 2,
    VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT = 3,
} VkPipelineRobustnessBufferBehaviorEXT;

• VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DEVICE_DEFAULT_EXT specifies that this pipeline stage follows the behavior of robustness features that are enabled on the device that created this pipeline
• VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DISABLED_EXT specifies that buffer accesses by this pipeline stage to the relevant resource types must not be out of bounds
• VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT specifies that out of bounds accesses by this pipeline stage to the relevant resource types behave as if the robustBufferAccess feature is enabled
• VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT specifies that out of bounds accesses by this pipeline stage to the relevant resource types behave as if the robustBufferAccess2 feature is enabled

Possible values of the images member of VkPipelineRobustnessCreateInfoEXT are:

typedef enum VkPipelineRobustnessImageBehaviorEXT {
    VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_DEVICE_DEFAULT_EXT = 0,
    VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_DISABLED_EXT = 1,
    VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_ROBUST_IMAGE_ACCESS_EXT = 2,
    VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_ROBUST_IMAGE_ACCESS_2_EXT = 3,
} VkPipelineRobustnessImageBehaviorEXT;

• VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_DEVICE_DEFAULT_EXT specifies that this pipeline stage follows the behavior of robustness features that are enabled on the device that created this pipeline
• VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_DISABLED_EXT specifies that image accesses by this pipeline stage to the relevant resource types must not be out of bounds
• VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_ROBUST_IMAGE_ACCESS_EXT specifies that out of bounds accesses by this pipeline stage to images behave as if the robustImageAccess feature is enabled
• VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_ROBUST_IMAGE_ACCESS_2_EXT specifies that out of bounds accesses by this pipeline stage to images behave as if the robustImageAccess2 feature is enabled

An identifier can be provided instead of shader code in an attempt to compile pipelines without providing complete SPIR-V to the implementation.

The VkPipelineShaderStageModuleIdentifierCreateInfoEXT structure is defined as:
typedef struct VkPipelineShaderStageModuleIdentifierCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t identifierSize;
    const uint8_t* pIdentifier;
} VkPipelineShaderStageModuleIdentifierCreateInfoEXT;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **identifierSize** is the size, in bytes, of the buffer pointed to by pIdentifier.
- **pIdentifier** is a pointer to a buffer of opaque data specifying an identifier.

Any identifier can be used. If the pipeline being created with identifier requires compilation to complete the pipeline creation call, pipeline compilation must fail as defined by VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT.

pIdentifier and identifierSize can be obtained from an VkShaderModuleIdentifierEXT queried earlier.

### Valid Usage

- **VUID-VkPipelineShaderStageModuleIdentifierCreateInfoEXT-pNext-06850**
  If this structure is included in a pNext chain and identifierSize is not equal to 0, the shaderModuleIdentifier feature must be enabled

- **VUID-VkPipelineShaderStageModuleIdentifierCreateInfoEXT-pNext-06851**
  If this struct is included in a pNext chain of VkPipelineShaderStageCreateInfo and identifierSize is not equal to 0, the pipeline must be created with the VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT flag set

- **VUID-VkPipelineShaderStageModuleIdentifierCreateInfoEXT-identifierSize-06852**
  identifierSize must be less-or-equal to VK_MAX_SHADER_MODULE_IDENTIFIER_SIZE_EXT

### Valid Usage (Implicit)

- **VUID-VkPipelineShaderStageModuleIdentifierCreateInfoEXT-sType-sType**
  sType must be VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_MODULE_IDENTIFIER_CREATE_INFO_EXT

- **VUID-VkPipelineShaderStageModuleIdentifierCreateInfoEXT-pIdentifier-parameter**
  If identifierSize is not 0, pIdentifier must be a valid pointer to an array of identifierSize uint8_t values

If a compute pipeline is going to be used in Device-Generated Commands by specifying its pipeline token with VkBindPipelineIndirectCommandNV, then that pipeline’s associated metadata must be
saved at a specified buffer device address for later use in indirect command generation. The buffer device address **must** be specified at the time of compute pipeline creation with `VkComputePipelineIndirectBufferInfoNV` structure in the `pNext` chain of `VkComputePipelineCreateInfo`.

The `VkComputePipelineIndirectBufferInfoNV` structure is defined as:

```c
// Provided by VK_NV_device_generated_commands_compute
typedef struct VkComputePipelineIndirectBufferInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkDeviceAddress deviceAddress;
    VkDeviceSize size;
    VkDeviceAddress pipelineDeviceAddressCaptureReplay;
} VkComputePipelineIndirectBufferInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `deviceAddress` is the address where the pipeline's metadata will be stored.
- `size` is the size of pipeline's metadata that was queried using `vkGetPipelineIndirectMemoryRequirementsNV`.
- `pipelineDeviceAddressCaptureReplay` is the device address where pipeline's metadata was originally saved and can now be used to re-populate `deviceAddress` for replay.

If `pipelineDeviceAddressCaptureReplay` is zero, no specific address is requested. If `pipelineDeviceAddressCaptureReplay` is not zero, then it **must** be an address retrieved from an identically created pipeline on the same implementation. The pipeline metadata **must** also be placed on an identically created buffer and at the same offset using the `vkCmdUpdatePipelineIndirectBufferNV` command.

### Valid Usage

- **VUID-VkComputePipelineIndirectBufferInfoNV-deviceGeneratedComputePipelines-09009**
  The `VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV::deviceGeneratedComputePipelines` feature **must** be enabled.

- **VUID-VkComputePipelineIndirectBufferInfoNV-flags-09010**
  The pipeline creation flags in `VkComputePipelineCreateInfo::flags` **must** include `VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV`.

- **VUID-VkComputePipelineIndirectBufferInfoNV-deviceAddress-09011**
  `deviceAddress` **must** be aligned to the `VkMemoryRequirements2::alignment`, as returned by `vkGetPipelineIndirectMemoryRequirementsNV`.

- **VUID-VkComputePipelineIndirectBufferInfoNV-deviceAddress-09012**
  `deviceAddress` **must** have been allocated from a buffer that was created with usage `VK_BUFFER_USAGE_TRANSFER_DST_BIT` and `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT`
**Valid Usage (Implicit)**

- **VUID-VkComputePipelineIndirectBufferInfoNV-sType-sType**
  
  sType must be VK_STRUCTURE_TYPE_COMPUTE_PIPELINE_INDIRECT_BUFFER_INFO_NV

To save a compute pipeline’s metadata at a device address call:

```c
// Provided by VK_NV_device_generated_commands_compute
void vkCmdUpdatePipelineIndirectBufferNV(
    VkCommandBuffer commandBuffer,
    VkPipelineBindPoint pipelineBindPoint,
    VkPipeline pipeline);
```

- **commandBuffer** is the command buffer into which the command will be recorded.

- **pipelineBindPoint** is a VkPipelineBindPoint value specifying the type of pipeline whose metadata will be saved.

- **pipeline** is the pipeline whose metadata will be saved.

vkCmdUpdatePipelineIndirectBufferNV is only allowed outside of a render pass. This command is treated as a “transfer” operation for the purposes of synchronization barriers. The writes to the address must be synchronized using stages VK_PIPELINE_STAGE_2_COPY_BIT and VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_NV and with access masks VK_ACCESS_MEMORY_WRITE_BIT.
and `VK_ACCESS_COMMAND_PREPROCESS_READ_BIT_NV` respectively before using the results in preprocessing.

**Valid Usage**

- **VUID-vkCmdUpdatePipelineIndirectBufferNV-pipelineBindPoint-09018**
  
  `pipelineBindPoint` must be `VK_PIPELINE_BIND_POINT_COMPUTE`

- **VUID-vkCmdUpdatePipelineIndirectBufferNV-pipeline-09019**
  
  `pipeline` must have been created with `VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV` flag set

- **VUID-vkCmdUpdatePipelineIndirectBufferNV-pipeline-09020**
  
  `pipeline` must have been created with `VkComputePipelineIndirectBufferInfoNV` structure specifying a valid address where its metadata will be saved

- **VUID-vkCmdUpdatePipelineIndirectBufferNV-deviceGeneratedComputePipelines-09021**
  
  The `VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV::deviceGeneratedComputePipelines` feature must be enabled

**Valid Usage (Implicit)**

- **VUID-vkCmdUpdatePipelineIndirectBufferNV-commandBuffer-parameter**
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdUpdatePipelineIndirectBufferNV-pipelineBindPoint-parameter**
  
  `pipelineBindPoint` must be a valid `VkPipelineBindPoint` value

- **VUID-vkCmdUpdatePipelineIndirectBufferNV-pipeline-parameter**
  
  `pipeline` must be a valid `VkPipeline` handle

- **VUID-vkCmdUpdatePipelineIndirectBufferNV-commandBuffer-recording**
  
  `commandBuffer` must be in the recording state

- **VUID-vkCmdUpdatePipelineIndirectBufferNV-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations

- **VUID-vkCmdUpdatePipelineIndirectBufferNV-renderpass**
  
  This command must only be called outside of a render pass instance

- **VUID-vkCmdUpdatePipelineIndirectBufferNV-videocoding**
  
  This command must only be called outside of a video coding scope

- **VUID-vkCmdUpdatePipelineIndirectBufferNV-commonparent**
  
  Both of `commandBuffer`, and `pipeline` must have been created, allocated, or retrieved from the same `VkDevice`

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized
Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized.

### 10.3. Graphics Pipelines

Graphics pipelines consist of multiple shader stages, multiple fixed-function pipeline stages, and a pipeline layout.

To create graphics pipelines, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateGraphicsPipelines(  
    VkDevice device,  
    VkPipelineCache pipelineCache,  
    uint32_t createInfoCount,  
    const VkGraphicsPipelineCreateInfo* pCreateInfos,  
    const VkAllocationCallbacks* pAllocator,  
    VkPipeline* pPipelines);
```

- `device` is the logical device that creates the graphics pipelines.
- `pipelineCache` is either VK_NULL_HANDLE, indicating that pipeline caching is disabled; or the handle of a valid pipeline cache object, in which case use of that cache is enabled for the duration of the command.
- `createInfoCount` is the length of the `pCreateInfos` and `pPipelines` arrays.
- `pCreateInfos` is a pointer to an array of VkGraphicsPipelineCreateInfo structures.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pPipelines` is a pointer to an array of VkPipeline handles in which the resulting graphics pipeline objects are returned.

The VkGraphicsPipelineCreateInfo structure includes an array of VkPipelineShaderStageCreateInfo structures for each of the desired active shader stages, as well as creation information for all relevant fixed-function stages, and a pipeline layout.

Pipelines are created and returned as described for Multiple Pipeline Creation.
Valid Usage

- VUID-vkCreateGraphicsPipelines-device-09662
  
  device must support at least one queue family with the VK_QUEUE_GRAPHICS_BIT capability

- VUID-vkCreateGraphicsPipelines-flags-00720
  If the flags member of any element of pCreateInfos contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and the basePipelineIndex member of that same element is not -1, basePipelineIndex must be less than the index into pCreateInfos that corresponds to that element

- VUID-vkCreateGraphicsPipelines-flags-00721
  If the flags member of any element of pCreateInfos contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, the base pipeline must have been created with the VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT flag set

- VUID-vkCreateGraphicsPipelines-pipelineCache-02876
  If pipelineCache was created with VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT, host access to pipelineCache must be externally synchronized

NOTE
An implicit cache may be provided by the implementation or a layer. For this reason, it is still valid to set VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT on flags for any element of pCreateInfos while passing VK_NULL_HANDLE for pipelineCache.

Valid Usage (Implicit)

- VUID-vkCreateGraphicsPipelines-device-parameter
  
  device must be a valid VkDevice handle

- VUID-vkCreateGraphicsPipelines-pipelineCache-parameter
  
  If pipelineCache is not VK_NULL_HANDLE, pipelineCache must be a valid VkPipelineCache handle

- VUID-vkCreateGraphicsPipelines-pCreateInfos-parameter
  
  pCreateInfos must be a valid pointer to an array of createInfoCount valid VkGraphicsPipelineCreateInfo structures

- VUID-vkCreateGraphicsPipelines-pAllocator-parameter
  
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateGraphicsPipelines-pPipelines-parameter
  
  pPipelines must be a valid pointer to an array of createInfoCount VkPipeline handles

- VUID-vkCreateGraphicsPipelines-createInfoCount-arraylength
  
  createInfoCount must be greater than 0

- VUID-vkCreateGraphicsPipelines-pipelineCache-parent
  
  If pipelineCache is a valid handle, it must have been created, allocated, or retrieved from device
## Return Codes

### Success
- `VK_SUCCESS`
- `VK_PIPELINE_COMPILE_REQUIRED_EXT`

### Failure
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INVALID_SHADER_NV`

The `VkGraphicsPipelineCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkGraphicsPipelineCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCreateFlags flags;
    uint32_t stageCount;
    const VkPipelineShaderStageCreateInfo* pStages;
    const VkPipelineVertexInputStateCreateInfo* pVertexInputState;
    const VkPipelineInputAssemblyStateCreateInfo* pInputAssemblyState;
    const VkPipelineTessellationStateCreateInfo* pTessellationState;
    const VkPipelineViewportStateCreateInfo* pViewportState;
    const VkPipelineRasterizationStateCreateInfo* pRasterizationState;
    const VkPipelineMultisampleStateCreateInfo* pMultisampleState;
    const VkPipelineColorBlendStateCreateInfo* pColorBlendState;
    const VkPipelineDynamicStateCreateInfo* pDynamicState;
    VkPipelineLayout layout;
    VkRenderPass renderPass;
    uint32_t subpass;
    VkPipeline basePipelineHandle;
    int32_t basePipelineIndex;
} VkGraphicsPipelineCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkPipelineCreateFlagBits` specifying how the pipeline will be generated.
- `stageCount` is the number of entries in the `pStages` array.
- `pStages` is a pointer to an array of `stageCount` `VkPipelineShaderStageCreateInfo` structures describing the set of the shader stages to be included in the graphics pipeline.
- `pVertexInputState` is a pointer to a `VkPipelineVertexInputStateCreateInfo` structure. It is ignored if the pipeline includes a mesh shader stage. It can be `NULL` if the pipeline is created with the
VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state set.

- **pInputAssemblyState** is a pointer to a VkPipelineInputAssemblyStateCreateInfo structure which determines input assembly behavior for vertex shading, as described in Drawing Commands. If the VK_EXT_extended_dynamic_state3 extension is enabled, it can be NULL if the pipeline is created with both VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE, and VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY dynamic states set and dynamicPrimitiveTopologyUnrestricted is VK_TRUE. It is ignored if the pipeline includes a mesh shader stage.

- **pTessellationState** is a pointer to a VkPipelineTessellationStateCreateInfo structure defining tessellation state used by tessellation shaders. It can be NULL if the pipeline is created with the VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT dynamic state set.

- **pViewportState** is a pointer to a VkPipelineViewportStateCreateInfo structure defining viewport state used when rasterization is enabled. If the VK_EXT_extended_dynamic_state3 extension is enabled, it can be NULL if the pipeline is created with both VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT, and VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic states set.

- **pRasterizationState** is a pointer to a VkPipelineRasterizationStateCreateInfo structure defining rasterization state. If the VK_EXT_extended_dynamic_state3 extension is enabled, it can be NULL if the pipeline is created with all of VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT, VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE, VK_DYNAMIC_STATE_POLYGON_MODE_EXT, VK_DYNAMIC_STATE_CULL_MODE, VK_DYNAMIC_STATE_FRONT_FACE, VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE, VK_DYNAMIC_STATE_DEPTH_BIAS, and VK_DYNAMIC_STATE_LINE_WIDTH dynamic states set.

- **pMultisampleState** is a pointer to a VkPipelineMultisampleStateCreateInfo structure defining multisample state used when rasterization is enabled. If the VK_EXT_extended_dynamic_state3 extension is enabled, it can be NULL if the pipeline is created with all of VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT, VK_DYNAMIC_STATE_SAMPLE_MASK_EXT, and VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT dynamic states set, and either alphaToOne is disabled on the device or VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT is set, in which case VkPipelineMultisampleStateCreateInfo::sampleShadingEnable is assumed to be VK_FALSE.

- **pDepthStencilState** is a pointer to a VkPipelineDepthStencilStateCreateInfo structure defining depth/stencil state used when rasterization is enabled for depth or stencil attachments accessed during rendering. If the VK_EXT_extended_dynamic_state3 extension is enabled, it can be NULL if the pipeline is created with all of VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE, VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE, VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE, VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE, VK_DYNAMIC_STATE_STENCIL_OP, and VK_DYNAMIC_STATE_DEPTH_BOUNDS dynamic states set.

- **pColorBlendState** is a pointer to a VkPipelineColorBlendStateCreateInfo structure defining color blend state used when rasterization is enabled for any color attachments accessed during rendering. If the VK_EXT_extended_dynamic_state3 extension is enabled, it can be NULL if the pipeline is created with all of VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT, VK_DYNAMIC_STATE_LOGIC_OP_EXT, VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT, VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT, VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT, and VK_DYNAMIC_STATE_BLEND_CONSTANTS dynamic states set.

- **pDynamicState** is a pointer to a VkPipelineDynamicStateCreateInfo structure defining which properties of the pipeline state object are dynamic and can be changed independently of the pipeline state. This can be NULL, which means no state in the pipeline is considered dynamic.
• **layout** is the description of binding locations used by both the pipeline and descriptor sets used with the pipeline.

• **renderPass** is a handle to a render pass object describing the environment in which the pipeline will be used. The pipeline **must** only be used with a render pass instance compatible with the one provided. See **Render Pass Compatibility** for more information.

• **subpass** is the index of the subpass in the render pass where this pipeline will be used.

• **basePipelineHandle** is a pipeline to derive from.

• **basePipelineIndex** is an index into the **pCreateInfos** parameter to use as a pipeline to derive from.

The parameters **basePipelineHandle** and **basePipelineIndex** are described in more detail in **Pipeline Derivatives**.

If any shader stage fails to compile, the compile log will be reported back to the application, and **VK_ERROR_INVALID_SHADER_NV** will be generated.

**NOTE**

With **VK_EXT_extended_dynamic_state3**, it is possible that many of the **VkGraphicsPipelineCreateInfo** members above **can** be **NULL** because all their state is dynamic and therefore ignored. This is optional so the application **can** still use a valid pointer if it needs to set the **pNext** or **flags** fields to specify state for other extensions.

The state required for a graphics pipeline is divided into vertex input state, pre-rasterization shader state, fragment shader state, and fragment output state.

**Vertex Input State**

Vertex input state is defined by:

- **VkPipelineVertexInputStateCreateInfo**
- **VkPipelineInputAssemblyStateCreateInfo**

If this pipeline specifies **pre-rasterization state** either directly or by including it as a pipeline library and its **pStages** includes a vertex shader, this state **must** be specified to create a complete graphics pipeline.

If a pipeline includes **VK_GRAPHICS_PIPELINE_LIBRARY_VERTEX_INPUT_INTERFACE_BIT_EXT** in **VkGraphicsPipelineLibraryCreateInfoEXT::flags** either explicitly or as a default, and either the conditions requiring this state for a complete graphics pipeline are met or this pipeline does not specify **pre-rasterization state** in any way, that pipeline **must** specify this state directly.

**Pre-Rasterization Shader State**

Pre-rasterization shader state is defined by:

- **VkPipelineShaderStageCreateInfo** entries for:
  - Vertex shaders
  - Tessellation control shaders
• Tessellation evaluation shaders
• Geometry shaders
• Task shaders
• Mesh shaders

• Within the `VkPipelineLayout`, all descriptor sets with pre-rasterization shader bindings if `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT` was specified.
  ◦ If `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT` was not specified, the full pipeline layout must be specified.

• `VkPipelineViewportStateCreateInfo`
• `VkPipelineRasterizationStateCreateInfo`
• `VkPipelineTessellationStateCreateInfo`
• `VkRenderPass` and `subpass` parameter
• The `viewMask` parameter of `VkPipelineRenderingCreateInfo` (formats are ignored)
• `VkPipelineDiscardRectangleStateCreateInfoEXT`
• `VkPipelineFragmentShadingRateStateCreateInfoKHR`

This state must be specified to create a complete graphics pipeline.

If either the `pNext` chain includes a `VkGraphicsPipelineLibraryCreateInfoEXT` structure with `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` included in `flags`, or it is not specified and would default to include that value, this state must be specified in the pipeline.

**Fragment Shader State**

Fragment shader state is defined by:

• A `VkPipelineShaderStageCreateInfo` entry for the fragment shader
• Within the `VkPipelineLayout`, all descriptor sets with fragment shader bindings if `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT` was specified.
  ◦ If `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT` was not specified, the full pipeline layout must be specified.
• `VkPipelineMultisampleStateCreateInfo` if sample shading is enabled or `renderpass` is not `VK_NULL_HANDLE`
• `VkPipelineDepthStencilStateCreateInfo`
• `VkRenderPass` and `subpass` parameter
• The `viewMask` parameter of `VkPipelineRenderingCreateInfo` (formats are ignored)
• `VkPipelineFragmentShadingRateStateCreateInfoKHR`
• `VkPipelineFragmentShadingRateEnumStateCreateInfoNV`
• `VkPipelineRepresentativeFragmentTestStateCreateInfoNV`

• Inclusion/omission of the `VK_PIPELINE_RASTERIZATION_STATE_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` flag
Inclusion/omission of the VK_PIPELINE_RASTERIZATION_STATE_CREATE_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT flag

• VkRenderingInputAttachmentIndexInfoKHR

If a pipeline specifies **pre-rasterization state** either directly or by including it as a pipeline library and `rasterizerDiscardEnable` is set to `VK_FALSE` or `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` is used, this state **must** be specified to create a complete graphics pipeline.

If a pipeline includes `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT` in `VkGraphicsPipelineLibraryCreateInfoEXT::flags` either explicitly or as a default, and either the conditions requiring this state for a complete graphics pipeline are met or this pipeline does not specify **pre-rasterization state** in any way, that pipeline **must** specify this state directly.

**Fragment Output State**

Fragment output state is defined by:

• VkPipelineColorBlendStateCreateInfo
• VkRenderPass and `subpass` parameter
• VkPipelineMultisampleStateCreateInfo
• VkPipelineRenderingCreateInfo
• VkAttachmentSampleCountInfoAMD
• VkAttachmentSampleCountInfoNV

• VkRenderingAttachmentLocationInfoKHR

If a pipeline specifies **pre-rasterization state** either directly or by including it as a pipeline library and `rasterizerDiscardEnable` is set to `VK_FALSE` or `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` is used, this state **must** be specified to create a complete graphics pipeline.

If a pipeline includes `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT` in `VkGraphicsPipelineLibraryCreateInfoEXT::flags` either explicitly or as a default, and either the conditions requiring this state for a complete graphics pipeline are met or this pipeline does not specify **pre-rasterization state** in any way, that pipeline **must** specify this state directly.

**Dynamic State**

Dynamic state values set via `pDynamicState` **must** be ignored if the state they correspond to is not otherwise statically set by one of the state subsets used to create the pipeline. Additionally, setting dynamic state values **must** not modify whether state in a linked library is static or dynamic; this is set and unchangeable when the library is created. For example, if a pipeline only included **pre-rasterization shader state**, then any dynamic state value corresponding to depth or stencil testing has no effect. Any linked library that has dynamic state enabled that same dynamic state **must** also be enabled in all the other linked libraries to which that dynamic state applies.
Complete Graphics Pipelines

A complete graphics pipeline always includes pre-rasterization shader state, with other subsets included depending on that state as specified in the above sections.

Graphics Pipeline Library Layouts

If different subsets are linked together with pipeline layouts created with \texttt{VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT}, the final effective pipeline layout is effectively the union of the linked pipeline layouts. When binding descriptor sets for this pipeline, the pipeline layout used \textbf{must} be compatible with this union. This pipeline layout \textbf{can} be overridden when linking with \texttt{VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT} by providing a \texttt{VkPipelineLayout} that is \textbf{compatible} with this union other than \texttt{VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT}, or when linking without \texttt{VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT} by providing a \texttt{VkPipelineLayout} that is fully \textbf{compatible} with this union.

If the \texttt{pNext} chain includes a \texttt{VkPipelineCreateFlags2CreateInfoKHR} structure, \texttt{VkPipelineCreateFlags2CreateInfoKHR::flags} from that structure is used instead of \texttt{flags} from this structure.

Valid Usage

- VUID-VkGraphicsPipelineCreateInfo-None-09497
  If the \texttt{pNext} chain does not include a \texttt{VkPipelineCreateFlags2CreateInfoKHR} structure, \texttt{flags} \textbf{must} be a valid combination of \texttt{VkPipelineCreateFlagBits} values

- VUID-VkGraphicsPipelineCreateInfo-flags-07984
  If \texttt{flags} contains the \texttt{VK_PIPELINE_CREATE_DERIVATIVE_BIT} flag, and \texttt{basePipelineIndex} is -1, \texttt{basePipelineHandle} \textbf{must} be a valid graphics \texttt{VkPipeline} handle

- VUID-VkGraphicsPipelineCreateInfo-flags-07985
  If \texttt{flags} contains the \texttt{VK_PIPELINE_CREATE_DERIVATIVE_BIT} flag, and \texttt{basePipelineHandle} is \texttt{VK_NULL_HANDLE}, \texttt{basePipelineIndex} \textbf{must} be a valid index into the calling command's \texttt{pCreateInfos} parameter

- VUID-VkGraphicsPipelineCreateInfo-flags-07986
  If \texttt{flags} contains the \texttt{VK_PIPELINE_CREATE_DERIVATIVE_BIT} flag, \texttt{basePipelineIndex} \textbf{must} be -1 or \texttt{basePipelineHandle} \textbf{must} be \texttt{VK_NULL_HANDLE}

- VUID-VkGraphicsPipelineCreateInfo-layout-07987
  If a push constant block is declared in a shader, a push constant range in \texttt{layout} \textbf{must} match the shader stage

- VUID-VkGraphicsPipelineCreateInfo-layout-10069
  If a push constant block is declared in a shader, the block must be contained inside the push constant range in \texttt{layout} that matches the stage

- VUID-VkGraphicsPipelineCreateInfo-layout-07988
  If a resource variables is declared in a shader, a descriptor slot in \texttt{layout} \textbf{must} match the shader stage

- VUID-VkGraphicsPipelineCreateInfo-layout-07990
  If a resource variables is declared in a shader, and the descriptor type is not \texttt{VK_DESCRIPTOR_TYPE_MUTABLE_EXT}, a descriptor slot in \texttt{layout} \textbf{must} match the descriptor
type

• VUID-VkGraphicsPipelineCreateInfo-layout-07991
  If a resource variables is declared in a shader as an array, a descriptor slot in layout must match the descriptor count

• VUID-VkGraphicsPipelineCreateInfo-stage-02096
  If the pipeline requires pre-rasterization shader state the stage member of one element of pStages must be VK_SHADER_STAGE_VERTEX_BIT or VK_SHADER_STAGE_MESH_BIT_EXT

• VUID-VkGraphicsPipelineCreateInfo-pStages-02095
  If the pipeline requires pre-rasterization shader state the geometric shader stages provided in pStages must be either from the mesh shading pipeline (stage is VK_SHADER_STAGE_TASK_BIT_EXT or VK_SHADER_STAGE_MESH_BIT_EXT) or from the primitive shading pipeline (stage is VK_SHADER_STAGE_VERTEX_BIT, VK_SHADER_STAGE_TESSellation_CONTROL_BIT, VK_SHADER_STAGE_TESSellation_EVALUATION_BIT, or VK_SHADER_STAGE_GEOMETRY_BIT)

• VUID-VkGraphicsPipelineCreateInfo-pStages-09631
  If the pipeline requires pre-rasterization shader state and pStages contains both VK_SHADER_STAGE_TASK_BIT_EXT and VK_SHADER_STAGE_MESH_BIT_EXT, then the mesh shader's entry point must not declare a variable with a DrawIndex BuiltIn decoration

• VUID-VkGraphicsPipelineCreateInfo-TaskNV-07063
  The shader stages for VK_SHADER_STAGE_TASK_BIT_EXT or VK_SHADER_STAGE_MESH_BIT_EXT must use either the TaskNV and MeshNV Execution Model or the TaskEXT and MeshEXT Execution Model, but must not use both

• VUID-VkGraphicsPipelineCreateInfo-pStages-00729
  If the pipeline requires pre-rasterization shader state and pStages includes a tessellation control shader stage, it must include a tessellation evaluation shader stage

• VUID-VkGraphicsPipelineCreateInfo-pStages-00730
  If the pipeline requires pre-rasterization shader state and pStages includes a tessellation evaluation shader stage, it must include a tessellation control shader stage

• VUID-VkGraphicsPipelineCreateInfo-pStages-09022
  If the pipeline requires pre-rasterization shader state and pStages includes a tessellation control shader stage, and the VK_EXT_extended_dynamic_state3 extension is not enabled or the VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT dynamic state is not set, pTessellationState must be a valid pointer to a valid VkPipelineTessellationStateCreateInfo structure

• VUID-VkGraphicsPipelineCreateInfo-pTessellationState-09023
  If pTessellationState is not NULL it must be a pointer to a valid VkPipelineTessellationStateCreateInfo structure

• VUID-VkGraphicsPipelineCreateInfo-pStages-00732
  If the pipeline requires pre-rasterization shader state and pStages includes tessellation shader stages, the shader code of at least one stage must contain an OpExecutionMode instruction specifying the type of subdivision in the pipeline

• VUID-VkGraphicsPipelineCreateInfo-pStages-00733
  If the pipeline requires pre-rasterization shader state and pStages includes tessellation
shader stages, and the shader code of both stages contain an `OpExecutionMode` instruction specifying the type of subdivision in the pipeline, they **must** both specify the same subdivision mode.

- **VUID-VkGraphicsPipelineCreateInfo-pStages-00734**
  If the pipeline requires pre-rasterization shader state and `pStages` includes tessellation shader stages, the shader code of at least one stage **must** contain an `OpExecutionMode` instruction specifying the output patch size in the pipeline.

- **VUID-VkGraphicsPipelineCreateInfo-pStages-00735**
  If the pipeline requires pre-rasterization shader state and `pStages` includes tessellation shader stages, and the shader code of both contain an `OpExecutionMode` instruction specifying the out patch size in the pipeline, they **must** both specify the same patch size.

- **VUID-VkGraphicsPipelineCreateInfo-pStages-08888**
  If the pipeline is being created with pre-rasterization shader state and `pStages` includes tessellation shader stages, and either `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` dynamic state is not enabled or `dynamicPrimitiveTopologyUnrestricted` is `VK_FALSE`, the `topology` member of `pInputAssembly` **must** be `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`.

- **VUID-VkGraphicsPipelineCreateInfo-topology-08889**
  If the pipeline is being created with pre-rasterization shader state and `pStages` includes tessellation shader stages, and the `topology` member of `pInputAssembly` is `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`, and either `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` dynamic state is not enabled or `dynamicPrimitiveTopologyUnrestricted` is `VK_FALSE`, then `pStages` **must** include tessellation shader stages.

- **VUID-VkGraphicsPipelineCreateInfo-TessellationEvaluation-07723**
  If the pipeline is being created with a TessellationEvaluation Execution Model, no Geometry Execution Model, uses the PointMode Execution Mode, and `shaderTessellationAndGeometryPointSize` is enabled, a `PointSize` decorated variable **must** be written to if `maintenance5` is not enabled.

- **VUID-VkGraphicsPipelineCreateInfo-TessellationEvaluation-07724**
  If the pipeline is being created with a TessellationEvaluation Execution Model, no Geometry Execution Model, uses the PointMode Execution Mode, and `shaderTessellationAndGeometryPointSize` is not enabled, a `PointSize` decorated variable **must** not be written to.

- **VUID-VkGraphicsPipelineCreateInfo-maintenance5-08775**
  If `maintenance5` is enabled and a `PointSize` decorated variable is written to, all execution paths **must** write to a `PointSize` decorated variable.

- **VUID-VkGraphicsPipelineCreateInfo-TessellationEvaluation-07725**
  If the pipeline is being created with a TessellationEvaluation Execution Model, no Geometry Execution Model, and the `topology` member of `pInputAssembly` is `VK_PRIMITIVE_TOPOLOGY_POINT_LIST`, and either `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` dynamic state is not enabled or `dynamicPrimitiveTopologyUnrestricted` is `VK_FALSE`, a `PointSize` decorated variable **must** be written to if `maintenance5` is not enabled.

