- *sampleLocationGridSize* is the size of the sample location grid to select custom sample locations for.
- *sampleLocationsCount* is the number of sample locations in *pSampleLocations*.
- *pSampleLocations* is a pointer to an array of *sampleLocationsCount* *VkSampleLocationEXT* structures.

This structure can be used either to specify the sample locations to be used for rendering or to specify the set of sample locations an image subresource has been last rendered with for the purposes of layout transitions of depth/stencil images created with *VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT*.

The sample locations in *pSampleLocations* specify *sampleLocationsPerPixel* number of sample locations for each pixel in the grid of the size specified in *sampleLocationGridSize*. The sample location for sample *i* at the pixel grid location *(x,y)* is taken from *pSampleLocations*[(x + y × sampleLocationGridSize.width) × sampleLocationsPerPixel + i].

If the render pass has a fragment density map, the implementation will choose the sample locations for the fragment and the contents of *pSampleLocations* may be ignored.
Valid Usage

• VUID-VkSampleLocationsInfoEXT-sampleLocationsPerPixel-01526
  sampleLocationsPerPixel must be a bit value that is set in
  VkPhysicalDeviceSampleLocationsPropertiesEXT::sampleLocationSampleCounts

• VUID-VkSampleLocationsInfoEXT-sampleLocationsCount-01527
  sampleLocationsCount must equal sampleLocationsPerPixel \times sampleLocationGridSize.width \times sampleLocationGridSize.height

Valid Usage (Implicit)

• VUID-VkSampleLocationsInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_SAMPLE_LOCATIONS_INFO_EXT

• VUID-VkSampleLocationsInfoEXT-pSampleLocations-parameter
  If sampleLocationsCount is not 0, pSampleLocations must be a valid pointer to an array of
  sampleLocationsCount VkSampleLocationEXT structures

The VkSampleLocationEXT structure is defined as:

```c
// Provided by VK_EXT_sample_locations
typedef struct VkSampleLocationEXT {
    float x;
    float y;
} VkSampleLocationEXT;
```

• x is the horizontal coordinate of the sample’s location.
• y is the vertical coordinate of the sample’s location.

The domain space of the sample location coordinates has an upper-left origin within the pixel in framebuffer space.

The values specified in a VkSampleLocationEXT structure are always clamped to the implementation-dependent sample location coordinate range \([sampleLocationCoordinateRange[0], sampleLocationCoordinateRange[1]]\) that can be queried using VkPhysicalDeviceSampleLocationsPropertiesEXT.

To dynamically set the sampleLocationsEnable state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetSampleLocationsEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 sampleLocationsEnable);
```

• commandBuffer is the command buffer into which the command will be recorded.
sampleLocationsEnable specifies the sampleLocationsEnable state.

This command sets the sampleLocationsEnable state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineSampleLocationsStateCreateInfo::sampleLocationsEnable value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetSampleLocationsEnableEXT-None-08554
  Either the extendedDynamicState3SampleLocationsEnable feature or the shaderObject feature or both must be enabled

Valid Usage (Implicit)

- VUID-vkCmdSetSampleLocationsEnableEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetSampleLocationsEnableEXT-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetSampleLocationsEnableEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetSampleLocationsEnableEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary, Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
</tbody>
</table>

To dynamically set the sample locations used for rasterization, call:
// Provided by VK_EXT_sample_locations
void vkCmdSetSampleLocationsEXT(
    VkCommandBuffer commandBuffer,
    const VkSampleLocationsInfoEXT* pSampleLocationsInfo);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pSampleLocationsInfo` is the sample locations state to set.

This command sets the custom sample locations for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and when the `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` property of the bound graphics pipeline is `VK_TRUE`. Otherwise, this state is specified by the `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsInfo` values used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetSampleLocationsEXT-variableSampleLocations-01530**
  If `VkPhysicalDeviceSampleLocationsPropertiesEXT::variableSampleLocations` is `VK_FALSE` then the current render pass must have been begun by specifying a `VkRenderPassSampleLocationsBeginInfoEXT` structure whose `pPostSubpassSampleLocations` member contains an element with a `subpassIndex` matching the current subpass index and the `sampleLocationsInfo` member of that element must match the sample locations state pointed to by `pSampleLocationsInfo`.

### Valid Usage (Implicit)

- **VUID-vkCmdSetSampleLocationsEXT-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdSetSampleLocationsEXT-pSampleLocationsInfo-parameter**
  `pSampleLocationsInfo` must be a valid pointer to a valid `VkSampleLocationsInfoEXT` structure.

- **VUID-vkCmdSetSampleLocationsEXT-commandBuffer-recording**
  `commandBuffer` must be in the recording state.

- **VUID-vkCmdSetSampleLocationsEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- **VUID-vkCmdSetSampleLocationsEXT-videocoding**
  This command must only be called outside of a video coding scope.
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

28.6. Fragment Shading Rates

The features advertised by `VkPhysicalDeviceFragmentShadingRateFeaturesKHR` allow an application to control the shading rate of a given fragment shader invocation.

The fragment shading rate strongly interacts with Multisampling, and the set of available rates for an implementation may be restricted by sample rate.

To query available shading rates, call:

```c
// Provided by VK_KHR_fragment_shading_rate
VkResult vkGetPhysicalDeviceFragmentShadingRatesKHR(
    VkPhysicalDevice physicalDevice,  // Provided by VK_KHR_fragment_shading_rate
    uint32_t* pFragmentShadingRateCount, // Provided by VK_KHR_fragment_shading_rate
    VkPhysicalDeviceFragmentShadingRateKHR* pFragmentShadingRates);
```

- `physicalDevice` is the handle to the physical device whose properties will be queried.
- `pFragmentShadingRateCount` is a pointer to an integer related to the number of fragment shading rates available or queried, as described below.
- `pFragmentShadingRates` is either `NULL` or a pointer to an array of `VkPhysicalDeviceFragmentShadingRateKHR` structures.

If `pFragmentShadingRates` is `NULL`, then the number of fragment shading rates available is returned in `pFragmentShadingRateCount`. Otherwise, `pFragmentShadingRateCount` must point to a variable set by the user to the number of elements in the `pFragmentShadingRates` array, and on return the variable is overwritten with the number of structures actually written to `pFragmentShadingRates`. If `pFragmentShadingRateCount` is less than the number of fragment shading rates available, at most `pFragmentShadingRateCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available fragment shading rates were returned.
The returned array of fragment shading rates must be ordered from largest \( \text{fragmentSize.width} \) value to smallest, and each set of fragment shading rates with the same \( \text{fragmentSize.width} \) value must be ordered from largest \( \text{fragmentSize.height} \) to smallest. Any two entries in the array must not have the same \( \text{fragmentSize} \) values.

For any entry in the array, the following rules also apply:

- The value of \( \text{fragmentSize.width} \) must be less than or equal to \( \text{maxFragmentSize.width} \).
- The value of \( \text{fragmentSize.width} \) must be greater than or equal to 1.
- The value of \( \text{fragmentSize.width} \) must be a power-of-two.
- The value of \( \text{fragmentSize.height} \) must be less than or equal to \( \text{maxFragmentSize.height} \).
- The value of \( \text{fragmentSize.height} \) must be greater than or equal to 1.
- The value of \( \text{fragmentSize.height} \) must be a power-of-two.
- The highest sample count in \( \text{sampleCounts} \) must be less than or equal to \( \text{maxFragmentShadingRateRasterizationSamples} \).
- The product of \( \text{fragmentSize.width} \), \( \text{fragmentSize.height} \), and the highest sample count in \( \text{sampleCounts} \) must be less than or equal to \( \text{maxFragmentShadingRateCoverageSamples} \).

Implementations must support at least the following shading rates:

<table>
<thead>
<tr>
<th>( \text{sampleCounts} )</th>
<th>( \text{fragmentSize} )</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_SAMPLE_COUNT_1_BIT</td>
<td>2,2</td>
</tr>
<tr>
<td>VK_SAMPLE_COUNT_4_BIT</td>
<td>2,1</td>
</tr>
<tr>
<td>~0</td>
<td>1,1</td>
</tr>
</tbody>
</table>

If \( \text{framebufferColorSampleCounts} \), includes VK\_SAMPLE\_COUNT\_2\_BIT, the required rates must also include VK\_SAMPLE\_COUNT\_2\_BIT.

Note

Including the \( \{1,1\} \) fragment size is done for completeness; it has no actual effect on the support of rendering without setting the fragment size. All sample counts and render pass transforms are supported for this rate.

The returned set of fragment shading rates must be returned in the native (rotated) coordinate system. For rasterization using render pass transform not equal to VK\_SURFACE\_TRANSFORM\_IDENTITY\_BIT\_KHR, the application must transform the returned fragment shading rates into the current (unrotated) coordinate system to get the supported rates for that transform.

Note

For example, consider an implementation returning support for 4x2, but not 2x4 in the set of supported fragment shading rates. This means that for transforms VK\_SURFACE\_TRANSFORM\_ROTATE\_90\_BIT\_KHR and VK\_SURFACE\_TRANSFORM\_ROTATE\_270\_BIT\_KHR, 2x4 is a supported rate, but 4x2 is an
Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

- VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-pFragmentShadingRateCount-parameter
  pFragmentShadingRateCount must be a valid pointer to a uint32_t value

- VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-pFragmentShadingRates-parameter
  If the value referenced by pFragmentShadingRateCount is not 0, and pFragmentShadingRates is not NULL, pFragmentShadingRates must be a valid pointer to an array of pFragmentShadingRateCount VkPhysicalDeviceFragmentShadingRateKHR structures

Return Codes

Success
- VK_SUCCESS
- VK_INCOMPLETE

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY

The VkPhysicalDeviceFragmentShadingRateKHR structure is defined as

```c
// Provided by VK_KHR_fragment_shading_rate
typedef struct VkPhysicalDeviceFragmentShadingRateKHR {
    VkStructureType sType;
    void* pNext;
    VkSampleCountFlags sampleCounts;
    VkExtent2D fragmentSize;
} VkPhysicalDeviceFragmentShadingRateKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- sampleCounts is a bitmask of sample counts for which the shading rate described by fragmentSize is supported.
- fragmentSize is a VkExtent2D describing the width and height of a supported shading rate.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceFragmentShadingRateKHR-sType-sType
Fragment shading rates can be set at three points, with the three rates combined to determine the final shading rate.

### 28.6.1. Pipeline Fragment Shading Rate

The pipeline fragment shading rate can be set on a per-draw basis by either setting the rate in a graphics pipeline, or dynamically via `vkCmdSetFragmentShadingRateKHR`.

The `VkPipelineFragmentShadingRateStateCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_fragment_shading_rate
typedef struct VkPipelineFragmentShadingRateStateCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkExtent2D fragmentSize;
    VkFragmentShadingRateCombinerOpKHR combinerOps[2];
} VkPipelineFragmentShadingRateStateCreateInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **fragmentSize** specifies a `VkExtent2D` structure containing the fragment size used to define the pipeline fragment shading rate for drawing commands using this pipeline.
- **combinerOps** specifies a `VkFragmentShadingRateCombinerOpKHR` value determining how the pipeline, primitive, and attachment shading rates are combined for fragments generated by drawing commands using the created pipeline.

If the `pNext` chain of `VkGraphicsPipelineCreateInfo` includes a `VkPipelineFragmentShadingRateStateCreateInfoKHR` structure, then that structure includes parameters controlling the pipeline fragment shading rate.

If this structure is not present, **fragmentSize** is considered to be equal to (1,1), and both elements of **combinerOps** are considered to be equal to `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`.

#### Valid Usage (Implicit)

- **VUID-VkPipelineFragmentShadingRateStateCreateInfoKHR-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_FRAGMENT_SHADING_RATE_STATE_CREATE_INFO_KHR`

To dynamically set the pipeline fragment shading rate and combiner operation, call:

```c
// Provided by VK_KHR_fragment_shading_rate
```
void vkCmdSetFragmentShadingRateKHR(
    VkCommandBuffer commandBuffer,
    const VkExtent2D* pFragmentSize,
    const VkFragmentShadingRateCombinerOpKHR combinerOps[2]);

• commandBuffer is the command buffer into which the command will be recorded.
• pFragmentSize specifies the pipeline fragment shading rate for subsequent drawing commands.
• combinerOps specifies a VkFragmentShadingRateCombinerOpKHR determining how the pipeline, primitive, and attachment shading rates are combined for fragments generated by subsequent drawing commands.

This command sets the pipeline fragment shading rate and combiner operation for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineFragmentShadingRateStateCreateInfoKHR values used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetFragmentShadingRateKHR-pipelineFragmentShadingRate-04507
  If pipelineFragmentShadingRate is not enabled, pFragmentSize->width must be 1

- VUID-vkCmdSetFragmentShadingRateKHR-primitiveFragmentShadingRate-04508
  If primitiveFragmentShadingRate is not enabled, pFragmentSize->height must be 1

- VUID-vkCmdSetFragmentShadingRateKHR-attachmentFragmentShadingRate-04509
  One of pipelineFragmentShadingRate, primitiveFragmentShadingRate, or attachmentFragmentShadingRate must be enabled

- VUID-vkCmdSetFragmentShadingRateKHR-attachmentFragmentShadingRateCombinerOp-04510
  If the primitiveFragmentShadingRate feature is not enabled, combinerOps[0] must be VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR

- VUID-vkCmdSetFragmentShadingRateKHR-attachmentFragmentShadingRateCombinerOp-04511
  If the attachmentFragmentShadingRate feature is not enabled, combinerOps[1] must be VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR

- VUID-vkCmdSetFragmentShadingRateKHR-fragmentSizeNonTrivialCombinerOps-04512
  If the fragmentSizeNonTrivialCombinerOps limit is not supported, elements of combinerOps must be either VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR or VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR

- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04513
  pFragmentSize->width must be greater than or equal to 1

- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04514
  pFragmentSize->height must be greater than or equal to 1

- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04515
  pFragmentSize->width must be a power-of-two value
• VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04516
  *pFragmentSize->height* must be a power-of-two value

• VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04517
  *pFragmentSize->width* must be less than or equal to 4

• VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04518
  *pFragmentSize->height* must be less than or equal to 4

**Valid Usage (Implicit)**

• VUID-vkCmdSetFragmentShadingRateKHR-commandBuffer-parameter
  *commandBuffer* must be a valid `VkCommandBuffer` handle

• VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-parameter
  *pFragmentSize* must be a valid pointer to a valid `VkExtent2D` structure

• VUID-vkCmdSetFragmentShadingRateKHR-combinerOps-parameter
  Each element of *combinerOps* must be a valid `VkFragmentShadingRateCombinerOpKHR` value

• VUID-vkCmdSetFragmentShadingRateKHR-commandBuffer-recording
  *commandBuffer* must be in the recording state

• VUID-vkCmdSetFragmentShadingRateKHR-commandBuffer-cmdpool
  The `VkCommandPool` that *commandBuffer* was allocated from must support graphics operations

• VUID-vkCmdSetFragmentShadingRateKHR-videocoding
  This command must only be called outside of a video coding scope

**Host Synchronization**

• Host access to *commandBuffer* must be externally synchronized

• Host access to the `VkCommandPool` that *commandBuffer* was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**28.6.2. Primitive Fragment Shading Rate**

The *primitive fragment shading rate* can be set via the `PrimitiveShadingRateKHR` built-in in the last
active pre-rasterization shader stage. If the last pre-rasterization shader stage is using the MeshEXT Execution Model, the rate associated with a given primitive is sourced from the value written to the per-primitive PrimitiveShadingRateKHR. Otherwise the rate associated with a given primitive is sourced from the value written to PrimitiveShadingRateKHR by that primitive’s provoking vertex.

