- `pMarkerInfo` is a pointer to a `VkDebugMarkerMarkerInfoEXT` structure specifying the parameters of the marker to insert.

### Valid Usage (Implicit)

- VUID-vkCmdDebugMarkerInsertEXT-commandBuffer-parameter `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdDebugMarkerInsertEXT-pMarkerInfo-parameter `pMarkerInfo` must be a valid pointer to a valid `VkDebugMarkerMarkerInfoEXT` structure
- VUID-vkCmdDebugMarkerInsertEXT-commandBuffer-recording `commandBuffer` must be in the recording state
- VUID-vkCmdDebugMarkerInsertEXT-commandBuffer-cmdpool The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations
- VUID-vkCmdDebugMarkerInsertEXT-videocoding This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the ` VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
51.3. Debug Report Callbacks

Debug report callbacks are represented by `VkDebugReportCallbackEXT` handles:

```c
// Provided by VK_EXT_debug_report
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDebugReportCallbackEXT)
```

Debug report callbacks give more detailed feedback on the application's use of Vulkan when events of interest occur.

To register a debug report callback, an application uses `vkCreateDebugReportCallbackEXT`.

```c
// Provided by VK_EXT_debug_report
VkResult vkCreateDebugReportCallbackEXT(
    VkInstance instance,
    const VkDebugReportCallbackCreateInfoEXT* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkDebugReportCallbackEXT* pCallback);
```

- `instance` is the instance the callback will be logged on.
- `pCreateInfo` is a pointer to a `VkDebugReportCallbackCreateInfoEXT` structure defining the conditions under which this callback will be called.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pCallback` is a pointer to a `VkDebugReportCallbackEXT` handle in which the created object is returned.

**Valid Usage (Implicit)**

- `VUID-vkCreateDebugReportCallbackEXT-instance-parameter` _instance must be a valid `VkInstance` handle_
- `VUID-vkCreateDebugReportCallbackEXT-pCreateInfo-parameter` _pCreateInfo must be a valid pointer to a valid `VkDebugReportCallbackCreateInfoEXT` structure_
- `VUID-vkCreateDebugReportCallbackEXT-pAllocator-parameter` If `pAllocator` is not `NULL`, `pAllocator must be a valid pointer to a valid`
The definition of `VkDebugReportCallbackCreateInfoEXT` is:

```c
// Provided by VK_EXT_debug_report
typedef struct VkDebugReportCallbackCreateInfoEXT {
    VkStructureType sType;
    const void*pNext;
    VkDebugReportFlagsEXT flags;
   PFN_vkDebugReportCallbackEXT pfnCallback;
    void*pUserData;
} VkDebugReportCallbackCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkDebugReportFlagBitsEXT` specifying which event(s) will cause this callback to be called.
- `pfnCallback` is the application callback function to call.
- `pUserData` is user data to be passed to the callback.

For each `VkDebugReportCallbackEXT` that is created the `VkDebugReportCallbackCreateInfoEXT::flags` determine when that `VkDebugReportCallbackCreateInfoEXT::pfnCallback` is called. When an event happens, the implementation will do a bitwise AND of the event’s `VkDebugReportFlagBitsEXT` flags to each `VkDebugReportCallbackEXT` object’s flags. For each non-zero result the corresponding callback will be called. The callback will come directly from the component that detected the event, unless some other layer intercepts the calls for its own purposes (filter them in a different way, log to a system error log, etc.).

An application may receive multiple callbacks if multiple `VkDebugReportCallbackEXT` objects were created. A callback will always be executed in the same thread as the originating Vulkan call.

A callback may be called from multiple threads simultaneously (if the application is making Vulkan calls from multiple threads).
Valid Usage (Implicit)

- VUID-VkDebugReportCallbackCreateInfoEXT-sType-sType
  
  *sType must be* VK_STRUCTURE_TYPE_DEBUG_REPORT_CALLBACK_CREATE_INFO_EXT

- VUID-VkDebugReportCallbackCreateInfoEXT-flags-parameter
  
  *flags must be a valid combination of* VkDebugReportFlagBitsEXT *values

- VUID-VkDebugReportCallbackCreateInfoEXT-pfnCallback-parameter
  
  *pfnCallback must be a valid PFN_vkDebugReportCallbackEXT value

Bits which *can* be set in VkDebugReportCallbackCreateInfoEXT::flags, specifying events which cause a debug report, are:

```c
// Provided by VK_EXT_debug_report
typedef enum VkDebugReportFlagBitsEXT {
    VK_DEBUG_REPORT_INFORMATION_BIT_EXT = 0x00000001,
    VK_DEBUG_REPORT_WARNING_BIT_EXT = 0x00000002,
    VK_DEBUG_REPORT_PERFORMANCE_WARNING_BIT_EXT = 0x00000004,
    VK_DEBUG_REPORT_ERROR_BIT_EXT = 0x00000008,
    VK_DEBUG_REPORT_DEBUG_BIT_EXT = 0x00000010,
} VkDebugReportFlagBitsEXT;
```

- **VK_DEBUG_REPORT_ERROR_BIT_EXT** specifies that the application has violated a valid usage condition of the specification.

- **VK_DEBUG_REPORT_WARNING_BIT_EXT** specifies use of Vulkan that *may* expose an app bug. Such cases may not be immediately harmful, such as a fragment shader outputting to a location with no attachment. Other cases *may* point to behavior that is almost certainly bad when unintended such as using an image whose memory has not been filled. In general if you see a warning but you know that the behavior is intended/desired, then simply ignore the warning.

- **VK_DEBUG_REPORT_PERFORMANCE_WARNING_BIT_EXT** specifies a potentially non-optimal use of Vulkan, e.g. using `vkCmdClearColorImage` when setting `VkAttachmentDescription::loadOp` to `VK_ATTACHMENT_LOAD_OP_CLEAR` would have worked.

- **VK_DEBUG_REPORT_INFORMATION_BIT_EXT** specifies an informational message such as resource details that may be handy when debugging an application.

- **VK_DEBUG_REPORT_DEBUG_BIT_EXT** specifies diagnostic information from the implementation and layers.

```c
// Provided by VK_EXT_debug_report
typedef VkFlags VkDebugReportFlagsEXT;
```

*VkDebugReportFlagsEXT* is a bitmask type for setting a mask of zero or more *VkDebugReportFlagBitsEXT*.

The prototype for the *VkDebugReportCallbackCreateInfoEXT::pfnCallback* function implemented by
the application is:

```
// Provided by VK_EXT_debug_report
typedef VkBool32 (VKAPI_PTR *PFN_vkDebugReportCallbackEXT)(
    VkDebugReportFlagsEXT flags,
    VkDebugReportObjectTypeEXT objectType,
    uint64_t object,
    size_t location,
    int32_t messageCode,
    const char* pLayerPrefix,
    const char* pMessage,
    void* pUserData);
```

- `flags` specifies the `VkDebugReportFlagBitsEXT` that triggered this callback.
- `objectType` is a `VkDebugReportObjectTypeEXT` value specifying the type of object being used or created at the time the event was triggered.
- `object` is the object where the issue was detected. If `objectType` is `VK_DEBUG_REPORT_OBJECT_TYPE_UNKNOWN_EXT`, `object` is undefined.
- `location` is a component (layer, driver, loader) defined value specifying the location of the trigger. This is an **optional** value.
- `messageCode` is a layer-defined value indicating what test triggered this callback.
- `pLayerPrefix` is a null-terminated UTF-8 string that is an abbreviation of the name of the component making the callback. `pLayerPrefix` is only valid for the duration of the callback.
- `pMessage` is a null-terminated UTF-8 string detailing the trigger conditions. `pMessage` is only valid for the duration of the callback.
- `pUserData` is the user data given when the `VkDebugReportCallbackEXT` was created.

The callback **must** not call `vkDestroyDebugReportCallbackEXT`.

The callback returns a `VkBool32`, which is interpreted in a layer-specified manner. The application **should** always return `VK_FALSE`. The `VK_TRUE` value is reserved for use in layer development.

`object` **must** be a Vulkan object or `VK_NULL_HANDLE`. If `objectType` is not `VK_DEBUG_REPORT_OBJECT_TYPE_UNKNOWN_EXT` and `object` is not `VK_NULL_HANDLE`, `object` **must** be a Vulkan object of the corresponding type associated with `objectType` as defined in `VkDebugReportObjectTypeEXT` and Vulkan Handle Relationship.

Possible values passed to the `objectType` parameter of the callback function specified by `VkDebugReportCallbackCreateInfoEXT::pfnCallback`, specifying the type of object handle being reported, are:

```
// Provided by VK_EXT_debug_marker, VK_EXT_debug_report
typedef enum VkDebugReportObjectTypeEXT {
    VK_DEBUG_REPORT_OBJECT_TYPE_UNKNOWN_EXT = 0,
    VK_DEBUG_REPORT_OBJECT_TYPE_INSTANCE_EXT = 1,
    VK_DEBUG_REPORT_OBJECT_TYPE_PHYSICAL_DEVICE_EXT = 2,
}
```
VK_DEBUG_REPORT_OBJECT_TYPE_DEVICE_EXT = 3,
VK_DEBUG_REPORT_OBJECT_TYPE_QUEUE_EXT = 4,
VK_DEBUG_REPORT_OBJECT_TYPE_SEMAPHORE_EXT = 5,
VK_DEBUG_REPORT_OBJECT_TYPE_COMMAND_BUFFER_EXT = 6,
VK_DEBUG_REPORT_OBJECT_TYPE_FENCE_EXT = 7,
VK_DEBUG_REPORT_OBJECT_TYPE_DEVICE_MEMORY_EXT = 8,
VK_DEBUG_REPORT_OBJECT_TYPE_BUFFER_EXT = 9,
VK_DEBUG_REPORT_OBJECT_TYPE_IMAGE_EXT = 10,
VK_DEBUG_REPORT_OBJECT_TYPE_EVENT_EXT = 11,
VK_DEBUG_REPORT_OBJECT_TYPE_QUERY_POOL_EXT = 12,
VK_DEBUG_REPORT_OBJECT_TYPE_BUFFER_VIEW_EXT = 13,
VK_DEBUG_REPORT_OBJECT_TYPE_IMAGE_VIEW_EXT = 14,
VK_DEBUG_REPORT_OBJECT_TYPE_SHADER_MODULE_EXT = 15,
VK_DEBUG_REPORT_OBJECT_TYPE_PIPELINE_CACHE_EXT = 16,
VK_DEBUG_REPORT_OBJECT_TYPE_PIPELINE_LAYOUT_EXT = 17,
VK_DEBUG_REPORT_OBJECT_TYPE_RENDER_PASS_EXT = 18,
VK_DEBUG_REPORT_OBJECT_TYPE_PIPELINE_EXT = 19,
VK_DEBUG_REPORT_OBJECT_TYPE_DESCRIPTOR_SET_LAYOUT_EXT = 20,
VK_DEBUG_REPORT_OBJECT_TYPE_SAMPLER_EXT = 21,
VK_DEBUG_REPORT_OBJECT_TYPE_DESCRIPTOR_POOL_EXT = 22,
VK_DEBUG_REPORT_OBJECT_TYPE_DESCRIPTOR_SET_EXT = 23,
VK_DEBUG_REPORT_OBJECT_TYPE_FRAMEBUFFER_EXT = 24,
VK_DEBUG_REPORT_OBJECT_TYPE_COMMAND_POOL_EXT = 25,
VK_DEBUG_REPORT_OBJECT_TYPE_SURFACE_KHR_EXT = 26,
VK_DEBUG_REPORT_OBJECT_TYPE_SWAPCHAIN_KHR_EXT = 27,
VK_DEBUG_REPORT_OBJECT_TYPE_DEBUG_REPORT_CALLBACK_EXT_EXT = 28,
VK_DEBUG_REPORT_OBJECT_TYPE_DISPLAY_KHR_EXT = 29,
VK_DEBUG_REPORT_OBJECT_TYPE_DISPLAY_MODE_KHR_EXT = 30,
VK_DEBUG_REPORT_OBJECT_TYPE_VALIDATION_CACHE_EXT_EXT = 33,

// Provided by VK_VERSION_1_1 with VK_EXT_debug_report
VK_DEBUG_REPORT_OBJECT_TYPE_SAMPLER_YCBCR_CONVERSION_EXT = 1000156000,

</tbody>
</table>

**Note**

The primary expected use of `VK_ERROR_VALIDATION_FAILED_EXT` is for validation layer testing. It is not expected that an application would see this error code during normal use of the validation layers.

To inject its own messages into the debug stream, call:

```c
// Provided by VK_EXT_debug_report
void vkDebugReportMessageEXT(
    VkInstance instance,
    VkDebugReportFlagsEXT flags,
    VkDebugReportObjectTypeEXT objectType,
    uint64_t object,
    size_t location,
    int32_t messageCode,
    const char* pLayerPrefix,
    const char* pMessage);
```

- **instance** is the debug stream's `VkInstance`.
- **flags** specifies the `VkDebugReportFlagBitsEXT` classification of this event/message.
- **objectType** is a `VkDebugReportObjectTypeEXT` specifying the type of object being used or created at the time the event was triggered.
- **object** is the object where the issue was detected. **object can be** `VK_NULL_HANDLE` if there is no object associated with the event.
- **location** is an application defined value.
• `messageCode` is an application defined value.
• `pLayerPrefix` is the abbreviation of the component making this event/message.
• `pMessage` is a null-terminated UTF-8 string detailing the trigger conditions.

The call will propagate through the layers and generate callback(s) as indicated by the message’s flags. The parameters are passed on to the callback in addition to the `pUserData` value that was defined at the time the callback was registered.

### Valid Usage

- **VUID-vkDebugReportMessageEXT-object-01241**
  - `object` must be a Vulkan object or `VK_NULL_HANDLE`

- **VUID-vkDebugReportMessageEXT-objectType-01498**
  - If `objectType` is not `VK_DEBUG_REPORT_OBJECT_TYPE_UNKNOWN_EXT` and `object` is not `VK_NULL_HANDLE`, `object` must be a Vulkan object of the corresponding type associated with `objectType` as defined in `VkDebugReportObjectTypeEXT` and Vulkan Handle Relationship

### Valid Usage (Implicit)

- **VUID-vkDebugReportMessageEXT-instance-parameter**
  - `instance` must be a valid `VkInstance` handle

- **VUID-vkDebugReportMessageEXT-flags-parameter**
  - `flags` must be a valid combination of `VkDebugReportFlagBitsEXT` values

- **VUID-vkDebugReportMessageEXT-flags-requiredbitmask**
  - `flags` must not be `0`

- **VUID-vkDebugReportMessageEXT-objectType-parameter**
  - `objectType` must be a valid `VkDebugReportObjectTypeEXT` value

- **VUID-vkDebugReportMessageEXT-pLayerPrefix-parameter**
  - `pLayerPrefix` must be a null-terminated UTF-8 string

- **VUID-vkDebugReportMessageEXT-pMessage-parameter**
  - `pMessage` must be a null-terminated UTF-8 string

To destroy a `VkDebugReportCallbackEXT` object, call:

```c
// Provided by VK_EXT_debug_report
void vkDestroyDebugReportCallbackEXT(
    VkInstance instance,        // instance is the instance where the callback was created.
    VkDebugReportCallbackEXT callback,         // callback is the VkDebugReportCallbackEXT object to destroy. callback is an externally
    const VkAllocationCallbacks* pAllocator);
```
synchronized object and must not be used on more than one thread at a time. This means that vkDestroyDebugReportCallbackEXT must not be called when a callback is active.

- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.

### Valid Usage

- VUID-vkDestroyDebugReportCallbackEXT-instance-01242
  If VkAllocationCallbacks were provided when callback was created, a compatible set of callbacks must be provided here.

- VUID-vkDestroyDebugReportCallbackEXT-instance-01243
  If no VkAllocationCallbacks were provided when callback was created, pAllocator must be NULL.

### Valid Usage (Implicit)

- VUID-vkDestroyDebugReportCallbackEXT-instance-parameter
  instance must be a valid VkInstance handle.

- VUID-vkDestroyDebugReportCallbackEXT-callback-parameter
  If callback is not VK_NULL_HANDLE, callback must be a valid VkDebugReportCallbackEXT handle.

- VUID-vkDestroyDebugReportCallbackEXT-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure.

- VUID-vkDestroyDebugReportCallbackEXT-callback-parent
  If callback is a valid handle, it must have been created, allocated, or retrieved from instance.

### Host Synchronization

- Host access to callback must be externally synchronized.

### 51.4. Device Loss Debugging

#### 51.4.1. Device Diagnostic Checkpoints

Device execution progress can be tracked for the purposes of debugging a device loss by annotating the command stream with application-defined diagnostic checkpoints.

Device diagnostic checkpoints are inserted into the command stream by calling vkCmdSetCheckpointNV.
void vkCmdSetCheckpointNV(
    VkCommandBuffer commandBuffer,
    const void* pCheckpointMarker);

- `commandBuffer` is the command buffer that will receive the marker
- `pCheckpointMarker` is an opaque application-provided value that will be associated with the checkpoint.

### Valid Usage (Implicit)

- **VUID-vkCmdSetCheckpointNV-commandBuffer-parameter**
  - `commandBuffer` must be a valid `VkCommandBuffer` handle
- **VUID-vkCmdSetCheckpointNV-commandBuffer-recording**
  - `commandBuffer` must be in the recording state
- **VUID-vkCmdSetCheckpointNV-commandBuffer-cmdpool**
  - The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, compute, or transfer operations
- **VUID-vkCmdSetCheckpointNV-videocoding**
  - This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td>Compute</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Transfer</td>
<td></td>
</tr>
</tbody>
</table>

Note that `pCheckpointMarker` is treated as an opaque value. It does not need to be a valid pointer and will not be dereferenced by the implementation.

If the device encounters an error during execution, the implementation will return a `VK_ERROR_DEVICE_LOST` error to the application at some point during host execution. When this happens, the application can call `vkGetQueueCheckpointData2NV` to retrieve information on the
most recent diagnostic checkpoints that were executed by the device.

```c
// Provided by VK_KHR_synchronization2 with VK_NV_device_diagnostic_checkpoints
void vkGetQueueCheckpointData2NV(
    VkQueue queue,
    uint32_t* pCheckpointDataCount,
    VkCheckpointData2NV* pCheckpointData);`

• `queue` is the `VkQueue` object the caller would like to retrieve checkpoint data for

• `pCheckpointDataCount` is a pointer to an integer related to the number of checkpoint markers available or queried, as described below.

• `pCheckpointData` is either `NULL` or a pointer to an array of `VkCheckpointData2NV` structures.

If `pCheckpointData` is `NULL`, then the number of checkpoint markers available is returned in `pCheckpointDataCount`. Otherwise, `pCheckpointDataCount` must point to a variable set by the user to the number of elements in the `pCheckpointData` array, and on return the variable is overwritten with the number of structures actually written to `pCheckpointData`.

If `pCheckpointDataCount` is less than the number of checkpoint markers available, at most `pCheckpointDataCount` structures will be written.

**Valid Usage**

- VUID-vkGetQueueCheckpointData2NV-queue-03892
  The device that `queue` belongs to must be in the lost state

**Valid Usage (Implicit)**

- VUID-vkGetQueueCheckpointData2NV-queue-parameter
  `queue` must be a valid `VkQueue` handle

- VUID-vkGetQueueCheckpointData2NV-pCheckpointDataCount-parameter
  `pCheckpointDataCount` must be a valid pointer to a `uint32_t` value

- VUID-vkGetQueueCheckpointData2NV-pCheckpointData-parameter
  If the value referenced by `pCheckpointDataCount` is not 0, and `pCheckpointData` is not `NULL`, `pCheckpointData` must be a valid pointer to an array of `pCheckpointDataCount` `VkCheckpointData2NV` structures

The `VkCheckpointData2NV` structure is defined as:
typedef struct VkCheckpointData2NV {
    VkStructureType sType;
    void* pNext;
    VkPipelineStageFlags2 stage;
    void* pCheckpointMarker;
} VkCheckpointData2NV;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **stage** indicates a single pipeline stage which the checkpoint marker data refers to.
- **pCheckpointMarker** contains the value of the last checkpoint marker executed in the stage that **stage** refers to.

### Valid Usage (Implicit)

- VUID-VkCheckpointData2NV-sType-sType
  * **sType** must be `VK_STRUCTURE_TYPE_CHECKPOINT_DATA_2_NV`
- VUID-VkCheckpointData2NV-pNext-pNext
  * **pNext** must be `NULL`

The stages at which a checkpoint marker can be executed are implementation-defined and can be queried by calling `vkGetPhysicalDeviceQueueFamilyProperties2`.

If the device encounters an error during execution, the implementation will return a `VK_ERROR_DEVICE_LOST` error to the application at a certain point during host execution. When this happens, the application can call `vkGetQueueCheckpointDataNV` to retrieve information on the most recent diagnostic checkpoints that were executed by the device.

```c
void vkGetQueueCheckpointDataNV(
    VkQueue queue,
    uint32_t* pCheckpointDataCount,
    VkCheckpointDataNV* pCheckpointData);
```

- **queue** is the `VkQueue` object the caller would like to retrieve checkpoint data for
- **pCheckpointDataCount** is a pointer to an integer related to the number of checkpoint markers available or queried, as described below.
- **pCheckpointData** is either `NULL` or a pointer to an array of `VkCheckpointDataNV` structures.

If **pCheckpointData** is `NULL`, then the number of checkpoint markers available is returned in **pCheckpointDataCount**.

Otherwise, **pCheckpointDataCount** must point to a variable set by the user to the number of elements
in the pCheckpointData array, and on return the variable is overwritten with the number of structures actually written to pCheckpointData.

If pCheckpointDataCount is less than the number of checkpoint markers available, at most pCheckpointDataCount structures will be written.

**Valid Usage**

- VUID-vkGetQueueCheckpointDataNV-queue-02025
  The device that queue belongs to must be in the lost state

**Valid Usage (Implicit)**

- VUID-vkGetQueueCheckpointDataNV-queue-parameter
  queue must be a valid VkQueue handle

- VUID-vkGetQueueCheckpointDataNV-pCheckpointDataCount-parameter
  pCheckpointDataCount must be a valid pointer to a uint32_t value

- VUID-vkGetQueueCheckpointDataNV-pCheckpointData-parameter
  If the value referenced by pCheckpointDataCount is not 0, and pCheckpointData is not NULL, pCheckpointData must be a valid pointer to an array of pCheckpointDataCount VkCheckpointDataNV structures

The VkCheckpointDataNV structure is defined as:

```c
// Provided by VK_NV_device_diagnostic_checkpoints
typedef struct VkCheckpointDataNV {
    VkStructureType sType;
    void* pNext;
    VkPipelineStageFlagBits stage;
    void* pCheckpointMarker;
} VkCheckpointDataNV;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- stage is a VkPipelineStageFlagBits value specifying which pipeline stage the checkpoint marker data refers to.
- pCheckpointMarker contains the value of the last checkpoint marker executed in the stage that stage refers to.

The stages at which a checkpoint marker can be executed are implementation-defined and can be queried by calling vkGetPhysicalDeviceQueueFamilyProperties2.
51.4.2. Device Fault Diagnosis

To retrieve diagnostic information about faults that may have caused device loss, call:

```c
// Provided by VK_EXT_device_fault
VkResult vkGetDeviceFaultInfoEXT(
    VkDevice device,
    VkDeviceFaultCountsEXT* pFaultCounts,
    VkDeviceFaultInfoEXT* pFaultInfo);
```

- `device` is the logical device from which to query the diagnostic fault information.
- `pFaultCounts` is a pointer to a `VkDeviceFaultCountsEXT` structure in which counts for structures describing additional fault information are returned.
- `pFaultInfo` is `NULL` or a pointer to a `VkDeviceFaultInfoEXT` structure in which fault information is returned.

If `pFaultInfo` is `NULL`, then the counts of corresponding additional fault information structures available are returned in the `addressInfoCount` and `vendorInfoCount` members of `pFaultCounts`. Additionally, the size of any vendor-specific binary crash dump is returned in the `vendorBinarySize` member of `pFaultCounts`.

If `pFaultInfo` is not `NULL`, `pFaultCounts` must point to a `VkDeviceFaultCountsEXT` structure with each structure count or size member (`addressInfoCount`, `vendorInfoCount`, `vendorBinarySize`) set by the user to the number of elements in the corresponding output array member of `pFaultInfo` (pAddressInfos and pVendorInfos), or to the size of the output buffer in bytes (`pVendorBinaryData`). On return, each structure count member is overwritten with the number of structures actually written to the corresponding output array member of `pFaultInfo`. Similarly, `vendorBinarySize` is overwritten with the number of bytes actually written to the `pVendorBinaryData` member of `pFaultInfo`.

If the `vendor-specific crash dumps` feature is not enabled, then implementations must set `pFaultCounts->vendorBinarySize` to zero and must not modify `pFaultInfo->pVendorBinaryData`.

If any `pFaultCounts` structure count member is less than the number of corresponding fault properties available, at most structure count (`addressInfoCount`, `vendorInfoCount`) elements will be written to the associated `pFaultInfo` output array. Similarly, if `vendorBinarySize` is less than the size in bytes of the available crash dump data, at most `vendorBinarySize` elements will be written to `pVendorBinaryData`.

If `pFaultInfo` is `NULL`, then subsequent calls to `vkGetDeviceFaultInfoEXT` for the same `device` must
return identical values in the addressInfoCount, vendorInfoCount and vendorBinarySize members of pFaultCounts.

If pFaultInfo is not NULL, then subsequent calls to vkGetDeviceFaultInfoEXT for the same device must return identical values in the output members of pFaultInfo (pAddressInfos, pVendorInfos, pVendorBinaryData), up to the limits described by the structure count and buffer size members of pFaultCounts (addressInfoCount, vendorInfoCount, vendorBinarySize). If the sizes of the output members of pFaultInfo increase for a subsequent call to vkGetDeviceFaultInfoEXT, then supplementary information may be returned in the additional available space.

If any pFaultCounts structure count member is smaller than the number of corresponding fault properties available, or if pFaultCounts->vendorBinarySize is smaller than the size in bytes of the generated binary crash dump data, VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available properties were returned.

If pFaultCounts->vendorBinarySize is less than what is necessary to store the binary crash dump header, nothing will be written to pFaultInfo->pVendorBinaryData and zero will be written to pFaultCounts->vendorBinarySize.

### Valid Usage

- **VUID-vkGetDeviceFaultInfoEXT-device-07336**
  
  device must be in the lost state

- **VUID-vkGetDeviceFaultInfoEXT-pFaultCounts-07337**
  
  If the value referenced by pFaultCounts->addressInfoCount is not 0, and pFaultInfo->pAddressInfos is not NULL, pFaultInfo->pAddressInfos must be a valid pointer to an array of pFaultCounts->addressInfoCount VkDeviceFaultAddressInfoEXT structures

- **VUID-vkGetDeviceFaultInfoEXT-pFaultCounts-07338**
  
  If the value referenced by pFaultCounts->vendorInfoCount is not 0, and pFaultInfo->pVendorInfos is not NULL, pFaultInfo->pVendorInfos must be a valid pointer to an array of pFaultCounts->vendorInfoCount VkDeviceFaultVendorInfoEXT structures

- **VUID-vkGetDeviceFaultInfoEXT-pFaultCounts-07339**
  
  If the value referenced by pFaultCounts->vendorBinarySize is not 0, and pFaultInfo->pVendorBinaryData is not NULL, pFaultInfo->pVendorBinaryData must be a valid pointer to an array of pFaultCounts->vendorBinarySize bytes

### Valid Usage (Implicit)

- **VUID-vkGetDeviceFaultInfoEXT-device-parameter**
  
  device must be a valid VkDevice handle

- **VUID-vkGetDeviceFaultInfoEXT-pFaultCounts-parameter**
  
  pFaultCounts must be a valid pointer to a VkDeviceFaultCountsEXT structure

- **VUID-vkGetDeviceFaultInfoEXT-pFaultInfo-parameter**
  
  If pFaultInfo is not NULL, pFaultInfo must be a valid pointer to a VkDeviceFaultInfoEXT structure
Return Codes

Success
• VK_SUCCESS
• VK_INCOMPLETE

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY

The `VkDeviceFaultCountsEXT` structure is defined as:

```c
// Provided by VK_EXT_device_fault
typedef struct VkDeviceFaultCountsEXT {
    VkStructureType sType;
    void* pNext;
    uint32_t addressInfoCount;
    uint32_t vendorInfoCount;
    VkDeviceSize vendorBinarySize;
} VkDeviceFaultCountsEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `addressInfoCount` is the number of `VkDeviceFaultAddressInfoEXT` structures describing either memory accesses which may have caused a page fault, or the addresses of active instructions at the time of the fault.
- `vendorInfoCount` is the number of `VkDeviceFaultVendorInfoEXT` structures describing vendor-specific fault information.
- `vendorBinarySize` is the size in bytes of a vendor-specific binary crash dump, which may provide additional information when imported into external tools.

Valid Usage (Implicit)

- VUID-VkDeviceFaultCountsEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPEDEVICE_FAULT_COUNTS_EXT`
- VUID-VkDeviceFaultCountsEXT-pNext-pNext
  `pNext` must be NULL

The `VkDeviceFaultInfoEXT` structure is defined as:
// Provided by VK_EXT_device_fault

typedef struct VkDeviceFaultInfoEXT {
    VkStructureType sType;
    void* pNext;
    char description[VK_MAX_DESCRIPTION_SIZE];
    VkDeviceFaultAddressInfoEXT* pAddressInfos;
    VkDeviceFaultVendorInfoEXT* pVendorInfos;
    void* pVendorBinaryData;
} VkDeviceFaultInfoEXT;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **description** is an array of VK_MAX_DESCRIPTION_SIZE char containing a null-terminated UTF-8 string which is a human readable description of the fault.
- **pAddressInfos** is NULL or a pointer to an array of VkDeviceFaultAddressInfoEXT structures describing either memory accesses which may have caused a page fault, or describing active instruction pointers at the time of the fault. If not NULL, each element of pAddressInfos describes the a bounded region of GPU virtual address space containing either the GPU virtual address accessed, or the value of an active instruction pointer.
- **pVendorInfos** is NULL or a pointer to an array of VkDeviceFaultVendorInfoEXT structures describing vendor-specific fault information.
- **pVendorBinaryData** is NULL or a pointer to vendorBinarySize number of bytes of data, which will be populated with a vendor-specific binary crash dump, as described in Vendor Binary Crash Dumps.

An implementation should populate as many members of VkDeviceFaultInfoEXT as possible, given the information available at the time of the fault and the constraints of the implementation itself.

Due to hardware limitations, pAddressInfos describes ranges of GPU virtual address space, rather than precise addresses. The precise memory address accessed or the precise value of the instruction pointer must lie within the region described.

**Note**

Each element of pAddressInfos describes either:

- A memory access which may have triggered a page fault and may have contributed to device loss
- The value of an active instruction pointer at the time a fault occurred. This value may be indicative of the active pipeline or shader at the time of device loss

Comparison of the GPU virtual addresses described by pAddressInfos to GPU virtual address ranges reported by the VK_EXT_device_address_binding_report extension may allow applications to correlate between these addresses and Vulkan objects. Applications should be aware that these addresses may also correspond to
resources internal to an implementation, which will not be reported via the VK_EXT_device_address_binding_report extension.

Valid Usage (Implicit)

• VUID-VkDeviceFaultInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEVICE_FAULT_INFO_EXT

• VUID-VkDeviceFaultInfoEXT-pNext-pNext
  pNext must be NULL

The VkDeviceFaultAddressInfoEXT structure is defined as:

```c
// Provided by VK_EXT_device_fault
typedef struct VkDeviceFaultAddressInfoEXT {
  VkDeviceFaultAddressTypeEXT addressType;
  VkDeviceAddress reportedAddress;
  VkDeviceSize addressPrecision;
} VkDeviceFaultAddressInfoEXT;
```

• **addressType** is either the type of memory operation that triggered a page fault, or the type of association between an instruction pointer and a fault.

• **reportedAddress** is the GPU virtual address recorded by the device.

• **addressPrecision** is a power of two value that specifies how precisely the device can report the address.

The combination of **reportedAddress** and **addressPrecision** allow the possible range of addresses to be calculated, such that:

```
lower_address = (pInfo->reportedAddress & ~(pInfo->addressPrecision-1))
upper_address = (pInfo->reportedAddress | (pInfo->addressPrecision-1))
```

**Note**

It is valid for the **reportedAddress** to contain a more precise address than indicated by **addressPrecision**. In this case, the value of **reportedAddress** should be treated as an additional hint as to the value of the address that triggered the page fault, or to the value of an instruction pointer.

Valid Usage (Implicit)

• VUID-VkDeviceFaultAddressInfoEXT-addressType-parameter
  addressType must be a valid VkDeviceFaultAddressTypeEXT value

Possible values of VkDeviceFaultAddressInfoEXT::addressType are:
typedef enum VkDeviceFaultAddressTypeEXT {
    VK_DEVICE_FAULT_ADDRESS_TYPE_NONE_EXT = 0,
    VK_DEVICE_FAULT_ADDRESS_TYPE_READ_INVALID_EXT = 1,
    VK_DEVICE_FAULT_ADDRESS_TYPE_WRITE_INVALID_EXT = 2,
    VK_DEVICE_FAULT_ADDRESS_TYPE_EXECUTE_INVALID_EXT = 3,
    VK_DEVICE_FAULT_ADDRESS_TYPE_INSTRUCTION_POINTER_UNKNOWN_EXT = 4,
    VK_DEVICE_FAULT_ADDRESS_TYPE_INSTRUCTION_POINTER_INVALID_EXT = 5,
    VK_DEVICE_FAULT_ADDRESS_TYPE_INSTRUCTION_POINTER_FAULT_EXT = 6,
} VkDeviceFaultAddressTypeEXT;

- **VK_DEVICE_FAULT_ADDRESS_TYPE_NONE_EXT** specifies that VkDeviceFaultAddressInfoEXT does not describe a page fault, or an instruction address.

- **VK_DEVICE_FAULT_ADDRESS_TYPE_READ_INVALID_EXT** specifies that VkDeviceFaultAddressInfoEXT describes a page fault triggered by an invalid read operation.

- **VK_DEVICE_FAULT_ADDRESS_TYPE_WRITE_INVALID_EXT** specifies that VkDeviceFaultAddressInfoEXT describes a page fault triggered by an invalid write operation.

- **VK_DEVICE_FAULT_ADDRESS_TYPE_EXECUTE_INVALID_EXT** describes a page fault triggered by an attempt to execute non-executable memory.

- **VK_DEVICE_FAULT_ADDRESS_TYPE_INSTRUCTION_POINTER_UNKNOWN_EXT** specifies an instruction pointer value at the time the fault occurred. This may or may not be related to a fault.

- **VK_DEVICE_FAULT_ADDRESS_TYPE_INSTRUCTION_POINTER_INVALID_EXT** specifies an instruction pointer value associated with an invalid instruction fault.

- **VK_DEVICE_FAULT_ADDRESS_TYPE_INSTRUCTION_POINTER_FAULT_EXT** specifies an instruction pointer value associated with a fault.

  **Note**
  
  The instruction pointer values recorded may not identify the specific instruction(s) that triggered the fault. The relationship between the instruction pointer reported and triggering instruction will be vendor-specific.

The VkDeviceFaultVendorInfoEXT structure is defined as:

```c
// Provided by VK_EXT_device_fault
typedef struct VkDeviceFaultVendorInfoEXT {
    char      description[VK_MAX_DESCRIPTION_SIZE];
    uint64_t  vendorFaultCode;
    uint64_t  vendorFaultData;
} VkDeviceFaultVendorInfoEXT;
```

- **description** is an array of VK_MAX_DESCRIPTION_SIZE char containing a null-terminated UTF-8 string which is a human readable description of the fault.

- **vendorFaultCode** is the vendor-specific fault code for this fault.
• **vendorFaultData** is the vendor-specific fault data associated with this fault.

## Vendor Binary Crash Dumps

Applications *can* store the vendor-specific binary crash dump data retrieved by calling `vkGetDeviceFaultInfoEXT` for later analysis using external tools.

However, the format of this data *may* depend on the vendor ID, device ID, driver version, and other details of the device. To enable external applications to identify the original device from which a crash dump was generated, the initial bytes written to `VkDeviceFaultInfoEXT::pVendorBinaryData` must begin with a valid crash dump header.

Version one of the crash dump header is defined as:

```c
// Provided by VK_EXT_device_fault
typedef struct VkDeviceFaultVendorBinaryHeaderVersionOneEXT {
    uint32_t headerSize;
    VkDeviceFaultVendorBinaryHeaderVersionEXT headerVersion;
    uint32_t vendorID;
    uint32_t deviceID;
    uint32_t driverVersion;
    uint8_t pipelineCacheUUID[VK_UUID_SIZE];
    uint32_t applicationNameOffset;
    uint32_t applicationVersion;
    uint32_t engineNameOffset;
    uint32_t engineVersion;
    uint32_t apiVersion;
} VkDeviceFaultVendorBinaryHeaderVersionOneEXT;
```

- **headerSize** is the length in bytes of the crash dump header.
- **headerVersion** is a `VkDeviceFaultVendorBinaryHeaderVersionEXT` enum value specifying the version of the header. A consumer of the crash dump should use the header version to interpret the remainder of the header.
- **vendorID** is the `VkPhysicalDeviceProperties::vendorID` of the implementation.
- **deviceID** is the `VkPhysicalDeviceProperties::deviceID` of the implementation.
- **driverVersion** is the `VkPhysicalDeviceProperties::driverVersion` of the implementation.
- **pipelineCacheUUID** is an array of `VK_UUID_SIZE` `uint8_t` values matching the `VkPhysicalDeviceProperties::pipelineCacheUUID` property of the implementation.
- **applicationNameOffset** is zero, or an offset from the base address of the crash dump header to a null-terminated UTF-8 string containing the name of the application. If `applicationNameOffset` is non-zero, this string must match the application name specified via `VkApplicationInfo::pApplicationName` during instance creation.
- **applicationVersion** must be zero or the value specified by `VkApplicationInfo::applicationVersion` during instance creation.
- **engineNameOffset** is zero, or an offset from the base address of the crash dump header to a null-
terminated UTF-8 string containing the name of the engine (if any) used to create the application. If `engineNameOffset` is non-zero, this string must match the engine name specified via `VkApplicationInfo::pEngineName` during instance creation.

- `engineVersion` must be zero or the value specified by `VkApplicationInfo::engineVersion` during instance creation.
- `apiVersion` must be zero or the value specified by `VkApplicationInfo::apiVersion` during instance creation.

Unlike most structures declared by the Vulkan API, all fields of this structure are written with the least significant byte first, regardless of host byte-order.

The C language specification does not define the packing of structure members. This layout assumes tight structure member packing, with members laid out in the order listed in the structure, and the intended size of the structure is 56 bytes. If a compiler produces code that diverges from that pattern, applications must employ another method to set values at the correct offsets.

**Valid Usage**

- VUID-VkDeviceFaultVendorBinaryHeaderVersionOneEXT-headerSize-07340
  - `headerSize` must be 56

- VUID-VkDeviceFaultVendorBinaryHeaderVersionOneEXT-headerVersion-07341
  - `headerVersion` must be `VKDEVICEFAULT_VENDOR_BINARY_HEADER_VERSION_ONE_EXT`

**Valid Usage (Implicit)**

- VUID-VkDeviceFaultVendorBinaryHeaderVersionOneEXT-headerVersion-parameter
  - `headerVersion` must be a valid `VkDeviceFaultVendorBinaryHeaderVersionEXT` value

Possible values of the `headerVersion` value of the crash dump header are:

```c
// Provided by VK_EXT_device_fault
typedef enum VkDeviceFaultVendorBinaryHeaderVersionEXT {
    VKDEVICEFAULT_VENDOR_BINARY_HEADER_VERSION_ONE_EXT = 1,
} VkDeviceFaultVendorBinaryHeaderVersionEXT;
```

- `VKDEVICEFAULT_VENDOR_BINARY_HEADER_VERSION_ONE_EXT` specifies version one of the binary crash dump header.

**51.5. Active Tooling Information**

Information about tools providing debugging, profiling, or similar services, active for a given physical device, can be obtained by calling:
// Provided by VK_VERSION_1_3
VkResult vkGetPhysicalDeviceToolProperties(
    VkPhysicalDevice physicalDevice,
    uint32_t* pToolCount,
    VkPhysicalDeviceToolProperties* pToolProperties);

or the equivalent command

// Provided by VK_EXT_tooling_info
VkResult vkGetPhysicalDeviceToolPropertiesEXT(
    VkPhysicalDevice physicalDevice,
    uint32_t* pToolCount,
    VkPhysicalDeviceToolProperties* pToolProperties);

- **physicalDevice** is the handle to the physical device to query for active tools.
- **pToolCount** is a pointer to an integer describing the number of tools active on **physicalDevice**.
- **pToolProperties** is either **NULL** or a pointer to an array of **VkPhysicalDeviceToolProperties** structures.

If **pToolProperties** is **NULL**, then the number of tools currently active on **physicalDevice** is returned in **pToolCount**. Otherwise, **pToolCount** must point to a variable set by the user to the number of elements in the **pToolProperties** array, and on return the variable is overwritten with the number of structures actually written to **pToolProperties**. If **pToolCount** is less than the number of currently active tools, at most **pToolCount** structures will be written.

The count and properties of active tools may change in response to events outside the scope of the specification. An application should assume these properties might change at any given time.

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceToolProperties-physicalDevice-parameter **physicalDevice** must be a valid **VkPhysicalDevice** handle
- VUID-vkGetPhysicalDeviceToolProperties-pToolCount-parameter **pToolCount** must be a valid pointer to a uint32_t value
- VUID-vkGetPhysicalDeviceToolProperties-pToolProperties-parameter If the value referenced by **pToolCount** is not 0, and **pToolProperties** is not **NULL**, **pToolProperties** must be a valid pointer to an array of **pToolCount** **VkPhysicalDeviceToolProperties** structures

### Return Codes

**Success**
- **VK_SUCCESS**
The `VkPhysicalDeviceToolProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceToolProperties {
    VkStructureType sType;
    void* pNext;
    char name[VK_MAX_EXTENSION_NAME_SIZE];
    char version[VK_MAX_EXTENSION_NAME_SIZE];
    VkToolPurposeFlags purposes;
    char description[VK_MAX_DESCRIPTION_SIZE];
    char layer[VK_MAX_EXTENSION_NAME_SIZE];
} VkPhysicalDeviceToolProperties;
```

or the equivalent

```c
// Provided by VK_EXT_tooling_info
typedef VkPhysicalDeviceToolProperties VkPhysicalDeviceToolPropertiesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `name` is a null-terminated UTF-8 string containing the name of the tool.
- `version` is a null-terminated UTF-8 string containing the version of the tool.
- `purposes` is a bitmask of `VkToolPurposeFlagBits` which is populated with purposes supported by the tool.
- `description` is a null-terminated UTF-8 string containing a description of the tool.
- `layer` is a null-terminated UTF-8 string containing the name of the layer implementing the tool, if the tool is implemented in a layer - otherwise it may be an empty string.

### Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceToolProperties-sType-sType`

  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TOOL_PROPERTIES`

- `VUID-VkPhysicalDeviceToolProperties-pNext-pNext`

  `pNext` must be `NULL`

Bits which can be set in `VkPhysicalDeviceToolProperties::purposes`, specifying the purposes of an active tool, are:
typedef enum VkToolPurposeFlagBits {
    VK_TOOL_PURPOSE_VALIDATION_BIT = 0x00000001,
    VK_TOOL_PURPOSE_PROFILING_BIT = 0x00000002,
    VK_TOOL_PURPOSE_TRACING_BIT = 0x00000004,
    VK_TOOL_PURPOSE_ADDITIONAL_FEATURES_BIT = 0x00000008,
    VK_TOOL_PURPOSE_MODIFYING_FEATURES_BIT = 0x00000010,
    VK_TOOL_PURPOSE_DEBUG_REPORTING_BIT_EXT = 0x00000020,
    VK_TOOL_PURPOSE_DEBUG_MARKERS_BIT_EXT = 0x00000040,
    VK_TOOL_PURPOSE_MODIFYING_FEATURES_BIT_EXT
} VkToolPurposeFlagBits;

or the equivalent

typedef VkToolPurposeFlagBits VkToolPurposeFlagBitsEXT;

- **VK_TOOL_PURPOSE_VALIDATION_BIT** specifies that the tool provides validation of API usage.
- **VK_TOOL_PURPOSE_PROFILING_BIT** specifies that the tool provides profiling of API usage.
- **VK_TOOL_PURPOSE_TRACING_BIT** specifies that the tool is capturing data about the application’s API usage, including anything from simple logging to capturing data for later replay.
- **VK_TOOL_PURPOSE_ADDITIONAL_FEATURES_BIT** specifies that the tool provides additional API features/extensions on top of the underlying implementation.
- **VK_TOOL_PURPOSE_MODIFYING_FEATURES_BIT** specifies that the tool modifies the API features/limits/extensions presented to the application.
- **VK_TOOL_PURPOSE_DEBUG_REPORTING_BIT_EXT** specifies that the tool reports additional information to the application via callbacks specified by `vkCreateDebugReportCallbackEXT` or `vkCreateDebugUtilsMessengerEXT`.
- **VK_TOOL_PURPOSE_DEBUG_MARKERS_BIT_EXT** specifies that the tool consumes debug markers or object debug annotation, queue labels, or command buffer labels.

typedef VkFlags VkToolPurposeFlags;
typedef VkToolPurposeFlags VkToolPurposeFlagsEXT;

VkToolPurposeFlags is a bitmask type for setting a mask of zero or more VkToolPurposeFlagBits.