- **VUID-VkGraphicsPipelineCreateInfo-shaderTessellationAndGeometryPointSize-08776**
  If `maintenance5` is enabled and a `PointSize` decorated variable is written to, all execution paths **must** write to a `PointSize` decorated variable.
If the pipeline is being created with a Geometry Execution Model, uses the OutputPoints Execution Mode, and shaderTessellationAndGeometryPointSize is enabled, a PointSize decorated variable must be written to for every vertex emitted if maintenance5 is not enabled.

- **VUID-VkGraphicsPipelineCreateInfo-Geometry-07726**
  If the pipeline is being created with a Geometry Execution Model, uses the OutputPoints Execution Mode, and shaderTessellationAndGeometryPointSize is not enabled, a PointSize decorated variable must not be written to.

- **VUID-VkGraphicsPipelineCreateInfo-pStages-00738**
  If the pipeline requires pre-rasterization shader state and pStages includes a geometry shader stage, and does not include any tessellation shader stages, its shader code must contain an OpExecutionMode instruction specifying an input primitive type that is compatible with the primitive topology specified in pInputAssembly.

- **VUID-VkGraphicsPipelineCreateInfo-pStages-00739**
  If the pipeline requires pre-rasterization shader state and pStages includes a geometry shader stage, and also includes tessellation shader stages, its shader code must contain an OpExecutionMode instruction specifying an input primitive type that is compatible with the primitive topology that is output by the tessellation stages.

- **VUID-VkGraphicsPipelineCreateInfo-pStages-00740**
  If the pipeline requires pre-rasterization shader state and fragment shader state, it includes both a fragment shader and a geometry shader, and the fragment shader code reads from an input variable that is decorated with PrimitiveId, then the geometry shader code must write to a matching output variable, decorated with PrimitiveId, in all execution paths.

- **VUID-VkGraphicsPipelineCreateInfo-PrimitiveId-06264**
  If the pipeline requires pre-rasterization shader state, it includes a mesh shader and the fragment shader code reads from an input variable that is decorated with PrimitiveId, then the mesh shader code must write to a matching output variable, decorated with PrimitiveId, in all execution paths.

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-06038**
  If renderPass is not VK_NULL_HANDLE and the pipeline is being created with fragment shader state the fragment shader must not read from any input attachment that is defined as VK_ATTACHMENT_UNUSED in subpass.

- **VUID-VkGraphicsPipelineCreateInfo-pStages-00742**
  If the pipeline requires pre-rasterization shader state and multiple pre-rasterization shader stages are included in pStages, the shader code for the entry points identified by those pStages and the rest of the state identified by this structure must adhere to the pipeline linking rules described in the Shader Interfaces chapter.

- **VUID-VkGraphicsPipelineCreateInfo-None-04889**
  If the pipeline requires pre-rasterization shader state and fragment shader state, the fragment shader and last pre-rasterization shader stage and any relevant state must adhere to the pipeline linking rules described in the Shader Interfaces chapter.

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-06041**
  If renderPass is not VK_NULL_HANDLE, and the pipeline is being created with fragment
output interface state, then for each color attachment in the subpass, if the potential format features of the format of the corresponding attachment description do not contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the blendEnable member of the corresponding element of the pAttachments member of pColorBlendState must be VK_FALSE

• VUID-VkGraphicsPipelineCreateInfo-renderPass-07609
If renderPass is not VK_NULL_HANDLE, the pipeline is being created with fragment output interface state, the pColorBlendState pointer is not NULL, the attachmentCount member of pColorBlendState is not ignored, and the subpass uses color attachments, the attachmentCount member of pColorBlendState must be equal to the colorAttachmentCount used to create subpass

• VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04130
If the pipeline requires pre-rasterization shader state, and pViewportState->pViewports is not dynamic, then pViewportState->pViewports must be a valid pointer to an array of VkViewport structures

• VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04131
If the pipeline requires pre-rasterization shader state, and pViewportState->pScissors is not dynamic, then pViewportState->pScissors must be a valid pointer to an array of VkRect2D structures

• VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-00749
If the pipeline requires pre-rasterization shader state, and the widelines feature is not enabled, and no element of the pDynamicStates member of pDynamicState is VK_DYNAMIC_STATE_LINE_WIDTH, the lineWidth member of pRasterizationState must be 1.0

• VUID-VkGraphicsPipelineCreateInfo-rasterizerDiscardEnable-09024
If the pipeline requires pre-rasterization shader state, and the VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE dynamic state is enabled or the rasterizerDiscardEnable member of pRasterizationState is VK_FALSE, and related dynamic state is not set, pViewportState must be a valid pointer to a valid VkPipelineViewportStateCreateInfo structure

• VUID-VkGraphicsPipelineCreateInfo-pViewportState-09025
If pViewportState is not NULL it must be a valid pointer to a valid VkPipelineViewportStateCreateInfo structure

• VUID-VkGraphicsPipelineCreateInfo-pMultisampleState-09026
If the pipeline requires fragment output interface state, and the VK_EXT_extended_dynamic_state3 extension is not enabled or any of the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT, VK_DYNAMIC_STATE_SAMPLE_MASK_EXT, or VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT dynamic states is not set, or alphaToOne is enabled on the device and VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT is not set, pMultisampleState must be a valid pointer to a valid VkPipelineMultisampleStateCreateInfo structure

• VUID-VkGraphicsPipelineCreateInfo-pMultisampleState-09027
If pMultisampleState is not NULL it must be a valid pointer to a valid VkPipelineMultisampleStateCreateInfo structure

• VUID-VkGraphicsPipelineCreateInfo-alphaToCoverageEnable-08891
If the pipeline is being created with fragment shader state, the
VkPipelineMultisampleStateCreateInfo::alphaToCoverageEnable is not ignored and is VK_TRUE, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0.

- VUID-VkGraphicsPipelineCreateInfo-renderPass-09028
  If renderPass is not VK_NULL_HANDLE, the pipeline is being created with fragment shader state, and subpass uses a depth/stencil attachment, and related dynamic state is not set, pDepthStencilState must be a valid pointer to a valid VkPipelineDepthStencilStateCreateInfo structure.

- VUID-VkGraphicsPipelineCreateInfo-pDepthStencilState-09029
  If pDepthStencilState is not NULL it must be a valid pointer to a valid VkPipelineDepthStencilStateCreateInfo structure.

- VUID-VkGraphicsPipelineCreateInfo-renderPass-09030
  If renderPass is not VK_NULL_HANDLE, the pipeline is being created with fragment output interface state, and subpass uses color attachments, and related dynamic state is not set, pColorBlendState must be a valid pointer to a valid VkPipelineColorBlendStateCreateInfo structure.

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-00754
  If the pipeline requires pre-rasterization shader state, the depthBiasClamp feature is not enabled, no element of the pDynamicStates member of pDynamicState is VK_DYNAMIC_STATE_DEPTH_BIAS, and the depthBiasEnable member of pRasterizationState is VK_TRUE, the depthBiasClamp member of pRasterizationState must be 0.0.

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-02510
  If the pipeline requires fragment shader state, the VK_EXT_depth_range_unrestricted extension is not enabled and no element of the pDynamicStates member of pDynamicState is VK_DYNAMIC_STATE_DEPTH_BOUNDS, and the depthBoundsTestEnable member of pDepthStencilState is VK_TRUE, the minDepthBounds and maxDepthBounds members of pDepthStencilState must be between 0.0 and 1.0, inclusive.

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07610
  If the pipeline requires fragment shader state or fragment output interface state, and rasterizationSamples and sampleLocationsInfo are not dynamic, and VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable included in thepNext chain of pMultisampleState is VK_TRUE, sampleLocationsInfo.sampleLocationGridSize.width must evenly divide VkMultisamplePropertiesEXT::sampleLocationGridSize.width as returned by vkGetPhysicalDeviceMultisamplePropertiesEXT with a samples parameter equaling rasterizationSamples.

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07611
  If the pipeline requires fragment shader state or fragment output interface state, and rasterizationSamples and sampleLocationsInfo are not dynamic, and VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable the included in thepNext chain of pMultisampleState is VK_TRUE or VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT is used, sampleLocationsInfo.sampleLocationGridSize.height must evenly divide VkMultisamplePropertiesEXT::sampleLocationGridSize.height as returned by vkGetPhysicalDeviceMultisamplePropertiesEXT with a samples parameter equaling
rasterizationSamples

• VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07612
  If the pipeline requires fragment shader state or fragment output interface state, and rasterizationSamples and sampleLocationsInfo are not dynamic, and VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable included in the pNext chain of pMultisampleState is VK_TRUE or VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT is used, sampleLocationsInfo.sampleLocationsPerPixel must equal rasterizationSamples

• VUID-VkGraphicsPipelineCreateInfo-sampleLocationsEnable-01524
  If the pipeline requires fragment shader state, and the sampleLocationsEnable member of a VkPipelineSampleLocationsStateCreateInfoEXT structure included in the pNext chain of pMultisampleState is VK_TRUE, the fragment shader code must not statically use the extended instruction InterpolateAtSample

• VUID-VkGraphicsPipelineCreateInfo-multisampledRenderToSingleSampled-06853
  If the pipeline requires fragment output interface state, and none of the VK_AMD_mixed_attachment_samples extension, the VK_NV_framebuffer_mixed_samples extension, or the multisampledRenderToSingleSampled feature are enabled, rasterizationSamples is not dynamic, and if subpass uses color and/or depth/stencil attachments, then the rasterizationSamples member of pMultisampleState must be the same as the sample count for those subpass attachments

• VUID-VkGraphicsPipelineCreateInfo-subpass-01505
  If the pipeline requires fragment output interface state, and the VK_AMD_mixed_attachment_samples extension is enabled, rasterizationSamples is not dynamic, and if subpass uses color and/or depth/stencil attachments, then the rasterizationSamples member of pMultisampleState must equal the maximum of the sample counts of those subpass attachments

• VUID-VkGraphicsPipelineCreateInfo-renderPass-06854
  If renderPass is not VK_NULL_HANDLE, the VK_EXT_multisampled_render_to_single_sampled extension is enabled, rasterizationSamples is not dynamic, and subpass has a VkMultisampledRenderToSingleSampledInfoEXT structure included in the VkSubpassDescription2::pNext chain with multisampledRenderToSingleSampledEnable equal to VK_TRUE, then the rasterizationSamples member of pMultisampleState must be equal to VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples

• VUID-VkGraphicsPipelineCreateInfo-subpass-01411
  If the pipeline requires fragment output interface state, the VK_NV_framebuffer_mixed_samples extension is enabled, rasterizationSamples is not dynamic, and if subpass has a depth/stencil attachment and depth test, stencil test, or depth bounds test are enabled, then the rasterizationSamples member of pMultisampleState must be the same as the sample count of the depth/stencil attachment

• VUID-VkGraphicsPipelineCreateInfo-subpass-01412
  If the pipeline requires fragment output interface state, the VK_NV_framebuffer_mixed_samples extension is enabled, rasterizationSamples is not dynamic, and if subpass has any color attachments, then the rasterizationSamples member of pMultisampleState must be greater than or equal to the sample count for those subpass attachments
If the pipeline requires fragment output interface state, the \texttt{VK_NV_coverage_reduction_mode} extension is enabled, and \texttt{rasterizationSamples} is not dynamic, the coverage reduction mode specified by \texttt{VkPipelineCoverageReductionStateCreateInfoNV::coverageReductionMode}, the \texttt{rasterizationSamples} member of \texttt{pMultisampleState} and the sample counts for the color and depth/stencil attachments (if the subpass has them) must be a valid combination returned by \texttt{vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV}.

If the pipeline requires fragment output interface state, \texttt{rasterizationSamples} is not dynamic, and \texttt{subpass} does not use any color and/or depth/stencil attachments, then the \texttt{rasterizationSamples} member of \texttt{pMultisampleState} must follow the rules for a zero-attachment subpass.

If \texttt{renderPass} is not \texttt{VK_NULL_HANDLE}, \texttt{subpass} must be a valid subpass within \texttt{renderPass}.

If \texttt{renderPass} is not \texttt{VK_NULL_HANDLE}, the pipeline is being created with prerasterization shader state, \texttt{subpass} viewMask is not 0, and \texttt{multiviewTessellationShader} is not enabled, then \texttt{pStages} must not include tessellation shaders.

If \texttt{renderPass} is not \texttt{VK_NULL_HANDLE}, the pipeline is being created with prerasterization shader state, \texttt{subpass} viewMask is not 0, and \texttt{multiviewGeometryShader} is not enabled, then \texttt{pStages} must not include a geometry shader.

If \texttt{renderPass} is not \texttt{VK_NULL_HANDLE} and the pipeline is being created with prerasterization shader state, and \texttt{subpass} viewMask is not 0, then all of the shaders in the pipeline must not include variables decorated with the \texttt{Layer} built-in decoration in their interfaces.

If \texttt{renderPass} is not \texttt{VK_NULL_HANDLE}, the pipeline is being created with prerasterization shader state, \texttt{subpass} viewMask is not 0, and \texttt{multiviewMeshShader} is not enabled, then \texttt{pStages} must not include a mesh shader.

flags must not contain the \texttt{VK_PIPELINE_CREATE_DISPATCH_BASE} flag.

If the pipeline requires fragment shader state and an input attachment was referenced by an \texttt{aspectMask} at \texttt{renderPass} creation time, the fragment shader must only read from the aspects that were specified for that input attachment.

The number of resources in \texttt{layout} accessible to each shader stage that is used by the pipeline must be less than or equal to \texttt{VkPhysicalDeviceLimits::maxPerStageResources}.

If the pipeline requires prerasterization shader state, and no element of the \texttt{pDynamicStates} member of \texttt{pDynamicState} is \texttt{VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV}, and
the `viewportWScalingEnable` member of a `VkPipelineViewportWScalingStateCreateInfoNV` structure, included in the `pNext` chain of `pViewportState`, is `VK_TRUE`, the `pViewportWScalings` member of the `VkPipelineViewportWScalingStateCreateInfoNV` must be a pointer to an array of `VkPipelineViewportWScalingStateCreateInfoNV::viewportsCount` valid `VkViewportWScalingNV` structures

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04056**
  If the pipeline requires pre-rasterization shader state, and no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_NV`, and if `pNext` chain includes a `VkPipelineViewportExclusiveScissorStateCreateInfoNV` structure, and if its `exclusiveScissorCount` member is not 0, then its `pExclusiveScissors` member must be a valid pointer to an array of `exclusiveScissorCount` `VkRect2D` structures

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07854**
  If `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_ENABLE_NV` is included in the `pDynamicStates` array then the implementation must support at least `specVersion` 2 of the `VK_NV_scissor_exclusive` extension

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04057**
  If the pipeline requires pre-rasterization shader state, and no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV`, and if `pNext` chain includes a `VkPipelineViewportShadingRateImageStateCreateInfoNV` structure, then its `pShadingRatePalettes` member must be a valid pointer to an array of `viewportCount` valid `VkShadingRatePaletteNV` structures

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04058**
  If the pipeline requires pre-rasterization shader state, and no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT`, and if `pNext` chain includes a `VkPipelineDiscardRectangleStateCreateInfoEXT` structure, and if its `discardRectangleCount` member is not 0, then its `pDiscardRectangles` member must be a valid pointer to an array of `discardRectangleCount` `VkRect2D` structures

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07855**
  If `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` is included in the `pDynamicStates` array then the implementation must support at least `specVersion` 2 of the `VK_EXT_discard_rectangles` extension

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07856**
  If `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT` is included in the `pDynamicStates` array then the implementation must support at least `specVersion` 2 of the `VK_EXT_discard_rectangles` extension

- **VUID-VkGraphicsPipelineCreateInfo-pStages-02097**
  If the pipeline requires vertex input state, and `pVertexInputState` is not dynamic, then `pVertexInputState` must be a valid pointer to a valid `VkPipelineVertexInputStateCreateInfo` structure

- **VUID-VkGraphicsPipelineCreateInfo-Input-07904**
  If the pipeline is being created with vertex input state and `pVertexInputState` is not dynamic, then all variables with the `Input` storage class decorated with `Location` in the `Vertex Execution Model OpEntryPoint` must contain a location in
If the pipeline requires vertex input state and pVertexInputState is not dynamic, then the numeric type associated with all Input variables of the corresponding Location in the Vertex Execution Model OpEntryPoint must be the same as VkVertexInputAttributeDescription::format.

If the pipeline is being created with vertex input state and pVertexInputState is not dynamic, and VkVertexInputAttributeDescription::format has a 64-bit component, then the scalar width associated with all Input variables of the corresponding Location in the Vertex Execution Model OpEntryPoint must be 64-bit.

If the pipeline is being created with vertex input state and pVertexInputState is not dynamic, and the scalar width associated with a Location decorated Input variable in the Vertex Execution Model OpEntryPoint is 64-bit, then the corresponding VkVertexInputAttributeDescription::format must have a 64-bit component.

If the pipeline requires vertex input state, and related dynamic state is not set, pInputAssemblyState must be a valid pointer to a valid VkPipelineInputAssemblyStateCreateInfo structure.

If pInputAssemblyState is not NULL it must be a valid pointer to a valid VkPipelineInputAssemblyStateCreateInfo structure.

If the pipeline requires pre-rasterization shader state, the Xfb execution mode can be specified by no more than one shader stage in pStages.

If the pipeline requires pre-rasterization shader state, and any shader stage in pStages specifies Xfb execution mode it must be the last pre-rasterization shader stage.

If the pipeline requires pre-rasterization shader state, and a VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream value other than zero is specified, all variables in the output interface of the entry point being compiled decorated with Position, PointSize, ClipDistance, or CullDistance must be decorated with identical Stream values that match the rasterizationStream.

If the pipeline requires pre-rasterization shader state, and VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream is zero, or not specified, all variables in the output interface of the entry point being compiled decorated...
with Position, PointSize, ClipDistance, or CullDistance must be decorated with a Stream value of zero, or must not specify the Stream decoration

- VUID-VkGraphicsPipelineCreateInfo-geometryStreams-02321
  If the pipeline requires pre-rasterization shader state, and the last pre-rasterization shader stage is a geometry shader, and that geometry shader uses the GeometryStreams capability, then VkPhysicalDeviceTransformFeedbackFeaturesEXT::geometryStreams feature must be enabled

- VUID-VkGraphicsPipelineCreateInfo-None-02322
  If the pipeline requires pre-rasterization shader state, and there are any mesh shader stages in the pipeline there must not be any shader stage in the pipeline with a Xfb execution mode

- VUID-VkGraphicsPipelineCreateInfo-lineRasterizationMode-02766
  If the pipeline requires pre-rasterization shader state and at least one of fragment output interface state or fragment shader state, and pMultisampleState is not NULL, the lineRasterizationMode member of a VkPipelineRasterizationLineStateCreateInfoKHR structure included in the pNext chain of pRasterizationState is VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR or VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR, then the alphaToCoverageEnable, alphaToOneEnable, and sampleShadingEnable members of pMultisampleState must all be VK_FALSE

- VUID-VkGraphicsPipelineCreateInfo-stippledLineEnable-02767
  If the pipeline requires pre-rasterization shader state, the stippledLineEnable member of VkPipelineRasterizationLineStateCreateInfoKHR is VK_TRUE, and no element of the pDynamicStates member of pDynamicState is VK_DYNAMIC_STATE_LINE_STIPPLE_EXT, then the lineStippleFactor member of VkPipelineRasterizationLineStateCreateInfoKHR must be in the range [1,256]

- VUID-VkGraphicsPipelineCreateInfo-flags-03372
  flags must not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR

- VUID-VkGraphicsPipelineCreateInfo-flags-03373
  flags must not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR

- VUID-VkGraphicsPipelineCreateInfo-flags-03374
  flags must not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR

- VUID-VkGraphicsPipelineCreateInfo-flags-03375
  flags must not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR

- VUID-VkGraphicsPipelineCreateInfo-flags-03376
  flags must not include VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR

- VUID-VkGraphicsPipelineCreateInfo-flags-03377
  flags must not include VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR

- VUID-VkGraphicsPipelineCreateInfo-flags-03577
  flags must not include VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR
• VUID-VkGraphicsPipelineCreateInfo-flags-04947
  flags must not include VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV

• VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-03378
  If the extendedDynamicState feature is not enabled, and the value of VkApplicationInfo::apiVersion used to create the VkInstance is less than Version 1.3 there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_CULL_MODE, VK_DYNAMIC_STATE_FRONT_FACE, VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT, VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE, VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE, VK_DYNAMIC_STATE_DEPTH_COMPARE_OP, VK_DYNAMIC_STATEDEPTH_BOUNDS_TEST_ENABLE, VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE, or VK_DYNAMIC_STATE_STENCIL_OP

• VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-03379
  If the pipeline requires pre-rasterization shader state, and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT is included in the pDynamicStates array then viewportCount must be zero

• VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-03380
  If the pipeline requires pre-rasterization shader state, and VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT is included in the pDynamicStates array then scissorCount must be zero

• VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04132
  If the pipeline requires pre-rasterization shader state, and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT is included in the pDynamicStates array then VK_DYNAMIC_STATE_VIEWPORT must not be present

• VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04133
  If the pipeline requires pre-rasterization shader state, and VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT is included in the pDynamicStates array then VK_DYNAMIC_STATE_SCISSOR must not be present

• VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07065
  If the pipeline requires pre-rasterization shader state, and includes a mesh shader, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY, or VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE

• VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04868
  If the extendedDynamicState2 feature is not enabled, and the value of VkApplicationInfo::apiVersion used to create the VkInstance is less than Version 1.3 there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE, VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE, or VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE

• VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04869
  If the extendedDynamicState2LogicOp feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_LOGIC_OP_EXT

• VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04870
  If the extendedDynamicState2PatchControlPoints feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to
If the pipeline requires pre-rasterization shader state, and includes a mesh shader, there must be no element of the psDynamicStates member of psDynamicState set to VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE, or VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT.

If flags includes VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV, then the deviceGeneratedCommands feature must be enabled.

If the pipeline requires pre-rasterization shader state and flags includes VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV, then all stages must not specify Xfb execution mode.

If the pipeline is not created with a complete set of state, or VkPipelineLibraryCreateInfoKHR::libraryCount is not 0, VkGraphicsPipelineShaderGroupsCreateInfoNV::groupCount and VkGraphicsPipelineShaderGroupsCreateInfoNV::pipelineCount must be 0.

If the pipeline is created with a complete set of state, and VkPipelineLibraryCreateInfoKHR::libraryCount is 0, and the pNext chain includes an instance of VkGraphicsPipelineShaderGroupsCreateInfoNV, VkGraphicsPipelineShaderGroupsCreateInfoNV::groupCount must be greater than 0.

If the pipelineCreationCacheControl feature is not enabled, flags must not include VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT or VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT.

If the pipelineProtectedAccess feature is not enabled, flags must not include VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT_EXT or VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT_EXT.

flags must not include both VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT_EXT and VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT_EXT.

If the pipeline requires pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in psDynamicState->pDynamicStates, VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width must be greater than or equal to 1.

If the pipeline requires pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in psDynamicState->pDynamicStates, VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height must be greater than or equal to 1.
If the pipeline requires pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width must be a power-of-two value.

If the pipeline requires pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height must be a power-of-two value.

If the pipeline requires pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, and the pipelineFragmentShadingRate feature is not enabled, VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width and VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height must both be equal to 1.

If the pipeline requires pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, and the primitiveFragmentShadingRate feature is not enabled, VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps[0] must be a valid VkFragmentShadingRateCombinerOpKHR value.

If the pipeline requires pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, and the primitiveFragmentShadingRate feature is not enabled, VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps[1] must be a valid VkFragmentShadingRateCombinerOpKHR value.

If the pipeline requires pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, and the primitiveFragmentShadingRate feature is not enabled, VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps[0] must be VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR.
**VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR** is not included in `pDynamicStates`, and the attachmentFragmentShadingRate feature is not enabled, **VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps[1]** must be **VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR**

- **VUID-VkGraphicsPipelineCreateInfo-primitiveFragmentShadingRateWithMultipleViewports-04503**
  If the pipeline requires pre-rasterization shader state and the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** is not included in `pDynamicState->pDynamicStates`, and **VkPipelineViewportStateCreateInfo::viewportCount** is greater than 1, entry points specified in `pStages` must not write to the `PrimitiveShadingRateKHR` built-in.

- **VUID-VkGraphicsPipelineCreateInfo-primitiveFragmentShadingRateWithMultipleViewports-04504**
  If the pipeline requires pre-rasterization shader state and the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, and entry points specified in `pStages` write to the `ViewportIndex` built-in, they must not also write to the `PrimitiveShadingRateKHR` built-in.

- **VUID-VkGraphicsPipelineCreateInfo-primitiveFragmentShadingRateWithMultipleViewports-04505**
  If the pipeline requires pre-rasterization shader state and the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, and entry points specified in `pStages` write to the `ViewportMaskNV` built-in, they must not also write to the `PrimitiveShadingRateKHR` built-in.

- **VUID-VkGraphicsPipelineCreateInfo-fragmentShadingRateNonTrivialCombinerOps-04506**
  If the pipeline requires pre-rasterization shader state or fragment shader state, the `fragmentShadingRateNonTrivialCombinerOps` limit is not supported, and **VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR** is not included in `pDynamicState->pDynamicStates`, elements of **VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps** must be **VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR** or **VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR**.

- **VUID-VkGraphicsPipelineCreateInfo-None-06569**
  If the pipeline requires fragment shader state and **VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR** is not included in `pDynamicState->pDynamicStates`, **VkPipelineFragmentShadingRateEnumStateCreateInfoNV::shadingRateType** must be a valid **VkFragmentShadingRateTypeNV** value.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicState-06570**
  If the pipeline requires fragment shader state and **VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR** is not included in `pDynamicState->pDynamicStates`, **VkPipelineFragmentShadingRateEnumStateCreateInfoNV::shadingRate** must be a valid **VkFragmentShadingRateNV** value.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicState-06571**
  If the pipeline requires fragment shader state and **VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR** is not included in `pDynamicState->pDynamicStates`, **VkPipelineFragmentShadingRateEnumStateCreateInfoNV::combinerOps[0]** must be a valid **VkFragmentShadingRateCombinerOpKHR** value.
• **VUID-VkGraphicsPipelineCreateInfo-pDynamicState-06572**
  If the pipeline requires fragment shader state and
  `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, `VkPipelineFragmentShadingRateEnumStateCreateInfoNV::combinerOps[1]` must be a valid `VkFragmentShadingRateCombinerOpKHR` value.

• **VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04569**
  If the pipeline requires fragment shader state and
  `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, and the fragmentShadingRateEnums feature is not enabled, `VkPipelineFragmentShadingRateEnumStateCreateInfoNV::shadingRateType` must be equal to `VK_FRAGMENT_SHADING_RATE_TYPE_FRAGMENT_SIZE_NV`.

• **VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04570**
  If the pipeline requires fragment shader state and
  `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, and the pipelineFragmentShadingRate feature is not enabled, `VkPipelineFragmentShadingRateEnumStateCreateInfoNV::shadingRate` must be equal to `VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_PIXEL_NV`.

• **VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04571**
  If the pipeline requires fragment shader state and
  `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, and the primitiveFragmentShadingRate feature is not enabled, `VkPipelineFragmentShadingRateEnumStateCreateInfoNV::combinerOps[0]` must be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`.

• **VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04572**
  If the pipeline requires fragment shader state and
  `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, and the attachmentFragmentShadingRate feature is not enabled, `VkPipelineFragmentShadingRateEnumStateCreateInfoNV::combinerOps[1]` must be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`.

• **VUID-VkGraphicsPipelineCreateInfo-fragmentShadingRateNonTrivialCombinerOps-04573**
  If the pipeline requires fragment shader state, and the fragmentShadingRateNonTrivialCombinerOps limit is not supported and
  `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, elements of `VkPipelineFragmentShadingRateEnumStateCreateInfoNV ::combinerOps` must be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR` or `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR`.

• **VUID-VkGraphicsPipelineCreateInfo-None-04574**
  If the pipeline requires fragment shader state, and the supersampleFragmentShadingRates feature is not enabled, `VkPipelineFragmentShadingRateEnumStateCreateInfoNV ::shadingRate` must not be equal to `VK_FRAGMENT_SHADING_RATE_2_INVOCATIONS_PER_PIXEL_NV`, `VK_FRAGMENT_SHADING_RATE_4_INVOCATIONS_PER_PIXEL_NV`, `VK_FRAGMENT_SHADING_RATE_8_INVOCATIONS_PER_PIXEL_NV`, or `VK_FRAGMENT_SHADING_RATE_16_INVOCATIONS_PER_PIXEL_NV`.

• **VUID-VkGraphicsPipelineCreateInfo-None-04575**
  If the pipeline requires fragment shader state, and the noInvocationFragmentShadingRates feature is not enabled, `VkPipelineFragmentShadingRateEnumStateCreateInfoNV ::shadingRate` must be valid.
feature is not enabled, `VkPipelineFragmentShadingRateEnumStateCreateInfoNV::shadingRate` must not be equal to `VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV`.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-03578**
  All elements of the `pDynamicStates` member of `pDynamicState` must not be `VK_DYNAMIC_STATERAY_TRACINGPIPELINE_STACK_SIZE_KHR`.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04807**
  If the pipeline requires pre-rasterization shader state and the `vertexInputDynamicState` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT`.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07067**
  If the pipeline requires pre-rasterization shader state, and includes a mesh shader, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT`.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04800**
  If the `colorWriteEnable` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT`.

- **VUID-VkGraphicsPipelineCreateInfo-rasterizationSamples-04899**
  If the pipeline requires fragment shader state, and the `VK_QCOM Render Pass Shader Resolve` extension is enabled, `rasterizationSamples` is not dynamic, and if subpass has any input attachments, and if the subpass description contains `VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM`, then the sample count of the input attachments must equal `rasterizationSamples`.

- **VUID-VkGraphicsPipelineCreateInfo-sampleShadingEnable-04900**
  If the pipeline requires fragment shader state, and the `VK_QCOM Render Pass Shader Resolve` extension is enabled, and if the subpass description contains `VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM`, then `sampleShadingEnable` must be false.

- **VUID-VkGraphicsPipelineCreateInfo-flags-04901**
  If `flags` includes `VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM`, then the subpass must be the last subpass in a subpass dependency chain.

- **VUID-VkGraphicsPipelineCreateInfo-flags-04902**
  If `flags` includes `VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM`, and if `pResolveAttachments` is not NULL, then each resolve attachment must be `VK_ATTACHMENT_UNUSED`.

- **VUID-VkGraphicsPipelineCreateInfo-dynamicRendering-06576**
  If the `dynamicRendering` feature is not enabled and the pipeline requires pre-rasterization shader state, fragment shader state, or fragment output interface state, `renderPass` must not be `VK_NULL_HANDLE`.

- **VUID-VkGraphicsPipelineCreateInfo-multiview-06577**
  If the `multiview` feature is not enabled, the pipeline requires pre-rasterization shader state, fragment shader state, or fragment output interface state, and `renderPass` is `VK_NULL_HANDLE`, `VkPipelineRenderingCreateInfo::viewMask` must be 0.

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-06578**
If the pipeline requires pre-rasterization shader state, fragment shader state, or fragment output interface state, and `renderPass` is `VK_NULL_HANDLE`, the index of the most significant bit in `VkPipelineRenderingCreateInfo::viewMask` must be less than `maxMultiviewViewCount`.

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-06579**
  If the pipeline requires fragment output interface state, and `renderPass` is `VK_NULL_HANDLE`, and `VkPipelineRenderingCreateInfo::colorAttachmentCount` is not 0, `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` must be a valid pointer to an array of `colorAttachmentCount` valid `VkFormat` values.

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-06580**
  If the pipeline requires fragment output interface state, and `renderPass` is `VK_NULL_HANDLE`, and `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` is not 0, each element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` must be a valid `VkFormat` value.

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-06581**
  If the pipeline requires fragment output interface state, and `renderPass` is `VK_NULL_HANDLE`, and any element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` is not `VK_FORMAT_UNDEFINED`, that format must be a format with potential format features that include `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT` or `VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV`.

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-06582**
  If the pipeline requires fragment output interface state, and `renderPass` is `VK_NULL_HANDLE`, `VkPipelineRenderingCreateInfo::depthAttachmentFormat` must be a valid `VkFormat` value.

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-06583**
  If the pipeline requires fragment output interface state, and `renderPass` is `VK_NULL_HANDLE`, `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` must be a valid `VkFormat` value.

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-06584**
  If the pipeline requires fragment output interface state, and `renderPass` is `VK_NULL_HANDLE`, and `VkPipelineRenderingCreateInfo::depthAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, it must be a format with potential format features that include `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`.

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-06585**
  If the pipeline requires fragment output interface state, and `renderPass` is `VK_NULL_HANDLE`, and `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, it must be a format with potential format features that include `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`.