28.6.3. Attachment Fragment Shading Rate

The attachment shading rate can be set by including VkFragmentShadingRateAttachmentInfoKHR in a subpass to define a fragment shading rate attachment. Each pixel in the framebuffer is assigned an attachment fragment shading rate by the corresponding texel in the fragment shading rate attachment, according to:

\[
x' = \text{floor}(x / \text{region}_x) \\
y' = \text{floor}(y / \text{region}_y)
\]

where \(x'\) and \(y'\) are the coordinates of a texel in the fragment shading rate attachment, \(x\) and \(y\) are the coordinates of the pixel in the framebuffer, and \(\text{region}_x\) and \(\text{region}_y\) are the size of the region each texel corresponds to, as defined by the shadingRateAttachmentTexelSize member of VkFragmentShadingRateAttachmentInfoKHR.

If multiview is enabled and the shading rate attachment has multiple layers, the shading rate attachment texel is selected from the layer determined by the ViewIndex built-in. If multiview is disabled, and both the shading rate attachment and the framebuffer have multiple layers, the shading rate attachment texel is selected from the layer determined by the Layer built-in. Otherwise, the texel is unconditionally selected from the first layer of the attachment.

The fragment size is encoded into the first component of the identified texel as follows:

\[
s_{\text{w}} = 2^{((\text{texel} / 4) \& 3)} \\
s_{\text{h}} = 2^{(\text{texel} \& 3)}
\]

where texel is the value in the first component of the identified texel, and \(s_{\text{w}}\) and \(s_{\text{h}}\) are the width and height of the fragment size, decoded from the texel.

If no fragment shading rate attachment is specified, this size is calculated as \(s_{\text{w}} = s_{\text{h}} = 1\). Applications must not specify a width or height greater than 4 by this method.

The Fragment Shading Rate enumeration in SPIR-V adheres to the above encoding.

28.6.4. Combining the Fragment Shading Rates

The final rate \((C_{xy}')\) used for fragment shading must be one of the rates returned by vkGetPhysicalDeviceFragmentShadingRatesKHR for the sample count and render pass transform
used by rasterization.

If any of the following conditions are met, $C_{xy}$ must be set to $\{1,1\}$:

- If Sample Shading is enabled.
- The `fragmentShadingRateWithSampleMask` limit is not supported, and `VkPipelineMultisampleStateCreateInfo::pSampleMask` contains a zero value in any bit used by fragment operations.
- The `fragmentShadingRateWithShaderSampleMask` is not supported, and the fragment shader has `SampleMask` in the input or output interface.
- The `fragmentShadingRateWithShaderDepthStencilWrites` limit is not supported, and the fragment shader declares the `FragDepth` or `FragStencilRefEXT` built-in.
- The `fragmentShadingRateWithConservativeRasterization` limit is not supported, and `VkPipelineRasterizationConservativeStateCreateInfoEXT::conservativeRasterizationMode` is not `VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT`.
- The `fragmentShadingRateWithFragmentShaderInterlock` limit is not supported, and the fragment shader declares any of the `fragment shader interlock` execution modes.
- The `fragmentShadingRateWithCustomSampleLocations` limit is not supported, and `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` is `VK_TRUE`.
- The fragment shader declares any of the `TileImageColorReadAccessEXT`, `TileImageDepthReadAccessEXT`, or `TileImageStencilReadAccessEXT` capabilities.

Otherwise, each of the specified shading rates are combined and then used to derive the value of $C_{xy}$. As there are three ways to specify shading rates, two combiner operations are specified - between the pipeline and primitive shading rates, and between the result of that and the attachment shading rate.

The equation used for each combiner operation is defined by `VkFragmentShadingRateCombinerOpKHR`:

```c
// Provided by VK_KHR_fragment_shading_rate
typedef enum VkFragmentShadingRateCombinerOpKHR {
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR = 0,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR = 1,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MIN_KHR = 2,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MAX_KHR = 3,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR = 4,
} VkFragmentShadingRateCombinerOpKHR;
```

- `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR` specifies a combiner operation of $\text{combine}(A_{xy}, B_{xy}) = A_{xy}$.
- `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR` specifies a combiner operation of $\text{combine}(A_{xy}, B_{xy}) = B_{xy}$.
- `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MIN_KHR` specifies a combiner operation of $\text{combine}(A_{xy}, B_{xy}) = \min(A_{xy}, B_{xy})$. 

2519
• **VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MAX_KHR** specifies a combiner operation of \( \text{combine}(A_{xy},B_{xy}) = \max(A_{xy},B_{xy}) \).

• **VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR** specifies a combiner operation of \( \text{combine}(A_{xy},B_{xy}) = A_{xy} \cdot B_{xy} \).

where \( \text{combine}(A_{xy},B_{xy}) \) is the combine operation, and \( A_{xy} \) and \( B_{xy} \) are the inputs to the operation.

If \( \text{fragmentShadingRateStrictMultiplyCombiner} \) is \( \text{VK_FALSE} \), using **VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR** with values of 1 for both \( A \) and \( B \) in the same dimension results in the value 2 being produced for that dimension. See the definition of **fragmentShadingRateStrictMultiplyCombiner** for more information.

These operations are performed in a component-wise fashion.

This is used to generate a combined fragment area using the equation:

\[
C_{xy} = \text{combine}(A_{xy},B_{xy})
\]

where \( C_{xy} \) is the combined fragment area result, and \( A_{xy} \) and \( B_{xy} \) are the fragment areas of the fragment shading rates being combined.

Two combine operations are performed, first with \( A_{xy} \) equal to the pipeline fragment shading rate and \( B_{xy} \) equal to the primitive fragment shading rate, with the combine() operation selected by combinerOps[0]. A second combination is then performed, with \( A_{xy} \) equal to the result of the first combination and \( B_{xy} \) equal to the attachment fragment shading rate, with the combine() operation selected by combinerOps[1]. The result of the second combination is used as the final fragment shading rate, reported via the **ShadingRateKHR** built-in.

Implementations should clamp the inputs to the combiner operations \( A_{xy} \) and \( B_{xy} \), and must clamp the result of the second combiner operation.

A fragment shading rate \( R_{xy} \) representing any of \( A_{xy}, B_{xy} \) or \( C_{xy} \) is clamped as follows. If \( R_{xy} \) is one of the rates returned by **vkGetPhysicalDeviceFragmentShadingRatesKHR** for the sample count and render pass transform used by rasterization, the clamped shading rate \( R_{xy}' \) is \( R_{xy} \). Otherwise, the clamped shading rate is selected from the rates returned by **vkGetPhysicalDeviceFragmentShadingRatesKHR** for the sample count and render pass transform used by rasterization. From this list of supported rates, the following steps are applied in order, to select a single value:

1. Keep only rates where \( R_{x}' \leq R_x \) and \( R_{y}' \leq R_y \).
   * Implementations may also keep rates where \( R_{x}' \leq R_y \) and \( R_{y}' \leq R_x \).
2. Keep only rates with the highest area (\( R_x' \times R_y' \)).
3. Keep only rates with the lowest aspect ratio (\( R_x' + R_y' \)).
4. In cases where a wide (e.g. 4x1) and tall (e.g. 1x4) rate remain, the implementation may choose either rate. However, it must choose this rate consistently for the same shading rates, render pass transform, and combiner operations for the lifetime of the **VkDevice**.
28.6.5. Extended Fragment Shading Rates

The features advertised by `VkPhysicalDeviceFragmentShadingRateEnumsFeaturesNV` provide support for additional fragment shading rates beyond those specifying one fragment shader invocation covering all pixels in a fragment whose size is indicated by the fragment shading rate.

If the `fragmentShadingRateEnums` feature is enabled, fragment shading rates may be specified using the `VkFragmentShadingRateNV` enumerated type defined as:

```c
// Provided by VK_NV_fragment_shading_rateEnums
typedef enum VkFragmentShadingRateNV {
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_PIXEL_NV = 0,
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_1X2_PIXELS_NV = 1,
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X1_PIXELS_NV = 4,
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X2_PIXELS_NV = 5,
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X4_PIXELS_NV = 6,
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_4X2_PIXELS_NV = 9,
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_4X4_PIXELS_NV = 10,
    VK_FRAGMENT_SHADING_RATE_2_INVOCATIONS_PER_PIXEL_NV = 11,
    VK_FRAGMENT_SHADING_RATE_4_INVOCATIONS_PER_PIXEL_NV = 12,
    VK_FRAGMENT_SHADING_RATE_8_INVOCATIONS_PER_PIXEL_NV = 13,
    VK_FRAGMENT_SHADING_RATE_16_INVOCATIONS_PER_PIXEL_NV = 14,
    VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV = 15,
} VkFragmentShadingRateNV;
```

- `VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_PIXEL_NV` specifies a fragment size of 1x1 pixels.
- `VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_1X2_PIXELS_NV` specifies a fragment size of 1x2 pixels.
- `VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X1_PIXELS_NV` specifies a fragment size of 2x1 pixels.
- `VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X2_PIXELS_NV` specifies a fragment size of 2x2 pixels.
- `VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X4_PIXELS_NV` specifies a fragment size of 2x4 pixels.
- `VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_4X2_PIXELS_NV` specifies a fragment size of 4x2 pixels.
- `VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_4X4_PIXELS_NV` specifies a fragment size of 4x4 pixels.
- `VK_FRAGMENT_SHADING_RATE_2_INVOCATIONS_PER_PIXEL_NV` specifies a fragment size of 1x1 pixels, with two fragment shader invocations per fragment.
- `VK_FRAGMENT_SHADING_RATE_4_INVOCATIONS_PER_PIXEL_NV` specifies a fragment size of 1x1 pixels, with four fragment shader invocations per fragment.
- `VK_FRAGMENT_SHADING_RATE_8_INVOCATIONS_PER_PIXEL_NV` specifies a fragment size of 1x1 pixels, with eight fragment shader invocations per fragment.
• **VK_FRAGMENT_SHADING_RATE_16_INVOCATIONS_PER_PIXEL_NV** specifies a fragment size of 1x1 pixels, with sixteen fragment shader invocations per fragment.

• **VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV** specifies that any portions of a primitive that use that shading rate should be discarded without invoking any fragment shader.

To use the shading rates **VK_FRAGMENT_SHADING_RATE_2_INVOCATIONS_PER_PIXEL_NV**, **VK_FRAGMENT_SHADING_RATE_4_INVOCATIONS_PER_PIXEL_NV**, **VK_FRAGMENT_SHADING_RATE_8_INVOCATIONS_PER_PIXEL_NV**, and **VK_FRAGMENT_SHADING_RATE_16_INVOCATIONS_PER_PIXEL_NV** as a pipeline, primitive, or attachment shading rate, the **supersampleFragmentShadingRates** feature must be enabled. To use the shading rate **VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV** as a pipeline, primitive, or attachment shading rate, the **noInvocationFragmentShadingRates** feature must be enabled.

When using fragment shading rate enums, the pipeline fragment shading rate can be set on a per-draw basis by either setting the rate in a graphics pipeline, or dynamically via **vkCmdSetFragmentShadingRateEnumNV**.

The **VkPipelineFragmentShadingRateEnumStateCreateInfoNV** structure is defined as:

```
// Provided by VK_NV_fragment_shading_rateEnums
typedef struct VkPipelineFragmentShadingRateEnumStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkFragmentShadingRateTypeNV shadingRateType;
    VkFragmentShadingRateNV shadingRate;
    VkFragmentShadingRateCombinerOpKHR combinerOps[2];
} VkPipelineFragmentShadingRateEnumStateCreateInfoNV;
```

• **sType** is a **VkStructureType** value identifying this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **shadingRateType** specifies a **VkFragmentShadingRateTypeNV** value indicating whether fragment shading rates are specified using fragment sizes or **VkFragmentShadingRateNV** enums.

• **shadingRate** specifies a **VkFragmentShadingRateNV** value indicating the pipeline fragment shading rate.

• **combinerOps** specifies **VkFragmentShadingRateCombinerOpKHR** values determining how the pipeline, primitive, and attachment shading rates are combined for fragments generated by drawing commands using the created pipeline.

If the **pNext** chain of **VkGraphicsPipelineCreateInfo** includes a **VkPipelineFragmentShadingRateEnumStateCreateInfoNV** structure, then that structure includes parameters controlling the pipeline fragment shading rate.

If this structure is not present, **shadingRateType** is considered to be equal to **VK_FRAGMENT_SHADING_RATE_TYPE_FRAGMENT_SIZE_NV**, **shadingRate** is considered to be equal to **VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_PIXEL_NV**, and both elements of **combinerOps** are considered to be equal to **VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR**.
Valid Usage (Implicit)

- VUID-VkPipelineFragmentShadingRateEnumStateCreateInfoNV-sType-sType must be VK_STRUCTURE_TYPE_PIPELINE_FRAGMENT_SHADING_RATE_ENUM_STATE_CREATE_INFO_NV

The VkFragmentShadingRateTypeNV enumerated type specifies whether a graphics pipeline gets its pipeline fragment shading rates and combiners from the VkPipelineFragmentShadingRateEnumStateCreateInfoNV structure or the VkPipelineFragmentShadingRateStateCreateInfoKHR structure.

// Provided by VK_NV_fragment_shading_rateEnums
typedef enum VkFragmentShadingRateTypeNV {
    VK_FRAGMENT_SHADING_RATE_TYPE_FRAGMENT_SIZE_NV = 0,
    VK_FRAGMENT_SHADING_RATE_TYPE_ENUMS_NV = 1,
} VkFragmentShadingRateTypeNV;

- VK_FRAGMENT_SHADING_RATE_TYPE_FRAGMENT_SIZE_NV specifies that a graphics pipeline should obtain its pipeline fragment shading rate and shading rate combiner state from the VkPipelineFragmentShadingRateStateCreateInfoKHR structure and that any state specified by the VkPipelineFragmentShadingRateEnumStateCreateInfoNV structure should be ignored.

- VK_FRAGMENT_SHADING_RATE_TYPE_ENUMS_NV specifies that a graphics pipeline should obtain its pipeline fragment shading rate and shading rate combiner state from the VkPipelineFragmentShadingRateEnumStateCreateInfoNV structure and that any state specified by the VkPipelineFragmentShadingRateStateCreateInfoKHR structure should be ignored.

To dynamically set the pipeline fragment shading rate and combiner operation, call:

// Provided by VK_NV_fragment_shading_rateEnums
void vkCmdSetFragmentShadingRateEnumNV(
    VkCommandBuffer commandBuffer,
    VkFragmentShadingRateNV shadingRate,
    const VkFragmentShadingRateCombinerOpKHR combinerOps[2]);

- commandBuffer is the command buffer into which the command will be recorded.

- shadingRate specifies a VkFragmentShadingRateNV enum indicating the pipeline fragment shading rate for subsequent drawing commands.

- combinerOps specifies a VkFragmentShadingRateCombinerOpKHR determining how the pipeline, primitive, and attachment shading rates are combined for fragments generated by subsequent drawing commands.

This command sets the pipeline fragment shading rate and combiner operation for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the
VkPipelineFragmentShadingRateEnumStateCreateInfoNV values used to create the currently active pipeline.

**Note**

This command allows specifying additional shading rates beyond those supported by `vkCmdSetFragmentShadingRateKHR`. For more information, refer to the `VK_NV_fragment_shading_rate Enums` appendix.

---

**Valid Usage**

- **VUID-vkCmdSetFragmentShadingRateEnumNV-pipelineFragmentShadingRate-04576**
  
  If `pipelineFragmentShadingRate` is not enabled, `shadingRate` must be `VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_PIXEL_NV`.