51.6. Frame Boundary

The VkFrameBoundaryEXT structure is defined as:

```c
typedef struct VkFrameBoundaryEXT {
    VkStructureType sType;
    const void* pNext;
    VkFrameBoundaryFlagsEXT flags;
    uint64_t frameID;
    uint32_t imageCount;
    const VkImage* pImages;
    uint32_t bufferCount;
    const VkBuffer* pBuffers;
    uint64_t tagName;
    size_t tagSize;
    const void* pTag;
} VkFrameBoundaryEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkFrameBoundaryFlagBitsEXT that can flag the last submission of a frame identifier.
- `frameID` is the frame identifier.
- `imageCount` is the number of images that store frame results.
- `pImages` is a pointer to an array of VkImage objects with imageCount entries.
- `bufferCount` is the number of buffers the store the frame results.
- `pBuffers` is a pointer to an array of VkBuffer objects with bufferCount entries.
- `tagName` is a numerical identifier for tag data.
- `tagSize` is the number of bytes of tag data.
- `pTag` is a pointer to an array of tagSize bytes containing tag data.

The application can associate frame boundary information to a queue submission call by adding a VkFrameBoundaryEXT structure to the pNext chain of queue submission, VkPresentInfoKHR, or VkBindSparseInfo.
The frame identifier is used to associate one or more queue submission to a frame, it is thus meant to be unique within a frame lifetime, i.e. it is possible (but not recommended) to reuse frame identifiers, as long as any two frames with any chance of having overlapping queue submissions (as in the example above) use two different frame identifiers.

**Note**

Since the concept of frame is application-dependent, there is no way to validate the use of frame identifier. It is good practice to use a monotonically increasing counter as the frame identifier and not reuse identifiers between frames.

The `pImages` and `pBuffers` arrays contain a list of images and buffers which store the "end result" of the frame. As the concept of frame is application-dependent, not all frames may produce their results in images or buffers, yet this is a sufficiently common case to be handled by `VkFrameBoundaryEXT`. Note that no extra information, such as image layout is being provided, since the images are meant to be used by tools which would already be tracking this required information. Having the possibility of passing a list of end-result images makes `VkFrameBoundaryEXT` as expressive as `vkQueuePresentKHR`, which is often the default frame boundary delimiter.

The application can also associate arbitrary extra information via tag data using `tagName`, `tagSize` and `pTag`. This extra information is typically tool-specific.

**Valid Usage (Implicit)**

- **VUID-VkFrameBoundaryEXT-sType-sType**
  
  `sType` **must** be `VK_STRUCTURE_TYPE_FRAME_BOUNDARY_EXT`

- **VUID-VkFrameBoundaryEXT-flags-parameter**
  
  `flags` **must** be a valid combination of `VkFrameBoundaryFlagBitsEXT` values

- **VUID-VkFrameBoundaryEXT-pImages-parameter**
  
  If `imageCount` is not 0, and `pImages` is not NULL, `pImages` **must** be a valid pointer to an array of `imageCount` valid `VkImage` handles

- **VUID-VkFrameBoundaryEXT-pBuffers-parameter**
  
  If `bufferCount` is not 0, and `pBuffers` is not NULL, `pBuffers` **must** be a valid pointer to an array of `bufferCount` valid `VkBuffer` handles

- **VUID-VkFrameBoundaryEXT-pTag-parameter**
  
  If `tagSize` is not 0, and `pTag` is not NULL, `pTag` **must** be a valid pointer to an array of `tagSize` bytes

- **VUID-VkFrameBoundaryEXT-commonparent**
  
  Both of the elements of `pBuffers`, and the elements of `pImages` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

The bit which can be set in `VkFrameBoundaryEXT::flags` is:
typedef enum VkFrameBoundaryFlagBitsEXT {
    VK_FRAME_BOUNDARY_FRAME_END_BIT_EXT = 0x00000001,
} VkFrameBoundaryFlagBitsEXT;

- **VK_FRAME_BOUNDARY_FRAME_END_BIT_EXT** specifies that this queue submission is the last one for this frame, i.e. once this queue submission has terminated, then the work for this frame is completed.

Note that in the presence of timeline semaphores, the last queue submission might not be the last one to be submitted, as timeline semaphores allow for wait-before-signal submissions. In the context of frame boundary, the queue submission that should be done flagged as the last one is the one that is meant to be executed last, even if it **may** not be the last one to be submitted.

typedef VkFlags VkFrameBoundaryFlagsEXT;

 VkFrameBoundaryFlagsEXT is a bitmask type for setting a mask of zero or more VkFrameBoundaryFlagBitsEXT.
Appendix A: Vulkan Environment for SPIR-V

Shaders for Vulkan are defined by the Khronos SPIR-V Specification as well as the Khronos SPIR-V Extended Instructions for GLSL Specification. This appendix defines additional SPIR-V requirements applying to Vulkan shaders.

Versions and Formats

A Vulkan 1.3 implementation must support the 1.0, 1.1, 1.2, 1.3, 1.4, 1.5, and 1.6 versions of SPIR-V and the 1.0 version of the SPIR-V Extended Instructions for GLSL.

A SPIR-V module passed into vkCreateShaderModule is interpreted as a series of 32-bit words in host endianness, with literal strings packed as described in section 2.2 of the SPIR-V Specification. The first few words of the SPIR-V module must be a magic number and a SPIR-V version number, as described in section 2.3 of the SPIR-V Specification.

Capabilities

The table below lists the set of SPIR-V capabilities that may be supported in Vulkan implementations. The application must not use any of these capabilities in SPIR-V passed to vkCreateShaderModule unless one of the following conditions is met for the VkDevice specified in the device parameter of vkCreateShaderModule:

- The corresponding field in the table is blank.
- Any corresponding Vulkan feature is enabled.
- Any corresponding Vulkan extension is enabled.
- Any corresponding Vulkan property is supported.
- The corresponding core version is supported (as returned by VkPhysicalDeviceProperties::apiVersion).

The application **must** not pass a SPIR-V module containing any of the following to `vkCreateShaderModule`:

- any `OpCapability` not listed above,
- an unsupported capability, or
- a capability which corresponds to a Vulkan feature or extension which has not been enabled.

### SPIR-V Extensions

The following table lists SPIR-V extensions that implementations **may** support. The application **must** not pass a SPIR-V module to `vkCreateShaderModule` that uses the following SPIR-V extensions unless one of the following conditions is met for the `VkDevice` specified in the `device` parameter of `vkCreateShaderModule`:

- Any corresponding Vulkan extension is enabled.
- The corresponding core version is supported (as returned by `VkPhysicalDeviceProperties::apiVersion`).

**Validation Rules Within a Module**

A SPIR-V module passed to `vkCreateShaderModule` must conform to the following rules:

### Standalone SPIR-V Validation

The following rules can be validated with only the SPIR-V module itself. They do not depend on knowledge of the implementation and its capabilities or knowledge of runtime information, such as enabled features.
Valid Usage

- VUID-StandaloneSpirv-None-04633
  Every entry point **must** have no return value and accept no arguments

- VUID-StandaloneSpirv-None-04634
  The static function-call graph for an entry point **must** not contain cycles; that is, static recursion is not allowed

- VUID-StandaloneSpirv-None-04635
  The Logical or PhysicalStorageBuffer64 addressing model **must** be selected

- VUID-StandaloneSpirv-None-04636
  Scope for execution **must** be limited to Workgroup or Subgroup

- VUID-StandaloneSpirv-None-04637
  If the Scope for execution is Workgroup, then it **must** only be used in the task, mesh, tessellation control, or compute Execution Model

- VUID-StandaloneSpirv-None-04638
  Scope for memory **must** be limited to Device, QueueFamily, Workgroup, ShaderCallKHR, Subgroup, or Invocation

- VUID-StandaloneSpirv-ExecutionModel-07320
  If the Execution Model is TessellationControl, and the MemoryModel is GLSL450, the Scope for memory **must** not be Workgroup

- VUID-StandaloneSpirv-None-07321
  If the Scope for memory is Workgroup, then it **must** only be used in the task, mesh, tessellation control, or compute Execution Model

- VUID-StandaloneSpirv-None-04640
  If the Scope for memory is ShaderCallKHR, then it **must** only be used in ray generation, intersection, closest hit, any-hit, miss, and callable Execution Model

- VUID-StandaloneSpirv-None-04641
  If the Scope for memory is Invocation, then memory semantics **must** be None

- VUID-StandaloneSpirv-None-04642
  Scope for group operations **must** be limited to Subgroup

- VUID-StandaloneSpirv-SubgroupVoteKHR-07951
  If none of the SubgroupVoteKHR, GroupNonUniform, or SubgroupBallotKHR capabilities are declared, Scope for memory **must** not be Subgroup

- VUID-StandaloneSpirv-None-04643
  Storage Class **must** be limited to UniformConstant, Input, Uniform, Output, Workgroup, Private, Function, PushConstant, Image, StorageBuffer, RayPayloadKHR, IncomingRayPayloadKHR, HitAttributeKHR, CallableDataKHR, IncomingCallableDataKHR, ShaderRecordBufferKHR, PhysicalStorageBuffer, or TileImageEXT

- VUID-StandaloneSpirv-None-04644
  If the Storage Class is Output, then it **must** not be used in the GlCompute, RayGenerationKHR, IntersectionKHR, AnyHitKHR, ClosestHitKHR, MissKHR, or CallableKHR Execution Model

- VUID-StandaloneSpirv-None-04645
If the Storage Class is Workgroup, then it must only be used in the task, mesh, or compute Execution Model.

- VUID-StandaloneSpirv-None-08720
  If the Storage Class is TileImageEXT, then it must only be used in the fragment execution model.

- VUID-StandaloneSpirv-OpAtomicStore-04730
  OpAtomicStore must not use Acquire, AcquireRelease, or SequentiallyConsistent memory semantics.

- VUID-StandaloneSpirv-OpAtomicLoad-04731
  OpAtomicLoad must not use Release, AcquireRelease, or SequentiallyConsistent memory semantics.

- VUID-StandaloneSpirv-OpMemoryBarrier-04732
  OpMemoryBarrier must use one of Acquire, Release, AcquireRelease, or SequentiallyConsistent memory semantics.

- VUID-StandaloneSpirv-OpMemoryBarrier-04733
  OpMemoryBarrier must include at least one Storage Class.

- VUID-StandaloneSpirv-OpControlBarrier-04650
  If the semantics for OpControlBarrier includes one of Acquire, Release, AcquireRelease, or SequentiallyConsistent memory semantics, then it must include at least one Storage Class.

- VUID-StandaloneSpirv-OpVariable-04651
  Any OpVariable with an Initializer operand must have Output, Private, Function, or Workgroup as its Storage Class operand.

- VUID-StandaloneSpirv-OpVariable-04734
  Any OpVariable with an Initializer operand and Workgroup as its Storage Class operand must use OpConstantNull as the initializer.

- VUID-StandaloneSpirv-OpReadClockKHR-04652
  Scope for OpReadClockKHR must be limited to Subgroup or Device.

- VUID-StandaloneSpirv-OriginLowerLeft-04653
  The OriginLowerLeft Execution Mode must not be used; fragment entry points must declare OriginUpperLeft.

- VUID-StandaloneSpirv-PixelCenterInteger-04654
  The PixelCenterInteger Execution Mode must not be used (pixels are always centered at half-integer coordinates).

- VUID-StandaloneSpirv-UniformConstant-04655
  Any variable in the UniformConstant Storage Class must be typed as either OpTypeImage, OpTypeSampler, OpTypeSampledImage, OpTypeAccelerationStructureKHR, or an array of one of these types.

- VUID-StandaloneSpirv-Uniform-06807
  Any variable in the Uniform or StorageBuffer Storage Class must be typed as OpTypeStruct or an array of this type.

- VUID-StandaloneSpirv-PushConstant-06808
  Any variable in the PushConstant Storage Class must be typed as OpTypeStruct.
OpTypeImage must declare a scalar 32-bit float, 64-bit integer, or 32-bit integer type for the “Sampled Type” (RelaxedPrecision can be applied to a sampling instruction and to the variable holding the result of a sampling instruction).

OpTypeImage must have a “Sampled” operand of 1 (sampled image) or 2 (storage image).

OpTypeSampledImage must have a OpTypeImage with a “Sampled” operand of 1 (sampled image).

The SPIR-V Type of the Image Format operand of an OpTypeImage must match the Sampled Type, as defined in Image Format and Type Matching.

If an OpImageTexelPointer is used in an atomic operation, the image type of the image parameter to OpImageTexelPointer must have an image format of R64i, R64ui, R32f, R32i, or R32ui.

OpImageQuerySizeLod, OpImageQueryLod, and OpImageQueryLevels must only consume an “Image” operand whose type has its “Sampled” operand set to 1.

An OpTypeImage must not have a “Dim” operand of Rect.

An OpTypeImage with a “Dim” operand of SubpassData must have an “Arrayed” operand of 0 (non-arrayed) and a “Sampled” operand of 2 (storage image).

The (u,v) coordinates used for a SubpassData must be the <id> of a constant vector (0,0).

Objects of types OpTypeImage, OpTypeSampler, OpTypeSampledImage, OpTypeAccelerationStructureKHR, and arrays of these types must not be stored to or modified.

Any variable in the Uniform Storage Class decorated as Block must not be stored to or modified.

Image operand Offset must only be used with OpImage*Gather instructions.

Any image instruction which uses an Offset, ConstOffset, or ConstOffsets image operand, must only consume a “Sampled Image” operand whose type has its “Sampled” operand set to 1.

The “Component” operand of OpImageGather, and OpImageSparseGather must be the <id> of a constant instruction.
- VUID-StandaloneSpirv-OpImage-04777
  OpImage*Dref* instructions must not consume an image whose Dim is 3D

- VUID-StandaloneSpirv-None-04667
  Structure types must not contain opaque types

- VUID-StandaloneSpirv-BuiltIn-04668
  Any BuiltIn decoration not listed in Built-In Variables must not be used

- VUID-StandaloneSpirv-OpEntryPoint-09658
  For a given OpEntryPoint, any BuiltIn decoration must not be used more than once by the Input interface.

- VUID-StandaloneSpirv-OpEntryPoint-09659
  For a given OpEntryPoint, any BuiltIn decoration must not be used more than once by the Output interface.

- VUID-StandaloneSpirv-Location-06672
  The Location or Component decorations must only be used with the Input, Output, RayPayloadKHR, IncomingRayPayloadKHR, HitAttributeKHR, HitObjectAttributeNV, CallableDataKHR, IncomingCallableDataKHR, or ShaderRecordBufferKHR storage classes

- VUID-StandaloneSpirv-Location-04915
  The Location or Component decorations must not be used with BuiltIn

- VUID-StandaloneSpirv-Location-04916
  The Location decorations must be used on user-defined variables

- VUID-StandaloneSpirv-Location-04917
  If a user-defined variable is not a pointer to a Block decorated OpTypeStruct, then the OpVariable must have a Location decoration

- VUID-StandaloneSpirv-Location-04918
  If a user-defined variable has a Location decoration, and the variable is a pointer to a OpTypeStruct, then the members of that structure must not have Location decorations

- VUID-StandaloneSpirv-Location-04919
  If a user-defined variable does not have a Location decoration, and the variable is a pointer to a Block decorated OpTypeStruct, then each member of the struct must have a Location decoration

- VUID-StandaloneSpirv-Component-04920
  The Component decoration value must not be greater than 3

- VUID-StandaloneSpirv-Component-04921
  If the Component decoration is used on an OpVariable that has a OpTypeVector type with a Component Type with a Width that is less than or equal to 32, the sum of its Component Count and the Component decoration value must be less than or equal to 4

- VUID-StandaloneSpirv-Component-04922
  If the Component decoration is used on an OpVariable that has a OpTypeVector type with a Component Type with a Width that is equal to 64, the sum of two times its Component Count and the Component decoration value must be less than or equal to 4

- VUID-StandaloneSpirv-Component-04923
  The Component decorations value must not be 1 or 3 for scalar or two-component 64-bit
data types

- **VUID-StandaloneSpirv-Component-04924**
  The Component decorations must not be used with any type that is not a scalar or vector, or an array of such a type.

- **VUID-StandaloneSpirv-Component-07703**
  The Component decorations must not be used for a 64-bit vector type with more than two components.

- **VUID-StandaloneSpirv-Input-09557**
  The pointers of any Input or Output Interface user-defined variables must not contain any PhysicalStorageBuffer Storage Class pointers.

- **VUID-StandaloneSpirv-GLSLShared-04669**
  The GLSLShared and GLSLPacked decorations must not be used.

- **VUID-StandaloneSpirv-Flat-04670**
  The Flat, NoPerspective, Sample, and Centroid decorations must only be used on variables with the Output or Input Storage Class.

- **VUID-StandaloneSpirv-Flat-06201**
  The Flat, NoPerspective, Sample, and Centroid decorations must not be used on variables with the Output storage class in a fragment shader.

- **VUID-StandaloneSpirv-Flat-06202**
  The Flat, NoPerspective, Sample, and Centroid decorations must not be used on variables with the Input storage class in a vertex shader.

- **VUID-StandaloneSpirv-PerVertexKHR-06777**
  The PerVertexKHR decoration must only be used on variables with the Input Storage Class in a fragment shader.

- **VUID-StandaloneSpirv-Flat-04744**
  Any variable with integer or double-precision floating-point type and with Input Storage Class in a fragment shader, must be decorated Flat.

- **VUID-StandaloneSpirv-ViewportRelativeNV-04672**
  The ViewportRelativeNV decoration must only be used on a variable decorated with Layer in the vertex, tessellation evaluation, or geometry shader stages.

- **VUID-StandaloneSpirv-ViewportRelativeNV-04673**
  The ViewportRelativeNV decoration must not be used unless a variable decorated with one of ViewportIndex or ViewportMaskNV is also statically used by the same OpEntryPoint.

- **VUID-StandaloneSpirv-ViewportMaskNV-04674**
  The ViewportMaskNV and ViewportIndex decorations must not both be statically used by one or more OpEntryPoint's that form the pre-rasterization shader stages of a graphics pipeline.

- **VUID-StandaloneSpirv-FPRoundingMode-04675**
  Rounding modes other than round-to-nearest-even and round-towards-zero must not be used for the FPRoundingMode decoration.

- **VUID-StandaloneSpirv-Invariant-04677**
  Variables decorated with Invariant and variables with structure types that have any members decorated with Invariant must be in the Output or Input Storage Class, Invariant.
used on an Input Storage Class variable or structure member has no effect

• VUID-StandaloneSpirv-VulkanMemoryModel-04678
If the VulkanMemoryModel capability is not declared, the Volatile decoration must be used on any variable declaration that includes one of the SMIDNV, WarpIDNV, SubgroupSize, SubgroupLocalInvocationId, SubgroupEqMask, SubgroupGtMask, SubgroupLtMask, or SubgroupLeMask BuiltIn decorations when used in the ray generation, closest hit, miss, intersection, or callable shaders, or with the RayTmaxKHR BuiltIn decoration when used in an intersection shader

• VUID-StandaloneSpirv-VulkanMemoryModel-04679
If the VulkanMemoryModel capability is declared, the OpLoad instruction must use the Volatile memory semantics when it accesses into any variable that includes one of the SMIDNV, WarpIDNV, SubgroupSize, SubgroupLocalInvocationId, SubgroupEqMask, SubgroupGtMask, SubgroupLeMask, or SubgroupLtMask BuiltIn decorations when used in the ray generation, closest hit, miss, intersection, or callable shaders, or with the RayTmaxKHR BuiltIn decoration when used in an intersection shader

• VUID-StandaloneSpirv-OpTypeRuntimeArray-04680
OpTypeRuntimeArray must only be used for:
- the last member of a Block-decorated OpTypeStruct in StorageBuffer or PhysicalStorageBuffer storage Storage Class
- BufferBlock-decorated OpTypeStruct in the Uniform storage Storage Class
- the outermost dimension of an arrayed variable in the StorageBuffer, Uniform, or UniformConstant storage Storage Class
- variables in the NodePayloadAMDX storage Storage Class when the CoalescingAMDX Execution Mode is specified

• VUID-StandaloneSpirv-Function-04681
A type T that is an array sized with a specialization constant must neither be, nor be contained in, the type T2 of a variable V, unless either: a) T is equal to T2, b) V is declared in the Function, or Private Storage Class, c) V is a non-Block variable in the Workgroup Storage Class, or d) V is an interface variable with an additional level of arrayness, as described in interface matching, and T is the member type of the array type T2

• VUID-StandaloneSpirv-OpControlBarrier-04682
If OpControlBarrier is used in ray generation, intersection, any-hit, closest hit, miss, fragment, vertex, tessellation evaluation, or geometry shaders, the execution Scope must be Subgroup

• VUID-StandaloneSpirv-LocalSize-06426
For each compute shader entry point, either a LocalSize or LocalSizeId Execution Mode, or an object decorated with the WorkgroupSize decoration must be specified

• VUID-StandaloneSpirv-DerivativeGroupQuadsNV-04684
For compute shaders using the DerivativeGroupQuadsNV execution mode, the first two dimensions of the local workgroup size must be a multiple of two

• VUID-StandaloneSpirv-DerivativeGroupLinearNV-04778
For compute shaders using the DerivativeGroupLinearNV execution mode, the product of the dimensions of the local workgroup size must be a multiple of four
If `OpGroupNonUniformBallotBitCount` is used, the group operation **must** be limited to `Reduce`, `InclusiveScan`, or `ExclusiveScan`.

The `Pointer` operand of all atomic instructions **must** have a `Storage Class` limited to `Uniform`, `Workgroup`, `Image`, `StorageBuffer`, `PhysicalStorageBuffer`, or `TaskPayloadWorkgroupEXT`.

Output variables or block members decorated with `Offset` that have a 64-bit type, or a composite type containing a 64-bit type, **must** specify an `Offset` value aligned to a 8 byte boundary.

The size of any output block containing any member decorated with `Offset` that is a 64-bit type **must** be a multiple of 8.

The first member of an output block specifying a `Offset` decoration **must** specify a `Offset` value that is aligned to an 8 byte boundary if that block contains any member decorated with `Offset` and is a 64-bit type.

Output variables or block members decorated with `Offset` that have a 32-bit type, or a composite type contains a 32-bit type, **must** specify an `Offset` value aligned to a 4 byte boundary.

Output variables, blocks or block members decorated with `Offset` **must** only contain base types that have components that are either 32-bit or 64-bit in size.

Only variables or block members in the output interface decorated with `Offset` can be captured for transform feedback, and those variables or block members **must** also be decorated with `XfbBuffer` and `XfbStride`, or inherit `XfbBuffer` and `XfbStride` decorations from a block containing them.

All variables or block members in the output interface of the entry point being compiled decorated with a specific `XfbBuffer` value **must** all be decorated with identical `XfbStride` values.

If any variables or block members in the output interface of the entry point being compiled are decorated with `Stream`, then all variables belonging to the same `XfbBuffer` **must** specify the same `Stream` value.

For any two variables or block members in the output interface of the entry point being compiled with the same `XfbBuffer` value, the ranges determined by the `Offset` decoration and the size of the type **must** not overlap.

All block members in the output interface of the entry point being compiled that are in
the same block and have a declared or inherited XfbBuffer decoration must specify the same XfbBuffer value

* VUID-StandaloneSpirv-RayPayloadKHR-04698
  RayPayloadKHR Storage Class must only be used in ray generation, closest hit or miss shaders

* VUID-StandaloneSpirv-IncomingRayPayloadKHR-04699
  IncomingRayPayloadKHR Storage Class must only be used in closest hit, any-hit, or miss shaders

* VUID-StandaloneSpirv-IncomingRayPayloadKHR-04700
  There must be at most one variable with the IncomingRayPayloadKHR Storage Class in the input interface of an entry point

* VUID-StandaloneSpirv-HitAttributeKHR-04701
  HitAttributeKHR Storage Class must only be used in intersection, any-hit, or closest hit shaders

* VUID-StandaloneSpirv-HitAttributeKHR-04702
  There must be at most one variable with the HitAttributeKHR Storage Class in the input interface of an entry point

* VUID-StandaloneSpirv-HitAttributeKHR-04703
  A variable with HitAttributeKHR Storage Class must only be written to in an intersection shader

* VUID-StandaloneSpirv-CallableDataKHR-04704
  CallableDataKHR Storage Class must only be used in ray generation, closest hit, miss, and callable shaders

* VUID-StandaloneSpirv-IncomingCallableDataKHR-04705
  IncomingCallableDataKHR Storage Class must only be used in callable shaders

* VUID-StandaloneSpirv-IncomingCallableDataKHR-04706
  There must be at most one variable with the IncomingCallableDataKHR Storage Class in the input interface of an entry point

* VUID-StandaloneSpirv-ShaderRecordBufferKHR-07119
  ShaderRecordBufferKHR Storage Class must only be used in ray generation, intersection, any-hit, closest hit, callable, or miss shaders

* VUID-StandaloneSpirv-Base-07650
  The Base operand of OpPtrAccessChain must have a storage class of Workgroup, StorageBuffer, or PhysicalStorageBuffer

* VUID-StandaloneSpirv-Base-07651
  If the Base operand of OpPtrAccessChain has a Workgroup Storage Class, then the VariablePointers capability must be declared

* VUID-StandaloneSpirv-Base-07652
  If the Base operand of OpPtrAccessChain has a StorageBuffer Storage Class, then the VariablePointers or VariablePointersStorageBuffer capability must be declared

* VUID-StandaloneSpirv-PhysicalStorageBuffer64-04708
  If the PhysicalStorageBuffer64 addressing model is enabled, all instructions that support
memory access operands and that use a physical pointer must include the Aligned operand.

- VUID-StandaloneSpirv-PhysicalStorageBuffer64-04709
  If the PhysicalStorageBuffer64 addressing model is enabled, any access chain instruction that accesses into a RowMajor matrix must only be used as the Pointer operand to OpLoad or OpStore.

- VUID-StandaloneSpirv-PhysicalStorageBuffer64-04710
  If the PhysicalStorageBuffer64 addressing model is enabled, OpConvertUToPtr and OpConvertPtrToU must use an integer type whose Width is 64.

- VUID-StandaloneSpirv-OpTypeForwardPointer-04711
  OpTypeForwardPointer must have a Storage Class of PhysicalStorageBuffer.

- VUID-StandaloneSpirv-None-04745
  All block members in a variable with a Storage Class of PushConstant declared as an array must only be accessed by dynamically uniform indices.

- VUID-StandaloneSpirv-OpVariable-06673
  There must not be more than one OpVariable in the PushConstant Storage Class listed in the Interface for each OpEntryPoint.

- VUID-StandaloneSpirv-OpEntryPoint-06674
  Each OpEntryPoint must not statically use more than one OpVariable in the PushConstant Storage Class.

- VUID-StandaloneSpirv-OpEntryPoint-08721
  Each OpEntryPoint must not have more than one Input variable assigned the same Component word inside a Location slot, either explicitly or implicitly.

- VUID-StandaloneSpirv-OpEntryPoint-08722
  Each OpEntryPoint must not have more than one Output variable assigned the same Component word inside a Location slot, either explicitly or implicitly.

- VUID-StandaloneSpirv-Result-04780
  The Result Type operand of any OpImageRead or OpImageSparseRead instruction must be a vector of four components.

- VUID-StandaloneSpirv-Base-04781
  The Base operand of any OpBitCount, OpBitReverse, OpBitFieldInsert, OpBitFieldSExtract, or OpBitFieldUExtract instruction must be a 32-bit integer scalar or a vector of 32-bit integers.

- VUID-StandaloneSpirv-PushConstant-06675
  Any variable in the PushConstant or StorageBuffer storage class must be decorated as Block.

- VUID-StandaloneSpirv-Uniform-06676
  Any variable in the Uniform Storage Class must be decorated as Block or BufferBlock.

- VUID-StandaloneSpirv-UniformConstant-06677
  Any variable in the UniformConstant, StorageBuffer, or Uniform Storage Class must be decorated with DescriptorSet and Binding.

- VUID-StandaloneSpirv-InputAttachmentIndex-06678
  Variables decorated with InputAttachmentIndex must be in the UniformConstant Storage.
If a variable is decorated by `DescriptorSet` or `Binding`, the Storage Class must correspond to an entry in Shader Resource and Storage Class Correspondence.

Variables with a Storage Class of `Input` in a fragment shader stage that are decorated with `PerVertexKHR` must be declared as arrays.

The module must not contain both an entry point that uses the `TaskEXT` or `MeshEXT` Execution Model and an entry point that uses the `TaskNV` or `MeshNV` Execution Model.

In mesh shaders using the MeshEXT Execution Model OpSetMeshOutputsEXT must be called before any outputs are written.

In mesh shaders using the MeshEXT Execution Model all variables declared as output must not be read from.

In mesh shaders using the MeshEXT Execution Model for OpSetMeshOutputsEXT instructions, the “Vertex Count” and “Primitive Count” operands must not depend on `ViewIndex`.

In mesh shaders using the MeshEXT Execution Model variables decorated with `PrimitivePointIndicesEXT`, `PrimitiveLineIndicesEXT`, or `PrimitiveTriangleIndicesEXT` declared as an array must not be accessed by indices that depend on `ViewIndex`.

In mesh shaders using the MeshEXT Execution Model any values stored in variables decorated with `PrimitivePointIndicesEXT`, `PrimitiveLineIndicesEXT`, or `PrimitiveTriangleIndicesEXT` must not depend on `ViewIndex`.

In mesh shaders using the MeshEXT Execution Model variables in workgroup or private Storage Class declared as or containing a composite type must not be accessed by indices that depend on `ViewIndex`.

In mesh shaders using the MeshEXT Execution Model the OutputVertices Execution Mode must be greater than 0.

In mesh shaders using the MeshEXT Execution Model the OutputPrimitivesEXT Execution Mode must be greater than 0.

Variables with a Storage Class of `Input` or `Output` and a type of `OpTypeBool` must be decorated with the `BuiltIn` decoration.

The tile image variable declarations must obey the constraints on the TileImageEXT Storage Class and the Location decoration described in Fragment Tile Image Interface.
The `TileImageEXT Storage Class` must only be used for declaring tile image variables.

The `Storage Class` of the `Pointer` operand to `OpCooperativeMatrixLoadKHR` or `OpCooperativeMatrixStoreKHR` must be limited to `Workgroup`, `StorageBuffer`, or `PhysicalStorageBuffer`.

**Runtime SPIR-V Validation**

The following rules **must** be validated at runtime. These rules depend on knowledge of the implementation and its capabilities and knowledge of runtime information, such as enabled features.

**Valid Usage**

- **VUID-RuntimeSpirv-vulkanMemoryModel-06265**
  If `vulkanMemoryModel` is enabled and `vulkanMemoryModelDeviceScope` is not enabled, `Device` memory scope **must** not be used.

- **VUID-RuntimeSpirv-vulkanMemoryModel-06266**
  If `vulkanMemoryModel` is not enabled, `QueueFamily` memory scope **must** not be used.

- **VUID-RuntimeSpirv-shaderSubgroupClock-06267**
  If `shaderSubgroupClock` is not enabled, the `Subgroup` scope **must** not be used for `OpReadClockKHR`.

- **VUID-RuntimeSpirv-shaderDeviceClock-06268**
  If `shaderDeviceClock` is not enabled, the `Device` scope **must** not be used for `OpReadClockKHR`.

- **VUID-RuntimeSpirv-None-09558**
  If `dynamicRenderingLocalRead` is not enabled, any variable created with a “Type” of `OpTypeImage` that has a “Dim” operand of `SubpassData` **must** be decorated with `InputAttachmentIndex`.

- **VUID-RuntimeSpirv-OpTypeImage-09644**
  Any variable declared as an `OpTypeArray` where the `Element Type` is an `OpTypeImage` with a “Dim” operand of `SubpassData` **must** be decorated with `InputAttachmentIndex`.

- **VUID-RuntimeSpirv-apiVersion-07954**
  If `VkPhysicalDeviceProperties::apiVersion` is less than Vulkan 1.3, the `VK_KHR_format_feature_flags2` extension is not supported, and `shaderStorageImageWriteWithoutFormat` is not enabled, any variable created with a “Type” of `OpTypeImage` that has a “Sampled” operand of 2 and an “Image Format” operand of `Unknown` **must** be decorated with `NonWritable`.

- **VUID-RuntimeSpirv-apiVersion-07955**
  If `VkPhysicalDeviceProperties::apiVersion` is less than Vulkan 1.3, the `VK_KHR_format_feature_flags2` extension is not supported, and `shaderStorageImageReadWithoutFormat` is not enabled, any variable created with a “Type” of `OpTypeImage` that has a “Sampled” operand of 2 and an “Image Format” operand of `Unknown` **must** be decorated with `NonReadable`.
OpImageWrite to any Image whose Image Format is not Unknown must have the Texel operand contain at least as many components as the corresponding VkFormat as given in the SPIR-V Image Format compatibility table.

The sum of Location and the number of locations the variable it decorates consumes must be less than or equal to the value for the matching Execution Model defined in Shader Input and Output Locations.

The maximum number of storage buffers, storage images, and output Location decorated color attachments written to in the Fragment Execution Model must be less than or equal to maxFragmentCombinedOutputResources.

If an instruction loads from or stores to a resource (including atomics and image instructions) and the resource descriptor being accessed is not dynamically uniform, then the operand corresponding to that resource (e.g. the pointer or sampled image operand) must be decorated with NonUniform.

shaderSubgroupExtendedTypes must be enabled for group operations to use 8-bit integer, 16-bit integer, 64-bit integer, 16-bit floating-point, and vectors of these types.

If subgroupBroadcastDynamicId is VK_TRUE, and the shader module version is 1.5 or higher, the “Index” for OpGroupNonUniformQuadBroadcast must be dynamically uniform within the derivative group. Otherwise, “Index” must be a constant.

If subgroupBroadcastDynamicId is VK_TRUE, and the shader module version is 1.5 or higher, the “Id” for OpGroupNonUniformBroadcast must be dynamically uniform within the subgroup. Otherwise, “Id” must be a constant.

shaderBufferInt64Atomics must be enabled for 64-bit integer atomic operations to be supported on a Pointer with a Storage Class of StorageBuffer or Uniform.

shaderSharedInt64Atomics must be enabled for 64-bit integer atomic operations to be supported on a Pointer with a Storage Class of Workgroup.

shaderBufferFloat32Atomics, or shaderBufferFloat32AtomicAdd, or shaderBufferFloat64Atomics, or shaderBufferFloat64AtomicAdd, or shaderBufferFloat16Atomics, or shaderBufferFloat16AtomicAdd, or shaderBufferFloat16AtomicMinMax, or shaderFloat16VectorAtomics must be enabled for floating-point atomic operations to be supported on a Pointer with a Storage Class of StorageBuffer.

shaderSharedFloat32Atomics, or shaderSharedFloat32AtomicAdd, or
shaderSharedFloat64Atomics, or shaderSharedFloat64AtomicAdd, or shaderSharedFloat16Atomics, or shaderSharedFloat16AtomicAdd, or shaderSharedFloat16AtomicMinMax, or shaderSharedFloat32AtomicMinMax, or shaderSharedFloat64AtomicMinMax, or shaderFloat16VectorAtomics, must be enabled for floating-point atomic operations to be supported on a Pointer with a Storage Class of Workgroup

- VUID-RuntimeSpirv-None-06286
  shaderImageFloat32Atomics, or shaderImageFloat32AtomicAdd, or shaderImageFloat32AtomicMinMax, must be enabled for 32-bit floating-point atomic operations to be supported on a Pointer with a Storage Class of Image

- VUID-RuntimeSpirv-None-06287
  sparseImageFloat32Atomics, or sparseImageFloat32AtomicAdd, or sparseImageFloat32AtomicMinMax, must be enabled for 32-bit floating-point atomics to be supported on sparse images

- VUID-RuntimeSpirv-None-06288
  shaderImageInt64Atomics must be enabled for 64-bit integer atomic operations to be supported on a Pointer with a Storage Class of Image

- VUID-RuntimeSpirv-denormBehaviorIndependence-06289
  If denormBehaviorIndependence is VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_32_BIT_ONLY, then the entry point must use the same denormals Execution Mode for both 16-bit and 64-bit floating-point types

- VUID-RuntimeSpirv-denormBehaviorIndependence-06290
  If denormBehaviorIndependence is VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_NONE, then the entry point must use the same denormals Execution Mode for all floating-point types

- VUID-RuntimeSpirv-roundingModeIndependence-06291
  If roundingModeIndependence is VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_32_BIT_ONLY, then the entry point must use the same rounding Execution Mode for both 16-bit and 64-bit floating-point types

- VUID-RuntimeSpirv-roundingModeIndependence-06292
  If roundingModeIndependence is VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_NONE, then the entry point must use the same rounding Execution Mode for all floating-point types

- VUID-RuntimeSpirv-shaderSignedZeroInfNanPreserveFloat16-06293
  If shaderSignedZeroInfNanPreserveFloat16 is VK_FALSE, then SignedZeroInfNanPreserve for 16-bit floating-point type must not be used

- VUID-RuntimeSpirv-shaderSignedZeroInfNanPreserveFloat32-06294
  If shaderSignedZeroInfNanPreserveFloat32 is VK_FALSE, then SignedZeroInfNanPreserve for 32-bit floating-point type must not be used

- VUID-RuntimeSpirv-shaderSignedZeroInfNanPreserveFloat64-06295
  If shaderSignedZeroInfNanPreserveFloat64 is VK_FALSE, then SignedZeroInfNanPreserve for 64-bit floating-point type must not be used

- VUID-RuntimeSpirv-shaderDenormPreserveFloat16-06296
  If shaderDenormPreserveFloat16 is VK_FALSE, then DenormPreserve for 16-bit floating-point type must not be used
• VUID-RuntimeSpirv-shaderDenormPreserveFloat32-06297
  If shaderDenormPreserveFloat32 is VK_FALSE, then DenormPreserve for 32-bit floating-point type must not be used

• VUID-RuntimeSpirv-shaderDenormPreserveFloat64-06298
  If shaderDenormPreserveFloat64 is VK_FALSE, then DenormPreserve for 64-bit floating-point type must not be used

• VUID-RuntimeSpirv-shaderDenormFlushToZeroFloat16-06299
  If shaderDenormFlushToZeroFloat16 is VK_FALSE, then DenormFlushToZero for 16-bit floating-point type must not be used

• VUID-RuntimeSpirv-shaderDenormFlushToZeroFloat32-06300
  If shaderDenormFlushToZeroFloat32 is VK_FALSE, then DenormFlushToZero for 32-bit floating-point type must not be used

• VUID-RuntimeSpirv-shaderDenormFlushToZeroFloat64-06301
  If shaderDenormFlushToZeroFloat64 is VK_FALSE, then DenormFlushToZero for 64-bit floating-point type must not be used

• VUID-RuntimeSpirv-shaderRoundingModeRTEFloat16-06302
  If shaderRoundingModeRTEFloat16 is VK_FALSE, then RoundingModeRTE for 16-bit floating-point type must not be used

• VUID-RuntimeSpirv-shaderRoundingModeRTEFloat32-06303
  If shaderRoundingModeRTEFloat32 is VK_FALSE, then RoundingModeRTE for 32-bit floating-point type must not be used

• VUID-RuntimeSpirv-shaderRoundingModeRTEFloat64-06304
  If shaderRoundingModeRTEFloat64 is VK_FALSE, then RoundingModeRTE for 64-bit floating-point type must not be used

• VUID-RuntimeSpirv-shaderRoundingModeRTZFloat16-06305
  If shaderRoundingModeRTZFloat16 is VK_FALSE, then RoundingModeRTZ for 16-bit floating-point type must not be used

• VUID-RuntimeSpirv-shaderRoundingModeRTZFloat32-06306
  If shaderRoundingModeRTZFloat32 is VK_FALSE, then RoundingModeRTZ for 32-bit floating-point type must not be used

• VUID-RuntimeSpirv-shaderRoundingModeRTZFloat64-06307
  If shaderRoundingModeRTZFloat64 is VK_FALSE, then RoundingModeRTZ for 64-bit floating-point type must not be used

• VUID-RuntimeSpirv-shaderSignedZeroInfNanPreserveFloat16-09559
  If shaderSignedZeroInfNanPreserveFloat16 is VK_FALSE then any FPFastMathDefault execution mode with a type of 16-bit float must include the NSZ, NotInf, and NotNaN flags

• VUID-RuntimeSpirv-shaderSignedZeroInfNanPreserveFloat32-09560
  If shaderSignedZeroInfNanPreserveFloat32 is VK_FALSE then any FPFastMathMode decoration on an instruction with result type or any operand type that includes a 16-bit float must include the NSZ, NotInf, and NotNaN flags

• VUID-RuntimeSpirv-shaderSignedZeroInfNanPreserveFloat32-09561
  If shaderSignedZeroInfNanPreserveFloat32 is VK_FALSE then any FPFastMathDefault execution mode with a type of 32-bit float must include the NSZ, NotInf, and NotNaN flags
If `shaderSignedZeroInfNanPreserveFloat32` is `VK_FALSE` then any FP FastMathMode decoration on an instruction with result type or any operand type that includes a 32-bit float must include the `NSZ`, `NotInf`, and `NotNaN` flags.

If `shaderSignedZeroInfNanPreserveFloat64` is `VK_FALSE` then any FP FastMathDefault execution mode with a type of 64-bit float must include the `NSZ`, `NotInf`, and `NotNaN` flags.

If `shaderSignedZeroInfNanPreserveFloat64` is `VK_FALSE` then any FP FastMathMode decoration on an instruction with result type or any operand type that includes a 64-bit float must include the `NSZ`, `NotInf`, and `NotNaN` flags.

The Offset plus size of the type of each variable, in the output interface of the entry point being compiled, decorated with `XfbBuffer` must not be greater than `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBufferDataSize`.

For any given `XfbBuffer` value, define the buffer data size to be smallest number of bytes such that, for all outputs decorated with the same `XfbBuffer` value, the size of the output interface variable plus the Offset is less than or equal to the buffer data size. For a given Stream, the sum of all the buffer data sizes for all buffers writing to that stream the must not exceed `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreamDataSize`.

The Stream value to OpEmitStreamVertex and OpEndStreamPrimitive must be less than `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams`.

If the geometry shader emits to more than one vertex stream and `VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackStreamsLinesTriangles` is `VK_FALSE`, then Execution Mode must be OutputPoints.

The stream number value to `Stream` must be less than `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams`.

The XFB Stride value to `XfbStride` must be less than or equal to `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBufferDataStride`.

If the `PhysicalStorageBuffer64` addressing model is enabled any load or store through a physical pointer type must be aligned to a multiple of the size of the largest scalar type in the pointed-to type.

If the `PhysicalStorageBuffer64` addressing model is enabled the pointer value of a memory access instruction must be at least as aligned as specified by the `Aligned` memory access operand.
For \texttt{OpTypeCooperativeMatrixNV}, the component type, scope, number of rows, and number of columns \textbf{must} match one of the matrices in any of the supported \texttt{VkCooperativeMatrixPropertiesNV}.

For \texttt{OpCooperativeMatrixMulAddNV}, the type of \texttt{A} \textbf{must} have \texttt{VkCooperativeMatrixPropertiesNV::MSize} rows and \texttt{VkCooperativeMatrixPropertiesNV::KSize} columns and have a component type that matches \texttt{VkCooperativeMatrixPropertiesNV::AType}.

For \texttt{OpCooperativeMatrixMulAddNV}, the type of \texttt{B} \textbf{must} have \texttt{VkCooperativeMatrixPropertiesNV::KSize} rows and \texttt{VkCooperativeMatrixPropertiesNV::NSize} columns and have a component type that matches \texttt{VkCooperativeMatrixPropertiesNV::BType}.

For \texttt{OpCooperativeMatrixMulAddNV}, the type of \texttt{C} \textbf{must} have \texttt{VkCooperativeMatrixPropertiesNV::MSize} rows and \texttt{VkCooperativeMatrixPropertiesNV::NSize} columns and have a component type that matches \texttt{VkCooperativeMatrixPropertiesNV::CType}.

For \texttt{OpCooperativeMatrixMulAddNV}, the type of \texttt{Result} \textbf{must} have \texttt{VkCooperativeMatrixPropertiesNV::MSize} rows and \texttt{VkCooperativeMatrixPropertiesNV::NSize} columns and have a component type that matches \texttt{VkCooperativeMatrixPropertiesNV::DType}.

For \texttt{OpCooperativeMatrixMulAddNV}, the type of \texttt{A}, \texttt{B}, \texttt{C}, and \texttt{Result} \textbf{must} all have a scope of \texttt{scope}.

\texttt{OpTypeCooperativeMatrixNV} and \texttt{OpCooperativeMatrix*} instructions \textbf{must} not be used in shader stages not included in \texttt{VkPhysicalDeviceCooperativeMatrixPropertiesNV::cooperativeMatrixSupportedStages}.

For \texttt{OpTypeCooperativeMatrixKHR}, the component type, scope, number of rows, and number of columns \textbf{must} match one of the matrices in any of the supported \texttt{VkCooperativeMatrixPropertiesKHR}.

For \texttt{OpCooperativeMatrixMulAddKHR}, the type of \texttt{A} \textbf{must} have \texttt{VkCooperativeMatrixPropertiesKHR::MSize} rows and \texttt{VkCooperativeMatrixPropertiesKHR::KSize} columns and have a component type that matches \texttt{VkCooperativeMatrixPropertiesKHR::AType}.

For \texttt{OpCooperativeMatrixMulAddKHR}, when the component type of \texttt{A} is a signed integer type, the \texttt{MatrixASignedComponents} cooperative matrix operand \textbf{must} be present.

\texttt{OpTypeCooperativeMatrixKHR} and \texttt{OpCooperativeMatrix*} instructions \textbf{must} not be used in shader stages not included in \texttt{VkPhysicalDeviceCooperativeMatrixPropertiesKHR::cooperativeMatrixSupportedStages}.
For `OpCooperativeMatrixMulAddKHR`, the type of `B` must have
`VkCooperativeMatrixPropertiesKHR::KSize` rows and
`VkCooperativeMatrixPropertiesKHR::NSize` columns and have a component type that
matches `VkCooperativeMatrixPropertiesKHR::BType`

- VUID/RuntimeSpirv-OpCooperativeMatrixMulAddKHR-08978
  For `OpCooperativeMatrixMulAddKHR`, when the component type of `B` is a signed integer type,
  the `MatrixBSignedComponents` cooperative matrix operand must be present

- VUID/RuntimeSpirv-MSize-08979
  For `OpCooperativeMatrixMulAddKHR`, the type of `C` must have
  `VkCooperativeMatrixPropertiesKHR::MSize` rows and
  `VkCooperativeMatrixPropertiesKHR::NSize` columns and have a component type that
  matches `VkCooperativeMatrixPropertiesKHR:: CType`

- VUID/RuntimeSpirv-OpCooperativeMatrixMulAddKHR-08980
  For `OpCooperativeMatrixMulAddKHR`, when the component type of `C` is a signed integer type,
  the `MatrixCSignedComponents` cooperative matrix operand must be present

- VUID/RuntimeSpirv-MSize-08981
  For `OpCooperativeMatrixMulAddKHR`, the type of `Result` must have
  `VkCooperativeMatrixPropertiesKHR::MSize` rows and
  `VkCooperativeMatrixPropertiesKHR::NSize` columns and have a component type that
  matches `VkCooperativeMatrixPropertiesKHR::ResultType`

- VUID/RuntimeSpirv-OpCooperativeMatrixMulAddKHR-08982
  For `OpCooperativeMatrixMulAddKHR`, when the component type of `Result` is a signed integer
  type, the `MatrixResultSignedComponents` cooperative matrix operand must be present

- VUID/RuntimeSpirv-saturatingAccumulation-08983
  For `OpCooperativeMatrixMulAddKHR`, the `SaturatingAccumulation` cooperative matrix operand
  must be present if and only if `VkCooperativeMatrixPropertiesKHR::saturatingAccumulation` is `VK_TRUE`

- VUID/RuntimeSpirv-scope-08984
  For `OpCooperativeMatrixMulAddKHR`, the type of `A`, `B`, `C`, and `Result` must all have a scope of
  scope

- VUID/RuntimeSpirv-cooperativeMatrixSupportedStages-08985
  `OpTypeCooperativeMatrixKHR` and `OpCooperativeMatrix*` instructions must not be used in
  shader stages not included in `VkPhysicalDeviceCooperativeMatrixPropertiesKHR::cooperativeMatrixSupportedStages`

- VUID/RuntimeSpirv-DescriptorSet-06323
  `DescriptorSet` and `Binding` decorations must obey the constraints on `Storage Class`, type,
  and descriptor type described in `DescriptorSet and Binding Assignment`

- VUID/RuntimeSpirv-OpCooperativeMatrixLoadNV-06324
  For `OpCooperativeMatrixLoadNV` and `OpCooperativeMatrixStoreNV` instructions, the `Pointer`
  and `Stride` operands must be aligned to at least the lesser of 16 bytes or the natural
  alignment of a row or column (depending on `ColumnMajor`) of the matrix (where the
  natural alignment is the number of columns/rows multiplied by the component size)

- VUID/RuntimeSpirv-MeshNV-07113
For mesh shaders using the MeshNV Execution Model the OutputVertices OpExecutionMode must be less than or equal to VkPhysicalDeviceMeshShaderPropertiesNV ::maxMeshOutputVertices.

- VUID/RuntimeSpirv-MeshNV-07114
  For mesh shaders using the MeshNV Execution Model the OutputPrimitivesNV OpExecutionMode must be less than or equal to VkPhysicalDeviceMeshShaderPropertiesNV ::maxMeshOutputPrimitives.

- VUID/RuntimeSpirv-MeshEXT-07115
  For mesh shaders using the MeshEXT Execution Model the OutputVertices OpExecutionMode must be less than or equal to VkPhysicalDeviceMeshShaderPropertiesEXT ::maxMeshOutputVertices.

- VUID/RuntimeSpirv-MeshEXT-07332
  For mesh shaders using the MeshEXT Execution Model the “Vertex Count” operand of OpSetMeshOutputsEXT must be less than or equal to OutputVertices OpExecutionMode.

- VUID/RuntimeSpirv-MeshEXT-07116
  For mesh shaders using the MeshEXT Execution Model the OutputPrimitivesEXT OpExecutionMode must be less than or equal to VkPhysicalDeviceMeshShaderPropertiesEXT ::maxMeshOutputPrimitives.

- VUID/RuntimeSpirv-MeshEXT-07333
  For mesh shaders using the MeshEXT Execution Model the “Primitive Count” operand of OpSetMeshOutputsEXT must be less than or equal to OutputPrimitivesEXT OpExecutionMode.

- VUID/RuntimeSpirv-TaskEXT-07117
  In task shaders using the TaskEXT Execution Model OpEmitMeshTasksEXT must be called exactly once under dynamically uniform conditions.

- VUID/RuntimeSpirv-MeshEXT-07118
  In mesh shaders using the MeshEXT Execution Model OpSetMeshOutputsEXT must be called at most once under dynamically uniform conditions.

- VUID/RuntimeSpirv-TaskEXT-07291
  In task shaders using the TaskEXT Execution Model the x size in LocalSize or LocalSizeId must be less than or equal to VkPhysicalDeviceMeshShaderPropertiesEXT ::maxTaskWorkGroupSize[0].

- VUID/RuntimeSpirv-TaskEXT-07292
  In task shaders using the TaskEXT Execution Model the y size in LocalSize or LocalSizeId must be less than or equal to VkPhysicalDeviceMeshShaderPropertiesEXT ::maxTaskWorkGroupSize[1].

- VUID/RuntimeSpirv-TaskEXT-07293
  In task shaders using the TaskEXT Execution Model the z size in LocalSize or LocalSizeId must be less than or equal to VkPhysicalDeviceMeshShaderPropertiesEXT ::maxTaskWorkGroupSize[2].

- VUID/RuntimeSpirv-TaskEXT-07294
  In task shaders using the TaskEXT Execution Model the product of x size, y size, and z size in LocalSize or LocalSizeId must be less than or equal to VkPhysicalDeviceMeshShaderPropertiesEXT ::maxTaskWorkGroupInvocations.
For mesh shaders using the MeshEXT Execution Model the \texttt{x} size in \texttt{LocalSize} or \texttt{LocalSizeId} \textbf{must} be less than or equal to \texttt{VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshWorkGroupSize[0]}

For mesh shaders using the MeshEXT Execution Model the \texttt{y} size in \texttt{LocalSize} or \texttt{LocalSizeId} \textbf{must} be less than or equal to \texttt{VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshWorkGroupSize[1]}

For mesh shaders using the MeshEXT Execution Model the \texttt{z} size in \texttt{LocalSize} or \texttt{LocalSizeId} \textbf{must} be less than or equal to \texttt{VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshWorkGroupSize[2]}

For mesh shaders using the MeshEXT Execution Model the product of \texttt{x} size, \texttt{y} size, and \texttt{z} size in \texttt{LocalSize} or \texttt{LocalSizeId} \textbf{must} be less than or equal to \texttt{VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshWorkGroupInvocations}

In task shaders using the TaskEXT Execution Model the value of the “Group Count X” operand of \texttt{OpEmitMeshTasksEXT} \textbf{must} be less than or equal to \texttt{VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshWorkGroupCount[0]}

In task shaders using the TaskEXT Execution Model the value of the “Group Count Y” operand of \texttt{OpEmitMeshTasksEXT} \textbf{must} be less than or equal to \texttt{VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshWorkGroupCount[1]}

In task shaders using the TaskEXT Execution Model the value of the “Group Count Z” operand of \texttt{OpEmitMeshTasksEXT} \textbf{must} be less than or equal to \texttt{VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshWorkGroupCount[2]}

In task shaders using the TaskEXT Execution Model the product of the “Group Count” operands of \texttt{OpEmitMeshTasksEXT} \textbf{must} be less than or equal to \texttt{VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshWorkGroupTotalCount}

The sum of size in bytes for variables and \texttt{padding} in the Workgroup Storage Class in the MeshEXT Execution Model \textbf{must} be less than or equal to \texttt{maxMeshSharedMemorySize}

The sum of size in bytes for variables and \texttt{padding} in the TaskPayloadWorkgroupEXT or Workgroup Storage Class in the MeshEXT Execution Model \textbf{must} be less than or equal to \texttt{maxMeshPayloadAndSharedMemorySize}

The sum of size in bytes for variables in the Output Storage Class in the MeshEXT Execution Model \textbf{must} be less than or equal to \texttt{maxMeshOutputMemorySize} according to the formula in Mesh Shader Output
The sum of size in bytes for variables and in the TaskPayloadWorkgroupEXT or Output Storage Class in the TaskEXT Execution Model must be less than or equal to maxMeshPayloadAndOutputMemorySize according to the formula in Mesh Shader Output.

The sum of size in bytes for variables and in the TaskPayloadWorkgroupEXT Storage Class in the TaskEXT Execution Model must be less than or equal to maxTaskPayloadSize.

The sum of size in bytes for variables and padding in the Workgroup Storage Class in the TaskEXT Execution Model must be less than or equal to maxTaskSharedMemorySize.

The sum of size in bytes for variables and padding in the TaskPayloadWorkgroupEXT or Workgroup Storage Class in the TaskEXT Execution Model must be less than or equal to maxTaskPayloadAndSharedMemorySize.

For OpCooperativeMatrixLoadKHR and OpCooperativeMatrixStoreKHR instructions, the Pointer and Stride operands must be aligned to at least the lesser of 16 bytes or the natural alignment of a row or column (depending on ColumnMajor) of the matrix (where the natural alignment is the number of columns/rows multiplied by the component size).

If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::shaderSampleRateInterpolationFunctions is VK_FALSE, then GLSL.std.450 fragment interpolation functions are not supported by the implementation and OpCapability must not be set to InterpolationFunction.

If tessellationShader is enabled, and the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationIsolines is VK_FALSE, then OpExecutionMode must not be set to Isolines.

If tessellationShader is enabled, and the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationPointMode is VK_FALSE, then OpExecutionMode must not be set to PointMode.

If storageBuffer8BitAccess is VK_FALSE, then objects containing an 8-bit integer element must not have Storage Class of StorageBuffer, ShaderRecordBufferKHR, or PhysicalStorageBuffer.

If uniformAndStorageBuffer8BitAccess is VK_FALSE, then objects in the Uniform Storage Class with the Block decoration must not have an 8-bit integer member.

If storagePushConstant8 is VK_FALSE, then objects containing an 8-bit integer element must not have Storage Class of PushConstant.
If `storageBuffer16BitAccess` is `VK_FALSE`, then objects containing 16-bit integer or 16-bit floating-point elements **must** not have Storage Class of StorageBuffer, ShaderRecordBufferKHR, or PhysicalStorageBuffer.

- **VUID-RuntimeSpirv-uniformAndStorageBuffer16BitAccess-06332**
  If `uniformAndStorageBuffer16BitAccess` is `VK_FALSE`, then objects in the Uniform Storage Class with the Block decoration **must** not have 16-bit integer or 16-bit floating-point members.

- **VUID-RuntimeSpirv-storagePushConstant16-06333**
  If `storagePushConstant16` is `VK_FALSE`, then objects containing 16-bit integer or 16-bit floating-point elements **must** not have Storage Class of PushConstant.

- **VUID-RuntimeSpirv-storageInputOutput16-06334**
  If `storageInputOutput16` is `VK_FALSE`, then objects containing 16-bit integer or 16-bit floating-point elements **must** not have Storage Class of Input or Output.

- **VUID-RuntimeSpirv-None-06337**
  `shaderBufferFloat16Atomics`, or `shaderBufferFloat16AtomicAdd`, or `shaderBufferFloat16AtomicMinMax`, or `shaderSharedFloat16Atomics`, or `shaderSharedFloat16AtomicAdd`, or `shaderSharedFloat16AtomicMinMax` **must** be enabled for 16-bit floating point atomic operations.

- **VUID-RuntimeSpirv-None-06338**
  `shaderBufferFloat32Atomics`, or `shaderBufferFloat32AtomicAdd`, or `shaderBufferFloat32AtomicMinMax`, or `shaderSharedFloat32Atomics`, or `shaderSharedFloat32AtomicAdd`, or `shaderSharedFloat32AtomicMinMax`, or `shaderImageFloat32Atomics`, or `shaderImageFloat32AtomicAdd`, or `shaderImageFloat32AtomicMinMax` **must** be enabled for 32-bit floating point atomic operations.

- **VUID-RuntimeSpirv-None-06339**
  `shaderBufferFloat64Atomics`, or `shaderBufferFloat64AtomicAdd`, or `shaderBufferFloat64AtomicMinMax`, or `shaderSharedFloat64Atomics`, or `shaderSharedFloat64AtomicAdd`, or `shaderSharedFloat64AtomicMinMax`, or `shaderBufferFloat64AtomicMinMax`, or `shaderSharedFloat64AtomicMinMax`, or `shaderImageFloat32AtomicMinMax` **must** be enabled for 64-bit floating point atomic operations.

- **VUID-RuntimeSpirv-shaderFloat16VectorAtomics-09581**
  `shaderFloat16VectorAtomics`, **must** be enabled for 16-bit floating-point, 2- and 4-component vector atomic operations to be supported.

- **VUID-RuntimeSpirv-NonWritable-06340**
  If `fragmentStoresAndAtomics` is not enabled, then all storage image, storage texel buffer, and storage buffer variables in the fragment stage **must** be decorated with the NonWritable decoration.

- **VUID-RuntimeSpirv-NonWritable-06341**
  If `vertexPipelineStoresAndAtomics` is not enabled, then all storage image, storage texel buffer, and storage buffer variables in the vertex, tessellation, and geometry stages **must** be decorated with the NonWritable decoration.

- **VUID-RuntimeSpirv-None-06342**
  If `subgroupQuadOperationsInAllStages` is `VK_FALSE`, then quad subgroup operations **must** not be used except for in fragment and compute stages.
Group operations with subgroup scope must not be used if the shader stage is not in subgroupSupportedStages.

The first element of the Offset operand of InterpolateAtOffset must be greater than or equal to:
\[ \text{frag}_\text{width} \times \text{minInterpolationOffset} \]
where \( \text{frag}_\text{width} \) is the width of the current fragment in pixels.

The first element of the Offset operand of InterpolateAtOffset must be less than or equal to:
\[ \text{frag}_\text{width} \times (\text{maxInterpolationOffset} + \text{ULP}) - \text{ULP} \]
where \( \text{frag}_\text{width} \) is the width of the current fragment in pixels and \( \text{ULP} = 1 / 2^{\text{subPixelInterpolationOffsetBits}} \).

The second element of the Offset operand of InterpolateAtOffset must be greater than or equal to:
\[ \text{frag}_\text{height} \times \text{minInterpolationOffset} \]
where \( \text{frag}_\text{height} \) is the height of the current fragment in pixels.

The second element of the Offset operand of InterpolateAtOffset must be less than or equal to:
\[ \text{frag}_\text{height} \times (\text{maxInterpolationOffset} + \text{ULP}) - \text{ULP} \]
where \( \text{frag}_\text{height} \) is the height of the current fragment in pixels and \( \text{ULP} = 1 / 2^{\text{subPixelInterpolationOffsetBits}} \).

For OpRayQueryInitializeKHR instructions, all components of the RayOrigin and RayDirection operands must be finite floating-point values.

For OpRayQueryInitializeKHR instructions, the RayTmin and RayTmax operands must be non-negative floating-point values.

For OpRayQueryInitializeKHR instructions, the RayTmin operand must be less than or equal to the RayTmax operand.

For OpRayQueryInitializeKHR instructions, Acceleration Structure must be an acceleration structure built as a top-level acceleration structure.

For OpRayQueryInitializeKHR instructions, the Rayflags operand must not contain both SkipTrianglesKHR and SkipAABBsKHR.
For `OpRayQueryInitializeKHR` instructions, the `Rayflags` operand must not contain more than one of `SkipTrianglesKHR`, `CullBackFacingTrianglesKHR`, and `CullFrontFacingTrianglesKHR`.

For `OpRayQueryInitializeKHR` instructions, the `Rayflags` operand must not contain more than one of `OpaqueKHR`, `NoOpaqueKHR`, `CullOpaqueKHR`, and `CullNoOpaqueKHR`.

For `OpRayQueryGenerateIntersectionKHR` instructions, `Hit T` must satisfy the condition `RayTmin ≤ Hit T ≤ RayTmax`, where `RayTmin` is equal to the value returned by `OpRayQueryGetRayTMinKHR` with the same ray query object, and `RayTmax` is equal to the value of `OpRayQueryGetIntersectionTKHR` for the current committed intersection with the same ray query object.

For `OpRayQueryGenerateIntersectionKHR` instructions, Acceleration Structure must not be built with `VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV` in flags.

For `OpRayQueryGetIntersectionTriangleVertexPositionsKHR` instructions, Acceleration Structure must have been built with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DATA_ACCESS_KHR` in flags.

For `OpTraceRayKHR` instructions, all components of the `RayOrigin` and `RayDirection` operands must be finite floating-point values.

For `OpTraceRayKHR` instructions, the `RayTmin` and `RayTmax` operands must be non-negative floating-point values.

For `OpTraceRayKHR` instructions, the `Rayflags` operand must not contain both `SkipTrianglesKHR` and `SkipAABBsKHR`.

For `OpTraceRayKHR` instructions, the `Rayflags` operand must not contain more than one of `SkipTrianglesKHR`, `CullBackFacingTrianglesKHR`, and `CullFrontFacingTrianglesKHR`.

For `OpTraceRayKHR` instructions, the `Rayflags` operand must not contain more than one of `OpaqueKHR`, `NoOpaqueKHR`, `CullOpaqueKHR`, and `CullNoOpaqueKHR`.

For `OpTraceRayKHR` instructions, if the `Rayflags` operand contains `SkipTrianglesKHR`, the pipeline must not have been created with `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR` set.

For `OpTraceRayKHR` instructions, if the `Rayflags` operand contains `SkipAABBsKHR`, the pipeline must not have been created with `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR` set.
• VUID-RuntimeSpirv-OpTraceRayKHR-06357
For OpTraceRayKHR instructions, the RayTmin operand must be less than or equal to the RayTmax operand.

• VUID-RuntimeSpirv-OpTraceRayKHR-06358
For OpTraceRayKHR instructions, RayOrigin, RayDirection, RayTmin, and RayTmax operands must not contain NaNs.

• VUID-RuntimeSpirv-OpTraceRayKHR-06359
For OpTraceRayKHR instructions, Acceleration Structure must be an acceleration structure built as a top-level acceleration structure.

• VUID-RuntimeSpirv-OpReportIntersectionKHR-06998
The value of the “Hit Kind” operand of OpReportIntersectionKHR must be in the range [0,127].

• VUID-RuntimeSpirv-OpTraceRayKHR-06360
For OpTraceRayKHR instructions, if Acceleration Structure was built with VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV in flags, the pipeline must have been created with VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV set.

• VUID-RuntimeSpirv-OpTraceRayMotionNV-06361
For OpTraceRayMotionNV instructions, all components of the RayOrigin and RayDirection operands must be finite floating-point values.

• VUID-RuntimeSpirv-OpTraceRayMotionNV-06362
For OpTraceRayMotionNV instructions, the RayTmin and RayTmax operands must be non-negative floating-point values.

• VUID-RuntimeSpirv-OpTraceRayMotionNV-06363
For OpTraceRayMotionNV instructions, the RayTmin operand must be less than or equal to the RayTmax operand.

• VUID-RuntimeSpirv-OpTraceRayMotionNV-06364
For OpTraceRayMotionNV instructions, RayOrigin, RayDirection, RayTmin, and RayTmax operands must not contain NaNs.

• VUID-RuntimeSpirv-OpTraceRayMotionNV-06365
For OpTraceRayMotionNV instructions, Acceleration Structure must be an acceleration structure built as a top-level acceleration structure with VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV in flags.

• VUID-RuntimeSpirv-OpTraceRayMotionNV-06366
For OpTraceRayMotionNV instructions the time operand must be between 0.0 and 1.0.

• VUID-RuntimeSpirv-OpTraceRayMotionNV-06367
For OpTraceRayMotionNV instructions the pipeline must have been created with VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV set.

• VUID-RuntimeSpirv-OpHitObjectTraceRayMotionNV-07704
For OpHitObjectTraceRayMotionNV instructions, if Acceleration Structure was built with VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV in flags, the pipeline must have been created with VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV set.

• VUID-RuntimeSpirv-OpHitObjectTraceRayNV-07705
For OpHitObjectTraceRayNV and OpHitObjectTraceRayMotionNV instructions, all components...
of the RayOrigin and RayDirection operands must be finite floating-point values

- VUID-RuntimeSpirv-OpHitObjectTraceRayNV-07706
  For OpHitObjectTraceRayNV and OpHitObjectTraceRayMotionNV instructions, the RayTmin and RayTmax operands must be non-negative floating-point values

- VUID-RuntimeSpirv-OpHitObjectTraceRayNV-07707
  For OpHitObjectTraceRayNV and OpHitObjectTraceRayMotionNV instructions, the RayTmin operand must be less than or equal to the RayTmax operand

- VUID-RuntimeSpirv-OpHitObjectTraceRayNV-07708
  For OpHitObjectTraceRayNV and OpHitObjectTraceRayMotionNV instructions, RayOrigin, RayDirection, RayTmin, and RayTmax operands must not contain NaNs

- VUID-RuntimeSpirv-OpHitObjectTraceRayMotionNV-07709
  For OpHitObjectTraceRayMotionNV instructions, Acceleration Structure must be an acceleration structure built as a top-level acceleration structure with VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV in flags

- VUID-RuntimeSpirv-OpHitObjectTraceRayNV-07710
  For OpHitObjectTraceRayNV and OpHitObjectTraceRayMotionNV instructions the time operand must be between 0.0 and 1.0

- VUID-RuntimeSpirv-OpHitObjectTraceRayMotionNV-07711
  For OpHitObjectTraceRayMotionNV instructions the pipeline must have been created with VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV set

- VUID-RuntimeSpirv-OpHitObjectTraceRayNV-07712
  For OpHitObjectTraceRayNV and OpHitObjectTraceRayMotionNV instructions, the Rayflags operand must not contain both SkipTrianglesKHR and SkipAABBsKHR

- VUID-RuntimeSpirv-OpHitObjectTraceRayNV-07713
  For OpHitObjectTraceRayNV and OpHitObjectTraceRayMotionNV instructions, the Rayflags operand must not contain more than one of SkipTrianglesKHR, CullBackFacingTrianglesKHR, and CullFrontFacingTrianglesKHR

- VUID-RuntimeSpirv-OpHitObjectTraceRayNV-07714
  For OpHitObjectTraceRayNV and OpHitObjectTraceRayMotionNV instructions, the Rayflags operand must not contain more than one of OpaqueKHR, NoOpaqueKHR, CullOpaqueKHR, and CullNoOpaqueKHR

- VUID-RuntimeSpirv-OpHitObjectTraceRayNV-07715
  For OpHitObjectTraceRayNV and OpHitObjectTraceRayMotionNV instructions, if the Rayflags operand contains SkipTrianglesKHR, the pipeline must not have been created with VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR set

- VUID-RuntimeSpirv-OpHitObjectTraceRayNV-07716
  For OpHitObjectTraceRayNV and OpHitObjectTraceRayMotionNV instructions, if the Rayflags operand contains SkipAABBsKHR, the pipeline must not have been created with VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR set

- VUID-RuntimeSpirv-x-06429
  In compute shaders using the GLCompute Execution Model the x size in LocalSize or LocalSizeId must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupSize[0]
In compute shaders using the GLCompute Execution Model the y size in LocalSize or LocalSizeId must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupSize[1]

In compute shaders using the GLCompute Execution Model the z size in LocalSize or LocalSizeId must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupSize[2]

In compute shaders using the GLCompute Execution Model the product of x size, y size, and z size in LocalSize or LocalSizeId must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupInvocations

If Execution Mode LocalSizeId is used, maintenance4 must be enabled

If maintenance4 is not enabled, any OpTypeVector output interface variables must not have a higher Component Count than a matching OpTypeVector input interface variable

Any user-defined variables shared between the OpEntryPoint of two shader stages, and declared with Input as its Storage Class for the subsequent shader stage, must have all Location slots and Component words declared in the preceding shader stage's OpEntryPoint with Output as the Storage Class

Any user-defined variables between the OpEntryPoint of two shader stages must have the same type and width for each Component

Any OpVariable, Block-decorated OpTypeStruct, or Block-decorated OpTypeStruct members shared between the OpEntryPoint of two shader stages must have matching decorations as defined in interface matching

The sum of size in bytes for variables and padding in the Workgroup Storage Class in the GLCompute Execution Model must be less than or equal to maxComputeSharedMemorySize

If shaderZeroInitializeWorkgroupMemory is not enabled, any OpVariable with Workgroup as its Storage Class must not have an Initializer operand

If an OpImage*Gather operation has an image operand of Offset, ConstOffset, or ConstOffsets the offset value must be greater than or equal to minTexelGatherOffset

If an OpImage*Gather operation has an image operand of Offset, ConstOffset, or ConstOffsets the offset value must be less than or equal to maxTexelGatherOffset

If an OpImageSample* or OpImageFetch* operation has an image operand of ConstOffset then
the offset value must be greater than or equal to minTexelOffset

- VUID-RuntimeSpirv-OpImageSample-06436
  If an OpImageSample* or OpImageFetch* operation has an image operand of ConstOffset then the offset value must be less than or equal to maxTexelOffset

- VUID-RuntimeSpirv-samples-08725

- VUID-RuntimeSpirv-samples-08726
  If an OpTypeImage has an MS operand 1, its bound image must not have been created with VkImageCreateInfo::samples as VK_SAMPLE_COUNT_1_BIT

- VUID-RuntimeSpirv-SampleRateShading-06378
  If the subpass description contains VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM, then the SPIR-V fragment shader Capability SampleRateShading must not be enabled

- VUID-RuntimeSpirv-SubgroupUniformControlFlowKHR-06379
  The Execution Mode SubgroupUniformControlFlowKHR must not be applied to an entry point unless shaderSubgroupUniformControlFlow is enabled, the corresponding shader stage bit is set in subgroupSupportedStages, and the entry point does not execute any invocation repack instructions

- VUID-RuntimeSpirv-shaderEarlyAndLateFragmentTests-06767
  If shaderEarlyAndLateFragmentTests is not enabled, the EarlyAndLateFragmentTestsEXT Execution Mode must not be used

- VUID-RuntimeSpirv-shaderEarlyAndLateFragmentTests-06768
  If shaderEarlyAndLateFragmentTests feature is not enabled, the StencilRefUnchangedFrontEXT Execution Mode must not be used

- VUID-RuntimeSpirv-shaderEarlyAndLateFragmentTests-06769
  If shaderEarlyAndLateFragmentTests is not enabled, the StencilRefUnchangedBackEXT Execution Mode must not be used

- VUID-RuntimeSpirv-shaderEarlyAndLateFragmentTests-06770
  If shaderEarlyAndLateFragmentTests is not enabled, the StencilRefGreaterFrontEXT Execution Mode must not be used

- VUID-RuntimeSpirv-shaderEarlyAndLateFragmentTests-06771
  If shaderEarlyAndLateFragmentTests is not enabled, the StencilRefGreaterBackEXT Execution Mode must not be used

- VUID-RuntimeSpirv-shaderEarlyAndLateFragmentTests-06772
  If shaderEarlyAndLateFragmentTests is not enabled, the StencilRefLessFrontEXT Execution Mode must not be used

- VUID-RuntimeSpirv-shaderEarlyAndLateFragmentTests-06773
  If shaderEarlyAndLateFragmentTests is not enabled, the StencilRefLessBackEXT Execution Mode must not be used

- VUID-RuntimeSpirv-OpImageWeightedSampleQCOM-06979
  If an OpImageWeightedSampleQCOM operation is used, then the Texture Sampled Image and Weight Image parameters must both be dynamically uniform for the quad

4290
If an `OpImageWeightedSampleQCOM` operation is used, then the Weight Image parameter must be of Storage Class UniformConstant and type `OpTypeImage` with Depth=0, Dim=2D, Arrayed=1, MS=0, and Sampled=1.

If an `OpImageWeightedSampleQCOM` operation is used, then the Weight Image parameter must be decorated with `WeightTextureQCOM`.

If an `OpImageBlockMatchSADQCOM` or `OpImageBlockMatchSSDQCOM` operation is used, then the target sampled image, reference sampled image, and Block Size parameters must both be dynamically uniform for the quad.

If an `OpImageBlockMatchSSDQCOM` or `OpImageBlockMatchSADQCOM` operation is used, then the target sampled image and reference sampled image parameters must be of storage class UniformConstant and type `OpTypeImage` with Depth=0, Dim=2D, Arrayed=0, MS=0, and Sampled=1.

If an `OpImageBlockMatchSSDQCOM` or `OpImageBlockMatchSADQCOM` operation is used, then the target sampled image and reference sampled image parameters must have been created using an identical sampler object.

If an `OpImageBlockMatchSSDQCOM` or `OpImageBlockMatchSADQCOM` operation is used, then the target sampled image and reference sampled image parameters must have been created with a sampler object with unnormalizedCoordinates equal to VK_TRUE.

If an `OpImageBlockMatchSSDQCOM` or `OpImageBlockMatchSADQCOM` operation is used, then Block Size less than or equal to `maxBlockMatchRegion`.

If an `OpImageBoxFilterQCOM` operation is used, then Box Size.y must be equal to or greater than 1.0 and less than or equal to `maxBoxFilterBlockSize.height`.

If an `OpImageBoxFilterQCOM` operation is used, then Sampled Texture Image and Box Size parameters must be dynamically uniform.

Each `OpEntryPoint` must not have more than one variable decorated with `InputAttachmentIndex` per image aspect of the attachment image bound to it, either
explicitly or implicitly as described by input attachment interface

- **VUID-RuntimeSpirv-shaderTileImageColorReadAccess-08728**
  If `shaderTileImageColorReadAccess` is not enabled, `OpColorAttachmentReadEXT` operation **must** not be used

- **VUID-RuntimeSpirv-shaderTileImageDepthReadAccess-08729**
  If `shaderTileImageDepthReadAccess` is not enabled, `OpDepthAttachmentReadEXT` operation **must** not be used

- **VUID-RuntimeSpirv-shaderTileImageStencilReadAccess-08730**
  If `shaderTileImageStencilReadAccess` is not enabled, `OpStencilAttachmentReadEXT` operation **must** not be used

- **VUID-RuntimeSpirv-minSampleShading-08731**
  If `sample shading` is enabled and `minSampleShading` is 1.0, the `sample` operand of any `OpColorAttachmentReadEXT`, `OpDepthAttachmentReadEXT`, or `OpStencilAttachmentReadEXT` operation **must** evaluate to the value of the `coverage index` for any given fragment invocation

- **VUID-RuntimeSpirv-minSampleShading-08732**
  If `sample shading` is enabled and any of the `OpColorAttachmentReadEXT`, `OpDepthAttachmentReadEXT`, or `OpStencilAttachmentReadEXT` operations are used, then `minSampleShading` **must** be 1.0

- **VUID-RuntimeSpirv-MeshEXT-09218**
  In mesh shaders using the `MeshEXT` or `MeshNV` Execution Model and the `OutputPoints Execution Mode`, if `maintenance5` is not enabled, and if the number of output points is greater than 0, a `PointSize` decorated variable **must** be written to for each output point

- **VUID-RuntimeSpirv-maintenance5-09190**
  If `maintenance5` is enabled and a `PointSize` decorated variable is written to, all execution paths **must** write to a `PointSize` decorated variable

- **VUID-RuntimeSpirv-ShaderEnqueueAMDX-09191**
  The `ShaderEnqueueAMDX` capability **must** only be used in shaders with the `GLCompute` execution model

- **VUID-RuntimeSpirv-NodePayloadAMDX-09192**
  Variables in the `NodePayloadAMDX` storage class **must** only be declared in the `GLCompute` execution model

- **VUID-RuntimeSpirv-maxExecutionGraphShaderPayloadSize-09193**
  Variables declared in the `NodePayloadAMDX` storage class **must** not be larger than the `maxExecutionGraphShaderPayloadSize` limit

- **VUID-RuntimeSpirv-maxExecutionGraphShaderPayloadSize-09194**
  Variables declared in the `NodeOutputPayloadAMDX` storage class **must** not be larger than the `maxExecutionGraphShaderPayloadSize` limit

- **VUID-RuntimeSpirv-maxExecutionGraphShaderPayloadSize-09195**
  For a given entry point, the sum of the size of any variable in the `NodePayloadAMDX` storage class, and the combined size of all statically initialized variables in the `NodeOutputPayloadAMDX` storage class **must** not be greater than `maxExecutionGraphShaderPayloadSize`
Shaders must not statically initialize more than `maxExecutionGraphShaderPayloadCount` variables in the `NodeOutputPayloadAMDX` storage class.

Shaders must not include more than `maxExecutionGraphShaderOutputNodes` instances of `OpInitializeNodePayloadsAMDX`.

If an `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` operation is used, then the target sampled image, reference sampled image, and Block Size parameters must both be dynamically uniform for the quad.

If an `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` operation is used, then target sampled image and reference sampled image parameters must be of storage class `UniformConstant` and type `OpTypeImage` with `Depth=0`, `Dim=2D`, `Arrayed=0`, `MS=0`, and `Sampled=1`.

If an `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` operation is used, then the target sampled image and reference sampled image parameters must be decorated with `BlockMatchTextureQCOM`.

If an `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` operation is used, then target sampled image and reference sampled image parameters must have been created using an identical sampler object.

If an `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` operation is used, then target sampled image and reference sampled image parameters must have been created with a sampler object with `unnormalizedCoordinates` equal to `VK_TRUE`.

If an `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` operation is used, then Block Size less than or equal to `maxBlockMatchRegion`.

If an `OpImageBlockMatchWindow*QCOM` operation is used, then target sampled image must have been created using a sampler object that included `VkSamplerBlockMatchWindowCreateInfoQCOM` in the `pNext` chain.

The execution mode `MaximallyReconvergesKHR` must not be applied to an entry point unless the entry point does not execute any invocation repack instructions.

If `shaderSubgroupRotateClustered` is `VK_FALSE`, then the `ClusterSize` operand to `OpGroupNonUniformRotateKHR` must not be used.
If `protectedNoFault` is not supported, the Storage Class of the PhysicalStorageBuffer must not be used if the buffer being accessed is `protected`.

**Precision and Operation of SPIR-V Instructions**

The following rules apply to half, single, and double-precision floating point instructions:

- Positive and negative infinities and positive and negative zeros are generated as dictated by IEEE 754, but subject to the precisions allowed in the following table.
- Dividing a non-zero by a zero results in the appropriately signed IEEE 754 infinity.
- Signaling NaNs are not required to be generated and exceptions are never raised. Signaling NaN may be converted to quiet NaNs values by any floating point instruction.
- The floating-point environment used for an instruction can be determined as follows:
  - If the SPIR-V specifies it explicitly using the `FPFastMath` decoration or `FPFastMathDefault Execution Mode` then that is used.
  - If the environment is not specified in the SPIR-V then it is determined as follows:
    - If the operation is not decorated `NoContraction` then the flags `AllowContract`, `AllowReassoc`, `AllowRecip`, and `AllowTransform` are assumed.
    - If any of the following conditions are true then the flags `NSZ`, `NotInf`, and `NotNaN` are assumed:
      - The entry point does not use the Execution Mode `SignedZeroInfNanPreserve` with a bit-width corresponding to one of the operands or to the result type.
    - The operation is an `OpLoad` from the Input Storage Class in the fragment shader stage.
- Denormalized values are supported.
  - By default, any half, single, or double-precision denormalized value input into a shader or potentially generated by any instruction (except those listed above) or any extended instructions for GLSL in a shader may be flushed to zero.
  - If the entry point is declared with the DenormFlushToZero Execution Mode then for the affected instructions the denormalized result must be flushed to zero and the denormalized operands may be flushed to zero. Denormalized values obtained via unpacking an integer into a vector of values with smaller bit width and interpreting those values as floating-point numbers must be flushed to zero.
numbers **must** be flushed to zero.

The precision of double-precision instructions is at least that of single precision.

The precision of individual operations is defined in [Precision of Individual Operations](#). Subject to the constraints below, however, implementations **may** reorder or combine operations, resulting in expressions exhibiting different precisions than might be expected from the constituent operations.

**Evaluation of Expressions**

Implementations **may** rearrange floating-point operations using any of the mathematical properties governing the expressions in precise arithmetic, even where the floating-point operations do not share these properties. This includes, but is not limited to, associativity and distributivity, and **may** involve a different number of rounding steps than would occur if the operations were not rearranged. In shaders that use the `SignedZeroInfNanPreserve Execution Mode` the values **must** be preserved if they are generated after any rearrangement but the Execution Mode does not change which rearrangements are valid. This rearrangement **can** be prevented for particular operations by using the `NoContraction` decoration.

---

**Note**

For example, in the absence of the `NoContraction` decoration implementations are allowed to implement \( a + b - a \) and \( \frac{a \times b}{a} \) as \( b \). The `SignedZeroInfNanPreserve` does not prevent these transformations, even though they may overflow to infinity or NaN when evaluated in floating-point.

If the `NoContraction` decoration is applied then operations may not be rearranged, so, for example, \( a + a - a \) must account for possible overflow to infinity. If infinities
are not preserved then the expression may be replaced with $a$, since the replacement is exact when overflow does not occur and infinities may be replaced with undefined values. If both NoContraction and SignedZeroInfNanPreserve are used then the result must be infinity for sufficiently large $a$.

**Precision of Individual Operations**

The precision of individual operations is defined either in terms of rounding (correctly rounded), as an error bound in ULP, or as inherited from a formula as follows:

**Correctly Rounded**

Operations described as “correctly rounded” will return the infinitely precise result, $x$, rounded so as to be representable in floating-point. The rounding mode is not specified, unless the entry point is declared with the RoundingModeRTE or the RoundingModeRTZ Execution Mode. These execution modes affect only correctly rounded SPIR-V instructions. These execution modes do not affect OpQuantizeToF16. If the rounding mode is not specified then this rounding is implementation specific, subject to the following rules. If $x$ is exactly representable then $x$ will be returned. Otherwise, either the floating-point value closest to and no less than $x$ or the value closest to and no greater than $x$ will be returned.

**ULP**

Where an error bound of $n$ ULP (units in the last place) is given, for an operation with infinitely precise result $x$, the value returned **must** be in the range $[x - n \times \text{ulp}(x), x + n \times \text{ulp}(x)]$. The function $\text{ulp}(x)$ is defined as follows:

If there exist non-equal, finite floating-point numbers $a$ and $b$ such that $a \leq x \leq b$ then $\text{ulp}(x)$ is the minimum possible distance between such numbers, $\text{ulp}(x) = \min_{a \neq b} |b - a|$. If such numbers do not exist then $\text{ulp}(x)$ is defined to be the difference between the two non-equal, finite floating-point numbers nearest to $x$.

Where the range of allowed return values includes any value of magnitude larger than that of the largest representable finite floating-point number, operations **may**, additionally, return either an infinity of the appropriate sign or the finite number with the largest magnitude of the appropriate sign. If the infinitely precise result of the operation is not mathematically defined then the value returned is undefined.

**Inherited From ...**

Where an operation’s precision is described as being inherited from a formula, the result returned **must** be at least as accurate as the result of computing an approximation to $x$ using a formula equivalent to the given formula applied to the supplied inputs. Specifically, the formula given may be transformed using the mathematical associativity, commutativity and distributivity of the operators involved to yield an equivalent formula. The SPIR-V precision rules, when applied to each such formula and the given input values, define a range of permitted values. If NaN is one of the permitted values then the operation may return any result, otherwise let the largest permitted value in any of the ranges be $F_{\text{max}}$ and the smallest be $F_{\text{min}}$. The operation **must** return a value in the range $[x - E, x + E]$ where $E = \max(|x - F_{\text{min}}|, |x - F_{\text{max}}|)$. If the entry point is declared with the DenormFlushToZero execution mode, then any intermediate denormal value(s) while evaluating the
formula may be flushed to zero. Denormal final results must be flushed to zero. If the entry point is declared with the DenormPreserve Execution Mode, then denormals must be preserved throughout the formula.

For half- (16 bit) and single- (32 bit) precision instructions, precisions are required to be at least as follows:

Table 98. Precision of core SPIR-V Instructions

<table>
<thead>
<tr>
<th>Instruction</th>
<th>Single precision, unless decorated with RelaxedPrecision</th>
<th>Half precision</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpFAdd</td>
<td>Correctly rounded.</td>
<td></td>
</tr>
<tr>
<td>OpFSub</td>
<td>Correctly rounded.</td>
<td></td>
</tr>
<tr>
<td>OpDot(x, y)</td>
<td>Inherited from $\sum_{i=0}^{n-1} x_i \times y_i$</td>
<td></td>
</tr>
<tr>
<td>OpFOrdEqual, OpFUnordEqual</td>
<td>Correct result.</td>
<td></td>
</tr>
<tr>
<td>OpFOrdLessThan, OpFUnordLessThan</td>
<td>Correct result.</td>
<td></td>
</tr>
<tr>
<td>OpFOrdGreaterThan, OpFUnordGreaterThan</td>
<td>Correct result.</td>
<td></td>
</tr>
<tr>
<td>OpFOrdGreaterThanEqual, OpFUnordGreaterThanEqual</td>
<td>Correct result.</td>
<td></td>
</tr>
<tr>
<td>OpFDiv(x,y)</td>
<td>2.5 ULP for $</td>
<td>y</td>
</tr>
<tr>
<td>OpFRem(x,y)</td>
<td>Inherited from $x - y \times \text{trunc}(x/y)$.</td>
<td></td>
</tr>
<tr>
<td>OpFMod(x,y)</td>
<td>Inherited from $x - y \times \text{floor}(x/y)$.</td>
<td></td>
</tr>
<tr>
<td>conversions between types</td>
<td>Correctly rounded.</td>
<td></td>
</tr>
</tbody>
</table>

**Note**

The OpFRem and OpFMod instructions use cheap approximations of remainder, and the error can be large due to the discontinuity in trunc() and floor(). This can produce mathematically unexpected results in some cases, such as FMod(x,x) computing x rather than 0, and can also cause the result to have a different sign than the infinitely precise result.

GLSL.std.450 extended instructions specifically defined in terms of the above instructions inherit the above errors. GLSL.std.450 extended instructions not listed above and not defined in terms of the above have undefined precision.

For the OpSRem and OpSMod instructions, if either operand is negative the result is undefined.

**Note**

While the OpSRem and OpSMod instructions are supported by the Vulkan environment, they require non-negative values and thus do not enable additional functionality beyond what OpUMod provides.

OpCooperativeMatrixMulAddNV performs its operations in an implementation-dependent order and internal precision.
OpCooperativeMatrixMulAddKHR performs its operations in an implementation-dependent order and internal precision.

**Signedness of SPIR-V Image Accesses**

SPIR-V associates a signedness with all integer image accesses. This is required in certain parts of the SPIR-V and the Vulkan image access pipeline to ensure defined results. The signedness is determined from a combination of the access instruction’s Image Operands and the underlying image’s Sampled Type as follows:

1. If the instruction’s Image Operands contains the SignExtend operand then the access is signed.
2. If the instruction’s Image Operands contains the ZeroExtend operand then the access is unsigned.
3. Otherwise, the image accesses signedness matches that of the Sampled Type of the OpTypeImage being accessed.

**Image Format and Type Matching**

When specifying the Image Format of an OpTypeImage, the converted bit width and type, as shown in the table below, must match the Sampled Type. The signedness must match the signedness of any access to the image.

> **Note**
> Formatted accesses are always converted from a shader readable type to the resource’s format or vice versa via Format Conversion for reads and Texel Output Format Conversion for writes. As such, the bit width and format below do not necessarily match 1:1 with what might be expected for some formats.

For a given Image Format, the Sampled Type must be the type described in the Type column of the below table, with its Literal Width set to that in the Bit Width column. Every access that is made to the image must have a signedness equal to that in the Signedness column (where applicable).

**Ray Query Precision and Operation**

The values returned by `OpRayQueryGetIntersectionTriangleVertexPositionsKHR` are transformed by
the geometry transform, which is performed at standard floating point precision, but without a specifically defined order of floating point operations to perform the matrix multiplication.
Appendix B: Memory Model

**Note**
This memory model describes synchronizations provided by all implementations; however, some of the synchronizations defined require extra features to be supported by the implementation. See VkPhysicalDeviceVulkanMemoryModelFeatures.

**Agent**

*Operation* is a general term for any task that is executed on the system.

**Note**
An operation is by definition something that is executed. Thus if an instruction is skipped due to control flow, it does not constitute an operation.

Each operation is executed by a particular *agent*. Possible agents include each shader invocation, each host thread, and each fixed-function stage of the pipeline.

**Memory Location**

A *memory location* identifies unique storage for 8 bits of data. Memory operations access a set of *memory locations* consisting of one or more memory locations at a time, e.g. an operation accessing a 32-bit integer in memory would read/write a set of four memory locations. Memory operations that access whole aggregates *may* access any padding bytes between elements or members, but no padding bytes at the end of the aggregate. Two sets of memory locations *overlap* if the intersection of their sets of memory locations is non-empty. A memory operation *must* not affect memory at a memory location not within its set of memory locations.

Memory locations for buffers and images are explicitly allocated in VkDeviceMemory objects, and are implicitly allocated for SPIR-V variables in each shader invocation.

Variables with *Workgroup* storage class that point to a block-decorated type share a set of memory locations.

**Allocation**

The values stored in newly allocated memory locations are determined by a SPIR-V variable’s initializer, if present, or else are undefined. At the time an allocation is created there have been no memory operations to any of its memory locations. The initialization is not considered to be a memory operation.

**Note**
For tessellation control shader output variables, a consequence of initialization not being considered a memory operation is that some implementations may need to
insert a barrier between the initialization of the output variables and any reads of those variables.

**Memory Operation**

For an operation A and memory location M:

- A **reads** M if and only if the data stored in M is an input to A.
- A **writes** M if and only if the data output from A is stored to M.
- A **accesses** M if and only if it either reads or writes (or both) M.

**Note**

A write whose value is the same as what was already in those memory locations is still considered to be a write and has all the same effects.

**Reference**

A **reference** is an object that a particular agent **can** use to access a set of memory locations. On the host, a reference is a host virtual address. On the device, a reference is:

- The descriptor that a variable is bound to, for variables in Image, Uniform, or StorageBuffer storage classes. If the variable is an array (or array of arrays, etc.) then each element of the array **may** be a unique reference.
- The address range for a buffer in PhysicalStorageBuffer storage class, where the base of the address range is queried with `vkGetBufferDeviceAddress` and the length of the range is the size of the buffer.
- A single common reference for all variables with Workgroup storage class that point to a block-decorated type.
- The variable itself for non-block-decorated type variables in Workgroup storage class.
- The variable itself for variables in other storage classes.

Two memory accesses through distinct references **may** require availability and visibility operations as defined **below**.

**Program-Order**

A **dynamic instance** of an instruction is defined in SPIR-V (https://registry.khronos.org/spir-v/specs/unified1/SPIRV.html#DynamicInstance) as a way of referring to a particular execution of a static instruction. Program-order is an ordering on dynamic instances of instructions executed by a single shader invocation:

- (Basic block): If instructions A and B are in the same basic block, and A is listed in the module before B, then the n'th dynamic instance of A is program-ordered before the n'th dynamic instance of B.
• (Branch): The dynamic instance of a branch or switch instruction is program-ordered before the
dynamic instance of the OpLabel instruction to which it transfers control.

• (Call entry): The dynamic instance of an OpFunctionCall instruction is program-ordered before
the dynamic instances of the OpFunctionParameter instructions and the body of the called
function.

• (Call exit): The dynamic instance of the instruction following an OpFunctionCall instruction is
program-ordered after the dynamic instance of the return instruction executed by the called
function.

• (Transitive Closure): If dynamic instance A of any instruction is program-ordered before
dynamic instance B of any instruction and B is program-ordered before dynamic instance C of
any instruction then A is program-ordered before C.

• (Complete definition): No other dynamic instances are program-ordered.

For instructions executed on the host, the source language defines the program-order relation (e.g.
as “sequenced-before”).

Shader Call Related

Shader-call-related is an equivalence relation on invocations defined as the symmetric and
transitive closure of:

• A is shader-call-related to B if A is created by an shader call instruction executed by B.

Shader Call Order

Shader-call-order is a partial order on dynamic instances of instructions executed by invocations
that are shader-call-related:

• (Program order): If dynamic instance A is program-ordered before B, then A is shader-call-
ordered before B.

• (Shader call entry): If A is a dynamic instance of an shader call instruction and B is a dynamic
instance executed by an invocation that is created by A, then A is shader-call-ordered before B.

• (Shader call exit): If A is a dynamic instance of an shader call instruction, B is the next dynamic
instance executed by the same invocation, and C is a dynamic instance executed by an
invocation that is created by A, then C is shader-call-ordered before B.

• (Transitive closure): If A is shader-call-ordered-before B and B is shader-call-ordered-before C,
then A is shader-call-ordered-before C.

• (Complete definition): No other dynamic instances are shader-call-ordered.

Scope

Atomic and barrier instructions include scopes which identify sets of shader invocations that must
obey the requested ordering and atomicity rules of the operation, as defined below.

The various scopes are described in detail in the Shaders chapter.
**Atomic Operation**

An *atomic operation* on the device is any SPIR-V operation whose name begins with `OpAtomic`. An atomic operation on the host is any operation performed with an `std::atomic` typed object.

Each atomic operation has a memory **scope** and a **semantics**. Informally, the scope determines which other agents it is atomic with respect to, and the semantics constrains its ordering against other memory accesses. Device atomic operations have explicit scopes and semantics. Each host atomic operation implicitly uses the `CrossDevice` scope, and uses a memory semantics equivalent to a C++ `std::memory_order` value of relaxed, acquire, release, `acq_rel`, or `seq_cst`.

Two atomic operations A and B are **potentially-mutually-ordered** if and only if all of the following are true:

- They access the same set of memory locations.
- They use the same reference.
- A is in the instance of B's memory scope.
- B is in the instance of A's memory scope.
- A and B are not the same operation (irreflexive).

Two atomic operations A and B are **mutually-ordered** if and only if they are potentially-mutually-ordered and any of the following are true:

- A and B are both device operations.
- A and B are both host operations.
- A is a device operation, B is a host operation, and the implementation supports concurrent host-and device-atomics.

**Note**

If two atomic operations are not mutually-ordered, and if their sets of memory locations overlap, then each *must* be synchronized against the other as if they were non-atomic operations.

**Scoped Modification Order**

For a given atomic write A, all atomic writes that are mutually-ordered with A occur in an order known as A's **scoped modification order**. A's scoped modification order relates no other operations.

**Note**

Invocations outside the instance of A's memory scope *may* observe the values at A's set of memory locations becoming visible to it in an order that disagrees with the scoped modification order.

**Note**

It is valid to have non-atomic operations or atomics in a different scope instance to
the same set of memory locations, as long as they are synchronized against each other as if they were non-atomic (if they are not, it is treated as a data race). That means this definition of A’s scoped modification order could include atomic operations that occur much later, after intervening non-atomics. That is a bit non-intuitive, but it helps to keep this definition simple and non-circular.

Memory Semantics

Non-atomic memory operations, by default, may be observed by one agent in a different order than they were written by another agent.

Atomics and some synchronization operations include memory semantics, which are flags that constrain the order in which other memory accesses (including non-atomic memory accesses and availability and visibility operations) performed by the same agent can be observed by other agents, or can observe accesses by other agents.

Device instructions that include semantics are OpAtomic*, OpControlBarrier, OpMemoryBarrier, and OpMemoryNamedBarrier. Host instructions that include semantics are some std::atomic methods and memory fences.

SPIR-V supports the following memory semantics:

- Relaxed: No constraints on order of other memory accesses.
- Acquire: A memory read with this semantic performs an acquire operation. A memory barrier with this semantic is an acquire barrier.
- Release: A memory write with this semantic performs a release operation. A memory barrier with this semantic is a release barrier.
- AcquireRelease: A memory read-modify-write operation with this semantic performs both an acquire operation and a release operation, and inherits the limitations on ordering from both of those operations. A memory barrier with this semantic is both a release and acquire barrier.

Note

SPIR-V does not support “consume” semantics on the device.

The memory semantics operand also includes storage class semantics which indicate which storage classes are constrained by the synchronization. SPIR-V storage class semantics include:

- UniformMemory
- WorkgroupMemory
- ImageMemory
- OutputMemory

Each SPIR-V memory operation accesses a single storage class. Semantics in synchronization operations can include a combination of storage classes.

The UniformMemory storage class semantic applies to accesses to memory in the
PhysicalStorageBuffer, ShaderRecordBufferKHR, Uniform and StorageBuffer storage classes. The WorkgroupMemory storage class semantic applies to accesses to memory in the Workgroup storage class. The ImageMemory storage class semantic applies to accesses to memory in the Image storage class. The OutputMemory storage class semantic applies to accesses to memory in the Output storage class.

**Note**
Informally, these constraints limit how memory operations can be reordered, and these limits apply not only to the order of accesses as performed in the agent that executes the instruction, but also to the order the effects of writes become visible to all other agents within the same instance of the instruction’s memory scope.

**Note**
Release and acquire operations in different threads can act as synchronization operations, to guarantee that writes that happened before the release are visible after the acquire. (This is not a formal definition, just an Informative forward reference.)

**Note**
The OutputMemory storage class semantic is only useful in tessellation control shaders, which is the only execution model where output variables are shared between invocations.

The memory semantics operand can also include availability and visibility flags, which apply availability and visibility operations as described in availability and visibility. The availability/visibility flags are:

- **MakeAvailable**: Semantics must be Release or AcquireRelease. Performs an availability operation before the release operation or barrier.
- **MakeVisible**: Semantics must be Acquire or AcquireRelease. Performs a visibility operation after the acquire operation or barrier.

The specifics of these operations are defined in Availability and Visibility Semantics.

Host atomic operations may support a different list of memory semantics and synchronization operations, depending on the host architecture and source language.

**Release Sequence**

After an atomic operation A performs a release operation on a set of memory locations M, the release sequence headed by A is the longest continuous subsequence of A's scoped modification order that consists of:

- the atomic operation A as its first element
- atomic read-modify-write operations on M by any agent
Synchronizes-With

_Synchronizes-with_ is a relation between operations, where each operation is either an atomic operation or a memory barrier (aka fence on the host).

If A and B are atomic operations, then A synchronizes-with B if and only if all of the following are true:

- A performs a release operation
- B performs an acquire operation
- A and B are mutually-ordered
- B reads a value written by A or by an operation in the release sequence headed by A

OpControlBarrier, OpMemoryBarrier, and OpMemoryNamedBarrier are memory barrier instructions in SPIR-V.

If A is a release barrier and B is an atomic operation that performs an acquire operation, then A synchronizes-with B if and only if all of the following are true:

- there exists an atomic write X (with any memory semantics)
- A is program-ordered before X
- X and B are mutually-ordered
- B reads a value written by X or by an operation in the release sequence headed by X
  - If X is relaxed, it is still considered to head a hypothetical release sequence for this rule
- A and B are in the instance of each other’s memory scopes
- X’s storage class is in A’s semantics.

If A is an atomic operation that performs a release operation and B is an acquire barrier, then A synchronizes-with B if and only if all of the following are true:

- there exists an atomic read X (with any memory semantics)
- X is program-ordered before B
- X and A are mutually-ordered
- X reads a value written by A or by an operation in the release sequence headed by A
- A and B are in the instance of each other’s memory scopes
• X's storage class is in B's semantics.

If A is a release barrier and B is an acquire barrier, then A synchronizes-with B if all of the following are true:

• there exists an atomic write X (with any memory semantics)
• A is program-ordered before X
• there exists an atomic read Y (with any memory semantics)
• Y is program-ordered before B
• X and Y are mutually-ordered
• Y reads the value written by X or by an operation in the release sequence headed by X
  ◦ If X is relaxed, it is still considered to head a hypothetical release sequence for this rule
• A and B are in the instance of each other's memory scopes
• X's and Y's storage class is in A's and B's semantics.
  ◦ NOTE: X and Y must have the same storage class, because they are mutually ordered.

If A is a release barrier, B is an acquire barrier, and C is a control barrier (where A can equal C, and B can equal C), then A synchronizes-with B if all of the following are true:

• A is program-ordered before (or equals) C
• C is program-ordered before (or equals) B
• A and B are in the instance of each other’s memory scopes
• A and B are in the instance of C's execution scope

**Note**
This is similar to the barrier-barrier synchronization above, but with a control barrier filling the role of the relaxed atomics.

Let F be an ordering of fragment shader invocations, such that invocation $F_1$ is ordered before invocation $F_2$ if and only if $F_1$ and $F_2$ overlap as described in Fragment Shader Interlock and $F_1$ executes the interlocked code before $F_2$.

If A is an `OpEndInvocationInterlockEXT` instruction and B is an `OpBeginInvocationInterlockEXT` instruction, then A synchronizes-with B if the agent that executes A is ordered before the agent that executes B in F. A and B are both considered to have FragmentInterlock memory scope and semantics of UniformMemory and ImageMemory, and A is considered to have Release semantics and B is considered to have Acquire semantics.

**Note**
`OpBeginInvocationInterlockEXT` and `OpBeginInvocationInterlockEXT` do not perform implicit availability or visibility operations. Usually, shaders using fragment shader interlock will declare the relevant resources as coherent to get implicit per-instruction availability and visibility operations.
If A is a release barrier and B is an acquire barrier, then A synchronizes-with B if all of the following are true:

- A is shader-call-ordered-before B
- A and B are in the instance of each other’s memory scopes

No other release and acquire barriers synchronize-with each other.

**System-Synchronizes-With**

*System-synchronizes-with* is a relation between arbitrary operations on the device or host. Certain operations system-synchronize-with each other, which informally means the first operation occurs before the second and that the synchronization is performed without using application-visible memory accesses.

If there is an *execution dependency* between two operations A and B, then the operation in the first synchronization scope system-synchronizes-with the operation in the second synchronization scope.

*Note*

This covers all Vulkan synchronization primitives, including device operations executing before a synchronization primitive is signaled, wait operations happening before subsequent device operations, signal operations happening before host operations that wait on them, and host operations happening before `vkQueueSubmit`. The list is spread throughout the synchronization chapter, and is not repeated here.

System-synchronizes-with implicitly includes all storage class semantics and has *CrossDevice* scope.

If A system-synchronizes-with B, we also say A is *system-synchronized-before* B and B is *system-synchronized-after* A.

**Private vs. Non-Private**

By default, non-atomic memory operations are treated as *private*, meaning such a memory operation is not intended to be used for communication with other agents. Memory operations with the NonPrivatePointer/NonPrivateTexel bit set are treated as *non-private*, and are intended to be used for communication with other agents.

More precisely, for private memory operations to be *Location-Ordered* between distinct agents requires using system-synchronizes-with rather than shader-based synchronization. Private memory operations still obey program-order.

Atomic operations are always considered non-private.
Inter-Thread-Happens-Before

Let SC be a non-empty set of storage class semantics. Then (using template syntax) operation A `inter-thread-happens-before<SC>` operation B if and only if any of the following is true:

- A system-synchronizes-with B
- A synchronizes-with B, and both A and B have all of SC in their semantics
- A is an operation on memory in a storage class in SC or that has all of SC in its semantics, B is a release barrier or release atomic with all of SC in its semantics, and A is program-ordered before B
- A is an acquire barrier or acquire atomic with all of SC in its semantics, B is an operation on memory in a storage class in SC or that has all of SC in its semantics, and A is program-ordered before B
- A and B are both host operations and A inter-thread-happens-before B as defined in the host language specification
- A inter-thread-happens-before<SC> some X and X inter-thread-happens-before<SC> B

Happens-Before

Operation A `happens-before` operation B if and only if any of the following is true:

- A is program-ordered before B
- A inter-thread-happens-before<SC> B for some set of storage classes SC

`Happens-after` is defined similarly.

Note

Unlike C++, happens-before is not always sufficient for a write to be visible to a read. Additional **availability and visibility** operations may be required for writes to be **visible-to** other memory accesses.

Note

Happens-before is not transitive, but each of program-order and inter-thread-happens-before<SC> are transitive. These can be thought of as covering the “single-threaded” case and the “multi-threaded” case, and it is not necessary (and not valid) to form chains between the two.

Availability and Visibility

**Availability** and **visibility** are states of a write operation, which (informally) track how far the write has permeated the system, i.e. which agents and references are able to observe the write. Availability state is per **memory domain**. Visibility state is per (agent,reference) pair. Availability and visibility states are per-memory location for each write.
Memory domains are named according to the agents whose memory accesses use the domain. Domains used by shader invocations are organized hierarchically into multiple smaller memory domains which correspond to the different scopes. Each memory domain is considered the dual of a scope, and vice versa. The memory domains defined in Vulkan include:

- **host** - accessible by host agents
- **device** - accessible by all device agents for a particular device
- **shader** - accessible by shader agents for a particular device, corresponding to the Device scope
- **queue family instance** - accessible by shader agents in a single queue family, corresponding to the QueueFamily scope.
- **fragment interlock instance** - accessible by fragment shader agents that overlap, corresponding to the FragmentInterlock scope.
- **shader call instance** - accessible by shader agents that are shader-call-related, corresponding to the ShaderCallKHR scope.
- **workgroup instance** - accessible by shader agents in the same workgroup, corresponding to the Workgroup scope.
- **subgroup instance** - accessible by shader agents in the same subgroup, corresponding to the Subgroup scope.

The memory domains are nested in the order listed above, except for shader call instance domain, with memory domains later in the list nested in the domains earlier in the list. The shader call instance domain is at an implementation-dependent location in the list, and is nested according to that location. The shader call instance domain is not broader than the queue family instance domain.

### Note

Memory domains do not correspond to storage classes or device-local and host-local VkDeviceMemory allocations, rather they indicate whether a write can be made visible only to agents in the same subgroup, same workgroup, overlapping fragment shader invocation, shader-call-related ray tracing invocation, in any shader invocation, or anywhere on the device, or host. The shader, queue family instance, fragment interlock instance, shader call instance, workgroup instance, and subgroup instance domains are only used for shader-based availability/visibility operations, in other cases writes can be made available from/visible to the shader via the device domain.

### Availability operations, visibility operations, and memory domain operations

Availability operations, visibility operations, and memory domain operations alter the state of the write operations that happen-before them, and which are included in their source scope to be available or visible to their destination scope.

- For an availability operation, the source scope is a set of (agent,reference,memory location) tuples, and the destination scope is a set of memory domains.
- For a memory domain operation, the source scope is a memory domain and the destination scope is a memory domain.
- For a visibility operation, the source scope is a set of memory domains and the destination scope is a set of memory domains.
scope is a set of (agent, reference, memory location) tuples.

How the scopes are determined depends on the specific operation. Availability and memory domain operations expand the set of memory domains to which the write is available. Visibility operations expand the set of (agent, reference, memory location) tuples to which the write is visible.

Recall that availability and visibility states are per-memory location, and let \( W \) be a write operation to one or more locations performed by agent \( A \) via reference \( R \). Let \( L \) be one of the locations written. \((W,L)\) (the write \( W \) to \( L \)), is initially not available to any memory domain and only visible to \((A,R,L)\). An availability operation \( AV \) that happens-after \( W \) and that includes \((A,R,L)\) in its source scope makes \((W,L)\) available to the memory domains in its destination scope.

A memory domain operation \( DOM \) that happens-after \( AV \) and for which \((W,L)\) is available in the source scope makes \((W,L)\) available in the destination memory domain.

A visibility operation \( VIS \) that happens-after \( AV \) (or \( DOM \)) and for which \((W,L)\) is available in any domain in the source scope makes \((W,L)\) visible to all \((agent,reference,L)\) tuples included in its destination scope.

If write \( W_2 \) happens-after \( W \), and their sets of memory locations overlap, then \( W \) will not be available/visible to all agents/references for those memory locations that overlap (and future AV/DOM/VIS ops cannot revive \( W \)'s write to those locations).

Availability, memory domain, and visibility operations are treated like other non-atomic memory accesses for the purpose of memory semantics, meaning they can be ordered by release-acquire sequences or memory barriers.

An availability chain is a sequence of availability operations to increasingly broad memory domains, where element \( N+1 \) of the chain is performed in the dual scope instance of the destination memory domain of element \( N \) and element \( N \) happens-before element \( N+1 \). An example is an availability operation with destination scope of the workgroup instance domain that happens-before an availability operation to the shader domain performed by an invocation in the same workgroup. An availability chain \( AVC \) that happens-after \( W \) and that includes \((A,R,L)\) in the source scope makes \((W,L)\) available to the memory domains in its final destination scope. An availability chain with a single element is just the availability operation.

Similarly, a visibility chain is a sequence of visibility operations from increasingly narrow memory domains, where element \( N \) of the chain is performed in the dual scope instance of the source memory domain of element \( N+1 \) and element \( N \) happens-before element \( N+1 \). An example is a visibility operation with source scope of the shader domain that happens-before a visibility operation with source scope of the workgroup instance domain performed by an invocation in the same workgroup. A visibility chain \( VISC \) that happens-after \( AVC \) (or \( DOM \)) and for which \((W,L)\) is available in any domain in the source scope makes \((W,L)\) visible to all \((agent,reference,L)\) tuples included in its final destination scope. A visibility chain with a single element is just the visibility operation.

**Availability, Visibility, and Domain Operations**

The following operations generate availability, visibility, and domain operations. When multiple
Availability/visibility/domain operations are described, they are system-synchronized with each other in the order listed.

An operation that performs a memory dependency generates:

- If the source access mask includes `VK_ACCESS_HOST_WRITE_BIT`, then the dependency includes a memory domain operation from host domain to device domain.
- An availability operation with source scope of all writes in the first access scope of the dependency and a destination scope of the device domain.
- A visibility operation with source scope of the device domain and destination scope of the second access scope of the dependency.
- If the destination access mask includes `VK_ACCESS_HOST_READ_BIT` or `VK_ACCESS_HOST_WRITE_BIT`, then the dependency includes a memory domain operation from device domain to host domain.

`vkFlushMappedMemoryRanges` performs an availability operation, with a source scope of (agents,references) = (all host threads, all mapped memory ranges passed to the command), and destination scope of the host domain.

`vkInvalidateMappedMemoryRanges` performs a visibility operation, with a source scope of the host domain and a destination scope of (agents,references) = (all host threads, all mapped memory ranges passed to the command).

`vkQueueSubmit` performs a memory domain operation from host to device, and a visibility operation with source scope of the device domain and destination scope of all agents and references on the device.

**Availability and Visibility Semantics**

A memory barrier or atomic operation via agent A that includes MakeAvailable in its semantics performs an availability operation whose source scope includes agent A and all references in the storage classes in that instruction’s storage class semantics, and all memory locations, and whose destination scope is a set of memory domains selected as specified below. The implicit availability operation is program-ordered between the barrier or atomic and all other operations program-ordered before the barrier or atomic.

A memory barrier or atomic operation via agent A that includes MakeVisible in its semantics performs a visibility operation whose source scope is a set of memory domains selected as specified below, and whose destination scope includes agent A and all references in the storage classes in that instruction’s storage class semantics, and all memory locations. The implicit visibility operation is program-ordered between the barrier or atomic and all other operations program-ordered after the barrier or atomic.

The memory domains are selected based on the memory scope of the instruction as follows:

- **Device** scope uses the shader domain
- **QueueFamily** scope uses the queue family instance domain
- **FragmentInterlock** scope uses the fragment interlock instance domain
• **ShaderCallKHR** scope uses the shader call instance domain
• **Workgroup** scope uses the workgroup instance domain
• **Subgroup** uses the subgroup instance domain
• **Invocation** perform no availability/visibility operations.

When an availability operation performed by an agent A includes a memory domain D in its destination scope, where D corresponds to scope instance S, it also includes the memory domains that correspond to each smaller scope instance S’ that is a subset of S and that includes A. Similarly for visibility operations.

**Per-Instruction Availability and Visibility Semantics**

A memory write instruction that includes MakePointerAvailable, or an image write instruction that includes MakeTexelAvailable, performs an availability operation whose source scope includes the agent and reference used to perform the write and the memory locations written by the instruction, and whose destination scope is a set of memory domains selected by the Scope operand specified in Availability and Visibility Semantics. The implicit availability operation is program-ordered between the write and all other operations program-ordered after the write.

A memory read instruction that includes MakePointerVisible, or an image read instruction that includes MakeTexelVisible, performs a visibility operation whose source scope is a set of memory domains selected by the Scope operand as specified in Availability and Visibility Semantics, and whose destination scope includes the agent and reference used to perform the read and the memory locations read by the instruction. The implicit visibility operation is program-ordered between read and all other operations program-ordered before the read.

**Note**
Although reads with per-instruction visibility only perform visibility ops from the shader or fragment interlock instance or shader call instance or workgroup instance or subgroup instance domain, they will also see writes that were made visible via the device domain, i.e. those writes previously performed by non-shader agents and made visible via API commands.

**Note**
It is expected that all invocations in a subgroup execute on the same processor with the same path to memory, and thus availability and visibility operations with subgroup scope can be expected to be “free”.

**Location-Ordered**

Let X and Y be memory accesses to overlapping sets of memory locations M, where X ≠ Y. Let \((A_X, R_X)\) be the agent and reference used for X, and \((A_Y, R_Y)\) be the agent and reference used for Y. For now, let “→” denote happens-before and “→_{rcpo}” denote the reflexive closure of program-ordered before.

If \(D_1\) and \(D_2\) are different memory domains, then let \(\text{DOM}(D_1, D_2)\) be a memory domain operation from \(D_1\) to \(D_2\). Otherwise, let \(\text{DOM}(D, D)\) be a placeholder such that \(X \rightarrow_{\text{DOM}(D, D)} Y\) if and only if
X → Y.

X is location-ordered before Y for a location L in M if and only if any of the following is true:

- \( A_X = A_Y \) and \( R_X = R_Y \) and \( X \rightarrow Y \)
  
  \( \text{NOTE: this case means no availability/visibility ops are required when it is the same (agent,reference).} \)

- X is a read, both X and Y are non-private, and \( X \rightarrow Y \)

- X is a read, and X (transitively) system-synchronizes with Y

- If \( R_X = R_Y \) and \( A_X \) and \( A_Y \) access a common memory domain D (e.g. are in the same workgroup instance if D is the workgroup instance domain), and both X and Y are non-private:
  
  \( \text{X is a write, Y is a write, } AVC(A_X, R_X, D, L) \text{ is an availability chain making } (X,L) \text{ available to domain } D, \text{ and } X \rightarrow r_{\text{rpo}} AVC(A_X, R_X, D, L) \rightarrow Y \)

  \( \text{X is a write, Y is a read, } AVC(A_X, R_X, D, L) \text{ is an availability chain making } (X,L) \text{ available to domain } D, \text{ VISC}(A_Y, R_Y, D, L) \text{ is a visibility chain making writes to } L \text{ available in domain } D \text{ visible to } Y, \text{ and } X \rightarrow r_{\text{rpo}} AVC(A_X, R_X, D, L) \rightarrow VISC(A_Y, R_Y, D, L) \rightarrow r_{\text{rpo}} Y \)

  \( \text{If } \text{VkPhysicalDeviceVulkanMemoryModelFeatures} ::vulkanMemoryModelAvailabilityVisibilityChains \text{ is VK_FALSE, then } AVC \text{ and VISC must each only have a single element in the chain, in each sub-bullet above.} \)

- Let \( D_X \) and \( D_Y \) each be either the device domain or the host domain, depending on whether \( A_X \) and \( A_Y \) execute on the device or host:
  
  \( \text{X is a write and Y is a write, and } X \rightarrow AV(A_X, R_X, D_X, L) \rightarrow DOM(D_X, D_Y) \rightarrow Y \)

  \( \text{X is a write and Y is a read, and } X \rightarrow AV(A_X, R_X, D_X, L) \rightarrow DOM(D_X, D_Y) \rightarrow VIS(A_Y, R_Y, D_Y, L) \rightarrow Y \)

\( \text{Note} \)

The final bullet (synchronization through device/host domain) requires API-level synchronization operations, since the device/host domains are not accessible via shader instructions. And “device domain” is not to be confused with “device scope”, which synchronizes through the “shader domain”.

**Data Race**

Let X and Y be operations that access overlapping sets of memory locations M, where X \( \neq Y \), and at least one of X and Y is a write, and X and Y are not mutually-ordered atomic operations. If there does not exist a location-ordered relation between X and Y for each location in M, then there is a *data race*.

Applications **must** ensure that no data races occur during the execution of their application.

\( \text{Note} \)

Data races can only occur due to instructions that are actually executed. For example, an instruction skipped due to control flow must not contribute to a data race.
Visible-To

Let $X$ be a write and $Y$ be a read whose sets of memory locations overlap, and let $M$ be the set of memory locations that overlap. Let $M_2$ be a non-empty subset of $M$. Then $X$ is visible-to $Y$ for memory locations $M_2$ if and only if all of the following are true:

- $X$ is location-ordered before $Y$ for each location $L$ in $M_2$.
- There does not exist another write $Z$ to any location $L$ in $M_2$ such that $X$ is location-ordered before $Z$ for location $L$ and $Z$ is location-ordered before $Y$ for location $L$.

If $X$ is visible-to $Y$, then $Y$ reads the value written by $X$ for locations $M_2$.

**Note**

It is possible for there to be a write between $X$ and $Y$ that overwrites a subset of the memory locations, but the remaining memory locations ($M_2$) will still be visible-to $Y$.

Acyclicity

*reads-from* is a relation between operations, where the first operation is a write, the second operation is a read, and the second operation reads the value written by the first operation. *From-reads* is a relation between operations, where the first operation is a read, the second operation is a write, and the first operation reads a value written earlier than the second operation in the second operation’s scoped modification order (or the first operation reads from the initial value, and the second operation is any write to the same locations).

Then the implementation must guarantee that no cycles exist in the union of the following relations:

- location-ordered
- scoped modification order (over all atomic writes)
- reads-from
- from-reads

**Note**

This is a “consistency” axiom, which informally guarantees that sequences of operations cannot violate causality.

Scoped Modification Order Coherence

Let $A$ and $B$ be mutually-ordered atomic operations, where $A$ is location-ordered before $B$. Then the following rules are a consequence of acyclicity:

- If $A$ and $B$ are both reads and $A$ does not read the initial value, then the write that $A$ takes its value from must be earlier in its own scoped modification order than (or the same as) the write that $B$ takes its value from (no cycles between location-order, reads-from, and from-reads).
• If A is a read and B is a write and A does not read the initial value, then A must take its value from a write earlier than B in B’s scoped modification order (no cycles between location-order, scope modification order, and reads-from).

• If A is a write and B is a read, then B must take its value from A or a write later than A in A’s scoped modification order (no cycles between location-order, scoped modification order, and from-reads).

• If A and B are both writes, then A must be earlier than B in A’s scoped modification order (no cycles between location-order and scoped modification order).

• If A is a write and B is a read-modify-write and B reads the value written by A, then B comes immediately after A in A’s scoped modification order (no cycles between scoped modification order and from-reads).

Shader I/O

If a shader invocation A in a shader stage other than Vertex performs a memory read operation X from an object in storage class CallableDataKHR, IncomingCallableDataKHR, RayPayloadKHR, HitAttributeKHR, IncomingRayPayloadKHR, or Input, then X is system-synchronized-after all writes to the corresponding CallableDataKHR, IncomingCallableDataKHR, RayPayloadKHR, HitAttributeKHR, IncomingRayPayloadKHR, or Output storage variable(s) in the shader invocation(s) that contribute to generating invocation A, and those writes are all visible-to X.

Note
It is not necessary for the upstream shader invocations to have completed execution, they only need to have generated the output that is being read.

Deallocation

A call to vkFreeMemory must happen-after all memory operations on all memory locations in that VkDeviceMemory object.

Note
Normally, device memory operations in a given queue are synchronized with vkFreeMemory by having a host thread wait on a fence signaled by that queue, and the wait happens-before the call to vkFreeMemory on the host.

The deallocation of SPIR-V variables is managed by the system and happens-after all operations on those variables.

Descriptions (Informative)

This subsection offers more easily understandable consequences of the memory model for app/compiler developers.

Let SC be the storage class(es) specified by a release or acquire operation or barrier.
• An atomic write with release semantics must not be reordered against any read or write to SC that is program-ordered before it (regardless of the storage class the atomic is in).

• An atomic read with acquire semantics must not be reordered against any read or write to SC that is program-ordered after it (regardless of the storage class the atomic is in).

• Any write to SC program-ordered after a release barrier must not be reordered against any read or write to SC program-ordered before that barrier.

• Any read from SC program-ordered before an acquire barrier must not be reordered against any read or write to SC program-ordered after the barrier.

A control barrier (even if it has no memory semantics) must not be reordered against any memory barriers.

This memory model allows memory accesses with and without availability and visibility operations, as well as atomic operations, all to be performed on the same memory location. This is critical to allow it to reason about memory that is reused in multiple ways, e.g. across the lifetime of different shader invocations or draw calls. While GLSL (and legacy SPIR-V) applies the “coherent” decoration to variables (for historical reasons), this model treats each memory access instruction as having optional implicit availability/visibility operations. GLSL to SPIR-V compilers should map all (non-atomic) operations on a coherent variable to Make{Pointer,Texel}{Available}{Visible} flags in this model.

Atomic operations implicitly have availability/visibility operations, and the scope of those operations is taken from the atomic operation’s scope.

**Tessellation Output Ordering**

For SPIR-V that uses the Vulkan Memory Model, the `OutputMemory` storage class is used to synchronize accesses to tessellation control output variables. For legacy SPIR-V that does not enable the Vulkan Memory Model via `OpMemoryModel`, tessellation outputs can be ordered using a control barrier with no particular memory scope or semantics, as defined below.

Let X and Y be memory operations performed by shader invocations Aₓ and Aᵧ. Operation X is **tessellation-output-ordered** before operation Y if and only if all of the following are true:

• There is a dynamic instance of an `OpControlBarrier` instruction C such that X is program-ordered before C in Aₓ and C is program-ordered before Y in Aᵧ.

• Aₓ and Aᵧ are in the same instance of C’s execution scope.

If shader invocations Aₓ and Aᵧ in the **TessellationControl** execution model execute memory operations X and Y, respectively, on the `Output` storage class, and X is tessellation-output-ordered before Y with a scope of `Workgroup`, then X is location-ordered before Y, and if X is a write and Y is a read then X is visible-to Y.

**Cooperative Matrix Memory Access**

For each dynamic instance of a cooperative matrix load or store instruction (`OpCooperativeMatrixLoadNV` or `OpCooperativeMatrixStoreNV`), a single implementation-dependent
invocation within the instance of the matrix's scope performs a non-atomic load or store (respectively) to each memory location that is defined to be accessed by the instruction.
Appendix C: Compressed Image Formats

The compressed texture formats used by Vulkan are described in the specifically identified sections of the Khronos Data Format Specification, version 1.3.

Unless otherwise described, the quantities encoded in these compressed formats are treated as normalized, unsigned values.

Those formats listed as sRGB-encoded have in-memory representations of R, G and B components which are nonlinearly-encoded as $R'$, $G'$, and $B'$; any alpha component is unchanged. As part of filtering, the nonlinear $R'$, $G'$, and $B'$ values are converted to linear R, G, and B components; any alpha component is unchanged. The conversion between linear and nonlinear encoding is performed as described in the “KHR_DF_TRANSFER_SRGB” section of the Khronos Data Format Specification.
Block-Compressed Image Formats

BC1, BC2 and BC3 formats are described in “S3TC Compressed Texture Image Formats” chapter of the Khronos Data Format Specification. BC4 and BC5 are described in the “RGTC Compressed Texture Image Formats” chapter. BC6H and BC7 are described in the “BPTC Compressed Texture Image Formats” chapter.

<td>VK_FORMAT_ASTC_10x6_SFLOAT_BLOCK</td>
<td>10 × 6</td>
<td>HDR</td>
</tr>
<tr>
<td>VK_FORMAT_ASTC_10x8_SFLOAT_BLOCK</td>
<td>10 × 8</td>
<td>HDR</td>
</tr>
<tr>
<td>VK_FORMAT_ASTC_10x10_SFLOAT_BLOCK</td>
<td>10 × 10</td>
<td>HDR</td>
</tr>
<tr>
<td>VK_FORMAT_ASTC_12x12_SFLOAT_BLOCK</td>
<td>12 × 12</td>
<td>HDR</td>
</tr>
</tbody>
</table>

ASTC textures containing HDR block encodings **should** be passed to the API using an ASTC SFLOAT texture format.

**Note**

An HDR block in a texture passed using a LDR UNORM format will return the appropriate ASTC error color if the implementation supports only the ASTC LDR profile, but may result in either the error color or a decompressed HDR color if the implementation supports HDR decoding.

**ASTC Decode Mode**

If the **VK_EXT_astc_decode_mode** extension is enabled, the decode mode is determined as follows:

**Table 104. Mapping of Vulkan ASTC decoding format to ASTC decoding modes**

<table>
<thead>
<tr>
<th>VkFormat</th>
<th>Decoding mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_FORMAT_R16G16B16A16_SFLOAT</td>
<td>decode_float16</td>
</tr>
<tr>
<td>VK_FORMAT_R8G8B8A8_UNORM</td>
<td>decode_unorm8</td>
</tr>
<tr>
<td>VK_FORMAT_E5B9G9R9_UFLOAT_PACK32</td>
<td>decode_rgb9e5</td>
</tr>
</tbody>
</table>

Otherwise, the ASTC decode mode is decode_float16.
Note that an implementation **may** use HDR mode when linear LDR mode is requested unless the decode mode is decode_unorm8.
PVRTC Compressed Image Formats

PVRTC formats are described in the “PVRTC Compressed Texture Image Formats” chapter of the Khronos Data Format Specification.

Appendix D: Core Revisions (Informative)

New minor versions of the Vulkan API are defined periodically by the Khronos Vulkan Working Group. These consist of some amount of additional functionality added to the core API, potentially including both new functionality and functionality promoted from extensions.

It is possible to build the specification for earlier versions, but to aid readability of the latest versions, this appendix gives an overview of the changes as compared to earlier versions.

Version 1.3

Vulkan Version 1.3 promoted a number of key extensions into the core API:

- VK_KHR_copy_commands2
- VK_KHR_dynamic_rendering
- VK_KHR_format_feature_flags2
- VK_KHR_maintenance4
- VK_KHR_shader_integer_dot_product
- VK_KHR_shader_non_semantic_info
- VK_KHR_shader_terminate_invocation
- VK_KHR_synchronization2
- VK_KHR_zero_initialize_workgroup_memory
- VK_EXT_4444_formats
- VK_EXT_extended_dynamic_state
- VK_EXT_extended_dynamic_state2
- VK_EXT_image_robustness
- VK_EXT_inline_uniform_block
- VK_EXT_pipeline_creation_cache_control
- VK_EXT_pipeline_creation_feedback
- VK_EXT_private_data
- VK_EXT_shader_demote_to_helper_invocation
- VK_EXT_subgroup_size_control
- VK_EXT_texel_buffer_alignment
• VK_EXT_texture_compression_astc_hdr
• VK_EXT_tooling_info
• VK_EXT_ycbcr_2plane_444_formats

All differences in behavior between these extensions and the corresponding Vulkan 1.3 functionality are summarized below.

**Differences Relative to VK_EXT_4444_formats**

If the VK_EXT_4444_formats extension is not supported, support for all formats defined by it are optional in Vulkan 1.3. There are no members in the VkPhysicalDeviceVulkan13Features structure corresponding to the VkPhysicalDevice4444FormatsFeaturesEXT structure.

**Differences Relative to VK_EXT_extended_dynamic_state**

All dynamic state enumerants and commands defined by VK_EXT_extended_dynamic_state are required in Vulkan 1.3. There are no members in the VkPhysicalDeviceVulkan13Features structure corresponding to the VkPhysicalDeviceExtendedDynamicStateFeaturesEXT structure.

**Differences Relative to VK_EXT_extended_dynamic_state2**

The optional dynamic state enumerants and commands defined by VK_EXT_extended_dynamic_state2 for patch control points and logic op are not promoted in Vulkan 1.3. There are no members in the VkPhysicalDeviceVulkan13Features structure corresponding to the VkPhysicalDeviceExtendedDynamicState2FeaturesEXT structure.

**Differences Relative to VK_EXT_texel_buffer_alignment**

The more specific alignment requirements defined by VkPhysicalDeviceTexelBufferAlignmentProperties are required in Vulkan 1.3. There are no members in the VkPhysicalDeviceVulkan13Features structure corresponding to the VkPhysicalDeviceTexelBufferAlignmentFeaturesEXT structure. The texelBufferAlignment feature is enabled if using a Vulkan 1.3 instance.

**Differences Relative to VK_EXT_texture_compression_astc_hdr**

If the VK_EXT_texture_compression_astc_hdr extension is not supported, support for all formats defined by it are optional in Vulkan 1.3. The textureCompressionASTC_HDR member of VkPhysicalDeviceVulkan13Features indicates whether a Vulkan 1.3 implementation supports these formats.

**Differences Relative to VK_EXT_ycbcr_2plane_444_formats**

If the VK_EXT_ycbcr_2plane_444_formats extension is not supported, support for all formats defined by it are optional in Vulkan 1.3. There are no members in the VkPhysicalDeviceVulkan13Features structure corresponding to the VkPhysicalDeviceYcbcr2Plane444FormatsFeaturesEXT structure.
Additional Vulkan 1.3 Feature Support

In addition to the promoted extensions described above, Vulkan 1.3 added required support for:

- SPIR-V version 1.6
  - SPIR-V 1.6 deprecates (but does not remove) the WorkgroupSize decoration.
- The bufferDeviceAddress feature which indicates support for accessing memory in shaders as storage buffers via vkGetBufferDeviceAddress.
- The vulkanMemoryModel and vulkanMemoryModelDeviceScope features, which indicate support for the corresponding Vulkan Memory Model capabilities.
- The maxInlineUniformTotalSize limit is added to provide the total size of all inline uniform block bindings in a pipeline layout.

Version 1.2

Vulkan Version 1.2 promoted a number of key extensions into the core API:

- VK_KHR_8bit_storage
- VK_KHR_buffer_device_address
- VK_KHR_create_renderpass2
- VK_KHR_depth_stencil_resolve
- VK_KHR_draw_indirect_count
- VK_KHR_driver_properties
- VK_KHR_image_format_list
- VK_KHR_imagelessFramebuffer
- VK_KHR_sampler_mirror_clamp_to_edge
- VK_KHR_separate_depth_stencil_layouts
All differences in behavior between these extensions and the corresponding Vulkan 1.2 functionality are summarized below.

**Differences Relative to VK_KHR_8bit_storage**

If the `VK_KHR_8bit_storage` extension is not supported, support for the SPIR-V `storageBuffer8BitAccess` capability in shader modules is optional. Support for this feature is defined by `VkPhysicalDeviceVulkan12Features::storageBuffer8BitAccess` when queried via `vkGetPhysicalDeviceFeatures2`.

**Differences Relative to VK_KHR_draw_indirect_count**

If the `VK_KHR_draw_indirect_count` extension is not supported, support for the commands `vkCmdDrawIndirectCount` and `vkCmdDrawIndexedIndirectCount` is optional. Support for this feature is defined by `VkPhysicalDeviceVulkan12Features::drawIndirectCount` when queried via `vkGetPhysicalDeviceFeatures2`.

**Differences Relative to VK_KHR_sampler_mirror_clamp_to_edge**

If the `VK_KHR_sampler_mirror_clamp_to_edge` extension is not supported, support for the `VkSamplerAddressMode VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE` is optional. Support for this feature is defined by `VkPhysicalDeviceVulkan12Features::samplerMirrorClampToEdge` when queried via `vkGetPhysicalDeviceFeatures2`. 
Differences Relative to **VK_EXT_descriptor_indexing**

If the **VK_EXT_descriptor_indexing** extension is not supported, support for the descriptorIndexing feature is optional. Support for this feature is defined by `VkPhysicalDeviceVulkan12Features::descriptorIndexing` when queried via `vkGetPhysicalDeviceFeatures2`.

Differences Relative to **VK_EXT_scalar_block_layout**

If the **VK_EXT_scalar_block_layout** extension is not supported, support for the scalarBlockLayout feature is optional. Support for this feature is defined by `VkPhysicalDeviceVulkan12Features::scalarBlockLayout` when queried via `vkGetPhysicalDeviceFeatures2`.

Differences Relative to **VK_EXT_shader_viewport_index_layer**

The `ShaderViewportIndexLayerEXT` SPIR-V capability was replaced with the `ShaderViewportIndex` and `ShaderLayer` capabilities. Declaring both is equivalent to declaring `ShaderViewportIndexLayerEXT`. If the **VK_EXT_shader_viewport_index_layer** extension is not supported, support for the `ShaderViewportIndexLayerEXT` SPIR-V capability is optional. Support for this feature is defined by `VkPhysicalDeviceVulkan12Features::shaderOutputViewportIndex` and `VkPhysicalDeviceVulkan12Features::shaderOutputLayer` when queried via `vkGetPhysicalDeviceFeatures2`.

Differences Relative to **VK_KHR_buffer_device_address**

If the **VK_KHR_buffer_device_address** extension is not supported, support for the bufferDeviceAddress feature is optional. Support for this feature is defined by `VkPhysicalDeviceVulkan12Features::bufferDeviceAddress` when queried via `vkGetPhysicalDeviceFeatures2`.

Differences Relative to **VK_KHR_shader_atomic_int64**

If the **VK_KHR_shader_atomic_int64** extension is not supported, support for the `shaderBufferInt64Atomics` feature is optional. Support for this feature is defined by `VkPhysicalDeviceVulkan12Features::shaderBufferInt64Atomics` when queried via `vkGetPhysicalDeviceFeatures2`.

Differences Relative to **VK_KHR_shader_float16_int8**

If the **VK_KHR_shader_float16_int8** extension is not supported, support for the `shaderFloat16` and `shaderInt8` features is optional. Support for these features are defined by `VkPhysicalDeviceVulkan12Features::shaderFloat16` and `VkPhysicalDeviceVulkan12Features::shaderInt8` when queried via `vkGetPhysicalDeviceFeatures2`.

Differences Relative to **VK_KHR_vulkan_memory_model**

If the **VK_KHR_vulkan_memory_model** extension is not supported, support for the `vulkanMemoryModel` feature is optional. Support for this feature is defined by `VkPhysicalDeviceVulkan12Features::vulkanMemoryModel` when queried via `vkGetPhysicalDeviceFeatures2`.

4342
Additional Vulkan 1.2 Feature Support

In addition to the promoted extensions described above, Vulkan 1.2 added support for:

- SPIR-V version 1.4.
- SPIR-V version 1.5.
- The `samplerMirrorClampToEdge` feature which indicates whether the implementation supports the `VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE` sampler address mode.
- The `ShaderNonUniform` capability in SPIR-V version 1.5.
- The `shaderOutputViewportIndex` feature which indicates that the `ShaderViewportIndex` capability can be used.
- The `shaderOutputLayer` feature which indicates that the `ShaderLayer` capability can be used.
- The `subgroupBroadcastDynamicId` feature which allows the “Id” operand of `OpGroupNonUniformBroadcast` to be dynamically uniform within a subgroup, and the “Index” operand of `OpGroupNonUniformQuadBroadcast` to be dynamically uniform within a derivative group, in shader modules of version 1.5 or higher.
- The `drawIndirectCount` feature which indicates whether the `vkCmdDrawIndirectCount` and `vkCmdDrawIndexedIndirectCount` functions can be used.
- The `descriptorIndexing` feature which indicates the implementation supports the minimum number of descriptor indexing features as defined in the Feature Requirements section.
- The `samplerFilterMinmax` feature which indicates whether the implementation supports the minimum number of image formats that support the `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT` feature bit as defined by the `filterMinmaxSingleComponentFormats` property minimum requirements.
- The `framebufferIntegerColorSampleCounts` limit which indicates the color sample counts that are supported for all framebuffer color attachments with integer formats.

New Macros

- `VK_API_VERSION_1_2`

New Commands

- `vkCmdBeginRenderPass2`
- `vkCmdDrawIndexedIndirectCount`
- `vkCmdDrawIndirectCount`
- `vkCmdEndRenderPass2`
- `vkCmdNextSubpass2`
- `vkCreateRenderPass2`
- `vkGetBufferDeviceAddress`
- `vkGetBufferOpaqueCaptureAddress`
- vkGetDeviceMemoryOpaqueCaptureAddress
- vkGetSemaphoreCounterValue
- vkResetQueryPool
- vkSignalSemaphore
- vkWaitSemaphores

New Structures

**Version 1.1**

Vulkan Version 1.1 promoted a number of key extensions into the core API:

- VK_KHR_16bit_storage
• VK_KHR_bind_memory2
• VK_KHR_dedicated_allocation
• VK_KHR_descriptor_update_template
• VK_KHR_device_group
• VK_KHR_device_group_creation
• VK_KHR_external_fence
• VK_KHR_external_fence_capabilities
• VK_KHR_external_memory
• VK_KHR_external_memory_capabilities
• VK_KHR_external_semaphore
• VK_KHR_external_semaphore_capabilities
• VK_KHR_get_memory_requirements2
• VK_KHR_get_physical_device_properties2
• VK_KHR_maintenance1
• VK_KHR_maintenance2
• VK_KHR_maintenance3
• VK_KHR_multiview
• VK_KHR_relaxed_block_layout
• VK_KHR_sampler_ycbcr_conversion
• VK_KHR_shader_draw_parameters
• VK_KHR_storage_buffer_storage_class
• VK_KHR_variable_pointers

All differences in behavior between these extensions and the corresponding Vulkan 1.1 functionality are summarized below.

**Differences Relative to VK_KHR_16bit_storage**

If the VK_KHR_16bit_storage extension is not supported, support for the `storageBuffer16BitAccess` feature is optional. Support for this feature is defined by `VkPhysicalDevice16BitStorageFeatures::storageBuffer16BitAccess` or `VkPhysicalDeviceVulkan11Features::storageBuffer16BitAccess` when queried via `vkGetPhysicalDeviceFeatures2`. 
Differences Relative to VK_KHR_sampler_ycbcr_conversion

If the VK_KHR_sampler_ycbcr_conversion extension is not supported, support for the samplerYcbcrConversion feature is optional. Support for this feature is defined by VkPhysicalDeviceSamplerYcbcrConversionFeatures::samplerYcbcrConversion or VkPhysicalDeviceVulkan11Features::samplerYcbcrConversion when queried via vkGetPhysicalDeviceFeatures2.

Differences Relative to VK_KHR_shader_draw_parameters

If the VK_KHR_shader_draw_parameters extension is not supported, support for the SPV_KHR_shader_draw_parameters SPIR-V extension is optional. Support for this feature is defined by VkPhysicalDeviceShaderDrawParametersFeatures::shaderDrawParameters or VkPhysicalDeviceVulkan11Features::shaderDrawParameters when queried via vkGetPhysicalDeviceFeatures2.

Differences Relative to VK_KHR_variable_pointers

If the VK_KHR_variable_pointers extension is not supported, support for the variablePointersStorageBuffer feature is optional. Support for this feature is defined by VkPhysicalDeviceVariablePointersFeatures::variablePointersStorageBuffer or VkPhysicalDeviceVulkan11Features::variablePointersStorageBuffer when queried via vkGetPhysicalDeviceFeatures2.

Additional Vulkan 1.1 Feature Support

In addition to the promoted extensions described above, Vulkan 1.1 added support for:

- The group operations and subgroup scope.
- The protected memory feature.
- A new command to enumerate the instance version: vkEnumerateInstanceVersion.
- The VkPhysicalDeviceShaderDrawParametersFeatures feature query struct (where the VK_KHR_shader_draw_parameters extension did not have one).

New Macros

- VK_API_VERSION_1_1

New Object Types

- VkDescriptorUpdateTemplate
- VkSamplerYcbcrConversion

New Commands

- vkBindBufferMemory2
- vkBindImageMemory2
• vkCmdDispatchBase
• vkCmdSetDeviceMask
• vkCreateDescriptorUpdateTemplate
• vkCreateSamplerYcbcrConversion
• vkDestroyDescriptorUpdateTemplate
• vkDestroySamplerYcbcrConversion
• vkEnumerateInstanceVersion
• vkEnumeratePhysicalDeviceGroups
• vkGetBufferMemoryRequirements2
• vkGetDescriptorSetLayoutSupport
• vkGetDeviceGroupPeerMemoryFeatures
• vkGetDeviceQueue2
• vkGetImageMemoryRequirements2
• vkGetImageSparseMemoryRequirements2
• vkGetPhysicalDeviceExternalBufferProperties
• vkGetPhysicalDeviceExternalFenceProperties
• vkGetPhysicalDeviceExternalSemaphoreProperties
• vkGetPhysicalDeviceFeatures2
• vkGetPhysicalDeviceFormatProperties2
• vkGetPhysicalDeviceImageFormatProperties2
• vkGetPhysicalDeviceMemoryProperties2
• vkGetPhysicalDeviceProperties2
• vkGetPhysicalDeviceQueueFamilyProperties2
• vkGetPhysicalDeviceSparseImageFormatProperties2
• vkTrimCommandPool
• vkUpdateDescriptorSetWithTemplate

New Structures

• VkBindBufferMemoryInfo
• VkBindImageMemoryInfo
• VkBufferMemoryRequirementsInfo2
• VkDescriptorSetLayoutSupport
• VkDescriptorUpdateTemplateCreateInfo
• VkDescriptorUpdateTemplateEntry
• VkDeviceQueueInfo2
• VkExternalBufferProperties
• VkExternalFenceProperties
• VkExternalMemoryProperties
• VkExternalSemaphoreProperties
• VkFormatProperties2
• VkImageProperties2
• VkImageMemoryRequirementsInfo2
• VkImageSparseMemoryRequirementsInfo2
• VkInputAttachmentAspectReference
• VkMemoryRequirements2
• VkPhysicalDeviceExternalBufferInfo
• VkPhysicalDeviceExternalFenceInfo
• VkPhysicalDeviceExternalSemaphoreInfo
• VkPhysicalDeviceGroupProperties
• VkPhysicalDeviceImageFormatInfo2
• VkPhysicalDeviceMemoryProperties2
• VkPhysicalDeviceProperties2
• VkPhysicalDeviceSparseImageFormatInfo2
• VkQueueFamilyProperties2
• VkSamplerYcbcrConversionCreateInfo
• VkSparseImageFormatProperties2
• VkSparseImageMemoryRequirements2
• Extending VkBindBufferMemoryInfo:
  ◦ VkBindBufferMemoryDeviceGroupInfo
• Extending VkBindImageMemoryInfo:
  ◦ VkBindImageMemoryDeviceGroupInfo
  ◦ VkBindImagePlaneMemoryInfo
• Extending VkBindSparseInfo:
  ◦ VkDeviceGroupBindSparseInfo
• Extending VkBufferCreateInfo:
  ◦ VkExternalMemoryBufferCreateInfo
• Extending VkCommandBufferBeginInfo:
  ◦ VkDeviceGroupCommandBufferBeginInfo
• Extending VkDeviceCreateInfo:
  ◦ VkDeviceGroupDeviceCreateInfo
- **VkPhysicalDeviceFeatures2**
  - Extending **VkFenceCreateInfo**:
    - **VkExportFenceCreateInfo**
  - Extending **VkImageCreateInfo**:
    - **VkExternalMemoryImageCreateInfo**
  - Extending **VkImageFormatProperties2**:
    - **VkExternalImageFormatProperties**
    - **VkSamplerYcbcrConversionImageFormatProperties**

    - **VkExportMemoryAllocateInfo**
    - **VkMemoryAllocateFlagsInfo**
    - **VkMemoryDedicatedAllocateInfo**
  - Extending **VkMemoryRequirements2**:
    - **VkMemoryDedicatedRequirements**
  - Extending **VkPhysicalDeviceFeatures2, VkDeviceCreateInfo**:
    - **VkPhysicalDevice16BitStorageFeatures**
    - **VkPhysicalDeviceMultiviewFeatures**
    - **VkPhysicalDeviceProtectedMemoryFeatures**
    - **VkPhysicalDeviceSamplerYcbcrConversionFeatures**
    - **VkPhysicalDeviceShaderDrawParameterFeatures**
    - **VkPhysicalDeviceShaderDrawParametersFeatures**
    - **VkPhysicalDeviceVariablePointerFeatures**
    - **VkPhysicalDeviceVariablePointersFeatures**
  - Extending **VkPhysicalDeviceImageFormatInfo2**:
    - **VkPhysicalDeviceExternalImageFormatInfo**
  - Extending **VkPhysicalDeviceProperties2**:
    - **VkPhysicalDeviceIDProperties**
    - **VkPhysicalDeviceMaintenance3Properties**
    - **VkPhysicalDeviceMultiviewProperties**
    - **VkPhysicalDevicePointClippingProperties**
    - **VkPhysicalDeviceProtectedMemoryProperties**
• **VkPhysicalDeviceSubgroupProperties**
  • **Extending** **VkPipelineTessellationStateCreateInfo:**
    • **VkPipelineTessellationDomainOriginStateCreateInfo**
  • **Extending** **VkRenderPassBeginInfo, VkRenderingInfo:**
    • **VkDeviceGroupRenderPassBeginInfo**
  • **Extending** **VkRenderPassCreateInfo:**
    • **VkRenderPassInputAttachmentAspectCreateInfo**
    • **VkRenderPassMultiviewCreateInfo**
  • **Extending** **VkSamplerCreateInfo, VkImageViewCreateInfo:**
    • **VkSamplerYcbcrConversionInfo**
  • **Extending** **VkSemaphoreCreateInfo:**
    • **VkExportSemaphoreCreateInfo**
  • **Extending** **VkSubmitInfo:**
    • **VkDeviceGroupSubmitInfo**
    • **VkProtectedSubmitInfo**

**New Enums**

• **VkChromaLocation**
• **VkDescriptorUpdateTemplateType**
• **VkDeviceQueueCreateFlagBits**
• **VkExternalFenceFeatureFlagBits**
• **VkExternalFenceHandleTypeFlagBits**
• **VkExternalMemoryFeatureFlagBits**
• **VkExternalMemoryHandleTypeFlagBits**
• **VkExternalSemaphoreFeatureFlagBits**
• **VkExternalSemaphoreHandleTypeFlagBits**
• **VkFenceImportFlagBits**
• **VkMemoryAllocateFlagBits**
• **VkPeerMemoryFeatureFlagBits**
• **VkPointClippingBehavior**
• **VkSamplerYcbcrModelConversion**
• **VkSamplerYcbcrRange**
• **VkSemaphoreImportFlagBits**
• **VkSubgroupFeatureFlagBits**
• **VkTessellationDomainOrigin**
New Bitmasks

- VkCommandPoolTrimFlags
- VkDescriptorUpdateTemplateCreateFlags
- VkExternalFenceFeatureFlags
- VkExternalFenceHandleTypeFlags
- VkExternalMemoryFeatureFlags
- VkExternalMemoryHandleTypeFlags
- VkExternalSemaphoreFeatureFlags
- VkExternalSemaphoreHandleTypeFlags
- VkFenceImportFlags
- VkMemoryAllocateFlags
- VkPeerMemoryFeatureFlags
- VkSemaphoreImportFlags
- VkSubgroupFeatureFlags

New Enum Constants

- VK_LUID_SIZE
- VK_MAX_DEVICE_GROUP_SIZE
- VK_QUEUE_FAMILY_EXTERNAL

Extending VkBufferCreateFlagBits:
  - VK_BUFFER_CREATE_PROTECTED_BIT

Extending VkCommandPoolCreateFlagBits:
  - VK_COMMAND_POOL_CREATE_PROTECTED_BIT

Extending VkDependencyFlagBits:
  - VK_DEPENDENCY_DEVICE_GROUP_BIT
  - VK_DEPENDENCY_VIEW_LOCAL_BIT

Extending VkDeviceQueueCreateFlagBits:
  - VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT

Extending VkFormat:

Appendix E: Layers & Extensions (Informative)

Extensions to the Vulkan API can be defined by authors, groups of authors, and the Khronos Vulkan Working Group. In order not to compromise the readability of the Vulkan Specification, the core Specification does not incorporate most extensions. The online Registry of extensions is available at URL

https://registry.khronos.org/vulkan/

and allows generating versions of the Specification incorporating different extensions.

Authors creating extensions and layers must follow the mandatory procedures described in the Vulkan Documentation and Extensions document when creating extensions and layers.

The remainder of this appendix documents a set of extensions chosen when this document was built. Versions of the Specification published in the Registry include:

- Core API + mandatory extensions required of all Vulkan implementations.
- Core API + all registered and published Khronos (KHR) extensions.
- Core API + all registered and published extensions.

Extensions are grouped as Khronos KHR, multivendor EXT, and then alphabetically by author ID. Within each group, extensions are listed in alphabetical order by their name.

Extension Dependencies

Extensions which have dependencies on specific core versions or on other extensions will list such dependencies.

For core versions, the specified version must be supported at runtime. All extensions implicitly require support for Vulkan 1.0.

For a device extension, use of any device-level functionality defined by that extension requires that any extensions that extension depends on be enabled.

For any extension, use of any instance-level functionality defined by that extension requires only that any extensions that extension depends on be supported at runtime.

Extension Interactions

Some extensions define APIs which are only supported when other extensions or core versions are supported at runtime. Such interactions are noted as “API Interactions”.

In order to be efficient, rendering techniques such as ray tracing need a quick way to identify which primitives may be intersected by a ray traversing the geometries. Acceleration structures are the most common way to represent the geometry spatially sorted, in order to quickly identify such potential intersections.

This extension adds new functionalities:

- Acceleration structure objects and build commands
- Structures to describe geometry inputs to acceleration structure builds
- Acceleration structure copy commands

**New Object Types**

- VkAccelerationStructureKHR

**New Commands**

- vkBuildAccelerationStructuresKHR
- vkCmdBuildAccelerationStructuresIndirectKHR
- vkCmdBuildAccelerationStructuresKHR
- vkCmdCopyAccelerationStructureKHR
- vkCmdCopyAccelerationStructureToMemoryKHR
- vkCmdCopyMemoryToAccelerationStructureKHR
- vkCmdWriteAccelerationStructuresPropertiesKHR
- vkCopyAccelerationStructureKHR
- vkCopyAccelerationStructureToMemoryKHR
- vkCopyMemoryToAccelerationStructureKHR
- vkCreateAccelerationStructureKHR
- vkDestroyAccelerationStructureKHR
- vkGetAccelerationStructureBuildSizesKHR
- vkGetAccelerationStructureDeviceAddressKHR
- vkGetDeviceAccelerationStructureCompatibilityKHR
- vkWriteAccelerationStructuresPropertiesKHR
New Structures

- VkAabbPositionsKHR
- VkAccelerationStructureBuildGeometryInfoKHR
- VkAccelerationStructureBuildRangeInfoKHR
- VkAccelerationStructureBuildSizesInfoKHR
- VkAccelerationStructureCreateInfoKHR
- VkAccelerationStructureDeviceAddressInfoKHR
- VkAccelerationStructureGeometryAabbsDataKHR
- VkAccelerationStructureGeometryInstancesDataKHR
- VkAccelerationStructureGeometryKHR
- VkAccelerationStructureGeometryTrianglesDataKHR
- VkAccelerationStructureInstanceKHR
- VkAccelerationStructureVersionInfoKHR
- VkCopyAccelerationStructureInfoKHR
- VkCopyAccelerationStructureToMemoryInfoKHR
- VkCopyMemoryToAccelerationStructureInfoKHR
- VkTransformMatrixKHR
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceAccelerationStructureFeaturesKHR
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceAccelerationStructurePropertiesKHR
- Extending VkWriteDescriptorSet:
  - VkWriteDescriptorSetAccelerationStructureKHR

New Unions

- VkAccelerationStructureGeometryDataKHR
- VkDeviceOrHostAddressConstKHR
- VkDeviceOrHostAddressKHR

New Enums

- VkAccelerationStructureBuildTypeKHR
- VkAccelerationStructureCompatibilityKHR
- VkAccelerationStructureCreateFlagBitsKHR
- VkAccelerationStructureTypeKHR
- VkBuildAccelerationStructureFlagBitsKHR
• VkBuildAccelerationStructureModeKHR
• VkCopyAccelerationStructureModeKHR
• VkGeometryFlagBitsKHR
• VkGeometryInstanceFlagBitsKHR
• VkGeometryTypeKHR

New Bitmasks
• VkAccelerationStructureCreateFlagsKHR
• VkBuildAccelerationStructureFlagsKHR
• VkGeometryFlagsKHR
• VkGeometryInstanceFlagsKHR

New Enum Constants
• VK_KHR_ACCELERATION_STRUCTURE_EXTENSION_NAME
• VK_KHR_ACCELERATION_STRUCTURE_SPEC_VERSION

Extending VkAccessFlagBits:
◦ VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR
◦ VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR

Extending VkBufferUsageFlagBits:
◦ VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR
◦ VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_STORAGE_BIT_KHR

Extending VkDescriptorType:
◦ VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR

Extending VkFormatFeatureFlagBits:
◦ VK_FORMAT_FEATURE_ACCELERATION_STRUCTURE_VERTEX_BUFFER_BIT_KHR

Extending VkIndexType:
◦ VK_INDEX_TYPE_NONE_KHR

Extending VkObjectType:
◦ VK_OBJECT_TYPE_ACCELERATION_STRUCTURE_KHR

Extending VkPipelineStageFlagBits:
◦ VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR

Extending VkQueryType:
◦ VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR
◦ VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR

Extending VkStructureType:
If `VK_EXT_debug_report` is supported:

- Extending `VkDebugReportObjectTypeEXT`:
  - `VK_DEBUG_REPORT_OBJECT_TYPE_ACCELERATION_STRUCTURE_KHR_EXT`

If `VK_KHR_format_feature_flags2` or Version 1.3 is supported:

- Extending `VkFormatFeatureFlagBits2`:
  - `VK_FORMAT_FEATURE_2_ACCELERATION_STRUCTURE_VERTEX_BUFFER_BIT_KHR`

Issues

(1) How does this extension differ from `VK_NV_ray_tracing`?

**DISCUSSION:**

The following is a summary of the main functional differences between `VK_KHR_acceleration_structure` and `VK_NV_ray_tracing`:

- added acceleration structure serialization / deserialization
  (`VK_COPY_ACCELERATION_STRUCTURE_MODE_SERIALIZE_KHR`,
  `VK_COPY_ACCELERATION_STRUCTURE_MODE_DESERIALIZE_KHR`,
  `vkCmdCopyAccelerationStructureToMemoryKHR`,
  `vkCmdCopyMemoryToAccelerationStructureKHR`)

- document inactive primitives and instances

- added `VkPhysicalDeviceAccelerationStructureFeaturesKHR` structure
• added indirect and batched acceleration structure builds (vkCmdBuildAccelerationStructuresIndirectKHR)
• added host acceleration structure commands
• reworked geometry structures so they could be better shared between device, host, and indirect builds
• explicitly made VkAccelerationStructureKHR use device addresses
• added acceleration structure compatibility check function (vkGetDeviceAccelerationStructureCompatibilityKHR)
• add parameter for requesting memory requirements for host and/or device build
• added format feature for acceleration structure build vertex formats (VK_FORMAT_FEATURE_ACCELERATION_STRUCTURE_VERTEX_BUFFER_BIT_KHR)

(2) Can you give a more detailed comparison of differences and similarities between VK_NV_ray_tracing and VK_KHR_acceleration_structure?

DISCUSSION:

The following is a more detailed comparison of which commands, structures, and enums are aliased, changed, or removed.

• Aliased functionality — enums, structures, and commands that are considered equivalent:
  ▪ VkGeometryTypeNV ↔ VkGeometryTypeKHR
  ▪ VkAccelerationStructureTypeNV ↔ VkAccelerationStructureTypeKHR
  ▪ VkCopyAccelerationStructureModeNV ↔ VkCopyAccelerationStructureModeKHR
  ▪ VkGeometryFlagsNV ↔ VkGeometryFlagsKHR
  ▪ VkGeometryFlagBitsNV ↔ VkGeometryFlagBitsKHR
  ▪ VkGeometryInstanceFlagsNV ↔ VkGeometryInstanceFlagsKHR
  ▪ VkGeometryInstanceFlagBitsNV ↔ VkGeometryInstanceFlagBitsKHR
  ▪ VkBuildAccelerationStructureFlagsNV ↔ VkBuildAccelerationStructureFlagsKHR
  ▪ VkBuildAccelerationStructureFlagBitsNV ↔ VkBuildAccelerationStructureFlagBitsKHR
  ▪ VkTransformMatrixNV ↔ VkTransformMatrixKHR (added to VK_NV_ray_tracing for descriptive purposes)
  ▪ VkAabbPositionsNV ↔ VkAabbPositionsKHR (added to VK_NV_ray_tracing for descriptive purposes)
  ▪ VkAccelerationStructureInstanceNV ↔ VkAccelerationStructureInstanceKHR (added to VK_NV_ray_tracing for descriptive purposes)

• Changed enums, structures, and commands:
  ▪ renamed VK_GEOMETRY_INSTANCE_TRIANGLE_CULL_DISABLE_BIT_NV to VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR in VkGeometryInstanceFlagBitsKHR
  ▪ VkGeometryTrianglesNV → VkAccelerationStructureGeometryTrianglesDataKHR (device or
host address instead of buffer+offset)

- **VkGeometryAABBNV** → **VkAccelerationStructureGeometryAabbsDataKHR** (device or host address instead of buffer+offset)

- **VkGeometryDataNV** → **VkAccelerationStructureGeometryDataKHR** (union of triangle/aabbs/instances)

- **VkGeometryNV** → **VkAccelerationStructureGeometryKHR** (changed type of geometry)

- **VkAccelerationStructureCreateInfoNV** → **VkAccelerationStructureCreateInfoKHR** (reshuffle geometry layout/information)

- **VkPhysicalDeviceRayTracingPropertiesNV** → **VkPhysicalDeviceAccelerationStructurePropertiesKHR** (for acceleration structure properties, renamed `maxTriangleCount` to `maxPrimitiveCount`, added per stage and update after bind limits) and **VkPhysicalDeviceRayTracingPipelinePropertiesKHR** (for ray tracing pipeline properties)

- **VkAccelerationStructureMemoryRequirementsInfoNV** (deleted - replaced by allocating on top of **VkBuffer**)

- **VkWriteDescriptorSetAccelerationStructureNV** → **VkWriteDescriptorSetAccelerationStructureKHR** (different acceleration structure type)

- **vkCreateAccelerationStructureNV** → **vkCreateAccelerationStructureKHR** (device address, different geometry layout/information)

- **vkGetAccelerationStructureMemoryRequirementsNV** (deleted - replaced by allocating on top of **VkBuffer**)

- **vkCmdBuildAccelerationStructureNV** → **vkCmdBuildAccelerationStructuresKHR** (params moved to structs, layout differences)

- **vkCmdCopyAccelerationStructureNV** → **vkCmdCopyAccelerationStructureKHR** (params to struct, extendable)

- **vkGetAccelerationStructureHandleNV** → **vkGetAccelerationStructureDeviceAddressKHR** (device address instead of handle)

- **VkAccelerationStructureMemoryRequirementsTypeNV** → **size queries for scratch space moved to vkGetAccelerationStructureBuildSizesKHR**

- **vkDestroyAccelerationStructureNV** → **vkDestroyAccelerationStructureKHR** (different acceleration structure types)

- **vkCmdWriteAccelerationStructuresPropertiesNV** → **vkCmdWriteAccelerationStructuresPropertiesKHR** (different acceleration structure types)

- **Added enums, structures and commands:**
  - **VK_GEOMETRY_TYPE_INSTANCES_KHR** to **VkGeometryTypeKHR** enum
  - **VK_COPY_ACCELERATION_STRUCTURE_MODE_SERIALIZE_KHR, VK_COPY_ACCELERATION_STRUCTURE_MODE_DESERIALIZE_KHR** to **VkCopyAccelerationStructureModeKHR** enum
  - **VkPhysicalDeviceAccelerationStructureFeaturesKHR** structure
  - **VkAccelerationStructureBuildTypeKHR** enum
- **VkBuildAccelerationStructureModeKHR** enum
- **VkDeviceOrHostAddressKHR** and **VkDeviceOrHostAddressConstKHR** unions
- **VkAccelerationStructureBuildRangeInfoKHR** struct
- **VkAccelerationStructureGeometryInstancesDataKHR** struct
- **VkAccelerationStructureDeviceAddressInfoKHR** struct
- **VkAccelerationStructureVersionInfoKHR** struct
- **VkStridedDeviceAddressRegionKHR** struct
- **VkCopyAccelerationStructureToMemoryInfoKHR** struct
- ** VkCopyMemoryToAccelerationStructureInfoKHR** struct
- ** VkCopyAccelerationStructureInfoKHR** struct
- **vkBuildAccelerationStructuresKHR** command (host build)
- **vkCopyAccelerationStructureKHR** command (host copy)
- **vkCopyAccelerationStructureToMemoryKHR** (host serialize)
- **vkCopyMemoryToAccelerationStructureKHR** (host deserialize)
- **vkWriteAccelerationStructuresPropertiesKHR** (host properties)
- **vkCmdCopyAccelerationStructureToMemoryKHR** (device serialize)
- **vkCmdCopyMemoryToAccelerationStructureKHR** (device deserialize)
- **vkGetDeviceAccelerationStructureCompatibilityKHR** (serialization)

(3) What are the changes between the public provisional (VK_KHR_ray_tracing v8) release and the internal provisional (VK_KHR_ray_tracing v9) release?

- added **geometryFlags** to **VkAccelerationStructureCreateGeometryTypeInfoKHR** (later reworked to obsolete this)
- added **minAccelerationStructureScratchOffsetAlignment** property to **VkPhysicalDeviceRayTracingPropertiesKHR**
- fix naming and return enum from **vkGetDeviceAccelerationStructureCompatibilityKHR**
  - renamed **VkAccelerationStructureVersionKHR** to **VkAccelerationStructureVersionInfoKHR**
  - renamed **VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_VERSION_KHR** to **VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_VERSION_INFO_KHR**
  - removed **VK_ERROR_INCOMPATIBLE_VERSION_KHR**
  - added **VkAccelerationStructureCompatibilityKHR** enum
  - remove return value from **vkGetDeviceAccelerationStructureCompatibilityKHR** and added return enum parameter
- Require Vulkan 1.1
- added creation time capture and replay flags
  - added **VkAccelerationStructureCreateFlagBitsKHR** and **VkAccelerationStructureCreateFlagsKHR**
• renamed the flags member of VkAccelerationStructureCreateInfoKHR to buildFlags (later removed) and added the createFlags member
• change vkCmdBuildAccelerationStructuresIndirectKHR to use buffer device address for indirect parameter
• make VK_KHR_deferred_host_operations an interaction instead of a required extension (later went back on this)
• renamed VkAccelerationStructureBuildOffsetInfoKHR to VkAccelerationStructureBuildRangeInfoKHR
  • renamed the ppOffsetInfos parameter of vkCmdBuildAccelerationStructuresKHR to ppBuildRangeInfos
• Re-unify geometry description between build and create
  • remove VkAccelerationStructureCreateGeometryTypeInfoKHR and VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_CREATE_GEOMETRY_TYPE_INFO_KHR
  • added VkAccelerationStructureCreateInfoKHR structure (later removed)
  • change type of the pGeometryInfos member of VkAccelerationStructureCreateInfoKHR from VkAccelerationStructureCreateGeometryTypeInfoKHR to VkAccelerationStructureGeometryKHR (later removed)
  • added pCreateInfo member to VkAccelerationStructureCreateInfoKHR (later removed)
• Fix ppGeometries ambiguity, add pGeometries
  • remove geometryArrayOfPointers member of VkAccelerationStructureBuildGeometryInfoKHR
  • disambiguate two meanings of ppGeometries by explicitly adding pGeometries to the VkAccelerationStructureBuildGeometryInfoKHR structure and require one of them be NULL
  • added nullDescriptor support for acceleration structures
• changed the update member of VkAccelerationStructureBuildGeometryInfoKHR from a bool to the mode VkBuildAccelerationStructureModeKHR enum which allows future extensibility in update types
• Clarify deferred host ops for pipeline creation
  • VkDeferredOperationKHR is now a top-level parameter for vkBuildAccelerationStructuresKHR, vkCreateRayTracingPipelinesKHR, vkCopyAccelerationStructureToMemoryKHR, vkCopyAccelerationStructureKHR, and vkCopyMemoryToAccelerationStructureKHR
  • removed VkDeferredOperationInfoKHR structure
  • change deferred host creation/return parameter behavior such that the implementation can modify such parameters until the deferred host operation completes
  • VK_KHR_deferred_host_operations is required again
• Change acceleration structure build to always be sized
  • de-alias VkAccelerationStructureMemoryRequirementsTypeNV and VkAccelerationStructureMemoryRequirementsTypeKHR, and remove VkAccelerationStructureMemoryRequirementsTypeKHR
• add `vkGetAccelerationStructureBuildSizesKHR` command and `VkAccelerationStructureBuildSizesInfoKHR` structure and `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_BUILD_SIZES_INFO_KHR` enum to query sizes for acceleration structures and scratch storage

• move size queries for scratch space to `vkGetAccelerationStructureBuildSizesKHR`

• remove `compactedSize`, `buildFlags`, `maxGeometryCount`, `pGeometryInfos`, `pCreateSizeInfos` members of `VkAccelerationStructureCreateInfoKHR` and add the `size` member

• add `maxVertex` member to `VkAccelerationStructureGeometryTrianglesDataKHR` structure

• remove `VkAccelerationStructureCreateInfoKHR` structure

(4) What are the changes between the internal provisional (VK_KHR_ray_tracing v9) release and the final (VK_KHR_acceleration_structure v11) release?

• refactor `VK_KHR_ray_tracing` into 3 extensions, enabling implementation flexibility and decoupling ray query support from ray pipelines:
  ◦ `VK_KHR_acceleration_structure` (for acceleration structure operations)
  ◦ `VK_KHR_ray_tracing_pipeline` (for ray tracing pipeline and shader stages)
  ◦ `VK_KHR_ray_query` (for ray queries in existing shader stages)

• clarify buffer usage flags for ray tracing
  ◦ `VK_BUFFER_USAGE_RAY_TRACING_BIT_NV` is left alone in `VK_NV_ray_tracing` (required on `scratch` and `instanceData`)
  ◦ `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` is added as an alias of `VK_BUFFER_USAGE_RAY_TRACING_BIT_NV` in `VK_KHR_ray_tracing_pipeline` and is required on shader binding table buffers
  ◦ `VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR` is added in `VK_KHR_acceleration_structure` for all vertex, index, transform, aabb, and instance buffer data referenced by device build commands
  ◦ `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT` is used for `scratchData`

• add max primitive counts (`ppMaxPrimitiveCounts`) to `vkCmdBuildAccelerationStructuresIndirectKHR`

• Allocate acceleration structures from `VkBuffers` and add a mode to constrain the device address
  ◦ de-alias `VkBindAccelerationStructureMemoryInfoNV` and `vkBindAccelerationStructureMemoryNV`, and remove `VkBindAccelerationStructureMemoryInfoKHR`, `VkAccelerationStructureMemoryRequirementsInfoKHR`, and `vkGetAccelerationStructureMemoryRequirementsKHR`

  ◦ acceleration structures now take a `VkBuffer` and offset at creation time for memory placement

  ◦ add a new `VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_STORAGE_BIT_KHR` buffer usage for such buffers

  ◦ add a new `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR` acceleration structure type for layering
• move VK_GEOMETRY_TYPEInstances_KHR to main enum instead of being added via extension

• make build commands more consistent - all now build multiple acceleration structures and are named plurally (vkCmdBuildAccelerationStructuresIndirectKHR, vkCmdBuildAccelerationStructuresKHR, vkBuildAccelerationStructuresKHR)

• add interactions with VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT for acceleration structures, including a new feature (descriptorBindingAccelerationStructureUpdateAfterBind) and 3 new properties (maxPerStageDescriptorAccelerationStructures, maxPerStageDescriptorUpdateAfterBindAccelerationStructures, maxDescriptorSetUpdateAfterBindAccelerationStructures)

• extension is no longer provisional

• define synchronization requirements for builds, traces, and copies

• define synchronization requirements for AS build inputs and indirect build buffer

(5) What is VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR for?

RESOLVED: It is primarily intended for API layering. In DXR, the acceleration structure is basically just a buffer in a special layout, and you do not know at creation time whether it will be used as a top or bottom level acceleration structure. We thus added a generic acceleration structure type whose type is unknown at creation time, but is specified at build time instead. Applications which are written directly for Vulkan should not use it.

Version History

• Revision 1, 2019-12-05 (Members of the Vulkan Ray Tracing TSG)
  ◦ Internal revisions (forked from VK_NV_ray_tracing)

• Revision 2, 2019-12-20 (Daniel Koch, Eric Werness)
  ◦ Add const version of DeviceOrHostAddress (!3515)
  ◦ Add VU to clarify that only handles in the current pipeline are valid (!3518)
  ◦ Restore some missing VUs and add in-place update language (#1902, !3522)
  ◦ rename VkAccelerationStructureInstanceKHR member from accelerationStructure to accelerationStructureReference to better match its type (1323)
  ◦ Allow VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS for pipeline creation if shader group handles cannot be reused (1323)
  ◦ update documentation for the VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS error code and add missing documentation for new return codes from VK_KHR_deferred_host_operations (1323)
  ◦ list new query types for VK_KHR_ray_tracing (1323)
  ◦ Fix VU statements for VkAccelerationStructureGeometryKHR referring to correct union members and update to use more current wording (1323)

• Revision 3, 2020-01-10 (Daniel Koch, Jon Leech, Christoph Kubisch)
  ◦ Fix ‘instance of’ and ‘that/which contains/defines’ markup issues (!3528)
- factor out VK_KHR_pipeline_library as stand-alone extension (!3540)
- Resolve Vulkan-hpp issues (!3543)
  - add missing require for VkGeometryInstanceFlagsKHR
  - de-alias VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_CREATE_INFO_NV since the KHR structure is no longer equivalent
  - add len to pDataSize attribute for vkWriteAccelerationStructuresPropertiesKHR

**Revision 4, 2020-01-23 (Daniel Koch, Eric Werness)**
- Improve vkWriteAccelerationStructuresPropertiesKHR, add return value and VUs (#1947)
- Clarify language to allow multiple raygen shaders (#1959)
- Various editorial feedback (!3556)
- Add language to help deal with looped self-intersecting fans (#1901)
- Change vkCmdTraceRays{,Indirect}KHR args to pointers (!3559)
- Add scratch address validation language (#1941, !3551)
- Fix definition and add hierarchy information for shader call scope (#1977, !3571)

**Revision 5, 2020-02-04 (Eric Werness, Jeff Bolz, Daniel Koch)**
- remove vestigial accelerationStructureUUID (!3582)
- update definition of repack instructions and improve memory model interactions (#1910, #1913, !3584)
- Fix wrong sType for VkPhysicalDeviceRayTracingFeaturesKHR (#1988)
- Use provisional SPIR-V capabilities (#1987)
- require rayTraversalPrimitiveCulling if rayQuery is supported (#1927)
- Miss shaders do not have object parameters (!3592)
- Fix missing required types in XML (!3592)
- clarify matching conditions for update (!3592)
- add goal that host and device builds be similar (!3592)
- clarify that maxPrimitiveCount limit should apply to triangles and AABBs (!3592)
- Require alignment for instance arrayOfPointers (!3592)
- Zero is a valid value for instance flags (!3592)
- Add some alignment VUs that got lost in refactoring (!3592)
- Recommend TMin epsilon rather than culling (!3592)
- Get angle from dot product not cross product (!3592)
- Clarify that AH can access the payload and attributes (!3592)
- Match DXR behavior for inactive primitive definition (!3592)
- Use a more generic term than degenerate for inactive to avoid confusion (!3592)

**Revision 6, 2020-02-20 (Daniel Koch)**
- fix some dangling NV references (#1996)
- rename `VkCmdTraceRaysIndirectCommandKHR` to `VkTraceRaysIndirectCommandKHR` (!3607)
- update contributor list (!3611)
- use `uint64_t` instead of `VkAccelerationStructureReferenceKHR` in `VkAccelerationStructureInstanceKHR` (#2004)

Revision 7, 2020-02-28 (Tobias Hector)
- remove `HitTKHR` SPIR-V builtin (spirv/spirv-extensions#7)

Revision 8, 2020-03-06 (Tobias Hector, Dae Kim, Daniel Koch, Jeff Bolz, Eric Werness)
- explicitly state that $T_{\text{max}}$ is updated when new closest intersection is accepted (#2020,!3536)
- Made references to min and max t values consistent (!3644)
- finish enumerating differences relative to VK_NV_ray_tracing in issues (1) and (2) (#1974,!3642)
- fix formatting in some math equations (!3642)
- Restrict the Hit Kind operand of `OpReportIntersectionKHR` to 7-bits (spirv/spirv-extensions#8,!3646)
- Say ray tracing 'should' be watertight (#2008,!3631)
- Clarify memory requirements for ray tracing buffers (#2005,!3649)
- Add callable size limits (#1997,!3652)

Revision 9, 2020-04-15 (Eric Werness, Daniel Koch, Tobias Hector, Joshua Barczak)
- Add geometry flags to acceleration structure creation (!3672)
- add build scratch memory alignment (minAccelerationStructureScratchOffsetAlignment) (#2065,!3725)
- fix naming and return enum from `vkGetDeviceAccelerationStructureCompatibilityKHR` (#2051,!3726)
- require SPIR-V 1.4 (#2096,!3777)
- added creation time capture/replay flags (#2104,!3774)
- require Vulkan 1.1 (#2133,!3806)
- use device addresses instead of `VkBuffers` for ray tracing commands (#2074,!3815)
- add interactions with Vulkan 1.2 and VK_KHR_vulkan_memory_model (#2133,!3830)
- make VK_KHR_pipeline_library an interaction instead of required (#2045,#2108,!3830)
- make VK_KHR_deferred_host_operations an interaction instead of required (#2045,!3830)
- removed maxCallableSize and added explicit stack size management for ray pipelines (#1997,!3817,!3772,!3844)
- improved documentation for `VkAccelerationStructureVersionInfoKHR` (#2135,3835)
- rename `VkAccelerationStructureBuildOffsetInfoKHR` to `VkAccelerationStructureBuildRangeInfoKHR` (#2058,!3754)
Re-unify geometry description between build and create (!3754)
Fix ppGeometries ambiguity, add pGeometries (#2032,!3811)
add interactions with VK_EXT_robustness2 and allow nullDescriptor support for acceleration structures (#1920,!3848)
added future extensibility for AS updates (#2114,!3849)
Fix VU for dispatchrays and add a limit on the size of the full grid (#2160,!3851)
Add shaderGroupHandleAlignment property (#2180,!3875)
Clarify deferred host ops for pipeline creation (#2067,!3813)
Change acceleration structure build to always be sized (#2131,#2197,#2198,#3854,#3883,#3880)

Revision 10, 2020-07-03 (Mathieu Robart, Daniel Koch, Eric Werness, Tobias Hector)

Decomposition of the specification, from VK_KHR_ray_tracing to VK_KHR_acceleration_structure (#1918,!3912)
clarify buffer usage flags for ray tracing (#2181,!3939)
add max primitive counts to build indirect command (#2233,!3944)
Allocate acceleration structures from VkBuffers and add a mode to constrain the device address (#2131,#3936)
Move VK_GEOMETRY_TYPE_INSTANCES_KHR to main enum (#2243,!3952)
make build commands more consistent (#2247,!3958)
add interactions with UPDATE_AFTER_BIND (#2128,!3986)
correct and expand build command VUs (!4020)
fix copy command VUs (!4018)
added various alignment requirements (#2229,#3943)
fix valid usage for arrays of geometryCount items (#2198,#4010)
define what is allowed to change on RTAS updates and relevant VUs (#2177,#3961)

Revision 11, 2020-11-12 (Eric Werness, Josh Barczak, Daniel Koch, Tobias Hector)
de-alias NV and KHR acceleration structure types and associated commands (#2271,#4035)
specify alignment for host copy commands (#2273,#4037)
document VK_FORMAT_FEATURE_ACCELERATION_STRUCTURE_VERTEX_BUFFER_BIT_KHR
specify that acceleration structures are non-linear (#2289,#4068)
add several missing VUs for strides, vertexFormat, and indexType (#2315,#4069)
restore VUs for VkAccelerationStructureBuildGeometryInfoKHR (#2337,#4098)
ban multi-instance memory for host operations (#2324,#4102)
allow dstAccelerationStructure to be null for vkGetAccelerationStructureBuildSizesKHR (#2330,#4111)
more build VU cleanup (#2138,#4130)

4397
- specify host endianness for AS serialization (#2261,#4136)
- add invertible transform matrix VU (#1710,#4140)
- require geometryCount to be 1 for TLAS builds (#4145)
- improved validity conditions for build addresses (#4142)
- add single statement SPIR-V VUs, build limit VUs (#4158)
- document limits for vertex and aabb strides (#2390,#4184)
- specify that `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` applies to AS copies (#2382,#4173)
- define sync for AS build inputs and indirect buffer (#2407,#4120)

- Revision 12, 2021-08-06 (Samuel Bourasseau)
  - rename `VK_GEOMETRY_INSTANCE_TRIANGLE_FRONT_COUNTERCLOCKWISE_BIT_KHR` to `VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR` (keep previous as alias).
  - Clarify description and add note.
- Revision 13, 2021-09-30 (Jon Leech)
  - Add interaction with `VK_KHR_format_feature_flags2` to `vk.xml`

Description
The `VK_KHR_android_surface` extension is an instance extension. It provides a mechanism to create a `VkSurfaceKHR` object (defined by the `VK_KHR_surface` extension) that refers to an `ANativeWindow`, Android’s native surface type. The `ANativeWindow` represents the producer endpoint of any buffer queue, regardless of consumer endpoint. Common consumer endpoints for `ANativeWindows` are the system window compositor, video encoders, and application-specific compositors importing the images through a `SurfaceTexture`.

New Base Types
- `ANativeWindow`

New Commands
- `vkCreateAndroidSurfaceKHR`

New Structures
- `VkAndroidSurfaceCreateInfoKHR`
New Bitmasks

- VkAndroidSurfaceCreateFlagsKHR

New Enum Constants

- VK_KHR_ANDROID_SURFACE_EXTENSION_NAME
- VK_KHR_ANDROID_SURFACE_SPEC_VERSION

Extending VkStructureType:

- VK_STRUCTURE_TYPE_ANDROID_SURFACE_CREATE_INFO_KHR

Issues

1) Does Android need a way to query for compatibility between a particular physical device (and queue family?) and a specific Android display?

RESOLVED: No. Currently on Android, any physical device is expected to be able to present to the system compositor, and all queue families must support the necessary image layout transitions and synchronization operations.

Version History

- Revision 1, 2015-09-23 (Jesse Hall)
  ◦ Initial draft.
- Revision 2, 2015-10-26 (Ian Elliott)
  ◦ Renamed from VK_EXT_KHR_android_surface to VK_KHR_android_surface.
- Revision 3, 2015-11-03 (Daniel Rakos)
  ◦ Added allocation callbacks to surface creation function.
- Revision 4, 2015-11-10 (Jesse Hall)
  ◦ Removed VK_ERROR_INVALID_ANDROID_WINDOW_KHR.
- Revision 5, 2015-11-28 (Daniel Rakos)
  ◦ Updated the surface create function to take a pCreateInfo structure.
- Revision 6, 2016-01-14 (James Jones)
  ◦ Moved VK_ERROR_NATIVE_WINDOW_IN_USE_KHR from the VK_KHR_android_surface to the VK_KHR_surface extension.

VK_KHR_calibrated_timestamps

Name String

VK_KHR_calibrated_timestamps

Extension Type

Device extension
This extension provides an interface to query calibrated timestamps obtained quasi simultaneously from two time domains.

New Commands

- `vkGetCalibratedTimestampsKHR`
- `vkGetPhysicalDeviceCalibrateableTimeDomainsKHR`
New Structures

- VkCalibratedTimestampInfoKHR

New Enums

- VkTimeDomainKHR

New Enum Constants

- VK_KHR_CALIBRATED_TIMESTAMPS_EXTENSION_NAME
- VK_KHR_CALIBRATED_TIMESTAMPS_SPEC_VERSION

Extending VkStructureType:

- VK_STRUCTURE_TYPE_CALIBRATED_TIMESTAMP_INFO_KHR

**Interactions and External Dependencies**

- This extension provides API support for **GLSL_KHR_cooperative_matrix**

**Contributors**

- Jeff Bolz, NVIDIA
- Markus Tavenrath, NVIDIA
- Daniel Koch, NVIDIA
- Kevin Petit, Arm Ltd.
- Boris Zanin, AMD

**Description**

This extension adds support for using cooperative matrix types in SPIR-V. Cooperative matrix types are medium-sized matrices that are primarily supported in compute shaders, where the storage for the matrix is spread across all invocations in some scope (usually a subgroup) and those invocations cooperate to efficiently perform matrix multiplies.

Cooperative matrix types are defined by the **SPV_KHR_cooperative_matrix** SPIR-V extension and can be used with the **GLSL_KHR_cooperative_matrix** GLSL extension.

This extension includes support for enumerating the matrix types and dimensions that are supported by the implementation.

**New Commands**

- `vkGetPhysicalDeviceCooperativeMatrixPropertiesKHR`

**New Structures**

- `VkCooperativeMatrixPropertiesKHR`

Description
The VK_KHR_deferred_host_operations extension defines the infrastructure and usage patterns for deferrable commands, but does not specify any commands as deferrable. This is left to additional dependent extensions. Commands must not be deferred unless the deferral is specifically allowed by another extension which depends on VK_KHR_deferred_host_operations.

New Object Types
- VkDeferredOperationKHR

New Commands
- vkCreateDeferredOperationKHR
- vkDeferredOperationJoinKHR
- vkDestroyDeferredOperationKHR
- vkGetDeferredOperationMaxConcurrencyKHR
- vkGetDeferredOperationResultKHR

New Enum Constants
- VK_KHR_DEFERRED_HOST_OPERATIONS_EXTENSION_NAME
- VK_KHR_DEFERRED_HOST_OPERATIONS_SPEC_VERSION
- Extending VkObjectType:
• VK_OBJECT_TYPE_DEFERRED_OPERATION_KHR

• Extending VkResult:
  • VK_OPERATION_DEFERRED_KHR
  • VK_OPERATION_NOT_DEFERRED_KHR
  • VK_THREAD_DONE_KHR
  • VK_THREAD_IDLE_KHR

**Code Examples**

The following examples will illustrate the concept of deferrable operations using a hypothetical example. The command `vkDoSomethingExpensive` denotes a deferrable command.

The following example illustrates how a vulkan application might request deferral of an expensive operation:

```cpp
// create a deferred operation
VkDeferredOperationKHR hOp;
VkResult result = vkCreateDeferredOperationKHR(device, pCallbacks, &hOp);
assert(result == VK_SUCCESS);

result = vkDoSomethingExpensive(device, hOp, ...);
assert(result == VK_OPERATION_DEFERRED_KHR);

// operation was deferred. Execute it asynchronously
std::async::launch(
    [ hOp ] ( )
    {
        vkDeferredOperationJoinKHR(device, hOp);

        result = vkGetDeferredOperationResultKHR(device, hOp);

        // deferred operation is now complete. 'result' indicates success or failure
        vkDestroyDeferredOperationKHR(device, hOp, pCallbacks);
    }
);
```

The following example illustrates extracting concurrency from a single deferred operation:

```cpp
// create a deferred operation
VkDeferredOperationKHR hOp;
VkResult result = vkCreateDeferredOperationKHR(device, pCallbacks, &hOp);
assert(result == VK_SUCCESS);

result = vkDoSomethingExpensive(device, hOp, ...);
assert(result == VK_OPERATION_DEFERRED_KHR);
```
// Query the maximum amount of concurrency and clamp to the desired maximum

```cpp
uint32_t numLaunches = std::min(vkGetDeferredOperationMaxConcurrencyKHR(device, hOp), maxThreads);
```

```cpp
std::vector<std::future<void>> joins;

for (uint32_t i = 0; i < numLaunches; i++) {
    joins.emplace_back(std::async::launch(
        [hOp]() {
            vkDeferredOperationJoinKHR(device, hOp);
            // in a job system, a return of VK_THREAD_IDLE_KHR should queue another
            // job, but it is not functionally required
        }
    ));
}

for (auto &f : joins) {
    f.get();
}

result = vkGetDeferredOperationResultKHR(device, hOp);
```

// deferred operation is now complete. 'result' indicates success or failure

```cpp
vkDestroyDeferredOperationKHR(device, hOp, pCallbacks);
```

The following example shows a subroutine which guarantees completion of a deferred operation, in the presence of multiple worker threads, and returns the result of the operation.

```cpp
VkResult FinishDeferredOperation(VkDeferredOperationKHR hOp) {
    // Attempt to join the operation until the implementation indicates that we should stop
    VkResult result = vkDeferredOperationJoinKHR(device, hOp);
    while (result == VK_THREAD_IDLE_KHR) {
        std::this_thread::yield();
        result = vkDeferredOperationJoinKHR(device, hOp);
    }

    switch (result) {
    case VK_SUCCESS:
        // deferred operation has finished. Query its result.
        result = vkGetDeferredOperationResultKHR(device, hOp);
    }
```
break;

case VK_THREAD_DONE_KHR:
{
    // deferred operation is being wrapped up by another thread
    // wait for that thread to finish
    do
    {
        std::this_thread::yield();
        result = vkGetDeferredOperationResultKHR(device, hOp);
    } while( result == VK_NOT_READY );
    break;

default:
    assert(false); // other conditions are illegal.
    break;
}

return result;
clarify return value of vkGetDeferredOperationResultKHR (#2339,!4110)

Extending VkObjectType:
  ◦ VK_OBJECT_TYPE_DISPLAY_KHR
  ◦ VK_OBJECT_TYPE_DISPLAY_MODE_KHR

Extending VkStructureType:
Issues

1) Which properties of a mode should be fixed in the mode information vs. settable in some other function when setting the mode? E.g., do we need to double the size of the mode pool to include both stereo and non-stereo modes? YUV and RGB scanout even if they both take RGB input images? BGR vs. RGB input? etc.

RESOLVED: Many modern displays support at most a handful of resolutions and timings natively. Other “modes” are expected to be supported using scaling hardware on the display engine or GPU. Other properties, such as rotation and mirroring should not require duplicating hardware modes just to express all combinations. Further, these properties may be implemented on a per-display or per-overlay granularity.

To avoid the exponential growth of modes as mutable properties are added, as was the case with EGLConfig/WGL pixel formats/GLXFBConfig, this specification should separate out hardware properties and configurable state into separate objects. Modes and overlay planes will express capabilities of the hardware, while a separate structure will allow applications to configure scaling, rotation, mirroring, color keys, LUT values, alpha masks, etc. for a given swapchain independent of the mode in use. Constraints on these settings will be established by properties of the immutable objects.

Note the resolution of this issue may affect issue 5 as well.

2) What properties of a display itself are useful?

RESOLVED: This issue is too broad. It was meant to prompt general discussion, but resolving this issue amounts to completing this specification. All interesting properties should be included. The issue will remain as a placeholder since removing it would make it hard to parse existing discussion notes that refer to issues by number.

3) How are multiple overlay planes within a display or mode enumerated?

RESOLVED: They are referred to by an index. Each display will report the number of overlay planes it contains.

4) Should swapchains be created relative to a mode or a display?

RESOLVED: When using this extension, swapchains are created relative to a mode and a plane. The mode implies the display object the swapchain will present to. If the specified mode is not the display’s current mode, the new mode will be applied when the first image is presented to the swapchain, and the default operating system mode, if any, will be restored when the swapchain is destroyed.

5) Should users query generic ranges from displays and construct their own modes explicitly using those constraints rather than querying a fixed set of modes (Most monitors only have one real “mode” these days, even though many support relatively arbitrary scaling, either on the monitor side or in the GPU display engine, making “modes” something of a relic/compatibility construct).
**RESOLVED:** Expose both. Display information structures will expose a set of predefined modes, as well as any attributes necessary to construct a customized mode.

6) Is it fine if we return the display and display mode handles in the structure used to query their properties?

**RESOLVED:** Yes.

7) Is there a possibility that not all displays of a device work with all of the present queues of a device? If yes, how do we determine which displays work with which present queues?

**RESOLVED:** No known hardware has such limitations, but determining such limitations is supported automatically using the existing `VK_KHR_surface` and `VK_KHR_swapchain` query mechanisms.

8) Should all presentation need to be done relative to an overlay plane, or can a display mode + display be used alone to target an output?

**RESOLVED:** Require specifying a plane explicitly.

9) Should displays have an associated window system display, such as an `HDC` or `Display`*

**RESOLVED:** No. Displays are independent of any windowing system in use on the system. Further, neither `HDC` nor `Display`* refer to a physical display object.

10) Are displays queried from a physical GPU or from a device instance?

**RESOLVED:** Developers prefer to query modes directly from the physical GPU so they can use display information as an input to their device selection algorithms prior to device creation. This avoids the need to create placeholder device instances to enumerate displays.

This preference must be weighed against the extra initialization that must be done by driver vendors prior to device instance creation to support this usage.

11) Should displays and/or modes be dispatchable objects? If functions are to take displays, overlays, or modes as their first parameter, they must be dispatchable objects as defined in Khronos bug 13529. If they are not added to the list of dispatchable objects, functions operating on them must take some higher-level object as their first parameter. There is no performance case against making them dispatchable objects, but they would be the first extension objects to be dispatchable.

**RESOLVED:** Do not make displays or modes dispatchable. They will dispatch based on their associated physical device.

12) Should hardware cursor capabilities be exposed?

**RESOLVED:** Defer. This could be a separate extension on top of the base WSI specs.

13) How many display objects should be enumerated for "tiled" display devices? There are ongoing design discussions among lower-level display API authors regarding how to expose displays if they are one physical display device to an end user, but may internally be implemented as two side-by-side displays using the same display engine (and sometimes cabling) resources as two physically
separate display devices.

**RESOLVED:** Tiled displays will appear as a single display object in this API.

14) Should the raw EDID data be included in the display information?

**RESOLVED:** No. A future extension could be added which reports the EDID if necessary. This may be complicated by the outcome of issue 13.

15) Should min and max scaling factor capabilities of overlays be exposed?

**RESOLVED:** Yes. This is exposed indirectly by allowing applications to query the min/max position and extent of the source and destination regions from which image contents are fetched by the display engine when using a particular mode and overlay pair.

16) Should devices be able to expose planes that can be moved between displays? If so, how?

**RESOLVED:** Yes. Applications can determine which displays a given plane supports using `vkGetDisplayPlaneSupportedDisplaysKHR`.

17) Should there be a way to destroy display modes? If so, does it support destroying “built in” modes?

**RESOLVED:** Not in this extension. A future extension could add this functionality.

18) What should the lifetime of display and built-in display mode objects be?

**RESOLVED:** The lifetime of the instance. These objects cannot be destroyed. A future extension may be added to expose a way to destroy these objects and/or support display hotplug.

19) Should persistent mode for smart panels be enabled/disabled at swapchain creation time, or on a per-present basis?

**RESOLVED:** On a per-present basis.

**Examples**

*Note*
The example code for the `VK_KHR_display` and `VK_KHR_display_swapchain` extensions was removed from the appendix after revision 1.0.43. The display enumeration example code was ported to the cube demo that is shipped with the official Khronos SDK, and is being kept up-to-date in that location (see: [https://github.com/KhronosGroup/Vulkan-Tools/blob/main/cube/cube.c](https://github.com/KhronosGroup/Vulkan-Tools/blob/main/cube/cube.c)).

**Version History**

- Revision 1, 2015-02-24 (James Jones)
  - Initial draft
- Revision 2, 2015-03-12 (Norbert Nopper)
  - Added overlay enumeration for a display.
• Revision 3, 2015-03-17 (Norbert Nopper)
  ◦ Fixed typos and namings as discussed in Bugzilla.
  ◦ Reordered and grouped functions.
  ◦ Added functions to query count of display, mode and overlay.
  ◦ Added native display handle, which may be needed on some platforms to create a native Window.

• Revision 4, 2015-03-18 (Norbert Nopper)
  ◦ Removed primary and virtualPosition members (see comment of James Jones in Bugzilla).
  ◦ Added native overlay handle to information structure.
  ◦ Replaced , with ; in struct.

• Revision 6, 2015-03-18 (Daniel Rakos)
  ◦ Added WSI extension suffix to all items.
  ◦ Made the whole API more “Vulkanish”.
  ◦ Replaced all functions with a single vkGetDisplayInfoKHR function to better match the rest of the API.
  ◦ Made the display, display mode, and overlay objects be first class objects, not subclasses of VkBaseObject as they do not support the common functions anyways.
  ◦ Renamed *Info structures to *Properties.
  ◦ Removed overlayIndex field from VkOverlayProperties as there is an implicit index already as a result of moving to a “Vulkanish” API.
  ◦ Displays are not get through device, but through physical GPU to match the rest of the Vulkan API. Also this is something ISVs explicitly requested.
  ◦ Added issue (6) and (7).

• Revision 7, 2015-03-25 (James Jones)
  ◦ Added an issues section
  ◦ Added rotation and mirroring flags

• Revision 8, 2015-03-25 (James Jones)
  ◦ Combined the duplicate issues sections introduced in last change.
  ◦ Added proposed resolutions to several issues.

• Revision 9, 2015-04-01 (Daniel Rakos)
  ◦ Rebased extension against Vulkan 0.82.0

• Revision 10, 2015-04-01 (James Jones)
  ◦ Added issues (10) and (11).
  ◦ Added more straw-man issue resolutions, and cleaned up the proposed resolution for issue (4).
  ◦ Updated the rotation and mirroring enums to have proper bitmask semantics.
• Revision 11, 2015-04-15 (James Jones)
  ◦ Added proposed resolution for issues (1) and (2).
  ◦ Added issues (12), (13), (14), and (15)
  ◦ Removed pNativeHandle field from overlay structure.
  ◦ Fixed small compilation errors in example code.

• Revision 12, 2015-07-29 (James Jones)
  ◦ Rewrote the guts of the extension against the latest WSI swapchain specifications and the
    latest Vulkan API.
  ◦ Address overlay planes by their index rather than an object handle and refer to them as
    “planes” rather than “overlays” to make it slightly clearer that even a display with no
    “overlays” still has at least one base “plane” that images can be displayed on.
  ◦ Updated most of the issues.
  ◦ Added an “extension type” section to the specification header.
  ◦ Reused the VK_EXT_KHR_surface surface transform enumerations rather than redefining
    them here.
  ◦ Updated the example code to use the new semantics.

• Revision 13, 2015-08-21 (Ian Elliott)
  ◦ Renamed this extension and all of its enumerations, types, functions, etc. This makes it
    compliant with the proposed standard for Vulkan extensions.
  ◦ Switched from “revision” to “version”, including use of the VK_MAKE_VERSION macro in the
    header file.

• Revision 14, 2015-09-01 (James Jones)
  ◦ Restore single-field revision number.

• Revision 15, 2015-09-08 (James Jones)
  ◦ Added alpha flags enum.
  ◦ Added premultiplied alpha support.

• Revision 16, 2015-09-08 (James Jones)
  ◦ Added description section to the spec.
  ◦ Added issues 16 - 18.

• Revision 17, 2015-10-02 (James Jones)
  ◦ Planes are now a property of the entire device rather than individual displays. This allows
    planes to be moved between multiple displays on devices that support it.
  ◦ Added a function to create a VkSurfaceKHR object describing a display plane and mode to
    align with the new per-platform surface creation conventions.
  ◦ Removed detailed mode timing data. It was agreed that the mode extents and refresh rate
    are sufficient for current use cases. Other information could be added back in as an
    extension if it is needed in the future.
- Added support for smart/persistent/buffered display devices.
- Revision 18, 2015-10-26 (Ian Elliott)
  - Renamed from VK_EXT_KHR_display to VK_KHR_display.
- Revision 19, 2015-11-02 (James Jones)
  - Updated example code to match revision 17 changes.
- Revision 20, 2015-11-03 (Daniel Rakos)
  - Added allocation callbacks to creation functions.
- Revision 21, 2015-11-10 (Jesse Hall)
  - Added VK_DISPLAY_PLANE_ALPHA_OPAQUE_BIT_KHR, and use VkDisplayPlaneAlphaFlagBitsKHR for VkDisplayPlanePropertiesKHR::alphaMode instead of VkDisplayPlaneAlphaFlagsKHR, since it only represents one mode.
  - Added reserved flags bitmask to VkDisplayPlanePropertiesKHR.
  - Use VkSurfaceTransformFlagBitsKHR instead of obsolete VkSurfaceTransformKHR.
  - Renamed vkGetDisplayPlaneSupportedDisplaysKHR parameters for clarity.
- Revision 22, 2015-12-18 (James Jones)
  - Added missing “planeIndex” parameter to vkGetDisplayPlaneSupportedDisplaysKHR()
- Revision 23, 2017-03-13 (James Jones)
  - Closed all remaining issues. The specification and implementations have been shipping with the proposed resolutions for some time now.
  - Removed the sample code and noted it has been integrated into the official Vulkan SDK cube demo.

**VK_KHR_display_swapchain**

**Name String**

VK_KHR_display_swapchain

**Extension Type**

Device extension

**Registered Extension Number**

4

**Revision**

10

**Ratification Status**

Ratified

**Extension and Version Dependencies**

VK_KHR_swapchain

and
This extension provides an API to create a swapchain directly on a device’s display without any underlying window system.

New Commands

- `vkCreateSharedSwapchainsKHR`

New Structures

- Extending `VkPresentInfoKHR`:
  - `VkDisplayPresentInfoKHR`

New Enum Constants

- `VK_KHR_DISPLAY_SWAPCHAIN_EXTENSION_NAME`
- `VK_KHR_DISPLAY_SWAPCHAIN_SPEC_VERSION`
- Extending `VkResult`:
  - `VK_ERROR_INCOMPATIBLE_DISPLAY_KHR`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_DISPLAY_PRESENT_INFO_KHR`

Issues

1) Should swapchains sharing images each hold a reference to the images, or should it be up to the application to destroy the swapchains and images in an order that avoids the need for reference counting?
RESOLVED: Take a reference. The lifetime of presentable images is already complex enough.

2) Should the `srcRect` and `dstRect` parameters be specified as part of the presentation command, or at swapchain creation time?

RESOLVED: As part of the presentation command. This allows moving and scaling the image on the screen without the need to respecify the mode or create a new swapchain and presentable images.

3) Should `srcRect` and `dstRect` be specified as rects, or separate offset/extent values?

RESOLVED: As rects. Specifying them separately might make it easier for hardware to expose support for one but not the other, but in such cases applications must just take care to obey the reported capabilities and not use non-zero offsets or extents that require scaling, as appropriate.

4) How can applications create multiple swapchains that use the same images?

RESOLVED: By calling `vkCreateSharedSwapchainsKHR`.

An earlier resolution used `vkCreateSwapchainKHR`, chaining multiple `VkSwapchainCreateInfoKHR` structures through `pNext`. In order to allow each swapchain to also allow other extension structs, a level of indirection was used: `VkSwapchainCreateInfoKHR::pNext` pointed to a different structure, which had both `sType` and `pNext` members for additional extensions, and also had a pointer to the next `VkSwapchainCreateInfoKHR` structure. The number of swapchains to be created could only be found by walking this linked list of alternating structures, and the `pSwapchains` out parameter was reinterpreted to be an array of `VkSwapchainKHR` handles.

Another option considered was a method to specify a “shared” swapchain when creating a new swapchain, such that groups of swapchains using the same images could be built up one at a time. This was deemed unusable because drivers need to know all of the displays an image will be used on when determining which internal formats and layouts to use for that image.

Examples

\[\text{Note}\]
The example code for the `VK_KHR.display` and `VK_KHR.display_swapchain` extensions was removed from the appendix after revision 1.0.43. The display swapchain creation example code was ported to the cube demo that is shipped with the official Khronos SDK, and is being kept up-to-date in that location (see: https://github.com/KhronosGroup/Vulkan-Tools/blob/main/cube/cube.c).

Version History

- Revision 1, 2015-07-29 (James Jones)
  - Initial draft
- Revision 2, 2015-08-21 (Ian Elliott)
  - Renamed this extension and all of its enumerations, types, functions, etc. This makes it compliant with the proposed standard for Vulkan extensions.
  - Switched from “revision” to “version”, including use of the `VK_MAKE_VERSION` macro in the
• Revision 3, 2015-09-01 (James Jones)
  ◦ Restore single-field revision number.

• Revision 4, 2015-09-08 (James Jones)
  ◦ Allow creating multiple swapchains that share the same images using a single call to
    vkCreateSwapchainKHR().

• Revision 5, 2015-09-10 (Alon Or-bach)
  ◦ Removed underscores from SWAP_CHAIN in two enums.

• Revision 6, 2015-10-02 (James Jones)
  ◦ Added support for smart panels/buffered displays.

• Revision 7, 2015-10-26 (Ian Elliott)
  ◦ Renamed from VK_EXT_KHR_display_swapchain to VK_KHR_display_swapchain.

• Revision 8, 2015-11-03 (Daniel Rakos)
  ◦ Updated sample code based on the changes to VK_KHR_swapchain.

• Revision 9, 2015-11-10 (Jesse Hall)
  ◦ Replaced VkDisplaySwapchainCreateInfoKHR with vkCreateSharedSwapchainsKHR,
    changing resolution of issue #4.

• Revision 10, 2017-03-13 (James Jones)
  ◦ Closed all remaining issues. The specification and implementations have been shipping with
    the proposed resolutions for some time now.
  ◦ Removed the sample code and noted it has been integrated into the official Vulkan SDK cube
    demo.

Description
This extension enables reads from attachments and resources written by previous fragment shaders within a dynamic render pass.

New Commands
- `vkCmdSetRenderingAttachmentLocationsKHR`
- `vkCmdSetRenderingInputAttachmentIndicesKHR`

New Structures
- Extending `VkGraphicsPipelineCreateInfo`, `VkCommandBufferInheritanceInfo`:
  - `VkRenderingAttachmentLocationInfoKHR`
  - `VkRenderingInputAttachmentIndexInfoKHR`
- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  - `VkPhysicalDeviceDynamicRenderingLocalReadFeaturesKHR`

New Enum Constants
- `VK_KHR_DYNAMIC_RENDERING_LOCAL_READ_EXTENSION_NAME`
- `VK_KHR_DYNAMIC_RENDERING_LOCAL_READ_SPEC_VERSION`
- Extending `VkImageLayout`:
  - `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DYNAMIC_RENDERING_LOCAL_READ_FEATURES_KHR`
  - `VK_STRUCTURE_TYPE_RENDERING_ATTACHMENT_LOCATION_INFO_KHR`
  - `VK_STRUCTURE_TYPE_RENDERING_INPUT_ATTACHMENT_INDEX_INFO_KHR`

Version History
- Revision 1, 2023-11-03 (Tobias Hector)
  - Initial revision

• Contributors to VK_KHR_external_semaphore_fd

Description
An application using external memory may wish to synchronize access to that memory using fences. This extension enables an application to export fence payload to and import fence payload from POSIX file descriptors.

New Commands
• vkGetFenceFdKHR
• vkImportFenceFdKHR

New Structures
• VkFenceGetFdInfoKHR
• VkImportFenceFdInfoKHR
New Enum Constants

- VK_KHR_EXTERNAL_FENCE_FD_EXTENSION_NAME
- VK_KHR_EXTERNAL_FENCE_FD_SPEC_VERSION

Extending VkStructureType:

- VK_STRUCTURE_TYPE_FENCE_GET_FD_INFO_KHR
- VK_STRUCTURE_TYPE_IMPORT_FENCE_FD_INFO_KHR

Issues

This extension borrows concepts, semantics, and language from VK_KHR_external_semaphore_fd. That extension’s issues apply equally to this extension.

Description
An application using external memory may wish to synchronize access to that memory using fences. This extension enables an application to export fence payload to and import fence payload from Windows handles.

New Commands
- vkGetFenceWin32HandleKHR
- vkImportFenceWin32HandleKHR

New Structures
- VkFenceGetWin32HandleInfoKHR
- VkImportFenceWin32HandleInfoKHR
- Extending VkFenceCreateInfo:
  - VkExportFenceWin32HandleInfoKHR

New Enum Constants
- VK_KHR_EXTERNAL_FENCE_WIN32_EXTENSION_NAME
- VK_KHR_EXTERNAL_FENCE_WIN32_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_EXPORT_FENCE_WIN32_HANDLE_INFO_KHR
  - VK_STRUCTURE_TYPE_FENCE_GET_WIN32_HANDLE_INFO_KHR
  - VK_STRUCTURE_TYPE_IMPORT_FENCE_WIN32_HANDLE_INFO_KHR

Issues
This extension borrows concepts, semantics, and language from VK_KHR_external_semaphore_win32. That extension's issues apply equally to this extension.

1) Should D3D12 fence handle types be supported, like they are for semaphores?

RESOLVED: No. Doing so would require extending the fence signal and wait operations to provide
values to signal / wait for, like VkD3D12FenceSubmitInfoKHR does. A D3D12 fence can be signaled by importing it into a VkSemaphore instead of a VkFence, and applications can check status or wait on the D3D12 fence using non-Vulkan APIs. The convenience of being able to do these operations on VkFence objects does not justify the extra API complexity.

- Jeff Juliano, NVIDIA
Description

An application may wish to reference device memory in multiple Vulkan logical devices or instances, in multiple processes, and/or in multiple APIs. This extension enables an application to export POSIX file descriptor handles from Vulkan memory objects and to import Vulkan memory objects from POSIX file descriptor handles exported from other Vulkan memory objects or from similar resources in other APIs.

New Commands

- `vkGetMemoryFdKHR`
- `vkGetMemoryFdPropertiesKHR`

New Structures

- `VkMemoryFdPropertiesKHR`
- `VkMemoryGetFdInfoKHR`
- Extending `VkMemoryAllocateInfo`:
  - `VkImportMemoryFdInfoKHR`

New Enum Constants

- `VK_KHR_EXTERNAL_MEMORY_FD_EXTENSION_NAME`
- `VK_KHR_EXTERNAL_MEMORY_FD_SPEC_VERSION`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_IMPORT_MEMORY_FD_INFO_KHR`
  - `VK_STRUCTURE_TYPE_MEMORY_FD_PROPERTIES_KHR`
  - `VK_STRUCTURE_TYPE_MEMORY_GET_FD_INFO_KHR`

Issues

1) Does the application need to close the file descriptor returned by `vkGetMemoryFdKHR`?

**RESOLVED:** Yes, unless it is passed back in to a driver instance to import the memory. A successful get call transfers ownership of the file descriptor to the application, and a successful import transfers it back to the driver. Destroying the original memory object will not close the file descriptor or remove its reference to the underlying memory resource associated with it.

2) Do drivers ever need to expose multiple file descriptors per memory object?

**RESOLVED:** No. This would indicate there are actually multiple memory objects, rather than a single memory object.

3) How should the valid size and memory type for POSIX file descriptor memory handles created outside of Vulkan be specified?

**RESOLVED:** The valid memory types are queried directly from the external handle. The size will be
specified by future extensions that introduce such external memory handle types.

Description

An application may wish to reference device memory in multiple Vulkan logical devices or instances, in multiple processes, and/or in multiple APIs. This extension enables an application to export Windows handles from Vulkan memory objects and to import Vulkan memory objects from Windows handles exported from other Vulkan memory objects or from similar resources in other APIs.

New Commands

- `vkGetMemoryWin32HandleKHR`
- `vkGetMemoryWin32HandlePropertiesKHR`

New Structures

- `VkMemoryGetWin32HandleInfoKHR`
- `VkMemoryWin32HandlePropertiesKHR`
- Extending `VkMemoryAllocateInfo`:
  - `VkExportMemoryWin32HandleInfoKHR`
  - `VkImportMemoryWin32HandleInfoKHR`

New Enum Constants

- `VK_KHR_EXTERNAL_MEMORY_WIN32_EXTENSION_NAME`
- `VK_KHR_EXTERNAL_MEMORY_WIN32_SPEC_VERSION`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_EXPORT_MEMORY_WIN32_HANDLE_INFO_KHR`
  - `VK_STRUCTURE_TYPE_IMPORT_MEMORY_WIN32_HANDLE_INFO_KHR`
  - `VK_STRUCTURE_TYPE_MEMORY_GET_WIN32_HANDLE_INFO_KHR`
  - `VK_STRUCTURE_TYPE_MEMORY_WIN32_HANDLE_PROPERTIES_KHR`

Issues

1) Do applications need to call `CloseHandle()` on the values returned from `vkGetMemoryWin32HandleKHR` when `handleType` is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT_KHR`?

**RESOLVED:** Yes. A successful get call transfers ownership of the handle to the application. Destroying the memory object will not destroy the handle or the handle's reference to the underlying memory resource. Unlike file descriptor opaque handles, win32 opaque handle ownership can not be transferred back to a driver by an import operation.

2) Should the language regarding KMT/Windows 7 handles be moved to a separate extension so that it can be deprecated over time?

**RESOLVED:** No. Support for them can be deprecated by drivers if they choose, by no longer
returning them in the supported handle types of the instance level queries.

3) How should the valid size and memory type for windows memory handles created outside of Vulkan be specified?

**RESOLVED:** The valid memory types are queried directly from the external handle. The size is determined by the associated image or buffer memory requirements for external handle types that require dedicated allocations, and by the size specified when creating the object from which the handle was exported for other external handle types.

Description

An application using external memory may wish to synchronize access to that memory using semaphores. This extension enables an application to export semaphore payload to and import semaphore payload from POSIX file descriptors.

New Commands

- vkGetSemaphoreFdKHR
- vkImportSemaphoreFdKHR

New Structures

- VkImportSemaphoreFdInfoKHR
- VkSemaphoreGetFdInfoKHR

New Enum Constants

- VK_KHR_EXTERNAL_SEMAPHORE_FD_EXTENSION_NAME
- VK_KHR_EXTERNAL_SEMAPHORE_FD_SPEC_VERSION

Extending VkStructureType:

- VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_FD_INFO_KHR
- VK_STRUCTURE_TYPE_SEMAPHORE_GET_FD_INFO_KHR

Issues

1) Does the application need to close the file descriptor returned by vkGetSemaphoreFdKHR?

RESOLVED: Yes, unless it is passed back in to a driver instance to import the semaphore. A successful get call transfers ownership of the file descriptor to the application, and a successful import transfers it back to the driver. Destroying the original semaphore object will not close the file descriptor or remove its reference to the underlying semaphore resource associated with it.

Description
An application using external memory may wish to synchronize access to that memory using semaphores. This extension enables an application to export semaphore payload to and import semaphore payload from Windows handles.

New Commands
- vkGetSemaphoreWin32HandleKHR
- vkImportSemaphoreWin32HandleKHR
New Structures

- VkImportSemaphoreWin32HandleInfoKHR
- VkSemaphoreGetWin32HandleInfoKHR
- Extending VkSemaphoreCreateInfo:
  - VkExportSemaphoreWin32HandleInfoKHR
- Extending VkSubmitInfo:
  - VkD3D12FenceSubmitInfoKHR

New Enum Constants

- VK_KHR_EXTERNAL_SEMAPHORE_WIN32_EXTENSION_NAME
- VK_KHR_EXTERNAL_SEMAPHORE_WIN32_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_D3D12_FENCE_SUBMIT_INFO_KHR
  - VK_STRUCTURE_TYPE_EXPORT_SEMAPHORE_WIN32_HANDLE_INFO_KHR
  - VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_WIN32_HANDLE_INFO_KHR
  - VK_STRUCTURE_TYPE_SEMAPHORE_GET_WIN32_HANDLE_INFO_KHR

Issues

1) Do applications need to call \texttt{CloseHandle()} on the values returned from \texttt{vkGetSemaphoreWin32HandleKHR} when \texttt{handleType} is \texttt{VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT_KHR}?

**RESOLVED:** Yes. A successful get call transfers ownership of the handle to the application. Destroying the semaphore object will not destroy the handle or the handle’s reference to the underlying semaphore resource. Unlike file descriptor opaque handles, win32 opaque handle ownership cannot be transferred back to a driver by an import operation.

2) Should the language regarding KMT/Windows 7 handles be moved to a separate extension so that it can be deprecated over time?

**RESOLVED:** No. Support for them can be deprecated by drivers if they choose, by no longer returning them in the supported handle types of the instance level queries.

3) Should applications be allowed to specify additional object attributes for shared handles?

**RESOLVED:** Yes. Applications will be allowed to provide similar attributes to those they would to any other handle creation API.

4) How do applications communicate the desired fence values to use with \texttt{D3D12_FENCE}-based Vulkan semaphores?

**RESOLVED:** There are a couple of options. The values for the signaled and reset states could be communicated up front when creating the object and remain static for the life of the Vulkan
semaphore, or they could be specified using auxiliary structures when submitting semaphore
signal and wait operations, similar to what is done with the keyed mutex extensions. The latter is
more flexible and consistent with the keyed mutex usage, but the former is a much simpler API.

Since Vulkan tends to favor flexibility and consistency over simplicity, a new structure specifying
D3D12 fence acquire and release values is added to the \texttt{vkQueueSubmit} function.

Interactions and External Dependencies

- This extension provides API support for GL_EXT_fragment_shader_barycentric

Contributors

- Stu Smith, AMD
- Tobias Hector, AMD
- Graeme Leese, Broadcom
- Jan-Harald Fredriksen, Arm
- Slawek Grajewski, Intel
- Pat Brown, NVIDIA
- Hans-Kristian Arntzen, Valve
- Contributors to the VK_NV_fragment_shader_barycentric specification

Description

This extension is based on the VK_NV_fragment_shader_barycentric extension, and adds support for the following SPIR-V extension in Vulkan:

- SPV_KHR_fragment_shader_barycentric

The extension provides access to three additional fragment shader variable decorations in SPIR-V:

- PerVertexKHR, which indicates that a fragment shader input will not have interpolated values, but instead must be accessed with an extra array index that identifies one of the vertices of the primitive producing the fragment
- BaryCoordKHR, which indicates that the variable is a three-component floating-point vector holding barycentric weights for the fragment produced using perspective interpolation
- BaryCoordNoPerspKHR, which indicates that the variable is a three-component floating-point vector holding barycentric weights for the fragment produced using linear interpolation

When using GLSL source-based shader languages, the following variables from GL_EXT_fragment_shader_barycentric map to these SPIR-V built-in decorations:

- in vec3 gl_BaryCoordEXT; → BaryCoordKHR
- in vec3 gl_BaryCoordNoPerspEXT; → BaryCoordNoPerspKHR

GLSL variables declared using the pervertexEXT GLSL qualifier are expected to be decorated with PerVertexKHR in SPIR-V.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceFragmentShaderBarycentricFeaturesKHR
Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceFragmentShaderBarycentricPropertiesKHR

New Enum Constants

- VK_KHR_FRAGMENT_SHADER_BARYCENTRIC_EXTENSION_NAME
- VK_KHR_FRAGMENT_SHADER_BARYCENTRIC_SPEC_VERSION

Extending VkStructureType:

- VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADER_BARYCENTRIC_FEATURES_KHR
- VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADER_BARYCENTRIC_PROPERTIES_KHR

New Built-In Variables

- BaryCoordKHR
- BaryCoordNoPerspKHR

New SPIR-V Decorations

- PerVertexKHR

New SPIR-V Capabilities

- FragmentBarycentricKHR

Issues

1) What are the interactions with MSAA and how are BaryCoordKHR and BaryCoordNoPerspKHR interpolated?

RESOLVED: The inputs decorated with BaryCoordKHR or BaryCoordNoPerspKHR may also be decorated with the Centroid or Sample qualifiers to specify interpolation, like any other fragment shader input. If shaderSampleRateInterpolationFunctions is enabled, the extended instructions InterpolateAtCentroid, InterpolateAtOffset, and InterpolateAtSample from the GLSL.std.450 may also be used with inputs decorated with BaryCoordKHR or BaryCoordNoPerspKHR.

Description

This extension adds the ability to change the rate at which fragments are shaded. Rather than the usual single fragment invocation for each pixel covered by a primitive, multiple pixels can be shaded by a single fragment shader invocation.

Up to three methods are available to the application to change the fragment shading rate:

- **Pipeline Fragment Shading Rate**, which allows the specification of a rate per-draw.
- **Primitive Fragment Shading Rate**, which allows the specification of a rate per primitive, specified during shading.
- **Attachment Fragment Shading Rate**, which allows the specification of a rate per-region of the framebuffer, specified in a specialized image attachment.

Additionally, these rates can all be specified and combined in order to adjust the overall detail in the image at each point.

This functionality can be used to focus shading efforts where higher levels of detail are needed in some parts of a scene compared to others. This can be particularly useful in high resolution rendering, or for XR contexts.

This extension also adds support for the `SPV_KHR_fragment_shading_rate` extension which enables setting the primitive fragment shading rate, and allows querying the final shading rate from a fragment shader.

New Commands

- `vkCmdSetFragmentShadingRateKHR`
- `vkGetPhysicalDeviceFragmentShadingRatesKHR`

New Structures

- `VkPhysicalDeviceFragmentShadingRateKHR`
- Extending `VkGraphicsPipelineCreateInfo`:
  - `VkPipelineFragmentShadingRateStateCreateInfoKHR`
- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  - `VkPhysicalDeviceFragmentShadingRateFeaturesKHR`
- Extending `VkPhysicalDeviceProperties2`:
  - `VkPhysicalDeviceFragmentShadingRatePropertiesKHR`
- Extending `VkSubpassDescription2`:
New Enums

- VkFragmentShadingRateCombinerOpKHR

New Enum Constants

Description

This extension provides new queries for device display properties and capabilities that can be easily extended by other extensions, without introducing any further queries. This extension can be considered the VK_KHR_display equivalent of the VK_KHR_get_physical_device_properties2 extension.

New Commands

• vkGetDisplayModeProperties2KHR
• vkGetDisplayPlaneCapabilities2KHR
• vkGetPhysicalDeviceDisplayPlaneProperties2KHR
• vkGetPhysicalDeviceDisplayProperties2KHR
New Structures

- VkDisplayModeProperties2KHR
- VkDisplayPlaneCapabilities2KHR
- VkDisplayPlaneInfo2KHR
- VkDisplayPlaneProperties2KHR
- VkDisplayProperties2KHR

New Enum Constants

- VK_KHR_GET_DISPLAY_PROPERTIES_2_EXTENSION_NAME
- VK_KHR_GET_DISPLAY_PROPERTIES_2_SPEC_VERSION

Extending VkStructureType:

- VK_STRUCTURE_TYPE_DISPLAY_MODE_PROPERTIES_2_KHR
- VK_STRUCTURE_TYPE_DISPLAY_PLANE_CAPABILITIES_2_KHR
- VK_STRUCTURE_TYPE_DISPLAY_PLANE_INFO_2_KHR
- VK_STRUCTURE_TYPE_DISPLAY_PLANE_PROPERTIES_2_KHR
- VK_STRUCTURE_TYPE_DISPLAY_PROPERTIES_2_KHR

Issues

1) What should this extension be named?

**RESOLVED:** VK_KHR_get_display_properties2. Other alternatives:

- VK_KHR_display2
- One extension, combined with VK_KHR_surface_capabilites2.

2) Should extensible input structs be added for these new functions:

**RESOLVED:**

- vkGetPhysicalDeviceDisplayProperties2KHR: No. The only current input is a VkPhysicalDevice. Other inputs would not make sense.
- vkGetPhysicalDeviceDisplayPlaneProperties2KHR: No. The only current input is a VkPhysicalDevice. Other inputs would not make sense.
- vkGetDisplayModeProperties2KHR: No. The only current inputs are a VkPhysicalDevice and a VkDisplayModeKHR. Other inputs would not make sense.

3) Should additional display query functions be extended?

**RESOLVED:**

- vkGetDisplayPlaneSupportedDisplaysKHR: No. Extensions should instead extend vkGetDisplayPlaneCapabilitiesKHR().

**Description**

This extension provides new queries for device surface capabilities that can be easily extended by other extensions, without introducing any further queries. This extension can be considered the VK_KHR_surface equivalent of the VK_KHR_get_physical_device_properties2 extension.
New Commands

- vkGetPhysicalDeviceSurfaceCapabilities2KHR
- vkGetPhysicalDeviceSurfaceFormats2KHR

New Structures

- VkPhysicalDeviceSurfaceInfo2KHR
- VkSurfaceCapabilities2KHR
- VkSurfaceFormat2KHR

New Enum Constants

- VK_KHR_GET_SURFACE_CAPABILITIES_2_EXTENSION_NAME
- VK_KHR_GET_SURFACE_CAPABILITIES_2_SPEC_VERSION

Extending VkStructureType:
- VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SURFACE_INFO_2_KHR
- VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_2_KHR
- VK_STRUCTURE_TYPE_SURFACE_FORMAT_2_KHR

Issues

1) What should this extension be named?

**RESOLVED:** VK_KHR_get_surface_capabilities2. Other alternatives:

- VK_KHR_surface2
- One extension, combining a separate display-specific query extension.

2) Should additional WSI query functions be extended?

**RESOLVED:**

- vkGetPhysicalDeviceSurfaceCapabilitiesKHR: Yes. The need for this motivated the extension.
- vkGetPhysicalDeviceSurfaceSupportKHR: No. Currently only has boolean output. Extensions should instead extend vkGetPhysicalDeviceSurfaceCapabilities2KHR.
- vkGetPhysicalDeviceSurfaceFormatsKHR: Yes.
- vkGetPhysicalDeviceSurfacePresentModesKHR: No. Recent discussion concluded this introduced too much variability for applications to deal with. Extensions should instead extend vkGetPhysicalDeviceSurfaceCapabilities2KHR.
- vkGetPhysicalDeviceXlibPresentationSupportKHR: Not in this extension.
- vkGetPhysicalDeviceXcbPresentationSupportKHR: Not in this extension.
- vkGetPhysicalDeviceWaylandPresentationSupportKHR: Not in this extension.
- vkGetPhysicalDeviceWin32PresentationSupportKHR: Not in this extension.

- Contributors to `VK_EXT_global_priority`
- Contributors to `VK_EXT_global_priority_query`

**Description**

In Vulkan, users can specify device-scope queue priorities. In some cases it may be useful to extend this concept to a system-wide scope. This device extension allows applications to query the global queue priorities supported by a queue family, and then set a priority when creating queues. The default queue priority is `VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_EXT`.

Implementations can report which global priority levels are treated differently by the
implementation. It is intended primarily for use in system integration along with certain platform-specific priority enforcement rules.

The driver implementation will attempt to skew hardware resource allocation in favor of the higher-priority task. Therefore, higher-priority work may retain similar latency and throughput characteristics even if the system is congested with lower priority work.

The global priority level of a queue shall take precedence over the per-process queue priority (VkDeviceQueueCreateInfo::pQueuePriorities).

Abuse of this feature may result in starving the rest of the system from hardware resources. Therefore, the driver implementation may deny requests to acquire a priority above the default priority (VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_EXT) if the caller does not have sufficient privileges. In this scenario VK_ERROR_NOT_PERMITTED_EXT is returned.

The driver implementation may fail the queue allocation request if resources required to complete the operation have been exhausted (either by the same process or a different process). In this scenario VK_ERROR_INITIALIZATION_FAILED is returned.

New Structures

• Extending VkDeviceQueueCreateInfo:
  ◦ VkDeviceQueueGlobalPriorityCreateInfoKHR

• Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  ◦ VkPhysicalDeviceGlobalPriorityQueryFeaturesKHR

• Extending VkQueueFamilyProperties2:
  ◦ VkQueueFamilyGlobalPriorityPropertiesKHR

New Enums

• VkQueueGlobalPriorityKHR

New Enum Constants

• VK_KHR_GLOBAL_PRIORITY_EXTENSION_NAME
• VK_KHR_GLOBAL_PRIORITY_SPEC_VERSION
• VK_MAX_GLOBAL_PRIORITY_SIZE_KHR

• Extending VkResult:
  ◦ VK_ERROR_NOT_PERMITTED_KHR

• Extending VkStructureType:
  ◦ VK_STRUCTURE_TYPE_DEVICE_QUEUE_GLOBAL_PRIORITY_CREATE_INFO_KHR
  ◦ VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_GLOBAL_PRIORITY_QUERY_FEATURES_KHR
  ◦ VK_STRUCTURE_TYPE_QUEUE_FAMILY_GLOBAL_PRIORITY_PROPERTIES_KHR
Issues

1) Can we additionally query whether a caller is permitted to acquire a specific global queue priority in this extension?

RESOLVED: No. Whether a caller has enough privilege goes with the OS, and the Vulkan driver cannot really guarantee that the privilege will not change in between this query and the actual queue creation call.

2) If more than 1 queue using global priority is requested, is there a good way to know which queue is failing the device creation?

RESOLVED: No. There is not a good way at this moment, and it is also not quite actionable for the applications to know that because the information may not be accurate. Queue creation can fail because of runtime constraints like insufficient privilege or lack of resource, and the failure is not necessarily tied to that particular queue configuration requested.

Description
This device extension extends \textit{vkQueuePresentKHR}, from the \textit{VK_KHR_swapchain} extension, allowing an application to specify a list of rectangular, modified regions of each image to present. This should be used in situations where an application is only changing a small portion of the presentable images within a swapchain, since it enables the presentation engine to avoid wasting time presenting parts of the surface that have not changed.

This extension is leveraged from the \textit{EGL_KHR_swap_buffers_with_damage} extension.

New Structures
• \textit{VkPresentRegionKHR}
• \textit{VkRectLayerKHR}
• Extending \textit{VkPresentInfoKHR}:
  ◦ \textit{VkPresentRegionsKHR}

New Enum Constants
• \textit{VK_KHR_INCREMENTAL_PRESENT_EXTENSION_NAME}
• \textit{VK_KHR_INCREMENTAL_PRESENT_SPEC_VERSION}
• Extending \textit{VkStructureType}:
  ◦ \textit{VK_STRUCTURE_TYPE_PRESENT_REGIONS_KHR}

Issues
1) How should we handle steroescopic-3D swapchains? We need to add a layer for each rectangle. One approach is to create another struct containing the \textit{VkRect2D} plus layer, and have \textit{VkPresentRegionsKHR} point to an array of that struct. Another approach is to have two parallel arrays, \textit{pRectangles} and \textit{pLayers}, where \textit{pRectangles[i]} and \textit{pLayers[i]} must be used together. Which
approach should we use, and if the array of a new structure, what should that be called?

**RESOLVED:** Create a new structure, which is a `VkRect2D` plus a layer, and will be called `VkRectLayerKHR`.

2) Where is the origin of the `VkRectLayerKHR`?

**RESOLVED:** The upper left corner of the presentable image(s) of the swapchain, per the definition of framebuffer coordinates.

3) Does the rectangular region, `VkRectLayerKHR`, specify pixels of the swapchain’s image(s), or of the surface?

**RESOLVED:** Of the image(s). Some presentation engines may scale the pixels of a swapchain’s image(s) to the size of the surface. The size of the swapchain’s image(s) will be consistent, where the size of the surface may vary over time.

4) What if all of the rectangles for a given swapchain contain a width and/or height of zero?

**RESOLVED:** The application is indicating that no pixels changed since the last present. The presentation engine may use such a hint and not update any pixels for the swapchain. However, all other semantics of `vkQueuePresentKHR` must still be honored, including waiting for semaphores to signal.

5) When the swapchain is created with `VkSwapchainCreateInfoKHR::preTransform` set to a value other than `VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR`, should the rectangular region, `VkRectLayerKHR`, be transformed to align with the `preTransform`?

**RESOLVED:** No. The rectangular region in `VkRectLayerKHR` should not be transformed. As such, it may not align with the extents of the swapchain’s image(s). It is the responsibility of the presentation engine to transform the rectangular region. This matches the behavior of the Android presentation engine, which set the precedent.

**Version History**

- Revision 1, 2016-11-02 (Ian Elliott)
  - Internal revisions
- Revision 2, 2021-03-18 (Ian Elliott)
  - Clarified alignment of rectangles for presentation engines that support transformed swapchains.

Description

This extension adds some line rasterization features that are commonly used in CAD applications and supported in other APIs like OpenGL. Bresenham-style line rasterization is supported, smooth rectangular lines (coverage to alpha) are supported, and stippled lines are supported for all three
line rasterization modes.

New Commands

- `vkCmdSetLineStippleKHR`

New Structures

- Extending `VkPhysicalDeviceFeatures2, VkDeviceCreateInfo`:
  - `VkPhysicalDeviceLineRasterizationFeaturesKHR`
- Extending `VkPhysicalDeviceProperties2`:
  - `VkPhysicalDeviceLineRasterizationPropertiesKHR`
- Extending `VkPipelineRasterizationStateCreateInfo`:
  - `VkPipelineRasterizationLineStateCreateInfoKHR`

New Enums

- `VkLineRasterizationModeKHR`

New Enum Constants

- `VK_KHR_LINE_RASTERIZATION_EXTENSION_NAME`
- `VK_KHR_LINE_RASTERIZATION_SPEC_VERSION`
- Extending `VkDynamicState`:
  - `VK_DYNAMIC_STATE_LINE_STIPPLE_KHR`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LINE_RASTERIZATION_FEATURES_KHR`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LINE_RASTERIZATION_PROPERTIES_KHR`
  - `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_LINE_STATE_CREATE_INFO_KHR`

Issues

1) Do we need to support Bresenham-style and smooth lines with more than one rasterization sample? i.e. the equivalent of `glDisable(GL_MULTISAMPLE)` in OpenGL when the framebuffer has more than one sample?

**RESOLVED:** Yes. For simplicity, Bresenham line rasterization carries forward a few restrictions from OpenGL, such as not supporting per-sample shading, alpha to coverage, or alpha to one.

Description

This extension provides VK_ATTACHMENT_LOAD_OP_NONE_KHR and VK_ATTACHMENT_STORE_OP_NONE_KHR, which are identically promoted from the VK_EXT_load_store_op_none extension.

New Enum Constants

• VK_KHR_LOAD_STORE_OP_NONE_EXTENSION_NAME
• VK_KHR_LOAD_STORE_OP_NONE_SPEC_VERSION
• Extending VkAttachmentLoadOp:
  • VK_ATTACHMENT_LOAD_OP_NONE_KHR
• Extending VkAttachmentStoreOp:
  ◦ VK_ATTACHMENT_STORE_OP_NONE_KHR

Note
While VK_ATTACHMENT_STORE_OP_NONE_KHR is part of Vulkan 1.3, this extension was not promoted to core either in whole or in part. This functionality was promoted from VK_KHR_dynamic_rendering.

Version History
• Revision 1, 2023-05-16 (Shahbaz Youssefi)

Description

VK_KHR_maintenance5 adds a collection of minor features, none of which would warrant an entire extension of their own.

The new features are as follows:

- A new VK_FORMAT_A1B5G5R5_UNORM_PACK16_KHR format
- A new VK_FORMAT_A8_UNORM_KHR format
- A property to indicate that multisample coverage operations are performed after sample counting in EarlyFragmentTests mode
- Relax VkBufferView creation requirements by allowing subsets of the associated VkBuffer usage using VkBufferUsageFlags2CreateInfoKHR
- A new command vkCmdBindIndexBuffer2KHR, allowing a range of memory to be bound as an index buffer
- vkGetDeviceProcAddr must return NULL for supported core functions beyond the version requested by the application.
- A property to indicate that the sample mask test is performed after sample counting in EarlyFragmentTests mode
- vkCmdBindVertexBuffers2 now supports using VK_WHOLE_SIZE in the pSizes parameter.
- A default size of 1.0 is used if POINTSIZE is not written
- Shader modules are deprecated - applications can now pass VkShaderModuleCreateInfo as a chained struct to pipeline creation via VkPipelineShaderStageCreateInfo
- A function vkGetRenderingAreaGranularityKHR to query the optimal render area for a dynamic rendering instance.
- A property to indicate that depth/stencil texturing operations with VK_COMPONENT_SWIZZLE_ONE have defined behavior
- Add vkGetImageSubresourceLayout2KHR and a new function vkGetDeviceImageSubresourceLayoutKHR to allow the application to query the image memory layout without having to create an image object and query it.
- Allow VK_REMAINING_ARRAY LAYERS as the layerCount member of VkImageSubresourceLayers
- Adds stronger guarantees for propagation of VK_ERROR_DEVICE_LOST return values
• A property to indicate whether `PointSize` controls the final rasterization of polygons if `polygon mode` is `VK_POLYGON_MODE_POINT`.

• Two properties to indicate the non-strict line rasterization algorithm used.

• Two new flags words `VkPipelineCreateFlagBits2KHR` and `VkBufferUsageFlagBits2KHR`.

• Physical-device-level functions can now be called with any value in the valid range for a type beyond the defined enumerants, such that applications can avoid checking individual features, extensions, or versions before querying supported properties of a particular enumerant.

• Clarification that copies between images of any type are allowed, treating 1D images as 2D images with a height of 1.

**New Commands**

- `vkCmdBindIndexBuffer2KHR`
- `vkGetDeviceImageSubresourceLayoutKHR`
- `vkGetImageSubresourceLayout2KHR`
- `vkGetRenderingAreaGranularityKHR`

**New Structures**

- `VkDeviceImageSubresourceInfoKHR`
- `VkImageSubresource2KHR`
- `VkRenderingAreaInfoKHR`
- `VkSubresourceLayout2KHR`

- Extending `VkBufferViewCreateInfo`, `VkBufferCreateInfo`, `VkPhysicalDeviceExternalBufferInfo`, `VkDescriptorBufferBindingInfoEXT`:
  - `VkBufferUsageFlags2CreateInfoKHR`

- Extending `VkComputePipelineCreateInfo`, `VkGraphicsPipelineCreateInfo`, `VkRayTracingPipelineCreateInfoNV`, `VkRayTracingPipelineCreateInfoKHR`:
  - `VkPipelineCreateFlags2CreateInfoKHR`

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  - `VkPhysicalDeviceMaintenance5FeaturesKHR`

- Extending `VkPhysicalDeviceProperties2`:
  - `VkPhysicalDeviceMaintenance5PropertiesKHR`

**New Enums**

- `VkBufferUsageFlagBits2KHR`
- `VkPipelineCreateFlagBits2KHR`

**New Bitmasks**

- `VkBufferUsageFlags2KHR`
- VkPipelineCreateFlags2KHR

**New Enum Constants**

- VK_KHR_MAINTENANCE_5_EXTENSION_NAME
- VK_KHR_MAINTENANCE_5_SPEC_VERSION

**Extending VkFormat:**
- VK_FORMAT_A1B5G5R5_UNORM_PACK16_KHR
- VK_FORMAT_A8_UNORM_KHR

**Extending VkStructureType:**
- VK_STRUCTURE_TYPE_BUFFER_USAGE_FLAGS_2_CREATE_INFO_KHR
- VK_STRUCTURE_TYPE_DEVICE_IMAGE_SUBRESOURCE_INFO_KHR
- VK_STRUCTURE_TYPE_IMAGE_SUBRESOURCE_2_KHR
- VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MAINTENANCE_5_FEATURES_KHR
- VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MAINTENANCE_5_PROPERTIES_KHR
- VK_STRUCTURE_TYPE_PIPELINE_CREATE_FLAGS_2_CREATE_INFO_KHR
- VK_STRUCTURE_TYPE_RENDERING_AREA_INFO_KHR
- VK_STRUCTURE_TYPE_SUBRESOURCE_LAYOUT_2_KHR

If **VK_EXT_attachment_feedback_loop_layout** is supported:

- Extending VkPipelineCreateFlagBits2KHR:
  - VK_PIPELINE_CREATE_2_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT
  - VK_PIPELINE_CREATE_2_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT

If **VK_EXT_conditional_rendering** is supported:

- Extending VkBufferUsageFlagBits2KHR:
  - VK_BUFFER_USAGE_2_CONDITIONAL_RENDERING_BIT_EXT

If **VK_EXT_descriptor_buffer** is supported:

- Extending VkBufferUsageFlagBits2KHR:
  - VK_BUFFER_USAGE_2_PUSH_DESCRIPTORS_DESCRIPTOR_BUFFER_BIT_EXT
  - VK_BUFFER_USAGE_2_RESOURCE_DESCRIPTOR_BUFFER_BIT_EXT
  - VK_BUFFER_USAGE_2_SAMPLER_DESCRIPTOR_BUFFER_BIT_EXT
- Extending VkPipelineCreateFlagBits2KHR:
  - VK_PIPELINE_CREATE_2_DESCRIPTOR_BUFFER_BIT_EXT

If **VK_EXT_graphics_pipeline_library** is supported:

- Extending VkPipelineCreateFlagBits2KHR:
If VK_EXT_opacity_micromap is supported:

- Extending VkBufferUsageFlagBits2KHR:
  - VK_BUFFER_USAGE_2_MICROMAP_BUILD_INPUT_READ_ONLY_BIT_EXT
  - VK_BUFFER_USAGE_2_MICROMAP_STORAGE_BIT_EXT

- Extending VkPipelineCreateFlagBits2KHR:
  - VK_PIPELINE_CREATE_2_RAY_TRACING_OPACITY_MICROMAP_BIT_EXT

If VK_EXT_pipeline_protected_access is supported:

- Extending VkPipelineCreateFlagBits2KHR:
  - VK_PIPELINE_CREATE_2_NO_PROTECTED_ACCESS_BIT_EXT
  - VK_PIPELINE_CREATE_2_PROTECTED_ACCESS_ONLY_BIT_EXT

If VK_EXT_transform_feedback is supported:

- Extending VkBufferUsageFlagBits2KHR:
  - VK_BUFFER_USAGE_2_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT
  - VK_BUFFER_USAGE_2_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT

If VK_KHR_acceleration_structure is supported:

- Extending VkBufferUsageFlagBits2KHR:
  - VK_BUFFER_USAGE_2_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR
  - VK_BUFFER_USAGE_2_ACCELERATION_STRUCTURE_STORAGE_BIT_KHR

If VK_KHR_pipeline_executable_properties is supported:

- Extending VkPipelineCreateFlagBits2KHR:
  - VK_PIPELINE_CREATE_2_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR
  - VK_PIPELINE_CREATE_2_CAPTURE_STATISTICS_BIT_KHR

If VK_KHR_pipeline_library is supported:

- Extending VkPipelineCreateFlagBits2KHR:
  - VK_PIPELINE_CREATE_2_LIBRARY_BIT_KHR

If VK_KHR_ray_tracing_pipeline is supported:

- Extending VkBufferUsageFlagBits2KHR:
  - VK_BUFFER_USAGE_2_SHADER_BINDING_TABLE_BIT_KHR

- Extending VkPipelineCreateFlagBits2KHR:
• VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR
• VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR
• VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR
• VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR
• VK_PIPELINE_CREATE_2_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR
• VK_PIPELINE_CREATE_2_RAY_TRACING_SKIP_AABBS_BIT_KHR
• VK_PIPELINE_CREATE_2_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR

If **VK_KHR_video_decode_queue** is supported:

• Extending **VkBufferUsageFlagBits2KHR**:
  ◦ VK_BUFFER_USAGE_2_VIDEO_DECODE_DST_BIT_KHR
  ◦ VK_BUFFER_USAGE_2_VIDEO_DECODE_SRC_BIT_KHR

If **VK_KHR_video_encode_queue** is supported:

• Extending **VkBufferUsageFlagBits2KHR**:
  ◦ VK_BUFFER_USAGE_2_VIDEO_ENCODE_DST_BIT_KHR
  ◦ VK_BUFFER_USAGE_2_VIDEO_ENCODE_SRC_BIT_KHR

If **VK_NV_device_generated_commands** is supported:

• Extending **VkPipelineCreateFlagBits2KHR**:
  ◦ VK_PIPELINE_CREATE_2_INDIRECT_BINDABLE_BIT_NV

If **VK_NV_displacement_micromap** is supported:

• Extending **VkPipelineCreateFlagBits2KHR**:
  ◦ VK_PIPELINE_CREATE_2_RAY_TRACING_DISPLACEMENT_MICROMAP_BIT_NV

If **VK_NV_ray_tracing** is supported:

• Extending **VkBufferUsageFlagBits2KHR**:
  ◦ VK_BUFFER_USAGE_2_RAY_TRACING_BIT_NV

• Extending **VkPipelineCreateFlagBits2KHR**:
  ◦ VK_PIPELINE_CREATE_2_DEFER_COMPILE_BIT_NV

If **VK_NV_ray_tracing_motion_blur** is supported:

• Extending **VkPipelineCreateFlagBits2KHR**:
  ◦ VK_PIPELINE_CREATE_2_RAY_TRACING_ALLOW_MOTION_BIT_NV

If **Version 1.1 or VK_KHR_device_group** is supported:

• Extending **VkPipelineCreateFlagBits2KHR**:
  ◦...
If Version 1.2 or VK_KHR_buffer_device_address or VK_EXT_buffer_device_address is supported:

- Extending VkBufferUsageFlagBits2KHR:
  - VK_BUFFER_USAGE_2_SHADER_DEVICE_ADDRESS_BIT_KHR

If Version 1.3 or VK_EXT_pipeline_creation_cache_control is supported:

- Extending VkPipelineCreateFlagBits2KHR:
  - VK_PIPELINE_CREATE_2_EARLY_RETURN_ON_FAILURE_BIT_KHR
  - VK_PIPELINE_CREATE_2_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT_KHR

Issues

None.

Description

VK_KHR_maintenance6 adds a collection of minor features, none of which would warrant an entire extension of their own.

The new features are as follows:

• VkBindMemoryStatusKHR may be included in the pNext chain of VkBindBufferMemoryInfo and VkBindImageMemoryInfo, allowing applications to identify individual resources for which memory binding failed during calls to vkBindBufferMemory2 and vkBindImageMemory2.

• A new property fragmentShadingRateClampCombinerInputs to indicate if an implementation clamps the inputs to fragment shading rate combiner operations.

• VK_NULL_HANDLE is allowed to be used when binding an index buffer, instead of a valid VkBuffer handle. When the nullDescriptor feature is enabled, every index fetched results in a value of zero.

• A new property maxCombinedImageSamplerDescriptorCount to indicate the maximum number of descriptors needed for any of the formats that require a sampler Y’CnCnR conversion supported by the implementation.

• A new property blockTexelViewCompatibleMultipleLayers indicating whether VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT is allowed to be used with layerCount > 1

• pNext extensible *2 versions of all descriptor binding commands.
New Commands

- vkCmdBindDescriptorSets2KHR
- vkCmdPushConstants2KHR

If VK_EXT_descriptor_buffer is supported:

- vkCmdBindDescriptorBufferEmbeddedSamplers2EXT
- vkCmdSetDescriptorBufferOffsets2EXT

If VK_KHR_push_descriptor is supported:

- vkCmdPushDescriptorSet2KHR
- vkCmdPushDescriptorSetWithTemplate2KHR

New Structures

- VkBindDescriptorSetsInfoKHR
- VkPushConstantsInfoKHR

Extending VkBindBufferMemoryInfo, VkBindImageMemoryInfo:

- VkBindMemoryStatusKHR

Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:

- VkPhysicalDeviceMaintenance6FeaturesKHR

Extending VkPhysicalDeviceProperties2:

- VkPhysicalDeviceMaintenance6PropertiesKHR

If VK_EXT_descriptor_buffer is supported:

- VkBindDescriptorBufferEmbeddedSamplersInfoEXT
- VkSetDescriptorBufferOffsetsInfoEXT

If VK_KHR_push_descriptor is supported:

- VkPushDescriptorSetInfoKHR
- VkPushDescriptorSetWithTemplateInfoKHR

New Enum Constants

- VK_KHR_MAINTENANCE_6_EXTENSION_NAME
- VK_KHR_MAINTENANCE_6_SPEC_VERSION

Extending VkStructureType:

- VK_STRUCTURE_TYPE_BIND_DESCRIPTOR_SETS_INFO_KHR
- VK_STRUCTURE_TYPE_BIND_MEMORY_STATUS_KHR
- VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MAINTENANCE_6_FEATURES_KHR
If `VK_EXT_descriptor_buffer` is supported:

- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_BIND_DESCRIPTOR_BUFFER_EMBEDDED_SAMPLERS_INFO_EXT`
  - `VK_STRUCTURE_TYPE_SET_DESCRIPTOR_BUFFER_OFFSETS_INFO_EXT`

If `VK_KHR_push_descriptor` is supported:

- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PUSH_DESCRIPTOR_SET_INFO_KHR`
  - `VK_STRUCTURE_TYPE_PUSH_DESCRIPTOR_SET_WITH_TEMPLATE_INFO_KHR`

**Issues**

None.

Description

The VK_KHR_performance_query extension adds a mechanism to allow querying of performance counters for use in applications and by profiling tools.

Each queue family may expose counters that can be enabled on a queue of that family. We extend VkQueryType to add a new query type for performance queries, and chain a structure on VkQueryPoolCreateInfo to specify the performance queries to enable.

New Commands

- vkAcquireProfilingLockKHR
- vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR
- vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR
- vkReleaseProfilingLockKHR

New Structures

- VkAcquireProfilingLockInfoKHR
- VkPerformanceCounterDescriptionKHR
- VkPerformanceCounterKHR
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDevicePerformanceQueryFeaturesKHR
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDevicePerformanceQueryPropertiesKHR
- Extending VkQueryPoolCreateInfo:
  - VkQueryPoolPerformanceCreateInfoKHR
- Extending VkSubmitInfo, VkSubmitInfo2:
• VkPerformanceQuerySubmitInfoKHR

New Unions

• VkPerformanceCounterResultKHR

New Enums

• VkAcquireProfilingLockFlagBitsKHR
• VkPerformanceCounterDescriptionFlagBitsKHR
• VkPerformanceCounterScopeKHR
• VkPerformanceCounterStorageKHR
• VkPerformanceCounterUnitKHR

New Bitmasks

• VkAcquireProfilingLockFlagsKHR
• VkPerformanceCounterDescriptionFlagsKHR

New Enum Constants

• VK_KHR_PERFORMANCE_QUERY_EXTENSION_NAME
• VK_KHR_PERFORMANCE_QUERY_SPEC_VERSION

Extending VkQueryType:

• VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR

Extending VkStructureType:

• VK_STRUCTURE_TYPE_ACQUIRE_PROFILING_LOCK_INFO_KHR
• VK_STRUCTURE_TYPE_PERFORMANCE_COUNTER_DESCRIPTION_KHR
• VK_STRUCTURE_TYPE_PERFORMANCE_COUNTER_KHR
• VK_STRUCTURE_TYPE_PERFORMANCE_QUERY_SUBMIT_INFO_KHR
• VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PERFORMANCE_QUERY_FEATURES_KHR
• VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PERFORMANCE_QUERY_PROPERTIES_KHR
• VK_STRUCTURE_TYPE_QUERY_POOL_PERFORMANCE_CREATE_INFO_KHR

Issues

1) Should this extension include a mechanism to begin a query in command buffer $A$ and end the query in command buffer $B$?

**RESOLVED** No - queries are tied to command buffer creation and thus have to be encapsulated within a single command buffer.

2) Should this extension include a mechanism to begin and end queries globally on the queue, not using the existing command buffer commands?
3) Should this extension expose counters that require multiple passes?

**RESOLVED** Yes - users should re-submit a command buffer with the same commands in it multiple times, specifying the pass to count as the query parameter in VkPerformanceQuerySubmitInfoKHR.

4) How to handle counters across parallel workloads?

**RESOLVED** In the spirit of Vulkan, a counter description flag `VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_BIT_KHR` denotes that the accuracy of a counter result is affected by parallel workloads.

5) How to handle secondary command buffers?

**RESOLVED** Secondary command buffers inherit any counter pass index specified in the parent primary command buffer. Note: this is no longer an issue after change from issue 10 resolution.

6) What commands does the profiling lock have to be held for?

**RESOLVED** For any command buffer that is being queried with a performance query pool, the profiling lock must be held while that command buffer is in the recording, executable, or pending state.

7) Should we support `vkCmdCopyQueryPoolResults`?

**RESOLVED** Yes.

8) Should we allow performance queries to interact with multiview?

**RESOLVED** Yes, but the performance queries must be performed once for each pass per view.

9) Should a queryCount > 1 be usable for performance queries?

**RESOLVED** Yes. Some vendors will have costly performance counter query pool creation, and would rather if a certain set of counters were to be used multiple times that a queryCount > 1 can be used to amortize the instantiation cost.

10) Should we introduce an indirect mechanism to set the counter pass index?

**RESOLVED** Specify the counter pass index at submit time instead, to avoid requiring re-recording of command buffers when multiple counter passes are needed.

**Examples**

The following example shows how to find what performance counters a queue family supports, setup a query pool to record these performance counters, how to add the query pool to the command buffer to record information, and how to get the results from the query pool.