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-06586**
  If the pipeline requires fragment output interface state, and `renderPass` is `VK_NULL_HANDLE`, and `VkPipelineRenderingCreateInfo::depthAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, it must be a format that includes a depth component.

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-06587**
  If the pipeline requires fragment output interface state, and `renderPass` is `VK_NULL_HANDLE`, and `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, it must be a format that includes a depth component.
it **must** be a format that includes a stencil component

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-06589**
  If the pipeline requires fragment output interface state, `renderPass` is `VK_NULL_HANDLE`, `VkPipelineRenderingCreateInfo`::`depthAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, and `VkPipelineRenderingCreateInfo`::`stencilAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, `depthAttachmentFormat` **must** equal `stencilAttachmentFormat`

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-09033**
  If `renderPass` is `VK_NULL_HANDLE`, the pipeline is being created with fragment shader state and fragment output interface state, and either of `VkPipelineRenderingCreateInfo`::`depthAttachmentFormat` or `VkPipelineRenderingCreateInfo`::`stencilAttachmentFormat` are not `VK_FORMAT_UNDEFINED`, and the `VK_EXT_extended_dynamic_state3` extension is not enabled or any of the `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE`, `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE`, `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP`, `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE`, `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE`, `VK_DYNAMIC_STATE_STENCIL_OP`, or `VK_DYNAMIC_STATE_DEPTH_BOUNDS` dynamic states are not set, `pDepthStencilState` **must** be a valid pointer to a valid `VkPipelineDepthStencilStateCreateInfo` structure

- **VUID-VkGraphicsPipelineCreateInfo-pDepthStencilState-09034**
  If `pDepthStencilState` is not `NULL` it **must** be a valid pointer to a valid `VkPipelineDepthStencilStateCreateInfo` structure

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-09035**
  If `renderPass` is `VK_NULL_HANDLE` and the pipeline is being created with fragment shader state but not fragment output interface state, and the `VK_EXT_extended_dynamic_state3` extension is not enabled, or any of the `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE`, `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE`, `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP`, `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE`, `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE`, `VK_DYNAMIC_STATE_STENCIL_OP`, or `VK_DYNAMIC_STATE_DEPTH_BOUNDS` dynamic states are not set, `pDepthStencilState` **must** be a valid pointer to a valid `VkPipelineDepthStencilStateCreateInfo` structure

- **VUID-VkGraphicsPipelineCreateInfo-pDepthStencilState-09036**
  If `pDepthStencilState` is not `NULL` it **must** be a valid pointer to a valid `VkPipelineDepthStencilStateCreateInfo` structure

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-09037**
  If `renderPass` is `VK_NULL_HANDLE`, the pipeline is being created with fragment output interface state, and any element of `VkPipelineRenderingCreateInfo`::`pColorAttachmentFormats` is not `VK_FORMAT_UNDEFINED`, and the `VK_EXT_extended_dynamic_state3` extension is not enabled, or any of the `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT`, `VK_DYNAMIC_STATE_LOGIC_OP_EXT`, `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT`, `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT`, `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT`, or `VK_DYNAMIC_STATE_BLEND_CONSTANTS` dynamic states are not set, `pColorBlendState` **must** be a valid pointer to a valid `VkPipelineColorBlendStateCreateInfo` structure

- **VUID-VkGraphicsPipelineCreateInfo-pColorBlendState-09038**
  If `pColorBlendState` is not `NULL` it **must** be a valid pointer to a valid `VkPipelineColorBlendStateCreateInfo` structure

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-06055**
If `renderPass` is `VK_NULL_HANDLE`, `pColorBlendState` is not dynamic, and the pipeline is being created with fragment output interface state, `pColorBlendState->attachmentCount` must be equal to `VkPipelineRenderingCreateInfo::colorAttachmentCount`.

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06057
  If `renderPass` is `VK_NULL_HANDLE`, the pipeline is being created with pre-rasterization shader state, `VkPipelineRenderingCreateInfo::viewMask` is not 0, and the `multiviewTessellationShader` feature is not enabled, then `pStages` must not include tessellation shaders.

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06058
  If `renderPass` is `VK_NULL_HANDLE`, the pipeline is being created with pre-rasterization shader state, `VkPipelineRenderingCreateInfo::viewMask` is not 0, and the `multiviewGeometryShader` feature is not enabled, then `pStages` must not include a geometry shader.

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06059
  If `renderPass` is `VK_NULL_HANDLE`, the pipeline is being created with pre-rasterization shader state, and `VkPipelineRenderingCreateInfo::viewMask` is not 0, all of the shaders in the pipeline must not include variables decorated with the `Layer` built-in decoration in their interfaces.

- VUID-VkGraphicsPipelineCreateInfo-renderPass-07720
  If `renderPass` is `VK_NULL_HANDLE`, the pipeline is being created with pre-rasterization shader state, and `VkPipelineRenderingCreateInfo::viewMask` is not 0, and `multiviewMeshShader` is not enabled, then `pStages` must not include a mesh shader.

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06061
  If the `dynamicRenderingLocalRead` feature is not enabled, the pipeline requires fragment shader state, and `renderPass` is `VK_NULL_HANDLE`, fragment shaders in `pStages` must not include the `InputAttachment` capability.

- VUID-VkGraphicsPipelineCreateInfo-renderPass-08710
  If the pipeline requires fragment shader state and `renderPass` is not `VK_NULL_HANDLE`, fragment shaders in `pStages` must not include any of the `TileImageColorReadAccessEXT`, `TileImageDepthReadAccessEXT`, or `TileImageStencilReadAccessEXT` capabilities.

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06062
  If the pipeline requires fragment output interface state and `renderPass` is `VK_NULL_HANDLE`, for each color attachment format defined by the `pColorAttachmentFormats` member of ` VkPipelineRenderingCreateInfo`, if its potential format features do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`.

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06063
  If the pipeline requires fragment output interface state and `renderPass` is `VK_NULL_HANDLE`, if the `pNext` chain includes `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV`, the `colorAttachmentCount` member of that structure must be equal to the value of `VkPipelineRenderingCreateInfo::colorAttachmentCount`.

- VUID-VkGraphicsPipelineCreateInfo-flags-06591
  If `pStages` includes a fragment shader stage, and the fragment shader declares the
EarlyFragmentTests execution mode, the flags member of VkPipelineDepthStencilStateCreateInfo must not include VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT or VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT

- VUID-VkGraphicsPipelineCreateInfo-flags-06482
  If the dynamicRenderingLocalRead feature is not enabled, the pipeline requires fragment output interface state, and the flags member of VkPipelineColorBlendStateCreateInfo includes VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT, renderPass must not be VK_NULL_HANDLE

- VUID-VkGraphicsPipelineCreateInfo-None-09526
  If the dynamicRenderingLocalRead feature is not enabled, the pipeline requires fragment output interface state, and the flags member of VkPipelineDepthStencilStateCreateInfo includes VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT or VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT, renderPass must not be VK_NULL_HANDLE

- VUID-VkGraphicsPipelineCreateInfo-pColorAttachmentSamples-06592
  If the fragment output interface state, elements of the pColorAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV must be valid VkSampleCountFlagBits values

- VUID-VkGraphicsPipelineCreateInfo-depthStencilAttachmentSamples-06593
  If the fragment output interface state and the depthStencilAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV is not 0, it must be a valid VkSampleCountFlagBits value

- VUID-VkGraphicsPipelineCreateInfo-renderPass-09527
  If the pipeline requires fragment output interface state, renderPass is not VK_NULL_HANDLE, and the flags member of VkPipelineColorBlendStateCreateInfo includes VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT, subpass must have been created with VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_COLOR_ACCESS_BIT_EXT

- VUID-VkGraphicsPipelineCreateInfo-renderPass-09528
  If the pipeline requires fragment shader state, renderPass is not VK_NULL_HANDLE, and the flags member of VkPipelineDepthStencilStateCreateInfo includes VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT, subpass must have been created with VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT

- VUID-VkGraphicsPipelineCreateInfo-renderPass-09529
  If the pipeline requires fragment shader state, renderPass is not VK_NULL_HANDLE, and the flags member of VkPipelineDepthStencilStateCreateInfo includes VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT
BIT_EXT, subpass must have been created with VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT

• VUID-VkGraphicsPipelineCreateInfo-pipelineStageCreationFeedbackCount-06594
  If VkPipelineCreationFeedbackCreateInfo::pipelineStageCreationFeedbackCount is not 0, it must be equal to stageCount

• VUID-VkGraphicsPipelineCreateInfo-renderPass-06595
  If renderPass is VK_NULL_HANDLE, the pipeline is being created with pre-rasterization shader state or fragment shader state, and VkMultiviewPerViewAttributesInfoNVX::perViewAttributesPositionXOnly is VK_TRUE then VkMultiviewPerViewAttributesInfoNVX::perViewAttributes must also be VK_TRUE

• VUID-VkGraphicsPipelineCreateInfo-infoFlags-06596
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes only one of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, and an element of VkPipelineLibraryCreateInfoKHR::pLibraries includes the other flag, the value of VkMultiviewPerViewAttributesInfoNVX::perViewAttributes specified in both this pipeline and the library must be equal

• VUID-VkGraphicsPipelineCreateInfo-infoFlags-06597
  If one element of VkPipelineLibraryCreateInfoKHR::pLibraries includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and another element includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, the value of VkMultiviewPerViewAttributesInfoNVX::perViewAttributes specified in both libraries must be equal

• VUID-VkGraphicsPipelineCreateInfo-infoFlags-06598
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes only one of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, and an element of VkPipelineLibraryCreateInfoKHR::pLibraries includes the other flag, the value of VkMultiviewPerViewAttributesInfoNVX::perViewAttributesPositionXOnly specified in both this pipeline and the library must be equal

• VUID-VkGraphicsPipelineCreateInfo-infoFlags-06599
  If one element of VkPipelineLibraryCreateInfoKHR::pLibraries includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and another element includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, the value of VkMultiviewPerViewAttributesInfoNVX::perViewAttributesPositionXOnly specified in both libraries must be equal

• VUID-VkGraphicsPipelineCreateInfo-pStages-06600
  If the pipeline requires pre-rasterization shader state or fragment shader state, pStages must be a valid pointer to an array of stageCount valid VkPipelineShaderStageCreateInfo structures

• VUID-VkGraphicsPipelineCreateInfo-stageCount-09587
  If the pipeline does not require pre-rasterization shader state or fragment shader state, stageCount must be zero

• VUID-VkGraphicsPipelineCreateInfo-pRasterizationState-06601
If the pipeline requires pre-rasterization shader state, and related dynamic state is not set, pRasterizationState must be a valid pointer to a valid VkPipelineRasterizationStateCreateInfo structure.

- **VUID-VkGraphicsPipelineCreateInfo-pRasterizationState-09039**
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT, and related dynamic state is not set, then pMultisampleState must be a valid pointer to a valid VkPipelineMultisampleStateCreateInfo structure.

- **VUID-VkGraphicsPipelineCreateInfo-pRasterizationState-09040**
  If pRasterizationState is not NULL it must be a valid pointer to a valid VkPipelineRasterizationStateCreateInfo structure.

- **VUID-VkGraphicsPipelineCreateInfo-layout-06602**
  If the pipeline requires fragment shader state or pre-rasterization shader state, layout must be a valid VkPipelineLayout handle.

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-06603**
  If the pipeline requires pre-rasterization shader state, fragment shader state, or fragment output state, and renderPass is not VK_NULL_HANDLE, renderPass must be a valid VkRenderPass handle.

- **VUID-VkGraphicsPipelineCreateInfo-stageCount-09530**
  If the pipeline requires pre-rasterization shader state, stageCount must be greater than 0.

- **VUID-VkGraphicsPipelineCreateInfo-graphicsPipelineLibrary-06606**
  If the graphicsPipelineLibrary feature is not enabled, flags must not include VK_PIPELINE_CREATE_LIBRARY_BIT_KHR.

- **VUID-VkGraphicsPipelineCreateInfo-flags-06608**
  If the pipeline defines, or includes as libraries, all the state subsets required for a complete graphics pipeline, flags must not include VK_PIPELINE_CREATE_LIBRARY_BIT_KHR.

- **VUID-VkGraphicsPipelineCreateInfo-flags-06609**
  If flags includes VK_PIPELINE_CREATE_LINKTIME_OPTIMIZATION_EXT, pipeline libraries included via VkPipelineLibraryCreateInfoKHR must have been created with VK_PIPELINE_CREATE_RETAIN_LINKTIME_OPTIMIZATION_EXT.

- **VUID-VkGraphicsPipelineCreateInfo-flags-09245**
  If flags includes VK_PIPELINE_CREATE_RETAIN_LINKTIME_OPTIMIZATION_EXT, flags must also include VK_PIPELINE_CREATE_LIBRARY_BIT_KHR.

- **VUID-VkGraphicsPipelineCreateInfo-flags-06610**
  If flags includes VK_PIPELINE_CREATE_RETAIN_LINKTIME_OPTIMIZATION_EXT, pipeline libraries included via VkPipelineLibraryCreateInfoKHR must have been created with VK_PIPELINE_CREATE_RETAIN_LINKTIME_OPTIMIZATION_EXT.

- **VUID-VkGraphicsPipelineCreateInfo-pLibraries-06611**
  Any pipeline libraries included via VkPipelineLibraryCreateInfoKHR::pLibraries must not include any state subset already defined by this structure or defined by any other pipeline library in VkPipelineLibraryCreateInfoKHR::pLibraries.

- **VUID-VkGraphicsPipelineCreateInfo-flags-06612**
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes only one of
or
VL_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, and an element of
VkPipelineLibraryCreateInfoKHR::pLibraries includes the other flag, and layout was not
created with VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT, then the layout used by
this pipeline and the library must be identically defined

• VUID-VkGraphicsPipelineCreateInfo-pLibraries-06613
If one element of VkPipelineLibraryCreateInfoKHR::pLibraries includes
VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and another element
includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, and the layout specified
by either library was not created with VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT, then the layout used by each library
must be identically defined

• VUID-VkGraphicsPipelineCreateInfo-flags-06614
If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes only one of
VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or
VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, an element of
VkPipelineLibraryCreateInfoKHR::pLibraries includes the other subset, and layout was
created with VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT, then the layout used by
the library must also have been created with VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT

• VUID-VkGraphicsPipelineCreateInfo-pLibraries-06615
If one element of VkPipelineLibraryCreateInfoKHR::pLibraries includes
VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and another element
includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, and the layout specified
by either library was created with VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT, then the layout used by both libraries must have been created with
VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT

• VUID-VkGraphicsPipelineCreateInfo-flags-06616
If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes only one of
VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or
VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, an element of
VkPipelineLibraryCreateInfoKHR::pLibraries includes the other subset, and layout was
created with VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT, elements of the
pSetLayouts array which layout was created with that are not VK_NULL_HANDLE must be
identically defined to the element at the same index of pSetLayouts used to create the
library's layout

• VUID-VkGraphicsPipelineCreateInfo-pLibraries-06617
If one element of VkPipelineLibraryCreateInfoKHR::pLibraries includes
VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and another element
includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, and the layout specified
by either library was created with VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT, elements of the
pSetLayouts array which layout was created with that are not VK_NULL_HANDLE must be identically defined to the element at the same index of pSetLayouts used to create the other library's layout

• VUID-VkGraphicsPipelineCreateInfo-flags-06618
If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes only one of `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` or `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, and an element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes the other flag, any descriptor set layout `N` specified by `layout` in both this pipeline and the library which include bindings accessed by shader stages in each must be identically defined.

- **VUID-VkGraphicsPipelineCreateInfo-pLibraries-06619**
  If one element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` and another element includes `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, any descriptor set layout `N` specified by `layout` in both libraries which include bindings accessed by shader stages in each must be identically defined.

- **VUID-VkGraphicsPipelineCreateInfo flags-06620**
  If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes only one of `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` or `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, an element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes the other subset, any element of the `pSetLayouts` array when `layout` was created and the corresponding element of the `pSetLayouts` array used to create the library's `layout` must not both be `VK_NULL_HANDLE`.

- **VUID-VkGraphicsPipelineCreateInfo-pLibraries-06621**
  If one element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` and another element includes `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, push constants specified in `layout` in both this pipeline and the library which are available to shader stages in each must be identically defined.

- **VUID-VkGraphicsPipelineCreateInfo flags-06679**
  If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes only one of `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` or `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, an element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes the other flag, push constants specified in `layout` in both libraries which are available to shader stages in each must be identically defined.

- **VUID-VkGraphicsPipelineCreateInfo-pLibraries-06681**
  If one element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` and another element includes `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, and any element of the `pSetLayouts` array used to create each library's `layout` was `VK_NULL_HANDLE`, then the corresponding element of the `pSetLayouts` array used to create the other library's `layout` must not be `VK_NULL_HANDLE`.

- **VUID-VkGraphicsPipelineCreateInfo-pLibraries-06682**
  If one element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` and another element includes `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, and any element of the `pSetLayouts` array used to create each library's `layout` was `VK_NULL_HANDLE`, then the corresponding element of the `pSetLayouts` array used to create the other library's `layout` must not be `VK_NULL_HANDLE`.

- **VUID-VkGraphicsPipelineCreateInfo flags-06756**
  If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes only one of `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` or `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, an element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes the other subset, and any element of the `pSetLayouts` array which `layout` was created with was `VK_NULL_HANDLE`, then the
corresponding element of the pSetLayouts array used to create the library's layout must not have shader bindings for shaders in the other subset

- **VUID-VkGraphicsPipelineCreateInfo-flags-06757**
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes only one of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, an element of VkPipelineLibraryCreateInfoKHR::pLibraries includes the other subset, and any element of the pSetLayouts array used to create the library's layout was VK_NULL_HANDLE, then the corresponding element of the pSetLayouts array used to create this pipeline’s layout must not have shader bindings for shaders in the other subset

- **VUID-VkGraphicsPipelineCreateInfo-pLibraries-06758**
  If one element of VkPipelineLibraryCreateInfoKHR::pLibraries includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and another element includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, and any element of the pSetLayouts array used to create each library's layout was VK_NULL_HANDLE, then the corresponding element of the pSetLayouts array used to create the other library's layout must not have shader bindings for shaders in the other subset

- **VUID-VkGraphicsPipelineCreateInfo-flags-06682**
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes both VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, layout must have been created with no elements of the pSetLayouts array set to VK_NULL_HANDLE

- **VUID-VkGraphicsPipelineCreateInfo-flags-06683**
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and pRasterizationState->rasterizerDiscardEnable is VK_TRUE, layout must have been created with no elements of the pSetLayouts array set to VK_NULL_HANDLE

- **VUID-VkGraphicsPipelineCreateInfo-flags-06684**
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes at least one of and no more than two of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT, VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, and an element of VkPipelineLibraryCreateInfoKHR::pLibraries includes one of the other flags, the value of subpass must be equal to that used to create the library

- **VUID-VkGraphicsPipelineCreateInfo-pLibraries-06623**
  If one element of VkPipelineLibraryCreateInfoKHR::pLibraries includes at least one of and no more than two of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT, VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, and another element of VkPipelineLibraryCreateInfoKHR::pLibraries includes one of the other flags, the value of subpass used to create each library must be identical

- **VUID-VkGraphicsPipelineCreateInfo-renderpass-06624**
  If renderpass is not VK_NULL_HANDLE, VkGraphicsPipelineLibraryCreateInfoEXT::flags includes at least one of and no more than two of
VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT,
VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT,
or
VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, and an element of
VkPipelineLibraryCreateInfoKHR::pLibraries includes one of the other flags, renderPass
must be compatible with that used to create the library

- VUID-VkGraphicsPipelineCreateInfo-renderpass-06625
  If renderPass is VK_NULL_HANDLE, VkGraphicsPipelineLibraryCreateInfoEXT::flags
  includes at least one of and no more than two of
  VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT,
  VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT,
or
  VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, an element of
  VkPipelineLibraryCreateInfoKHR::pLibraries includes one of the other flags, the value of
  renderPass used to create that library must also be VK_NULL_HANDLE

- VUID-VkGraphicsPipelineCreateInfo-flags-06626
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes at least one of and no more
  than two of
  VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT,
  VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT,
or
  VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, an element of
  VkPipelineLibraryCreateInfoKHR::pLibraries includes one of the other flags, and
  renderPass is VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::viewMask
  used by this pipeline and that specified by the library must be identical

- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06627
  If one element of VkPipelineLibraryCreateInfoKHR::pLibraries includes at least one of
  and no more than two of
  VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT,
  VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT,
or
  VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, another element of
  VkPipelineLibraryCreateInfoKHR::pLibraries includes one of the other flags, and
  renderPass was VK_NULL_HANDLE for both libraries, the value of
  VkPipelineRenderingCreateInfo::viewMask set by each library must be identical

- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06628
  If one element of VkPipelineLibraryCreateInfoKHR::pLibraries includes at least one of
  and no more than two of
  VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT,
  VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT,
or
  VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, and another element of
  VkPipelineLibraryCreateInfoKHR::pLibraries includes one of the other flags, the
  renderPass objects used to create each library must be compatible or all equal to
  VK_NULL_HANDLE

- VUID-VkGraphicsPipelineCreateInfo-renderpass-06631
  If renderPass is not VK_NULL_HANDLE, the pipeline requires fragment shader state, and
  the VK_EXT_extended_dynamic_state3 extension is not enabled or any of the
  VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT, VK_DYNAMIC_STATE_SAMPLE_MASK_EXT, or
  VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT dynamic states is not set, or alphaToOne
  is enabled on the device and VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT is not set, then
  pMultisampleState must be a valid pointer to a valid
If the pipeline requires fragment shader state with a fragment shader that either enables sample shading or decorates any variable in the Input storage class with Sample, and the VK_EXT_extended_dynamic_state3 extension is not enabled or any of the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT, VK_DYNAMIC_STATE_SAMPLE_MASK_EXT, or VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT dynamic states is not set, or alphaToOne is enabled on the device and VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT is not set, then pMultisampleState must be a valid pointer to a valid VkPipelineMultisampleStateCreateInfo structure.

If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT with a pMultisampleState that was not NULL, and an element of VkPipelineLibraryCreateInfoKHR::pLibraries was created with VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, pMultisampleState must be identically defined to that used to create the library.

If an element of VkPipelineLibraryCreateInfoKHR::pLibraries was created with VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT with a pMultisampleState that was not NULL, and if VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, pMultisampleState must be identically defined to that used to create the library.

If one element of VkPipelineLibraryCreateInfoKHR::pLibraries was created with VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT and a value of pMultisampleState->sampleShadingEnable equal VK_TRUE, and if a different element of VkPipelineLibraryCreateInfoKHR::pLibraries was created with VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, the pMultisampleState used to create each library must be identically defined.

If one element of VkPipelineLibraryCreateInfoKHR::pLibraries was created with VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT and a value of pMultisampleState->sampleShadingEnable is VK_TRUE, and an element of VkPipelineLibraryCreateInfoKHR::pLibraries was created with VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, pMultisampleState must be identically defined to that used to create the library.

If one element of VkPipelineLibraryCreateInfoKHR::pLibraries was created with VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT and a value of pMultisampleState->sampleShadingEnable equal VK_TRUE, and if
VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, pMultisampleState must be identically defined to that used to create the library

- VUID-VkGraphicsPipelineCreateInfo-flags-06638
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes only one of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, and an element of VkPipelineLibraryCreateInfoKHR::pLibraries includes the other flag, values specified in VkPipelineFragmentShadingRateStateCreateInfoKHR for both this pipeline and that library must be identical

- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06639
  If one element of VkPipelineLibraryCreateInfoKHR::pLibraries includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and another element includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, values specified in VkPipelineFragmentShadingRateStateCreateInfoKHR for both this pipeline and that library must be identical

- VUID-VkGraphicsPipelineCreateInfo-flags-06640
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, pStages must be a valid pointer to an array of stageCount valid VkPipelineShaderStageCreateInfo structures

- VUID-VkGraphicsPipelineCreateInfo-flags-06642
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, layout must be a valid VkPipelineLayout handle

- VUID-VkGraphicsPipelineCreateInfo-flags-06643
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT, or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, and renderPass is not VK_NULL_HANDLE, renderPass must be a valid VkRenderPass handle

- VUID-VkGraphicsPipelineCreateInfo-flags-06644
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, stageCount must be greater than 0

- VUID-VkGraphicsPipelineCreateInfo-flags-06645
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags is non-zero, if flags includes VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR, any libraries must have also been created with VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR

- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06646
  If VkPipelineLibraryCreateInfoKHR::pLibraries includes more than one library, and any library was created with VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR, all libraries must have also been created with VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR
• VUID-VkGraphicsPipelineCreateInfo-pLibraries-06647
  If VkPipelineLibraryCreateInfoKHR::pLibraries includes at least one library,
  VkGraphicsPipelineLibraryCreateInfoEXT::flags is non-zero, and any library was created
  with VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR, flags must include
  VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR.

• VUID-VkGraphicsPipelineCreateInfo-None-07826
  If the pipeline includes a complete set of state, and there are no libraries included in
  VkPipelineLibraryCreateInfoKHR::pLibraries, then VkPipelineLayout must be a valid
  pipeline layout.

• VUID-VkGraphicsPipelineCreateInfo-layout-07827
  If the pipeline includes a complete set of state specified entirely by libraries, and each
  library was created with a VkPipelineLayout created without
  VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT, then layout must be compatible
  with the layouts in those libraries.

• VUID-VkGraphicsPipelineCreateInfo-flags-06729
  If flags includes VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT, the pipeline
  includes a complete set of state specified entirely by libraries, and each library was
  created with a VkPipelineLayout created with
  VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT, then layout must be compatible
  with the union of the libraries' pipeline layouts other than the inclusion/exclusion of
  VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT.

• VUID-VkGraphicsPipelineCreateInfo-flags-06730
  If flags does not include VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT, the pipeline
  includes a complete set of state specified entirely by libraries, and each library was
  created with a VkPipelineLayout created with
  VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT, then layout must be compatible
  with the union of the libraries' pipeline layouts.

• VUID-VkGraphicsPipelineCreateInfo-conservativePointAndLineRasterization-08892
  If conservativePointAndLineRasterization is not supported; the pipeline is being created
  with vertex input state and pre-rasterization shader state; the pipeline does not include a
  geometry shader; and the value of VkPipelineInputAssemblyStateCreateInfo::topology is
  VK_PRIMITIVE_TOPOLOGY_POINT_LIST, VK_PRIMITIVE_TOPOLOGY_LINE_LIST, or
  VK_PRIMITIVE_TOPOLOGY_LINE_STRIP, and either VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY
dynamic state is not enabled or dynamicPrimitiveTopologyUnrestricted is VK_FALSE, then
  VkPipelineRasterizationConservativeStateCreateInfoEXT::conservativeRasterizationMode
must be VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT.

• VUID-VkGraphicsPipelineCreateInfo-conservativePointAndLineRasterization-06760
  If conservativePointAndLineRasterization is not supported, the pipeline requires pre-
rasterization shader state, and the pipeline includes a geometry shader with either the
  OutputPoints or OutputLineStrip execution modes,
  VkPipelineRasterizationConservativeStateCreateInfoEXT::conservativeRasterizationMode
must be VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT.

• VUID-VkGraphicsPipelineCreateInfo-conservativePointAndLineRasterization-06761
  If conservativePointAndLineRasterization is not supported, the pipeline requires pre-
rasterization shader state, and the pipeline includes a mesh shader with either the
OutputPoints or OutputLinesNV execution modes, 
```
VkPipelineRasterizationConservativeStateCreateInfoEXT::conservativeRasterizationMode
```
must be `VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT`

- **VUID-VkGraphicsPipelineCreateInfo-pStages-06894**
  If the pipeline requires pre-rasterization shader state but not fragment shader state, elements of `pStages` must not have `stage` set to `VK_SHADER_STAGE_FRAGMENT_BIT`

- **VUID-VkGraphicsPipelineCreateInfo-pStages-06895**
  If the pipeline requires fragment shader state but not pre-rasterization shader state, elements of `pStages` must not have `stage` set to a shader stage which participates in pre-rasterization

- **VUID-VkGraphicsPipelineCreateInfo-pStages-06896**
  If the pipeline requires pre-rasterization shader state, all elements of `pStages` must have a `stage` set to a shader stage which participates in fragment shader state or pre-rasterization shader state

- **VUID-VkGraphicsPipelineCreateInfo-stage-06897**
  If the pipeline requires fragment shader state and/or pre-rasterization shader state, any value of `stage` must not be set in more than one element of `pStages`

- **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3TessellationDomainOrigin-07370**
  If the `extendedDynamicState3TessellationDomainOrigin` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT`

- **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3DepthClampEnable-07371**
  If the `extendedDynamicState3DepthClampEnable` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT`

- **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3PolygonMode-07372**
  If the `extendedDynamicState3PolygonMode` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_POLYGON_MODE_EXT`

- **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3RasterizationSamples-07373**
  If the `extendedDynamicState3RasterizationSamples` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT`

- **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3SampleMask-07374**
  If the `extendedDynamicState3SampleMask` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT`

- **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3AlphaToCoverageEnable-07375**
  If the `extendedDynamicState3AlphaToCoverageEnable` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT`

- **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3AlphaToOneEnable-07376**
  If the `extendedDynamicState3AlphaToOneEnable` feature is not enabled, there must be no...
element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3LogicOpEnable-07377
  If the extendedDynamicState3LogicOpEnable feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ColorBlendEnable-07378
  If the extendedDynamicState3ColorBlendEnable feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ColorBlendEquation-07379
  If the extendedDynamicState3ColorBlendEquation feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ColorWriteMask-07380
  If the extendedDynamicState3ColorWriteMask feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3RasterizationStream-07381
  If the extendedDynamicState3RasterizationStream feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ConservativeRasterizationMode-07382
  If the extendedDynamicState3ConservativeRasterizationMode feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ExtraPrimitiveOverestimationSize-07383
  If the extendedDynamicState3ExtraPrimitiveOverestimationSize feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT

• VUID-VkGraphicsPipelineCreateInfo-pDynamicState-09639
  If the pipeline requires pre-rasterization shader state, pDynamicState includes VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT, and pDynamicState does not include VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT, pRasterizationState must include a VkPipelineRasterizationConservativeStateCreateInfoEXT in its pNext chain

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3DepthClipEnable-07384
  If the extendedDynamicState3DepthClipEnable feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3SampleLocationsEnable-07385
  If the extendedDynamicState3SampleLocationsEnable feature is not enabled, there must be
no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ColorBlendAdvanced-07386
  If the extendedDynamicState3ColorBlendAdvanced feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ProvokingVertexMode-07387
  If the extendedDynamicState3ProvokingVertexMode feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3LineRasterizationMode-07388
  If the extendedDynamicState3LineRasterizationMode feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3LineStippleEnable-07389
  If the extendedDynamicState3LineStippleEnable feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3DepthClipNegativeOneToOne-07390
  If the extendedDynamicState3DepthClipNegativeOneToOne feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_DEPTH_CLIP_NEGATIVE_ONE_TO_ONE_EXT

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ViewportWScalingEnable-07391
  If the extendedDynamicState3ViewportWScalingEnable feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_ENABLE_NV

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ViewportSwizzle-07392
  If the extendedDynamicState3ViewportSwizzle feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3CoverageToColorEnable-07393
  If the extendedDynamicState3CoverageToColorEnable feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3CoverageToColorLocation-07394
  If the extendedDynamicState3CoverageToColorLocation feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_LOCATION_NV

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3CoverageModulationMode-
If the `extendedDynamicState3CoverageModulationMode` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COVERAGE_MODULATION_MODE_NV`.

- **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3CoverageModulationTableEnable-07396**
  If the `extendedDynamicState3CoverageModulationTableEnable` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV`.

- **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3CoverageReductionMode-07398**
  If the `extendedDynamicState3CoverageReductionMode` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COVERAGE_REDUCTION_MODE_NV`.

- **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3RepresentativeFragmentTestEnable-07399**
  If the `extendedDynamicState3RepresentativeFragmentTestEnable` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_REPRESENTATIVE_FRAGMENT_TEST_ENABLE_NV`.

- **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ShadingRateImageEnable-07400**
  If the `extendedDynamicState3ShadingRateImageEnable` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_SHADING_RATE_IMAGE_ENABLE_NV`.

- **VUID-VkGraphicsPipelineCreateInfo-flags-07401**
  Flags **must** not include `VK_PIPELINE_CREATE_RAY_TRACING_OPACITY_MICROMAP_BIT_EXT`.