- **VUID-vkCmdSetFragmentShadingRateEnumNV-supersampleFragmentShadingRates-04577**
  
  If `supersampleFragmentShadingRates` is not enabled, `shadingRate` must not be `VK_FRAGMENT_SHADING_RATE_2_INVOCATIONS_PER_PIXEL_NV`, `VK_FRAGMENT_SHADING_RATE_4_INVOCATIONS_PER_PIXEL_NV`, `VK_FRAGMENT_SHADING_RATE_8_INVOCATIONS_PER_PIXEL_NV`, or `VK_FRAGMENT_SHADING_RATE_16_INVOCATIONS_PER_PIXEL_NV`.

- **VUID-vkCmdSetFragmentShadingRateEnumNV-noInvocationFragmentShadingRates-04578**
  
  If `noInvocationFragmentShadingRates` is not enabled, `shadingRate` must not be `VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV`.

- **VUID-vkCmdSetFragmentShadingRateEnumNV-fragmentShadingRateEnums-04579**

  The `fragmentShadingRateEnums` feature must be enabled.

- **VUID-vkCmdSetFragmentShadingRateEnumNV-pipelineFragmentShadingRate-04580**

  One of the `pipelineFragmentShadingRate`, `primitiveFragmentShadingRate`, or `attachmentFragmentShadingRate` features must be enabled.

- **VUID-vkCmdSetFragmentShadingRateEnumNV-primitiveFragmentShadingRate-04581**

  If the `primitiveFragmentShadingRate` feature is not enabled, `combinerOps[0]` must be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`.

- **VUID-vkCmdSetFragmentShadingRateEnumNV-attachmentFragmentShadingRate-04582**

  If the `attachmentFragmentShadingRate` feature is not enabled, `combinerOps[1]` must be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`.

- **VUID-vkCmdSetFragmentShadingRateEnumNV-fragmentSizeNonTrivialCombinerOps-04583**

  If the `fragmentSizeNonTrivialCombinerOps` limit is not supported, elements of `combinerOps` must be either `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR` or `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR`.
Valid Usage (Implicit)

- VUID-vkCmdSetFragmentShadingRateEnumNV-commandBuffer-parameter
  
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetFragmentShadingRateEnumNV-shadingRate-parameter
  
  shadingRate must be a valid VkFragmentShadingRateNV value

- VUID-vkCmdSetFragmentShadingRateEnumNV-combinerOps-parameter
  
  Each element of combinerOps must be a valid VkFragmentShadingRateCombinerOpKHR value

- VUID-vkCmdSetFragmentShadingRateEnumNV-commandBuffer-recording
  
  commandBuffer must be in the recording state

- VUID-vkCmdSetFragmentShadingRateEnumNV-commandBuffer-cmdpool
  
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetFragmentShadingRateEnumNV-videocoding
  
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

When the supersampleFragmentShadingRates or noInvocationFragmentShadingRates features are enabled, the behavior of the shading rate combiner operations is extended to support the shading rates enabled by those features. Primitive and attachment shading rate values are interpreted as VkFragmentShadingRateNV values and the behavior of the combiners is modified as follows:

- For VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MIN_KHR, VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MAX_KHR, and VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR, if either Axy or Bxy is VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV, combine(Axy, Bxy) produces a shading rate of VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV, regardless of the other input shading rate.

- For VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MIN_KHR, combine(Axy, Bxy) produces a shading rate
whose fragment size is the smaller of the fragment sizes of $A_{xy}$ and $B_{xy}$ and whose invocation count is the larger of the invocation counts of $A_{xy}$ and $B_{xy}$.

- For `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MAX_KHR`, combine($A_{xy}$,$B_{xy}$) produces a shading rate whose fragment size is the larger of the fragment sizes of $A_{xy}$ and $B_{xy}$ and whose invocation count is the smaller of the invocation counts of $A_{xy}$ and $B_{xy}$.

- For `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR`, combine($A_{xy}$,$B_{xy}$) produces a shading rate whose fragment size and invocation count is the product of the fragment sizes and invocation counts, respectively, of $A_{xy}$ and $B_{xy}$. If the resulting shading rate has both multiple pixels and multiple invocations per fragment, an implementation may adjust the shading rate by reducing both the pixel and invocation counts.

If the final shading rate from the combiners is `VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV`, no fragments will be generated for any portion of a primitive using that shading rate.

If the final shading rate from the combiners specifies multiple fragment shader invocations per fragment, the fragment will be processed with multiple unique samples as in sample shading, where the total number the total number of invocations is taken from the shading rate and then clamped to `rasterizationSamples` and `maxFragmentShadingRateInvocationCount`.

### 28.7. Shading Rate Image

The `shadingRateImage` feature allows pipelines to use a shading rate image to control the fragment area and the minimum number of fragment shader invocations launched for each fragment. When the shading rate image is enabled, the rasterizer determines a base shading rate for each region of the framebuffer covered by a primitive by fetching a value from the shading rate image and translating it to a shading rate using a per-viewport shading rate palette. This base shading rate is then adjusted to derive a final shading rate. The final shading rate specifies the fragment area and fragment shader invocation count to use for fragments generated in the region.

If the `pNext` chain of `VkPipelineViewportStateCreateInfo` includes a `VkPipelineViewportShadingRateImageStateCreateInfoNV` structure, then that structure includes parameters controlling the shading rate.

The `VkPipelineViewportShadingRateImageStateCreateInfoNV` structure is defined as:

```c
// Provided by VK_NV_shading_rate_image
typedef struct VkPipelineViewportShadingRateImageStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkBool32 shadingRateImageEnable;
    uint32_t viewportCount;
    const VkShadingRatePaletteNV* pShadingRatePalettes;
} VkPipelineViewportShadingRateImageStateCreateInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
• shadingRateImageEnable specifies whether shading rate image and palettes are used during rasterization.

• viewportCount specifies the number of per-viewport palettes used to translate values stored in shading rate images.

• pShadingRatePalettes is a pointer to an array of VkShadingRatePaletteNV structures defining the palette for each viewport. If the shading rate palette state is dynamic, this member is ignored.

If this structure is not present, shadingRateImageEnable is considered to be VK_FALSE, and the shading rate image and palettes are not used.

Valid Usage

• VUID-VkPipelineViewportShadingRateImageStateCreateInfoNV-viewportCount-02054
If the multiViewport feature is not enabled, viewportCount must be 0 or 1

• VUID-VkPipelineViewportShadingRateImageStateCreateInfoNV-viewportCount-02055
viewportCount must be less than or equal to VkPhysicalDeviceLimits::maxViewports

• VUID-VkPipelineViewportShadingRateImageStateCreateInfoNV-shadingRateImageEnable-02056
If shadingRateImageEnable is VK_TRUE, viewportCount must be greater or equal to the viewportCount member of VkPipelineViewportStateCreateInfo

Valid Usage (Implicit)

• VUID-VkPipelineViewportShadingRateImageStateCreateInfoNV-sType-sType
sType must be VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_SHADING_RATE_IMAGE_STATE_CREATE_INFO_NV

When shading rate image usage is enabled in the bound pipeline, the pipeline uses a shading rate image specified by the command:

```c
void vkCmdBindShadingRateImageNV(
    VkCommandBuffer commandBuffer, 
    VkImageView imageView, 
    VkImageLayout imageLayout);
```

• commandBuffer is the command buffer into which the command will be recorded.

• imageView is an image view handle specifying the shading rate image. imageView may be set to VK_NULL_HANDLE, which is equivalent to specifying a view of an image filled with zero values.

• imageLayout is the layout that the image subresources accessible from imageView will be in when the shading rate image is accessed.
Valid Usage

- VUID-vkCmdBindShadingRateImageNV-None-02058
  The shadingRateImage feature **must** be enabled

- VUID-vkCmdBindShadingRateImageNV-imageView-02059
  If imageView is not VK_NULL_HANDLE, it **must** be a valid VkImageView handle of type VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY

- VUID-vkCmdBindShadingRateImageNV-imageView-02060
  If imageView is not VK_NULL_HANDLE, it **must** be a valid VkImageView handle of type VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY

- VUID-vkCmdBindShadingRateImageNV-imageView-02061
  If imageView is not VK_NULL_HANDLE, it **must** have a format of VK_FORMAT_R8_UINT

- VUID-vkCmdBindShadingRateImageNV-imageView-02062
  If imageView is not VK_NULL_HANDLE, it **must** have been created with a usage value including VK_IMAGE_USAGE_SHADING_RATE_IMAGE_BIT_NV

- VUID-vkCmdBindShadingRateImageNV-imageView-02063
  If imageView is not VK_NULL_HANDLE, it **must** have imageLayout match the actual VkImageLayout of each subresource accessible from imageView at the time the subresource is accessed

- VUID-vkCmdBindShadingRateImageNV-imageView-02064
  If imageView is not VK_NULL_HANDLE, imageLayout **must** be VK_IMAGE_LAYOUT_SHADING_RATE_OPTIMAL_NV or VK_IMAGE_LAYOUT_GENERAL

Valid Usage (Implicit)

- VUID-vkCmdBindShadingRateImageNV-commandBuffer-parameter
  commandBuffer **must** be a valid VkCommandBuffer handle

- VUID-vkCmdBindShadingRateImageNV-imageView-parameter
  If imageView is not VK_NULL_HANDLE, imageView **must** be a valid VkImageView handle

- VUID-vkCmdBindShadingRateImageNV-imageLayout-parameter
  imageLayout **must** be a valid VkImageLayout value

- VUID-vkCmdBindShadingRateImageNV-commandBuffer-recording
  commandBuffer **must** be in the recording state

- VUID-vkCmdBindShadingRateImageNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from **must** support graphics operations

- VUID-vkCmdBindShadingRateImageNV-videocoding
  This command **must** only be called outside of a video coding scope

- VUID-vkCmdBindShadingRateImageNV-commonparent
  Both of commandBuffer, and imageView that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer **must** be externally synchronized
Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized.

### Command Properties

<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

When the shading rate image is enabled in the current pipeline, rasterizing a primitive covering the pixel with coordinates \((x,y)\) will fetch a shading rate index value from the shading rate image bound by `vkCmdBindShadingRateImageNV`. If the shading rate image view has a type of `VK_IMAGE_VIEW_TYPE_2D`, the lookup will use texel coordinates \((u,v)\) where \(u = \lfloor \frac{x}{\text{tw} \times \text{th}} \rfloor\), \(v = \lfloor \frac{y}{\text{th}} \rfloor\), and \(\text{tw} \times \text{th}\) are the width and height of the implementation-dependent shading rate texel size. If the shading rate image view has a type of `VK_IMAGE_VIEW_TYPE_2D_ARRAY`, the lookup will use texel coordinates \((u,v)\) to extract a texel from the layer \(l\), where \(l\) is the layer of the framebuffer being rendered to. If \(l\) is greater than or equal to the number of layers in the image view, layer zero will be used.

If the bound shading rate image view is not `VK_NULL_HANDLE` and contains a texel with coordinates \((u,v)\) in layer \(l\) (if applicable), the single unsigned integer component for that texel will be used as the shading rate index. If the \((u,v)\) coordinate is outside the extents of the subresource used by the shading rate image view, or if the image view is `VK_NULL_HANDLE`, the shading rate index is zero. If the shading rate image view has multiple mipmap levels, the base level identified by `VkImageSubresourceRange::baseMipLevel` will be used.

A shading rate index is mapped to a base shading rate using a lookup table called the shading rate image palette. There is a separate palette for each viewport. The number of entries in each palette is given by the implementation-dependent shading rate image palette size.

To dynamically set the `shadingRateImageEnable` state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3 with VK_NV_shading_rate_image,
// VK_EXT_shader_object with VK_NV_shading_rate_image
void vkCmdSetShadingRateImageEnableNV(
    VkCommandBuffer commandBuffer,
    VkBool32 shadingRateImageEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `shadingRateImageEnable` specifies the `shadingRateImageEnable` state.

This command sets the `shadingRateImageEnable` state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_SHADING_RATE_IMAGE_ENABLE_NV` set in `VkPipelineDynamicStateCreateInfo`.
Otherwise, this state is specified by the `VkPipelineViewportShadingRateImageStateCreateInfoNV::shadingRateImageEnable` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetShadingRateImageEnableNV-None-08556
  Either the `extendedDynamicState3ShadingRateImageEnable` feature or the `shaderObject` feature or both must be enabled

### Valid Usage (Implicit)

- VUID-vkCmdSetShadingRateImageEnableNV-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetShadingRateImageEnableNV-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetShadingRateImageEnableNV-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetShadingRateImageEnableNV-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>

</tr>
</tbody>
</table>

To **dynamically set** the per-viewport shading rate image palettes, call:

// Provided by VK_NV_shading_rate_image

```c
void vkCmdSetViewportShadingRatePaletteNV(
    VkCommandBuffer commandBuffer,
    uint32_t firstViewport,
);```
This command sets the per-viewport shading rate image palettes for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineViewportShadingRateImageStateCreateInfoNV::pShadingRatePalettes values used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetViewportShadingRatePaletteNV-None-02064
  The shadingRateImage feature must be enabled

- VUID-vkCmdSetViewportShadingRatePaletteNV-firstViewport-02067
  The sum of firstViewport and viewportCount must be between 1 and VkPhysicalDeviceLimits::maxViewports, inclusive

- VUID-vkCmdSetViewportShadingRatePaletteNV-firstViewport-02068
  If the multiViewport feature is not enabled, firstViewport must be 0

- VUID-vkCmdSetViewportShadingRatePaletteNV-viewportCount-02069
  If the multiViewport feature is not enabled, viewportCount must be 1

**Valid Usage (Implicit)**

- VUID-vkCmdSetViewportShadingRatePaletteNV-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetViewportShadingRatePaletteNV-pShadingRatePalettes-parameter
  pShadingRatePalettes must be a valid pointer to an array of viewportCount valid VkShadingRatePaletteNV structures

- VUID-vkCmdSetViewportShadingRatePaletteNV-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetViewportShadingRatePaletteNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The `VkShadingRatePaletteNV` structure specifies the contents of a single shading rate image palette and is defined as:

```c
// Provided by VK_NV_shading_rate_image
typedef struct VkShadingRatePaletteNV {
    uint32_t shadingRatePaletteEntryCount;
    const VkShadingRatePaletteEntryNV* pShadingRatePaletteEntries;
} VkShadingRatePaletteNV;
```

- `shadingRatePaletteEntryCount` specifies the number of entries in the shading rate image palette.
- `pShadingRatePaletteEntries` is a pointer to an array of `VkShadingRatePaletteEntryNV` enums defining the shading rate for each palette entry.

Valid Usage

- VUID-VkShadingRatePaletteNV-shadingRatePaletteEntryCount-02071
  
  `shadingRatePaletteEntryCount` must be between 1 and `VkPhysicalDeviceShadingRateImagePropertiesNV::shadingRatePaletteSize`, inclusive.

Valid Usage (Implicit)

- VUID-VkShadingRatePaletteNV-pShadingRatePaletteEntries-parameter
  
  `pShadingRatePaletteEntries` must be a valid pointer to an array of
shadingRatePaletteEntryCount valid VkShadingRatePaletteEntryNV values

- VUID-VkShadingRatePaletteNV-shadingRatePaletteEntryCount-arraylength
shadingRatePaletteEntryCount must be greater than 0

To determine the base shading rate image, a shading rate index \( i \) is mapped to array element \( i \) in the array pShadingRatePaletteEntries for the palette corresponding to the viewport used for the fragment. If \( i \) is greater than or equal to the palette size shadingRatePaletteEntryCount, the base shading rate is undefined.