```cpp
// A previously created physical device
VkPhysicalDevice physicalDevice;
```
// One of the queue families our device supports
uint32_t queueFamilyIndex;

uint32_t counterCount;

// Get the count of counters supported
vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR(
    physicalDevice,
    queueFamilyIndex,
    &counterCount,
    NULL,
    NULL);

VkPerformanceCounterKHR* counters =
    malloc(sizeof(VkPerformanceCounterKHR) * counterCount);
VkPerformanceCounterDescriptionKHR* counterDescriptions =
    malloc(sizeof(VkPerformanceCounterDescriptionKHR) * counterCount);

// Get the counters supported
vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR(
    physicalDevice,
    queueFamilyIndex,
    counterCount,
    counters,
    counterDescriptions);

// Try to enable the first 8 counters
uint32_t enabledCounters[8];

const uint32_t enabledCounterCount = min(counterCount, 8));

for (uint32_t i = 0; i < enabledCounterCount; i++) {
    enabledCounters[i] = i;
}

// A previously created device that had the performanceCounterQueryPools feature
// set to VK_TRUE
VkDevice device;

VkQueryPoolPerformanceCreateInfoKHR performanceQueryCreateInfo = {
   .sType = VK_STRUCTURE_TYPE_QUERY_POOL_PERFORMANCE_CREATE_INFO_KHR,
   .pNext = NULL,

   // Specify the queue family that this performance query is performed on
   .queueFamilyIndex = queueFamilyIndex,

   // The number of counters to enable
   .counterIndexCount = enabledCounterCount,

   // The array of indices of counters to enable
   .pCounterIndices = enabledCounters
};
// Get the number of passes our counters will require.

uint32_t numPasses;

vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR Zweq
physicalDevice, &performanceQueryCreateInfo, &numPasses);

VkQueryPoolCreateInfo queryPoolCreateInfo = {
    .sType = VK_STRUCTURE_TYPE_QUERY_POOL_CREATE_INFO,
    .pNext = &performanceQueryCreateInfo,
    .flags = 0,
    // Using our new query type here
    .queryType = VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR,
    .queryCount = 1,
    .pipelineStatistics = 0
};

VkQueryPool queryPool;

VkResult result = vkCreateQueryPool device, &queryPoolCreateInfo, NULL, &queryPool);

assert(VK_SUCCESS == result);

// A queue from queueFamilyIndex

VkQueue queue;

// A command buffer we want to record counters on

VkCommandBuffer commandBuffer;

VkCommandBufferBeginInfo commandBufferBeginInfo = {
    .sType = VK_STRUCTURE_TYPE_COMMAND_BUFFER_BEGIN_INFO,
    .pNext = NULL,
    .flags = 0,
    .pInheritanceInfo = NULL
};

VkAcquireProfilingLockInfoKHR lockInfo = {
    .sType = VK_STRUCTURE_TYPE_ACQUIRE_PROFILING_LOCK_INFO_KHR,
    .pNext = NULL,
    .flags = 0,
    .timeout = UINT64_MAX // Wait forever for the lock
};
// Acquire the profiling lock before we record command buffers
// that will use performance queries

result = vkAcquireProfilingLockKHR(device, &lockInfo);

assert(VK_SUCCESS == result);

result = vkBeginCommandBuffer(commandBuffer, &commandBufferBeginInfo);

assert(VK_SUCCESS == result);

vkCmdResetQueryPool(commandBuffer, queryPool, 0, 1);

vkCmdBeginQuery(commandBuffer, queryPool, 0, 0);

// Perform the commands you want to get performance information on
// ...

// Perform a barrier to ensure all previous commands were complete before
// ending the query
vkCmdPipelineBarrier(commandBuffer, VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT, VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT, 0, 0, NULL, 0, NULL, 0);

vkCmdEndQuery(commandBuffer, queryPool, 0);

result = vkEndCommandBuffer(commandBuffer);

assert(VK_SUCCESS == result);

for (uint32_t counterPass = 0; counterPass < numPasses; counterPass++) {
    VkPerformanceQuerySubmitInfoKHR performanceQuerySubmitInfo = {

// Submit the command buffer and wait for its completion
// ...

// Release the profiling lock after the command buffer is no longer in the pending state.
vkReleaseProfilingLockKHR(device);

result = vkResetCommandBuffer(commandBuffer, 0);
assert(VK_SUCCESS == result);

// Create an array to hold the results of all counters
VkPerformanceCounterResultKHR* recordedCounters = malloc(
    sizeof(VkPerformanceCounterResultKHR) * enabledCounterCount);

result = vkGetQueryPoolResults(
    device,
    queryPool,
    0,
    1,
    sizeof(VkPerformanceCounterResultKHR) * enabledCounterCount,
    recordedCounters,
    sizeof(VkPerformanceCounterResultKHR) * enabledCounterCount,
    NULL);

// recordedCounters is filled with our counters, we will look at one for posterity
switch (counters[0].storage) {
    case VK_PERFORMANCE_COUNTER_STORAGE_INT32:
        // use recordCounters[0].int32 to get at the counter result!
        break;
    case VK_PERFORMANCE_COUNTER_STORAGE_INT64:
        // use recordCounters[0].int64 to get at the counter result!
        break;
    case VK_PERFORMANCE_COUNTER_STORAGE_UINT32:
        // use recordCounters[0].uint32 to get at the counter result!
        break;
    case VK_PERFORMANCE_COUNTER_STORAGE_UINT64:
        // use recordCounters[0].uint64 to get at the counter result!
        break;
    case VK_PERFORMANCE_COUNTER_STORAGE_FLOAT32:
        // use recordCounters[0].float32 to get at the counter result!
        break;
    case VK_PERFORMANCE_COUNTER_STORAGE_FLOAT64:
        // use recordCounters[0].float64 to get at the counter result!
        break;
}

Description

When a pipeline is created, its state and shaders are compiled into zero or more device-specific executables, which are used when executing commands against that pipeline. This extension adds a mechanism to query properties and statistics about the different executables produced by the pipeline compilation process. This is intended to be used by debugging and performance tools to allow them to provide more detailed information to the user. Certain compile time shader statistics provided through this extension may be useful to developers for debugging or performance analysis.

New Commands

- vkGetPipelineExecutableInternalRepresentationsKHR
- vkGetPipelineExecutablePropertiesKHR
- vkGetPipelineExecutableStatisticsKHR

New Structures

- VkPipelineExecutableInfoKHR
- VkPipelineExecutableInternalRepresentationKHR
- VkPipelineExecutablePropertiesKHR
- VkPipelineExecutableStatisticKHR
- VkPipelineInfoKHR
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDevicePipelineExecutablePropertiesFeaturesKHR

New Unions

- VkPipelineExecutableStatisticValueKHR
New Enums

- VkPipelineExecutableStatisticFormatKHR

New Enum Constants

- VK_KHR_PIPELINE_EXECUTABLE_PROPERTIES_EXTENSION_NAME
- VK_KHR_PIPELINE_EXECUTABLE_PROPERTIES_SPEC_VERSION

Extending VkPipelineCreateFlagBits:

- VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR
- VK_PIPELINE_CREATE_CAPTURE_STATISTICS_BIT_KHR

Extending VkStructureType:

- VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PIPELINE_EXECUTABLE_PROPERTIES_FEATURES_KHR
- VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_INFO_KHR
- VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_INTERNAL_REPRESENTATION_KHR
- VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_PROPERTIES_KHR
- VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_STATISTIC_KHR
- VK_STRUCTURE_TYPE_PIPELINE_INFO_KHR

Issues

1) What should we call the pieces of the pipeline which are produced by the compilation process and about which you can query properties and statistics?

**RESOLVED:** Call them “executables”. The name “binary” was used in early drafts of the extension but it was determined that “pipeline binary” could have a fairly broad meaning (such as a binary serialized form of an entire pipeline) and was too big of a namespace for the very specific needs of this extension.

Description
A pipeline library is a special pipeline that cannot be bound, instead it defines a set of shaders and shader groups which can be linked into other pipelines. This extension defines the infrastructure for pipeline libraries, but does not specify the creation or usage of pipeline libraries. This is left to additional dependent extensions.

New Structures

• Charles Giessen, LunarG

Description
This extension allows applications to control whether devices that expose the VK_KHR_portability_subset extension are included in the results of physical device enumeration. Since devices which support the VK_KHR_portability_subset extension are not fully conformant Vulkan implementations, the Vulkan loader does not report those devices unless the application explicitly asks for them. This prevents applications which may not be aware of non-conformant devices from accidentally using them, as any device which supports the VK_KHR_portability_subset
extension mandates that the extension must be enabled if that device is used.

This extension is implemented in the loader.

New Enum Constants

- `VK_KHR_PORTABILITY_ENUMERATION_EXTENSION_NAME`
- `VK_KHR_PORTABILITY_ENUMERATION_SPEC_VERSION`
- Extending `VkInstanceCreateFlagBits`:
  - `VK_INSTANCE_CREATE_ENUMERATE_PORTABILITY_BIT_KHR`

Description
This device extension allows an application that uses the `VK_KHR_swapchain` extension to provide an identifier for present operations on a swapchain. An application can use this to reference specific present operations in other extensions.

New Structures
- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  - `VkPhysicalDevicePresentIdFeaturesKHR`
- Extending `VkPresentInfoKHR`:
  - `VkPresentIdKHR`

New Enum Constants
- `VK_KHR_PRESENT_ID_EXTENSION_NAME`
- `VK_KHR_PRESENT_ID_SPEC_VERSION`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PRESENT_ID_FEATURES_KHR`
  - `VK_STRUCTURE_TYPE_PRESENT_ID_KHR`

Issues
None.

• Tobias Hector, AMD
• Daniel Stone, Collabora

Description
This device extension allows an application that uses the VK_KHR_swapchain extension to wait for present operations to complete. An application can use this to monitor and control the pacing of the application by managing the number of outstanding images yet to be presented.

New Commands
• vkWaitForPresentKHR

New Structures
• Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
New Enum Constants

- VK_KHR_PRESENT_WAIT_EXTENSION_NAME
- VK_KHR_PRESENT_WAIT_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PRESENT_WAIT_FEATURES_KHR

Issues

1) When does the wait finish?

**RESOLVED.** The wait will finish when the present is visible to the user. There is no requirement for any precise timing relationship between the presentation of the image to the user, but implementations should signal the wait as close as possible to the presentation of the first pixel in the new image to the user.

2) Should this use fences or other existing synchronization mechanism.

**RESOLVED.** Because display and rendering are often implemented in separate drivers, this extension will provide a separate synchronization API.

3) Should this extension share present identification with other extensions?

**RESOLVED.** Yes. A new extension, VK_KHR_present_id, should be created to provide a shared structure for presentation identifiers.

4) What happens when presentations complete out of order wrt calls to vkQueuePresent? This could happen if the semaphores for the presentations were ready out of order.

**OPTION A:** Require that when a PresentId is set that the driver ensure that images are always presented in the order of calls to vkQueuePresent.

**OPTION B:** Finish both waits when the earliest present completes. This will complete the later present wait earlier than the actual presentation. This should be the easiest to implement as the driver need only track the largest present ID completed. This is also the ‘natural’ consequence of interpreting the existing vkWaitForPresentKHR specification.

**OPTION C:** Finish both waits when both have completed. This will complete the earlier presentation later than the actual presentation time. This is allowed by the current specification as there is no precise timing requirement for when the presentId value is updated. This requires slightly more complexity in the driver as it will need to track all outstanding presentId values.

Description
This extension allows descriptors to be written into the command buffer, while the implementation is responsible for managing their memory. Push descriptors may enable easier porting from older APIs and in some cases can be more efficient than writing descriptors into descriptor sets.
New Commands

- `vkCmdPushDescriptorSetKHR`

If `VK_KHR_descriptor_update_template` is supported:

- `vkCmdPushDescriptorSetWithTemplateKHR`

If `Version 1.1` is supported:

- `vkCmdPushDescriptorSetWithTemplateKHR`

New Structures

- Extending `VkPhysicalDeviceProperties2`:
  - `VkPhysicalDevicePushDescriptorPropertiesKHR`

New Enum Constants

- `VK_KHR_PUSH_DESCRIPTOR_EXTENSION_NAME`
- `VK_KHR_PUSH_DESCRIPTOR_SPEC_VERSION`

Extending `VkDescriptorSetLayoutCreateFlagBits`:

- `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR`

Extending `VkStructureType`:

- `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PUSH_DESCRIPTOR_PROPERTIES_KHR`

If `VK_KHR_descriptor_update_template` is supported:

- Extending `VkDescriptorUpdateTemplateType`:
  - `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR`

If `Version 1.1` is supported:

- Extending `VkDescriptorUpdateTemplateType`:
  - `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR`

Rasterization has been the dominant method to produce interactive graphics, but increasing performance of graphics hardware has made ray tracing a viable option for interactive rendering. Being able to integrate ray tracing with traditional rasterization makes it easier for applications to incrementally add ray traced effects to existing applications or to do hybrid approaches with rasterization for primary visibility and ray tracing for secondary queries.
Ray queries are available to all shader types, including graphics, compute and ray tracing pipelines. Ray queries are not able to launch additional shaders, instead returning traversal results to the calling shader.

This extension adds support for the following SPIR-V extension in Vulkan:

- `SPV_KHR_ray_query`

**New Structures**

- Extending `VkPhysicalDeviceFeatures2, VkDeviceCreateInfo`:
  - `VkPhysicalDeviceRayQueryFeaturesKHR`

**New Enum Constants**

- `VK_KHR_RAY_QUERY_EXTENSION_NAME`
- `VK_KHR_RAY_QUERY_SPEC_VERSION`

- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RAY_QUERYFEATURES_KHR`

**New SPIR-V Capabilities**

- `RayQueryKHR`
- `RayTraversalPrimitiveCullingKHR`

**Sample Code**

Example of ray query in a GLSL shader, illustrating how to use ray queries to determine whether a given position (at ray origin) is in shadow or not, by tracing a ray towards the light, and checking for any intersections with geometry occluding the light.

```cpp
rayQueryEXT rq;

rayQueryInitializeEXT(rq, accStruct, gl_RayFlagsTerminateOnFirstHitEXT, cullMask, origin, tMin, direction, tMax);

// Traverse the acceleration structure and store information about the first intersection (if any)
rayQueryProceedEXT(rq);

if (rayQueryGetIntersectionTypeEXT(rq, true) == gl_RayQueryCommittedIntersectionNoneEXT) {
    // Not in shadow
}
```
Issues

(1) What are the changes between the public provisional (VK_KHR_ray_tracing v8) release and the final (VK_KHR_acceleration_structure v11 / VK_KHR_ray_query v1) release?

- refactor VK_KHR_ray_tracing into 3 extensions, enabling implementation flexibility and decoupling ray query support from ray pipelines:
  - 
    - VK_KHR_acceleration_structure (for acceleration structure operations)
  - VK_KHR_ray_tracing_pipeline (for ray tracing pipeline and shader stages)
  - VK_KHR_ray_query (for ray queries in existing shader stages)
- Update SPIRV capabilities to use RayQueryKHR
- extension is no longer provisional

Version History

- Revision 1, 2020-11-12 (Mathieu Robart, Daniel Koch, Andrew Garrard)
  - Decomposition of the specification, from VK_KHR_ray_tracing to VK_KHR_ray_query (#1918,!3912)
  - update to use RayQueryKHR SPIR-V capability
  - add numerical limits for ray parameters (#2235,!3960)
  - relax formula for ray intersection candidate determination (#2322,!4080)
  - restrict traces to TLAS (#2239,!4141)
  - require HitT to be in ray interval for OpRayQueryGenerateIntersectionKHR (#2359,!4146)
  - add ray query shader stages for AS read bit (#2407,!4203)

- Eric Werness, NVIDIA
- Spencer Fricke, Samsung

Description

VK_KHR_ray_tracing_maintenance1 adds a collection of minor ray tracing features, none of which would warrant an entire extension of their own.

The new features are as follows:

- Adds support for the SPV_KHR_ray_cull_mask SPIR-V extension in Vulkan. This extension provides
access to built-in CullMaskKHR shader variable which contains the value of the OpTrace* Cull Mask parameter. This new shader variable is accessible in the intersection, any-hit, closest hit and miss shader stages.

- Adds support for a new pipeline stage and access mask built on top of VK_KHR_synchronization2:
  - VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR to specify execution of acceleration structure copy commands
  - VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR to specify read access to a shader binding table in any shader pipeline stage

- Adds two new acceleration structure query parameters:
  - VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR to query the acceleration structure size on the device timeline
  - VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR to query the number of bottom level acceleration structure pointers for serialization

- Adds an optional new indirect ray tracing dispatch command, vkCmdTraceRaysIndirect2KHR, which sources the shader binding table parameters as well as the dispatch dimensions from the device. The rayTracingPipelineTraceRaysIndirect2 feature indicates whether this functionality is supported.

New Commands

If VK_KHR_ray_tracing_pipeline is supported:

- vkCmdTraceRaysIndirect2KHR

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceRayTracingMaintenance1FeaturesKHR

If VK_KHR_ray_tracing_pipeline is supported:

- VkTraceRaysIndirectCommand2KHR

New Enum Constants

- VK_KHR_RAY_TRACING_MAINTENANCE_1_EXTENSION_NAME
- VK_KHR_RAY_TRACING_MAINTENANCE_1_SPEC_VERSION
- Extending VkQueryType:
  - VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR
  - VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RAY_TRACING_MAINTENANCE_1_FEATURES_KHR

If VK_KHR_synchronization2 or Version 1.3 is supported:
• Extending VkPipelineStageFlagBits2:
  ◦ VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR

New Built-In Variables

• CullMaskKHR

New SPIR-V Capabilities

• RayCullMaskKHR

Description

Rasterization has been the dominant method to produce interactive graphics, but increasing performance of graphics hardware has made ray tracing a viable option for interactive rendering. Being able to integrate ray tracing with traditional rasterization makes it easier for applications to incrementally add ray traced effects to existing applications or to do hybrid approaches with rasterization for primary visibility and ray tracing for secondary queries.

To enable ray tracing, this extension adds a few different categories of new functionality:

- A new ray tracing pipeline type with new shader domains: ray generation, intersection, any-hit, closest hit, miss, and callable
- A shader binding indirection table to link shader groups with acceleration structure items
- Ray tracing commands which initiate the ray pipeline traversal and invocation of the various new shader domains depending on which traversal conditions are met

This extension adds support for the following SPIR-V extension in Vulkan:

- `SPV_KHR_ray_tracing`

New Commands

- `vkCmdSetRayTracingPipelineStackSizeKHR`
- `vkCmdTraceRaysIndirectKHR`
• `vkCmdTraceRaysKHR`
• `vkCreateRayTracingPipelinesKHR`
• `vkGetRayTracingCaptureReplayShaderGroupHandlesKHR`
• `vkGetRayTracingShaderGroupHandlesKHR`
• `vkGetRayTracingShaderGroupStackSizeKHR`

New Structures

• `VkRayTracingPipelineCreateInfoKHR`
• `VkRayTracingPipelineInterfaceCreateInfoKHR`
• `VkRayTracingShaderGroupCreateInfoKHR`
• `VkStridedDeviceAddressRegionKHR`
• `VkTraceRaysIndirectCommandKHR`

Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:

• `VkPhysicalDeviceRayTracingPipelineFeaturesKHR`

Extending `VkPhysicalDeviceProperties2`:

• `VkPhysicalDeviceRayTracingPipelinePropertiesKHR`

New Enums

• `VkRayTracingShaderGroupTypeKHR`
• `VkShaderGroupShaderKHR`

New Enum Constants

• `VK_KHR_RAY_TRACING_PIPELINE_EXTENSION_NAME`
• `VK_KHR_RAY_TRACING_PIPELINE_SPEC_VERSION`
• `VK_SHADER_UNUSED_KHR`

Extending `VkBufferUsageFlagBits`:

• `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR`

Extending `VkDynamicState`:

• `VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR`

Extending `VkPipelineBindPoint`:

• `VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR`

Extending `VkPipelineCreateFlagBits`:

• `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR`
• `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`
• `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`
• `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR`
- `VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR`
- `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR`
- `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR`

**Extending `VkPipelineStageFlagBits`:**
- `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`

**Extending `VkShaderStageFlagBits`:**
- `VK_SHADER_STAGE_ANY_HIT_BIT_KHR`
- `VK_SHADER_STAGE_CALLABLE_BIT_KHR`
- `VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR`
- `VK_SHADER_STAGE_INTERSECTION_BIT_KHR`
- `VK_SHADER_STAGE_MISS_BIT_KHR`
- `VK_SHADER_STAGE_RAYGEN_BIT_KHR`

**Extending `VkStructureType`:**
- `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RAY_TRACING_PIPELINE_FEATURES_KHR`
- `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RAY_TRACING_PIPELINE_PROPERTIES_KHR`
- `VK_STRUCTURE_TYPE_RAY_TRACING_PIPELINE_CREATE_INFO_KHR`
- `VK_STRUCTURE_TYPE_RAY_TRACING_PIPELINE_INTERFACE_CREATE_INFO_KHR`
- `VK_STRUCTURE_TYPE_RAY_TRACING_SHADER_GROUP_CREATE_INFO_KHR`

**New or Modified Built-In Variables**
- `LaunchIdKHR`
- `LaunchSizeKHR`
- `WorldRayOriginKHR`
- `WorldRayDirectionKHR`
- `ObjectRayOriginKHR`
- `ObjectRayDirectionKHR`
- `RayTminKHR`
- `RayTmaxKHR`
- `InstanceCustomIndexKHR`
- `InstanceId`
- `ObjectToWorldKHR`
- `WorldToObjectKHR`
- `HitKindKHR`
- `IncomingRayFlagsKHR`
- `RayGeometryIndexKHR`
New SPIR-V Capabilities

- RayTracingKHR
- RayTraversalPrimitiveCullingKHR

Issues

(1) How does this extension differ from VK_NV_ray_tracing?

**DISCUSSION:**

The following is a summary of the main functional differences between VK_KHR_ray_tracing_pipeline and VK_NV_ray_tracing:

- added support for indirect ray tracing (vkCmdTraceRaysIndirect_KHR)
- uses SPV_KHR_ray_tracing instead of SPV_NV_ray_tracing
  - refer to KHR SPIR-V enums instead of NV SPIR-V enums (which are functionally equivalent and aliased to the same values).
  - added RayGeometryIndex_KHR built-in
- removed vkCompileDeferredNV compilation functionality and replaced with deferred host operations interactions for ray tracing
- added VkPhysicalDeviceRayTracingPipelineFeaturesKHR structure
- extended VkPhysicalDeviceRayTracingPipelineProperties_KHR structure
  - renamed maxRecursionDepth to maxRayRecursionDepth and it has a minimum of 1 instead of 31
  - require shaderGroupHandleSize to be 32 bytes
  - added maxRayDispatchInvocationCount, shaderGroupHandleAlignment and maxRayHitAttributeSize
- reworked geometry structures so they could be better shared between device, host, and indirect builds
- changed SBT parameters to a structure and added size (VkStridedDeviceAddressRegionKHR)
- add parameter for requesting memory requirements for host and/or device build
- added pipeline library support for ray tracing
- added watertightness guarantees
- added no-null-shader pipeline flags (VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_*)
- added memory model interactions with ray tracing and define how subgroups work and can be repacked

(2) Can you give a more detailed comparison of differences and similarities between VK_NV_ray_tracing and VK_KHR_ray_tracing_pipeline?

**DISCUSSION:**
The following is a more detailed comparison of which commands, structures, and enums are aliased, changed, or removed.

- **Aliased functionality** — enums, structures, and commands that are considered equivalent:
  - `VkRayTracingShaderGroupTypeNV` ↔ `VkRayTracingShaderGroupTypeKHR`
  - `vkGetRayTracingShaderGroupHandlesNV` ↔ `vkGetRayTracingShaderGroupHandlesKHR`

- **Changed enums, structures, and commands**:
  - `VkRayTracingShaderGroupCreateInfoNV` → `VkRayTracingShaderGroupCreateInfoKHR` (added `pShaderGroupCaptureReplayHandle`)
  - `VkRayTracingPipelineCreateInfoNV` → `VkRayTracingPipelineCreateInfoKHR` (changed type of `pGroups`, added `libraries`, `pLibraryInterface`, and `pDynamicState`)
  - `VkPhysicalDeviceRayTracingPropertiesNV` → `VkPhysicalDeviceRayTracingPropertiesKHR` (renamed `maxTriangleCount` to `maxPrimitiveCount`, added `shaderGroupHandleCaptureReplaySize`)
  - `vkCmdTraceRaysNV` → `vkCmdTraceRaysKHR` (params to struct)
  - `vkCreateRayTracingPipelinesNV` → `vkCreateRayTracingPipelinesKHR` (different struct, changed functionality)

- **Added enums, structures and commands**:
  - `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR`
  - `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`
  - `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR`
  - `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`
  - `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR`
  - `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR` to `VkPipelineCreateFlagBits`
  - `VkPhysicalDeviceRayTracingPipelineFeaturesKHR` structure
  - `VkDeviceOrHostAddressKHR` and `VkDeviceOrHostAddressConstKHR` unions
  - `VkPipelineLibraryCreateInfoKHR` struct
  - `VkRayTracingPipelineInterfaceCreateInfoKHR` struct
  - `VkStridedDeviceAddressRegionKHR` struct
  - `vkCmdTraceRaysIndirectKHR` command and `VkTraceRaysIndirectCommandKHR` struct
  - `vkGetRayTracingCaptureReplayShaderGroupHandlesKHR` (shader group capture/replay)
  - `vkCmdSetRayTracingPipelineStackSizeKHR` and `vkGetRayTracingShaderGroupStackSizeKHR` commands for stack size control

- **Functionality removed**:
  - `VK_PIPELINE_CREATE_DEFER_COMPILE_BIT_NV`
  - `vkCompileDeferredNV` command (replaced with `VK_KHR_deferred_host_operations`)

(3) What are the changes between the public provisional (VK_KHR_ray_tracing v8) release and the internal provisional (VK_KHR_ray_tracing v9) release?

- Require Vulkan 1.1 and SPIR-V 1.4
- Added interactions with Vulkan 1.2 and VK_KHR_vulkan_memory_model
- added creation time capture and replay flags
  - added VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR to VkPipelineCreateFlagBits
- replace VkStridedBufferRegionKHR with VkStridedDeviceAddressRegionKHR and change vkCmdTraceRaysKHR, vkCmdTraceRaysIndirectKHR, to take these for the shader binding table and use device addresses instead of buffers.
- require the shader binding table buffers to have the VK_BUFFER_USAGE_RAY_TRACING_BIT_KHR set
- make VK_KHR_pipeline_library an interaction instead of required extension
- rename the libraries member of VkRayTracingPipelineCreateInfoKHR to pLibraryInfo and make it a pointer
- make VK_KHR_deferred_host_operations an interaction instead of a required extension (later went back on this)
- added explicit stack size management for ray tracing pipelines
  - removed the maxCallableSize member of VkRayTracingPipelineInterfaceCreateInfoKHR
  - added the pDynamicState member to VkRayTracingPipelineCreateInfoKHR
  - added VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR dynamic state for ray tracing pipelines
  - added vkGetRayTracingShaderGroupStackSizeKHR and vkCmdSetRayTracingPipelineStackSizeKHR commands
  - added VkShaderGroupShaderKHR enum
- Added maxRayDispatchInvocationCount limit to VkPhysicalDeviceRayTracingPipelinePropertiesKHR
- Added shaderGroupHandleAlignment property to VkPhysicalDeviceRayTracingPipelinePropertiesKHR
- Added maxRayHitAttributeSize property to VkPhysicalDeviceRayTracingPipelinePropertiesKHR
- Clarify deferred host ops for pipeline creation
  - VkDeferredOperationKHR is now a top-level parameter for vkCreateRayTracingPipelinesKHR
  - removed VkDeferredOperationInfoKHR structure
  - change deferred host creation/return parameter behavior such that the implementation can modify such parameters until the deferred host operation completes
  - VK_KHR_deferred_host_operations is required again

(4) What are the changes between the internal provisional (VK_KHR_ray_tracing v9) release and the final (VK_KHR_acceleration_structure v11 / VK_KHR_ray_tracing_pipeline v1) release?

- refactor VK_KHR_ray_tracing into 3 extensions, enabling implementation flexibility and decoupling ray query support from ray pipelines:
  - VK_KHR_acceleration_structure (for acceleration structure operations)
- **VK_KHR_ray_tracing_pipeline** (for ray tracing pipeline and shader stages)
- **VK_KHR_ray_query** (for ray queries in existing shader stages)

- **Require** _Volatile_ for the following builtins in the ray generation, closest hit, miss, intersection, and callable shader stages:
  - SubgroupSize, SubgroupLocalInvocationId, SubgroupEqMask, SubgroupGeMask, SubgroupGtMask, SubgroupLeMask, SubgroupLtMask
  - SMIDNV, WarpIDNV

- **clarify buffer usage flags for ray tracing**
  - **VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR** is added as an alias of **VK_BUFFER_USAGE_RAY_TRACING_BIT_NV** and is required on shader binding table buffers
  - **VK_BUFFER_USAGE_STORAGE_BUFFER_BIT** is used in **VK_KHR_acceleration_structure** for **scratchData**

- **rename** maxRecursionDepth to maxRayPipelineRecursionDepth (pipeline creation) and maxRayRecursionDepth (limit) to reduce confusion

- **Add** queryable maxRayHitAttributeSize limit and rename members of VkRayTracingPipelineInterfaceCreateInfoKHR to maxPipelineRayPayloadSize and maxPipelineRayHitAttributeSize for clarity

- **Update** SPIRV capabilities to use RayTracing_KHR

- **extension** is no longer provisional

- **define** synchronization requirements for indirect trace rays and indirect buffer

(5) This extension adds gl_InstanceID for the intersection, any-hit, and closest hit shaders, but in KHR_vulkan_gsl, gl_InstanceID is replaced with gl_InstanceIndex. Which should be used for Vulkan in this extension?

**RESOLVED**: This extension uses gl_InstanceID and maps it to InstanceId in SPIR-V. It is acknowledged that this is different than other shader stages in Vulkan. There are two main reasons for the difference here:

- symmetry with gl_PrimitiveID which is also available in these shaders
- there is no “baseInstance” relevant for these shaders, and so ID makes it more obvious that this is zero-based.

(6) Why is **VK_KHR_pipeline_library** an interaction instead of a required dependency, particularly when the “Feature Requirements” section says it is required to be supported anyhow?

**RESOLVED**: If **VK_KHR_pipeline_library** were a required extension dependency, then every application would need to enable the extension whether or not they actually want to use the pipeline library functionality. Developers found this to be annoying and unfriendly behavior. We do wish to require all implementations to support it though, and thus it is listed in the feature requirements section.

**Sample Code**

Example ray generation GLSL shader
#version 450 core
#extension GL_EXT_ray_tracing : require
layout(set = 0, binding = 0, rgba8) uniform image2D image;
layout(set = 0, binding = 1) uniform accelerationStructureEXT as;
layout(location = 0) rayPayloadEXT float payload;

void main()
{
    vec4 col = vec4(0, 0, 0, 1);

    vec3 origin = vec3(float(gl_LaunchIDEXT.x)/float(gl_LaunchSizeEXT.x),
                              float(gl_LaunchIDEXT.y)/float(gl_LaunchSizeEXT.y), 1.0);
    vec3 dir = vec3(0.0, 0.0, -1.0);

    traceRayEXT(as, 0, 0xff, 0, 1, 0, origin, 0.0, dir, 1000.0, 0);

    col.y = payload;

    imageStore(image, ivec2(gl_LaunchIDEXT.xy), col);
}

Version History

Description

`VK_KHR_ray_tracing_position_fetch` adds the ability to fetch the vertex positions in the shader from a hit triangle as stored in the acceleration structure.

An application adds `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DATA_ACCESS_KHR` to the acceleration structure at build time. Then, if the hit is a triangle geometry, the shader (any-hit or closest hit for ray pipelines or using ray query) can fetch the three, three-component vertex positions in object space, of the triangle which was hit.

New Structures

- Extending `VkPhysicalDeviceFeatures2, VkDeviceCreateInfo`:
  - `VkPhysicalDeviceRayTracingPositionFetchFeaturesKHR`

New Enum Constants

- `VK_KHR_RAY_TRACING_POSITION_FETCH_EXTENSION_NAME`
- `VK_KHR_RAY_TRACING_POSITION_FETCH_SPEC_VERSION`

Extending `VkBuildAccelerationStructureFlagBitsKHR`:

- `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DATA_ACCESS_KHR`

Extending `VkStructureType`:

- `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RAY_TRACING_POSITION_FETCH_FEATURES_KHR`

New Built-In Variables

- `HitTriangleVertexPositionsKHR`
New SPIR-V Capabilities

- RayTracingPositionFetchKHR
- RayQueryPositionFetchKHR

Interactions and External Dependencies

- This extension provides API support for GL_ARB_shader_clock and GL_EXT_shader_realtime_clock

Contributors

- Aaron Hagan, AMD
- Daniel Koch, NVIDIA

Description

This extension advertises the SPIR-V ShaderClockKHR capability for Vulkan, which allows a shader to query a real-time or monotonically incrementing counter at the subgroup level or across the device level. The two valid SPIR-V scopes for OpReadClockKHR are Subgroup and Device.

When using GLSL source-based shading languages, the clockRealtime*EXT() timing functions map to the OpReadClockKHR instruction with a scope of Device, and the clock*ARB() timing functions map to the OpReadClockKHR instruction with a scope of Subgroup.

Extension Proposal

VK_KHR_shader_float_controls2
Interactions and External Dependencies

- This extension requires `SPV_KHR_float_controls2`.

Contributors

- Graeme Leese, Broadcom

Description

This extension enables use of the more expressive fast floating-point math flags in the `SPV_KHR_float_controls2` extension. These flags give finer-grained control over which optimizations compilers may apply, potentially speeding up execution while retaining correct results.

The extension also adds control over the fast-math modes to the GLSL extended instruction set, making these operations more consistent with SPIR-V and allowing their use in situations where floating-point conformance is important.

New Structures

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:

Description

This extension allows the use of the SPV_KHR_maximal_reconvergence SPIR-V extension in shader modules. SPV_KHR_maximal_reconvergence provides stronger guarantees that diverged subgroups will reconverge. These guarantees should match shader author intuition about divergence and reconvergence of invocations based on the structure of the code in the HLL.

Developers should utilize this extension if they require stronger guarantees about reconvergence than either the core spec or SPV_KHR_subgroup_uniform_control_flow. This extension will define the rules that govern how invocations diverge and reconverge in a way that should match
developer intuition. It allows robust programs to be written relying on subgroup operations and other tangled instructions.

**New Structures**

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:

Description
This extension allows the use of the SPV_KHR_subgroup_uniform_control_flow SPIR-V extension in shader modules. SPV_KHR_subgroup_uniform_control_flow provides stronger guarantees that diverged subgroups will reconverge.

Developers should utilize this extension if they use subgroup operations to reduce the work performed by a uniform subgroup. This extension will guarantee that uniform subgroup will reconverge in the same manner as invocation groups (see “Uniform Control Flow” in the Khronos SPIR-V Specification).

Description

This extension extends VK_KHR_swapchain to enable creation of a shared presentable image. This allows the application to use the image while the presentation engine is accessing it, in order to reduce the latency between rendering and presentation.

New Commands

- vkGetSwapchainStatusKHR

New Structures

- Extending VkSurfaceCapabilities2KHR:
  - VkSharedPresentSurfaceCapabilitiesKHR

New Enum Constants

- VK_KHR_SHARED_PRESENTABLE_IMAGE_EXTENSION_NAME
- VK_KHR_SHARED_PRESENTABLE_IMAGE_SPEC_VERSION

- Extending VkImageLayout:
  - VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR

- Extending VkPresentModeKHR:
  - VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR
  - VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR

- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_SHARED_PRESENT_SURFACE_CAPABILITIES_KHR
Issues

1) Should we allow a Vulkan WSI swapchain to toggle between normal usage and shared presentation usage?

RESOLVED: No. WSI swapchains are typically recreated with new properties instead of having their properties changed. This can also save resources, assuming that fewer images are needed for shared presentation, and assuming that most VR applications do not need to switch between normal and shared usage.

2) Should we have a query for determining how the presentation engine refresh is triggered?

RESOLVED: Yes. This is done via which presentation modes a surface supports.

3) Should the object representing a shared presentable image be an extension of a VkSwapchainKHR or a separate object?

RESOLVED: Extension of a swapchain due to overlap in creation properties and to allow common functionality between shared and normal presentable images and swapchains.

4) What should we call the extension and the new structures it creates?

RESOLVED: Shared presentable image / shared present.

5) Should the minImageCount and presentMode values of the VkSwapchainCreateInfoKHR be ignored, or required to be compatible values?

RESOLVED: minImageCount must be set to 1, and presentMode should be set to either VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR or VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR.

6) What should the layout of the shared presentable image be?

RESOLVED: After acquiring the shared presentable image, the application must transition it to the VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR layout prior to it being used. After this initial transition, any image usage that was requested during swapchain creation can be performed on the image without layout transitions being performed.

7) Do we need a new API for the trigger to refresh new content?

RESOLVED: vkQueuePresentKHR to act as API to trigger a refresh, as will allow combination with other compatible extensions to vkQueuePresentKHR.

8) How should an application detect a VK_ERROR_OUT_OF_DATE_KHR error on a swapchain using the VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR present mode?

RESOLVED: Introduce vkGetSwapchainStatusKHR to allow applications to query the status of a swapchain using a shared presentation mode.

9) What should subsequent calls to vkQueuePresentKHR for VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR swapchains be defined to do?

RESOLVED: State that implementations may use it as a hint for updated content.
10) Can the ownership of a shared presentable image be transferred to a different queue?

**RESOLVED:** No. It is not possible to transfer ownership of a shared presentable image obtained from a swapchain created using `VK_SHARING_MODE_EXCLUSIVE` after it has been presented.

11) How should `vkQueueSubmit` behave if a command buffer uses an image from a `VK_ERROR_OUT_OF_DATE_KHR` swapchain?

**RESOLVED:** `vkQueueSubmit` is expected to return the `VK_ERROR_DEVICE_LOST` error.

12) Can Vulkan provide any guarantee on the order of rendering, to enable beam chasing?

**RESOLVED:** This could be achieved via use of render passes to ensure strip rendering.

Description

The **VkKHR_surface** extension is an instance extension. It introduces **VkSurfaceKHR** objects, which abstract native platform surface or window objects for use with Vulkan. It also provides a way to determine whether a queue family in a physical device supports presenting to particular surface.

Separate extensions for each platform provide the mechanisms for creating **VkSurfaceKHR** objects, but once created they may be used in this and other platform-independent extensions, in particular the **VK_KHR_swapchain** extension.

New Object Types

- **VkSurfaceKHR**

New Commands

- **vkDestroySurfaceKHR**
- **vkGetPhysicalDeviceSurfaceCapabilitiesKHR**
- **vkGetPhysicalDeviceSurfaceFormatsKHR**
- **vkGetPhysicalDeviceSurfacePresentModesKHR**
- **vkGetPhysicalDeviceSurfaceSupportKHR**

New Structures

- **VkSurfaceCapabilitiesKHR**
- **VkSurfaceFormatKHR**
New Enums

- VkColorSpaceKHR
- VkCompositeAlphaFlagBitsKHR
- VkPresentModeKHR
- VkSurfaceTransformFlagBitsKHR

New Bitmasks

- VkCompositeAlphaFlagsKHR

New Enum Constants

- VK_KHR_SURFACE_EXTENSION_NAME
- VK_KHR_SURFACE_SPEC_VERSION

Extending VkObjectType:
- VK_OBJECT_TYPE_SURFACE_KHR

Extending VkResult:
- VK_ERROR_NATIVE_WINDOW_IN_USE_KHR
- VK_ERROR_SURFACE_LOST_KHR

Examples

Note

The example code for the VK_KHR_surface and VK_KHR_swapchain extensions was removed from the appendix after revision 1.0.29. This WSI example code was ported to the cube demo that is shipped with the official Khronos SDK, and is being kept up-to-date in that location (see: https://github.com/KhronosGroup/Vulkan-Tools/blob/main/cube/cube.c).

Issues

1) Should this extension include a method to query whether a physical device supports presenting to a specific window or native surface on a given platform?

RESOLVED: Yes. Without this, applications would need to create a device instance to determine whether a particular window can be presented to. Knowing that a device supports presentation to a platform in general is not sufficient, as a single machine might support multiple seats, or instances of the platform that each use different underlying physical devices. Additionally, on some platforms, such as the X Window System, different drivers and devices might be used for different windows depending on which section of the desktop they exist on.

2) Should the vkGetPhysicalDeviceSurfaceCapabilitiesKHR, vkGetPhysicalDeviceSurfaceFormatsKHR, and vkGetPhysicalDeviceSurfacePresentModesKHR functions be in this extension and operate on physical devices, rather than being in VK_KHR_swapchain (i.e. device extension) and being dependent on VkDevice?
RESOLVED: Yes. While it might be useful to depend on VkDevice (and therefore on enabled extensions and features) for the queries, Vulkan was released only with the VkPhysicalDevice versions. Many cases can be resolved by a Valid Usage statement, and/or by a separate pNext chain version of the query struct specific to a given extension or parameters, via extensible versions of the queries: vkGetPhysicalDeviceSurfacePresentModes2EXT, vkGetPhysicalDeviceSurfaceCapabilities2KHR, and vkGetPhysicalDeviceSurfaceFormats2KHR.

3) Should Vulkan support Xlib or XCB as the API for accessing the X Window System platform?

RESOLVED: Both. XCB is a more modern and efficient API, but Xlib usage is deeply ingrained in many applications and likely will remain in use for the foreseeable future. Not all drivers necessarily need to support both, but including both as options in the core specification will probably encourage support, which should in turn ease adoption of the Vulkan API in older codebases. Additionally, the performance improvements possible with XCB likely will not have a measurable impact on the performance of Vulkan presentation and other minimal window system interactions defined here.

4) Should the GBM platform be included in the list of platform enums?

RESOLVED: Deferred, and will be addressed with a platform-specific extension to be written in the future.

Version History

- Revision 1, 2015-05-20 (James Jones)
  - Initial draft, based on LunarG KHR spec, other KHR specs, patches attached to bugs.
- Revision 2, 2015-05-22 (Ian Elliott)
  - Created initial Description section.
  - Removed query for whether a platform requires the use of a queue for presentation, since it was decided that presentation will always be modeled as being part of the queue.
  - Fixed typos and other minor mistakes.
- Revision 3, 2015-05-26 (Ian Elliott)
  - Improved the Description section.
- Revision 4, 2015-05-27 (James Jones)
  - Fixed compilation errors in example code.
- Revision 5, 2015-06-01 (James Jones)
  - Added issues 1 and 2 and made related spec updates.
- Revision 6, 2015-06-01 (James Jones)
  - Merged the platform type mappings table previously removed from VK_KHR_swapchain with the platform description table in this spec.
  - Added issues 3 and 4 documenting choices made when building the initial list of native platforms supported.
- Revision 7, 2015-06-11 (Ian Elliott)
Updated table 1 per input from the KHR TSG.

Updated issue 4 (GBM) per discussion with Daniel Stone. He will create a platform-specific extension sometime in the future.

- Revision 8, 2015-06-17 (James Jones)
  - Updated enum-extending values using new convention.
  - Fixed the value of VK_SURFACE_PLATFORM_INFO_TYPE_SUPPORTED_KHR.

- Revision 9, 2015-06-17 (James Jones)
  - Rebased on Vulkan API version 126.

- Revision 10, 2015-06-18 (James Jones)
  - Marked issues 2 and 3 resolved.

- Revision 11, 2015-06-23 (Ian Elliott)
  - Examples now show use of function pointers for extension functions.
  - Eliminated extraneous whitespace.

- Revision 12, 2015-07-07 (Daniel Rakos)
  - Added error section describing when each error is expected to be reported.
  - Replaced the term “queue node index” with “queue family index” in the spec as that is the agreed term to be used in the latest version of the core header and spec.
  - Replaced bool32_t with VkBool32.

- Revision 13, 2015-08-06 (Daniel Rakos)
  - Updated spec against latest core API header version.

- Revision 14, 2015-08-20 (Ian Elliott)
  - Renamed this extension and all of its enumerations, types, functions, etc. This makes it compliant with the proposed standard for Vulkan extensions.
  - Switched from “revision” to “version”, including use of the VK_MAKE_VERSION macro in the header file.
  - Did miscellaneous cleanup, etc.

- Revision 15, 2015-08-20 (Ian Elliott—porting a 2015-07-29 change from James Jones)
  - Moved the surface transform enums here from VK_WSI_swapchain so they could be reused by VK_WSI_display.

- Revision 16, 2015-09-01 (James Jones)
  - Restore single-field revision number.

- Revision 17, 2015-09-01 (James Jones)
  - Fix example code compilation errors.

- Revision 18, 2015-09-26 (Jesse Hall)
  - Replaced VkSurfaceDescriptionKHR with the VkSurfaceKHR object, which is created via layered extensions. Added VkDestroySurfaceKHR.
• Revision 19, 2015-09-28 (Jesse Hall)
  ◦ Renamed from VK_EXT_KHR_swapchain to VK_EXT_KHR_surface.

• Revision 20, 2015-09-30 (Jeff Vigil)
  ◦ Add error result VK_ERROR_SURFACE_LOST_KHR.

• Revision 21, 2015-10-15 (Daniel Rakos)
  ◦ Updated the resolution of issue #2 and include the surface capability queries in this extension.
  ◦ Renamed SurfaceProperties to SurfaceCapabilities as it better reflects that the values returned are the capabilities of the surface on a particular device.
  ◦ Other minor cleanup and consistency changes.

• Revision 22, 2015-10-26 (Ian Elliott)
  ◦ Renamed from VK_EXT_KHR_surface to VK_KHR_surface.

• Revision 23, 2015-11-03 (Daniel Rakos)
  ◦ Added allocation callbacks to vkDestroySurfaceKHR.

• Revision 24, 2015-11-10 (Jesse Hall)
  ◦ Removed VkSurfaceTransformKHR. Use VkSurfaceTransformFlagBitsKHR instead.
  ◦ Rename VkSurfaceCapabilitiesKHR member maxImageArraySize to maxImageArrayLayers.

• Revision 25, 2016-01-14 (James Jones)
  ◦ Moved VK_ERROR_NATIVE_WINDOW_IN_USE_KHR from the VK_KHR_android_surface to the VK_KHR_surface extension.

• 2016-08-23 (Ian Elliott)
  ◦ Update the example code, to not have so many characters per line, and to split out a new example to show how to obtain function pointers.

• 2016-08-25 (Ian Elliott)
  ◦ A note was added at the beginning of the example code, stating that it will be removed from future versions of the appendix.

Description
This extension extends VkSurfaceCapabilities2KHR, providing applications a way to query whether swapchains can be created with the VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR flag set.

Vulkan 1.1 added (optional) support for protect memory and protected resources including buffers (VK_BUFFER_CREATE_PROTECTED_BIT), images (VK_IMAGE_CREATE_PROTECTED_BIT), and swapchains (VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR). However, on implementations which support multiple windowing systems, not all window systems may be able to provide a protected display path.

This extension provides a way to query if a protected swapchain created for a surface (and thus a specific windowing system) can be displayed on screen. It extends the existing VkSurfaceCapabilities2KHR structure with a new VkSurfaceProtectedCapabilitiesKHR structure from which the application can obtain information about support for protected swapchain creation through vkGetPhysicalDeviceSurfaceCapabilities2KHR.

New Structures
• Extending VkSurfaceCapabilities2KHR:
  ◦ VkSurfaceProtectedCapabilitiesKHR

New Enum Constants
• VK_KHR_SURFACE_PROTECTED_CAPABILITIES_EXTENSION_NAME
• **VK_KHR_SURFACE_PROTECTED_CAPABILITIES_SPEC_VERSION**

• Extending `VkStructureType`:
  ◦ `VK_STRUCTURE_TYPE_SURFACE_PROTECTED_CAPABILITIES_KHR`

Description

The `VK_KHR_swapchain` extension is the device-level companion to the `VK_KHR_surface` extension. It introduces `VkSwapchainKHR` objects, which provide the ability to present rendering results to a surface.

New Object Types

- `VkSwapchainKHR`

New Commands

- `vkAcquireNextImageKHR`
- `vkCreateSwapchainKHR`
- `vkDestroySwapchainKHR`
- `vkGetSwapchainImagesKHR`
- `vkQueuePresentKHR`

If Version 1.1 is supported:

- `vkAcquireNextImage2KHR`
- `vkGetDeviceGroupPresentCapabilitiesKHR`
- `vkGetDeviceGroupSurfacePresentModesKHR`
- `vkGetPhysicalDevicePresentRectanglesKHR`
New Structures

- VkPresentInfoKHR
- VkSwapchainCreateInfoKHR

If Version 1.1 is supported:

- VkAcquireNextImageInfoKHR
- VkDeviceGroupPresentCapabilitiesKHR
- Extending VkBindImageMemoryInfo:
  - VkBindImageMemorySwapchainInfoKHR
- Extending VkImageCreateInfo:
  - VkImageSwapchainCreateInfoKHR
- Extending VkPresentInfoKHR:
  - VkDeviceGroupPresentInfoKHR
- Extending VkSwapchainCreateInfoKHR:
  - VkDeviceGroupSwapchainCreateInfoKHR

New Enums

- VkSwapchainCreateFlagBitsKHR

If Version 1.1 is supported:

- VkDeviceGroupPresentModeFlagBitsKHR

New Bitmasks

- VkSwapchainCreateFlagsKHR

If Version 1.1 is supported:

- VkDeviceGroupPresentModeFlagsKHR

New Enum Constants

- VK_KHR_SWAPCHAIN_EXTENSION_NAME
- VK_KHR_SWAPCHAIN_SPEC_VERSION
- Extending VkImageLayout:
  - VK_IMAGE_LAYOUT_PRESENT_SRC_KHR
- Extending VkObjectType:
  - VK_OBJECT_TYPE_SWAPCHAIN_KHR
- Extending VkResult:
  - VK_ERROR_OUT_OF_DATE_KHR
• VK_SUBOPTIMAL_KHR

**Extending VkStructureType:**

• VK_STRUCTURE_TYPE_PRESENT_INFO_KHR
• VK_STRUCTURE_TYPE_SWAPCHAIN_CREATE_INFO_KHR

If Version 1.1 is supported:

• Extending VkStructureType:
  
  • VK_STRUCTURE_TYPE_ACQUIRE_NEXT_IMAGE_INFO_KHR
  • VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_SWAPCHAIN_INFO_KHR
  • VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_CAPABILITIES_KHR
  • VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_INFO_KHR
  • VK_STRUCTURE_TYPE_DEVICE_GROUP_SWAPCHAIN_CREATE_INFO_KHR
  • VK_STRUCTURE_TYPE_IMAGE_SWAPCHAIN_CREATE_INFO_KHR

• Extending VkSwapchainCreateFlagBitsKHR:
  
  • VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR
  • VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR

**Issues**

1) Does this extension allow the application to specify the memory backing of the presentable images?

**RESOLVED:** No. Unlike standard images, the implementation will allocate the memory backing of the presentable image.

2) What operations are allowed on presentable images?

**RESOLVED:** This is determined by the image usage flags specified when creating the presentable image’s swapchain.

3) Does this extension support MSAA presentable images?

**RESOLVED:** No. Presentable images are always single-sampled. Multi-sampled rendering must use regular images. To present the rendering results the application must manually resolve the multi-sampled image to a single-sampled presentable image prior to presentation.

4) Does this extension support stereo/multi-view presentable images?

**RESOLVED:** Yes. The number of views associated with a presentable image is determined by the imageArrayLayers specified when creating a swapchain. All presentable images in a given swapchain use the same array size.

5) Are the layers of stereo presentable images half-sized?

**RESOLVED:** No. The image extents always match those requested by the application.
6) Do the “present” and “acquire next image” commands operate on a queue? If not, do they need to include explicit semaphore objects to interlock them with queue operations?

**RESOLVED:** The present command operates on a queue. The image ownership operation it represents happens in order with other operations on the queue, so no explicit semaphore object is required to synchronize its actions.

Applications may want to acquire the next image in separate threads from those in which they manage their queue, or in multiple threads. To make such usage easier, the acquire next image command takes a semaphore to signal as a method of explicit synchronization. The application must later queue a wait for this semaphore before queuing execution of any commands using the image.

7) Does vkAcquireNextImageKHR block if no images are available?

**RESOLVED:** The command takes a timeout parameter. Special values for the timeout are 0, which makes the call a non-blocking operation, and UINT64_MAX, which blocks indefinitely. Values in between will block for up to the specified time. The call will return when an image becomes available or an error occurs. It may, but is not required to, return before the specified timeout expires if the swapchain becomes out of date.

8) Can multiple presents be queued using one vkQueuePresentKHR call?

**RESOLVED:** Yes. VkPresentInfoKHR contains a list of swapchains and corresponding image indices that will be presented. When supported, all presentations queued with a single vkQueuePresentKHR call will be applied atomically as one operation. The same swapchain must not appear in the list more than once. Later extensions may provide applications stronger guarantees of atomicity for such present operations, and/or allow them to query whether atomic presentation of a particular group of swapchains is possible.

9) How do the presentation and acquire next image functions notify the application the targeted surface has changed?

**RESOLVED:** Two new result codes are introduced for this purpose:

- **VK_SUBOPTIMAL_KHR** - Presentation will still succeed, subject to the window resize behavior, but the swapchain is no longer configured optimally for the surface it targets. Applications should query updated surface information and recreate their swapchain at the next convenient opportunity.
- **VK_ERROR_OUT_OF_DATE_KHR** - Failure. The swapchain is no longer compatible with the surface it targets. The application must query updated surface information and recreate the swapchain before presentation will succeed.

These can be returned by both vkAcquireNextImageKHR and vkQueuePresentKHR.

10) Does the vkAcquireNextImageKHR command return a semaphore to the application via an output parameter, or accept a semaphore to signal from the application as an object handle parameter?

**RESOLVED:** Accept a semaphore to signal as an object handle. This avoids the need to specify
whether the application must destroy the semaphore or whether it is owned by the swapchain, and if the latter, what its lifetime is and whether it can be reused for other operations once it is received from `vkAcquireNextImageKHR`.

11) What types of swapchain queuing behavior should be exposed? Options include swap interval specification, mailbox/most recent vs. FIFO queue management, targeting specific vertical blanking intervals or absolute times for a given present operation, and probably others. For some of these, whether they are specified at swapchain creation time or as per-present parameters needs to be decided as well.

**RESOLVED:** The base swapchain extension will expose 3 possible behaviors (of which, FIFO will always be supported):

- **Immediate present:** Does not wait for vertical blanking period to update the current image, likely resulting in visible tearing. No internal queue is used. Present requests are applied immediately.

- **Mailbox queue:** Waits for the next vertical blanking period to update the current image. No tearing should be observed. An internal single-entry queue is used to hold pending presentation requests. If the queue is full when a new presentation request is received, the new request replaces the existing entry, and any images associated with the prior entry become available for reuse by the application.

- **FIFO queue:** Waits for the next vertical blanking period to update the current image. No tearing should be observed. An internal queue containing `numSwapchainImages - 1` entries is used to hold pending presentation requests. New requests are appended to the end of the queue, and one request is removed from the beginning of the queue and processed during each vertical blanking period in which the queue is non-empty.

Not all surfaces will support all of these modes, so the modes supported will be returned using a surface information query. All surfaces must support the FIFO queue mode. Applications must choose one of these modes up front when creating a swapchain. Switching modes can be accomplished by recreating the swapchain.

12) Can `VK_PRESENT_MODE_MAILBOX_KHR` provide non-blocking guarantees for `vkAcquireNextImageKHR`? If so, what is the proper criteria?

**RESOLVED:** Yes. The difficulty is not immediately obvious here. Naively, if at least 3 images are requested, mailbox mode should always have an image available for the application if the application does not own any images when the call to `vkAcquireNextImageKHR` was made. However, some presentation engines may have more than one “current” image, and would still need to block in some cases. The right requirement appears to be that if the application allocates the surface’s minimum number of images + 1 then it is guaranteed non-blocking behavior when it does not currently own any images.

13) Is there a way to create and initialize a new swapchain for a surface that has generated a `VK_SUBOPTIMAL_KHR` return code while still using the old swapchain?

**RESOLVED:** Not as part of this specification. This could be useful to allow the application to create an “optimal” replacement swapchain and rebuild all its command buffers using it in a background thread at a low priority while continuing to use the “suboptimal” swapchain in the main thread. It
could probably use the same “atomic replace” semantics proposed for recreating direct-to-device swapchains without incurring a mode switch. However, after discussion, it was determined some platforms probably could not support concurrent swapchains for the same surface though, so this will be left out of the base KHR extensions. A future extension could add this for platforms where it is supported.

14) Should there be a special value for VkSurfaceCapabilitiesKHR::maxImageCount to indicate there are no practical limits on the number of images in a swapchain?

**RESOLVED**: Yes. There will often be cases where there is no practical limit to the number of images in a swapchain other than the amount of available resources (i.e., memory) in the system. Trying to derive a hard limit from things like memory size is prone to failure. It is better in such cases to leave it to applications to figure such soft limits out via trial/failure iterations.

15) Should there be a special value for VkSurfaceCapabilitiesKHR::currentExtent to indicate the size of the platform surface is undefined?

**RESOLVED**: Yes. On some platforms (Wayland, for example), the surface size is defined by the images presented to it rather than the other way around.

16) Should there be a special value for VkSurfaceCapabilitiesKHR::maxImageExtent to indicate there is no practical limit on the surface size?

**RESOLVED**: No. It seems unlikely such a system would exist. 0 could be used to indicate the platform places no limits on the extents beyond those imposed by Vulkan for normal images, but this query could just as easily return those same limits, so a special “unlimited” value does not seem useful for this field.

17) How should surface rotation and mirroring be exposed to applications? How do they specify rotation and mirroring transforms applied prior to presentation?

**RESOLVED**: Applications can query both the supported and current transforms of a surface. Both are specified relative to the device’s “natural” display rotation and direction. The supported transforms indicate which orientations the presentation engine accepts images in. For example, a presentation engine that does not support transforming surfaces as part of presentation, and which is presenting to a surface that is displayed with a 90-degree rotation, would return only one supported transform bit: VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR. Applications must transform their rendering by the transform they specify when creating the swapchain in preTransform field.

18) Can surfaces ever not support VK_MIRROR_NONE? Can they support vertical and horizontal mirroring simultaneously? Relatedly, should VK_MIRROR_NONE[_BIT] be zero, or bit one, and should applications be allowed to specify multiple pre and current mirror transform bits, or exactly one?

**RESOLVED**: Since some platforms may not support presenting with a transform other than the native window’s current transform, and prerotation/mirroring are specified relative to the device’s natural rotation and direction, rather than relative to the surface’s current rotation and direction, it is necessary to express lack of support for no mirroring. To allow this, the MIRROR_NONE enum must occupy a bit in the flags. Since MIRROR_NONE must be a bit in the bitmask rather than a bitmask with no values set, allowing more than one bit to be set in the bitmask would make it possible to describe undefined transforms such as VK_MIRROR_NONE_BIT | VK_MIRROR_HORIZONTAL_BIT, or a
transform that includes both “no mirroring” and “horizontal mirroring” simultaneously. Therefore, it is desirable to allow specifying all supported mirroring transforms using only one bit. The question then becomes, should there be a `VK_MIRROR_HORIZONTAL_AND_VERTICAL_BIT` to represent a simultaneous horizontal and vertical mirror transform? However, such a transform is equivalent to a 180 degree rotation, so presentation engines and applications that wish to support or use such a transform can express it through rotation instead. Therefore, 3 exclusive bits are sufficient to express all needed mirroring transforms.

19) Should support for sRGB be required?

**RESOLVED:** In the advent of UHD and HDR display devices, proper color space information is vital to the display pipeline represented by the swapchain. The app can discover the supported format/color-space pairs and select a pair most suited to its rendering needs. Currently only the sRGB color space is supported, future extensions may provide support for more color spaces. See issues 23 and 24.

20) Is there a mechanism to modify or replace an existing swapchain with one targeting the same surface?

**RESOLVED:** Yes. This is described above in the text.

21) Should there be a way to set prerotation and mirroring using native APIs when presenting using a Vulkan swapchain?

**RESOLVED:** Yes. The transforms that can be expressed in this extension are a subset of those possible on native platforms. If a platform exposes a method to specify the transform of presented images for a given surface using native methods and exposes more transforms or other properties for surfaces than Vulkan supports, it might be impossible, difficult, or inconvenient to set some of those properties using Vulkan KHR extensions and some using the native interfaces. To avoid overwriting properties set using native commands when presenting using a Vulkan swapchain, the application can set the pretransform to “inherit”, in which case the current native properties will be used, or if none are available, a platform-specific default will be used. Platforms that do not specify a reasonable default or do not provide native mechanisms to specify such transforms should not include the inherit bits in the `supportedTransforms` bitmask they return in `VkSurfaceCapabilitiesKHR`.

22) Should the content of presentable images be clipped by objects obscuring their target surface?

**RESOLVED:** Applications can choose which behavior they prefer. Allowing the content to be clipped could enable more efficient presentation methods on some platforms, but some applications might rely on the content of presentable images to perform techniques such as partial updates or motion blurs.

23) What is the purpose of specifying a `VkColorSpaceKHR` along with `VkFormat` when creating a swapchain?

**RESOLVED:** While Vulkan itself is color space agnostic (e.g. even the meaning of R, G, B and A can be freely defined by the rendering application), the swapchain eventually will have to present the images on a display device with specific color reproduction characteristics. If any color space transformations are necessary before an image can be displayed, the color space of the presented
image must be known to the swapchain. A swapchain will only support a restricted set of color format and -space pairs. This set can be discovered via `vkGetPhysicalDeviceSurfaceFormatsKHR`. As it can be expected that most display devices support the sRGB color space, at least one format/color-space pair has to be exposed, where the color space is `VK_COLOR_SPACE_SRGB_NONLINEAR_KHR`.

24) How are sRGB formats and the sRGB color space related?

**RESOLVED**: While Vulkan exposes a number of SRGB texture formats, using such formats does not guarantee working in a specific color space. It merely means that the hardware can directly support applying the non-linear transfer functions defined by the sRGB standard color space when reading from or writing to images of those formats. Still, it is unlikely that a swapchain will expose a * _SRGB format along with any color space other than `VK_COLOR_SPACE_SRGB_NONLINEAR_KHR`.

On the other hand, non-* _SRGB formats will be very likely exposed in pair with a SRGB color space. This means, the hardware will not apply any transfer function when reading from or writing to such images, yet they will still be presented on a device with sRGB display characteristics. In this case the application is responsible for applying the transfer function, for instance by using shader math.

25) How are the lifetimes of surfaces and swapchains targeting them related?

**RESOLVED**: A surface must outlive any swapchains targeting it. A `VkSurfaceKHR` owns the binding of the native window to the Vulkan driver.

26) How can the client control the way the alpha component of swapchain images is treated by the presentation engine during compositing?

**RESOLVED**: We should add new enum values to allow the client to negotiate with the presentation engine on how to treat image alpha values during the compositing process. Since not all platforms can practically control this through the Vulkan driver, a value of `VK_COMPOSITE_ALPHA_INHERIT_BIT_KHR` is provided like for surface transforms.

27) Is `vkCreateSwapchainKHR` the right function to return `VK_ERROR_NATIVE_WINDOW_IN_USE_KHR`, or should the various platform-specific `VkSurfaceKHR` factory functions catch this error earlier?

**RESOLVED**: For most platforms, the `VkSurfaceKHR` structure is a simple container holding the data that identifies a native window or other object representing a surface on a particular platform. For the surface factory functions to return this error, they would likely need to register a reference on the native objects with the native display server somehow, and ensure no other such references exist. Surfaces were not intended to be that heavyweight.

Swapchains are intended to be the objects that directly manipulate native windows and communicate with the native presentation mechanisms. Swapchains will already need to communicate with the native display server to negotiate allocation and/or presentation of presentable images for a native surface. Therefore, it makes more sense for swapchain creation to be the point at which native object exclusivity is enforced. Platforms may choose to enforce further restrictions on the number of `VkSurfaceKHR` objects that may be created for the same native window if such a requirement makes sense on a particular platform, but a global requirement is only sensible at the swapchain level.
Examples

Note

The example code for the `VK_KHR_surface` and `VK_KHR_swapchain` extensions was removed from the appendix after revision 1.0.29. This WSI example code was ported to the cube demo that is shipped with the official Khronos SDK, and is being kept up-to-date in that location (see: https://github.com/KhronosGroup/Vulkan-Tools/blob/main/cube/cube.c).

Version History

- Revision 1, 2015-05-20 (James Jones)
  - Initial draft, based on LunarG KHR spec, other KHR specs, patches attached to bugs.
- Revision 2, 2015-05-22 (Ian Elliott)
  - Made many agreed-upon changes from 2015-05-21 KHR TSG meeting. This includes using only a queue for presentation, and having an explicit function to acquire the next image.
  - Fixed typos and other minor mistakes.
- Revision 3, 2015-05-26 (Ian Elliott)
  - Improved the Description section.
  - Added or resolved issues that were found in improving the Description. For example, `pSurfaceDescription` is used consistently, instead of sometimes using `pSurface`.
- Revision 4, 2015-05-27 (James Jones)
  - Fixed some grammatical errors and typos
  - Filled in the description of `imageUseFlags` when creating a swapchain.
  - Added a description of `swapInterval`.
  - Replaced the paragraph describing the order of operations on a queue for image ownership and presentation.
- Revision 5, 2015-05-27 (James Jones)
  - Imported relevant issues from the (abandoned) `vk_wsi_persistent_swapchain_images` extension.
  - Added issues 6 and 7, regarding behavior of the acquire next image and present commands with respect to queues.
  - Updated spec language and examples to align with proposed resolutions to issues 6 and 7.
- Revision 6, 2015-05-27 (James Jones)
  - Added issue 8, regarding atomic presentation of multiple swapchains
  - Updated spec language and examples to align with proposed resolution to issue 8.
- Revision 7, 2015-05-27 (James Jones)
  - Fixed compilation errors in example code, and made related spec fixes.
- Revision 8, 2015-05-27 (James Jones)
- Added issue 9, and the related VK_SUBOPTIMAL_KHR result code.
- Renamed VK_OUT_OF_DATE_KHR to VK_ERROR_OUT_OF_DATE_KHR.

Revision 9, 2015-05-27 (James Jones)
- Added inline proposed resolutions (marked with [JR]) to some XXX questions/issues. These should be moved to the issues section in a subsequent update if the proposals are adopted.

Revision 10, 2015-05-28 (James Jones)
- Converted vkAcquireNextImageKHR back to a non-queue operation that uses a VkSemaphore object for explicit synchronization.
- Added issue 10 to determine whether vkAcquireNextImageKHR generates or returns semaphores, or whether it operates on a semaphore provided by the application.

Revision 11, 2015-05-28 (James Jones)
- Marked issues 6, 7, and 8 resolved.
- Renamed VkSurfaceCapabilityPropertiesKHR to VkSurfacePropertiesKHR to better convey the mutable nature of the information it contains.

Revision 12, 2015-05-28 (James Jones)
- Added issue 11 with a proposed resolution, and the related issue 12.
- Updated various sections of the spec to match the proposed resolution to issue 11.

Revision 13, 2015-06-01 (James Jones)
- Moved some structures to VK_EXT_KHR_swap_chain to resolve the specification’s issues 1 and 2.

Revision 14, 2015-06-01 (James Jones)
- Added code for example 4 demonstrating how an application might make use of the two different present and acquire next image KHR result codes.
- Added issue 13.

Revision 15, 2015-06-01 (James Jones)
- Added issues 14 - 16 and related spec language.
- Fixed some spelling errors.
- Added language describing the meaningful return values for vkAcquireNextImageKHR and vkQueuePresentKHR.

Revision 16, 2015-06-02 (James Jones)
- Added issues 17 and 18, as well as related spec language.
- Removed some erroneous text added by mistake in the last update.

Revision 17, 2015-06-15 (Ian Elliott)
- Changed special value from “-1” to “0” so that the data types can be unsigned.

Revision 18, 2015-06-15 (Ian Elliott)
- Clarified the values of VkSurfacePropertiesKHR::minImageCount and the timeout parameter of the vkAcquireNextImageKHR function.
Revision 19, 2015-06-17 (James Jones)
  ◦ Misc. cleanup. Removed resolved inline issues and fixed typos.
  ◦ Fixed clarification of VkSurfacePropertiesKHR::minImageCount made in version 18.
  ◦ Added a brief “Image Ownership” definition to the list of terms used in the spec.

Revision 20, 2015-06-17 (James Jones)
  ◦ Updated enum-extending values using new convention.

Revision 21, 2015-06-17 (James Jones)
  ◦ Added language describing how to use VK_IMAGE_LAYOUT_PRESENT_SOURCE_KHR.
  ◦ Cleaned up an XXX comment regarding the description of which queues vkQueuePresentKHR can be used on.

Revision 22, 2015-06-17 (James Jones)
  ◦ Rebased on Vulkan API version 126.

Revision 23, 2015-06-18 (James Jones)
  ◦ Updated language for issue 12 to read as a proposed resolution.
  ◦ Marked issues 11, 12, 13, 16, and 17 resolved.
  ◦ Temporarily added links to the relevant bugs under the remaining unresolved issues.
  ◦ Added issues 19 and 20 as well as proposed resolutions.

Revision 24, 2015-06-19 (Ian Elliott)
  ◦ Changed special value for VkSurfacePropertiesKHR::currentExtent back to “-1” from “0”.
    This value will never need to be unsigned, and “0” is actually a legal value.

Revision 25, 2015-06-23 (Ian Elliott)
  ◦ Examples now show use of function pointers for extension functions.
  ◦ Eliminated extraneous whitespace.

Revision 26, 2015-06-25 (Ian Elliott)
  ◦ Resolved Issues 9 & 10 per KHR TSG meeting.

Revision 27, 2015-06-25 (James Jones)
  ◦ Added oldSwapchain member to VkSwapchainCreateInfoKHR.

Revision 28, 2015-06-25 (James Jones)
  ◦ Added the “inherit” bits to the rotation and mirroring flags and the associated issue 21.

Revision 29, 2015-06-25 (James Jones)
  ◦ Added the “clipped” flag to VkSwapchainCreateInfoKHR, and the associated issue 22.
  ◦ Specified that presenting an image does not modify it.

Revision 30, 2015-06-25 (James Jones)
  ◦ Added language to the spec that clarifies the behavior of vkCreateSwapchainKHR when the oldSwapchain field of VkSwapchainCreateInfoKHR is not NULL.
• Revision 31, 2015-06-26 (Ian Elliott)
  ○ Example of new VkSwapchainCreateInfoKHR members, “oldSwapchain” and “clipped”.
  ○ Example of using VkSurfacePropertiesKHR::{min|max}ImageCount to set VkSwapchainCreateInfoKHR::minImageCount.
  ○ Rename vkGetSurfaceInfoKHR()’s 4th parameter to “pDataSize”, for consistency with other functions.
  ○ Add macro with C-string name of extension (just to header file).

• Revision 32, 2015-06-26 (James Jones)
  ○ Minor adjustments to the language describing the behavior of “oldSwapchain”
  ○ Fixed the version date on my previous two updates.

• Revision 33, 2015-06-26 (Jesse Hall)
  ○ Add usage flags to VkSwapchainCreateInfoKHR

• Revision 34, 2015-06-26 (Ian Elliott)
  ○ Rename vkQueuePresentKHR()’s 2nd parameter to “pPresentInfo”, for consistency with other functions.

• Revision 35, 2015-06-26 (Faith Ekstrand)
  ○ Merged the VkRotationFlagBitsKHR and VkMirrorFlagBitsKHR enums into a single VkSurfaceTransformFlagBitsKHR enum.

• Revision 36, 2015-06-26 (Faith Ekstrand)
  ○ Added a VkSurfaceTransformKHR enum that is not a bitmask. Each value in VkSurfaceTransformKHR corresponds directly to one of the bits in VkSurfaceTransformFlagBitsKHR so transforming from one to the other is easy. Having a separate enum means that currentTransform and preTransform are now unambiguous by definition.

• Revision 37, 2015-06-29 (Ian Elliott)
  ○ Corrected one of the signatures of vkAcquireNextImageKHR, which had the last two parameters switched from what it is elsewhere in the specification and header files.

• Revision 38, 2015-06-30 (Ian Elliott)
  ○ Corrected a typo in description of the vkGetSwapchainInfoKHR() function.
  ○ Corrected a typo in header file comment for VkPresentInfoKHR::sType.

• Revision 39, 2015-07-07 (Daniel Rakos)
  ○ Added error section describing when each error is expected to be reported.
  ○ Replaced bool32_t with VkBool32.

• Revision 40, 2015-07-10 (Ian Elliott)
  ○ Updated to work with version 138 of the vulkan.h header. This includes declaring the VkSwapchainKHR type using the new VK_DEFINE_NONDISP_HANDLE macro, and no longer extending VkObjectType (which was eliminated).

• Revision 41 2015-07-09 (Mathias Heyer)
- Added color space language.

- Revision 42, 2015-07-10 (Daniel Rakos)
  - Updated query mechanism to reflect the convention changes done in the core spec.
  - Removed “queue” from the name of VK_STRUCTURE_TYPE_QUEUE_PRESENT_INFO_KHR to be consistent with the established naming convention.
  - Removed reference to the no longer existing VkObjectType enum.

- Revision 43, 2015-07-17 (Daniel Rakos)
  - Added support for concurrent sharing of swapchain images across queue families.
  - Updated sample code based on recent changes

- Revision 44, 2015-07-27 (Ian Elliott)
  - Noted that support for VK_PRESENT_MODE_FIFO_KHR is required. That is ICDs may optionally support IMMEDIATE and MAILBOX, but must support FIFO.

- Revision 45, 2015-08-07 (Ian Elliott)
  - Corrected a typo in spec file (type and variable name had wrong case for the imageColorSpace member of the VkSwapchainCreateInfoKHR struct).
  - Corrected a typo in header file (last parameter in PFN_vkGetSurfacePropertiesKHR was missing “KHR” at the end of type: VkSurfacePropertiesKHR).

- Revision 46, 2015-08-20 (Ian Elliott)
  - Renamed this extension and all of its enumerations, types, functions, etc. This makes it compliant with the proposed standard for Vulkan extensions.
  - Switched from “revision” to “version”, including use of the VK_MAKE_VERSION macro in the header file.
  - Made improvements to several descriptions.
  - Changed the status of several issues from PROPOSED to RESOLVED, leaving no unresolved issues.
  - Resolved several TODOs, did miscellaneous cleanup, etc.

- Revision 47, 2015-08-20 (Ian Elliott—porting a 2015-07-29 change from James Jones)
  - Moved the surface transform enums to VK_WSI_swapchain so they could be reused by VK_WSI_display.

- Revision 48, 2015-09-01 (James Jones)
  - Various minor cleanups.

- Revision 49, 2015-09-01 (James Jones)
  - Restore single-field revision number.

- Revision 50, 2015-09-01 (James Jones)
  - Update Example #4 to include code that illustrates how to use the oldSwapchain field.

- Revision 51, 2015-09-01 (James Jones)
  - Fix example code compilation errors.
• Revision 52, 2015-09-08 (Matthaeus G. Chajdas)
  ◦ Corrected a typo.
• Revision 53, 2015-09-10 (Alon Or-bach)
  ◦ Removed underscore from SWAP_CHAIN left in VK_STRUCTURE_TYPE_SWAPCHAIN_CREATE_INFO_KHR.
• Revision 54, 2015-09-11 (Jesse Hall)
  ◦ Described the execution and memory coherence requirements for image transitions to and from VK_IMAGE_LAYOUT_PRESENT_SOURCE_KHR.
• Revision 55, 2015-09-11 (Ray Smith)
  ◦ Added errors for destroying and binding memory to presentable images
• Revision 56, 2015-09-18 (James Jones)
  ◦ Added fence argument to vkAcquireNextImageKHR
  ◦ Added example of how to meter a host thread based on presentation rate.
• Revision 57, 2015-09-26 (Jesse Hall)
  ◦ Replace VkSurfaceDescriptionKHR with VkSurfaceKHR.
  ◦ Added issue 25 with agreed resolution.
• Revision 58, 2015-09-28 (Jesse Hall)
  ◦ Renamed from VK_EXT_KHR_device_swapchain to VK_EXT_KHR_swapchain.
• Revision 59, 2015-09-29 (Ian Elliott)
  ◦ Changed vkDestroySwapchainKHR() to return void.
• Revision 60, 2015-10-01 (Jeff Vigil)
  ◦ Added error result VK_ERROR_SURFACE_LOST_KHR.
• Revision 61, 2015-10-05 (Faith Ekstrand)
  ◦ Added the VkCompositeAlpha enum and corresponding structure fields.
• Revision 62, 2015-10-12 (Daniel Rakos)
  ◦ Added VK_PRESENT_MODE_FIFO_RELAXED_KHR.
• Revision 63, 2015-10-15 (Daniel Rakos)
  ◦ Moved surface capability queries to VK_EXT_KHR_surface.
• Revision 64, 2015-10-26 (Ian Elliott)
  ◦ Renamed from VK_EXT_KHR_swapchain to VK_KHR_swapchain.
• Revision 65, 2015-10-28 (Ian Elliott)
  ◦ Added optional pResult member to VkPresentInfoKHR, so that per-swapchain results can be obtained from vkQueuePresentKHR().
• Revision 66, 2015-11-03 (Daniel Rakos)
  ◦ Added allocation callbacks to create and destroy functions.
Updated resource transition language.
Updated sample code.

Revision 67, 2015-11-10 (Jesse Hall)
- Add reserved flags bitmask to VkSwapchainCreateInfoKHR.
- Modify naming and member ordering to match API style conventions, and so the VkSwapchainCreateInfoKHR image property members mirror corresponding VkImageCreateInfo members but with an ‘image’ prefix.
- Make VkPresentInfoKHR::pResults non-const; it is an output array parameter.
- Make pPresentInfo parameter to vkQueuePresentKHR const.

Revision 68, 2016-04-05 (Ian Elliott)
- Moved the “validity” include for vkAcquireNextImage to be in its proper place, after the prototype and list of parameters.
- Clarified language about presentable images, including how they are acquired, when applications can and cannot use them, etc. As part of this, removed language about “ownership” of presentable images, and replaced it with more-consistent language about presentable images being “acquired” by the application.

2016-08-23 (Ian Elliott)
- Update the example code, to use the final API command names, to not have so many characters per line, and to split out a new example to show how to obtain function pointers. This code is more similar to the LunarG “cube” demo program.

2016-08-25 (Ian Elliott)
- A note was added at the beginning of the example code, stating that it will be removed from future versions of the appendix.

Revision 69, 2017-09-07 (Tobias Hector)
- Added interactions with Vulkan 1.1

Revision 70, 2017-10-06 (Ian Elliott)
- Corrected interactions with Vulkan 1.1

Description
This extension allows processing of swapchain images as different formats to that used by the window system, which is particularly useful for switching between sRGB and linear RGB formats.

It adds a new swapchain creation flag that enables creating image views from presentable images with a different format than the one used to create the swapchain.

New Enum Constants

• VK_KHR_SWAPCHAIN_MUTABLE_FORMAT_EXTENSION_NAME
• VK_KHR_SWAPCHAIN_MUTABLE_FORMAT_SPEC_VERSION
• Extending VkSwapchainCreateFlagBitsKHR:
  ◦ VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR
Issues

1) Are there any new capabilities needed?

**RESOLVED:** No. It is expected that all implementations exposing this extension support swapchain image format mutability.

2) Do we need a separate `VK_SWAPCHAIN_CREATE_EXTENDED_USAGE_BIT_KHR`?

**RESOLVED:** No. This extension requires `VK_KHR_maintenance2` and presentable images of swapchains created with `VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR` are created internally in a way equivalent to specifying both `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT` and `VK_IMAGE_CREATE_EXTENDED_USAGE_BIT_KHR`.

3) Do we need a separate structure to allow specifying an image format list for swapchains?

**RESOLVED:** No. We simply use the same `VkImageFormatListCreateInfoKHR` structure introduced by `VK_KHR_image_format_list`. The structure is required to be included in the `pNext` chain of `VkSwapchainCreateInfoKHR` for swapchains created with `VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR`.

• Contributors to VK_EXT_vertex_attribute_divisor

Description
This extension is based on the VK_EXT_vertex_attribute_divisor extension. The only difference is the new property supportsNonZeroFirstInstance, which indicates support for non-zero values in firstInstance. This allows the extension to be supported on implementations that have traditionally only supported OpenGL ES.

New Structures
• VkVertexInputBindingDivisorDescriptionKHR
• Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  ◦ VkPhysicalDeviceVertexAttributeDivisorFeaturesKHR
• Extending VkPhysicalDeviceProperties2:
  ◦ VkPhysicalDeviceVertexAttributeDivisorPropertiesKHR
• Extending VkPipelineVertexInputStateCreateInfo:
  ◦ VkPipelineVertexInputDivisorStateCreateInfoKHR

New Enum Constants
• VK_KHR_VERTEX_ATTRIBUTE_DIVISOR_EXTENSION_NAME
• VK_KHR_VERTEX_ATTRIBUTE_DIVISOR_SPEC_VERSION
• Extending VkStructureType:

Description

This extension builds upon the `VK_KHR_video_decode_queue` extension by adding support for decoding elementary video stream sequences compliant with the AV1 video compression standard.

New Structures

- Extending `VkVideoCapabilitiesKHR`
  - `VkVideoDecodeAV1CapabilitiesKHR`
- Extending `VkVideoDecodeInfoKHR`
  - `VkVideoDecodeAV1PictureInfoKHR`
- Extending `VkVideoProfileInfoKHR, VkQueryPoolCreateInfo`
  - `VkVideoDecodeAV1ProfileInfoKHR`
- Extending `VkVideoReferenceSlotInfoKHR`
  - `VkVideoDecodeAV1DpbSlotInfoKHR`
- Extending `VkVideoSessionParametersCreateInfoKHR`
  - `VkVideoDecodeAV1SessionParametersCreateInfoKHR`

New Enum Constants

- `VK_KHR_VIDEO_DECODE_AV1_EXTENSION_NAME`
- `VK_KHR_VIDEO_DECODE_AV1_SPEC_VERSION`
- `VK_MAX_VIDEO_AV1_REFERENCES_PER_FRAME_KHR`
- Extending `VkStructureType`
  - `VK_STRUCTURE_TYPE_VIDEO_DECODE_AV1_CAPABILITIES_KHR`
  - `VK_STRUCTURE_TYPE_VIDEO_DECODE_AV1_DPB_SLOT_INFO_KHR`
  - `VK_STRUCTURE_TYPE_VIDEO_DECODE_AV1_PICTURE_INFO_KHR`
  - `VK_STRUCTURE_TYPE_VIDEO_DECODE_AV1_PROFILE_INFO_KHR`
  - `VK_STRUCTURE_TYPE_VIDEO_DECODE_AV1_SESSION_PARAMETERS_CREATE_INFO_KHR`
- Extending `VkVideoCodecOperationFlagBitsKHR`
  - `VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR`

Description

This extension builds upon the `VK_KHR_video_decode_queue` extension by adding support for decoding elementary video stream sequences compliant with the H.264/AVC video compression standard.

Note

This extension was promoted to `KHR` from the provisional extension `VK_EXT_video_decode_h264`.

New Structures

- Extending `VkVideoCapabilitiesKHR`:
  - `VkVideoDecodeH264CapabilitiesKHR`
- Extending `VkVideoDecodeInfoKHR`:
  - `VkVideoDecodeH264PictureInfoKHR`
- Extending `VkVideoProfileInfoKHR, VkQueryPoolCreateInfo`:
  - `VkVideoDecodeH264ProfileInfoKHR`
- Extending `VkVideoReferenceSlotInfoKHR`:
  - `VkVideoDecodeH264DpbSlotInfoKHR`
- Extending `VkVideoSessionParametersCreateInfoKHR`:
  - `VkVideoDecodeH264SessionParametersCreateInfoKHR`
- Extending `VkVideoSessionParametersUpdateInfoKHR`:
  - `VkVideoDecodeH264SessionParametersAddInfoKHR`

New Enums

- `VkVideoDecodeH264PictureLayoutFlagBitsKHR`

New Bitmasks

- `VkVideoDecodeH264PictureLayoutFlagsKHR`

New Enum Constants

- `VK_KHR_VIDEO_DECODE_H264_EXTENSION_NAME`
- `VK_KHR_VIDEO_DECODE_H264_SPEC_VERSION`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_CAPABILITIES_KHR`
VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_DPB_SLOT_INFO_KHR
VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_PICTURE_INFO_KHR
VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_PROFILE_INFO_KHR
VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_SESSION_PARAMETERS_ADD_INFO_KHR
VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_SESSION_PARAMETERS_CREATE_INFO_KHR

Extending VkVideoCodecOperationFlagBitsKHR:
VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR

Version History

• Revision 1, 2018-6-11 (Peter Fang)
  Initial draft
• Revision 2, March 29 2021 (Tony Zlatinski)
  Spec and API Updates
• Revision 3, August 1 2021 (Srinath Kumarapuram)
  Rename VkVideoDecodeH264FieldLayoutFlagsEXT to VkVideoDecodeH264PictureLayoutFlagsEXT, VkVideoDecodeH264FieldLayoutFlagBitsEXT to VkVideoDecodeH264PictureLayoutFlagBitsEXT (along with the names of enumerants it defines), and VkVideoDecodeH264ProfileEXT.fieldLayout to VkVideoDecodeH264ProfileEXT.pictureLayout, following Vulkan naming conventions.
• Revision 4, 2022-03-16 (Ahmed Abdelkhalek)
  Relocate Std header version reporting/requesting from this extension to VK_KHR_video_queue extension.
  Remove the now empty VkVideoDecodeH264SessionCreateInfoEXT.
• Revision 5, 2022-03-31 (Ahmed Abdelkhalek)
  Use type StdVideoH264Level for VkVideoDecodeH264Capabilities.maxLevel
• Revision 6, 2022-08-09 (Daniel Rakos)
  Rename VkVideoDecodeH264ProfileEXT to VkVideoDecodeH264ProfileInfoEXT
  Rename VkVideoDecodeH264MvcEXT to VkVideoDecodeH264MvcInfoEXT
• Revision 7, 2022-09-18 (Daniel Rakos)
  Change type of VkVideoDecodeH264ProfileInfoEXT::pictureLayout to VkVideoDecodeH264PictureLayoutFlagBitsEXT
  Remove MVC support and related VkVideoDecodeH264MvcInfoEXT structure
  Rename spsStdCount, pSpsStd, ppsStdCount, and pPpsStd to stdSPSCount, pStdSPSs, stdPPSCount, and pStdPPSs, respectively, in VkVideoDecodeH264SessionParametersAddInfoEXT
  Rename maxSpsStdCount and maxPpsStdCount to maxStdSPSCount and maxStdPPSCount, respectively, in VkVideoDecodeH264SessionParametersCreateInfoEXT
  Rename slicesCount and pSlicesDataOffsets to sliceCount and pSliceOffsets, respectively, in
VkVideoDecodeH264PictureInfoEXT

- Revision 8, 2022-09-29 (Daniel Rakos)
  - Change extension from EXT to KHR
  - Extension is no longer provisional
- Revision 9, 2023-12-05 (Daniel Rakos)
  - Condition reference picture setup based on the value of StdVideoDecodeH264PictureInfo::flags.is_reference

Description

This extension builds upon the `VK_KHR_video_decode_queue` extension by adding support for decoding elementary video stream sequences compliant with the H.265/HEVC video compression standard.

Note

This extension was promoted to KHR from the provisional extension `VK_EXT_video_decode_h265`.

New Structures

- Extending `VkVideoCapabilitiesKHR`:
  - `VkVideoDecodeH265CapabilitiesKHR`
- Extending `VkVideoDecodeInfoKHR`:
  - `VkVideoDecodeH265PictureInfoKHR`
- Extending `VkVideoProfileInfoKHR`, `VkQueryPoolCreateInfo`:
  - `VkVideoDecodeH265ProfileInfoKHR`
- Extending `VkVideoReferenceSlotInfoKHR`:
  - `VkVideoDecodeH265DpbSlotInfoKHR`
- Extending `VkVideoSessionParametersCreateInfoKHR`:
  - ` VkVideoDecodeH265SessionParametersCreateInfoKHR`
- Extending `VkVideoSessionParametersUpdateInfoKHR`:
  - `VkVideoDecodeH265SessionParametersAddInfoKHR`

New Enum Constants

- `VK_KHR_VIDEO_DECODE_H265_EXTENSION_NAME`
- `VK_KHR_VIDEO_DECODE_H265_SPEC_VERSION`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_CAPABILITIES_KHR`
  - `VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_DPB_SLOT_INFO_KHR`
  - `VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_PICTURE_INFO_KHR`
  - `VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_PROFILE_INFO_KHR`
  - `VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_SESSION_PARAMETERS_ADD_INFO_KHR`
- **VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_SESSION_PARAMETERS_CREATE_INFO_KHR**

- **Extending** `VkVideoCodecOperationFlagBitsKHR`:
  - `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`

### Version History

- **Revision 1, 2018-6-11 (Peter Fang)**
  - Initial draft

- **Revision 1.6, March 29 2021 (Tony Zlatinski)**
  - Spec and API updates.

- **Revision 2, 2022-03-16 (Ahmed Abdelkhalek)**
  - Relocate Std header version reporting/requesting from this extension to `VK_KHR_video_queue` extension.
  - Remove the now empty `VkVideoDecodeH265SessionCreateInfoEXT`.

- **Revision 3, 2022-03-31 (Ahmed Abdelkhalek)**
  - Use type `StdVideoH265Level` for `VkVideoDecodeH265Capabilities.maxLevel`

- **Revision 4, 2022-08-09 (Daniel Rakos)**
  - Rename `VkVideoDecodeH265ProfileEXT` to `VkVideoDecodeH265ProfileInfoEXT`

- **Revision 5, 2022-09-18 (Daniel Rakos)**
  - Rename `vpsStdCount`, `pVpsStd`, `spsStdCount`, `pSpsStd`, `ppsStdCount`, and `pPpsStd` to `stdVPSCount`, `pStdVPSs`, `stdSPSCount`, `pStdSPSs`, `stdPPSCount`, and `pStdPPSs`, respectively, in `VkVideoDecodeH265SessionParametersAddInfoEXT`
  - Rename `maxVpsStdCount`, `maxSpsStdCount`, and `maxPpsStdCount` to `maxStdVPSCount`, `maxStdSPSCount`, and `maxStdPPSCount`, respectively, in `VkVideoDecodeH265SessionParametersCreateInfoEXT`
  - Rename `slicesCount` and `pSlicesDataOffsets` to `sliceCount` and `pSliceOffsets`, respectively, in `VkVideoDecodeH265PictureInfoEXT`

- **Revision 6, 2022-11-14 (Daniel Rakos)**
  - Rename `slice` to `sliceSegment` in the APIs for better clarity

- **Revision 7, 2022-11-14 (Daniel Rakos)**
  - Change extension from `EXT` to `KHR`
  - Extension is no longer provisional

- **Revision 8, 2023-12-05 (Daniel Rakos)**
  - Condition reference picture setup based on the value of `StdVideoDecodeH265PictureInfo::flags.IsReference`

• Olivier Lapicque, NVIDIA
• Peter Fang, AMD
• Piers Daniell, NVIDIA
• Srinath Kumarapuram, NVIDIA
Description

This extension builds upon the `VK_KHR_video_queue` extension by adding common APIs specific to video decoding and thus enabling implementations to expose queue families supporting video decode operations.

More specifically, it adds video decode specific capabilities and a new command buffer command that allows recording video decode operations against a video session.

This extension is to be used in conjunction with other codec specific video decode extensions that enable decoding video sequences of specific video compression standards.

New Commands

- `vkCmdDecodeVideoKHR`

New Structures

- `VkVideoDecodeInfoKHR`
- Extending `VkVideoCapabilitiesKHR`:
  - `VkVideoDecodeCapabilitiesKHR`
- Extending `VkVideoProfileInfoKHR, VkQueryPoolCreateInfo`:
  - `VkVideoDecodeUsageInfoKHR`

New Enums

- `VkVideoDecodeCapabilityFlagBitsKHR`
- `VkVideoDecodeUsageFlagBitsKHR`

New Bitmasks

- `VkVideoDecodeCapabilityFlagsKHR`
- `VkVideoDecodeFlagsKHR`
- `VkVideoDecodeUsageFlagsKHR`

New Enum Constants

- `VK_KHR_VIDEO_DECODE_QUEUE_EXTENSION_NAME`
- `VK_KHR_VIDEO_DECODE_QUEUE_SPEC_VERSION`
- Extending `VkAccessFlagBits2`:
  - `VK_ACCESS_2_VIDEO_DECODE_READ_BIT_KHR`
  - `VK_ACCESS_2_VIDEO_DECODE_WRITE_BIT_KHR`
• Extending VkBufferUsageFlagBits:
  ◦ VK_BUFFER_USAGE_VIDEO_DECODE_DST_BIT_KHR
  ◦ VK_BUFFER_USAGE_VIDEO_DECODE_SRC_BIT_KHR

• Extending VkFormatFeatureFlagBits:
  ◦ VK_FORMAT_FEATURE_VIDEO_DECODE_DPB_BIT_KHR
  ◦ VK_FORMAT_FEATURE_VIDEO_DECODE_OUTPUT_BIT_KHR

• Extending VkImageLayout:
  ◦ VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR
  ◦ VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR
  ◦ VK_IMAGE_LAYOUT_VIDEO_DECODE_SRC_KHR

• Extending VkImageUsageFlagBits:
  ◦ VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR
  ◦ VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR
  ◦ VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR

• Extending VkPipelineStageFlagBits2:
  ◦ VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR

• Extending VkQueueFlagBits:
  ◦ VK_QUEUE_VIDEO_DECODE_BIT_KHR

• Extending VkStructureType:
  ◦ VK_STRUCTURE_TYPE_VIDEO_DECODE_CAPABILITIES_KHR
  ◦ VK_STRUCTURE_TYPE_VIDEO_DECODE_INFO_KHR
  ◦ VK_STRUCTURE_TYPE_VIDEO_DECODE_USAGE_INFO_KHR

If VK_KHR_format_feature_flags2 or Version 1.3 is supported:

• Extending VkFormatFeatureFlagBits2:
  ◦ VK_FORMAT_FEATURE_2_VIDEO_DECODE_DPB_BIT_KHR
  ◦ VK_FORMAT_FEATURE_2_VIDEO_DECODE_OUTPUT_BIT_KHR

Version History

• Revision 1, 2018-6-11 (Peter Fang)
  ◦ Initial draft

• Revision 1.5, Nov 09 2018 (Tony Zlatinski)
  ◦ API Updates

• Revision 1.6, Jan 08 2020 (Tony Zlatinski)
  ◦ API unify with the video_encode_queue spec
• Revision 1.7, March 29 2021 (Tony Zlatinski)
  ◦ Spec and API updates.

• Revision 2, September 30 2021 (Jon Leech)
  ◦ Add interaction with VK_KHR_format_feature_flags2 to vk.xml

• Revision 3, 2022-02-25 (Ahmed Abdelkhalek)
  ◦ Add VkVideoDecodeCapabilitiesKHR with new flags to report support for decode DPB and output coinciding in the same image, or in distinct images.

• Revision 4, 2022-03-31 (Ahmed Abdelkhalek)
  ◦ Remove redundant VkVideoDecodeInfoKHR.coded{Offset|Extent}

• Revision 5, 2022-07-18 (Daniel Rakos)
  ◦ Remove VkVideoDecodeFlagBitsKHR as it contains no defined flags for now

• Revision 6, 2022-08-12 (Daniel Rakos)
  ◦ Add VkVideoDecodeUsageInfoKHR structure and related flags

• Revision 7, 2022-09-29 (Daniel Rakos)
  ◦ Extension is no longer provisional

• Revision 8, 2023-12-05 (Daniel Rakos)
  ◦ Require the specification of a reconstructed picture in all cases, except when the video session was created with no DPB slots to match shipping implementations
  ◦ Make DPB slot activation behavior codec-specific to continue allowing application control over reference picture setup now that a reconstructed picture is always mandatory

Description

This extension builds upon the VK_KHR_video_encode_queue extension by adding support for encoding elementary video stream sequences compliant with the H.264/AVC video compression standard.

Note

This extension was promoted to KHR from the provisional extension VK_EXT_video_encode_h264.

New Structures

- VkVideoEncodeH264FrameSizeKHR
- VkVideoEncodeH264NaluSliceInfoKHR
- VkVideoEncodeH264QpKHR
• Extending `VkVideoBeginCodingInfoKHR`:
  ◦ `VkVideoEncodeH264GopRemainingFrameInfoKHR`

• Extending `VkVideoCapabilitiesKHR`:
  ◦ `VkVideoEncodeH264CapabilitiesKHR`

• Extending `VkVideoCodingControlInfoKHR, VkVideoBeginCodingInfoKHR`:
  ◦ `VkVideoEncodeH264RateControlInfoKHR`

• Extending `VkVideoEncodeInfoKHR`:
  ◦ `VkVideoEncodeH264PictureInfoKHR`

• Extending `VkVideoEncodeQualityLevelPropertiesKHR`:
  ◦ `VkVideoEncodeH264QualityLevelPropertiesKHR`

• Extending `VkVideoEncodeRateControlLayerInfoKHR`:
  ◦ `VkVideoEncodeH264RateControlLayerInfoKHR`

• Extending `VkVideoEncodeSessionParametersFeedbackInfoKHR`:
  ◦ `VkVideoEncodeH264SessionParametersFeedbackInfoKHR`

• Extending `VkVideoEncodeSessionParametersGetInfoKHR`:
  ◦ `VkVideoEncodeH264SessionParametersGetInfoKHR`

• Extending `VkVideoProfileInfoKHR, VkQueryPoolCreateInfo`:
  ◦ `VkVideoEncodeH264ProfileInfoKHR`

• Extending `VkVideoReferenceSlotInfoKHR`:
  ◦ `VkVideoEncodeH264DpbSlotInfoKHR`

• Extending `VkVideoSessionCreateInfoKHR`:
  ◦ `VkVideoEncodeH264SessionCreateInfoKHR`

• Extending `VkVideoSessionParametersCreateInfoKHR`:
  ◦ `VkVideoEncodeH264SessionParametersCreateInfoKHR`

• Extending `VkVideoSessionParametersUpdateInfoKHR`:
  ◦ `VkVideoEncodeH264SessionParametersAddInfoKHR`

**New Enums**

• `VkVideoEncodeH264CapabilityFlagBitsKHR`
• `VkVideoEncodeH264RateControlFlagBitsKHR`
• `VkVideoEncodeH264StdFlagBitsKHR`

**New Bitmasks**

• `VkVideoEncodeH264CapabilityFlagsKHR`
• `VkVideoEncodeH264RateControlFlagsKHR`
New Enum Constants

- VK_KHR_VIDEO_ENCODE_H264_EXTENSION_NAME
- VK_KHR_VIDEO_ENCODE_H264_SPEC_VERSION

Extending VkStructureType:
- VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_CAPABILITIES_KHR
- VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_DPB_SLOT_INFO_KHR
- VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_GOP_REMAINING_FRAME_INFO_KHR
- VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_NALU_SLICE_INFO_KHR
- VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_PICTURE_INFO_KHR
- VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_PROFILE_INFO_KHR
- VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_QUALITY_LEVEL_PROPERTIES_KHR
- VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_RATE_CONTROL_INFO_KHR
- VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_RATE_CONTROL_LAYER_INFO_KHR
- VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_SESSION_CREATE_INFO_KHR
- VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_SESSION_PARAMETERS_ADD_INFO_KHR
- VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_SESSION_PARAMETERS_CREATE_INFO_KHR
- VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_SESSION_PARAMETERS_FEEDBACK_INFO_KHR
- VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_SESSION_PARAMETERS_GET_INFO_KHR

Extending VkVideoCodecOperationFlagBitsKHR:
- VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR

Version History

- Revision 0, 2018-7-23 (Ahmed Abdelkhalek)
  - Initial draft
- Revision 0.5, 2020-02-13 (Tony Zlatinski)
  - General Spec cleanup
  - Added DPB structures
  - Change the VCL frame encode structure
  - Added a common Non-VCL Picture Paramarameters structure
- Revision 1, 2021-03-29 (Tony Zlatinski)
  - Spec and API updates
- Revision 2, August 1 2021 (Srinath Kumarapuram)
  - Rename VkVideoEncodeH264CapabilitiesFlagsEXT to VkVideoEncodeH264CapabilityFlagsEXT and VkVideoEncodeH264CapabilitiesFlagsEXT to VkVideoEncodeH264CapabilityFlagsEXT, following
Vulkan naming conventions.

- Revision 3, 2021-12-08 (Ahmed Abdelkhalek)
  - Rate control updates

- Revision 4, 2022-02-04 (Ahmed Abdelkhalek)
  - Align `VkVideoEncodeH264VclFrameInfoEXT` structure to similar one in `VK_EXT_video_encode_h265` extension

- Revision 5, 2022-02-10 (Ahmed Abdelkhalek)
  - Updates to encode capability interface

- Revision 6, 2022-03-16 (Ahmed Abdelkhalek)
  - Relocate Std header version reporting/requesting from this extension to `VK_KHR_video_queue` extension.
  - Remove redundant maxPictureSizeInMbs from `VkVideoEncodeH264SessionCreateInfoEXT`.
  - Remove the now empty `VkVideoEncodeH264SessionCreateInfoEXT`.

- Revision 7, 2022-04-06 (Ahmed Abdelkhalek)
  - Add capability flag to report support to use B frame in L1 reference list.
  - Add capability flag to report support for disabling SPS direct_8x8_inference_flag.

- Revision 8, 2022-07-18 (Daniel Rakos)
  - Replace `VkVideoEncodeH264RateControlStructureFlagBitsEXT` bit enum with `VkVideoEncodeH264RateControlStructureEXT` enum
  - Rename `VkVideoEncodeH264ProfileEXT` to `VkVideoEncodeH264ProfileInfoEXT`
  - Rename `VkVideoEncodeH264ReferenceListsEXT` to `VkVideoEncodeH264ReferenceListsInfoEXT`
    - Rename `VkVideoEncodeH264EmitPictureParametersEXT` to `VkVideoEncodeH264EmitPictureParametersInfoEXT`
    - Rename `VkVideoEncodeH264NaluSliceEXT` to `VkVideoEncodeH264NaluSliceInfoEXT`

- Revision 9, 2022-09-18 (Daniel Rakos)
  - Rename `spsStdCount`, `pSpsStd`, `ppsStdCount`, and `pPpsStd` to `stdSPSCount`, `stdSPSs`, `stdPPSCount`, and `stdPPSs`, respectively, in `VkVideoEncodeH264SessionParametersAddInfoEXT`
  - Rename `maxSpsStdCount` and `maxPpsStdCount` to `maxStdSPSCount` and `maxStdPPSCount`, respectively, in `VkVideoEncodeH264SessionParametersCreateInfoEXT`

- Revision 10, 2023-03-06 (Daniel Rakos)
  - Removed `VkVideoEncodeH264EmitPictureParametersInfoEXT`
  - Changed member types in `VkVideoEncodeH264CapabilitiesEXT` and `VkVideoEncodeH264ReferenceListsInfoEXT` from `uint8_t` to `uint32_t`
  - Changed the type of `VkVideoEncodeH264RateControlInfoEXT::temporalLayerCount` and `VkVideoEncodeH264RateControlLayerInfoEXT::temporalLayerId` from `uint8_t` to `uint32_t`
  - Removed `VkVideoEncodeH264InputModeFlagsEXT` and `VkVideoEncodeH264OutputModeFlagsEXT` as we only support frame-in-frame-out mode for now
- Rename `pCurrentPictureInfo` in `VkVideoEncodeH264VclFrameInfoEXT` to `pStdPictureInfo`
- Rename `pSliceHeaderStd` in `VkVideoEncodeH264NaluSliceInfoEXT` to `pStdSliceHeader`
- Rename `pReferenceFinalLists` in `VkVideoEncodeH264VclFrameInfoEXT` and `VkVideoEncodeH264NaluSliceInfoEXT` to `pStdReferenceFinalLists`
- Removed the `slotIndex` member of `VkVideoEncodeH264DpbSlotInfoEXT` and changed it to be chained to `VkVideoReferenceSlotInfoKHR`
- Replaced `VkVideoEncodeH264ReferenceListsInfoEXT` with the new Video Std header structure `StdVideoEncodeH264ReferenceLists` that also includes data previously part of the now removed `StdVideoEncodeH264RefMemMgmtCtrlOperations` structure
- Added new capability flag `VK_VIDEO_ENCODE_H264_CAPABILITY_DIFFERENT_REFERENCE_FINAL_LISTS_BIT_EXT`

Revision 11, 2023-05-22 (Daniel Rakos)

- Renamed `VkVideoEncodeH264VclFrameInfoEXT` to `VkVideoEncodeH264PictureInfoEXT`
- Added `VkVideoEncodeH264PictureInfoEXT::generatePrefixNalu` and `VK_VIDEO_ENCODE_H264_CAPABILITY_GENERATE_PREFIX_NALU_BIT_EXT` to enable the generation of H.264 prefix NALUs when supported by the implementation
- Removed `VkVideoEncodeH264RateControlLayerInfoEXT::temporalLayerId`
- Added `expectDyadicTemporalLayerPattern` capability
- Added the `VkVideoEncodeH264SessionParametersGetInfoEXT` structure to identify the H.264 parameter sets to retrieve encoded parameter data for, and the `VkVideoEncodeH264SessionParametersFeedbackInfoEXT` structure to retrieve H.264 parameter set override information when using the new `vkGetEncodedVideoSessionParametersKHR` command
- Added `VkVideoEncodeH264NaluSliceInfoEXT::constantQp` to specify per-slice constant QP when rate control mode is `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR`
- Added `VkVideoEncodeH264QualityLevelPropertiesEXT` for retrieving H.264 specific quality level recommendations
- Replaced `VkVideoEncodeH264RateControlStructureEXT` enum with the flags type `VkVideoEncodeH264RateControlFlagsEXT` and bits defined in `VkVideoEncodeH264RateControlFlagBitsEXT` and added HRD compliance flag
- Removed `useInitialRcQp` and `initialRcQp` members of `VkVideoEncodeH264RateControlLayerInfoEXT`
- Added `prefersGopRemainingFrames` and `requiresGopRemainingFrames`, and the new `VkVideoEncodeH264GopRemainingFrameInfoEXT` structure to allow specifying remaining frames of each type in the rate control GOP
- Added `maxTemporalLayers`, `maxQp`, and `minQp` capabilities
- Added `maxLevelIdc` capability and new `VkVideoEncodeH264SessionCreateInfoEXT` structure to specify upper bounds on the H.264 level of the produced video bitstream
- Moved capability flags specific to codec syntax restrictions from `VkVideoEncodeH264CapabilityFlagsEXT` to the new `VkVideoEncodeH264StdFlagsEXT` which is now
included as a separate stdSyntaxFlags member in VkVideoEncodeH264CapabilitiesEXT
◦ Removed codec syntax override values from VkVideoEncodeH264CapabilitiesEXT
◦ Removed VkVideoEncodeH264NaluSliceInfoEXT::mbCount and VK_VIDEO_ENCODE_H264_CAPABILITY_SLICE_MB_COUNT_BIT_EXT
◦ Replaced VK_VIDEO_ENCODE_H264_CAPABILITY_MULTIPLE_SLICES_PER_FRAME_BIT_EXT with the new maxSliceCount capability
◦ Removed capability flag VK_VIDEO_ENCODE_H264_CAPABILITY_DIFFERENT_REFERENCE_FINAL_LISTS_BIT_EXT and removed pStdReferenceFinalLists members from the VkVideoEncodeH264PictureInfoExt and VkVideoEncodeH264NaluSliceInfoEXT structures as reference lists info is now included in pStdPictureInfo
◦ Added capability flag VK_VIDEO_ENCODE_H264_CAPABILITY_B_FRAME_IN_L0_LIST_BIT_EXT

• Revision 12, 2023-07-19 (Daniel Rakos)
  ◦ Added video std capability flags VK_VIDEO_ENCODE_H264_STD_SLICE_QP_DELTA_BIT_EXT and VK_VIDEO_ENCODE_H264_STD_DIFFERENT_SLICE_QP_DELTA_BIT_EXT
  ◦ Fixed optionality of the array members of VkVideoEncodeH264SessionParametersAddInfoEXT
  ◦ Fixed optionality of VkVideoEncodeH264RateControlInfoExt::flags

• Revision 13, 2023-09-04 (Daniel Rakos)
  ◦ Change extension from EXT to KHR
  ◦ Extension is no longer provisional

• Revision 14, 2023-12-05 (Daniel Rakos)
  ◦ Condition reference picture setup based on the value of StdVideoEncodeH264PictureInfo::flags.is_reference

Description

This extension builds upon the VK_KHR_video_encode_queue extension by adding support for encoding elementary video stream sequences compliant with the H.265/HEVC video compression standard.

Note

This extension was promoted to KHR from the provisional extension VK_EXT_video_encode_h265.

New Structures

• VkVideoEncodeH265FrameSizeKHR
• VkVideoEncodeH265NaluSliceSegmentInfoKHR
• VkVideoEncodeH265QpKHR

• Extending VkVideoBeginCodingInfoKHR:
  ◦ VkVideoEncodeH265GopRemainingFrameInfoKHR

• Extending VkVideoCapabilitiesKHR:
  ◦ VkVideoEncodeH265CapabilitiesKHR

• Extending VkVideoCodingControlInfoKHR, VkVideoBeginCodingInfoKHR:
  ◦ VkVideoEncodeH265RateControlInfoKHR

• Extending VkVideoEncodeInfoKHR:
  ◦ VkVideoEncodeH265PictureInfoKHR

• Extending VkVideoEncodeQualityLevelPropertiesKHR:
  ◦ VkVideoEncodeH265QualityLevelPropertiesKHR

• Extending VkVideoEncodeRateControlLayerInfoKHR:
  ◦ VkVideoEncodeH265RateControlLayerInfoKHR

• Extending VkVideoEncodeSessionParametersFeedbackInfoKHR:
  ◦ VkVideoEncodeH265SessionParametersFeedbackInfoKHR

• Extending VkVideoEncodeSessionParametersGetInfoKHR:
  ◦ VkVideoEncodeH265SessionParametersGetInfoKHR

• Extending VkVideoProfileInfoKHR, VkQueryPoolCreateInfo:
  ◦ VkVideoEncodeH265ProfileInfoKHR

• Extending VkVideoReferenceSlotInfoKHR:
  ◦ VkVideoEncodeH265DpbSlotInfoKHR

• Extending VkVideoSessionCreateInfoKHR:
  ◦ VkVideoEncodeH265SessionCreateInfoKHR

• Extending VkVideoSessionParametersCreateInfoKHR:
  ◦ VkVideoEncodeH265SessionParametersCreateInfoKHR

• Extending VkVideoSessionParametersUpdateInfoKHR:
  ◦ VkVideoEncodeH265SessionParametersAddInfoKHR

New Enums

• VkVideoEncodeH265CapabilityFlagBitsKHR
• VkVideoEncodeH265CtbSizeFlagBitsKHR
• VkVideoEncodeH265RateControlFlagBitsKHR
• VkVideoEncodeH265StdFlagBitsKHR
• VkVideoEncodeH265TransformBlockSizeFlagBitsKHR
New Bitmasks

- VkVideoEncodeH265CapabilityFlagsKHR
- VkVideoEncodeH265CtbSizeFlagsKHR
- VkVideoEncodeH265RateControlFlagsKHR
- VkVideoEncodeH265StdFlagsKHR
- VkVideoEncodeH265TransformBlockSizeFlagsKHR

New Enum Constants

- VK_KHR_VIDEO_ENCODE_H265_EXTENSION_NAME
- VK_KHR_VIDEO_ENCODE_H265_SPEC_VERSION

Extending VkStructureType:

- VK_STRUCTURE_TYPE_VIDEO.Encode.H265.Capabilities_KHR
- VK_STRUCTURE_TYPE_VIDEO.Encode.H265.DPB_Slot_INFO_KHR
- VK_STRUCTURE_TYPE_VIDEO.Encode.H265.GOP.Remaining_Frame_INFO_KHR
- VK_STRUCTURE_TYPE_VIDEO.Encode.H265.NALU.Slice_Segment_INFO_KHR
- VK_STRUCTURE_TYPE_VIDEO.Encode.H265.Picture_INFO_KHR
- VK_STRUCTURE_TYPE_VIDEO.Encode.H265.Profile_INFO_KHR
- VK_STRUCTURE_TYPE_VIDEO.Encode.H265.Quality_Level_PROPERTIES_KHR
- VK_STRUCTURE_TYPE_VIDEO.Encode.H265.Rate_Control_INFO_KHR
- VK_STRUCTURE_TYPE_VIDEO.Encode.H265.Rate_Control_LAYER_INFO_KHR
- VK_STRUCTURE_TYPE_VIDEO.Encode.H265.Session_CREATE_INFO_KHR
- VK_STRUCTURE_TYPE_VIDEO.Encode.H265.Session_Parameters_ADD_INFO_KHR
- VK_STRUCTURE_TYPE_VIDEO.Encode.H265.Session_Parameters_CREATE_INFO_KHR
- VK_STRUCTURE_TYPE_VIDEO.Encode.H265.Session_Parameters_Feedback_INFO_KHR
- VK_STRUCTURE_TYPE_VIDEO.Encode.H265.Session_Parameters_Get_INFO_KHR

Extending VkVideoCodecOperationFlagBitsKHR:

- VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR

Version History

- Revision 0, 2019-11-14 (Ahmed Abdelkhalek)
  - Initial draft
- Revision 0.5, 2020-02-13 (Tony Zlatinski)
  - General Spec cleanup
  - Added DPB structures
  - Change the VCL frame encode structure
- Added a common Non-VCL Picture Parameters structure

Revision 2, Oct 10 2021 (Srinath Kumarakuram)
- Vulkan Video Encode h.265 update and spec edits

Revision 3, 2021-12-08 (Ahmed Abdelkhalek)
- Rate control updates

Revision 4, 2022-01-11 (Ahmed Abdelkhalek)
- Replace occurrences of “slice” by “slice segment” and rename structures/enums to reflect this.

Revision 5, 2022-02-10 (Ahmed Abdelkhalek)
- Updates to encode capability interface

Revision 6, 2022-03-16 (Ahmed Abdelkhalek)
- Relocate Std header version reporting/requesting from this extension to VK_KHR_video_queue extension.
- Remove the now empty VkVideoEncodeH265SessionCreateInfoEXT.

Revision 7, 2022-03-24 (Ahmed Abdelkhalek)
- Add capability flags to report support to disable transform skip and support to use B frame in L1 reference list.

Revision 8, 2022-07-18 (Daniel Rakos)
- Replace \texttt{VkVideoEncodeH265RateControlStructureFlagBitsEXT} bit enum with \texttt{VkVideoEncodeH265RateControlStructureEXT} enum
- Rename \texttt{VkVideoEncodeH265ProfileEXT} to \texttt{VkVideoEncodeH265ProfileInfoEXT}
- Rename \texttt{VkVideoEncodeH265ReferenceListsEXT} to \texttt{VkVideoEncodeH265ReferenceListsInfoEXT}
- Rename \texttt{VkVideoEncodeH265EmitPictureParametersEXT} to \texttt{VkVideoEncodeH265EmitPictureParametersInfoEXT}
- Rename \texttt{VkVideoEncodeH265NaluSliceSegmentEXT} to \texttt{VkVideoEncodeH265NaluSliceSegmentInfoEXT}

Revision 9, 2022-09-18 (Daniel Rakos)
- Rename \texttt{vpsStdCount}, \texttt{pVpsStd}, \texttt{spsStdCount}, \texttt{pSpsStd}, \texttt{ppsStdCount}, and \texttt{pPpsStd} to \texttt{stdVPSCount}, \texttt{pStdVPSs}, \texttt{stdSPSCount}, \texttt{pStdSPSSs}, \texttt{stdPPSCount}, and \texttt{pStdPPSSs}, respectively, in \texttt{VkVideoEncodeH265SessionParametersAddInfoEXT}
- Rename \texttt{maxVpsStdCount}, \texttt{maxSpsStdCount}, and \texttt{maxPpsStdCount} to \texttt{maxStdVPSCount}, \texttt{maxStdSPSCount}, and \texttt{maxStdPPSCount}, respectively, in \texttt{VkVideoEncodeH265SessionParametersCreateInfoEXT}

Revision 10, 2023-03-06 (Daniel Rakos)
- Removed \texttt{VkVideoEncodeH265EmitPictureParametersInfoEXT}
- Changed member types in \texttt{VkVideoEncodeH265CapabilitiesEXT} and \texttt{VkVideoEncodeH265ReferenceListsInfoEXT} from \texttt{uint8_t} to \texttt{uint32_t}
- Changed the type of \texttt{VkVideoEncodeH265RateControlInfoEXT::subLayerCount} and \texttt{VkVideoEncodeH265RateControlLayerInfoEXT::temporalId} from \texttt{uint8_t} to \texttt{uint32_t}
- Removed `VkVideoEncodeH265InputModeFlagsEXT` and `VkVideoEncodeH265OutputModeFlagsEXT` as we only support frame-in-frame-out mode for now
- Rename `pCurrentPictureInfo` in `VkVideoEncodeH265VclFrameInfoEXT` to `pStdPictureInfo`
- Rename `pSliceSegmentHeaderStd` in `VkVideoEncodeH265NaluSliceSegmentInfoEXT` to `pStdSliceSegmentHeader`
- Rename `pReferenceFinalLists` in `VkVideoEncodeH265VclFrameInfoEXT` and `VkVideoEncodeH265NaluSliceSegmentInfoEXT` to `pStdReferenceFinalLists`
- Removed the `slotIndex` member of `VkVideoEncodeH265DpbSlotInfoEXT` and changed it to be chained to `VkVideoReferenceSlotInfoKHR`
- Replaced `VkVideoEncodeH265ReferenceListsInfoEXT` with the new Video Std header structure `StdVideoEncodeH265ReferenceLists`
- Added new capability flag `VK_VIDEO_ENCODE_H265_CAPABILITY_DIFFERENT_REFERENCE_FINAL_LISTS_BIT_EXT`

Revision 11, 2023-05-26 (Daniel Rakos)

- Renamed `VkVideoEncodeH265VclFrameInfoEXT` to `VkVideoEncodeH265PictureInfoEXT`
- Removed `VkVideoEncodeH265RateControlLayerInfoEXT::temporalId`
- Added `expectDyadicTemporalSubLayerPattern` capability
- Added the `VkVideoEncodeH265SessionParametersGetInfoEXT` structure to identify the H.265 parameter sets to retrieve encoded parameter data for, and the `VkVideoEncodeH265SessionParametersFeedbackInfoEXT` structure to retrieve H.265 parameter set override information when using the new `vkGetEncodedVideoSessionParametersKHR` command
- Added `VkVideoEncodeH265NaluSliceSegmentInfoEXT::constantQp` to specify per-slice segment constant QP when rate control mode is `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR`
- Added `VkVideoEncodeH265QualityLevelPropertiesEXT` for retrieving H.265 specific quality level recommendations
- Replaced `VkVideoEncodeH265RateControlStructureEXT` enum with the flags type `VkVideoEncodeH265RateControlFlagBitsEXT` and added HRD compliance flag
- Removed `useInitialRcQp` and `initialRcQp` members of `VkVideoEncodeH265RateControlLayerInfoEXT`
- Added `prefersGopRemainingFrames` and `requiresGopRemainingFrames`, and the new `VkVideoEncodeH265GopRemainingFrameInfoEXT` structure to allow specifying remaining frames of each type in the rate control GOP
- Renamed `maxSubLayersCount` capability to `maxSubLayerCount`
- Added `maxQp`, and `minQp` capabilities
- Added `maxLevelIdc` capability and new `VkVideoEncodeH265SessionCreateInfoEXT` structure to specify upper bounds on the H.265 level of the produced video bitstream
- Moved capability flags specific to codec syntax restrictions from `VkVideoEncodeH265CapabilityFlagsEXT` to the new `VkVideoEncodeH265StdFlagsEXT` which is now...
included as a separate stdSyntaxFlags member in VkVideoEncodeH265CapabilitiesEXT

- Added std prefix to codec syntax capabilities in VkVideoEncodeH265CapabilitiesEXT
- Removed VkVideoEncodeH265NaluSliceSegmentInfoEXT::ctbCount and VK_VIDEO_ENCODE_H265_CAPABILITY_SLICE_SEGMENT_CTB_COUNT_BIT_EXT
- Replaced VK_VIDEO_ENCODE_H265_CAPABILITY_MULTIPLE_SLICE_SEGMENTS_PER_FRAME_BIT_EXT with the new maxSliceSegmentCount capability
- Added maxTiles capability
- Removed codec syntax min/max capabilities from VkVideoEncodeH265CapabilitiesEXT
- Removed capability flag VK_VIDEO_ENCODE_H265_CAPABILITY_DIFFERENT_REFERENCE_FINAL_LISTS_BIT_EXT and removed pStdReferenceFinalLists members from the VkVideoEncodeH265PictureInfoEXT and VkVideoEncodeH265NaluSliceSegmentInfoEXT structures as reference lists info is now included in pStdPictureInfo
- Added capability flag VK_VIDEO_ENCODE_H265_CAPABILITY_B_FRAME_IN_L0_LIST_BIT_EXT

- Revision 12, 2023-07-19 (Daniel Rakos)
  - Added video std capability flags VK_VIDEO_ENCODE_H265_STD_SLICE_QP_DELTA_BIT_EXT and VK_VIDEO_ENCODE_H265_STD_DIFFERENT_SLICE_QP_DELTA_BIT_EXT
  - Fixed optionality of the array members of VkVideoEncodeH265SessionParametersAddInfoEXT
  - Fixed optionality of VkVideoEncodeH265RateControlInfoEXT::flags

- Revision 13, 2023-09-04 (Daniel Rakos)
  - Change extension from EXT to KHR
  - Extension is no longer provisional

- Revision 14, 2023-12-05 (Daniel Rakos)
  - Condition reference picture setup based on the value of StdVideoEncodeH265PictureInfo::flags.is_reference

Description

This extension builds upon the VK_KHR_video_queue extension by adding common APIs specific to video encoding and thus enabling implementations to expose queue families supporting video encode operations.

More specifically, it adds video encode specific capabilities and a new command buffer command that allows recording video encode operations against a video session.

This extension is to be used in conjunction with other codec specific video encode extensions that enable encoding video sequences of specific video compression standards.

New Commands

- vkCmdEncodeVideoKHR
- vkGetEncodedVideoSessionParametersKHR
- vkGetPhysicalDeviceVideoEncodeQualityLevelPropertiesKHR

New Structures

- VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR
- VkVideoEncodeInfoKHR
- VkVideoEncodeQualityLevelPropertiesKHR
- VkVideoEncodeRateControlLayerInfoKHR
- VkVideoEncodeSessionParametersFeedbackInfoKHR
- VkVideoEncodeSessionParametersGetInfoKHR

- Extending VkQueryPoolCreateInfo:
  - VkQueryPoolVideoEncodeFeedbackCreateInfoKHR

- Extending VkVideoCapabilitiesKHR:
  - VkVideoEncodeCapabilitiesKHR

- Extending VkVideoCodingControlInfoKHR, VkVideoBeginCodingInfoKHR:
  - VkVideoEncodeRateControlInfoKHR

- Extending VkVideoCodingControlInfoKHR, VkVideoSessionParametersCreateInfoKHR:
  - VkVideoEncodeQualityLevelInfoKHR

- Extending VkVideoProfileInfoKHR, VkQueryPoolCreateInfo:
  - VkVideoEncodeUsageInfoKHR

New Enums

- VkVideoEncodeCapabilityFlagBitsKHR
- VkVideoEncodeContentFlagBitsKHR
- VkVideoEncodeFeedbackFlagBitsKHR

4566
• VkVideoEncodeRateControlModeFlagBitsKHR
• VkVideoEncodeTuningModeKHR
• VkVideoEncodeUsageFlagBitsKHR

New Bitmasks
• VkVideoEncodeCapabilityFlagsKHR
• VkVideoEncodeContentFlagsKHR
• VkVideoEncodeFeedbackFlagsKHR
• VkVideoEncodeFlagsKHR
• VkVideoEncodeRateControlFlagsKHR
• VkVideoEncodeRateControlModeFlagsKHR
• VkVideoEncodeUsageFlagsKHR

New Enum Constants
• VK_KHR_VIDEO_ENCODE_QUEUE_EXTENSION_NAME
• VK_KHR_VIDEO_ENCODE_QUEUE_SPEC_VERSION

Extending VkAccessFlagBits2:
  ◦ VK_ACCESS_2_VIDEO_ENCODE_READ_BIT_KHR
  ◦ VK_ACCESS_2_VIDEO_ENCODE_WRITE_BIT_KHR

Extending VkBufferUsageFlagBits:
  ◦ VK_BUFFER_USAGE_VIDEO_ENCODE_DST_BIT_KHR
  ◦ VK_BUFFER_USAGE_VIDEO_ENCODE_SRC_BIT_KHR

Extending VkFormatFeatureFlagBits:
  ◦ VK_FORMAT_FEATURE_VIDEO_ENCODE_DPB_BIT_KHR
  ◦ VK_FORMAT_FEATURE_VIDEO_ENCODE_INPUT_BIT_KHR

Extending VkImageLayout:
  ◦ VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR
  ◦ VK_IMAGE_LAYOUT_VIDEO_ENCODE_DST_KHR
  ◦ VK_IMAGE_LAYOUT_VIDEO_ENCODE_SRC_KHR

Extending VkImageUsageFlagBits:
  ◦ VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR
  ◦ VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR
  ◦ VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR

Extending VkPipelineStageFlagBits2:
  ◦ VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR
• Extending `VkQueryResultStatusKHR`:
  ◦ `VK_QUERY_RESULT_STATUS_INSUFFICIENT_BITSTREAM_BUFFER_RANGE_KHR`

• Extending `VkQueryType`:
  ◦ `VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR`

• Extending `VkQueueFlagBits`:
  ◦ `VK_QUEUE_VIDEO_ENCODE_BIT_KHR`

• Extending `VkResult`:
  ◦ `VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR`

• Extending `VkStructureType`:
  ◦ `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VIDEO_ENCODE_QUALITY_LEVEL_INFO_KHR`
  ◦ `VK_STRUCTURE_TYPE_QUERY_POOL_VIDEO_ENCODE_FEEDBACK_CREATE_INFO_KHR`
  ◦ `VK_STRUCTURE_TYPE_VIDEO_ENCODE_CAPABILITIES_KHR`
  ◦ `VK_STRUCTURE_TYPE_VIDEO_ENCODE_INFO_KHR`
  ◦ `VK_STRUCTURE_TYPE_VIDEO_ENCODE_QUALITY_LEVEL_INFO_KHR`
  ◦ `VK_STRUCTURE_TYPE_VIDEO_ENCODE_QUALITY_LEVEL_PROPERTIES_KHR`
  ◦ `VK_STRUCTURE_TYPE_VIDEO_ENCODE_RATE_CONTROL_INFO_KHR`
  ◦ `VK_STRUCTURE_TYPE_VIDEO_ENCODE_RATE_CONTROL_LAYER_INFO_KHR`
  ◦ `VK_STRUCTURE_TYPE_VIDEO_ENCODE_SESSION_PARAMETERS_FEEDBACK_INFO_KHR`
  ◦ `VK_STRUCTURE_TYPE_VIDEO_ENCODE_SESSION_PARAMETERS_GET_INFO_KHR`
  ◦ `VK_STRUCTURE_TYPE_VIDEO_ENCODE_USAGE_INFO_KHR`

• Extending `VkVideoCodingControlFlagBitsKHR`:
  ◦ `VK_VIDEO_CODING_CONTROL_ENCODE_QUALITY_LEVEL_BIT_KHR`
  ◦ `VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR`

• Extending `VkVideoSessionCreateFlagBitsKHR`:
  ◦ `VK_VIDEO_SESSION_CREATE_ALLOW_ENCODE_PARAMETER_OPTIMIZATIONS_BIT_KHR`

If `VK_KHR_format_feature_flags2` or Version 1.3 is supported:

• Extending `VkFormatFeatureFlagBits2`:
  ◦ `VK_FORMAT_FEATURE_2_VIDEO_ENCODE_DPB_BIT_KHR`
  ◦ `VK_FORMAT_FEATURE_2_VIDEO_ENCODE_INPUT_BIT_KHR`

**Version History**

• Revision 1, 2018-07-23 (Ahmed Abdelkhalek)
  ◦ Initial draft

• Revision 1.1, 10/29/2019 (Tony Zlatinski)
- Updated the reserved spec tokens and renamed VkVideoEncoderKHR to VkVideoSessionKHR
- Revision 1.6, Jan 08 2020 (Tony Zlatinski)
  - API unify with the video_decode_queue spec
- Revision 2, March 29 2021 (Tony Zlatinski)
  - Spec and API updates.
- Revision 3, 2021-09-30 (Jon Leech)
  - Add interaction with VK_KHR_format_feature_flags2 to vk.xml
- Revision 4, 2022-02-10 (Ahmed Abdelkhalek)
  - Updates to encode capability interface
- Revision 5, 2022-03-31 (Ahmed Abdelkhalek)
  - Remove redundant VkVideoEncodeInfoKHR.codedExtent
- Revision 6, 2022-07-18 (Daniel Rakos)
  - Remove VkVideoEncodeRateControlFlagBitsKHR and VkVideoEncodeFlagBitsKHR as they contain no defined flags for now
  - Add VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR and VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_LAYER_BIT_KHR to indicate rate control and rate control layer change requests, respectively, in video coding control operations
- Revision 7, 2022-08-12 (Daniel Rakos)
  - Add VkVideoEncodeUsageInfoKHR structure and related flags
- Revision 8, 2023-03-06 (Daniel Rakos)
  - Replace VK_QUERY_TYPE_VIDEO_ENCODE_BITSTREAM_BUFFER_RANGE_KHR queries with more generic VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR queries that can be extended in the future with more feedback values
  - Rename dstBitstreamBuffer, dstBitstreamBufferOffset, and dstBitstreamBufferMaxRange in VkVideoEncodeInfoKHR to dstBuffer, dstBufferOffset, and dstBufferRange, respectively, for consistency with the naming convention in the video decode extensions
  - Change the type of rateControlLayerCount and qualityLevelCount in VkVideoEncodeCapabilitiesKHR from uint8_t to uint32_t and rename them to maxRateControlLayers and maxQualityLevels, respectively
  - Change the type of averageBitrate and maxBitrate in VkVideoEncodeRateControlLayerInfoKHR from uint32_t to uint64_t
  - Fixed the definition of rate control flag bits and added the new VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DEFAULT_KHR constant to indicate implementation-specific automatic rate control
  - Change the type of VkVideoEncodeRateControlInfoKHR::layerCount from uint8_t to uint32_t
  - Rename pLayerConfigs to pLayers in VkVideoEncodeRateControlInfoKHR
- Revision 9, 2023-03-28 (Daniel Rakos)
  - Removed VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_LAYER_BIT_KHR and the ability to
change the state of individual rate control layers

- Added new `VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_HAS_OVERRIDES_BIT_KHR` flag to video encode feedback queries
- Added new video session create flag `VK_VIDEO_SESSION_CREATE_ALLOW_ENCODE_PARAMETER_OPTIMIZATIONS_BIT_KHR` to opt-in to video session and encoding parameter optimizations
- Added the `vkGetEncodedVideoSessionParametersKHR` command to enable retrieving encoded video session parameter data
- Moved `virtualBufferSizeInMs` and `initialVirtualBufferSizeInMs` from `VkVideoEncodeRateControlLayerInfoKHR` to `VkVideoEncodeRateControlInfoKHR`
- Added `maxBitrate` capability
- Renamed `inputImageDataFillAlignment` capability to `encodeInputPictureGranularity` to better reflect its purpose
- Added new `vkGetPhysicalDeviceVideoEncodeQualityLevelPropertiesKHR` command and related structures to enable querying recommended settings for video encode quality levels
- Added `VK_VIDEO_CODING_CONTROL_ENCODE_QUALITY_LEVEL_BIT_KHR` flag and `VkVideoEncodeQualityLevelInfoKHR` structure to allow controlling video encode quality level and removed `qualityLevel` from the encode operation parameters

Revision 10, 2023-07-19 (Daniel Rakos)

- Added `VK_QUERY_RESULT_STATUS_INSUFFICIENT_BITSTREAM_BUFFER_RANGE_KHR` query result status code and the related capability flag `VK_VIDEO_ENCODE_CAPABILITY_INSUFFICIENT_BITSTREAM_BUFFER_RANGE_DETECTION_BIT_KHR`

Revision 11, 2023-09-04 (Daniel Rakos)

- Extension is no longer provisional

Revision 12, 2023-12-05 (Daniel Rakos)

- Require the specification of a reconstructed picture in all cases, except when the video session was created with no DPB slots to match shipping implementations
- Make DPB slot activation behavior codec-specific to continue allowing application control over reference picture setup now that a reconstructed picture is always mandatory

**VK_KHR_video_maintenance1**

• Daniel Rakos, RasterGrid

Description
VK_KHR_video_maintenance1 adds a collection of minor video coding features, none of which would warrant an entire extension of their own.

The new features are as follows:

• Allow creating buffers that can be used in video coding operations, independent of the used video profile, using the new buffer creation flag VK_BUFFER_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR.

• Allow creating images that can be used as decode output or encode input pictures, independent of the used video profile, using the new image creation flag VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR.

• Allow specifying queries used by video coding operations as part of the video coding command
parameters, instead of using begin/end query when the video session is created using the new video session creation flag VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceVideoMaintenance1FeaturesKHR

- Extending VkVideoDecodeInfoKHR, VkVideoEncodeInfoKHR:
  - VkVideoInlineQueryInfoKHR

New Enum Constants

- VK_KHR_VIDEO_MAINTENANCE_1_EXTENSION_NAME
- VK_KHR_VIDEO_MAINTENANCE_1_SPEC_VERSION

- Extending VkBufferCreateFlagBits:
  - VK_BUFFER_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR

- Extending VkImageCreateFlagBits:
  - VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR

- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VIDEO_MAINTENANCE_1_FEATURES_KHR
  - VK_STRUCTURE_TYPE_VIDEO_INLINE_QUERY_INFO_KHR

- Extending VkVideoSessionCreateFlagBitsKHR:
  - VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR

This extension provides common APIs to enable exposing queue families with support for video codec operations by introducing the following new object types and related functionalities:

- Video session objects that represent and maintain the state needed to perform video codec operations.
- Video session parameters objects that act as a container for codec specific parameters.

In addition, it also introduces query commands that allow applications to determine video coding related capabilities, and command buffer commands that enable recording video coding operations against a video session.
This extension is to be used in conjunction with other extensions that enable specific video coding operations.

**New Object Types**

- VkVideoSessionKHR
- VkVideoSessionParametersKHR

**New Commands**

- vkBindVideoSessionMemoryKHR
- vkCmdBeginVideoCodingKHR
- vkCmdControlVideoCodingKHR
- vkCmdEndVideoCodingKHR
- vkCreateVideoSessionKHR
- vkCreateVideoSessionParametersKHR
- vkDestroyVideoSessionKHR
- vkDestroyVideoSessionParametersKHR
- vkGetPhysicalDeviceVideoCapabilitiesKHR
- vkGetPhysicalDeviceVideoFormatPropertiesKHR
- vkGetVideoSessionMemoryRequirementsKHR
- vkUpdateVideoSessionParametersKHR

**New Structures**

- VkBindVideoSessionMemoryInfoKHR
- VkPhysicalDeviceVideoFormatInfoKHR
- VkVideoBeginCodingInfoKHR
- VkVideoCapabilitiesKHR
- VkVideoCodingControlInfoKHR
- VkVideoEndCodingInfoKHR
- VkVideoFormatPropertiesKHR
- VkVideoPictureResourceInfoKHR
- VkVideoReferenceSlotInfoKHR
- VkVideoSessionCreateInfoKHR
- VkVideoSessionMemoryRequirementsKHR
- VkVideoSessionParametersCreateInfoKHR
- VkVideoSessionParametersUpdateInfoKHR

Extending VkPhysicalDeviceImageFormatInfo2, VkPhysicalDeviceVideoFormatInfoKHR
VkImageCreateInfo, VkBufferCreateInfo:
  • VkVideoProfileListInfoKHR

• Extending VkQueryPoolCreateInfo:
  • VkVideoProfileInfoKHR

• Extending VkQueueFamilyProperties2:
  • VkQueueFamilyQueryResultStatusPropertiesKHR
  • VkQueueFamilyVideoPropertiesKHR

New Enums

• VkQueryResultStatusKHR
• VkVideoCapabilityFlagBitsKHR
• VkVideoChromaSubsamplingFlagBitsKHR
• VkVideoCodecOperationFlagBitsKHR
• VkVideoCodingControlFlagBitsKHR
• VkVideoComponentBitDepthFlagBitsKHR
• VkVideoSessionCreateFlagBitsKHR

New Bitmasks

• VkVideoBeginCodingFlagsKHR
• VkVideoCapabilityFlagsKHR
• VkVideoChromaSubsamplingFlagsKHR
• VkVideoCodecOperationFlagsKHR
• VkVideoCodingControlFlagsKHR
• VkVideoComponentBitDepthFlagsKHR
• VkVideoEndCodingFlagsKHR
• VkVideoSessionCreateFlagsKHR
• VkVideoSessionParametersCreateFlagsKHR

New Enum Constants

• VK_KHR_VIDEO_QUEUE_EXTENSION_NAME
• VK_KHR_VIDEO_QUEUE_SPEC_VERSION

• Extending VkObjectType:
  • VK_OBJECT_TYPE_VIDEO_SESSION_KHR
  • VK_OBJECT_TYPE_VIDEO_SESSION_PARAMETERS_KHR

• Extending VkQueryResultFlagBits:
  • VK_QUERY_RESULT_WITH_STATUS_BIT_KHR
• Extending `VkQueryType`:
  ◦ `VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR`

• Extending `VkResult`:
  ◦ `VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR`
  ◦ `VK_ERROR_VIDEO_PICTURE_LAYOUT_NOT_SUPPORTED_KHR`
  ◦ `VK_ERROR_VIDEO_PROFILE_CODEC_NOT_SUPPORTED_KHR`
  ◦ `VK_ERROR_VIDEO_PROFILE_FORMAT_NOT_SUPPORTED_KHR`
  ◦ `VK_ERROR_VIDEO_PROFILE_OPERATION_NOT_SUPPORTED_KHR`
  ◦ `VK_ERROR_VIDEO_STD_VERSION_NOT_SUPPORTED_KHR`

• Extending `VkStructureType`:
  ◦ `VK_STRUCTURE_TYPE_BIND_VIDEO_SESSION_MEMORY_INFO_KHR`
  ◦ `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VIDEO_FORMAT_INFO_KHR`
  ◦ `VK_STRUCTURE_TYPE_QUEUE_FAMILY_QUERY_RESULT_STATUS_PROPERTIES_KHR`
  ◦ `VK_STRUCTURE_TYPE_QUEUE_FAMILY_VIDEO_PROPERTIES_KHR`
  ◦ `VK_STRUCTURE_TYPE_VIDEO_BEGIN_CODING_INFO_KHR`
  ◦ `VK_STRUCTURE_TYPE_VIDEO_CAPABILITIES_KHR`
  ◦ `VK_STRUCTURE_TYPE_VIDEO_CODING_CONTROL_INFO_KHR`
  ◦ `VK_STRUCTURE_TYPE_VIDEO_END_CODING_INFO_KHR`
  ◦ `VK_STRUCTURE_TYPE_VIDEO_FORMAT_PROPERTIES_KHR`
  ◦ `VK_STRUCTURE_TYPE_VIDEO_PICTURE_RESOURCE_INFO_KHR`
  ◦ `VK_STRUCTURE_TYPE_VIDEO_PROFILE_INFO_KHR`
  ◦ `VK_STRUCTURE_TYPE_VIDEO_PROFILE_LIST_INFO_KHR`
  ◦ `VK_STRUCTURE_TYPE_VIDEO_REFERENCE_SLOT_INFO_KHR`
  ◦ `VK_STRUCTURE_TYPE_VIDEO_SESSION_CREATE_INFO_KHR`
  ◦ `VK_STRUCTURE_TYPE_VIDEO_SESSION_MEMORY_REQUIREMENTS_KHR`
  ◦ `VK_STRUCTURE_TYPE_VIDEO_SESSION_PARAMETERS_CREATE_INFO_KHR`
  ◦ `VK_STRUCTURE_TYPE_VIDEO_SESSION_PARAMETERS_UPDATE_INFO_KHR`

**Version History**

• Revision 0.1, 2019-11-21 (Tony Zlatinski)
  ◦ Initial draft

• Revision 0.2, 2019-11-27 (Tony Zlatinski)
  ◦ Make vulkan video core common between decode and encode

• Revision 1, March 29 2021 (Tony Zlatinski)
  ◦ Spec and API updates.
• Revision 2, August 1 2021 (Srinath Kumarapuram)
  ◦ Rename `VkVideoCapabilitiesFlagBitsKHR` to `VkVideoCapabilityFlagBitsKHR` (along with the names of enumerants it defines) and `VkVideoCapabilitiesFlagsKHR` to `VkVideoCapabilityFlagsKHR`, following Vulkan naming conventions.

• Revision 3, 2022-03-16 (Ahmed Abdelkhalek)
  ◦ Relocate Std header version reporting/requesting from codec-operation specific extensions to this extension.
  ◦ Make Std header versions codec-operation specific instead of only codec-specific.

• Revision 4, 2022-05-30 (Daniel Rakos)
  ◦ Refactor the video format query APIs and related language
  ◦ Extend `VkResult` with video-specific error codes

• Revision 5, 2022-08-11 (Daniel Rakos)
  ◦ Add `VkVideoSessionParametersCreateFlagsKHR`
  ◦ Remove `VkVideoCodingQualityPresetFlagsKHR`
  ◦ Rename `VkQueueFamilyQueryResultStatusProperties2KHR` to `VkQueueFamilyQueryResultStatusPropertiesKHR`
  ◦ Rename `VkVideoQueueFamilyProperties2KHR` to `VkQueueFamilyVideoPropertiesKHR`
  ◦ Rename `VkVideoProfileKHR` to `VkVideoProfileInfoKHR`
  ◦ Rename `VkVideoProfilesKHR` to `VkVideoProfileListInfoKHR`
  ◦ Rename `VkVideoGetMemoryPropertiesKHR` to `VkVideoSessionMemoryRequirementsKHR`
  ◦ Rename `VkVideoBindMemoryKHR` to `VkBindVideoSessionMemoryInfoKHR`
  ◦ Fix `pNext` constness of `VkPhysicalDeviceVideoFormatInfoKHR` and `VkVideoSessionMemoryRequirementsKHR`
  ◦ Fix incorrectly named value enums in bit enum types `VkVideoCodecOperationFlagBitsKHR` and `VkVideoChromaSubsamplingFlagBitsKHR`
  ◦ Remove unnecessary default values from `VkVideoSessionCreateFlagBitsKHR` and `VkVideoCodingControlFlagBitsKHR`
  ◦ Eliminate nested pointer in `VkVideoSessionMemoryRequirementsKHR`
  ◦ Rename `VkVideoPictureResourceKHR` to `VkVideoPictureResourceInfoKHR`
  ◦ Rename `VkVideoReferenceSlotKHR` to `VkVideoReferenceSlotInfoKHR`

• Revision 6, 2022-09-18 (Daniel Rakos)
  ◦ Rename the `maxReferencePicturesSlotsCount` and `maxReferencePicturesActiveCount` fields of `VkVideoCapabilitiesKHR` and `VkVideoSessionCreateInfoKHR` to `maxDpbSlots` and `maxActiveReferencePictures`, respectively, to clarify their meaning
  ◦ Rename `capabilityFlags` to `flags` in `VkVideoCapabilitiesKHR`
  ◦ Rename `videoPictureExtentGranularity` to `pictureAccessGranularity` in `VkVideoCapabilitiesKHR`
- Rename `minExtent` and `maxExtent` to `minCodedExtent` and `maxCodedExtent`, respectively, in `VkVideoCapabilitiesKHR`
- Rename `referencePicturesFormat` to `referencePictureFormat` in `VkVideoSessionCreateInfoKHR`

- Revision 7, 2022-09-26 (Daniel Rakos)
  - Change type of `VkVideoReferenceSlotInfoKHR::slotIndex` from `int8_t` to `int32_t`
- Revision 8, 2022-09-29 (Daniel Rakos)
  - Extension is no longer provisional

- Ian Elliott, LunarG
- Courtney Goeltzenleuchter, LunarG
Description

The **VK_KHR_wayland_surface** extension is an instance extension. It provides a mechanism to create a `VkSurfaceKHR` object (defined by the **VK_KHR_surface** extension) that refers to a Wayland `wl_surface`, as well as a query to determine support for rendering to a Wayland compositor.

New Commands

- `vkCreateWaylandSurfaceKHR`
- `vkGetPhysicalDeviceWaylandPresentationSupportKHR`

New Structures

- `VkWaylandSurfaceCreateInfoKHR`

New Bitmasks

- `VkWaylandSurfaceCreateFlagsKHR`

New Enum Constants

- `VK_KHR_WAYLAND_SURFACE_EXTENSION_NAME`
- `VK_KHR_WAYLAND_SURFACE_SPEC_VERSION`

Extending `VkStructureType`:

- `VK_STRUCTURE_TYPE_WAYLAND_SURFACE_CREATE_INFO_KHR`

Issues

1) Does Wayland need a way to query for compatibility between a particular physical device and a specific Wayland display? This would be a more general query than `vkGetPhysicalDeviceSurfaceSupportKHR`: if the Wayland-specific query returned `VK_TRUE` for a
(VkPhysicalDevice, struct wl_display*) pair, then the physical device could be assumed to support presentation to any VkSurfaceKHR for surfaces on the display.

**RESOLVED:** Yes.VkGetPhysicalDeviceWaylandPresentationSupportKHR was added to address this issue.

2) Should we require surfaces created with vkCreateWaylandSurfaceKHR to support the VK_PRESENT_MODE_MAILBOX_KHR present mode?

**RESOLVED:** Yes. Wayland is an inherently mailbox window system and mailbox support is required for some Wayland compositor interactions to work as expected. While handling these interactions may be possible with VK_PRESENT_MODE_FIFO_KHR, it is much more difficult to do without deadlock and requiring all Wayland applications to be able to support implementations which only support VK_PRESENT_MODE_FIFO_KHR would be an onerous restriction on application developers.

### Version History

- Revision 1, 2015-09-23 (Jesse Hall)
  - Initial draft, based on the previous contents of VK_EXT_KHR_swapchain (later renamed VK_EXT_KHR_surface).
- Revision 2, 2015-10-02 (James Jones)
  - Added vkGetPhysicalDeviceWaylandPresentationSupportKHR() to resolve issue #1.
  - Adjusted wording of issue #1 to match the agreed-upon solution.
  - Renamed “window” parameters to “surface” to match Wayland conventions.
- Revision 3, 2015-10-26 (Ian Elliott)
  - Renamed from VK_EXT_KHR_wayland_surface to VK_KHR_wayland_surface.
- Revision 4, 2015-11-03 (Daniel Rakos)
  - Added allocation callbacks to vkCreateWaylandSurfaceKHR.
- Revision 5, 2015-11-28 (Daniel Rakos)
  - Updated the surface create function to take a pCreateInfo structure.
- Revision 6, 2017-02-08 (Faith Ekstrand)
  - Added the requirement that implementations support VK_PRESENT_MODE_MAILBOX_KHR.
  - Added wording about interactions between vkQueuePresentKHR and the Wayland requests sent to the compositor.

**VK_KHR_win32_keyed_mutex**

**Name String**

VK_KHR_win32_keyed_mutex

**Extension Type**

Device extension
Applications that wish to import Direct3D 11 memory objects into the Vulkan API may wish to use the native keyed mutex mechanism to synchronize access to the memory between Vulkan and Direct3D. This extension provides a way for an application to access the keyed mutex associated with an imported Vulkan memory object when submitting command buffers to a queue.

**New Structures**

- Extending `VkSubmitInfo`, `VkSubmitInfo2`:
  - `VkWin32KeyedMutexAcquireReleaseInfoKHR`

**New Enum Constants**

- `VK_KHR_WIN32_KEYED_MUTEX_EXTENSION_NAME`
- `VK_KHR_WIN32_KEYED_MUTEX_SPEC_VERSION`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_WIN32_KEYED_MUTEX_ACQUIRE_RELEASE_INFO_KHR`
Version History

- Revision 1, 2016-10-21 (James Jones)
  - Initial revision

Description

The `VK_KHR_win32_surface` extension is an instance extension. It provides a mechanism to create a `VkSurfaceKHR` object (defined by the `VK_KHR_surface` extension) that refers to a Win32 `HWND`, as well as a query to determine support for rendering to the windows desktop.

New Commands

- `vkCreateWin32SurfaceKHR`
- `vkGetPhysicalDeviceWin32PresentationSupportKHR`

New Structures

- `VkWin32SurfaceCreateInfoKHR`

New Bitmasks

- `VkWin32SurfaceCreateFlagsKHR`

New Enum Constants

- `VK_KHR_WIN32_SURFACE_EXTENSION_NAME`
- `VK_KHR_WIN32_SURFACE_SPEC_VERSION`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_WIN32_SURFACE_CREATE_INFO_KHR`

Issues

1) Does Win32 need a way to query for compatibility between a particular physical device and a specific screen? Compatibility between a physical device and a window generally only depends on what screen the window is on. However, there is not an obvious way to identify a screen without already having a window on the screen.

**RESOLVED:** No. While it may be useful, there is not a clear way to do this on Win32. However, a method was added to query support for presenting to the windows desktop as a whole.
2) If a native window object (HWND) is used by one graphics API, and then is later used by a different graphics API (one of which is Vulkan), can these uses interfere with each other?

**RESOLVED:** Yes.

Uses of a window object by multiple graphics APIs results in undefined behavior. Such behavior may succeed when using one Vulkan implementation but fail when using a different Vulkan implementation. Potential failures include:

- Creating then destroying a flip presentation model DXGI swapchain on a window object can prevent `vkCreateSwapchainKHR` from succeeding on the same window object.
- Creating then destroying a `VkSwapchainKHR` on a window object can prevent creation of a bitblt model DXGI swapchain on the same window object.
- Creating then destroying a `VkSwapchainKHR` on a window object can effectively `SetPixelFormat` to a different format than the format chosen by an OpenGL application.
- Creating then destroying a `VkSwapchainKHR` on a window object on one `VkPhysicalDevice` can prevent `vkCreateSwapchainKHR` from succeeding on the same window object, but on a different `VkPhysicalDevice` that is associated with a different Vulkan ICD.

In all cases the problem can be worked around by creating a new window object.

Technical details include:

- Creating a DXGI swapchain over a window object can alter the object for the remainder of its lifetime. The alteration persists even after the DXGI swapchain has been destroyed. This alteration can make it impossible for a conformant Vulkan implementation to create a `VkSwapchainKHR` over the same window object. Mention of this alteration can be found in the remarks section of the MSDN documentation for `DXGI_SWAP_EFFECT`.
- Calling GDI's `SetPixelFormat` (needed by OpenGL's WGL layer) on a window object alters the object for the remainder of its lifetime. The MSDN documentation for `SetPixelFormat` explains that a window object's pixel format can be set only one time.
- Creating a `VkSwapchainKHR` over a window object can alter the object for its remaining lifetime. Either of the above alterations may occur as a side effect of `vkCreateSwapchainKHR`.

**Version History**

- Revision 1, 2015-09-23 (Jesse Hall)
  - Initial draft, based on the previous contents of VK_EXT_KHR_swapchain (later renamed VK_EXT_KHR_surface).
- Revision 2, 2015-10-02 (James Jones)
  - Added presentation support query for win32 desktops.
- Revision 3, 2015-10-26 (Ian Elliott)
  - Renamed from VK_EXT_KHR_win32_surface to VK_KHR_win32_surface.
- Revision 4, 2015-11-03 (Daniel Rakos)
  - Added allocation callbacks to `vkCreateWin32SurfaceKHR`. 
• Revision 5, 2015-11-28 (Daniel Rakos)
  ◦ Updated the surface create function to take a pCreateInfo structure.
• Revision 6, 2017-04-24 (Jeff Juliano)
  ◦ Add issue 2 addressing reuse of a native window object in a different Graphics API, or by a different Vulkan ICD.

Description

This extension adds Vulkan support for the SPV_KHR_workgroup_memory_explicit_layout SPIR-V extension, which allows shaders to explicitly define the layout of Workgroup storage class memory and create aliases between variables from that storage class in a compute shader.

The aliasing feature allows different “views” on the same data, so the shader can bulk copy data from another storage class using one type (e.g. an array of large vectors), and then use the data with a more specific type. It also enables reducing the amount of workgroup memory consumed by allowing the shader to alias data whose lifetimes do not overlap.

The explicit layout support and some form of aliasing is also required for layering OpenCL on top of Vulkan.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceWorkgroupMemoryExplicitLayoutFeaturesKHR

New Enum Constants

- VK_KHR_WORKGROUP_MEMORY_EXPLICIT_LAYOUT_EXTENSION_NAME
- VK_KHR_WORKGROUP_MEMORY_EXPLICIT_LAYOUT_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_WORKGROUP_MEMORY_EXPLICIT_LAYOUT_FEATURES_KHR

New SPIR-V Capabilities

- WorkgroupMemoryExplicitLayoutKHR
- WorkgroupMemoryExplicitLayout8BitAccessKHR
- WorkgroupMemoryExplicitLayout16BitAccessKHR

Version History

- Revision 1, 2020-06-01 (Caio Marcelo de Oliveira Filho)
  - Initial version

Description

The `VK_KHR_xcb_surface` extension is an instance extension. It provides a mechanism to create a `VkSurfaceKHR` object (defined by the `VK_KHR_surface` extension) that refers to an X11 Window, using the XCB client-side library, as well as a query to determine support for rendering via XCB.

New Commands

• `vkCreateXcbSurfaceKHR`
• `vkGetPhysicalDeviceXcbPresentationSupportKHR`

New Structures

• `VkXcbSurfaceCreateInfoKHR`

New Bitmasks

• `VkXcbSurfaceCreateFlagsKHR`

New Enum Constants

• `VK_KHR_XCB_SURFACE_EXTENSION_NAME`
• `VK_KHR_XCB_SURFACE_SPEC_VERSION`

Extending `VkStructureType`:

◦ `VK_STRUCTURE_TYPE_XCB_SURFACE_CREATE_INFO_KHR`

Issues

1) Does XCB need a way to query for compatibility between a particular physical device and a specific screen? This would be a more general query than `vkGetPhysicalDeviceSurfaceSupportKHR`: If it returned `VK_TRUE`, then the physical device could be assumed to support presentation to any window on that screen.

**RESOLVED**: Yes, this is needed for toolkits that want to create a `VkDevice` before creating a window. To ensure the query is reliable, it must be made against a particular X visual rather than the screen in general.

Version History

• Revision 1, 2015-09-23 (Jesse Hall)
  ◦ Initial draft, based on the previous contents of VK_EXT_KHR_swapchain (later renamed VK_EXT_KHR_surface).
• Revision 2, 2015-10-02 (James Jones)
  ◦ Added presentation support query for an `(xcb_connection_t*, xcb_visualid_t)` pair.
- Removed “root” parameter from CreateXcbSurfaceKHR(), as it is redundant when a window on the same screen is specified as well.
- Adjusted wording of issue #1 and added agreed upon resolution.

- Revision 3, 2015-10-14 (Ian Elliott)
  - Removed “root” parameter from CreateXcbSurfaceKHR() in one more place.

- Revision 4, 2015-10-26 (Ian Elliott)
  - Renamed from VK_EXT_KHR_xcb_surface to VK_KHR_xcb_surface.

- Revision 5, 2015-10-23 (Daniel Rakos)
  - Added allocation callbacks to vkCreateXcbSurfaceKHR.

- Revision 6, 2015-11-28 (Daniel Rakos)
  - Updated the surface create function to take a pCreateInfo structure.

Description
This extension allows an application to take exclusive control on a display currently associated with an X11 screen. When control is acquired, the display will be deassociated from the X11 screen until control is released or the specified display connection is closed. Essentially, the X11 screen will behave as if the monitor has been unplugged until control is released.
New Commands

- `vkAcquireXlibDisplayEXT`
- `vkGetRandROutputDisplayEXT`

New Enum Constants

- `VK_EXT_ACQUIRE_XLIB_DISPLAY_EXTENSION_NAME`
- `VK_EXT_ACQUIRE_XLIB_DISPLAY_SPEC_VERSION`

Issues

1) Should `vkAcquireXlibDisplayEXT` take an RandR display ID, or a Vulkan display handle as input?

**RESOLVED:** A Vulkan display handle. Otherwise there would be no way to specify handles to displays that had been prevented from being included in the X11 display list by some native platform or vendor-specific mechanism.

2) How does an application figure out which RandR display corresponds to a Vulkan display?

**RESOLVED:** A new function, `vkGetRandROutputDisplayEXT`, is introduced for this purpose.

3) Should `vkGetRandROutputDisplayEXT` be part of this extension, or a general Vulkan / RandR or Vulkan / Xlib extension?

**RESOLVED:** To avoid yet another extension, include it in this extension.

Description

The existing specification requires that low dynamic range (LDR) ASTC textures are decompressed to FP16 values per component. In many cases, decompressing LDR textures to a lower precision intermediate result gives acceptable image quality. Source material for LDR textures is typically authored as 8-bit UNORM values, so decoding to FP16 values adds little value. On the other hand, reducing precision of the decoded result reduces the size of the decompressed data, potentially improving texture cache performance and saving power.

The goal of this extension is to enable this efficiency gain on existing ASTC texture data. This is achieved by giving the application the ability to select the intermediate decoding precision.

Three decoding options are provided:

• Decode to VK_FORMAT_R16G16B16A16_SFLOAT precision: This is the default, and matches the required behavior in the core API.

• Decode to VK_FORMAT_R8G8B8A8_UNORM precision: This is provided as an option in LDR mode.

• Decode to VK_FORMAT_E5B9G9R9_UFLOAT_PACK32 precision: This is provided as an option in both LDR and HDR mode. In this mode, negative values cannot be represented and are clamped to zero. The alpha component is ignored, and the results are as if alpha was 1.0. This decode mode is optional and support can be queried via the physical device properties.

New Structures

• Extending VkImageViewCreateInfo:
  ◦ VkImageViewASTCDecodeModeEXT

• Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  ◦ VkPhysicalDeviceASTCDecodeFeaturesEXT
New Enum Constants

- VK_EXT_ASTC DECODE_MODE_EXTENSION_NAME
- VK_EXT_ASTC DECODE_MODE_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_IMAGE_VIEW_ASTC_DECODE_MODE_EXT
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ASTC_DECODE_FEATURES_EXT

Issues

1) Are implementations allowed to decode at a higher precision than what is requested?

RESOLUTION: No.
If we allow this, then this extension could be exposed on all implementations that support ASTC.
But developers would have no way of knowing what precision was actually used, and thus whether the image quality is sufficient at reduced precision.

2) Should the decode mode be image view state and/or sampler state?

RESOLUTION: Image view state only.
Some implementations treat the different decode modes as different texture formats.

Example

Create an image view that decodes to VK_FORMAT_R8G8B8A8_UNORM precision:

```c
VkImageViewASTCDecodeModeEXT decodeMode =
{
    .sType = VK_STRUCTURE_TYPE_IMAGE_VIEW_ASTC_DECODE_MODE_EXT,
    .pNext = NULL,
    .decodeMode = VK_FORMAT_R8G8B8A8_UNORM
};

VkImageViewCreateInfo createInfo =
{
    .sType = VK_STRUCTURE_TYPE_IMAGE_VIEW_CREATE_INFO,
    .pNext = &decodeMode,
    // flags, image, viewType set to application-desired values
    .format = VK_FORMAT_ASTC_8x8_UNORM_BLOCK,
    // components, subresourceRange set to application-desired values
};

VkImageView imageView;
```
VkResult result = vkCreateImageView(
    device,
    &createInfo,
    NULL,
    &imageView);

Extension and Version Dependencies
  VK_KHR_get_physical_device_properties2
  or
This extension adds a number of “advanced” blending operations that can be used to perform new color blending operations, many of which are more complex than the standard blend modes provided by unextended Vulkan. This extension requires different styles of usage, depending on the level of hardware support and the enabled features:

- If `VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT::advancedBlendCoherentOperations` is `VK_FALSE`, the new blending operations are supported, but a memory dependency must separate each advanced blend operation on a given sample. `VK_ACCESS_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT` is used to synchronize reads using advanced blend operations.
- If `VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT::advancedBlendCoherentOperations` is `VK_TRUE`, advanced blend operations obey primitive order just like basic blend operations.

In unextended Vulkan, the set of blending operations is limited, and can be expressed very simply. The `VK_BLEND_OP_MIN` and `VK_BLEND_OP_MAX` blend operations simply compute component-wise minimums or maximums of source and destination color components. The `VK_BLEND_OP_ADD`, `VK_BLEND_OP_SUBTRACT`, and `VK_BLEND_OP_REVERSE_SUBTRACT` modes multiply the source and destination colors by source and destination factors and either add the two products together or subtract one from the other. This limited set of operations supports many common blending operations but precludes the use of more sophisticated transparency and blending operations commonly available in many dedicated imaging APIs.

This extension provides a number of new “advanced” blending operations. Unlike traditional blending operations using `VK_BLEND_OP_ADD`, these blending equations do not use source and destination factors specified by `VkBlendFactor`. Instead, each blend operation specifies a complete equation based on the source and destination colors. These new blend operations are used for both RGB and alpha components; they must not be used to perform separate RGB and alpha blending (via different values of color and alpha `VkBlendOp`).

These blending operations are performed using premultiplied colors, where RGB colors can be considered premultiplied or non-premultiplied by alpha, according to the `srcPremultiplied` and `dstPremultiplied` members of `VkPipelineColorBlendAdvancedStateCreateInfoEXT`. If a color is considered non-premultiplied, the (R,G,B) color components are multiplied by the alpha component prior to blending. For non-premultiplied color components in the range [0,1], the corresponding
premultiplied color component would have values in the range $[0 \times A, 1 \times A]$. Many of these advanced blending equations are formulated where the result of blending source and destination colors with partial coverage have three separate contributions: from the portions covered by both the source and the destination, from the portion covered only by the source, and from the portion covered only by the destination. The blend parameter `VkPipelineColorBlendAdvancedStateCreateInfoEXT::blendOverlap` can be used to specify a correlation between source and destination pixel coverage. If set to `VK_BLEND_OVERLAP_CONJOINT_EXT`, the source and destination are considered to have maximal overlap, as would be the case if drawing two objects on top of each other. If set to `VK_BLEND_OVERLAP_DISJOINT_EXT`, the source and destination are considered to have minimal overlap, as would be the case when rendering a complex polygon tessellated into individual non-intersecting triangles. If set to `VK_BLEND_OVERLAP_UNCORRELATED_EXT`, the source and destination coverage are assumed to have no spatial correlation within the pixel.

In addition to the coherency issues on implementations not supporting `advancedBlendCoherentOperations`, this extension has several limitations worth noting. First, the new blend operations have a limit on the number of color attachments they can be used with, as indicated by `VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT::advancedBlendMaxColorAttachments`. Additionally, blending precision may be limited to 16-bit floating-point, which may result in a loss of precision and dynamic range for framebuffer formats with 32-bit floating-point components, and in a loss of precision for formats with 12- and 16-bit signed or unsigned normalized integer components.

**New Structures**

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:

Description

After the publication of VK_EXT_custom_border_color, it was discovered that some implementations had undefined behavior when combining a sampler that uses a custom border color with image views whose component mapping is not the identity mapping.

Since VK_EXT_custom_border_color has already shipped, this new extension VK_EXT_border_color_swizzle was created to define the interaction between custom border colors and non-identity image view swizzles, and provide a work-around for implementations that must pre-swizzle the sampler border color to match the image view component mapping it is combined with.

This extension also defines the behavior between samplers with an opaque black border color and image views with a non-identity component swizzle, which was previously left undefined.

Description
This extension allows for selectively enabling and disabling writes to output color attachments via a pipeline dynamic state.

The intended use cases for this new state are mostly identical to those of colorWriteMask, such as selectively disabling writes to avoid feedback loops between subpasses or bandwidth savings for unused outputs. By making the state dynamic, one additional benefit is the ability to reduce pipeline counts and pipeline switching via shaders that write a superset of the desired data of which subsets are selected dynamically. The reason for a new state, colorWriteEnable, rather than making colorWriteMask dynamic is that, on many implementations, the more flexible per-component semantics of the colorWriteMask state cannot be made dynamic in a performant manner.

Description

This extension allows the execution of one or more rendering commands to be conditional on a value in buffer memory. This may help an application reduce the latency by conditionally discarding rendering commands without application intervention. The conditional rendering commands are limited to draws, compute dispatches and clearing attachments within a conditional rendering block.

New Commands

- `vkCmdBeginConditionalRenderingEXT`
- `vkCmdEndConditionalRenderingEXT`

New Structures

- `VkConditionalRenderingBeginInfoEXT`
- Extending `VkCommandBufferInheritanceInfo`:
  - `VkCommandBufferInheritanceConditionalRenderingInfoEXT`
- Extending `VkPhysicalDeviceFeatures2,VkDeviceCreateInfo`:
  - `VkPhysicalDeviceConditionalRenderingFeaturesEXT`

New Enums

- `VkConditionalRenderingFlagBitsEXT`

New Bitmasks

- `VkConditionalRenderingFlagsEXT`

New Enum Constants

- `VK_EXT_CONDITIONAL_RENDERING_EXTENSION_NAME`
- `VK_EXT_CONDITIONAL_RENDERING_SPEC_VERSION`
- Extending `VkAccessFlagBits`:
  - `VK_ACCESS_CONDITIONAL_RENDERING_READ_BIT_EXT`
- Extending `VkBufferUsageFlagBits`:
  - `VK_BUFFER_USAGE_CONDITIONAL_RENDERING_BIT_EXT`
- Extending `VkPipelineStageFlagBits`:
  - `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_CONDITIONAL_RENDERING_INFO_EXT`
  - `VK_STRUCTURE_TYPE_CONDITIONAL_RENDERING_BEGIN_INFO_EXT`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CONDITIONAL_RENDERING_FEATURES_EXT`
Issues

1) Should conditional rendering affect copy and blit commands?

RESOLVED: Conditional rendering should not affect copies and blits.

2) Should secondary command buffers be allowed to execute while conditional rendering is active in the primary command buffer?

RESOLVED: The rendering commands in secondary command buffer will be affected by an active conditional rendering in primary command buffer if the conditionalRenderingEnable is set to VK_TRUE. Conditional rendering must not be active in the primary command buffer if conditionalRenderingEnable is VK_FALSE.

Examples

None.

Description

This extension adds a new rasterization mode called conservative rasterization. There are two modes of conservative rasterization: overestimation and underestimation.

When overestimation is enabled, if any part of the primitive, including its edges, covers any part of the rectangular pixel area, including its sides, then a fragment is generated with all coverage samples turned on. This extension allows for some variation in implementations by accounting for differences in overestimation, where the generating primitive size is increased at each of its edges by some sub-pixel amount to further increase conservative pixel coverage. Implementations can allow the application to specify an extra overestimation beyond the base overestimation the implementation already does. It also allows implementations to either cull degenerate primitives or rasterize them.

When underestimation is enabled, fragments are only generated if the rectangular pixel area is fully covered by the generating primitive. If supported by the implementation, when a pixel rectangle is fully covered the fragment shader input variable builtin called `FullyCoveredEXT` is set to true. The shader variable works in either overestimation or underestimation mode.
Implementations can process degenerate triangles and lines by either discarding them or generating conservative fragments for them. Degenerate triangles are those that end up with zero area after the rasterizer quantizes them to the fixed-point pixel grid. Degenerate lines are those with zero length after quantization.

New Structures

- Extending `VkPhysicalDeviceProperties2`:
  - `VkPhysicalDeviceConservativeRasterizationPropertiesEXT`

- Extending `VkPipelineRasterizationStateCreateInfo`:
  - `VkPipelineRasterizationConservativeStateCreateInfoEXT`

New Enums

- `VkConservativeRasterizationModeEXT`

New Bitmasks

- `VkPipelineRasterizationConservativeStateCreateFlagsEXT`

New Enum Constants

- `VK_EXT_CONSERVATIVE_RASTERIZATION_EXTENSION_NAME`
- `VK_EXT_CONSERVATIVE_RASTERIZATION_SPEC_VERSION`

- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CONSERVATIVE_RASTERIZATION_PROPERTIES_EXT`
  - `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_CONSERVATIVE_STATE_CREATE_INFO_EXT`

New Built-In Variables

- `FullyCoveredEXT`

New SPIR-V Capabilities

- `FragmentFullyCoveredEXT`

Version History

- Revision 1.1, 2020-09-06 (Piers Daniell)
  - Add missing SPIR-V and GLSL dependencies.

Description

This extension provides cross-vendor functionality to specify a custom border color for use when the sampler address mode `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER` is used.

To create a sampler which uses a custom border color set `VkSamplerCreateInfo::borderColor` to one of:

- `VK_BORDER_COLOR_FLOAT_CUSTOM_EXT`
- `VK_BORDER_COLOR_INT_CUSTOM_EXT`

When `VK_BORDER_COLOR_FLOAT_CUSTOM_EXT` or `VK_BORDER_COLOR_INT_CUSTOM_EXT` is used, applications must provide a `VkSamplerCustomBorderColorCreateInfoEXT` in the `pNext` chain for `VkSamplerCreateInfo`.

New Structures

- Extending `VkPhysicalDeviceFeatures2, VkDeviceCreateInfo`:
  - `VkPhysicalDeviceCustomBorderColorFeaturesEXT`

- Extending `VkPhysicalDeviceProperties2`:
  - `VkPhysicalDeviceCustomBorderColorPropertiesEXT`

- Extending `VkSamplerCreateInfo`:
  - `VkSamplerCustomBorderColorCreateInfoEXT`

New Enum Constants

- `VK_EXT_CUSTOM_BORDER_COLOR_EXTENSION_NAME`
- `VK_EXT_CUSTOM_BORDER_COLOR_SPEC_VERSION`

- Extending `VkBorderColor`:
  - `VK_BORDER_COLOR_FLOAT_CUSTOM_EXT`
  - `VK_BORDER_COLOR_INT_CUSTOM_EXT`

- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CUSTOM_BORDER_COLOR_FEATURES_EXT`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CUSTOM_BORDER_COLOR_PROPERTIES_EXT`
Issues

1) Should VkClearColorValue be used for the border color value, or should we have our own struct/union? Do we need to specify the type of the input values for the components? This is more of a concern if VkClearColorValue is used here because it provides a union of float, int, uint types.

**RESOLVED:** Will reuse existing VkClearColorValue structure in order to easily take advantage of float, int, uint borderColor types.

2) For hardware which supports a limited number of border colors what happens if that number is exceeded? Should this be handled by the driver unbeknownst to the application? In Revision 1 we had solved this issue using a new Object type, however that may have lead to additional system resource consumption which would otherwise not be required.

**RESOLVED:** Added VkPhysicalDeviceCustomBorderColorPropertiesEXT::maxCustomBorderColorSamplers for tracking implementation-specific limit, and Valid Usage statement handling overflow.

3) Should this be supported for immutable samplers at all, or by a feature bit? Some implementations may not be able to support custom border colors on immutable samplers — is it worthwhile enabling this to work on them for implementations that can support it, or forbidding it entirely.

**RESOLVED:** Samplers created with a custom border color are forbidden from being immutable. This resolves concerns for implementations where the custom border color is an index to a LUT instead of being directly embedded into sampler state.

4) Should UINT and SINT (unsigned integer and signed integer) border color types be separated or should they be combined into one generic INT (integer) type?

**RESOLVED:** Separating these does not make much sense as the existing fixed border color types do not have this distinction, and there is no reason in hardware to do so. This separation would also create unnecessary work and considerations for the application.

Version History

- Revision 1, 2019-10-10 (Joshua Ashton)
  - Internal revisions.
- Revision 2, 2019-10-11 (Liam Middlebrook)
  - Remove VkCustomBorderColor object and associated functions
  - Add issues concerning HW limitations for custom border color count
- Revision 3, 2019-10-12 (Joshua Ashton)
  - Re-expose the limits for the maximum number of unique border colors
  - Add extra details about border color tracking
  - Fix typos
- Revision 4, 2019-10-12 (Joshua Ashton)
- Changed maxUniqueCustomBorderColors to a uint32_t from a VkDeviceSize

- Revision 5, 2019-10-14 (Liam Middlebrook)
  - Added features bit

- Revision 6, 2019-10-15 (Joshua Ashton)
  - Type-ize VK BORDER COLOR CUSTOM
  - Fix const-ness on pNext of VkSamplerCustomBorderColorCreateInfoEXT

- Revision 7, 2019-11-26 (Liam Middlebrook)
  - Renamed maxUniqueCustomBorderColors to maxCustomBorderColors

- Revision 8, 2019-11-29 (Joshua Ashton)
  - Renamed borderColor member of VkSamplerCustomBorderColorCreateInfoEXT to customBorderColor

- Revision 9, 2020-02-19 (Joshua Ashton)
  - Renamed maxCustomBorderColors to maxCustomBorderColorSamplers

- Revision 10, 2020-02-21 (Joshua Ashton)
  - Added format to VkSamplerCustomBorderColorCreateInfoEXT and feature bit

- Revision 11, 2020-04-07 (Joshua Ashton)
  - Dropped UINT/SINT border color differences, consolidated types

- Revision 12, 2020-04-16 (Joshua Ashton)
  - Renamed VK BORDER COLOR CUSTOM_FLOAT_EXT to VK BORDER COLOR FLOAT CUSTOM_EXT for consistency

Extension and Version Dependencies

None
Due to the nature of the Vulkan interface, there is very little error information available to the developer and application. By using the `VK_EXT_debug_utils` extension, developers can obtain more information. When combined with validation layers, even more detailed feedback on the application’s use of Vulkan will be provided.
This extension provides the following capabilities:

- The ability to create a debug messenger which will pass along debug messages to an application supplied callback.
- The ability to identify specific Vulkan objects using a name or tag to improve tracking.
- The ability to identify specific sections within a `VkQueue` or `VkCommandBuffer` using labels to aid organization and offline analysis in external tools.

The main difference between this extension and `VK_EXT_debug_report` and `VK_EXT_debug_marker` is that those extensions use `VkDebugReportObjectTypeEXT` to identify objects. This extension uses the core `VkObjectType` in place of `VkDebugReportObjectTypeEXT`. The primary reason for this move is that no future object type handle enumeration values will be added to `VkDebugReportObjectTypeEXT` since the creation of `VkObjectType`.

In addition, this extension combines the functionality of both `VK_EXT_debug_report` and `VK_EXT_debug_marker` by allowing object name and debug markers (now called labels) to be returned to the application's callback function. This should assist in clarifying the details of a debug message including: what objects are involved and potentially which location within a `VkQueue` or `VkCommandBuffer` the message occurred.

**New Object Types**

- `VkDebugUtilsMessengerEXT`

**New Commands**

- `vkCmdBeginDebugUtilsLabelEXT`
- `vkCmdEndDebugUtilsLabelEXT`
- `vkCmdInsertDebugUtilsLabelEXT`
- `vkCreateDebugUtilsMessengerEXT`

- `vkQueueEndDebugUtilsLabelEXT`
- `vkQueueInsertDebugUtilsLabelEXT`
- `vkSetDebugUtilsObjectNameEXT`
- `vkSetDebugUtilsObjectTagEXT`
- `vkSubmitDebugUtilsMessageEXT`

**New Structures**

- `VkDebugUtilsLabelEXT`
- `VkDebugUtilsMessengerCallbackDataEXT`
- `VkDebugUtilsObjectTagInfoEXT`
- Extending `VkInstanceCreateInfo`: 4618
- \texttt{VkDebugUtilsMessengerCreateInfoEXT}
- Extending \texttt{VkPipelineShaderStageCreateInfo}:
  - \texttt{VkDebugUtilsObjectNameInfoEXT}

**New Function Pointers**

- \texttt{PFN_vkDebugUtilsMessengerCallbackEXT}

**New Enums**

- \texttt{VkDebugUtilsMessageSeverityFlagBitsEXT}
- \texttt{VkDebugUtilsMessageTypeFlagBitsEXT}

**New Bitmasks**

- \texttt{VkDebugUtilsMessageSeverityFlagsEXT}
- \texttt{VkDebugUtilsMessageTypeFlagsEXT}
- \texttt{VkDebugUtilsMessengerCallbackDataFlagsEXT}
- \texttt{VkDebugUtilsMessengerCreateFlagsEXT}

**New Enum Constants**

- \texttt{VK_EXT_DEBUG_UTILS_EXTENSION_NAME}
- \texttt{VK_EXT_DEBUG_UTILS_SPEC_VERSION}

- Extending \texttt{VkObjectType}:
  - \texttt{VK_OBJECT_TYPE_DEBUG_UTILS_MESSENGER_EXT}

- Extending \texttt{VkStructureType}:
  - \texttt{VK_STRUCTURE_TYPE_DEBUG_UTILS_LABEL_EXT}
  - \texttt{VK_STRUCTURE_TYPE_DEBUG_UTILS_MESSENGER_CALLBACK_DATA_EXT}
  - \texttt{VK_STRUCTURE_TYPE_DEBUG_UTILS_MESSENGER_CREATE_INFO_EXT}
  - \texttt{VK_STRUCTURE_TYPE_DEBUG_UTILS_OBJECT_NAME_INFO_EXT}
  - \texttt{VK_STRUCTURE_TYPE_DEBUG_UTILS_OBJECT_TAG_INFO_EXT}

**Examples**

**Example 1**

\texttt{VK_EXT_debug_utils} allows an application to register multiple callbacks with any Vulkan component wishing to report debug information. Some callbacks may log the information to a file, others may cause a debug break point or other application defined behavior. An application \texttt{can} register callbacks even when no validation layers are enabled, but they will only be called for loader and, if implemented, driver events.

To capture events that occur while creating or destroying an instance an application \texttt{can} link a
VkDebugUtilsMessengerCreateInfoEXT structure to the pNext element of the VkInstanceCreateInfo structure given to vkCreateInstance.

Example uses: Create three callback objects. One will log errors and warnings to the debug console using Windows OutputDebugString. The second will cause the debugger to break at that callback when an error happens and the third will log warnings to stdout.

```c
extern VkInstance instance;
VkResult res;
VkDebugUtilsMessengerEXT cb1, cb2, cb3;

// Must call extension functions through a function pointer:
PFN_vkCreateDebugUtilsMessengerEXT pfnCreateDebugUtilsMessengerEXT = (PFN_vkCreateDebugUtilsMessengerEXT)vkGetInstanceProcAddr(instance, "vkCreateDebugUtilsMessengerEXT");
PFN_vkDestroyDebugUtilsMessengerEXT pfnDestroyDebugUtilsMessengerEXT = (PFN_vkDestroyDebugUtilsMessengerEXT)vkGetInstanceProcAddr(instance, "vkDestroyDebugUtilsMessengerEXT");

VkDebugUtilsMessengerCreateInfoEXT callback1 = {
    .sType = VK_STRUCTURE_TYPE_DEBUG_UTILS_MESSENGER_CREATE_INFO_EXT,
    .pNext = NULL,
    .flags = 0,
    .messageSeverity = VK_DEBUG_UTILS_MESSAGE_SEVERITY_ERROR_BIT_EXT |
                      VK_DEBUG_UTILS_MESSAGE_SEVERITY_WARNING_BIT_EXT,
    .messageType = VK_DEBUG_UTILS_MESSAGE_TYPE_GENERAL_BIT_EXT |
                   VK_DEBUG_UTILS_MESSAGE_TYPE_VALIDATION_BIT_EXT,
    .pfnUserCallback = myOutputDebugString,
    .pUserData = NULL
};
res = pfnCreateDebugUtilsMessengerEXT(instance, &callback1, NULL, &cb1);
if (res != VK_SUCCESS) {
    // Do error handling for VK_ERROR_OUT_OF_MEMORY
}

callback1.messageSeverity = VK_DEBUG_UTILS_MESSAGE_SEVERITY_ERROR_BIT_EXT;
callback1.pfnUserCallback = myDebugBreak;
callback1.pUserData = NULL;
res = pfnCreateDebugUtilsMessengerEXT(instance, &callback1, NULL, &cb2);
if (res != VK_SUCCESS) {
    // Do error handling for VK_ERROR_OUT_OF_MEMORY
}

VkDebugUtilsMessengerCreateInfoEXT callback3 = {
    .sType = VK_STRUCTURE_TYPE_DEBUG_UTILS_MESSENGER_CREATE_INFO_EXT,
    .pNext = NULL,
    .flags = 0,
    .messageSeverity = VK_DEBUG_UTILS_MESSAGE_SEVERITY_WARNING_BIT_EXT,
    .messageType = VK_DEBUG_UTILS_MESSAGE_TYPE_GENERAL_BIT_EXT |
                   VK_DEBUG_UTILS_MESSAGE_TYPE_VALIDATION_BIT_EXT,
};
```
Example 2

Associate a name with an image, for easier debugging in external tools or with validation layers that can print a friendly name when referring to objects in error messages.

```c
extern VkInstance instance;
extern VkDevice device;
extern VkImage image;

// Must call extension functions through a function pointer:
PFN_vkSetDebugUtilsObjectNameEXT pfnSetDebugUtilsObjectNameEXT = (PFN_vkSetDebugUtilsObjectNameEXT)vkGetInstanceProcAddr(instance, "vkSetDebugUtilsObjectNameEXT");

// Set a name on the image
const VkDebugUtilsObjectNameInfoEXT imageNameInfo = {
    .sType = VK_STRUCTURE_TYPE_DEBUG_UTILS_OBJECT_NAME_INFO_EXT,
    .pNext = NULL,
    .objectType = VK_OBJECT_TYPE_IMAGE,
    .objectHandle = (uint64_t)image,
    .pObjectName = "Brick Diffuse Texture",
};

pfnSetDebugUtilsObjectNameEXT(device, &imageNameInfo);

// A subsequent error might print:
// Image 'Brick Diffuse Texture' (0xc0dec0dedeadbeef) is used in a command buffer with no memory bound to it.
```

Example 3

Annotating regions of a workload with naming information so that offline analysis tools can display a more usable visualization of the commands submitted.
extern VkInstance instance;
extern VkCommandBuffer commandBuffer;

// Must call extension functions through a function pointer:
PFN_vkQueueBeginDebugUtilsLabelEXT pfnQueueBeginDebugUtilsLabelEXT =
    (PFN_vkQueueBeginDebugUtilsLabelEXT)vkGetInstanceProcAddr(instance,
     "vkQueueBeginDebugUtilsLabelEXT");
PFN_vkQueueEndDebugUtilsLabelEXT pfnQueueEndDebugUtilsLabelEXT =
    (PFN_vkQueueEndDebugUtilsLabelEXT)vkGetInstanceProcAddr(instance,
     "vkQueueEndDebugUtilsLabelEXT");
PFN_vkCmdBeginDebugUtilsLabelEXT pfnCmdBeginDebugUtilsLabelEXT =
    (PFN_vkCmdBeginDebugUtilsLabelEXT)vkGetInstanceProcAddr(instance,
     "vkCmdBeginDebugUtilsLabelEXT");
PFN_vkCmdEndDebugUtilsLabelEXT pfnCmdEndDebugUtilsLabelEXT =
    (PFN_vkCmdEndDebugUtilsLabelEXT)vkGetInstanceProcAddr(instance,
     "vkCmdEndDebugUtilsLabelEXT");
PFN_vkCmdInsertDebugUtilsLabelEXT pfnCmdInsertDebugUtilsLabelEXT =
    (PFN_vkCmdInsertDebugUtilsLabelEXT)vkGetInstanceProcAddr(instance,
     "vkCmdInsertDebugUtilsLabelEXT");

// Describe the area being rendered
const VkDebugUtilsLabelEXT houseLabel =
{
  .sType = VK_STRUCTURE_TYPE_DEBUG_UTILS_LABEL_EXT,
  .pNext = NULL,
  .pLabelName = "Brick House",
  .color = { 1.0f, 0.0f, 0.0f, 1.0f },
};

// Start an annotated group of calls under the 'Brick House' name
pfnCmdBeginDebugUtilsLabelEXT(commandBuffer, &houseLabel);
{
  // A mutable structure for each part being rendered
  VkDebugUtilsLabelEXT housePartLabel =
  {
    .sType = VK_STRUCTURE_TYPE_DEBUG_UTILS_LABEL_EXT,
    .pNext = NULL,
    .pLabelName = NULL,
    .color = { 0.0f, 0.0f, 0.0f, 0.0f },
  };

  // Set the name and insert the marker
  housePartLabel.pLabelName = "Walls";
pfnCmdInsertDebugUtilsLabelEXT(commandBuffer, &housePartLabel);

  // Insert the drawcall for the walls
  vkCmdDrawIndexed(commandBuffer, 1000, 1, 0, 0, 0);

  // Insert a recursive region for two sets of windows
  housePartLabel.pLabelName = "Windows";
}
PFNCDMBEGINDEBUGUTILSLABELEXT(commandBuffer, &housePartLabel);
{
    vkCmdDrawIndexed(commandBuffer, 75, 6, 1000, 0, 0);
    vkCmdDrawIndexed(commandBuffer, 100, 2, 1450, 0, 0);
}
PFNCDMENDDDEBUGUTILSLABELEXT(commandBuffer);

housePartLabel.pLabelName = "Front Door";
PfnCmdInsertDebugUtilsLabelEXT(commandBuffer, &housePartLabel);

vkCmdDrawIndexed(commandBuffer, 350, 1, 1650, 0, 0);

housePartLabel.pLabelName = "Roof";
PfnCmdInsertDebugUtilsLabelEXT(commandBuffer, &housePartLabel);

vkCmdDrawIndexed(commandBuffer, 500, 1, 2000, 0, 0);
}
// End the house annotation started above
PFNCDMENDDDEBUGUTILSLABELEXT(commandBuffer);

// Do other work

vkEndCommandBuffer(commandBuffer);

// Describe the queue being used
const VkDebugUtilsLabelEXT queueLabel =
{
    .sType = VK_STRUCTURE_TYPE_DEBUG_UTILS_LABEL_EXT,
    .pNext = NULL,
    .pLabelName = "Main Render Work",
    .color = { 0.0f, 1.0f, 0.0f, 1.0f },
};

// Identify the queue label region
PFNQUEUEBEGINDEBUGUTILSLABELEXT(queue, &queueLabel);

// Submit the work for the main render thread
const VkCommandBuffer cmd_bufs[] = {commandBuffer};
VkSubmitInfo submit_info =
{
    .sType = VK_STRUCTURE_TYPE_SUBMIT_INFO,
    .pNext = NULL,
    .waitSemaphoreCount = 0,
    .pWaitSemaphores = NULL,
    .pWaitDstStageMask = NULL,
    .commandBufferCount = 1,
    .pCommandBuffers = cmd_bufs,
    .signalSemaphoreCount = 0,
    .pSignalSemaphores = NULL
};
vkQueueSubmit(queue, 1, &submit_info, fence);
Issues

1) Should we just name this extension VK_EXT_debug_report2

**RESOLVED:** No. There is enough additional changes to the structures to break backwards compatibility. So, a new name was decided that would not indicate any interaction with the previous extension.

2) Will validation layers immediately support all the new features.

**RESOLVED:** Not immediately. As one can imagine, there is a lot of work involved with converting the validation layer logging over to the new functionality. Basic logging, as seen in the origin VK_EXT_debug_report extension will be made available immediately. However, adding the labels and object names will take time. Since the priority for Khronos at this time is to continue focusing on Valid Usage statements, it may take a while before the new functionality is fully exposed.

3) If the validation layers will not expose the new functionality immediately, then what is the point of this extension?

**RESOLVED:** We needed a replacement for VK_EXT_debug_report because the VkDebugReportObjectTypeEXT enumeration will no longer be updated and any new objects will need to be debugged using the new functionality provided by this extension.

4) Should this extension be split into two separate parts (1 extension that is an instance extension providing the callback functionality, and another device extension providing the general debug marker and annotation functionality)?

**RESOLVED:** No, the functionality for this extension is too closely related. If we did split up the extension, where would the structures and enums live, and how would you define that the device behavior in the instance extension is really only valid if the device extension is enabled, and the functionality is passed in. It is cleaner to just define this all as an instance extension, plus it allows the application to enable all debug functionality provided with one enable string during vkCreateInstance.

Version History

- Revision 1, 2017-09-14 (Mark Young and all listed Contributors)
  - Initial draft, based on VK_EXT_debug_report and VK_EXT_debug_marker in addition to previous feedback supplied from various companies including Valve, Epic, and Oxide games.
- Revision 2, 2020-04-03 (Mark Young and Piers Daniell)
  - Updated to allow either NULL or an empty string to be passed in for pObjectName in VkDebugUtilsObjectNameInfoEXT, because the loader and various drivers support NULL already.

Description

This extension adds a new structure, \texttt{VkDepthBiasRepresentationInfoEXT}, that can be added to a \texttt{pNext} chain of \texttt{VkPipelineRasterizationStateCreateInfo} and allows setting the scaling and representation of depth bias for a pipeline.

This state can also be set dynamically by using the new structure mentioned above in combination with the new \texttt{vkCmdSetDepthBias2EXT} command.

New Commands

- \texttt{vkCmdSetDepthBias2EXT}

New Structures

- \texttt{VkDepthBiasInfoEXT}
- Extending \texttt{VkDepthBiasInfoEXT}, \texttt{VkPipelineRasterizationStateCreateInfo}:
  - \texttt{VkDepthBiasRepresentationInfoEXT}
- Extending \texttt{VkPhysicalDeviceFeatures2}, \texttt{VkDeviceCreateInfo}:
  - \texttt{VkPhysicalDeviceDepthBiasControlFeaturesEXT}

New Enums

- \texttt{VkDepthBiasRepresentationEXT}

New Enum Constants

- \texttt{VK_EXT_DEPTH_BIAS_CONTROL_EXTENSION_NAME}

Description

This extension gives defined behavior to fragment depth values which end up outside the conventional [0, 1] range. It can be used to ensure portability in edge cases of features like depthBias. The particular behavior is chosen to match OpenGL to aid porting or emulation.

New Structures

• Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:

Last Modified Date

2021-11-09

Contributors

• Spencer Fricke, Samsung Electronics
• Shahbaz Youssefi, Google
• Ralph Potter, Samsung Electronics
Description

This extension allows the application to use the OpenGL depth range in NDC, i.e. with depth in range \([-1, 1]\), as opposed to Vulkan's default of \([0, 1]\). The purpose of this extension is to allow efficient layering of OpenGL over Vulkan, by avoiding emulation in the pre-rasterization shader stages. This emulation, which effectively duplicates \texttt{gl\_Position} but with a different depth value, costs ALU and consumes shader output components that the implementation may not have to spare to meet OpenGL minimum requirements.

New Structures

- Extending \texttt{VkPhysicalDeviceFeatures2, VkDeviceCreateInfo}:
  - \texttt{VkPhysicalDeviceDepthClipControlFeaturesEXT}
- Extending \texttt{VkPipelineViewportStateCreateInfo}:
  - \texttt{VkPipelineViewportDepthClipControlCreateInfoEXT}

New Enum Constants

- \texttt{VK_EXT_DEPTH_CLIP_CONTROL_EXTENSION_NAME}
- \texttt{VK_EXT_DEPTH_CLIP_CONTROL_SPEC_VERSION}
- Extending \texttt{VkStructureType}:
  - \texttt{VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEPTH_CLIP_CONTROL_FEATURES_EXT}
  - \texttt{VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_DEPTH_CLIP_CONTROL_CREATE_INFO_EXT}

Issues

1) Should this extension include an origin control option to match \texttt{GL\_LOWER\_LEFT} found in \texttt{ARB\_clip\_control}?

**RESOLVED**: No. The fix for porting over the origin is a simple y-axis flip. The depth clip control is a much harder problem to solve than what this extension is aimed to solve. Adding an equivalent to \texttt{GL\_LOWER\_LEFT} would require more testing.

2) Should this pipeline state be dynamic?

**RESOLVED**: Yes. The purpose of this extension is to emulate the OpenGL depth range, which is expected to be globally fixed (in case of OpenGL ES) or very infrequently changed (with \texttt{gl\_ClipControl} in OpenGL).

3) Should the control provided in this extension be an enum that could be extended in the future?

**RESOLVED**: No. It is highly unlikely that the depth range is changed to anything other than \([0, 1]\) in the future. Should that happen a new extension will be required to extend such an enum, and that extension might as well add a new struct to chain to \texttt{VkPipelineViewportStateCreateInfo::pNext} instead.

Description

This extension allows the depth clipping operation, that is normally implicitly controlled by `VkPipelineRasterizationStateCreateInfo::depthClampEnable`, to instead be controlled explicitly by `VkPipelineRasterizationDepthClipStateCreateInfoEXT::depthClipEnable`.

This is useful for translating DX content which assumes depth clamping is always enabled, but depth clip can be controlled by the DepthClipEnable rasterization state (D3D12_RASTERIZER_DESC).

New Structures

- Extending `VkPhysicalDeviceFeatures2, VkDeviceCreateInfo`:
  - `VkPhysicalDeviceDepthClipEnableFeaturesEXT`
- Extending `VkPipelineRasterizationStateCreateInfo`:
  - `VkPipelineRasterizationDepthClipStateCreateInfoEXT`

New Bitmasks

- `VkPipelineRasterizationDepthClipStateCreateFlagsEXT`

New Enum Constants

- `VK_EXT_DEPTH_CLIP_ENABLE_EXTENSION_NAME`
- `VK_EXT_DEPTH_CLIP_ENABLE_SPEC_VERSION`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEPTH_CLIP_ENABLE_FEATURES_EXT`
  - `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_DEPTH_CLIP_STATE_CREATE_INFO_EXT`

Contributors
   • Daniel Koch, NVIDIA
   • Jeff Bolz, NVIDIA

Description
   This extension removes the VkViewport minDepth and maxDepth restrictions that the values must be between \(0.0\) and \(1.0\), inclusive. It also removes the same restriction on VkPipelineDepthStencilStateCreateInfo minDepthBounds and maxDepthBounds. Finally it removes the restriction on the depth value in VkClearDepthStencilValue.

New Enum Constants
   • VK_EXT_DEPTH_RANGE_UNRESTRICTED_EXTENSION_NAME
   • VK_EXT_DEPTH_RANGE_UNRESTRICTED_SPEC_VERSION

Issues

1) How do VkViewport minDepth and maxDepth values outside of the \(0.0\) to \(1.0\) range interact with Primitive Clipping?

**RESOLVED**: The behavior described in Primitive Clipping still applies. If depth clamping is disabled the depth values are still clipped to \(0 \leq z_{c} \leq w_{c}\) before the viewport transform. If depth clamping is enabled the above equation is ignored and the depth values are instead clamped to the VkViewport minDepth and maxDepth values, which in the case of this extension can be outside of the \(0.0\) to \(1.0\) range.

2) What happens if a resulting depth fragment is outside of the \(0.0\) to \(1.0\) range and the depth buffer is fixed-point rather than floating-point?

**RESOLVED**: This situation can also arise without this extension (when fragment shaders replace depth values, for example), and this extension does not change the behavior, which is defined in the Depth Test section of the Fragment Operations chapter.

Description

This extension enables applications to track the binding of regions of the GPU virtual address space, and to associate those regions with Vulkan objects. This extension is primarily intended to aid in crash postmortem, where applications may wish to map a faulting GPU address to a Vulkan object.

For example, a page fault triggered by accessing an address located within a region of the GPU virtual address space that was previously reported as bound and then unbound may indicate a use-after-free error. Similarly, faults generated by accessing virtual addresses outside the limits of a bound region of GPU virtual address space may indicate indexing beyond the bounds of a resource.

New Structures

- Extending `VkDebugUtilsMessengerCallbackDataEXT`:
  - `VkDeviceAddressBindingCallbackDataEXT`
- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  - `VkPhysicalDeviceAddressBindingReportFeaturesEXT`

New Enums

- `VkDeviceAddressBindingFlagBitsEXT`
- `VkDeviceAddressBindingTypeEXT`

New Bitmasks

- `VkDeviceAddressBindingFlagsEXT`

New Enum Constants

- `VK_EXT_DEVICE_ADDRESS_BINDING_REPORT_EXTENSION_NAME`
- `VK_EXT_DEVICE_ADDRESS_BINDING_REPORT_SPEC_VERSION`

- Extending `VkDebugUtilsMessageTypeFlagBitsEXT`:
  - `VK_DEBUG_UTILS_MESSAGE_TYPE_DEVICE_ADDRESS_BINDING_BIT_EXT`

- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_DEVICE_ADDRESS_BINDING_CALLBACK_DATA_EXT`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ADDRESS_BINDING_REPORT_FEATURES_EXT`
**Issues**

1.) Should this extend VK_EXT_debug_utils or VK_EXT_device_memory_report?

**RESOLVED:** Extend VK_EXT_debug_utils. VK_EXT_device_memory_report focuses on memory allocations and would not normally trigger callbacks in all of the situations where VK_EXT_device_address_binding_report is expected to.

2.) Should this extension cover all Vulkan object types, or only resources such as buffers and images?

**RESOLVED:** The extension covers all Vulkan objects, and is not restricted to objects backed by VkDeviceMemory objects.

3.) Should reallocation be identified explicitly, or as a unbind/bind pair?

**RESOLVED:** Reallocation should be represented as an unbind/bind pair.

4.) Can multiple Vulkan objects share an overlapping virtual address range?

**RESOLVED:** Yes. This can be expected to occur due to resources aliasing.

5.) Can a single Vulkan object be associated with multiple virtual address ranges concurrently?

**RESOLVED:** Yes. These should be reported via multiple calls to the reporting callback.

6.) Should the virtual address ranges associated with internal allocations such as memory pools be reported?

**RESOLVED:** Virtual address ranges associated with internal allocations should only be reported when they become associated with a specific Vulkan object. In the case of internal pool allocations, a bind event should be reported when resources from the pool are assigned to a Vulkan object, and an unbind event should be reported when those resources are returned to the pool. Implementations should not report the binding or unbinding of virtual address ranges for which there are no related API objects visible to the application developer.

7.) Can an implementation report binding a virtual address range at VkImage or VkImageView creation, rather than in response to vkBindImageMemory?

**RESOLVED:** Yes. Virtual address range binding should be reported at the appropriate point at which it occurs within the implementation. This extension does not mandate when that should occur, and applications should anticipate receiving callback events at any point after registering callbacks.

8.) Can reporting of binding/unbinding be deferred until a resource is referenced by an executing command buffer?

**RESOLVED:** Changes to the virtual address ranges associated with a Vulkan object should be reported as close as possible to where they occur within the implementation. If virtual address binding is deferred, then the callback should also be deferred to match.

9.) Do bind/unbind callbacks have to form matched pairs? Can a large region be bound, and then
subregions unbound, resulting in fragmentation?

**RESOLVED:** Splitting of virtual address regions, and unmatched bind/unbind callbacks may occur. Developers should anticipate that sparse memory may exhibit this behavior.

10.) The specification mandates that a callback **must** be triggered whenever a GPU virtual address range associated with any Vulkan object is bound or unbound. Do we need queries or properties indicating which Vulkan objects will report binding modifications?

**RESOLVED:** No. This extension is not intended to mandate how and when implementations bind virtual ranges to objects. Adding queries or properties would constrain implementations, which might otherwise vary how virtual address bindings occur based on usage.

11.) Should `vkAllocateMemory` and `vkFreeMemory` trigger reporting callbacks?

**RESOLVED:** If an implementation binds a GPU virtual address range when `vkAllocateMemory` is called, then the callbacks must be triggered associating the virtual address range with the `VkDeviceMemory` object. If the device memory is subsequently bound to a buffer or image via `vkBind*Memory`, the callbacks should be triggered a second time, reporting the association between virtual address range and the buffer/image.

Description

Device loss can be triggered by a variety of issues, including invalid API usage, implementation errors, or hardware failures.

This extension introduces a new command: vkGetDeviceFaultInfoEXT, which may be called subsequent to a VK_ERROR_DEVICE_LOST error code having been returned by the implementation. This command allows developers to query for additional information on GPU faults which may have caused device loss, and to generate binary crash dumps, which may be loaded into external tools for further diagnosis.

New Commands

- vkGetDeviceFaultInfoEXT

Description

This device extension allows registration of device memory event callbacks upon device creation, so that applications or middleware can obtain detailed information about memory usage and how memory is associated with Vulkan objects. This extension exposes the actual underlying device memory usage, including allocations that are not normally visible to the application, such as memory consumed by `vkCreateGraphicsPipelines`. It is intended primarily for use by debug tooling rather than for production applications.

New Structures

- `VkDeviceMemoryReportCallbackDataEXT`
- Extending `VkDeviceCreateInfo`:
  - `VkDeviceDeviceMemoryReportCreateInfoEXT`
- Extending `VkPhysicalDeviceFeatures2, VkDeviceCreateInfo`:
  - `VkPhysicalDeviceDeviceMemoryReportFeaturesEXT`

New Function Pointers

- `PFN_vkDeviceMemoryReportCallbackEXT`

New Enums

- `VkDeviceMemoryReportEventTypeEXT`
New Bitmasks

- `VkDeviceMemoryReportFlagsEXT`

New Enum Constants

- `VK_EXT_DEVICE_MEMORY_REPORT_EXTENSION_NAME`
- `VK_EXT_DEVICE_MEMORY_REPORT_SPEC_VERSION`

Extending `VkStructureType`:

- `VK_STRUCTURE_TYPE_DEVICE_DEVICE_MEMORY_REPORT_CREATE_INFO_EXT`
- `VK_STRUCTURE_TYPE_DEVICE_MEMORY_REPORT_CALLBACK_DATA_EXT`
- `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEVICE_MEMORY_REPORT_FEATURES_EXT`

Issues

1) Should this be better expressed as an extension to `VK_EXT_debug_utils` and its general-purpose messenger construct?

**RESOLVED:** No. The intended lifecycle is quite different. We want to make this extension tied to the device's lifecycle. Each ICD just handles its own implementation of this extension, and this extension will only be directly exposed from the ICD. So we can avoid the extra implementation complexity used to accommodate the flexibility of `VK_EXT_debug_utils` extension.

2) Can we extend and use the existing internal allocation callbacks instead of adding the new callback structure in this extension?

**RESOLVED:** No. Our memory reporting layer that combines this information with other memory information it collects directly (e.g. bindings of resources to `VkDeviceMemory`) would have to intercept all entry points that take a `VkAllocationCallbacks` parameter and inject its own `PFNInternalAllocation` and `PFNInternalFree`. That may be doable for the extensions we know about, but not for ones we do not. The proposal would work fine in the face of most unknown extensions. But even for ones we know about, since apps can provide a different set of callbacks and userdata and those can be retained by the driver and used later (esp. for pool object, but not just those), we would have to dynamically allocate the interception trampoline every time. That is getting to be an unreasonably large amount of complexity and (possibly) overhead.

We are interested in both alloc/free and import/unimport. The latter is fairly important for tracking (and avoiding double-counting) of swapchain images (still true with "native swapchains" based on external memory) and media/camera interop. Though we might be able to handle this with additional `VkInternalAllocationType` values, for import/export we do want to be able to tie this to the external resource, which is one thing that the `memoryObjectId` is for.

The internal alloc/free callbacks are not extensible except via new `VkInternalAllocationType` values. The `VkDeviceMemoryReportCallbackDataEXT` in this extension is extensible. That was deliberate: there is a real possibility we will want to get extra information in the future. As one example, currently this reports only physical allocations, but we believe there are interesting cases for tracking how populated that VA region is.
The callbacks are clearly specified as only callable within the context of a call from the app into Vulkan. We believe there are some cases where drivers can allocate device memory asynchronously. This was one of the sticky issues that derailed the internal device memory allocation reporting design (which is essentially what this extension is trying to do) leading up to 1.0.

**VkAllocationCallbacks** is described in a section called “Host memory” and the intro to it is very explicitly about host memory. The other callbacks are all inherently about host memory. But this extension is very focused on device memory.

3) Should the callback be reporting which heap is used?

**RESOLVED**: Yes. It is important for non-UMA systems to have all the device memory allocations attributed to the corresponding device memory heaps. For internally-allocated device memory, `heapIndex` will always correspond to an advertised heap, rather than having a magic value indicating a non-advertised heap. Drivers can advertise heaps that do not have any corresponding memory types if they need to.

4) Should we use an array of callback for the layers to intercept instead of chaining multiple of the `VkDeviceDeviceMemoryReportCreateInfoEXT` structures in the `pNext` of `VkDeviceCreateInfo`?

**RESOLVED** No. The pointer to the `VkDeviceDeviceMemoryReportCreateInfoEXT` structure itself is `const` and you cannot just cast it away. Thus we cannot update the callback array inside the structure. In addition, we cannot drop this `pNext` chain either, so making a copy of this whole structure does not work either.

5) Should we track bulk allocations shared among multiple objects?

**RESOLVED** No. Take the shader heap as an example. Some implementations will let multiple `VkPipeline` objects share the same shader heap. We are not asking the implementation to report `VK_OBJECT_TYPE_PIPELINE` along with a `VK_NULL_HANDLE` for this bulk allocation. Instead, this bulk allocation is considered as a layer below what this extension is interested in. Later, when the actual `VkPipeline` objects are created by suballocating from the bulk allocation, we ask the implementation to report the valid handles of the `VkPipeline` objects along with the actual suballocated sizes and different `memoryObjectId`.

6) Can we require the callbacks to be always called in the same thread with the Vulkan commands?

**RESOLVED** No. Some implementations might choose to multiplex work from multiple application threads into a single backend thread and perform JIT allocations as a part of that flow. Since this behavior is theoretically legit, we cannot require the callbacks to be always called in the same thread with the Vulkan commands, and the note is to remind the applications to handle this case properly.

7) Should we add an additional “allocation failed” event type with things like size and heap index reported?

**RESOLVED** Yes. This fits in well with the callback infrastructure added in this extension, and implementation touches the same code and has the same overheads as the rest of the extension. It could help debugging things like getting a `VK_ERROR_OUT_OF_HOST_MEMORY` error when ending a
command buffer. Right now the allocation failure could have happened anywhere during recording, and a callback would be really useful to understand where and why.

Description

This is an extension, along with related platform extensions, allows applications to take exclusive control of displays associated with a native windowing system. This is especially useful for virtual reality applications that wish to hide HMDs (head mounted displays) from the native platform’s display management system, desktop, and/or other applications.

New Commands

- `vkReleaseDisplayEXT`

New Enum Constants

- `VK_EXT_DIRECT_MODE_DISPLAY_EXTENSION_NAME`
- `VK_EXT_DIRECT_MODE_DISPLAY_SPEC_VERSION`

Issues

1) Should this extension and its related platform-specific extensions leverage `VK_KHR_display`, or provide separate equivalent interfaces.

**RESOLVED**: Use `VK_KHR_display` concepts and objects. `VK_KHR_display` can be used to enumerate all displays on the system, including those attached to/in use by a window system or native platform, but `VK_KHR_display_swapchain` will fail to create a swapchain on in-use displays. This extension and its platform-specific children will allow applications to grab in-use displays away from window systems and/or native platforms, allowing them to be used with `VK_KHR_display_swapchain`.

2) Are separate calls needed to acquire displays and enable direct mode?

**RESOLVED**: No, these operations happen in one combined command. Acquiring a display puts it into direct mode.

Version History

  - Initial draft

`VK_EXT_directfb_surface`

Name String

`VK_EXT_directfb_surface`

Extension Type

Instance extension

Registered Extension Number

347
Description

The `VK_EXT_directfb_surface` extension is an instance extension. It provides a mechanism to create a `VkSurfaceKHR` object (defined by the `VK_KHR_surface` extension) that refers to a DirectFB `IDirectFBSurface`, as well as a query to determine support for rendering via DirectFB.

New Commands

- `vkCreateDirectFBSurfaceEXT`
- `vkGetPhysicalDeviceDirectFBPresentationSupportEXT`

New Structures

- `VkDirectFBSurfaceCreateInfoEXT`

New Bitmasks

- `VkDirectFBSurfaceCreateFlagsEXT`

New Enum Constants

- `VK_EXT_DIRECTFB_SURFACE_EXTENSION_NAME`
- `VK_EXT_DIRECTFB_SURFACE_SPEC_VERSION`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_DIRECTFB_SURFACE_CREATE_INFO_EXT`

  • Jeff Bolz, NVIDIA

Description
This extension provides additional orthogonally aligned “discard rectangles” specified in framebuffer-space coordinates that restrict rasterization of all points, lines and triangles.
From zero to an implementation-dependent limit (specified by \texttt{maxDiscardRectangles}) number of discard rectangles can be operational at once. When one or more discard rectangles are active, rasterized fragments can either survive if the fragment is within any of the operational discard rectangles (\texttt{VK_DISCARD_RECTANGLE_MODE_INCLUSIVE_EXT} mode) or be rejected if the fragment is within any of the operational discard rectangles (\texttt{VK_DISCARD_RECTANGLE_MODE_EXCLUSIVE_EXT} mode).

These discard rectangles operate orthogonally to the existing scissor test functionality. The discard rectangles can be different for each physical device in a device group by specifying the device mask and setting discard rectangle dynamic state.

Version 2 of this extension introduces new dynamic states \texttt{VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT} and \texttt{VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT}, and the corresponding functions \texttt{vkCmdSetDiscardRectangleEnableEXT} and \texttt{vkCmdSetDiscardRectangleModeEXT}. Applications that use these dynamic states must ensure the implementation advertises at least \texttt{specVersion 2} of this extension.

**New Commands**

- \texttt{vkCmdSetDiscardRectangleEXT}
- \texttt{vkCmdSetDiscardRectangleEnableEXT}
- \texttt{vkCmdSetDiscardRectangleModeEXT}

**New Structures**

- Extending \texttt{VkGraphicsPipelineCreateInfo}:
  - \texttt{VkPipelineDiscardRectangleStateCreateInfoEXT}

- Extending \texttt{VkPhysicalDeviceProperties2}:
  - \texttt{VkPhysicalDeviceDiscardRectanglePropertiesEXT}

Description

This extension defines a set of utility functions for use with the `VK_KHR_display` and `VK_KHR_display_swapchain` extensions.

New Commands

- `vkDisplayPowerControlEXT`
- `vkGetSwapchainCounterEXT`
- `vkRegisterDeviceEventEXT`
- `vkRegisterDisplayEventEXT`

New Structures

- `VkDeviceEventInfoEXT`
- `VkDisplayEventInfoEXT`
- `VkDisplayPowerInfoEXT`
- Extending `VkSwapchainCreateInfoKHR`:
  - `VkSwapchainCounterCreateInfoEXT`

New Enums

- `VkDeviceEventTypeEXT`
- `VkDisplayEventTypeEXT`
- `VkDisplayPowerStateEXT`

New Enum Constants

- `VK_EXT_DISPLAY_CONTROL_EXTENSION_NAME`
- `VK_EXT_DISPLAY_CONTROL_SPEC_VERSION`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_DEVICE_EVENT_INFO_EXT`
  - `VK_STRUCTURE_TYPE_DISPLAY_EVENT_INFO_EXT`
  - `VK_STRUCTURE_TYPE_DISPLAY_POWER_INFO_EXT`
  - `VK_STRUCTURE_TYPE_SWAPCHAIN_COUNTER_CREATE_INFO_EXT`

Issues

1) Should this extension add an explicit “WaitForVsync” API or a fence signaled at vsync that the
application can wait on?

**RESOLVED**: A fence. A separate API could later be provided that allows exporting the fence to a native object that could be inserted into standard run loops on POSIX and Windows systems.

2) Should callbacks be added for a vsync event, or in general to monitor events in Vulkan?

**RESOLVED**: No, fences should be used. Some events are generated by interrupts which are managed in the kernel. In order to use a callback provided by the application, drivers would need to have the userspace driver spawn threads that would wait on the kernel event, and hence the callbacks could be difficult for the application to synchronize with its other work given they would arrive on a foreign thread.

3) Should vblank or scanline events be exposed?

**RESOLVED**: Vblank events. Scanline events could be added by a separate extension, but the latency of processing an interrupt and waking up a userspace event is high enough that the accuracy of a scanline event would be rather low. Further, per-scanline interrupts are not supported by all hardware.

Description

This extension lifts some restrictions in the `VK_KHR_dynamic_rendering` extension to allow render pass instances and bound pipelines within those render pass instances to have an unused attachment specified in one but not the other. It also allows pipelines to use different formats in a render pass as long the attachment is NULL.

New Structures

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  - `VkPhysicalDeviceDynamicRenderingUnusedAttachmentsFeaturesEXT`

New Enum Constants

- `VK_EXT_DYNAMIC_RENDERING_UNUSED_ATTACHMENTS_EXTENSION_NAME`
- `VK_EXT_DYNAMIC_RENDERING_UNUSED_ATTACHMENTS_SPEC_VERSION`

- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DYNAMIC_RENDERING_UNUSED_ATTACHMENTS_FEATURES_EXT`

Issues

None.

Description

This extension adds almost all of the remaining pipeline state as dynamic state to help applications further reduce the number of monolithic pipelines they need to create and bind.

New Commands

- `vkCmdSetAlphaToCoverageEnableEXT`
- `vkCmdSetAlphaToOneEnableEXT`
- `vkCmdSetColorBlendEnableEXT`
- `vkCmdSetColorBlendEquationEXT`
- `vkCmdSetColorWriteMaskEXT`
- `vkCmdSetDepthClampEnableEXT`
- `vkCmdSetLogicOpEnableEXT`
- `vkCmdSetPolygonModeEXT`
- `vkCmdSetRasterizationSamplesEXT`
- `vkCmdSetSampleMaskEXT`

If `VK_EXT_blend_operation_advanced` is supported:

- `vkCmdSetColorBlendAdvancedEXT`

If `VK_EXT_conservative_rasterization` is supported:

- `vkCmdSetConservativeRasterizationModeEXT`
- `vkCmdSetExtraPrimitiveOverestimationSizeEXT`

If `VK_EXT_depth_clip_control` is supported:

- `vkCmdSetDepthClipNegativeOneToOneEXT`
If `VK_EXT_depth_clip_enable` is supported:

- `vkCmdSetDepthClipEnableEXT`

If `VK_EXT_line_rasterization` is supported:

- `vkCmdSetLineRasterizationModeEXT`
- `vkCmdSetLineStippleEnableEXT`

If `VK_EXT_provoking_vertex` is supported:

- `vkCmdSetProvokingVertexModeEXT`

If `VK_EXT_sample_locations` is supported:

- `vkCmdSetSampleLocationsEnableEXT`

If `VK_EXT_transform_feedback` is supported:

- `vkCmdSetRasterizationStreamEXT`

If `VK_KHR_maintenance2` or Version 1.1 is supported:

- `vkCmdSetTessellationDomainOriginEXT`

If `VK_NV_clip_space_w_scaling` is supported:

- `vkCmdSetViewportWScalingEnableNV`

If `VK_NV_coverage_reduction_mode` is supported:

- `vkCmdSetCoverageReductionModeNV`

If `VK_NV_fragment_coverage_to_color` is supported:

- `vkCmdSetCoverageToColorEnableNV`
- `vkCmdSetCoverageToColorLocationNV`

If `VK_NV_framebuffer_mixed_samples` is supported:

- `vkCmdSetCoverageModulationModeNV`
- `vkCmdSetCoverageModulationTableEnableNV`
- `vkCmdSetCoverageModulationTableNV`

If `VK_NV_representative_fragment_test` is supported:

- `vkCmdSetRepresentativeFragmentTestEnableNV`

If `VK_NV_shading_rate_image` is supported:

- `vkCmdSetShadingRateImageEnableNV`
If **VK_NV_viewport_swizzle** is supported:

- **vkCmdSetViewportSwizzleNV**

**New Structures**

- **VkColorBlendAdvancedEXT**
- **VkColorBlendEquationEXT**

Extending **VkPhysicalDeviceFeatures2, VkDeviceCreateInfo**:

- **VkPhysicalDeviceExtendedDynamicState3FeaturesEXT**

Extending **VkPhysicalDeviceProperties2**:

- **VkPhysicalDeviceExtendedDynamicState3PropertiesEXT**

**New Enum Constants**

- **VK_EXT_EXTENDED_DYNAMIC_STATE_3_EXTENSION_NAME**
- **VK_EXT_EXTENDED_DYNAMIC_STATE_3_SPEC_VERSION**

Extending **VkDynamicState**:

- **VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT**
- **VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT**
- **VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT**
- **VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT**
- **VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT**
- **VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT**
- **VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT**
- **VK_DYNAMIC_STATE_POLYGON_MODE_EXT**
- **VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT**
- **VK_DYNAMIC_STATE_SAMPLE_MASK_EXT**

Extending **VkStructureType**:

- **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTENDED_DYNAMIC_STATE_3_FEATURES_EXT**
- **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTENDED_DYNAMIC_STATE_3_PROPERTIES_EXT**

If **VK_EXT_blend_operation_advanced** is supported:

- Extending **VkDynamicState**:
  - **VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT**

If **VK_EXT_conservative_rasterization** is supported:

- Extending **VkDynamicState**:
  - **VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT**
If `VK_EXT_depth_clip_control` is supported:

- Extending `VkDynamicState`:
  - `VK_DYNAMIC_STATE_DEPTH_CLIP_NEGATIVE_ONE_TO_ONE_EXT`

If `VK_EXT_depth_clip_enable` is supported:

- Extending `VkDynamicState`:
  - `VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT`

If `VK_EXT_line_rasterization` is supported:

- Extending `VkDynamicState`:
  - `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT`
  - `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT`

If `VK_EXT_provoking_vertex` is supported:

- Extending `VkDynamicState`:
  - `VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT`

If `VK_EXT_sample_locations` is supported:

- Extending `VkDynamicState`:
  - `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT`

If `VK_EXT_transform_feedback` is supported:

- Extending `VkDynamicState`:
  - `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT`

If `VK_KHR_maintenance2` or Version 1.1 is supported:

- Extending `VkDynamicState`:
  - `VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT`

If `VK_NV_clip_space_w_scaling` is supported:

- Extending `VkDynamicState`:
  - `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_ENABLE_NV`

If `VK_NV_coverage_reduction_mode` is supported:

- Extending `VkDynamicState`:
  - `VK_DYNAMIC_STATE_COVERAGE_REDUCTION_MODE_NV`
If `VK_NV_fragment_coverage_to_color` is supported:

- Extending `VkDynamicState`:
  - `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV`
  - `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_LOCATION_NV`

If `VK_NV_framebuffer_mixed_samples` is supported:

- Extending `VkDynamicState`:
  - `VK_DYNAMIC_STATE_COVERAGE_MODULATION_MODE_NV`
  - `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV`
  - `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_NV`

If `VK_NV_representative_fragment_test` is supported:

- Extending `VkDynamicState`:
  - `VK_DYNAMIC_STATE_REPRESENTATIVE_FRAGMENT_TEST_ENABLE_NV`

If `VK_NV_shading_rate_image` is supported:

- Extending `VkDynamicState`:
  - `VK_DYNAMIC_STATE_SHADING_RATE_IMAGE_ENABLE_NV`

If `VK_NV_viewport_swizzle` is supported:

- Extending `VkDynamicState`:
  - `VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV`

**Issues**

1) What about the `VkPipelineMultisampleStateCreateInfo` state `sampleShadingEnable` and `minSampleShading`?

**UNRESOLVED**

- `sampleShadingEnable` and `minSampleShading` are required when compiling the fragment shader, and it is not meaningful to set them dynamically since they always need to match the fragment shader state, so this hardware state may as well just come from the pipeline with the fragment shader.

**Version History**

- Revision 2, 2022-07-18 (Piers Daniell)
  - Added `rasterizationSamples`

Description
A memory barrier may have a performance penalty when acquiring ownership of a subresource range from an external queue family. This extension provides API that may reduce the performance penalty if ownership of the subresource range was previously released to the external queue family and if the resource's memory has remained unmodified between the release and acquire operations.
New Structures

- Extending `VkBufferMemoryBarrier`, `VkBufferMemoryBarrier2`, `VkImageMemoryBarrier`, `VkImageMemoryBarrier2`:
  - `VkExternalMemoryAcquireUnmodifiedEXT`

New Enum Constants

- `VK_EXT_EXTERNAL_MEMORY_ACQUIRE_UNMODIFIED_EXTENSION_NAME`
- `VK_EXT_EXTERNAL_MEMORY_ACQUIRE_UNMODIFIED_SPEC_VERSION`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_EXTERNAL_MEMORY_ACQUIRE_UNMODIFIED_EXT`

Version History

- James Jones, NVIDIA
- Faith Ekstrand, Intel

Description
A *dma_buf* is a type of file descriptor, defined by the Linux kernel, that allows sharing memory across kernel device drivers and across processes. This extension enables applications to import a *dma_buf* as *VkDeviceMemory*, to export *VkDeviceMemory* as a *dma_buf*, and to create *VkBuffer* objects that *can* be bound to that memory.

New Enum Constants
- **VK_EXT_EXTERNAL_MEMORY_DMA_BUF_EXTENSION_NAME**
- **VK_EXT_EXTERNAL_MEMORY_DMA_BUF_SPEC_VERSION**
- Extending *VkExternalMemoryHandleTypeFlagBits*:
  - **VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT**

Issues
1) How does the application, when creating a * VkImage* that it intends to bind to *dma_buf* *VkDeviceMemory* containing an externally produced image, specify the memory layout (such as row pitch and DRM format modifier) of the *VkImage*? In other words, how does the application achieve behavior comparable to that provided by *EGL_EXT_image_dma_buf_import* and *EGL_EXT_image_dma_buf_import_modifiers*?

**RESOLVED**: Features comparable to those in *EGL_EXT_image_dma_buf_import* and *EGL_EXT_image_dma_buf_import_modifiers* will be provided by an extension layered atop this one.

2) Without the ability to specify the memory layout of external *dma_buf* images, how is this extension useful?

**RESOLVED**: This extension provides exactly one new feature: the ability to import/export between *dma_buf* and *VkDeviceMemory*. This feature, together with features provided by *VK_KHR_external_memory_fd*, is sufficient to bind a *VkBuffer* to *dma_buf*.

Description
This extension enables an application to import host allocations and host mapped foreign device memory to Vulkan memory objects.
New Commands

• `vkGetMemoryHostPointerPropertiesEXT`

New Structures

• `VkMemoryHostPointerPropertiesEXT`

• Extending `VkMemoryAllocateInfo`:
  ◦ `VkImportMemoryHostPointerInfoEXT`

• Extending `VkPhysicalDeviceProperties2`:
  ◦ `VkPhysicalDeviceExternalMemoryHostPropertiesEXT`

New Enum Constants

• `VK_EXT_EXTERNAL_MEMORY_HOST_EXTENSION_NAME`

• `VK_EXT_EXTERNAL_MEMORY_HOST_SPEC_VERSION`

• Extending `VkExternalMemoryHandleTypeFlagBits`:
  ◦ `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT`
  ◦ `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT`

• Extending `VkStructureType`:
  ◦ `VK_STRUCTURE_TYPE_IMPORT_MEMORY_HOST_POINTER_INFO_EXT`
  ◦ `VK_STRUCTURE_TYPE_MEMORY_HOST_POINTER_PROPERTIES_EXT`
  ◦ `VK_STRUCTURE_TYPE_PHYSICALDEVICE_EXTERNAL_MEMORY_HOST_PROPERTIES_EXT`

Issues

1) What memory type has to be used to import host pointers?

RESOLVED: Depends on the implementation. Applications have to use the new `vkGetMemoryHostPointerPropertiesEXT` command to query the supported memory types for a particular host pointer. The reported memory types may include memory types that come from a memory heap that is otherwise not usable for regular memory object allocation and thus such a heap’s size may be zero.

2) Can the application still access the contents of the host allocation after importing?

RESOLVED: Yes. However, usual synchronization requirements apply.

3) Can the application free the host allocation?

RESOLVED: No, it violates valid usage conditions. Using the memory object imported from a host allocation that is already freed thus results in undefined behavior.

4) Is `vkMapMemory` expected to return the same host address which was specified when importing it to the memory object?
RESOLVED: No. Implementations are allowed to return the same address but it is not required. Some implementations might return a different virtual mapping of the allocation, although the same physical pages will be used.

5) Is there any limitation on the alignment of the host pointer and/or size?

RESOLVED: Yes. Both the address and the size have to be an integer multiple of `minImportedHostPointerAlignment`. In addition, some platforms and foreign devices may have additional restrictions.

6) Can the same host allocation be imported multiple times into a given physical device?

RESOLVED: No, at least not guaranteed by this extension. Some platforms do not allow locking the same physical pages for device access multiple times, so attempting to do it may result in undefined behavior.

7) Does this extension support exporting the new handle type?

RESOLVED: No.

8) Should we include the possibility to import host mapped foreign device memory using this API?

RESOLVED: Yes, through a separate handle type. Implementations are still allowed to support only one of the handle types introduced by this extension by not returning import support for a particular handle type as returned in `VkExternalMemoryPropertiesKHR`.

Description

VK_EXT_filter_cubic extends VK_IMG_filter_cubic.

It documents cubic filtering of other image view types. It adds new structures that can be added to the pNext chain of VkPhysicalDeviceImageFormatInfo2 and VkImageFormatProperties2 that can be used to determine which image types and which image view types support cubic filtering.

New Structures

- Extending VkImageFormatProperties2:
  - VkFilterCubicImageViewImageFormatPropertiesEXT
- Extending VkPhysicalDeviceImageFormatInfo2:
  - VkPhysicalDeviceImageViewImageFormatInfoEXT

New Enum Constants

- VK_EXT_FILTER_CUBIC_EXTENSION_NAME
- VK_EXT_FILTER_CUBIC_SPEC_VERSION
- Extending VkFilter:
  - VK_FILTER_CUBIC_EXT
- Extending VkFormatFeatureFlagBits:
Extending VkStructureType:

- VK_STRUCTURE_TYPE_FILTER_CUBIC_IMAGE_VIEW_IMAGE_FORMAT_PROPERTIES_EXT

Description

This extension allows an application to specify areas of the render target where the fragment shader may be invoked fewer times. These fragments are broadcasted out to multiple pixels to cover the render target.

The primary use of this extension is to reduce workloads in areas where lower quality may not be perceived such as the distorted edges of a lens or the periphery of a user’s gaze.

New Structures

• Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  ◦ VkPhysicalDeviceFragmentDensityMapFeaturesEXT
• Extending VkPhysicalDeviceProperties2:
  ◦ VkPhysicalDeviceFragmentDensityMapPropertiesEXT
• Extending VkRenderPassCreateInfo, VkRenderPassCreateInfo2:
  ◦ VkRenderPassFragmentDensityMapCreateInfoEXT

New Enum Constants

• VK_EXT_FRAGMENT_DENSITY_MAP_EXTENSION_NAME
• VK_EXT_FRAGMENT_DENSITY_MAP_SPEC_VERSION
• Extending `VkAccessFlagBits`:
  ◦ `VK_ACCESS_FRAGMENTS_DENSITY_MAP_READ_BIT_EXT`

• Extending `VkFormatFeatureFlagBits`:
  ◦ `VK_FORMAT_FEATURE_FRAGMENT_DENSITY_MAP_BIT_EXT`

• Extending `VkImageCreateFlagBits`:
  ◦ `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`

• Extending `VkImageLayout`:
  ◦ `VK_IMAGE_LAYOUT_FRAGMENT_DENSITY_MAP_OPTIMAL_EXT`

• Extending `VkImageUsageFlagBits`:
  ◦ `VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT`

• Extending `VkImageViewCreateFlagBits`:
  ◦ `VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT`

• Extending `VkPipelineStageFlagBits`:
  ◦ `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

• Extending `VkSamplerCreateFlagBits`:
  ◦ `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT`
  ◦ `VK_SAMPLER_CREATE_SUBSAMPLED_COARSE_RECONSTRUCTION_BIT_EXT`

• Extending `VkStructureType`:
  ◦ `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_DENSITY_MAP_FEATURES_EXT`
  ◦ `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_DENSITY_MAP_PROPERTIES_EXT`
  ◦ `VK_STRUCTURE_TYPE_RENDER_PASS_FRAGMENT_DENSITY_MAP_CREATE_INFO_EXT`

If `VK_KHR_format_feature_flags2` or Version 1.3 is supported:

• Extending `VkFormatFeatureFlagBits2`:
  ◦ `VK_FORMAT_FEATURE_2_FRAGMENT_DENSITY_MAP_BIT_EXT`

New or Modified Built-In Variables

• `FragInvocationCountEXT`
• `FragSizeEXT`

New SPIR-V Capabilities

• `FragmentDensityEXT`

Description

This extension adds support for the FragmentShaderPixelInterlockEXT, FragmentShaderSampleInterlockEXT, and FragmentShaderShadingRateInterlockEXT capabilities from the SPV_EXT_fragment_shader_interlock extension to Vulkan.

Enabling these capabilities provides a critical section for fragment shaders to avoid overlapping pixels being processed at the same time, and certain guarantees about the ordering of fragment shader invocations of fragments of overlapping pixels.

This extension can be useful for algorithms that need to access per-pixel data structures via shader loads and stores. Algorithms using this extension can access per-pixel data structures in critical sections without other invocations accessing the same per-pixel data. Additionally, the ordering guarantees are useful for cases where the API ordering of fragments is meaningful. For example, applications may be able to execute programmable blending operations in the fragment shader, where the destination buffer is read via image loads and the final value is written via image stores.

New Structures

• James Jones, NVIDIA
• Daniel Rakos, AMD
• Jeff Juliano, NVIDIA
• Joshua Schnarr, NVIDIA
• Aaron Hagan, AMD

Description

This extension allows applications to set the policy for swapchain creation and presentation mechanisms relating to full-screen access. Implementations may be able to acquire exclusive access to a particular display for an application window that covers the whole screen. This can increase performance on some systems by bypassing composition, however it can also result in disruptive or expensive transitions in the underlying windowing system when a change occurs.

Applications can choose between explicitly disallowing or allowing this behavior, letting the implementation decide, or managing this mode of operation directly using the new \texttt{vkAcquireFullScreenExclusiveModeEXT} and \texttt{vkReleaseFullScreenExclusiveModeEXT} commands.

New Commands

• \texttt{vkAcquireFullScreenExclusiveModeEXT}
• \texttt{vkGetPhysicalDeviceSurfacePresentModes2EXT}
• \texttt{vkReleaseFullScreenExclusiveModeEXT}

If \texttt{VK_KHR_device_group} is supported:

• \texttt{vkGetDeviceGroupSurfacePresentModes2EXT}

If \texttt{Version 1.1} is supported:

• \texttt{vkGetDeviceGroupSurfacePresentModes2EXT}

New Structures

• Extending \texttt{VkPhysicalDeviceSurfaceInfo2KHR}, \texttt{VkSwapchainCreateInfoKHR}:
  ◦ \texttt{VkSurfaceFullScreenExclusiveInfoEXT}
• Extending `VkSurfaceCapabilities2KHR`
  ◦ `VkSurfaceCapabilitiesFullScreenExclusiveEXT`

If `VK_KHR_win32_surface` is supported:

• Extending `VkPhysicalDeviceSurfaceInfo2KHR, VkSwapchainCreateInfoKHR`:
  ◦ `VkSurfaceFullScreenExclusiveWin32InfoEXT`

**New Enums**

• `VkFullScreenExclusiveEXT`

**New Enum Constants**

• `VK_EXT_FULL_SCREEN_EXCLUSIVE_EXTENSION_NAME`
• `VK_EXT_FULL_SCREEN_EXCLUSIVE_SPEC_VERSION`

• Extending `VkResult`:
  ◦ `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT`

• Extending `VkStructureType`:
  ◦ `VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_FULL_SCREEN_EXCLUSIVE_EXT`
  ◦ `VK_STRUCTURE_TYPE_SURFACE_FULL_SCREEN_EXCLUSIVE_INFO_EXT`

If `VK_KHR_win32_surface` is supported:

• Extending `VkStructureType`:
  ◦ `VK_STRUCTURE_TYPE_SURFACE_FULL_SCREEN_EXCLUSIVE_WIN32_INFO_EXT`

**Issues**

1) What should the extension & flag be called?

**RESOLVED**: `VK_EXT_full_screen_exclusive`.

Other options considered (prior to the app-controlled mode) were:

• `VK_EXT_smooth_fullscreen_transition`
• `VK_EXT_fullscreen_behavior`
• `VK_EXT_fullscreen_preference`
• `VK_EXT_fullscreen_hint`
• `VK_EXT_fast_fullscreen_transition`
• `VK_EXT_avoid_fullscreen_exclusive`

2) Do we need more than a boolean toggle?

**RESOLVED**: Yes.
Using an enum with default/allowed/disallowed/app-controlled enables applications to accept driver default behavior, specifically override it in either direction without implying the driver is ever required to use full-screen exclusive mechanisms, or manage this mode explicitly.

3) Should this be a KHR or EXT extension?

**RESOLVED:** EXT, in order to allow it to be shipped faster.

4) Can the fullscreen hint affect the surface capabilities, and if so, should the hint also be specified as input when querying the surface capabilities?

**RESOLVED:** Yes on both accounts.

While the hint does not guarantee a particular fullscreen mode will be used when the swapchain is created, it can sometimes imply particular modes will NOT be used. If the driver determines that it will opt-out of using a particular mode based on the policy, and knows it can only support certain capabilities if that mode is used, it would be confusing at best to the application to report those capabilities in such cases. Not allowing implementations to report this state to applications could result in situations where applications are unable to determine why swapchain creation fails when they specify certain hint values, which could result in never-terminating surface creation loops.

5) Should full-screen be one word or two?

**RESOLVED:** Two words.

"Fullscreen" is not in my dictionary, and web searches did not turn up definitive proof that it is a colloquially accepted compound word. Documentation for the corresponding Windows API mechanisms dithers. The text consistently uses a hyphen, but none-the-less, there is a SetFullScreenState method in the DXGI swapchain object. Given this inconclusive external guidance, it is best to adhere to the Vulkan style guidelines and avoid inventing new compound words.

**Version History**

- Revision 4, 2019-03-12 (Tobias Hector)
  - Added application-controlled mode, and related functions
  - Tidied up appendix
- Revision 3, 2019-01-03 (James Jones)
  - Renamed to VK_EXT_full_screen_exclusive
  - Made related adjustments to the tri-state enumerant names.
- Revision 2, 2018-11-27 (James Jones)
  - Renamed to VK_KHR_fullscreen_behavior
  - Switched from boolean flag to tri-state enum
- Revision 1, 2018-11-06 (James Jones)
  - Internal revision

Description

This extension allows the separate compilation of four distinct parts of graphics pipelines, with the intent of allowing faster pipeline loading for applications reusing the same shaders or state in multiple pipelines. Each part can be independently compiled into a graphics pipeline library, with a final link step required to create an executable pipeline that can be bound to a command buffer.

New Structures

- Extending `VkGraphicsPipelineCreateInfo`:
  - `VkGraphicsPipelineLibraryCreateInfoEXT`
- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  - `VkPhysicalDeviceGraphicsPipelineLibraryFeaturesEXT`
- Extending `VkPhysicalDeviceProperties2`:
  - `VkPhysicalDeviceGraphicsPipelineLibraryPropertiesEXT`

New Enums

- `VkGraphicsPipelineLibraryFlagBitsEXT`
- `VkPipelineLayoutCreateFlagBits`

New Bitmasks

- `VkGraphicsPipelineLibraryFlagsEXT`

New Enum Constants

- `VK_EXT_GRAPHICS_PIPELINE_LIBRARY_EXTENSION_NAME`
- `VK_EXT_GRAPHICS_PIPELINE_LIBRARY_SPEC_VERSION`
- Extending `VkPipelineCreateFlagBits`:
  - `VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT`
  - `VK_PIPELINE_CREATE_RETAIN_LINK_TIME_OPTIMIZATION_INFO_BIT_EXT`
- Extending `VkPipelineLayoutCreateFlagBits`:
  - `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_GRAPHICS_PIPELINE_LIBRARY_CREATE_INFO_EXT`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_GRAPHICS_PIPELINE_LIBRARY_FEATURES_EXT`
Version History

• Revision 1, 2021-08-17 (Tobias Hector)
  ◦ Initial draft.

Description

This extension defines two new structures and a function to assign SMPTE (the Society of Motion Picture and Television Engineers) 2086 metadata and CTA (Consumer Technology Association) 861.3 metadata to a swapchain. The metadata includes the color primaries, white point, and luminance range of the reference monitor, which all together define the color volume containing all the possible colors the reference monitor can produce. The reference monitor is the display where
creative work is done and creative intent is established. To preserve such creative intent as much as possible and achieve consistent color reproduction on different viewing displays, it is useful for the display pipeline to know the color volume of the original reference monitor where content was created or tuned. This avoids performing unnecessary mapping of colors that are not displayable on the original reference monitor. The metadata also includes the \texttt{maxContentLightLevel} and \texttt{maxFrameAverageLightLevel} as defined by CTA 861.3.

While the intended purpose of the metadata is to assist in the transformation between different color volumes of different displays and help achieve better color reproduction, it is not in the scope of this extension to define how exactly the metadata should be used in such a process. It is up to the implementation to determine how to make use of the metadata.

**New Commands**

- \texttt{vkSetHdrMetadataEXT}

**New Structures**

- \texttt{VkHdrMetadataEXT}
- \texttt{VkXYColorEXT}

**New Enum Constants**

- \texttt{VK_EXT_HDR_METADATA_EXTENSION_NAME}
- \texttt{VK_EXT_HDR_METADATA_SPEC_VERSION}
- Extending \texttt{VkStructureType}:
  - \texttt{VK_STRUCTURE_TYPE_HDR_METADATA_EXT}

**Issues**

1) Do we need a query function?

**PROPOSED:** No, Vulkan does not provide queries for state that the application can track on its own.

2) Should we specify default if not specified by the application?

**PROPOSED:** No, that leaves the default up to the display.

**Version History**

- Revision 1, 2016-12-27 (Courtney Goeltzenleuchter)
  - Initial version
- Revision 2, 2018-12-19 (Courtney Goeltzenleuchter)
  - Correct implicit validity for \texttt{VkHdrMetadataEXT} structure

Description

The **VK_EXT_headless_surface** extension is an instance extension. It provides a mechanism to create VkSurfaceKHR objects independently of any window system or display device. The presentation operation for a swapchain created from a headless surface is by default a no-op, resulting in no externally-visible result.

Because there is no real presentation target, future extensions can layer on top of the headless surface to introduce arbitrary or customizable sets of restrictions or features. These could include features like saving to a file or restrictions to emulate a particular presentation target.

This functionality is expected to be useful for application and driver development because it allows any platform to expose an arbitrary or customizable set of restrictions and features of a presentation engine. This makes it a useful portable test target for applications targeting a wide range of presentation engines where the actual target presentation engines might be scarce, unavailable or otherwise undesirable or inconvenient to use for general Vulkan application development.

  and
Description

This extension allows applications to copy data between host memory and images on the host processor, without staging the data through a GPU-accessible buffer. This removes the need to allocate and manage the buffer and its associated memory. On some architectures it may also eliminate an extra copy operation. This extension additionally allows applications to copy data between images on the host.

To support initializing a new image in preparation for a host copy, it is now possible to transition a new image to `VK_IMAGE_LAYOUT_GENERAL` or other host-copyable layouts via `vkTransitionImageLayoutEXT`. Additionally, it is possible to perform copies that preserve the swizzling layout of the image by using the `VK_HOST_IMAGE_COPY_MEMCPY_EXT` flag. In that case, the memory size needed for copies to or from a buffer can be retrieved by chaining `VkSubresourceHostMemcpySizeEXT` to `pLayout` in `vkGetImageSubresourceLayout2EXT`.

New Commands

- `vkCopyImageToImageEXT`
- `vkCopyImageToMemoryEXT`
- `vkCopyMemoryToImageEXT`
- `vkGetImageSubresourceLayout2EXT`
New Structures

- VkCopyImageToImageInfoEXT
- VkCopyImageToMemoryInfoEXT
- VkCopyMemoryToImageInfoEXT
- VkHostImageLayoutTransitionInfoEXT
- VkImageSubresource2EXT
- VkImageToMemoryCopyEXT

- VkHostImageCopyFlagBitsEXT

New Bitmasks

- VkHostImageCopyFlagsEXT

New Enum Constants

- VK_EXT_HOST_IMAGE_COPY_EXTENSION_NAME
- VK_EXT_HOST_IMAGE_COPY_SPEC_VERSION

Extending VkFormatFeatureFlagBits2:

- VK_FORMAT_FEATURE_2_HOST_IMAGE_TRANSFER_BIT_EXT

Extending VkImageUsageFlagBits:

- VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT

Extending VkStructureType:

- VK_STRUCTURE_TYPE_COPY_IMAGE_TO_IMAGE_INFO_EXT
- VK_STRUCTURE_TYPE_COPY_IMAGE_TO_MEMORY_INFO_EXT
• VK_STRUCTURE_TYPE_COPY_MEMORY_TO_IMAGE_INFO_EXT
• VK_STRUCTURE_TYPE_HOST_IMAGE_COPY_DEVICE_PERFORMANCE_QUERY_EXT
• VK_STRUCTURE_TYPE_HOST_IMAGE_LAYOUT_TRANSITION_INFO_EXT
• VK_STRUCTURE_TYPE_IMAGE_TO_MEMORY_COPY_EXT
• VK_STRUCTURE_TYPE_MEMORY_TO_IMAGE_COPY_EXT
• VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_HOST_IMAGE_COPY_FEATURES_EXT
• VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_HOST_IMAGE_COPY_PROPERTIES_EXT
• VK_STRUCTURE_TYPE_SUBRESOURCE_HOST_MEMCPY_SIZE_EXT

Issues

1) When uploading data to an image, the data is usually loaded from disk. Why not have the application load the data directly into a VkDeviceMemory bound to a buffer (instead of host memory), and use vkCmdCopyBufferToImage? The same could be done when downloading data from an image.

RESOLVED: This may not always be possible. Complicated Vulkan applications such as game engines often have decoupled subsystems for streaming data and rendering. It may be unreasonable to require the streaming subsystem to coordinate with the rendering subsystem to allocate memory on its behalf, especially as Vulkan may not be the only API supported by the engine. In emulation layers, the image data is necessarily provided by the application in host memory, so an optimization as suggested is not possible. Most importantly, the device memory may not be mappable by an application, but still accessible to the driver.

2) Are optimalBufferCopyOffsetAlignment and optimalBufferCopyRowPitchAlignment applicable to host memory as well with the functions introduced by this extension? Or should there be new limits?

RESOLVED: No alignment requirements for the host memory pointer.

3) Should there be granularity requirements for image offsets and extents?

RESOLVED: No granularity requirements, i.e. a granularity of 1 pixel (for non-compressed formats) and 1 texel block (for compressed formats) is assumed.

4) How should the application deal with layout transitions before or after copying to or from images?

RESOLVED: An existing issue with linear images is that when emulating other APIs, it is impossible to know when to transition them as they are written to by the host and then used bindlessly. The copy operations in this extension are affected by the same limitation. A new command is thus introduced by this extension to address this problem by allowing the host to perform an image layout transition between a handful of layouts.

Description

This extension allows a single slice of a 3D image to be used as a 2D view in image descriptors, matching both the functionality of glBindImageTexture in OpenGL with the `layer` parameter set to `true` and 2D view binding provided by the extension `EGL_KHR_gl_texture_3D_image`. It is primarily intended to support GL emulation.

New Structures

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  - `VkPhysicalDeviceImage2DViewOf3DFeaturesEXT`

New Enum Constants

- `VK_EXT_IMAGE_2D_VIEW_OF_3D_EXTENSION_NAME`
- `VK_EXT_IMAGE_2D_VIEW_OF_3D_SPEC_VERSION`

Description
This extension enables fixed-rate image compression and adds the ability to control when this kind of compression can be applied. Many implementations support some form of framebuffer compression. This is typically transparent to applications as lossless compression schemes are used. With fixed-rate compression, the compression is done at a defined bitrate. Such compression algorithms generally produce results that are visually lossless, but the results are typically not bit-exact when compared to a non-compressed result. The implementation may not be able to use the requested compression rate in all cases. This extension adds a query that can be used to determine the compression scheme and rate that was applied to an image.

New Commands
• vkGetImageSubresourceLayout2EXT

New Structures
• VkImageSubresource2EXT
• VkSubresourceLayout2EXT

Description

This extension enables fixed-rate image compression and adds the ability to control when this kind of compression can be applied to swapchain images.

New Structures

  • Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
    ◦ VkPhysicalDeviceImageCompressionControlSwapchainFeaturesEXT
New Enum Constants

- `VK_EXT_IMAGE_COMPRESSION_CONTROL_SWAPCHAIN_EXTENSION_NAME`
- `VK_EXT_IMAGE_COMPRESSION_CONTROL_SWAPCHAIN_SPEC_VERSION`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_COMPRESSION_CONTROL_SWAPCHAIN_FEATURES_EXT`

Version History

- Revision 1, 2022-05-02 (Jan-Harald Fredriksen)
  - Initial draft

**VK_EXT_image_drm_format_modifier**

Revision

- 2

Ratification Status

- Not ratified

Extension and Version Dependencies

- `VK_KHR_bind_memory2` and `VK_KHR_get_physical_device_properties2` and `VK_KHR_sampler_ycbcr_conversion`
  - or
- `VK_KHR_image_format_list`
  - or
- `VK_KHR_format_feature_flags2`

API Interactions

- Interacts with `VK_VERSION_1_3`
- Interacts with `VK_KHR_format_feature_flags2`
This extension provides the ability to use DRM format modifiers with images, enabling Vulkan to better integrate with the Linux ecosystem of graphics, video, and display APIs.

Its functionality closely overlaps with EGL_EXT_image_dma_buf_import_modifiers and EGL_MESA_image_dma_buf_export. Unlike the EGL extensions, this extension does not require the use of a specific handle type (such as a dma_buf) for external memory and provides more explicit control of image creation.

Introduction to DRM Format Modifiers

A DRM format modifier is a 64-bit, vendor-prefix, semi-opaque unsigned integer. Most modifiers represent a concrete, vendor-specific tiling format for images. Some exceptions are DRM_FORMAT_MOD_LINEAR (which is not vendor-specific); DRM_FORMAT_MOD_NONE (which is an alias of DRM_FORMAT_MOD_LINEAR due to historical accident); and DRM_FORMAT_MOD_INVALID (which does not represent a tiling format). The modifier’s vendor prefix consists of the 8 most significant bits. The canonical list of modifiers and vendor prefixes is found in drm_fourcc.h in the Linux kernel source. The other dominant source of modifiers are vendor kernel trees.

One goal of modifiers in the Linux ecosystem is to enumerate for each vendor a reasonably sized set of tiling formats that are appropriate for images shared across processes, APIs, and/or devices, where each participating component may possibly be from different vendors. A non-goal is to enumerate all tiling formats supported by all vendors. Some tiling formats used internally by vendors are inappropriate for sharing; no modifiers should be assigned to such tiling formats.
Modifier values typically do not describe memory layouts. More precisely, a modifier's lower 56 bits usually have no structure. Instead, modifiers name memory layouts; they name a small set of vendor-preferred layouts for image sharing. As a consequence, in each vendor namespace the modifier values are often sequentially allocated starting at 1.

Each modifier is usually supported by a single vendor and its name matches the pattern {VENDOR}_FORMAT_MOD_* or DRM_FORMAT_MOD_{VENDOR}_*. Examples are I915_FORMAT_MOD_X_TILED and DRM_FORMAT_MOD_BROADCOM_VC4_T_TILED. An exception is DRM_FORMAT_MOD_LINEAR, which is supported by most vendors.

Many APIs in Linux use modifiers to negotiate and specify the memory layout of shared images. For example, a Wayland compositor and Wayland client may, by relaying modifiers over the Wayland protocol zwp_linux_dmabuf_v1, negotiate a vendor-specific tiling format for a shared wl_buffer. The client may allocate the underlying memory for the wl_buffer with GBM, providing the chosen modifier to gbm_bo_create_with_modifiers. The client may then import the wl_buffer into Vulkan for producing image content, providing the resource's dma_buf to VkImportMemoryFdInfoKHR and its modifier to VkImageDrmFormatModifierExplicitCreateInfoEXT. The compositor may then import the wl_buffer into OpenGL for sampling, providing the resource's dma_buf and modifier to eglCreateImage. The compositor may also bypass OpenGL and submit the wl_buffer directly to the kernel's display API, providing the dma_buf and modifier through drm_mode_fb_cmd2.

**Format Translation**

Modifier-capable APIs often pair modifiers with DRM formats, which are defined in drm_fourcc.h. However, VK_EXT_image_drm_format_modifier uses VkFormat instead of DRM formats. The application must convert between VkFormat and DRM format when it sends or receives a DRM format to or from an external API.

The mapping from VkFormat to DRM format is lossy. Therefore, when receiving a DRM format from an external API, often the application must use information from the external API to accurately map the DRM format to a VkFormat. For example, DRM formats do not distinguish between RGB and sRGB (as of 2018-03-28); external information is required to identify the image's color space.

The mapping between VkFormat and DRM format is also incomplete. For some DRM formats there exist no corresponding Vulkan format, and for some Vulkan formats there exist no corresponding DRM format.

**Usage Patterns**

Three primary usage patterns are intended for this extension:

- **Negotiation.** The application negotiates with modifier-aware, external components to determine sets of image creation parameters supported among all components.

  In the Linux ecosystem, the negotiation usually assumes the image is a 2D, single-sampled, non-mipmapped, non-array image; this extension permits that assumption but does not require it. The result of the negotiation usually resembles a set of tuples such as (drmFormat, drmFormatModifier), where each participating component supports all tuples in the set.

  Many details of this negotiation - such as the protocol used during negotiation, the set of image
creation parameters expressible in the protocol, and how the protocol chooses which process and which API will create the image - are outside the scope of this specification.

In this extension, \texttt{vkGetPhysicalDeviceFormatProperties2} with \texttt{VkDrmFormatModifierPropertiesListEXT} serves a primary role during the negotiation, and \texttt{vkGetPhysicalDeviceImageFormatProperties2} with \texttt{VkPhysicalDeviceImageDrmFormatModifierInfoEXT} serves a secondary role.

- **Import.** The application imports an image with a modifier.

In this pattern, the application receives from an external source the image's memory and its creation parameters, which are often the result of the negotiation described above. Some image creation parameters are implicitly defined by the external source; for example, \texttt{VK_IMAGE_TYPE_2D} is often assumed. Some image creation parameters are usually explicit, such as the image's \texttt{format}, \texttt{drmFormatModifier}, and \texttt{extent}; and each plane's \texttt{offset} and \texttt{rowPitch}.

Before creating the image, the application first verifies that the physical device supports the received creation parameters by querying \texttt{vkGetPhysicalDeviceFormatProperties2} with \texttt{VkDrmFormatModifierPropertiesListEXT} and \texttt{vkGetPhysicalDeviceImageFormatProperties2} with \texttt{VkPhysicalDeviceImageDrmFormatModifierInfoEXT}. Then the application creates the image by chaining \texttt{VkImageDrmFormatModifierExplicitCreateInfoEXT} and \texttt{VkExternalMemoryImageCreateInfo} onto \texttt{VkImageCreateInfo}.

- **Export.** The application creates an image and allocates its memory. Then the application exports to modifier-aware consumers the image's memory handles; its creation parameters; its modifier; and the \texttt{offset}, \texttt{size}, and \texttt{rowPitch} of each memory plane.

In this pattern, the Vulkan device is the authority for the image; it is the allocator of the image's memory and the decider of the image's creation parameters. When choosing the image's creation parameters, the application usually chooses a tuple \((\texttt{format}, \texttt{drmFormatModifier})\) from the result of the negotiation described above. The negotiation's result often contains multiple tuples that share the same format but differ in their \texttt{modifier}. In this case, the application should defer the choice of the image's \texttt{modifier} to the Vulkan implementation by providing all such \texttt{modifiers} to \texttt{VkImageDrmFormatModifierListCreateInfoEXT::pDrmFormatModifiers}; and the implementation should choose from \texttt{pDrmFormatModifiers} the optimal \texttt{modifier} in consideration with the other image parameters.

The application creates the image by chaining \texttt{VkImageDrmFormatModifierListCreateInfoEXT} and \texttt{VkExternalMemoryImageCreateInfo} onto \texttt{VkImageCreateInfo}. The protocol and APIs by which the application will share the image with external consumers will likely determine the value of \texttt{VkExternalMemoryImageCreateInfo::handleTypes}. The implementation chooses for the image an optimal \texttt{modifier} from \texttt{VkImageDrmFormatModifierListCreateInfoEXT::pDrmFormatModifiers}. The application then queries the implementation-chosen \texttt{modifier} with \texttt{vkGetImageDrmFormatModifierPropertiesEXT}, and queries the memory layout of each plane with \texttt{vkGetImageSubresourceLayout}.

The application then allocates the image's memory with \texttt{VkMemoryAllocateInfo}, adding chained extending structures for external memory; binds it to the image; and exports the memory, for example, with \texttt{vkGetMemoryFdKHR}.
Finally, the application sends the image’s creation parameters, its modifier, its per-plane memory layout, and the exported memory handle to the external consumers. The details of how the application transmits this information to external consumers is outside the scope of this specification.

Prior Art

Extension EGL_EXT_image_dma_buf_import\(^1\) introduced the ability to create an EGLImage by importing for each plane a dma_buf, offset, and row pitch.

Later, extension EGL_EXT_image_dma_buf_import_modifiers\(^2\) introduced the ability to query which combination of formats and modifiers the implementation supports and to specify modifiers during creation of the EGLImage.

Extension EGL_MESA_image_dma_buf_export\(^3\) is the inverse of EGL_EXT_image_dma_buf_import_modifiers.

The Linux kernel modesetting API (KMS), when configuring the display’s framebuffer with struct drm_mode_fb_cmd\(^4\), allows one to specify the framebuffer’s modifier as well as a per-plane memory handle, offset, and row pitch.

GBM, a graphics buffer manager for Linux, allows creation of a gbm_bo (that is, a graphics buffer object) by importing data similar to that in EGL_EXT_image_dma_buf_import_modifiers\(^1\); and symmetrically allows exporting the same data from the gbm_bo. See the references to modifier and plane in gbm.h\(^5\).

New Commands

- vkGetImageDrmFormatModifierPropertiesEXT

New Structures

- VkDrmFormatModifierPropertiesEXT
- VkImageDrmFormatModifierPropertiesEXT
- Extending VkFormatProperties2:
  - VkDrmFormatModifierPropertiesListEXT
- Extending VkImageCreateInfo:
  - VkImageDrmFormatModifierExplicitCreateInfoEXT
  - VkImageDrmFormatModifierListCreateInfoEXT
- Extending VkPhysicalDeviceImageFormatInfo2:
  - VkPhysicalDeviceImageDrmFormatModifierInfoEXT

If VK_KHR_format_feature_flags2 or Version 1.3 is supported:

- VkDrmFormatModifierProperties2EXT
- Extending VkFormatProperties2:
  - VkDrmFormatModifierPropertiesList2EXT
New Enum Constants

- VK_EXT_IMAGE_DRM_FORMAT_MODIFIER_EXTENSION_NAME
- VK_EXT_IMAGE_DRM_FORMAT_MODIFIER_SPEC_VERSION

Extending VkImageAspectFlagBits:
- VK_IMAGE_ASPECT_MEMORY_PLANE_0_BIT_EXT
- VK_IMAGE_ASPECT_MEMORY_PLANE_1_BIT_EXT
- VK_IMAGE_ASPECT_MEMORY_PLANE_2_BIT_EXT
- VK_IMAGE_ASPECT_MEMORY_PLANE_3_BIT_EXT

Extending VkImageTiling:
- VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT

Extending VkResult:

- VK_STRUCTURE_TYPE_IMAGE_DRM_FORMAT_MODIFIER_EXPLICIT_CREATE_INFO_EXT
- VK_STRUCTURE_TYPE_IMAGE_DRM_FORMAT_MODIFIER_LIST_CREATE_INFO_EXT
- VK_STRUCTURE_TYPE_IMAGE_DRM_FORMAT_MODIFIER_PROPERTIES_EXT
- VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_DRM_FORMAT_MODIFIER_INFO_EXT

If VK_KHR_format_feature_flags2 or Version 1.3 is supported:

- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_DRM_FORMAT_MODIFIER_PROPERTIES_LIST_2_EXT

Issues

1) Should this extension define a single DRM format modifier per VkImage? Or define one per plane?

+ RESOLVED: There exists a single DRM format modifier per VkImage.

DISCUSSION: Prior art, such as EGL_EXT_image_dma_buf_import_modifiers, struct drm_mode_fb_cmd2, and struct gbm_import_fd_modifier_data, allows defining one modifier per plane. However, developers of the GBM and kernel APIs concede it was a mistake. Beginning in Linux 4.10, the kernel requires that the application provide the same DRM format modifier for each plane. (See Linux commit bae781b259269590109e8a4a8227331362b88212). And GBM provides an entry point, gbm_bo_get_modifier, for querying the modifier of the image but does not provide one to query the modifier of individual planes.

2) When creating an image with VkImageDrmFormatModifierExplicitCreateInfoEXT, which is typically used when importing an image, should the application explicitly provide the size of each
plane?

RESOLVED: No. The application must not provide the size. To enforce this, the API requires that `VkImageDrmFormatModifierExplicitCreateInfoEXT::pPlaneLayouts->size` must be 0.

DISCUSSION: Prior art, such as `EGL_EXT_image_dma_buf_import_modifiers`, `struct drm_mode_fb_cmd2`, and `struct gbm_import_fd_modifier_data`, omits from the API the size of each plane. Instead, the APIs infer each plane's size from the import parameters, which include the image's pixel format and a `dma_buf`, offset, and row pitch for each plane.

However, Vulkan differs from EGL and GBM with regards to image creation in the following ways:

Differences in Image Creation

- **Undedicated allocation by default.** When importing or exporting a set of `dma_bufs` as an `EGLImage` or `gbm_bo`, common practice mandates that each `dma_buf`'s memory be dedicated (in the sense of `VK_KHR_dedicated_allocation`) to the image (though not necessarily dedicated to a single plane). In particular, neither the GBM documentation nor the EGL extension specifications explicitly state this requirement, but in light of common practice this is likely due to under-specification rather than intentional omission. In contrast, `VK_EXT_image_drm_format_modifier` permits, but does not require, the implementation to require dedicated allocations for images created with `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`.

- **Separation of image creation and memory allocation.** When importing a set of `dma_bufs` as an `EGLImage` or `gbm_bo`, EGL and GBM create the image resource and bind it to memory (the `dma_bufs`) simultaneously. This allows EGL and GBM to query each `dma_buf`'s size during image creation. In Vulkan, image creation and memory allocation are independent unless a dedicated allocation is used (as in `VK_KHR_dedicated_allocation`). Therefore, without requiring dedicated allocation, Vulkan cannot query the size of each `dma_buf` (or other external handle) when calculating the image's memory layout. Even if dedication allocation were required, Vulkan cannot calculate the image's memory layout until after the image is bound to its `dma_ufs`.

The above differences complicate the potential inference of plane size in Vulkan. Consider the following problematic cases:

Problematic Plane Size Calculations

- **Padding.** Some plane of the image may require implementation-dependent padding.

- **Metadata.** For some modifiers, the image may have a metadata plane which requires a non-trivial calculation to determine its size.

- **Mipmapped, array, and 3D images.** The implementation may support `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT` for images whose `mipLevels`, `arrayLayers`, or `depth` is greater than 1. For such images with certain modifiers, the calculation of each plane's size may be non-trivial.

However, an application-provided plane size solves none of the above problems.

For simplicity, consider an external image with a single memory plane. The implementation is
obviously capable calculating the image’s size when its tiling is `VK_IMAGE_TILING_OPTIMAL`. Likewise, any reasonable implementation is capable of calculating the image’s size when its tiling uses a supported modifier.

Suppose that the external image’s size is smaller than the implementation-calculated size. If the application provided the external image’s size to `vkCreateImage`, the implementation would observe the mismatched size and recognize its inability to comprehend the external image’s layout (unless the implementation used the application-provided size to select a refinement of the tiling layout indicated by the modifier, which is strongly discouraged). The implementation would observe the conflict, and reject image creation with `VK_ERROR_INVALID_DRM_FORMAT_MODIFIER_PLANE_LAYOUT_EXT`. On the other hand, if the application did not provide the external image’s size to `vkCreateImage`, then the application would observe after calling `vkGetImageMemoryRequirements` that the external image’s size is less than the size required by the implementation. The application would observe the conflict and refuse to bind the `VkImage` to the external memory. In both cases, the result is explicit failure.

Suppose that the external image’s size is larger than the implementation-calculated size. If the application provided the external image’s size to `vkCreateImage`, for reasons similar to above the implementation would observe the mismatched size and recognize its inability to comprehend the image data residing in the extra size. The implementation, however, must assume that image data resides in the entire size provided by the application. The implementation would observe the conflict and reject image creation with `VK_ERROR_INVALID_DRM_FORMAT_MODIFIER_PLANE_LAYOUT_EXT`. On the other hand, if the application did not provide the external image’s size to `vkCreateImage`, then the application would observe after calling `vkGetImageMemoryRequirements` that the external image’s size is larger than the implementation-usable size. The application would observe the conflict and refuse to bind the `VkImage` to the external memory. In both cases, the result is explicit failure.

Therefore, an application-provided size provides no benefit, and this extension should not require it. This decision renders `VkSubresourceLayout::size` an unused field during image creation, and thus introduces a risk that implementations may require applications to submit sideband creation parameters in the unused field. To prevent implementations from relying on sideband data, this extension requires the application to set `size` to 0.

Description

This extension allows creating 3D views of 3D images such that the views contain a subset of the slices in the image, using a Z offset and range, for the purpose of using the views as storage image descriptors. This matches functionality in D3D12 and is primarily intended to support D3D12 emulation.

New Structures

- Extending `VkImageViewCreateInfo`:
  - `VkImageViewSlicedCreateInfoEXT`

Description

This extension allows applications to clamp the minimum LOD value during Image Level(s) Selection, Texel Gathering and Integer Texel Coordinate Operations with a given VkImageView by VkImageViewMinLodCreateInfoEXT::minLod.

This extension may be useful to restrict a VkImageView to only mips which have been uploaded, and the use of fractional minLod can be useful for smoothly introducing new mip levels when using linear mipmap filtering.

Description

This extension provides a mechanism for configuring programmatically through the Vulkan API the behavior of layers.

This extension provides the `VkLayerSettingsCreateInfoEXT` struct that can be included in the `pNext` chain of the `VkInstanceCreateInfo` structure passed as the `pCreateInfo` parameter of `vkCreateInstance`.

The structure contains an array of `VkLayerSettingEXT` structure values that configure specific features of layers.

Example

`VK_EXT_layer_settings` is implemented by the Vulkan Profiles layer.

It allows the profiles layer tests used by the profiles layer C.I. to programmatically configure the layer for each test without affecting the C.I. environment, allowing to run multiple tests concurrently.