- **VUID-VkGraphicsPipelineCreateInfo-flags-07997**
  Flags **must** not include `VK_PIPELINE_CREATE_RAY_TRACING_DISPLACEMENT_MICROMAP_BIT_NV`.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07730**
  If the pipeline requires pre-rasterization shader state, and no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_VIEWPORT` or `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT`, and if multiviewPerViewViewports is enabled, then the index of the most significant bit in each element of `VkRenderPassMultiviewCreateInfo::pViewMasks` **must** be less than `pViewportState->viewportCount`.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07731**
  If the pipeline requires pre-rasterization shader state, and no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_SCISSOR` or `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT`, and if multiviewPerViewViewports is enabled, then
the index of the most significant bit in each element of
VkRenderPassMultiviewCreateInfo::pViewMasks must be less than pViewportState->scissorCount

- **VUID-VkGraphicsPipelineCreateInfo-pStages-08711**
  If pStages includes a fragment shader stage, VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE is not set in VkPipelineDynamicStateCreateInfo::pDynamicStates, and the fragment shader declares the EarlyFragmentTests execution mode and uses OpDepthAttachmentReadEXT, the depthWriteEnable member of VkPipelineDepthStencilStateCreateInfo must be VK_FALSE

- **VUID-VkGraphicsPipelineCreateInfo-pStages-08712**
  If pStages includes a fragment shader stage, VK_DYNAMIC_STATE_STENCIL_WRITE_MASK is not set in VkPipelineDynamicStateCreateInfo::pDynamicStates, and the fragment shader declares the EarlyFragmentTests execution mode and uses OpStencilAttachmentReadEXT, the value of VkStencilOpState::writeMask for both front and back in VkPipelineDepthStencilStateCreateInfo must be 0

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-08744**
  If renderPass is VK_NULL_HANDLE, the pipeline requires fragment output state or fragment shader state, the pipeline enables sample shading, rasterizationSamples is not dynamic, and the pNext chain includes a VkPipelineRenderingCreateInfo structure, rasterizationSamples must be a valid VkSampleCountFlagBits value that is set in imageCreateSampleCounts (as defined in Image Creation Limits) for every element of depthAttachmentFormat, stencilAttachmentFormat and the pColorAttachmentFormats array which is not VK_FORMAT_UNDEFINED

- **VUID-VkGraphicsPipelineCreateInfo-flags-08897**
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_VERTEX_INPUT_INTERFACE_BIT_EXT, pre-rasterization shader state is specified either in a library or by the inclusion of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT, and that state includes a vertex shader stage in pStages, the pipeline must define vertex input state

- **VUID-VkGraphicsPipelineCreateInfo-flags-08898**
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_VERTEX_INPUT_INTERFACE_BIT_EXT, and pre-rasterization shader state is not specified, the pipeline must define vertex input state

- **VUID-VkGraphicsPipelineCreateInfo-flags-08899**
  If flags does not include VK_PIPELINE_CREATE_LIBRARY_BIT_KHR, pre-rasterization shader state is specified either in a library or by the inclusion of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT, and that state includes a vertex shader stage in pStages, the pipeline must either define vertex input state or include that state in a linked pipeline library

- **VUID-VkGraphicsPipelineCreateInfo-flags-08900**
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT the pipeline must define pre-rasterization shader state

- **VUID-VkGraphicsPipelineCreateInfo-flags-08901**
  If flags does not include VK_PIPELINE_CREATE_LIBRARY_BIT_KHR, the pipeline must either define pre-rasterization shader state or include that state in a linked pipeline library
• VUID-VkGraphicsPipelineCreateInfo-flags-08903
  If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, pre-rasterization shader state is specified either in a library or by the inclusion of `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT`, and that state either includes `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` or has `pRasterizationState->rasterizerDiscardEnable` set to `VK_FALSE`, the pipeline must define fragment shader state.

• VUID-VkGraphicsPipelineCreateInfo-flags-08904
  If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, and pre-rasterization shader state is not specified, the pipeline must define fragment shader state.

• VUID-VkGraphicsPipelineCreateInfo-flags-08906
  If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, pre-rasterization shader state is specified either in a library or by the inclusion of `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT`, and that state either includes `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` or has `pRasterizationState->rasterizerDiscardEnable` set to `VK_FALSE`, the pipeline must define fragment output interface state.

• VUID-VkGraphicsPipelineCreateInfo-flags-08907
  If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, and pre-rasterization shader state is not specified, the pipeline must define fragment output interface state.

• VUID-VkGraphicsPipelineCreateInfo-flags-08909
  If flags does not include `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR`, pre-rasterization shader state is specified either in a library or by the inclusion of `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT`, and that state either includes `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` or has `pRasterizationState->rasterizerDiscardEnable` set to `VK_FALSE`, the pipeline must define fragment output interface state and fragment shader state or include those states in linked pipeline libraries.

• VUID-VkGraphicsPipelineCreateInfo-None-09043
  If `pDynamicState->pDynamicStates` does not include `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT`, and the format of any color attachment is `VK_FORMAT_E5B9G9R9_UFLOAT_PACK32`, the colorWriteMask member of the corresponding element of `pColorBlendState->pAttachments` must either include all of `VK_COLOR_COMPONENT_R_BIT`, `VK_COLOR_COMPONENT_G_BIT`, and `VK_COLOR_COMPONENT_B_BIT`, or none of them.

• VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09301
  If the externalFormatResolve feature is enabled, the pipeline requires fragment output interface state, `renderPass` is `VK_NULL_HANDLE`, and `VkExternalFormatANDROID::externalFormat` is not `0`, `VkPipelineRenderingCreateInfo::viewMask` must be `0`.

• VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09304
  If the externalFormatResolve feature is enabled, the pipeline requires fragment output interface state, `renderPass` is `VK_NULL_HANDLE`, `VkExternalFormatANDROID::externalFormat` is not `0`, and `rasterizationSamples` is not dynamic.
 VkPipelineMultisampleStateCreateInfo::rasterizationSamples must be 1

• VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09305
  If the externalFormatResolve feature is enabled, the pipeline requires fragment output interface state, renderPass is VK_NULL_HANDLE, and VkExternalFormatANDROID::externalFormat is not 0, and blendEnable is not dynamic, the blendEnable member of each element of pColorBlendState->pAttachments must be VK_FALSE

• VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09306
  If the externalFormatResolve feature is enabled, the pipeline requires fragment output interface state, renderPass is VK_NULL_HANDLE, and VkExternalFormatANDROID::externalFormat is not 0, and pDynamicState->pDynamicStates does not include VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR,
  VkPipelineFragmentShadingRateStateCreateInfoKHR::width must be 1

• VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09307
  If the externalFormatResolve feature is enabled, the pipeline requires fragment output interface state, renderPass is VK_NULL_HANDLE, and VkExternalFormatANDROID::externalFormat is not 0, and pDynamicState->pDynamicStates does not include VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR,
  VkPipelineFragmentShadingRateStateCreateInfoKHR::height must be 1

• VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09308
  If the externalFormatResolve feature is enabled, the pipeline requires pre-rasterization shader state and fragment output interface state, renderPass is VK_NULL_HANDLE, and VkExternalFormatANDROID::externalFormat is not 0, the last pre-rasterization shader stage must not statically use a variable with the PrimitiveShadingRateKHR built-in

• VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09309
  If the externalFormatResolve feature is enabled, the pipeline requires fragment shader state and fragment output interface state, renderPass is VK_NULL_HANDLE, and VkExternalFormatANDROID::externalFormat is not 0, VkPipelineRenderingCreateInfo::colorAttachmentCount must be 1

• VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09310
  If the externalFormatResolve feature is enabled, the pipeline requires fragment shader state and fragment output interface state, renderPass is VK_NULL_HANDLE, and VkExternalFormatANDROID::externalFormat is not 0, the fragment shader must not declare the DepthReplacing or StencilRefReplacingEXT execution modes

• VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09313
  If the externalFormatResolve feature is enabled, the pipeline requires fragment output interface state, renderPass is not VK_NULL_HANDLE, subpass includes an external format resolve attachment, and rasterizationSamples is not dynamic, VkPipelineMultisampleStateCreateInfo::rasterizationSamples must be VK_SAMPLE_COUNT_1_BIT

• VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09314
  If the externalFormatResolve feature is enabled, the pipeline requires fragment output interface state, renderPass is not VK_NULL_HANDLE, subpass includes an external format resolve attachment, and blendEnable is not dynamic, the blendEnable member of each element of pColorBlendState->pAttachments must be VK_FALSE

• VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09315
If the `externalFormatResolve` feature is enabled, the pipeline requires fragment output interface state, `renderPass` is not `VK_NULL_HANDLE`, `subpass` includes an external format resolve attachment, and `pDynamicState->pDynamicStates` does not include `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR`, `VkPipelineFragmentShadingRateStateCreateInfoKHR::width` must be 1.

- **VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09316**
  If the `externalFormatResolve` feature is enabled, the pipeline requires fragment output interface state, `renderPass` is not `VK_NULL_HANDLE`, `subpass` includes an external format resolve attachment, and `pDynamicState->pDynamicStates` does not include `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR`, `VkPipelineFragmentShadingRateStateCreateInfoKHR::height` must be 1.

- **VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09317**
  If the `externalFormatResolve` feature is enabled, the pipeline requires pre-rasterization shader state and fragment output interface state, `renderPass` is not `VK_NULL_HANDLE`, and `subpass` includes an external format resolve attachment, the last pre-rasterization shader stage must not statically use a variable with the `PrimitiveShadingRateKHR` built-in.

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-09531**
  If the pipeline is being created with fragment shader state and fragment output state, the value of `renderPass` is `VK_NULL_HANDLE`, and `VkRenderingInputAttachmentIndexInfoKHR` is included, `VkRenderingInputAttachmentIndexInfoKHR::colorAttachmentCount` must be equal to `VkPipelineRenderingCreateInfo::colorAttachmentCount`.

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-09532**
  If the pipeline is being created with fragment shader state and fragment output state, the value of `renderPass` is `VK_NULL_HANDLE`, and `VkRenderingInputAttachmentIndexInfoKHR` is not included, the fragment shader must not contain any input attachments with a `InputAttachmentIndex` greater than or equal to `VkPipelineRenderingCreateInfo::colorAttachmentCount`.

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-09652**
  If the pipeline is being created with fragment output state, and the value of `renderPass` is `VK_NULL_HANDLE`, `VkRenderingAttachmentLocationInfoKHR::colorAttachmentCount` must be equal to `VkPipelineRenderingCreateInfo::colorAttachmentCount`.

**Valid Usage (Implicit)**

- **VUID-VkGraphicsPipelineCreateInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_GRAPHICS_PIPELINE_CREATE_INFO`.

- **VUID-VkGraphicsPipelineCreateInfo-pNext-pNext**
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkAttachmentSampleCountInfoAMD`, `VkExternalFormatANDROID`, `VkGraphicsPipelineLibraryCreateInfoEXT`, `VkGraphicsPipelineShaderGroupsCreateInfoNV`, `VkMultiviewPerViewAttributesCreateInfoNVX`, `VkPipelineCompilerControlCreateInfoAMD`, `VkPipelineCreateFlags2CreateInfoKHR`, `VkPipelineCreationFeedbackCreateInfo`, `VkPipelineDiscardRectangleStateCreateInfoEXT`, `VkPipelineSampleRateDilationCreateInfoEXT`, `VkPipelineSamplerConversionCreateInfoEXT`, `VkPipelineSpecializationInfo`, `VkPipelineUniformCombiningFlagsCreateInfoKHR`, `VkPipelineUniformSeedCreateInfo`, `VkPipelineWindingControlCreateInfoEXT`, `VkPresentModeKHR`, `VkQueueCreateInfo`, `VkRayQueryModeEXT`, `VkRayQueryThresholdCreateInfoEXT`, and `VkShaderModuleCreateInfo`.
The `VkPipelineRenderingCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPipelineRenderingCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t viewMask;
    uint32_t colorAttachmentCount;
    const VkFormat* pColorAttachmentFormats;
    VkFormat depthAttachmentFormat;
    VkFormat stencilAttachmentFormat;
} VkPipelineRenderingCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_dynamic_rendering
typedef VkPipelineRenderingCreateInfo VkPipelineRenderingCreateInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **viewMask** is the viewMask used for rendering.
- **colorAttachmentCount** is the number of entries in `pColorAttachmentFormats`
- **pColorAttachmentFormats** is a pointer to an array of `VkFormat` values defining the format of color attachments used in this pipeline.
- **depthAttachmentFormat** is a `VkFormat` value defining the format of the depth attachment used in this pipeline.
- **stencilAttachmentFormat** is a `VkFormat` value defining the format of the stencil attachment used in this pipeline.
When a pipeline is created without a `VkRenderPass`, if the `pNext` chain of `VkGraphicsPipelineCreateInfo` includes this structure, it specifies the view mask and format of attachments used for rendering. If this structure is not specified, and the pipeline does not include a `VkRenderPass`, `viewMask` and `colorAttachmentCount` are 0, and `depthAttachmentFormat` and `stencilAttachmentFormat` are `VK_FORMAT_UNDEFINED`. If a graphics pipeline is created with a valid `VkRenderPass`, parameters of this structure are ignored.

If `depthAttachmentFormat`, `stencilAttachmentFormat`, or any element of `pColorAttachmentFormats` is `VK_FORMAT_UNDEFINED`, it indicates that the corresponding attachment is unused within the render pass. Valid formats indicate that an attachment can be used - but it is still valid to set the attachment to `NULL` when beginning rendering.

If the render pass is going to be used with an external format resolve attachment, a `VkExternalFormatANDROID` structure must also be included in the `pNext` chain of `VkGraphicsPipelineCreateInfo`, defining the external format of the resolve attachment that will be used.

### Valid Usage

• VUID-VkPipelineRenderingCreateInfo-colorAttachmentCount-09533
  `colorAttachmentCount` must be less than or equal to `maxColorAttachments`

### Valid Usage (Implicit)

• VUID-VkPipelineRenderingCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_RENDERING_CREATE_INFO`

The `VkPipelineCreateFlags2CreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_maintenance5
typedef struct VkPipelineCreateFlags2CreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCreateFlags2KHR flags;
} VkPipelineCreateFlags2CreateInfoKHR;
```

• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `flags` is a bitmask of `VkPipelineCreateFlagBits2KHR` specifying how a pipeline will be generated.

If this structure is included in the `pNext` chain of a pipeline creation structure, `flags` is used instead of the corresponding `flags` value passed in that creation structure, allowing additional creation flags to be specified.
Valid Usage (Implicit)

- VUID-VkPipelineCreateFlags2CreateInfoKHR-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_PIPELINE_CREATE_FLAGS_2_CREATE_INFO_KHR

- VUID-VkPipelineCreateFlags2CreateInfoKHR-flags-parameter
  
  flags must be a valid combination of VkPipelineCreateFlagBits2KHR values

- VUID-VkPipelineCreateFlags2CreateInfoKHR-flags-requiredbitmask
  
  flags must not be 0

Bits which can be set in VkPipelineCreateFlags2CreateInfoKHR::flags, specifying how a pipeline is created, are:

```c
// Provided by VK_KHR_maintenance5
// Flag bits for VkPipelineCreateFlagBits2KHR
typedef VkFlags64 VkPipelineCreateFlagBits2KHR;
static const VkPipelineCreateFlagBits2KHR VK_PIPELINE_CREATE_2_DISABLE_OPTIMIZATION_BIT_KHR = 0x00000001ULL;
static const VkPipelineCreateFlagBits2KHR VK_PIPELINE_CREATE_2_ALLOW_DERIVATIVES_BIT_KHR = 0x00000002ULL;
static const VkPipelineCreateFlagBits2KHR VK_PIPELINE_CREATE_2_DERIVATIVE_BIT_KHR = 0x00000004ULL;
// Provided by VK_EXT_legacy_dithering with (VK_KHR_dynamic_rendering or VK_VERSION_1_3) and VK_KHR_maintenance5
static const VkPipelineCreateFlagBits2KHR VK_PIPELINE_CREATE_2_ENABLE_LEGACY_DITHERING_BIT_EXT = 0x400000000ULL;
// Provided by VK_KHR_maintenance5 with VK_VERSION_1_1 or VK_KHR_device_group
static const VkPipelineCreateFlagBits2KHR VK_PIPELINE_CREATE_2_VIEW_INDEX_FROM_DEVICE_INDEX_BIT_KHR = 0x00000008ULL;
// Provided by VK_KHR_maintenance5 with VK_VERSION_1_1 or VK_KHR_device_group
static const VkPipelineCreateFlagBits2KHR VK_PIPELINE_CREATE_2_DISPATCH_BASE_BIT_KHR = 0x00000010ULL;
// Provided by VK_KHR_maintenance5 with VK_NV_ray_tracing

VK_PIPELINE_CREATE_2_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT = 0x00400000ULL;

static const VkPipelineCreateFlagBits2KHR
VK_PIPELINE_CREATE_2_RAY_TRACING.OPAQUITY_MICROMAP_BIT_EXT = 0x01000000ULL;
• **VK_PIPELINE_CREATE_2_DISABLE_OPTIMIZATION_BIT_KHR** specifies that the created pipeline will not be optimized. Using this flag may reduce the time taken to create the pipeline.

• **VK_PIPELINE_CREATE_2_ALLOW_DERIVATIVES_BIT_KHR** specifies that the pipeline to be created is allowed to be the parent of a pipeline that will be created in a subsequent pipeline creation call.

• **VK_PIPELINE_CREATE_2_DERIVATIVE_BIT_KHR** specifies that the pipeline to be created will be a child of a previously created parent pipeline.

• **VK_PIPELINE_CREATE_2_VIEW_INDEX_FROM_DEVICE_INDEX_BIT_KHR** specifies that any shader input variables decorated as `ViewIndex` will be assigned values as if they were decorated as `DeviceIndex`.

• **VK_PIPELINE_CREATE_2_DISPATCH_BASE_BIT_KHR** specifies that a compute pipeline can be used with `vkCmdDispatchBase` with a non-zero base workgroup.

• **VK_PIPELINE_CREATE_2_DEFER_COMPILE_BIT_NV** specifies that a pipeline is created with all shaders in the deferred state. Before using the pipeline the application must call `vkCompileDeferredNV` exactly once on each shader in the pipeline before using the pipeline.

• **VK_PIPELINE_CREATE_2_CAPTURE_STATISTICS_BIT_KHR** specifies that the shader compiler should capture statistics for the pipeline executables produced by the compile process which can later be retrieved by calling `vkGetPipelineExecutableStatisticsKHR`. Enabling this flag must not affect the final compiled pipeline but may disable pipeline caching or otherwise affect pipeline creation time.

• **VK_PIPELINE_CREATE_2_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR** specifies that the shader compiler should capture the internal representations of pipeline executables produced by the compile process which can later be retrieved by calling `vkGetPipelineExecutableInternalRepresentationsKHR`. Enabling this flag must not affect the final compiled pipeline but may disable pipeline caching or otherwise affect pipeline creation time. When capturing IR from pipelines created with pipeline libraries, there is no guarantee that IR from libraries can be retrieved from the linked pipeline. Applications should retrieve IR from each library, and any linked pipelines, separately.
• **VK_PIPELINE_CREATE_2_LIBRARY_BIT_KHR** specifies that the pipeline cannot be used directly, and instead defines a *pipeline library* that can be combined with other pipelines using the `VkPipelineLibraryCreateInfoKHR` structure. This is available in ray tracing and graphics pipelines.

• **VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR** specifies that an any-hit shader will always be present when an any-hit shader would be executed. A NULL any-hit shader is an any-hit shader which is effectively `VK_SHADER_UNUSED_KHR`, such as from a shader group consisting entirely of zeros.

• **VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR** specifies that a closest hit shader will always be present when a closest hit shader would be executed. A NULL closest hit shader is a closest hit shader which is effectively `VK_SHADER_UNUSED_KHR`, such as from a shader group consisting entirely of zeros.

• **VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR** specifies that a miss shader will always be present when a miss shader would be executed. A NULL miss shader is a miss shader which is effectively `VK_SHADER_UNUSED_KHR`, such as from a shader group consisting entirely of zeros.

• **VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR** specifies that an intersection shader will always be present when an intersection shader would be executed. A NULL intersection shader is an intersection shader which is effectively `VK_SHADER_UNUSED_KHR`, such as from a shader group consisting entirely of zeros.

• **VK_PIPELINE_CREATE_2_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR** specifies that triangle primitives will be skipped during traversal using pipeline trace ray instructions.

• **VK_PIPELINE_CREATE_2_RAY_TRACING_SKIP_AABBS_BIT_KHR** specifies that AABB primitives will be skipped during traversal using pipeline trace ray instructions.

• **VK_PIPELINE_CREATE_2_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR** specifies that the shader group handles can be saved and reused on a subsequent run (e.g. for trace capture and replay).

• **VK_PIPELINE_CREATE_2_INDIRECT_BINDABLE_BIT_NV** specifies that the pipeline can be used in combination with Device-Generated Commands.

• **VK_PIPELINE_CREATE_2_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT_KHR** specifies that pipeline creation will fail if a compile is required for creation of a valid `VkPipeline` object; `VK_PIPELINE_COMPILE_REQUIRED` will be returned by pipeline creation, and the `VkPipeline` will be set to `VK_NULL_HANDLE`.

• When creating multiple pipelines, **VK_PIPELINE_CREATE_2_EARLY_RETURN_ON_FAILURE_BIT_KHR** specifies that control will be returned to the application if any individual pipeline returns a result which is not `VK_SUCCESS` rather than continuing to create additional pipelines.

• **VK_PIPELINE_CREATE_2_RAY_TRACING_ALLOW_MOTION_BIT_NV** specifies that the pipeline is allowed to use `OpTraceRayMotionNV`.

• **VK_PIPELINE_CREATE_2_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR** specifies that the pipeline will be used with a fragment shading rate attachment.

• **VK_PIPELINE_CREATE_2_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT** specifies that the pipeline will be used with a fragment density map attachment.
• `VK_PIPELINE_CREATE_2_LINK_TIME_OPTIMIZATION_BIT_EXT` specifies that pipeline libraries being linked into this library should have link time optimizations applied. If this bit is omitted, implementations should instead perform linking as rapidly as possible.

• `VK_PIPELINE_CREATE_2_RETAIN_LINK_TIME_OPTIMIZATION_INFO_BIT_EXT` specifies that pipeline libraries should retain any information necessary to later perform an optimal link with `VK_PIPELINE_CREATE_2_LINK_TIME_OPTIMIZATION_BIT_EXT`.

• `VK_PIPELINE_CREATE_2_DESCRIPTOR_BUFFER_BIT_EXT` specifies that a pipeline will be used with descriptor buffers, rather than descriptor sets.

• `VK_PIPELINE_CREATE_2_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` specifies that the pipeline may be used with an attachment feedback loop including color attachments.

• `VK_PIPELINE_CREATE_2_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` specifies that the pipeline may be used with an attachment feedback loop including depth-stencil attachments.

• `VK_PIPELINE_CREATE_2_RAY_TRACING_OPACITY_MICROMAP_BIT_EXT` specifies that the ray tracing pipeline can be used with acceleration structures which reference an opacity micromap array.

• `VK_PIPELINE_CREATE_2_RAY_TRACING_DISPLACEMENT_MICROMAP_BIT_NV` specifies that the ray tracing pipeline can be used with acceleration structures which reference a displacement micromap array.

• `VK_PIPELINE_CREATE_2_NO_PROTECTED_ACCESS_BIT_EXT` specifies that the pipeline must not be bound to a protected command buffer.

• `VK_PIPELINE_CREATE_2_PROTECTED_ACCESS_ONLY_BIT_EXT` specifies that the pipeline must not be bound to an unprotected command buffer.

• `VK_PIPELINE_CREATE_2_ENABLE_LEGACY_DITHERING_BIT_EXT` specifies that the pipeline will be used in a render pass that is begun with `VK_RENDERING_ENABLE_LEGACY_DITHERING_BIT_EXT`.

It is valid to set both `VK_PIPELINE_CREATE_2_ALLOW_DERIVATIVES_BIT_KHR` and `VK_PIPELINE_CREATE_2_DERIVATIVE_BIT_KHR`. This allows a pipeline to be both a parent and possibly a child in a pipeline hierarchy. See Pipeline Derivatives for more information.

When an implementation is looking up a pipeline in a pipeline cache, if that pipeline is being created using linked libraries, implementations should always return an equivalent pipeline created with `VK_PIPELINE_CREATE_2_LINK_TIME_OPTIMIZATION_BIT_EXT` if available, whether or not that bit was specified.

**NOTE**

Using `VK_PIPELINE_CREATE_2_LINK_TIME_OPTIMIZATION_BIT_EXT` (or not) when linking pipeline libraries is intended as a performance tradeoff between host and device. If the bit is omitted, linking should be faster and produce a pipeline more rapidly, but performance of the pipeline on the target device may be reduced. If the bit is included, linking may be slower but should produce a pipeline with device performance comparable to a monolithically created pipeline. Using both options can allow latency-sensitive applications to generate a suboptimal but usable pipeline quickly, and then perform an optimal link in the background, substituting the result for the suboptimally linked pipeline as soon as it is available.
VkPipelineCreateFlags2KHR is a bitmask type for setting a mask of zero or more VkPipelineCreateFlagBits2KHR.

Bits which can be set in

- VkGraphicsPipelineCreateInfo::flags
- VkComputePipelineCreateInfo::flags
- VkRayTracingPipelineCreateInfoKHR::flags
- VkRayTracingPipelineCreateInfoNV::flags

specify how a pipeline is created, and are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPipelineCreateFlagBits {
    VK_PIPELINE_CREATE_DISABLE_OPTIMIZATION_BIT = 0x00000001,

 // Provided by VK_EXT_pipeline_creation_cache_control
 VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT_EXT = 0x792
VK_PIPELINE_CREATE_DISABLE_OPTIMIZATION_BIT specifies that the created pipeline will not be optimized. Using this flag may reduce the time taken to create the pipeline.

VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT specifies that the pipeline to be created is allowed to be the parent of a pipeline that will be created in a subsequent pipeline creation call.

VK_PIPELINE_CREATE_DERIVATIVE_BIT specifies that the pipeline to be created will be a child of a previously created parent pipeline.

VK_PIPELINE_CREATE_VIEW_INDEX_FROM_DEVICE_INDEX_BIT specifies that any shader input variables decorated as ViewIndex will be assigned values as if they were decorated as DeviceIndex.

VK_PIPELINE_CREATE_DISPATCH_BASE specifies that a compute pipeline can be used with vkCmdDispatchBase with a non-zero base workgroup.

VK_PIPELINE_CREATE_DEFER_COMPILE_BIT_NV specifies that a pipeline is created with all shaders in the deferred state. Before using the pipeline the application must call vkCompileDeferredNV exactly once on each shader in the pipeline before using the pipeline.

VK_PIPELINE_CREATE_CAPTURE_STATISTICS_BIT_KHR specifies that the shader compiler should capture statistics for the pipeline executables produced by the compile process which can later be retrieved by calling vkGetPipelineExecutableStatisticsKHR. Enabling this flag must not affect the final compiled pipeline but may disable pipeline caching or otherwise affect pipeline creation time.

VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR specifies that the shader compiler should capture the internal representations of pipeline executables produced by the compile process which can later be retrieved by calling vkGetPipelineExecutableInternalRepresentationsKHR. Enabling this flag must not affect the final compiled pipeline but may disable pipeline caching or otherwise affect pipeline creation time. When capturing IR from pipelines created with pipeline libraries, there is no guarantee that IR from libraries can be retrieved from the linked pipeline. Applications should retrieve IR from each library, and any linked pipelines, separately.

VK_PIPELINE_CREATE_LIBRARY_BIT_KHR specifies that the pipeline cannot be used directly, and instead defines a pipeline library that can be combined with other pipelines using the VkPipelineLibraryCreateInfoKHR structure. This is available in ray tracing and graphics pipelines.

VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR specifies that an any-hit shader will always be present when an any-hit shader would be executed. A NULL any-hit shader is an any-hit shader which is effectively VK_SHADER_UNUSED_KHR, such as from a shader group consisting entirely of zeros.

VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR specifies that a closest hit shader will always be present when a closest hit shader would be executed. A NULL closest hit shader is a closest hit shader which is effectively VK_SHADER_UNUSED_KHR, such as from a shader group consisting entirely of zeros.
• **VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR** specifies that a miss shader will always be present when a miss shader would be executed. A NULL miss shader is a miss shader which is effectively **VK_SHADER_UNUSED_KHR**, such as from a shader group consisting entirely of zeros.

• **VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR** specifies that an intersection shader will always be present when an intersection shader would be executed. A NULL intersection shader is an intersection shader which is effectively **VK_SHADER_UNUSED_KHR**, such as from a shader group consisting entirely of zeros.

• **VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR** specifies that triangle primitives will be skipped during traversal using pipeline trace ray instructions.

• **VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBs_BIT_KHR** specifies that AABB primitives will be skipped during traversal using pipeline trace ray instructions.

• **VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR** specifies that the shader group handles can be saved and reused on a subsequent run (e.g. for trace capture and replay).

• **VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV** specifies that the pipeline can be used in combination with Device-Generated Commands.

• **VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT** specifies that pipeline creation will fail if a compile is required for creation of a valid **VkPipeline** object; **VK_PIPELINE_COMPILE_REQUIRED** will be returned by pipeline creation, and the **VkPipeline** will be set to **VK_NULL_HANDLE**.

When creating multiple pipelines, **VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT** specifies that control will be returned to the application if any individual pipeline returns a result which is not **VK_SUCCESS** rather than continuing to create additional pipelines.

• **VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV** specifies that the pipeline is allowed to use OpTraceRayMotionNV.

• **VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR** specifies that the pipeline will be used with a fragment shading rate attachment and dynamic rendering.

• **VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT** specifies that the pipeline will be used with a fragment density map attachment and dynamic rendering.

• **VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT** specifies that pipeline libraries being linked into this library should have link time optimizations applied. If this bit is omitted, implementations should instead perform linking as rapidly as possible.

• **VK_PIPELINE_CREATE_RETAIN_LINK_TIME_OPTIMIZATION_INFO_BIT_EXT** specifies that pipeline libraries should retain any information necessary to later perform an optimal link with **VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT**.

• **VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT** specifies that a pipeline will be used with descriptor buffers, rather than descriptor sets.

• **VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT** specifies that the pipeline may be used with an attachment feedback loop including color attachments. It is ignored if **VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT** is set in pDynamicStates.

• **VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT** specifies that the pipeline
may be used with an attachment feedback loop including depth-stencil attachments. It is ignored if `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` is set in `pDynamicStates`.

- `VK_PIPELINE_CREATERAY_TRACING_OPACITY_MICROMAP_BIT_EXT` specifies that the ray tracing pipeline can be used with acceleration structures which reference an opacity micromap array.
- `VK_PIPELINE_CREATERAY_TRACING_DISPLACEMENT_MICROMAP_BIT_NV` specifies that the ray tracing pipeline can be used with acceleration structures which reference a displacement micromap array.
- `VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT_EXT` specifies that the pipeline must not be bound to a protected command buffer.
- `VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT_EXT` specifies that the pipeline must not be bound to an unprotected command buffer.

It is valid to set both `VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT` and `VK_PIPELINE_CREATE_DERIVATIVE_BIT`. This allows a pipeline to be both a parent and possibly a child in a pipeline hierarchy. See Pipeline Derivatives for more information.

When an implementation is looking up a pipeline in a pipeline cache, if that pipeline is being created using linked libraries, implementations should always return an equivalent pipeline created with `VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT` if available, whether or not that bit was specified.

**NOTE**

Using `VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT` (or not) when linking pipeline libraries is intended as a performance tradeoff between host and device. If the bit is omitted, linking should be faster and produce a pipeline more rapidly, but performance of the pipeline on the target device may be reduced. If the bit is included, linking may be slower but should produce a pipeline with device performance comparable to a monolithically created pipeline. Using both options can allow latency-sensitive applications to generate a suboptimal but usable pipeline quickly, and then perform an optimal link in the background, substituting the result for the suboptimally linked pipeline as soon as it is available.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineCreateFlags;

VkPipelineCreateFlags is a bitmask type for setting a mask of zero or more VkPipelineCreateFlagBits.

The VkGraphicsPipelineLibraryCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_graphics_pipeline_library
typedef struct VkGraphicsPipelineLibraryCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkGraphicsPipelineLibraryFlagsEXT flags;
} VkGraphicsPipelineLibraryCreateInfoEXT;
```
• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is `NULL` or a pointer to a structure extending this structure.

• **flags** is a bitmask of `VkGraphicsPipelineLibraryFlagBitsEXT` specifying the subsets of the graphics pipeline that are being compiled.

If a `VkGraphicsPipelineLibraryCreateInfoEXT` structure is included in the `pNext` chain of `VkGraphicsPipelineCreateInfo`, it specifies the subsets of the graphics pipeline being created, excluding any subsets from linked pipeline libraries. If the pipeline is created with pipeline libraries, state from those libraries is aggregated with said subset.

If this structure is omitted, and either `VkGraphicsPipelineCreateInfo::flags` includes `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR` or the `VkGraphicsPipelineCreateInfo::pNext` chain includes a `VkPipelineLibraryCreateInfoKHR` structure with a `libraryCount` greater than 0, it is as if `flags` is 0. Otherwise if this structure is omitted, it is as if `flags` includes all possible subsets of the graphics pipeline (i.e. a complete graphics pipeline).

### Valid Usage (Implicit)

- VUID-VkGraphicsPipelineLibraryCreateInfoEXT-sType-sType
  - **sType** must be `VK_STRUCTURE_TYPE_GRAPHICS_PIPELINE_LIBRARY_CREATE_INFO_EXT`

- VUID-VkGraphicsPipelineLibraryCreateInfoEXT-flags-parameter
  - **flags** must be a valid combination of `VkGraphicsPipelineLibraryFlagBitsEXT` values

- VUID-VkGraphicsPipelineLibraryCreateInfoEXT-flags-requiredbitmask
  - **flags** must not be 0

---

```
// Provided by VK_EXT_graphics_pipeline_library
typedef VkFlags VkGraphicsPipelineLibraryFlagsEXT;
```

`VkGraphicsPipelineLibraryFlagsEXT` is a bitmask type for setting a mask of zero or more `VkGraphicsPipelineLibraryFlagBitsEXT`.

Possible values of the `flags` member of `VkGraphicsPipelineLibraryCreateInfoEXT`, specifying the subsets of a graphics pipeline to compile are:

```
// Provided by VK_EXT_graphics_pipeline_library
typedef enum VkGraphicsPipelineLibraryFlagBitsEXT {
    VK_GRAPHICS_PIPELINE_LIBRARY_VERTEX_INPUT_INTERFACE_BIT_EXT = 0x00000001,
    VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT = 0x00000002,
    VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT = 0x00000004,
    VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT = 0x00000008,
} VkGraphicsPipelineLibraryFlagBitsEXT;
```

- `VK_GRAPHICS_PIPELINE_LIBRARY_VERTEX_INPUT_INTERFACE_BIT_EXT` specifies that a pipeline will include vertex input interface state.
• `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` specifies that a pipeline will include pre-rasterization shader state.

• `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT` specifies that a pipeline will include fragment shader state.

• `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT` specifies that a pipeline will include fragment output interface state.

The `VkPipelineDynamicStateCreateInfo` structure is defined as:

// Provided by VK_VERSION_1_0
typedef struct VkPipelineDynamicStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineDynamicStateCreateFlags flags;
    uint32_t dynamicStateCount;
    const VkDynamicState* pDynamicStates;
} VkPipelineDynamicStateCreateInfo;

• `sType` is a `VkStructureType` value identifying this structure.

• `pNext` is NULL or a pointer to a structure extending this structure.

• `flags` is reserved for future use.

• `dynamicStateCount` is the number of elements in the `pDynamicStates` array.

• `pDynamicStates` is a pointer to an array of `VkDynamicState` values specifying which pieces of pipeline state will use the values from dynamic state commands rather than from pipeline state creation information.

### Valid Usage

- VUID-VkPipelineDynamicStateCreateInfo-pDynamicStates-01442
  Each element of `pDynamicStates` must be unique

### Valid Usage (Implicit)

- VUID-VkPipelineDynamicStateCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_DYNAMIC_STATE_CREATE_INFO`

- VUID-VkPipelineDynamicStateCreateInfo-pNext-pNext
  `pNext` must be NULL

- VUID-VkPipelineDynamicStateCreateInfo-flags-zerobitmask
  `flags` must be 0

- VUID-VkPipelineDynamicStateCreateInfo-pDynamicStates-parameter
  If `dynamicStateCount` is not 0, `pDynamicStates` must be a valid pointer to an array of `VkDynamicState` values
typedef VkFlags VkPipelineDynamicStateCreateFlags;

VkPipelineDynamicStateCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

The source of different pieces of dynamic state is specified by the VkPipelineDynamicStateCreateInfo::pDynamicStates property of the currently active pipeline, each of whose elements must be one of the values:

typedef enum VkDynamicState {
    VK_DYNAMIC_STATE_VIEWPORT = 0,
    VK_DYNAMIC_STATE_SCISSOR = 1,
    VK_DYNAMIC_STATE_LINE_WIDTH = 2,
    VK_DYNAMIC_STATE_DEPTH_BIAS = 3,
    VK_DYNAMIC_STATE_BLEND_CONSTANTS = 4,
    VK_DYNAMIC_STATE_DEPTH_BOUNDS = 5,
    VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK = 6,
    VK_DYNAMIC_STATE_STENCIL_WRITE_MASK = 7,
    VK_DYNAMIC_STATE_STENCIL_REFERENCE = 8,
    // Provided by VK_VERSION_1_3
    VK_DYNAMIC_STATE_CULL_MODE = 1000267000,
    // Provided by VK_VERSION_1_3
    VK_DYNAMIC_STATE_FRONT_FACE = 1000267001,
    // Provided by VK_VERSION_1_3
    VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY = 1000267002,
    // Provided by VK_VERSION_1_3

} VkDynamicState;

• **VK_DYNAMIC_STATE_VIEWPORT** specifies that the *pViewports* state in *VkPipelineViewportStateCreateInfo* will be ignored and **must** be set dynamically with *vkCmdSetViewport* before any drawing commands. The number of viewports used by a pipeline is still specified by the *viewportCount* member of *VkPipelineViewportStateCreateInfo*.

• **VK_DYNAMIC_STATE_SCISSOR** specifies that the *pScissors* state in *VkPipelineViewportStateCreateInfo* will be ignored and **must** be set dynamically with *vkCmdSetScissor* before any drawing commands. The number of scissor rectangles used by a pipeline is still specified by the *scissorCount* member of *VkPipelineViewportStateCreateInfo*.

• **VK_DYNAMIC_STATE_LINE_WIDTH** specifies that the *lineWidth* state in *VkPipelineRasterizationStateCreateInfo* will be ignored and **must** be set dynamically with *vkCmdSetLineWidth* before any drawing commands that generate line primitives for the rasterizer.
• **VK_DYNAMIC_STATE_DEPTH_BIAS** specifies that any instance of `VkDepthBiasRepresentationInfoEXT` included in the `pNext` chain of `VkPipelineRasterizationStateCreateInfo` as well as the `depthBiasConstantFactor`, `depthBiasClamp` and `depthBiasSlopeFactor` states in `VkPipelineRasterizationStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetDepthBias` or `vkCmdSetDepthBias2EXT` before any draws are performed with depth bias enabled.

• **VK_DYNAMIC_STATE_BLEND_CONSTANTS** specifies that the `blendConstants` state in `VkPipelineColorBlendStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetBlendConstants` before any draws are performed with a pipeline state with `VkPipelineColorBlendAttachmentState` member `blendEnable` set to **VK_TRUE** and any of the blend functions using a constant blend color.

• **VK_DYNAMIC_STATE_DEPTH_BOUNDS** specifies that the `minDepthBounds` and `maxDepthBounds` states of `VkPipelineDepthStencilStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetDepthBounds` before any draws are performed with a pipeline state with `VkPipelineDepthStencilStateCreateInfo` member `depthBoundsTestEnable` set to **VK_TRUE**.

• **VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK** specifies that the `compareMask` state in `VkPipelineDepthStencilStateCreateInfo` for both front and back will be ignored and **must** be set dynamically with `vkCmdSetStencilCompareMask` before any draws are performed with a pipeline state with `VkPipelineDepthStencilStateCreateInfo` member `stencilTestEnable` set to **VK_TRUE**.

• **VK_DYNAMIC_STATE_STENCIL_WRITE_MASK** specifies that the `writeMask` state in `VkPipelineDepthStencilStateCreateInfo` for both front and back will be ignored and **must** be set dynamically with `vkCmdSetStencilWriteMask` before any draws are performed with a pipeline state with `VkPipelineDepthStencilStateCreateInfo` member `stencilTestEnable` set to **VK_TRUE**.

• **VK_DYNAMIC_STATE_STENCIL_REFERENCE** specifies that the `reference` state in `VkPipelineDepthStencilStateCreateInfo` for both front and back will be ignored and **must** be set dynamically with `vkCmdSetStencilReference` before any draws are performed with a pipeline state with `VkPipelineDepthStencilStateCreateInfo` member `stencilTestEnable` set to **VK_TRUE**.

• **VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV** specifies that the `pViewportWScalings` state in `VkPipelineViewportWScalingStateCreateInfoNV` will be ignored and **must** be set dynamically with `vkCmdSetViewportWScalingNV` before any draws are performed with a pipeline state with `VkPipelineViewportWScalingStateCreateInfoNV` member `viewportScalingEnable` set to **VK_TRUE**.

• **VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT** specifies that the `pDiscardRectangles` state in `VkPipelineDiscardRectangleStateCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetDiscardRectangleEXT` before any draw or clear commands.

• **VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT** specifies that the presence of the `VkPipelineDiscardRectangleStateCreateInfoEXT` structure in the `VkGraphicsPipelineCreateInfo` chain with a `discardRectangleCount` greater than zero does not implicitly enable discard rectangles and they **must** be enabled dynamically with `vkCmdSetDiscardRectangleEnableEXT` before any draw commands. This is available on implementations that support at least specVersion 2 of the **VK_EXT_discard_rectangles** extension.

• **VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT** specifies that the `discardRectangleMode` state in `VkPipelineDiscardRectangleStateCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetDiscardRectangleModeEXT` before any draw commands. This is available on
implementations that support at least `specVersion 2` of the `VK_EXT_discard_rectangles` extension.

- **VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT** specifies that the `sampleLocationsInfo` state in `VkPipelineSampleLocationsStateCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetSampleLocationsEXT` before any draw or clear commands. Enabling custom sample locations is still indicated by the `sampleLocationsEnable` member of `VkPipelineSampleLocationsStateCreateInfoEXT`.

- **VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_NV** specifies that the `pExclusiveScissors` state in `VkPipelineViewportExclusiveScissorStateCreateInfoNV` will be ignored and **must** be set dynamically with `vkCmdSetExclusiveScissorNV` before any drawing commands.

- **VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_ENABLE_NV** specifies that the exclusive scissors **must** be explicitly enabled with `vkCmdSetExclusiveScissorEnableNV` and the exclusiveScissorCount value in `VkPipelineViewportExclusiveScissorStateCreateInfoNV` will not implicitly enable them. This is available on implementations that support at least `specVersion 2` of the `VK_NV_scissor_exclusive` extension.

- **VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV** specifies that the `pShadingRatePalettes` state in `VkPipelineViewportShadingRateImageStateCreateInfoNV` will be ignored and **must** be set dynamically with `vkCmdSetViewportShadingRatePaletteNV` before any drawing commands.

- **VK_DYNAMIC_STATE_VIEWPORT_COARSE_SAMPLE_ORDER_NV** specifies that the coarse sample order state in `VkPipelineViewportCoarseSampleOrderStateCreateInfoNV` will be ignored and **must** be set dynamically with `vkCmdSetCoarseSampleOrderNV` before any drawing commands.

- **VK_DYNAMIC_STATE_LINE_STIPPLE_EXT** specifies that the `lineStippleFactor` and `lineStipplePattern` state in `VkPipelineRasterizationLineStateCreateInfoKHR` will be ignored and **must** be set dynamically with `vkCmdSetLineStippleKHR` before any draws are performed with a pipeline state with `VkPipelineRasterizationLineStateCreateInfoKHR` member `stippledLineEnable` set to `VK_TRUE`.

- **VK_DYNAMIC_STATE_CULL_MODE** specifies that the `cullMode` state in `VkPipelineRasterizationStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetCullMode` before any drawing commands.

- **VK_DYNAMIC_STATE_FRONT_FACE** specifies that the `frontFace` state in `VkPipelineRasterizationStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetFrontFace` before any drawing commands.

- **VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY** specifies that the `topology` state in `VkPipelineInputAssemblyStateCreateInfo` only specifies the topology class, and the specific topology order and adjacency **must** be set dynamically with `vkCmdSetPrimitiveTopology` before any drawing commands.

- **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** specifies that the `viewportCount` and `pViewports` state in `VkPipelineViewportStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetViewportWithCount` before any draw call.

- **VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT** specifies that the `scissorCount` and `pScissors` state in `VkPipelineViewportStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetScissorWithCount` before any draw call.

- **VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE** specifies that the `stride` state in `VkVertexInputBindingDescription` will be ignored and **must** be set dynamically with...
`vkCmdBindVertexBuffers2` before any draw call.

- **VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE** specifies that the `depthTestEnable` state in `VkPipelineDepthStencilStateCreateInfo` will be ignored and must be set dynamically with `vkCmdSetDepthTestEnable` before any draw call.

- **VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE** specifies that the `depthWriteEnable` state in `VkPipelineDepthStencilStateCreateInfo` will be ignored and must be set dynamically with `vkCmdSetDepthWriteEnable` before any draw call.

- **VK_DYNAMIC_STATE_DEPTH_COMPARE_OP** specifies that the `depthCompareOp` state in `VkPipelineDepthStencilStateCreateInfo` will be ignored and must be set dynamically with `vkCmdSetDepthCompareOp` before any draw call.

- **VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE** specifies that the `depthBoundsTestEnable` state in `VkPipelineDepthStencilStateCreateInfo` will be ignored and must be set dynamically with `vkCmdSetDepthBoundsTestEnable` before any draw call.

- **VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE** specifies that the `stencilTestEnable` state in `VkPipelineDepthStencilStateCreateInfo` will be ignored and must be set dynamically with `vkCmdSetStencilTestEnable` before any draw call.

- **VK_DYNAMIC_STATE_STENCIL_OP** specifies that the `failOp`, `passOp`, `depthFailOp`, and `compareOp` states in `VkPipelineDepthStencilStateCreateInfo` for both `front` and `back` will be ignored and must be set dynamically with `vkCmdSetStencilOp` before any draws are performed with a pipeline state with `VkPipelineDepthStencilStateCreateInfo` member `stencilTestEnable` set to `VK_TRUE`.

- **VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT** specifies that the `patchControlPoints` state in `VkPipelineTessellationStateCreateInfo` will be ignored and must be set dynamically with `vkCmdSetPatchControlPointsEXT` before any drawing commands.

- **VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE** specifies that the `rasterizerDiscardEnable` state in `VkPipelineRasterizationStateCreateInfo` will be ignored and must be set dynamically with `vkCmdSetRasterizerDiscardEnable` before any drawing commands.

- **VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE** specifies that the `depthBiasEnable` state in `VkPipelineRasterizationStateCreateInfo` will be ignored and must be set dynamically with `vkCmdSetDepthBiasEnable` before any drawing commands.

- **VK_DYNAMIC_STATE_LOGIC_OP_EXT** specifies that the `logicOp` state in `VkPipelineColorBlendStateCreateInfo` will be ignored and must be set dynamically with `vkCmdSetLogicOpEXT` before any drawing commands.

- **VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE** specifies that the `primitiveRestartEnable` state in `VkPipelineInputAssemblyStateCreateInfo` will be ignored and must be set dynamically with `vkCmdSetPrimitiveRestartEnable` before any drawing commands.

- **VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR** specifies that state in `VkPipelineFragmentShadingRateStateCreateInfoKHR` and `VkPipelineFragmentShadingRateEnumStateCreateInfoNV` will be ignored and must be set dynamically with `vkCmdSetFragmentShadingRateKHR` or `vkCmdSetFragmentShadingRateEnumNV` before any drawing commands.

- **VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR** specifies that the default stack size computation for the pipeline will be ignored and must be set dynamically with `vkCmdSetRayTracingPipelineStackSizeKHR` before any ray tracing calls are performed.
• **VK_DYNAMIC_STATE_VERTEX_INPUT_EXT** specifies that the `pVertexInputState` state will be ignored and **must** be set dynamically with `vkCmdSetVertexInputEXT` before any drawing commands.

• **VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT** specifies that the `pColorWriteEnables` state in `VkPipelineColorWriteCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetColorWriteEnableEXT` before any draw call.

• **VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT** specifies that the `domainOrigin` state in ` VkPipelineTessellationDomainOriginStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetTessellationDomainOriginEXT` before any draw call.

• **VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT** specifies that the `depthClampEnable` state in `VkPipelineRasterizationStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetDepthClampEnableEXT` before any draw call.

• **VK_DYNAMIC_STATE_POLYGON_MODE_EXT** specifies that the `polygonMode` state in `VkPipelineRasterizationStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetPolygonModeEXT` before any draw call.

• **VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT** specifies that the `rasterizationSamples` state in `VkPipelineMultisampleStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetRasterizationSamplesEXT` before any draw call.

• **VK_DYNAMIC_STATE_SAMPLE_MASK_EXT** specifies that the `pSampleMask` state in `VkPipelineMultisampleStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetSampleMaskEXT` before any draw call.

• **VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT** specifies that the `alphaToCoverageEnable` state in `VkPipelineMultisampleStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetAlphaToCoverageEnableEXT` before any draw call.

• **VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT** specifies that the `alphaToOneEnable` state in `VkPipelineMultisampleStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetAlphaToOneEnableEXT` before any draw call.

• **VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT** specifies that the `logicOpEnable` state in `VkPipelineColorBlendStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetLogicOpEnableEXT` before any draw call.

• **VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT** specifies that the `blendEnable` state in `VkPipelineColorBlendAttachmentState` will be ignored and **must** be set dynamically with `vkCmdSetColorBlendEnableEXT` before any draw call.

• **VK_DYNAMIC_STATE_COLOR_BLEND_EQUIATION_EXT** specifies that the `srcColorBlendFactor`, `dstColorBlendFactor`, `colorBlendOp`, `srcAlphaBlendFactor`, `dstAlphaBlendFactor`, and `alphaBlendOp` states in `VkPipelineColorBlendAttachmentState` will be ignored and **must** be set dynamically with `vkCmdSetColorBlendEquationEXT` before any draw call.

• **VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT** specifies that the `colorWriteMask` state in `VkPipelineColorBlendAttachmentState` will be ignored and **must** be set dynamically with `vkCmdSetColorWriteMaskEXT` before any draw call.

• **VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT** specifies that the `rasterizationStream` state in `VkPipelineRasterizationStateStreamCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetRasterizationStreamEXT` before any draw call.
• **VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT** specifies that the conservativeRasterizationMode state in `VkPipelineRasterizationConservativeStateCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetConservativeRasterizationModeEXT` before any draw call.

• **VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT** specifies that the extraPrimitiveOverestimationSize state in `VkPipelineRasterizationConservativeStateCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetExtraPrimitiveOverestimationSizeEXT` before any draw call.

• **VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT** specifies that the depthClipEnable state in `VkPipelineRasterizationDepthClipStateCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetDepthClipEnableEXT` before any draw call.

• **VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT** specifies that the sampleLocationsEnable state in `VkPipelineSampleLocationsStateCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetSampleLocationsEnableEXT` before any draw call.

• **VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT** specifies that the colorBlendOp state in `VkPipelineColorBlendAttachmentState`, and `srcPremultiplied`, `dstPremultiplied`, and `blendOverlap` states in `VkPipelineColorBlendAdvancedStateCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetColorBlendAdvancedEXT` before any draw call.

• **VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT** specifies that the provokingVertexMode state in `VkPipelineRasterizationProvokingVertexStateCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetProvokingVertexModeEXT` before any draw call.

• **VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT** specifies that the lineRasterizationMode state in `VkPipelineRasterizationLineStateCreateInfoKHR` will be ignored and **must** be set dynamically with `vkCmdSetLineRasterizationModeEXT` before any draw call.

• **VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT** specifies that the stippledLineEnable state in `VkPipelineRasterizationLineStateCreateInfoKHR` will be ignored and **must** be set dynamically with `vkCmdSetLineStippleEnableEXT` before any draw call.

• **VK_DYNAMIC_STATE_DEPTH_CLIP_NEGATIVE_ONE_TO_ONE_EXT** specifies that the negativeOneToOne state in `VkPipelineViewportDepthClipControlCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetDepthClipNegativeOneToOneEXT` before any draw call.

• **VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_ENABLE_NV** specifies that the viewportWScalingEnable state in `VkPipelineViewportWScalingStateCreateInfoNV` will be ignored and **must** be set dynamically with `vkCmdSetViewportWScalingEnableNV` before any draw call.

• **VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV** specifies that the viewportCount, and pViewportSwizzles states in `VkPipelineViewportSwizzleStateCreateInfoNV` will be ignored and **must** be set dynamically with `vkCmdSetViewportSwizzleNV` before any draw call.

• **VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV** specifies that the coverageToColorEnable state in `VkPipelineCoverageToColorStateCreateInfoNV` will be ignored and **must** be set dynamically with `vkCmdSetCoverageToColorEnableNV` before any draw call.

• **VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_LOCATION_NV** specifies that the coverageToColorLocation state in `VkPipelineCoverageToColorStateCreateInfoNV` will be ignored and **must** be set dynamically with `vkCmdSetCoverageToColorLocationNV` before any draw call.

• **VK_DYNAMIC_STATE_COVERAGE_MODULATION_MODE_NV** specifies that the coverageModulationMode state in
VkPipelineCoverageModulationStateCreateInfoNV will be ignored and **must** be set dynamically with vkCmdSetCoverageModulationModeNV before any draw call.

- **VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV** specifies that the coverageModulationTableEnable state in VkPipelineCoverageModulationStateCreateInfoNV will be ignored and **must** be set dynamically with vkCmdSetCoverageModulationTableEnableNV before any draw call.

- **VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_NV** specifies that the coverageModulationTableCount, and pCoverageModulationTable states in VkPipelineCoverageModulationStateCreateInfoNV will be ignored and **must** be set dynamically with vkCmdSetCoverageModulationTableNV before any draw call.

- **VK_DYNAMIC_STATE_SHADING_RATE_IMAGE_ENABLE_NV** specifies that the shadingRateImageEnable state in VkPipelineViewportShadingRateImageStateCreateInfoNV will be ignored and **must** be set dynamically with vkCmdSetShadingRateImageEnableNV before any draw call.

- **VK_DYNAMIC_STATE_REPRESENTATIVE_FRAGMENT_TEST_ENABLE_NV** specifies that the representativeFragmentTestEnable state in VkPipelineRepresentativeFragmentTestStateCreateInfoNV will be ignored and **must** be set dynamically with vkCmdSetRepresentativeFragmentTestEnableNV before any draw call.

- **VK_DYNAMIC_STATE_COVERAGE_REDUCTION_MODE_NV** specifies that the coverageReductionMode state in VkPipelineCoverageReductionStateCreateInfoNV will be ignored and **must** be set dynamically with vkCmdSetCoverageReductionModeNV before any draw call.

- **VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT** specifies that the VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT and VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT flags will be ignored and **must** be set dynamically with vkCmdSetAttachmentFeedbackLoopEnableEXT before any draw call.

### 10.3.1. Valid Combinations of Stages for Graphics Pipelines

Primitive processing can be handled either on a per primitive basis by the vertex, tessellation, and geometry shader stages, or on a per mesh basis using task and mesh shader stages. If the pipeline includes a mesh shader stage, it uses the mesh pipeline, otherwise it uses the primitive pipeline.

If a task shader is omitted, the task shading stage is skipped.

If tessellation shader stages are omitted, the tessellation shading and fixed-function stages of the pipeline are skipped.

If a geometry shader is omitted, the geometry shading stage is skipped.

If a fragment shader is omitted, fragment color outputs have undefined values, and the fragment depth value is determined by **Fragment Operations** state. This **can** be useful for depth-only rendering.

Presence of a shader stage in a pipeline is indicated by including a valid VkPipelineShaderStageCreateInfo with **module** and **pName** selecting an entry point from a shader module, where that entry point is valid for the stage specified by **stage**.
Presence of some of the fixed-function stages in the pipeline is implicitly derived from enabled shaders and provided state. For example, the fixed-function tessellator is always present when the pipeline has valid Tessellation Control and Tessellation Evaluation shaders.

For example:

- Depth/stencil-only rendering in a subpass with no color attachments
  - Active Pipeline Shader Stages
    - Vertex Shader
  - Required: Fixed-Function Pipeline Stages
    - VkPipelineVertexInputStateCreateInfo
    - VkPipelineInputAssemblyStateCreateInfo
    - VkPipelineViewportStateCreateInfo
    - VkPipelineRasterizationStateCreateInfo
    - VkPipelineMultisampleStateCreateInfo
    - VkPipelineDepthStencilStateCreateInfo

- Color-only rendering in a subpass with no depth/stencil attachment
  - Active Pipeline Shader Stages
    - Vertex Shader
    - Fragment Shader
  - Required: Fixed-Function Pipeline Stages
    - VkPipelineVertexInputStateCreateInfo
    - VkPipelineInputAssemblyStateCreateInfo
    - VkPipelineViewportStateCreateInfo
    - VkPipelineRasterizationStateCreateInfo
    - VkPipelineMultisampleStateCreateInfo
    - VkPipelineColorBlendStateCreateInfo

- Rendering pipeline with tessellation and geometry shaders
  - Active Pipeline Shader Stages
    - Vertex Shader
    - Tessellation Control Shader
    - Tessellation Evaluation Shader
    - Geometry Shader
    - Fragment Shader
  - Required: Fixed-Function Pipeline Stages
    - VkPipelineVertexInputStateCreateInfo
    - VkPipelineInputAssemblyStateCreateInfo
- VkPipelineTessellationStateCreateInfo
- VkPipelineViewportStateCreateInfo
- VkPipelineRasterizationStateCreateInfo
- VkPipelineMultisampleStateCreateInfo
- VkPipelineDepthStencilStateCreateInfo
- VkPipelineColorBlendStateCreateInfo

- Rendering pipeline with task and mesh shaders
  - Active Pipeline Shader Stages
    - Task Shader
    - Mesh Shader
    - Fragment Shader
  - Required: Fixed-Function Pipeline Stages
    - VkPipelineViewportStateCreateInfo
    - VkPipelineRasterizationStateCreateInfo
    - VkPipelineMultisampleStateCreateInfo
    - VkPipelineDepthStencilStateCreateInfo
    - VkPipelineColorBlendStateCreateInfo

10.3.2. Graphics Pipeline Shader Groups

Graphics pipelines can contain multiple shader groups that can be bound individually. Each shader group behaves as if it was a pipeline using the shader group's state. When the pipeline is bound by regular means, it behaves as if the state of group 0 is active, use `vkCmdBindPipelineShaderGroupNV` to bind an individual shader group.

The primary purpose of shader groups is allowing the device to bind different pipeline state using Device-Generated Commands.

The `VkGraphicsPipelineShaderGroupsCreateInfoNV` structure is defined as:

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkGraphicsPipelineShaderGroupsCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    uint32_t groupCount;
    const VkGraphicsShaderGroupCreateInfoNV* pGroups;
    uint32_t pipelineCount;
    const VkPipeline* pPipelines;
} VkGraphicsPipelineShaderGroupsCreateInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.

• groupCount is the number of elements in the pGroups array.

• pGroups is a pointer to an array of VkGraphicsShaderGroupCreateInfoNV structures specifying which state of the original VkGraphicsPipelineCreateInfo each shader group overrides.

• pipelineCount is the number of elements in the pPipelines array.

• pPipelines is a pointer to an array of graphics VkPipeline structures which are referenced within the created pipeline, including all their shader groups.

When referencing shader groups by index, groups defined in the referenced pipelines are treated as if they were defined as additional entries in pGroups. They are appended in the order they appear in the pPipelines array and in the pGroups array when those pipelines were defined.

The application must maintain the lifetime of all such referenced pipelines based on the pipelines that make use of them.

Valid Usage

• VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-groupCount-02879
  groupCount must be at least 1 and as maximum VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxGraphicsShaderGroupCount

• VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-groupCount-02880
  The sum of groupCount including those groups added from referenced pPipelines must also be as maximum VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxGraphicsShaderGroupCount

• VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-pGroups-02881
  The state of the first element of pGroups must match its equivalent within the parent's VkGraphicsPipelineCreateInfo

• VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-pGroups-02882
  Each element of pGroups must in combination with the rest of the pipeline state yield a valid state configuration

• VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-pGroups-02884
  All elements of pGroups must use the same shader stage combinations unless any mesh shader stage is used, then either combination of task and mesh or just mesh shader is valid

• VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-pGroups-02885
  Mesh and regular primitive shading stages cannot be mixed across pGroups

• VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-pPipelines-02886
  Each element of pPipelines must have been created with identical state to the pipeline currently created except the state that can be overridden by VkGraphicsShaderGroupCreateInfoNV

• VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-deviceGeneratedCommands-02887
  The deviceGeneratedCommands feature must be enabled
Valid Usage (Implicit)

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_GRAPHICS_PIPELINE_SHADER_GROUPS_CREATE_INFO_NV

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-pGroups-parameter
  
  If groupCount is not 0, pGroups must be a valid pointer to an array of groupCount valid VkGraphicsShaderGroupCreateInfoNV structures

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-pPipelines-parameter
  
  If pipelineCount is not 0, pPipelines must be a valid pointer to an array of pipelineCount valid VkPipeline handles

The VkGraphicsShaderGroupCreateInfoNV structure provides the state overrides for each shader group. Each shader group behaves like a pipeline that was created from its state as well as the remaining parent’s state. It is defined as:

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkGraphicsShaderGroupCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    uint32_t stageCount;
    const VkPipelineShaderStageCreateInfo* pStages;
    const VkPipelineVertexInputStateCreateInfo* pVertexInputState;
    const VkPipelineTessellationStateCreateInfo* pTessellationState;
} VkGraphicsShaderGroupCreateInfoNV;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- stageCount is the number of entries in the pStages array.
- pStages is a pointer to an array VkPipelineShaderStageCreateInfo structures specifying the set of the shader stages to be included in this shader group.
- pVertexInputState is a pointer to a VkPipelineVertexInputStateCreateInfo structure.
- pTessellationState is a pointer to a VkPipelineTessellationStateCreateInfo structure, and is ignored if the shader group does not include a tessellation control shader stage and tessellation evaluation shader stage.

Valid Usage

- VUID-VkGraphicsShaderGroupCreateInfoNV-stageCount-02888
  
  For stageCount, the same restrictions as in VkGraphicsPipelineCreateInfo::stageCount apply

- VUID-VkGraphicsShaderGroupCreateInfoNV-pStages-02889
  
  For pStages, the same restrictions as in VkGraphicsPipelineCreateInfo::pStages apply
• VUID-VkGraphicsShaderGroupCreateInfoNV-pVertexInputState-02890
  For \texttt{pVertexInputState}, the same restrictions as in \texttt{VkGraphicsPipelineCreateInfo::pVertexInputState} apply

• VUID-VkGraphicsShaderGroupCreateInfoNV-pTessellationState-02891
  For \texttt{pTessellationState}, the same restrictions as in \texttt{VkGraphicsPipelineCreateInfo::pTessellationState} apply

### Valid Usage (Implicit)

- VUID-VkGraphicsShaderGroupCreateInfoNV-sType-sType
  \texttt{sType} \textbf{must} be \texttt{VK_STRUCTURE_TYPE_GRAPHICS_SHADER_GROUP_CREATE_INFO_NV}

- VUID-VkGraphicsShaderGroupCreateInfoNV-pNext-pNext
  \texttt{pNext} \textbf{must} be \texttt{NULL}

- VUID-VkGraphicsShaderGroupCreateInfoNV-pStages-parameter
  \texttt{pStages} \textbf{must} be a valid pointer to an array of \texttt{stageCount} valid \texttt{VkPipelineShaderStageCreateInfo} structures

- VUID-VkGraphicsShaderGroupCreateInfoNV-stageCount-arraylength
  \texttt{stageCount} \textbf{must} be greater than 0

## 10.4. Ray Tracing Pipelines

Ray tracing pipelines consist of multiple shader stages, fixed-function traversal stages, and a pipeline layout.

\texttt{VK_SHADER_UNUSED_KHR} is a special shader index used to indicate that a ray generation, miss, or callable shader member is not used.