The supported shading rate image palette entries are defined by VkShadingRatePaletteEntryNV:

```c
// Provided by VK_NV_shading_rate_image
typedef enum VkShadingRatePaletteEntryNV {
    VK_SHADING_RATE_PALETTE_ENTRY_NO_INVOCATIONS_NV = 0,
    VK_SHADING_RATE_PALETTE_ENTRY_16_INVOCATIONS_PER_PIXEL_NV = 1,
    VK_SHADING_RATE_PALETTE_ENTRY_8_INVOCATIONS_PER_PIXEL_NV = 2,
    VK_SHADING_RATE_PALETTE_ENTRY_4_INVOCATIONS_PER_PIXEL_NV = 3,
    VK_SHADING_RATE_PALETTE_ENTRY_2_INVOCATIONS_PER_PIXEL_NV = 4,
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_PIXEL_NV = 5,
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_2X1_PIXELS_NV = 6,
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_1X2_PIXELS_NV = 7,
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_2X2_PIXELS_NV = 8,
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_4X2_PIXELS_NV = 9,
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_2X4_PIXELS_NV = 10,
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_4X4_PIXELS_NV = 11,
} VkShadingRatePaletteEntryNV;
```

The following table indicates the width and height (in pixels) of each fragment generated using the indicated shading rate, as well as the maximum number of fragment shader invocations launched for each fragment. When processing regions of a primitive that have a shading rate of VK_SHADING_RATE_PALETTE_ENTRY_NO_INVOCATIONS_NV, no fragments will be generated in that region.

<table>

</table>

When the shading rate image is disabled, a shading rate of VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_PIXEL_NV will be used as the base shading rate.

Once a base shading rate has been established, it is adjusted to produce a final shading rate. First, if the base shading rate uses multiple pixels for each fragment, the implementation may reduce the fragment area to ensure that the total number of coverage samples for all pixels in a fragment does not exceed an implementation-dependent maximum.

If sample shading is active in the current pipeline and would result in processing \( n (n > 1) \) unique samples per fragment when the shading rate image is disabled, the shading rate is adjusted in an implementation-dependent manner to increase the number of fragment shader invocations spawned by the primitive. If the shading rate indicates \( f_s \) pixels per fragment and \( f_s \) is greater than \( n \), the fragment area is adjusted so each fragment has approximately \( f_s \frac{f}{n} \) pixels. Otherwise, if the shading rate indicates \( ipf \) invocations per fragment, the fragment area will be adjusted to a single pixel with approximately \( ipf \times \frac{f}{n} \) invocations per fragment.

If sample shading occurs due to the use of a fragment shader input variable decorated with SampleId or SamplePosition, the shading rate is ignored. Each fragment will have a single pixel and will spawn up to rasterizationSamples fragment shader invocations, as when using sample shading without a shading rate image.

Finally, if the shading rate specifies multiple fragment shader invocations per fragment, the total number of invocations in the shading rate is clamped to be no larger than rasterizationSamples.

When the final shading rate for a primitive covering pixel \((x,y)\) has a fragment area of \( fw \times fh \), the fragment for that pixel will cover all pixels with coordinates \((x',y')\) that satisfy the equations:
This combined fragment is considered to have multiple coverage samples; the total number of samples in this fragment is given by \( \text{samples} = \frac{fw \times fh \times rs}{f} \) where \( rs \) indicates the value of \text{VkPipelineMultisampleStateCreateInfo::rasterizationSamples} specified at pipeline creation time. The set of coverage samples in the fragment is the union of the per-pixel coverage samples in each of the fragment’s pixels. The location and order of coverage samples within each pixel in the combined fragment are assigned as described in Multisampling and Custom Sample Locations. Each coverage sample in the set of pixels belonging to the combined fragment is assigned a unique coverage index in the range \([0, \text{samples}-1]\). If the shadingRateCoarseSampleOrder feature is supported, the order of coverage samples can be specified for each combination of fragment area and coverage sample count. If this feature is not supported, the sample order is implementation-dependent.

If the \text{pNext} chain of \text{VkPipelineViewportStateCreateInfo} includes a \text{VkPipelineViewportCoarseSampleOrderStateCreateInfoNV} structure, then that structure includes parameters controlling the order of coverage samples in fragments larger than one pixel.

The \text{VkPipelineViewportCoarseSampleOrderStateCreateInfoNV} structure is defined as:

```c
typedef struct VkPipelineViewportCoarseSampleOrderStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkCoarseSampleOrderTypeNV sampleOrderType;
    uint32_t customSampleOrderCount;
    const VkCoarseSampleOrderCustomNV* pCustomSampleOrders;
} VkPipelineViewportCoarseSampleOrderStateCreateInfoNV;
```

- \text{sType} is a \text{VkStructureType} value identifying this structure.
- \text{pNext} is NULL or a pointer to a structure extending this structure.
- \text{sampleOrderType} specifies the mechanism used to order coverage samples in fragments larger than one pixel.
- \text{customSampleOrderCount} specifies the number of custom sample orderings to use when ordering coverage samples.
- \text{pCustomSampleOrders} is a pointer to an array of \text{customSampleOrderCount} \text{VkCoarseSampleOrderCustomNV} structures, each structure specifying the coverage sample order for a single combination of fragment area and coverage sample count.

If this structure is not present, \text{sampleOrderType} is considered to be \text{VK_COARSE_SAMPLE_ORDER_TYPE_DEFAULT_NV}.

If \text{sampleOrderType} is \text{VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV}, the coverage sample order used for any combination of fragment area and coverage sample count not enumerated in
pCustomSampleOrders will be identical to that used for VK_COARSE_SAMPLE_ORDER_TYPE_DEFAULT_NV.

If the pipeline was created with VK_DYNAMIC_STATE_VIEWPORT_COARSE_SAMPLE_ORDER_NV, the contents of this structure (if present) are ignored, and the coverage sample order is instead specified by 
vkCmdSetCoarseSampleOrderNV.

### Valid Usage

- VUID-VkPipelineViewportCoarseSampleOrderStateCreateInfoNV-sampleOrderType-02072
  If sampleOrderType is not VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV, customSamplerOrderCount must be 0

- VUID-VkPipelineViewportCoarseSampleOrderStateCreateInfoNV-pCustomSampleOrders-02234
  The array pCustomSampleOrders must not contain two structures with matching values for both the shadingRate and sampleCount members

### Valid Usage (Implicit)

- VUID-VkPipelineViewportCoarseSampleOrderStateCreateInfoNV-sType-sType must be VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_COARSE_SAMPLE_ORDER_STATE_CREATE_INFO_NV

- VUID-VkPipelineViewportCoarseSampleOrderStateCreateInfoNV-sampleOrderType-parameter sampleOrderType must be a valid VkCoarseSampleOrderTypeNV value

- VUID-VkPipelineViewportCoarseSampleOrderStateCreateInfoNV-pCustomSampleOrders-parameter If customSampleOrderCount is not 0, pCustomSampleOrders must be a valid pointer to an array of customSampleOrderCount valid VkCoarseSampleOrderCustomNV structures

The type VkCoarseSampleOrderTypeNV specifies the technique used to order coverage samples in fragments larger than one pixel, and is defined as:

```c
// Provided by VK_NV_shading_rate_image
typedef enum VkCoarseSampleOrderTypeNV {
    VK_COARSE_SAMPLE_ORDER_TYPE_DEFAULT_NV = 0,
    VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV = 1,
    VK_COARSE_SAMPLE_ORDER_TYPE_PIXEL_MAJOR_NV = 2,
    VK_COARSE_SAMPLE_ORDER_TYPE_SAMPLE_MAJOR_NV = 3,
} VkCoarseSampleOrderTypeNV;
```

- VK_COARSE_SAMPLE_ORDER_TYPE_DEFAULT_NV specifies that coverage samples will be ordered in an implementation-dependent manner.

- VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV specifies that coverage samples will be ordered according to the array of custom orderings provided in either the pCustomSampleOrders member
of VkPipelineViewportCoarseSampleOrderStateCreateInfoNV or the pCustomSampleOrders member of vkCmdSetCoarseSampleOrderNV.

- **VK_COARSE_SAMPLE_ORDER_TYPE_PIXEL_MAJOR_NV** specifies that coverage samples will be ordered sequentially, sorted first by pixel coordinate (in row-major order) and then by sample index.
- **VK_COARSE_SAMPLE_ORDER_TYPE_SAMPLE_MAJOR_NV** specifies that coverage samples will be ordered sequentially, sorted first by sample index and then by pixel coordinate (in row-major order).

When using a coarse sample order of **VK_COARSE_SAMPLE_ORDER_TYPE_PIXEL_MAJOR_NV** for a fragment with an upper-left corner of \((fx, fy)\) with a width of \(fw \times fh\) and \(fsc\) samples per pixel, coverage index \(cs\) of the fragment will be assigned to sample index \(fs\) of pixel \((px, py)\) as follows:

\[
px = fx + \left\lfloor \frac{\lfloor c \frac{s}{fsc} \% f w \}}{s} \right\rfloor \\
py = fy + \left\lfloor \frac{x}{w} \% f h \right\rfloor \\
fs = cs \% fsc
\]

When using a coarse sample order of **VK_COARSE_SAMPLE_ORDER_TYPE_SAMPLE_MAJOR_NV**, coverage index \(cs\) will be assigned as follows:

\[
px = fx + cs \% fw \\
py = fy + \left\lfloor \frac{x}{w} \% fh \right\rfloor \\
fs = \left\lfloor c \frac{s}{fw \times fh} \right\rfloor
\]

The **VkCoarseSampleOrderCustomNV** structure is used with a coverage sample ordering type of **VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV** to specify the order of coverage samples for one combination of fragment width, fragment height, and coverage sample count.

```c
// Provided by VK_NV_shading_rate_image
typedef struct VkCoarseSampleOrderCustomNV {
    VkShadingRatePaletteEntryNV shadingRate;
    uint32_t sampleCount;
    uint32_t sampleLocationCount;
    const VkCoarseSampleLocationNV* pSampleLocations;
} VkCoarseSampleOrderCustomNV;
```

- **shadingRate** is a shading rate palette entry that identifies the fragment width and height for the combination of fragment area and per-pixel coverage sample count to control.
- **sampleCount** identifies the per-pixel coverage sample count for the combination of fragment area and coverage sample count to control.
- **sampleLocationCount** specifies the number of sample locations in the custom ordering.
- **pSampleLocations** is a pointer to an array of **VkCoarseSampleLocationNV** structures specifying the location of each sample in the custom ordering.
When using a custom sample ordering, element $j$ in $p\text{SampleLocations}$ specifies a specific pixel location and sample index that corresponds to coverage index $j$ in the multi-pixel fragment.

### Valid Usage

- **VUID-VkCoarseSampleOrderCustomNV-shadingRate-02073**
  
  shadingRate must be a shading rate that generates fragments with more than one pixel

- **VUID-VkCoarseSampleOrderCustomNV-sampleCount-02074**
  
  sampleCount must correspond to a sample count enumerated in $\text{VkSampleCountFlags}$ whose corresponding bit is set in $\text{VkPhysicalDeviceLimits::framebufferNoAttachmentsSampleCounts}$

- **VUID-VkCoarseSampleOrderCustomNV-sampleLocationCount-02075**
  
  sampleLocationCount must be equal to the product of sampleCount, the fragment width for shadingRate, and the fragment height for shadingRate

- **VUID-VkCoarseSampleOrderCustomNV-sampleLocationCount-02076**
  
  sampleLocationCount must be less than or equal to the value of $\text{VkPhysicalDeviceShadingRateImagePropertiesNV::shadingRateMaxCoarseSamples}$

- **VUID-VkCoarseSampleOrderCustomNV-pSampleLocations-02077**
  
  The array $p\text{SampleLocations}$ must contain exactly one entry for every combination of valid values for pixelX, pixelY, and sample in the structure $\text{VkCoarseSampleOrderCustomNV}$

### Valid Usage (Implicit)

- **VUID-VkCoarseSampleOrderCustomNV-shadingRate-parameter**
  
  shadingRate must be a valid $\text{VkShadingRatePaletteEntryNV}$ value

- **VUID-VkCoarseSampleOrderCustomNV-pSampleLocations-parameter**
  
  $p\text{SampleLocations}$ must be a valid pointer to an array of sampleLocationCount $\text{VkCoarseSampleLocationNV}$ structures

- **VUID-VkCoarseSampleOrderCustomNV-sampleLocationCount-arraylength**
  
  sampleLocationCount must be greater than 0

The $\text{VkCoarseSampleLocationNV}$ structure identifies a specific pixel and sample index for one of the coverage samples in a fragment that is larger than one pixel. This structure is defined as:

```c
// Provided by VK_NV_shading_rate_image
typedef struct VkCoarseSampleLocationNV {
    uint32_t pixelX;
    uint32_t pixelY;
    uint32_t sample;
} VkCoarseSampleLocationNV;
```

- pixelX is added to the x coordinate of the upper-leftmost pixel of each fragment to identify the pixel containing the coverage sample.
• `pixelY` is added to the y coordinate of the upper-leftmost pixel of each fragment to identify the pixel containing the coverage sample.

• `sample` is the number of the coverage sample in the pixel identified by `pixelX` and `pixelY`.

**Valid Usage**

- VUID-VkCoarseSampleLocationNV-pixelX-02078
  `pixelX` **must** be less than the width (in pixels) of the fragment

- VUID-VkCoarseSampleLocationNV-pixelY-02079
  `pixelY` **must** be less than the height (in pixels) of the fragment

- VUID-VkCoarseSampleLocationNV-sample-02080
  `sample` **must** be less than the number of coverage samples in each pixel belonging to the fragment

To **dynamically set** the order of coverage samples in fragments larger than one pixel, call:

```c
// Provided by VK_NV_shading_rate_image
void vkCmdSetCoarseSampleOrderNV(
    VkCommandBuffer commandBuffer,
    VkCoarseSampleOrderTypeNV sampleOrderType,
    uint32_t customSampleOrderCount,
    const VkCoarseSampleOrderCustomNV* pCustomSampleOrders);
```

- `commandBuffer` is the command buffer into which the command will be recorded.

- `sampleOrderType` specifies the mechanism used to order coverage samples in fragments larger than one pixel.

- `customSampleOrderCount` specifies the number of custom sample orderings to use when ordering coverage samples.

- `pCustomSampleOrders` is a pointer to an array of `VkCoarseSampleOrderCustomNV` structures, each structure specifying the coverage sample order for a single combination of fragment area and coverage sample count.

If `sampleOrderType` is `VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV`, the coverage sample order used for any combination of fragment area and coverage sample count not enumerated in `pCustomSampleOrders` will be identical to that used for `VK_COARSE_SAMPLE_ORDER_TYPE_DEFAULT_NV`.

This command sets the order of coverage samples for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_VIEWPORT_COARSE_SAMPLE_ORDER_NV` set in `VkPipelineDynamicStateCreateInfo`::`pDynamicStates`. Otherwise, this state is specified by the `VkPipelineViewportCoarseSampleOrderStateCreateInfoNV` values used to create the currently active pipeline.
Valid Usage

• VUID-vkCmdSetCoarseSampleOrderNV-sampleOrderType-02081
  If `sampleOrderType` is not `VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV`, `customSamplerOrderCount` must be 0

• VUID-vkCmdSetCoarseSampleOrderNV-pCustomSampleOrders-02235
  The array `pCustomSampleOrders` must not contain two structures with matching values for both the `shadingRate` and `sampleCount` members

Valid Usage (Implicit)

• VUID-vkCmdSetCoarseSampleOrderNV-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

• VUID-vkCmdSetCoarseSampleOrderNV-sampleOrderType-parameter
  `sampleOrderType` must be a valid `VkCoarseSampleOrderTypeNV` value

• VUID-vkCmdSetCoarseSampleOrderNV-pCustomSampleOrders-parameter
  If `customSampleOrderCount` is not 0, `pCustomSampleOrders` must be a valid pointer to an array of `customSampleOrderCount` valid `VkCoarseSampleOrderCustomNV` structures

• VUID-vkCmdSetCoarseSampleOrderNV-commandBuffer-recording
  `commandBuffer` must be in the `recording state`

• VUID-vkCmdSetCoarseSampleOrderNV-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

• VUID-vkCmdSetCoarseSampleOrderNV-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

• Host access to `commandBuffer` must be externally synchronized

• Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

If the final shading rate for a primitive covering pixel \((x,y)\) results in \(n\) invocations per pixel \((n > 1)\),
Each coverage sample in the fragment will be assigned to one of the \( n \) fragment shader invocations in an implementation-dependent manner. The outputs from the fragment output interface of each shader invocation will be broadcast to all of the framebuffer samples associated with the invocation. If none of the coverage samples associated with a fragment shader invocation is covered by a primitive, the implementation may discard the fragment shader invocation for those samples.