```c
const char* profile_file_data = JSON_TEST_FILES_PATH "VP_KHR_roadmap_2022.json";
const char* profile_name_data = "VP_KHR_roadmap_2022";
VkBool32 emulate_portability_data = VK_TRUE;
const char* simulate_capabilities[] = {
    "SIMULATE_API_VERSION_BIT",
    "SIMULATE_FEATURES_BIT",
    "SIMULATE_PROPERTIES_BIT",
    "SIMULATE_EXTENSIONS_BIT",
    "SIMULATE_FORMATS_BIT",
    "SIMULATE_QUEUE_FAMILY_PROPERTIES_BIT"
};
const char* debug_reports[] = {
    "DEBUG_REPORT_ERROR_BIT",
    "DEBUG_REPORT_WARNING_BIT",
    "DEBUG_REPORT_NOTIFICATION_BIT",
    "DEBUG_REPORT_DEBUG_BIT"
};
```
const VkLayerSettingEXT settings[] = {
    {kLayerName, kLayerSettingsProfileFile, VK_LAYER_SETTING_TYPE_STRING_EXT, 1, &profile_file_data},
    {kLayerName, kLayerSettingsProfileName, VK_LAYER_SETTING_TYPE_STRING_EXT, 1, &profile_name_data},
    {kLayerName, kLayerSettingsEmulatePortability, VK_LAYER_SETTING_TYPE_BOOL32_EXT, 1, &emulate_portability_data},
    {kLayerName, kLayerSettingsSimulateCapabilities, VK_LAYER_SETTING_TYPE_STRING_EXT, static_cast<uint32_t>(std::size(simulate_capabilities)), simulate_capabilities},
    {kLayerName, kLayerSettingsDebugReports, VK_LAYER_SETTING_TYPE_STRING_EXT, static_cast<uint32_t>(std::size(debug_reports)), debug_reports}
};

const VkLayerSettingsCreateInfoEXT layer_settings_create_info{
    VK_STRUCTURE_TYPE_LAYER_SETTINGS_CREATE_INFO_EXT, nullptr,
    static_cast<uint32_t>(std::size(settings)), settings};

VkInstanceCreateInfo inst_create_info = {};
...
inst_create_info.pNext = &layer_settings_create_info;
vkCreateInstance(&inst_create_info, nullptr, &instances);

---

**Note**
The VK_EXT_layer_settings extension subsumes all the functionality provided in the VK_EXT_validation_flags extension and the VK_EXT_validation_features extension.

**New Structures**
- VkLayerSettingEXT
- Extending VkInstanceCreateInfo:
  - VkLayerSettingsCreateInfoEXT

**New Enums**

  ◦ Added pipeline create flag to support dynamic rendering

Issues

1) In OpenGL, the dither state can change dynamically. Should this extension add a pipeline state for dither?
RESOLVED: No. Changing dither state is rarely, if ever, done during rendering. Every surveyed Android application either entirely disables dither, explicitly enables it, or uses the default state (which is enabled). Additionally, on some hardware dither can only be specified in a render pass granularity, so a change in dither state would necessarily need to cause a render pass break. This extension considers dynamic changes in OpenGL dither state a theoretical situation, and expects the layer to break the render pass in such a situation without any practical downsides.

**IP Status**

No known IP claims.

**Contributors**

- Mike Blumenkrantz, Valve
- Piers Daniell, NVIDIA
- Spencer Fricke, LunarG
Description

This extension adds support for legacy features of (non-64-bit) vertex attributes as found in OpenGL:

- Vertex attributes loaded from arbitrary buffer alignments
- Vertex attributes using arbitrary strides
- Vertex attributes where the component data type of the binding does not match the component numeric type of the shader input

These features are only usable with dynamic vertex input. Unaligned loads of vertex attributes may incur performance penalties, indicated with a property.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceLegacyVertexAttributesFeaturesEXT
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceLegacyVertexAttributesPropertiesEXT

New Enum Constants

- VK_EXT_LEGACY_VERTEX_ATTRIBUTES_EXTENSION_NAME
- VK_EXT_LEGACY_VERTEX_ATTRIBUTES_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LEGACY_VERTEX_ATTRIBUTES_FEATURES_EXT
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LEGACY_VERTEX_ATTRIBUTES_PROPERTIES_EXT

Issues

1.) Should implementations convert float/integer values?

**RESOLVED:** No. When fetching an integer data type from float values or float data types from integer values, the resulting shader values are implementation-dependent.

Description

While running a Vulkan application, other processes on the machine might also be attempting to use the same device memory, which can pose problems. This extension adds support for querying the amount of memory used and the total memory budget for a memory heap. The values returned by this query are implementation-dependent and can depend on a variety of factors including operating system and system load.

The `VkPhysicalDeviceMemoryBudgetPropertiesEXT::heapBudget` values can be used as a guideline for how much total memory from each heap the current process can use at any given time, before allocations may start failing or causing performance degradation. The values may change based on other activity in the system that is outside the scope and control of the Vulkan implementation.

The `VkPhysicalDeviceMemoryBudgetPropertiesEXT::heapUsage` will display the current process estimated heap usage.

With this information, the idea is for an application at some interval (once per frame, per few seconds, etc) to query `heapBudget` and `heapUsage`. From here the application can notice if it is over budget and decide how it wants to handle the memory situation (free it, move to host memory, changing mipmap levels, etc). This extension is designed to be used in concert with `VK_EXT_memory_priority` to help with this part of memory management.

New Structures

• Extending `VkPhysicalDeviceMemoryProperties2`:
  • `VkPhysicalDeviceMemoryBudgetPropertiesEXT`

New Enum Constants

• `VK_EXT_MEMORY_BUDGET_EXTENSION_NAME`
• `VK_EXT_MEMORY_BUDGET_SPEC_VERSION`
• Extending VkStructureType:
  ◦ VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MEMORY_BUDGET_PROPERTIES_EXT

Description

This extension adds a priority value specified at memory allocation time. On some systems with both device-local and non-device-local memory heaps, the implementation may transparently move memory from one heap to another when a heap becomes full (for example, when the total memory used across all processes exceeds the size of the heap). In such a case, this priority value may be
used to determine which allocations are more likely to remain in device-local memory.

New Structures

• Extending `VkMemoryAllocateInfo`:
  ◦ `VkMemoryPriorityAllocateInfoEXT`

• Extending `VkPhysicalDeviceFeatures2, VkDeviceCreateInfo`:
  ◦ `VkPhysicalDeviceMemoryPriorityFeaturesEXT`

New Enum Constants

Description

This extension provides a new mechanism allowing applications to generate collections of geometric primitives via programmable mesh shading. It is an alternative to the existing programmable primitive shading pipeline, which relied on generating input primitives by a fixed function assembler as well as fixed function vertex fetch.

This extension also adds support for the following SPIR-V extension in Vulkan:

• SPV_EXT_mesh_shader

New Commands

• vkCmdDrawMeshTasksEXT
• vkCmdDrawMeshTasksIndirectCountEXT
• vkCmdDrawMeshTasksIndirectEXT

New Structures

• VkDrawMeshTasksIndirectCommandEXT
• Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  ◦ VkPhysicalDeviceMeshShaderFeaturesEXT
• Extending VkPhysicalDeviceProperties2:
  ◦ VkPhysicalDeviceMeshShaderPropertiesEXT

New Enum Constants

• VK_EXT_MESH_SHADER_EXTENSION_NAME
• VK_EXT_MESH_SHADER_SPEC_VERSION
• Extending VkPipelineStageFlagBits:
  ◦ VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT
  ◦ VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT
• Extending VkQueryPipelineStatisticFlagBits:
  ◦ VK_QUERY_PIPELINE_STATISTIC_MESH_SHADER_INVOCATIONS_BIT_EXT
  ◦ VK_QUERY_PIPELINE_STATISTIC_TASK_SHADER_INVOCATIONS_BIT_EXT
• Extending VkQueryType:
  ◦ VK_QUERY_TYPE_MESH_PRIMITIVES_GENERATED_EXT
• Extending VkShaderStageFlagBits:
- `VK_SHADER_STAGE_MESH_BIT_EXT`
- `VK_SHADER_STAGE_TASK_BIT_EXT`

**Extending VkStructureType:**
- `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MESH_SHADER_FEATURES_EXT`
- `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MESH_SHADER_PROPERTIES_EXT`

If `VK_NV_device_generated_commands` is supported:

**Extending VkIndirectCommandsTokenTypeNV:**
- `VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_MESH_TASKS_NV`

### New or Modified Built-In Variables

**Description**

In a Vulkan implementation that is layered on top of Metal on Apple device platforms, this extension provides the ability to import and export the underlying Metal objects associated with specific Vulkan objects.
As detailed in the extension proposal document, this extension adds one new Vulkan command, `vkExportMetalObjectsEXT`, to export underlying Metal objects from Vulkan objects, and supports importing the appropriate existing Metal objects when creating Vulkan objects of types `VkDeviceMemory`, `VkImage`, `VkSemaphore`, and `VkEvent`.

The intent is that this extension will be advertised and supported only on implementations that are layered on top of Metal on Apple device platforms.

**New Base Types**
- IOSurfaceRef
- MTLBuffer_id
- MTLCommandQueue_id
- MTLDevice_id
- MTLSharedEvent_id
- MTLTexture_id

**New Commands**

Description
Processing multiple draw commands in sequence incurs measurable overhead within drivers due to repeated state checks and updates during dispatch. This extension enables passing the entire sequence of draws directly to the driver in order to avoid any such overhead, using an array of VkMultiDrawInfoEXT or VkMultiDrawIndexedInfoEXT structs with vkCmdDrawMultiEXT or vkCmdDrawMultiIndexedEXT, respectively. These functions could be used any time multiple draw commands are being recorded without any state changes between them in order to maximize performance.

New Commands
- vkCmdDrawMultiEXT
- vkCmdDrawMultiIndexedEXT

New Structures
- VkMultiDrawIndexedInfoEXT

Extension Proposal

VK_EXT_multisampled_render_to_single_sampled
Description

With careful usage of resolve attachments, multisampled image memory allocated with `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT`, `loadOp` not equal to `VK_ATTACHMENT_LOAD_OP_LOAD` and `storeOp` not equal to `VK_ATTACHMENT_STORE_OP_STORE`, a Vulkan application is able to efficiently perform multisampled rendering without incurring any additional memory penalty on some implementations.

Under certain circumstances however, the application may not be able to complete its multisampled rendering within a single render pass; for example if it does partial rasterization from frame to frame, blending on an image from a previous frame, or in emulation of `GL_EXT_multisampled_render_to_texture`. In such cases, the application can use an initial subpass to effectively load single-sampled data from the next subpass’s resolve attachment and fill in the multisampled attachment which otherwise uses `loadOp` equal to `VK_ATTACHMENT_LOAD_OP_DONT_CARE`. However, this is not always possible (for example for stencil in the absence of `VK_EXT_shader_stencil_export`) and has multiple drawbacks.

Some implementations are able to perform said operation efficiently in hardware, effectively loading a multisampled attachment from the contents of a single sampled one. Together with the ability to perform a resolve operation at the end of a subpass, these implementations are able to perform multisampled rendering on single-sampled attachments with no extra memory or bandwidth overhead. This extension exposes this capability by allowing a framebuffer and render pass to include single-sampled attachments while rendering is done with a specified number of samples.

New Structures

- Extending `VkFormatProperties2`:
  - `VkSubpassResolvePerformanceQueryEXT`
- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  - `VkPhysicalDeviceMultisampledRenderToSingleSampledFeaturesEXT`
• Extending `VkSubpassDescription2`, `VkRenderingInfo`:
  ◦ `VkMultisampledRenderToSingleSampledInfoEXT`

New Enum Constants

• `VK_EXT_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_EXTENSION_NAME`
• `VK_EXT_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_SPEC_VERSION`

Extending `VkImageCreateFlagBits`:

◦ `VK_IMAGE_CREATE_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_BIT_EXT`

Extending `VkStructureType`:

◦ `VK_STRUCTURE_TYPE_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_INFO_EXT`
◦ `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_FEATURES_EXT`
◦ `VK_STRUCTURE_TYPE_SUBPASS_RESOLVE_PERFORMANCE_QUERY_EXT`

Issues

1) Could the multisampled attachment be initialized through some form of copy?

**RESOLVED**: No. Some implementations do not support copying between attachments in general, and find expressing this operation through a copy unnatural.

2) Another way to achieve this is by introducing a new `loadOp` to load the contents of the multisampled image from a single-sampled one. Why is this extension preferred?

**RESOLVED**: Using this extension simplifies the application, as it does not need to manage a secondary lazily-allocated image. Additionally, using this extension leaves less room for error; for example a single mistake in `loadOp` or `storeOp` would result in the lazily-allocated image to actually take up memory, and remain so until destruction.

3) There is no guarantee that multisampled data between two subpasses with the same number of samples will be retained as the implementation may be forced to split the render pass implicitly for various reasons. Should this extension require that every subpass that uses multisampled-render-to-single-sampled end in an implicit render pass split (which results in a resolve operation)?

**RESOLVED**: No. Not requiring this allows render passes with multiple multisampled-render-to-single-sampled subpasses to potentially execute more efficiently (though there is no guarantee).

Description
  This extension allows applications to reduce descriptor memory footprint by allowing a descriptor
to be able to mutate to a given list of descriptor types depending on which descriptor types are
written into, or copied into a descriptor set.

  The main use case this extension intends to address is descriptor indexing with
VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT where the descriptor types are completely
generic, as this means applications can allocate one large descriptor set, rather than having one
large descriptor set per descriptor type, which significantly bloats descriptor memory usage and
causes performance issues.
This extension also adds a mechanism to declare that a descriptor pool, and therefore the descriptor sets that are allocated from it, reside only in host memory; as such these descriptors can only be updated/copied, but not bound.

These features together allow much more efficient emulation of the raw D3D12 binding model. This extension is primarily intended to be useful for API layering efforts.

New Structures

- **VkMutableDescriptorTypeListEXT**
- Extending `VkDescriptorSetLayoutCreateInfo`, `VkDescriptorPoolCreateInfo`:
  - `VkMutableDescriptorTypeCreateInfoEXT`

Description
With core Vulkan it is not legal to call vkCmdExecuteCommands when recording a secondary command buffer. This extension relaxes that restriction, allowing secondary command buffers to execute other secondary command buffers.

New Structures
• Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  ◦ VkPhysicalDeviceNestedCommandBufferFeaturesEXT
• Extending VkPhysicalDeviceProperties2:
  ◦ VkPhysicalDeviceNestedCommandBufferPropertiesEXT

New Enum Constants
• VK_EXT_NESTED_COMMAND_BUFFER_EXTENSION_NAME
• VK_EXT_NESTED_COMMAND_BUFFER_SPEC_VERSION
• Extending `VkRenderingFlagBits`:
  ◦ `VK_RENDERING_CONTENTS_INLINE_BIT_EXT`

• Extending `VkStructureType`:
  ◦ `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_NESTED_COMMAND_BUFFER_FEATURES_EXT`
  ◦ `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_NESTED_COMMAND_BUFFER_PROPERTIES_EXT`

• Extending `VkSubpassContents`:
  ◦ `VK_SUBPASS_CONTENTS_INLINE_AND_SECONDARY_COMMAND_BUFFERS_EXT`

**Issues**

1) The Command Buffer Levels property for the Vulkan commands comes from the `cmdbufferlevel` attribute in `vk.xml` for the command, and it is currently not possible to modify this attribute based on whether an extension is enabled. For this extension we want the `cmdbufferlevel` attribute for `vkCmdExecuteCommands` to be `primary,secondary` when this extension is enabled and `primary` otherwise.

**RESOLVED:** The `cmdbufferlevel` attribute for `vkCmdExecuteCommands` has been changed to `primary,secondary` and a new VUID added to prohibit recording this command in a secondary command buffer unless this extension is enabled.

Description

This extension provides functionality to disable cube map edge handling on a per sampler level which matches the behavior of other graphics APIs.

This extension may be useful for building translation layers for those APIs or for porting applications that rely on this cube map behavior.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceNonSeamlessCubeMapFeaturesEXT

New Enum Constants

- VK_EXT_NON_SEAMLESS_CUBE_MAP_EXTENSION_NAME
- VK_EXT_NON_SEAMLESS_CUBE_MAP_SPEC_VERSION

- Extending VkSamplerCreateFlagBits:
  - VK_SAMPLER_CREATE_NON_SEAMLESS_CUBE_MAP_BIT_EXT

- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_NON_SEAMLESS_CUBE_MAP_FEATURES_EXT

Description

When adding transparency to a ray traced scene, an application can choose between further tessellating the geometry or using an any-hit shader to allow the ray through specific parts of the geometry. These options have the downside of either significantly increasing memory consumption or adding runtime overhead to run shader code in the middle of traversal, respectively.

This extension adds the ability to add an opacity micromap to geometry when building an acceleration structure. The opacity micromap compactly encodes opacity information which can be read by the implementation to mark parts of triangles as opaque or transparent. The format is externally visible to allow the application to compress its internal geometry and surface representations into the compressed format ahead of time. The compressed format subdivides each triangle into a set of subtriangles, each of which can be assigned either two or four opacity values. These opacity values can control if a ray hitting that subtriangle is treated as an opaque hit, complete miss, or possible hit, depending on the controls described in Ray Opacity Micromap.

This extension provides:

- a VkMicromapEXT structure to store the micromap,
- functions similar to acceleration structure build functions to build the opacity micromap array, and
- a structure to extend VkAccelerationStructureGeometryTrianglesDataKHR to attach a micromap to the geometry of the acceleration structure.

New Object Types

- VkMicromapEXT

New Commands

- vkBuildMicromapsEXT
- vkCmdBuildMicromapsEXT

  \item \texttt{VK_STRUCTURE_TYPE_MICROMAP_BUILD_INFO_EXT}
  \item \texttt{VK_STRUCTURE_TYPE_MICROMAP_BUILD_SIZES_INFO_EXT}
  \item \texttt{VK_STRUCTURE_TYPE_MICROMAP_CREATE_INFO_EXT}
  \item \texttt{VK_STRUCTURE_TYPE_MICROMAP_VERSION_INFO_EXT}
  \item \texttt{VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_OPACITY_MICROMAP_FEATURES_EXT}
  \item \texttt{VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_OPACITY_MICROMAP_PROPERTIES_EXT}
  \end{itemize}

\textbf{Reference Code}

```c
uint32_t BarycentricsToSpaceFillingCurveIndex(float u, float v, uint32_t level)
{
    u = clamp(u, 0.0f, 1.0f);
```
v = clamp(v, 0.0f, 1.0f);

uint32_t iu, iv, iw;

// Quantize barycentric coordinates
float fu = u * (1u << level);
float fv = v * (1u << level);

iu = (uint32_t)fu;
iv = (uint32_t)fv;

float uf = fu - float(iu);
float vf = fv - float(iv);

if (iu >= (1u << level)) iu = (1u << level) - 1u;
if (iv >= (1u << level)) iv = (1u << level) - 1u;

uint32_t iuv = iu + iv;
if (iuv >= (1u << level)) iu = iuv - (1u << level) + 1u;

iw = ~(iu + iv);

if (uf + vf >= 1.0f) iuv < (1u << level) - 1u) --iw;

uint32_t b0 = ~(iu ^ iw);
b0 &= ((1u << level) - 1u);
uint32_t t = (iu ^ iv) & b0;

uint32_t f = t;
f &= f >> 1u;
f &= f >> 2u;
f &= f >> 4u;
f &= f >> 8u;
uint32_t b1 = ((f ^ iu) & ~b0) | t;

// Interleave bits
b0 = (b0 | (b0 << 8u)) & 0x00ff00ffu;
b0 = (b0 | (b0 << 4u)) & 0x0f0f0f0fu;
b0 = (b0 | (b0 << 2u)) & 0x33333333u;
b0 = (b0 | (b0 << 1u)) & 0x55555555u;
b1 = (b1 | (b1 << 8u)) & 0x00ff00ffu;
b1 = (b1 | (b1 << 4u)) & 0x0f0f0f0fu;
b1 = (b1 | (b1 << 2u)) & 0x33333333u;
b1 = (b1 | (b1 << 1u)) & 0x55555555u;

return b0 | (b1 << 1u);
**Issues**

(1) Is the build actually similar to an acceleration structure build?

- Resolved: The build should be much lighter-weight than an acceleration structure build, but the infrastructure is similar enough that it makes sense to keep the concepts compatible.

(2) Why does VkMicromapUsageEXT not have type/pNext?

- Resolved: There can be a very large number of these structures, so doubling the size of these can be significant memory consumption. Also, an application may be loading these directly from a file which is more compatible with it being a flat structure. The including structures are extensible and are probably a more suitable place to add extensibility.

(3) Why is there a SPIR-V extension?

- Resolved: There is a ray flag. To be consistent with how the existing ray tracing extensions work that ray flag needs its own extension.

(4) Should there be indirect micromap build?

- Resolved: Not for now. There is more in-depth usage metadata required and it seems less likely that something like a GPU culling system would need to change the counts for a micromap.

(5) Should micromaps have a micromap device address?

- Resolved: There is no need right now (can just use the handle) but that is a bit different from acceleration structures, though the two are not completely parallel in their usage.

(6) Why are the alignment requirements defined as a mix of hardcoded values and caps?

- Resolved: This is most parallel with the definition of `VK_KHR_acceleration_structure` and maintaining commonality makes it easier for applications to share memory.

**VK_EXT_pageable_device_local_memory**

**Name String**

- `VK_EXT_pageable_device_local_memory`

**Extension Type**

- Device extension
Vulkan is frequently implemented on multi-user and multi-process operating systems where the device-local memory can be shared by more than one process. On such systems the size of the device-local memory available to the application may not be the full size of the memory heap at all times. In order for these operating systems to support multiple applications the device-local memory is virtualized and paging is used to move memory between device-local and host-local memory heaps, transparent to the application.

The current Vulkan specification does not expose this behavior well and may cause applications to make suboptimal memory choices when allocating memory. For example, in a system with multiple applications running, the application may think that device-local memory is full and revert to making performance-sensitive allocations from host-local memory. In reality the memory heap might not have been full, it just appeared to be at the time memory consumption was queried, and a device-local allocation would have succeeded. A well designed operating system that implements pageable device-local memory will try to have all memory allocations for the foreground application paged into device-local memory, and paged out for other applications as needed when...
When this extension is exposed by the Vulkan implementation it indicates to the application that the operating system implements pageable device-local memory and the application should adjust its memory allocation strategy accordingly. The extension also exposes a new `vkSetDeviceMemoryPriorityEXT` function to allow the application to dynamically adjust the priority of existing memory allocations based on its current needs. This will help the operating system page out lower priority memory allocations before higher priority allocations when needed. It will also help the operating system decide which memory allocations to page back into device-local memory first.

To take best advantage of pageable device-local memory the application must create the Vulkan device with the `VkPhysicalDevicePageableDeviceLocalMemoryFeaturesEXT::pageableDeviceLocalMemory` feature enabled. When enabled the Vulkan implementation will allow device-local memory allocations to be paged in and out by the operating system, and may not return `VK_ERROR_OUT_OF_DEVICE_MEMORY` even if device-local memory appears to be full, but will instead page this, or other allocations, out to make room. The Vulkan implementation will also ensure that host-local memory allocations will never be promoted to device-local memory by the operating system, or consume device-local memory.

**New Commands**

- `vkSetDeviceMemoryPriorityEXT`

Description

This extension adds a new query to obtain PCI bus information about a physical device.

Not all physical devices have PCI bus information, either due to the device not being connected to the system through a PCI interface or due to platform specific restrictions and policies. Thus this extension is only expected to be supported by physical devices which can provide the information.

As a consequence, applications should always check for the presence of the extension string for each individual physical device for which they intend to issue the new query for and should not have any assumptions about the availability of the extension on any given platform.

New Structures
    • Extending VkPhysicalDeviceProperties2:
        ◦ VkPhysicalDevicePCIBusInfoPropertiesEXT

Description

This extension provides new facilities to query DRM properties for physical devices, enabling users to match Vulkan physical devices with DRM nodes on Linux.

Its functionality closely overlaps with `EGL_EXT_device_drm`. Unlike the EGL extension, this extension does not expose a string containing the name of the device file and instead exposes device minor numbers.

DRM defines multiple device node types. Each physical device may have one primary node and one render node associated. Physical devices may have no primary node (e.g. if the device does not have a display subsystem), may have no render node (e.g. if it is a software rendering engine), or may have neither (e.g. if it is a software rendering engine without a display subsystem).

To query DRM properties for a physical device, chain `VkPhysicalDeviceDrmPropertiesEXT` to `VkPhysicalDeviceProperties2`.

New Structures

- Extending `VkPhysicalDeviceProperties2`:
  - `VkPhysicalDeviceDrmPropertiesEXT`

New Enum Constants

- `VK_EXT_PHYSICAL_DEVICE_DRM_EXTENSION_NAME`
- `VK_EXT_PHYSICAL_DEVICE_DRM_SPEC_VERSION`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DRM_PROPERTIES_EXT`

**VK_EXT_pipeline_library_group_handles**

Name String

`VK_EXT_pipeline_library_group_handles`

Extension Type

- Device extension
Description

When using pipeline libraries in ray tracing pipelines, a library might get linked into different pipelines in an incremental way. An application can have a strategy where a ray tracing pipeline is comprised of N pipeline libraries and is later augmented by creating a new pipeline with N + 1 libraries. Without this extension, all group handles must be re-queried as the group handle is tied to the pipeline, not the library. This is problematic for applications which aim to decouple construction of record buffers and the linkage of ray tracing pipelines.

To aid in this, this extension enables support for querying group handles directly from pipeline libraries. Group handles obtained from a library must remain bitwise identical in any VkPipeline.
that links to the library.

With this feature, the extension also improves compatibility with DXR 1.1 AddToStateObject(), which guarantees that group handles returned remain bitwise identical between parent and child pipelines. In addition, querying group handles from COLLECTION objects is also supported with that API.

New Structures

• Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  ◦ VkPhysicalDevicePipelineLibraryGroupHandlesFeaturesEXT

New Enum Constants

• VK_EXT_PIPELINE_LIBRARY_GROUP_HANDLES_EXTENSION_NAME
• VK_EXT_PIPELINE_LIBRARY_GROUP_HANDLES_SPEC_VERSION

Description

Vulkan SC requires offline compilation of pipelines. In order to support this, the pipeline state is represented in a JSON schema that is read by an offline tool for compilation.

One method of developing a Vulkan SC application is to author a Vulkan application and use a layer to record and serialize the pipeline state and shaders for offline compilation. Each pipeline is represented by a separate JSON file, and can be identified with a pipelineIdentifier.

Once the pipelines have been compiled by the offline pipeline cache compiler, the Vulkan SC application can then use this pipelineIdentifier for identifying the pipeline via Vulkan SC's VkPipelineIdentifierInfo structure.

This extension allows the Vulkan application to query the pipelineIdentifier associated with each pipeline so that the application can store this with its pipeline metadata and the Vulkan SC application will then use to map the same state to an entry in the Vulkan SC pipeline cache.

It is expected that this extension will initially be implemented in the json generation layer, although we can envision that there might be future uses for it in native Vulkan drivers as well.

New Commands

- vkGetPipelinePropertiesEXT

New Structures

- VkPipelineInfoEXT
- VkPipelinePropertiesIdentifierEXT
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDevicePipelinePropertiesFeaturesEXT
New Enum Constants

- VK_EXT_PIPELINE_PROPERTIES_EXTENSION_NAME
- VK_EXT_PIPELINE_PROPERTIES_SPEC_VERSION

Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PIPELINE_PROPERTIES_FEATURES_EXT
  - VK_STRUCTURE_TYPE_PIPELINE_INFO_EXT
  - VK_STRUCTURE_TYPE_PIPELINE_PROPERTIES_IDENTIFIER_EXT

Issues

(1) This extension does not make sense on a strict Vulkan SC implementation. It may however be of potential use in a non-strict Vulkan SC implementation. Should this extension be enabled as part of Vulkan SC as well?

**RESOLVED**: No. This extension will not be enabled for Vulkan SC.

(2) This is intended to be a general pipeline properties query, but is currently only retrieving the pipeline identifier. Should the pipeline identifier query be mandatory for this extension and for all queries using this command?

**RESOLVED**: Use `VkBaseOutStructure` for the return parameter. Currently this is required to actually be a `VkPipelinePropertiesIdentifierEXT` structure, but that could be relaxed in the future to allow other structure types or to allow other structures to be chained in along with this one.

(3) Should there be a feature structure? Should it be required?

**RESOLVED**: Add a feature structure, and a feature for querying pipeline identifier, but allow it to be optional so that this extension can be used as the basis for other pipeline property queries without requiring the pipeline identifier to be supported.

Version History

Interactions and External Dependencies
- This extension provides API support for GL_ARB_post_depth_coverage and GL_EXT_post_depth_coverage

Contributors
- Jeff Bolz, NVIDIA

Description
This extension adds support for the following SPIR-V extension in Vulkan:

- SPV_KHR_post_depth_coverage

which allows the fragment shader to control whether values in the SampleMask built-in input variable reflect the coverage after early depth and stencil tests are applied.

This extension adds a new PostDepthCoverage execution mode under the SampleMaskPostDepthCoverage capability. When this mode is specified along with EarlyFragmentTests, the value of an input variable decorated with the SampleMask built-in reflects the coverage after the
early fragment tests are applied. Otherwise, it reflects the coverage before the depth and stencil tests.

When using GLSL source-based shading languages, the post_depth_coverage layout qualifier from GL_ARB_post_depth_coverage or GL_EXT_post_depth_coverage maps to the PostDepthCoverage execution mode.

New Enum Constants

VK_EXT_primitives_generated_query

Name String
VK_EXT_primitives_generated_query

Extension Type
Device extension
Description

This extension adds support for a new query type to match OpenGL's `GL_PRIMITIVES_GENERATED` to support layering.

New Structures

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  - `VkPhysicalDevicePrimitivesGeneratedQueryFeaturesEXT`

New Enum Constants

- `VK_EXT_PRIMITIVES_GENERATED_QUERY_EXTENSION_NAME`
- `VK_EXT_PRIMITIVES_GENERATED_QUERY_SPEC_VERSION`
- Extending `VkQueryType`:
Extending VkStructureType:

• VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PRIMITIVES_GENERATED_QUERY_FEATURES_EXT

Issues

1) Can the query from VK_EXT_transform_feedback be used instead?

RESOLVED: No. While the query from VK_EXT_transform_feedback can produce the same results as in this extension, it is only available while transform feedback is active. The OpenGL GL_PRIMITIVES_GENERATED query is independent from transform feedback. Emulation through artificial transform feedback is unnecessarily inefficient.

2) Can VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT be used instead?

RESOLVED: It could, but we prefer the extension for simplicity. Vulkan requires that only one query be active at a time. If both the GL_PRIMITIVES_GENERATED and the GL_CLIPPING_INPUT_PRIMITIVES_ARB queries need to be simultaneously enabled, emulation of both through VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT is inconvenient.

3) On some hardware, this query cannot be implemented if VkPipelineRasterizationStateCreateInfo::rasterizerDiscardEnable is enabled. How will this be handled?

RESOLVED: A feature flag is exposed by this extension for this. On said hardware, the GL implementation disables rasterizer-discard and achieves the same effect through other means. It will not be able to do the same in Vulkan due to lack of state information. A feature flag is exposed by this extension so the OpenGL implementation on top of Vulkan would be able to implement a similar workaround.

4) On some hardware, this query cannot be implemented for non-zero query indices. How will this be handled?

RESOLVED: A feature flag is exposed by this extension for this. If this feature is not present, the query from VK_EXT_transform_feedback can be used to the same effect.

5) How is the interaction of this extension with transformFeedbackRasterizationStreamSelect handled?

RESOLVED: Disallowed for non-zero streams. In OpenGL, the rasterization stream is always stream zero.

Description

This extension allows changing the provoking vertex convention between Vulkan’s default convention (first vertex) and OpenGL’s convention (last vertex).

This extension is intended for use by API-translation layers that implement APIs like OpenGL on top of Vulkan, and need to match the source API’s provoking vertex convention. Applications using Vulkan directly should use Vulkan’s default convention.

New Structures

- Extending `VkPhysicalDeviceFeatures2, VkDeviceCreateInfo`:
  - `VkPhysicalDeviceProvokingVertexFeaturesEXT`
- Extending `VkPhysicalDeviceProperties2`:
  - `VkPhysicalDeviceProvokingVertexPropertiesEXT`
- Extending `VkPipelineRasterizationStateCreateInfo`:
  - `VkPipelineRasterizationProvokingVertexStateCreateInfoEXT`

New Enums

- `VkProvokingVertexModeEXT`

New Enum Constants

- `VK_EXT_PROVOKING_VERTEX_EXTENSION_NAME`
- `VK_EXT_PROVOKING_VERTEX_SPEC_VERSION`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PROVOKING_VERTEX_FEATURES_EXT`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PROVOKING_VERTEX_PROPERTIES_EXT`
  - `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_PROVOKING_VERTEX_STATE_CREATE_INFO_EXT`

Issues

1) At what granularity should this state be set?

**RESOLVED:** At pipeline bind, with an optional per-render pass restriction.

The most natural place to put this state is in the graphics pipeline object. Some implementations require it to be known when creating the pipeline, and pipeline state is convenient for
implementing OpenGL 3.2’s glProvokingVertex, which can change the state between draw calls. However, some implementations can only change it approximately render pass granularity. To accommodate both, provoking vertex will be pipeline state, but implementations can require that only one mode is used within a render pass instance; the render pass’s mode is chosen implicitly when the first pipeline is bound.

2) Does the provoking vertex mode affect the order that vertices are written to transform feedback buffers?

RESOLVED: Yes, to enable layered implementations of OpenGL and D3D.

All of OpenGL, OpenGL ES, and Direct3D 11 require that vertices are written to transform feedback buffers such that flat-shaded attributes have the same value when drawing the contents of the transform feedback buffer as they did in the original drawing when the transform feedback buffer was written (assuming the provoking vertex mode has not changed, in APIs that support more than one mode).

Version History

Description
This extension defines a special queue family, VK_QUEUE_FAMILY_FOREIGN_EXT, which can be used to transfer ownership of resources backed by external memory to foreign, external queues. This is similar to VK_QUEUE_FAMILY_EXTERNAL_KHR, defined in VK_KHR_external_memory. The key differences between the two are:

• The queues represented by VK_QUEUE_FAMILY_EXTERNAL_KHR must share the same physical device and the same driver version as the current VkInstance. VK_QUEUE_FAMILY_FOREIGN_EXT has no such restrictions. It can represent devices and drivers from other vendors, and can even represent non-Vulkan-capable devices.

• All resources backed by external memory support VK_QUEUE_FAMILY_EXTERNAL_KHR. Support for VK_QUEUE_FAMILY_FOREIGN_EXT is more restrictive.

• Applications should expect transitions to/from VK_QUEUE_FAMILY_FOREIGN_EXT to be more expensive than transitions to/from VK_QUEUE_FAMILY_EXTERNAL_KHR.

New Enum Constants
• VK_EXT_QUEUE_FAMILY_FOREIGN_EXTENSION_NAME
• VK_EXT_QUEUE_FAMILY_FOREIGN_SPEC_VERSION
• VK_QUEUE_FAMILY_FOREIGN_EXT

Description
This extension enables the VK_FORMAT_R10X6G10X6B10X6A10X6_UNORM_4PACK16 format to be used without a sampler Y'CbCr conversion enabled.

New Structures
• Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  ○ VkPhysicalDeviceRGBA10X6FormatsFeaturesEXT
New Enum Constants

- VK_EXT_RGBA10X6_FORMATS_EXTENSION_NAME
- VK_EXT_RGBA10X6_FORMATS_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RGBA10X6_FORMATS_FEATURES_EXT

Issues

1) Should we reuse the existing format enumeration or introduce a new one?

RESOLVED: We reuse an existing format enumeration, VK_FORMAT_R10X6G10X6B10X6A10X6_UNORM_4PACK16, that was previously exclusively used for YCbCr and therefore had a set of limitations related to that usage. The alternative was to introduce a new format token with exactly the same bit representation as the existing token, but without the limitations.

2) Should we only introduce VK_FORMAT_R10X6G10X6B10X6A10X6_UNORM_4PACK16 or also 1-3 component variations?

RESOLVED: Only the 4-component format is introduced because the 1- and 2- component variations are already not exclusive to YCbCr, and the 3-component variation is not a good match for hardware capabilities.

Extension and Version Dependencies

VK_KHR_get_physical_device_properties2
Description

This extension adds stricter requirements for how out of bounds reads and writes are handled. Most accesses **must** be tightly bounds-checked, out of bounds writes **must** be discarded, out of bound reads **must** return zero. Rather than allowing multiple possible (0,0,0,x) vectors, the out of bounds values are treated as zero, and then missing components are inserted based on the format as described in Conversion to RGBA and vertex input attribute extraction.

These additional requirements **may** be expensive on some implementations, and should only be enabled when truly necessary.

This extension also adds support for “null descriptors”, where VK_NULL_HANDLE can be used instead of a valid handle. Accesses to null descriptors have well-defined behavior, and do not rely on robustness.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceRobustness2FeaturesEXT
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceRobustness2PropertiesEXT

New Enum Constants

- VK_EXT_ROBUSTNESS_2_EXTENSION_NAME
- VK_EXT_ROBUSTNESS_2_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ROBUSTNESS_2_FEATURES_EXT
Issues

RESOLVED: Some implementations cannot efficiently tightly bounds-check all buffer accesses. Rather, the size of the bound range is padded to some power of two multiple, up to 256 bytes for uniform buffers and up to 4 bytes for storage buffers, and that padded size is bounds-checked. This is sufficient to implement D3D-like behavior, because D3D only allows binding whole uniform buffers or ranges that are a multiple of 256 bytes, and D3D raw and structured buffers only support 32-bit accesses.

Examples

None.

Description

This extension allows an application to modify the locations of samples within a pixel used in rasterization. Additionally, it allows applications to specify different sample locations for each pixel in a group of adjacent pixels, which can increase antialiasing quality (particularly if a custom resolve shader is used that takes advantage of these different locations).

It is common for implementations to optimize the storage of depth values by storing values that can be used to reconstruct depth at each sample location, rather than storing separate depth values for each sample. For example, the depth values from a single triangle may be represented using plane equations. When the depth value for a sample is needed, it is automatically evaluated at the sample location. Modifying the sample locations causes the reconstruction to no longer evaluate the same depth values as when the samples were originally generated, thus the depth aspect of a depth/stencil attachment must be cleared before rendering to it using different sample locations.

Some implementations may need to evaluate depth image values while performing image layout transitions. To accommodate this, instances of the VkSampleLocationsInfoEXT structure can be specified for each situation where an explicit or automatic layout transition has to take place. VkSampleLocationsInfoEXT can be chained from VkImageMemoryBarrier structures to provide sample locations for layout transitions performed by vkCmdWaitEvents and vkCmdPipelineBarrier calls, and VkRenderPassSampleLocationsBeginInfoEXT can be chained from VkRenderPassBeginInfo to provide sample locations for layout transitions performed implicitly by a render pass instance.

Other Extension Metadata
Description
This extension allows a shader to perform 16-bit floating-point atomic operations on buffer and workgroup memory as well as floating-point atomic minimum and maximum operations on buffer, workgroup, and image memory. It advertises the SPIR-V `AtomicFloat16AddEXT` capability which allows atomic add operations on 16-bit floating-point numbers and the SPIR-V `AtomicFloat16MinMaxEXT`, `AtomicFloat32MinMaxEXT` and `AtomicFloat64MinMaxEXT` capabilities which allow atomic minimum and maximum operations on floating-point numbers. The supported operations include `OpAtomicFAddEXT`, `OpAtomicFMinEXT` and `OpAtomicFMaxEXT`.

New Structures

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  - `VkPhysicalDeviceShaderAtomicFloat2FeaturesEXT`

New Enum Constants

- `VK_EXT_SHADER_ATOMIC_FLOAT_2_EXTENSION_NAME`
- `VK_EXT_SHADER_ATOMIC_FLOAT_2_SPEC_VERSION`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_ATOMIC_FLOAT_2_FEATURES_EXT`

Issues

1) Should this extension add support for 16-bit image atomics?

**RESOLVED:** No. While Vulkan supports creating storage images with `VK_FORMAT_R16_SFLOAT` and doing load and store on them, the data in the shader has a 32-bit representation. Vulkan currently has no facility for even basic reading or writing such images using 16-bit float values in the shader. Adding such functionality would be required before 16-bit image atomics would make sense and is outside the scope of this extension.

New SPIR-V Capabilities

- `AtomicFloat32MinMaxEXT`
- `AtomicFloat32MinMaxEXT`
• AtomicFloat32MinMaxEXT
• AtomicFloat64MinMaxEXT

- Graham Wihlidal, Epic Games
- Tobias Hector, AMD
- Jeff Bolz, Nvidia
- Faith Ekstrand, Intel

Description

This extension extends existing 64-bit integer atomic support to enable these operations on images as well.

When working with large 2- or 3-dimensional data sets (e.g. rasterization or screen-space effects), image accesses are generally more efficient than equivalent buffer accesses. This extension allows applications relying on 64-bit integer atomics in this manner to quickly improve performance with only relatively minor code changes.

64-bit integer atomic support is guaranteed for optimally tiled images with the `VK_FORMAT_R64_UINT` and `VK_FORMAT_R64_SINT` formats.

New Structures

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  - `VkPhysicalDeviceShaderImageAtomicInt64FeaturesEXT`

New Enum Constants

VK_EXT_shader_module_identifier

Name String

- `VK_EXT_shader_module_identifier`

Extension Type

- Device extension
Some applications generate SPIR-V code at runtime. When pipeline caches are primed, either explicitly through e.g. VkPipelineCache mechanisms, or implicitly through driver managed caches, having to re-generate SPIR-V modules is redundant. SPIR-V modules could be cached on disk by an application, but the extra disk size requirement might be prohibitive in some use cases.
This extension adds the ability for an application to query a small identifier associated with a `VkShaderModule`. On subsequent runs of the application, the same identifier can be provided in lieu of a `VkShaderModule` object. A pipeline creation call with such a module may succeed if a pipeline could be created without invoking compilation, and information inside the SPIR-V module is not required by the implementation.

`VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT` must be used if only the identifier is provided, and this use case is intended to work like a non-blocking, speculative compile. Applications can fallback as necessary.

The main motivation for identifying the module itself and not the entire pipeline is that pipeline identifiers change when a driver is updated, but module identifiers are expected to be stable for any particular driver implementation. This approach is helpful for shader pre-compilation systems which can prime pipeline caches ahead of time. When on-disk pipeline caches are updated, the same shader identifiers could lead to a pipeline cache hit.

**New Commands**

- `vkGetShaderModuleCreateInfoIdentifierEXT`
- `vkGetShaderModuleIdentifierEXT`

**New Structures**

- `VkShaderModuleIdentifierEXT`
- Extending `VkPhysicalDeviceFeatures2, VkDeviceCreateInfo`:

  - VK_STRUCTURE_TYPE_VERTEX_INPUT_ATTRIBUTE_DESCRIPTION_2_EXT
  - VK_STRUCTURE_TYPE_VERTEX_INPUT_BINDING_DESCRIPTION_2_EXT
If **VK_EXT_fragment_density_map** is supported:

- Extending `VkShaderCreateFlagBitsEXT`:
  - `VK_SHADER_CREATE_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT`

If **VK_EXT_mesh_shader** or **VK_NV_mesh_shader** is supported:

- Extending `VkShaderCreateFlagBitsEXT`:
  - `VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT`

If **VK_EXT_subgroup_size_control** or **Version 1.3** is supported:

- Extending `VkShaderCreateFlagBitsEXT`:
  - `VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT`
  - `VK_SHADER_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT`

If **VK_KHR_device_group** or **Version 1.1** is supported:

- Extending `VkShaderCreateFlagBitsEXT`:
  - `VK_SHADER_CREATE_DISPATCH_BASE_BIT_EXT`

If **VK_KHR_fragment_shading_rate** is supported:

- Extending `VkShaderCreateFlagBitsEXT`:
  - `VK_SHADER_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_EXT`

**Examples**

**Example 1**

Create linked pair of vertex and fragment shaders.

```c
// Logical device created with the shaderObject feature enabled
VkDevice device;

// SPIR-V shader code for a vertex shader, along with its size in bytes
void* pVertexSpirv;
size_t vertexSpirvSize;

// SPIR-V shader code for a fragment shader, along with its size in bytes
void* pFragmentSpirv;
size_t fragmentSpirvSize;

// Descriptor set layout compatible with the shaders
VkDescriptorSetLayout descriptorSetLayout;

VkShaderCreateInfoEXT shaderCreateInfos[2] = {
  {
  }
```

4784
Later, during command buffer recording, bind the linked shaders and draw.

```c
// Command buffer in the recording state
VkCommandBuffer commandBuffer;

// Vertex and fragment shader objects created above
VkShaderEXT shaders[2];
```
// Assume vertex buffers, descriptor sets, etc. have been bound, and existing
// state setting commands have been called to set all required state

const VkShaderStageFlagBits stages[2] =
{
    VK_SHADER_STAGE_VERTEX_BIT,
    VK_SHADER_STAGE_FRAGMENT_BIT
};

// Bind linked shaders
vkCmdBindShadersEXT(commandBuffer, 2, stages, shaders);

// Equivalent to the previous line. Linked shaders can be bound one at a time,
// in any order:
vkCmdBindShadersEXT(commandBuffer, 1, &stages[1], &shaders[1]);
vkCmdBindShadersEXT(commandBuffer, 1, &stages[0], &shaders[0]);

// The above is sufficient to draw if the device was created with the
tessellationShader and geometryShader features disabled. Otherwise, since
those stages should not execute, vkCmdBindShadersEXT() must be called at
least once with each of their stages in pStages before drawing:

const VkShaderStageFlagBits unusedStages[3] =
{
    VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT,
    VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT,
    VK_SHADER_STAGE_GEOMETRY_BIT
};

// NULL pShaders is equivalent to an array of stageCount VK_NULL_HANDLE values,
// meaning no shaders are bound to those stages, and that any previously bound
// shaders are unbound
vkCmdBindShadersEXT(commandBuffer, 3, unusedStages, NULL);

// Graphics shader objects may only be used to draw inside dynamic render pass
// instances begun with vkCmdBeginRendering(), assume one has already been begun

// Draw a triangle
vkCmdDraw(commandBuffer, 3, 1, 0, 0);

Example 2

Create unlinked vertex, geometry, and fragment shaders.

// Logical device created with the shaderObject feature enabled
VkDevice device;

// SPIR-V shader code for vertex shaders, along with their sizes in bytes
void* pVertexSpirv[2];
size_t vertexSpirvSize[2];
// SPIR-V shader code for a geometry shader, along with its size in bytes
void pGeometrySpirv;
size_t geometrySpirvSize;

// SPIR-V shader code for fragment shaders, along with their sizes in bytes
void* pFragmentSpirv[2];
size_t fragmentSpirvSize[2];

// Descriptor set layout compatible with the shaders
VkDescriptorSetLayout descriptorSetLayout;

VkShaderCreateInfoEXT shaderCreateInfos[5] =
{
    .sType = VK_STRUCTURE_TYPE_SHADER_CREATE_INFO_EXT,
    .pNext = NULL,
    .flags = 0,
    .stage = VK_SHADER_STAGE_GEOMETRY_BIT,
    .nextStage = VK_SHADER_STAGE_FRAGMENT_BIT,
    .codeType = VK_SHADER_CODE_TYPE_SPIRV_EXT,
    .codeSize = pGeometrySpirv,
    .pCode = geometrySpirvSize,
    .pName = "main",
    .setLayoutCount = 1,
    .pSetLayouts = &descriptorSetLayout,
    .pushConstantRangeCount = 0,
    .pPushConstantRanges = NULL,
    .pSpecializationInfo = NULL
},
{
    .sType = VK_STRUCTURE_TYPE_SHADER_CREATE_INFO_EXT,
    .pNext = NULL,
    .flags = 0,
    .stage = VK_SHADER_STAGE_VERTEX_BIT,
    .nextStage = VK_SHADER_STAGE_GEOMETRY_BIT,
    .codeType = VK_SHADER_CODE_TYPE_SPIRV_EXT,
    .codeSize = vertexSpirvSize[0],
    .pCode = pVertexSpirv[0],
    .pName = "main",
    .setLayoutCount = 1,
    .pSetLayouts = &descriptorSetLayout,
    .pushConstantRangeCount = 0,
    .pPushConstantRanges = NULL,
    .pSpecializationInfo = NULL
},
{
    .sType = VK_STRUCTURE_TYPE_SHADER_CREATE_INFO_EXT,
    .pNext = NULL,
    .flags = 0,
```c
VkResult result;
VkShaderEXT shaders[5];
```
result = vkCreateShadersEXT(device, 5, shaderCreateInfos, NULL, shaders);
if (result != VK_SUCCESS)
{
    // Handle error
}

Later, during command buffer recording, bind the linked shaders in different combinations and draw.

```
// Command buffer in the recording state
VkCommandBuffer commandBuffer;

// Vertex, geometry, and fragment shader objects created above
VkShaderEXT shaders[5];

// Assume vertex buffers, descriptor sets, etc. have been bound, and existing
// state setting commands have been called to set all required state

const VkShaderStageFlagBits stages[3] =
{
    // Any order is allowed
    VK_SHADER_STAGE_FRAGMENT_BIT,
    VK_SHADER_STAGE_VERTEX_BIT,
    VK_SHADER_STAGE_GEOMETRY_BIT,
};

VkShaderEXT bindShaders[3] =
{
    shaders[2], // FS
    shaders[1], // VS
    shaders[0] // GS
};

// Bind unlinked shaders
vkCmdBindShadersEXT(commandBuffer, 3, stages, bindShaders);

// Assume the tessellationShader feature is disabled, so vkCmdBindShadersEXT()
// need not have been called with either tessellation stage

// Graphics shader objects may only be used to draw inside dynamic render pass
// instances begun with vkCmdBeginRendering(), assume one has already been begun

// Draw a triangle
vkCmdDraw(commandBuffer, 3, 1, 0, 0);

// Bind a different unlinked fragment shader
const VkShaderStageFlagBits fragmentStage = VK_SHADER_STAGE_FRAGMENT_BIT;
vkCmdBindShadersEXT(commandBuffer, 1, fragmentStage, shaders[3]);

// Draw another triangle
```
vkCmdDraw(commandBuffer, 3, 1, 0, 0);

// Bind a different unlinked vertex shader
const VkShaderStageFlagBits vertexStage = VK_SHADER_STAGE_VERTEX_BIT;
vkCmdBindShadersEXT(commandBuffer, 1, &vertexStage, &shaders[4]);

// Draw another triangle
vkCmdDraw(commandBuffer, 3, 1, 0, 0);

Description
This extension adds support for the SPIR-V extension SPV_EXT_shader_stencil_export, providing a mechanism whereby a shader may generate the stencil reference value per invocation. When stencil testing is enabled, this allows the test to be performed against the value generated in the shader.

New Enum Constants

• Tobias Hector, AMD
• Jeff Bolz, NVIDIA
Description

This extension allows fragment shader invocations to read color, depth and stencil values at their pixel location in rasterization order. The functionality is only available when using dynamic render passes introduced by VK_KHR_dynamic_rendering. Example use cases are programmable blending and deferred shading.

See fragment shader tile image reads for more information.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceShaderTileImageFeaturesEXT
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceShaderTileImagePropertiesEXT

New Enum Constants

- VK_EXT_SHADER_TILE_IMAGE_EXTENSION_NAME
- VK_EXT_SHADER_TILE_IMAGE_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_TILE_IMAGE_FEATURES_EXT
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_TILE_IMAGE_PROPERTIES_EXT

Issues

None.

Examples

Color read example.

```glsl
layout( location = 0 /* aliased to color attachment 0 */ ) tileImageEXT highp attachmentEXT color0;
layout( location = 1 /* aliased to color attachment 1 */ ) tileImageEXT highp attachmentEXT color1;

layout( location = 0 ) out vec4 fragColor;

void main()
{
    vec4 value = colorAttachmentReadEXT(color0) + colorAttachmentReadEXT(color1);
    fragColor = value;
}
```
Depth & Stencil read example.

```c
void main()
{
    // read sample 0: works for non-MSAA or MSAA targets
    highp float last_depth = depthAttachmentReadEXT();
    lowp uint last_stencil = stencilAttachmentReadEXT();

    //..
}
```

Description

`VK_EXT_surface_maintenance1` adds a collection of window system integration features that were intentionally left out or overlooked in the original `VK_KHR_surface` extension.

The new features are as follows:

- Allow querying number of min/max images from a surface for a particular presentation mode.
- Allow querying a surface’s scaled presentation capabilities.
- Allow querying a surface for the set of presentation modes which can be easily switched between without requiring swapchain recreation.

New Structures

- Extending `VkPhysicalDeviceSurfaceInfo2KHR`:
  - `VkSurfacePresentModeEXT`

- Extending `VkSurfaceCapabilities2KHR`:
  - `VkSurfacePresentModeCompatibilityEXT`
  - `VkSurfacePresentScalingCapabilitiesEXT`

New Enums

- `VkPresentGravityFlagBitsEXT`
- `VkPresentScalingFlagBitsEXT`

New Bitmasks

- `VkPresentGravityFlagsEXT`
- `VkPresentScalingFlagsEXT`

New Enum Constants

- `VK_EXT_SURFACE_MAINTENANCE_1_EXTENSION_NAME`
- `VK_EXT_SURFACE_MAINTENANCE_1_SPEC_VERSION`

- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_SURFACE_PRESENT_MODE_COMPATIBILITY_EXT`
  - `VK_STRUCTURE_TYPE_SURFACE_PRESENT_MODE_EXT`
  - `VK_STRUCTURE_TYPE_SURFACE_PRESENT_SCALING_CAPABILITIES_EXT`

Version History

- Revision 0, 2019-02-27 (Lionel Landwerlin)

Other Extension Metadata

Last Modified Date
2019-04-26

IP Status
No known IP claims.

Contributors
• Courtney Goeltzenleuchter, Google

Description
This extension expands VkColorSpaceKHR to add support for most standard color spaces beyond VK_COLOR_SPACE_SRGB_NONLINEAR_KHR. This extension also adds support for VK_COLOR_SPACE_PASS_THROUGH_EXT which allows applications to use color spaces not explicitly enumerated in VkColorSpaceKHR.

New Enum Constants
• VK_EXT_SWAPCHAIN_COLOR_SPACE_EXTENSION_NAME
Extending VkColorSpaceKHR:

- VK_COLOR_SPACE_ADOBERGB_LINEAR_EXT
- VK_COLOR_SPACE_ADOBERGB_NONLINEAR_EXT
- VK_COLOR_SPACE_BT2020_LINEAR_EXT
- VK_COLOR_SPACE_BT709_LINEAR_EXT
- VK_COLOR_SPACE_BT709_NONLINEAR_EXT
- VK_COLOR_SPACE_DCI_P3_LINEAR_EXT
- VK_COLOR_SPACE_DCI_P3_NONLINEAR_EXT
- VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT
- VK_COLOR_SPACE_DISPLAY_P3_NONLINEAR_EXT
- VK_COLOR_SPACE_DOLBYVISION_EXT
- VK_COLOR_SPACE_EXTENDED_SRGB_LINEAR_EXT
- VK_COLOR_SPACE_EXTENDED_SRGB_NONLINEAR_EXT
- VK_COLOR_SPACE_HDR10_HLG_EXT
- VK_COLOR_SPACE_HDR10_ST2084_EXT
- VK_COLOR_SPACE_PASS_THROUGH_EXT

Issues

1) Does the spec need to specify which kinds of image formats support the color spaces?

**RESOLVED**: Pixel format is independent of color space (though some color spaces really want / need floating point color components to be useful). Therefore, do not plan on documenting what formats support which color spaces. An application can call vkGetPhysicalDeviceSurfaceFormatsKHR to query what a particular implementation supports.

2) How does application determine if HW supports appropriate transfer function for a color space?

**RESOLVED**: Extension indicates that implementation must not do the OETF encoding if it is not sRGB. That responsibility falls to the application shaders. Any other native OETF / EOTF functions supported by an implementation can be described by separate extension.

Version History

- Revision 1, 2016-12-27 (Courtney Goeltzenleuchter)
  - Initial version
- Revision 2, 2017-01-19 (Courtney Goeltzenleuchter)
  - Add pass through and multiple options for BT2020.
  - Clean up some issues with equations not displaying properly.
- Revision 3, 2017-06-23 (Courtney Goeltzenleuchter)
- Add extended sRGB non-linear enum.
- Revision 4, 2019-04-26 (Graeme Leese)
  - Clarify color space transfer function usage.
  - Refer to normative definitions in the Data Format Specification.
  - Clarify DCI-P3 and Display P3 usage.

Description

VK_EXT_swapchain_maintenance1 adds a collection of window system integration features that were intentionally left out or overlooked in the original VK_KHR_swapchain extension.

The new features are as follows:

- Specify a fence that will be signaled when the resources associated with a present operation can be safely destroyed.
- Allow changing the present mode a swapchain is using at per-present granularity.
- Allow applications to define the behavior when presenting a swapchain image to a surface with different dimensions than the image. Using this feature may allow implementations to avoid returning VK_ERROR_OUT_OF_DATE_KHR in this situation.
- Allow applications to defer swapchain memory allocation for improved startup time and memory footprint.
- Allow applications to release previously acquired images without presenting them.

New Commands

- vkReleaseSwapchainImagesEXT

New Structures

- VkReleaseSwapchainImagesInfoEXT
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
• VkPhysicalDeviceSwapchainMaintenance1FeaturesEXT

• Extending VkPresentInfoKHR:

Description

This extension adds transform feedback to the Vulkan API by exposing the SPIR-V TransformFeedback and GeometryStreams capabilities to capture vertex, tessellation or geometry shader outputs to one or more buffers. It adds API functionality to bind transform feedback buffers to capture the primitives emitted by the graphics pipeline from SPIR-V outputs decorated for transform feedback. The transform feedback capture can be paused and resumed by way of storing and retrieving a byte counter. The captured data can be drawn again where the vertex count is derived from the byte counter without CPU intervention. If the implementation is capable, a vertex stream other than zero can be rasterized.

All these features are designed to match the full capabilities of OpenGL core transform feedback functionality and beyond. Many of the features are optional to allow base OpenGL ES GPUs to also implement this extension.

The primary purpose of the functionality exposed by this extension is to support translation layers from other 3D APIs. This functionality is not considered forward looking, and is not expected to be promoted to a KHR extension or to core Vulkan. Unless this is needed for translation, it is recommended that developers use alternative techniques of using the GPU to process and capture vertex data.

New Commands

- `vkCmdBeginQueryIndexedEXT`
- `vkCmdBeginTransformFeedbackEXT`
- `vkCmdBindTransformFeedbackBuffersEXT`
- `vkCmdDrawIndirectByteCountEXT`
- `vkCmdEndQueryIndexedEXT`
- `vkCmdEndTransformFeedbackEXT`

New Structures

- Extending `VkPhysicalDeviceFeatures2, VkDeviceCreateInfo`:
  - `VkPhysicalDeviceTransformFeedbackFeaturesEXT`
- Extending `VkPhysicalDeviceProperties2`:
  - `VkPhysicalDeviceTransformFeedbackPropertiesEXT`
- Extending `VkPipelineRasterizationStateCreateInfo`:
  - `VkPipelineRasterizationStateStreamCreateInfoEXT`

New Bitmasks

- `VkPipelineRasterizationStateStreamCreateFlagsEXT`

New Enum Constants

- `VK_EXT_TRANSFORM_FEEDBACK_EXTENSION_NAME`
• VK_EXT_TRANSFORM_FEEDBACK_SPEC_VERSION

• Extending VkAccessFlagBits:
  ◦ VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT
  ◦ VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT
  ◦ VK_ACCESS_TRANSFORM_FEEDBACK_WRITE_BIT_EXT

• Extending VkBufferUsageFlagBits:
  ◦ VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT
  ◦ VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT

• Extending VkPipelineStageFlagBits:
  ◦ VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT

• Extending VkQueryType:
  ◦ VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT

• Extending VkStructureType:
  ◦ VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TRANSFORM_FEEDBACK_FEATURES_EXT
  ◦ VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TRANSFORM_FEEDBACK_PROPERTIES_EXT
  ◦ VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_STATE_STREAM_CREATE_INFO_EXT

Issues

1) Should we include pause/resume functionality?

RESOLVED: Yes, this is needed to ease layering other APIs which have this functionality. To pause use `vkCmdEndTransformFeedbackEXT` and provide valid buffer handles in the `pCounterBuffers` array and offsets in the `pCounterBufferOffsets` array for the implementation to save the resume points. Then to resume use `vkCmdBeginTransformFeedbackEXT` with the previous `pCounterBuffers` and `pCounterBufferOffsets` values. Between the pause and resume there needs to be a memory barrier for the counter buffers with a source access of `VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT` at pipeline stage `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT` to a destination access of `VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT` at pipeline stage `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`.

2) How does this interact with multiview?

RESOLVED: Transform feedback cannot be made active in a render pass with multiview enabled.

3) How should queries be done?

RESOLVED: There is a new query type `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT`. A query pool created with this type will capture 2 integers - numPrimitivesWritten and numPrimitivesNeeded - for the specified vertex stream output from the last pre-rasterization shader stage. The vertex stream output queried is zero by default, but can be specified with the new `vkCmdBeginQueryIndexedEXT` and `vkCmdEndQueryIndexedEXT` commands.

Description

This extension provides a mechanism for caching the results of potentially expensive internal validation operations across multiple runs of a Vulkan application. At the core is the VkValidationCacheEXT object type, which is managed similarly to the existing VkPipelineCache.

The new struct VkShaderModuleValidationCacheCreateInfoEXT can be included in the pNext chain at vkCreateShaderModule time. It contains a VkValidationCacheEXT to use when validating the
VkShaderModule.

New Object Types

- VkValidationCacheEXT

New Commands

- vkCreateValidationCacheEXT
- vkDestroyValidationCacheEXT
- vkGetValidationCacheDataEXT
- vkMergeValidationCachesEXT

New Structures

- VkValidationCacheCreateInfoEXT
- Extending VkShaderModuleCreateInfo, VkPipelineShaderStageCreateInfo:
  - VkShaderModuleValidationCacheCreateInfoEXT

New Enums

- VkValidationCacheHeaderVersionEXT

New Bitmasks

- VkValidationCacheCreateFlagsEXT

New Enum Constants

- VK_EXT_VALIDATION_CACHE_EXTENSION_NAME
- VK_EXT_VALIDATION_CACHE_SPEC_VERSION
  - Extending VkObjectType:
    - VK_OBJECT_TYPE_VALIDATION_CACHE_EXT
  - Extending VkStructureType:
    - VK_STRUCTURE_TYPE_SHADER_MODULE_VALIDATION_CACHE_CREATE_INFO_EXT
    - VK_STRUCTURE_TYPE_VALIDATION_CACHE_CREATE_INFO_EXT

Description

One of the states that contributes to the combinatorial explosion of pipeline state objects that need to be created, is the vertex input binding and attribute descriptions. By allowing them to be dynamic applications may reduce the number of pipeline objects they need to create.

This extension adds dynamic state support for what is normally static state in VkPipelineVertexInputStateCreateInfo.

New Commands

• vkCmdSetVertexInputEXT
New Structures

- VkVertexInputAttributeDescription2EXT
- VkVertexInputBindingDescription2EXT
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceVertexInputDynamicStateFeaturesEXT

New Enum Constants

Description
This extension adds the device coherent and device uncached memory types. Any device accesses to device coherent memory are automatically made visible to any other device access. Device
uncached memory indicates to applications that caches are disabled for a particular memory type, which guarantees device coherence.

Device coherent and uncached memory are expected to have lower performance for general access than non-device coherent memory, but can be useful in certain scenarios; particularly so for debugging.

New Structures

Description

This extension enables applications to use multisampled rendering with a depth/stencil sample count that is larger than the color sample count. Having a depth/stencil sample count larger than the color sample count allows maintaining geometry and coverage information at a higher sample rate than color information. All samples are depth/stencil tested, but only the first color sample...
count number of samples get a corresponding color output.

Description

This extension introduces `VkPipelineCompilerControlCreateInfoAMD` structure that can be chained to a pipeline’s creation information to specify additional flags that affect pipeline compilation.

New Structures

- Extending `VkGraphicsPipelineCreateInfo`, `VkComputePipelineCreateInfo`, `VkExecutionGraphPipelineCreateInfoAMDX`:
  - `VkPipelineCompilerControlCreateInfoAMD`

New Enums

- `VkPipelineCompilerControlFlagBitsAMD`

New Bitmasks

- `VkPipelineCompilerControlFlagsAMD`

New Enum Constants

- `VK_AMD_PIPELINE_COMPILER_CONTROL_EXTENSION_NAME`
- `VK_AMD_PIPELINE_COMPILER_CONTROL_SPEC_VERSION`

Extending `VkStructureType`:

- `VK_STRUCTURE_TYPE_PIPELINE_COMPILER_CONTROL_CREATE_INFO_AMD`

Issues

None.

Examples

None.

Version History

- Revision 1, 2019-07-26 (Tobias Hector)
  - Initial revision.
This extension introduces the possibility for the application to control the order of primitive rasterization. In unextended Vulkan, the following stages are guaranteed to execute in *API order*:

- depth bounds test
- stencil test, stencil op, and stencil write
- depth test and depth write
• occlusion queries
• blending, logic op, and color write

This extension enables applications to opt into a relaxed, implementation defined primitive rasterization order that may allow better parallel processing of primitives and thus enabling higher primitive throughput. It is applicable in cases where the primitive rasterization order is known to not affect the output of the rendering or any differences caused by a different rasterization order are not a concern from the point of view of the application’s purpose.

A few examples of cases when using the relaxed primitive rasterization order would not have an effect on the final rendering:

• If the primitives rendered are known to not overlap in framebuffer space.
• If depth testing is used with a comparison operator of \texttt{VK\_COMPARE\_OP\_LESS}, \texttt{VK\_COMPARE\_OP\_LESS\_OR\_EQUAL}, \texttt{VK\_COMPARE\_OP\_GREATER}, or \texttt{VK\_COMPARE\_OP\_GREATER\_OR\_EQUAL}, and the primitives rendered are known to not overlap in clip space.
• If depth testing is not used and blending is enabled for all attachments with a commutative blend operator.

New Structures

• Extending \texttt{VkPipelineRasterizationStateCreateInfo}:
  ◦ \texttt{VkPipelineRasterizationStateRasterizationOrderAMD}

New Enums

• \texttt{VkRasterizationOrderAMD}

New Enum Constants

• \texttt{VK\_AMD\_RASTERIZATION\_ORDER\_EXTENSION\_NAME}
• \texttt{VK\_AMD\_RASTERIZATION\_ORDER\_SPEC\_VERSION}

• Extending \texttt{VkStructureType}:
  ◦ \texttt{VK\_STRUCTURE\_TYPE\_PIPELINE\_RASTERIZATION\_STATE\_RASTERIZATION\_ORDER\_AMD}

Issues

1) How is this extension useful to application developers?

**RESOLVED**: Allows them to increase primitive throughput for cases when strict API order rasterization is not important due to the nature of the content, the configuration used, or the requirements towards the output of the rendering.

2) How does this extension interact with content optimizations aiming to reduce overdraw by appropriately ordering the input primitives?

**RESOLVED**: While the relaxed rasterization order might somewhat limit the effectiveness of such content optimizations, most of the benefits of it are expected to be retained even when the relaxed
rasterization order is used, so applications should still apply these optimizations even if they intend to use the extension.

3) Are there any guarantees about the primitive rasterization order when using the new relaxed mode?

**RESOLVED:** No. In this case the rasterization order is completely implementation-dependent, but in practice it is expected to partially still follow the order of incoming primitives.

4) Does the new relaxed rasterization order have any adverse effect on repeatability and other invariance rules of the API?

**RESOLVED:** Yes, in the sense that it extends the list of exceptions when the repeatability requirement does not apply.

**Examples**

None

**Issues**

Description
  This extension exposes shader core properties for a target physical device through the
  VK_KHR_get_physical_device_properties2 extension. Please refer to the example below for proper
  usage.

New Structures
  • Extending VkPhysicalDeviceProperties2:
    ◦ VkPhysicalDeviceShaderCorePropertiesAMD

New Enum Constants
  • VK_AMD_SHADER_CORE_PROPERTIES_EXTENSION_NAME
  • VK_AMD_SHADER_CORE_PROPERTIES_SPEC_VERSION
• Extending `VkStructureType`:
  ◦ `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_CORE_PROPERTIES_AMD`

**Examples**

This example retrieves the shader core properties for a physical device.

```c
extern VkInstance instance;

VkPhysicalDeviceProperties2 general_props;
VkPhysicalDeviceShaderCorePropertiesAMD shader_core_properties;

shader_core_properties.pNext = nullptr;
shader_core_properties.sType = VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_CORE_PROPERTIES_AMD;

general_props.pNext = &shader_core_properties;
general_props.sType = VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PROPERTIES_2;

// After this call, shader_core_properties has been populated
pfnVkGetPhysicalDeviceProperties2(device, &general_props);

printf("Number of shader engines: %d\n",
    m_shader_core_properties.shader_engine_count);
printf("Number of shader arrays: %d\n",
    m_shader_core_properties.shader_arrays_per_engine_count);
printf("Number of CUs per shader array: %d\n",
    m_shader_core_properties.compute_units_per_shader_array);
printf("Number of SIMDs per compute unit: %d\n",
    m_shader_core_properties.simd_per_compute_unit);
printf("Number of wavefront slots in each SIMD: %d\n",
    m_shader_core_properties.wavefronts_per_simd);
printf("Number of threads per wavefront: %d\n",
    m_shader_core_properties.wavefront_size);
printf("Number of physical SGPRs per SIMD: %d\n",
    m_shader_core_properties.sgprs_per_simd);
printf("Minimum number of SGPRs that can be allocated by a wave: %d\n",
    m_shader_core_properties.min_sgpr_allocation);

```

4827
printf("Number of available SGPRs: %d\n",
    m_shader_core_properties.max_sgpr_allocation =
    shader_core_properties.maxSgprAllocation;
printf("SGPRs are allocated in groups of this size: %d\n",
    m_shader_core_properties.sgpr_allocation_granularity =
    shader_core_properties.sgprAllocationGranularity;
printf("Number of physical VGPRs per SIMD: %d\n",
    m_shader_core_properties.vgprs_per_simd =
    shader_core_properties.vgprsPerSimd;
printf("Minimum number of VGPRs that can be allocated by a wave: %d\n",
    m_shader_core_properties.min_vgpr_allocation =
    shader_core_properties.minVgprAllocation;
printf("Number of available VGPRs: %d\n",
    m_shader_core_properties.max_vgpr_allocation =
    shader_core_properties.maxVgprAllocation;
printf("VGPRs are allocated in groups of this size: %d\n",
    m_shader_core_properties.vgpr_allocation_granularity =
    shader_core_properties.vgprAllocationGranularity;

Interactions and External Dependencies
   • This extension interacts with VK_EXT_shader_stencil_export

Contributors
   • Tobias Hector, AMD

Description

This extension adds support for the SPV_AMD_shader_early_and_late_fragment_tests extension, allowing shaders to explicitly opt in to allowing both early and late fragment tests with the EarlyAndLateFragmentTestsAMD execution mode.

If VK_EXT_shader_stencil_export is supported, additional execution modes allowing early depth tests similar to DepthUnchanged, DepthLess, and DepthGreater are provided.
New Structures

Interactions and External Dependencies
• This extension provides API support for GL_AMD_shader_fragment_mask

Contributors
• Aaron Hagan, AMD
• Daniel Rakos, AMD
• Timothy Lottes, AMD

Description
This extension provides efficient read access to the fragment mask in compressed multisampled color surfaces. The fragment mask is a lookup table that associates color samples with color fragment values.

From a shader, the fragment mask can be fetched with a call to fragmentMaskFetchAMD, which returns a single uint where each subsequent four bits specify the color fragment index corresponding to the color sample, starting from the least significant bit. For example, when eight color samples are used, the color fragment index for color sample 0 will be in bits 0-3 of the fragment mask, for color sample 7 the index will be in bits 28-31.

The color fragment for a particular color sample may then be fetched with the corresponding fragment mask value using the fragmentFetchAMD shader function.

New Enum Constants
• VK_AMD_SHADER_FRAGMENT_MASK_EXTENSION_NAME
• VK_AMD_SHADER_FRAGMENT_MASK_SPEC_VERSION

New SPIR-V Capabilities
• FragmentMaskAMD
Examples

This example shows a shader that queries the fragment mask from a multisampled compressed surface and uses it to query fragment values.

```glsl
#version 450 core

#extension GL_AMD_shader_fragment_mask: enable

layout(binding = 0) uniform sampler2DMS s2DMS;
layout(binding = 1) uniform isampler2DMSArray is2DMSArray;
layout(binding = 2, input_attachment_index = 0) uniform usubpassInputMS usubpassMS;

layout(location = 0) out vec4 fragColor;

void main()
{
    vec4 fragOne = vec4(0.0);

    uint fragMask = fragmentMaskFetchAMD(s2DMS, ivec2(2, 3));
    uint fragIndex = (fragMask & 0xF0) >> 4;
    fragOne += fragmentFetchAMD(s2DMS, ivec2(2, 3), 1);

    fragMask = fragmentMaskFetchAMD(is2DMSArray, ivec3(2, 3, 1));
    fragIndex = (fragMask & 0xF0) >> 4;
    fragOne += fragmentFetchAMD(is2DMSArray, ivec3(2, 3, 1), fragIndex);

    fragMask = fragmentMaskFetchAMD(usubpassMS);
    fragIndex = (fragMask & 0xF0) >> 4;
    fragOne += fragmentFetchAMD(usubpassMS, fragIndex);

    fragColor = fragOne;
}

2017-10-09

IP Status
No known IP claims.

Contributors
- Jaakko Konttinen, AMD

Description
This extension adds a way to query certain information about a compiled shader which is part of a pipeline. This information may include shader disassembly, shader binary and various statistics about a shader’s resource usage.

While this extension provides a mechanism for extracting this information, the details regarding the contents or format of this information are not specified by this extension and may be provided by the vendor externally.
Furthermore, all information types are optionally supported, and users should not assume every implementation supports querying every type of information.

New Commands

- `vkGetShaderInfoAMD`

New Structures

- `VkShaderResourceUsageAMD`
- `VkShaderStatisticsInfoAMD`

New Enums

- `VkShaderInfoTypeAMD`

New Enum Constants

- `VK_AMD_SHADER_INFO_EXTENSION_NAME`
- `VK_AMD_SHADER_INFO_SPEC_VERSION`

Examples

This example extracts the register usage of a fragment shader within a particular graphics pipeline:

```c
extern VkDevice device;
extern VkPipeline gfxPipeline;

PFN_vkGetShaderInfoAMD pfGetShaderInfoAMD = (PFN_vkGetShaderInfoAMD)
vkGetDeviceProcAddr(
    device, "vkGetShaderInfoAMD");

VkShaderStatisticsInfoAMD statistics = {};

size_t dataSize = sizeof(statistics);

if (pfGetShaderInfoAMD(device,
    gfxPipeline,
    VK_SHADER_STAGE_FRAGMENT_BIT,
    VK_SHADER_INFO_TYPE_STATISTICS_AMD,
    &dataSize,
    &statistics) == VK_SUCCESS)
{
    printf("VGPR usage: %d\n", statistics.resourceUsage.numUsedVgprs);
    printf("SGPR usage: %d\n", statistics.resourceUsage.numUsedSgprs);
}
```

The following example continues the previous example by subsequently attempting to query and print shader disassembly about the fragment shader:
// Query disassembly size (if available)
if (PFNGetShaderInfoAMD(device, gfxPipeline, VK_SHADER_STAGE_FRAGMENT_BIT, VK_SHADER_INFO_TYPE_DISASSEMBLY_AMD, &dataSize, nullptr) == VK_SUCCESS)
{
    printf("Fragment shader disassembly:\n");

    void* disassembly = malloc(dataSize);

    // Query disassembly and print
    if (PFNGetShaderInfoAMD(device, gfxPipeline, VK_SHADER_STAGE_FRAGMENT_BIT, VK_SHADER_INFO_TYPE_DISASSEMBLY_AMD, &dataSize, disassembly) == VK_SUCCESS)
    {
        printf((char*)disassembly);
    }

    free(disassembly);
}

Description

This extension adds two related features.
Firstly, support for the following SPIR-V extension in Vulkan is added:

- **SPV_AMD_texture_gather_bias_lod**

Secondly, the extension allows the application to query which formats can be used together with the new function prototypes introduced by the SPIR-V extension.

**New Structures**

- Extending **VkImageFormatProperties2**:
  - **VkTextureLODGatherFormatPropertiesAMD**

**New Enum Constants**

- **VK_AMD_TEXTURE_GATHER_BIAS_LOD_EXTENSION_NAME**
- **VK_AMD_TEXTURE_GATHER_BIAS_LOD_SPEC_VERSION**
- Extending **VkStructureType**:
  - **VK_STRUCTURE_TYPE_TEXTURE_LOD_GATHER_FORMAT_PROPERTIES_AMD**

**New SPIR-V Capabilities**

- **ImageGatherBiasLodAMD**

**Examples**

```c
struct VkTextureLODGatherFormatPropertiesAMD
{
    VkStructureType sType;
    const void* pNext;
    VkBool32 supportsTextureGatherLODBiasAMD;
};

// How to detect if an image format can be used with the new function prototypes.
VkPhysicalDeviceImageFormatInfo2 formatInfo;
VkImageFormatProperties2 formatProps;
VkTextureLODGatherFormatPropertiesAMD textureLODGatherSupport;

textureLODGatherSupport.sType = VK_STRUCTURE_TYPE_TEXTURE_LOD_GATHER_FORMAT_PROPERTIES_AMD;
textureLODGatherSupport.pNext = nullptr;

formatInfo.sType = VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_FORMAT_INFO_2;
formatInfo.pNext = nullptr;
formatInfo.format = ...;
formatInfo.type = ...;
formatInfo.tiling = ...;
```
formatInfo.usage = ...;
formatInfo.flags = ...;

formatProps.sType = VK_STRUCTURE_TYPE_IMAGE_FORMAT_PROPERTIES_2;
formatProps.pNext = &textureLODGatherSupport;

vkGetPhysicalDeviceImageFormatProperties2(physical_device, &formatInfo, &formatProps);

if (textureLODGatherSupport.supportsTextureGatherLODBiasAMD == VK_TRUE)
{
   // physical device supports SPV_AMD_texture_gather_bias_lod for the specified
   // format configuration.
}
else
{
   // physical device does not support SPV_AMD_texture_gather_bias_lod for the
   // specified format configuration.
}

Description

This extension enables an application to import Android AHardwareBuffer objects created outside of the Vulkan device into Vulkan memory objects, where they can be bound to images and buffers. It also allows exporting an AHardwareBuffer from a Vulkan memory object for symmetry with other operating systems. But since not all AHardwareBuffer usages and formats have Vulkan equivalents, exporting from Vulkan provides strictly less functionality than creating the AHardwareBuffer externally and importing it.

Some AHardwareBuffer images have implementation-defined external formats that may not correspond to Vulkan formats. Sampler Y’C_B C_R conversion can be used to sample from these images and convert them to a known color space.

New Base Types

- AHardwareBuffer
New Commands

- vkGetAndroidHardwareBufferPropertiesANDROID
- vkGetMemoryAndroidHardwareBufferANDROID

New Structures

- VkAndroidHardwareBufferPropertiesANDROID
- VkMemoryGetAndroidHardwareBufferInfoANDROID
- Extending VkAndroidHardwareBufferPropertiesANDROID:
  - VkAndroidHardwareBufferFormatPropertiesANDROID

  - VkExternalFormatANDROID
- Extending VkImageFormatProperties2:
  - VkAndroidHardwareBufferUsageANDROID
- Extending VkMemoryAllocateInfo:
  - VkImportAndroidHardwareBufferInfoANDROID

If VK_KHR_format_feature_flags2 or Version 1.3 is supported:

- Extending VkAndroidHardwareBufferPropertiesANDROID:
  - VkAndroidHardwareBufferFormatProperties2ANDROID

New Enum Constants

- VK_ANDROID_EXTERNAL_MEMORY_ANDROID_HARDWARE_BUFFER_EXTENSION_NAME
- VK_ANDROID_EXTERNAL_MEMORY_ANDROID_HARDWARE_BUFFER_SPEC_VERSION
- Extending VkExternalMemoryHandleTypeFlagBits:
  - VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_ANDROID_HARDWARE_BUFFER_FORMAT_PROPERTIES_ANDROID
  - VK_STRUCTURE_TYPE_ANDROID_HARDWARE_BUFFER_PROPERTIES_ANDROID
  - VK_STRUCTURE_TYPE_ANDROID_HARDWARE_BUFFER_USAGE_ANDROID
  - VK_STRUCTURE_TYPE_EXTERNAL_FORMAT_ANDROID
  - VK_STRUCTURE_TYPE_IMPORT_ANDROID_HARDWARE_BUFFER_INFO_ANDROID
  - VK_STRUCTURE_TYPE_MEMORY_GET_ANDROID_HARDWARE_BUFFER_INFO_ANDROID

If VK_KHR_format_feature_flags2 or Version 1.3 is supported:

- Extending VkStructureType:
Issues

1) Other external memory objects are represented as weakly-typed handles (e.g. Win32 HANDLE or POSIX file descriptor), and require a handle type parameter along with handles. AHardwareBuffer is strongly typed, so naming the handle type is redundant. Does symmetry justify adding handle type parameters/fields anyway?

**RESOLVED:** No. The handle type is already provided in places that treat external memory objects generically. In the places we would add it, the application code that would have to provide the handle type value is already dealing with AHardwareBuffer-specific commands/structures; the extra symmetry would not be enough to make that code generic.

2) The internal layout and therefore size of a AHardwareBuffer image may depend on native usage flags that do not have corresponding Vulkan counterparts. Do we provide this information to vkCreateImage somehow, or allow the allocation size reported by vkGetImageMemoryRequirements to be approximate?

**RESOLVED:** Allow the allocation size to be unspecified when allocating the memory. It has to work this way for exported image memory anyway, since AHardwareBuffer allocation happens in vkAllocateMemory, and internally is performed by a separate HAL, not the Vulkan implementation itself. There is a similar issue with vkGetImageSubresourceLayout: the layout is determined by the allocator HAL, so it is not known until the image is bound to memory.

3) Should the result of sampling an external-format image with the suggested Y′C₈C₆C₄R conversion parameters yield the same results as using a samplerExternalOES in OpenGL ES?

**RESOLVED:** This would be desirable, so that apps converting from OpenGL ES to Vulkan could get the same output given the same input. But since sampling and conversion from Y′C₈C₆C₄R images is so loosely defined in OpenGL ES, multiple implementations do it in a way that does not conform to Vulkan’s requirements. Modifying the OpenGL ES implementation would be difficult, and would change the output of existing unmodified applications. Changing the output only for applications that are being modified gives developers the chance to notice and mitigate any problems. Implementations are encouraged to minimize differences as much as possible without causing compatibility problems for existing OpenGL ES applications or violating Vulkan requirements.

4) Should an AHardwareBuffer with AHARDWAREBUFFER_USAGE_CPU_* usage be mappable in Vulkan? Should it be possible to export an AHardwareBuffers with such usage?

**RESOLVED:** Optional, and mapping in Vulkan is not the same as AHardwareBuffer_lock. The semantics of these are different: mapping in memory is persistent, just gives a raw view of the memory contents, and does not involve ownership. AHardwareBuffer_lock gives the host exclusive access to the buffer, is temporary, and allows for reformatting copy-in/copy-out. Implementations are not required to support host-visible memory types for imported Android hardware buffers or resources backed by them. If a host-visible memory type is supported and used, the memory can be mapped in Vulkan, but doing so follows Vulkan semantics: it is just a raw view of the data and does not imply ownership (this means implementations must not internally call AHardwareBuffer_lock to implement vkMapMemory, or assume the application has done so). Implementations are not required to support linear-tiled images backed by Android hardware buffers, even if the
AHardwareBuffer has CPU usage. There is no reliable way to allocate memory in Vulkan that can be exported to a AHardwareBuffer with CPU usage.

5) Android may add new AHardwareBuffer formats and usage flags over time. Can reference to them be added to this extension, or do they need a new extension?

RESOLVED: This extension can document the interaction between the new AHB formats/usages and existing Vulkan features. No new Vulkan features or implementation requirements can be added. The extension version number will be incremented when this additional documentation is added, but the version number does not indicate that an implementation supports Vulkan memory or resources that map to the new AHardwareBuffer features: support for that must be queried with vkGetPhysicalDeviceImageFormatProperties2 or is implied by successfully allocating a AHardwareBuffer outside of Vulkan that uses the new feature and has a GPU usage flag.

In essence, these are new features added to a new Android API level, rather than new Vulkan features. The extension will only document how existing Vulkan features map to that new Android feature.

Other Extension Metadata
Interactions and External Dependencies

• This extension provides API support for `GL_ARM_shader_core_builtins`

Contributors

• Kevin Petit, Arm Ltd.
• Jan-Harald Fredriksen, Arm Ltd.

Description

This extension provides the ability to determine device-specific properties on Arm GPUs. It exposes properties for the number of shader cores, the maximum number of warps that can run on a shader core, and shader builtins to enable invocations to identify which core and warp a shader invocation is executing on.

This extension enables support for the SPIR-V `CoreBuiltinsARM` capability.

These properties and built-ins can be used for debugging or performance optimization purposes. A typical optimization example would be to use `CoreIDARM` to select a per-shader-core instance of a data structure in algorithms that use atomics so as to reduce contention.

New Structures

• Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  ◦ `VkPhysicalDeviceShaderCoreBuiltinsFeaturesARM`

• Extending `VkPhysicalDeviceProperties2`:
  ◦ `VkPhysicalDeviceShaderCoreBuiltinsPropertiesARM`

New Enum Constants

• `VK_ARM_SHADER_CORE_BUILTINS_EXTENSION_NAME`

Description
A buffer collection is a collection of one or more buffers which were allocated together as a group and which all have the same properties. These properties describe the buffers' internal representation such as its dimensions and memory layout. This ensures that all of the buffers can be used interchangeably by tasks that require swapping among multiple buffers, such as double-buffered graphics rendering.

By sharing such a collection of buffers between components, communication about buffer lifecycle can be made much simpler and more efficient. For example, when a content producer finishes writing to a buffer, it can message the consumer of the buffer with the buffer index, rather than passing a handle to the shared memory.

On Fuchsia, the Sysmem service uses buffer collections as a core construct in its design. VK_FUCHSIA_buffer_collection is the Vulkan extension that allows Vulkan applications to interoperate with the Sysmem service on Fuchsia.

If VK_EXT_debug_report is supported:

- Extending VkDebugReportObjectTypeEXT:
  - VK_DEBUG_REPORT_OBJECT_TYPE_BUFFER_COLLECTION_FUCHSIA_EXT

Issues

1) When configuring a VkImageConstraintsInfoFUCHSIA structure for constraint setting, should a NULL pFormatConstraints parameter be allowed?

**RESOLVED:** No. Specifying a NULL pFormatConstraints results in logical complexity of interpreting the relationship between the VkImageCreateInfo::usage settings of the elements of the pImageCreateInfos array and the implied or desired VkFormatFeatureFlags.

The explicit requirement for pFormatConstraints to be non-NULL simplifies the implied logic of the implementation and expectations for the Vulkan application.

Description

Vulkan apps may wish to export or import device memory handles to or from other logical devices, instances or APIs.

This memory sharing can eliminate copies of memory buffers when different subsystems need to interoperate on them. Sharing memory buffers may also facilitate a better distribution of processing workload for more complex memory manipulation pipelines.

Description
An application using external memory may wish to synchronize access to that memory using
semaphores. This extension enables an application to export semaphore payload to and import
semaphore payload from Zircon event handles.

New Commands
• vkGetSemaphoreZirconHandleFUCHSIA
• vkImportSemaphoreZirconHandleFUCHSIA

New Structures
• VkImportSemaphoreZirconHandleInfoFUCHSIA
• VkSemaphoreGetZirconHandleInfoFUCHSIA

New Enum Constants
• VK_FUCHSIA_EXTERNAL_SEMAPHORE_EXTENSION_NAME
• VK_FUCHSIA_EXTERNAL_SEMAPHORE_SPEC_VERSION
• Extending VkExternalSemaphoreHandleTypeFlagBits:
  ◦ VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_ZIRCON_EVENT_BIT_FUCHSIA
• Extending VkStructureType:
  ◦ VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_ZIRCON_HANDLE_INFO_FUCHSIA
  ◦ VK_STRUCTURE_TYPE_SEMAPHORE_GET_ZIRCON_HANDLE_INFO_FUCHSIA

Issues
1) Does the application need to close the Zircon event handle returned by
vkGetSemaphoreZirconHandleFUCHSIA?

RESOLVED: Yes, unless it is passed back in to a driver instance to import the semaphore. A
successful get call transfers ownership of the Zircon event handle to the application, and a
successful import transfers it back to the driver. Destroying the original semaphore object will not
close the Zircon event handle nor remove its reference to the underlying semaphore resource
associated with it.

Description

This device extension allows an application that uses the VK_KHR_swapchain extension to obtain information about the presentation engine’s display, to obtain timing information about each present, and to schedule a present to happen no earlier than a desired time. An application can use this to minimize various visual anomalies (e.g. stuttering).

Traditional game and real-time animation applications need to correctly position their geometry for when the presentable image will be presented to the user. To accomplish this, applications need various timing information about the presentation engine’s display. They need to know when presentable images were actually presented, and when they could have been presented. Applications also need to tell the presentation engine to display an image no sooner than a given time. This allows the application to avoid stuttering, so the animation looks smooth to the user.

This extension treats variable-refresh-rate (VRR) displays as if they are fixed-refresh-rate (FRR) displays.

New Commands

• vkGetPastPresentationTimingGOOGLE
• vkGetRefreshCycleDurationGOOGLE

New Structures

• VkPastPresentationTimingGOOGLE
• VkPresentTimeGOOGLE
• VkRefreshCycleDurationGOOGLE
• Extending VkPresentInfoKHR:
  • VkPresentTimesInfoGOOGLE
New Enum Constants

- VK_GOOGLE_DISPLAY_TIMING_EXTENSION_NAME
- VK_GOOGLE_DISPLAY_TIMING_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PRESENT_TIMES_INFO_GOOGLE

Examples

Note
The example code for the this extension (like the VK_KHR_surface and VK_GOOGLE_display_timing extensions) is contained in the cube demo that is shipped with the official Khronos SDK, and is being kept up-to-date in that location (see: https://github.com/KhronosGroup/Vulkan-Tools/blob/main/cube/cube.c).

Description

This extension allows the `vkGetPhysicalDeviceSurfaceFormatsKHR` and `vkGetPhysicalDeviceSurfacePresentModesKHR` functions to accept `VK_NULL_HANDLE` as their `surface` parameter, allowing potential surface formats, color spaces and present modes to be queried without providing a surface. Identically, `vkGetPhysicalDeviceSurfaceFormats2KHR`, `vkGetPhysicalDeviceSurfacePresentModes2EXT`, and `vkGetPhysicalDeviceSurfaceCapabilities2KHR` would accept `VK_NULL_HANDLE` in `VkPhysicalDeviceSurfaceInfo2KHR::surface`. **This can only be supported on platforms where the results of these queries are surface-agnostic and a single presentation engine is the implicit target of all present operations.**

**Interactions and External Dependencies**

- This extension provides API support for GL_HUAWEI_cluster_culling_shader.

**Contributors**

- Yuchang Wang, Huawei
- Juntao Li, Huawei
- Pan Gao, Huawei
Description

Cluster Culling Shaders (CCS) are similar to the existing compute shaders. Their main purpose is to provide an execution environment in order to perform coarse-level geometry culling and LOD selection more efficiently on the GPU.

The traditional 2-pass GPU culling solution using a compute shader sometimes needs a pipeline barrier between compute and graphics pipeline to optimize performance. An additional compaction process may also be required. This extension addresses these shortcomings, allowing compute shaders to directly emit visible clusters to the following graphics pipeline.

A set of new built-in output variables are used to express a visible cluster, including per-cluster shading rate. In addition, a new built-in function is used to emit these variables from CCS to the IA stage. The IA stage can use these variables to fetches vertices of a visible cluster and drive vertex shaders to shading these vertices.

Note that CCS do not work with geometry or tessellation shaders, but both IA and vertex shaders are preserved. Vertex shaders are still used for vertex position shading, instead of directly outputting transformed vertices from the compute shader. This makes CCS more suitable for mobile GPUs.

New Commands

- `vkCmdDrawClusterHUAWEI`
- `vkCmdDrawClusterIndirectHUAWEI`

New Structures

- Extending `VkPhysicalDeviceClusterCullingShaderFeaturesHUAWEI`:
  - `VkPhysicalDeviceClusterCullingShaderVrsFeaturesHUAWEI`

- **IndexCountHUAWEI**
- **VertexCountHUAWEI**
- **InstanceCountHUAWEI**
- **FirstIndexHUAWEI**
- **FirstVertexHUAWEI**
- **VertexOffsetHUAWEI**
- **FirstInstanceHUAWEI**
- **ClusterIDHUAWEI**
- **ClusterShadingRateHUAWEI**

**New SPIR-V Capability**

- **ClusterCullingShadingHUAWEI**

**Sample Code**

Example of cluster culling in a GLSL shader

```glsl
#extension GL_HUAWEI_cluster_culling_shader: enable

#define GPU_WARP_SIZE                   32
#define GPU_GROUP_SIZE                  GPU_WARP_SIZE

#define GPU_CLUSTER_PER_INVOCATION      1
#define GPU_CLUSTER_PER_WORKGROUP       (GPU_GROUP_SIZE * GPU_CLUSTER_PER_INVOCATION)

// Number of threads per workgroup
// - 1D only
```

4875
layout(local_size_x=GPU_GROUP_SIZE, local_size_y=1, local_size_z=1) in;

#define GPU_DRAW_BUFFER_BINDING 0
#define GPU_INSTANCE_DESCRIPTOR_BINDING 1

struct BoundingSphere
{
    vec3 center;
    float radius;
};

struct InstanceData
{
    mat4 mvp_matrix; // mvp matrix.
    vec4 frustum_planes[6]; // six frustum planes
    mat4 model_matrix_transpose_inverse; // inverse transpose of model matrix.
    vec3 view_origin; // view origin
};

struct InstanceDescriptor
{
    uint begin;
    uint end;
    uint cluster_count;
    uint debug;
    BoundingSphere sphere;
    InstanceData instance_data;
};

struct DrawElementsCommand
{
    uint indexcount;
    uint instanceCount;
    uint firstIndex;
    int vertexoffset;
    uint firstInstance;
    uint cluster_id;
};

// indexed mode
out gl_PerClusterHUAWEI{
    uint gl_IndexCountHUAWEI;
    uint gl_InstanceCountHUAWEI;
    uint gl_FirstIndexHUAWEI;
    int gl_VertexOffsetHUAWEI;
    uint gl_FirstInstanceHUAWEI;
    uint gl_ClusterIDHUAWEI;
    uint gl_ClusterShadingRateHUAWEI;
};

layout(binding = GPU_DRAW_BUFFER_BINDING, std430) buffer draw_indirect_ssbo
```cpp
{  
    DrawElementsCommand draw_commands[];
};

layout(binding = GPU_INSTANCE_DESCRIPTOR_BINDING, std430) buffer
instance_descriptor_ssbo
{
    InstanceDescriptor instance_descriptors[];
};

float Distance(uint instance_id)
{
    vec3 v = normalize(instance_descriptor[instance_id].sphere.center -
    instance_descriptor[instance_id].instance_data.view_origin);
    float dist = sqrt(dot(v,v));
    
    return dist;
}

bool isSphereOutsideFrustum( vec3 sphere_center, float sphere_radius )
{
    bool isInside = false;
    
    for(int i = 0; i < 6; i++)
    {
        isInside = isInside ||
        (dot(instance_descriptors[instance_id].instance_data.frustum_planes[i].xyz, sphere_center) + instance_descriptors[instance_id].instance_data.frustum_planes[i].w <
        sphere_radius);
    }
    return isInside;
}

void main()
{
    // get instance description
    instance_id = gl_GlobalInvocationID.x;
    InstanceDescriptor inst_desc = instance_descriptors[instance_id];
    
    //instance based culling
    bool render = isSphereOutsideFrustum(inst_desc.sphere.center, inst_desc.sphere.
    radius);
    
    if (render)
    {
        // calculate distance
        float distance = Distance(instance_id);
    }
}
// update shading rate built-in variable
if (distance > 0.7)
    gl_ClusterShadingRateHUAWEI =
        gl_ShadingRateFlag4VerticalPixelsEXT |
        gl_ShadingRateFlag4HorizontalPixelsEXT;
else if (distance > 0.3)
    gl_ClusterShadingRateHUAWEI =
        gl_ShadingRateFlag2VerticalPixelsEXT |
        gl_ShadingRateFlag2HorizontalPixelsEXT;
else
    gl_ClusterShadingRateHUAWEI = 0;

// this is a visible cluster, update built-in output variable.
// in case of indexed mode:
    gl_IndexCountHUAWEI = draw_commands[cluster_id].indexcount;
    gl_InstanceCountHUAWEI = draw_commands[cluster_id].instanceCount;
    gl_FirstIndexHUAWEI = draw_commands[cluster_id].firstIndex;
    gl_VertexOffsetHUAWEI = draw_commands[cluster_id].vertexoffset;
    gl_FirstInstanceHUAWEI = draw_commands[cluster_id].firstInstance;
    gl_ClusterIDHUAWEI = draw_commands[cluster_id].cluster_id;

    // emit built-in output variables as a drawing command to subsequent
    // rendering pipeline.
    dispatchClusterHUAWEI();
}
Example of launching the execution of cluster culling shader

```cpp
vkCmdBindPipeline(commandBuffer, VK_PIPELINE_BIND_POINT_GRAPHICS, graphicsPipeline);
vkCmdDrawClusterHUAWEI(commandBuffer, groupCountX, 1, 1);
vkCmdEndRenderPass(commandBuffer);
```

Extension Proposal

VK_HUAWEI_invocation_mask

Other Extension Metadata

Last Modified Date
2021-05-27

Interactions and External Dependencies

- This extension requires VK_KHR_ray_tracing_pipeline, which allow to bind an invocation mask image before the ray tracing command
- This extension requires VK_KHR_synchronization2, which allows new pipeline stage for the invocation mask image

Contributors

- Yunpeng Zhu
- Juntao Li, Huawei
- Liang Chen, Huawei
- Shaozhuang Shi, Huawei
- Hailong Chu, Huawei

Description

The rays to trace may be sparse in some use cases. For example, the scene only have a few regions to reflect. Providing an invocation mask image to the ray tracing commands could potentially give the hardware the hint to do certain optimization without invoking an additional pass to compact the ray buffer.

New Commands

- vkCmdBindInvocationMaskHUAWEI

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceInvocationMaskFeaturesHUAWEI

New Enum Constants

- VK_HUAWEI_INVOCATION_MASK_EXTENSION_NAME
- VK_HUAWEI_INVOCATION_MASK_SPEC_VERSION
- Extending VkAccessFlagBits2:
  - VK_ACCESS_2_INVOCATION_MASK_READ_BIT_HUAWEI
- Extending VkImageUsageFlagBits:
  - VK_IMAGE_USAGE_INVOCATION_MASK_BIT_HUAWEI
- Extending `VkPipelineStageFlagBits2`:
  - `VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI`

- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_INVOCATION_MASK_FEATURES_HUAWEI`

### Examples

RT mask is updated before each traceRay.

#### Step 1. Generate InvocationMask

```cpp
//the rt mask image bind as color attachment in the fragment shader
Layout(location = 2) out vec4 outRTmask
vec4 mask = vec4(x, x, x, x);
outRTmask = mask;
```

#### Step 2. traceRay with InvocationMask

```cpp
vkCmdBindPipeline(
    commandBuffers[imageIndex],
    VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR, m_rtPipeline);
vkCmdBindDescriptorSets(commandBuffers[imageIndex],
    VK_PIPELINE_BIND_POINT_RAY_TRACING_NV,
    m_rtPipelineLayout, 0, 1, &m_rtDescriptorSet,
    0, nullptr);

vkCmdBindInvocationMaskHUAWEI(
    commandBuffers[imageIndex],
    InvocationMaskImageView, InvocationMaskImageLayout);
vkCmdTraceRaysKHR(commandBuffers[imageIndex],
pRaygenShaderBindingTable,
pMissShaderBindingTable,
swapChainExtent.width,
swapChainExtent.height, 1);
```

### Version History

Interactions and External Dependencies
- This extension provides API support for GL_HUAWEI_subpass_shading.

Contributors
- Hueilong Wang
- Juntao Li, Huawei
- Renmiaof Lu, Huawei
- Pan Gao, Huawei

Description
This extension allows applications to execute a subpass shading pipeline in a subpass of a render pass in order to save memory bandwidth for algorithms like tile-based deferred rendering and forward plus. A subpass shading pipeline is a pipeline with the compute pipeline ability, allowed to read values from input attachments, and only allowed to be dispatched inside a stand-alone subpass. Its work dimension is defined by the render pass's render area size. Its workgroup size
(width, height) shall be a power-of-two number in width or height, with minimum value from 8, and maximum value shall be decided from the render pass attachments and sample counts but depends on implementation.

The `GlobalInvocationId.xy` of a subpass shading pipeline is equal to the `FragCoord.xy` of a graphic pipeline in the same render pass subtracted the offset of the `VkRenderPassBeginInfo::renderArea`. `GlobalInvocationId.z` is mapped to the Layer if `VK_EXT_shader_viewport_index_layer` is supported. The `GlobalInvocationId.xy` is equal to the index of the local workgroup multiplied by the size of the local workgroup plus the `LocalInvocationId` and the offset of the `VkRenderPassBeginInfo::renderArea`.

This extension allows a subpass’s pipeline bind point to be `VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI`.

**New Commands**

- `vkCmdSubpassShadingHUAWEI`
- `vkGetDeviceSubpassShadingMaxWorkgroupSizeHUAWEI`

**New Structures**

- Extending `VkComputePipelineCreateInfo`:
  - `VkSubpassShadingPipelineCreateInfoHUAWEI`
- Extending `VkPhysicalDeviceFeatures2, VkDeviceCreateInfo`:
  - `VkPhysicalDeviceSubpassShadingFeaturesHUAWEI`
- Extending `VkPhysicalDeviceProperties2`:
  - `VkPhysicalDeviceSubpassShadingPropertiesHUAWEI`

**New Enum Constants**

- `VK_HUAWEI_SUBPASS_SHADING_EXTENSION_NAME`
- `VK_HUAWEI_SUBPASS_SHADING_SPEC_VERSION`
- Extending `VkPipelineBindPoint`:
  - `VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI`
- Extending `VkPipelineStageFlagBits2`:
  - `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI`
  - `VK_PIPELINE_STAGE_2_SUBPASS_SHADING_BIT_HUAWEI`
- Extending `VkShaderStageFlagBits`:
  - `VK_SHADER_STAGE_SUBPASS_SHADING_BIT_HUAWEI`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SUBPASS_SHADING_FEATURES_HUAWEI`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SUBPASS_SHADING_PROPERTIES_HUAWEI`
Sample Code

Example of subpass shading in a GLSL shader

```glsl
#extension GL_HUAWEI_subpass_shading: enable
#extension GL_KHR_shader_subgroup_arithmetic: enable

layout(constant_id = 0) const uint tileWidth = 8;
layout(constant_id = 1) const uint tileHeight = 8;
layout(local_size_x_id = 0, local_size_y_id = 1, local_size_z = 1) in;
layout(set=0, binding=0, input_attachment_index=0) uniform subpassInput depth;

void main()
{
    float d = subpassLoad(depth).x;
    float minD = subgroupMin(d);
    float maxD = subgroupMax(d);
}
```

Example of subpass shading dispatching in a subpass

```glsl
vkCmdNextSubpass(commandBuffer, VK_SUBPASS_CONTENTS_INLINE);
vkCmdBindPipeline(commandBuffer, VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI, subpassShadingPipeline);
vkCmdBindDescriptorSets(commandBuffer, VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI, subpassShadingPipelineLayout, firstSet, descriptorSetCount, pDescriptorSets, dynamicOffsetCount, pDynamicOffsets);
vkCmdSubpassShadingHUAWEI(commandBuffer);
vkCmdEndRenderPass(commandBuffer);
```

Example of subpass shading render pass creation

```glsl
VkAttachmentDescription2 attachments[] = {
    {
        VK_STRUCTURE_TYPE_ATTACHMENT_DESCRIPTION_2, NULL,
        0, VK_FORMAT_R8G8B8A8_UNORM, VK_SAMPLE_COUNT_1_BIT,
        VK_ATTACHMENT_LOAD_OP_CLEAR, VK_ATTACHMENT_STORE_OP_DONT_CARE,
        VK_ATTACHMENT_LOAD_OP_DONT_CARE, VK_ATTACHMENT_LOAD_OP_DONT_CARE,
        VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL
    },
    {
        VK_STRUCTURE_TYPE_ATTACHMENT_DESCRIPTION_2, NULL,
        0, VK_FORMAT_R8G8B8A8_UNORM, VK_SAMPLE_COUNT_1_BIT,
        VK_ATTACHMENT_LOAD_OP_CLEAR, VK_ATTACHMENT_STORE_OP_DONT_CARE,
        VK_ATTACHMENT_LOAD_OP_DONT_CARE, VK_ATTACHMENT_LOAD_OP_DONT_CARE,
        VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL
    }
};
```

VkAttachmentReference2 gBufferAttachmentReferences[] = {
    { VK_STRUCTURE_TYPE_ATTACHMENTREFERENCE_2, NULL, 0, VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL, VK_IMAGE_ASPECT_COLOR_BIT },
    { VK_STRUCTURE_TYPE_ATTACHMENTREFERENCE_2, NULL, 1, VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL, VK_IMAGE_ASPECT_COLOR_BIT },
    { VK_STRUCTURE_TYPE_ATTACHMENTREFERENCE_2, NULL, 2, VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL, VK_IMAGE_ASPECT_COLOR_BIT }
};

VkAttachmentReference2 gBufferDepthStencilAttachmentReferences =
    { VK_STRUCTURE_TYPE_ATTACHMENTREFERENCE_2, NULL, 3, VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL, VK_IMAGE_ASPECT_DEPTH_BIT | VK_IMAGE_ASPECT_STENCIL_BIT };
VkAttachmentReference2 colorAttachmentReferences[] = {
    { VK_STRUCTURE_TYPE_ATTACHMENT_REFERENCE_2, NULL, 4,
      VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL, VK_IMAGE_AsPECT_COLOR_BIT }
};
VkAttachmentReference2 resolveAttachmentReference = {
    { VK_STRUCTURE_TYPE_ATTACHMENT_REFERENCE_2, NULL, 4,
      VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL, VK_IMAGE_AsPECT_COLOR_BIT }
};

VkSubpassDescription2 subpasses[] = {
    {
        VK_STRUCTURE_TYPE_SUBPASS_DESCRIPTION_2, NULL, 0, VK_PIPELINE_BIND_POINT_GRAPHICS,
        0,
        NULL, // input
        sizeof(gBufferAttachmentReferences)/sizeof(gBufferAttachmentReferences[0]),
        gBufferAttachmentReferences, // color
        NULL, 8gBufferDepthStencilAttachmentReferences, // resolve & DS
        0, NULL
    },
    {
        VK_STRUCTURE_TYPE_SUBPASS_DESCRIPTION_2, NULL, 0,
        VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI , 0,
        sizeof(depthInputAttachmentReferences)/sizeof(depthInputAttachmentReferences[0]),
        depthInputAttachmentReferences, // input
        0, NULL, // color
        NULL, NULL, // resolve & DS
        sizeof(preserveAttachmentReferences)/sizeof(preserveAttachmentReferences[0]),
        preserveAttachmentReferences,
    },
    {
        VK_STRUCTURE_TYPE_SUBPASS_DESCRIPTION_2, NULL, 0, VK_PIPELINE_BIND_POINT_GRAPHICS,
        0,
        sizeof(gBufferAttachmentReferences)/sizeof(gBufferAttachmentReferences[0]),
        gBufferAttachmentReferences, // input
        sizeof(colorAttachmentReferences)/sizeof(colorAttachmentReferences[0]),
        colorAttachmentReferences, // color
        8resolveAttachmentReference, 8gBufferDepthStencilAttachmentReferences, // resolve
        & DS
        0, NULL
    },
};

VkMemoryBarrier2KHR fragmentToSubpassShading = {
    VK_STRUCTURE_TYPE_MEMORY_BARRIER_2_KHR, NULL,
    VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT_KHR,
    VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT | VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT,
    VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI, VK_ACCESS_INPUT_ATTACHMENT_READ_BIT
};

VkMemoryBarrier2KHR subpassShadingToFragment = {
Example of subpass shading pipeline creation

```c
VkExtent2D maxWorkgroupSize;

VkSpecializationMapEntry subpassShadingConstantMapEntries[] = {
    { 0, 0 * sizeof(uint32_t), sizeof(uint32_t) },
    { 1, 1 * sizeof(uint32_t), sizeof(uint32_t) }
};

VkSpecializationInfo subpassShadingConstants = {
    2, subpassShadingConstantMapEntries,
    sizeof(VkExtent2D), &maxWorkgroupSize
};

VkSubpassShadingPipelineCreateInfoHUAWEI subpassShadingPipelineCreateInfo {
    VK_STRUCTURE_TYPE_SUBPASS_S_SHADING_PIPELINE_CREATE_INFO_HUAWEI,
    NULL, renderPass, 1
};

VkPipelineShaderStageCreateInfo subpassShadingPipelineStageCreateInfo {
```
VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_CREATE_INFO, NULL, 0, VK_SHADER_STAGE_SUBPASS_SHADING_BIT_HUAWEI,
shaderModule, "main",
&subpassShadingConstants
};

VkComputePipelineCreateInfo subpassShadingComputePipelineCreateInfo = {
    VK_STRUCTURE_TYPE_COMPUTE_PIPELINE_CREATE_INFO, &subpassShadingPipelineCreateInfo, 0, &subpassShadingPipelineStageCreateInfo,
pipelineLayout, basePipelineHandle, basePipelineIndex
};

VKPipeline pipeline;

vkGetDeviceSubpassShadingMaxWorkgroupSizeHUAWEI(device, renderPass, &
maxWorkgroupSize);
vkCreateComputePipelines(device, pipelineCache, 1,
&subpassShadingComputePipelineCreateInfo, NULL, &pipeline);

Version History

• Revision 3, 2023-06-19 (Pan Gao)
  ◦ Rename VK_PIPELINE_STAGE_2_SUBPASS_SHADING_BIT_HUAWEI to
    VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI to better aligned with naming of other
    pipeline stages

• Revision 2, 2021-06-28 (Hueilong Wang)
  ◦ Change vkGetSubpassShadingMaxWorkgroupSizeHUAWEI to
    vkGetDeviceSubpassShadingMaxWorkgroupSizeHUAWEI to resolve issue pub1564

• Revision 1, 2020-12-15 (Hueilong Wang)
  ◦ Initial draft.

**VK_IMG_filter_cubic**

Name String

VK_IMG_filter_cubic

Extension Type

Device extension

Registered Extension Number

16

Revision

1

Ratification Status

Not ratified
Description

`VK_IMG_filter_cubic` adds an additional, high quality cubic filtering mode to Vulkan, using a Catmull-Rom bicubic filter. Performing this kind of filtering can be done in a shader by using 16 samples and a number of instructions, but this can be inefficient. The cubic filter mode exposes an optimized high quality texture sampling using fixed texture sampling functionality.

New Enum Constants

- `VK_IMG_FILTER_CUBIC_EXTENSION_NAME`
- `VK_IMG_FILTER_CUBIC_SPEC_VERSION`
- Extending `VkFilter`:
  - `VK_FILTER_CUBIC_IMG`
- Extending `VkFormatFeatureFlagBits`:
  - `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_IMG`

Example

Creating a sampler with the new filter for both magnification and minification

```c
VkSamplerCreateInfo createInfo = {
    .sType = VK_STRUCTURE_TYPE_SAMPLER_CREATE_INFO,
    // Other members set to application-desired values
};
createInfo.magFilter = VK_FILTER_CUBIC_IMG;
createInfo.minFilter = VK_FILTER_CUBIC_IMG;

VkSampler sampler;
VkResult result = vkCreateSampler(
    device,
    &createInfo,
```
Version History

Description

OpenGL specifies that implementations should rasterize lines using the diamond exit rule (a slightly modified version of Bresenham’s algorithm). To implement OpenGL some implementations have a device-level compatibility mode to rasterize lines according to the OpenGL specification.

This extension allows OpenGL emulation layers to enable the OpenGL compatible line rasterization mode of such implementations.

New Structures

- Extending `VkPhysicalDeviceFeatures2, VkDeviceCreateInfo`:
  - `VkPhysicalDeviceRelaxedLineRasterizationFeaturesIMG`

New Enum Constants

- `VK_IMG_RELAXED_LINE_RASTERIZATION_EXTENSION_NAME`
- `VK_IMG_RELAXED_LINE_RASTERIZATION_SPEC_VERSION`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RELAXED_LINE_RASTERIZATION_FEATURES_IMG`

Issues

None.

Description
This extension allows an application to capture performance data to be interpreted by an external application or library.

Such a library is available at: https://github.com/intel/metrics-discovery

Performance analysis tools such as Graphics Performance Analyzers make use of this extension and the metrics-discovery library to present the data in a human readable way.

Description
This extension allows applications to request a narrower alignment for images than an implementation would otherwise require. Some implementations internally support multiple image layouts in VK_IMAGE_TILING_OPTIMAL, each with different alignment requirements and performance trade-offs. In some API layering use cases such as D3D12, it is beneficial to be able to control the alignment, since certain alignments for placed resources are guaranteed to be supported, and emulating that expectation requires unnecessary padding of allocations.

VkImageAlignmentControlCreateInfoMESA can be chained to VkImageCreateInfo, requesting that the alignment is no more than the provided alignment. If the requested alignment is not supported for a given VkImageCreateInfo, a larger alignment may be returned.

While something similar could be achieved with VK_EXT_image_drm_format_modifier in theory, this is not the intended way to use that extension. Format modifiers are generally used for externally shareable images, and would not be platform portable. It is also a cumbersome API to use just to lower the alignment.

**Description**
The VK_NN_vi_surface extension is an instance extension. It provides a mechanism to create a VkSurfaceKHR object (defined by the VK_KHR_surface extension) associated with an nn::vi::Layer.

**New Commands**
- vkCreateViSurfaceNN

**New Structures**
- VkViSurfaceCreateInfoNN

**New Bitmasks**
- VkViSurfaceCreateFlagsNN
New Enum Constants

- VK_NN_VI_SURFACE_EXTENSION_NAME
- VK_NN_VI_SURFACE_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_VI_SURFACE_CREATE_INFO_NN

Issues

1) Does VI need a way to query for compatibility between a particular physical device (and queue family?) and a specific VI display?

**RESOLVED:** No. It is currently always assumed that the device and display will always be compatible.

2) `VkViSurfaceCreateInfoNN::pWindow` is intended to store an `nn::vi::NativeWindowHandle`, but its declared type is a bare `void*` to store the window handle. Why the discrepancy?

**RESOLVED:** It is for C compatibility. The definition for the VI native window handle type is defined inside the `nn::vi` C++ namespace. This prevents its use in C source files. `nn::vi::NativeWindowHandle` is always defined to be `void*`, so this extension uses `void*` to match.

- `VK_EXT_direct_mode_display`
Description

This extension allows an application to take exclusive control of a display on Windows 10 provided that the display is not already controlled by a compositor. Examples of compositors include the Windows desktop compositor, other applications using this Vulkan extension, and applications that “Acquire” a “DisplayTarget” using a “WinRT” command such as “winrt::Windows::Devices::Display::Core::DisplayManager.TryAcquireTarget()”.

When control is acquired the application has exclusive access to the display until control is released or the application terminates. An application’s attempt to acquire is denied if a different application has already acquired the display.

New Commands

- vkAcquireWinrtDisplayNV
- vkGetWinrtDisplayNV

New Enum Constants

- VK_NV_ACQUIRE_WINRT_DISPLAY_EXTENSION_NAME
- VK_NV_ACQUIRE_WINRT_DISPLAY_SPEC_VERSION

Issues

1) What should the platform substring be for this extension:

RESOLVED: The platform substring is “Winrt”.

The substring “Winrt” matches the fact that the OS API exposing the acquire and release functionality is called “WinRT”.

The substring “Win32” is wrong because the related “WinRT” API is explicitly not a “Win32” API. “WinRT” is a competing API family to the “Win32” API family.

The substring “Windows” is suboptimal because there could be more than one relevant API on the
Windows platform. There is preference to use the more-specific substring “Winrt”.

2) Should `vkAcquireWinrtDisplayNV` take a winRT DisplayTarget, or a Vulkan display handle as input?

**RESOLVED:** A Vulkan display handle. This matches the design of `vkAcquireXlibDisplayEXT`.

3) Should the acquire command be platform-independent named “vkAcquireDisplayNV”, or platform-specific named “vkAcquireWinrtDisplayNV”?

**RESOLVED:** Add a platform-specific command.

The inputs to the Acquire command are all Vulkan types. None are WinRT types. This opens the possibility of the winrt extension defining a platform-independent acquire command.

The X11 acquire command does need to accept a platform-specific parameter. This could be handled by adding to a platform-independent acquire command a params struct to which platform-dependent types can be chained by `pNext` pointer.

The prevailing opinion is that it would be odd to create a second platform-independent function that is used on the Windows 10 platform, but that is not used for the X11 platform. Since a Windows 10 platform-specific command is needed anyway for converting between `vkDisplayKHR` and platform-native handles, opinion was to create a platform-specific acquire function.

4) Should the `vkGetWinrtDisplayNV` parameter identifying a display be named “deviceRelativeId” or “adapterRelativeId”?

**RESOLVED:** The WinRT name is “AdapterRelativeId”. The name “adapter” is the Windows analog to a Vulkan “physical device”. Vulkan already has precedent to use the name `deviceLUID` for the concept that Windows APIs call “AdapterLuid”. Keeping form with this precedent, the name “deviceRelativeId” is chosen.

5) Does `vkAcquireWinrtDisplayNV` cause the Windows desktop compositor to release a display?

**RESOLVED:** No. `vkAcquireWinrtDisplayNV` does not itself cause the Windows desktop compositor to release a display. This action must be performed outside of Vulkan.

Beginning with Windows 10 version 2004 it is possible to cause the Windows desktop compositor to release a display by using the “Advanced display settings” sub-page of the “Display settings” control panel. See [https://docs.microsoft.com/en-us/windows-hardware/drivers/display/specialized-monitors](https://docs.microsoft.com/en-us/windows-hardware/drivers/display/specialized-monitors)

6) Where can one find additional information about custom compositors for Windows 10?

**RESOLVED:** Relevant references are as follows.

According to Microsoft’s documentation on “building a custom compositor”, the ability to write a custom compositor is not a replacement for a fullscreen desktop window. The feature is for writing compositor apps that drive specialized hardware.

Only certain editions of Windows 10 support custom compositors, "documented here". The product
type can be queried from Windows 10. See https://docs.microsoft.com/en-us/windows/win32/api/sysinfoapi/nf-sysinfoapi-getproductinfo

**Description**

Virtual Reality (VR) applications often involve a post-processing step to apply a “barrel” distortion to the rendered image to correct the “pincushion” distortion introduced by the optics in a VR device. The barrel distorted image has lower resolution along the edges compared to the center. Since the original image is rendered at high resolution, which is uniform across the complete image, a lot of pixels towards the edges do not make it to the final post-processed image.
This extension provides a mechanism to render VR scenes at a non-uniform resolution, in particular a resolution that falls linearly from the center towards the edges. This is achieved by scaling the \( w \) coordinate of the vertices in the clip space before perspective divide. The clip space \( w \) coordinate of the vertices can be offset as a function of \( x \) and \( y \) coordinates as follows:

\[
\begin{align*}
    w' &= w + Ax + By \\
\end{align*}
\]

In the intended use case for viewport position scaling, an application should use a set of four viewports, one for each of the four quadrants of a Cartesian coordinate system. Each viewport is set to the dimension of the image, but is scissored to the quadrant it represents. The application should specify \( A \) and \( B \) coefficients of the \( w \)-scaling equation above, that have the same value, but different signs, for each of the viewports. The signs of \( A \) and \( B \) should match the signs of \( x \) and \( y \) for the quadrant that they represent such that the value of \( w' \) will always be greater than or equal to the original \( w \) value for the entire image. Since the offset to \( w \), \((Ax + By)\), is always positive, and increases with the absolute values of \( x \) and \( y \), the effective resolution will fall off linearly from the center of the image to its edges.

**New Commands**

- `vkCmdSetViewportWScalingNV`

**New Structures**

- `VkViewportWScalingNV`
- Extending `VkPipelineViewportStateCreateInfo`:
  - `VkPipelineViewportWScalingStateCreateInfoNV`

**New Enum Constants**

- `VK_NV_CLIP_SPACE_W_SCALING_EXTENSION_NAME`
- `VK_NV_CLIP_SPACE_W_SCALING_SPEC_VERSION`
- Extending `VkDynamicState`:
  - `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_W_SCALING_STATE_CREATE_INFO_NV`

**Issues**

1) Is the pipeline struct name too long?

**RESOLVED:** It fits with the naming convention.

2) Separate \( W \) scaling section or fold into coordinate transformations?

**RESOLVED:** Leaving it as its own section for now.
Examples

```c
VkViewport viewports[4];
VkRect2D scissors[4];
VkViewportWScalingNV scalings[4];

for (int i = 0; i < 4; i++) {
    int x = (i & 2) ? currentWindowWidth / 2;
    int y = (i & 1) ? currentWindowHeight / 2;

    viewports[i].x = 0;
    viewports[i].y = 0;
    viewports[i].width = currentWindowWidth;
    viewports[i].height = currentWindowHeight;
    viewports[i].minDepth = 0.0f;
    viewports[i].maxDepth = 1.0f;

    scissors[i].offset.x = x;
    scissors[i].offset.y = y;
    scissors[i].extent.width = currentWindowWidth/2;
    scissors[i].extent.height = currentWindowHeight/2;

    const float factor = 0.15;
    scalings[i].xcoeff = ((i & 2) ? -1.0 : 1.0) * factor;
    scalings[i].ycoeff = ((i & 1) ? -1.0 : 1.0) * factor;
}

VkPipelineViewportWScalingStateCreateInfoNV vpWScalingStateInfo = {
    .viewportWScalingEnable = VK_TRUE,
    .viewportCount = 4,
    .pViewportWScalings = &scalings[0];
}

VkPipelineViewportStateCreateInfo vpStateInfo = {
    .viewportCount = 4,
    .pViewports = &viewports[0];
    .scissorCount = 4;
    .pScissors = &scissors[0];
    .pNext = &vpWScalingStateInfo;
}

Example shader to read from a w-scaled texture:

```c
const vec4 positions[3] = vec4[3](vec4(-1, -1, 0, 1),
                                  vec4( 3, -1, 0, 1),
                                  vec4(-1,  3, 0, 1));
```
out vec2 uv;
void main()
{
    vec4 pos = positions[ gl_VertexID ];
    gl_Position = pos;
    uv = pos.xy;
}

// Fragment Shader
uniform sampler2D tex;
uniform float xcoeff;
uniform float ycoeff;
out vec4 Color;
in vec2 uv;

void main()
{
    // Handle uv as if upper right quadrant
    vec2 uvabs = abs(uv);

    // unscale: transform w-scaled image into an unscaled image
    // scale: transform unscaled image into a w-scaled image
    float unscale = 1.0 / (1 + xcoeff * uvabs.x + xcoeff * uvabs.y);
    //float scale = 1.0 / (1 - xcoeff * uvabs.x - xcoeff * uvabs.y);

    vec2 P = vec2(unscale * uvabs.x, unscale * uvabs.y);

    // Go back to the right quadrant
    P *= sign(uv);

    Color = texture(tex, P * 0.5 + 0.5);
}

Contributors
• Pat Brown, NVIDIA

Description
This extension adds Vulkan support for the SPV_NV_compute_shader_derivatives SPIR-V extension.