```c
#define VK_SHADER_UNUSED_KHR (~0U)
```

or the equivalent

```c
#define VK_SHADER_UNUSED_NV VK_SHADER_UNUSED_KHR
```

To create ray tracing pipelines, call:
// Provided by VK_NV_ray_tracing

```
VkResult vkCreateRayTracingPipelinesNV(
    VkDevice device, 
    VkPipelineCache pipelineCache, 
    uint32_t createInfoCount, 
    const VkRayTracingPipelineCreateInfoNV* pCreateInfos, 
    const VkAllocationCallbacks* pAllocator, 
    VkPipeline* pPipelines);
```

- **device** is the logical device that creates the ray tracing pipelines.
- **pipelineCache** is either VK_NULL_HANDLE, indicating that pipeline caching is disabled, or the handle of a valid pipeline cache object, in which case use of that cache is enabled for the duration of the command.
- **createInfoCount** is the length of the **pCreateInfos** and **pPipelines** arrays.
- **pCreateInfos** is a pointer to an array of VkRayTracingPipelineCreateInfoNV structures.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pPipelines** is a pointer to an array in which the resulting ray tracing pipeline objects are returned.

Pipelines are created and returned as described for Multiple Pipeline Creation.

### Valid Usage

- **VUID-vkCreateRayTracingPipelinesNV-device-09677**
  device **must** support at least one queue family with the VK_QUEUE_COMPUTE_BIT capability

- **VUID-vkCreateRayTracingPipelinesNV-flags-03415**
  If the **flags** member of any element of **pCreateInfos** contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and the basePipelineIndex member of that same element is not -1, **basePipelineIndex** **must** be less than the index into **pCreateInfos** that corresponds to that element

- **VUID-vkCreateRayTracingPipelinesNV-flags-03416**
  If the **flags** member of any element of **pCreateInfos** contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, the base pipeline **must** have been created with the VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT flag set

- **VUID-vkCreateRayTracingPipelinesNV-flags-03816**
  **flags** **must** not contain the VK_PIPELINE_CREATE_DISPATCH_BASE flag

- **VUID-vkCreateRayTracingPipelinesNV-pipelineCache-02903**
  If **pipelineCache** was created with VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT, host access to **pipelineCache** **must** be externally synchronized
Valid Usage (Implicit)

- VUID-vkCreateRayTracingPipelinesNV-device-parameter
device must be a valid VkDevice handle

- VUID-vkCreateRayTracingPipelinesNV-pipelineCache-parameter
  If pipelineCache is not VK_NULL_HANDLE, pipelineCache must be a valid VkPipelineCache handle

- VUID-vkCreateRayTracingPipelinesNV-pCreateInfos-parameter
  pCreateInfos must be a valid pointer to an array of createInfoCount valid VkRayTracingPipelineCreateInfoNV structures

- VUID-vkCreateRayTracingPipelinesNV-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateRayTracingPipelinesNV-pPipelines-parameter
  pPipelines must be a valid pointer to an array of createInfoCount VkPipeline handles

- VUID-vkCreateRayTracingPipelinesNV-createInfoCount-arraylength
  createInfoCount must be greater than 0

- VUID-vkCreateRayTracingPipelinesNV-pipelineCache-parent
  If pipelineCache is a valid handle, it must have been created, allocated, or retrieved from device

Return Codes

Success
- VK_SUCCESS
- VK_PIPELINE_COMPILE_REQUIRED_EXT

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INVALID_SHADER_NV

To create ray tracing pipelines, call:
// Provided by VK_KHR_ray_tracing_pipeline
VkResult vkCreateRayTracingPipelinesKHR(
    VkDevice device,
    VkDeferredOperationKHR deferredOperation,
    VkPipelineCache pipelineCache,
    uint32_t createInfoCount,
    const VkRayTracingPipelineCreateInfoKHR* pCreateInfos,
    const VkAllocationCallbacks* pAllocator,
    VkPipeline* pPipelines);

- **device** is the logical device that creates the ray tracing pipelines.
- **deferredOperation** is **VK_NULL_HANDLE** or the handle of a valid **VkDeferredOperationKHR** request deferral object for this command.
- **pipelineCache** is either **VK_NULL_HANDLE**, indicating that pipeline caching is disabled, or the handle of a valid pipeline cache object, in which case use of that cache is enabled for the duration of the command.
- **createInfoCount** is the length of the **pCreateInfos** and **pPipelines** arrays.
- **pCreateInfos** is a pointer to an array of **VkRayTracingPipelineCreateInfoKHR** structures.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pPipelines** is a pointer to an array in which the resulting ray tracing pipeline objects are returned.

The **VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS** error is returned if the implementation is unable to reuse the shader group handles provided in **VkRayTracingShaderGroupCreateInfoKHR** ::**pShaderGroupCaptureReplayHandle** when **VkPhysicalDeviceRayTracingPipelineFeaturesKHR** ::**rayTracingPipelineShaderGroupHandleCaptureReplay** is enabled.

Pipelines are created and returned as described for Multiple Pipeline Creation.

### Valid Usage

- **VUID-vkCreateRayTracingPipelinesKHR-device-09677**
  device must support at least one queue family with the **VK_QUEUE_COMPUTE_BIT** capability

- **VUID-vkCreateRayTracingPipelinesKHR-flags-03415**
  If the **flags** member of any element of **pCreateInfos** contains the **VK_PIPELINE_CREATE_DERIVATIVE_BIT** flag, and the **basePipelineIndex** member of that same element is not -1, **basePipelineIndex** must be less than the index into **pCreateInfos** that corresponds to that element

- **VUID-vkCreateRayTracingPipelinesKHR-flags-03416**
  If the **flags** member of any element of **pCreateInfos** contains the **VK_PIPELINE_CREATE_DERIVATIVE_BIT** flag, the base pipeline must have been created with the **VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT** flag set

- **VUID-vkCreateRayTracingPipelinesKHR-flags-03816**
  flags must not contain the **VK_PIPELINE_CREATE_DISPATCH_BASE** flag
If `pipelineCache` was created with `VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT`, host access to `pipelineCache` must be externally synchronized.

Any previous deferred operation that was associated with `deferredOperation` must be complete.
The `rayTracingPipeline` feature must be enabled.
If `deferredOperation` is not `VK_NULL_HANDLE`, the `flags` member of elements of `pCreateInfos` must not include `VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT`.

---

**Valid Usage (Implicit)**

- **device** must be a valid `VkDevice` handle.
- If `deferredOperation` is not `VK_NULL_HANDLE`, `deferredOperation` must be a valid `VkDeferredOperationKHR` handle.
- If `pipelineCache` is not `VK_NULL_HANDLE`, `pipelineCache` must be a valid `VkPipelineCache` handle.
- `pCreateInfos` must be a valid pointer to an array of `createInfoCount` valid `VkRayTracingPipelineCreateInfoKHR` structures.
- If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.
- `pPipelines` must be a valid pointer to an array of `createInfoCount` `VkPipeline` handles.
- `createInfoCount` must be greater than 0.
- If `deferredOperation` is a valid handle, it must have been created, allocated, or retrieved from `device`.
- If `pipelineCache` is a valid handle, it must have been created, allocated, or retrieved from `device`.
Return Codes

Success

- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR
- VK_PIPELINE_COMPILE_REQUIRED_EXT

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS

The VkRayTracingPipelineCreateInfoNV structure is defined as:

```c
// Provided by VK_NV_ray_tracing
typedef struct VkRayTracingPipelineCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCreateFlags flags;
    uint32_t stageCount;
    const VkPipelineShaderStageCreateInfo* pStages;
    uint32_t pGroups;
    const VkRayTracingShaderGroupCreateInfoNV* pGroups;
    uint32_t maxRecursionDepth;
    VkPipelineLayout layout;
    VkPipeline basePipelineHandle;
    int32_t basePipelineIndex;
} VkRayTracingPipelineCreateInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkPipelineCreateFlagBits` specifying how the pipeline will be generated.
- `stageCount` is the number of entries in the `pStages` array.
- `pStages` is a pointer to an array of `VkPipelineShaderStageCreateInfo` structures specifying the set of the shader stages to be included in the ray tracing pipeline.
- `groupCount` is the number of entries in the `pGroups` array.
- `pGroups` is a pointer to an array of `VkRayTracingShaderGroupCreateInfoNV` structures describing the set of the shader stages to be included in each shader group in the ray tracing pipeline.
- `maxRecursionDepth` is the maximum recursion depth of shaders executed by this pipeline.
- `layout` is the description of binding locations used by both the pipeline and descriptor sets used
with the pipeline.

- **basePipelineHandle** is a pipeline to derive from.
- **basePipelineIndex** is an index into the **pCreateInfos** parameter to use as a pipeline to derive from.

The parameters **basePipelineHandle** and **basePipelineIndex** are described in more detail in **Pipeline Derivatives**.

If the **pNext** chain includes a **VkPipelineCreateFlags2CreateInfoKHR** structure, **VkPipelineCreateFlags2CreateInfoKHR::flags** from that structure is used instead of **flags** from this structure.

---

**Valid Usage**

- **VUID-VkRayTracingPipelineCreateInfoNV-None-09497**
  If the **pNext** chain does not include a **VkPipelineCreateFlags2CreateInfoKHR** structure, **flags** must be a valid combination of **VkPipelineCreateFlagBits** values.

- **VUID-VkRayTracingPipelineCreateInfoNV-flags-07984**
  If **flags** contains the **VK_PIPELINE_CREATE_DERIVATIVE_BIT** flag, and **basePipelineIndex** is -1, **basePipelineHandle** must be a valid ray tracing **VkPipeline** handle.

- **VUID-VkRayTracingPipelineCreateInfoNV-flags-07985**
  If **flags** contains the **VK_PIPELINE_CREATE_DERIVATIVE_BIT** flag, and **basePipelineHandle** is **VK_NULL_HANDLE**, **basePipelineIndex** must be a valid index into the calling command’s **pCreateInfos** parameter.

- **VUID-VkRayTracingPipelineCreateInfoNV-flags-07986**
  If **flags** contains the **VK_PIPELINE_CREATE_DERIVATIVE_BIT** flag, **basePipelineIndex** must be -1 or **basePipelineHandle** must be **VK_NULL_HANDLE**.

- **VUID-VkRayTracingPipelineCreateInfoNV-layout-07987**
  If a push constant block is declared in a shader, a push constant range in **layout** must match the shader stage.

- **VUID-VkRayTracingPipelineCreateInfoNV-layout-10069**
  If a push constant block is declared in a shader, the block must be contained inside the push constant range in **layout** that matches the stage.

- **VUID-VkRayTracingPipelineCreateInfoNV-layout-07988**
  If a **resource variables** is declared in a shader, a descriptor slot in **layout** must match the shader stage.

- **VUID-VkRayTracingPipelineCreateInfoNV-layout-07990**
  If a **resource variables** is declared in a shader, and the descriptor type is not **VK_DESCRIPTOR_TYPE_MUTABLE_EXT**, a descriptor slot in **layout** must match the descriptor type.

- **VUID-VkRayTracingPipelineCreateInfoNV-layout-07991**
  If a **resource variables** is declared in a shader as an array, a descriptor slot in **layout** must match the descriptor count.
The shader code for the entry points identified by `pStages`, and the rest of the state identified by this structure must adhere to the pipeline linking rules described in the Shader Interfaces chapter.

The number of resources in `layout` accessible to each shader stage that is used by the pipeline must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageResources`.

If the `pipelineCreationCacheControl` feature is not enabled, flags must not include `VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT` or `VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT`.

The `stage` member of at least one element of `pStages` must be `VK_SHADER_STAGE_RAYGEN_BIT_KHR`.

Flags must not include both `VK_PIPELINE_CREATE_DEFER_COMPILE_BIT_NV` and either `VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV` or `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR`.

The stage of at least one element of `pStages` must be `VK_SHADER_STAGE_RAYGEN_BIT_KHR`.

Flags must not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR`.

Flags must not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`.

Flags must not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR`.

Flags must not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`.

Flags must not include `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR`.

Flags must not include `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR`.

Flags must not include `VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR`.

Flags must not include `VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV`.

Flags must not include both `VK_PIPELINE_CREATE_DEFER_COMPILE_BIT_NV` and
VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT at the same time

- VUID-VkRayTracingPipelineCreateInfoNV-pipelineStageCreationFeedbackCount-06651
  If VkPipelineCreationFeedbackCreateInfo::pipelineStageCreationFeedbackCount is not 0, it must be equal to stageCount

- VUID-VkRayTracingPipelineCreateInfoNV-stage-06898
  The stage value in all pStages elements must be one of VK_SHADER_STAGE_RAYGEN_BIT_KHR, VK_SHADER_STAGE_ANY_HIT_BIT_KHR, VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR, VK_SHADER_STAGE_MISS_BIT_KHR, VK_SHADER_STAGE_INTERSECTION_BIT_KHR, or VK_SHADER_STAGE_CALLABLE_BIT_KHR

- VUID-VkRayTracingPipelineCreateInfoNV-flags-07402
  flags must not include VK_PIPELINE_CREATE_RAY_TRACING_OPACITY_MICROMAP_BIT_EXT

- VUID-VkRayTracingPipelineCreateInfoNV-flags-07998
  flags must not include VK_PIPELINE_CREATE_RAY_TRACING_DISPLACEMENT_MICROMAP_BIT_NV

Valid Usage (Implicit)

- VUID-VkRayTracingPipelineCreateInfoNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_RAY_TRACING_PIPELINE_CREATE_INFO_NV

- VUID-VkRayTracingPipelineCreateInfoNV-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkPipelineCreateFlags2CreateInfoKHR or VkPipelineCreationFeedbackCreateInfo

- VUID-VkRayTracingPipelineCreateInfoNV-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkRayTracingPipelineCreateInfoNV-pStages-parameter
  pStages must be a valid pointer to an array of stageCount valid VkPipelineShaderStageCreateInfo structures

- VUID-VkRayTracingPipelineCreateInfoNV-pGroups-parameter
  pGroups must be a valid pointer to an array of groupCount valid VkRayTracingShaderGroupCreateInfoNV structures

- VUID-VkRayTracingPipelineCreateInfoNV-layout-parameter
  layout must be a valid VkPipelineLayout handle

- VUID-VkRayTracingPipelineCreateInfoNV-stageCount-arraylength
  stageCount must be greater than 0

- VUID-VkRayTracingPipelineCreateInfoNV-groupCount-arraylength
  groupCount must be greater than 0

- VUID-VkRayTracingPipelineCreateInfoNV-commonparent
  Both of basePipelineHandle, and layout that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

The VkRayTracingPipelineCreateInfoKHR structure is defined as:
typedef struct VkRayTracingPipelineCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCreateFlags flags;
    uint32_t stageCount;
    const VkPipelineShaderStageCreateInfo* pStages;
    uint32_t groupCount;
    const VkRayTracingShaderGroupCreateInfoKHR* pGroups;
    uint32_t maxPipelineRayRecursionDepth;
    const VkPipelineLibraryCreateInfoKHR* pLibraryInfo;
    const VkRayTracingPipelineInterfaceCreateInfoKHR* pLibraryInterface;
    const VkPipelineDynamicStateCreateInfo* pDynamicState;
    VkPipelineLayout layout;
    VkPipeline basePipelineHandle;
    int32_t basePipelineIndex;
} VkRayTracingPipelineCreateInfoKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is a bitmask of `VkPipelineCreateFlagBits` specifying how the pipeline will be generated.
- **stageCount** is the number of entries in the **pStages** array.
- **pStages** is a pointer to an array of **stageCount** `VkPipelineShaderStageCreateInfo` structures describing the set of the shader stages to be included in the ray tracing pipeline.
- **groupCount** is the number of entries in the **pGroups** array.
- **pGroups** is a pointer to an array of **groupCount** `VkRayTracingShaderGroupCreateInfoKHR` structures describing the set of the shader stages to be included in each shader group in the ray tracing pipeline.
- **maxPipelineRayRecursionDepth** is the maximum recursion depth of shaders executed by this pipeline.
- **pLibraryInfo** is a pointer to a `VkPipelineLibraryCreateInfoKHR` structure defining pipeline libraries to include.
- **pLibraryInterface** is a pointer to a `VkRayTracingPipelineInterfaceCreateInfoKHR` structure defining additional information when using pipeline libraries.
- **pDynamicState** is a pointer to a `VkPipelineDynamicStateCreateInfo` structure, and is used to indicate which properties of the pipeline state object are dynamic and can be changed independently of the pipeline state. This can be `NULL`, which means no state in the pipeline is considered dynamic.
- **layout** is the description of binding locations used by both the pipeline and descriptor sets used with the pipeline.
- **basePipelineHandle** is a pipeline to derive from.
- **basePipelineIndex** is an index into the **pCreateInfos** parameter to use as a pipeline to derive from.
The parameters `basePipelineHandle` and `basePipelineIndex` are described in more detail in Pipeline Derivatives.

When `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR` is specified, this pipeline defines a pipeline library which cannot be bound as a ray tracing pipeline directly. Instead, pipeline libraries define common shaders and shader groups which can be included in future pipeline creation.

If pipeline libraries are included in `LibraryInfo`, shaders defined in those libraries are treated as if they were defined as additional entries in `pStages`, appended in the order they appear in the `pLibraries` array and in the `pStages` array when those libraries were defined.

When referencing shader groups in order to obtain a shader group handle, groups defined in those libraries are treated as if they were defined as additional entries in `pGroups`, appended in the order they appear in the `pLibraries` array and in the `pGroups` array when those libraries were defined. The shaders these groups reference are set when the pipeline library is created, referencing those specified in the pipeline library, not in the pipeline that includes it.

The default stack size for a pipeline if `VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR` is not provided is computed as described in Ray Tracing Pipeline Stack.

If the `pNext` chain includes a `VkPipelineCreateFlags2CreateInfoKHR` structure, `VkPipelineCreateFlags2CreateInfoKHR::flags` from that structure is used instead of `flags` from this structure.

### Valid Usage

- **VUID-VkRayTracingPipelineCreateInfoKHR-None-09497**
  If the `pNext` chain does not include a `VkPipelineCreateFlags2CreateInfoKHR` structure, `flags` must be a valid combination of ` VkPipelineCreateFlagBits` values

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-07984**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineIndex` is -1, `basePipelineHandle` must be a valid ray tracing `VkPipeline` handle

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-07985**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineHandle` is `VK_NULL_HANDLE`, `basePipelineIndex` must be a valid index into the calling command's `pCreateInfos` parameter

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-07986**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, `basePipelineIndex` must be -1 or `basePipelineHandle` must be `VK_NULL_HANDLE`

- **VUID-VkRayTracingPipelineCreateInfoKHR-layout-07987**
  If a push constant block is declared in a shader, a push constant range in `layout` must match the shader stage

- **VUID-VkRayTracingPipelineCreateInfoKHR-layout-10069**
  If a push constant block is declared in a shader, the block must be contained inside the push constant range in `layout` that matches the stage

- **VUID-VkRayTracingPipelineCreateInfoKHR-layout-07988**

822
If a **resource variables** is declared in a shader, a descriptor slot in **layout** must match the shader stage

- VUID-VkRayTracingPipelineCreateInfoKHR-layout-07990
  If a **resource variables** is declared in a shader, and the descriptor type is not **VK_DESCRIPTOR_TYPE_MUTABLE_EXT**, a descriptor slot in **layout** must match the descriptor type

- VUID-VkRayTracingPipelineCreateInfoKHR-layout-07991
  If a **resource variables** is declared in a shader as an array, a descriptor slot in **layout** must match the descriptor count

- VUID-VkRayTracingPipelineCreateInfoKHR-pStages-03426
  The shader code for the entry points identified by **pStages**, and the rest of the state identified by this structure must adhere to the pipeline linking rules described in the **Shader Interfaces** chapter

- VUID-VkRayTracingPipelineCreateInfoKHR-layout-03428
  The number of resources in **layout** accessible to each shader stage that is used by the pipeline must be less than or equal to **VkPhysicalDeviceLimits::maxPerStageResources**

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-02904
  flags must not include **VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV**

- VUID-VkRayTracingPipelineCreateInfoKHR-pipelineCreationCacheControl-02905
  If the **pipelineCreationCacheControl** feature is not enabled, flags must not include **VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT** or **VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT**

- VUID-VkRayTracingPipelineCreateInfoKHR-stage-03425
  If **flags** does not include **VK_PIPELINE_CREATE_LIBRARY_BIT_KHR**, the stage member of at least one element of **pStages**, including those implicitly added by **pLibraryInfo**, must be **VK_SHADER_STAGE_RAYGEN_BIT_KHR**

- VUID-VkRayTracingPipelineCreateInfoKHR-maxPipelineRayRecursionDepth-03589
  **maxPipelineRayRecursionDepth** must be less than or equal to **VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxRayRecursionDepth**

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-03465
  If **flags** includes **VK_PIPELINE_CREATE_LIBRARY_BIT_KHR**, **pLibraryInterface** must not be **NULL**

- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-03590
  If **pLibraryInfo** is not **NULL** and its **libraryCount** member is greater than 0, **pLibraryInterface** must not be **NULL**

- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraries-03591
  Each element of **pLibraryInfo->pLibraries** must have been created with the value of **maxPipelineRayRecursionDepth** equal to that in this pipeline

- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-03592
  If **pLibraryInfo** is not **NULL**, each element of its **pLibraries** member must have been created with a **layout** that is compatible with the **layout** in this pipeline

- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-03593
  If **pLibraryInfo** is not **NULL**, each element of its **pLibraries** member must have been created
with values of the `maxPipelineRayPayloadSize` and `maxPipelineRayHitAttributeSize` members of `pLibraryInterface` equal to those in this pipeline

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-03594**
  If `flags` includes `VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR`, each element of `pLibraryInfo->pLibraries` must have been created with the `VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR` bit set

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-04718**
  If `flags` includes `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR`, each element of `pLibraryInfo->pLibraries` must have been created with the `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR` bit set

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-04719**
  If `flags` includes `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR`, each element of `pLibraryInfo->pLibraries` must have been created with the `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR` bit set

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-04720**
  If `flags` includes `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR`, each element of `pLibraryInfo->pLibraries` must have been created with the `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR` bit set

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-04721**
  If `flags` includes `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`, each element of `pLibraryInfo->pLibraries` must have been created with the `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR` bit set

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-04722**
  If `flags` includes `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`, each element of `pLibraryInfo->pLibraries` must have been created with the `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR` bit set

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-04723**
  If `flags` includes `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR`, each element of `pLibraryInfo->pLibraries` must have been created with the `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR` bit set

- **VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-03595**
  If the `VK_KHR_pipeline_library` extension is not enabled, `pLibraryInfo` and `pLibraryInterface` must be `NULL`

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-03470**
  If `flags` includes `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR`, for any element of `pGroups` with a type of `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR` or `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR`, the `anyHitShader` of that element must not be `VK_SHADER_UNUSED_KHR`

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-03471**
  If `flags` includes `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`, for any element of `pGroups` with a type of `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR` or `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR`, the `closestHitShader` of that element must not be `VK_SHADER_UNUSED_KHR`
VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR, the closestHitShader of that element must not be VK_SHADER_UNUSED_KHR

- VUID-VkRayTracingPipelineCreateInfoKHR-rayTraversalPrimitiveCulling-03596
  If the rayTraversalPrimitiveCulling feature is not enabled, flags must not include VK_PIPELINE_CREATERAY_TRACING_SKIP_AABBS_BIT_KHR

- VUID-VkRayTracingPipelineCreateInfoKHR-rayTraversalPrimitiveCulling-03597
  If the rayTraversalPrimitiveCulling feature is not enabled, flags must not include VK_PIPELINE_CREATERAY_TRACING_SKIP_TRIANGLES_BIT_KHR

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-06546
  flags must not include both VK_PIPELINE_CREATERAY_TRACING_SKIP_TRIANGLES_BIT_KHR and VK_PIPELINE_CREATERAY_TRACING_SKIP_AABBS_BIT_KHR

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-03598
  If flags includes VK_PIPELINE_CREATERAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR, rayTracingPipelineShaderGroupHandleCaptureReplay must be enabled

- VUID-VkRayTracingPipelineCreateInfoKHR-rayTracingPipelineShaderGroupHandleCaptureReplay-03599
  If VkPhysicalDeviceRayTracingPipelineFeaturesKHR::rayTracingPipelineShaderGroupHandleCaptureReplay is VK_TRUE and the pShaderGroupCaptureReplayHandle member of any element of pGroups is not NULL, flags must include VK_PIPELINE_CREATERAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR

- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-07999
  If pLibraryInfo is NULL or its libraryCount is 0, stageCount must not be 0

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-08700
  If flags does not include VK_PIPELINE_CREATE_LIBRARY_BIT_KHR and either pLibraryInfo is NULL or its libraryCount is 0, groupCount must not be 0

- VUID-VkRayTracingPipelineCreateInfoKHR-pDynamicStates-03602
  Any element of the pDynamicStates member of pDynamicState must be VK_DYNAMIC_STATERAY_TRACING_PIPELINE_STACK_SIZE_KHR

- VUID-VkRayTracingPipelineCreateInfoKHR-pipelineStageCreationFeedbackCount-06652
  If VkPipelineCreationFeedbackCreateInfo::pipelineStageCreationFeedbackCount is not 0, it must be equal to stageCount

- VUID-VkRayTracingPipelineCreateInfoKHR-stage-06899
  The stage value in all pStages elements must be one of VK_SHADER_STAGE_RAYGEN_BIT_KHR, VK_SHADER_STAGE_ANY_HIT_BIT_KHR, VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR, VK_SHADER_STAGE_MISS_BIT_KHR, VK_SHADER_STAGE_INTERSECTION_BIT_KHR, or VK_SHADER_STAGE_CALLABLE_BIT_KHR

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-07403
  If flags includes VK_PIPELINE_CREATERAY_TRACING_OPACITY_MICROMAP_BIT_EXT, each element of pLibraryInfo->pLibraries must have been created with the VK_PIPELINE_CREATERAY_TRACING_OPACITY_MICROMAP_BIT_EXT bit set

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-08701
If flags includes VK_PIPELINE_CREATE_RAY_TRACING_DISPLACEMENT_MICROMAP_BIT_NV, each element of pLibraryInfo->pLibraries must have been created with the VK_PIPELINE_CREATE_RAY_TRACING_DISPLACEMENT_MICROMAP_BIT_NV bit set.

### Valid Usage (Implicit)

- **VUID-VkRayTracingPipelineCreateInfoKHR-sType-sType**
  - The sType must be VK_STRUCTURE_TYPE_RAY_TRACING_PIPELINE_CREATE_INFO_KHR.

- **VUID-VkRayTracingPipelineCreateInfoKHR-pNext-pNext**
  - Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkPipelineCreateFlags2CreateInfoKHR, VkPipelineCreationFeedbackCreateInfo, or VkPipelineRobustnessCreateInfoEXT.

- **VUID-VkRayTracingPipelineCreateInfoKHR-sType-unique**
  - The sType value of each struct in the pNext chain must be unique.

- **VUID-VkRayTracingPipelineCreateInfoKHR-pStages-parameter**
  - If stageCount is not 0, pStages must be a valid pointer to an array of stageCount valid VkPipelineShaderStageCreateInfo structures.

- **VUID-VkRayTracingPipelineCreateInfoKHR-pGroups-parameter**
  - If groupCount is not 0, pGroups must be a valid pointer to an array of groupCount valid VkRayTracingShaderGroupCreateInfoKHR structures.

- **VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-parameter**
  - If pLibraryInfo is not NULL, pLibraryInfo must be a valid pointer to a valid VkPipelineLibraryCreateInfoKHR structure.

- **VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInterface-parameter**
  - If pLibraryInterface is not NULL, pLibraryInterface must be a valid pointer to a valid VkRayTracingPipelineInterfaceCreateInfoKHR structure.

- **VUID-VkRayTracingPipelineCreateInfoKHR-pDynamicState-parameter**
  - If pDynamicState is not NULL, pDynamicState must be a valid pointer to a valid VkPipelineDynamicStateCreateInfo structure.

- **VUID-VkRayTracingPipelineCreateInfoKHR-layout-parameter**
  - layout must be a valid VkPipelineLayout handle.

- **VUID-VkRayTracingPipelineCreateInfoKHR-commonparent**
  - Both of basePipelineHandle, and layout that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice.

The VkRayTracingShaderGroupCreateInfoNV structure is defined as:
// Provided by VK_NV_ray_tracing
typedef struct VkRayTracingShaderGroupCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkRayTracingShaderGroupTypeKHR type;
    uint32_t generalShader;
    uint32_t closestHitShader;
    uint32_t anyHitShader;
    uint32_t intersectionShader;
} VkRayTracingShaderGroupCreateInfoNV;

• **sType** is a VkStructureType value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **type** is the type of hit group specified in this structure.

  • **generalShader** is the index of the ray generation, miss, or callable shader from VkRayTracingPipelineCreateInfoNV::pStages in the group if the shader group has type of VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_NV, and VK_SHADER_UNUSED_NV otherwise.

  • **closestHitShader** is the optional index of the closest hit shader from VkRayTracingPipelineCreateInfoNV::pStages in the group if the shader group has type of VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_NV or VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_NV, and VK_SHADER_UNUSED_NV otherwise.

  • **anyHitShader** is the optional index of the any-hit shader from VkRayTracingPipelineCreateInfoNV::pStages in the group if the shader group has type of VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_NV or VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_NV, and VK_SHADER_UNUSED_NV otherwise.

  • **intersectionShader** is the index of the intersection shader from VkRayTracingPipelineCreateInfoNV::pStages in the group if the shader group has type of VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_NV, and VK_SHADER_UNUSED_NV otherwise.

**Valid Usage**

• VUID-VkRayTracingShaderGroupCreateInfoNV-type-02413
  If **type** is VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_NV then **generalShader** must be a valid index into VkRayTracingPipelineCreateInfoNV::pStages referring to a shader of VK_SHADER_STAGE_RAYGEN_BIT_NV, VK_SHADER_STAGE_MISS_BIT_NV, or VK_SHADER_STAGE_CALLABLE_BIT_NV

• VUID-VkRayTracingShaderGroupCreateInfoNV-type-02414
  If **type** is VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_NV then **closestHitShader**, **anyHitShader**, and **intersectionShader** must be VK_SHADER_UNUSED_NV

• VUID-VkRayTracingShaderGroupCreateInfoNV-type-02415
  If **type** is VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_NV then **intersectionShader** must be a valid index into VkRayTracingPipelineCreateInfoNV::pStages referring to a shader of VK_SHADER_STAGE_INTERSECTION_BIT_NV
If `type` is `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_NV` then `intersectionShader` must be `VK_SHADER_UNUSED_NV`.

`closestHitShader` must be either `VK_SHADER_UNUSED_NV` or a valid index into `VkRayTracingPipelineCreateInfoNV::pStages` referring to a shader of `VK_SHADER_STAGE_CLOSEST_HIT_BIT_NV`.

`anyHitShader` must be either `VK_SHADER_UNUSED_NV` or a valid index into `VkRayTracingPipelineCreateInfoNV::pStages` referring to a shader of `VK_SHADER_STAGE_ANY_HIT_BIT_NV`.

Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_RAY_TRACING_SHADER_GROUP_CREATE_INFO_NV`.
- `pNext` must be `NULL`.
- `type` must be a valid `VkRayTracingShaderGroupTypeKHR` value.

---

The `VkRayTracingShaderGroupCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_ray_tracing_pipeline
typedef struct VkRayTracingShaderGroupCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkRayTracingShaderGroupTypeKHR type;
    uint32_t generalShader;
    uint32_t closestHitShader;
    uint32_t anyHitShader;
    uint32_t intersectionShader;
    const void* pShaderGroupCaptureReplayHandle;
} VkRayTracingShaderGroupCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `type` is the type of hit group specified in this structure.
- `generalShader` is the index of the ray generation, miss, or callable shader from `VkRayTracingPipelineCreateInfoKHR::pStages` in the group if the shader group has `type` of `VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR`, and `VK_SHADER_UNUSED_KHR` otherwise.
- `closestHitShader` is the optional index of the closest hit shader from `VkRayTracingPipelineCreateInfoKHR::pStages` in the group if the shader group has `type` of `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_NV`, and `VK_SHADER_UNUSED_KHR` otherwise.
- `anyHitShader` is the optional index of the any hit shader from `VkRayTracingPipelineCreateInfoKHR::pStages` in the group if the shader group has `type` of `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_NV`, and `VK_SHADER_UNUSED_KHR` otherwise.
- `intersectionShader` is the index of the intersection shader from `VkRayTracingPipelineCreateInfoKHR::pStages` in the group if the shader group has `type` of `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_NV`, and `VK_SHADER_UNUSED_KHR` otherwise.
- `pShaderGroupCaptureReplayHandle` is a pointer to the capture replay handle for the shader group.
VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR or VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR, and VK_SHADER_UNUSED_KHR otherwise.