If the final shading rate for a primitive covering pixel \((x, y)\) results in a fragment containing multiple pixels, a single set of fragment shader invocations will be generated for all pixels in the combined fragment. Outputs from the fragment output interface will be broadcast to all covered framebuffer samples belonging to the fragment. If the fragment shader executes code discarding the fragment, none of the samples of the fragment will be updated.

### 28.8. Sample Shading

Sample shading can be used to specify a minimum number of unique samples to process for each fragment. If sample shading is enabled, an implementation must invoke the fragment shader at least \( \text{max} (\lceil \text{VkPipelineMultisampleStateCreateInfo::minSampleShading} \times \text{VkPipelineMultisampleStateCreateInfo::rasterizationSamples} \rceil, 1) \) times per fragment. If \text{VkPipelineMultisampleStateCreateInfo::sampleShadingEnable} is set to \text{VK_TRUE}, sample shading is enabled.

If a fragment shader entry point statically uses an input variable decorated with a BuiltIn of SampleId or SamplePosition, sample shading is enabled and a value of 1.0 is used instead of minSampleShading. If a fragment shader entry point statically uses an input variable decorated with Sample, sample shading may be enabled and a value of 1.0 will be used instead of minSampleShading if it is. If the VK_AMD_mixed_attachment_samples extension is enabled and the subpass uses color attachments, the samples value used to create each color attachment is used instead of rasterizationSamples.

#### Note

If a shader decorates an input variable with Sample and that value meaningfully impacts the output of a shader, sample shading will be enabled to ensure that the input is in fact interpolated per-sample. This is inherent to the specification and not spelled out here - if an application simply declares such a variable it is implementation-defined whether sample shading is enabled or not. It is possible to see the effects of this by using atomics in the shader or using a pipeline statistics query to query the number of fragment invocations, even if the shader itself does not use any per-sample variables.

If there are fewer fragment invocations than covered samples, implementations may include those samples in fragment shader invocations in any manner as long as covered samples are all shaded at least once, and each invocation that is not a helper invocation covers at least one sample.

### 28.9. Barycentric Interpolation

When the fragmentShaderBarycentric feature is enabled, the PerVertexKHR interpolation decoration
can be used with fragment shader inputs to indicate that the decorated inputs do not have associated data in the fragment. Such inputs can only be accessed in a fragment shader using an array index whose value (0, 1, or 2) identifies one of the vertices of the primitive that produced the fragment. Reads of per-vertex values for missing vertices, such as the third vertex of a line primitive, will return values from the valid vertex with the highest index. This means that the per-vertex values of indices 1 and 2 for point primitives will be equal to those of index 0, and the per-vertex values of index 2 for line primitives will be equal to those of index 1.

When tessellation, geometry shading, and mesh shading are not active, fragment shader inputs decorated with PerVertexKHR will take values from one of the vertices of the primitive that produced the fragment, identified by the extra index provided in SPIR-V code accessing the input. If the \( n \) vertices passed to a draw call are numbered 0 through \( n-1 \), and the point, line, and triangle primitives produced by the draw call are numbered with consecutive integers beginning with zero, the following table indicates the original vertex numbers used when the provoking vertex mode is VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT for index values of 0, 1, and 2. If an input decorated with PerVertexKHR is accessed with any other vertex index value, or is accessed while rasterizing a polygon when the VkPipelineRasterizationStateCreateInfo::polygonMode property of the currently active pipeline is not VK_POLYGON_MODE_FILL, an undefined value is returned.

</tbody>
</table>

When geometry or mesh shading is active, primitives processed by fragment shaders are assembled from the vertices emitted by the geometry or mesh shader. In this case, the vertices used for fragment shader inputs decorated with PerVertexKHR are derived by treating the primitives produced by the shader as though they were specified by a draw call and consulting the table above.

When using tessellation without geometry shading, the tessellator produces primitives in an implementation-dependent manner. While there is no defined vertex ordering for inputs decorated with PerVertexKHR, the vertex ordering used in this case will be consistent with the ordering used to derive the values of inputs decorated with BaryCoordKHR or BaryCoordNoPerspKHR.

Fragment shader inputs decorated with BaryCoordKHR or BaryCoordNoPerspKHR hold three-component vectors with barycentric weights that indicate the location of the fragment relative to the screen-space locations of vertices of its primitive. For point primitives, such variables are always assigned the value (1,0,0). For line primitives, the built-ins are obtained by interpolating an attribute whose values for the vertices numbered 0 and 1 are (1,0,0) and (0,1,0), respectively. For polygon primitives, the built-ins are obtained by interpolating an attribute whose values for the vertices numbered 0, 1, and 2 are (1,0,0), (0,1,0), and (0,0,1), respectively. For BaryCoordKHR, the values are obtained using perspective interpolation. For BaryCoordNoPerspKHR, the values are obtained using linear interpolation. The values of BaryCoordKHR and BaryCoordNoPerspKHR are undefined while rasterizing a polygon when the VkPipelineRasterizationStateCreateInfo::polygonMode property of the currently active pipeline is not VK_POLYGON_MODE_FILL.
28.10. Points

A point is drawn by generating a set of fragments in the shape of a square centered around the vertex of the point. Each vertex has an associated point size controlling the width/height of that square. The point size is taken from the (potentially clipped) shader built-in PointSize written by:

- the geometry shader, if active;
- the tessellation evaluation shader, if active and no geometry shader is active;
- the vertex shader, otherwise

and clamped to the implementation-dependent point size range \([\text{pointSizeRange}[0], \text{pointSizeRange}[1]]\). The value written to PointSize **must** be greater than zero. If maintenance5 is enabled, and a value is not written to PointSize, the point size takes a default value of 1.0.

Not all point sizes need be supported, but the size 1.0 **must** be supported. The range of supported sizes and the size of evenly-spaced gradations within that range are implementation-dependent. The range and gradations are obtained from the pointSizeRange and pointSizeGranularity members of VkPhysicalDeviceLimits. If, for instance, the size range is from 0.1 to 2.0 and the gradation size is 0.1, then the sizes 0.1, 0.2, ..., 1.9, 2.0 are supported. Additional point sizes may also be supported. There is no requirement that these sizes be equally spaced. If an unsupported size is requested, the nearest supported size is used instead.

Further, if the render pass has a fragment density map attachment, point size may be rounded by the implementation to a multiple of the fragment's width or height.

28.10.1. Basic Point Rasterization

Point rasterization produces a fragment for each fragment area group of framebuffer pixels with one or more sample points that intersect a region centered at the point’s \((x_f,y_f)\). This region is a square with side equal to the current point size. Coverage bits that correspond to sample points that intersect the region are 1, other coverage bits are 0. All fragments produced in rasterizing a point are assigned the same associated data, which are those of the vertex corresponding to the point. However, the fragment shader built-in PointCoord contains point sprite texture coordinates. The s and t point sprite texture coordinates vary from zero to one across the point horizontally left-to-right and vertically top-to-bottom, respectively. The following formulas are used to evaluate s and t:

\[
\begin{align*}
    s &= \frac{1}{2} + \frac{(x_p - x_f)}{\text{size}} \\
    t &= \frac{1}{2} + \frac{(y_p - y_f)}{\text{size}}
\end{align*}
\]

where size is the point’s size; \((x_p,y_p)\) is the location at which the point sprite coordinates are evaluated - this may be the framebuffer coordinates of the fragment center, or the location of a sample; and \((x_f,y_f)\) is the exact, unrounded framebuffer coordinate of the vertex for the point.
28.11. Line Segments

Line segment rasterization options are controlled by the 
VkPipelineRasterizationLineStateCreateInfoEXT structure.

The `VkPipelineRasterizationLineStateCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_line_rasterization
typedef struct VkPipelineRasterizationLineStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkLineRasterizationModeEXT lineRasterizationMode;
    VkBool32 stippledLineEnable;
    uint32_t lineStippleFactor;
    uint16_t lineStipplePattern;
} VkPipelineRasterizationLineStateCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `lineRasterizationMode` is a `VkLineRasterizationModeEXT` value selecting the style of line rasterization.
- `stippledLineEnable` enables stippled line rasterization.
- `lineStippleFactor` is the repeat factor used in stippled line rasterization.
- `lineStipplePattern` is the bit pattern used in stippled line rasterization.

If `stippledLineEnable` is `VK_FALSE`, the values of `lineStippleFactor` and `lineStipplePattern` are ignored.

### Valid Usage

- VUID-VkPipelineRasterizationLineStateCreateInfoEXT-lineRasterizationMode-02768
  If `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT`, then the `rectangularLines` feature **must** be enabled

- VUID-VkPipelineRasterizationLineStateCreateInfoEXT-lineRasterizationMode-02769
  If `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT`, then the `bresenhamLines` feature **must** be enabled

- VUID-VkPipelineRasterizationLineStateCreateInfoEXT-lineRasterizationMode-02770
  If `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT`, then the `smoothLines` feature **must** be enabled

- VUID-VkPipelineRasterizationLineStateCreateInfoEXT-stippledLineEnable-02771
  If `stippledLineEnable` is `VK_TRUE` and `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT`, then the `stippledRectangularLines` feature **must** be enabled

- VUID-VkPipelineRasterizationLineStateCreateInfoEXT-stippledLineEnable-02772
If `stippledLineEnable` is `VK_TRUE` and `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT`, then the `stippledBresenhamLines` feature must be enabled

- VUID-VkPipelineRasterizationLineStateCreateInfoEXT-stippledLineEnable-02773
  If `stippledLineEnable` is `VK_TRUE` and `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT`, then the `stippledSmoothLines` feature must be enabled

- VUID-VkPipelineRasterizationLineStateCreateInfoEXT-stippledLineEnable-02774
  If `stippledLineEnable` is `VK_TRUE` and `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT`, then the `stippledRectangularLines` feature must be enabled and `VkPhysicalDeviceLimits::strictLines` must be `VK_TRUE`

**Valid Usage (Implicit)**

- VUID-VkPipelineRasterizationLineStateCreateInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_LINE_STATE_CREATE_INFO_EXT`

- VUID-VkPipelineRasterizationLineStateCreateInfoEXT-lineRasterizationMode-parameter
  `lineRasterizationMode` must be a valid `VkLineRasterizationModeEXT` value

Possible values of `VkPipelineRasterizationLineStateCreateInfoEXT::lineRasterizationMode` are:

```c
// Provided by VK_EXT_line_rasterization
typedef enum VkLineRasterizationModeEXT {
    VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT = 0,
    VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT = 1,
    VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT = 2,
    VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT = 3,
} VkLineRasterizationModeEXT;
```

- `VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT` is equivalent to `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT` if `VkPhysicalDeviceLimits::strictLines` is `VK_TRUE`, otherwise lines are drawn as non-strictLines parallelograms. Both of these modes are defined in Basic Line Segment Rasterization.

- `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT` specifies lines drawn as if they were rectangles extruded from the line

- `VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT` specifies lines drawn by determining which pixel diamonds the line intersects and exits, as defined in Bresenham Line Segment Rasterization.

- `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT` specifies lines drawn if they were rectangles extruded from the line, with alpha falloff, as defined in Smooth Lines.

To dynamically set the `lineRasterizationMode` state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
```
void vkCmdSetLineRasterizationModeEXT(
    VkCommandBuffer commandBuffer,
    VkLineRasterizationModeEXT lineRasterizationMode);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `lineRasterizationMode` specifies the `lineRasterizationMode` state.

This command sets the `lineRasterizationMode` state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` set in `VkPipelineDynamicStateCreateInfo` ::`pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationLineStateCreateInfoEXT` ::`lineRasterizationMode` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetLineRasterizationModeEXT-None-08558
  Either the extendedDynamicState3LineRasterizationMode feature or the shaderObject feature or both must be enabled

- VUID-vkCmdSetLineRasterizationModeEXT-lineRasterizationMode-07418
  If `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT`, then the rectangularLines feature must be enabled

- VUID-vkCmdSetLineRasterizationModeEXT-lineRasterizationMode-07419
  If `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT`, then the brendamhlines feature must be enabled

- VUID-vkCmdSetLineRasterizationModeEXT-lineRasterizationMode-07420
  If `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT`, then the smoothlines feature must be enabled

### Valid Usage (Implicit)

- VUID-vkCmdSetLineRasterizationModeEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetLineRasterizationModeEXT-lineRasterizationMode-parameter
  `lineRasterizationMode` must be a valid `VkLineRasterizationModeEXT` value

- VUID-vkCmdSetLineRasterizationModeEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetLineRasterizationModeEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetLineRasterizationModeEXT-videocoding
  This command must only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

To dynamically set the `stippledLineEnable` state, call:

```c
void vkCmdSetLineStippleEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 stippledLineEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `stippledLineEnable` specifies the `stippledLineEnable` state.

This command sets the `stippledLineEnable` state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationLineStateCreateInfoEXT::stippledLineEnable` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetLineStippleEnableEXT-None-08560
  Either the `extendedDynamicState3LineStippleEnable` feature or the `shaderObject` feature or both must be enabled

### Valid Usage (Implicit)

- VUID-vkCmdSetLineStippleEnableEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetLineStippleEnableEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state
The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

This command must only be called outside of a video coding scope.

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

**Command Properties**

To dynamically set the line width, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetLineWidth(
    VkCommandBuffer commandBuffer,
    float lineWidth);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `lineWidth` is the width of rasterized line segments.

This command sets the line width for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_LINE_WIDTH` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateCreateInfo::lineWidth` value used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetLineWidth-lineWidth-00788
  - If the `wideLines` feature is not enabled, `lineWidth` must be `1.0`
Valid Usage (Implicit)

- VUID-vkCmdSetLineWidth-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetLineWidth-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetLineWidth-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdSetLineWidth-videocoding
  This command must only be called outside of a video coding scope

</table>

Not all line widths need be supported for line segment rasterization, but width 1.0 antialiased segments must be provided. The range and gradations are obtained from the lineWidthRange and lineWidthGranularity members of VkPhysicalDeviceLimits. If, for instance, the size range is from 0.1 to 2.0 and the gradation size is 0.1, then the sizes 0.1, 0.2, ..., 1.9, 2.0 are supported. Additional line widths may also be supported. There is no requirement that these widths be equally spaced. If an unsupported width is requested, the nearest supported width is used instead.

Further, if the render pass has a fragment density map attachment, line width may be rounded by the implementation to a multiple of the fragment’s width or height.

28.11.1. Basic Line Segment Rasterization

If the lineRasterizationMode member of VkPipelineRasterizationLineStateCreateInfoEXT is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT, rasterized line segments produce fragments which intersect a rectangle centered on the line segment. Two of the edges are parallel to the specified line segment; each is at a distance of one-half the current width from that segment in directions perpendicular to the direction of the line. The other two edges pass through the line endpoints and...
are perpendicular to the direction of the specified line segment. Coverage bits that correspond to sample points that intersect the rectangle are 1, other coverage bits are 0.