The SPIR-V extension provides two new execution modes, both of which allow compute shaders to use built-ins that evaluate compute derivatives explicitly or implicitly. Derivatives will be computed via differencing over a 2x2 group of shader invocations. The DerivativeGroupQuadsNV execution mode assembles shader invocations into 2x2 groups, where each group has x and y coordinates of the local invocation ID of the form (2m+{0,1}, 2n+{0,1}). The DerivativeGroupLinearNV execution mode assembles shader invocations into 2x2 groups, where each group has local invocation index values of the form 4m+{0,1,2,3}.

New Structures
• Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  ◦ VkPhysicalDeviceComputeShaderDerivativesFeaturesNV
New Enum Constants

- `VK_NV_COMPUTE_SHADER_DERIVATIVES_EXTENSION_NAME`
- `VK_NV_COMPUTE_SHADER_DERIVATIVES_SPEC_VERSION`

Extending `VkStructureType`:
- `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_COMPUTE_SHADER_DERIVATIVES_FEATURES_NV`

New SPIR-V Capability

- `ComputeDerivativeGroupQuadsNV`
- `ComputeDerivativeGroupLinearNV`

Issues

(1) Should we specify that the groups of four shader invocations used for derivatives in a compute shader are the same groups of four invocations that form a “quad” in shader subgroups?

**RESOLVED**: Yes.

Examples

None.

Interactions and External Dependencies
  • This extension provides API support for GL_NV_cooperative_matrix

Contributors
  • Jeff Bolz, NVIDIA
  • Markus Tavenrath, NVIDIA
  • Daniel Koch, NVIDIA

Description

This extension adds support for using cooperative matrix types in SPIR-V. Cooperative matrix types are medium-sized matrices that are primarily supported in compute shaders, where the storage for the matrix is spread across all invocations in some scope (usually a subgroup) and those invocations cooperate to efficiently perform matrix multiplies.

Cooperative matrix types are defined by the SPV_NV_cooperative_matrix SPIR-V extension and can be used with the GL_NV_cooperative_matrix GLSL extension.

This extension includes support for enumerating the matrix types and dimensions that are supported by the implementation.

New Commands
  • vkGetPhysicalDeviceCooperativeMatrixPropertiesNV

New Structures
  • VkCooperativeMatrixPropertiesNV
  • Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
    ◦ VkPhysicalDeviceCooperativeMatrixFeaturesNV
  • Extending VkPhysicalDeviceProperties2:
    ◦ VkPhysicalDeviceCooperativeMatrixPropertiesNV
New Enums

  • Pat Brown, NVIDIA
  • Chris Lentini, NVIDIA

Description

This extension adds support for a new image organization, which this extension refers to as “corner-sampled” images. A corner-sampled image differs from a conventional image in the following ways:

• Texels are centered on integer coordinates. See Unnormalized Texel Coordinate Operations

• Normalized coordinates are scaled using \( \text{coord} \times (\text{dim} - 1) \) rather than \( \text{coord} \times \text{dim} \), where \( \text{dim} \) is the size of one dimension of the image. See normalized texel coordinate transform.

• Partial derivatives are scaled using \( \text{coord} \times (\text{dim} - 1) \) rather than \( \text{coord} \times \text{dim} \). See Scale Factor Operation.

• Calculation of the next higher LOD size goes according to \( \lceil \text{dim} / 2 \rceil \) rather than \( \lfloor \text{dim} / 2 \rfloor \). See Image Mip Level Sizing.

• The minimum level size is 2x2 for 2D images and 2x2x2 for 3D images. See Image Mip Level Sizing.
This image organization is designed to facilitate a system like Ptex with separate textures for each face of a subdivision or polygon mesh. Placing sample locations at pixel corners allows applications to maintain continuity between adjacent patches by duplicating values along shared edges. Additionally, using the modified mipmapping logic along with texture dimensions of the form $2^n+1$ allows continuity across shared edges even if the adjacent patches use different LOD values.

New Structures

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  - `VkPhysicalDeviceCornerSampledImageFeaturesNV`

New Enum Constants

- `VK_NV_CORNER_SAMPLED_IMAGE_EXTENSION_NAME`
- `VK_NV_CORNER_SAMPLED_IMAGE_SPEC_VERSION`
- Extending `VkImageCreateFlagBits`:
  - `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CORNER_SAMPLED_IMAGE_FEATURES_NV`

Issues

1. What should this extension be named?

   **DISCUSSION:** While naming this extension, we chose the most distinctive aspect of the image organization and referred to such images as “corner-sampled images”. As a result, we decided to name the extension `NV_corner_sampled_image`.

2. Do we need a format feature flag so formats can advertise if they support corner-sampling?

   **DISCUSSION:** Currently NVIDIA supports this for all 2D and 3D formats, but not for cube maps or depth-stencil formats. A format feature might be useful if other vendors would only support this on some formats.

3. Do integer texel coordinates have a different range for corner-sampled images?

   **RESOLVED:** No, these are unchanged.

4. Do unnormalized sampler coordinates work with corner-sampled images? Are there any functional differences?

   **RESOLVED:** Yes. Unnormalized coordinates are treated as already scaled for corner-sample usage.

5. Should we have a diagram in the “Image Operations” chapter demonstrating different texel sampling locations?

   **UNRESOLVED:** Probably, but later.

Description

When using a framebuffer with mixed samples, a per-fragment coverage reduction operation is performed which generates color sample coverage from the pixel coverage. This extension defines
the following modes to control how this reduction is performed.

- **Merge**: When there are more samples in the pixel coverage than color samples, there is an implementation-dependent association of each pixel coverage sample to a color sample. In the merge mode, the color sample coverage is computed such that only if any associated sample in the pixel coverage is covered, the color sample is covered. This is the default mode.

- **Truncate**: When there are more raster samples (N) than color samples (M), there is one to one association of the first M raster samples to the M color samples; other raster samples are ignored.

When the number of raster samples is equal to the color samples, there is a one to one mapping between them in either of the above modes.

The new command `vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV` can be used to query the various raster, color, depth/stencil sample count and reduction mode combinations that are supported by the implementation. This extension would allow an implementation to support the behavior of both `VK_NV_framebuffer_mixed_samples` and `VK_AMD_mixed_attachment_samples` extensions simultaneously.

**New Commands**

- `vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV`

Description

There are scenarios where the application does not know ahead of time how many descriptor sets it may need to allocate from a descriptor pool, or how many descriptors of any of the descriptor types it may need to allocate from the descriptor pool.

This extension gives applications the ability to request the implementation allow more sets or descriptors to be allocated than initially specified at descriptor pool creation time, subject to available resources.

The `VK_DESCRIPTOR_POOL_CREATE_ALLOW_OVERALLOCATION_SETS_BIT_NV` flag lets the application allocate more than `VkDescriptorPoolCreateInfo::maxSets` descriptor sets, and the `VK_DESCRIPTOR_POOL_CREATE_ALLOW_OVERALLOCATION_POOLS_BIT_NV` lets the application allocate more descriptors than initially specified by `VkDescriptorPoolSize::descriptorCount` for any descriptor types.

- VK_KHR_get_physical_device_properties2
  - or
  - Version 1.1
Applications using Nvidia Nsight™ Aftermath SDK for Vulkan to integrate device crash dumps into their error reporting mechanisms, may use this extension to configure options related to device crash dump creation.

Version 2 of this extension adds `VK_DEVICE_DIAGNOSTICS_CONFIG_ENABLE_SHADER_ERROR_REPORTING_BIT_NV` which when set enables enhanced reporting of shader execution errors.

**New Structures**

- Extending `VkDeviceCreateInfo`:
  - `VkDeviceDiagnosticsConfigCreateInfoNV`

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  - `VkPhysicalDeviceDiagnosticsConfigFeaturesNV`

**New Enums**

- `VkDeviceDiagnosticsConfigFlagBitsNV`

**New Bitmasks**

- `VkDeviceDiagnosticsConfigFlagsNV`

**New Enum Constants**

- `VK_NV_DEVICE_DIAGNOSTICS_CONFIG_EXTENSION_NAME`
- `VK_NV_DEVICE_DIAGNOSTICS_CONFIG_SPEC_VERSION`

- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_DEVICE_DIAGNOSTICS_CONFIG_CREATE_INFO_NV`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DIAGNOSTICS_CONFIG_FEATURES_NV`

**Interactions and External Dependencies**

- This extension requires Vulkan 1.1

- This extension requires \texttt{VK\_EXT\_buffer\_device\_address} or \texttt{VK\_KHR\_buffer\_device\_address} or Vulkan 1.2 for the ability to bind vertex and index buffers on the device.

- This extension interacts with \texttt{VK\_NV\_mesh\_shader}. If the latter extension is not supported, remove the command token to initiate mesh tasks drawing in this extension.

**Description**

This extension allows the device to generate a number of critical graphics commands for command buffers.

When rendering a large number of objects, the device can be leveraged to implement a number of critical functions, like updating matrices, or implementing occlusion culling, frustum culling, front to back sorting, etc. Implementing those on the device does not require any special extension, since an application is free to define its own data structures, and just process them using shaders.

However, if the application desires to quickly kick off the rendering of the final stream of objects, then unextended Vulkan forces the application to read back the processed stream and issue graphics command from the host. For very large scenes, the synchronization overhead and cost to generate the command buffer can become the bottleneck. This extension allows an application to generate a device side stream of state changes and commands, and convert it efficiently into a command buffer without having to read it back to the host.

Furthermore, it allows incremental changes to such command buffers by manipulating only partial sections of a command stream— for example pipeline bindings. Unextended Vulkan requires recreation of entire command buffers in such a scenario, or updates synchronized on the host.

The intended usage for this extension is for the application to:

- create `VkBuffer` objects and retrieve physical addresses from them via `vkGetBufferDeviceAddressEXT`
- create a graphics pipeline using `VkGraphicsPipelineShaderGroupsCreateInfoNV` for the ability to change shaders on the device.
- create a `VkIndirectCommandsLayoutNV`, which lists the `VkIndirectCommandsTokenTypeNV` it wants to dynamically execute as an atomic command sequence. This step likely involves some internal device code compilation, since the intent is for the GPU to generate the command buffer in the pipeline.
- fill the input stream buffers with the data for each of the inputs it needs. Each input is an array that will be filled with token-dependent data.
• set up a preprocess `VkBuffer` that uses memory according to the information retrieved via `vkGetGeneratedCommandsMemoryRequirementsNV`.

• optionally preprocess the generated content using `vkCmdPreprocessGeneratedCommandsNV`, for example on an asynchronous compute queue, or for the purpose of re-using the data in multiple executions.

• call `vkCmdExecuteGeneratedCommandsNV` to create and execute the actual device commands for all sequences based on the inputs provided.

For each draw in a sequence, the following can be specified:

• a different shader group
• a number of vertex buffer bindings
• a different index buffer, with an optional dynamic offset and index type
• a number of different push constants
• a flag that encodes the primitive winding

While the GPU can be faster than a CPU to generate the commands, it will not happen asynchronously to the device, therefore the primary use case is generating “less” total work (occlusion culling, classification to use specialized shaders, etc.).

**New Object Types**

• `VkIndirectCommandsLayoutNV`

**New Commands**

• `vkCmdBindPipelineShaderGroupNV`
• `vkCmdExecuteGeneratedCommandsNV`
• `vkCmdPreprocessGeneratedCommandsNV`
• `vkCreateIndirectCommandsLayoutNV`
• `vkDestroyIndirectCommandsLayoutNV`
• `vkGetGeneratedCommandsMemoryRequirementsNV`

  ◦ VK_STRUCTURE_TYPE_GENERATED_COMMANDS_MEMORY_REQUIREMENTS_INFO_NV
  ◦ VK_STRUCTURE_TYPE_GRAPHICS_PIPELINE_SHADER_GROUPS_CREATE_INFO_NV
  ◦ VK_STRUCTURE_TYPE_GRAPHICS_SHADER_GROUP_CREATE_INFO_NV
Issues

1) How to name this extension?

VK_NV_device_generated_commands

As usual, one of the hardest issues ;)

Alternatives: VK_gpu_commands, VK_execute_commands, VK_device_commands, VK_device_execute_commands, VK_device_execute, VK_device_created_commands, VK_device_recorded_commands, VK_device_generated_commands, VK_indirect_generated_commands

2) Should we use a serial stateful token stream or stateless sequence descriptions?

Similarly to VkPipeline, fixed layouts have the most likelihood to be cross-vendor adoptable. They also benefit from being processable in parallel. This is a different design choice compared to the serial command stream generated through GL_NV_command_list.

3) How to name a sequence description?

VkIndirectCommandsLayout as in the NVX extension predecessor.

Alternative: VkGeneratedCommandsLayout

4) Do we want to provide indirectCommands inputs with layout or at indirectCommands time?

Separate layout from data as Vulkan does. Provide full flexibility for indirectCommands.

5) Should the input be provided as SoA or AoS?

Both ways are desirable. AoS can provide portability to other APIs and easier to setup, while SoA allows to update individual inputs in a cache-efficient manner, when others remain static.

6) How do we make developers aware of the memory requirements of implementation-dependent data used for the generated commands?

Make the API explicit and introduce a preprocess VkBuffer. Developers have to allocate it using vkGetGeneratedCommandsMemoryRequirementsNV.

In the NVX version the requirements were hidden implicitly as part of the command buffer reservation process, however as the memory requirements can be substantial, we want to give developers the ability to budget the memory themselves. By lowering the maxSequencesCount the memory consumption can be reduced. Furthermore reuse of the memory is possible, for example for doing explicit preprocessing and execution in a ping-pong fashion.

The actual buffer size is implementation-dependent and may be zero, i.e. not always required.
When making use of Graphics Shader Groups, the programs should behave similar with regards to vertex inputs, clipping and culling outputs of the geometry stage, as well as sample shading behavior in fragment shaders, to reduce the amount of the worst-case memory approximation.

7) Should we allow additional per-sequence dynamic state changes?

Yes

Introduced a lightweight indirect state flag \texttt{VkIndirectStateFlagBitsNV}. So far only switching front face winding state is exposed. Especially in CAD/DCC mirrored transforms that require such changes are common, and similar flexibility is given in the ray tracing instance description.

The flag could be extended further, for example to switch between primitive-lists or -strips, or make other state modifications.

Furthermore, as new tokens can be added easily, future extension could add the ability to change any \texttt{VkDynamicState}.

8) How do we allow re-using already “generated” \texttt{indirectCommands}?

Expose a \texttt{preprocessBuffer} to reuse implementation-dependencyFlags data. Set the \texttt{isPreprocessed} to true in \texttt{vkCmdExecuteGeneratedCommandsNV}.

9) Under which conditions is \texttt{vkCmdExecuteGeneratedCommandsNV} legal?

It behaves like a regular draw call command.

10) Is \texttt{vkCmdPreprocessGeneratedCommandsNV} copying the input data or referencing it?

There are multiple implementations possible:

- one could have some emulation code that parses the inputs, and generates an output command buffer, therefore copying the inputs.
- one could just reference the inputs, and have the processing done in pipe at execution time.

If the data is mandated to be copied, then it puts a penalty on implementation that could process the inputs directly in pipe. If the data is “referenced”, then it allows both types of implementation.

The inputs are “referenced”, and must not be modified after the call to \texttt{vkCmdExecuteGeneratedCommandsNV} has completed.

11) Which buffer usage flags are required for the buffers referenced by \texttt{VkGeneratedCommandsInfoNV}?

Reuse existing \texttt{VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT}

- \texttt{VkGeneratedCommandsInfoNV::preprocessBuffer}
- \texttt{VkGeneratedCommandsInfoNV::sequencesCountBuffer}
- \texttt{VkGeneratedCommandsInfoNV::sequencesIndexBuffer}
- \texttt{VkIndirectCommandsStreamNV::buffer}
12) In which pipeline stage does the device generated command expansion happen?

`vkCmdPreprocessGeneratedCommandsNV` is treated as if it occurs in a separate logical pipeline from either graphics or compute, and that pipeline only includes `VK_PIPELINE_STAGE_TOP_OF_PIPE_BIT`, a new stage `VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_NV`, and `VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT`. This new stage has two corresponding new access types, `VK_ACCESS_COMMAND_PREPROCESS_READ_BIT_NV` and `VK_ACCESS_COMMAND_PREPROCESS_WRITE_BIT_NV`, used to synchronize reading the buffer inputs and writing the preprocess memory output.

The generated output written in the preprocess buffer memory by `vkCmdExecuteGeneratedCommandsNV` is considered to be consumed by the `VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT` pipeline stage.

Thus, to synchronize from writing the input buffers to preprocessing via `vkCmdPreprocessGeneratedCommandsNV`, use:

- `dstStageMask = VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_NV`
- `dstAccessMask = VK_ACCESS_COMMAND_PREPROCESS_READ_BIT_NV`

To synchronize from `vkCmdPreprocessGeneratedCommandsNV` to executing the generated commands by `vkCmdExecuteGeneratedCommandsNV`, use:

- `srcStageMask = VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_NV`
- `srcAccessMask = VK_ACCESS_COMMAND_PREPROCESS_WRITE_BIT_NV`
- `dstStageMask = VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT`
- `dstAccessMask = VK_ACCESS_INDIRECT_COMMAND_READ_BIT`

When `vkCmdExecuteGeneratedCommandsNV` is used with a `isPreprocessed` of `VK_FALSE`, the generated commands are implicitly preprocessed, therefore one only needs to synchronize the inputs via:

- `dstStageMask = VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT`
- `dstAccessMask = VK_ACCESS_INDIRECT_COMMAND_READ_BIT`

13) What if most token data is “static”, but we frequently want to render a subsection?

Added “sequencesIndexBuffer”. This allows to easier sort and filter what should actually be executed.

14) What are the changes compared to the previous NVX extension?

- Compute dispatch support was removed (was never implemented in drivers). There are different approaches how dispatching from the device should work, hence we defer this to a future extension.
- The `ObjectTableNVX` was replaced by using physical buffer addresses and introducing Shader Groups for the graphics pipeline.
- Less state changes are possible overall, but the important operations are still there (reduces complexity of implementation).
• The API was redesigned so all inputs must be passed at both preprocessing and execution time (this was implicit in NVX, now it is explicit)

• The reservation of intermediate command space is now mandatory and explicit through a preprocess buffer.

• The `VkIndirectStateFlagBitsNV` were introduced

15) When porting from other APIs, their indirect buffers may use different enums, for example for index buffer types. How to solve this?

Added “pIndexTypeValues” to map custom `uint32_t` values to corresponding `VkIndexType`.

16) Do we need more shader group state overrides?

The NVX version allowed all PSO states to be different, however as the goal is not to replace all state setup, but focus on highly-frequent state changes for drawing lots of objects, we reduced the amount of state overrides. Especially `VkPipelineLayout` as well as `VkRenderPass` configuration should be left static, the rest is still open for discussion.

The current focus is just to allow VertexInput changes as well as shaders, while all shader groups use the same shader stages.

Too much flexibility will increase the test coverage requirement as well. However, further extensions could allow more dynamic state as well.

17) Do we need more detailed physical device feature queries/enables?

An EXT version would need detailed implementor feedback to come up with a good set of features. Please contact us if you are interested, we are happy to make more features optional, or add further restrictions to reduce the minimum feature set of an EXT.

18) Is there an interaction with VK_KHR_pipeline_library planned?

Yes, a future version of this extension will detail the interaction, once VK_KHR_pipeline_library is no longer provisional.

Example Code

Open-Source samples illustrating the usage of the extension can be found at the following location (may not yet exist at time of writing):

https://github.com/nvpro-samples/vk_device_generated_cmds

Description
Implementations may be able to support an extended address space for sparse memory resources, but only for a certain set of usages.

This extension adds a query for the extended limit, and the supported usages that are allowed for that limit. This limit is an increase to `VkPhysicalDeviceLimits::sparseAddressSpaceSize` when the `VkImage` or `VkBuffer` uses only usages that are supported.

New Structures

Description
This extension adds a new `VkPolygonMode` enum where a triangle is rasterized by computing and filling its axis-aligned screen-space bounding box, disregarding the actual triangle edges. This can be useful for drawing a rectangle without being split into two triangles with an internal edge. It is also useful to minimize the number of primitives that need to be drawn, particularly for a user interface.

New Enum Constants

Description
This extension allows the fragment coverage value, represented as an integer bitmask, to be substituted for a color output being written to a single-component color attachment with integer components (e.g. VK_FORMAT_R8_UINT). The functionality provided by this extension is different from simply writing the SampleMask fragment shader output, in that the coverage value written to the framebuffer is taken after stencil test and depth test, as well as after fragment operations such as alpha-to-coverage.

This functionality may be useful for deferred rendering algorithms, where the second pass needs to know which samples belong to which original fragments.

Contributors

- Pat Brown, NVIDIA
- Jeff Bolz, NVIDIA

Description

This extension builds on the fragment shading rate functionality provided by the VK_KHR_fragment_shading_rate extension, adding support for “supersample” fragment shading rates that trigger multiple fragment shader invocations per pixel as well as a “no invocations” shading rate that discards any portions of a primitive that would use that shading rate.

New Commands

- vkCmdSetFragmentShadingRateEnumNV

New Structures

- Extending VkGraphicsPipelineCreateInfo:
New Enums

- VkFragmentShadingRateNV
- VkFragmentShadingRateTypeNV

New Enum Constants

- VK_NV_FRAGMENT_SHADING_RATE_ENUMS_EXTENSION_NAME
- VK_NV_FRAGMENT_SHADING_RATE_ENUMS_SPEC_VERSION

Extending VkStructureType:

- VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADING_RATE_ENUMS_FEATURES_NV
- VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADING_RATE_ENUMS_PROPERTIES_NV
- VK_STRUCTURE_TYPE_PIPELINE_FRAGMENT_SHADING_RATE_ENUM_STATE_CREATE_INFO_NV

Issues

1. Why was this extension created? How should it be named?

   **RESOLVED:** The primary goal of this extension was to expose support for supersample and “no invocations” shading rates, which are supported by the VK_NV_shading_rate_image extension but not by VK_KHR_fragment_shading_rate. Because VK_KHR_fragment_shading_rate specifies the primitive shading rate using a fragment size in pixels, it lacks a good way to specify supersample rates. To deal with this, we defined enums covering shading rates supported by the KHR extension as well as the new shading rates and added structures and APIs accepting shading rate enums instead of fragment sizes.

   Since this extension adds two different types of shading rates, both expressed using enums, we chose the extension name VK_NV_fragment_shading_rate Enums.

2. Is this a standalone extension?

   **RESOLVED:** No, this extension requires VK_KHR_fragment_shading_rate. In order to use the features of this extension, applications must enable the relevant features of KHR extension.

3. How are the shading rate enums used, and how were the enum values assigned?

   **RESOLVED:** The shading rates supported by the enums in this extension are accepted as pipeline, primitive, and attachment shading rates and behave identically. For the shading rates also supported by the KHR extension, the values assigned to the corresponding enums are identical to the values already used for the primitive and attachment shading rates in the KHR...
extension. For those enums, bits 0 and 1 specify the base two logarithm of the fragment height and bits 2 and 3 specify the base two logarithm of the fragment width. For the new shading rates added by this extension, we chose to use 11 through 14 (10 plus the base two logarithm of the invocation count) for the supersample rates and 15 for the “no invocations” rate. None of those values are supported as primitive or attachment shading rates by the KHR extension.

4. Between this extension, VK_KHR_fragment_shading_rate, and VK_NV_shading_rate_image, there are three different ways to specify shading rate state in a pipeline. How should we handle this?

**RESOLVED:** We do not allow the concurrent use of VK_NV_shading_rate_image and VK_KHR_fragment_shading_rate; it is an error to enable shading rate features from both extensions. But we do allow applications to enable this extension together with VK_KHR_fragment_shading_rate together. While we expect that applications will never attach pipeline CreateInfo structures for both this extension and the KHR extension concurrently, Vulkan does not have any precedent forbidding such behavior and instead typically treats a pipeline created without an extension-specific CreateInfo structure as equivalent to one containing default values specified by the extension. Rather than adding such a rule considering the presence or absence of our new CreateInfo structure, we instead included a `shadingRateType` member to `VkPipelineFragmentShadingRateEnumStateCreateInfoNV` that selects between using state specified by that structure and state specified by `VkPipelineFragmentShadingRateStateCreateInfoKHR`.

Description

This extension allows multisample rendering with a raster and depth/stencil sample count that is larger than the color sample count. Rasterization and the results of the depth and stencil tests together determine the portion of a pixel that is “covered”. It can be useful to evaluate coverage at a higher frequency than color samples are stored. This coverage is then “reduced” to a collection of covered color samples, each having an opacity value corresponding to the fraction of the color sample covered. The opacity can optionally be blended into individual color samples.

Rendering with fewer color samples than depth/stencil samples greatly reduces the amount of memory and bandwidth consumed by the color buffer. However, converting the coverage values into opacity introduces artifacts where triangles share edges and may not be suitable for normal triangle mesh rendering.

One expected use case for this functionality is Stencil-then-Cover path rendering (similar to the OpenGL GL_NV_path_rendering extension). The stencil step determines the coverage (in the stencil buffer) for an entire path at the higher sample frequency, and then the cover step draws the path into the lower frequency color buffer using the coverage information to antialias path edges. With this two-step process, internal edges are fully covered when antialiasing is applied and there is no corruption on these edges.

The key features of this extension are:

- It allows render pass and framebuffer objects to be created where the number of samples in the depth/stencil attachment in a subpass is a multiple of the number of samples in the color attachments in the subpass.

- A coverage reduction step is added to Fragment Operations which converts a set of covered raster/depth/stencil samples to a set of color samples that perform blending and color writes. The coverage reduction step also includes an optional coverage modulation step, multiplying color values by a fractional opacity corresponding to the number of associated raster/depth/stencil samples covered.

Interactions and External Dependencies

- This extension provides API support for `GL_NV_geometry_shader_passthrough`
- This extension requires the `geometryShader` feature.

Contributors

- Piers Daniell, NVIDIA
- Jeff Bolz, NVIDIA

Description

This extension adds support for the following SPIR-V extension in Vulkan:

- `SPV_NV_geometry_shader_passthrough`

Geometry shaders provide the ability for applications to process each primitive sent through the graphics pipeline using a programmable shader. However, one common use case treats them largely as a “passthrough”. In this use case, the bulk of the geometry shader code simply copies inputs from each vertex of the input primitive to corresponding outputs in the vertices of the output primitive. Such shaders might also compute values for additional built-in or user-defined per-primitive attributes (e.g., `Layer`) to be assigned to all the vertices of the output primitive.

This extension provides access to the `PassthroughNV` decoration under the `GeometryShaderPassthroughNV` capability. Adding this to a geometry shader input variable specifies that the values of this input are copied to the corresponding vertex of the output primitive.

When using GLSL source-based shading languages, the `passthrough` layout qualifier from `GL_NV_geometry_shader_passthrough` maps to the `PassthroughNV` decoration. To use the `passthrough` layout, in GLSL the `GL_NV_geometry_shader_passthrough` extension must be enabled. Behavior is described in the `GL_NV_geometry_shader_passthrough` extension specification.

New Enum Constants

- `VK_NV_GEOMETRY_SHADER_PASSTHROUGH_EXTENSION_NAME`
- `VK_NV_GEOMETRY_SHADER_PASSTHROUGH_SPEC_VERSION`

New Variable Decoration

- `PassthroughNV` in `Geometry Shader Passthrough`

New SPIR-V Capabilities

- `GeometryShaderPassthroughNV`
Issues

1) Should we require or allow a passthrough geometry shader to specify the output layout qualifiers for the output primitive type and maximum vertex count in the SPIR-V?

**RESOLVED:** Yes they should be required in the SPIR-V. Per GL_NV_geometry_shader_passthrough they are not permitted in the GLSL source shader, but SPIR-V is lower-level. It is straightforward for the GLSL compiler to infer them from the input primitive type and to explicitly emit them in the SPIR-V according to the following table.

<table>
<thead>
<tr>
<th>Input Layout</th>
<th>Implied Output Layout</th>
</tr>
</thead>
<tbody>
<tr>
<td>points</td>
<td>layout(points, max_vertices=1)</td>
</tr>
<tr>
<td>lines</td>
<td>layout(line_strip, max_vertices=2)</td>
</tr>
<tr>
<td>triangles</td>
<td>layout(triangle_strip, max_vertices=3)</td>
</tr>
</tbody>
</table>

2) How does interface matching work with passthrough geometry shaders?

**RESOLVED:** This is described in [Passthrough Interface Matching](#). In GL when using passthrough geometry shaders in separable mode, all inputs must also be explicitly assigned location layout qualifiers. In Vulkan all SPIR-V shader inputs (except built-ins) must also have location decorations specified. Redeclarations of built-in variables that add the passthrough layout qualifier are exempted from the rule requiring location assignment because built-in variables do not have locations and are matched by `BuiltIn` decoration.

Sample Code

Consider the following simple geometry shader in unextended GLSL:

```
layout(triangles) in;
layout(triangle_strip) out;
layout(max_vertices=3) out;

in Inputs {
    vec2 texcoord;
    vec4 baseColor;
} v_in[];
out Outputs {
    vec2 texcoord;
    vec4 baseColor;
};

void main()
{
    int layer = compute_layer();
    for (int i = 0; i < 3; i++) {
        gl_Position = gl_in[i].gl_Position;
        texcoord = v_in[i].texcoord;
        baseColor = v_in[i].baseColor;
        gl_Layer = layer;
    }
}  ```
In this shader, the inputs gl_Position, Inputs.texcoord, and Inputs.baseColor are simply copied from the input vertex to the corresponding output vertex. The only “interesting” work done by the geometry shader is computing and emitting a gl_Layer value for the primitive.

The following geometry shader, using this extension, is equivalent:

```glsl
#extension GL_NV_geometry_shader_passthrough : require

layout(triangles) in;
// No output primitive layout qualifiers required.

// Redeclare gl_PerVertex to pass through "gl_Position".
layout(passthrough) in gl_PerVertex {
    vec4 gl_Position;
} gl_in[];

// Declare "Inputs" with "passthrough" to automatically copy members.
layout(passthrough) in Inputs {
    vec2 texcoord;
    vec4 baseColor;
} v_in[];

// No output block declaration required.

void main()
{
    // The shader simply computes and writes gl_Layer. We do not
    // loop over three vertices or call EmitVertex().
    gl_Layer = compute_layer();
}
```

**VK_NV_inherited_viewport_scissor**

**Name String**

`VK_NV_inherited_viewport_scissor`

**Extension Type**

Device extension
Description

This extension adds the ability for a secondary command buffer to inherit the dynamic viewport and scissor state from a primary command buffer, or a previous secondary command buffer executed within the same \texttt{vkCmdExecuteCommands} call. It addresses a frequent scenario in applications that deal with window resizing and want to improve utilization of reusable secondary command buffers. The functionality is provided through \texttt{VkCommandBufferInheritanceViewportScissorInfoNV}. Viewport inheritance is effectively limited to the 2D rectangle; secondary command buffers must re-specify the inherited depth range values.

New Structures

- Extending \texttt{VkCommandBufferInheritanceInfo}:
  - \texttt{VkCommandBufferInheritanceViewportScissorInfoNV}
- Extending \texttt{VkPhysicalDeviceFeatures2, VkDeviceCreateInfo}:
  - \texttt{VkPhysicalDeviceInheritedViewportScissorFeaturesNV}
New Enum Constants

- VK_NV_INHERITED_VIEWPORT_SCISSOR_EXTENSION_NAME
- VK_NV_INHERITED_VIEWPORT_SCISSOR_SPEC_VERSION

Extending VkStructureType:
- VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_VIEWPORT_SCISSOR_INFO_NV
- VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_INHERITED_VIEWPORT_SCISSOR_FEATURES_NV

Issues

(1) Why are viewport depth values configured in the VkCommandBufferInheritanceViewportScissorInfoNV struct, rather than by a vkCmd… function?

DISCUSSION:
We considered both adding a new vkCmdSetViewportDepthNV function, and modifying vkCmdSetViewport to ignore the x, y, width, and height values when called with a secondary command buffer that activates this extension.

The primary design considerations for this extension are debuggability and easy integration into existing applications. The main issue with adding a new vkCmdSetViewportDepthNV function is reducing ease-of-integration. A new function pointer will have to be loaded, but more importantly, a new function would require changes to be supported in graphics debuggers; this would delay widespread adoption of the extension.

The proposal to modify vkCmdSetViewport would avoid these issues. However, we expect that the intent of applications using this extension is to have the viewport values used for drawing exactly match the inherited values; thus, it would be better for debuggability if no function for modifying the viewport depth alone is provided. By specifying viewport depth values when starting secondary command buffer recording, and requiring the specified depth values to match the inherited depth values, we allow for validation layers that flag depth changes as errors.

This design also better matches the hardware model. In fact, there is no need to re-execute a depth-setting command. The graphics device retains the viewport depth state; it is the CPU-side state of VkCommandBuffer that must be re-initialized.

(2) Why are viewport depth values specified as a partial VkViewport struct, rather than a leaner depth-only struct?

DISCUSSION:
We considered adding a new VkViewportDepthNV struct containing only minDepth and maxDepth. However, as application developers would need to maintain both a VK_NV_inherited_viewport_scissor code path and a fallback code path (at least in the short term), we ultimately chose to continue using the existing VkViewport structure. Doing so would allow application developers to reuse the same VkViewport array for both code paths, rather than constructing separate VkViewportDepthNV and VkViewport arrays for each code path.

Description

This extension expands support for using `VK_IMAGE_TILING_LINEAR` images as color attachments when all the color attachments in the render pass instance have `VK_IMAGE_TILING_LINEAR` tiling. This extension adds a new flag bit `VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV` that extends the existing `VkFormatFeatureFlagBits2KHR` bits. This flag can be set for renderable color formats in the `VkFormatProperties3KHR::linearTilingFeatures` format properties structure member. Formats with the `VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV` flag may be used as color attachments as long as all the color attachments in the render pass instance have `VK_IMAGE_TILING_LINEAR` tiling, and the formats their images views are created with have `VkFormatProperties3KHR::linearTilingFeatures` which include `VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV`. This extension supports both dynamic rendering and traditional render passes.

New Structures

- Extending `VkPhysicalDeviceFeatures2, VkDeviceCreateInfo`:
  - `VkPhysicalDeviceLinearColorAttachmentFeaturesNV`

New Enum Constants

- VK_STRUCTURE_TYPE_SWAPCHAIN_LATENCY_CREATE_INFO_NV

Description

This extension gives applications timing suggestions on when to start the recording of new frames to reduce the latency between input sampling and frame presentation. Applications can accomplish this through the extension by calling vkSetLatencySleepModeNV to allow the driver to pace a given
swapchain, then calling `vkLatencySleepNV` before input sampling to delay the start of the CPU side work. Additional methods and structures are provided to give insight into the latency pipeline of an application through the latency markers. `VK_NV_low_latency` provides legacy support for applications that make use of the NVIDIA Reflex SDK whereas new implementations should use the `VK_NV_low_latency2` extension.

**Issues**

1) How does Low Latency 2 work with applications that utilize device groups?

Low Latency 2 does not support device groups.

**Version History**

- Revision 2, 2023-11-15 (Charles Hansen)
  - Update `vkGetLatencyTimingsNV`. This is a breaking API change which brings behavior in line with other array querying commands. More background can be found in [https://github.com/KhronosGroup/Vulkan-Docs/issues/2269](https://github.com/KhronosGroup/Vulkan-Docs/issues/2269)

**Interactions and External Dependencies**

- This extension provides API support for GLSL_NV_mesh_shader

**Contributors**

- Pat Brown, NVIDIA
- Jeff Bolz, NVIDIA
- Daniel Koch, NVIDIA
- Piers Daniell, NVIDIA
Description

This extension provides a new mechanism allowing applications to generate collections of geometric primitives via programmable mesh shading. It is an alternative to the existing programmable primitive shading pipeline, which relied on generating input primitives by a fixed function assembler as well as fixed function vertex fetch.

There are new programmable shader types—the task and mesh shader—to generate these collections to be processed by fixed-function primitive assembly and rasterization logic. When task and mesh shaders are dispatched, they replace the core pre-rasterization stages, including vertex array attribute fetching, vertex shader processing, tessellation, and geometry shader processing.

This extension also adds support for the following SPIR-V extension in Vulkan:

- SPV_NV_mesh_shader

New Commands

- vkCmdDrawMeshTasksIndirectCountNV
- vkCmdDrawMeshTasksIndirectNV

New SPIR-V Capability

- MeshShadingNV

Issues

1. How to name this extension?

   **RESOLVED:** VK_NV_mesh_shader

Other options considered:
Do we need a new VkPrimitiveTopology?

**RESOLVED:** No. We skip the InputAssembler stage.

Should we allow Instancing?

**RESOLVED:** No. There is no fixed function input, other than the IDs. However, allow offsetting with a “first” value.

Should we use existing vkCmdDraw or introduce new functions?

**RESOLVED:** Introduce new functions.

New functions make it easier to separate from “programmable primitive shading” chapter, less “dual use” language about existing functions having alternative behavior. The text around the existing “draws” is heavily based around emitting vertices.

If new functions, how to name?

**RESOLVED:** CmdDrawMeshTasks*

Other options considered:

- CmdDrawMeshed
- CmdDrawTasked
- CmdDrawGrouped

Should VK_SHADER_STAGE_ALL_GRAPHICS be updated to include the new stages?

**RESOLVED:** No. If an application were to be recompiled with headers that include additional shader stage bits in VK_SHADER_STAGE_ALL_GRAPHICS, then the previously valid application would no longer be valid on implementations that do not support mesh or task shaders. This means the change would not be backwards compatible. It is too bad VkShaderStageFlagBits does not have a dedicated “all supported graphics stages” bit like VK_PIPELINE_STAGE_ALL_GRAPHICS_BIT, which would have avoided this problem.

Description
    This extension introduces a new descriptor set layout creation flag that allows bindings in a
    descriptor set to be scoped to each shader stage. This means that shaders bound at the same time
    may use completely different descriptor set layouts without any restrictions on compatibility, and
    that the descriptor limits that would otherwise apply to the union of all stages together instead
    apply to each stage individually. It also means that descriptors shared by multiple stages must
    be bound to each stage or set of stages that use a unique descriptor set layout using their specific per
    stage descriptor set layout(s).

    This extension also allows each of the new descriptor binding functions from
    VK_KHR_maintenance6 to have their VkPipelineLayout member be optionally set to
    VK_NULL_HANDLE, in which case the pipeline layout information is taken from a
    VkPipelineLayoutCreateInfo structure in the pNext chain. This enables descriptors to be directly
    bound using descriptor set layouts without applications needing to create and manage
    VkPipelineLayout objects at command recording time.

New Structures

  - or
  - Version 1.1
  - and
- VK_KHR_surface
  - and
- VK_KHR_get_surface_capabilities2
  - and
- VK_KHR_swapchain
Description

This extension adds support for synchronizing corresponding presentation requests across multiple swapchains using the *present barrier*.

New Structures

- Extending *VkPhysicalDeviceFeatures2*, *VkDeviceCreateInfo*:
  - *VkPhysicalDevicePresentBarrierFeaturesNV*
- Extending *VkSurfaceCapabilities2KHR*:
  - *VkSurfaceCapabilitiesPresentBarrierNV*
- Extending *VkSwapchainCreateInfoKHR*:
  - *VkSwapchainPresentBarrierCreateInfoNV*

New Enum Constants

- *VK_NV_PRESENT_BARRIER_EXTENSION_NAME*
- *VK_NV_PRESENT_BARRIER_SPEC_VERSION*
- Extending *VkStructureType*:
  - *VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PRESENT_BARRIER_FEATURES_NV*
  - *VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_PRESENT_BARRIER_NV*
  - *VK_STRUCTURE_TYPE_SWAPCHAIN_PRESENT_BARRIER_CREATE_INFO_NV*

Issues

1) Is there a query interface to check if a swapchain is using the present barrier?
RESOLVED. There is no such query interface. When creating a swapchain, an application can specify to use the present barrier, and if the swapchain is created successfully, this swapchain will be using the present barrier.

2) Do we need an extra interface to set up the present barrier across distributed systems?

RESOLVED. If the required hardware is presented in the system, and all settings for the physical synchronization with other systems are set up, an implementation manages the configuration automatically when creating a swapchain, without any extra calls from the application.

• Rodrigo Locatti, NVIDIA

Description
This extension allows the use of the `SPV_NV_raw_access_chains` extension in SPIR-V shader modules. This enables SPIR-V producers to efficiently implement interfaces similar to Direct3D structured buffers and byte address buffers, allowing shaders compiled from an HLSL source to generate more efficient code.

**Description**

Rasterization has been the dominant method to produce interactive graphics, but increasing performance of graphics hardware has made ray tracing a viable option for interactive rendering. Being able to integrate ray tracing with traditional rasterization makes it easier for applications to incrementally add ray traced effects to existing applications or to do hybrid approaches with rasterization for primary visibility and ray tracing for secondary queries.

To enable ray tracing, this extension adds a few different categories of new functionality:

• Acceleration structure objects and build commands
• A new pipeline type with new shader domains
• An indirection table to link shader groups with acceleration structure items

This extension adds support for the following SPIR-V extension in Vulkan:
New Object Types

- VkAccelerationStructureNV

New Commands

- vkBindAccelerationStructureMemoryNV
- vkCmdBuildAccelerationStructureNV
- vkCmdCopyAccelerationStructureNV
- vkCmdTraceRaysNV
- vkCmdWriteAccelerationStructuresPropertiesNV
- vkCompileDeferredNV
- vkCreateAccelerationStructureNV
- vkCreateRayTracingPipelinesNV
- vkDestroyAccelerationStructureNV
- vkGetAccelerationStructureHandleNV
- vkGetAccelerationStructureMemoryRequirementsNV
- vkGetRayTracingShaderGroupHandlesNV

New Structures

- VkAabbPositionsNV
- VkAccelerationStructureCreateInfoNV
- VkAccelerationStructureInfoNV
- VkAccelerationStructureInstanceNV
- VkAccelerationStructureMemoryRequirementsInfoNV
- VkBindAccelerationStructureMemoryInfoNV
- VkGeometryAABBNV
- VkGeometryDataNV
- VkGeometryNV
- VkGeometryTrianglesNV
- VkRayTracingPipelineCreateInfoNV
- VkRayTracingShaderGroupCreateInfoNV
- VkTransformMatrixNV

Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceRayTracingPropertiesNV

Extending VkWriteDescriptorSet:
If VK_KHR_get_memory_requirements2 or Version 1.1 is supported:

- VkMemoryRequirements2KHR

**New Enums**

Issues

1) Are there issues?

RESOLVED: Yes.

Sample Code

Example ray generation GLSL shader

```glsl
#version 450 core
#extension GL_NV_ray_tracing : require
layout(set = 0, binding = 0, rgba8) uniform image2D image;
layout(set = 0, binding = 1) uniform accelerationStructureNV as;
layout(location = 0) rayPayloadNV float payload;

void main()
{
    vec4 col = vec4(0, 0, 0, 1);

    vec3 origin = vec3(float(gl_LaunchIDNV.x)/float(gl_LaunchSizeNV.x), float(gl_LaunchIDNV.y)/float(gl_LaunchSizeNV.y), 1.0);
    vec3 dir = vec3(0.0, 0.0, -1.0);

    traceNV(as, 0, 0xff, 0, 1, 0, origin, 0.0, dir, 1000.0, 0);

    col.y = payload;

    imageStore(image, ivec2(gl_LaunchIDNV.xy), col);
}
```

Version History

- Revision 1, 2018-09-11 (Robert Stepinski, Nuno Subtil, Eric Werness)
  - Internal revisions
- Revision 2, 2018-10-19 (Eric Werness)
- rename to VK_NV_ray_tracing, add support for callables.
- too many updates to list

- Revision 3, 2018-11-20 (Daniel Koch)
  - update to use InstanceId instead of InstanceIndex as implemented.

**Interactions and External Dependencies**

- This extension provides API support for GL_NV_shader_invocation_reorder

**Contributors**

- Eric Werness, NVIDIA
- Ashwin Lele, NVIDIA

**Description**

The ray tracing pipeline API provides some ability to reorder for locality, but it is useful to have more control over how the reordering happens and what information is included in the reordering. The shader API provides a hit object to contain result information from the hit which can be used
as part of the explicit sorting plus options that contain an integer for hint bits to use to add more locality.

New Structures

- Extending `VkPhysicalDeviceFeatures2, VkDeviceCreateInfo`:
  - `VkPhysicalDeviceRayTracingInvocationReorderFeaturesNV`

- Extending `VkPhysicalDeviceProperties2`:
  - `VkPhysicalDeviceRayTracingInvocationReorderPropertiesNV`

New Enums

- `VkRayTracingInvocationReorderModeNV`

New Enum Constants

- `VK_NV_RAY_TRACING_INVOCATION_REORDER_EXTENSION_NAME`
- `VK_NV_RAY_TRACING_INVOCATION_REORDER_SPEC_VERSION`

- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RAY_TRACING_INVOCATION_REORDER_FEATURES_NV`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RAY_TRACING_INVOCATION_REORDER_PROPERTIES_NV`

HLSL Mapping

HLSL does not provide this functionality natively yet.

However, it is possible to use this functionality via SPIR-V Intrinsics.

The codes for shader invocation reorder are obtained from this page:

```plaintext
#define ShaderInvocationReorderNV 5383
#define HitObjectAttributeNV 5385

#define OpHitObjectRecordHitMotionNV 5249
#define OpHitObjectRecordHitWithIndexMotionNV 5250
#define OpHitObjectRecordMissMotionNV 5251
#define OpHitObjectGetWorldToObjectNV 5252
#define OpHitObjectGetObjectToWorldNV 5253
#define OpHitObjectGetObjectRayDirectionNV 5254
#define OpHitObjectGetObjectRayOriginNV 5255
#define OpHitObjectTraceRayMotionNV 5256
#define OpHitObjectGetShaderRecordBufferHandleNV 5257
#define OpHitObjectGetShaderBindingTableRecordIndexNV 5258
#define OpHitObjectRecordEmptyNV 5259
#define OpHitObjectTraceRayNV 5260
#define OpHitObjectRecordHitNV 5261
#define OpHitObjectRecordHitWithIndexNV 5262
#define OpHitObjectRecordMissNV 5263
```
The capability and extension need to be added:

```cpp
[[vk::ext_capability(ShaderInvocationReorderNV)]]
[[vk::ext_extension("SPV_NV_shader_invocation_reorder")]]
```

The creation of the `HitObject` type can be done like this:

```cpp
[[vk::ext_type_def(HitObjectAttributeNV, OpTypeHitObjectNV)]]
void createHitObjectNV();
#define HitObjectNV vk::ext_type<HitObjectAttributeNV>
```

The payload:

- must be global
- needs the `RayPayloadKHR` attribute as an extra storage class

```cpp
struct [raypayload] HitPayload
{
    float hitT : write(closesthit, miss) : read(caller);
    int instanceIndex : write(closesthit) : read(caller);
    float3 pos : write(closesthit) : read(caller);
    float3 nrm : write(closesthit) : read(caller);
};
#define RayPayloadKHR 5338
[[vk::ext_storage_class(RayPayloadKHR)]] static HitPayload payload;
```
Here is the declaration of a few invocation reordering functions:

```c
[[vk::ext_instruction(OpHitObjectRecordEmptyNV)]]
void hitObjectRecordEmptyNV([[vk::ext_reference]] HitObjectNV hitObject);

[[vk::ext_instruction(OpHitObjectTraceRayNV)]]
void hitObjectTraceRayNV(
    [[vk::ext_reference]] HitObjectNV hitObject,
    RaytracingAccelerationStructure as,
    uint RayFlags,
    uint CullMask,
    uint SBTOffset,
    uint SBTStride,
    uint MissIndex,
    float3 RayOrigin,
    float RayTmin,
    float3 RayDirection,
    float RayTMax,
    [[vk::ext_reference]] [[vk::ext_storage_class(RayPayloadKHR)]] HitPayload payload);

[[vk::ext_instruction(OpReorderThreadWithHintNV)]]
void reorderThreadWithHintNV(int Hint, int Bits);

[[vk::ext_instruction(OpReorderThreadWithHitObjectNV)]]
void reorderThreadWithHitObjectNV([[vk::ext_reference]] HitObjectNV hitObject);

[[vk::ext_instruction(OpHitObjectExecuteShaderNV)]]
void hitObjectExecuteShaderNV([[vk::ext_reference]] HitObjectNV hitObject,
                                 [[vk::ext_reference]] [[vk::ext_storage_class(RayPayloadKHR)]] HitPayload payload);

[[vk::ext_instruction(OpHitObjectIsHitNV)]]
bool hitObjectIsHitNV([[vk::ext_reference]] HitObjectNV hitObject);
```

Using the function in the code, can be done like this:

```c
if (USE_SER == 1)
{
    createHitObjectNV();
    HitObjectNV hObj; // hitObjectNV hObj;
    hitObjectRecordEmptyNV(hObj); // Initialize to an empty hit object
    hitObjectTraceRayNV(hObj, topLevelAS, rayFlags, 0xFF, 0, 0, 0, r.Origin, 0.0, r.Direction, INFINITE, payload);
    reorderThreadWithHitObjectNV(hObj);
    hitObjectExecuteShaderNV(hObj, payload);
}
```

Note:
• `createHitObjectNV()` needs to be call at least once. This can be also done in the main entry of the shader.

• Function with a payload parameter, needs to have the payload struct defined before. There are no templated declaration of the function.

Interactions and External Dependencies
  • This extension provides API support for GL_NV_ray_tracing_motion_blur

Contributors
  • Eric Werness, NVIDIA
  • Ashwin Lele, NVIDIA
Ray tracing support in the API provides an efficient mechanism to intersect rays against static geometry, but rendering algorithms often want to support motion, which is more efficiently supported with motion-specific algorithms. This extension adds a set of mechanisms to support fast tracing of moving geometry:

- A ray pipeline trace call which takes a time parameter
- Flags to enable motion support in an acceleration structure
- Support for time-varying vertex positions in a geometry
- Motion instances to move existing instances over time

The motion represented here is parameterized across a normalized timestep between 0.0 and 1.0. A motion trace using `OpTraceRayMotionNV` provides a time within that normalized range to be used when intersecting that ray with geometry. The geometry can be provided with motion by a combination of adding a second vertex position for time of 1.0 using `VkAccelerationStructureGeometryMotionTrianglesDataNV` and providing multiple transforms in the instance using `VkAccelerationStructureMotionInstanceNV`.

**New Structures**

- `VkAccelerationStructureMatrixMotionInstanceNV`
- `VkAccelerationStructureMotionInstanceNV`
- `VkAccelerationStructureSRTMotionInstanceNV`
- `VkSRTDataNV`

**Extending `VkAccelerationStructureCreateInfoKHR`:**

- VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_MOTION_INFO_NV
- VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RAY_TRACING_MOTION_BLUR_FEATURES_NV

Issues

1. What size is VkAccelerationStructureMotionInstanceNV?
   - Added a note on the structure size and made the stride explicit in the language.

2. Allow arrayOfPointers for motion TLAS?
   - Yes, with a packed encoding to minimize the amount of data sent for metadata.

Description
This extension provides a new representative fragment test that allows implementations to reduce the amount of rasterization and fragment processing work performed for each point, line, or triangle primitive. For any primitive that produces one or more fragments that pass all other early fragment tests, the implementation is permitted to choose one or more “representative” fragments for processing and discard all other fragments. For draw calls rendering multiple points, lines, or triangles arranged in lists, strips, or fans, the representative fragment test is performed independently for each of those primitives.

This extension is useful for applications that use an early render pass to determine the full set of primitives that would be visible in the final scene. In this render pass, such applications would set up a fragment shader that enables early fragment tests and writes to an image or shader storage buffer to record the ID of the primitive that generated the fragment. Without this extension, the
shader would record the ID separately for each visible fragment of each primitive. With this extension, fewer stores will be performed, particularly for large primitives.

The representative fragment test has no effect if early fragment tests are not enabled via the fragment shader. The set of fragments discarded by the representative fragment test is implementation-dependent and may vary from frame to frame. In some cases, the representative fragment test may not discard any fragments for a given primitive.

New Structures

- Extending `VkGraphicsPipelineCreateInfo`:
  - `VkPipelineRepresentativeFragmentTestStateCreateInfoNV`

- Extending `VkPhysicalDeviceFeatures2, VkDeviceCreateInfo`:
  - `VkPhysicalDeviceRepresentativeFragmentTestFeaturesNV`

New Enum Constants

- `VK_NV_REPRESENTATIVE_FRAGMENT_TEST_EXTENSION_NAME`
- `VK_NV_REPRESENTATIVE_FRAGMENT_TEST_SPEC_VERSION`

- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_REPRESENTATIVE_FRAGMENT_TEST_FEATURES_NV`
  - `VK_STRUCTURE_TYPE_PIPELINE_REPRESENTATIVE_FRAGMENT_TEST_STATE_CREATE_INFO_NV`

Issues

(1) Is the representative fragment test guaranteed to have any effect?

**RESOLVED:** No. As specified, we only guarantee that each primitive with at least one fragment that passes prior tests will have one fragment passing the representative fragment tests. We do not guarantee that any particular fragment will fail the test.

In the initial implementation of this extension, the representative fragment test is treated as an optimization that may be completely disabled for some pipeline states. This feature was designed for a use case where the fragment shader records information on individual primitives using shader storage buffers or storage images, with no writes to color or depth buffers.

(2) Will the set of fragments that pass the representative fragment test be repeatable if you draw the same scene over and over again?

**RESOLVED:** No. The set of fragments that pass the representative fragment test is implementation-dependent and may vary due to the timing of operations performed by the GPU.

(3) What happens if you enable the representative fragment test with writes to color and/or depth render targets enabled?

**RESOLVED:** If writes to the color or depth buffer are enabled, they will be performed for any fragments that survive the relevant tests. Any fragments that fail the representative fragment test will not update color buffers. For the use cases intended for this feature, we do not expect color or
depth writes to be enabled.

(4) How do derivatives and automatic texture LOD computations work with the representative fragment test enabled?

**RESOLVED:** If a fragment shader uses derivative functions or texture lookups using automatic LOD computation, derivatives will be computed identically whether or not the representative fragment test is enabled. For the use cases intended for this feature, we do not expect the use of derivatives in the fragment shader.

Interactions and External Dependencies
- This extension provides API support for GL_NV_sample_mask_override_coverage

Contributors
- Daniel Koch, NVIDIA
- Jeff Bolz, NVIDIA

Description
This extension adds support for the following SPIR-V extension in Vulkan:

- SPV_NV_sample_mask_override_coverage

The extension provides access to the OverrideCoverageNV decoration under the SampleMaskOverrideCoverageNV capability. Adding this decoration to a variable with the SampleMask builtin decoration allows the shader to modify the coverage mask and affect which samples are used to process the fragment.

When using GLSL source-based shader languages, the override_coverage layout qualifier from GL_NV_sample_mask_override_coverage maps to the OverrideCoverageNV decoration. To use the override_coverage layout qualifier in GLSL the GL_NV_sample_mask_override_coverage extension must be enabled. Behavior is described in the GL_NV_sample_mask_override_coverage extension spec.

New Enum Constants
- VK_NV_SAMPLE_MASK_OVERRIDE_COVERAGE_EXTENSION_NAME
- VK_NV_SAMPLE_MASK_OVERRIDE_COVERAGE_SPEC_VERSION

New Variable Decoration
- OverrideCoverageNV in SampleMask

New SPIR-V Capabilities

VK_NV_scissor_exclusive

Name String
- VK_NV_scissor_exclusive
This extension adds support for an exclusive scissor test to Vulkan. The exclusive scissor test behaves like the scissor test, except that the exclusive scissor test fails for pixels inside the corresponding rectangle and passes for pixels outside the rectangle. If the same rectangle is used for both the scissor and exclusive scissor tests, the exclusive scissor test will pass if and only if the scissor test fails.

Version 2 of this extension introduces `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_ENABLE_NV` and `vkCmdSetExclusiveScissorEnableNV`. Applications that use this dynamic state must ensure the...
implementation advertises at least specVersion 2 of this extension.

New Commands

• `vkCmdSetExclusiveScissorEnableNV`
• `vkCmdSetExclusiveScissorNV`

New Structures

• Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  ◦ `VkPhysicalDeviceExclusiveScissorFeaturesNV`
• Extending `VkPipelineViewportStateCreateInfo`:
  ◦ `VkPipelineViewportExclusiveScissorStateCreateInfoNV`

New Enum Constants

• `VK_NV_SCISSOR_EXCLUSIVE_EXTENSION_NAME`
• `VK_NV_SCISSOR_EXCLUSIVE_SPEC_VERSION`
• Extending `VkDynamicState`:
  ◦ `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_ENABLE_NV`
  ◦ `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_NV`
• Extending `VkStructureType`:
  ◦ `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXCLUSIVE_SCISSOR_FEATURES_NV`
  ◦ `VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_EXCLUSIVE_SCISSOR_STATE_CREATE_INFO_NV`

Issues

1) For the scissor test, the viewport state must be created with a matching number of scissor and viewport rectangles. Should we have the same requirement for exclusive scissors?

**RESOLVED:** For exclusive scissors, we relax this requirement and allow an exclusive scissor rectangle count that is either zero or equal to the number of viewport rectangles. If you pass in an exclusive scissor count of zero, the exclusive scissor test is treated as disabled.

Interactions and External Dependencies
- This extension provides API support for GL_NV_shader_texture_footprint

Contributors
- Pat Brown, NVIDIA
- Chris Lentini, NVIDIA
- Daniel Koch, NVIDIA
- Jeff Bolz, NVIDIA

Description
This extension adds Vulkan support for the SPV_NV_shader_image_footprint SPIR-V extension. That SPIR-V extension provides a new instruction OpImageSampleFootprintNV allowing shaders to determine the set of texels that would be accessed by an equivalent filtered texture lookup.

Instead of returning a filtered texture value, the instruction returns a structure that can be interpreted by shader code to determine the footprint of a filtered texture lookup. This structure includes integer values that identify a small neighborhood of texels in the image being accessed and a bitfield that indicates which texels in that neighborhood would be used. The structure also includes a bitfield where each bit identifies whether any texel in a small aligned block of texels would be fetched by the texture lookup. The size of each block is specified by an access granularity provided by the shader. The minimum granularity supported by this extension is 2x2 (for 2D textures) and 2x2x2 (for 3D textures); the maximum granularity is 256x256 (for 2D textures) or 64x32x32 (for 3D textures). Each footprint query returns the footprint from a single texture level. When using minification filters that combine accesses from multiple mipmap levels, shaders must perform separate queries for the two levels accessed (“fine” and “coarse”). The footprint query also returns a flag indicating if the texture lookup would access texels from only one mipmap level or from two neighboring levels.

This extension should be useful for multi-pass rendering operations that do an initial expensive rendering pass to produce a first image that is then used as a texture for a second pass. If the second pass ends up accessing only portions of the first image (e.g., due to visibility), the work spent rendering the non-accessed portion of the first image was wasted. With this feature, an application can limit this waste using an initial pass over the geometry in the second image that performs a footprint query for each visible pixel to determine the set of pixels that it needs from the first image. This pass would accumulate an aggregate footprint of all visible pixels into a separate “footprint image” using shader atomics. Then, when rendering the first image, the application can kill all shading work for pixels not in this aggregate footprint.

This extension has a number of limitations. The OpImageSampleFootprintNV instruction only supports
for two- and three-dimensional textures. Footprint evaluation only supports the CLAMP_TO_EDGE wrap mode; results are undefined for all other wrap modes. Only a limited set of granularity values and that set does not support separate coverage information for each texel in the original image.

When using SPIR-V generated from the OpenGL Shading Language, the new instruction will be generated from code using the new `textureFootprintNV` built-in functions from the `GL_NV_shader_texture_footprint` shading language extension.

**New Structures**

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  - `VkPhysicalDeviceShaderImageFootprintFeaturesNV`

**New Enum Constants**

- `VK_NV_SHADER_IMAGE_FOOTPRINT_EXTENSION_NAME`
- `VK_NV_SHADER_IMAGE_FOOTPRINT_SPEC_VERSION`

- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_IMAGE_FOOTPRINT_FEATURES_NV`

**New SPIR-V Capability**

- `ImageFootprintNV`

**Issues**

(1) The footprint returned by the SPIR-V instruction is a structure that includes an anchor, an offset, and a mask that represents a 8x8 or 4x4x4 neighborhood of texel groups. But the bits of the mask are not stored in simple pitch order. Why is the footprint built this way?

**RESOLVED:** We expect that applications using this feature will want to use a fixed granularity and accumulate coverage information from the returned footprints into an aggregate “footprint image” that tracks the portions of an image that would be needed by regular texture filtering. If an application is using a two-dimensional image with 4x4 pixel granularity, we expect that the footprint image will use 64-bit texels where each bit in an 8x8 array of bits corresponds to coverage for a 4x4 block in the original image. Texel (0,0) in the footprint image would correspond to texels (0,0) through (31,31) in the original image.

In the usual case, the footprint for a single access will fully contained in a 32x32 aligned region of the original texture, which corresponds to a single 64-bit texel in the footprint image. In that case, the implementation will return an anchor coordinate pointing at the single footprint image texel, an offset vector of (0,0), and a mask whose bits are aligned with the bits in the footprint texel. For this case, the shader can simply atomically OR the mask bits into the contents of the footprint texel to accumulate footprint coverage.

In the worst case, the footprint for a single access spans multiple 32x32 aligned regions and may require updates to four separate footprint image texels. In this case, the implementation will return an anchor coordinate pointing at the lower right footprint image texel and an offset will identify
how many “columns” and “rows” of the returned 8x8 mask correspond to footprint texels to the left and above the anchor texel. If the anchor is (2,3), the 64 bits of the returned mask are arranged spatially as follows, where each 4x4 block is assigned a bit number that matches its bit number in the footprint image texels:

```
+----------------------------------+----------------------------------+
| -- -- -- -- -- -- -- --  | -- -- -- -- -- -- -- --  |
| -- -- -- -- -- -- -- --  | -- -- -- -- -- -- -- --  |
| -- -- -- -- -- -- -- --  | -- -- -- -- -- -- -- --  |
| -- -- -- -- -- -- -- --  | -- -- -- -- -- -- -- --  |
| -- -- -- -- -- -- 46 47 | 40 41 42 43 44 45 -- -- |
| -- -- -- -- -- -- 54 55 | 48 49 50 51 52 53 -- -- |
| -- -- -- -- -- -- 62 63 | 56 57 58 59 60 61 -- -- |
+----------------------------------+----------------------------------+
| -- -- -- -- -- -- 06 07 | 00 01 02 03 04 05 -- -- |
| -- -- -- -- -- -- 14 15 | 08 09 10 11 12 13 -- -- |
| -- -- -- -- -- -- 22 23 | 16 17 18 19 20 21 -- -- |
| -- -- -- -- -- -- 30 31 | 24 25 26 27 28 29 -- -- |
| -- -- -- -- -- -- 38 39 | 32 33 34 35 36 37 -- -- |
+----------------------------------+----------------------------------+
```

To accumulate coverage for each of the four footprint image texels, a shader can AND the returned mask with simple masks derived from the x and y offset values and then atomically OR the updated mask bits into the contents of the corresponding footprint texel.

```c
uint64_t returnedMask = (uint64_t)(footprint.mask.x) | (uint64_t)(footprint.mask.y) << 32);
uint64_t rightMask = ((0xFF >> footprint.offset.x) * 0x0101010101010101UL);
uint64_t bottomMask = 0xFFFFFFFFFFFFFFFFUL >> (8 * footprint.offset.y);
uint64_t bottomRight = returnedMask & bottomMask & rightMask;
uint64_t bottomLeft = returnedMask & bottomMask & (~rightMask);
uint64_t topRight = returnedMask & (~bottomMask) & rightMask;
uint64_t topLeft = returnedMask & (~bottomMask) & (~rightMask);
```

(2) What should an application do to ensure maximum performance when accumulating footprints into an aggregate footprint image?

**RESOLVED:** We expect that the most common usage of this feature will be to accumulate aggregate footprint coverage, as described in the previous issue. Even if you ignore the anisotropic filtering case where the implementation may return a granularity larger than that requested by the caller, each shader invocation will need to use atomic functions to update up to four footprint image texels for each LOD accessed. Having each active shader invocation perform multiple atomic operations can be expensive, particularly when neighboring invocations will want to update the same footprint image texels.
Techniques can be used to reduce the number of atomic operations performed when accumulating coverage include:

- Have logic that detects returned footprints where all components of the returned offset vector are zero. In that case, the mask returned by the footprint function is guaranteed to be aligned with the footprint image texels and affects only a single footprint image texel.

- Have fragment shaders communicate using built-in functions from the \texttt{VK_NV_shader_subgroup_partitioned} extension or other shader subgroup extensions. If you have multiple invocations in a subgroup that need to update the same texel \((x,y)\) in the footprint image, compute an aggregate footprint mask across all invocations in the subgroup updating that texel and have a single invocation perform an atomic operation using that aggregate mask.

- When the returned footprint spans multiple texels in the footprint image, each invocation need to perform four atomic operations. In the previous issue, we had an example that computed separate masks for “topLeft”, “topRight”, “bottomLeft”, and “bottomRight”. When the invocations in a subgroup have good locality, it might be the case the “top left” for some invocations might refer to footprint image texel \((10,10)\), while neighbors might have their “top left” texels at \((11,10)\), \((10,11)\), and \((11,11)\). If you compute separate masks for even/odd \(x\) and \(y\) values instead of left/right or top/bottom, the “odd/odd” mask for all invocations in the subgroup hold coverage for footprint image texel \((11,11)\), which can be updated by a single atomic operation for the entire subgroup.

**Examples**

TBD

Interactions and External Dependencies
- This extension provides API support for GL_NV_shader_sm_builtins

Contributors
- Jeff Bolz, NVIDIA
- Eric Werness, NVIDIA

Description
This extension provides the ability to determine device-specific properties on NVIDIA GPUs. It provides the number of streaming multiprocessors (SMs), the maximum number of warps (subgroups) that can run on an SM, and shader builtins to enable invocations to identify which SM and warp a shader invocation is executing on.

This extension enables support for the SPIR-V ShaderSMBuiltinsNV capability.

These properties and built-ins should typically only be used for debugging purposes.

New Structures
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  o VkPhysicalDeviceShaderSMBuiltinsFeaturesNV
- Extending VkPhysicalDeviceProperties2:
  o VkPhysicalDeviceShaderSMBuiltinsPropertiesNV

New Enum Constants
- VK_NV_SHADER_SM_BUILTINS_EXTENSION_NAME
- VK_NV_SHADER_SM_BUILTINS_SPEC_VERSION
- Extending VkStructureType:
New or Modified Built-In Variables

- WarpsPerSMNV
- SMCountNV
- WarpIDNV
- SMIDNV

New SPIR-V Capabilities

- ShaderSMBuiltinsNV

Issues

1. What should we call this extension?

   **RESOLVED**: NV_shader_sm_builtins. Other options considered included:

   - NV_shader_smid - but SMID is really easy to typo/confuse as SIMD.
   - NV_shader_sm_info - but Info is typically reserved for input structures

• Jeff Bolz, NVIDIA
• Daniel Koch, NVIDIA
• Mathias Schott, NVIDIA
• Matthew Netsch, Qualcomm Technologies, Inc.

Description
This extension allows applications to use a variable shading rate when processing fragments of rasterized primitives. By default, Vulkan will spawn one fragment shader for each pixel covered by a primitive. In this extension, applications can bind a shading rate image that can be used to vary the number of fragment shader invocations across the framebuffer. Some portions of the screen may be configured to spawn up to 16 fragment shaders for each pixel, while other portions may use a single fragment shader invocation for a 4x4 block of pixels. This can be useful for use cases like eye tracking, where the portion of the framebuffer that the user is looking at directly can be processed at high frequency, while distant corners of the image can be processed at lower frequency. Each texel in the shading rate image represents a fixed-size rectangle in the framebuffer, covering 16x16 pixels in the initial implementation of this extension. When rasterizing a primitive covering one of these rectangles, the Vulkan implementation reads a texel in the bound shading rate image and looks up the fetched value in a palette to determine a base shading rate.
In addition to the API support controlling rasterization, this extension also adds Vulkan support for the `SPV_NV_shading_rate` extension to SPIR-V. That extension provides two fragment shader variable decorations that allow fragment shaders to determine the shading rate used for processing the fragment:

- `FragmentSizeNV`, which indicates the width and height of the set of pixels processed by the fragment shader.
- `InvocationsPerPixel`, which indicates the maximum number of fragment shader invocations that could be spawned for the pixel(s) covered by the fragment.

When using SPIR-V in conjunction with the OpenGL Shading Language (GLSL), the fragment shader capabilities are provided by the `GL_NV_shading_rate_image` language extension and correspond to the built-in variables `gl_FragmentSizeNV` and `gl_InvocationsPerPixelNV`, respectively.

### Issues

1. When using shading rates specifying “coarse” fragments covering multiple pixels, we will generate a combined coverage mask that combines the coverage masks of all pixels covered by the fragment. By default, these masks are combined in an implementation-dependent order. Should we provide a mechanism allowing applications to query or specify an exact order?

**RESOLVED**: Yes, this feature is useful for cases where most of the fragment shader can be evaluated once for an entire coarse fragment, but where some per-pixel computations are also required. For example, a per-pixel alpha test may want to kill all the samples for some pixels in a coarse fragment. This sort of test can be implemented using an output sample mask, but such a shader would need to know which bit in the mask corresponds to each sample in the coarse fragment. We are including a mechanism to allow applications to specify the orders of coverage samples for each shading rate and sample count, either as static pipeline state or dynamically via a command buffer. This portion of the extension has its own feature bit.

We will not be providing a query to determine the implementation-dependent default ordering. The thinking here is that if an application cares enough about the coarse fragment sample ordering to perform such a query, it could instead just set its own order, also using custom per-pixel sample locations if required.

2. For the pipeline stage `VK_PIPELINE_STAGE_SHADING_RATE_IMAGE_BIT_NV`, should we specify a precise location in the pipeline the shading rate image is accessed (after geometry shading, but before the early fragment tests) or leave it under-specified in case there are other implementations that access the image in a different pipeline location?

**RESOLVED** We are specifying the pipeline stage to be between the final pre-rasterization shader stage (`VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`) and before the first stage used for fragment
processing (VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT), which seems to be the natural place to access the shading rate image.

(3) How do centroid-sampled variables work with fragments larger than one pixel?

**RESOLVED** For single-pixel fragments, fragment shader inputs decorated with **Centroid** are sampled at an implementation-dependent location in the intersection of the area of the primitive being rasterized and the area of the pixel that corresponds to the fragment. With multi-pixel fragments, we follow a similar pattern, using the intersection of the primitive and the set of pixels corresponding to the fragment.

One important thing to keep in mind when using such “coarse” shading rates is that fragment attributes are sampled at the center of the fragment by default, regardless of the set of pixels/samples covered by the fragment. For fragments with a size of 4x4 pixels, this center location will be more than two pixels (1.5 * sqrt(2)) away from the center of the pixels at the corners of the fragment. When rendering a primitive that covers only a small part of a coarse fragment, sampling a color outside the primitive can produce overly bright or dark color values if the color values have a large gradient. To deal with this, an application can use centroid sampling on attributes where “extrapolation” artifacts can lead to overly bright or dark pixels. Note that this same problem also exists for multisampling with single-pixel fragments, but is less severe because it only affects certain samples of a pixel and such bright/dark samples may be averaged with other samples that do not have a similar problem.

Description

This extension adds support for the following SPIR-V extension in Vulkan:

• SPV_NV_viewport_array2

which allows a single primitive to be broadcast to multiple viewports and/or multiple layers. A new shader built-in output ViewportMaskNV is provided, which allows a single primitive to be output to multiple viewports simultaneously. Also, a new SPIR-V decoration is added to control whether the effective viewport index is added into the variable decorated with the Layer built-in decoration. These capabilities allow a single primitive to be output to multiple layers simultaneously.

This extension allows variables decorated with the Layer and ViewportIndex built-ins to be exported from vertex or tessellation shaders, using the ShaderViewportIndexLayerNV capability.

This extension adds a new ViewportMaskNV built-in decoration that is available for output variables in vertex, tessellation evaluation, and geometry shaders, and a new ViewportRelativeNV decoration that can be added on variables decorated with Layer when using the ShaderViewportMaskNV capability.

When using GLSL source-based shading languages, the gl_VertexMask[] built-in output variable and viewport_relative layout qualifier from GL_NV_viewport_array2 map to the ViewportMaskNV and ViewportRelativeNV decorations, respectively. Behavior is described in the GL_NV_viewport_array2 specification.
extension specification.

**Note**

The `ShaderViewportIndexLayerNV` capability is equivalent to the `ShaderViewportIndexLayerEXT` capability added by `VK_EXT_shaderViewportIndexLayer`.

Interactions and External Dependencies
• This extension requires `multiViewport` and `geometryShader` features to be useful.

Contributors
• Daniel Koch, NVIDIA
• Jeff Bolz, NVIDIA

Description
This extension provides a new per-viewport swizzle that can modify the position of primitives sent to each viewport. New viewport swizzle state is added for each viewport, and a new position vector is computed for each vertex by selecting from and optionally negating any of the four components of the original position vector.

This new viewport swizzle is useful for a number of algorithms, including single-pass cube map rendering (broadcasting a primitive to multiple faces and reorienting the vertex position for each face) and voxel rasterization. The per-viewport component remapping and negation provided by the swizzle allows application code to re-orient three-dimensional geometry with a view along any of the X, Y, or Z axes. If a perspective projection and depth buffering is required, \(1/W\) buffering should be used, as described in the single-pass cube map rendering example in the “Issues” section below.

New Structures
• `VkViewportSwizzleNV`

Extending `VkPipelineViewportStateCreateInfo`:
• `VkPipelineViewportSwizzleStateCreateInfoNV`

New Enums
• `VkViewportCoordinateSwizzleNV`
New Bitmasks

• VkPipelineViewportSwizzleStateCreateFlagsNV

New Enum Constants

• VK_NV_VIEWPORT_SWIZZLE_EXTENSION_NAME
• VK_NV_VIEWPORT_SWIZZLE_SPEC_VERSION
• Extending VkStructureType:
  ◦ VK_STRUCTURE_TYPE_PIPELINEVIEWPORT_SWIZZLE_STATE_CREATE_INFO_NV

Issues

1) Where does viewport swizzling occur in the pipeline?

RESOLVED: Despite being associated with the viewport, viewport swizzling must happen prior to
the viewport transform. In particular, it needs to be performed before clipping and perspective
division.

The viewport mask expansion (VK_NV_viewport_array2) and the viewport swizzle could potentially
be performed before or after transform feedback, but feeding back several viewports worth of
primitives with different swizzles does not seem particularly useful. This specification applies the
viewport mask and swizzle after transform feedback, and makes primitive queries only count each
primitive once.

2) Any interesting examples of how this extension, VK_NV_viewport_array2, and
VK_NV_geometry_shader_passthrough can be used together in practice?

RESOLVED: One interesting use case for this extension is for single-pass rendering to a cube map.
In this example, the application would attach a cube map texture to a layered FBO where the six
cube faces are treated as layers. Vertices are sent through the vertex shader without applying a
projection matrix, where the gl_Position output is (x,y,z,1) and the center of the cube map is at
(0,0,0). With unextended Vulkan, one could have a conventional instanced geometry shader that
looks something like the following:

```glsl
layout(invocations = 6) in;  // separate invocation per face
layout(triangles) in;
layout(triangle_strip) out;
layout(max_vertices = 3) out;

in Inputs {
  vec2 texcoord;
  vec3 normal;
  vec4 baseColor;
} v[];

out Outputs {
  vec2 texcoord;
  vec3 normal;
}
```
vec4 baseColor;

void main()
{
    int face = gl_InvocationID;  // which face am I?

    // Project gl_Position for each vertex onto the cube map face.
    vec4 positions[3];
    for (int i = 0; i < 3; i++) {
        positions[i] = rotate(gl_in[i].gl_Position, face);
    }

    // If the primitive does not project onto this face, we are done.
    if (shouldCull(positions)) {
        return;
    }

    // Otherwise, emit a copy of the input primitive to the
    // appropriate face (using gl_Layer).
    for (int i = 0; i < 3; i++) {
        gl_Layer = face;
        gl_Position = positions[i];
        texcoord = v[i].texcoord;
        normal = v[i].normal;
        baseColor = v[i].baseColor;
        EmitVertex();
    }
}

With passthrough geometry shaders, this can be done using a much simpler shader:

layout(triangles) in;
layout(passthrough) in Inputs {
    vec2 texcoord;
    vec3 normal;
    vec4 baseColor;
}
layout(passthrough) in gl_PerVertex {
    vec4 gl_Position;
} gl_in[];
layout(viewport_relative) out int gl_Layer;

void main()
{
    // Figure out which faces the primitive projects onto and
    // generate a corresponding viewport mask.
    uint mask = 0;
    for (int i = 0; i < 6; i++) {
        if (!shouldCull(face)) {
            gl_Layer = face;
            gl_Position = positions[i];
            texcoord = v[i].texcoord;
            normal = v[i].normal;
            baseColor = v[i].baseColor;
            EmitVertex();
        }
    }
}
The application code is set up so that each of the six cube faces has a separate viewport (numbered 0 to 5). Each face also has a separate swizzle, programmed via the `gl_Layer` layout qualifier says that the viewport number (0 to 5) is added to the base `gl_Layer` value of 0 to determine which layer (cube face) the primitive should be sent to.

Note that the use of the passed through input `normal` in this example suggests that the fragment shader in this example would perform an operation like per-fragment lighting. The viewport swizzle would transform the position to be face-relative, but `normal` would remain in the original coordinate system. It seems likely that the fragment shader in either version of the example would want to perform lighting in the original coordinate system. It would likely do this by reconstructing the position of the fragment in the original coordinate system using `gl_FragCoord`, a constant or uniform holding the size of the cube face, and the input `gl_Layer` value of 0 to determine which layer (cube face) the primitive should be sent to.

Note that while the `rotate()` operation in the regular geometry shader above could include an arbitrary post-rotation projection matrix, the viewport swizzle does not support arbitrary math. To get proper projection, 1/W buffering should be used. To do this:

1. Program the viewport swizzles to move the pre-projection W eye coordinate (typically 1.0) into the Z coordinate of the swizzle output and the eye coordinate component used for depth into the W coordinate. For example, the viewport corresponding to the +Z face might use a swizzle of (+X, -Y, +W, +Z). The Z normalized device coordinate computed after swizzling would then be \( z'/w' = 1/Z_{\text{eye}} \).

2. On NVIDIA implementations supporting floating-point depth buffers with values outside [0,1], prevent unwanted near plane clipping by enabling `depthClampEnable`. Ensure that the depth clamp does not mess up depth testing by programming the depth range to very large values, such as `minDepthBounds=-z`, `maxDepthBounds=+z`, where \( z = 2^{127} \). It should be possible to use IEEE infinity encodings also (0xFF800000 for -INF, 0x7F800000 for +INF). Even when near/far clipping is disabled, primitives extending behind the eye will still be clipped because one or more vertices will have a negative W coordinate and fail X/Y clipping tests.

3. Adjust depth testing to reflect the fact that 1/W values are large near the eye and small away from the eye. Clear the depth buffer to zero (infinitely far away) and use a depth test of `VK_COMPARE_OP_GREATER` instead of `VK_COMPARE_OP_LESS`. 

```cpp
mask |= 1U << i;
}
gl_ViewportMask = mask;
gl_Layer = 0;
}
```

On other implementations, scale X, Y, and Z eye coordinates so that vertices on the near plane have a post-swizzle W coordinate of 1.0. For example, if the near plane is at \( Z_{\text{eye}} = 1/256 \), scale X, Y, and Z by 256.

3. Adjust depth testing to reflect the fact that 1/W values are large near the eye and small away from the eye. Clear the depth buffer to zero (infinitely far away) and use a depth test of `VK_COMPARE_OP_GREATER` instead of `VK_COMPARE_OP_LESS`.

Interactions and External Dependencies
- This extension provides API support for GL_NVX_multiview_per_view_attributes
- This extension interacts with VK_NV_viewport_array2.

Contributors
- Jeff Bolz, NVIDIA
- Daniel Koch, NVIDIA

Description
This extension adds a new way to write shaders to be used with multiview subpasses, where the attributes for all views are written out by a single invocation of the pre-rasterization shader stages. Related SPIR-V and GLSL extensions SPV_NVX_multiview_per_view_attributes and GL_NVX_multiview_per_view_attributes introduce per-view position and viewport mask attributes arrays, and this extension defines how those per-view attribute arrays are interpreted by Vulkan. Pipelines using per-view attributes may only execute the pre-rasterization shader stages once for all views rather than once per-view, which reduces redundant shading work.

A subpass creation flag controls whether the subpass uses this extension. A subpass must either exclusively use this extension or not use it at all.

Some Vulkan implementations only support the position attribute varying between views in the X component. A subpass can declare via a second creation flag whether all pipelines compiled for this subpass will obey this restriction.
Shaders that use the new per-view outputs (e.g. \texttt{gl\_Position\_Per\_View\_NV}) must also write the non-per-view output (\texttt{gl\_Position}), and the values written must be such that \texttt{gl\_Position = gl\_Position\_Per\_View\_NV[gl\_View\_Index]} for all views in the subpass. Implementations are free to either use the per-view outputs or the non-per-view outputs, whichever would be more efficient.

If \texttt{VK\_NV\_viewport\_array2} is not also supported and enabled, the per-view viewport mask must not be used.

Description

This extension extends cubic filtering by adding the ability to enable an anti-ringing clamp. Cubic filtering samples from a 4x4 region of texels and computes a cubic weighted average of the region.
In some cases, the resulting value is outside the range of any of the texels in the 4x4 region. This is sometimes referred to as “filter overshoot” or “filter ringing” and can occur when there is a sharp discontinuity in the 4x4 region being filtered. For some use cases this “ringing” can produce unacceptable artifacts.

The solution to the ringing problem is to clamp the post-cubic-filtered value to be within the max and min of texel values in the 4x4 region. While such “range clamping” can be performed in shader code, the additional texture fetches and clamping ALU operations can be costly.

Certain Adreno GPUs are able to perform the range clamp in the texture unit during cubic filtering at significant performance/power savings versus a shader-based clamping approach. This extension exposes such hardware functionality.

This extension extends VkSamplerReductionMode, adding VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM which enables the range clamp operation.

Description
This extension extends cubic filtering by adding the ability to select a set of weights. Without this extension, the weights used in cubic filtering are limited to those corresponding to a Catmull-Rom spline. This extension adds support for 3 additional spline weights.

This extension adds a new structure that can be added to the pNext chain of VkSamplerCreateInfo that can be used to specify which set of cubic weights are used in cubic filtering. A similar structure can be added to the pNext chain of VkBlitImageInfo2 to specify cubic weights used in a blit operation.

With this extension weights corresponding to the following additional splines can be selected for cubic filtered sampling and blits:

• Zero Tangent Cardinal
• B-Spline
• Mitchell-Netravali

Description

GPUs are commonly used to process images for various applications from 3D graphics to UI and from composition to compute applications. Simple scaling and filtering can be done with bilinear filtering, which comes for free during texture sampling. However, as screen sizes get larger and more use cases rely on GPU such as camera and video post-processing needs, there is increasing demand for GPU to support higher order filtering and other advanced image processing.

This extension introduces a new set of SPIR-V built-in functions for image processing. It exposes the following new imaging operations:

- The **OpImageSampleWeightedQCOM** instruction takes 3 operands: sampled image, weight image, and texture coordinates. The instruction computes a weighted average of an MxN region of texels in the sampled image, using a set of MxN weights in the weight image.

- The **OpImageBoxFilterQCOM** instruction takes 3 operands: sampled image, box size, and texture coordinates. Note that box size specifies a floating point width and height in texels. The instruction computes a weighted average of all texels in the sampled image that are covered (either partially or fully) by a box with the specified size and centered at the specified texture coordinates.

- The **OpImageBlockMatchSADQCOM** and **OpImageBlockMatchSSDQCOM** instructions each takes 5 operands: target image, target coordinates, reference image, reference coordinates, and block size. Each instruction computes an error metric, that describes whether a block of texels in the target image matches a corresponding block of texels in the reference image. The error metric is computed per-component. OpImageBlockMatchSADQCOM computes "Sum Of Absolute Difference" and OpImageBlockMatchSSDQCOM computes "Sum of Squared Difference".

Each of the image processing instructions operate only on 2D images. The instructions do not support sampling of mipmap, multi-plane, multi-layer, multi-sampled, or depth/stencil images. The instructions can be used in any shader stage.

Implementations of this extension should support these operations natively at the HW instruction level, offering potential performance gains as well as ease of development.

Description

This extension enables support for the SPIR-V TextureBlockMatch2QCOM capability. It builds on the functionality of QCOM_image_processing with the addition of 4 new image processing operations.

• The `opImageBlockMatchWindowSADQCOM` SPIR-V instruction builds upon the functionality of `opImageBlockMatchSADQCOM` by repeatedly performing block match operations across a 2D window. The “2D windowExtent” and “compareMode” are specified by `VkSamplerBlockMatchWindowCreateInfoQCOM` in the sampler used to create the target image. Like `OpImageBlockMatchSADQCOM`, `opImageBlockMatchWindowSADQCOM` computes an error metric, that describes whether a block of texels in the target image matches a corresponding block of texels in the reference image. Unlike `OpImageBlockMatchSADQCOM`, this instruction computes an error metric at each (X,Y) location within the 2D window and returns either the minimum or maximum error. The instruction only supports single-component formats. Refer to the pseudocode below for details.

• The `opImageBlockMatchWindowSSDQCOM` follows the same pattern, computing the SSD error metric at each location within the 2D window.

• The `opImageBlockMatchGatherSADQCOM` builds upon `OpImageBlockMatchSADQCOM`. This instruction computes an error metric, that describes whether a block of texels in the target image matches a corresponding block of texels in the reference image. The instruction computes the SAD error metric at 4 texel offsets and returns the error metric for each offset in the X,Y,Z,and W components. The instruction only supports single-component texture formats. Refer to the pseudocode below for details.

• The `opImageBlockMatchGatherSSDQCOM` follows the same pattern, computing the SSD error metric for 4 offsets.

Each of the above 4 image processing instructions are limited to single-component formats.
Below is the pseudocode for GLSL built-in function `textureWindowBlockMatchSADQCOM`. The pseudocode for `textureWindowBlockMatchSSD` is identical other than replacing all instances of "SAD" with "SSD".

```cpp
vec4 textureBlockMatchWindowSAD( sampler2D target,
                                uvec2 targetCoord,
                                sampler2D reference,
                                uvec2 refCoord,
                                uvec2 blocksize) {
  // compareMode (MIN or MAX) comes from the vkSampler associated with `target`
  // uvec2 window  comes from the vkSampler associated with `target`
  minSAD = INF;
  maxSAD = -INF;
  uvec2 minCoord;
  uvec2 maxCoord;

  for (uint x=0; x < window.width; x++) {
    for (uint y=0; y < window.height; y++) {
      float SAD = textureBlockMatchSAD(target,
                                       targetCoord + uvec2(x, y),
                                       reference,
                                       refCoord,
                                       blocksize).x;

      // Note: the below comparison operator will produce undefined results
      // if SAD is a denorm value.
      if (SAD < minSAD) {
        minSAD = SAD;
        minCoord = uvec2(x,y);
      } else {
        if (SAD > maxSAD) {
          maxSAD = SAD;
          maxCoord = uvec2(x,y);
        } else {
          return vec4(minSAD, minCoord.x, minCoord.y, 0.0);
        } else {
          return vec4(maxSAD, maxCoord.x, maxCoord.y, 0.0);
        }
      }
    }
    if (compareMode=MIN) {
      return vec4(minSAD, minCoord.x, minCoord.y, 0.0);
    } else {
      return vec4(maxSAD, maxCoord.x, maxCoord.y, 0.0);
    }
  }
}
```

Below is the pseudocode for `textureBlockMatchGatherSADQCOM`. The pseudocode for `textureBlockMatchGatherSSD` follows an identical pattern.

```cpp
vec4 textureBlockMatchGatherSAD( sampler2D target,
                                uvec2 targetCoord,
                                sampler2D reference,
                                uvec2 refCoord,
                                uvec2 blocksize) {
  // compareMode (MIN or MAX) comes from the vkSampler associated with `target`
  // uvec2 window  comes from the vkSampler associated with `target`
  minSAD = INF;
  maxSAD = -INF;
  uvec2 minCoord;
  uvec2 maxCoord;

  for (uint x=0; x < window.width; x++) {
    for (uint y=0; y < window.height; y++) {
      float SAD = textureBlockMatchSAD(target,
                                       targetCoord + uvec2(x, y),
                                       reference,
                                       refCoord,
                                       blocksize).x;

      // Note: the below comparison operator will produce undefined results
      // if SAD is a denorm value.
      if (SAD < minSAD) {
        minSAD = SAD;
        minCoord = uvec2(x,y);
      } else {
        if (SAD > maxSAD) {
          maxSAD = SAD;
          maxCoord = uvec2(x,y);
        } else {
          return vec4(minSAD, minCoord.x, minCoord.y, 0.0);
        } else {
          return vec4(maxSAD, maxCoord.x, maxCoord.y, 0.0);
        }
      }
    }
    if (compareMode=MIN) {
      return vec4(minSAD, minCoord.x, minCoord.y, 0.0);
    } else {
      return vec4(maxSAD, maxCoord.x, maxCoord.y, 0.0);
    }
  }
}
```
```cpp
vec4 out;
for (uint x = 0; x < 4; x++) {
    float SAD = textureBlockMatchSAD(target, targetCoord + uvec2(x, 0), reference, refCoord, blocksize).x;
    out[x] = SAD;
}
return out;
}
```

**New Structures**

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  - `VkPhysicalDeviceImageProcessing2FeaturesQCOM`
- Extending `VkPhysicalDeviceProperties2`:
  - `VkPhysicalDeviceImageProcessing2PropertiesQCOM`
- Extending `VkSamplerCreateInfo`:
  - `VkSamplerBlockMatchWindowCreateInfoQCOM`

**New Enums**

- `VkBlockMatchWindowCompareModeQCOM`

**New Enum Constants**

- `VK_QCOM_IMAGE_PROCESSING_2_EXTENSION_NAME`
- `VK_QCOM_IMAGE_PROCESSING_2_SPEC_VERSION`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_PROCESSING_2_FEATURES_QCOM`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_PROCESSING_2_PROPERTIES_QCOM`
  - `VK_STRUCTURE_TYPE_SAMPLER_BLOCK_MATCH_WINDOW_CREATE_INFO_QCOM`

**Issues**

1) What is the precision of the min/max comparison checks?

**RESOLVED**: Intermediate computations for the new operations are performed at 16-bit floating point precision. If the value of "float SAD" in the above code sample is a 16-bit denorm value, then behavior of the MIN/MAX comparison is undefined.

• Jonathan Wicks, Qualcomm

Description
Certain use cases (e.g., side-by-side VR rendering) use multiview and render to distinct regions of the framebuffer for each view. On some implementations, there may be a performance benefit for providing per-view render areas to the implementation. Such per-view render areas can be used by the implementation to reduce the pixels that are affected by attachment load, store, and multisample resolve operations.
The extension enables a multiview render pass instance to define per-view render areas. For each view of a multiview render pass instance, only those pixels in the per-view render area are affected by load, store and resolve operations.

**New Structures**

- Extending `VkPhysicalDeviceFeatures2, VkDeviceCreateInfo`:
  - `VkPhysicalDeviceMultiviewPerViewRenderAreasFeaturesQCOM`
- Extending `VkRenderPassBeginInfo, VkRenderingInfo`:
  - `VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM`

**New Enum Constants**

- `VK_QCOM_MULTIVIEW_PER_VIEW_RENDER_AREAS_EXTENSION_NAME`
- `VK_QCOM_MULTIVIEW_PER_VIEW_RENDER_AREAS_SPEC_VERSION`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_MULTIVIEW_PER_VIEW_RENDER_AREAS_RENDER_PASS_BEGIN_INFO_QCOM`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MULTIVIEW_PER_VIEW_RENDER_AREAS_FEATURES_QCOM`

**Issues**

1) Do the per-view `renderAreas` interact with `vkGetRenderAreaGranularity`?

**RESOLVED**: There is no change. The granularity returned by `vkGetRenderAreaGranularity` also applies to the per-view `renderAreas`.

2) How does this extension interact with `VK_QCOM_render_pass_transform`?

**RESOLVED**: When `VK_QCOM_render_pass_transform` is enabled, the application provides render area in non-rotated coordinates which is rotated by the implementation to the rotated coordinate system. When this extension is used in combination with `VK_QCOM_render_pass_transform`, then the `renderArea` provided in `VkRenderingInfo::renderArea`, `VkRenderPassBeginInfo::renderArea`, or `VkCommandBufferInheritanceRenderPassTransformInfoQCOM::renderArea` is rotated by the implementation. The per-view render areas are not rotated.

3) How does this extension interact with `VK_QCOM_multiview_per_view_viewports`?

**RESOLVED**: There is no direct interaction. The per-view viewports and the per-view renderAreas are orthogonal features.

4) When a per-view `renderArea` is specified, must multiview rendering for each view of a multiview render pass be contained within the per-view `renderArea`?

**RESOLVED**: Yes, and the `VK_QCOM_multiview_per_view_viewports` may help here since it provides per-view scissors.

5) When per-view render areas are specified, what purpose if any do `VkRenderPassBeginInfo::renderArea` and `VkRenderingInfo::renderArea` serve?
RESOLVED: The per-view renderArea effectively overrides the per-renderpass renderArea. The per-view renderArea defines the regions of the attachments that are effected by load, store, and multisample resolve operations. A valid implementation could ignore the per-renderpass renderArea. However, as an aid to the implementation, the application must set the per-renderpass renderArea to an area that is at least as large as the union of all the per-view render areas. Pixels that are within the per-renderpass renderArea but not within any per-view render area must not be affected by load, store, or multisample resolve operations.

Description

Certain use cases for multiview have a need for specifying a separate viewport and scissor for each view, without using shader-based viewport indexing as introduced with VK_EXT_shader_viewport_index_layer.

This extension adds a new way to control ViewportIndex with multiview. When the multiviewPerViewViewports feature is enabled and if the last pre-rasterization shader entry point’s interface does not use the ViewportIndex built-in decoration, then each view of a multiview render pass instance will use a viewport and scissor index equal to the ViewIndex.

New Structures

• Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  ◦ VkPhysicalDeviceMultiviewPerViewViewportsFeaturesQCOM

New Enum Constants

• VK_QCOM_MULTIVIEW_PER_VIEW_VIEWPORTS_EXTENSION_NAME
• VK_QCOM_MULTIVIEW_PER_VIEW_VIEWPORTS_SPEC_VERSION

Extending VkStructureType:
  ◦ VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MULTIVIEW_PER_VIEW_VIEWPORTS_FEATURES_QCOM

Issues

1) Is it possible to enable/disable the multiviewPerViewViewports feature for individual render pass instances?

RESOLVED: No, when the multiviewPerViewViewports feature is enabled during vkCreateDevice, then all created render pass instances (including dynamic render passes from VK_KHR_dynamic_rendering) and all created VkPipelines will have the feature enabled. This approach was chosen because it simplifies application code and there is no known use case to enable/disable the feature for individual render passes or pipelines.

2) When this extension is used, is the value of ViewportIndex implicitly written by the last pre-rasterization shader stage and can the value of ViewportIndex be read in the fragment shader?

RESOLVED: No, use of the extension does not add an implicit write to ViewportIndex in any shader stage, and additionally, the value of ViewportIndex in the fragment shader is undefined.

Description
This extension allows a shader resolve to replace fixed-function resolve.

Fixed-function resolve is limited in function to simple filters of multisample buffers to a single sample buffer.

Fixed-function resolve is more performance efficient and/or power efficient than shader resolve for such simple filters.
Shader resolve allows a shader writer to create complex, non-linear filtering of a multisample buffer in the last subpass of a subpass dependency chain.

This extension also provides a bit which can be used to enlarge a sample region dependency to a fragment region dependency, so that a framebuffer-region dependency can replace a framebuffer-global dependency in some cases.

**New Enum Constants**

- VK_QCOM_RENDER_PASS_SHADER_RESOLVE_EXTENSION_NAME

- Extending VkSubpassDescriptionFlagBits:
  - VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM
  - VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM

**Issues**

1) Should this extension be named render_pass_shader_resolve?

**RESOLVED** Yes.

This is part of suite of small extensions to render pass.

Following the style guide, instead of following VK_KHR_create_renderpass2.

2) Should the VK_SAMPLE_COUNT_1_BIT be required for each pColorAttachment and the DepthStencilAttachment?

**RESOLVED** No.

While this may not be a common use case, and while most fixed-function resolve hardware has this limitation, there is little reason to require a shader resolve to resolve to a single sample buffer.

3) Should a shader resolve subpass be the last subpass in a render pass?

**RESOLVED** Yes.

To be more specific, it should be the last subpass in a subpass dependency chain.

4) Do we need the VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM bit?

**RESOLVED** Yes.

This applies when an input attachment’s sample count is equal to rasterizationSamples. Further, if sampleShading is enabled (explicitly or implicitly) then minSampleShading must equal 0.0.

However, this bit may be set on any subpass, it is not restricted to a shader resolve subpass.

Description

Render pass attachments can be read-only for the duration of a render pass.

Examples include input attachments and depth attachments where depth tests are enabled but depth writes are not enabled.

In such cases, there can be no contents generated for an attachment within the render area.

This extension adds a new VkAttachmentStoreOp VK_ATTACHMENT_STORE_OP_NONE_QCOM specifying that the contents within the render area may not be written to memory, but that the prior contents of the attachment in memory are preserved. However, if any contents were generated within the render area during rendering, the contents of the attachment will be undefined inside the render area.

Note

The VkAttachmentStoreOp VK_ATTACHMENT_STORE_OP_STORE may force an implementation to assume that the attachment was written and force an implementation to flush data to memory or to a higher level cache. The VkAttachmentStoreOp VK_ATTACHMENT_STORE_OP_NONE_QCOM may allow an implementation to assume that the attachment was not written and allow an implementation to avoid such a flush.

Description

This extension provides a mechanism for applications to enable driver support for render pass transform.

Mobile devices can be rotated and mobile applications need to render properly when a device is held in a landscape or portrait orientation. When the current orientation differs from the device's native orientation, a rotation is required so that the “up” direction of the rendered scene matches the current orientation.

If the Display Processing Unit (DPU) does not natively support rotation, the Vulkan presentation engine can handle this rotation in a separate composition pass. Alternatively, the application can render frames “pre-rotated” to avoid this extra pass. The latter is preferred to reduce power consumption and achieve the best performance because it avoids tasking the GPU with extra work to perform the copy/rotate operation.

Unlike OpenGL ES, the burden of pre-rotation in Vulkan falls on the application. To implement pre-
rotation, applications render into swapchain images matching the device native aspect ratio of the
display and “pre-rotate” the rendering content to match the device’s current orientation. The
burden is more than adjusting the Model View Projection (MVP) matrix in the vertex shader to
account for rotation and aspect ratio. The coordinate systems of scissors, viewports, derivatives and
several shader built-ins may need to be adapted to produce the correct result.

It is difficult for some game engines to manage this burden; many chose to simply accept the
performance/power overhead of performing rotation in the presentation engine.

This extension allows applications to achieve the performance benefits of pre-rotated rendering by
moving much of the above-mentioned burden to the graphics driver. The following is unchanged
with this extension:

- Applications create a swapchain matching the native orientation of the display. Applications
  must also set the `VkSwapchainCreateInfoKHR::preTransform` equal to the `currentTransform` as
  returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`.

The following is changed with this extension:

- At `vkCmdBeginRenderPass`, the application provides extension struct
  `VkRenderPassTransformBeginInfoQCOM` specifying the render pass transform parameters.
- At `vkBeginCommandBuffer` for secondary command buffers, the application provides extension
  struct `VkCommandBufferInheritanceRenderPassTransformInfoQCOM` specifying the render
  pass transform parameters.
- The `renderArea`, viewports, scissors, and `fragmentSize` are all provided in the current (non-
  rotated) coordinate system. The implementation will transform those into the native (rotated)
  coordinate system.
- The implementation is responsible for transforming shader built-ins (`FragCoord`, `PointCoord`,
  `SamplePosition`, `PrimitiveShadingRateKHR`, interpolateAt(), dFdx, dFdy, fWidth) into the rotated
  coordinate system.
- The implementation is responsible for transforming `position` to the rotated coordinate system.
- If this extension is used with `VK_QCOM_tile_properties`, then
  `vkGetFramebufferTilePropertiesQCOM` and `vkGetDynamicRenderingTilePropertiesQCOM`
  return tile properties in the rotated coordinate space.

**New Structures**

- Extending `VkCommandBufferInheritanceInfo`:
  - `VkCommandBufferInheritanceRenderPassTransformInfoQCOM`
- Extending `VkRenderPassBeginInfo`:
  - `VkRenderPassTransformBeginInfoQCOM`

**New Enum Constants**

- `VK_QCOM_RENDER_PASS_TRANSFORM_EXTENSION_NAME`
- `VK_QCOM_RENDER_PASS_TRANSFORM_SPEC_VERSION`
• Extending VkRenderPassCreateFlagBits:
  ◦ VK_RENDER_PASS_CREATE_TRANSFORM_BIT_QCOM

• Extending VkStructureType:
  ◦ VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_RENDER_PASS_TRANSFORM_INFO_QCOM
  ◦ VK_STRUCTURE_TYPE_RENDER_PASS_TRANSFORM_BEGIN_INFO_QCOM

Issues

1) Some early Adreno drivers (October 2019 through March 2020) advertised support for this extension but expected VK_STRUCTURE_TYPE values different from those in the vulkan headers. To cover all Adreno devices on the market, applications need to detect the driver version and use the appropriate VK_STRUCTURE_TYPE values from the table below.

The driver version reported in VkPhysicalDeviceProperties.driverVersion is a uint32_t type. You can decode the uint32_t value into a major.minor.patch version as shown below:

```c
uint32_t major = ((driverVersion) >> 22);
uint32_t minor = ((driverVersion) >> 12) & 0x3ff;
uint32_t patch = ((driverVersion) & 0xfff);
```

If the Adreno major.minor.patch version is greater than or equal to 512.469.0, then simply use the VK_STRUCTURE_TYPE values as defined in vulkan_core.h. If the version is less than or equal to 512.468.0, then use the alternate values for the two VK_STRUCTURE_TYPEs in the table below.

<table>
<thead>
<tr>
<th>Table 106. Adreno Driver Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Adreno Driver Version</strong></td>
</tr>
<tr>
<td>---------------------------------------</td>

</tr>
<tr>
<td>1000282000</td>
</tr>
</tbody>
</table>

2) Should the extension support only rotations (e.g. 90, 180, 270-degrees), or also mirror transforms (e.g. vertical flips)? Mobile use cases only require rotation. Other display systems such as projectors might require a flipped transform.

**RESOLVED:** In this version of the extension, the functionality is restricted to 90, 180, and 270-degree rotations to address mobile use cases.

3) How does this extension interact with VK_EXT_fragment_density_map?
RESOLVED Some implementations may not be able to support a render pass that enables both render pass transform and fragment density maps. For simplicity, this extension disallows enabling both features within a single render pass.

4) What should this extension be named?

We considered names such as “rotated_rendering”, “pre_rotation” and others. Since the functionality is limited to a render pass, it seemed the name should include “render_pass”. While the current extension is limited to rotations, it could be extended to other transforms (like mirror) in the future.

RESOLVED The name “render_pass_transform” seems like the most accurate description of the introduced functionality.

5) How does this extension interact with VK_KHR_fragment_shading_rate?

RESOLVED: For the same reasons as issue 3, this extension disallows enabling both pFragmentShadingRateAttachment and render pass transform within a single render pass.

However, pipeline shading rate and primitive shading rate are supported, and their respective fragmentSize and PrimitiveShadingRateKHR are provided in the current (non-rotated) coordinate system. The implementation is responsible for transforming them to the rotated coordinate system.

The set of supported shading rates may be different per transform. Supported rates queried from vkGetPhysicalDeviceFragmentShadingRatesKHR are in the native (rotated) coordinate system. This means that the application must swap the x/y of the reported rates to get the set of rates supported for 90 and 270 degree rotation.

Version History

- Revision 2, 2021-03-09 (Matthew Netsch)
  - Adds interactions with VK_KHR_fragment_shading_rate
- Revision 3, 2022-07-11 (Arpit Agarwal)
  - Adds interactions with VK_QCOM_tile_properties
- Revision 4, 2023-12-13 (Matthew Netsch)
  - Relax dependencies on VK_KHR_surface and VK_KHR_swapchain

VK_QCOM_rotated_copy_commands

Name String

VK_QCOM_rotated_copy_commands

Extension Type

Device extension
This extension extends adds an optional rotation transform to copy commands `vkCmdBlitImage2KHR`, `vkCmdCopyImageToBuffer2KHR` and `vkCmdCopyBufferToImage2KHR`. When copying between two resources, where one resource contains rotated content and the other does not, a rotated copy may be desired. This extension may be used in combination with `VK_QCOM_render_pass_transform` which adds rotated render passes.

This extension adds an extension structure to the following commands: `vkCmdBlitImage2KHR`, `vkCmdCopyImageToBuffer2KHR` and `vkCmdCopyBufferToImage2KHR`.

**Issues**

1) What is an appropriate name for the added extension structure? The style guide says “Structures which extend other structures through the `pNext` chain should reflect the name of the base structure they extend.”, but in this case a single extension structure is used to extend three base structures (`vkCmdBlitImage2KHR`, `vkCmdCopyImageToBuffer2KHR` and `vkCmdCopyBufferToImage2KHR`). Creating three identical structures with unique names seemed
undesirable.

**RESOLVED:** Deviate from the style guide for extension structure naming.

2) Should this extension add a rotation capability to vkCmdCopyImage2KHR?

**RESOLVED:** No. Use of rotated vkCmdBlitImage2KHR can fully address this use case.

3) Should this extension add a rotation capability to vkCmdResolveImage2KHR?

**RESOLVED** No. Use of vkCmdResolveImage2KHR is very slow and extremely bandwidth intensive on Qualcomm's GPU architecture and use of pResolveAttachments in vkRenderPass is the strongly preferred approach. Therefore, we choose not to introduce a rotation capability to vkCmdResolveImage2KHR.

**New Structures**

- Extending `VkBufferImageCopy2`, `VkImageBlit2`:
  - `VkCopyCommandTransformInfoQCOM`

**New Enum Constants**

Description
This extension allows implementations to expose support for “sRGB EOTF” also known as “sRGB degamma”, used in combination with images using 8-bit Y′C_bC_a formats. In addition, the degamma can be selectively applied to the Y (luma) or CrCb (chroma).

`VK_KHR_sampler_ycbcr_conversion` adds support for Y′C_bC_a conversion, but allows texture sampling in a non-linear space which can cause artifacts. This extension allows implementations to expose sRGB degamma for Y′C_bC_a formats, which is performed during texture filtering, allowing texture filtering to operate in a linear space.

New Structures
• Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  ◦ `VkPhysicalDeviceYcbcrDegammaFeaturesQCOM`
• Extending `VkSamplerYcbcrConversionCreateInfo`:
  ◦ `VkSamplerYcbcrConversionYcbcrDegammaCreateInfoQCOM`

New Enum Constants
• `VK_QCOM_YCBCR_DEGAMMA_EXTENSION_NAME`
• `VK_QCOM_YCBCR_DEGAMMA_SPEC_VERSION`
• Extending `VkStructureType`:
  ◦ `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_YCBCR_DEGAMMA_FEATURES_QCOM`
  ◦ `VK_STRUCTURE_TYPE_SAMPLER_YCBCR_CONVERSION_YCBCR_DEGAMMA_CREATE_INFO_QCOM`

Issues
1) Which Y′C_bC_a formats support the degamma feature?

**Resolved**: For implementations that support the extension, each format that contains 8-bit R, G, and B components and supports either `VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT` or `VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT` must support degamma.

Since non-compressed Vulkan sRGB formats are already limited to 8-bit components, and since Adreno supports degamma for all 8bit Y′C_bC_a formats, this extension does not introduce a new `VK_FORMAT_FEATURE*` bit for the degamma feature.

2) On which Y′C_bC_a components is the degamma applied?
RESOLVED: While degamma is expected to be applied to only the Y (luma) component, the extension provides the ability to selectively enable degamma for both the Y (luma) and/or CbCr (chroma) components.

3) Should degamma be enabled for the sampler object or for the image view object?

RESOLVED: Both. This extension extends `VkSamplerYcbcrConversionCreateInfo` and the specification already requires that both sampler and view objects must be created with an identical `VkSamplerYcbcrConversionCreateInfo` in their pNext chains.

4) Why apply the “sRGB” transfer function directly to Y’C_bC_r data when it would be more correct to use the “ITU transfer function”, and do so only after the values have been converted into non-linear R’G’B’?

RESOLVED: Y’C_bC_r is frequently stored according to standards (e.g. BT.601 and BT.709) that specify that the conversion between linear and non-linear should use the ITU Transfer function. The ITU transfer function is mathematically different from the sRGB transfer function and while sRGB and ITU define similar curves, the difference is significant. Performing the “sRGB degamma” prior to range expansion can introduce artifacts if the content uses `VK_SAMPLER_YCBCR_RANGE_ITU_NARROW` encoding. Nevertheless, using sRGB can make sense for certain use-cases where camera YCbCr images are known to be encoded with sRGB (or a pure gamma 2.2) transfer function and are known to use full-range encoding.

For those use-cases, this extension leverages the GPU ability to enable sRGB degamma at little cost, and can improve quality because texture filtering is able to occur in linear space.

Description

This extension enables an application to import QNX Screen _screen_buffer objects created outside of the Vulkan device into Vulkan memory objects, where they can be bound to images and buffers.

Some _screen_buffer images have implementation-defined external formats that may not correspond to Vulkan formats. Sampler Y’CbCr conversion can be used to sample from these images and convert them to a known color space.

_screen_buffer is strongly typed, so naming the handle type is redundant. The internal layout and therefore size of a _screen_buffer image may depend on native usage flags that do not have corresponding Vulkan counterparts.

**Description**

This extension is intended to communicate information from layered API implementations such as ANGLE to internal proprietary system schedulers. It has no behavioral implications beyond enabling more intelligent behavior from the system scheduler.

Application developers should avoid using this extension. It is documented solely for the benefit of tools and layer developers, who may need to manipulate $pNext$ chains that include these structures.

**Note**
There is currently no specification language written for this extension. The links to APIs defined by the extension are to stubs that only include generated content such as API declarations and implicit valid usage statements.

**Note**

This extension is only intended for use in specific embedded environments with known implementation details, and is therefore undocumented.

**New Structures**

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  - `VkPhysicalDeviceAmigoProfilingFeaturesSEC`
- Extending `VkSubmitInfo`:
  - `VkAmigoProfilingSubmitInfoSEC`

**New Enum Constants**

- `VK_SEC_AMIGO_PROFILING_EXTENSION_NAME`
- `VK_SEC_AMIGO_PROFILING_SPEC_VERSION`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_AMIGO_PROFILING_SUBMIT_INFO_SEC`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_AMIGO_PROFILING_FEATURES_SEC`

**Stub API References**

There is currently no specification language written for this type. This section acts only as placeholder and to avoid dead links in the specification and reference pages.

```c
// Provided by VK_SEC_amigo_profiling
typedef struct VkPhysicalDeviceAmigoProfilingFeaturesSEC {
    VkStructureType sType;
    void* pNext;
    VkBool32 amigoProfiling;
} VkPhysicalDeviceAmigoProfilingFeaturesSEC;
```

**Valid Usage (Implicit)**

- `VUID-VkPhysicalDeviceAmigoProfilingFeaturesSEC-sType-sType`  
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_AMIGO_PROFILING_FEATURES_SEC`

There is currently no specification language written for this type. This section acts only as placeholder and to avoid dead links in the specification and reference pages.
// Provided by VK_SEC_amigo_profiling

typedef struct VkAmigoProfilingSubmitInfoSEC {
    VkStructureType sType;
    const void* pNext;

Stub API References

There is currently no specification language written for this command. This section acts only as placeholder and to avoid dead links in the specification and reference pages.

```c
// Provided by VK_VALVE_descriptor_set_host_mapping
void vkGetDescriptorSetLayoutHostMappingInfoVALVE(
    VkDevice device,
    const VkDescriptorSetBindingReferenceVALVE* pBindingReference,
    VkDescriptorSetLayoutHostMappingInfoVALVE* pHostMapping);
```

**Valid Usage (Implicit)**

- VUID-vkGetDescriptorSetLayoutHostMappingInfoVALVE-device-parameter
  - `device` must be a valid `VkDevice` handle

- VUID-vkGetDescriptorSetLayoutHostMappingInfoVALVE-pBindingReference-parameter
  - `pBindingReference` must be a valid pointer to a valid `VkDescriptorSetBindingReferenceVALVE` structure

- VUID-vkGetDescriptorSetLayoutHostMappingInfoVALVE-pHostMapping-parameter
  - `pHostMapping` must be a valid pointer to a `VkDescriptorSetLayoutHostMappingInfoVALVE` structure

There is currently no specification language written for this command. This section acts only as placeholder and to avoid dead links in the specification and reference pages.

```c
// Provided by VK_VALVE_descriptor_set_host_mapping
void vkGetDescriptorSetHostMappingVALVE(
    VkDevice device,
    VkDescriptorSet descriptorSet,
    void** ppData);
```

**Valid Usage (Implicit)**

- VUID-vkGetDescriptorSetHostMappingVALVE-device-parameter
  - `device` must be a valid `VkDevice` handle

- VUID-vkGetDescriptorSetHostMappingVALVE-descriptorSet-parameter
  - `descriptorSet` must be a valid `VkDescriptorSet` handle

- VUID-vkGetDescriptorSetHostMappingVALVE-ppData-parameter
  - `ppData` must be a valid pointer to a pointer value

- VUID-vkGetDescriptorSetHostMappingVALVE-descriptorSet-parent
  - `descriptorSet` must have been created, allocated, or retrieved from `device`
There is currently no specification language written for this type. This section acts only as placeholder and to avoid dead links in the specification and reference pages.

```c
// Provided by VK_VALVE_descriptor_set_host_mapping
typedef struct VkPhysicalDeviceDescriptorSetHostMappingFeaturesVALVE {
    VkStructureType sType;
    void* pNext;
    VkBool32 descriptorSetHostMapping;
} VkPhysicalDeviceDescriptorSetHostMappingFeaturesVALVE;
```

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDescriptorSetHostMappingFeaturesVALVE-sType-sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DESCRIPTOR_SET_HOST_MAPPING_FEATURES_VALVE`

There is currently no specification language written for this type. This section acts only as placeholder and to avoid dead links in the specification and reference pages.