- **anyHitShader** is the optional index of the any-hit shader from VkRayTracingPipelineCreateInfoKHR::pStages in the group if the shader group has type of VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR or VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR, and VK_SHADER_UNUSED_KHR otherwise.

- **intersectionShader** is the index of the intersection shader from VkRayTracingPipelineCreateInfoKHR::pStages in the group if the shader group has type of VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR, and VK_SHADER_UNUSED_KHR otherwise.

- **pShaderGroupCaptureReplayHandle** is NULL or a pointer to replay information for this shader group queried from vkGetRayTracingCaptureReplayShaderGroupHandlesKHR, as described in Ray Tracing Capture Replay. Ignored if VkPhysicalDeviceRayTracingPipelineFeaturesKHR::rayTracingPipelineShaderGroupHandleCaptureReplay is VK_FALSE.

If the pipeline is created with VK_PIPELINE_CREATE_LIBRARY_BIT_KHR and the pipelineLibraryGroupHandles feature is enabled, pShaderGroupCaptureReplayHandle is inherited by all pipelines which link against this pipeline and remains bitwise identical for any pipeline which references this pipeline library.

---

**Valid Usage**

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-type-03474**
  If type is VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR then generalShader must be a valid index into VkRayTracingPipelineCreateInfoKHR::pStages referring to a shader of VK_SHADER_STAGE_RAYGEN_BIT_KHR, VK_SHADER_STAGE_MISS_BIT_KHR, or VK_SHADER_STAGE_CALLABLE_BIT_KHR

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-type-03475**
  If type is VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR then closestHitShader, anyHitShader, and intersectionShader must be VK_SHADER_UNUSED_KHR

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-type-03476**
  If type is VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR then intersectionShader must be a valid index into VkRayTracingPipelineCreateInfoKHR::pStages referring to a shader of VK_SHADER_STAGE_INTERSECTION_BIT_KHR

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-type-03477**
  If type is VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR then intersectionShader must be VK_SHADER_UNUSED_KHR

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-closestHitShader-03478**
  closestHitShader must be either VK_SHADER_UNUSED_KHR or a valid index into VkRayTracingPipelineCreateInfoKHR::pStages referring to a shader of VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-anyHitShader-03479**
anyHitShader must be either VK_SHADER_UNUSED_KHR or a valid index into 
VkRayTracingPipelineCreateInfoKHR::pStages referring to a shader of 
VK_SHADER_STAGE_ANY_HIT_BIT_KHR

• VUID-VkRayTracingShaderGroupCreateInfoKHR- 
rayTracingPipelineShaderGroupHandleCaptureReplayMixed-03603
  If VkPhysicalDeviceRayTracingPipelineFeaturesKHR:: 
rayTracingPipelineShaderGroupHandleCaptureReplayMixed is VK_FALSE then 
pShaderGroupCaptureReplayHandle must not be provided if it has not been provided on a 
previous call to ray tracing pipeline creation

• VUID-VkRayTracingShaderGroupCreateInfoKHR- 
rayTracingPipelineShaderGroupHandleCaptureReplayMixed-03604
  If VkPhysicalDeviceRayTracingPipelineFeaturesKHR:: 
rayTracingPipelineShaderGroupHandleCaptureReplayMixed is VK_FALSE then the caller must 
guarantee that no ray tracing pipeline creation commands with 
pShaderGroupCaptureReplayHandle provided execute simultaneously with ray tracing 
pipeline creation commands without pShaderGroupCaptureReplayHandle provided

Valid Usage (Implicit)

• VUID-VkRayTracingShaderGroupCreateInfoKHR-sType-sType 
sType must be VK_STRUCTURE_TYPE_RAY_TRACING_SHADER_GROUP_CREATE_INFO_KHR

• VUID-VkRayTracingShaderGroupCreateInfoKHR-pNext-pNext 
pNext must be NULL

• VUID-VkRayTracingShaderGroupCreateInfoKHR-type-parameter 
type must be a valid VkRayTracingShaderGroupTypeKHR value

Possible values of type in VkRayTracingShaderGroupCreateInfoKHR are:

    // Provided by VK_KHR_ray_tracing_pipeline
    typedef enum VkRayTracingShaderGroupTypeKHR {
        VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR = 0,
        VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR = 1,
        VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR = 2,
    // Provided by VK_NV_ray_tracing
        VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_NV =
        VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR,
    // Provided by VK_NV_ray_tracing
        VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_NV =
        VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR,
    // Provided by VK_NV_ray_tracing
        VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_NV =
        VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR,
    } VkRayTracingShaderGroupTypeKHR;

or the equivalent
typedef VkRayTracingShaderGroupTypeKHR VkRayTracingShaderGroupTypeNV;

- **VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR** indicates a shader group with a single
  VK_SHADER_STAGE_RAYGEN_BIT_KHR, VK_SHADER_STAGE_MISS_BIT_KHR, or
  VK_SHADER_STAGE_CALLABLE_BIT_KHR shader in it.
- **VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR** specifies a shader group that only
  hits triangles and must not contain an intersection shader, only closest hit and any-hit shaders.
- **VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR** specifies a shader group that only
  intersects with custom geometry and must contain an intersection shader and may contain
  closest hit and any-hit shaders.

**NOTE**

For current group types, the hit group type could be inferred from the presence or
absence of the intersection shader, but we provide the type explicitly for future hit
groups that do not have that property.

The **VkRayTracingPipelineInterfaceCreateInfoKHR** structure is defined as:

```c
typedef struct VkRayTracingPipelineInterfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t maxPipelineRayPayloadSize;
    uint32_t maxPipelineRayHitAttributeSize;
} VkRayTracingPipelineInterfaceCreateInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **maxPipelineRayPayloadSize** is the maximum payload size in bytes used by any shader in the
  pipeline.
- **maxPipelineRayHitAttributeSize** is the maximum attribute structure size in bytes used by any
  shader in the pipeline.

**maxPipelineRayPayloadSize** is calculated as the maximum number of bytes used by any block
declared in the RayPayloadKHR or IncomingRayPayloadKHR storage classes.
**maxPipelineRayHitAttributeSize** is calculated as the maximum number of bytes used by any block
declared in the HitAttributeKHR storage class. As variables in these storage classes do not have
explicit offsets, the size should be calculated as if each variable has a scalar alignment equal to the
largest scalar alignment of any of the block’s members.

**NOTE**

There is no explicit upper limit for **maxPipelineRayPayloadSize**, but in practice it
should be kept as small as possible. Similar to invocation local memory, it must be
allocated for each shader invocation and for devices which support many
simultaneous invocations, this storage can rapidly be exhausted, resulting in
Valid Usage

- VUID-VkRayTracingPipelineInterfaceCreateInfoKHR-maxPipelineRayHitAttributeSize-03605
  maxPipelineRayHitAttributeSize must be less than or equal to
  VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxRayHitAttributeSize

Valid Usage (Implicit)

- VUID-VkRayTracingPipelineInterfaceCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_RAY_TRACING_PIPELINE_INTERFACE_CREATE_INFO_KHR

- VUID-VkRayTracingPipelineInterfaceCreateInfoKHR-pNext-pNext
  pNext must be NULL

To query the opaque handles of shaders in the ray tracing pipeline, call:

```c
// Provided by VK_KHR_ray_tracing_pipeline
VkResult vkGetRayTracingShaderGroupHandlesKHR(
    VkDevice device,
    VkPipeline pipeline,
    uint32_t firstGroup,
    uint32_t groupCount,
    size_t dataSize,
    void* pData);
```

or the equivalent command

```c
// Provided by VK_NV_ray_tracing
VkResult vkGetRayTracingShaderGroupHandlesNV(
    VkDevice device,
    VkPipeline pipeline,
    uint32_t firstGroup,
    uint32_t groupCount,
    size_t dataSize,
    void* pData);
```

- device is the logical device containing the ray tracing pipeline.
- pipeline is the ray tracing pipeline object containing the shaders.
- firstGroup is the index of the first group to retrieve a handle for from the
  VkRayTracingPipelineCreateInfoKHR::pGroups or VkRayTracingPipelineCreateInfoNV::pGroups
  array.
• `groupCount` is the number of shader handles to retrieve.

• `dataSize` is the size in bytes of the buffer pointed to by `pData`.

• `pData` is a pointer to an application-allocated buffer where the results will be written.

On success, an array of `groupCount` shader handles will be written to `pData`, with each element being of size `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleSize`.

If `pipeline` was created with `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR` and the `pipelineLibraryGroupHandles` feature is enabled applications can query group handles from that pipeline, even if the pipeline is a library and is never bound to a command buffer. These group handles remain bitwise identical for any `pipeline` which references the pipeline library. Group indices are assigned as-if the pipeline was created without `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR`.

### Valid Usage

- VUID-vkGetRayTracingShaderGroupHandlesKHR-pipeline-04619
  - `pipeline` must be a ray tracing pipeline

- VUID-vkGetRayTracingShaderGroupHandlesKHR-firstGroup-04050
  - `firstGroup` must be less than the number of shader groups in `pipeline`

- VUID-vkGetRayTracingShaderGroupHandlesKHR-firstGroup-02419
  - The sum of `firstGroup` and `groupCount` must be less than or equal to the number of shader groups in `pipeline`

- VUID-vkGetRayTracingShaderGroupHandlesKHR-dataSize-02420
  - `dataSize` must be at least `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleSize` × `groupCount`

- VUID-vkGetRayTracingShaderGroupHandlesKHR-pipeline-07828
  - If the `pipelineLibraryGroupHandles` feature is not enabled, `pipeline` must not have been created with `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR`

### Valid Usage (Implicit)

- VUID-vkGetRayTracingShaderGroupHandlesKHR-device-parameter
  - `device` must be a valid `VkDevice` handle

- VUID-vkGetRayTracingShaderGroupHandlesKHR-pipeline-parameter
  - `pipeline` must be a valid `VkPipeline` handle

- VUID-vkGetRayTracingShaderGroupHandlesKHR-pData-parameter
  - `pData` must be a valid pointer to an array of `dataSize` bytes

- VUID-vkGetRayTracingShaderGroupHandlesKHR-dataSize-arraylength
  - `dataSize` must be greater than 0

- VUID-vkGetRayTracingShaderGroupHandlesKHR-pipeline-parent
  - `pipeline` must have been created, allocated, or retrieved from `device`
Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To query the opaque capture data of shader groups in a ray tracing pipeline, call:

```c
// Provided by VK_KHR_ray_tracing_pipeline
VkResult vkGetRayTracingCaptureReplayShaderGroupHandlesKHR(
    VkDevice device,
    VkPipeline pipeline,
    uint32_t firstGroup,
    uint32_t groupCount,
    size_t dataSize,
    void* pData);
```

- `device` is the logical device containing the ray tracing pipeline.
- `pipeline` is the ray tracing pipeline object containing the shaders.
- `firstGroup` is the index of the first group to retrieve a handle for from the `VkRayTracingPipelineCreateInfoKHR::pGroups` array.
- `groupCount` is the number of shader handles to retrieve.
- `dataSize` is the size in bytes of the buffer pointed to by `pData`.
- `pData` is a pointer to an application-allocated buffer where the results will be written.

On success, an array of `groupCount` shader handles will be written to `pData`, with each element being of size `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleCaptureReplaySize`.

Once queried, this opaque data can be provided at pipeline creation time (in a subsequent execution), using `VkRayTracingShaderGroupCreateInfoKHR::pShaderGroupCaptureReplayHandle`, as described in Ray Tracing Capture Replay.

If `pipeline` was created with `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR` and the `pipelineLibraryGroupHandles` feature is enabled applications can query capture replay group handles from that pipeline. The capture replay handle remains bitwise identical for any `pipeline` which references the pipeline library. Group indices are assigned as-if the pipeline was created without `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR`.

Valid Usage

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pipeline-04620
pipeline must be a ray tracing pipeline

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-firstGroup-04051
  firstGroup must be less than the number of shader groups in pipeline

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-firstGroup-03483
  The sum of firstGroup and groupCount must be less than or equal to the number of shader groups in pipeline

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-dataSize-03484
  dataSize must be at least VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleCaptureReplaySize × groupCount

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-rayTracingPipelineShaderGroupHandleCaptureReplay-03606
  VkPhysicalDeviceRayTracingPipelineFeaturesKHR::rayTracingPipelineShaderGroupHandleCaptureReplay must be enabled to call this function

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pipeline-03607
  pipeline must have been created with a flags that included VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pipeline-07829
  If the pipelineLibraryGroupHandles feature is not enabled, pipeline must not have been created with VK_PIPELINE_CREATE_LIBRARY_BIT_KHR

Valid Usage (Implicit)

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pipeline-parameter
  pipeline must be a valid VkPipeline handle

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pData-parameter
  pData must be a valid pointer to an array of dataSize bytes

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-dataSize-arraylength
  dataSize must be greater than 0

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pipeline-parent
  pipeline must have been created, allocated, or retrieved from device

Return Codes

Success
  - VK_SUCCESS

Failure
  - VK_ERROR_OUT_OF_HOST_MEMORY
  - VK_ERROR_OUT_OF_DEVICE_MEMORY
Ray tracing pipelines can contain more shaders than a graphics or compute pipeline, so to allow parallel compilation of shaders within a pipeline, an application can choose to defer compilation until a later point in time.

To compile a deferred shader in a pipeline call:

```c
// Provided by VK_NV_ray_tracing
VkResult vkCompileDeferredNV(
    VkDevice device,
    VkPipeline pipeline,
    uint32_t shader);
```

- `device` is the logical device containing the ray tracing pipeline.
- `pipeline` is the ray tracing pipeline object containing the shaders.
- `shader` is the index of the shader to compile.

### Valid Usage

- VUID-vkCompileDeferredNV-pipeline-04621
  `pipeline` must be a ray tracing pipeline
- VUID-vkCompileDeferredNV-pipeline-02237
  `pipeline` must have been created with `VK_PIPELINE_CREATE_DEFER_COMPILE_BIT_NV`
- VUID-vkCompileDeferredNV-shader-02238
  `shader` must not have been called as a deferred compile before

### Valid Usage (Implicit)

- VUID-vkCompileDeferredNV-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkCompileDeferredNV-pipeline-parameter
  `pipeline` must be a valid `VkPipeline` handle
- VUID-vkCompileDeferredNV-pipeline-parent
  `pipeline` must have been created, allocated, or retrieved from `device`

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
To query the pipeline stack size of shaders in a shader group in the ray tracing pipeline, call:

```c
// Provided by VK_KHR_ray_tracing_pipeline
VkDeviceSize vkGetRayTracingShaderGroupStackSizeKHR(
    VkDevice device,  // Logical device containing the ray tracing pipeline.
    VkPipeline pipeline,  // Ray tracing pipeline object containing the shader groups.
    uint32_t group,  // Index of the shader group to query.
    VkShaderGroupShaderKHR groupShader);  // Type of shader from the group to query.
```

- `device` is the logical device containing the ray tracing pipeline.
- `pipeline` is the ray tracing pipeline object containing the shader groups.
- `group` is the index of the shader group to query.
- `groupShader` is the type of shader from the group to query.

The return value is the ray tracing pipeline stack size in bytes for the specified shader as called from the specified shader group.

### Valid Usage

- VUID-vkGetRayTracingShaderGroupStackSizeKHR-pipeline-04622
  
  pipeline must be a ray tracing pipeline

- VUID-vkGetRayTracingShaderGroupStackSizeKHR-group-03608
  
  The value of group must be less than the number of shader groups in pipeline

- VUID-vkGetRayTracingShaderGroupStackSizeKHR-groupShader-03609
  
  The shader identified by groupShader in group must not be VK_SHADER_UNUSED_KHR

### Valid Usage (Implicit)

- VUID-vkGetRayTracingShaderGroupStackSizeKHR-device-parameter
  
  device must be a valid VkDevice handle

- VUID-vkGetRayTracingShaderGroupStackSizeKHR-pipeline-parameter
  
  pipeline must be a valid VkPipeline handle

- VUID-vkGetRayTracingShaderGroupStackSizeKHR-groupShader-parameter
  
  groupShader must be a valid VkShaderGroupShaderKHR value

- VUID-vkGetRayTracingShaderGroupStackSizeKHR-pipeline-parent
  
  pipeline must have been created, allocated, or retrieved from device

Possible values of groupShader in vkGetRayTracingShaderGroupStackSizeKHR are:
// Provided by VK_KHR_ray_tracing_pipeline
typedef enum VkShaderGroupShaderKHR {
    VK_SHADER_GROUP_SHADER_GENERAL_KHR = 0,
    VK_SHADER_GROUP_SHADER_CLOSEST_HIT_KHR = 1,
    VK_SHADER_GROUP_SHADER_ANY_HIT_KHR = 2,
    VK_SHADER_GROUP_SHADER_INTERSECTION_KHR = 3,
} VkShaderGroupShaderKHR;

• **VK_SHADER_GROUP_SHADER_GENERAL_KHR** uses the shader specified in the group with
  `VkRayTracingShaderGroupCreateInfoKHR::generalShader`

• **VK_SHADER_GROUP_SHADER_CLOSEST_HIT_KHR** uses the shader specified in the group with
  `VkRayTracingShaderGroupCreateInfoKHR::closestHitShader`

• **VK_SHADER_GROUP_SHADER_ANY_HIT_KHR** uses the shader specified in the group with
  `VkRayTracingShaderGroupCreateInfoKHR::anyHitShader`

• **VK_SHADER_GROUP_SHADER_INTERSECTION_KHR** uses the shader specified in the group with
  `VkRayTracingShaderGroupCreateInfoKHR::IntersectionShader`

To **dynamically set** the stack size for a ray tracing pipeline, call:

```c
// Provided by VK_KHR_ray_tracing_pipeline
void vkCmdSetRayTracingPipelineStackSizeKHR(
    VkCommandBuffer commandBuffer,  // Provided by VK_KHR_ray_tracing_pipeline
    uint32_t pipelineStackSize);
```

• **commandBuffer** is the command buffer into which the command will be recorded.

• **pipelineStackSize** is the stack size to use for subsequent ray tracing trace commands.

This command sets the stack size for subsequent ray tracing commands when the ray tracing pipeline is created with **VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR** set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, the stack size is computed as described in **Ray Tracing Pipeline Stack**.

---

### Valid Usage

• VUID-vkCmdSetRayTracingPipelineStackSizeKHR-pipelineStackSize-03610
  **pipelineStackSize** must be large enough for any dynamic execution through the shaders in the ray tracing pipeline used by a subsequent trace call

---

### Valid Usage (Implicit)

• VUID-vkCmdSetRayTracingPipelineStackSizeKHR-commandBuffer-parameter
  **commandBuffer** must be a valid `VkCommandBuffer` handle

• VUID-vkCmdSetRayTracingPipelineStackSizeKHR-commandBuffer-recording
**commandBuffer** must be in the **recording state**

- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-commandBuffer-cmdpool
  The **VkCommandPool** that **commandBuffer** was allocated from must support compute operations

- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-videocoding
  This command must only be called outside of a video coding scope

**Host Synchronization**

- Host access to **commandBuffer** must be externally synchronized

- Host access to the **VkCommandPool** that **commandBuffer** was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>

</tbody>
</table>

**10.5. Pipeline Destruction**

To destroy a pipeline, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyPipeline(
    VkDevice device,
    VkPipeline pipeline,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the pipeline.
- **pipeline** is the handle of the pipeline to destroy.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

**Valid Usage**

- VUID-vkDestroyPipeline-pipeline-00765
  All submitted commands that refer to **pipeline** must have completed execution
10.6. Pipeline Derivatives

A pipeline derivative is a child pipeline created from a parent pipeline, where the child and parent are expected to have much commonality.

The goal of derivative pipelines is that they be cheaper to create using the parent as a starting point, and that it be more efficient (on either host or device) to switch/bind between children of the same parent.

A derivative pipeline is created by setting the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag in the `Vk*PipelineCreateInfo` structure. If this is set, then exactly one of `basePipelineHandle` or `basePipelineIndex` members of the structure must have a valid handle/index, and specifies the parent pipeline. If `basePipelineHandle` is used, the parent pipeline must have already been created. If `basePipelineIndex` is used, then the parent is being created in the same command. `VK_NULL_HANDLE` acts as the invalid handle for `basePipelineHandle`, and -1 is the invalid index for `basePipelineIndex`. If `basePipelineIndex` is used, the base pipeline must appear earlier in the array. The base pipeline must have been created with the `VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT` flag set.
10.7. Pipeline Cache

Pipeline cache objects allow the result of pipeline construction to be reused between pipelines and between runs of an application. Reuse between pipelines is achieved by passing the same pipeline cache object when creating multiple related pipelines. Reuse across runs of an application is achieved by retrieving pipeline cache contents in one run of an application, saving the contents, and using them to preinitialize a pipeline cache on a subsequent run. The contents of the pipeline cache objects are managed by the implementation. Applications can manage the host memory consumed by a pipeline cache object and control the amount of data retrieved from a pipeline cache object.

Pipeline cache objects are represented by VkPipelineCache handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPipelineCache)
```

10.7.1. Creating a Pipeline Cache

To create pipeline cache objects, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreatePipelineCache(VkDevice device, const VkPipelineCacheCreateInfo* pCreateInfo, const VkAllocationCallbacks* pAllocator, VkPipelineCache* pPipelineCache);
```

- `device` is the logical device that creates the pipeline cache object.
- `pCreateInfo` is a pointer to a VkPipelineCacheCreateInfo structure containing initial parameters for the pipeline cache object.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pPipelineCache` is a pointer to a VkPipelineCache handle in which the resulting pipeline cache object is returned.

**NOTE** Applications can track and manage the total host memory size of a pipeline cache object using the `pAllocator`. Applications can limit the amount of data retrieved from a pipeline cache object in `vkGetPipelineCacheData`. Implementations should not internally limit the total number of entries added to a pipeline cache object or the total host memory consumed.

Once created, a pipeline cache can be passed to the `vkCreateGraphicsPipelines`, `vkCreateRayTracingPipelinesKHR`, `vkCreateRayTracingPipelinesNV`, and `vkCreateComputePipelines` commands. If the pipeline cache passed into these commands is not `VK_NULL_HANDLE`, the implementation will query it for possible reuse opportunities and update it with new content. The use of the pipeline cache object in these commands is internally synchronized, and the same
pipeline cache object can be used in multiple threads simultaneously.

If flags of pCreateInfo includes VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT, all commands that modify the returned pipeline cache object must be externally synchronized.

NOTE: Implementations should make every effort to limit any critical sections to the actual accesses to the cache, which is expected to be significantly shorter than the duration of the vkCreate*Pipelines commands.

Valid Usage (Implicit)

- VUID-vkCreatePipelineCache-device-parameter
device must be a valid VkDevice handle

- VUID-vkCreatePipelineCache-pCreateInfo-parameter
pCreateInfo must be a valid pointer to a valid VkPipelineCacheCreateInfo structure

- VUID-vkCreatePipelineCache-pAllocator-parameter
If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreatePipelineCache-pPipelineCache-parameter
pPipelineCache must be a valid pointer to a VkPipelineCache handle

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkPipelineCacheCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineCacheCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCacheCreateFlags flags;
    size_t initialDataSize;
    const void* pInitialData;
} VkPipelineCacheCreateInfo;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
• **flags** is a bitmask of `VkPipelineCacheCreateFlagBits` specifying the behavior of the pipeline cache.

• **initialDataSize** is the number of bytes in `pInitialData`. If `initialDataSize` is zero, the pipeline cache will initially be empty.

• **pInitialData** is a pointer to previously retrieved pipeline cache data. If the pipeline cache data is incompatible (as defined below) with the device, the pipeline cache will be initially empty. If `initialDataSize` is zero, `pInitialData` is ignored.

---

### Valid Usage

- **VUID-VkPipelineCacheCreateInfo-initialDataSize-00768**
  
  If `initialDataSize` is not 0, it **must** be equal to the size of `pInitialData`, as returned by `vkGetPipelineCacheData` when `pInitialData` was originally retrieved.

- **VUID-VkPipelineCacheCreateInfo-initialDataSize-00769**
  
  If `initialDataSize` is not 0, `pInitialData` **must** have been retrieved from a previous call to `vkGetPipelineCacheData`.

- **VUID-VkPipelineCacheCreateInfo-pipelineCreationCacheControl-02892**
  
  If the `pipelineCreationCacheControl` feature is not enabled, **flags** **must** not include `VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT`.

---

### Valid Usage (Implicit)

- **VUID-VkPipelineCacheCreateInfo-sType-sType**
  
  `sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_CACHE_CREATE_INFO`.

- **VUID-VkPipelineCacheCreateInfo-pNext-pNext**
  
  `pNext` **must** be `NULL`.

- **VUID-VkPipelineCacheCreateInfo-flags-parameter**
  
  **flags** **must** be a valid combination of `VkPipelineCacheCreateFlagBits` values.

- **VUID-VkPipelineCacheCreateInfo-pInitialData-parameter**
  
  If `initialDataSize` is not 0, `pInitialData` **must** be a valid pointer to an array of `initialDataSize` bytes.

---

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineCacheCreateFlags;
```

`VkPipelineCacheCreateFlags` is a bitmask type for setting a mask of zero or more `VkPipelineCacheCreateFlagBits`.

Bits which **can** be set in `VkPipelineCacheCreateInfo::flags`, specifying behavior of the pipeline cache, are:
typedef enum VkPipelineCacheCreateFlagBits {
    // Provided by VK_VERSION_1_3
    VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT = 0x00000001,
    // Provided by VK_EXT_pipeline_creation_cache_control
    VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT_EXT =
    VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT,
} VkPipelineCacheCreateFlagBits;

• **VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT** specifies that all commands that modify the created **VkPipelineCache** will be **externally synchronized**. When set, the implementation may skip any unnecessary processing needed to support simultaneous modification from multiple threads where allowed.

### 10.7.2. Merging Pipeline Caches

Pipeline cache objects can be merged using the command:

```c
// Provided by VK_VERSION_1_0
VkResult vkMergePipelineCaches(
    VkDevice device,                     // Provided by VK_EXT_pipeline_creation_cache_control
    VkPipelineCache dstCache,            // Provided by VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT
    uint32_t srcCacheCount,              // Provided by VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT_EXT
    const VkPipelineCache* pSrcCaches); // Provided by VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT
```

• **device** is the logical device that owns the pipeline cache objects.

• **dstCache** is the handle of the pipeline cache to merge results into.

• **srcCacheCount** is the length of the **pSrcCaches** array.

• **pSrcCaches** is a pointer to an array of pipeline cache handles, which will be merged into **dstCache**. The previous contents of **dstCache** are included after the merge.

**NOTE** The details of the merge operation are implementation-dependent, but implementations should merge the contents of the specified pipelines and prune duplicate entries.

### Valid Usage

• VUID-vkMergePipelineCaches-dstCache-00770
  **dstCache** must not appear in the list of source caches

### Valid Usage (Implicit)

• VUID-vkMergePipelineCaches-device-parameter
  **device** must be a valid **VkDevice** handle
• VUID-vkMergePipelineCaches-dstCache-parameter
dstCache must be a valid VkPipelineCache handle

• VUID-vkMergePipelineCaches-pSrcCaches-parameter
pSrcCaches must be a valid pointer to an array of srcCacheCount valid VkPipelineCache handles

• VUID-vkMergePipelineCaches-srcCacheCount-arraylength
srcCacheCount must be greater than 0

• VUID-vkMergePipelineCaches-dstCache-parent
dstCache must have been created, allocated, or retrieved from device

• VUID-vkMergePipelineCaches-pSrcCaches-parent
Each element of pSrcCaches must have been created, allocated, or retrieved from device

Host Synchronization

• Host access to dstCache must be externally synchronized

Return Codes

Success
  • VK_SUCCESS

Failure
  • VK_ERROR_OUT_OF_HOST_MEMORY
  • VK_ERROR_OUT_OF_DEVICE_MEMORY

10.7.3. Retrieving Pipeline Cache Data

Data can be retrieved from a pipeline cache object using the command:

```c
// Provided by VK_VERSION_1_0
VkResult vkGetPipelineCacheData(
    VkDevice device,
    VkPipelineCache pipelineCache,
    size_t* pDataSize,
    void* pData);
```

• device is the logical device that owns the pipeline cache.

• pipelineCache is the pipeline cache to retrieve data from.

• pDataSize is a pointer to a size_t value related to the amount of data in the pipeline cache, as described below.

• pData is either NULL or a pointer to a buffer.
If `pData` is NULL, then the maximum size of the data that can be retrieved from the pipeline cache, in bytes, is returned in `pDataSize`. Otherwise, `pDataSize` must point to a variable set by the application to the size of the buffer, in bytes, pointed to by `pData`, and on return the variable is overwritten with the amount of data actually written to `pData`. If `pDataSize` is less than the maximum size that can be retrieved by the pipeline cache, at most `pDataSize` bytes will be written to `pData`, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all of the pipeline cache was returned.

Any data written to `pData` is valid and can be provided as the `pInitialData` member of the `VkPipelineCacheCreateInfo` structure passed to `vkCreatePipelineCache`.

Two calls to `vkGetPipelineCacheData` with the same parameters must retrieve the same data unless a command that modifies the contents of the cache is called between them.

The initial bytes written to `pData` must be a header as described in the Pipeline Cache Header section.

If `pDataSize` is less than what is necessary to store this header, nothing will be written to `pData` and zero will be written to `pDataSize`.

---

**Valid Usage (Implicit)**

- VUID-vkGetPipelineCacheData-device-parameter  
  `device` must be a valid `VkDevice` handle

- VUID-vkGetPipelineCacheData-pipelineCache-parameter  
  `pipelineCache` must be a valid `VkPipelineCache` handle

- VUID-vkGetPipelineCacheData-pDataSize-parameter  
  `pDataSize` must be a valid pointer to a `size_t` value

- VUID-vkGetPipelineCacheData-pData-parameter  
  If the value referenced by `pDataSize` is not 0, and `pData` is not NULL, `pData` must be a valid pointer to an array of `pDataSize` bytes

- VUID-vkGetPipelineCacheData-pipelineCache-parent  
  `pipelineCache` must have been created, allocated, or retrieved from `device`

---

**Return Codes**

**Success**

- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
10.7.4. Pipeline Cache Header

Applications can store the data retrieved from the pipeline cache, and use these data, possibly in a future run of the application, to populate new pipeline cache objects. The results of pipeline compiles, however, may depend on the vendor ID, device ID, driver version, and other details of the device. To enable applications to detect when previously retrieved data is incompatible with the device, the pipeline cache data must begin with a valid pipeline cache header.

**NOTE**

Structures described in this section are not part of the Vulkan API and are only used to describe the representation of data elements in pipeline cache data. Accordingly, the valid usage clauses defined for structures defined in this section do not define valid usage conditions for APIs accepting pipeline cache data as input, as providing invalid pipeline cache data as input to any Vulkan API commands will result in the provided pipeline cache data being ignored.

Version one of the pipeline cache header is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineCacheHeaderVersionOne {
    uint32_t headerSize;
    VkPipelineCacheHeaderVersion headerVersion;
    uint32_t vendorID;
    uint32_t deviceID;
    uint8_t pipelineCacheUUID[VK_UUID_SIZE];
} VkPipelineCacheHeaderVersionOne;
```

- **headerSize** is the length in bytes of the pipeline cache header.
- **headerVersion** is a `VkPipelineCacheHeaderVersion` value specifying the version of the header. A consumer of the pipeline cache should use the cache version to interpret the remainder of the cache header.
- **vendorID** is the `VkPhysicalDeviceProperties::vendorID` of the implementation.
- **deviceID** is the `VkPhysicalDeviceProperties::deviceID` of the implementation.
- **pipelineCacheUUID** is the `VkPhysicalDeviceProperties::pipelineCacheUUID` of the implementation.

Unlike most structures declared by the Vulkan API, all fields of this structure are written with the least significant byte first, regardless of host byte-order.

The C language specification does not define the packing of structure members. This layout assumes tight structure member packing, with members laid out in the order listed in the structure, and the intended size of the structure is 32 bytes. If a compiler produces code that diverges from that pattern, applications must employ another method to set values at the correct offsets.

**Valid Usage**

- VUID-VkPipelineCacheHeaderVersionOne-headerSize-04967
  
  headerSize must be 32
Valid Usage (Implicit)

- VUID-VkPipelineCacheHeaderVersionOne-headerVersion-parameter
  headerVersion must be a valid VkPipelineCacheHeaderVersion value

Possible values of the headerVersion value of the pipeline cache header are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPipelineCacheHeaderVersion {
    VK_PIPELINE_CACHE_HEADER_VERSION_ONE = 1,
} VkPipelineCacheHeaderVersion;
```

- VK_PIPELINE_CACHE_HEADER_VERSION_ONE specifies version one of the pipeline cache, described by VkPipelineCacheHeaderVersionOne.