Next we specify how the data associated with each rasterized fragment are obtained. Let \( p_r = (x_d, y_d) \) be the framebuffer coordinates at which associated data are evaluated. This may be the center of a fragment or the location of a sample within the fragment. When \( \text{rasterizationSamples} \) is \( \text{VK\_SAMPLE\_COUNT\_1\_BIT} \), the fragment center must be used. Let \( p_a = (x_a, y_a) \) and \( p_b = (x_b, y_b) \) be initial and final endpoints of the line segment, respectively. Set

\[
t = \frac{(p_r - p_a) \cdot (p_b - p_a)}{||p_b - p_a||^2}
\]

(Note that \( t = 0 \) at \( p_a \) and \( t = 1 \) at \( p_b \). Also note that this calculation projects the vector from \( p_a \) to \( p_r \) onto the line, and thus computes the normalized distance of the fragment along the line.)

If \( \text{strictLines} \) is \( \text{VK\_TRUE} \), line segments are rasterized using perspective or linear interpolation.

**Perspective interpolation** for a line segment interpolates two values in a manner that is correct when taking the perspective of the viewport into consideration, by way of the line segment's clip coordinates. An interpolated value \( f \) can be determined by

\[
f = \frac{(1 - t)f_a / w_a + tf_b / w_b}{(1 - t) / w_a + t / w_b}
\]

where \( f_a \) and \( f_b \) are the data associated with the starting and ending endpoints of the segment, respectively; \( w_a \) and \( w_b \) are the clip w coordinates of the starting and ending endpoints of the segment, respectively.

**Linear interpolation** for a line segment directly interpolates two values, and an interpolated value \( f \) can be determined by

\[
f = (1 - t)f_a + tf_b
\]

where \( f_a \) and \( f_b \) are the data associated with the starting and ending endpoints of the segment, respectively.

The clip coordinate \( w \) for a sample is determined using perspective interpolation. The depth value \( z \) for a sample is determined using linear interpolation. Interpolation of fragment shader input values are determined by **Interpolation decorations**.

The above description documents the preferred method of line rasterization, and must be used when \( \text{lineRasterizationMode} \) is \( \text{VK\_LINE\_RASTERIZATION\_MODE\_RECTANGULAR\_EXT} \).

By default, when \( \text{strictLines} \) is \( \text{VK\_FALSE} \), and when the \( \text{lineRasterizationMode} \) is \( \text{VK\_LINE\_RASTERIZATION\_MODE\_DEFAULT\_EXT} \), the edges of the lines are generated as a parallelogram surrounding the original line. The major axis is chosen by noting the axis in which there is the greatest distance between the line start and end points. If the difference is equal in both directions then the X axis is chosen as the major axis. Edges 2 and 3 are aligned to the minor axis and are centered on the endpoints of the line as in **Non strict lines**, and each is \( \text{lineWidth} \) long. Edges 0 and 1
are parallel to the line and connect the endpoints of edges 2 and 3. Coverage bits that correspond to sample points that intersect the parallelogram are 1, other coverage bits are 0.

Samples that fall exactly on the edge of the parallelogram follow the polygon rasterization rules.

Interpolation occurs as if the parallelogram was decomposed into two triangles where each pair of vertices at each end of the line has identical attributes.

![Parallelogram Diagram](image)

*Figure 20. Non strict lines*

Only when `strictLines` is `VK_FALSE` implementations may deviate from the non-strict line algorithm described above in the following ways:

- Implementations may instead interpolate each fragment according to the formula in [Basic Line Segment Rasterization](#) using the original line segment endpoints.
- Rasterization of non-antialiased non-strict line segments may be performed using the rules defined in [Bresenham Line Segment Rasterization](#).

If `VkPhysicalDeviceMaintenance5PropertiesKHR::nonStrictSinglePixelWideLinesUseParallelogram` is `VK_TRUE`, the `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT`, and `strictLines` is `VK_FALSE`, non-strict lines of width 1.0 are rasterized as parallelograms, otherwise they are rasterized using Bresenham’s algorithm.

If `VkPhysicalDeviceMaintenance5PropertiesKHR::nonStrictWideLinesUseParallelogram` is `VK_TRUE`, the `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT`, and `strictLines` is `VK_FALSE`, non-strict lines of width greater than 1.0 are rasterized as parallelograms, otherwise they are rasterized using Bresenham’s algorithm.

### 28.11.2. Bresenham Line Segment Rasterization

If `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT`, then the following rules replace the line rasterization rules defined in [Basic Line Segment Rasterization](#).

Non-strict lines may also follow these rasterization rules for non-antialiased lines.
Line segment rasterization begins by characterizing the segment as either *x-major* or *y-major*. *x-major* line segments have slope in the closed interval [-1,1]; all other line segments are *y-major* (slope is determined by the segment’s endpoints). We specify rasterization only for *x-major* segments except in cases where the modifications for *y-major* segments are not self-evident.

Ideally, Vulkan uses a *diamond-exit* rule to determine those fragments that are produced by rasterizing a line segment. For each fragment *f* with center at framebuffer coordinates *x_f* and *y_f*, define a diamond-shaped region that is the intersection of four half planes:

\[ R_f = \{(x, y) \mid |x - x_f| + |y - y_f| < \frac{1}{2}\} \]

Essentially, a line segment starting at *p_a* and ending at *p_b* produces those fragments *f* for which the segment intersects *R_f*, except if *p_b* is contained in *R_f*.

![Figure 21. Visualization of Bresenham's algorithm](image)

To avoid difficulties when an endpoint lies on a boundary of *R_f* we (in principle) perturb the supplied endpoints by a tiny amount. Let *p_a* and *p_b* have framebuffer coordinates (*x_a*, *y_a*) and (*x_b*, *y_b*), respectively. Obtain the perturbed endpoints *p_a'* given by (*x_a*, *y_a*) - (*ε*, *ε*) and *p_b'* given by (*x_b*, *y_b*) - (*ε*, *ε*). Rasterizing the line segment starting at *p_a'* and ending on *p_b'* produces those fragments *f* for which the segment starting at *p_a'* and ending on *p_b'* intersects *R_f*, except if *p_b'* is contained in *R_f*. *ε* is chosen to be so small that rasterizing the line segment produces the same fragments when *δ* is substituted for *ε* for any 0 < *δ* ≤ *ε*.

When *p_a* and *p_b* lie on fragment centers, this characterization of fragments reduces to Bresenham’s algorithm with one modification: lines produced in this description are “half-open”, meaning that the final fragment (corresponding to *p_b*) is not drawn. This means that when rasterizing a series of connected line segments, shared endpoints will be produced only once rather than twice (as would
Implementations may use other line segment rasterization algorithms, subject to the following rules:

- The coordinates of a fragment produced by the algorithm must not deviate by more than one unit in either x or y framebuffer coordinates from a corresponding fragment produced by the diamond-exit rule.
- The total number of fragments produced by the algorithm must not differ from that produced by the diamond-exit rule by no more than one.
- For an x-major line, two fragments that lie in the same framebuffer-coordinate column must not be produced (for a y-major line, two fragments that lie in the same framebuffer-coordinate row must not be produced).
- If two line segments share a common endpoint, and both segments are either x-major (both left-to-right or both right-to-left) or y-major (both bottom-to-top or both top-to-bottom), then rasterizing both segments must not produce duplicate fragments. Fragments also must not be omitted so as to interrupt continuity of the connected segments.

The actual width \( w \) of Bresenham lines is determined by rounding the line width to the nearest integer, clamping it to the implementation-dependent lineWidthRange (with both values rounded to the nearest integer), then clamping it to be no less than 1.

Bresenham line segments of width other than one are rasterized by offsetting them in the minor direction (for an x-major line, the minor direction is y, and for a y-major line, the minor direction is x) and producing a row or column of fragments in the minor direction. If the line segment has endpoints given by \((x_0, y_0)\) and \((x_1, y_1)\) in framebuffer coordinates, the segment with endpoints \((x_0, y_0 - \frac{w-1}{2})\) and \((x_1, y_1 - \frac{w-1}{2})\) is rasterized, but instead of a single fragment, a column of fragments of height \( w \) (a row of fragments of length \( w \) for a y-major segment) is produced at each \( x \) (y for y-major) location. The lowest fragment of this column is the fragment that would be produced by rasterizing the segment of width 1 with the modified coordinates.

The preferred method of attribute interpolation for a wide line is to generate the same attribute values for all fragments in the row or column described above, as if the adjusted line was used for interpolation and those values replicated to the other fragments, except for FragCoord which is interpolated as usual. Implementations may instead interpolate each fragment according to the formula in Basic Line Segment Rasterization, using the original line segment endpoints.

When Bresenham lines are being rasterized, sample locations may all be treated as being at the pixel center (this may affect attribute and depth interpolation).

\[ \text{Note} \]

The sample locations described above are not used for determining coverage, they are only used for things like attribute interpolation. The rasterization rules that determine coverage are defined in terms of whether the line intersects pixels, as opposed to the point sampling rules used for other primitive types. So these rules are independent of the sample locations. One consequence of this is that Bresenham lines cover the same pixels regardless of the number of rasterization
samples, and cover all samples in those pixels (unless masked out or killed).

28.11.3. Line Stipple

If the `stippledLineEnable` member of `VkPipelineRasterizationLineStateCreateInfoEXT` is `VK_TRUE`, then lines are rasterized with a line stipple determined by `lineStippleFactor` and `lineStipplePattern`. `lineStipplePattern` is an unsigned 16-bit integer that determines which fragments are to be drawn or discarded when the line is rasterized. `lineStippleFactor` is a count that is used to modify the effective line stipple by causing each bit in `lineStipplePattern` to be used `lineStippleFactor` times.

Line stippling discards certain fragments that are produced by rasterization. The masking is achieved using three parameters: the 16-bit line stipple pattern $p$, the line stipple factor $r$, and an integer stipple counter $s$. Let

$$b = \left\lfloor \frac{s}{r} \right\rfloor \mod 16$$

Then a fragment is produced if the $b$'th bit of $p$ is 1, and discarded otherwise. The bits of $p$ are numbered with 0 being the least significant and 15 being the most significant.

The initial value of $s$ is zero. For `VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT` lines, $s$ is incremented after production of each fragment of a line segment (fragments are produced in order, beginning at the starting point and working towards the ending point). For `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT` and `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT` lines, the rectangular region is subdivided into adjacent unit-length rectangles, and $s$ is incremented once for each rectangle. Rectangles with a value of $s$ such that the $b$'th bit of $p$ is zero are discarded. If the last rectangle in a line segment is shorter than unit-length, then the remainder may carry over to the next line segment in the line strip using the same value of $s$ (this is the preferred behavior, for the stipple pattern to appear more consistent through the strip).

$s$ is reset to 0 at the start of each strip (for line strips), and before every line segment in a group of independent segments.

If the line segment has been clipped, then the value of $s$ at the beginning of the line segment is implementation-dependent.

To dynamically set the line stipple state, call:

```c
// Provided by VK_EXT_line_rasterization
void vkCmdSetLineStippleEXT(
    VkCommandBuffer commandBuffer,  // commandBuffer is the command buffer into which the command will be recorded.
    uint32_t lineStippleFactor,     // lineStippleFactor is the repeat factor used in stippled line rasterization.
    uint16_t lineStipplePattern);
```
• **lineStipplePattern** is the bit pattern used in stippled line rasterization.

This command sets the line stipple state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with **VK_DYNAMIC_STATE_LINE_STIPPLE_EXT** set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**. Otherwise, this state is specified by the **VkPipelineRasterizationLineStateCreateInfoEXT::lineStippleFactor** and **VkPipelineRasterizationLineStateCreateInfoEXT::lineStipplePattern** values used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetLineStippleEXT-lineStippleFactor-02776
  - **lineStippleFactor** must be in the range [1,256]

### Valid Usage (Implicit)

- VUID-vkCmdSetLineStippleEXT-commandBuffer-parameter
  - **commandBuffer** must be a valid **VkCommandBuffer** handle
- VUID-vkCmdSetLineStippleEXT-commandBuffer-recording
  - **commandBuffer** must be in the recording state
- VUID-vkCmdSetLineStippleEXT-commandBuffer-cmdpool
  - The **VkCommandPool** that **commandBuffer** was allocated from must support graphics operations
- VUID-vkCmdSetLineStippleEXT-videocoding
  - This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to **commandBuffer** must be externally synchronized
- Host access to the **VkCommandPool** that **commandBuffer** was allocated from must be externally synchronized

28.11.4. Smooth Lines

If the `lineRasterizationMode` member of `VkPipelineRasterizationLineStateCreateInfoEXT` is
`VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT`, then lines are considered to be rectangles
using the same geometry as for `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT` lines. The rules for
determining which pixels are covered are implementation-dependent, and may include nearby
pixels where no sample locations are covered or where the rectangle does not intersect the pixel at
all. For each pixel that is considered covered, the fragment computes a coverage value that
approximates the area of the intersection of the rectangle with the pixel square, and this coverage
value is multiplied into the color location 0's alpha value after fragment shading, as described in
Multisample Coverage.

Note

The details of the rasterization rules and area calculation are left intentionally
vague, to allow implementations to generate coverage and values that are
aesthetically pleasing.

28.12. Polygons

A polygon results from the decomposition of a triangle strip, triangle fan or a series of independent
triangles. Like points and line segments, polygon rasterization is controlled by several variables in
the `VkPipelineRasterizationStateCreateInfo` structure.

28.12.1. Basic Polygon Rasterization

The first step of polygon rasterization is to determine whether the triangle is back-facing or front-
facing. This determination is made based on the sign of the (clipped or unclipped) polygon's area
computed in framebuffer coordinates. One way to compute this area is:

\[
\text{a} = -\frac{1}{2} \sum_{i=0}^{n-1} x_i f y_i f^t - x_i f^t y_i f
\]

where \(x_i\) and \(y_i\) are the x and y framebuffer coordinates of the ith vertex of the n-vertex polygon
(verticies are numbered starting at zero for the purposes of this computation) and \(i \oplus 1\) is \((i + 1) \mod n\).

The interpretation of the sign of \(a\) is determined by the `VkPipelineRasterizationStateCreateInfo`:
::frontFace property of the currently active pipeline. Possible values are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkFrontFace {
    VK_FRONT_FACE_COUNTER_CLOCKWISE = 0,
    VK_FRONT_FACE_CLOCKWISE = 1,
} VkFrontFace;
```

- `VK_FRONT_FACE_COUNTER_CLOCKWISE` specifies that a triangle with positive area is considered front-
facing.
• **VK_FRONT_FACE_CLOCKWISE** specifies that a triangle with negative area is considered front-facing.

Any triangle which is not front-facing is back-facing, including zero-area triangles.

To **dynamically set** the front face orientation, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetFrontFace(
    VkCommandBuffer commandBuffer,
    VkFrontFace frontFace);
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object
void vkCmdSetFrontFaceEXT(
    VkCommandBuffer commandBuffer,
    VkFrontFace frontFace);
```

• **commandBuffer** is the command buffer into which the command will be recorded.

• **frontFace** is a **VkFrontFace** value specifying the front-facing triangle orientation to be used for culling.