```c
// Provided by VK_VALVE_descriptor_set_host_mapping
typedef struct VkDescriptorSetBindingReferenceVALVE {
    VkStructureType sType;
    const void* pNext;
    VkDescriptorSetLayout descriptorSetLayout;
    uint32_t binding;
} VkDescriptorSetBindingReferenceVALVE;
```

### Valid Usage (Implicit)

- VUID-VkDescriptorSetBindingReferenceVALVE-sType-sType must be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_BINDINGREFERENCE_VALVE`
- VUID-VkDescriptorSetBindingReferenceVALVE-pNext-pNext must be `NULL`
- VUID-VkDescriptorSetBindingReferenceVALVE-descriptorSetLayout-parameter descriptorSetLayout must be a valid `VkDescriptorSetLayout` handle

There is currently no specification language written for this type. This section acts only as placeholder and to avoid dead links in the specification and reference pages.
// Provided by VK_VALVE_descriptor_set_host_mapping

typedef struct VkDescriptorSetLayoutHostMappingInfoVALVE {
    VkStructureType sType;
    void* pNext;
    size_t descriptorOffset;
    uint32_t descriptorSize;
} VkDescriptorSetLayoutHostMappingInfoVALVE;

Valid Usage (Implicit)

• VUID-VkDescriptorSetLayoutHostMappingInfoVALVE-sType-sType
  sType must be VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_HOST_MAPPING_INFO_VALVE

• VUID-VkDescriptorSetLayoutHostMappingInfoVALVE-pNext-pNext
  pNext must be NULL

Description

The `VK_KHR_portability_subset` extension allows a non-conformant Vulkan implementation to be built on top of another non-Vulkan graphics API, and identifies differences between that implementation and a fully-conformant native Vulkan implementation.

This extension provides Vulkan implementations with the ability to mark otherwise-required capabilities as unsupported, or to establish additional properties and limits that the application should adhere to in order to guarantee portable behavior and operation across platforms, including platforms where Vulkan is not natively supported.

The goal of this specification is to document, and make queryable, capabilities which are required to be supported by a fully-conformant Vulkan 1.0 implementation, but may be optional for an implementation of the Vulkan 1.0 Portability Subset.

The intent is that this extension will be advertised only on implementations of the Vulkan 1.0 Portability Subset, and not on conformant implementations of Vulkan 1.0. Fully-conformant Vulkan implementations provide all the required capabilities, and so will not provide this extension. Therefore, the existence of this extension can be used to determine that an implementation is likely not fully conformant with the Vulkan spec.

If this extension is supported by the Vulkan implementation, the application must enable this extension.

This extension defines several new structures that can be chained to the existing structures used by certain standard Vulkan calls, in order to query for non-conformant portable behavior.

New Structures

- Extending `VkPhysicalDeviceFeatures2, VkDeviceCreateInfo`:
  - `VkPhysicalDevicePortabilitySubsetFeaturesKHR`
- Extending `VkPhysicalDeviceProperties2`:
  - `VkPhysicalDevicePortabilitySubsetPropertiesKHR`

New Enum Constants

- `VK_KHR_PORTABILITY_SUBSET_EXTENSION_NAME`
- `VK_KHR_PORTABILITY_SUBSET_SPEC_VERSION`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PORTABILITY_SUBSET_FEATURES_KHR`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PORTABILITY_SUBSET_PROPERTIES_KHR`

Issues

None.

Description
This extension adds the ability for developers to enqueue compute shader workgroups from other compute shaders.

New Commands
- `vkCmdDispatchGraphAMDX`
- `vkCmdDispatchGraphIndirectAMDX`
- `vkCmdDispatchGraphIndirectCountAMDX`
- `vkCmdInitializeGraphScratchMemoryAMDX`
- `vkCreateExecutionGraphPipelinesAMDX`
- `vkGetExecutionGraphPipelineNodeIndexAMDX`
- `vkGetExecutionGraphPipelineScratchSizeAMDX`

New Structures
- `VkDispatchGraphCountInfoAMDX`
- `VkDispatchGraphInfoAMDX`
- `VkExecutionGraphPipelineCreateInfoAMDX`
• VkExecutionGraphPipelineScratchSizeAMDX

Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  ◦ VkPhysicalDeviceShaderEnqueueFeaturesAMDX

Extending VkPhysicalDeviceProperties2:
  ◦ VkPhysicalDeviceShaderEnqueuePropertiesAMDX

Extending VkPipelineShaderStageCreateInfo:
  ◦ VkPipelineShaderStageNodeCreateInfoAMDX

New Unions
  • VkDeviceOrHostAddressConstAMDX

New Enum Constants
  • VK_AMDX_SHADER_ENQUEUE_EXTENSION_NAME
  • VK_AMDX_SHADER_ENQUEUE_SPEC_VERSION
  • VK_SHADER_INDEX_UNUSED_AMDX

Extending VkBufferUsageFlagBits:
  ◦ VK_BUFFER_USAGE_EXECUTION_GRAPH_SCRATCH_BIT_AMDX

Extending VkPipelineBindPoint:
  ◦ VK_PIPELINE_BIND_POINT_EXECUTION_GRAPH_AMDX

Extending VkStructureType:
  ◦ VK_STRUCTURE_TYPE_EXECUTION_GRAPH_PIPELINE_CREATE_INFO_AMDX
  ◦ VK_STRUCTURE_TYPE_EXECUTION_GRAPH_PIPELINE_SCRATCH_SIZE_AMDX
  ◦ VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_ENQUEUE_FEATURES_AMDX
  ◦ VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_ENQUEUE_PROPERTIES_AMDX
  ◦ VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_NODE_CREATE_INFO_AMDX

If VK_KHR_maintenance5 is supported:

• Extending VkBufferUsageFlagBits2KHR:
  ◦ VK_BUFFER_USAGE_2_EXECUTION_GRAPH_SCRATCH_BIT_AMDX

Description

Interoperability between APIs can sometimes create additional overhead depending on the platform used. This extension targets deployment of existing CUDA kernels via Vulkan, with a way to directly upload PTX kernels and dispatch the kernels from Vulkan’s command buffer without the need to use interoperability between the Vulkan and CUDA contexts. However, we do encourage actual development using the native CUDA runtime for the purpose of debugging and profiling.

The application will first have to create a CUDA module using vkCreateCudaModuleNV then create the CUDA function entry point with vkCreateCudaFunctionNV.

Then in order to dispatch this function, the application will create a command buffer where it will launch the kernel with vkCmdCudaLaunchKernelNV.

When done, the application will then destroy the function handle, as well as the CUDA module.
handle with `vkDestroyCudaFunctionNV` and `vkDestroyCudaModuleNV`.

To reduce the impact of compilation time, this extension offers the capability to return a binary cache from the PTX that was provided. For this, a first query for the required cache size is made with `vkGetCudaModuleCacheNV` with a NULL pointer to a buffer and with a valid pointer receiving the size; then another call of the same function with a valid pointer to a buffer to retrieve the data. The resulting cache could then be user later for further runs of this application by sending this cache instead of the PTX code (using the same `vkCreateCudaModuleNV`), thus significantly speeding up the initialization of the CUDA module.

As with `VkPipelineCache`, the binary cache depends on the hardware architecture. The application must assume the cache might fail, and need to handle falling back to the original PTX code as necessary. Most often, the cache will succeed if the same GPU driver and architecture is used between the cache generation from PTX and the use of this cache. In the event of a new driver version, or if using a different GPU architecture, the cache is likely to become invalid.

**New Object Types**

- `VkCudaFunctionNV`
- `VkCudaModuleNV`

**New Commands**

- `vkCmdCudaLaunchKernelNV`
- `vkCreateCudaFunctionNV`
- `vkCreateCudaModuleNV`
- `vkDestroyCudaFunctionNV`
- `vkDestroyCudaModuleNV`
- `vkGetCudaModuleCacheNV`

**New Structures**

- `VkCudaFunctionCreateInfoNV`
- `VkCudaLaunchInfoNV`
- `VkCudaModuleCreateInfoNV`

Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:

- `VkPhysicalDeviceCudaKernelLaunchFeaturesNV`

Extending `VkPhysicalDeviceProperties2`:

- `VkPhysicalDeviceCudaKernelLaunchPropertiesNV`

**New Enum Constants**

- `VK_NV_CUDA_KERNEL_LAUNCH_EXTENSION_NAME`
- `VK_NV_CUDA_KERNEL_LAUNCH_SPEC_VERSION`
• Extending VkObjectType:
  ◦ VK_OBJECT_TYPE_CUDA_FUNCTION_NV
  ◦ VK_OBJECT_TYPE_CUDA_MODULE_NV

• Extending VkStructureType:
  ◦ VK_STRUCTURE_TYPE_CUDA_FUNCTION_CREATE_INFO_NV
  ◦ VK_STRUCTURE_TYPE_CUDA_LAUNCH_INFO_NV
  ◦ VK_STRUCTURE_TYPE_CUDA_MODULE_CREATE_INFO_NV
  ◦ VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CUDA_KERNEL_LAUNCH_FEATURES_NV
  ◦ VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CUDA_KERNEL_LAUNCH_PROPERTIES_NV

If VK_EXT_debug_report is supported:

• Extending VkDebugReportObjectTypeEXT:
  ◦ VK_DEBUG_REPORT_OBJECT_TYPE_CUDA_FUNCTION_NV_EXT
  ◦ VK_DEBUG_REPORT_OBJECT_TYPE_CUDA_MODULE_NV_EXT

Issues

None.

Description

Ray tracing can very efficiently render from geometry which has very fine detail, but when using only a basic triangle representation, memory consumption can be an issue. This extension adds the ability to add a\emph{displacement map} to add more detail to triangles in an acceleration structure with an efficient in-memory format. The format is externally visible to allow the application to compress its internal geometry representations into the compressed format ahead of time. This format adds displacements along a defined vector to subtriangle vertices which are subdivided from the main triangles.

This extension provides:

• a new \emph{VkMicromapTypeEXT} format for the displacement micromap,
• a structure to extend \emph{VkAccelerationStructureGeometryTrianglesDataKHR} to attach a displacement micromap to the geometry of the acceleration structure,
• enums extending \emph{VkBuildAccelerationStructureFlagBitsKHR} to allow for updates.

New Structures

• Extending \emph{VkAccelerationStructureGeometryTrianglesDataKHR}:
  - \emph{VkAccelerationStructureTrianglesDisplacementMicromapNV}
• Extending \emph{VkPhysicalDeviceFeatures2, VkDeviceCreateInfo}:
  - \emph{VkPhysicalDeviceDisplacementMicromapFeaturesNV}
• Extending \emph{VkPhysicalDeviceProperties2}:
  - \emph{VkPhysicalDeviceDisplacementMicromapPropertiesNV}
New Enums

- VkDisplacementMicromapFormatNV

New Enum Constants

- VK_NV_DISPLACEMENT_MICROMAP_EXTENSION_NAME
- VK_NV_DISPLACEMENT_MICROMAP_SPEC_VERSION

Extending VkBuildAccelerationStructureFlagBitsKHR:
- VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DISPLACEMENT_MICROMAP_UPDATE_NV

Extending VkMicromapTypeEXT:
- VK_MICROMAP_TYPE_DISPLACEMENT_MICROMAP_NV

Extending VkPipelineCreateFlagBits:
- VK_PIPELINE_CREATE_RAY_TRACING_DISPLACEMENT_MICROMAP_BIT_NV

Extending VkStructureType:
- VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_TRIANGLES_DISPLACEMENT_MICROMAP_NV
- VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DISPLACEMENT_MICROMAPFEATURES_NV
- VK_STRUCTURE_TYPE_PHYSICALDEVICE_DISPLACEMENT_MICROMAP_PROPERTIES_NV

Issues

(1) What is the status of this extension?

- Provisional and expected to change. The broad structure and encoding format are stable, but there will likely be changes to the structures, enumerant values, and shader interface.

Version History

- Revision 1, 2023-03-17 (Eric Werness)
  - Initial public revision
- Revision 2, 2023-07-07 (Eric Werness)
  - Add shader support for decode intrinsics

Description

The `VK_KHR_16bit_storage` extension allows use of 16-bit types in shader input and output interfaces, and push constant blocks. This extension introduces several new optional features which map to SPIR-V capabilities and allow access to 16-bit data in `Block`-decorated objects in the `Uniform` and the `StorageBuffer` storage classes, and objects in the `PushConstant` storage class. This extension allows 16-bit variables to be declared and used as user-defined shader inputs and outputs but does not change location assignment and component assignment rules.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. However, if Vulkan 1.1 is supported and this extension is not, the `storageBuffer16BitAccess` capability is optional. The original type, enum and command names are still available as aliases of the core functionality.

New Structures

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  - `VkPhysicalDevice16BitStorageFeaturesKHR`

New Enum Constants

- `VK_KHR_16BIT_STORAGE_EXTENSION_NAME`
- `VK_KHR_16BIT_STORAGE_SPEC_VERSION`

Extending `VkStructureType`:
- `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_16BIT_STORAGE_FEATURES_KHR`

New SPIR-V Capabilities

- `StorageBuffer16BitAccess`
- `UniformAndStorageBuffer16BitAccess`
- `StoragePushConstant16`
- `StorageInputOutput16`

Version History

- Revision 1, 2017-03-23 (Alexander Galazin)

Description

The VK_KHR_8bit_storage extension allows use of 8-bit types in uniform and storage buffers, and
push constant blocks. This extension introduces several new optional features which map to SPIR-V capabilities and allow access to 8-bit data in Block-decorated objects in the Uniform and the StorageBuffer storage classes, and objects in the PushConstant storage class.

The StorageBuffer8BitAccess capability must be supported by all implementations of this extension. The other capabilities are optional.

**Promotion to Vulkan 1.2**

Functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. However, if Vulkan 1.2 is supported and this extension is not, the StorageBuffer8BitAccess capability is optional. The original type, enum and command names are still available as aliases of the core functionality.

**New Structures**

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  - `VkPhysicalDevice8BitStorageFeaturesKHR`

**New Enum Constants**

Description

This extension provides versions of vkBindBufferMemory and vkBindImageMemory that allow multiple bindings to be performed at once, and are extensible.

This extension also introduces VK_IMAGE_CREATE_ALIAS_BIT_KHR, which allows “identical” images that alias the same memory to interpret the contents consistently, even across image layout changes.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

New Commands
   • vkBindBufferMemory2KHR
   • vkBindImageMemory2KHR

New Structures
   • VkBindBufferMemoryInfoKHR
   • VkBindImageMemoryInfoKHR
New Enum Constants

- VK_KHR_BIND_MEMORY_2_EXTENSION_NAME
- VK_KHR_BIND_MEMORY_2_SPEC_VERSION
- Extending VkImageCreateFlagBits:

Description
This extension allows the application to query a 64-bit buffer device address value for a buffer, which can be used to access the buffer memory via the PhysicalStorageBuffer storage class in the GL_EXT_buffer_reference GLSL extension and SPV_KHR_physical_storage_buffer SPIR-V extension.

Another way to describe this extension is that it adds “pointers to buffer memory in shaders”. By calling vkGetBufferDeviceAddress with a VkBuffer, it will return a VkDeviceAddress value which represents the address of the start of the buffer.

vkGetBufferOpaqueCaptureAddress and vkGetDeviceMemoryOpaqueCaptureAddress allow opaque addresses for buffers and memory objects to be queried for the current process. A trace capture and replay tool can then supply these addresses to be used at replay time to match the addresses used when the trace was captured. To enable tools to insert these queries, new memory allocation flags must be specified for memory objects that will be bound to buffers accessed via the PhysicalStorageBuffer storage class. Note that this mechanism is intended only to support capture/replay tools, and is not recommended for use in other applications.

Promotion to Vulkan 1.2
All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. However, if Vulkan 1.2 is supported and this extension is not, the bufferDeviceAddress feature is optional. The original type, enum and command names are still available as aliases of the core functionality.

Promotion to Vulkan 1.3
Support for the bufferDeviceAddress feature is mandatory in Vulkan 1.3, regardless of whether this
extension is supported.

**New Commands**

- `vkGetBufferDeviceAddressKHR`
- `vkGetBufferOpaqueCaptureAddressKHR`
- `vkGetDeviceMemoryOpaqueCaptureAddressKHR`

**New Structures**

- `VkBufferDeviceAddressInfoKHR`
- `VkDeviceMemoryOpaqueCaptureAddressInfoKHR`
- Extending `VkBufferCreateInfo`:
  - `VkBufferOpaqueCaptureAddressCreateInfoKHR`
- Extending `VkMemoryAllocateInfo`:
  - `VkMemoryOpaqueCaptureAddressAllocateInfoKHR`
- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  - `VkPhysicalDeviceBufferDeviceAddressFeaturesKHR`

**New Enum Constants**

- `VK_KHR_BUFFER_DEVICE_ADDRESS_EXTENSION_NAME`
- `VK_KHR_BUFFER_DEVICE_ADDRESS_SPEC_VERSION`
- Extending `VkBufferCreateFlagBits`:
  - `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR`
- Extending `VkBufferUsageFlagBits`:
  - `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT_KHR`
- Extending `VkMemoryAllocateFlagBits`:
  - `VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT_KHR`
  - `VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR`
- Extending `VkResult`:
  - `VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_BUFFER_DEVICE_ADDRESS_INFO_KHR`
  - `VK_STRUCTURE_TYPE_BUFFER_OPAQUE_CAPTURE_ADDRESS_CREATE_INFO_KHR`
  - `VK_STRUCTURE_TYPE_DEVICE_MEMORY_OPAQUE_CAPTURE_ADDRESS_INFO_KHR`
  - `VK_STRUCTURE_TYPE_MEMORY_OPAQUE_CAPTURE_ADDRESS_ALLOCATE_INFO_KHR`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_BUFFER_DEVICE_ADDRESS_FEATURES_KHR`
New SPIR-V Capabilities

- PhysicalStorageBufferAddresses

Description

This extension provides extensible versions of the Vulkan buffer and image copy commands. The new commands are functionally identical to the core commands, except that their copy parameters are specified using extensible structures that can be used to pass extension-specific information.

The following extensible copy commands are introduced with this extension: vkCmdCopyBuffer2KHR, vkCmdCopyImage2KHR, vkCmdCopyBufferToImage2KHR, vkCmdCopyImageToBuffer2KHR, vkCmdBlitImage2KHR, and vkCmdResolveImage2KHR. Each command contains an *Info2KHR structure parameter that includes sType/pNext members. Lower level structures describing each region to be copied are also extended with sType/pNext members.

New Commands

- vkCmdBlitImage2KHR
- vkCmdCopyBuffer2KHR
- vkCmdCopyBufferToImage2KHR
- vkCmdCopyImage2KHR
- vkCmdCopyImageToBuffer2KHR
- vkCmdResolveImage2KHR

New Structures

- VkBlitImageInfo2KHR
- VkBufferCopy2KHR
- VkBufferImageCopy2KHR
- VkCopyBufferInfo2KHR
- VkCopyBufferToImageInfo2KHR
- VkCopyImageInfo2KHR
- VkCopyImageToBufferInfo2KHR
- VkImageBlit2KHR
- VkImageCopy2KHR
- VkImageResolve2KHR
- VkResolveImageInfo2KHR

New Enum Constants

- VK_KHR_COPY_COMMANDS_2_EXTENSION_NAME
- VK_KHR_COPY_COMMANDS_2_SPEC_VERSION

Extending VkStructureType:

- VK_STRUCTURE_TYPE_BLIT_IMAGE_INFO_2_KHR
- VK_STRUCTURE_TYPE_BUFFER_COPY_2_KHR
• VK_STRUCTURE_TYPE_BUFFER_IMAGE_COPY_2_KHR
• VK_STRUCTURE_TYPE_COPY_BUFFER_INFO_2_KHR
• VK_STRUCTURE_TYPE_COPY_BUFFER_TO_IMAGE_INFO_2_KHR
• VK_STRUCTURE_TYPE_COPY_IMAGE_INFO_2_KHR
• VK_STRUCTURE_TYPE_COPY_IMAGE_TO_BUFFER_INFO_2_KHR
• VK_STRUCTURE_TYPE_IMAGE_BLIT_2_KHR
• VK_STRUCTURE_TYPE_IMAGE_COPY_2_KHR
• VK_STRUCTURE_TYPE_IMAGE_RESOLVE_2_KHR
• VK_STRUCTURE_TYPE_RESOLVE_IMAGE_INFO_2_KHR

Promotion to Vulkan 1.3

Functionality in this extension is included in core Vulkan 1.3, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

Description

This extension provides a new command to create render passes in a way that can be easily extended by other extensions through the substructures of render pass creation. The Vulkan 1.0 render pass creation sub-structures do not include sType/pNext members. Additionally, the render pass begin/next/end commands have been augmented with new extensible structures for passing additional subpass information.

The VkRenderPassMultiviewCreateInfo and VkInputAttachmentAspectReference structures that extended the original VkRenderPassCreateInfo are not accepted into the new creation functions, and instead their parameters are folded into this extension as follows:

- Elements of VkRenderPassMultiviewCreateInfo::pViewMasks are now specified in VkSubpassDescription2KHR::viewMask.
- Elements of VkRenderPassMultiviewCreateInfo::pViewOffsets are now specified in VkSubpassDependency2KHR::viewOffset.
- VkRenderPassMultiviewCreateInfo::correlationMaskCount and VkRenderPassMultiviewCreateInfo::pCorrelationMasks are directly specified in VkRenderPassCreateInfo2KHR.
- VkInputAttachmentAspectReference::aspectMask is now specified in the relevant input attachment reference in VkAttachmentReference2KHR::aspectMask

The details of these mappings are explained fully in the new structures.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

New Commands

- vkCmdBeginRenderPass2KHR
- vkCmdEndRenderPass2KHR
• vkCmdNextSubpass2KHR
• vkCreateRenderPass2KHR

New Structures

• VkAttachmentDescription2KHR
• VkAttachmentReference2KHR
• VkRenderPassCreateInfo2KHR
• VkSubpassBeginInfoKHR
• VkSubpassDependency2KHR
• VkSubpassDescription2KHR
• VkSubpassEndInfoKHR

New Enum Constants

Description
This extension enables resources to be bound to a dedicated allocation, rather than suballocated. For any particular resource, applications can query whether a dedicated allocation is recommended, in which case using a dedicated allocation may improve the performance of access to that resource. Normal device memory allocations must support multiple resources per allocation, memory aliasing and sparse binding, which could interfere with some optimizations. Applications should query the implementation for when a dedicated allocation may be beneficial by adding a VkMemoryDedicatedRequirementsKHR structure to the pNext chain of the VkMemoryRequirements2 structure passed as the pMemoryRequirements parameter of a call to vkGetBufferMemoryRequirements2 or vkGetImageMemoryRequirements2. Certain external handle types and external images or buffers may also depend on dedicated allocations on implementations that associate image or buffer metadata with OS-level memory objects.

This extension adds a two small structures to memory requirements querying and memory allocation: a new structure that flags whether an image/buffer should have a dedicated allocation, and a structure indicating the image or buffer that an allocation will be bound to.
Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

New Structures

- Extending `VkMemoryAllocateInfo`:
  - `VkMemoryDedicatedAllocateInfoKHR`
- Extending `VkMemoryRequirements2`:
  - `VkMemoryDedicatedRequirementsKHR`

New Enum Constants

- `VK_KHR_DEDICATED_ALLOCATION_EXTENSION_NAME`
- `VK_KHR_DEDICATED_ALLOCATION_SPEC_VERSION`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_MEMORY_DEDICATED_ALLOCATE_INFO_KHR`
  - `VK_STRUCTURE_TYPE_MEMORY_DEDICATED_REQUIREMENTS_KHR`

Examples

```c
// Create an image with a dedicated allocation based on the implementation's preference

VkImageCreateInfo imageCreateInfo = {
    // Image creation parameters
};

VkImage image;
VkResult result = vkCreateImage(
    device,
    &imageCreateInfo,
    NULL,       // pAllocator
    &image);

VkMemoryDedicatedRequirementsKHR dedicatedRequirements = {
    .sType = VK_STRUCTURE_TYPE_MEMORY_DEDICATED_REQUIREMENTS_KHR,
    .pNext = NULL,
};

VkMemoryRequirements2 memoryRequirements = {
    .sType = VK_STRUCTURE_TYPE_MEMORY_REQUIREMENTS_2,
    .pNext = &dedicatedRequirements,
};
```
const VkImageMemoryRequirementsInfo2 imageRequirementsInfo =
{
    .sType = VK_STRUCTURE_TYPE_IMAGE_MEMORY_REQUIREMENTS_INFO_2,
    .pNext = NULL,
    .image = image
};

vkGetImageMemoryRequirements2(
    device,
    &imageRequirementsInfo,
    &memoryRequirements);

if (dedicatedRequirements.prefersDedicatedAllocation) {
    // Allocate memory with VkMemoryDedicatedAllocateInfoKHR::image
    // pointing to the image we are allocating the memory for

    VkMemoryDedicatedAllocateInfoKHR dedicatedInfo =
    {
        .sType = VK_STRUCTURE_TYPE_MEMORY_DEDICATED_ALLOCATE_INFO_KHR,
        .pNext = NULL,
        .image = image,
        .buffer = VK_NULL_HANDLE,
    };

    VkMemoryAllocateInfo memoryAllocateInfo =
    {
        .sType = VK_STRUCTURE_TYPE_MEMORY_ALLOCATE_INFO,
        .pNext = &dedicatedInfo,
        .allocationSize = memoryRequirements.size,
        .memoryTypeIndex = FindMemoryTypeIndex(memoryRequirements.memoryTypeBits),
    };

    VkDeviceMemory memory;
    vkAllocateMemory(
        device,
        &memoryAllocateInfo,
        NULL, // pAllocator
        &memory);

    // Bind the image to the memory

    vkBindImageMemory(
        device,
        image,
        memory,
        0);
} else {
    // Take the normal memory sub-allocation path

Description

This extension adds support for automatically resolving multisampled depth/stencil attachments in a subpass in a similar manner as for color attachments.

Multisampled color attachments can be resolved at the end of a subpass by specifying `pResolveAttachments` entries corresponding to the `pColorAttachments` array entries. This does not allow for a way to map the resolve attachments to the depth/stencil attachment. The `vkCmdResolveImage` command does not allow for depth/stencil images. While there are other ways to resolve the depth/stencil attachment, they can give sub-optimal performance. Extending the `VkSubpassDescription2` in this extension allows an application to add a `pDepthStencilResolveAttachment`, that is similar to the color `pResolveAttachments`, that the `pDepthStencilAttachment` can be resolved into.

Depth and stencil samples are resolved to a single value based on the resolve mode. The set of possible resolve modes is defined in the `VkResolveModeFlagBits` enum. The `VK_RESOLVE_MODE_SAMPLE_ZERO_BIT` mode is the only mode that is required of all implementations (that support the extension or support Vulkan 1.2 or higher). Some implementations may also support averaging (the same as color sample resolve) or taking the minimum or maximum sample, which may be more suitable for depth/stencil resolve.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

New Structures

- Extending `VkPhysicalDeviceProperties2`:
  - `VkPhysicalDeviceDepthStencilResolvePropertiesKHR`

API Interactions
- Interacts with VK_EXT_debug_report
- Interacts with VK_KHR_push_descriptor
Applications may wish to update a fixed set of descriptors in a large number of descriptor sets very frequently, i.e. during initialization phase or if it is required to rebuild descriptor sets for each frame. For those cases it is also not unlikely that all information required to update a single descriptor set is stored in a single struct. This extension provides a way to update a fixed set of descriptors in a single `VkDescriptorSet` with a pointer to a user defined data structure describing the new descriptors.

**Promotion to Vulkan 1.1**

`vkCmdPushDescriptorSetWithTemplateKHR` is included as an interaction with `VK_KHR_push_descriptor`. If Vulkan 1.1 and `VK_KHR_push_descriptor` are supported, this is included by `VK_KHR_push_descriptor`.

The base functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

**New Object Types**

- `VkDescriptorUpdateTemplateKHR`

**New Commands**

- `vkCreateDescriptorUpdateTemplateKHR`
- `vkDestroyDescriptorUpdateTemplateKHR`
- `vkUpdateDescriptorSetWithTemplateKHR`
If `VK_KHR_push_descriptor` is supported:

- `vkCmdPushDescriptorSetWithTemplateKHR`

**New Structures**

- `VkDescriptorUpdateTemplateCreateInfoKHR`
- `VkDescriptorUpdateTemplateEntryKHR`

**New Enums**

- `VkDescriptorUpdateTemplateTypeKHR`

**New Bitmasks**

- `VkDescriptorUpdateTemplateCreateFlagsKHR`

**New Enum Constants**

Description

This extension provides functionality to use a logical device that consists of multiple physical devices, as created with the `VK_KHR_device_group_creation` extension. A device group can allocate
memory across the subdevices, bind memory from one subdevice to a resource on another subdevice, record command buffers where some work executes on an arbitrary subset of the subdevices, and potentially present a swapchain image from one or more subdevices.

**Promotion to Vulkan 1.1**

The following enums, types and commands are included as interactions with `VK_KHR_swapchain`:

- `VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_CAPABILITIES_KHR`
- `VK_STRUCTURE_TYPE_IMAGE_SWAPCHAIN_CREATE_INFO_KHR`
- `VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_SWAPCHAIN_INFO_KHR`
- `VK_STRUCTURE_TYPE_ACQUIRE_NEXT_IMAGE_INFO_KHR`
- `VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_INFO_KHR`
- `VK_STRUCTURE_TYPE_DEVICE_GROUP_SWAPCHAIN_CREATE_INFO_KHR`
- `VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR`
- `VkDeviceGroupPresentModeFlagBitsKHR`
- `VkDeviceGroupPresentCapabilitiesKHR`
- `VkImageSwapchainCreateInfoKHR`
- `VkBindImageMemorySwapchainInfoKHR`
- `VkAcquireNextImageInfoKHR`
- `VkDeviceGroupPresentInfoKHR`
- `VkDeviceGroupSwapchainCreateInfoKHR`
- `vkGetDeviceGroupPresentCapabilitiesKHR`
- `vkGetDeviceGroupSurfacePresentModesKHR`
- `vkGetPhysicalDevicePresentRectanglesKHR`
- `vkAcquireNextImage2KHR`

If Vulkan 1.1 and `VK_KHR_swapchain` are supported, these are included by `VK_KHR_swapchain`.

The base functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

**New Commands**

- `vkCmdDispatchBaseKHR`
- `vkCmdSetDeviceMaskKHR`
- `vkGetDeviceGroupPeerMemoryFeaturesKHR`

If `VK_KHR_surface` is supported:

- `vkGetDeviceGroupPresentCapabilitiesKHR`
- `vkGetDeviceGroupSurfacePresentModesKHR`
• `vkGetPhysicalDevicePresentRectanglesKHR`

If `VK_KHR_swapchain` is supported:
• `vkAcquireNextImage2KHR`

**New Structures**

• Extending `VkBindSparseInfo`:
  ◦ `VkDeviceGroupBindSparseInfoKHR`
• Extending `VkCommandBufferBeginInfo`:
  ◦ `VkDeviceGroupCommandBufferBeginInfoKHR`
• Extending `VkMemoryAllocateInfo`:
  ◦ `VkMemoryAllocateFlagsInfoKHR`
• Extending `VkRenderPassBeginInfo, VkRenderingInfo`:
  ◦ `VkDeviceGroupRenderPassBeginInfoKHR`
• Extending `VkSubmitInfo`:
  ◦ `VkDeviceGroupSubmitInfoKHR`

If `VK_KHR_bind_memory2` is supported:
• Extending `VkBindBufferMemoryInfo`:
  ◦ `VkBindBufferMemoryDeviceGroupInfoKHR`
• Extending `VkBindImageMemoryInfo`:
  ◦ `VkBindImageMemoryDeviceGroupInfoKHR`

If `VK_KHR_surface` is supported:
• `VkDeviceGroupPresentCapabilitiesKHR`

If `VK_KHR_swapchain` is supported:
• `VkAcquireNextImageInfoKHR`
• Extending `VkBindImageMemoryInfo`:
  ◦ `VkBindImageMemorySwapchainInfoKHR`
• Extending `VkImageCreateInfo`:
  ◦ `VkImageSwapchainCreateInfoKHR`
• Extending `VkPresentInfoKHR`:
  ◦ `VkDeviceGroupPresentInfoKHR`
• Extending `VkSwapchainCreateInfoKHR`:
  ◦ `VkDeviceGroupSwapchainCreateInfoKHR`
New Enums

- VkMemoryAllocateFlagBitsKHR
- VkPeerMemoryFeatureFlagBitsKHR

If VK_KHR_surface is supported:

- VkDeviceGroupPresentModeFlagBitsKHR

New Bitmasks

- VkMemoryAllocateFlagsKHR
- VkPeerMemoryFeatureFlagsKHR

If VK_KHR_surface is supported:

- VkDeviceGroupPresentModeFlagsKHR

New Enum Constants

- VK_KHR_DEVICE_GROUP_EXTENSION_NAME
- VK_KHR_DEVICE_GROUP_SPEC_VERSION

Extending VkDependencyFlagBits:

- VK_DEPENDENCY_DEVICE_GROUP_BIT_KHR

Extending VkMemoryAllocateFlagBits:

- VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT_KHR

Extending VkPeerMemoryFeatureFlagBits:

- VK_PEER_MEMORY_FEATURE_COPY_DST_BIT_KHR
- VK_PEER_MEMORY_FEATURE_COPY_SRC_BIT_KHR
- VK_PEER_MEMORY_FEATURE_GENERIC_DST_BIT_KHR
- VK_PEER_MEMORY_FEATURE_GENERIC_SRC_BIT_KHR

Extending VkPipelineCreateFlagBits:

- VK_PIPELINE_CREATE_DISPATCH_BASE_KHR
- VK_PIPELINE_CREATE_VIEW_INDEX_FROM_DEVICE_INDEX_BIT_KHR

Extending VkStructureType:

- VK_STRUCTURE_TYPE_DEVICE_GROUP_BIND_SPARSE_INFO_KHR
- VK_STRUCTURE_TYPE_DEVICE_GROUP_COMMAND_BUFFER_BEGIN_INFO_KHR
- VK_STRUCTURE_TYPE_DEVICE_GROUP_RENDER_PASS_BEGIN_INFO_KHR
- VK_STRUCTURE_TYPE_DEVICE_GROUP_SUBMIT_INFO_KHR
- VK_STRUCTURE_TYPE_MEMORY_ALLOCATE_FLAGS_INFO_KHR

If VK_KHR_bind_memory2 is supported:
• Extending `VkImageCreateFlagBits`:
  ◦ `VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR`

• Extending `VkStructureType`:
  ◦ `VK_STRUCTURE_TYPE_BIND_BUFFER_MEMORY_DEVICE_GROUP_INFO_KHR`
  ◦ `VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_DEVICE_GROUP_INFO_KHR`

If `VK_KHR_surface` is supported:

• Extending `VkStructureType`:
  ◦ `VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_CAPABILITIES_KHR`

If `VK_KHR_swapchain` is supported:

• Extending `VkStructureType`:
  ◦ `VK_STRUCTURE_TYPE_ACQUIRE_NEXT_IMAGE_INFO_KHR`
  ◦ `VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_SWAPCHAIN_INFO_KHR`
  ◦ `VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_INFO_KHR`
  ◦ `VK_STRUCTURE_TYPE_DEVICE_GROUP_SWAPCHAIN_CREATE_INFO_KHR`
  ◦ `VK_STRUCTURE_TYPE_IMAGE_SWAPCHAIN_CREATE_INFO_KHR`

• Extending `VkSwapchainCreateFlagBitsKHR`:
  ◦ `VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR`

**New Built-in Variables**

- `DeviceIndex`

**New SPIR-V Capabilities**

- `DeviceGroup`

**Version History**

• Revision 1, 2016-10-19 (Jeff Bolz)
  ◦ Internal revisions

• Revision 2, 2017-05-19 (Tobias Hector)
  ◦ Removed extended memory bind functions to `VK_KHR_bind_memory2`, added dependency on that extension, and device-group-specific structs for those functions.

• Revision 3, 2017-10-06 (Ian Elliott)
  ◦ Corrected Vulkan 1.1 interactions with the WSI extensions. All Vulkan 1.1 WSI interactions are with the `VK_KHR_swapchain` extension.

• Revision 4, 2017-10-10 (Jeff Bolz)
  ◦ Rename “SFR” bits and structure members to use the phrase “split instance bind regions”.

Description

This extension provides instance-level commands to enumerate groups of physical devices, and to create a logical device from a subset of one of those groups. Such a logical device can then be used with new features in the VK_KHR_device_group extension.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.
New Commands

- `vkEnumeratePhysicalDeviceGroupsKHR`

New Structures

- `VkPhysicalDeviceGroupPropertiesKHR`
- Extending `VkDeviceCreateInfo`:
  - `VkDeviceGroupDeviceCreateInfoKHR`

New Enum Constants

- `VK_KHR_DEVICE_GROUP_CREATION_EXTENSION_NAME`
- `VK_KHR_DEVICE_GROUP_CREATION_SPEC_VERSION`
- `VK_MAX_DEVICE_GROUP_SIZE_KHR`
- Extending `VkMemoryHeapFlagBits`:
  - `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT_KHR`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_DEVICE_GROUP_DEVICE_CREATE_INFO_KHR`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_GROUP_PROPERTIES_KHR`

Examples

```c
VkDeviceCreateInfo devCreateInfo = {VK_STRUCTURE_TYPE_DEVICE_CREATE_INFO};
// (not shown) fill out devCreateInfo as usual.
uint32_t deviceGroupCount = 0;

Description

This extension is based on the VK_AMD_draw_indirect_count extension. This extension allows an application to source the number of draws for indirect drawing calls from a buffer.

Applications might want to do culling on the GPU via a compute shader prior to drawing. This enables the application to generate an arbitrary number of drawing commands and execute them without host intervention.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. However, if Vulkan 1.2 is supported and this extension is not, the commands vkCmdDrawIndirectCount and vkCmdDrawIndexedIndirectCount are optional. The original type, enum and command names are still available as aliases of the core functionality.

New Commands

- vkCmdDrawIndexedIndirectCountKHR
- vkCmdDrawIndirectCountKHR

New Enum Constants

- VK_KHR_DRAW_INDIRECT_COUNT_EXTENSION_NAME
- VK_KHR_DRAW_INDIRECT_COUNT_SPEC_VERSION

Description

This extension allows applications to create single-pass render pass instances without needing to create render pass objects or framebuffers. Dynamic render passes can also span across multiple primary command buffers, rather than relying on secondary command buffers.

This extension also incorporates VK_ATTACHMENT_STORE_OP_NONE_KHR from VK_QCOM_render_pass_store_ops, enabling applications to avoid unnecessary synchronization when an attachment is not written during a render pass.

New Commands

**VK_KHR_external_memory**

Name String

VK_KHR_external_memory

Extension Type

Device extension

Registered Extension Number

73
An application may wish to reference device memory in multiple Vulkan logical devices or
instances, in multiple processes, and/or in multiple APIs. This extension enables an application to export non-Vulkan handles from Vulkan memory objects such that the underlying resources can be referenced outside the scope of the Vulkan logical device that created them.

**Promotion to Vulkan 1.1**

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

**New Structures**

- Extending `VkBufferCreateInfo`:
  - `VkExternalMemoryBufferCreateInfoKHR`
- Extending `VkImageCreateInfo`:
  - `VkExternalMemoryImageCreateInfoKHR`
- Extending `VkMemoryAllocateInfo`:
  - `VkExportMemoryAllocateInfoKHR`

**New Enum Constants**

- `VK_KHR_EXTERNAL_MEMORY_EXTENSION_NAME`
- `VK_KHR_EXTERNAL_MEMORY_SPEC_VERSION`
- `VK_QUEUE_FAMILY_EXTERNAL_KHR`

- Extending `VkResult`:
  - `VK_ERROR_INVALID_EXTERNAL_HANDLE_KHR`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_EXPORT_MEMORY_ALLOCATE_INFO_KHR`
  - `VK_STRUCTURE_TYPE_EXTERNAL_MEMORY_BUFFER_CREATE_INFO_KHR`
  - `VK_STRUCTURE_TYPE_EXTERNAL_MEMORY_IMAGE_CREATE_INFO_KHR`

**Issues**

1) How do applications correlate two physical devices across process or Vulkan instance boundaries?

**RESOLVED:** New device ID fields have been introduced by `VK_KHR_external_memory_capabilities`. These fields, combined with the existing `VkPhysicalDeviceProperties::driverVersion` field can be used to identify compatible devices across processes, drivers, and APIs. `VkPhysicalDeviceProperties::pipelineCacheUUID` is not sufficient for this purpose because despite its description in the specification, it need only identify a unique pipeline cache format in practice. Multiple devices may be able to use the same pipeline cache data, and hence it would be desirable for all of them to have the same pipeline cache UUID. However, only the same concrete physical device can be used when sharing memory, so an actual unique device ID was introduced. Further, the pipeline cache UUID was specific to Vulkan, but correlation with other, non-extensible APIs is
required to enable interoperation with those APIs.

2) If memory objects are shared between processes and APIs, is this considered aliasing according to the rules outlined in the Memory Aliasing section?

RESOLVED: Yes. Applications must take care to obey all restrictions imposed on aliased resources when using memory across multiple Vulkan instances or other APIs.

3) Are new image layouts or metadata required to specify image layouts and layout transitions compatible with non-Vulkan APIs, or with other instances of the same Vulkan driver?

RESOLVED: Separate instances of the same Vulkan driver running on the same GPU should have identical internal layout semantics, so applications have the tools they need to ensure views of images are consistent between the two instances. Other APIs will fall into two categories: Those that are Vulkan-compatible, and those that are Vulkan-incompatible. Vulkan-incompatible APIs will require the image to be in the GENERAL layout whenever they are accessing them.

Note this does not attempt to address cross-device transitions, nor transitions to engines on the same device which are not visible within the Vulkan API. Both of these are beyond the scope of this extension.

4) Is a new barrier flag or operation of some type needed to prepare external memory for handoff to another Vulkan instance or API and/or receive it from another instance or API?

RESOLVED: Yes. Some implementations need to perform additional cache management when transitioning memory between address spaces and other APIs, instances, or processes which may operate in a separate address space. Options for defining this transition include:

- A new structure that can be added to the pNext list in `VkMemoryBarrier`, `VkBufferMemoryBarrier`, and `VkImageMemoryBarrier`.
- A new bit in `VkAccessFlags` that can be set to indicate an “external” access.
- A new bit in `VkDependencyFlags`.
- A new special queue family that represents an “external” queue.

A new structure has the advantage that the type of external transition can be described in as much detail as necessary. However, there is not currently a known need for anything beyond differentiating between external and internal accesses, so this is likely an over-engineered solution. The access flag bit has the advantage that it can be applied at buffer, image, or global granularity, and semantically it maps pretty well to the operation being described. Additionally, the API already includes `VK_ACCESS_MEMORY_READ_BIT` and `VK_ACCESS_MEMORY_WRITE_BIT` which appear to be intended for this purpose. However, there is no obvious pipeline stage that would correspond to an external access, and therefore no clear way to use `VK_ACCESS_MEMORY_READ_BIT` or `VK_ACCESS_MEMORY_WRITE_BIT`. `VkDependencyFlags` and `VkPipelineStageFlags` operate at command granularity rather than image or buffer granularity, which would make an entire pipeline barrier an internal→external or external→internal barrier. This may not be a problem in practice, but seems like the wrong scope. Another downside of `VkDependencyFlags` is that it lacks inherent directionality: there are no src and dst variants of it in the barrier or dependency description semantics, so two bits might need to be added to describe both internal→external and external→internal transitions. Transitioning a resource to a special queue family corresponds well with the operation of transitioning to a
separate Vulkan instance, in that both operations ideally include scheduling a barrier on both sides of the transition: Both the releasing and the acquiring queue or process. Using a special queue family requires adding an additional reserved queue family index. Re-using VK_QUEUE_FAMILY_IGNORED would have left it unclear how to transition a concurrent usage resource from one process to another, since the semantics would have likely been equivalent to the currently-ignored transition of VK_QUEUE_FAMILY_IGNORED → VK_QUEUE_FAMILY_IGNORED. Fortunately, creating a new reserved queue family index is not invasive.

Based on the above analysis, the approach of transitioning to a special “external” queue family was chosen.

5) Do internal driver memory arrangements and/or other internal driver image properties need to be exported and imported when sharing images across processes or APIs.

**RESOLVED:** Some vendors claim this is necessary on their implementations, but it was determined that the security risks of allowing opaque metadata to be passed from applications to the driver were too high. Therefore, implementations which require metadata will need to associate it with the objects represented by the external handles, and rely on the dedicated allocation mechanism to associate the exported and imported memory objects with a single image or buffer.

6) Most prior interoperation and cross-process sharing APIs have been based on image-level sharing. Should Vulkan sharing be based on memory-object sharing or image sharing?

**RESOLVED:** These extensions have assumed memory-level sharing is the correct granularity. Vulkan is a lower-level API than most prior APIs, and as such attempts to closely align with to the underlying primitives of the hardware and system-level drivers it abstracts. In general, the resource that holds the backing store for both images and buffers of various types is memory. Images and buffers are merely metadata containing brief descriptions of the layout of bits within that memory.

Because memory object-based sharing is aligned with the overall Vulkan API design, it enables the full range of Vulkan capabilities with external objects. External memory can be used as backing for sparse images, for example, whereas such usage would be awkward at best with a sharing mechanism based on higher-level primitives such as images. Further, aligning the mechanism with the API in this way provides some hope of trivial compatibility with future API enhancements. If new objects backed by memory objects are added to the API, they too can be used across processes with minimal additions to the base external memory APIs.

Earlier APIs implemented interop at a higher level, and this necessitated entirely separate sharing APIs for images and buffers. To co-exist and interoperate with those APIs, the Vulkan external sharing mechanism must accommodate their model. However, if it can be agreed that memory-based sharing is the more desirable and forward-looking design, legacy interoperation constraints can be considered another reason to favor memory-based sharing: while native and legacy driver primitives that may be used to implement sharing may not be as low-level as the API here suggests, raw memory is still the least common denominator among the types. Image-based sharing can be cleanly derived from a set of base memory-object sharing APIs with minimal effort, whereas image-based sharing does not generalize well to buffer or raw-memory sharing. Therefore, following the general Vulkan design principle of minimalism, it is better to expose interoperability with image-based native and external primitives via the memory sharing API, and place sufficient
limits on their usage to ensure they can be used only as backing for equivalent Vulkan images. This provides a consistent API for applications regardless of which platform or external API they are targeting, which makes development of multi-API and multi-platform applications simpler.

7) Should Vulkan define a common external handle type and provide Vulkan functions to facilitate cross-process sharing of such handles rather than relying on native handles to define the external objects?

**RESOLVED:** No. Cross-process sharing of resources is best left to native platforms. There are myriad security and extensibility issues with such a mechanism, and attempting to re-solve all those issues within Vulkan does not align with Vulkan’s purpose as a graphics API. If desired, such a mechanism could be built as a layer or helper library on top of the opaque native handle defined in this family of extensions.

8) Must implementations provide additional guarantees about state implicitly included in memory objects for those memory objects that may be exported?

**RESOLVED:** Implementations must ensure that sharing memory objects does not transfer any information between the exporting and importing instances and APIs other than that required to share the data contained in the memory objects explicitly shared. As specific examples, data from previously freed memory objects that used the same underlying physical memory, and data from memory objects using adjacent physical memory must not be visible to applications importing an exported memory object.

9) Must implementations validate external handles the application provides as inputs to memory import operations?

**RESOLVED:** Implementations must return an error to the application if the provided memory handle cannot be used to complete the requested import operation. However, implementations need not validate handles are of the exact type specified by the application.

  - VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT_KHR
  - VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT_KHR

Extending VkStructureType:
Issues

1) Why do so many external memory capabilities need to be queried on a per-memory-handle-type basis?

**PROPOSED RESOLUTION:** This is because some handle types are based on OS-native objects that have far more limited capabilities than the very generic Vulkan memory objects. Not all memory handle types can name memory objects that support 3D images, for example. Some handle types cannot even support the deferred image and memory binding behavior of Vulkan and require specifying the image when allocating or importing the memory object.

2) Do the `VkExternalImageFormatPropertiesKHR` and `VkExternalBufferPropertiesKHR` structs need to include a list of memory type bits that support the given handle type?

**PROPOSED RESOLUTION:** No. The memory types that do not support the handle types will simply be filtered out of the results returned by `vkGetImageMemoryRequirements` and `vkGetBufferMemoryRequirements` when a set of handle types was specified at image or buffer creation time.

3) Should the non-opaque handle types be moved to their own extension?

**PROPOSED RESOLUTION:** Perhaps. However, defining the handle type bits does very little and does not require any platform-specific types on its own, and it is easier to maintain the bitfield values in a single extension for now. Presumably more handle types could be added by separate extensions though, and it would be midly weird to have some platform-specific ones defined in the core spec and some in extensions.

4) Do we need a `D3D11_TILEPOOL` type?

**PROPOSED RESOLUTION:** No. This is technically possible, but the synchronization is awkward. D3D11 surfaces must be synchronized using shared mutexes, and these synchronization primitives are shared by the entire memory object, so D3D11 shared allocations divided among multiple buffer and image bindings may be difficult to synchronize.

5) Should the Windows 7-compatible handle types be named “KMT” handles or “GLOBAL_SHARE” handles?

**PROPOSED RESOLUTION:** KMT, simply because it is more concise.

6) How do applications identify compatible devices and drivers across instance, process, and API boundaries when sharing memory?

**PROPOSED RESOLUTION:** New device properties are exposed that allow applications to correctly
correlate devices and drivers. A device and driver UUID that must both match to ensure sharing compatibility between two Vulkan instances, or a Vulkan instance and an extensible external API are added. To allow correlating with Direct3D devices, a device LUID is added that corresponds to a DXGI adapter LUID. A driver ID is not needed for Direct3D because mismatched driver component versions are not currently supported on the Windows OS. Should support for such configurations be introduced at the OS level, further Vulkan extensions would be needed to correlate userspace component builds.

- VkSemaphoreImportFlagsKHR

New Enum Constants

- VK_KHR_EXTERNAL_SEMAPHORE_EXTENSION_NAME
- VK_KHR_EXTERNAL_SEMAPHORE_SPEC_VERSION

Extending VkSemaphoreImportFlagBits:

- VK_SEMAPHORE_IMPORT_TEMPORARY_BIT_KHR

Extending VkStructureType:

- VK_STRUCTURE_TYPE_EXPORT_SEMAPHORE_CREATE_INFO_KHR
Issues

1) Should there be restrictions on what side effects can occur when waiting on imported semaphores that are in an invalid state?

**RESOLVED:** Yes. Normally, validating such state would be the responsibility of the application, and the implementation would be free to enter an undefined state if valid usage rules were violated. However, this could cause security concerns when using imported semaphores, as it would require the importing application to trust the exporting application to ensure the state is valid. Requiring this level of trust is undesirable for many potential use cases.

2) Must implementations validate external handles the application provides as input to semaphore state import operations?

**RESOLVED:** Implementations must return an error to the application if the provided semaphore state handle cannot be used to complete the requested import operation. However, implementations need not validate handles are of the exact type specified by the application.

VK_KHR_get_physical_device_properties2

or

Version 1.1

**Deprecation State**

- Promoted to Vulkan 1.1
Description

An application may wish to reference device semaphores in multiple Vulkan logical devices or instances, in multiple processes, and/or in multiple APIs. This extension provides a set of capability queries and handle definitions that allow an application to determine what types of “external” semaphore handles an implementation supports for a given set of use cases.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

New Commands

- `vkGetPhysicalDeviceExternalSemaphorePropertiesKHR`

New Structures

- `VkExternalSemaphorePropertiesKHR`
- `VkPhysicalDeviceExternalSemaphoreInfoKHR`
- Extending `VkPhysicalDeviceProperties2`:
  - `VkPhysicalDeviceIDPropertiesKHR`

New Enums

- `VkExternalSemaphoreFeatureFlagBitsKHR`
- `VkExternalSemaphoreHandleTypeFlagBitsKHR`

New Bitmasks

- `VkExternalSemaphoreFeatureFlagsKHR`
• VkExternalSemaphoreHandleTypeFlagsKHR

New Enum Constants

• VK_KHR_EXTERNAL_SEMAPHORE_CAPABILITIES_EXTENSION_NAME
• VK_KHR_EXTERNAL_SEMAPHORE_CAPABILITIES_SPEC_VERSION
• VK_LUID_SIZE_KHR

Extending VkExternalSemaphoreFeatureFlagBits:

• VK_EXTERNAL_SEMAPHORE_FEATURE_EXPORTABLE_BIT_KHR
• VK_EXTERNAL_SEMAPHORE_FEATURE_IMPORTABLE_BIT_KHR

Extending VkExternalSemaphoreHandleTypeFlagBits:

• VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT_KHR
• VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT_KHR
• VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT_KHR
• VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT_KHR
• VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT_KHR

Extending VkStructureType:

Description

This extension adds a new VkFormatFeatureFlagBits2KHR 64bits format feature flag type to extend the existing VkFormatFeatureFlagBits which is limited to 31 flags. At the time of this writing 29 bits of VkFormatFeatureFlagBits are already used.

Because VkFormatProperties2 is already defined to extend the Vulkan 1.0 vkGetPhysicalDeviceFormatProperties command, this extension defines a new VkFormatProperties3KHR to extend the VkFormatProperties.

On top of replicating all the bits from VkFormatFeatureFlagBits, VkFormatFeatureFlagBits2KHR adds the following bits:

- VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT_KHR and VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT_KHR indicate that an implementation supports respectively reading and writing a given VkFormat through storage operations without specifying the format in the shader.
- VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT_KHR indicates that an implementation supports depth comparison performed by OpImage*Dref* instructions on a given VkFormat. Previously the result of executing a OpImage*Dref* instruction on an image view, where the
format was not one of the depth/stencil formats with a depth component, was undefined. This bit clarifies on which formats such instructions can be used.

Prior to version 2 of this extension, implementations exposing the shaderStorageImageReadWithoutFormat and shaderStorageImageWriteWithoutFormat features may not report VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT_KHR and VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT_KHR in VkFormatProperties3KHR::bufferFeatures. Despite this, buffer reads/writes are supported as intended by the original features.

New Structures

Description

This extension provides new queries for memory requirements of images and buffers that can be easily extended by other extensions, without introducing any additional commands. The Vulkan 1.0 VkMemoryRequirements and VkSparseImageMemoryRequirements structures do not include sType and pNext members. This extension wraps them in new structures with these members, so an application can query a chain of memory requirements structures by constructing the chain and letting the implementation fill them in. A new command is added for each vkGet*MemoryRequirements command in core Vulkan 1.0.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.
New Commands

- vkGetBufferMemoryRequirements2KHR
- vkGetImageMemoryRequirements2KHR

Description
This extension provides new queries for device features, device properties, and format properties that can be easily extended by other extensions, without introducing any further queries. The Vulkan 1.0 feature/limit/formatproperty structures do not include sType/pNext members. This extension wraps them in new structures with sType/pNext members, so an application can query a chain of feature/limit/formatproperty structures by constructing the chain and letting the implementation fill them in. A new command is added for each vkGetPhysicalDevice* command in core Vulkan 1.0. The new feature structure (and a pNext chain of extending structures) can also be passed in to device creation to enable features.

This extension also allows applications to use the physical-device components of device extensions before vkCreateDevice is called.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

New Commands
- vkGetPhysicalDeviceFeatures2KHR
- vkGetPhysicalDeviceFormatProperties2KHR
- vkGetPhysicalDeviceImageFormatProperties2KHR
• vkGetPhysicalDeviceMemoryProperties2KHR
• vkGetPhysicalDeviceProperties2KHR
• vkGetPhysicalDeviceQueueFamilyProperties2KHR
• vkGetPhysicalDeviceSparseImageFormatProperties2KHR

New Structures

• VkFormatProperties2KHR
• VkImageFormatProperties2KHR
• VkPhysicalDeviceImageFormatInfo2KHR
• VkPhysicalDeviceMemoryProperties2KHR
• VkPhysicalDeviceProperties2KHR
• VkPhysicalDeviceSparseImageFormatInfo2KHR
• VkQueueFamilyProperties2KHR
• VkSparseImageFormatProperties2KHR

• Extending VkDeviceCreateInfo:
  ◦ VkPhysicalDeviceFeatures2KHR

New Enum Constants

• VK_KHR_GET_PHYSICAL_DEVICE_PROPERTIES_2_EXTENSION_NAME
• VK_KHR_GET_PHYSICAL_DEVICE_PROPERTIES_2_SPEC_VERSION

• Extending VkStructureType:
  ◦ VK_STRUCTURE_TYPE_FORMAT_PROPERTIES_2_KHR
  ◦ VK_STRUCTURE_TYPE_IMAGE_FORMAT_PROPERTIES_2_KHR
  ◦ VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FEATURES_2_KHR
  ◦ VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_FORMAT_INFO_2_KHR
  ◦ VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MEMORY_PROPERTIES_2_KHR
  ◦ VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PROPERTIES_2_KHR
  ◦ VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SPARSE_IMAGE_FORMAT_INFO_2_KHR
  ◦ VK_STRUCTURE_TYPE_QUEUE_FAMILY_PROPERTIES_2_KHR
  ◦ VK_STRUCTURE_TYPE_SPARSE_IMAGE_FORMAT_PROPERTIES_2_KHR

Examples

// Get features with a hypothetical future extension.
VkHypotheticalExtensionFeaturesKHR hypotheticalFeatures = {
  .sType = VK_STRUCTURE_TYPE_HYPOTHETICAL_FEATURES_KHR,
  .pNext = NULL,
};
VkPhysicalDeviceFeatures2KHR features =
{
    .sType = VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FEATURES_2_KHR,
    .pNext = &hypotheticalFeatures,
};

// After this call, features and hypotheticalFeatures have been filled out.
vkGetPhysicalDeviceFeatures2KHR(physicalDevice, &features);

// Properties/limits can be chained and queried similarly.

// Enable some features:
VkHypotheticalExtensionFeaturesKHR enabledHypotheticalFeatures =
{
    .sType = VK_STRUCTURE_TYPE_HYPOTHETICAL_FEATURES_KHR,
    .pNext = NULL,
};
VkPhysicalDeviceFeatures2KHR enabledFeatures =
{
    .sType = VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FEATURES_2_KHR,
    .pNext = &enabledHypotheticalFeatures,
};

enabledFeatures.features.xyz = VK_TRUE;
enabledHypotheticalFeatures.abc = VK_TRUE;

VkDeviceCreateInfo deviceCreateInfo =
{
    .sType = VK_STRUCTURE_TYPE_DEVICE_CREATE_INFO,
    .pNext = &enabledFeatures,
    ...,
    .pEnabledFeatures = NULL,
};

VkDevice device;
vkCreateDevice(physicalDevice, &deviceCreateInfo, NULL, &device);

---

Description

On some implementations, setting the VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT on image creation can cause access to that image to perform worse than an equivalent image created without VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT because the implementation does not know what view formats will be paired with the image.
This extension allows an application to provide the list of all formats that can be used with an image when it is created. The implementation may then be able to create a more efficient image that supports the subset of formats required by the application without having to support all formats in the format compatibility class of the image format.

**Promotion to Vulkan 1.2**

All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

**New Structures**

`VK_KHR_get_physical_device_properties2`
Description

This extension allows framebuffers to be created without the need for creating images first, allowing more flexibility in how they are used, and avoiding the need for many of the confusing compatibility rules.

Framebuffers are now created with a small amount of additional metadata about the image views that will be used in `VkFramebufferAttachmentsCreateInfoKHR`, and the actual image views are provided at render pass begin time via `VkRenderPassAttachmentBeginInfoKHR`.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

New Structures

- `VkFramebufferAttachmentImageInfoKHR`
- Extending `VkFramebufferCreateInfo`:
  - `VkFramebufferAttachmentsCreateInfoKHR`
- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  - `VkPhysicalDeviceImagelessFramebufferFeaturesKHR`
- Extending `VkRenderPassBeginInfo`:
New Enum Constants

- VK_KHR_IMAGELESS_FRAMEBUFFER_EXTENSION_NAME
- VK_KHR_IMAGELESS_FRAMEBUFFER_SPEC_VERSION

Extending VkFramebufferCreateFlagBits:
- VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR

Extending VkStructureType:
- VK_STRUCTURE_TYPE_FRAMEBUFFER_ATTACHMENTS_CREATE_INFO_KHR
- VK_STRUCTURE_TYPE_FRAMEBUFFER_ATTACHMENT_IMAGE_INFO_KHR
- VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGELESS_FRAMEBUFFER_FEATURES_KHR

**Description**

`VK_KHR_maintenance1` adds a collection of minor features that were intentionally left out or overlooked from the original Vulkan 1.0 release.

The new features are as follows:

- Allow 2D and 2D array image views to be created from 3D images, which can then be used as color framebuffer attachments. This allows applications to render to slices of a 3D image.

- Support `vkCmdCopyImage` between 2D array layers and 3D slices. This extension allows copying from layers of a 2D array image to slices of a 3D image and vice versa.

- Allow negative height to be specified in the `VkViewport::height` field to perform y-inversion of the clip-space to framebuffer-space transform. This allows apps to avoid having to use `gl_Position.y = -gl_Position.y` in shaders also targeting other APIs.

- Allow implementations to express support for doing just transfers and clears of image formats that they otherwise support no other format features for. This is done by adding new format feature flags `VK_FORMAT_FEATURE_TRANSFER_SRC_BIT_KHR` and `VK_FORMAT_FEATURE_TRANSFER_DST_BIT_KHR`.

- Support `vkCmdFillBuffer` on transfer-only queues. Previously `vkCmdFillBuffer` was defined to only work on command buffers allocated from command pools which support graphics or compute queues. It is now allowed on queues that just support transfer operations.
• Fix the inconsistency of how error conditions are returned between the `vkCreateGraphicsPipelines` and `vkCreateComputePipelines` functions and the `vkAllocateDescriptorSets` and `vkAllocateCommandBuffers` functions.

• Add new `VK_ERROR_OUT_OF_POOL_MEMORY_KHR` error so implementations can give a more precise reason for `vkAllocateDescriptorSets` failures.

• Add a new command `vkTrimCommandPoolKHR` which gives the implementation an opportunity to release any unused command pool memory back to the system.

**Promotion to Vulkan 1.1**

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

**New Commands**

• `vkTrimCommandPoolKHR`

**New Bitmasks**

• `VkCommandPoolTrimFlagsKHR`

**New Enum Constants**

• `VK_KHR_MAINTENANCE1_EXTENSION_NAME`

• `VK_KHR_MAINTENANCE1_SPEC_VERSION`

• `VK_KHR_MAINTENANCE_1_EXTENSION_NAME`

Description

VK_KHR_maintenance2 adds a collection of minor features that were intentionally left out or overlooked from the original Vulkan 1.0 release.

The new features are as follows:

- Allow the application to specify which aspect of an input attachment might be read for a given subpass.
- Allow implementations to express the clipping behavior of points.
- Allow creating images with usage flags that may not be supported for the base image's format, but are supported for image views of the image that have a different but compatible format.
- Allow creating uncompressed image views of compressed images.
- Allow the application to select between an upper-left and lower-left origin for the tessellation domain space.
- Adds two new image layouts for depth stencil images to allow either the depth or stencil aspect to be read-only while the other aspect is writable.

Input Attachment Specification

Input attachment specification allows an application to specify which aspect of a multi-aspect image (e.g. a depth/stencil format) will be accessed via a subpassLoad operation.

On some implementations there may be a performance penalty if the implementation does not know (at vkCreateRenderPass time) which aspect(s) of multi-aspect images can be accessed as input attachments.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

New Structures

- VkInputAttachmentAspectReferenceKHR
- Extending VkImageViewCreateInfo:
  - VkImageViewUsageCreateInfoKHR
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDevicePointClippingPropertiesKHR
- Extending VkPipelineTessellationStateCreateInfo:
  - VkPipelineTessellationDomainOriginStateCreateInfoKHR
- Extending VkRenderPassCreateInfo:
  - VkRenderPassInputAttachmentAspectCreateInfoKHR
New Enums

- VkPointClippingBehaviorKHR
- VkTessellationDomainOriginKHR

New Enum Constants

- VK_KHR_MAINTENANCE2_EXTENSION_NAME
- VK_KHR_MAINTENANCE2_SPEC_VERSION
- VK_KHR_MAINTENANCE_2_EXTENSION_NAME
- VK_KHR_MAINTENANCE_2_SPEC_VERSION

Extending VkImageCreateFlagBits:

- VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT_KHR
- VK_IMAGE_CREATE_EXTENDED_USAGE_BIT_KHR

Extending VkImageLayout:

- VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL_KHR
- VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL_KHR

Extending VkPointClippingBehavior:

- VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES_KHR
- VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY_KHR

Extending VkStructureType:

- VK_STRUCTURE_TYPE_IMAGE_VIEW_USAGE_CREATE_INFO_KHR
- VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_POINT_CLIPPING_PROPERTIES_KHR
- VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_DOMAIN_ORIGIN_STATE_CREATE_INFO_KHR
- VK_STRUCTURE_TYPE_RENDER_PASS_INPUT_ATTACHMENT_ASPECT_CREATE_INFO_KHR

Extending VkTessellationDomainOrigin:

- VK_TESSELLATION_DOMAIN_ORIGIN_LOWER_LEFT_KHR
- VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT_KHR

Input Attachment Specification Example

Consider the case where a render pass has two subpasses and two attachments.

Attachment 0 has the format VK_FORMAT_D24_UNORM_S8_UINT, attachment 1 has some color format.

Subpass 0 writes to attachment 0, subpass 1 reads only the depth information from attachment 0 (using inputAttachmentRead) and writes to attachment 1.

```c
VkInputAttachmentAspectReferenceKHR references[] = {
    {
        .subpass = 1,
```
Issues

1) What is the default tessellation domain origin?

**RESOLVED:** Vulkan 1.0 originally inadvertently documented a lower-left origin, but the conformance tests and all implementations implemented an upper-left origin. This extension adds a control to select between lower-left (for compatibility with OpenGL) and upper-left, and we retroactively fix unextended Vulkan to have a default of an upper-left origin.

Description

VK_KHR_maintenance3 adds a collection of minor features that were intentionally left out or overlooked from the original Vulkan 1.0 release.

The new features are as follows:

• A limit on the maximum number of descriptors that are supported in a single descriptor set layout. Some implementations have a limit on the total size of descriptors in a set, which cannot be expressed in terms of the limits in Vulkan 1.0.
• A limit on the maximum size of a single memory allocation. Some platforms have kernel interfaces that limit the maximum size of an allocation.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

Interactions and External Dependencies

- Requires SPIR-V 1.2 for LocalSizeId
Description

VK_KHR_maintenance4 adds a collection of minor features, none of which would warrant an entire extension of their own.

The new features are as follows:

- Allow the application to destroy their VkPipelineLayout object immediately after it was used to create another object. It is no longer necessary to keep its handle valid while the created object is in use.
- Add a new maxBufferSize implementation-defined limit for the maximum size VkBuffer that can be created.
- Add support for the SPIR-V 1.2 LocalSizeId execution mode, which can be used as an alternative to LocalSize to specify the local workgroup size with specialization constants.
- Add a guarantee that images created with identical creation parameters will always have the same alignment requirements.
- Add new vkGetDeviceBufferMemoryRequirementsKHR, vkGetDeviceImageMemoryRequirementsKHR, and vkGetDeviceImageSparseMemoryRequirementsKHR to allow the application to query the image memory requirements without having to create an image object and query it.
- Relax the requirement that push constants must be initialized before they are dynamically accessed.
- Relax the interface matching rules to allow a larger output vector to match with a smaller input vector, with additional values being discarded.
- Add a guarantee for buffer memory requirement that the size memory requirement is never greater than the result of aligning create size with the alignment memory requirement.

New Commands

- vkGetDeviceBufferMemoryRequirementsKHR
- vkGetDeviceImageMemoryRequirementsKHR
- vkGetDeviceImageSparseMemoryRequirementsKHR

**New Structures**

- VkDeviceBufferMemoryRequirementsKHR
- VkDeviceImageMemoryRequirementsKHR

Interactions and External Dependencies
• This extension provides API support for GL_EXT_multiview

Contributors
• Jeff Bolz, NVIDIA

Description
This extension has the same goal as the OpenGL ES GL_OVR_multiview extension. Multiview is a rendering technique originally designed for VR where it is more efficient to record a single set of commands to be executed with slightly different behavior for each “view”.

It includes a concise way to declare a render pass with multiple views, and gives implementations freedom to render the views in the most efficient way possible. This is done with a multiview configuration specified during render pass creation with the VkRenderPassMultiviewCreateInfo passed into VkRenderPassCreateInfo::pNext.
This extension enables the use of the SPV_KHR_multiview shader extension, which adds a new ViewIndex built-in type that allows shaders to control what to do for each view. If using GLSL there is also the GL_EXT_multiview extension that introduces a highp int gl_ViewIndex; built-in variable for vertex, tessellation, geometry, and fragment shaders.

**Promotion to Vulkan 1.1**

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

**New Structures**

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceMultiviewFeaturesKHR

- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceMultiviewPropertiesKHR

- Extending VkRenderPassCreateInfo:
  - VkRenderPassMultiviewCreateInfoKHR

**New Enum Constants**

- VK_KHR_MULTIVIEW_EXTENSION_NAME
- VK_KHR_MULTIVIEW_SPEC_VERSION

- Extending VkDependencyFlagBits:
  - VK_DEPENDENCY_VIEW_LOCAL_BIT_KHR

- Extending VkStructureType:

- Jon Leech, Khronos

Description

VK_KHR_sampler_mirror_clamp_to_edge extends the set of sampler address modes to include an additional mode (VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE) that effectively uses a texture map twice as large as the original image in which the additional half of the new image is a mirror image
of the original image.

This new mode relaxes the need to generate images whose opposite edges match by using the original image to generate a matching “mirror image”. This mode allows the texture to be mirrored only once in the negative s, t, and r directions.

**Promotion to Vulkan 1.2**

All functionality in this extension is included in core Vulkan 1.2. However, if Vulkan 1.2 is supported and this extension is not, the `VkSamplerAddressMode VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE` is optional. Since the original extension did not use an author suffix on the enum `VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE`, it is used by both core and extension implementations.

**New Enum Constants**

- `VK_KHR_SAMPLER_MIRROR_CLAMP_TO_EDGE_EXTENSION_NAME`
- `VK_KHR_SAMPLER_MIRROR_CLAMP_TO_EDGE_SPEC_VERSION`
- Extending `VkSamplerAddressMode`:
  - `VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE`
  - `VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE_KHR`

**Example**

Creating a sampler with the new address mode in each dimension

```c
VkSamplerCreateInfo createInfo =
{
    .sType = VK_STRUCTURE_TYPE_SAMPLER_CREATE_INFO,
    // Other members set to application-desired values
};

createInfo.addressModeU = VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE;
createInfo.addressModeV = VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE);
createInfo.addressModeW = VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE);

VkSampler sampler;
VkResult result = vkCreateSampler(
    device,
    &createInfo,
    &sampler);
```

**Issues**

1) Why are both KHR and core versions of the `VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE` token present?

**RESOLVED**: This functionality was intended to be required in Vulkan 1.0. We realized shortly
before public release that not all implementations could support it, and moved the functionality into an optional extension, but did not apply the KHR extension suffix. Adding a KHR-suffixed alias of the non-suffixed enum has been done to comply with our own naming rules.

In a related change, before spec revision 1.1.121 this extension was hardwiring into the spec Makefile so it was always included with the Specification, even in the core-only versions. This has now been reverted, and it is treated as any other extension.

Version History

- Revision 1, 2016-02-16 (Tobias Hector)
  - Initial draft
- Revision 2, 2019-08-14 (Jon Leech)
  - Add KHR-suffixed alias of non-suffixed enum.
- Revision 3, 2019-08-17 (Jon Leech)
  - Add an issue explaining the reason for the extension API not being suffixed with KHR.

Description

The use of \( Y'CbCr \) sampler conversion is an area in 3D graphics not used by most Vulkan developers. It is mainly used for processing inputs from video decoders and cameras. The use of the extension assumes basic knowledge of \( Y'CbCr \) concepts.

This extension provides the ability to perform specified color space conversions during texture sampling operations for the \( Y'CbCr \) color space natively. It also adds a selection of multi-planar
formats, image aspect plane, and the ability to bind memory to the planes of an image collectively or separately.

**Promotion to Vulkan 1.1**

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. However, if Vulkan 1.1 is supported and this extension is not, the `samplerYcbcrConversion` capability is optional. The original type, enum and command names are still available as aliases of the core functionality.

**New Object Types**

Description
This extension allows image memory barriers for depth/stencil images to have just one of the VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT aspect bits set, rather than require both. This allows their layouts to be set independently. To support depth/stencil images with different
layouts for the depth and stencil aspects, the depth/stencil attachment interface has been updated to support a separate layout for stencil.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

New Structures

- Extending `VkAttachmentDescription2`:
  - `VkAttachmentDescriptionStencilLayoutKHR`
- Extending `VkAttachmentReference2`:
  - `VkAttachmentReferenceStencilLayoutKHR`
- Extending `VkPhysicalDeviceFeatures2, VkDeviceCreateInfo`:
  - `VkPhysicalDeviceSeparateDepthStencilLayoutsFeaturesKHR`

New Enum Constants

- `VK_KHR_SEPARATE_DEPTH_STENCIL_LAYOUTS_EXTENSION_NAME`
- `VK_KHR_SEPARATE_DEPTH_STENCIL_LAYOUTS_SPEC_VERSION`

VK_KHR_shader_atomic_int64

Name String

- `VK_KHR_shader_atomic_int64`

Extension Type

- Device extension
This extension advertises the SPIR-V **Int64Atomics** capability for Vulkan, which allows a shader to contain 64-bit atomic operations on signed and unsigned integers. The supported operations include OpAtomicMin, OpAtomicMax, OpAtomicAnd, OpAtomicOr, OpAtomicXor, OpAtomicAdd, OpAtomicExchange, and OpAtomicCompareExchange.

**Promotion to Vulkan 1.2**

All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. However, if Vulkan 1.2 is supported and this extension is not, the `shaderBufferInt64Atomics` capability is optional. The original type, enum and command names are still available as aliases of the core functionality.
New Structures

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  - `VkPhysicalDeviceShaderAtomicInt64FeaturesKHR`

New Enum Constants

- `VK_KHR_SHADER_ATOMIC_INT64_EXTENSION_NAME`
- `VK_KHR_SHADER_ATOMIC_INT64_SPEC_VERSION`

- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_ATOMIC_INT64_FEATURES_KHR`

New SPIR-V Capabilities

- `Int64Atomics`

Interactions and External Dependencies

• This extension provides API support for `GL_ARB_shader_draw_parameters`

Contributors

• Daniel Koch, NVIDIA Corporation
• Jeff Bolz, NVIDIA
• Daniel Rakos, AMD
• Jan-Harald Fredriksen, ARM
• John Kessenich, Google
• Stuart Smith, IMG

Description

This extension adds support for the following SPIR-V extension in Vulkan:

• `SPV_KHR_shader_draw_parameters`

The extension provides access to three additional built-in shader variables in Vulkan:

• `BaseInstance`, containing the `firstInstance` parameter passed to drawing commands,
• `BaseVertex`, containing the `firstVertex` or `vertexOffset` parameter passed to drawing commands, and
• `DrawIndex`, containing the index of the draw call currently being processed from an indirect drawing call.

When using GLSL source-based shader languages, the following variables from `GL_ARB_shader_draw_parameters` can map to these SPIR-V built-in decorations:

• `in int gl_BaseInstanceARB; → BaseInstance`,
• `in int gl_BaseVertexARB; → BaseVertex`, and
• `in int gl_DrawIDARB; → DrawIndex`.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1. However, the `shaderDrawParameters` feature bit was added to distinguish whether it is actually available or not.
New Enum Constants

- VK_KHR_SHADER_DRAW_PARAMETERS_EXTENSION_NAME
- VK_KHR_SHADER_DRAW_PARAMETERS_SPEC_VERSION

New Built-In Variables

- BaseInstance
- BaseVertex
- DrawIndex

New SPIR-V Capabilities

- DrawParameters

Issues

1) Is this the same functionality as GL_ARB_shader_draw_parameters?

**RESOLVED**: It is actually a superset, as it also adds in support for arrayed drawing commands.

In GL for GL_ARB_shader_draw_parameters, gl_BaseVertexARB holds the integer value passed to the parameter to the command that resulted in the current shader invocation. In the case where the command has no baseVertex parameter, the value of gl_BaseVertexARB is zero. This means that gl_BaseVertexARB = baseVertex (for glDrawElements commands with baseVertex) or 0. In particular there are no glDrawArrays commands that take a baseVertex parameter.

Now in Vulkan, we have BaseVertex = vertexOffset (for indexed drawing commands) or firstVertex (for arrayed drawing commands), and so Vulkan’s version is really a superset of GL functionality.

**IP Status**
No known IP claims.

**Contributors**
- Alexander Galazin, Arm
- Jan-Harald Fredriksen, Arm
- Jeff Bolz, NVIDIA
- Graeme Leese, Broadcom
- Daniel Rakos, AMD

**Description**
The VK_KHR_shader_float16_int8 extension allows use of 16-bit floating-point types and 8-bit integer types in shaders for arithmetic operations.

It introduces two new optional features shaderFloat16 and shaderInt8 which directly map to the Float16 and the Int8 SPIR-V capabilities. The VK_KHR_shader_float16_int8 extension also specifies precision requirements for half-precision floating-point SPIR-V operations. This extension does not enable use of 8-bit integer types or 16-bit floating-point types in any shader input and output interfaces and therefore does not supersede the VK_KHR_8bit_storage or VK_KHR_16bit_storage extensions.
Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. However, if Vulkan 1.2 is supported and this extension is not, both the `shaderFloat16` and `shaderInt8` capabilities are optional. The original type, enum and command names are still available as aliases of the core functionality.

Description

The VK_KHR_shader_float_controls extension enables efficient use of floating-point computations through the ability to query and override the implementation's default behavior for rounding modes, denormals, signed zero, and infinity.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

New Structures
  • Extending VkPhysicalDeviceProperties2:
    ◦ VkPhysicalDeviceFloatControlsPropertiesKHR

New Enums
  • VkShaderFloatControlsIndependenceKHR

New Enum Constants
  • VK_KHR_SHADER_FLOAT_CONTROLS_EXTENSION_NAME
  • VK_KHR_SHADER_FLOAT_CONTROLS_SPEC_VERSION
• Extending \texttt{VkShaderFloatControlsIndependence}:
  \begin{itemize}
    \item \texttt{VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_32_BIT_ONLY_KHR}
    \item \texttt{VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_ALL_KHR}
    \item \texttt{VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_NONE_KHR}
  \end{itemize}

• Extending \texttt{VkStructureType}:
  \begin{itemize}
    \item \texttt{VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FLOAT_CONTROLS_PROPERTIES_KHR}
  \end{itemize}

\textbf{New SPIR-V Capabilities}

• \texttt{DenormPreserve}
• \texttt{DenormFlushToZero}
• \texttt{SignedZeroInfNanPreserve}
• \texttt{RoundingModeRTE}
• \texttt{RoundingModeRTZ}

\textbf{Issues}

1) Which instructions must flush denorms?

\textbf{RESOLVED}: Only floating-point conversion, floating-point arithmetic, floating-point relational (except \texttt{OpIsNaN}, \texttt{OpIsInf}), and floating-point GLSL.std.450 extended instructions must flush denormals.

2) What is the denorm behavior for intermediate results?

\textbf{RESOLVED}: When a SPIR-V instruction is implemented as a sequence of other instructions:

• in the \texttt{DenormFlushToZero} execution mode, the intermediate instructions may flush denormals, the final result of the sequence \textbf{must} not be denormal.
• in the \texttt{DenormPreserve} execution mode, denormals must be preserved throughout the whole sequence.

3) Do denorm and rounding mode controls apply to \texttt{OpSpecConstantOp}?

\textbf{RESOLVED}: Yes, except when the opcode is \texttt{OpQuantizeToF16}.

4) The SPIR-V specification says that \texttt{OpConvertFToU} and \texttt{OpConvertFToS} unconditionally round towards zero. Do the rounding mode controls specified through the execution modes apply to them?

\textbf{RESOLVED}: No, these instructions unconditionally round towards zero.

5) Do any of the “Pack” GLSL.std.450 instructions count as conversion instructions and have the rounding mode applied?

\textbf{RESOLVED}: No, only instructions listed in “section 3.32.11. Conversion Instructions” of the SPIR-V specification count as conversion instructions.
6) When using inf/nan-ignore mode, what is expected of OpIsNan and OpIsInf?

**RESOLVED:** These instructions must always accurately detect inf/nan if it is passed to them.

**Version 4 API Incompatibility**

The original versions of `VK_KHR_shader_float_controls` shipped with booleans named “separateDenormSettings” and “separateRoundingModeSettings”, which at first glance could have indicated “they can all be set independently, or not”. However the spec language as written indicated that the 32-bit value could always be set independently, and only the 16- and 64-bit controls needed to be the same if these values were `VK_FALSE`.

As a result of this slight disparity, and lack of test coverage for this facet of the extension, we ended up with two different behaviors in the wild, where some implementations worked as written, and others worked based on the naming. As these are hard limits in hardware with reasons for exposure as written, it was not possible to standardize on a single way to make this work within the existing API.

No known users of this part of the extension exist in the wild, and as such the Vulkan WG took the unusual step of retroactively changing the once boolean value into a tri-state enum, breaking source compatibility. This was however done in such a way as to retain ABI compatibility, in case any code using this did exist; with the numerical values 0 and 1 retaining their original specified meaning, and a new value signifying the additional “all need to be set together” state. If any applications exist today, compiled binaries will continue to work as written in most cases, but will need changes before the code can be recompiled.

Description

This extension adds support for the integer dot product SPIR-V instructions defined in SPV_KHR_integer_dot_product. These instructions are particularly useful for neural network inference and training but find uses in other general-purpose compute applications as well.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceShaderIntegerDotProductFeaturesKHR

- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceShaderIntegerDotProductPropertiesKHR

New Enum Constants

- VK_KHR_SHADER_INTEGER_DOT_PRODUCT_EXTENSION_NAME
- VK_KHR_SHADER_INTEGER_DOT_PRODUCT_SPEC_VERSION

- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_INTEGER_DOT_PRODUCT_FEATURES_KHR
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_INTEGER_DOT_PRODUCT_PROPERTIES_KHR

Promotion to Vulkan 1.3

Functionality in this extension is included in core Vulkan 1.3, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

New SPIR-V Capabilities

- DotProductInputAllKHR
- DotProductInput4x8BitKHR
- DotProductInput4x8BitPackedKHR
- DotProductKHR

Description
This extension adds Vulkan support for the SPV_KHR_terminate_invocation SPIR-V extension. That SPIR-V extension provides a new instruction, OpTerminateInvocation, which causes a shader invocation to immediately terminate and sets the coverage of shaded samples to 0; only previously executed instructions will have observable effects. The OpTerminateInvocation instruction, along with the OpDemoteToHelperInvocation instruction from the VK_EXT_shader_demote_to_helper_invocation extension, together replace the OpKill instruction, which could behave like either of these instructions. OpTerminateInvocation provides the behavior required by the GLSL discard statement, and should be used when available by GLSL compilers and applications that need the GLSL discard behavior.
New Structures

- Extending `VkPhysicalDeviceFeatures2, VkDeviceCreateInfo`:
  - `VkPhysicalDeviceShaderTerminateInvocationFeaturesKHR`

New Enum Constants

- Jesse Hall, Google
- John Kessenich, Google
- Neil Henning, AMD
- Tom Olson, Arm

Description
This extension allows the use of SPIR-V 1.4 shader modules. SPIR-V 1.4’s new features primarily make it an easier target for compilers from high-level languages, rather than exposing new hardware functionality.

SPIR-V 1.4 incorporates features that are also available separately as extensions. SPIR-V 1.4 shader modules do not need to enable those extensions with the `OpExtension` opcode, since they are integral parts of SPIR-V 1.4.

SPIR-V 1.4 introduces new floating point execution mode capabilities, also available via SPV_KHR_float_controls. Implementations are not required to support all of these new capabilities; support can be queried using VkPhysicalDeviceFloatControlsPropertiesKHR from the VK_KHR_shader_float_controls extension.

Promotion to Vulkan 1.2
All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

New Enum Constants
- VK_KHR_SPIRV_1_4_EXTENSION_NAME
- VK_KHR_SPIRV_1_4_SPEC_VERSION

Issues
1. Should we have an extension specific to this SPIR-V version, or add a version-generic query for SPIR-V version? SPIR-V 1.4 does not need any other API changes.
RESOLVED: Just expose SPIR-V 1.4.

Most new SPIR-V versions introduce optionally-required capabilities or have implementation-defined limits, and would need more API and specification changes specific to that version to make them available in Vulkan. For example, to support the subgroup capabilities added in SPIR-V 1.3 required introducing `VkPhysicalDeviceSubgroupProperties` to allow querying the supported group operation categories, maximum supported subgroup size, etc. While we could expose the parts of a new SPIR-V version that do not need accompanying changes generically, we will still end up writing extensions specific to each version for the remaining parts. Thus the generic mechanism will not reduce future spec-writing effort. In addition, making it clear which parts of a future version are supported by the generic mechanism and which cannot be used without specific support would be difficult to get right ahead of time.

2. Can different stages of the same pipeline use shaders with different SPIR-V versions?

RESOLVED: Yes.

Mixing SPIR-V versions 1.0-1.3 in the same pipeline has not been disallowed, so it would be inconsistent to disallow mixing 1.4 with previous versions. SPIR-V 1.4 does not introduce anything that should cause new difficulties here.

3. Must Vulkan extensions corresponding to SPIR-V extensions that were promoted to core in 1.4 be enabled in order to use that functionality in a SPIR-V 1.4 module?

RESOLVED: No, with caveats.

The SPIR-V 1.4 module does not need to declare the SPIR-V extensions, since the functionality is now part of core, so there is no need to enable the Vulkan extension that allows SPIR-V modules to declare the SPIR-V extension. However, when the functionality that is now core in SPIR-V 1.4 is optionally supported, the query for support is provided by a Vulkan extension, and that query can only be used if the extension is enabled.

This applies to any SPIR-V version; specifically for SPIR-V 1.4 this only applies to the functionality from `SPV_KHR_float_controls`, which was made available in Vulkan by `VK_KHR_shader_float_controls`. Even though the extension was promoted in SPIR-V 1.4, the capabilities are still optional in implementations that support `VK_KHR_spirv_1_4`.

A SPIR-V 1.4 module does not need to enable `SPV_KHR_float_controls` in order to use the capabilities, so if the application has a priori knowledge that the implementation supports the capabilities, it does not need to enable `VK_KHR_shader_float_controls`. However, if it does not have this knowledge and has to query for support at runtime, it must enable `VK_KHR_shader_float_controls` in order to use `VkPhysicalDeviceFloatControlsPropertiesKHR`.

**Description**

This extension modifies the original core synchronization APIs to simplify the interface and improve usability of these APIs. It also adds new pipeline stage and access flag types that extend into the 64-bit range, as we have run out within the 32-bit range. The new flags are identical to the old values within the 32-bit range, with new stages and bits beyond that.

Pipeline stages and access flags are now specified together in memory barrier structures, making the connection between the two more obvious. Additionally, scoping the pipeline stages into the barrier structs allows the use of the **MEMORY_READ** and **MEMORY_WRITE** flags without sacrificing precision. The per-stage access flags should be used to disambiguate specific accesses in a given stage or set of stages - for instance, between uniform reads and sampling operations.

Layout transitions have been simplified as well; rather than requiring a different set of layouts for depth/stencil/color attachments, there are generic **VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR** and **VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR** layouts which are contextually applied based on the image format. For example, for a depth format image, **VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR** is equivalent to **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL_KHR**. **VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR** also functionally replaces **VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL**.

Events are now more efficient, because they include memory dependency information when you set them on the device. Previously, this information was only known when waiting on an event, so the dependencies could not be satisfied until the wait occurred. That sometimes meant stalling the pipeline when the wait occurred. The new API provides enough information for implementations
to satisfy these dependencies in parallel with other tasks.

Queue submission has been changed to wrap command buffers and semaphores in extensible structures, which incorporate changes from Vulkan 1.1, VK_KHR_device_group, and VK_KHR_timeline_semaphore. This also adds a pipeline stage to the semaphore signal operation, mirroring the existing pipeline stage specification for wait operations.

Other miscellaneous changes include:

- Events can now be specified as interacting only with the device, allowing more efficient access to the underlying object.
- Image memory barriers that do not perform an image layout transition can be specified by setting `oldLayout` equal to `newLayout`.
  - E.g. the old and new layout can both be set to `VK_IMAGE_LAYOUT_UNDEFINED`, without discarding data in the image.
- Queue family ownership transfer parameters are simplified in some cases.
- Extensions with commands or functions with a `VkPipelineStageFlags` or `VkPipelineStageFlagBits` parameter have had those APIs replaced with equivalents using `VkPipelineStageFlags2KHR`.
- The new event and barrier interfaces are now more extensible for future changes.
- Relevant pipeline stage masks can now be specified as empty with the new `VK_PIPELINE_STAGE_NONE_KHR` and `VK_PIPELINE_STAGE_2_NONE_KHR` values.
- `VkMemoryBarrier2KHR` can be chained to `VkSubpassDependency2`, overriding the original 32-bit stage and access masks.

**New Base Types**

- `VkFlags64`

**New Commands**

- `vkCmdPipelineBarrier2KHR`
- `vkCmdResetEvent2KHR`
- `vkCmdSetEvent2KHR`
- `vkCmdWaitEvents2KHR`
- `vkCmdWriteTimestamp2KHR`
- `vkQueueSubmit2KHR`

If `VK_AMD_buffer_marker` is supported:

- `vkCmdWriteBufferMarker2AMD`

If `VK_NV_device_diagnostic_checkpoints` is supported:

- `vkGetQueueCheckpointData2NV`
New Structures

- VkBufferMemoryBarrier2KHR
- VkCommandBufferSubmitInfoKHR
- VkDependencyInfoKHR
- VkImageMemoryBarrier2KHR
- VkSemaphoreSubmitInfoKHR
- VkSubmitInfo2KHR

Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:

- VkPhysicalDeviceSynchronization2FeaturesKHR

Extending VkSubpassDependency2:

- VkMemoryBarrier2KHR

If VK_NV_device_diagnostic_checkpoints is supported:

- VkCheckpointData2NV

Extending VkQueueFamilyProperties2:

- VkQueueFamilyCheckpointProperties2NV

New Enums

- VkAccessFlagBits2KHR
- VkPipelineStageFlagBits2KHR
- VkSubmitFlagBitsKHR

New Bitmasks

- VkAccessFlags2KHR
- VkPipelineStageFlags2KHR
- VkSubmitFlagsKHR

New Enum Constants

- VK_KHR_SYNCHRONIZATION_2_EXTENSION_NAME
- VK_KHR_SYNCHRONIZATION_2_SPEC_VERSION

Extending VkAccessFlagBits:

- VK_ACCESS_NONE_KHR

Extending VkEventCreateFlagBits:

- VK_EVENT_CREATE_DEVICE_ONLY_BIT_KHR

Extending VkImageLayout:

- VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR
- VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

**Extending VkPipelineStageFlagBits:**
- VK_PIPELINE_STAGE_NONE_KHR

**Extending VkStructureType:**
- VK_STRUCTURE_TYPE_BUFFER_MEMORY_BARRIER_2_KHR
- VK_STRUCTURE_TYPE_COMMAND_BUFFER_SUBMIT_INFO_KHR
- VK_STRUCTURE_TYPE_DEPENDENCY_INFO_KHR
- VK_STRUCTURE_TYPE_IMAGE_MEMORY_BARRIER_2_KHR
- VK_STRUCTURE_TYPE_MEMORY_BARRIER_2_KHR
- VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SYNCHRONIZATION_2_FEATURES_KHR
- VK_STRUCTURE_TYPE_SEMAPHORE_SUBMIT_INFO_KHR
- VK_STRUCTURE_TYPE_SUBMIT_INFO_2_KHR

If VK_EXT_blend_operation_advanced is supported:

- Extending VkAccessFlagBits2:
  - VK_ACCESS_2_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT

If VK_EXT_conditional_rendering is supported:

- Extending VkAccessFlagBits2:
  - VK_ACCESS_2_CONDITIONAL_RENDERING_READ_BIT_EXT
- Extending VkPipelineStageFlagBits2:
  - VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT

If VK_EXT_fragment_density_map is supported:

- Extending VkAccessFlagBits2:
  - VK_ACCESS_2_FRAGMENT_DENSITY_MAP_READ_BIT_EXT
- Extending VkPipelineStageFlagBits2:
  - VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT

If VK_EXT_mesh_shader is supported:

- Extending VkPipelineStageFlagBits2:
  - VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT
  - VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT

If VK_EXT_transform_feedback is supported:

- Extending VkAccessFlagBits2:
  - VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT
- VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT
- VK_ACCESS_2_TRANSFORM_FEEDBACK_WRITE_BIT_EXT

• Extending VkPipelineStageFlagBits2:
  - VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT

If VK_KHR_acceleration_structure is supported:

• Extending VkAccessFlagBits2:
  - VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR
  - VK_ACCESS_2_ACCELERATION_STRUCTURE_WRITE_BIT_KHR

• Extending VkPipelineStageFlagBits2:
  - VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR

If VK_KHR_fragment_shading_rate is supported:

• Extending VkAccessFlagBits2:
  - VK_ACCESS_2_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR

• Extending VkPipelineStageFlagBits2:
  - VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

If VK_KHR_ray_tracing_pipeline is supported:

• Extending VkPipelineStageFlagBits2:
  - VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR

If VK_NV_device_diagnostic_checkpoints is supported:

• Extending VkStructureType:
  - VK_STRUCTURE_TYPE_CHECKPOINT_DATA_2_NV
  - VK_STRUCTURE_TYPE_QUEUE_FAMILY_CHECKPOINT_PROPERTIES_2_NV

If VK_NV_device_generated_commands is supported:

• Extending VkAccessFlagBits2:
  - VK_ACCESS_2_COMMAND_PREPROCESS_READ_BIT_NV
  - VK_ACCESS_2_COMMAND_PREPROCESS_WRITE_BIT_NV

• Extending VkPipelineStageFlagBits2:
  - VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV

If VK_NV_mesh_shader is supported:

• Extending VkPipelineStageFlagBits2:
  - VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_NV
If **VK_NV_ray_tracing** is supported:

- Extending **VkAccessFlagBits2**:
  - **VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_NV**
  - **VK_ACCESS_2_ACCELERATION_STRUCTURE_WRITE_BIT_NV**

- Extending **VkPipelineStageFlagBits2**:
  - **VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_NV**
  - **VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_NV**

If **VK_NV_shading_rate_image** is supported:

- Extending **VkAccessFlagBits2**:
  - **VK_ACCESS_2_SHADING_RATE_IMAGE_READ_BIT_NV**

- Extending **VkPipelineStageFlagBits2**:
  - **VK_PIPELINE_STAGE_2_SHADING_RATE_IMAGE_BIT_NV**

**Promotion to Vulkan 1.3**

Functionality in this extension is included in core Vulkan 1.3, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

• Ray Smith, Arm

Description
This extension introduces a new type of semaphore that has an integer payload identifying a point in a timeline. Such timeline semaphores support the following operations:

• Host query - A host operation that allows querying the payload of the timeline semaphore.
• Host wait - A host operation that allows a blocking wait for a timeline semaphore to reach a specified value.
• Host signal - A host operation that allows advancing the timeline semaphore to a specified value.

• Device wait - A device operation that allows waiting for a timeline semaphore to reach a specified value.

• Device signal - A device operation that allows advancing the timeline semaphore to a specified value.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

New Commands

• vkGetSemaphoreCounterValueKHR
• vkSignalSemaphoreKHR
• vkWaitSemaphoresKHR

New Structures

• VkSemaphoreSignalInfoKHR
• VkSemaphoreWaitInfoKHR
• Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  ◦ VkPhysicalDeviceTimelineSemaphoreFeaturesKHR
• Extending VkPhysicalDeviceProperties2:
  ◦ VkPhysicalDeviceTimelineSemaphorePropertiesKHR
• Extending VkSemaphoreCreateInfo, VkPhysicalDeviceExternalSemaphoreInfo:
  ◦ VkSemaphoreTypeCreateInfoKHR
• Extending VkSubmitInfo, VkBindSparseInfo:
  ◦ VkTimelineSemaphoreSubmitInfoKHR

New Enums

• VkSemaphoreTypeKHR
• VkSemaphoreWaitFlagBitsKHR

New Bitmasks

• VkSemaphoreWaitFlagsKHR

New Enum Constants

• VK_KHR_TIMELINE_SEMAPHORE_EXTENSION_NAME
• VK_KHR_TIMELINE_SEMAPHORE_SPEC_VERSION
• Extending `VkSemaphoreType`:
  ◦ `VK_SEMAPHORE_TYPE_BINARY_KHR`
  ◦ `VK_SEMAPHORE_TYPE_TIMELINE_KHR`

• Extending `VkSemaphoreWaitFlagBits`:
  ◦ `VK_SEMAPHORE_WAIT_ANY_BIT_KHR`

• Extending `VkStructureType`:
  ◦ `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TIMELINE_SEMAPHORE_FEATURES_KHR`
  ◦ `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TIMELINE_SEMAPHORE_PROPERTIES_KHR`
  ◦ `VK_STRUCTURE_TYPE_SEMAPHORE_SIGNAL_INFO_KHR`
  ◦ `VK_STRUCTURE_TYPE_SEMAPHORE_TYPE_CREATE_INFO_KHR`
  ◦ `VK_STRUCTURE_TYPE_SEMAPHORE_WAIT_INFO_KHR`
  ◦ `VK_STRUCTURE_TYPE_TIMELINE_SEMAPHORE_SUBMIT_INFO_KHR`

Issues

1) Do we need a new object type for this?

**RESOLVED:** No, we just introduce a new type of semaphore object, as `VK_KHR_external_semaphore_win32` already uses semaphores as the destination for importing D3D12 fence objects, which are semantically close/identical to the proposed synchronization primitive.

2) What type of payload the new synchronization primitive has?

**RESOLVED:** A 64-bit unsigned integer that can only be set to strictly increasing values by signal operations and is not changed by wait operations.

3) Does the new synchronization primitive have the same signal-before-wait requirement as the existing semaphores do?

**RESOLVED:** No. Timeline semaphores support signaling and waiting entirely asynchronously. It is the responsibility of the client to avoid deadlock.

4) Does the new synchronization primitive allow resetting its payload?

**RESOLVED:** No, allowing the payload value to “go backwards” is problematic. Applications looking for reset behavior should create a new instance of the synchronization primitive instead.

5) How do we enable host waits on the synchronization primitive?

**RESOLVED:** Both a non-blocking query of the current payload value of the synchronization primitive, and a blocking wait operation are provided.

6) How do we enable device waits and signals on the synchronization primitive?

**RESOLVED:** Similar to `VK_KHR_external_semaphore_win32`, this extension introduces a new structure that can be chained to `VkSubmitInfo` to specify the values signaled semaphores should be set to,
and the values waited semaphores need to reach.

7) Can the new synchronization primitive be used to synchronize presentation and swapchain image acquisition operations?

**RESOLVED:** Some implementations may have problems with supporting that directly, thus it is not allowed in this extension.

8) Do we want to support external sharing of the new synchronization primitive type?

**RESOLVED:** Yes. Timeline semaphore specific external sharing capabilities can be queried using `vkGetPhysicalDeviceExternalSemaphoreProperties` by chaining the new `VkSemaphoreTypeCreateInfoKHR` structure to its `pExternalSemaphoreInfo` structure. This allows having a different set of external semaphore handle types supported for timeline semaphores vs. binary semaphores.

9) Do we need to add a host signal operation for the new synchronization primitive type?

**RESOLVED:** Yes. This helps in situations where one host thread submits a workload but another host thread has the information on when the workload is ready to be executed.

10) How should the new synchronization primitive interact with the ordering requirements of the original `VkSemaphore`?

**RESOLVED:** Prior to calling any command which may cause a wait operation on a binary semaphore, the client **must** ensure that the semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends (if any) **must** have also been submitted for execution.

11) Should we have separate feature bits for different sub-features of timeline semaphores?

**RESOLVED:** No. The only feature which cannot be supported universally is timeline semaphore import/export. For import/export, the client is already required to query available external handle types via `vkGetPhysicalDeviceExternalSemaphoreProperties` and provide the semaphore type by adding a `VkSemaphoreTypeCreateInfoKHR` structure to the `pNext` chain of `VkPhysicalDeviceExternalSemaphoreInfo` so no new feature bit is required.

**Version History**

- Revision 1, 2018-05-10 (Faith Ekstrand)
  - Initial version
- Revision 2, 2019-06-12 (Faith Ekstrand)
  - Added an initialvalue parameter to timeline semaphore creation

Description
This extension enables tighter array and struct packing to be used with uniform buffers.

It modifies the alignment rules for uniform buffers, allowing for tighter packing of arrays and structures. This allows, for example, the std430 layout, as defined in GLSL to be supported in uniform buffers.

Promotion to Vulkan 1.2
All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.
New Structures

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  - `VkPhysicalDeviceUniformBufferStandardLayoutFeaturesKHR`

New Enum Constants

- `VK_KHR_UNIFORM_BUFFER_STANDARD_LAYOUT_EXTENSION_NAME`
- `VK_KHR_UNIFORM_BUFFER_STANDARD_LAYOUT_SPEC_VERSION`

- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_UNIFORM_BUFFER_STANDARD_LAYOUT_FEATURES_KHR`

Version History

- Revision 1, 2019-01-25 (Graeme Leese)
  - Initial draft

Description

The `VK_KHR_variable_pointers` extension allows implementations to indicate their level of support for the `SPV_KHR_variable_pointers` SPIR-V extension. The SPIR-V extension allows shader modules to use invocation-private pointers into uniform and/or storage buffers, where the pointer values can be dynamic and non-uniform.

The `SPV_KHR_variable_pointers` extension introduces two capabilities. The first, `VariablePointersStorageBuffer`, must be supported by all implementations of this extension. The second, `VariablePointers`, is optional.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted, however support for the `variablePointersStorageBuffer` feature is made optional. The original type, enum and command names are still available as aliases of the core functionality.

New Structures

• Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  ◦ `VkPhysicalDeviceVariablePointerFeaturesKHR`
  ◦ `VkPhysicalDeviceVariablePointersFeaturesKHR`
New Enum Constants

- `VK_KHR_VARIABLE_POINTERS_EXTENSION_NAME`
- `VK_KHR_VARIABLE_POINTERS_SPEC_VERSION`

Extending `VkStructureType`:

- `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VARIABLE_POINTERS_FEATURES_KHR`
- `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VARIABLE_POINTER_FEATURES_KHR`

New SPIR-V Capabilities

- `VariablePointers`
- `VariablePointersStorageBuffer`

Issues

1) Do we need an optional property for the SPIR-V `VariablePointersStorageBuffer` capability or should it be mandatory when this extension is advertised?

**RESOLVED:** Add it as a distinct feature, but make support mandatory. Adding it as a feature makes the extension easier to include in a future core API version. In the extension, the feature is mandatory, so that presence of the extension guarantees some functionality. When included in a core API version, the feature would be optional.

2) Can support for these capabilities vary between shader stages?

**RESOLVED:** No, if the capability is supported in any stage it must be supported in all stages.

3) Should the capabilities be features or limits?

**RESOLVED:** Features, primarily for consistency with other similar extensions.

Description
The VK_KHR_vulkan_memory_model extension allows use of the features guarded by the VulkanMemoryModel, VulkanMemoryModelDeviceScope, and VulkanMemoryModelAvailabilityVisibilityChains capabilities in shader modules. The Vulkan Memory Model formally defines how to synchronize memory accesses to the same memory locations performed by multiple shader invocations.

Note
Version 3 of the spec added a member (vulkanMemoryModelAvailabilityVisibilityChains) to
**VkPhysicalDeviceVulkanMemoryModelFeaturesKHR**, which is an incompatible change from version 2.

**Promotion to Vulkan 1.2**

All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. However, if Vulkan 1.2 is supported and this extension is not, the `vulkanMemoryModel` capability is optional. The original type, enum and command names are still available as aliases of the core functionality.

**New Structures**

- Extending `VkPhysicalDeviceFeatures2, VkDeviceCreateInfo`:
  - `VkPhysicalDeviceVulkanMemoryModelFeaturesKHR`

**New Enum Constants**

- `VK_KHR_VULKAN_MEMORY_MODEL_EXTENSION_NAME`
- `VK_KHR_VULKAN_MEMORY_MODEL_SPEC_VERSION`

- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_MEMORY_MODEL_FEATURES_KHR`

**New SPIR-V Capabilities**

- `VulkanMemoryModelKHR`

**Version History**

- Revision 1, 2018-06-24 (Jeff Bolz)
  - Initial draft
- Revision 3, 2018-12-10 (Jeff Bolz)
  - Add `vulkanMemoryModelAvailabilityVisibilityChains` member to the `VkPhysicalDeviceVulkanMemoryModelFeaturesKHR` structure.

**VK_KHR_zero_initialize_workgroup_memory**

**Name String**

`VK_KHR_zero_initialize_workgroup_memory`

**Extension Type**

Device extension

**Registered Extension Number**

326
Description

This extension allows the use of a null constant initializer on shader Workgroup memory variables, allowing implementations to expose any special hardware or instructions they may have. Zero initialization is commonly used by applications running untrusted content (e.g. web browsers) as way of defeating memory-scraping attacks.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceZeroInitializeWorkgroupMemoryFeaturesKHR

New Enum Constants

- VK_KHR_ZERO_INITIALIZE_WORKGROUP_MEMORY_EXTENSION_NAME
- VK_KHR_ZERO_INITIALIZE_WORKGROUP_MEMORY_SPEC_VERSION
- Extending VkStructureType:
Promotion to Vulkan 1.3

Functionality in this extension is included in core Vulkan 1.3, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

Version History

- Revision 1, 2020-11-18 (Alan Baker)

Description

This extension defines the `VK_FORMAT_A4R4G4B4_UNORM_PACK16_EXT` and `VK_FORMAT_A4B4G4R4_UNORM_PACK16_EXT` formats which are defined in other current graphics APIs.

This extension may be useful for building translation layers for those APIs or for porting applications that use these formats without having to resort to swizzles.

When `VK_EXT_custom_border_color` is used, these formats are not subject to the same restrictions for border color without format as with `VK_FORMAT_B4G4R4A4_UNORM_PACK16`.

New Structures

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  - `VkPhysicalDevice4444FormatsFeaturesEXT`

New Enum Constants

- `VK_EXT_4444_FORMATS_EXTENSION_NAME`
- `VK_EXT_4444_FORMATS_SPEC_VERSION`

- Extending `VkFormat`:
  - `VK_FORMAT_A4B4G4R4_UNORM_PACK16_EXT`
  - `VK_FORMAT_A4R4G4B4_UNORM_PACK16_EXT`

- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_4444_FORMATS_FEATURES_EXT`

Promotion to Vulkan 1.3

This extension has been partially promoted. The format enumerants introduced by the extension are included in core Vulkan 1.3, with the EXT suffix omitted. However, runtime support for these formats is optional in core Vulkan 1.3, while if this extension is supported, runtime support is mandatory. The feature structure is not promoted. The original enum names are still available as aliases of the core functionality.

Interactions and External Dependencies
• This extension provides API support for GLSL_EXT_buffer_reference and GLSL_EXT_buffer_reference_uvec2

Contributors
• Jeff Bolz, NVIDIA
• Neil Henning, AMD
• Tobias Hector, AMD
• Faith Ekstrand, Intel
**Description**

This extension allows the application to query a 64-bit buffer device address value for a buffer, which can be used to access the buffer memory via the `PhysicalStorageBufferEXT` storage class in the `GL_EXT_buffer_reference` GLSL extension and `SPV_EXT_physical_storage_buffer` SPIR-V extension.

It also allows buffer device addresses to be provided by a trace replay tool, so that it matches the address used when the trace was captured.

**New Commands**

- `vkGetBufferDeviceAddressEXT`

**New Structures**

- `VkBufferDeviceAddressInfoEXT`
- Extending `VkBufferCreateInfo`:
  - `VkBufferDeviceAddressCreateInfoEXT`
- Extending `VkPhysicalDeviceFeatures2, VkDeviceCreateInfo`:
  - `VkPhysicalDeviceBufferAddressFeaturesEXT`
  - `VkPhysicalDeviceBufferDeviceAddressFeaturesEXT`

**New Enum Constants**

- `VK_EXT_BUFFER_DEVICE_ADDRESS_EXTENSION_NAME`
- `VK_EXT_BUFFER_DEVICE_ADDRESS_SPEC_VERSION`
- Extending `VkBufferCreateFlagBits`:
  - `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_EXT`
- Extending `VkBufferUsageFlagBits`:
  - `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT_EXT`
- Extending `VkResult`:
  - `VK_ERROR_INVALID_DEVICE_ADDRESS_EXT`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_BUFFER_DEVICE_ADDRESS_CREATE_INFO_EXT`
  - `VK_STRUCTURE_TYPE_BUFFER_DEVICE_ADDRESS_INFO_EXT`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_BUFFER_ADDRESS_FEATURES_EXT`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_BUFFER_DEVICE_ADDRESS_FEATURES_EXT`

**New SPIR-V Capabilities**

- `PhysicalStorageBufferAddressesEXT`
Issues

1) Where is VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_BUFFER_ADDRESS_FEATURES_EXT and VkPhysicalDeviceBufferAddressFeaturesEXT?

RESOLVED: They were renamed as VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_BUFFER_DEVICE_ADDRESS_FEATURES_EXT and VkPhysicalDeviceBufferDeviceAddressFeaturesEXT accordingly for consistency. Even though, the old names can still be found in the generated header files for compatibility.

Description
The VK_EXT_debug_marker extension is a device extension. It introduces concepts of object naming and tagging, for better tracking of Vulkan objects, as well as additional commands for recording annotations of named sections of a workload to aid organization and offline analysis in external tools.

New Commands
• vkCmdDebugMarkerBeginEXT
• vkCmdDebugMarkerEndEXT
• vkCmdDebugMarkerInsertEXT
• vkDebugMarkerSetObjectNameEXT
• vkDebugMarkerSetObjectTagEXT

New Structures
• VkDebugMarkerMarkerInfoEXT
• VkDebugMarkerObjectNameInfoEXT
• VkDebugMarkerObjectTagInfoEXT

New Enums
• VkDebugReportObjectTypeEXT

New Enum Constants
• VK_EXT_DEBUG_MARKER_EXTENSION_NAME
• VK_EXT_DEBUG_MARKER_SPEC_VERSION
• Extending VkStructureType:
  ◦ VK_STRUCTURE_TYPE_DEBUG_MARKER_MARKER_INFO_EXT
  ◦ VK_STRUCTURE_TYPE_DEBUG_MARKER_OBJECT_NAME_INFO_EXT
  ◦ VK_STRUCTURE_TYPE_DEBUG_MARKER_OBJECT_TAG_INFO_EXT
Examples

Example 1

Associate a name with an image, for easier debugging in external tools or with validation layers that can print a friendly name when referring to objects in error messages.

```c
extern VkDevice device;
extern VkImage image;

// Must call extension functions through a function pointer:
PFN_vkDebugMarkerSetObjectNameEXT pfnDebugMarkerSetObjectNameEXT =
(PFN_vkDebugMarkerSetObjectNameEXT)vkGetDeviceProcAddr(device,
"vkDebugMarkerSetObjectNameEXT");

// Set a name on the image
const VkDebugMarkerObjectNameInfoEXT imageNameInfo =
{
    .sType = VK_STRUCTURE_TYPE_DEBUG_MARKER_OBJECT_NAME_INFO_EXT,
    .pNext = NULL,
    .objectType = VK_DEBUG_REPORT_OBJECT_TYPE_IMAGE_EXT,
    .object = (uint64_t)image,
    .pObjectName = "Brick Diffuse Texture",
};
pfnDebugMarkerSetObjectNameEXT(device, &imageNameInfo);

// A subsequent error might print:
//   Image 'Brick Diffuse Texture' (0xc0dec0dedeadbeef) is used in a
//   command buffer with no memory bound to it.
```

Example 2

Annotating regions of a workload with naming information so that offline analysis tools can display a more usable visualization of the commands submitted.

```c
extern VkDevice device;
extern VkCommandBuffer commandBuffer;

// Must call extension functions through a function pointer:
PFN_vkCmdDebugMarkerBeginEXT pfnCmdDebugMarkerBeginEXT =
(PFN_vkCmdDebugMarkerBeginEXT)vkGetDeviceProcAddr(device, "vkCmdDebugMarkerBeginEXT");
PFN_vkCmdDebugMarkerEndEXT pfnCmdDebugMarkerEndEXT =
(PFN_vkCmdDebugMarkerEndEXT)vkGetDeviceProcAddr(device, "vkCmdDebugMarkerEndEXT");
PFN_vkCmdDebugMarkerInsertEXT pfnCmdDebugMarkerInsertEXT =
(PFN_vkCmdDebugMarkerInsertEXT)vkGetDeviceProcAddr(device, "vkCmdDebugMarkerInsertEXT");

// Describe the area being rendered
const VkDebugMarkerMarkerInfoEXT houseMarker =
```
Start an annotated group of calls under the 'Brick House' name

```
PFN_CMD_DEBUG_MARKER_BEGINEXT pfnCmdDebugMarkerBeginEXT(commandBuffer, &houseMarker);
{
    // A mutable structure for each part being rendered
    VkDebugMarkerMarkerInfoEXT housePartMarker = {
        .sType = VK_STRUCTURE_TYPE_DEBUG_MARKER_MARKER_INFO_EXT,
        .pNext = NULL,
        .pMarkerName = NULL,
        .color = { 0.0f, 0.0f, 0.0f, 0.0f },
    }
    // Set the name and insert the marker
    housePartMarker.pMarkerName = "Walls";
    pfnCmdDebugMarkerInsertEXT(commandBuffer, &housePartMarker);

    // Insert the drawcall for the walls
    vkCmdDrawIndexed(commandBuffer, 1000, 1, 0, 0);

    // Insert a recursive region for two sets of windows
    housePartMarker.pMarkerName = "Windows";
    pfnCmdDebugMarkerBeginEXT(commandBuffer, &housePartMarker);
    {
        vkCmdDrawIndexed(commandBuffer, 75, 6, 1000, 0, 0);
        vkCmdDrawIndexed(commandBuffer, 100, 2, 1450, 0, 0);
    }
    pfnCmdDebugMarkerEndEXT(commandBuffer);

    housePartMarker.pMarkerName = "Front Door";
    pfnCmdDebugMarkerInsertEXT(commandBuffer, &housePartMarker);

    vkCmdDrawIndexed(commandBuffer, 350, 1, 1650, 0, 0);

    housePartMarker.pMarkerName = "Roof";
    pfnCmdDebugMarkerInsertEXT(commandBuffer, &housePartMarker);

    vkCmdDrawIndexed(commandBuffer, 500, 1, 2000, 0, 0);
}
// End the house annotation started above
pfnCmdDebugMarkerEndEXT(commandBuffer);
```
Issues

1) Should the tag or name for an object be specified using the `pNext` parameter in the object’s `Vk*CreateInfo` structure?

**RESOLVED**: No. While this fits with other Vulkan patterns and would allow more type safety and future proofing against future objects, it has notable downsides. In particular passing the name at `Vk*CreateInfo` time does not allow renaming, prevents late binding of naming information, and does not allow naming of implicitly created objects such as queues and swapchain images.

2) Should the command annotation functions `vkCmdDebugMarkerBeginEXT` and `vkCmdDebugMarkerEndEXT` support the ability to specify a color?

**RESOLVED**: Yes. The functions have been expanded to take an optional color which can be used at will by implementations consuming the command buffer annotations in their visualization.

3) Should the functions added in this extension accept an extensible structure as their parameter for a more flexible API, as opposed to direct function parameters? If so, which functions?

**RESOLVED**: Yes. All functions have been modified to take a structure type with extensible `pNext` pointer, to allow future extensions to add additional annotation information in the same commands.

Version History

- Revision 1, 2016-02-24 (Baldur Karlsson)
  - Initial draft, based on LunarG marker spec
- Revision 2, 2016-02-26 (Baldur Karlsson)
  - Renamed Dbg to DebugMarker in function names
  - Allow markers in secondary command buffers under certain circumstances
  - Minor language tweaks and edits
- Revision 3, 2016-04-23 (Baldur Karlsson)
  - Reorganize spec layout to closer match desired organization
  - Added optional color to markers (both regions and inserted labels)
  - Changed functions to take extensible structs instead of direct function parameters
- Revision 4, 2017-01-31 (Baldur Karlsson)
  - Added explicit dependency on VK_EXT_debug_report
  - Moved definition of `VkDebugReportObjectTypeEXT` to debug report chapter.
  - Fixed typo in dates in revision history

Description
Due to the nature of the Vulkan interface, there is very little error information available to the developer and application. By enabling optional validation layers and using the VK_EXT_debug_report extension, developers can obtain much more detailed feedback on the application’s use of Vulkan. This extension defines a way for layers and the implementation to call back to the application for events of interest to the application.
New Object Types

- VkDebugReportCallbackEXT

New Commands

- vkCreateDebugReportCallbackEXT
- vkDebugReportMessageEXT
- vkDestroyDebugReportCallbackEXT

New Structures

- Extending VkInstanceCreateInfo:
  - VkDebugReportCallbackCreateInfoEXT

New Function Pointers

- PFN_vkDebugReportCallbackEXT

New Enums

- VkDebugReportFlagBitsEXT
- VkDebugReportObjectTypeEXT

New Bitmasks

- VkDebugReportFlagsEXT

New Enum Constants

- VK_EXT_DEBUG_REPORT_EXTENSION_NAME
- VK_EXT_DEBUG_REPORT_SPEC_VERSION
- Extending VkObjectType:
  - VK_OBJECT_TYPE_DEBUG_REPORT_CALLBACK_EXT
- Extending VkResult:
  - VK_ERROR_VALIDATION_FAILED_EXT
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_DEBUG_REPORT_CALLBACK_CREATE_INFO_EXT
  - VK_STRUCTURE_TYPE_DEBUG_REPORT_CREATE_INFO_EXT

If Version 1.1 is supported:

- Extending VkDebugReportObjectTypeEXT:
  - VK_DEBUG_REPORT_OBJECT_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_EXT
  - VK_DEBUG_REPORT_OBJECT_TYPE_SAMPLER_YCBCR_CONVERSION_EXT
Examples

VK_EXT_debug_report allows an application to register multiple callbacks with the validation layers. Some callbacks may log the information to a file, others may cause a debug break point or other application defined behavior. An application can register callbacks even when no validation layers are enabled, but they will only be called for loader and, if implemented, driver events.

To capture events that occur while creating or destroying an instance an application can link a VkDebugReportCallbackCreateInfoEXT structure to the pNext element of the VkInstanceCreateInfo structure given to vkCreateInstance.

Example uses: Create three callback objects. One will log errors and warnings to the debug console using Windows OutputDebugString. The second will cause the debugger to break at that callback when an error happens and the third will log warnings to stdout.

```c
VkResult res;
VkDebugReportCallbackEXT cb1, cb2, cb3;

VkDebugReportCallbackCreateInfoEXT callback1 = {
    .sType = VK_STRUCTURE_TYPE_DEBUG_REPORT_CALLBACK_CREATE_INFO_EXT,
    .pNext = NULL,
    .flags = VK_DEBUG_REPORT_ERROR_BIT_EXT |
    VK_DEBUG_REPORT_WARNING_BIT_EXT,
    .pfnCallback = myOutputDebugString,
    .pUserData = NULL
};
res = vkCreateDebugReportCallbackEXT(instance, &callback1, &cb1);
if (res != VK_SUCCESS)
    /* Do error handling for VK_ERROR_OUT_OF_MEMORY */

    callback.flags = VK_DEBUG_REPORT_ERROR_BIT_EXT;
    callback.pfnCallback = myDebugBreak;
    callback.pUserData = NULL;
    res = vkCreateDebugReportCallbackEXT(instance, &callback, &cb2);
    if (res != VK_SUCCESS)
        /* Do error handling for VK_ERROR_OUT_OF_MEMORY */

VkDebugReportCallbackCreateInfoEXT callback3 = {
    .sType = VK_STRUCTURE_TYPE_DEBUG_REPORT_CALLBACK_CREATE_INFO_EXT,
    .pNext = NULL,
    .flags = VK_DEBUG_REPORT_WARNING_BIT_EXT,
    .pfnCallback = mystdOutLogger,
    .pUserData = NULL
};
res = vkCreateDebugReportCallbackEXT(instance, &callback3, &cb3);
if (res != VK_SUCCESS)
    /* Do error handling for VK_ERROR_OUT_OF_MEMORY */
```

...
/* remove callbacks when cleaning up */
vkDestroyDebugReportCallbackEXT(instance, cb1);
vkDestroyDebugReportCallbackEXT(instance, cb2);
vkDestroyDebugReportCallbackEXT(instance, cb3);

Note
In the initial release of the VK_EXT_debug_report extension, the token VK_STRUCTURE_TYPE_DEBUG_REPORT_CREATE_INFO_EXT was used. Starting in version 2 of the extension branch, VK_STRUCTURE_TYPE_DEBUG_REPORT_CALLBACK_CREATE_INFO_EXT is used instead for consistency with Vulkan naming rules. The older enum is still available for backwards compatibility.

Note
In the initial release of the VK_EXT_debug_report extension, the token VK_DEBUG_REPORT_OBJECT_TYPE_DEBUG_REPORT_EXT was used. Starting in version 8 of the extension branch, VK_DEBUG_REPORT_OBJECT_TYPE_DEBUG_REPORT_CALLBACK_EXT is used instead for consistency with Vulkan naming rules. The older enum is still available for backwards compatibility.

Issues

1) What is the hierarchy / seriousness of the message flags? E.g. ERROR > WARN > PERF_WARN ...

RESOLVED: There is no specific hierarchy. Each bit is independent and should be checked via bitwise AND. For example:

```c
if (localFlags & VK_DEBUG_REPORT_ERROR_BIT_EXT) {
    process error message
}
if (localFlags & VK_DEBUG_REPORT_DEBUG_BIT_EXT) {
    process debug message
}
```

The validation layers do use them in a hierarchical way (ERROR > WARN > PERF, WARN > DEBUG > INFO) and they (at least at the time of this writing) only set one bit at a time. But it is not a requirement of this extension.

It is possible that a layer may intercept and change, or augment the flags with extension values the application's debug report handler may not be familiar with, so it is important to treat each flag independently.

2) Should there be a VU requiring VkDebugReportCallbackCreateInfoEXT::flags to be non-zero?

RESOLVED: It may not be very useful, but we do not need VU statement requiring the VkDebugReportCallbackCreateInfoEXT::msgFlags at create-time to be non-zero. One can imagine that apps may prefer it as it allows them to set the mask as desired - including nothing - at runtime without having to check.
3) What is the difference between `VK_DEBUG_REPORT_DEBUG_BIT_EXT` and `VK_DEBUG_REPORT_INFORMATION_BIT_EXT`?

**RESOLVED:** `VK_DEBUG_REPORT_DEBUG_BIT_EXT` specifies information that could be useful debugging the Vulkan implementation itself.

4) How do you compare handles returned by the debug_report callback to the application’s handles?

**RESOLVED:** Due to the different nature of dispatchable and nondispatchable handles there is no generic way (that we know of) that works for common compilers with 32bit, 64bit, C and C++. We recommend applications use the same cast that the validation layers use:

```cpp
reinterpret_cast<uint64_t&>(dispatchableHandle)(uint64_t)(nondispatchableHandle)
```

+ This does require that the app treat dispatchable and nondispatchable handles differently.

**Version History**

- Revision 1, 2015-05-20 (Courtney Goetzenleuchter)
  - Initial draft, based on LunarG KHR spec, other KHR specs
- Revision 2, 2016-02-16 (Courtney Goetzenleuchter)
  - Update usage, documentation
- Revision 3, 2016-06-14 (Courtney Goetzenleuchter)
  - Update `VK_EXT_DEBUG_REPORT_SPEC_VERSION` to indicate added support for `vkCreateInstance` and `vkDestroyInstance`
- Revision 4, 2016-12-08 (Mark Lobodzinski)
  - Added `Display_KHR`, `DisplayModeKHR` extension objects
  - Added `ObjectTable_NVX`, `IndirectCommandsLayout_NVX` extension objects
  - Bumped spec revision
  - Retroactively added version history
- Revision 5, 2017-01-31 (Baldur Karlsson)
  - Moved definition of `VkDebugReportObjectTypeEXT` from debug marker chapter
- Revision 6, 2017-01-31 (Baldur Karlsson)
  - Added `VK_DEBUG_REPORT_OBJECT_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_KHR_EXT`
- Revision 7, 2017-04-20 (Courtney Goeltzenleuchter)
  - Clarify wording and address questions from developers.
- Revision 8, 2017-04-21 (Courtney Goeltzenleuchter)
- Remove unused enum VkDebugReportErrorEXT
- Revision 9, 2017-09-12 (Tobias Hector)
  - Added interactions with Vulkan 1.1
- Revision 10, 2020-12-14 (Courtney Goetzenleuchter)
  - Add issue 4 discussing matching handles returned by the extension, based on suggestion in public issue 368.

**Interactions and External Dependencies**

- This extension provides API support for GL_EXT_nonuniform_qualifier
Contributors

- Jeff Bolz, NVIDIA
- Daniel Rakos, AMD
- Slawomir Grajewski, Intel
- Tobias Hector, Imagination Technologies

Description

This extension adds several small features which together enable applications to create large descriptor sets containing substantially all of their resources, and selecting amongst those resources with dynamic (non-uniform) indexes in the shader. There are feature enables and SPIR-V capabilities for non-uniform descriptor indexing in the shader, and non-uniform indexing in the shader requires use of a new `NonUniformEXT` decoration defined in the `SPV_EXT_descriptor_indexing` SPIR-V extension. There are descriptor set layout binding creation flags enabling several features:

- Descriptors can be updated after they are bound to a command buffer, such that the execution of the command buffer reflects the most recent update to the descriptors.
- Descriptors that are not used by any pending command buffers can be updated, which enables writing new descriptors for frame N+1 while frame N is executing.
- Relax the requirement that all descriptors in a binding that is “statically used” must be valid, such that descriptors that are not accessed by a submission need not be valid and can be updated while that submission is executing.
- The final binding in a descriptor set layout can have a variable size (and unsized arrays of resources are allowed in the `GL_EXT_nonuniform_qualifier` and `SPV_EXT_descriptor_indexing` extensions).

Note that it is valid for multiple descriptor arrays in a shader to use the same set and binding number, as long as they are all compatible with the descriptor type in the pipeline layout. This means a single array binding in the descriptor set can serve multiple texture dimensionalities, or an array of buffer descriptors can be used with multiple different block layouts.

There are new descriptor set layout and descriptor pool creation flags that are required to opt in to the update-after-bind functionality, and there are separate `maxPerStage*` and `maxDescriptorSet*` limits that apply to these descriptor set layouts which may be much higher than the pre-existing limits. The old limits only count descriptors in non-updateAfterBind descriptor set layouts, and the new limits count descriptors in all descriptor set layouts in the pipeline layout.

New Structures

- Extending `VkDescriptorSetAllocateInfo`:
  - `VkDescriptorSetVariableDescriptorCountAllocateInfoEXT`
- Extending `VkDescriptorSetLayoutCreateInfo`:
  - `VkDescriptorSetLayoutBindingFlagsCreateInfoEXT`
- Extending `VkDescriptorSetLayoutSupport`:
  - `VkDescriptorSetVariableDescriptorCountLayoutSupportEXT`
Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
- `VkPhysicalDeviceDescriptorIndexingFeaturesEXT`

Extending `VkPhysicalDeviceProperties2`:
- `VkPhysicalDeviceDescriptorIndexingPropertiesEXT`

New Enums
- `VkDescriptorBindingFlagBitsEXT`  

New Bitmasks
- `VkDescriptorBindingFlagsEXT`  

New Enum Constants
- `VK_EXT_DESCRIPTOR_INDEXING_EXTENSION_NAME`
- `VK_EXT_DESCRIPTOR_INDEXING_SPEC_VERSION`

Extending `VkDescriptorBindingFlagBits`:
- `VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT_EXT`
- `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT_EXT`
- `VK_DESCRIPTOR_BINDING_UPDATE_UNUSED WHILE_PENDING_BIT_EXT`
- `VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT_EXT`

Extending `VkDescriptorPoolCreateFlagBits`:
- `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT_EXT`

Extending `VkDescriptorSetLayoutCreateFlagBits`:
- `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT_EXT`

Extending `VkResult`:
- `VK_ERROR_FRAGMENTATION_EXT`

Extending `VkStructureType`:
- `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_BINDING_FLAGS_CREATE_INFO_EXT`
- `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_VARIABLE_DESCRIPTOR_COUNT_ALLOCATE_INFO_EXT`
- `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_VARIABLE_DESCRIPTOR_COUNT_LAYOUT_SUPPORT_EXT`
- `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DESCRIPTOR_INDEXING_FEATURES_EXT`
- `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DESCRIPTOR_INDEXING_PROPERTIES_EXT`

Promotion to Vulkan 1.2

Functionality in this extension is included in core Vulkan 1.2, with the EXT suffix omitted. However, if Vulkan 1.2 is supported and this extension is not, the `descriptorIndexing` capability is optional. The original type, enum and command names are still available as aliases of the core functionality.

Description

This extension adds some more dynamic state to support applications that need to reduce the number of pipeline state objects they compile and bind.

New Commands

• vkCmdBindVertexBuffer2EXT
• vkCmdSetCullModeEXT
• vkCmdSetDepthBoundsTestEnableEXT
• vkCmdSetDepthCompareOpEXT
• vkCmdSetDepthTestEnableEXT
• vkCmdSetDepthWriteEnableEXT
• vkCmdSetFrontFaceEXT
• vkCmdSetPrimitiveTopologyEXT
• vkCmdSetScissorWithCountEXT
• vkCmdSetStencilOpEXT
• vkCmdSetStencilTestEnableEXT
• vkCmdSetViewportWithCountEXT

New Structures

• Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  ◦ VkPhysicalDeviceExtendedDynamicStateFeaturesEXT

New Enum Constants

• VK_EXT_EXTENDED_DYNAMIC_STATE_EXTENSION_NAME
• VK_EXT_EXTENDED_DYNAMIC_STATE_SPEC_VERSION

• Extending VkDynamicState:
  ◦ VK_DYNAMIC_STATE_CULL_MODE_EXT
  ◦ VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE_EXT
Extending VkStructureType:

- VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTENDED_DYNAMIC_STATE_FEATURES_EXT

**Promotion to Vulkan 1.3**

This extension has been partially promoted. All dynamic state enumerants and commands in this extension are included in core Vulkan 1.3, with the EXT suffix omitted. The feature structure is not promoted. Extension interfaces that were promoted remain available as aliases of the core functionality.

**Issues**

1) Why are the values of `pStrides` in `vkCmdBindVertexBuffers2` limited to be between 0 and the maximum extent of the binding, when this restriction is not present for the same static state?

Implementing these edge cases adds overhead to some implementations that would require significant cost when calling this function, and the intention is that this state should be more or less free to change.

`VK_EXT_vertex_input_dynamic_state` allows the stride to be changed freely when supported via `vkCmdSetVertexInputEXT`.

Description

In Vulkan, users can specify device-scope queue priorities. In some cases it may be useful to extend this concept to a system-wide scope. This extension provides a mechanism for callers to set their system-wide priority. The default queue priority is `VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_EXT`.

The driver implementation will attempt to skew hardware resource allocation in favor of the higher-priority task. Therefore, higher-priority work may retain similar latency and throughput characteristics even if the system is congested with lower priority work.

The global priority level of a queue shall take precedence over the per-process queue priority (`VkDeviceQueueCreateInfo::pQueuePriorities`).

Abuse of this feature may result in starving the rest of the system from hardware resources. Therefore, the driver implementation may deny requests to acquire a priority above the default priority (`VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_EXT`) if the caller does not have sufficient privileges. In this scenario `VK_ERROR_NOT_PERMITTED_EXT` is returned.

The driver implementation may fail the queue allocation request if resources required to complete
the operation have been exhausted (either by the same process or a different process). In this scenario `VK_ERROR_INITIALIZATION_FAILED` is returned.

New Structures

- Extending `VkDeviceQueueCreateInfo`:
  - `VkDeviceQueueGlobalPriorityCreateInfoEXT`

New Enums

- `VkQueueGlobalPriorityEXT`

New Enum Constants

- `VK_EXT_GLOBAL_PRIORITY_EXTENSION_NAME`
- `VK_EXT_GLOBAL_PRIORITY_SPEC_VERSION`

- Extending `VkResult`:
  - `VK_ERROR_NOT_PERMITTED_EXT`

**Description**

This device extension allows applications to query the global queue priorities supported by a queue family. It allows implementations to report which global priority levels are treated differently by the implementation, instead of silently mapping multiple requested global priority levels to the same internal priority, or using device creation failure to signal that a requested priority is not supported. It is intended primarily for use by system integration along with certain platform-specific priority enforcement rules.

**New Structures**

- Extending **VkPhysicalDeviceFeatures2, VkDeviceCreateInfo**:
  - **VkPhysicalDeviceGlobalPriorityQueryFeaturesEXT**
- Extending **VkQueueFamilyProperties2**:
  - **VkQueueFamilyGlobalPriorityPropertiesEXT**

**New Enum Constants**

- **VK_EXT_GLOBAL_PRIORITY_QUERY_EXTENSION_NAME**
- **VK_EXT_GLOBAL_PRIORITY_QUERY_SPEC_VERSION**
- **VK_MAX_GLOBAL_PRIORITY_SIZE_EXT**
- Extending **VkStructureType**: 
Issues

1) Can we additionally query whether a caller is permitted to acquire a specific global queue priority in this extension?

**RESOLVED**: No. Whether a caller has enough privilege goes with the OS, and the Vulkan driver cannot really guarantee that the privilege will not change in between this query and the actual queue creation call.

2) If more than 1 queue using global priority is requested, is there a good way to know which queue is failing the device creation?

**RESOLVED**: No. There is not a good way at this moment, and it is also not quite actionable for the applications to know that because the information may not be accurate. Queue creation can fail because of runtime constraints like insufficient privilege or lack of resource, and the failure is not necessarily tied to that particular queue configuration requested.

- Slawomir Cygan, Intel

**Description**

This extension adds stricter requirements for how out of bounds reads from images are handled.
Rather than returning undefined values, most out of bounds reads return R, G, and B values of zero and alpha values of either zero or one. Components not present in the image format may be set to zero or to values based on the format as described in Conversion to RGBA.

New Structures

- Extending `VkPhysicalDeviceFeatures2, VkDeviceCreateInfo`:
  - `VkPhysicalDeviceImageRobustnessFeaturesEXT`

New Enum Constants

- `VK_EXT_IMAGE_ROBUSTNESS_EXTENSION_NAME`
- `VK_EXT_IMAGE_ROBUSTNESS_SPEC_VERSION`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_ROBUSTNESS_FEATURES_EXT`

Promotion to Vulkan 1.3

Functionality in this extension is included in core Vulkan 1.3, with the EXT suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

Issues

1. How does this extension differ from VK_EXT_robustness2?

The guarantees provided by this extension are a subset of those provided by the robustImageAccess2 feature of VK_EXT_robustness2. Where this extension allows return values of (0, 0, 0, 0) or (0, 0, 0, 1), robustImageAccess2 requires that a particular value dependent on the image format be returned. This extension provides no guarantees about the values returned for an access to an invalid Lod.

Examples

None.

Description

This extension introduces the ability to back uniform blocks directly with descriptor sets by storing inline uniform data within descriptor pool storage. Compared to push constants this new construct allows uniform data to be reused across multiple disjoint sets of drawing or dispatching commands and may enable uniform data to be accessed with fewer indirections compared to uniforms backed by buffer memory.

New Structures

- Extending `VkDescriptorPoolCreateInfo`:
  - `VkDescriptorPoolInlineUniformBlockCreateInfoEXT`
- Extending `VkPhysicalDeviceFeatures2, VkDeviceCreateInfo`:
  - `VkPhysicalDeviceInlineUniformBlockFeaturesEXT`
- Extending `VkPhysicalDeviceProperties2`:
  - `VkPhysicalDeviceInlineUniformBlockPropertiesEXT`
- Extending `VkWriteDescriptorSet`:
  - `VkWriteDescriptorSetInlineUniformBlockEXT`

New Enum Constants

- `VK_EXT_INLINE_UNIFORM_BLOCK_EXTENSION_NAME`
- `VK_EXT_INLINE_UNIFORM_BLOCK_SPEC_VERSION`
- Extending `VkDescriptorType`:
  - `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_DESCRIPTOR_POOL_INLINE_UNIFORM_BLOCK_CREATE_INFO_EXT`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_INLINE_UNIFORM_BLOCK_FEATURES_EXT`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_INLINE_UNIFORM_BLOCK_PROPERTIES_EXT`
  - `VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET_INLINE_UNIFORM_BLOCK_EXT`

Promotion to Vulkan 1.3

Functionality in this extension is included in core Vulkan 1.3, with the EXT suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.
Vulkan 1.3 adds additional functionality related to this extension in the form of the maxInlineUniformTotalSize limit.

Issues

1) Do we need a new storage class for inline uniform blocks vs. uniform blocks?

**RESOLVED**: No. The Uniform storage class is used to allow the same syntax used for both uniform buffers and inline uniform blocks.

2) Is the descriptor array index and array size expressed in terms of bytes or dwords for inline uniform block descriptors?

**RESOLVED**: In bytes, but both must be a multiple of 4, similar to how push constant ranges are specified. The descriptorCount of VkDescriptorSetLayoutBinding thus provides the total number of bytes a particular binding with an inline uniform block descriptor type can hold, while the srcArrayElement, dstArrayElement, and descriptorCount members of VkWriteDescriptorSet, VkCopyDescriptorSet, and VkDescriptorUpdateTemplateEntry (where applicable) specify the byte offset and number of bytes to write/copy to the binding's backing store. Additionally, the stride member of VkDescriptorUpdateTemplateEntry is ignored for inline uniform blocks and a default value of one is used, meaning that the data to update inline uniform block bindings with must be contiguous in memory.

3) What layout rules apply for uniform blocks corresponding to inline constants?

**RESOLVED**: They use the same layout rules as uniform buffers.

4) Do we need to add non-uniform indexing features/properties as introduced by VK_EXT_descriptor_indexing for inline uniform blocks?

**RESOLVED**: No, because inline uniform blocks are not allowed to be “arrayed”. A single binding with an inline uniform block descriptor type corresponds to a single uniform block instance and the array indices inside that binding refer to individual offsets within the uniform block (see issue #2). However, this extension does introduce new features/properties about the level of support for update-after-bind inline uniform blocks.

5) Is the descriptorBindingVariableDescriptorCount feature introduced by VK_EXT_descriptor_indexing supported for inline uniform blocks?

**RESOLVED**: Yes, as long as other inline uniform block specific limits are respected.

6) Do the robustness guarantees of robustBufferAccess apply to inline uniform block accesses?

**RESOLVED**: No, similarly to push constants, as they are not backed by buffer memory like uniform buffers.

  • Allen Jensen, NVIDIA
  • Faith Ekstrand, Intel

**Description**

This extension adds some line rasterization features that are commonly used in CAD applications and supported in other APIs like OpenGL. Bresenham-style line rasterization is supported, smooth rectangular lines (coverage to alpha) are supported, and stippled lines are supported for all three
line rasterization modes.

**Promotion to** **VK_KHR_line_rasterization**

All functionality in this extension is included in **VK_KHR_line_rasterization**, with the suffix changed to KHR. The original enum names are still available as aliases of the KHR functionality.

**New Commands**

- `vkCmdSetLineStippleEXT`

**New Structures**

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  - `VkPhysicalDeviceLineRasterizationFeaturesEXT`
- Extending `VkPhysicalDeviceProperties2`:
  - `VkPhysicalDeviceLineRasterizationPropertiesEXT`
- Extending `VkPipelineRasterizationStateCreateInfo`:
  - `VkPipelineRasterizationLineStateCreateInfoEXT`

**New Enums**

- `VkLineRasterizationModeEXT`

**New Enum Constants**

- `VK_EXT_LINE_RASTERIZATION_EXTENSION_NAME`
- `VK_EXT_LINE_RASTERIZATION_SPEC_VERSION`
- Extending `VkDynamicState`:
  - `VK_DYNAMIC_STATE_LINE_STIPPLE_EXT`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LINE_RASTERIZATION_FEATURES_EXT`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LINE_RASTERIZATION_PROPERTIES_EXT`
  - `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_LINE_STATE_CREATE_INFO_EXT`

**Issues**

1) Do we need to support Bresenham-style and smooth lines with more than one rasterization sample? i.e. the equivalent of `glDisable(GL_MULTISAMPLE)` in OpenGL when the framebuffer has more than one sample?

**RESOLVED**: Yes. For simplicity, Bresenham line rasterization carries forward a few restrictions from OpenGL, such as not supporting per-sample shading, alpha to coverage, or alpha to one.

**Description**

This extension incorporates **VK_ATTACHMENT_STORE_OP_NONE_EXT** from **VK_QCOM_render_pass_store_ops**, enabling applications to avoid unnecessary synchronization when an attachment is not written during a render pass.

Additionally, **VK_ATTACHMENT_LOAD_OP_NONE_EXT** is introduced to avoid unnecessary synchronization...
when an attachment is not used during a render pass at all. In combination with `VK_ATTACHMENT_STORE_OP_NONE_EXT`, this is useful as an alternative to preserve attachments in applications that cannot decide if an attachment will be used in a render pass until after the necessary pipelines have been created.

**Promotion to VK_KHR_load_store_op_none**

All functionality in this extension is included in `VK_KHR_load_store_op_none`, with the suffix changed to KHR. The original enum names are still available as aliases of the KHR functionality.

**New Enum Constants**

- `VK_EXT_LOAD_STORE_OP_NONE_EXTENSION_NAME`
- `VK_EXT_LOAD_STORE_OP_NONE_SPEC_VERSION`
- Extending `VkAttachmentLoadOp`:
  - `VK_ATTACHMENT_LOAD_OP_NONE_EXT`
- Extending `VkAttachmentStoreOp`:
  - `VK_ATTACHMENT_STORE_OP_NONE_EXT`

**Note**

While `VK_ATTACHMENT_STORE_OP_NONE` is part of Vulkan 1.3, this extension was not promoted to core either in whole or in part. This functionality was promoted from `VK_KHR_dynamic_rendering`.

**Version History**

- Revision 1, 2021-06-06 (Shahbaz Youssefi)
  - Initial revision, based on VK_QCOM_render_pass_store_ops.
  - Added `VK_ATTACHMENT_LOAD_OP_NONE_EXT`.

Description

This extension adds flags to Vk*PipelineCreateInfo and VkPipelineCacheCreateInfo structures with the aim of improving the predictability of pipeline creation cost. The goal is to provide information about potentially expensive hazards within the client driver during pipeline creation to the application before carrying them out rather than after.

Background

Pipeline creation is a costly operation, and the explicit nature of the Vulkan design means that cost is not hidden from the developer. Applications are also expected to schedule, prioritize, and load balance all calls for pipeline creation. It is strongly advised that applications create pipelines
sufficiently ahead of their usage. Failure to do so will result in an unresponsive application, intermittent stuttering, or other poor user experiences. Proper usage of pipeline caches and/or derivative pipelines help mitigate this but is not assured to eliminate disruption in all cases. In the event that an ahead-of-time creation is not possible, considerations should be taken to ensure that the current execution context is suitable for the workload of pipeline creation including possible shader compilation.

Applications making API calls to create a pipeline must be prepared for any of the following to occur:

- OS/kernel calls to be made by the ICD
- Internal memory allocation not tracked by the pAllocator passed to \texttt{vkCreate*Pipelines}
- Internal thread synchronization or yielding of the current thread's core
- Extremely long (multi-millisecond+), blocking, compilation times
- Arbitrary call stacks depths and stack memory usage

The job or task based game engines that are being developed to take advantage of explicit graphics APIs like Vulkan may behave exceptionally poorly if any of the above scenarios occur. However, most game engines are already built to “stream” in assets dynamically as the user plays the game. By adding control by way of \texttt{VkPipelineCreateFlags}, we can require an ICD to report back a failure in critical execution paths rather than forcing an unexpected wait.

Applications can prevent unexpected compilation by setting \texttt{VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT_EXT} on \texttt{Vk*PipelineCreateInfo::flags}. When set, an ICD must not attempt pipeline or shader compilation to create the pipeline object. In such a case, if the implementation fails to create a pipeline without compilation, the implementation must return the result \texttt{VK_PIPELINE_COMPILE_REQUIRED_EXT} and return \texttt{VK_NULL_HANDLE} for the pipeline.

By default \texttt{vkCreate*Pipelines} calls must attempt to create all pipelines before returning. Setting \texttt{VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT_EXT} on \texttt{Vk*PipelineCreateInfo::flags} can be used as an escape hatch for batched pipeline creates.

Hidden locks also add to the unpredictability of the cost of pipeline creation. The most common case of locks inside the \texttt{vkCreate*Pipelines} is internal synchronization of the \texttt{VkPipelineCache} object. \texttt{VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT_EXT} can be set when calling \texttt{vkCreatePipelineCache} to state the cache is externally synchronized.

The hope is that armed with this information application and engine developers can leverage existing asset streaming systems to recover from ”just-in-time” pipeline creation stalls.

New Structures

- Extending \texttt{VkPhysicalDeviceFeatures2, VkDeviceCreateInfo}:
  - \texttt{VkPhysicalDevicePipelineCreationCacheControlFeaturesEXT}
New Enums

- VkPipelineCacheCreateFlagBits

New Enum Constants

- VK_EXT_PIPELINE_CREATION_CACHE_CONTROL_EXTENSION_NAME
- VK_EXT_PIPELINE_CREATION_CACHE_CONTROL_SPEC_VERSION

Extending VkPipelineCacheCreateFlagBits:
- VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT_EXT

Extending VkPipelineCreateFlagBits:
- VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT_EXT
- VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT_EXT

Extending VkResult:
- VK_ERROR_PIPELINE_COMPILE_REQUIRED_EXT
- VK_PIPELINE_COMPILE_REQUIRED_EXT

Extending VkStructureType:
- VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PIPELINE_CREATION_CACHE_CONTROL_FEATURES_EXT

Promotion to Vulkan 1.3

Functionality in this extension is included in core Vulkan 1.3, with the EXT suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

Description
This extension is a device extension which enables attaching arbitrary payloads to Vulkan objects. It introduces the idea of private data slots as a means of storing a 64-bit unsigned integer of application defined data. Private data slots can be created or destroyed any time an associated device is available. Private data slots can be reserved at device creation time, and limiting use to the amount reserved will allow the extension to exhibit better performance characteristics.

New Object Types
- VkPrivateDataSlotEXT

New Commands
- vkCreatePrivateDataSlotEXT
- vkDestroyPrivateDataSlotEXT
- vkGetPrivateDataEXT
- vkSetPrivateDataEXT
New Structures

- VkPrivateDataSlotCreateInfoEXT

- Extending VkDeviceCreateInfo:
  - VkDevicePrivateDataCreateInfoEXT

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDevicePrivateDataFeaturesEXT

New Bitmasks

- VkPrivateDataSlotCreateFlagsEXT

New Enum Constants

- VK_EXT_PRIVATE_DATA_EXTENSION_NAME
- VK_EXT_PRIVATE_DATA_SPEC_VERSION

- Extending VkObjectType:
  - VK_OBJECT_TYPE_PRIVATE_DATA_SLOT_EXT

- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_DEVICE_PRIVATE_DATA_CREATE_INFO_EXT
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PRIVATE_DATA_FEATURES_EXT
  - VK_STRUCTURE_TYPE_PRIVATE_DATA_SLOT_CREATE_INFO_EXT

Promotion to Vulkan 1.3

Functionality in this extension is included in core Vulkan 1.3, with the EXT suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

Examples

- In progress

Issues

(1) If I have to create a VkPrivateDataSlot to store and retrieve data on an object, how does this extension help me? Will I not need to store the VkPrivateDataSlot mapping with each object, and if I am doing that, I might as well just store the original data!

**RESOLVED:** The VkPrivateDataSlot can be thought of as an opaque index into storage that is reserved in each object. That is, you can use the same VkPrivateDataSlot with each object for a specific piece of information. For example, if a layer wishes to track per-object information, the layer only needs to allocate one VkPrivateDataSlot per device and it can use that private data slot for all of the device’s child objects. This allows multiple layers to store private data without conflicting with each other’s and/or the application’s private data.

(2) What if I need to store more than 64-bits of information per object?
RESOLVED: The data that you store per object could be a pointer to another object or structure of your own allocation.

Description

In unextended Vulkan, minification and magnification filters such as LINEAR allow sampled image lookups to return a filtered texel value produced by computing a weighted average of a collection of texels in the neighborhood of the texture coordinate provided.

This extension provides a new sampler parameter which allows applications to produce a filtered texel value by computing a component-wise minimum (MIN) or maximum (MAX) of the texels that would normally be averaged. The reduction mode is orthogonal to the minification and magnification filter parameters. The filter parameters are used to identify the set of texels used to produce a final filtered value; the reduction mode identifies how these texels are combined.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2, with the EXT suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

Description
This extension adds Vulkan support for the SPV_EXT_demote_to_helper_invocation SPIR-V extension. That SPIR-V extension provides a new instruction OpDemoteToHelperInvocationEXT allowing shaders to “demote” a fragment shader invocation to behave like a helper invocation for its duration. The
demoted invocation will have no further side effects and will not output to the framebuffer, but remains active and can participate in computing derivatives and in group operations. This is a better match for the “discard” instruction in HLSL.

New Structures

• Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:

Interactions and External Dependencies
• This extension provides API support for GL_ARB_shader_ballot

Contributors
• Jeff Bolz, NVIDIA
• Neil Henning, Codeplay
• Daniel Koch, NVIDIA Corporation

Description
This extension adds support for the following SPIR-V extension in Vulkan:

• SPV_KHR_shader_ballot

This extension provides the ability for a group of invocations, which execute in parallel, to do limited forms of cross-invocation communication via a group broadcast of an invocation value, or broadcast of a bit array representing a predicate value from each invocation in the group.