10.7.5. Destroying a Pipeline Cache

To destroy a pipeline cache, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyPipelineCache(
    VkDevice device,
    VkPipelineCache pipelineCache,
    const VkAllocationCallbacks* pAllocator);
```

- device is the logical device that destroys the pipeline cache object.
- pipelineCache is the handle of the pipeline cache to destroy.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyPipelineCache-pipelineCache-00771
  If VkAllocationCallbacks were provided when pipelineCache was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyPipelineCache-pipelineCache-00772
  If no VkAllocationCallbacks were provided when pipelineCache was created, pAllocator must be NULL
Valid Usage (Implicit)

- VUID-vkDestroyPipelineCache-device-parameter
  `device` **must** be a valid `VkDevice` handle

- VUID-vkDestroyPipelineCache-pipelineCache-parameter
  If `pipelineCache` is not `VK_NULL_HANDLE`, `pipelineCache` **must** be a valid `VkPipelineCache` handle

- VUID-vkDestroyPipelineCache-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkDestroyPipelineCache-pipelineCache-parent
  If `pipelineCache` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `pipelineCache` **must** be externally synchronized

10.8. Specialization Constants

Specialization constants are a mechanism whereby constants in a SPIR-V module **can** have their constant value specified at the time the `VkPipeline` is created. This allows a SPIR-V module to have constants that **can** be modified while executing an application that uses the Vulkan API.

**NOTE** Specialization constants are useful to allow a compute shader to have its local workgroup size changed at runtime by the user, for example.

Each `VkPipelineShaderStageCreateInfo` structure contains a `pSpecializationInfo` member, which **can** be `NULL` to indicate no specialization constants, or point to a `VkSpecializationInfo` structure.

The `VkSpecializationInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSpecializationInfo {
    uint32_t mapEntryCount;
    const VkSpecializationMapEntry* pMapEntries;
    size_t dataSize;
    const void* pData;
} VkSpecializationInfo;
```

- `mapEntryCount` is the number of entries in the `pMapEntries` array.
- `pMapEntries` is a pointer to an array of `VkSpecializationMapEntry` structures, which map constant IDs to offsets in `pData`.
• `dataSize` is the byte size of the `pData` buffer.

• `pData` contains the actual constant values to specialize with.

### Valid Usage

- VUID-VkSpecializationInfo-offset-00773
  The `offset` member of each element of `pMapEntries` must be less than `dataSize`

- VUID-VkSpecializationInfo-pMapEntries-00774
  The `size` member of each element of `pMapEntries` must be less than or equal to `dataSize` minus `offset`

- VUID-VkSpecializationInfo-constantID-04911
  The `constantID` value of each element of `pMapEntries` must be unique within `pMapEntries`

### Valid Usage (Implicit)

- VUID-VkSpecializationInfo-pMapEntries-parameter
  If `mapEntryCount` is not 0, `pMapEntries` must be a valid pointer to an array of `mapEntryCount` valid `VkSpecializationMapEntry` structures

- VUID-VkSpecializationInfo-pData-parameter
  If `dataSize` is not 0, `pData` must be a valid pointer to an array of `dataSize` bytes

The `VkSpecializationMapEntry` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSpecializationMapEntry {
    uint32_t   constantID;
    uint32_t   offset;
    size_t     size;
} VkSpecializationMapEntry;
```

• `constantID` is the ID of the specialization constant in SPIR-V.

• `offset` is the byte offset of the specialization constant value within the supplied data buffer.

• `size` is the byte size of the specialization constant value within the supplied data buffer.

If a `constantID` value is not a specialization constant ID used in the shader, that map entry does not affect the behavior of the pipeline.

### Valid Usage

- VUID-VkSpecializationMapEntry-constantID-00776
  For a `constantID` specialization constant declared in a shader, `size` must match the byte size of the `constantID`. If the specialization constant is of type `bool`, `size` must be the byte size of `VkBool32`
In human readable SPIR-V:

```glsl
OpDecorate %x SpecId  13 ; decorate .x component of WorkgroupSize with ID 13
OpDecorate %y SpecId  42 ; decorate .y component of WorkgroupSize with ID 42
OpDecorate %z SpecId  3  ; decorate .z component of WorkgroupSize with ID 3
OpDecorate %wgsize BuiltIn WorkgroupSize ; decorate WorkgroupSize onto constant
%i32 = OpTypeInt 32 0 ; declare an unsigned 32-bit type
%uvec3 = OpTypeVector %i32 3 ; declare a 3 element vector type of unsigned 32-bit
%x = OpSpecConstant %i32 1 ; declare the .x component of WorkgroupSize
%y = OpSpecConstant %i32 1 ; declare the .y component of WorkgroupSize
%z = OpSpecConstant %i32 1 ; declare the .z component of WorkgroupSize
%wgsize = OpSpecConstantComposite %uvec3 %x %y %z ; declare WorkgroupSize
```

From the above we have three specialization constants, one for each of the x, y & z elements of the WorkgroupSize vector.

Now to specialize the above via the specialization constants mechanism:

```c
const VkSpecializationMapEntry entries[] =
{
    { .constantID = 13,
        .offset = 0 * sizeof(uint32_t),
        .size = sizeof(uint32_t) },
    { .constantID = 42,
        .offset = 1 * sizeof(uint32_t),
        .size = sizeof(uint32_t) },
    { .constantID = 3,
        .offset = 2 * sizeof(uint32_t),
        .size = sizeof(uint32_t) }
};

const uint32_t data[] = { 16, 8, 4 }; // our workgroup size is 16x8x4

const VkSpecializationInfo info =
{
    .mapEntryCount = 3,
    .pMapEntries = entries,
    .dataSize = 3 * sizeof(uint32_t),
    .pData = data,
};
```

Then when calling `vkCreateComputePipelines`, and passing the `VkSpecializationInfo` we defined as
the `pSpecializationInfo` parameter of `VkPipelineShaderStageCreateInfo`, we will create a compute pipeline with the runtime specified local workgroup size.

Another example would be that an application has a SPIR-V module that has some platform-dependent constants they wish to use.

In human readable SPIR-V:

```
OpDecorate %1 SpecId 0 ; decorate our signed 32-bit integer constant
OpDecorate %2 SpecId 12 ; decorate our 32-bit floating-point constant
%32 = OpTypeInt 32 1 ; declare a signed 32-bit type
%float = OpTypeFloat 32 ; declare a 32-bit floating-point type
%1 = OpSpecConstant %i32 -1 ; some signed 32-bit integer constant
%2 = OpSpecConstant %float 0.5 ; some 32-bit floating-point constant
```

From the above we have two specialization constants, one is a signed 32-bit integer and the second is a 32-bit floating-point value.

Now to specialize the above via the specialization constants mechanism:

```c
struct SpecializationData {
    int32_t data0;
    float data1;
};

const VkSpecializationMapEntry entries[] =
{
    
    // set the data for the 32-bit integer
    { .constantID = 0,
      .offset = offsetof(SpecializationData, data0),
      .size = sizeof(SpecializationData::data0)
    },

    // set the data for the 32-bit floating-point
    { .constantID = 12,
      .offset = offsetof(SpecializationData, data1),
      .size = sizeof(SpecializationData::data1)
    }
};

SpecializationData data;
data.data0 = -42; // set the data for the 32-bit integer
data.data1 = 42.0f; // set the data for the 32-bit floating-point

const VkSpecializationInfo info =
{
    .mapEntryCount = 2,
    .pMapEntries = entries,
    .dataSize = sizeof(data),
    .pdata = &data,
};
```
It is legal for a SPIR-V module with specializations to be compiled into a pipeline where no specialization information was provided. SPIR-V specialization constants contain default values such that if a specialization is not provided, the default value will be used. In the examples above, it would be valid for an application to only specialize some of the specialization constants within the SPIR-V module, and let the other constants use their default values encoded within the OpSpecConstant declarations.

### 10.9. Pipeline Libraries

A pipeline library is a special pipeline that was created using the `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR` and cannot be bound, instead it defines a set of pipeline state which can be linked into other pipelines. For ray tracing pipelines this includes shaders and shader groups. For graphics pipelines this includes distinct library types defined by `VkGraphicsPipelineLibraryFlagBitsEXT`. The application must maintain the lifetime of a pipeline library based on the pipelines that link with it.

This linkage is achieved by using the following structure within the appropriate creation mechanisms:

The `VkPipelineLibraryCreateInfoKHR` structure is defined as:

```c
typedef struct VkPipelineLibraryCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t libraryCount;
    const VkPipeline* pLibraries;
} VkPipelineLibraryCreateInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **libraryCount** is the number of pipeline libraries in `pLibraries`.
- **pLibraries** is a pointer to an array of `VkPipeline` structures specifying pipeline libraries to use when creating a pipeline.

#### Valid Usage

- **VUID-VkPipelineLibraryCreateInfoKHR-pLibraries-03381**
  Each element of `pLibraries` must have been created with `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR`.

- **VUID-VkPipelineLibraryCreateInfoKHR-pLibraries-06855**
  If any library in `pLibraries` was created with a shader stage with `VkPipelineShaderStageModuleIdentifierCreateInfoEXT` and `identifierSize` not equal to 0,
the pipeline **must** be created with the `VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT` flag set

- **VUID-VkPipelineLibraryCreateInfoKHR-pLibraries-08096**
  If any element of `pLibraries` was created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, all elements **must** have been created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

- **VUID-VkPipelineLibraryCreateInfoKHR-pipeline-07404**
  If `pipeline` is being created with `VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT_EXT`, every element of `pLibraries` **must** have been created with `VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT_EXT`

- **VUID-VkPipelineLibraryCreateInfoKHR-pipeline-07405**
  If `pipeline` is being created without `VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT_EXT`, every element of `pLibraries` **must** have been created without `VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT_EXT`

- **VUID-VkPipelineLibraryCreateInfoKHR-pipeline-07406**
  If `pipeline` is being created with `VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT_EXT`, every element of `pLibraries` **must** have been created with `VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT_EXT`

- **VUID-VkPipelineLibraryCreateInfoKHR-pipeline-07407**
  If `pipeline` is being created without `VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT_EXT`, every element of `pLibraries` **must** have been created without `VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT_EXT`

---

**Valid Usage (Implicit)**

- **VUID-VkPipelineLibraryCreateInfoKHR-sType-sType**
  `sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_LIBRARY_CREATE_INFO_KHR`

- **VUID-VkPipelineLibraryCreateInfoKHR-pLibraries-parameter**
  If `libraryCount` is not 0, `pLibraries` **must** be a valid pointer to an array of `libraryCount` valid `VkPipeline` handles

Pipelines created with `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR` libraries can depend on other pipeline libraries in `VkPipelineLibraryCreateInfoKHR`.

A pipeline library is considered in-use, as long as one of the linking pipelines is in-use. This applies recursively if a pipeline library includes other pipeline libraries.

### 10.10. Pipeline Binding

Once a pipeline has been created, it **can** be bound to the command buffer using the command:
void vkCmdBindPipeline(
    VkCommandBuffer commandBuffer,
    VkPipelineBindPoint pipelineBindPoint,
    VkPipeline pipeline);

• commandBuffer is the command buffer that the pipeline will be bound to.
• pipelineBindPoint is a VkPipelineBindPoint value specifying to which bind point the pipeline is bound. Binding one does not disturb the others.
• pipeline is the pipeline to be bound.

Once bound, a pipeline binding affects subsequent commands that interact with the given pipeline type in the command buffer until a different pipeline of the same type is bound to the bind point, or until the pipeline bind point is disturbed by binding a shader object as described in Interaction with Pipelines. Commands that do not interact with the given pipeline type must not be affected by the pipeline state.

Valid Usage

• VUID-vkCmdBindPipeline-pipelineBindPoint-00777
  If pipelineBindPoint is VK_PIPELINE_BIND_POINT_COMPUTE, the VkCommandPool that commandBuffer was allocated from must support compute operations

• VUID-vkCmdBindPipeline-pipelineBindPoint-00778
  If pipelineBindPoint is VK_PIPELINE_BIND_POINT_GRAPHICS, the VkCommandPool that commandBuffer was allocated from must support graphics operations

• VUID-vkCmdBindPipeline-pipelineBindPoint-00779
  If pipelineBindPoint is VK_PIPELINE_BIND_POINT_COMPUTE, pipeline must be a compute pipeline

• VUID-vkCmdBindPipeline-pipelineBindPoint-00780
  If pipelineBindPoint is VK_PIPELINE_BIND_POINT_GRAPHICS, pipeline must be a graphics pipeline

• VUID-vkCmdBindPipeline-pipeline-00781
  If the variableMultisampleRate feature is not supported, pipeline is a graphics pipeline, the current subpass uses no attachments, and this is not the first call to this function with a graphics pipeline after transitioning to the current subpass, then the sample count specified by this pipeline must match that set in the previous pipeline

• VUID-vkCmdBindPipeline-variableSampleLocations-01525
  If VkPhysicalDeviceSampleLocationsPropertiesEXT::variableSampleLocations is VK_FALSE, and pipeline is a graphics pipeline created with a VkPipelineSampleLocationsStateCreateInfoEXT structure having its sampleLocationsEnable member set to VK_TRUE but without VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT enabled then the current render pass instance must have been begun by specifying a VkRenderPassSampleLocationsBeginInfoEXT structure whose pPostSubpassSampleLocations member contains an element with a subpassIndex matching
the current subpass index and the `sampleLocationsInfo` member of that element **must** match the `sampleLocationsInfo` specified in `VkPipelineSampleLocationsStateCreateInfoEXT` when the pipeline was created.

- **VUID-vkCmdBindPipeline-None-02323**
  This command **must** not be recorded when transform feedback is active.

- **VUID-vkCmdBindPipeline-pipelineBindPoint-02391**
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR`, the `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations.

- **VUID-vkCmdBindPipeline-pipelineBindPoint-02392**
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR`, `pipeline` **must** be a ray tracing pipeline.

- **VUID-vkCmdBindPipeline-pipelineBindPoint-06721**
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR`, `commandBuffer` **must** not be a protected command buffer.

- **VUID-vkCmdBindPipeline-pipelineProtectedAccess-07408**
  If the `pipelineProtectedAccess` feature is enabled, and `commandBuffer` is a protected command buffer, `pipeline` **must** have been created without `VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT_EXT`.

- **VUID-vkCmdBindPipeline-pipelineProtectedAccess-07409**
  If the `pipelineProtectedAccess` feature is enabled, and `commandBuffer` is not a protected command buffer, `pipeline` **must** have been created without `VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT_EXT`.

- **VUID-vkCmdBindPipeline-pipeline-03382**
  `pipeline` **must** not have been created with `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR` set.

- **VUID-vkCmdBindPipeline-commandBuffer-04808**
  If `commandBuffer` is a secondary command buffer with `VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D` enabled and `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_GRAPHICS`, then the pipeline **must** have been created with `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` or `VK_DYNAMIC_STATE_VIEWPORT`, and `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` or `VK_DYNAMIC_STATE_SCISSOR` enabled.

- **VUID-vkCmdBindPipeline-commandBuffer-04809**
  If `commandBuffer` is a secondary command buffer with `VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D` enabled and `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_GRAPHICS` and `pipeline` was created with `VkPipelineDiscardRectangleStateCreateInfoEXT` structure and its `discardRectangleCount` member is not 0, or the pipeline was created with `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` enabled, then the pipeline **must** have been created with `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` enabled.

- **VUID-vkCmdBindPipeline-pipelineBindPoint-04881**
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_GRAPHICS` and the `provokingVertexModePerPipeline` limit is `VK_FALSE`, then pipeline's `VkPipelineRasterizationProvokingVertexStateCreateInfoEXT::provokingVertexMode` **must** be the same as that of any other pipelines previously bound to this bind point within the current render pass instance, including any pipeline already bound when beginning the
render pass instance

- VUID-vkCmdBindPipeline-pipelineBindPoint-04949
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI`, the `VkCommandPool` that `commandBuffer` was allocated from must support compute operations.

- VUID-vkCmdBindPipeline-pipelineBindPoint-04950
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI`, `pipeline` must be a subpass shading pipeline.

**Valid Usage (Implicit)**

- VUID-vkCmdBindPipeline-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- VUID-vkCmdBindPipeline-pipelineBindPoint-parameter
  `pipelineBindPoint` must be a valid `VkPipelineBindPoint` value.

- VUID-vkCmdBindPipeline-pipeline-parameter
  `pipeline` must be a valid `VkPipeline` handle.

- VUID-vkCmdBindPipeline-commandBuffer-recording
  `commandBuffer` must be in the recording state.

- VUID-vkCmdBindPipeline-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations.

- VUID-vkCmdBindPipeline-videocoding
  This command must only be called outside of a video coding scope.

- VUID-vkCmdBindPipeline-commonparent
  Both of `commandBuffer`, and `pipeline` must have been created, allocated, or retrieved from the same `VkDevice`.

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics Compute</td>
<td>State</td>
</tr>
</tbody>
</table>
Possible values of `vkCmdBindPipeline::pipelineBindPoint`, specifying the bind point of a pipeline object, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPipelineBindPoint {
    VK_PIPELINE_BIND_POINT_GRAPHICS = 0,
    VK_PIPELINE_BIND_POINT_COMPUTE = 1,
#ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_AMDX_shader_enqueue
    VK_PIPELINE_BIND_POINT_EXECUTION_GRAPH_AMDX = 1000134000,
#endif
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR = 1000165000,
    // Provided by VK_HUAWEI_subpass_shading
    VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI = 1000369003,
    // Provided by VK_NV_ray_tracing
    VK_PIPELINE_BIND_POINT_RAY_TRACING_NV = VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR,
} VkPipelineBindPoint;
```

- `VK_PIPELINE_BIND_POINT_COMPUTE` specifies binding as a compute pipeline.
- `VK_PIPELINE_BIND_POINT_GRAPHICS` specifies binding as a graphics pipeline.
- `VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR` specifies binding as a ray tracing pipeline.
- `VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI` specifies binding as a subpass shading pipeline.
- `VK_PIPELINE_BIND_POINT_EXECUTION_GRAPH_AMDX` specifies binding as an execution graph pipeline.

For pipelines that were created with the support of multiple shader groups (see Graphics Pipeline Shader Groups), the regular `vkCmdBindPipeline` command will bind Shader Group 0. To explicitly bind a shader group use:

```c
// Provided by VK_NV_device_generated_commands
void vkCmdBindPipelineShaderGroupNV(
    VkCommandBuffer commandBuffer,
    VkPipelineBindPoint pipelineBindPoint,
    VkPipeline pipeline,
    uint32_t groupIndex);
```

- `commandBuffer` is the command buffer that the pipeline will be bound to.
- `pipelineBindPoint` is a `VkPipelineBindPoint` value specifying the bind point to which the pipeline will be bound.
- `pipeline` is the pipeline to be bound.
- `groupIndex` is the shader group to be bound.
**Valid Usage**

- VUID-vkCmdBindPipelineShaderGroupNV-groupIndex-02893
  
  `groupIndex` must be 0 or less than the effective `VkGraphicsPipelineShaderGroupsCreateInfoNV::groupCount` including the referenced pipelines

- VUID-vkCmdBindPipelineShaderGroupNV-pipelineBindPoint-02894
  The `pipelineBindPoint` must be `VK_PIPELINE_BIND_POINT_GRAPHICS`.

- VUID-vkCmdBindPipelineShaderGroupNV-groupIndex-02895
  The same restrictions as `vkCmdBindPipeline` apply as if the bound pipeline was created only with the Shader Group from the `groupIndex` information.

- VUID-vkCmdBindPipelineShaderGroupNV-deviceGeneratedCommands-02896
  The `deviceGeneratedCommands` feature must be enabled.

**Valid Usage (Implicit)**

- VUID-vkCmdBindPipelineShaderGroupNV-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- VUID-vkCmdBindPipelineShaderGroupNV-pipelineBindPoint-parameter
  
  `pipelineBindPoint` must be a valid `VkPipelineBindPoint` value.

- VUID-vkCmdBindPipelineShaderGroupNV-pipeline-parameter
  
  `pipeline` must be a valid `VkPipeline` handle.

- VUID-vkCmdBindPipelineShaderGroupNV-commandBuffer-recording
  
  `commandBuffer` must be in the recording state.

- VUID-vkCmdBindPipelineShaderGroupNV-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations.

- VUID-vkCmdBindPipelineShaderGroupNV-videocoding
  
  This command must only be called outside of a video coding scope.

- VUID-vkCmdBindPipelineShaderGroupNV-commonparent
  
  Both of `commandBuffer`, and `pipeline` must have been created, allocated, or retrieved from the same `VkDevice`.

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

### 10.10.1. Interaction With Shader Objects

If the `shaderObject` feature is enabled, applications can use both pipelines and shader objects at the same time. The interaction between pipelines and shader objects is described in Interaction with Pipelines.

### 10.11. Dynamic State

When a pipeline object is bound, any pipeline object state that is not specified as dynamic is applied to the command buffer state. Pipeline object state that is specified as dynamic is not applied to the command buffer state at this time.

Instead, dynamic state can be modified at any time and persists for the lifetime of the command buffer, or until modified by another dynamic state setting command, or made invalid by binding a pipeline in which that state is statically specified.

When a pipeline object is bound, the following applies to each state parameter:

- If the state is not specified as dynamic in the new pipeline object, then that command buffer state is overwritten by the state in the new pipeline object. Before any draw or dispatch call with this pipeline there must not have been any calls to any of the corresponding dynamic state setting commands after this pipeline was bound.

- If the state is specified as dynamic in the new pipeline object, then that command buffer state is not disturbed. Before any draw or dispatch call with this pipeline there must have been at least one call to each of the corresponding dynamic state setting commands. The state-setting commands must be recorded after command buffer recording was begun, or after the last command binding a pipeline object with that state specified as static, whichever was the latter.

- If the state is not included (corresponding pointer in `VkGraphicsPipelineCreateInfo` was NULL or was ignored) in the new pipeline object, then that command buffer state is not disturbed. For example, mesh shading pipelines do not include vertex input state and therefore do not disturb any such command buffer state.

Dynamic state that does not affect the result of operations can be left undefined.

**NOTE**

For example, if blending is disabled by the pipeline object state then the dynamic color blend constants do not need to be specified in the command buffer, even if this state is specified as dynamic in the pipeline object.
Applications running on Vulkan implementations advertising an `VkPhysicalDeviceDriverProperties::conformanceVersion` less than 1.3.8.0 should be aware that rebinding the currently bound pipeline object may not reapply static state.

## 10.12. Pipeline Properties and Shader Information

When a pipeline is created, its state and shaders are compiled into zero or more device-specific executables, which are used when executing commands against that pipeline. To query the properties of these pipeline executables, call:

```c
// Provided by VK_KHR_pipeline_executable_properties
VkResult vkGetPipelineExecutablePropertiesKHR(
    VkDevice device,          // device is the device that created the pipeline.
    const VkPipelineInfoKHR* pPipelineInfo,  // pPipelineInfo describes the pipeline being queried.
    uint32_t* pExecutableCount,  // pExecutableCount is a pointer to an integer related to the number of pipeline executables available or queried, as described below.
    VkPipelineExecutablePropertiesKHR* pProperties);  // pProperties is either NULL or a pointer to an array of VkPipelineExecutablePropertiesKHR structures.
```

If `pProperties` is `NULL`, then the number of pipeline executables associated with the pipeline is returned in `pExecutableCount`. Otherwise, `pExecutableCount` must point to a variable set by the application to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If `pExecutableCount` is less than the number of pipeline executables associated with the pipeline, at most `pExecutableCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available properties were returned.

### Valid Usage

- VUID-vkGetPipelineExecutablePropertiesKHR-pipelineExecutableInfo-03270
  The `pipelineExecutableInfo` feature must be enabled
- VUID-vkGetPipelineExecutablePropertiesKHR-pipeline-03271
  The `pipeline` member of `pPipelineInfo` must have been created with `device`

### Valid Usage (Implicit)

- VUID-vkGetPipelineExecutablePropertiesKHR-device-parameter
  `device` must be a valid `VkDevice` handle
• VUID-vkGetPipelineExecutablePropertiesKHR-pPipelineInfo-parameter
  `pPipelineInfo` must be a valid pointer to a valid `VkPipelineInfoKHR` structure.

• VUID-vkGetPipelineExecutablePropertiesKHR-pExecutableCount-parameter
  `pExecutableCount` must be a valid pointer to a `uint32_t` value.

• VUID-vkGetPipelineExecutablePropertiesKHR-pProperties-parameter
  If the value referenced by `pExecutableCount` is not 0, and `pProperties` is not NULL, `pProperties` must be a valid pointer to an array of `pExecutableCount` `VkPipelineExecutablePropertiesKHR` structures.

Return Codes

Success
  • `VK_SUCCESS`
  • `VK_INCOMPLETE`

Failure
  • `VK_ERROR_OUT_OF_HOST_MEMORY`
  • `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkPipelineExecutablePropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_pipeline_executable_properties
typedef struct VkPipelineExecutablePropertiesKHR {
    VkStructureType sType;
    void* pNext;
    VkShaderStageFlags stages;
    char name[VK_MAX_DESCRIPTION_SIZE];
    char description[VK_MAX_DESCRIPTION_SIZE];
    uint32_t subgroupSize;
} VkPipelineExecutablePropertiesKHR;
```

• `sType` is a `VkStructureType` value identifying this structure.

• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `stages` is a bitmask of zero or more `VkShaderStageFlagBits` indicating which shader stages (if any) were principally used as inputs to compile this pipeline executable.

• `name` is an array of `VK_MAX_DESCRIPTION_SIZE` `char` containing a null-terminated UTF-8 string which is a short human readable name for this pipeline executable.

• `description` is an array of `VK_MAX_DESCRIPTION_SIZE` `char` containing a null-terminated UTF-8 string which is a human readable description for this pipeline executable.

• `subgroupSize` is the subgroup size with which this pipeline executable is dispatched.

Not all implementations have a 1:1 mapping between shader stages and pipeline executables and some implementations may reduce a given shader stage to fixed function hardware programming.
such that no pipeline executable is available. No guarantees are provided about the mapping between shader stages and pipeline executables and *stages should* be considered a best effort hint. Because the application *cannot* rely on the *stages* field to provide an exact description, *name* and *description* provide a human readable name and description which more accurately describes the given pipeline executable.

### Valid Usage (Implicit)

- VUID-VkPipelineExecutablePropertiesKHR-sType-sType
  
  *sType* must be `VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_PROPERTIES_KHR`

- VUID-VkPipelineExecutablePropertiesKHR-pNext-pNext
  
  *pNext* must be `NULL`

To query the pipeline properties call:

```c
// Provided by VK_EXT_pipeline_properties
VkResult vkGetPipelinePropertiesEXT(
    VkDevice device,
    const VkPipelineInfoEXT* pPipelineInfo,
    VkBaseOutStructure* pPipelineProperties);
```

- *device* is the logical device that created the pipeline.
- *pPipelineInfo* is a pointer to a `VkPipelineInfoEXT` structure which describes the pipeline being queried.
- *pPipelineProperties* is a pointer to a `VkBaseOutStructure` structure in which the pipeline properties will be written.

To query a pipeline's *pipelineIdentifier* pass a `VkPipelinePropertiesIdentifierEXT` structure in `pPipelineProperties`. Each pipeline is associated with a *pipelineIdentifier* and the identifier is implementation specific.

### Valid Usage

- VUID-vkGetPipelinePropertiesEXT-pipeline-06738
  
  The `pipeline` member of `pPipelineInfo` must have been created with `device`

- VUID-vkGetPipelinePropertiesEXT-pPipelineProperties-06739
  
  *pPipelineProperties* must be a valid pointer to a `VkPipelinePropertiesIdentifierEXT` structure

- VUID-vkGetPipelinePropertiesEXT-None-06766
  
  The `pipelinePropertiesIdentifier` feature must be enabled
Valid Usage (Implicit)

- VUID-vkGetPipelinePropertiesEXT-device-parameter
device must be a valid VkDevice handle

- VUID-vkGetPipelinePropertiesEXT-pPipelineInfo-parameter
pPipelineInfo must be a valid pointer to a valid VkPipelineInfoEXT structure

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY

The VkPipelinePropertiesIdentifierEXT structure is defined as:

```c
// Provided by VK_EXT_pipeline_properties
typedef struct VkPipelinePropertiesIdentifierEXT {
    VkStructureType sType;
    void* pNext;
    uint8_t pipelineIdentifier[VK_UUID_SIZE];
} VkPipelinePropertiesIdentifierEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- pipelineIdentifier is an array of VK_UUID_SIZE uint8_t values into which the pipeline identifier will be written.

Valid Usage (Implicit)

- VUID-VkPipelinePropertiesIdentifierEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_PROPERTIES_IDENTIFIER_EXT

- VUID-VkPipelinePropertiesIdentifierEXT-pNext-pNext
  pNext must be NULL

The VkPipelineInfoKHR structure is defined as:
// Provided by VK_KHR_pipeline_executable_properties
typedef struct VkPipelineInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkPipeline pipeline;
} VkPipelineInfoKHR;

or the equivalent

// Provided by VK_EXT_pipeline_properties
typedef VkPipelineInfoKHR VkPipelineInfoEXT;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• pipeline is a VkPipeline handle.

Valid Usage (Implicit)

• VUID-VkPipelineInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_INFO_KHR
• VUID-VkPipelineInfoKHR-pNext-pNext
  pNext must be NULL
• VUID-VkPipelineInfoKHR-pipeline-parameter
  pipeline must be a valid VkPipeline handle

Each pipeline executable may have a set of statistics associated with it that are generated by the pipeline compilation process. These statistics may include things such as instruction counts, amount of spilling (if any), maximum number of simultaneous threads, or anything else which may aid developers in evaluating the expected performance of a shader. To query the compile time statistics associated with a pipeline executable, call:

// Provided by VK_KHR_pipeline_executable_properties
VkResult vkGetPipelineExecutableStatisticsKHR(
    VkDevice device,
    const VkPipelineExecutableInfoKHR* pExecutableInfo,
    uint32_t* pStatisticCount,
    VkPipelineExecutableStatisticKHR* pStatistics);

• device is the device that created the pipeline.
• pExecutableInfo describes the pipeline executable being queried.
• pStatisticCount is a pointer to an integer related to the number of statistics available or queried, as described below.
- `pStatistics` is either `NULL` or a pointer to an array of `VkPipelineExecutableStatisticKHR` structures.

If `pStatistics` is `NULL`, then the number of statistics associated with the pipeline executable is returned in `pStatisticCount`. Otherwise, `pStatisticCount` must point to a variable set by the application to the number of elements in the `pStatistics` array, and on return the variable is overwritten with the number of structures actually written to `pStatistics`. If `pStatisticCount` is less than the number of statistics associated with the pipeline executable, at most `pStatisticCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available statistics were returned.

### Valid Usage

- VUID-vkGetPipelineExecutableStatisticsKHR-pipelineExecutableInfo-03272
  
  The `pipelineExecutableInfo` feature must be enabled

- VUID-vkGetPipelineExecutableStatisticsKHR-pipeline-03273
  
  The `pipeline` member of `pExecutableInfo` must have been created with `device`

- VUID-vkGetPipelineExecutableStatisticsKHR-pipeline-03274
  
  The `pipeline` member of `pExecutableInfo` must have been created with `VK_PIPELINE_CREATE_CAPTURE_STATISTICS_BIT_KHR`

### Valid Usage (Implicit)

- VUID-vkGetPipelineExecutableStatisticsKHR-device-parameter
  
  `device` must be a valid `VkDevice` handle

- VUID-vkGetPipelineExecutableStatisticsKHR-pExecutableInfo-parameter
  
  `pExecutableInfo` must be a valid pointer to a valid `VkPipelineExecutableInfoKHR` structure

- VUID-vkGetPipelineExecutableStatisticsKHR-pStatisticCount-parameter
  
  `pStatisticCount` must be a valid pointer to a `uint32_t` value

- VUID-vkGetPipelineExecutableStatisticsKHR-pStatistics-parameter
  
  If the value referenced by `pStatisticCount` is not 0, and `pStatistics` is not `NULL`, `pStatistics` must be a valid pointer to an array of `pStatisticCount` `VkPipelineExecutableStatisticKHR` structures

### Return Codes

**Success**

- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
The `VkPipelineExecutableInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_pipeline_executable_properties
typedef struct VkPipelineExecutableInfoKHR {
    VkStructureType sType;