This command sets the front face orientation for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with **VK_DYNAMIC_STATE_FRONT_FACE** set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**. Otherwise, this state is specified by the **VkPipelineRasterizationStateCreateInfo::frontFace** value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetFrontFace-None-08971**
  At least one of the following must be true:
  - the **extendedDynamicState** feature is enabled
  - the **shaderObject** feature is enabled
  - the value of **VkApplicationInfo::apiVersion** used to create the **VkInstance** parent of **commandBuffer** is greater than or equal to Version 1.3

### Valid Usage (Implicit)

- **VUID-vkCmdSetFrontFace-commandBuffer-parameter**
  **commandBuffer** must be a valid **VkCommandBuffer** handle

- **VUID-vkCmdSetFrontFace-frontFace-parameter**
  **frontFace** must be a valid **VkFrontFace** value
VUID-vkCmdSetFrontFace-commandBuffer-recording

commandBuffer must be in the recording state

VUID-vkCmdSetFrontFace-commandBuffer-cmdpool

The VkCommandPool that commandBuffer was allocated from must support graphics operations

VUID-vkCmdSetFrontFace-videcoding

This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

Once the orientation of triangles is determined, they are culled according to the VkPipelineRasterizationStateCreateInfo::cullMode property of the currently active pipeline. Possible values are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCullModeFlagBits {
    VK_CULL_MODE_NONE = 0,
    VK_CULL_MODE_FRONT_BIT = 0x00000001,
    VK_CULL_MODE_BACK_BIT = 0x00000002,
    VK_CULL_MODE_FRONT_AND_BACK = 0x00000003,
} VkCullModeFlagBits;
```

- **VK_CULL_MODE_NONE** specifies that no triangles are discarded
- **VK_CULL_MODE_FRONT_BIT** specifies that front-facing triangles are discarded
- **VK_CULL_MODE_BACK_BIT** specifies that back-facing triangles are discarded
- **VK_CULL_MODE_FRONT_AND_BACK** specifies that all triangles are discarded.

Following culling, fragments are produced for any triangles which have not been discarded.

```c
// Provided by VK_VERSION_1_0
```
typedef VkFlags VkCullModeFlags;

VkCullModeFlags is a bitmask type for setting a mask of zero or more VkCullModeFlagBits.

To dynamically set the cull mode, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetCullMode(
    VkCommandBuffer commandBuffer,
    VkCullModeFlags cullMode);
```
or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object
void vkCmdSetCullModeEXT(
    VkCommandBuffer commandBuffer,
    VkCullModeFlags cullMode);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `cullMode` specifies the cull mode property to use for drawing.

This command sets the cull mode for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_CULL_MODE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateCreateInfo::cullMode` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetCullMode-None-08971
  At least one of the following **must** be true:
  - the `extendedDynamicState` feature is enabled
  - the `shaderObject` feature is enabled
  - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

### Valid Usage (Implicit)

- VUID-vkCmdSetCullMode-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetCullMode-cullMode-parameter
  `cullMode` **must** be a valid combination of `VkCullModeFlagBits` values

- VUID-vkCmdSetCullMode-commandBuffer-recording
  `commandBuffer` **must** be in the **recording state**
Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

The rule for determining which fragments are produced by polygon rasterization is called point sampling. The two-dimensional projection obtained by taking the x and y framebuffer coordinates of the polygon’s vertices is formed. Fragments are produced for any fragment area groups of pixels for which any sample points lie inside of this polygon. Coverage bits that correspond to sample points that satisfy the point sampling criteria are 1, other coverage bits are 0. Special treatment is given to a sample whose sample location lies on a polygon edge. In such a case, if two polygons lie on either side of a common edge (with identical endpoints) on which a sample point lies, then exactly one of the polygons must result in a covered sample for that fragment during rasterization. As for the data associated with each fragment produced by rasterizing a polygon, we begin by specifying how these values are produced for fragments in a triangle.

Barycentric coordinates are a set of three numbers, a, b, and c, each in the range [0,1], with $a + b + c = 1$. These coordinates uniquely specify any point p within the triangle or on the triangle’s boundary as

$$p = a \, p_a + b \, p_b + c \, p_c,$$

where $p_a$, $p_b$, and $p_c$ are the vertices of the triangle. a, b, and c are determined by:

$$a = \frac{A(p \, p_b \, p_c)}{A(p_a \, p_b \, p_c)}, \quad b = \frac{A(p \, p_a \, p_c)}{A(p_a \, p_b \, p_c)}, \quad c = \frac{A(p \, p_a \, p_b)}{A(p_a \, p_b \, p_c)},$$

where $A(lmn)$ denotes the area in framebuffer coordinates of the triangle with vertices l, m, and n.

Denote an associated datum at $p_a$, $p_b$, or $p_c$ as $f_a$, $f_b$, or $f_c$, respectively.
Perspective interpolation for a triangle interpolates three values in a manner that is correct when taking the perspective of the viewport into consideration, by way of the triangle’s clip coordinates. An interpolated value \( f \) can be determined by

\[
f = \frac{af_a / w_a + bf_b / w_b + cf_c / w_c}{a / w_a + b / w_b + c / w_c}
\]

where \( w_a, w_b \) and \( w_c \) are the clip \( w \) coordinates of \( p_a, p_b \), and \( p_c \), respectively. \( a, b \), and \( c \) are the barycentric coordinates of the location at which the data are produced.

Linear interpolation for a triangle directly interpolates three values, and an interpolated value \( f \) can be determined by

\[
f = a f_a + b f_b + c f_c
\]

where \( f_a, f_b \), and \( f_c \) are the data associated with \( p_a, p_b \), and \( p_c \), respectively.

The clip coordinate \( w \) for a sample is determined using perspective interpolation. The depth value \( z \) for a sample is determined using linear interpolation. Interpolation of fragment shader input values are determined by Interpolation decorations.

For a polygon with more than three edges, such as are produced by clipping a triangle, a convex combination of the values of the datum at the polygon’s vertices must be used to obtain the value assigned to each fragment produced by the rasterization algorithm. That is, it must be the case that at every fragment

\[
f = \sum_{i=1}^{n} a_i f_i
\]

where \( n \) is the number of vertices in the polygon and \( f_i \) is the value of \( f \) at vertex \( i \). For each \( i \), \( 0 \leq a_i \leq 1 \) and \( \sum_{i=1}^{n} a_i = 1 \). The values of \( a_i \) may differ from fragment to fragment, but at vertex \( i \), \( a_i = 1 \) and \( a_j = 0 \) for \( j \neq i \).

Note

One algorithm that achieves the required behavior is to triangulate a polygon (without adding any vertices) and then treat each triangle individually as already discussed. A scan-line rasterizer that linearly interpolates data along each edge and then linearly interpolates data across each horizontal span from edge to edge also satisfies the restrictions (in this case the numerator and denominator of perspective interpolation are iterated independently, and a division is performed for each fragment).

28.12.2. Polygon Mode

Possible values of the \texttt{VkPipelineRasterizationStateCreateInfo::polygonMode} property of the currently active pipeline, specifying the method of rasterization for polygons, are:

// Provided by VK_VERSION_1_0
typedef enum VkPolygonMode {
    VK_POLYGON_MODE_FILL = 0,
    VK_POLYGON_MODE_LINE = 1,
    VK_POLYGON_MODE_POINT = 2,
    // Provided by VK_NV_fill_rectangle
    VK_POLYGON_MODE_FILL_RECTANGLE_NV = 1000153000,
} VkPolygonMode;

- **VK_POLYGON_MODE_POINT** specifies that polygon vertices are drawn as points.
- **VK_POLYGON_MODE_LINE** specifies that polygon edges are drawn as line segments.
- **VK_POLYGON_MODE_FILL** specifies that polygons are rendered using the polygon rasterization rules in this section.
- **VK_POLYGON_MODE_FILL_RECTANGLE_NV** specifies that polygons are rendered using polygon rasterization rules, modified to consider a sample within the primitive if the sample location is inside the axis-aligned bounding box of the triangle after projection. Note that the barycentric weights used in attribute interpolation can extend outside the range [0,1] when these primitives are shaded. Special treatment is given to a sample position on the boundary edge of the bounding box. In such a case, if two rectangles lie on either side of a common edge (with identical endpoints) on which a sample position lies, then exactly one of the triangles must produce a fragment that covers that sample during rasterization.

Polygons rendered in **VK_POLYGON_MODE_FILL_RECTANGLE_NV** mode may be clipped by the frustum or by user clip planes. If clipping is applied, the triangle is culled rather than clipped.

Area calculation and facingness are determined for **VK_POLYGON_MODE_FILL_RECTANGLE_NV** mode using the triangle’s vertices.

These modes affect only the final rasterization of polygons: in particular, a polygon’s vertices are shaded and the polygon is clipped and possibly culled before these modes are applied.

If **VkPhysicalDeviceMaintenance5PropertiesKHR::polygonModePointSize** is set to **VK_TRUE**, the point size of the final rasterization of polygons is taken from **PointSize** when **polygon mode** is **VK_POLYGON_MODE_POINT**.

Otherwise, if **VkPhysicalDeviceMaintenance5PropertiesKHR::polygonModePointSize** is set to **VK_FALSE**, the point size of the final rasterization of polygons is **1.0** when **polygon mode** is **VK_POLYGON_MODE_POINT**.

To dynamically set the polygon mode, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetPolygonModeEXT(
    VkCommandBuffer commandBuffer,  // commandBuffer is the command buffer into which the command will be recorded.
    VkPolygonMode polygonMode);    // polygonMode specifies polygon mode.
```
This command sets the polygon mode for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_POLYGON_MODE_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineRasterizationStateCreateInfo::polygonMode value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetPolygonModeEXT-None-08566
  Either the extendedDynamicState3PolygonMode feature or the shaderObject feature or both must be enabled

- VUID-vkCmdSetPolygonModeEXT-fillModeNonSolid-07424
  If the fillModeNonSolid feature is not enabled, polygonMode must be VK_POLYGON_MODE_FILL or VK_POLYGON_MODE_FILL_RECTANGLE_NV

- VUID-vkCmdSetPolygonModeEXT-polygonMode-07425
  If the VK_NV_fill_rectangle extension is not enabled, polygonMode must not be VK_POLYGON_MODE_FILL_RECTANGLE_NV

Valid Usage (Implicit)

- VUID-vkCmdSetPolygonModeEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetPolygonModeEXT-polygonMode-parameter
  polygonMode must be a valid VkPolygonMode value

- VUID-vkCmdSetPolygonModeEXT-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetPolygonModeEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetPolygonModeEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
**Command Properties**

### 28.12.3. Depth Bias

The depth values of all fragments generated by the rasterization of a polygon can be biased (offset) by a single depth bias value \( \delta \) that is computed for that polygon.

**Depth Bias Enable**

The depth bias computation is enabled by the `depthBiasEnable` set with `vkCmdSetDepthBiasEnable` and `vkCmdSetDepthBiasEnableEXT`, or the corresponding `VkPipelineRasterizationStateCreateInfo::depthBiasEnable` value used to create the currently active pipeline. If the depth bias enable is `VK_FALSE`, no bias is applied and the fragment's depth values are unchanged.

To dynamically enable whether to bias fragment depth values, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetDepthBiasEnable(
    VkCommandBuffer commandBuffer,
    VkBool32 depthBiasEnable);
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state2, VK_EXT_shader_object
void vkCmdSetDepthBiasEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 depthBiasEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthBiasEnable` controls whether to bias fragment depth values.

This command sets the depth bias enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateCreateInfo::depthBiasEnable` value used to create the currently active pipeline.
Valid Usage

- VUID-vkCmdSetDepthBiasEnable-None-08970
  At least one of the following must be true:
  - the `extendedDynamicState2` feature is enabled
  - the `shaderObject` feature is enabled
  - the value of `VkApplicationInfo::apiKeyVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

Valid Usage (Implicit)

- VUID-vkCmdSetDepthBiasEnable-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDepthBiasEnable-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetDepthBiasEnable-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetDepthBiasEnable-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Depth Bias Computation

The depth bias depends on three parameters:

- `depthBiasSlopeFactor` scales the maximum depth slope $m$ of the polygon
- `depthBiasConstantFactor` scales the parameter $r$ of the depth attachment
• the scaled terms are summed to produce a value which is then clamped to a minimum or
maximum value specified by depthBiasClamp

depthBiasSlopeFactor, depthBiasConstantFactor, and depthBiasClamp can each be positive, negative,
or zero. These parameters are set as described for vkCmdSetDepthBias and
vkCmdSetDepthBias2EXT below.

The maximum depth slope of a triangle is

\[ m = \sqrt{\left(\frac{\partial z_f}{\partial x_f}\right)^2 + \left(\frac{\partial z_f}{\partial y_f}\right)^2} \]

where \((x_f, y_f, z_f)\) is a point on the triangle. \(m\) may be approximated as

\[ m = \max\left(\left|\frac{\partial z_f}{\partial x_f}\right|, \left|\frac{\partial z_f}{\partial y_f}\right|\right). \]

In a pipeline with a depth bias representation of VK_DEPTH_BIAS_REPRESENTATION_FLOAT_EXT, \(r\), for the
given primitive is defined as

\[ r = 1 \]

Otherwise \(r\) is the minimum resolvable difference that depends on the depth attachment
representation. If VkDepthBiasRepresentationInfoEXT::depthBiasExact is VK_FALSE it is the smallest
difference in framebuffer coordinate \(z\) values that is guaranteed to remain distinct throughout
polygon rasterization and in the depth attachment. All pairs of fragments generated by the
rasterization of two polygons with otherwise identical vertices, but \(z\) values that differ by \(r\), will
have distinct depth values.

For fixed-point depth attachment representations, or in a pipeline with a depth bias representation
of VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORCE_UNORM_EXT, \(r\) is constant
throughout the range of the entire depth attachment. If VkDepthBiasRepresentationInfoEXT
::depthBiasExact is VK_TRUE, then its value must be

\[ r = 2^n \]

Otherwise its value is implementation-dependent but must be at most

\[ r = 2 \times 2^n \]

where \(n\) is the number of bits used for the depth aspect when using a fixed-point attachment, or the
number of mantissa bits plus one when using a floating-point attachment.

Otherwise for floating-point depth attachment, there is no single minimum resolvable difference. In
this case, the minimum resolvable difference for a given polygon is dependent on the maximum
exponent, \(e\), in the range of \(z\) values spanned by the primitive. If \(n\) is the number of bits in the
floating-point mantissa, the minimum resolvable difference, \(r\), for the given primitive is defined as
If a triangle is rasterized using the `VK_POLYGON_MODE_FILL_RECTANGLE_NV` polygon mode, then this minimum resolvable difference may not be resolvable for samples outside of the triangle, where the depth is extrapolated.

If no depth attachment is present, \( r \) is undefined.

The bias value \( o \) for a polygon is

\[
o = \text{dbclamp}(m \times \text{depthBiasSlopeFactor} + r \times \text{depthBiasConstantFactor})
\]

where \( \text{dbclamp}(x) = \begin{cases} 
  x & \text{depthBiasClamp} = 0 \text{ or } \text{NaN} \\
  \min(x, \text{depthBiasClamp}) & \text{depthBiasClamp} > 0 \\
  \max(x, \text{depthBiasClamp}) & \text{depthBiasClamp} < 0
\end{cases} \)

\( m \) is computed as described above. If the depth attachment uses a fixed-point representation, \( m \) is a function of depth values in the range \([0,1]\), and \( o \) is applied to depth values in the same range.

Depth bias is applied to triangle topology primitives received by the rasterizer regardless of polygon mode. Depth bias may also be applied to line and point topology primitives received by the rasterizer.

To dynamically set the depth bias parameters, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetDepthBias(
    VkCommandBuffer commandBuffer,
    float depthBiasConstantFactor,
    float depthBiasClamp,
    float depthBiasSlopeFactor);
```

- \( \text{commandBuffer} \) is the command buffer into which the command will be recorded.
- \( \text{depthBiasConstantFactor} \) is a scalar factor controlling the constant depth value added to each fragment.
- \( \text{depthBiasClamp} \) is the maximum (or minimum) depth bias of a fragment.
- \( \text{depthBiasSlopeFactor} \) is a scalar factor applied to a fragment's slope in depth bias calculations.