This extension provides access to a number of additional built-in shader variables in Vulkan:

• SubgroupEqMaskKHR, containing the subgroup mask of the current subgroup invocation,
• SubgroupGeMaskKHR, containing the subgroup mask of the invocations greater than or equal to the current invocation,
• SubgroupGtMaskKHR, containing the subgroup mask of the invocations greater than the current invocation,
• SubgroupLeMaskKHR, containing the subgroup mask of the invocations less than or equal to the current invocation,
• SubgroupLtMaskKHR, containing the subgroup mask of the invocations less than the current invocation,
invocation,
- **SubgroupLocalInvocationId**, containing the index of an invocation within a subgroup, and
- **SubgroupSize**, containing the maximum number of invocations in a subgroup.

Additionally, this extension provides access to the new SPIR-V instructions:
- **OpSubgroupBallotKHR**, 
- **OpSubgroupFirstInvocationKHR**, and
- **OpSubgroupReadInvocationKHR**, 

When using GLSL source-based shader languages, the following variables and shader functions from GL_ARB_shader_ballot can map to these SPIR-V built-in decorations and instructions:
- `in uint64_t gl_SubGroupEqMaskARB;` → **SubgroupEqMaskKHR**, 
- `in uint64_t gl_SubGroupGeMaskARB;` → **SubgroupGeMaskKHR**, 
- `in uint64_t gl_SubGroupGtMaskARB;` → **SubgroupGtMaskKHR**, 
- `in uint64_t gl_SubGroupLeMaskARB;` → **SubgroupLeMaskKHR**, 
- `in uint64_t gl_SubGroupLtMaskARB;` → **SubgroupLtMaskKHR**, 
- `in uint gl_SubGroupInvocationARB;` → **SubgroupLocalInvocationId**, 
- `uniform uint gl_SubGroupSizeARB;` → **SubgroupSize**, 
- `ballotARB()` → **OpSubgroupBallotKHR**, 
- `readFirstInvocationARB()` → **OpSubgroupFirstInvocationKHR**, and
- `readInvocationARB()` → **OpSubgroupReadInvocationKHR**.

**Deprecated by Vulkan 1.2**

Most of the functionality in this extension is superseded by the core Vulkan 1.1 subgroup operations. However, Vulkan 1.1 required the **OpGroupNonUniformBroadcast “Id”** to be constant. This restriction was removed in Vulkan 1.2 with the addition of the **subgroupBroadcastDynamicId** feature.

**New Enum Constants**
- **VK_EXT_SHADER_SUBGROUP_BALLOT_EXTENSION_NAME**
- **VK_EXT_SHADER_SUBGROUP_BALLOT_SPEC_VERSION**

**New Built-In Variables**
- **SubgroupEqMaskKHR**
- **SubgroupGeMaskKHR**
- **SubgroupGtMaskKHR**
- **SubgroupLeMaskKHR**
- **SubgroupLtMaskKHR**
• SubgroupLocalInvocationId
• SubgroupSize

New SPIR-V Capabilities
• SubgroupBallotKHR

Description

This extension adds support for the following SPIR-V extension in Vulkan:

- SPV_KHR_subgroup_vote

This extension provides new SPIR-V instructions:

- OpSubgroupAllKHR,
- OpSubgroupAnyKHR, and
- OpSubgroupAllEqualKHR.

to compute the composite of a set of boolean conditions across a group of shader invocations that are running concurrently (a subgroup). These composite results may be used to execute shaders more efficiently on a VkPhysicalDevice.

When using GLSL source-based shader languages, the following shader functions from GL_ARB_shader_group_vote can map to these SPIR-V instructions:

- anyInvocationARB() → OpSubgroupAnyKHR,
- allInvocationsARB() → OpSubgroupAllKHR, and
- allInvocationsEqualARB() → OpSubgroupAllEqualKHR.

The subgroup across which the boolean conditions are evaluated is implementation-dependent, and this extension provides no guarantee over how individual shader invocations are assigned to subgroups. In particular, a subgroup has no necessary relationship with the compute shader local workgroup — any pair of shader invocations in a compute local workgroup may execute in different subgroups as used by these instructions.

Compute shaders operate on an explicitly specified group of threads (a local workgroup), but many implementations will also group non-compute shader invocations and execute them concurrently. When executing code like

```c
if (condition) {
    result = do_fast_path();
} else {
    result = do_general_path();
}
```

where condition diverges between invocations, an implementation might first execute do_fast_path() for the invocations where condition is true and leave the other invocations dormant.
Once `do_fast_path()` returns, it might call `do_general_path()` for invocations where `condition` is `false` and leave the other invocations dormant. In this case, the shader executes both the fast and the general path and might be better off just using the general path for all invocations.

This extension provides the ability to avoid divergent execution by evaluating a condition across an entire subgroup using code like:

```c
if (allInvocationsARB(condition)) {
    result = do_fast_path();
} else {
    result = do_general_path();
}
```

The built-in function `allInvocationsARB()` will return the same value for all invocations in the group, so the group will either execute `do_fast_path()` or `do_general_path()`, but never both. For example, shader code might want to evaluate a complex function iteratively by starting with an approximation of the result and then refining the approximation. Some input values may require a small number of iterations to generate an accurate result (`do_fast_path`) while others require a larger number (`do_general_path`). In another example, shader code might want to evaluate a complex function (`do_general_path`) that can be greatly simplified when assuming a specific value for one of its inputs (`do_fast_path`).

**Deprecated by Vulkan 1.1**

All functionality in this extension is superseded by the core Vulkan 1.1 subgroup operations.

**New Enum Constants**

- `VK_EXT_SHADER_SUBGROUP_VOTE_EXTENSION_NAME`
- `VK_EXT_SHADER_SUBGROUP_VOTE_SPEC_VERSION`

**New SPIR-V Capabilities**

- `SubgroupVoteKHR`

**Version History**

  - Initial draft

**VK_EXT_shader_viewport_index_layer**

**Name String**

- `VK_EXT_shader_viewport_index_layer`

**Extension Type**

- Device extension
Description

This extension adds support for the ShaderViewportIndexLayerEXT capability from the SPV_EXT_shader_viewport_index_layer extension in Vulkan.

This extension allows variables decorated with the Layer and ViewportIndex built-ins to be exported from vertex or tessellation shaders, using the ShaderViewportIndexLayerEXT capability.

When using GLSL source-based shading languages, the gl_ViewportIndex and gl_Layer built-in
variables map to the SPIR-V ViewportIndex and Layer built-in decorations, respectively. Behavior of these variables is extended as described in the GL_ARB_shader_viewport_layer_array (or the precursor GL_AMD_vertex_shader_layer, GL_AMD_vertex_shader_viewport_index, and GL_NV_viewport_array2 extensions).

Note

The ShaderViewportIndexLayerEXT capability is equivalent to the ShaderViewportIndexLayerNV capability added by VK_NV_viewport_array2.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2.

The single ShaderViewportIndexLayerEXT capability from the SPV_EXT_shader_viewport_index_layer extension is replaced by the ShaderViewportIndex and ShaderLayer capabilities from SPIR-V 1.5 which are enabled by the shaderOutputViewportIndex and shaderOutputLayer features, respectively. Additionally, if Vulkan 1.2 is supported but this extension is not, these capabilities are optional.

Enabling both features is equivalent to enabling the VK_EXT_shader_viewport_index_layer extension.

New Enum Constants

- VK_EXT_SHADER_VIEWPORT_INDEX_LAYER_EXTENSION_NAME
- VK_EXT_SHADER_VIEWPORT_INDEX_LAYER_SPEC_VERSION

New or Modified Built-In Variables

- (modified) Layer
- (modified) ViewportIndex

New SPIR-V Capabilities

- ShaderViewportIndexLayerEXT

VK_EXT_subgroup_size_control

Name String

VK_EXT_subgroup_size_control

Extension Type

Device extension
Description

This extension enables an implementation to control the subgroup size by allowing a varying subgroup size and also specifying a required subgroup size.

It extends the subgroup support in Vulkan 1.1 to allow an implementation to expose a varying subgroup size. Previously Vulkan exposed a single subgroup size per physical device, with the expectation that implementations will behave as if all subgroups have the same size. Some implementations may dispatch shaders with a varying subgroup size for different subgroups. As a
result they could implicitly split a large subgroup into smaller subgroups or represent a small subgroup as a larger subgroup, some of whose invocations were inactive on launch.

To aid developers in understanding the performance characteristics of their programs, this extension exposes a minimum and maximum subgroup size that a physical device supports and a pipeline create flag to enable that pipeline to vary its subgroup size. If enabled, any SubgroupSize decorated variables in the SPIR-V shader modules provided to pipeline creation may vary between the minimum and maximum subgroup sizes.

An implementation is also optionally allowed to support specifying a required subgroup size for a given pipeline stage. Implementations advertise which stages support a required subgroup size, and any pipeline of a supported stage can be passed a VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT structure to set the subgroup size for that shader stage of the pipeline. For compute shaders, this requires the developer to query the maxComputeWorkgroupSubgroups and ensure that:

\[ s = \text{WorkGroupSize}_x \times \text{WorkGroupSize}_y \times \text{WorkgroupSize}_z \leq \text{SubgroupSize} \times \text{maxComputeWorkgroupSubgroups} \]

Developers can also specify a new pipeline shader stage create flag that requires the implementation to have fully populated subgroups within local workgroups. This requires the workgroup size in the X dimension to be a multiple of the subgroup size.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceSubgroupSizeControlFeaturesEXT

- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceSubgroupSizeControlPropertiesEXT

- Extending VkPipelineShaderStageCreateInfo, VkShaderCreateInfoEXT:
  - VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT

New Enum Constants

- VK_EXT_SUBGROUP_SIZE_CONTROL_EXTENSION_NAME
- VK_EXT_SUBGROUP_SIZE_CONTROL_SPEC_VERSION

- Extending VkPipelineShaderStageCreateFlagBits:
  - VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT
  - VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT

- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SUBGROUP_SIZE_CONTROL_FEATURES_EXT
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SUBGROUP_SIZE_CONTROL_PROPERTIES_EXT
  - VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_REQUIRED_SUBGROUP_SIZE_CREATE_INFO_EXT
Promotion to Vulkan 1.3

Functionality in this extension is included in core Vulkan 1.3, with the EXT suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

Version History

- Revision 1, 2019-03-05 (Neil Henning)
  - Initial draft
- Revision 2, 2019-07-26 (Faith Ekstrand)
  - Add the missing `VkPhysicalDeviceSubgroupSizeControlFeaturesEXT` for querying subgroup size control features.

Description

This extension adds more expressive alignment requirements for uniform and storage texel buffers. Some implementations have single texel alignment requirements that cannot be expressed via `VkPhysicalDeviceLimits::minTexelBufferOffsetAlignment`.

New Structures

- Extending `VkPhysicalDeviceFeatures2, VkDeviceCreateInfo`:
  - `VkPhysicalDeviceTexelBufferAlignmentFeaturesEXT`
- Extending `VkPhysicalDeviceProperties2`:
  - `VkPhysicalDeviceTexelBufferAlignmentPropertiesEXT`

New Enum Constants

- `VK_EXT_TEXEL_BUFFER_ALIGNMENT_EXTENSION_NAME`
- `VK_EXT_TEXEL_BUFFER_ALIGNMENT_SPEC_VERSION`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TEXEL_BUFFER_ALIGNMENT_FEATURES_EXT`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TEXEL_BUFFER_ALIGNMENT_PROPERTIES_EXT`

Promotion to Vulkan 1.3

Functionality in this extension is included in core Vulkan 1.3, with the EXT suffix omitted. However, only the properties structure is promoted. The feature structure is not promoted and `texelBufferAlignment` is enabled if using a Vulkan 1.3 instance. The original type name is still available as an alias of the core functionality.

Description
This extension adds support for textures compressed using the Adaptive Scalable Texture
Compression (ASTC) High Dynamic Range (HDR) profile.

When this extension is enabled, the HDR profile is supported for all ASTC formats listed in ASTC
Compressed Image Formats.

New Structures
• Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  ◦ VkPhysicalDeviceTextureCompressionASTCHDRFeaturesEXT

New Enum Constants
• VK_EXT_TEXTURE_COMPRESSION_ASTC_HDR_EXTENSION_NAME
• VK_EXT_TEXTURE_COMPRESSION_ASTC_HDR_SPEC_VERSION
• Extending VkFormat:
  ◦ VK_FORMAT_ASTC_10x10_SFLOAT_BLOCK_EXT
  ◦ VK_FORMAT_ASTC_10x5_SFLOAT_BLOCK_EXT
• Extending VkStructureType:
  ◦ VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TEXTURE_COMPRESSION_ASTC_HDR_FEATURES_EXT

Promotion to Vulkan 1.3

This extension has been partially promoted. Functionality in this extension is included in core Vulkan 1.3, with the EXT suffix omitted. However, the feature is made optional in Vulkan 1.3. The original type, enum and command names are still available as aliases of the core functionality.

Issues

1) Should we add a feature or limit for this functionality?
   
   Yes. It is consistent with the ASTC LDR support to add a feature like textureCompressionASTC_HDR.

   The feature is strictly speaking redundant as long as this is just an extension; it would be sufficient to just enable the extension. But adding the feature is more forward-looking if wanted to make this an optional core feature in the future.

2) Should we introduce new format enums for HDR?
   
   Yes. Vulkan 1.0 describes the ASTC format enums as UNORM, e.g. VK_FORMAT_ASTC_4x4_UNORM_BLOCK, so it is confusing to make these contain HDR data. Note that the OpenGL (ES) extensions did not make this distinction because a single ASTC HDR texture may contain both unorm and float blocks. Implementations may not be able to distinguish between LDR and HDR ASTC textures internally and just treat them as the same format, i.e. if this extension is supported then sampling from a VK_FORMAT_ASTC_4x4_UNORM_BLOCK image format may return HDR results. Applications can get predictable results by using the appropriate image format.

Description
When an error occurs during application development, a common question is "What tools are
actually running right now?" This extension adds the ability to query that information directly from the Vulkan implementation.

Outdated versions of one tool might not play nicely with another, or perhaps a tool is not actually running when it should have been. Trying to figure that out can cause headaches as it is necessary to consult each known tool to figure out what is going on—in some cases the tool might not even be known.

Typically, the expectation is that developers will simply print out this information for visual inspection when an issue occurs, however a small amount of semantic information about what the tool is doing is provided to help identify it programmatically. For example, if the advertised limits or features of an implementation are unexpected, is there a tool active which modifies these limits? Or if an application is providing debug markers, but the implementation is not actually doing anything with that information, this can quickly point that out.

**New Commands**

- `vkGetPhysicalDeviceToolPropertiesEXT`

**New Structures**

- `VkPhysicalDeviceToolPropertiesEXT`

**New Enums**

- `VkToolPurposeFlagBitsEXT`

**New Bitmasks**

- `VkToolPurposeFlagsEXT`

**New Enum Constants**

- `VK_EXT_TOOLING_INFO_EXTENSION_NAME`
- `VK_EXT_TOOLING_INFO_SPEC_VERSION`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TOOL_PROPERTIES_EXT`

If `VK_EXT_debug_marker` is supported:

- Extending `VkToolPurposeFlagBits`:
  - `VK_TOOL_PURPOSE_DEBUG_MARKERS_BIT_EXT`

If `VK_EXT_debug_report` is supported:

- Extending `VkToolPurposeFlagBits`:
  - `VK_TOOL_PURPOSE_DEBUG_REPORTING_BIT_EXT`

If `VK_EXT_debug_utils` is supported:
• Extending VkToolPurposeFlagBits:
  ◦ VK_TOOL_PURPOSE_DEBUG_MARKERS_BIT_EXT
  ◦ VK_TOOL_PURPOSE_DEBUG_REPORTING_BIT_EXT

**Promotion to Vulkan 1.3**

Functionality in this extension is included in core Vulkan 1.3, with the EXT suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

**Examples**

*Printing Tool Information*

```c
uint32_t num_tools;
VkPhysicalDeviceToolPropertiesEXT *pToolProperties;
vkGetPhysicalDeviceToolPropertiesEXT(physicalDevice, &num_tools, NULL);

pToolProperties = (VkPhysicalDeviceToolPropertiesEXT*)malloc(sizeof(VkPhysicalDeviceToolPropertiesEXT) * num_tools);

vkGetPhysicalDeviceToolPropertiesEXT(physicalDevice, &num_tools, pToolProperties);

for (int i = 0; i < num_tools; ++i) {
    printf("%s:\n", pToolProperties[i].name);
    printf("Version:\n");
    printf("%s:\n", pToolProperties[i].version);
    printf("Description:\n");
    printf("\t%s\n", pToolProperties[i].description);
    printf("Purposes:\n");
    printf("\t%s\n", VkToolPurposeFlagBitsEXT_to_string(pToolProperties[i].purposes));
    if (strnlen_s(pToolProperties[i].layer,VK_MAX_EXTENSION_NAME_SIZE) > 0) {
        printf("Corresponding Layer:\n");
        printf("\t%s\n", pToolProperties[i].layer);
    }
}
```

**Issues**

1) Why is this information separate from the layer mechanism?

Some tooling may be built into a driver, or be part of the Vulkan loader etc. Tying this information directly to layers would have been awkward at best.

Description

This extension provides the `VkValidationFeaturesEXT` struct that can be included in the `pNext` chain of the `VkInstanceCreateInfo` structure passed as the `pCreateInfo` parameter of `vkCreateInstance`. The structure contains an array of `VkValidationFeatureEnableEXT` enum values that enable specific validation features that are disabled by default. The structure also contains an array of `VkValidationFeatureDisableEXT` enum values that disable specific validation layer features that are enabled by default.

**Deprecation by VK_EXT_layer_settings**

Functionality in this extension is subsumed into the `VK_EXT_layer_settings` extension.

**New Structures**

Description

This extension allows instance-rate vertex attributes to be repeated for certain number of instances instead of advancing for every instance when instanced rendering is enabled.

New Structures

• VkVertexInputBindingDivisorDescriptionEXT

• Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  • VkPhysicalDeviceVertexAttributeDivisorFeaturesEXT

• Extending VkPhysicalDeviceProperties2:
  • VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT

• Extending VkPipelineVertexInputStateCreateInfo:
  • VkPipelineVertexInputDivisorStateCreateInfoEXT

New Enum Constants

• VK_EXT_VERTEX_ATTRIBUTE_DIVISOR_EXTENSION_NAME
• VK_EXT_VERTEX_ATTRIBUTE_DIVISOR_SPEC_VERSION

• Extending VkStructureType:
  • VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VERTEX_ATTRIBUTE_DIVISOR_FEATURES_EXT
  • VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VERTEX_ATTRIBUTE_DIVISOR_PROPERTIES_EXT
Issues

1) What is the effect of a non-zero value for `firstInstance`?

**RESOLVED:** The Vulkan API should follow the OpenGL convention and offset attribute fetching by `firstInstance` while computing vertex attribute offsets.

2) Should zero be an allowed divisor?

**RESOLVED:** Yes. A zero divisor means the vertex attribute is repeated for all instances.

Examples

To create a vertex binding such that the first binding uses instanced rendering and the same attribute is used for every 4 draw instances, an application could use the following set of structures:

```c
const VkVertexInputBindingDivisorDescriptionEXT divisorDesc =
{
    .binding = 0,
    .divisor = 4
};

const VkPipelineVertexInputDivisorStateCreateInfoEXT divisorInfo =
{
    .sType = VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_DIVISOR_STATE_CREATE_INFO_EXT,
    .pNext = NULL,
    .vertexBindingDivisorCount = 1,
    .pVertexBindingDivisors = &divisorDesc
}

const VkVertexInputBindingDescription binding =
{
    .binding = 0,
    .stride = sizeof(Vertex),
    .inputRate = VK_VERTEX_INPUT_RATE_INSTANCE
};

const VkPipelineVertexInputStateCreateInfo viInfo =
{
    .sType = VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_CREATE_INFO,
    .pNext = &divisorInfo,
    ...
};
//...
```
Version History

- Revision 1, 2017-12-04 (Vikram Kushwaha)
  - First Version
- Revision 2, 2018-07-16 (Faith Ekstrand)
  - Adjust the interaction between divisor and firstInstance to match the OpenGL convention.
  - Disallow divisors of zero.
- Revision 3, 2018-08-03 (Vikram Kushwaha)
  - Allow a zero divisor.
  - Add a physical device features structure to query/enable this feature.

**Description**

This extension adds some $Y'C'B'\text{R}$ formats that are in common use for video encode and decode, but were not part of the `VK_KHR_sampler_ycbcr_conversion` extension.

**New Structures**

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  - `VkPhysicalDeviceYcbcr2Plane444FormatsFeaturesEXT`

**New Enum Constants**

- `VK_EXT_YCBCR_2PLANE_444_FORMATS_EXTENSION_NAME`
- `VK_EXT_YCBCR_2PLANE_444_FORMATS_SPEC_VERSION`

- Extending `VkFormat`:
  - `VK_FORMAT_G10X6_B10X6R10X6_2PLANE_444_UNORM_3PACK16_EXT`
  - `VK_FORMAT_G12X4_B12X4R12X4_2PLANE_444_UNORM_3PACK16_EXT`
  - `VK_FORMAT_G16_B16R16_2PLANE_444_UNORM_EXT`
  - `VK_FORMAT_G8_B8R8_2PLANE_444_UNORM_EXT`

- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_YCBCR_2_PLANE_444_FORMATS_FEATURES_EXT`

**Promotion to Vulkan 1.3**

This extension has been partially promoted. The format enumerants introduced by the extension are included in core Vulkan 1.3, with the EXT suffix omitted. However, runtime support for these formats is optional in core Vulkan 1.3, while if this extension is supported, runtime support is mandatory. The feature structure is not promoted. The original enum names are still available as aliases of the core functionality.

Description
This extension allows an application to specify a negative viewport height. The result is that the viewport transformation will flip along the y-axis.

• Allow negative height to be specified in the VkViewport::height field to perform y-inversion of the clip-space to framebuffer-space transform. This allows apps to avoid having to use gl_Position.y = -gl_Position.y in shaders also targeting other APIs.

Obsoletion by VK_KHR_maintenance1 and Vulkan 1.1
Functionality in this extension is included in VK_KHR_maintenance1 and subsequently Vulkan 1.1. Due to some slight behavioral differences, this extension must not be enabled alongside VK_KHR_maintenance1, or in an instance created with version 1.1 or later requested in VkApplicationInfo::apiVersion.

New Enum Constants

VK_ARM_rasterization_order_attachment_access

Name String
VK_ARM_rasterization_order_attachment_access

Extension Type
Device extension
Render passes, and specifically subpass dependencies, enable much of the same functionality as the framebuffer fetch and pixel local storage extensions did for OpenGL ES. But certain techniques such as programmable blending are awkward or impractical to implement with these alone, in part because a self-dependency is required every time a fragment will read a value at a given sample coordinate.

This extension extends the mechanism of input attachments to allow access to framebuffer attachments when used as both input and color, or depth/stencil, attachments from one fragment to the next, in rasterization order, without explicit synchronization.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceRasterizationOrderAttachmentAccessFeaturesARM
New Enum Constants

- `VK_ARM_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_EXTENSION_NAME`
- `VK_ARM_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_SPEC_VERSION`

Extending `VkPipelineColorBlendStateCreateFlagBits`:
- `VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_ARM`

Extending `VkPipelineDepthStencilStateCreateFlagBits`:
- `VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_ARM`
- `VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_ARM`

Extending `VkStructureType`:
- `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_FEATURES_ARM`

Extending `VkSubpassDescriptionFlagBits`:
- `VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_COLOR_ACCESS_BIT_ARM`
- `VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_ARM`
- `VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_ARM`

Issues

1) Is there any interaction with the `VK_KHR_dynamic_rendering` extension?

No. This extension only affects reads from input attachments. Render pass instances begun with `vkCmdBeginRenderingKHR` do not have input attachments and a different mechanism will be needed to provide similar functionality in this case.

Examples

None.

Description

VK_IMG_format_pvrtc provides additional texture compression functionality specific to Imagination Technologies PowerVR Texture compression format (called PVRTC).

Note
As also noted in the Khronos Data Format Specification, PVRTC1 images must have dimensions that are a power of two.

Deprecation

Both PVRTC1 and PVRTC2 are slower than standard image formats on PowerVR GPUs, and support will be removed from future hardware.

New Enum Constants

- VK_IMG_FORMAT_PVRTC_EXTENSION_NAME
- VK_IMG_FORMAT_PVRTC_SPEC_VERSION
- Extending VkFormat:
VK_FORMAT_PVRTC1_2BPP_SRGB_BLOCK_IMG
VK_FORMAT_PVRTC1_2BPP_UNORM_BLOCK_IMG
VK_FORMAT_PVRTC1_4BPP_SRGB_BLOCK_IMG

Description

The `VK_MVK_ios_surface` extension is an instance extension. It provides a mechanism to create a `VkSurfaceKHR` object (defined by the `VK_KHR_surface` extension) based on a `UIView`, the native surface type of iOS, which is underpinned by a `CAMetalLayer`, to support rendering to the surface using Apple's Metal framework.

Deprecation by `VK_EXT_metal_surface`

The `VK_MVK_ios_surface` extension is considered deprecated and has been superseded by the `VK_EXT_metal_surface` extension.

New Commands

- `vkCreateIOSSurfaceMVK`

New Structures

- `VkIOSSurfaceCreateInfoMVK`

New Bitmasks

- `VkIOSSurfaceCreateFlagsMVK`

New Enum Constants

- `VK_MVK_IOS_SURFACE_EXTENSION_NAME`
- `VK_MVK_IOS_SURFACE_SPEC_VERSION`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_IOS_SURFACE_CREATE_INFO_MVK`

Version History

- Revision 1, 2017-02-15 (Bill Hollings)
  - Initial draft.
- Revision 2, 2017-02-24 (Bill Hollings)
  - Minor syntax fix to emphasize firm requirement for `UIView` to be backed by a `CAMetalLayer`.
- Revision 3, 2020-07-31 (Bill Hollings)
  - Update documentation on requirements for `UIView`.
  - Mark as deprecated by `VK_EXT_metal_surface`.

Description
This extension allows device memory to be allocated for a particular buffer or image resource, which on some devices can significantly improve the performance of that resource. Normal device memory allocations must support memory aliasing and sparse binding, which could interfere with optimizations like framebuffer compression or efficient page table usage. This is important for render targets and very large resources, but need not (and probably should not) be used for smaller resources that can benefit from suballocation.

This extension adds a few small structures to resource creation and memory allocation: a new structure that flags whether an image/buffer will have a dedicated allocation, and a structure indicating the image or buffer that an allocation will be bound to.

New Structures

- Extending VkBufferCreateInfo:
  - VkDedicatedAllocationBufferCreateInfoNV
- Extending VkImageCreateInfo:
  - VkDedicatedAllocationImageCreateInfoNV
- Extending VkMemoryAllocateInfo:
  - VkDedicatedAllocationMemoryAllocateInfoNV

New Enum Constants

- VK_NV_DEDICATED_ALLOCATION_EXTENSION_NAME
- VK_NV_DEDICATED_ALLOCATION_SPEC_VERSION
• Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPEDEDICATED_ALLOCATION_BUFFER_CREATE_INFO_NV`
  - `VK_STRUCTURE_TYPEDEDICATED_ALLOCATION_IMAGE_CREATE_INFO_NV`
  - `VK_STRUCTURE_TYPEDEDICATED_ALLOCATION_MEMORY_ALLOCATE_INFO_NV`

Examples

```c
// Create an image with
// VkDedicatedAllocationImageCreateInfoNV::dedicatedAllocation
// set to VK_TRUE

VkDedicatedAllocationImageCreateInfoNV dedicatedImageInfo = {
    .sType = VK_STRUCTURE_TYPE_DEDICATED_ALLOCATION_IMAGE_CREATE_INFO_NV,
    .pNext = NULL,
    .dedicatedAllocation = VK_TRUE,
};

VkImageCreateInfo imageCreateInfo = {
    .sType = VK_STRUCTURE_TYPE_IMAGE_CREATE_INFO,
    .pNext = &dedicatedImageInfo
    // Other members set as usual
};

VkImage image;
VkResult result = vkCreateImage(  
    device,  
    &imageCreateInfo,  
    NULL, // pAllocator  
    &image);

VkMemoryRequirements memoryRequirements;
vkGetImageMemoryRequirements(  
    device,  
    image,  
    &memoryRequirements);

// Allocate memory with VkDedicatedAllocationMemoryAllocateInfoNV::image  
// pointing to the image we are allocating the memory for

VkDedicatedAllocationMemoryAllocateInfoNV dedicatedInfo = {
    .sType = VK_STRUCTURE_TYPEDEDICATED_ALLOCATION_MEMORY_ALLOCATE_INFO_NV,
    .pNext = NULL,
    .image = image,  
    .buffer = VK_NULL_HANDLE,
};
```
VkMemoryAllocateInfo memoryAllocateInfo =
{
    .sType = VK_STRUCTURE_TYPE_MEMORY_ALLOCATE_INFO,
    .pNext = &dedicatedInfo,
    .allocationSize = memoryRequirements.size,
    .memoryTypeIndex = FindMemoryTypeIndex(memoryRequirements.memoryTypeBits),
};

VkDeviceMemory memory;
vkAllocateMemory(
    device,
    &memoryAllocateInfo,  
    NULL,                   // pAllocator
    &memory);

// Bind the image to the memory

evBindImageMemory(
    device, 
    image, 
    memory, 
    0);

Description

Applications may wish to export memory to other Vulkan instances or other APIs, or import memory from other Vulkan instances or other APIs to enable Vulkan workloads to be split up across application module, process, or API boundaries. This extension enables applications to create exportable Vulkan memory objects such that the underlying resources can be referenced outside the Vulkan instance that created them.

New Structures

- Extending VkImageCreateInfo:
  - VkExternalMemoryImageCreateInfoNV
- Extending VkMemoryAllocateInfo:
  - VkExportMemoryAllocateInfoNV

New Enum Constants

- VK_NV_EXTERNAL_MEMORY_EXTENSION_NAME
- VK_NV_EXTERNAL_MEMORY_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_EXPORT_MEMORY_ALLOCATE_INFO_NV
  - VK_STRUCTURE_TYPE_EXTERNAL_MEMORY_IMAGE_CREATE_INFO_NV

Issues

1) If memory objects are shared between processes and APIs, is this considered aliasing according to the rules outlined in the Memory Aliasing section?
RESOLVED: Yes, but strict exceptions to the rules are added to allow some forms of aliasing in these cases. Further, other extensions may build upon these new aliasing rules to define specific support usage within Vulkan for imported native memory objects, or memory objects from other APIs.

2) Are new image layouts or metadata required to specify image layouts and layout transitions compatible with non-Vulkan APIs, or with other instances of the same Vulkan driver?

RESOLVED: No. Separate instances of the same Vulkan driver running on the same GPU should have identical internal layout semantics, so applications have the tools they need to ensure views of images are consistent between the two instances. Other APIs will fall into two categories: Those that are Vulkan compatible (a term to be defined by subsequent interoperability extensions), or Vulkan incompatible. When sharing images with Vulkan incompatible APIs, the Vulkan image must be transitioned to the `VK_IMAGE_LAYOUT_GENERAL` layout before handing it off to the external API.

Note this does not attempt to address cross-device transitions, nor transitions to engines on the same device which are not visible within the Vulkan API. Both of these are beyond the scope of this extension.

Examples

```
// TODO: Write some sample code here.
```

Description

Applications may wish to import memory from the Direct 3D API, or export memory to other Vulkan instances. This extension provides a set of capability queries that allow applications determine what types of win32 memory handles an implementation supports for a given set of use cases.

New Commands

- vkGetPhysicalDeviceExternalImageFormatPropertiesNV

New Structures

- VkExternalImageFormatPropertiesNV

New Enums

- VkExternalMemoryFeatureFlagBitsNV
- VkExternalMemoryHandleTypeFlagBitsNV

New Bitmasks

- VkExternalMemoryFeatureFlagsNV
- VkExternalMemoryHandleTypeFlagsNV
New Enum Constants

• VK_NV_EXTERNAL_MEMORY_CAPABILITIES_EXTENSION_NAME
• VK_NV_EXTERNAL_MEMORY_CAPABILITIES_SPEC_VERSION

Issues

1) Why do so many external memory capabilities need to be queried on a per-memory-handle-type basis?

**RESOLVED:** This is because some handle types are based on OS-native objects that have far more limited capabilities than the very generic Vulkan memory objects. Not all memory handle types can name memory objects that support 3D images, for example. Some handle types cannot even support the deferred image and memory binding behavior of Vulkan and require specifying the image when allocating or importing the memory object.

2) Does the `VkExternalImageFormatPropertiesNV` struct need to include a list of memory type bits that support the given handle type?

**RESOLVED:** No. The memory types that do not support the handle types will simply be filtered out of the results returned by `vkGetImageMemoryRequirements` when a set of handle types was specified at image creation time.

3) Should the non-opaque handle types be moved to their own extension?

**RESOLVED:** Perhaps. However, defining the handle type bits does very little and does not require any platform-specific types on its own, and it is easier to maintain the bitmask values in a single extension for now. Presumably more handle types could be added by separate extensions though, and it would be mildly weird to have some platform-specific ones defined in the core spec and some in extensions

Description
Applications may wish to export memory to other Vulkan instances or other APIs, or import memory from other Vulkan instances or other APIs to enable Vulkan workloads to be split up across application module, process, or API boundaries. This extension enables win32 applications to export win32 handles from Vulkan memory objects such that the underlying resources can be referenced outside the Vulkan instance that created them, and import win32 handles created in the Direct3D API to Vulkan memory objects.

New Commands
- vkGetMemoryWin32HandleNV

New Structures
- Extending VkMemoryAllocateInfo:
  - VkExportMemoryWin32HandleInfoNV
  - VkImportMemoryWin32HandleInfoNV

New Enum Constants
- VK_NV_EXTERNAL_MEMORY_WIN32_EXTENSION_NAME
- VK_NV_EXTERNAL_MEMORY_WIN32_SPEC_VERSION
- Extending VkStructureType:
Issues

1) If memory objects are shared between processes and APIs, is this considered aliasing according to the rules outlined in the Memory Aliasing section?

**RESOLVED**: Yes, but strict exceptions to the rules are added to allow some forms of aliasing in these cases. Further, other extensions may build upon these new aliasing rules to define specific support usage within Vulkan for imported native memory objects, or memory objects from other APIs.

2) Are new image layouts or metadata required to specify image layouts and layout transitions compatible with non-Vulkan APIs, or with other instances of the same Vulkan driver?

**RESOLVED**: No. Separate instances of the same Vulkan driver running on the same GPU should have identical internal layout semantics, so applications have the tools they need to ensure views of images are consistent between the two instances. Other APIs will fall into two categories: Those that are Vulkan compatible (a term to be defined by subsequent interoperability extensions), or Vulkan incompatible. When sharing images with Vulkan incompatible APIs, the Vulkan image must be transitioned to the `VK_IMAGE_LAYOUT_GENERAL` layout before handing it off to the external API.

Note this does not attempt to address cross-device transitions, nor transitions to engines on the same device which are not visible within the Vulkan API. Both of these are beyond the scope of this extension.

3) Do applications need to call `CloseHandle()` on the values returned from `vkGetMemoryWin32HandleNV` when `handleType` is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT_NV`?

**RESOLVED**: Yes, unless it is passed back in to another driver instance to import the object. A successful get call transfers ownership of the handle to the application, while an import transfers ownership to the associated driver. Destroying the memory object will not destroy the handle or the handle’s reference to the underlying memory resource.

Examples

```
// Create an exportable memory object and export an external handle from it.

// Pick an external format and handle type.
static const VkFormat format = VK_FORMAT_R8G8B8A8_UNORM;
static const VkExternalMemoryHandleTypeFlagsNV handleType =
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT_NV;

extern VkPhysicalDevice physicalDevice;

Interactions and External Dependencies
  • This extension provides API support for GL_NV_fragment_shader_barycentric

Contributors
  • Pat Brown, NVIDIA
  • Daniel Koch, NVIDIA

Description

This extension adds support for the following SPIR-V extension in Vulkan:

  • SPV_NV_fragment_shader_barycentric

The extension provides access to three additional fragment shader variable decorations in SPIR-V:

  • PerVertexNV, which indicates that a fragment shader input will not have interpolated values, but instead must be accessed with an extra array index that identifies one of the vertices of the primitive producing the fragment
  • BaryCoordNV, which indicates that the variable is a three-component floating-point vector holding barycentric weights for the fragment produced using perspective interpolation
  • BaryCoordNoPerspNV, which indicates that the variable is a three-component floating-point vector holding barycentric weights for the fragment produced using linear interpolation

When using GLSL source-based shader languages, the following variables from GL_NV_fragment_shader_barycentric maps to these SPIR-V built-in decorations:

  • in vec3 gl_BaryCoordNV; → BaryCoordNV
  • in vec3 gl_BaryCoordNoPerspNV; → BaryCoordNoPerspNV

GLSL variables declared using the __pervertexNV GLSL qualifier are expected to be decorated with PerVertexNV in SPIR-V.

Promotion to VK_KHR_fragment_shader_barycentric

All functionality in this extension is included in VK_KHR_fragment_shader_barycentric, with the suffix changed to KHR.
New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceFragmentShaderBarycentricFeaturesNV

New Enum Constants

- VK_NV_FRAGMENT_SHADER_BARYCENTRIC_EXTENSION_NAME
- VK_NV_FRAGMENT_SHADER_BARYCENTRIC_SPEC_VERSION

- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADER_BARYCENTRIC_FEATURES_NV

New Built-In Variables

- BaryCoordNV
- BaryCoordNoPerspNV

New SPIR-V Decorations

- PerVertexNV

New SPIR-V Capabilities

- FragmentBarycentricNV

Issues

(1) The AMD_shader_explicit_vertex_parameter extension provides similar functionality. Why write a new extension, and how is this extension different?

**RESOLVED:** For the purposes of Vulkan/SPIR-V, we chose to implement a separate extension due to several functional differences.

First, the hardware supporting this extension can provide a three-component barycentric weight vector for variables decorated with BaryCoordNV, while variables decorated with BaryCoordSmoothAMD provide only two components. In some cases, it may be more efficient to explicitly interpolate an attribute via:

```plaintext
float value = (baryCoordNV.x * v[0].attrib +
               baryCoordNV.y * v[1].attrib +
               baryCoordNV.z * v[2].attrib);
```

instead of

```plaintext
float value = (baryCoordSmoothAMD.x * (v[0].attrib - v[2].attrib) +
               baryCoordSmoothAMD.y * (v[1].attrib - v[2].attrib) +
               v[2].attrib);
```
Additionally, the semantics of the decoration `BaryCoordPullModelAMD` do not appear to map to anything supported by the initial hardware implementation of this extension.

This extension provides a smaller number of decorations than the AMD extension, as we expect that shaders could derive variables decorated with things like `BaryCoordNoPerspCentroidAMD` with explicit attribute interpolation instructions. One other relevant difference is that explicit per-vertex attribute access using this extension does not require a constant vertex number.

(2) Why do the built-in SPIR-V decorations for this extension include two separate built-ins `BaryCoordNV` and `BaryCoordNoPerspNV` when a “no perspective” variable could be decorated with `BaryCoordNV` and `NoPerspective`?

**RESOLVED:** The SPIR-V extension for this feature chose to mirror the behavior of the GLSL extension, which provides two built-in variables. Additionally, it is not clear that it's a good idea (or even legal) to have two variables using the “same attribute”, but with different interpolation modifiers.

Description
This extension allows GLSL shaders written to the GL_KHR_vulkan_gls1 extension specification to be used instead of SPIR-V. The implementation will automatically detect whether the shader is SPIR-V or GLSL, and compile it appropriately.

Deprecation
Functionality in this extension is outside of the scope of Vulkan and is better served by a compiler library such as glslang. No new implementations will support this extension, so applications should not use it.

New Enum Constants
• VK_NV_GLSL_SHADER_EXTENSION_NAME
• VK_NV_GLSL_SHADER_SPEC_VERSION
• Extending VkResult:
  ◦ VK_ERROR_INVALID_SHADER_NV

Examples
Example 1
Passing in GLSL code

```c
char const vss[] =
    "#version 450 core"
    "layout(location = 0) in vec2 aVertex;
    "layout(location = 1) in vec4 aColor;
    "out vec4 vColor;
    "void main()
    
    "{vColor = aColor;
    "    gl_Position = vec4(aVertex, 0, 1);
    "}
    
    VkShaderModuleCreateInfo vertexShaderInfo = {
        VK_STRUCTURE_TYPE_SHADER_MODULE_CREATE_INFO
    };
```
vertexShaderInfo.codeSize = sizeof vss;
vertexShaderInfo.pCode = vss;
VkShaderModule vertexShader;
vkCreateShaderModule(device, &vertexShaderInfo, 0, &vertexShader);

Description

This extension allows applications to reduce descriptor memory footprint by allowing a descriptor to be able to mutate to a given list of descriptor types depending on which descriptor types are written into, or copied into a descriptor set.

The main use case this extension intends to address is descriptor indexing with `VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT` where the descriptor types are completely generic, as this means applications can allocate one large descriptor set, rather than having one large descriptor set per descriptor type, which significantly bloats descriptor memory usage and causes performance issues.

This extension also adds a mechanism to declare that a descriptor pool, and therefore the descriptor sets that are allocated from it, reside only in host memory; as such these descriptors can only be updated/copied, but not bound.

These features together allow much more efficient emulation of the raw D3D12 binding model. This extension is primarily intended to be useful for API layering efforts.

Appendix F: Vulkan Roadmap Milestones

Roadmap milestones are intended to be supported by mid-to-high-end smartphones, tablets, laptops, consoles, and desktop devices.

Each milestone indicates support for a set of extensions, features, limits, and formats across these devices, and should be supported by all such new hardware shipping by the end of the target year or shortly thereafter.

Roadmap 2022

The Roadmap 2022 milestone is intended to be supported by newer mid-to-high-end devices shipping in 2022 or shortly thereafter across mainstream smartphone, tablet, laptops, console and desktop devices.

Required API Versions

This profile requires Vulkan 1.3.

Required Features

The following core optional features are required to be supported:

- Vulkan 1.0 Optional Features
  - fullDrawIndexUint32
  - imageCubeArray
  - independentBlend
  - sampleRateShading
  - drawIndirectFirstInstance
  - depthClamp
  - depthBiasClamp
  - samplerAnisotropy
  - occlusionQueryPrecise
  - fragmentStoresAndAtomics
  - shaderStorageImageExtendedFormats
  - shaderUniformBufferArrayDynamicIndexing
  - shaderSampledImageArrayDynamicIndexing
  - shaderStorageBufferArrayDynamicIndexing
  - shaderStorageImageArrayDynamicIndexing

- Vulkan 1.1 Optional Features
  - samplerYcbcrConversion
• Vulkan 1.2 Optional Features
  ◦ samplerMirrorClampToEdge
  ◦ descriptorIndexing
  ◦ shaderUniformTexelBufferArrayDynamicIndexing
  ◦ shaderStorageTexelBufferArrayDynamicIndexing
  ◦ shaderUniformBufferArrayNonUniformIndexing
  ◦ shaderSampledImageArrayNonUniformIndexing
  ◦ shaderStorageBufferArrayNonUniformIndexing
  ◦ shaderStorageImageArrayNonUniformIndexing
  ◦ shaderUniformTexelBufferArrayNonUniformIndexing
  ◦ shaderStorageTexelBufferArrayNonUniformIndexing
  ◦ descriptorBindingSampledImageUpdateAfterBind
  ◦ descriptorBindingStorageImageUpdateAfterBind
  ◦ descriptorBindingStorageBufferUpdateAfterBind
  ◦ descriptorBindingUniformTexelBufferUpdateAfterBind
  ◦ descriptorBindingStorageTexelBufferUpdateAfterBind
  ◦ descriptorBindingUpdateUnusedWhilePending
  ◦ descriptorBindingPartiallyBound
  ◦ descriptorBindingVariableDescriptorCount
  ◦ runtimeDescriptorArray
  ◦ scalarBlockLayout

VK_KHR_global_priority

Roadmap 2024

The Roadmap 2024 milestone is intended to be supported by newer mid-to-high-end devices shipping in 2024 or shortly thereafter across mainstream smartphone, tablet, laptops, console and desktop devices.

Two of the core aims of this roadmap profile are to enable developers to rely on a number of important rasterization and shader features have been available for a long time, but until now have not enjoyed wide support.

Shader features required include smaller types (**8/16-bit integers** and **16-bit floats**), reconvergence guarantees for subgroup ops (**VK_KHR_shader_maximal_reconvergence** and **VK_KHR_shader_quad_control**), and more consistent floating point handling (**VK_KHR_shader_float_controls2** and **round-to-nearest-even for 32/16-bit floats**). Rasterization features include requiring support for multi-draw indirect, shader draw parameters, 8-bit indices, better line rasterization definitions, and local reads when using dynamic rendering. A few other features have been added opportunistically, in lieu of shipping a Vulcan 1.4 in the same time frame, such as **push descriptors** and the various minor improvements included in **VK_KHR_maintenance5**.

Required Profiles

This profile requires the Roadmap 2022 profile.

Required Features

The following core optional features are required to be supported:

- Vulkan 1.0 Optional Features
  - multiDrawIndirect
  - shaderImageGatherExtended
  - shaderInt16
- Vulkan 1.1 Optional Features
  - shaderDrawParameters
  - storageBuffer16BitAccess
• Vulkan 1.2 Optional Features
  ◦ shaderInt8
  ◦ shaderFloat16
  ◦ storageBuffer8BitAccess

Required Limits

The following core increased limits are **required**

Appendix G: API Boilerplate

This appendix defines Vulkan API features that are infrastructure required for a complete functional description of Vulkan, but do not logically belong elsewhere in the Specification.

Vulkan Header Files

Vulkan is defined as an API in the C99 language. Khronos provides a corresponding set of header files for applications using the API, which may be used in either C or C++ code. The interface descriptions in the specification are the same as the interfaces defined in these header files, and both are derived from the vk.xml XML API Registry, which is the canonical machine-readable description of the Vulkan API. The Registry, scripts used for processing it into various forms, and documentation of the registry schema are available as described at https://registry.khronos.org/vulkan/#apiregistry.

Language bindings for other languages can be defined using the information in the Specification and the Registry. Khronos does not provide any such bindings, but third-party developers have created some additional bindings.

Vulkan Combined API Header vulkan.h (Informative)

Applications normally will include the header vulkan.h. In turn, vulkan.h always includes the following headers:

- vk_platform.h, defining platform-specific macros and headers.
- vulkan_core.h, defining APIs for the Vulkan core and all registered extensions other than window system-specific and provisional extensions, which are included in separate header files.

In addition, specific preprocessor macros defined at the time vulkan.h is included cause header files for the corresponding window system-specific and provisional interfaces to be included, as described below.

Vulkan Platform-Specific Header vk_platform.h (Informative)

Platform-specific macros and interfaces are defined in vk_platform.h. These macros are used to control platform-dependent behavior, and their exact definitions are under the control of specific platforms and Vulkan implementations.

Platform-Specific Calling Conventions

On many platforms the following macros are empty strings, causing platform- and compiler-specific default calling conventions to be used.

VKAPI_ATTR is a macro placed before the return type in Vulkan API function declarations. This macro controls calling conventions for C++11 and GCC/Clang-style compilers.

VKAPI_CALL is a macro placed after the return type in Vulkan API function declarations. This macro controls calling conventions for MSVC-style compilers.
VKAPI_PTR is a macro placed between the '(' and '*' in Vulkan API function pointer declarations. This macro also controls calling conventions, and typically has the same definition as VKAPI_ATTR or VKAPI_CALL, depending on the compiler.

With these macros, a Vulkan function declaration takes the form of:

```c
VKAPI_ATTR <return_type> VKAPI_CALL <command_name>(<command_parameters>);
```

Additionally, a Vulkan function pointer type declaration takes the form of:

```c
typedef <return_type> (VKAPI_PTR *PFN_<command_name>)(<command_parameters>);
```

Platform-Specific Header Control

If the VK_NO_STDINT_H macro is defined by the application at compile time, extended integer types used by the Vulkan API, such as `uint8_t`, must also be defined by the application. Otherwise, the Vulkan headers will not compile. If VK_NO_STDINT_H is not defined, the system `<stdint.h>` is used to define these types. There is a fallback path when Microsoft Visual Studio version 2008 and earlier versions are detected at compile time.

If the VK_NO_STDDEF_H macro is defined by the application at compile time, `size_t`, must also be defined by the application. Otherwise, the Vulkan headers will not compile. If VK_NO_STDDEF_H is not defined, the system `<stddef.h>` is used to define this type.

Vulkan Core API Header `vulkan_core.h`

Applications that do not make use of window system-specific extensions may simply include `vulkan_core.h` instead of `vulkan.h`, although there is usually no reason to do so. In addition to the Vulkan API, `vulkan_core.h` also defines a small number of C preprocessor macros that are described below.

Vulkan Header File Version Number

`VK_HEADER_VERSION` is the version number of the `vulkan_core.h` header. This value is kept synchronized with the patch version of the released Specification.

```c
// Provided by VK_VERSION_1_0
// Version of this file
#define VK_HEADER_VERSION 287
```

`VK_HEADER_VERSION_COMPLETE` is the complete version number of the `vulkan_core.h` header, comprising the major, minor, and patch versions. The major/minor values are kept synchronized with the complete version of the released Specification. This value is intended for use by automated tools to identify exactly which version of the header was used during their generation.

Applications should not use this value as their `VkApplicationInfo::apiVersion`. Instead applications
should explicitly select a specific fixed major/minor API version using, for example, one of the `VK_API_VERSION_*_*` values.

```c
// Provided by VK_VERSION_1_0
// Complete version of this file
#define VK_HEADER_VERSION_COMPLETE VK_MAKE_API_VERSION(0, 1, 3, VK_HEADER_VERSION)
```

`VK_API_VERSION` is now commented out of `vulkan_core.h` and cannot be used.

```c
// Provided by VK_VERSION_1_0
// DEPRECATED: This define has been removed. Specific version defines (e.g. VK_API_VERSION_1_0), or the VK_MAKE_VERSION macro, should be used instead.
// #define VK_API_VERSION VK_MAKE_API_VERSION(0, 1, 0, 0) // Patch version should always be set to 0
```

**Vulkan Handle Macros**

`VK_DEFINE_HANDLE` defines a **dispatchable handle** type.

```c
// Provided by VK_VERSION_1_0

#define VK_DEFINE_HANDLE(object) typedef struct object##_T* object;
```

- `object` is the name of the resulting C type.

The only dispatchable handle types are those related to device and instance management, such as `VkDevice`.

`VK_DEFINE_NON_DISPATCHABLE_HANDLE` defines a **non-dispatchable handle** type.

```c
// Provided by VK_VERSION_1_0

#ifndef VK_DEFINE_NON_DISPATCHABLE_HANDLE
#if (VK_USE_64_BIT_PTR_DEFINES==1)
#define VK_DEFINE_NON_DISPATCHABLE_HANDLE(object) typedef struct object##_T* object;
#else
#define VK_DEFINE_NON_DISPATCHABLE_HANDLE(object) typedef uint64_t object;
#endif
#endif
```

- `object` is the name of the resulting C type.

Most Vulkan handle types, such as `VkBuffer`, are non-dispatchable.

---

>Note

5323
The `vulkan_core.h` header allows the `VK_DEFINE_NON_DISPATCHABLE_HANDLE` and `VK_NULL_HANDLE` definitions to be overridden by the application. If `VK_DEFINE_NON_DISPATCHABLE_HANDLE` is already defined when `vulkan_core.h` is compiled, the default definitions for `VK_DEFINE_NON_DISPATCHABLE_HANDLE` and `VK_NULL_HANDLE` are skipped. This allows the application to define a binary-compatible custom handle which may provide more type-safety or other features needed by the application. Applications must not define handles in a way that is not binary compatible - where binary compatibility is platform dependent.

`VK_NULL_HANDLE` is a reserved value representing a non-valid object handle. It may be passed to and returned from Vulkan commands only when specifically allowed.

```c
// Provided by VK_VERSION_1_0

#ifndef VK_DEFINE_NON_DISPATCHABLE_HANDLE
    #if (VK_USE_64_BIT_PTR_DEFINES==1)
        #if (defined(__cplusplus) && (__cplusplus >= 201103L)) || (defined(_MSVC_LANG) && (_MSVC_LANG >= 201103L))
            #define VK_NULL_HANDLE nullptr
        #else
            #define VK_NULL_HANDLE ((void*)0)
        #endif
    #else
        #define VK_NULL_HANDLE 0ULL
    #endif
#else
    #define VK_NULL_HANDLE 0
#endif
#endif
```

`VK_USE_64_BIT_PTR_DEFINES` defines whether the default non-dispatchable handles are declared using either a 64-bit pointer type or a 64-bit unsigned integer type.

`VK_USE_64_BIT_PTR_DEFINES` is set to `1` to use a 64-bit pointer type or any other value to use a 64-bit unsigned integer type.

```c
// Provided by VK_VERSION_1_0

#ifndef VK_USE_64_BIT_PTR_DEFINES
    #if defined(__LP64__) || defined(_WIN64) || (defined(__x86_64__) && !defined(__ILP32__)) || defined(_M_X64) || defined(__ia64) || defined(_M_IA64) || defined(__aarch64__) || defined(__powerpc64__) || (defined(__riscv) && __riscv_xlen == 64)
        #define VK_USE_64_BIT_PTR_DEFINES 1
    #else
        #define VK_USE_64_BIT_PTR_DEFINES 0
    #endif
#endif
```
The `vulkan_core.h` header allows the `VK_USE_64_BIT_PTR_DEFINES` definition to be overridden by the application. This allows the application to select either a 64-bit pointer type or a 64-bit unsigned integer type for non-dispatchable handles in the case where the predefined preprocessor check does not identify the desired configuration.

This macro was introduced starting with the Vulkan 1.2.174 headers, and its availability can be checked at compile time by requiring `VK_HEADER_VERSION >= 174`.

It is not available if you are using older headers, such as may be shipped with an older Vulkan SDK. Developers requiring this functionality may wish to include a copy of the current Vulkan headers with their project in this case.

## Window System-Specific Header Control (Informative)

To use a Vulkan extension supporting a platform-specific window system, header files for that window system must be included at compile time, or platform-specific types must be forward-declared. The Vulkan header files are unable to determine whether or not an external header is available at compile time, so platform-specific extensions are provided in separate headers from the core API and platform-independent extensions, allowing applications to decide which ones they need to be defined and how the external headers are included.

Extensions dependent on particular sets of platform headers, or that forward-declare platform-specific types, are declared in a header named for that platform. Before including these platform-specific Vulkan headers, applications must include both `vulkan_core.h` and any external native headers the platform extensions depend on.

As a convenience for applications that do not need the flexibility of separate platform-specific Vulkan headers, `vulkan.h` includes `vulkan_core.h`, and then conditionally includes platform-specific Vulkan headers and the external headers they depend on. Applications control which platform-specific headers are included by #defining macros before including `vulkan.h`.

The correspondence between platform-specific extensions, external headers they require, the platform-specific header which declares them, and the preprocessor macros which enable inclusion by `vulkan.h` are shown in the following table.

**Note**

This section describes the purpose of the headers independently of the specific underlying functionality of the window system extensions themselves. Each extension name will only link to a description of that extension when viewing a specification built with that extension included.
Provisional Extension Header Control (Informative)

Provisional extensions should not be used in production applications. The functionality defined by such extensions may change in ways that break backwards compatibility between revisions, and before final release of a non-provisional version of that extension.

Provisional extensions are defined in a separate provisional header, `vulkan_beta.h`, allowing applications to decide whether or not to include them. The mechanism is similar to window system-specific headers: before including `vulkan_beta.h`, applications must include `vulkan_core.h`.

Note

Sometimes a provisional extension will include a subset of its interfaces in `vulkan_core.h`. This may occur if the provisional extension is promoted from an existing vendor or EXT extension and some of the existing interfaces are defined as aliases of the provisional extension interfaces. All other interfaces of that provisional extension which are not aliased will be included in `vulkan_beta.h`.

As a convenience for applications, `vulkan.h` conditionally includes `vulkan_beta.h`. Applications can control inclusion of `vulkan_beta.h` by defining the macro `VK_ENABLE_BETA_EXTENSIONS` before including `vulkan.h`.

Note

Starting in version 1.2.171 of the Specification, all provisional enumerants are protected by the macro `VK_ENABLE_BETA_EXTENSIONS`. Applications needing to use provisional extensions must always define this macro, even if they are explicitly including `vulkan_beta.h`. This is a minor change to behavior, affecting only provisional extensions.

Note

This section describes the purpose of the provisional header independently of the specific provisional extensions which are contained in that header at any given time. The extension appendices for provisional extensions note their provisional status, and link back to this section for more information. Provisional extensions are intended to provide early access for bleeding-edge developers, with the understanding that extension interfaces may change in response to developer feedback. Provisional extensions are very likely to eventually be updated and released as non-provisional extensions, but there is no guarantee this will happen, or how long it will take if it does happen.

Video Std Headers

Performing video coding operations usually involves the application having to provide various parameters, data structures, or other syntax elements specific to the particular video compression standard used, and the associated semantics are covered by the specification of those.

The interface descriptions of these are available in the header files derived from the `video.xml` XML
file, which is the canonical machine-readable description of data structures and enumerations that are associated with the externally-provided video compression standards.

</table>
Appendix H: Invariance

The Vulkan specification is not pixel exact. It therefore does not guarantee an exact match between images produced by different Vulkan implementations. However, the specification does specify exact matches, in some cases, for images produced by the same implementation. The purpose of this appendix is to identify and provide justification for those cases that require exact matches.

Repeatability

The obvious and most fundamental case is repeated issuance of a series of Vulkan commands. For any given Vulkan and framebuffer state vector, and for any Vulkan command, the resulting Vulkan and framebuffer state must be identical whenever the command is executed on that initial Vulkan and framebuffer state. This repeatability requirement does not apply when using shaders containing side effects (image and buffer variable stores and atomic operations), because these memory operations are not guaranteed to be processed in a defined order.

The repeatability requirement does not apply for rendering done using a graphics pipeline that uses VK_RASTERIZATION_ORDER_RELAXED_AMD.

One purpose of repeatability is avoidance of visual artifacts when a double-buffered scene is redrawn. If rendering is not repeatable, swapping between two buffers rendered with the same command sequence may result in visible changes in the image. Such false motion is distracting to the viewer. Another reason for repeatability is testability.

Repeatability, while important, is a weak requirement. Given only repeatability as a requirement, two scenes rendered with one (small) polygon changed in position might differ at every pixel. Such a difference, while within the law of repeatability, is certainly not within its spirit. Additional invariance rules are desirable to ensure useful operation.

Multi-pass Algorithms

Invariance is necessary for a whole set of useful multi-pass algorithms. Such algorithms render multiple times, each time with a different Vulkan mode vector, to eventually produce a result in the framebuffer. Examples of these algorithms include:

- “Erasing” a primitive from the framebuffer by redrawing it, either in a different color or using the XOR logical operation.
- Using stencil operations to compute capping planes.

Invariance Rules

For a given Vulkan device:

Rule 1 For any given Vulkan and framebuffer state vector, and for any given Vulkan command, the resulting Vulkan and framebuffer state must be identical each time the command is executed on that initial Vulkan and framebuffer state.
**Rule 2** Changes to the following state values have no side effects (the use of any other state value is not affected by the change):

**Required:**

- Color and depth/stencil attachment contents
- Scissor parameters (other than enable)
- Write masks (color, depth, stencil)
- Clear values (color, depth, stencil)

**Strongly suggested:**

- Stencil parameters (other than enable)
- Depth test parameters (other than enable)
- Blend parameters (other than enable)
- Logical operation parameters (other than enable)

**Corollary 1** Fragment generation is invariant with respect to the state values listed in Rule 2.

**Rule 3** The arithmetic of each per-fragment operation is invariant except with respect to parameters that directly control it.

**Corollary 2** Images rendered into different color attachments of the same framebuffer, either simultaneously or separately using the same command sequence, are pixel identical.

**Rule 4** Identical pipelines will produce the same result when run multiple times with the same input. The wording “Identical pipelines” means VkPipeline objects that have been created with identical SPIR-V binaries and identical state, which are then used by commands executed using the same Vulkan state vector. Invariance is relaxed for shaders with side effects, such as performing stores or atomics.

**Rule 5** All fragment shaders that either conditionally or unconditionally assign FragCoord.z to FragDepth are depth-invariant with respect to each other, for those fragments where the assignment to FragDepth actually is done.

If a sequence of Vulkan commands specifies primitives to be rendered with shaders containing side effects (image and buffer variable stores and atomic operations), invariance rules are relaxed. In particular, rule 1, corollary 2, and rule 4 do not apply in the presence of shader side effects.

The following weaker versions of rules 1 and 4 apply to Vulkan commands involving shader side effects:

**Rule 6** For any given Vulkan and framebuffer state vector, and for any given Vulkan command, the contents of any framebuffer state not directly or indirectly affected by results of shader image or buffer variable stores or atomic operations must be identical each time the command is executed on that initial Vulkan and framebuffer state.

**Rule 7** Identical pipelines will produce the same result when run multiple times with the same input
as long as:

- shader invocations do not use image atomic operations;
- no framebuffer memory is written to more than once by image stores, unless all such stores write the same value; and
- no shader invocation, or other operation performed to process the sequence of commands, reads memory written to by an image store.

Note

The OpenGL specification has the following invariance rule: Consider a primitive $p'$ obtained by translating a primitive $p$ through an offset $(x, y)$ in window coordinates, where $x$ and $y$ are integers. As long as neither $p'$ nor $p$ is clipped, it must be the case that each fragment $f'$ produced from $p'$ is identical to a corresponding fragment $f$ from $p$ except that the center of $f'$ is offset by $(x, y)$ from the center of $f$.

This rule does not apply to Vulkan and is an intentional difference from OpenGL.

When any sequence of Vulkan commands triggers shader invocations that perform image stores or atomic operations, and subsequent Vulkan commands read the memory written by those shader invocations, these operations must be explicitly synchronized.

Tessellation Invariance

When using a pipeline containing tessellation evaluation shaders, the fixed-function tessellation primitive generator consumes the input patch specified by an application and emits a new set of primitives. The following invariance rules are intended to provide repeatability guarantees. Additionally, they are intended to allow an application with a carefully crafted tessellation evaluation shader to ensure that the sets of triangles generated for two adjacent patches have identical vertices along shared patch edges, avoiding “cracks” caused by minor differences in the positions of vertices along shared edges.

Rule 1 When processing two patches with identical outer and inner tessellation levels, the tessellation primitive generator will emit an identical set of point, line, or triangle primitives as long as the pipeline used to process the patch primitives has tessellation evaluation shaders specifying the same tessellation mode, spacing, vertex order, and point mode decorations. Two sets of primitives are considered identical if and only if they contain the same number and type of primitives and the generated tessellation coordinates for the vertex numbered $m$ of the primitive numbered $n$ are identical for all values of $m$ and $n$.

Rule 2 The set of vertices generated along the outer edge of the subdivided primitive in triangle and quad tessellation, and the tessellation coordinates of each, depend only on the corresponding outer tessellation level and the spacing decorations in the tessellation shaders of the pipeline.

Rule 3 The set of vertices generated when subdividing any outer primitive edge is always symmetric. For triangle tessellation, if the subdivision generates a vertex with tessellation coordinates of the form $(0, x, 1-x)$, $(x, 0, 1-x)$, or $(x, 1-x, 0)$, it will also generate a vertex with coordinates of exactly $(0, 1-x, x)$,
(1-x, 0, x), or (1-x, x, 0), respectively. For quad tessellation, if the subdivision generates a vertex with coordinates of (x, 0) or (0, x), it will also generate a vertex with coordinates of exactly (1-x, 0) or (0, 1-x), respectively. For isoline tessellation, if it generates vertices at (0, x) and (1, x) where x is not zero, it will also generate vertices at exactly (0, 1-x) and (1, 1-x), respectively.

**Rule 4** The set of vertices generated when subdividing outer edges in triangular and quad tessellation must be independent of the specific edge subdivided, given identical outer tessellation levels and spacing. For example, if vertices at (x, 1-x, 0) and (1-x, x, 0) are generated when subdividing the w = 0 edge in triangular tessellation, vertices must be generated at (x, 0, 1-x) and (1-x, 0, x) when subdividing an otherwise identical v = 0 edge. For quad tessellation, if vertices at (x, 0) and (1-x, 0) are generated when subdividing the v = 0 edge, vertices must be generated at (0, x) and (0, 1-x) when subdividing an otherwise identical u = 0 edge.

**Rule 5** When processing two patches that are identical in all respects enumerated in rule 1 except for vertex order, the set of triangles generated for triangle and quad tessellation must be identical except for vertex and triangle order. For each triangle n1 produced by processing the first patch, there must be a triangle n2 produced when processing the second patch each of whose vertices has the same tessellation coordinates as one of the vertices in n1.

**Rule 6** When processing two patches that are identical in all respects enumerated in rule 1 other than matching outer tessellation levels and/or vertex order, the set of interior triangles generated for triangle and quad tessellation must be identical in all respects except for vertex and triangle order. For each interior triangle n1 produced by processing the first patch, there must be a triangle n2 produced when processing the second patch each of whose vertices has the same tessellation coordinates as one of the vertices in n1. A triangle produced by the tessellator is considered an interior triangle if none of its vertices lie on an outer edge of the subdivided primitive.

**Rule 7** For quad and triangle tessellation, the set of triangles connecting an inner and outer edge depends only on the inner and outer tessellation levels corresponding to that edge and the spacing decorations.

**Rule 8** The value of all defined components of TessCoord will be in the range [0, 1]. Additionally, for any defined component x of TessCoord, the results of computing 1.0-x in a tessellation evaluation shader will be exact. If any floating-point values in the range [0, 1] fail to satisfy this property, such values must not be used as tessellation coordinate components.
Appendix I: Lexicon

This appendix defines terms, abbreviations, and API prefixes used in the Specification.

Glossary

The terms defined in this section are used consistently throughout the Specification and may be used with or without capitalization.

Accessible (Descriptor Binding)
A descriptor binding is accessible to a shader stage if that stage is included in the `stageFlags` of the descriptor binding. Descriptors using that binding can only be used by stages in which they are accessible.

Acquire Operation (Resource)
An operation that acquires ownership of an image subresource or buffer range.

Active (Descriptor Type)
When a descriptor with `mutable` type is updated with `vkUpdateDescriptorSets`, the active descriptor type changes. When the descriptor is consumed by shaders, it is the active descriptor type which determines validity, i.e. `VkDescriptorSetLayoutBinding::descriptorType` is replaced with the active descriptor type. A mismatch in active descriptor type and consumption by shader is considered an undefined descriptor.

Active (Transform Feedback)
Transform feedback is made active after `vkCmdBeginTransformFeedbackEXT` executes and remains active until `vkCmdEndTransformFeedbackEXT` executes. While transform feedback is active, data written to variables in the output interface of the last pre-rasterization shader stage of the graphics pipeline are captured to the bound transform feedback buffers if those variables are decorated for transform feedback.

Adjacent Vertex
A vertex in an adjacency primitive topology that is not part of a given primitive, but is accessible in geometry shaders.

Active Object (Ray Tracing)
A primitive or instance in a ray tracing acceleration structure which has a corresponding ID, and is not `inactive` (meaning that it is visible to rays).

Advanced Blend Operation
Blending performed using one of the blend operation enums introduced by the `VK_EXT_blend_operation_advanced` extension. See Advanced Blending Operations.

Alias (API type/command)
An identical definition of another API type/command with the same behavior but a different name.
Aliased Range (Memory)
A range of a device memory allocation that is bound to multiple resources simultaneously.

Allocation Scope
An association of a host memory allocation to a parent object or command, where the allocation’s lifetime ends before or at the same time as the parent object is freed or destroyed, or during the parent command.

API command
Any command defined in the Vulkan specification. These entry points all have a vk prefix.

Aspect (Image)
Some image types contain multiple kinds (called “aspects”) of data for each pixel, where each aspect is used in a particular way by the pipeline and may be stored differently or separately from other aspects. For example, the color components of an image format make up the color aspect of the image, and can be used as a framebuffer color attachment. Some operations, like depth testing, operate only on specific aspects of an image.

Attachment (Render Pass)
A zero-based integer index name used in render pass creation to refer to a framebuffer attachment that is accessed by one or more subpasses. The index also refers to an attachment description which includes information about the properties of the image view that will later be attached.

Availability Operation
An operation that causes the values generated by specified memory write accesses to become available for future access.

Available
A state of values written to memory that allows them to be made visible.

Axis-aligned Bounding Box
A box bounding a region in space defined by extents along each axis and thus representing a box where each edge is aligned to one of the major axes.

Back-Facing
See Facingness.

Backward Prediction
Sample prediction performed during video decode and encode operations based on reference pictures that occur temporally (in display order) after the current picture.

Backward Reference
A reference picture that occurs temporally (in display order) after the current picture.

Batch
A single structure submitted to a queue as part of a queue submission command, describing a set of queue operations to execute.
Backwards Compatibility

A given version of the API is backwards compatible with an earlier version if an application, relying only on valid behavior and functionality defined by the earlier specification, is able to correctly run against each version without any modification. This assumes no active attempt by that application to not run when it detects a different version.

Binary Semaphore

A semaphore with a boolean payload indicating whether the semaphore is signaled or unsigned. Represented by a VkSemaphore object created with a semaphore type of VK_SEMAPHORE_TYPE_BINARY.

Binding (Memory)

An association established between a range of a resource object and a range of a memory object. These associations determine the memory locations affected by operations performed on elements of a resource object. Memory bindings are established using the vkBindBufferMemory command for non-sparse buffer objects, using the vkBindImageMemory command for non-sparse image objects, and using the vkQueueBindSparse command for sparse resources.

Blend Constant

Four floating point (RGBA) values used as an input to blending.

Blending

Arithmetic operations between a fragment color value and a value in a color attachment that produce a final color value to be written to the attachment.

Buffer

A resource that represents a linear array of data in device memory. Represented by a VkBuffer object.

Buffer Device Address

A 64-bit value used in a shader to access buffer memory through the PhysicalStorageBuffer storage class.

Buffer View

An object that represents a range of a specific buffer, and state controlling how the contents are interpreted. Represented by a VkBufferView object.

Built-In Variable

A variable decorated in a shader, where the decoration makes the variable take values provided by the execution environment or values that are generated by fixed-function pipeline stages.

Built-In Interface Block

A block defined in a shader containing only variables decorated with built-in decorations, and is used to match against other shader stages.

Clip Coordinates

The homogeneous coordinate space in which vertex positions (Position decoration) are written by pre-rasterization shader stages.
Clip Distance
A built-in output from pre-rasterization shader stages defining a clip half-space against which the primitive is clipped.

Clip Volume
The intersection of the view volume with all clip half-spaces.

Color Attachment
A subpass attachment point, or image view, that is the target of fragment color outputs and blending.

Color Fragment
A unique color value within a pixel of a multisampled color image. The fragment mask will contain indices to the color fragment.

Color Renderable Format
A VkFormat where VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT is set in one of the following, depending on the image's tiling:

- VkFormatProperties::linearTilingFeatures
- VkFormatProperties::optimalTilingFeatures or a VkFormat where VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV is set in VkFormatProperties::linearTilingFeatures
- VkDrmFormatModifierPropertiesEXT::drmFormatModifierTilingFeatures

Combined Image Sampler
A descriptor type that includes both a sampled image and a sampler.

Command Buffer
An object that records commands to be submitted to a queue. Represented by a VkCommandBuffer object.

Command Buffer Nesting Level
The Command Buffer Nesting Level of a secondary command buffer is equal to the maximum nesting level of all secondary command buffers executed by that command buffer plus one, where a secondary command buffer that executes no other secondary command buffers has a nesting level of zero.

Command Pool
An object that command buffer memory is allocated from, and that owns that memory. Command pools aid multithreaded performance by enabling different threads to use different allocators, without internal synchronization on each use. Represented by a VkCommandPool object.

Compatible Allocator
When allocators are compatible, allocations from each allocator can be freed by the other allocator.
Compatible Image Formats
When formats are compatible, images created with one of the formats can have image views created from it using any of the compatible formats. Also see Size-Compatible Image Formats.

Compatible Queues
Queues within a queue family. Compatible queues have identical properties.

Complete Mipmap Chain
The entire set of mip levels that can be provided for an image, from the largest application specified mip level size down to the minimum mip level size. See Image Mip Level Sizing.

Completed Operation
A deferred operation whose corresponding command has been executed to completion. See Deferred Host Operations

Component (Format)
A distinct part of a format. Color components are represented with R, G, B, and A. Depth and stencil components are represented with D and S. Formats can have multiple instances of the same component. Some formats have other notations such as E or X which are not considered a component of the format.

Compressed Texel Block
An element of an image having a block-compressed format, comprising a rectangular block of texel values that are encoded as a single value in memory. Compressed texel blocks of a particular block-compressed format have a corresponding width, height, and depth defining the dimensions of these elements in units of texels, and a size in bytes of the encoding in memory.

Constant Integral Expressions
A SPIR-V constant instruction whose type is OpTypeInt. See Constant Instruction in section 2.2.1 "Instructions" of the Khronos SPIR-V Specification.

Cooperative Matrix
A SPIR-V type where the storage for and computations performed on the matrix are spread across a set of invocations such as a subgroup.

Corner-Sampled Image
A VkImage where unnormalized texel coordinates are centered on integer values instead of half-integer values. Specified by setting the VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV bit on VkImageCreateInfo::flags at image creation.

Coverage Index
The index of a sample in the coverage mask.

Coverage Mask
A bitfield associated with a fragment representing the samples that were determined to be covered based on the result of rasterization, and then subsequently modified by fragment operations or the fragment shader.
Cull Distance
A built-in output from *pre-rasterization shader stages* defining a cull half-space where the primitive is rejected if all vertices have a negative value for the same cull distance.

Cull Volume
The intersection of the view volume with all cull half-spaces.

Decode Output Picture
A video picture resource used to store the result of a video decode operation.

Decoded Picture Buffer
An indexed set of reference pictures used by a video session. Abbreviated as DPB.

Decoded Picture Buffer Slot
An entry within a DPB that can be associated with a particular reference picture.

Decoded Picture Buffer Slot Index
The index of a DPB slot within its encompassing DPB.

Decoration (SPIR-V)
Auxiliary information such as built-in variables, stream numbers, invariance, interpolation type, relaxed precision, etc., added to variables or structure-type members through decorations.

Deferrable Command
A command which allows deferred execution of host-side work. See *Deferred Host Operations*.

Deferrable Operation
A single logical item of host-side work which can be deferred. Represented by the *VkDeferredOperationKHR* object. See *Deferred Host Operations*.

Deprecated (feature)
A feature is deprecated if it is no longer recommended as the correct or best way to achieve its intended purpose.

Depth/Stencil Attachment
A subpass attachment point, or image view, that is the target of depth and/or stencil test operations and writes.

Depth/Stencil Format
A *VkFormat* that includes depth and/or stencil components.

Depth/Stencil Image (or ImageView)
A *VkImage* (or *VkImageView*) with a depth/stencil format.

Depth/Stencil Resolve Attachment
A subpass attachment point, or image view, that is the target of a multisample resolve operation from the corresponding depth/stencil attachment at the end of the subpass.
**Derivative Group**
A set of fragment or compute shader invocations that cooperate to compute derivatives, including implicit derivatives for sampled image operations.

**Descriptor**
Information about a resource or resource view written into a descriptor set that is used to access the resource or view from a shader.

**Descriptor Binding**
An entry in a descriptor set layout corresponding to zero or more descriptors of a single descriptor type in a set. Defined by a VkDescriptorSetLayoutBinding structure.

**Descriptor Pool**
An object that descriptor sets are allocated from, and that owns the storage of those descriptor sets. Descriptor pools aid multithreaded performance by enabling different threads to use different allocators, without internal synchronization on each use. Represented by a VkDescriptorPool object.

**Descriptor Set**
An object that resource descriptors are written into via the API, and that can be bound to a command buffer such that the descriptors contained within it can be accessed from shaders. Represented by a VkDescriptorSet object.

**Descriptor Set Layout**
An object defining the set of resources (types and counts) and their relative arrangement (in the binding namespace) within a descriptor set. Used when allocating descriptor sets and when creating pipeline layouts. Represented by a VkDescriptorSetLayout object.

**Device**
The processor(s) and execution environment that perform tasks requested by the application via the Vulkan API.

**Device Group**
A set of physical devices that support accessing each other's memory and recording a single command buffer that can be executed on all the physical devices.

**Device Index**
A zero-based integer that identifies one physical device from a logical device. A device index is valid if it is less than the number of physical devices in the logical device.

**Device Mask**
A bitmask where each bit represents one device index. A device mask value is valid if every bit that is set in the mask is at a bit position that is less than the number of physical devices in the logical device.

**Device Memory**
Memory accessible to the device. Represented by a VkDeviceMemory object.
Device-Level Command

Any command that is dispatched from a logical device, or from a child object of a logical device.

Device-Level Functionality

All device-level commands and objects, and their structures, enumerated types, and enumerants. Additionally, physical-device-level functionality defined by a device extension is also considered device-level functionality.

Device-Level Object

Logical device objects and their child objects. For example, VkDevice, VkQueue, and VkCommandBuffer objects are device-level objects.

Device-Local Memory

Memory that is connected to the device, and may be more performant for device access than host-local memory.

Direct Drawing Commands

Direct drawing commands that take all their parameters as direct arguments to the command (and not sourced via structures in buffer memory as the indirect drawing commands). Includes vkCmdDrawMultiIndexedEXT, vkCmdDrawMultiEXT, vkCmdDrawMeshTasksNV, vkCmdDrawMeshTasksEXT, vkCmdDraw, and vkCmdDrawIndexed.

Disjoint

Disjoint planes are image planes to which memory is bound independently. A disjoint image consists of multiple disjoint planes, and is created with the VK_IMAGE_CREATE_DISJOINT_BIT bit set.

Dispatchable Command

A non-global command. The first argument to each dispatchable command is a dispatchable handle type.

Dispatchable Handle

A handle of a pointer handle type which may be used by layers as part of intercepting API commands.

Dispatching Commands

Commands that provoke work using a compute pipeline. Includes vkCmdDispatch and vkCmdDispatchIndirect.

Drawing Commands

Commands that provoke work using a graphics pipeline. Includes vkCmdDraw, vkCmdDrawIndexed, vkCmdDrawIndirectCount, vkCmdDrawIndexedIndirectCount, vkCmdDispatch, vkCmdDispatchIndirect, vkCmdDrawIndirectCountKHR, vkCmdDrawIndirectCountAMD, vkCmdDispatch, vkCmdDispatchIndirect, vkCmdDrawIndirectCountEXT, vkCmdDrawMeshTasksIndirectNV, vkCmdDrawMeshTasksEXT, vkCmdDrawMeshTasksIndirectCountEXT, and
vkCmdDrawIndexedIndirect.

**Duration (Command)**

The *duration* of a Vulkan command refers to the interval between calling the command and its return to the caller.

**Dynamic Storage Buffer**

A storage buffer whose offset is specified each time the storage buffer is bound to a command buffer via a descriptor set.

**Dynamic Uniform Buffer**

A uniform buffer whose offset is specified each time the uniform buffer is bound to a command buffer via a descriptor set.

**Dynamically Uniform**

See *Dynamically Uniform* in section 2.2 “Terms” of the Khronos SPIR-V Specification.

**Encode Input Picture**

A video picture resource used as the input of a video encode operation.

**Element**

Arrays are composed of multiple elements, where each element exists at a unique index within that array. Used primarily to describe data passed to or returned from the Vulkan API.

**Explicitly-Enabled Layer**

A layer enabled by the application by adding it to the enabled layer list in `vkCreateInstance` or `vkCreateDevice`.

**Event**

A synchronization primitive that is signaled when execution of previous commands completes through a specified set of pipeline stages. Events can be waited on by the device and polled by the host. Represented by a `VkEvent` object.

**Executable State (Command Buffer)**

A command buffer that has ended recording commands and can be executed. See also Initial State and Recording State.

**Execution Dependency**

A dependency that guarantees that certain pipeline stages’ work for a first set of commands has completed execution before certain pipeline stages’ work for a second set of commands begins execution. This is accomplished via pipeline barriers, subpass dependencies, events, or implicit ordering operations.

**Execution Dependency Chain**

A sequence of execution dependencies that transitively act as a single execution dependency.

**Explicit chroma reconstruction**

An implementation of sampler Y′C_Br conversion which reconstructs reduced-resolution chroma...
samples to luma resolution and then separately performs texture sample interpolation. This is distinct from an implicit implementation, which incorporates chroma sample reconstruction into texture sample interpolation.

**Extension Scope**

The set of objects and commands that **can** be affected by an extension. Extensions are either device scope or instance scope.

**Extending Structure**

A structure type which may appear in the `pNext` chain of another structure, extending the functionality of the other structure. Extending structures may be defined by either core API versions or extensions.

**External Handle**

A resource handle which has meaning outside of a specific Vulkan device or its parent instance. External handles **may** be used to share resources between multiple Vulkan devices in different instances, or between Vulkan and other APIs. Some external handle types correspond to platform-defined handles, in which case the resource **may** outlive any particular Vulkan device or instance and **may** be transferred between processes, or otherwise manipulated via functionality defined by the platform for that handle type.

**External synchronization**

A type of synchronization **required** of the application, where parameters defined to be externally synchronized **must** not be used simultaneously in multiple threads.

**Facingness (Polygon)**

A classification of a polygon as either front-facing or back-facing, depending on the orientation (winding order) of its vertices.

**Facingness (Fragment)**

A fragment is either front-facing or back-facing, depending on the primitive it was generated from. If the primitive was a polygon (regardless of polygon mode), the fragment inherits the facingness of the polygon. All other fragments are front-facing.

**Fence**

A synchronization primitive that is signaled when a set of batches or sparse binding operations complete execution on a queue. Fences **can** be waited on by the host. Represented by a `VkFence` object.

**Field (Video)**

Possibly discontinuous subregions of a frame. Frames **may** consist of two fields, a top field and a bottom field.

**Flat Shading**

A property of a vertex attribute that causes the value from a single vertex (the provoking vertex) to be used for all vertices in a primitive, and for interpolation of that attribute to return that single value unaltered.
**Format Features**
A set of features from VkFormatFeatureFlagBits that a VkFormat is capable of using for various commands. The list is determined by factors such as VkImageTiling.

**Forward Prediction**
Sample prediction performed during video decode and encode operations based on reference pictures that occur temporally (in display order) before the current picture.

**Forward Reference**
A reference picture that occurs temporally (in display order) before the current picture.

**Fragment**
A rectangular framebuffer region with associated data produced by rasterization and processed by fragment operations including the fragment shader.

**Fragment Area**
The width and height, in pixels, of a fragment.

**Fragment Density**
The ratio of fragments per framebuffer area in the x and y direction.

**Fragment Density Texel Size**
The (w,h) framebuffer region in pixels that each texel in a fragment density map applies to.

**Fragment Input Attachment Interface**
Variables with UniformConstant storage class and a decoration of InputAttachmentIndex that are statically used by a fragment shader's entry point, which receive values from input attachments.

**Fragment Mask**
A lookup table that associates color samples with color fragment values.

**Fragment Output Interface**
A fragment shader entry point's variables with Output storage class, which output to color and/or depth/stencil attachments.

**Frame (Video)**
A multi-dimensional array of luma samples and an optional multi-dimensional array of chroma samples.

**Fragment Tile Image Interface**
A fragment shader entry point's variables with TileImageEXT storage class and a decoration of Location, which are used to read values from color attachments.

**Framebuffer**
A collection of image views and a set of dimensions that, in conjunction with a render pass, define the inputs and outputs used by drawing commands. Represented by a VkFramebuffer object.
Framebuffer Attachment
One of the image views used in a framebuffer.

Framebuffer Coordinates
A coordinate system in which adjacent pixels' coordinates differ by 1 in x and/or y, with (0,0) in the upper left corner and pixel centers at half-integers.

Framebuffer-Space
Operating with respect to framebuffer coordinates.

Framebuffer-Local
A framebuffer-local dependency guarantees that only for a single framebuffer region, the first set of operations happens-before the second set of operations.

Framebuffer-Global
A framebuffer-global dependency guarantees that for all framebuffer regions, the first set of operations happens-before the second set of operations.

Framebuffer Region
A framebuffer region is a set of sample (x, y, layer, sample) coordinates that is a subset of the entire framebuffer.

Front-Facing
See Facingness.

Full Compatibility
A given version of the API is fully compatible with another version if an application, relying only on valid behavior and functionality defined by either of those specifications, is able to correctly run against each version without any modification. This assumes no active attempt by that application to not run when it detects a different version.

Global Command
A Vulkan command for which the first argument is not a dispatchable handle type.

Global Workgroup
A collection of local workgroups dispatched by a single dispatching or single mesh task drawing command.

Handle
An opaque integer or pointer value used to refer to a Vulkan object. Each object type has a unique handle type.

Happen-after, happens-after
A transitive, irreflexive and antisymmetric ordering relation between operations. An execution dependency with a source of A and a destination of B enforces that B happens-after A. The inverse relation of happens-before.
**Happen-before, happens-before**
A transitive, irreflexive and antisymmetric ordering relation between operations. An execution dependency with a source of \textit{A} and a destination of \textit{B} enforces that \textit{A} happens-before \textit{B}. The inverse relation of happens-after.

**Helper Invocation**
A fragment shader invocation that is created solely for the purposes of evaluating derivatives for use in non-helper fragment shader invocations, and which does not have side effects.

**Host**
The processor(s) and execution environment that the application runs on, and that the Vulkan API is exposed on.

**Host Mapped Device Memory**
Device memory that is mapped for host access using \texttt{vkMapMemory}.

**Host Mapped Foreign Memory**
Memory owned by a foreign device that is mapped for host access.

**Host Memory**
Memory not accessible to the device, used to store implementation data structures.

**Host-Accessible Subresource**
A buffer, or a linear image subresource in either the \texttt{VK_IMAGE_LAYOUT_PREINITIALIZED} or \texttt{VK_IMAGE_LAYOUT_GENERAL} layout. Host-accessible subresources have a well-defined addressing scheme which can be used by the host.

**Host-Local Memory**
Memory that is not local to the device, and \textbf{may} be less performant for device access than device-local memory.

**Host-Visible Memory**
Device memory that \textbf{can} be mapped on the host and \textbf{can} be read and written by the host.

**ICD**
Installable Client Driver. An ICD is represented as a \texttt{VkPhysicalDevice}.

**Identically Defined Objects**
Objects of the same type where all arguments to their creation or allocation functions, with the exception of \texttt{pAllocator}, are

1. Vulkan handles which refer to the same object or
2. identical scalar or enumeration values or
3. Host pointers which point to an array of values or structures which also satisfy these three constraints.

**Image**
A resource that represents a multi-dimensional formatted interpretation of device memory.
Represented by a `VkImage` object.

**Image Subresource**
A specific mipmap level, layer, and set of aspects of an image.

**Image Subresource Range**
A set of image subresources that are contiguous mipmap levels and layers.

**Image View**
An object that represents an image subresource range of a specific image, and state controlling how the contents are interpreted. Represented by a `VkImageView` object.

**Immutable Sampler**
A sampler descriptor provided at descriptor set layout creation time for a specific binding. This sampler is then used for that binding in all descriptor sets allocated with the layout, and it cannot be changed.

**Implicit chroma reconstruction**
An implementation of sampler \( Y'\text{C}_b\text{C}_r \) conversion which reconstructs the reduced-resolution chroma samples directly at the sample point, as part of the normal texture sampling operation. This is distinct from an *explicit chroma reconstruction* implementation, which reconstructs the reduced-resolution chroma samples to the resolution of the luma samples, then filters the result as part of texture sample interpolation.

**Implicitly-Enabled Layer**
A layer enabled by a loader-defined mechanism outside the Vulkan API, rather than explicitly by the application during instance or device creation.

**Inactive Object (Ray Tracing)**
A primitive or instance in a ray tracing acceleration structure which has a corresponding ID, but which will never report an intersection with any ray.

**Index Buffer**
A buffer bound via `vkCmdBindIndexBuffer` which is the source of index values used to fetch vertex attributes for a `vkCmdDrawIndexed` or `vkCmdDrawIndexedIndirect` command.

**Indexed Drawing Commands**
*Drawing commands* which use an *index buffer* as the source of index values used to fetch vertex attributes for a drawing command. Includes `vkCmdDrawIndexed`, `vkCmdDrawIndexedIndirectCount`, `vkCmdDrawIndexedIndirectCountKHR`, `vkCmdDrawIndexedIndirectCountAMD`, `vkCmdDrawMultiIndexedEXT`, and `vkCmdDrawIndexedIndirect`.

**Indirect Commands**
Drawing or dispatching commands that source some of their parameters from structures in buffer memory. Includes `vkCmdDrawIndirect`, `vkCmdDrawIndexedIndirect`, `vkCmdDrawIndexedIndirectCount`, `vkCmdDrawIndexedIndirectCountKHR`, `vkCmdDrawIndexedIndirectCountAMD`,
Indirect Commands Layout

A definition of a sequence of commands, that are generated on the device via `vkCmdPreprocessGeneratedCommandsNV` and `vkCmdExecuteGeneratedCommandsNV`. Each sequence is comprised of multiple `VkIndirectCommandsTokenTypeNV`, which represent a subset of traditional command buffer commands. Represented as `VkIndirectCommandsLayoutNV`.

Indirect Drawing Commands

*Drawing commands* that source some of their parameters from structures in buffer memory. Includes `vkCmdDrawIndirect`, `vkCmdDrawIndirectCount`, `vkCmdDrawIndexedIndirectCount`, `vkCmdDrawIndirectCountKHR`, `vkCmdDrawIndexedIndirectCountKHR`, `vkCmdDrawMeshTasksIndirectNV`, `vkCmdDrawMeshTasksIndirectCountNV`, `vkCmdDrawMeshTasksIndirectEXT`, `vkCmdDrawMeshTasksIndirectCountEXT`, and `vkCmdDrawIndexedIndirect`.

Initial State (Command Buffer)

A command buffer that has not begun recording commands. See also Recording State and Executable State.

Inline Uniform Block

A descriptor type that represents uniform data stored directly in descriptor sets, and supports read-only access in a shader.

Input Attachment

A descriptor type that represents an image view, and supports unfiltered read-only access in a shader, only at the fragment’s location in the view.

Instance

The top-level Vulkan object, which represents the application’s connection to the implementation. Represented by a `VkInstance` object.

Instance-Level Command

Any command that is dispatched from an instance, or from a child object of an instance, except for physical devices and their children.

Instance-Level Functionality

All instance-level commands and objects, and their structures, enumerated types, and enumerants.

Instance-Level Object

High-level Vulkan objects, which are not physical devices, nor children of physical devices. For example, `VkInstance` is an instance-level object.
**Instance (Memory)**

In a logical device representing more than one physical device, some device memory allocations have the requested amount of memory allocated multiple times, once for each physical device in a device mask. Each such replicated allocation is an instance of the device memory.

**Instance (Resource)**

In a logical device representing more than one physical device, buffer and image resources exist on all physical devices but can be bound to memory differently on each. Each such replicated resource is an instance of the resource.

**Internal Synchronization**

A type of synchronization **required** of the implementation, where parameters not defined to be externally synchronized **may** require internal mutexing to avoid multithreaded race conditions.

**Invocation (Shader)**

A single execution of an entry point in a SPIR-V module. For example, a single vertex's execution of a vertex shader or a single fragment's execution of a fragment shader.

**Invocation Group**

A set of shader invocations that are executed in parallel and that **must** execute the same control flow path in order for control flow to be considered dynamically uniform.

**Invocation Repack Instruction**

A ray tracing instruction where the implementation **may** change the set of invocations that are executing.

**Join (Deferred Host Operations)**

The act of instructing a thread to participate in the execution of a deferred operation. See Deferred Host Operations.

**Linear Color Attachment**

A color attachment with linear tiling

**Linear Resource**

A resource is **linear** if it is one of the following:

- a VkBuffer
- a VkImage created with VK_IMAGE_TILING_LINEAR
- a VkImage created with VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT and whose Linux DRM format modifier is DRM_FORMAT_MOD_LINEAR
- a VkAccelerationStructureNV

Because a VkAccelerationStructureKHR resource does not have memory bound to it directly, it is considered neither linear nor non-linear. However, the VkBuffer on which a VkAccelerationStructureKHR resource is placed is a linear resource.

A resource is **non-linear** if it is one of the following:
• a VkImage created with VK_IMAGE_TILING_OPTIMAL

• a VkImage created with VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT and whose Linux DRM format modifier is not DRM_FORMAT_MOD_LINEAR

Linux DRM Format Modifier
A 64-bit, vendor-prefixed, semi-opaque unsigned integer describing vendor-specific details of an image’s memory layout. In Linux graphics APIs, modifiers are commonly used to specify the memory layout of externally shared images. An image has a modifier if and only if it is created with tiling equal to VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT. For more details, refer to the appendix for extension VK_EXT_image_drm_format_modifier.

Local Workgroup
A collection of compute shader invocations invoked by a single dispatching command, which share data via WorkgroupLocal variables and can synchronize with each other.

Logical Device
An object that represents the application’s interface to the physical device. The logical device is the parent of most Vulkan objects. Represented by a VkDevice object.

Logical Operation
Bitwise operations between a fragment color value and a value in a color attachment, that produce a final color value to be written to the attachment.

Lost Device
A state that a logical device may be in as a result of unrecoverable implementation errors, or other exceptional conditions.

Mappable
See Host-Visible Memory.

Memory Dependency
A memory dependency is an execution dependency which includes availability and visibility operations such that:

• The first set of operations happens-before the availability operation

• The availability operation happens-before the visibility operation

• The visibility operation happens-before the second set of operations

Memory Domain
A memory domain is an abstract place to which memory writes are made available by availability operations and memory domain operations. The memory domains correspond to the set of agents that the write can then be made visible to. The memory domains are host, device, shader, workgroup instance (for workgroup instance there is a unique domain for each compute workgroup) and subgroup instance (for subgroup instance there is a unique domain for each subgroup).
Memory Domain Operation
An operation that makes the writes that are available to one memory domain available to another memory domain.

Memory Heap
A region of memory from which device memory allocations can be made.

Memory Type
An index used to select a set of memory properties (e.g. mappable, cached) for a device memory allocation.

Mesh Shading Pipeline
A graphics pipeline where the primitives are assembled explicitly in the shader stages. In contrast to the primitive shading pipeline where input primitives are assembled by fixed function processing.

Mesh Tasks Drawing Commands
Drawing commands which create shader invocations organized in workgroups for drawing mesh tasks. Includes `vkCmdDrawMeshTasksNV`, `vkCmdDrawMeshTasksIndirectNV`, and `vkCmdDrawMeshTasksIndirectCountNV`, `vkCmdDrawMeshTasksEXT`, `vkCmdDrawMeshTasksIndirectEXT`, and `vkCmdDrawMeshTasksIndirectCountEXT`.

Minimum Mip Level Size
The smallest size that is permitted for a mip level. For conventional images this is 1x1x1. For corner-sampled images, this is 2x2x2. See Image Mip Level Sizing.

Mip Tail Region
The set of mipmap levels of a sparse residency texture that are too small to fill a sparse block, and that must all be bound to memory collectively and opaquely.

Multi-planar
A multi-planar format (or “planar format”) is an image format consisting of more than one plane, identifiable with a _2PLANE or _3PLANE component to the format name and listed in Formats requiring sampler Y’C₆C₈ conversion for VK_IMAGE_ASPECT_COLOR_BIT image views. A multi-planar image (or “planar image”) is an image of a multi-planar format.

Nested Command Buffers
A nested command buffer is a secondary command buffer that is executed by another secondary command buffer, which may itself execute other secondary command buffers.

Non-Dispatchable Handle
A handle of an integer handle type. Handle values may not be unique, even for two objects of the same type.

Non-Indexed Drawing Commands
Drawing commands for which the vertex attributes are sourced in linear order from the vertex input attributes for a drawing command (i.e. they do not use an index buffer). Includes `vkCmdDraw`, `vkCmdDrawIndirectCount`, and `vkCmdDrawIndirectCountKHR`,
Normalized
A value that is interpreted as being in the range [0,1] as a result of being implicitly divided by some other value.

Normalized Device Coordinates
A coordinate space after perspective division is applied to clip coordinates, and before the viewport transformation converts them to framebuffer coordinates.

Obsoleted (feature)
A feature is obsolete if it can no longer be used.

Opaque Capture Address
A 64-bit value representing the device address of a buffer or memory object that is expected to be used by trace capture/replay tools in combination with the `bufferDeviceAddress` feature.

Overlapped Range (Aliased Range)
The aliased range of a device memory allocation that intersects a given image subresource of an image or range of a buffer.

Ownership (Resource)
If an entity (e.g. a queue family) has ownership of a resource, access to that resource is well-defined for access by that entity.

Packed Format
A format whose components are stored as a single texel block in memory, with their relative locations defined within that element.

Passthrough Geometry Shader
A geometry shader which uses the `PassthroughNV` decoration on a variable in its input interface. Output primitives in a passthrough geometry shader always have the same topology as the input primitive and are not produced by emitting vertices.

Payload
Importable or exportable reference to the internal data of an object in Vulkan.

Per-View
A variable that has an array of values which are output, one for each view that is being generated. A mesh shader which uses the `PerViewNV` decoration on a variable in its output interface.

Peer Memory
An instance of memory corresponding to a different physical device than the physical device performing the memory access, in a logical device that represents multiple physical devices.

Physical Device
An object that represents a single device in the system. Represented by a `VkPhysicalDevice`
Physical-Device-Level Command
Any command that is dispatched from a physical device.

Physical-Device-Level Functionality
All physical-device-level commands and objects, and their structures, enumerated types, and enumerants.

Physical-Device-Level Object
Physical device objects. For example, VkPhysicalDevice is a physical-device-level object.

Pipeline
An object controlling how graphics or compute work is executed on the device. A pipeline includes one or more shaders, as well as state controlling any non-programmable stages of the pipeline. Represented by a VkPipeline object.

Pipeline Barrier
An execution and/or memory dependency recorded as an explicit command in a command buffer, that forms a dependency between the previous and subsequent commands.

Pipeline Cache
An object that can be used to collect and retrieve information from pipelines as they are created, and can be populated with previously retrieved information in order to accelerate pipeline creation. Represented by a VkPipelineCache object.

Pipeline Layout
An object defining the set of resources (via a collection of descriptor set layouts) and push constants used by pipelines that are created using the layout. Used when creating a pipeline and when binding descriptor sets and setting push constant values. Represented by a VkPipelineLayout object.

Pipeline Library
A pipeline that cannot be directly used, instead defining a set of shaders and shader groups which will be linked into other pipelines.

Pipeline Stage
A logically independent execution unit that performs some of the operations defined by an action command.

Pipeline Trace Ray Instruction
A ray tracing instruction which traces a ray into an acceleration structure when using ray tracing pipelines. One of:

- OpTraceNV
- OpTraceRayKHR
- OpTraceRayMotionNV
- `OpTraceMotionNV`
- `OpHitObjectTraceRayNV`
- `OpHitObjectTraceRayMotionNV`

**pNext Chain**

A set of structures chained together through their `pNext` members.

**Planar**

See multi-planar.

**Plane**

An *image plane* is part of the representation of an image, containing a subset of the color components necessary to represent the texels in the image and with a contiguous mapping of coordinates to bound memory. Most images consist only of a single plane, but some formats spread the components across multiple image planes. The host-accessible properties of each image plane are accessible for a linear layout using `vkGetImageSubresourceLayout`. If a multi-planar image is created with the `VK_IMAGE_CREATE_DISJOINT_BIT` bit set, the image is described as disjoint, and its planes are therefore bound to memory independently.

**Point Sampling (Rasterization)**

A rule that determines whether a fragment sample location is covered by a polygon primitive by testing whether the sample location is in the interior of the polygon in framebuffer-space, or on the boundary of the polygon according to the tie-breaking rules.

**Potential Format Features**

The union of all `VkFormatFeatureFlagBits` that the implementation supports for a specified `VkFormat`, over all supported image tilings. For Android external formats the `VkFormatFeatureFlagBits` is provided by the implementation. For QNX Screen external formats the `VkFormatFeatureFlagBits` is provided by the implementation.

**Pre-rasterization**

Operations that execute before rasterization, and any state associated with those operations.

**Presentable image**

A `VkImage` object obtained from a `VkSwapchainKHR` used to present to a `VkSurfaceKHR` object.

**Preserve Attachment**

One of a list of attachments in a subpass description that is not read or written by the subpass, but that is read or written on earlier and later subpasses and whose contents must be preserved through this subpass.

**Primary Command Buffer**

A command buffer that can execute secondary command buffers, and can be submitted directly to a queue.

**Primitive Shading Pipeline**

A graphics pipeline where input primitives are assembled by fixed function processing. It is the counterpart to mesh shading.
**Primitive Topology**
State controlling how vertices are assembled into primitives, e.g. as lists of triangles, strips of lines, etc.

**Promoted (feature)**
A feature from an older extension is considered promoted if it is made available as part of a new core version or newer extension with wider support.

**Protected Buffer**
A buffer to which protected device memory can be bound.

**Protected-capable Device Queue**
A device queue to which protected command buffers can be submitted.

**Protected Command Buffer**
A command buffer which can be submitted to a protected-capable device queue.

**Protected Device Memory**
Device memory which can be visible to the device but must not be visible to the host.

**Protected Image**
An image to which protected device memory can be bound.

**Provisional**
A feature is released provisionally in order to get wider feedback on the functionality before it is finalized. Provisional features may change in ways that break backwards compatibility, and thus are not recommended for use in production applications.

**Provoking Vertex**
The vertex in a primitive from which flat shaded attribute values are taken. This is generally the “first” vertex in the primitive, and depends on the primitive topology.

**Push Constants**
A small bank of values writable via the API and accessible in shaders. Push constants allow the application to set values used in shaders without creating buffers or modifying and binding descriptor sets for each update.

**Push Constant Interface**
The set of variables with PushConstant storage class that are statically used by a shader entry point, and which receive values from push constant commands.

**Push Descriptors**
Descriptors that are written directly into a command buffer rather than into a descriptor set. Push descriptors allow the application to set descriptors used in shaders without allocating or modifying descriptor sets for each update.

**Descriptor Update Template**
An object specifying a mapping from descriptor update information in host memory to elements
in a descriptor set, which helps enable more efficient descriptor set updates.

**Query Pool**
An object containing a number of query entries and their associated state and results. Represented by a `VkQueryPool` object.

**Queue**
An object that executes command buffers and sparse binding operations on a device. Represented by a `VkQueue` object.

**Queue Family**
A set of queues that have common properties and support the same functionality, as advertised in `VkQueueFamilyProperties`.

**Queue Operation**
A unit of work to be executed by a specific queue on a device, submitted via a queue submission command. Each queue submission command details the specific queue operations that occur as a result of calling that command. Queue operations typically include work that is specific to each command, and synchronization tasks.

**Queue Submission**
Zero or more batches and an optional fence to be signaled, passed to a command for execution on a queue. See the Devices and Queues chapter for more information.

**Ray Tracing Command**
Commands that provoke work using a ray tracing pipeline. Includes `vkCmdTraceRaysNV`, `vkCmdTraceRaysKHR`, and `vkCmdTraceRaysIndirectKHR`.

**Reconstructed Picture**
A video picture resource reconstructed from a compressed bitstream using video decode or encode operations that can be used as a reference picture by future video decode or encode operations with the same video session.

**Recording State (Command Buffer)**
A command buffer that is ready to record commands. See also Initial State and Executable State.

**Reference Picture**
A video picture resource used by video decode and encode operations to provide predictions of the values of samples in the subsequently decoded or encoded pictures.

**Reference Picture Metadata**
Opaque state associated with a DPB slot, maintained by a video session.

**Release Operation (Resource)**
An operation that releases ownership of an image subresource or buffer range.

**Render Pass**
An object that represents a set of framebuffer attachments and phases of rendering using those
attachments. Represented by a VkRenderPass object.

**Render Pass Instance**
A use of a render pass in a command buffer.

**Required Extensions**
Extensions that **must** be enabled alongside extensions dependent on them (see Extension Dependencies).

**Reset (Command Buffer)**
Resetting a command buffer discards any previously recorded commands and puts a command buffer in the initial state.

**Residency Code**
An integer value returned by sparse image instructions, indicating whether any sparse unbound texels were accessed.

**Resolve Attachment**
A subpass attachment point, or image view, that is the target of a multisample resolve operation from the corresponding color attachment at the end of the subpass.

**Retired Swapchain**
A swapchain that has been used as the `oldSwapchain` parameter to `vkCreateSwapchainKHR`. Images cannot be acquired from a retired swapchain, however images that were acquired (but not presented) before the swapchain was retired **can** be presented.

**Sample Index**
The index of a sample within a single set of samples.

**Sample Shading**
Invoking the fragment shader multiple times per fragment, with the covered samples partitioned among the invocations.

**Sampled Image**
A descriptor type that represents an image view, and supports filtered (sampled) and unfiltered read-only access in a shader.

**Sampler**
An object containing state controlling how sampled image data is sampled (or filtered) when accessed in a shader. Also a descriptor type describing the object. Represented by a VkSampler object.

**Secondary Command Buffer**
A command buffer that **can** be executed by a primary command buffer, and **must** not be submitted directly to a queue.

**Self-Dependency**
A subpass dependency from a subpass to itself, i.e. with `srcSubpass` equal to `dstSubpass`. A self-
dependency is not automatically performed during a render pass instance, rather a subset of it can be performed via vkCmdPipelineBarrier during the subpass.

Semaphore
A synchronization primitive that supports signal and wait operations, and can be used to synchronize operations within a queue or across queues. Represented by a VkSemaphore object.

Shader
Instructions selected (via an entry point) from a shader module, which are executed in a shader stage.

Shader Call
An instruction which may cause execution to continue in a different shader stage.

Shader Code
A stream of instructions used to describe the operation of a shader.

Shader Group
A set of Shader Stages that are part of a VkPipeline containing multiple of such sets. This allows the device to make use of all the shader groups from the bound pipeline independently.

Shader Module
A collection of shader code, potentially including several functions and entry points, that is used to create shaders in pipelines. Represented by a VkShaderModule object.

Shader Stage
A stage of the graphics or compute pipeline that executes shader code.

Shading Rate
The ratio of the number of fragment shader invocations generated in a fully covered framebuffer region to the size (in pixels) of that region.

Shading Rate Image
An image used to establish the shading rate for a framebuffer region, where each pixel controls the shading rate for a corresponding framebuffer region.

Shared presentable image
A presentable image created from a swapchain with VkPresentModeKHR set to either VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR or VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR.

Side Effect
A store to memory or atomic operation on memory from a shader invocation.

Single-plane format
A format that is not multi-planar.

Size-Compatible Image Formats
When a compressed image format and an uncompressed image format are size-compatible, it
means that the texel block size of the uncompressed format must equal the texel block size of the compressed format.

**Sparse Block**

An element of a sparse resource that can be independently bound to memory. Sparse blocks of a particular sparse resource have a corresponding size in bytes that they use in the bound memory.

**Sparse Image Block**

A sparse block in a sparse partially-resident image. In addition to the sparse block size in bytes, sparse image blocks have a corresponding width, height, and depth defining the dimensions of these elements in units of texels or compressed texel blocks, the latter being used in case of sparse images having a block-compressed format.

**Sparse Unbound Texel**

A texel read from a region of a sparse texture that does not have memory bound to it.

**SRT**

A decomposition of a spatial transform separating out scale, rotation, and translation which has better linear interpolation properties for representing motion.

**Static Use**

An object in a shader is statically used by a shader entry point if any function in the entry point’s call tree contains an instruction using the object. A reference in the entry point’s interface list does not constitute a static use. Static use is used to constrain the set of descriptors used by a shader entry point.

**Storage Buffer**

A descriptor type that represents a buffer, and supports reads, writes, and atomics in a shader.

**Storage Image**

A descriptor type that represents an image view, and supports unfiltered loads, stores, and atomics in a shader.

**Storage Texel Buffer**

A descriptor type that represents a buffer view, and supports unfiltered, formatted reads, writes, and atomics in a shader.

**Subgroup**

A set of shader invocations that can synchronize and share data with each other efficiently. In compute shaders, the local workgroup is a superset of the subgroup.

**Subgroup Mask**

A bitmask for all invocations in the current subgroup with one bit per invocation, starting with the least significant bit in the first vector component, continuing to the last bit (less than SubgroupSize) in the last required vector component.
Subpass
A phase of rendering within a render pass, that reads and writes a subset of the attachments.

Subpass Dependency
An execution and/or memory dependency between two subpasses described as part of render pass creation, and automatically performed between subpasses in a render pass instance. A subpass dependency limits the overlap of execution of the pair of subpasses, and can provide guarantees of memory coherence between accesses in the subpasses.

Subpass Description
Lists of attachment indices for input attachments, color attachments, depth/stencil attachment, resolve attachments, depth/stencil resolve, and preserve attachments used by the subpass in a render pass.

Subset (Self-Dependency)
A subset of a self-dependency is a pipeline barrier performed during the subpass of the self-dependency, and whose stage masks and access masks each contain a subset of the bits set in the identically named mask in the self-dependency.

Texel Block
A single addressable element of an image with an uncompressed VkFormat, or a single compressed block of an image with a compressed VkFormat.

Texel Block Size
The size (in bytes) used to store a texel block of a compressed or uncompressed image.

Texel Coordinate System
One of three coordinate systems (normalized, unnormalized, integer) defining how texel coordinates are interpreted in an image or a specific mipmap level of an image.

Tile Image
A per-tile view of a framebuffer attachment. If the VK_EXT_shader_tile_image extension is enabled, the framebuffer is considered to be divided into tiles.

Timeline Semaphore
A semaphore with a strictly increasing 64-bit unsigned integer payload indicating whether the semaphore is signaled with respect to a particular reference value. Represented by a VkSemaphore object created with a semaphore type of VK_SEMAPHORE_TYPE_TIMELINE.

Uniform Texel Buffer
A descriptor type that represents a buffer view, and supports unfiltered, formatted, read-only access in a shader.

Uniform Buffer
A descriptor type that represents a buffer, and supports read-only access in a shader.

Units in the Last Place (ULP)
A measure of floating-point error loosely defined as the smallest representable step in a floating-
point format near a given value. For the precise definition see Precision and Operation of SPIR-V instructions or Jean-Michel Muller, “On the definition of ulp(x)”, RR-5504, INRIA. Other sources may also use the term “unit of least precision”.

**Unnormalized**
A value that is interpreted according to its conventional interpretation, and is not normalized.

**Unprotected Buffer**
A buffer to which unprotected device memory can be bound.

**Unprotected Command Buffer**
A command buffer which can be submitted to an unprotected device queue or a protected-capable device queue.

**Unprotected Device Memory**
Device memory which can be visible to the device and can be visible to the host.

**Unprotected Image**
An image to which unprotected device memory can be bound.

**User-Defined Variable Interface**
A shader entry point’s variables with Input or Output storage class that are not built-in variables.

**Vertex Input Attribute**
A graphics pipeline resource that produces input values for the vertex shader by reading data from a vertex input binding and converting it to the attribute's format.

**Vertex Stream**
A vertex stream is where the last pre-rasterization shader stages outputs vertex data, which then goes to the rasterizer, is captured to a transform feedback buffer, or both. Geometry shaders can emit primitives to multiple independent vertex streams. Each vertex emitted by the geometry shader is directed at one of the vertex streams.

**Validation Cache**
An object that can be used to collect and retrieve validation results from the validation layers, and can be populated with previously retrieved results in order to accelerate the validation process. Represented by a VkValidationCacheEXT object.

**Variable-Sized Descriptor Binding**
A descriptor binding whose size will be specified when a descriptor set is allocated using this layout.

**Vertex Input Binding**
A graphics pipeline resource that is bound to a buffer and includes state that affects addressing calculations within that buffer.

**Vertex Input Interface**
A vertex shader entry point’s variables with Input storage class, which receive values from
vertex input attributes.

**Video Bitstream Buffer**
A resource that represents a linear array of data in device memory storing encoded video data. Represented by a *VkBuffer* object.

**Video Coding Scope**
A series of subsequent commands recorded into a command buffer starting with a *vkCmdBeginVideoCodingKHR* command and ending with a *vkCmdEndVideoCodingKHR* command that encompasses a set of video decode or encode operations.

**Video Coding Operations**
Any operations recorded into a command buffer within a video coding scope, including video decode and encode operations.

**Video Decode Operation**
An operation consuming data from a video bitstream buffer and zero or more reference pictures, and producing data to a decode output picture and an optional reconstructed picture.

**Video Encode Operation**
An operation consuming data from an encode input picture and zero or more reference pictures, and producing data to a video bitstream buffer and an optional reconstructed picture.

**Video Picture Resource**
A resource that represents a multi-dimensional formatted interpretation of device memory to be used with a video session as a decode output picture, encode input picture, reconstructed picture, and/or reference picture. It *may* contain metadata associated with a particular video session it is used with. Represented by a *VkImage* object and referred to using *VkImageView* objects created from it.

**Video Session**
A resource that represents and maintains the state needed to perform video decode or encode operations. Represented by a *VkVideoSessionKHR* object.

**Video Session Parameters**
A resource that stores preprocessed codec-specific parameters used with a compatible video session in video codec operations. Represented by a *VkVideoSessionParametersKHR* object.

**Video Transcoding**
The process of using the outputs of video decoding operations as inputs in video encoding operations.

**View Mask**
When multiview is enabled, a view mask is a property of a subpass controlling which views the rendering commands are broadcast to.

**View Volume**
A subspace in homogeneous coordinates, corresponding to post-projection x and y values
between -1 and +1, and z values between 0 and +1.

**Viewport Transformation**
A transformation from normalized device coordinates to framebuffer coordinates, based on a viewport rectangle and depth range.

**Visibility Operation**
An operation that causes available values to become visible to specified memory accesses.

**Visible**
A state of values written to memory that allows them to be accessed by a set of operations.

## Common Abbreviations

The abbreviations and acronyms defined in this section are sometimes used in the Specification and the API where they are considered clear and commonplace.

**Src**
Source

**Dst**
Destination

**Min**
Minimum

**Max**
Maximum

**Rect**
Rectangle

**Info**
Information

**LOD**
Level of Detail

**Log**
Logarithm

**ID**
Identifier

**UUID**
Universally Unique Identifier
Op
Operation

R
Red color component

G
Green color component

B
Blue color component

A
Alpha color component

RTZ
Round towards zero

RTE
Round to nearest even

**Video-Specific Abbreviations**

The following abbreviations and acronyms are used in the context of video decode and encode operations to refer to commonly used video compression terms in their usual abbreviated form:

**AVC**
Advanced Video Coding

**Bipred**
Bidirectional Prediction

**CABAC**
Context-Adaptive Binary Arithmetic Coding

**CAVLC**
Context-Adaptive Variable-Length Coding

**CBR**
Constant Bit Rate

**CTB**
Coding Tree Block

**Diff**
Difference
DPB
Decoded Picture Buffer

GOP
Group Of Pictures

HDR
High Dynamic Range

HEVC
High Efficiency Video Coding

HRD
Hypothetical Reference Decoder

IDC
Indicator

IDR
Instantaneous Decoder Refresh

MB
Macroblock

MV
Motion Vector

NALU
Network Abstraction Layer Unit

OBU
Open Bitstream Unit

PCM
Pulse-Code Modulation

Pic
Picture

Pred
Prediction

PPS
Picture Parameter Set

QP
Quantization Parameter
Prefixes

Prefixes are used in the API to denote specific semantic meaning of Vulkan names, or as a label to avoid name clashes, and are explained here:

**VK/Vk/vk**
- Vulkan namespace
  - All types, commands, enumerants and defines in this specification are prefixed with these two characters.

**PFN/pfn**
- Function Pointer
  - Denotes that a type is a function pointer, or that a variable is of a pointer type.

**p**
- Pointer
  - Variable is a pointer.

**vkCmd**
- Commands that record commands in command buffers
  - These API commands do not result in immediate processing on the device. Instead, they record the requested action in a command buffer for execution when the command buffer is submitted to a queue.

**s**
- Structure
  - Used to denote the `VK_STRUCTURE_TYPE*` member of each structure in `sType`
Appendix J: Credits (Informative)

Vulkan 1.3 is the result of contributions from many people and companies participating in the Khronos Vulkan Working Group, as well as input from the Vulkan Advisory Panel.

Members of the Working Group, including the company that they represented at the time of their most recent contribution, are listed in the following section. Some specific contributions made by individuals are listed together with their name.

**Working Group Contributors to Vulkan**

- Aaron Greig, Codeplay Software Ltd. (version 1.1)
- Aaron Hagan, AMD (version 1.1)
- Adam Jackson, Red Hat (versions 1.0, 1.1)
- Adam Śmigielski, Mobica (version 1.0)
- Aditi Verma, Qualcomm (version 1.3)
- Ahmed Abdelkhalek, AMD (version 1.3)
- Aidan Fabius, Core Avionics & Industrial Inc. (version 1.2)
- Alan Baker, Google (versions 1.1, 1.2, 1.3)
- Alan Ward, Google (versions 1.1, 1.2)
- Alejandro Piñeiro, Igalia (version 1.1)
- Alex Bourd, Qualcomm Technologies, Inc. (versions 1.0, 1.1)
- Alex Crabb, Caster Communications (versions 1.2, 1.3)
- Alex Walters, Imagination Technologies (versions 1.2, 1.3)
- Alexander Galazin, Arm (versions 1.0, 1.1, 1.2, 1.3)
- Alexey Sachkov, Intel (version 1.3)
- Allan MacKinnon, Google (version 1.3)
- Allen Hux, Intel (version 1.0)
- Alon Or-bach, Google (versions 1.0, 1.1, 1.2, 1.3) (WSI technical sub-group chair)
- Anastasia Stulova, Arm (versions 1.2, 1.3)
- Andreas Vasilakis, Think Silicon (version 1.2)
- Andres Gomez, Igalia (version 1.1)
- Andrew Cox, Samsung Electronics (version 1.0)
- Andrew Ellem, Google (version 1.3)
- Andrew Garrard, Imagination Technologies (versions 1.0, 1.1, 1.2, 1.3) (format wrangler)
- Andrew Poole, Samsung Electronics (version 1.0)
- Andrew Rafter, Samsung Electronics (version 1.0)
• Andrew Richards, Codeplay Software Ltd. (version 1.0)
• Andrew Woloszyn, Google (versions 1.0, 1.1)
• Ann Thorsnes, Khronos (versions 1.2, 1.3)
• Antoine Labour, Google (versions 1.0, 1.1)
• Aras Pranckevičius, Unity Technologies (version 1.0)
• Arseny Kapoulkine, Roblox (version 1.3)
• Ashwin Kolhe, NVIDIA (version 1.0)
• Baldur Karlsson, Valve Software (versions 1.1, 1.2, 1.3)
• Barthold Lichtenbelt, NVIDIA (version 1.1)
• Bas Nieuwenhuizen, Google (versions 1.1, 1.2)
• Ben Bowman, Imagination Technologies (version 1.0)
• Benj Lipchak, Unknown (version 1.0)
• Bill Hollings, Brenwill (versions 1.0, 1.1, 1.2, 1.3)
• Bill Licea-Kane, Qualcomm Technologies, Inc. (versions 1.0, 1.1)
• Blaine Kohl, Khronos (versions 1.2, 1.3)
• Bob Fraser, Google (version 1.3)
• Boris Zanin, Mobica (versions 1.2, 1.3)
• Brent E. Insko, Intel (version 1.0)
• Brian Ellis, Qualcomm Technologies, Inc. (version 1.0)
• Brian Paul, VMware (versions 1.2, 1.3)
• Caio Marcelo de Oliveira Filho, Intel (versions 1.2, 1.3)
• Cass Everitt, Oculus VR (versions 1.0, 1.1)
• Cemil Azizoglu, Canonical (version 1.0)
• Lina Versace, Google (versions 1.0, 1.1, 1.2)
• Chang-Hyo Yu, Samsung Electronics (version 1.0)
• Charles Giessen, LunarG (version 1.3)
• Chia-I Wu, LunarG (version 1.0)
• Chris Frascati, Qualcomm Technologies, Inc. (version 1.0)
• Chris Glover, Google (version 1.3)
• Christian Forfang, Arm (version 1.3)
• Christoph Kubisch, NVIDIA (version 1.3)
• Christophe Riccio, Unity Technologies (versions 1.0, 1.1)
• Cody Northrop, Unity Technologies (version 1.0)
• Colin Riley, AMD (version 1.1)
• Cort Stratton, Google (versions 1.1, 1.2)
• Courtney Goeltzenleuchter, Google (versions 1.0, 1.1, 1.3)
• Craig Davies, Huawei (version 1.2)
• Dae Kim, Imagination Technologies (version 1.1)
• Damien Leone, NVIDIA (version 1.0)
• Dan Baker, Oxide Games (versions 1.0, 1.1)
• Dan Ginsburg, Valve Software (versions 1.0, 1.1, 1.2, 1.3)
• Daniel Johnston, Intel (versions 1.0, 1.1)
• Daniel Koch, NVIDIA (versions 1.0, 1.1, 1.2, 1.3)
• Daniel Rakos, AMD (versions 1.0, 1.1, 1.2, 1.3)
• Daniel Stone, Collabora (versions 1.1, 1.2)
• Daniel Vetter, Intel (version 1.2)
• David Airlie, Red Hat (versions 1.0, 1.1, 1.2, 1.3)
• David Mao, AMD (versions 1.0, 1.2)
• David Miller, Miller & Mattson (versions 1.0, 1.1) (Vulkan reference card)
• David Neto, Google (versions 1.0, 1.1, 1.2, 1.3)
• David Pankratz, Huawei (version 1.3)
• David Wilkinson, AMD (version 1.2)
• David Yu, Pixar (version 1.0)
• Dejan Mircevski, Google (version 1.1)
• Diego Novillo, Google (version 1.3)
• Dimitris Georgakakis, Think Silicon (version 1.3)
• Dominik Witczak, AMD (versions 1.0, 1.1, 1.3)
• Donald Scorgie, Imagination Technologies (version 1.2)
• Dzmitry Malyshau, Mozilla (versions 1.1, 1.2, 1.3)
• Ed Hutchins, Oculus (version 1.2)
• Emily Stearns, Khronos (versions 1.2, 1.3)
• François Duranleau, Gameloft (version 1.3)
• Frank (LingJun) Chen, Qualcomm Technologies, Inc. (version 1.0)
• Fred Liao, Mediatek (version 1.0)
• Gabe Dagani, Freescale (version 1.0)
• Gabor Sines, AMD (version 1.2)
• Graeme Leese, Broadcom (versions 1.0, 1.1, 1.2, 1.3)
• Graham Connor, Imagination Technologies (version 1.0)
• Graham Sellers, AMD (versions 1.0, 1.1)
• Graham Wihlidal, Electronic Arts (version 1.3)
• Greg Fischer, LunarG (version 1.1)
• Gregory Grebe, AMD (version 1.3)
• Hai Nguyen, Google (versions 1.2, 1.3)
• Hans-Kristian Arntzen, Valve Software (versions 1.1, 1.2, 1.3)
• Henri Verbeet, Codeweavers (version 1.2)
• Wyvern Wang, Huawei (version 1.3)
• Hwanyong Lee, Kyungpook National University (version 1.0)
• Iago Toral, Igalia (versions 1.1, 1.2)
• Ian Elliott, Google (versions 1.0, 1.1, 1.2)
• Ian Romanick, Intel (versions 1.0, 1.1, 1.3)
• Ivan Briano, Intel (version 1.3)
• James Fitzpatrick, Imagination (version 1.3)
• James Hughes, Oculus VR (version 1.0)
• James Jones, NVIDIA (versions 1.0, 1.1, 1.2, 1.3)
• James Riordon, Khronos (versions 1.2, 1.3)
• Jamie Madill, Google (version 1.3)
• Jan Hermes, Continental Corporation (versions 1.0, 1.1)
• Jan-Harald Fredriksen, Arm (versions 1.0, 1.1, 1.2, 1.3)
• Faith Ekstrand, Intel (versions 1.0, 1.1, 1.2, 1.3)
• Jean-François Roy, Google (versions 1.1, 1.2, 1.3)
• Jeff Bolz, NVIDIA (versions 1.0, 1.1, 1.2, 1.3)
• Jeff Juliano, NVIDIA (versions 1.0, 1.1, 1.2)
• Jeff Leger, Qualcomm Technologies, Inc. (versions 1.1, 1.3)
• Jeff Phillips, Khronos (version 1.3)
• Jeff Vigil, Samsung Electronics (versions 1.0, 1.1, 1.2, 1.3)
• Jens Owen, Google (versions 1.0, 1.1)
• Jeremy Hayes, LunarG (version 1.0)
• Jesse Barker, Unity Technologies (versions 1.0, 1.1, 1.2, 1.3)
• Jesse Hall, Google (versions 1.0, 1.1, 1.2, 1.3)
• Joe Davis, Samsung Electronics (version 1.1)
• Johannes van Waveren, Oculus VR (versions 1.0, 1.1)
• John Anthony, Arm (version 1.2, 1.3)
• John Kessenich, Google (versions 1.0, 1.1, 1.2, 1.3) (SPIR-V and GLSL for Vulkan spec author)
• John McDonald, Valve Software (versions 1.0, 1.1, 1.2, 1.3)
• John Zulauf, LunarG (versions 1.1, 1.2, 1.3)
• Jon Ashburn, LunarG (version 1.0)
• Jon Leech, Independent (versions 1.0, 1.1, 1.2, 1.3) (XML toolchain, normative language, release wrangler)
• Jonas Gustavsson, Samsung Electronics (versions 1.0, 1.1)
• Jonas Meyer, Epic Games (versions 1.2, 1.3)
• Jonathan Hamilton, Imagination Technologies (version 1.0)
• Jordan Justen, Intel (version 1.1)
• Joshua Ashton, Valve Software (version 1.3)
• Jungwoo Kim, Samsung Electronics (versions 1.0, 1.1)
• Jörg Wagner, Arm (version 1.1)
• Kalle Raita, Google (version 1.1)
• Karen Ghavam, LunarG (versions 1.1, 1.2, 1.3)
• Karl Schultz, LunarG (versions 1.1, 1.2)
• Kathleen Mattson, Khronos (versions 1.0, 1.1, 1.2)
• Kaye Mason, Google (version 1.2)
• Keith Packard, Valve (version 1.2)
• Kenneth Benzie, Codeplay Software Ltd. (versions 1.0, 1.1)
• Kenneth Russell, Google (version 1.1)
• Kerch Holt, NVIDIA (versions 1.0, 1.1)
• Kevin O’Neil, AMD (version 1.1)
• Kevin Petit, Arm (version 1.3)
• Kris Rose, Khronos (versions 1.2, 1.3)
• Kristian Kristensen, Intel (versions 1.0, 1.1)
• Krzysztof Iwanicki, Samsung Electronics (version 1.0)
• Larry Seiler, Intel (version 1.0)
• Laura Shubel, Caster Communications (version 1.3)
• Lauri Ilola, Nokia (version 1.1)
• Lei Zhang, Google (version 1.2)
• Lenny Komow, LunarG (versions 1.1, 1.2)
• Liam Middlebrook, NVIDIA (version 1.3)
• Lionel Landwerlin, Intel (versions 1.1, 1.2)
• Lisie Aartsen, Khronos (version 1.3)
• Liz Maitral, Khronos (version 1.2)
• Lou Kramer, AMD (version 1.3)
• Lutz Latta, Lucasfilm (version 1.0)
- Maciej Jesionowski, AMD (version 1.1)
- Mais Alnasser, AMD (version 1.1)
- Marcin Kantoch, AMD (version 1.3)
- Marcin Rogucki, Mobica (version 1.1)
- Maria Rovatsou, Codeplay Software Ltd. (version 1.0)
- Mariusz Merecki, Intel (version 1.3)
- Mark Bellamy, Arm (version 1.2, 1.3)
- Mark Callow, Independent (versions 1.0, 1.1, 1.2, 1.3)
- Mark Kilgard, NVIDIA (versions 1.1, 1.2)
- Mark Lobodzinski, LunarG (versions 1.0, 1.1, 1.2)
- Mark Young, LunarG (versions 1.1, 1.3)
- Markus Tavenrath, NVIDIA (version 1.1)
- Marty Johnson, Khronos (version 1.3)
- Mateusz Przybylski, Intel (version 1.0)
- Mathias Heyer, NVIDIA (versions 1.0, 1.1)
- Mathias Schott, NVIDIA (versions 1.0, 1.1)
- Mathieu Robart, Arm (version 1.2)
- Matt Netsch, Qualcomm Technologies, Inc. (version 1.1)
- Matthew Rusch, NVIDIA (version 1.3)
- Matthäus Chajdas, AMD (versions 1.1, 1.2, 1.3)
- Maurice Ribble, Qualcomm Technologies, Inc. (versions 1.0, 1.1)
- Maxim Lukyanov, Samsung Electronics (version 1.0)
- Michael Blumenkrantz, Self (version 1.3)
- Michael Lentine, Google (version 1.0)
- Michael O’Hara, AMD (version 1.1)
- Michael Phillip, Samsung Electronics (version 1.2)
- Michael Wong, Codeplay Software Ltd. (version 1.1)
- Michael Worcester, Imagination Technologies (versions 1.0, 1.1)
- Michal Pietrasiuk, Intel (versions 1.0, 1.3)
- Mika Isojarvi, Google (versions 1.0, 1.1)
- Mike Schuchardt, LunarG (versions 1.1, 1.2)
- Mike Stroyan, LunarG (version 1.0)
- Mike Weiblen, LunarG (versions 1.1, 1.2, 1.3)
- Minyoung Son, Samsung Electronics (version 1.0)
- Mitch Singer, AMD (versions 1.0, 1.1, 1.2, 1.3)
• Mythri Venugopal, Samsung Electronics (version 1.0)
• Naveen Leekha, Google (version 1.0)
• Neil Henning, AMD (versions 1.0, 1.1, 1.2, 1.3)
• Neil Hickey, Arm (version 1.2)
• Neil Trevett, NVIDIA (versions 1.0, 1.1, 1.2, 1.3)
• Nick Penwarden, Epic Games (version 1.0)
• Nicolai Hähnle, AMD (version 1.1)
• Niklas Smedberg, Unity Technologies (version 1.0)
• Norbert Nopper, Independent (versions 1.0, 1.1)
• Nuno Subtil, NVIDIA (versions 1.1, 1.2, 1.3)
• Pat Brown, NVIDIA (version 1.0)
• Patrick Cozzi, Independent (version 1.1)
• Patrick Doane, Blizzard Entertainment (version 1.0)
• Peter Lohrmann, AMD (versions 1.0, 1.2)
• Petros Bantolas, Imagination Technologies (version 1.1)
• Philip Rebohle, Valve Software (version 1.3)
• Pierre Boudier, NVIDIA (versions 1.0, 1.1, 1.2, 1.3)
• Pierre-Loup Griffais, Valve Software (versions 1.0, 1.1, 1.2, 1.3)
• Piers Daniell, NVIDIA (versions 1.0, 1.1, 1.2, 1.3)
• Ping Liu, Intel (version 1.3)
• Piotr Bialecki, Intel (version 1.0)
• Piotr Byszewski, Mobica (version 1.3)
• Prabindh Sundareson, Samsung Electronics (version 1.0)
• Pyry Haulos, Google (versions 1.0, 1.1) (Vulkan conformance test subcommittee chair)
• Rachel Bradshaw, Caster Communications (version 1.3)
• Rajeev Rao, Qualcomm (version 1.2)
• Ralph Potter, Samsung Electronics (versions 1.1, 1.2, 1.3)
• Raun Krisch, Samsung Electronics (version 1.3)
• Ray Smith, Arm (versions 1.0, 1.1, 1.2)
• Ricardo Garcia, Igalia (version 1.3)
• Richard Huddy, Samsung Electronics (versions 1.2, 1.3)
• Rob Barris, NVIDIA (version 1.1)
• Rob Stepinski, Transgaming (version 1.0)
• Robert Simpson, Qualcomm Technologies, Inc. (versions 1.0, 1.1, 1.3)
• Rolando Caloca Olivares, Epic Games (versions 1.0, 1.1, 1.2, 1.3)
• Ronan Keryell, Xilinx (version 1.3)
• Roy Ju, Mediatek (version 1.0)
• Rufus Hamade, Imagination Technologies (version 1.0)
• Ruihao Zhang, Qualcomm Technologies, Inc. (versions 1.1, 1.2, 1.3)
• Samuel (Sheng-Wen) Huang, Mediatek (version 1.3)
• Samuel Iglesias Gonsalvez, Igalia (version 1.3)
• Sascha Willems, Self (version 1.3)
• Sean Ellis, Arm (version 1.0)
• Sean Harmer, KDAB Group (versions 1.0, 1.1)
• Shannon Woods, Google (versions 1.0, 1.1, 1.2, 1.3)
• Slawomir Cygan, Intel (versions 1.0, 1.1, 1.3)
• Slawomir Grajewski, Intel (versions 1.0, 1.1, 1.3)
• Sorel Bosan, AMD (version 1.1)
• Spencer Fricke, Samsung Electronics (versions 1.2, 1.3)
• Stefanus Du Toit, Google (version 1.0)
• Stephen Huang, Mediatek (version 1.1)
• Steve Hill, Broadcom (versions 1.0, 1.2)
• Steve Viggers, Core Avionics & Industrial Inc. (versions 1.0, 1.2)
• Steve Winston, Holochip (version 1.3)
• Stuart Smith, AMD (versions 1.0, 1.1, 1.2, 1.3)
• Sujeewan Rajayogam, Google (version 1.3)
• Tilmann Scheller, Samsung Electronics (version 1.1)
• Tim Foley, Intel (version 1.0)
• Tim Lewis, Khronos (version 1.3)
• Timo Suoranta, AMD (version 1.0)
• Timothy Lottes, AMD (versions 1.0, 1.1)
• Tobias Hector, AMD (versions 1.0, 1.1, 1.2, 1.3) (validity language and toolchain)
• Tobin Ehlis, LunarG (version 1.0)
• Tom Olson, Arm (versions 1.0, 1.1, 1.2, 1.3) (Working Group chair)
• Tomasz Bednarz, Independent (version 1.1)
• Tomasz Kubale, Intel (version 1.0)
• Tony Barbour, LunarG (versions 1.0, 1.1, 1.2)
• Tony Zlatinski, NVIDIA (version 1.3)
• Victor Eruhimov, Unknown (version 1.1)
• Vikram Kushwaha, NVIDIA (version 1.3)
• Vincent Hindriksen, Stream HPC (versions 1.2, 1.3)
• Wasim Abbas, Arm (version 1.3)
• Wayne Lister, Imagination Technologies (version 1.0)
• Wolfgang Engel, Unknown (version 1.1)
• Yanjun Zhang, VeriSilicon (versions 1.0, 1.1, 1.2, 1.3)
• Yunxing Zhu, Huawei (version 1.3)

Other Credits

The Vulkan Advisory Panel members provided important real-world usage information and advice that helped guide design decisions.

The wider Vulkan community have provided useful feedback, questions and specification changes that have helped improve the quality of the Specification via GitHub.

Administrative support to the Working Group for Vulkan 1.1, 1.2, and 1.3 was provided by Khronos staff including Ann Thorsnes, Blaine Kohl, Dominic Agoro-Ombaka, Emily Stearns, Jeff Phillips, Lisie Aartsen, Liz Maitral, Marty Johnson, Tim Lewis, and Xiao-Yu CHENG; and by Alex Crabb, Laura Shubel, and Rachel Bradshaw of Caster Communications.

Administrative support for Vulkan 1.0 was provided by Andrew Riegel, Elizabeth Riegel, Glenn Fredericks, Kathleen Mattson and Michelle Clark of Gold Standard Group.

Technical support was provided by James Riordon, site administration of Khronos.org and OpenGL.org.