This command sets the depth bias parameters for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_BIAS` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the corresponding `VkPipelineRasterizationStateCreateInfo::depthBiasConstantFactor`, `depthBiasClamp`, and `depthBiasSlopeFactor` values used to create the currently active pipeline.

Calling this function is equivalent to calling `vkCmdSetDepthBias2EXT` without a `VkDepthBiasRepresentationInfoEXT` in the pNext chain of `VkDepthBiasInfoEXT`.
Valid Usage

- VUID-vkCmdSetDepthBias-depthBiasClamp-00790
  If the depthBiasClamp feature is not enabled, depthBiasClamp must be 0.0

Valid Usage (Implicit)

- VUID-vkCmdSetDepthBias-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetDepthBias-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetDepthBias-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdSetDepthBias-videoencoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

<td>State</td>
</tr>
</tbody>
</table>

The VkDepthBiasRepresentationInfoEXT structure is defined as:

```c
// Provided by VK_EXT_depth_bias_control
typedef struct VkDepthBiasRepresentationInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDepthBiasRepresentationEXT depthBiasRepresentation;
    VkBool32 depthBiasExact;
} VkDepthBiasRepresentationInfoEXT;
```
• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **depthBiasRepresentation** is a `VkDepthBiasRepresentationEXT` value specifying the depth bias representation.

• **depthBiasExact** specifies that the implementation is not allowed to scale the depth bias value to ensure a minimum resolvable distance.

### Valid Usage

- **VUID-VkDepthBiasRepresentationInfoEXT-leastRepresentableValueForceUnormRepresentation-08947**
  
  If the `leastRepresentableValueForceUnormRepresentation` feature is not enabled, `depthBiasRepresentation` must not be `VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORCE_UNORM_EXT`

- **VUID-VkDepthBiasRepresentationInfoEXT-floatRepresentation-08948**
  
  If the `floatRepresentation` feature is not enabled, `depthBiasRepresentation` must not be `VK_DEPTH_BIAS_REPRESENTATION_FLOAT_EXT`

- **VUID-VkDepthBiasRepresentationInfoEXT-depthBiasExact-08949**
  
  If the `depthBiasExact` feature is not enabled, `depthBiasExact` must be `VK_FALSE`

### Valid Usage (Implicit)

- **VUID-VkDepthBiasRepresentationInfoEXT-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_DEPTH_BIAS_REPRESENTATION_INFO_EXT`

- **VUID-VkDepthBiasRepresentationInfoEXT-depthBiasRepresentation-parameter**
  
  `depthBiasRepresentation` must be a valid `VkDepthBiasRepresentationEXT` value

Possible values of `VkDepthBiasRepresentationInfoEXT::depthBiasRepresentation`, specifying the depth bias representation are:

```c
// Provided by VK_EXT_depth_bias_control
typedef enum VkDepthBiasRepresentationEXT {
    VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORMAT_EXT = 0,
    VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORCE_UNORM_EXT = 1,
    VK_DEPTH_BIAS_REPRESENTATION_FLOAT_EXT = 2,
} VkDepthBiasRepresentationEXT;
```

- **`VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORMAT_EXT`** specifies that the depth bias representation is a factor of the format's `r` as described in **Depth Bias Computation**.

- **`VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORCE_UNORM_EXT`** specifies that the depth bias representation is a factor of a constant `r` defined by the bit-size or mantissa of the format as described in **Depth Bias Computation**.
VK_DEPTH_BIAS_REPRESENTATION_FLOAT_EXT specifies that the depth bias representation is a factor of constant \( r \) equal to 1.

The VkDepthBiasInfoEXT structure is defined as:

```c
// Provided by VK_EXT_depth_bias_control
typedef struct VkDepthBiasInfoEXT {
    VkStructureType sType;
    const void* pNext;
    float depthBiasConstantFactor;
    float depthBiasClamp;
    float depthBiasSlopeFactor;
} VkDepthBiasInfoEXT;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **depthBiasConstantFactor** is a scalar factor controlling the constant depth value added to each fragment.
- **depthBiasClamp** is the maximum (or minimum) depth bias of a fragment.
- **depthBiasSlopeFactor** is a scalar factor applied to a fragment’s slope in depth bias calculations.

If **pNext** does not contain a VkDepthBiasRepresentationInfoEXT structure, then this command is equivalent to including a VkDepthBiasRepresentationInfoEXT with depthBiasExact set to VK_FALSE and depthBiasRepresentation set to VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORMAT_EXT.

### Valid Usage

- VUID-VkDepthBiasInfoEXT-depthBiasClamp-08950
  If the depthBiasClamp feature is not enabled, depthBiasClamp must be 0.0

### Valid Usage (Implicit)

- VUID-VkDepthBiasInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEPTH_BIAS_INFO_EXT

- VUID-VkDepthBiasInfoEXT-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkDepthBiasRepresentationInfoEXT

- VUID-VkDepthBiasInfoEXT-sType-unique
  The sType value of each struct in the pNext chain must be unique

To dynamically set the depth bias parameters, call:

```c
// Provided by VK_EXT_depth_bias_control
```
```c
void vkCmdSetDepthBias2EXT(
    VkCommandBuffer commandBuffer,
    const VkDepthBiasInfoEXT* pDepthBiasInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pDepthBiasInfo` is a pointer to a `VkDepthBiasInfoEXT` structure specifying depth bias parameters.

This command is functionally identical to `vkCmdSetDepthBias`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

**Valid Usage (Implicit)**

- VUID-vkCmdSetDepthBias2EXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDepthBias2EXT-pDepthBiasInfo-parameter
  `pDepthBiasInfo` must be a valid pointer to a valid `VkDepthBiasInfoEXT` structure
- VUID-vkCmdSetDepthBias2EXT-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetDepthBias2EXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetDepthBias2EXT-videocoding
  This command must only be called outside of a video coding scope

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

**Command Properties**

**28.12.4. Conservative Rasterization**

If the `pNext` chain of `VkPipelineRasterizationStateCreateInfo` includes a
VkPipelineRasterizationConservativeStateCreateInfoEXT structure, then that structure includes parameters controlling conservative rasterization.

VkPipelineRasterizationConservativeStateCreateInfoEXT is defined as:

```c
// Provided by VK_EXT_conservative_rasterization
typedef struct VkPipelineRasterizationConservativeStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkPipelineRasterizationConservativeStateCreateFlagsEXT flags;
    VkConservativeRasterizationModeEXT conservativeRasterizationMode;
    float extraPrimitiveOverestimationSize;
} VkPipelineRasterizationConservativeStateCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `conservativeRasterizationMode` is the conservative rasterization mode to use.
- `extraPrimitiveOverestimationSize` is the extra size in pixels to increase the generating primitive during conservative rasterization at each of its edges in X and Y equally in screen space beyond the base overestimation specified in `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::primitiveOverestimationSize`. If `conservativeRasterizationMode` is not `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT`, this value is ignored.

If this structure is not included in the `pNext` chain, `conservativeRasterizationMode` is considered to be `VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT`, and and conservative rasterization is disabled.

Polygon rasterization can be made conservative by setting `conservativeRasterizationMode` to `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT` or `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` in `VkPipelineRasterizationConservativeStateCreateInfoEXT`.

**Note**

If `conservativePointAndLineRasterization` is supported, conservative rasterization can be applied to line and point primitives, otherwise it must be disabled.

**Valid Usage**

- `VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-extraPrimitiveOverestimationSize-01769` `extraPrimitiveOverestimationSize` must be in the range of 0.0 to `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::maxExtraPrimitiveOverestimationSize` inclusive.
Valid Usage (Implicit)

- VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-sType-sType must be 
  VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_CONSERVATIVE_STATE_CREATE_INFO_EXT
- VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-flags-zerobitmask
  flags must be 0
- VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-
  conservativeRasterizationMode-parameter
  conservativeRasterizationMode must be a valid VkConservativeRasterizationModeEXT value

// Provided by VK_EXT_conservative_rasterization
typedef VkFlags VkPipelineRasterizationConservativeStateCreateFlagsEXT;

VkPipelineRasterizationConservativeStateCreateFlagsEXT is a bitmask type for setting a mask, but is currently reserved for future use.

Possible values of VkPipelineRasterizationConservativeStateCreateInfoEXT::conservativeRasterizationMode, specifying the conservative rasterization mode are:

// Provided by VK_EXT_conservative_rasterization
typedef enum VkConservativeRasterizationModeEXT {
  VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT = 0,
  VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT = 1,
  VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT = 2,
} VkConservativeRasterizationModeEXT;

- VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT specifies that conservative rasterization is disabled and rasterization proceeds as normal.
- VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT specifies that conservative rasterization is enabled in overestimation mode.
- VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT specifies that conservative rasterization is enabled in underestimation mode.

To dynamically set the conservativeRasterizationMode, call:

// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetConservativeRasterizationModeEXT(
  VkCommandBuffer commandBuffer,
  VkConservativeRasterizationModeEXT conservativeRasterizationMode);

- commandBuffer is the command buffer into which the command will be recorded.
conservativeRasterizationMode specifies the conservativeRasterizationMode state.

This command sets the conservativeRasterizationMode state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineRasterizationConservativeStateCreateInfoEXT::conservativeRasterizationMode value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetConservativeRasterizationModeEXT-None-08570
  Either the extendedDynamicState3ConservativeRasterizationMode feature or the shaderObject feature or both must be enabled

Valid Usage (Implicit)

- VUID-vkCmdSetConservativeRasterizationModeEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetConservativeRasterizationModeEXT-conservativeRasterizationMode-parameter
  conservativeRasterizationMode must be a valid VkConservativeRasterizationModeEXT value
- VUID-vkCmdSetConservativeRasterizationModeEXT-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetConservativeRasterizationModeEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdSetConservativeRasterizationModeEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
To dynamically set the `extraPrimitiveOverestimationSize`, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetExtraPrimitiveOverestimationSizeEXT(
    VkCommandBuffer commandBuffer, 
    float extraPrimitiveOverestimationSize);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `extraPrimitiveOverestimationSize` specifies the `extraPrimitiveOverestimationSize`.

This command sets the `extraPrimitiveOverestimationSize` for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationConservativeStateCreateInfoEXT::extraPrimitiveOverestimationSize` value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetExtraPrimitiveOverestimationSizeEXT-None-08572**
  Either the `extendedDynamicState3ExtraPrimitiveOverestimationSize` feature or the `shaderObject` feature or both must be enabled

- **VUID-vkCmdSetExtraPrimitiveOverestimationSizeEXT-extraPrimitiveOverestimationSize-07428**
  `extraPrimitiveOverestimationSize` must be in the range of 0.0 to `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::maxExtraPrimitiveOverestimationSize` inclusive

### Valid Usage (Implicit)

- **VUID-vkCmdSetExtraPrimitiveOverestimationSizeEXT-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetExtraPrimitiveOverestimationSizeEXT-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdSetExtraPrimitiveOverestimationSizeEXT-commandBuffer-cmdpool**
The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \textbf{must} support graphics operations.

- VUID-vkCmdSetExtraPrimitiveOverestimationSizeEXT-videocoding
  This command \textbf{must} only be called outside of a video coding scope.

### Host Synchronization

- Host access to \texttt{commandBuffer} \textbf{must} be externally synchronized.
- Host access to the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \textbf{must} be externally synchronized.

### Command Properties

<td></td>
</tr>
</tbody>
</table>

When overestimate conservative rasterization is enabled, rather than evaluating coverage at individual sample locations, a determination is made whether any portion of the pixel (including its edges and corners) is covered by the primitive. If any portion of the pixel is covered, then all bits of the \textit{coverage mask} for the fragment corresponding to that pixel are enabled. If the render pass has a fragment density map attachment and any bit of the \textit{coverage mask} for the fragment is enabled, then all bits of the \textit{coverage mask} for the fragment are enabled.

For the purposes of evaluating which pixels are covered by the primitive, implementations \textbf{can} increase the size of the primitive by up to \texttt{VkPhysicalDeviceConservativeRasterizationPropertiesEXT::primitiveOverestimationSize} pixels at each of the primitive edges. This \textbf{may} increase the number of fragments generated by this primitive and represents an overestimation of the pixel coverage.

This overestimation size can be increased further by setting the \texttt{extraPrimitiveOverestimationSize} value above \texttt{0.0} in steps of \texttt{VkPhysicalDeviceConservativeRasterizationPropertiesEXT::extraPrimitiveOverestimationSizeGranularity} up to and including \texttt{VkPhysicalDeviceConservativeRasterizationPropertiesEXT::extraPrimitiveOverestimationSize}. This \textbf{may} further increase the number of fragments generated by this primitive.

The actual precision of the overestimation size used for conservative rasterization \textbf{may} vary between implementations and produce results that only approximate the \texttt{primitiveOverestimationSize} and \texttt{extraPrimitiveOverestimationSizeGranularity} properties. Implementations \textbf{may} especially vary these approximations when the render pass has a fragment density map and the fragment area covers multiple pixels.

For triangles if \texttt{VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT} is enabled, fragments will be generated if the primitive area covers any portion of any pixel inside the fragment area, including...
their edges or corners. The tie-breaking rule described in Basic Polygon Rasterization does not apply during conservative rasterization and coverage is set for all fragments generated from shared edges of polygons. Degenerate triangles that evaluate to zero area after rasterization, even for pixels containing a vertex or edge of the zero-area polygon, will be culled if VkPhysicalDeviceConservativeRasterizationPropertiesEXT::degenerateTrianglesRasterized is VK_FALSE or will generate fragments if degenerateTrianglesRasterized is VK_TRUE. The fragment input values for these degenerate triangles take their attribute and depth values from the provoking vertex. Degenerate triangles are considered back-facing and the application can enable backface culling if desired. Triangles that are zero area before rasterization may be culled regardless.

For lines if VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT is enabled, and the implementation sets VkPhysicalDeviceConservativeRasterizationPropertiesEXT::conservativePointAndLineRasterization to VK_TRUE, fragments will be generated if the line covers any portion of any pixel inside the fragment area, including their edges or corners. Degenerate lines that evaluate to zero length after rasterization will be culled if VkPhysicalDeviceConservativeRasterizationPropertiesEXT::degenerateLinesRasterized is VK_FALSE or will generate fragments if degenerateLinesRasterized is VK_TRUE. The fragments input values for these degenerate lines take their attribute and depth values from the provoking vertex. Lines that are zero length before rasterization may be culled regardless.

For points if VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT is enabled, and the implementation sets VkPhysicalDeviceConservativeRasterizationPropertiesEXT::conservativePointAndLineRasterization to VK_TRUE, fragments will be generated if the point square covers any portion of any pixel inside the fragment area, including their edges or corners.

When underestimate conservative rasterization is enabled, rather than evaluating coverage at individual sample locations, a determination is made whether all of the pixel (including its edges and corners) is covered by the primitive. If the entire pixel is covered, then a fragment is generated with all bits of its coverage mask corresponding to the pixel enabled, otherwise the pixel is not considered covered even if some portion of the pixel is covered. The fragment is discarded if no pixels inside the fragment area are considered covered. If the render pass has a fragment density map attachment and any pixel inside the fragment area is not considered covered, then the fragment is discarded even if some pixels are considered covered.

For triangles, if VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT is enabled, fragments will only be generated if any pixel inside the fragment area is fully covered by the generating primitive, including its edges and corners.

For lines, if VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT is enabled, fragments will be generated if any pixel inside the fragment area, including its edges and corners, are entirely covered by the line.

For points, if VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT is enabled, fragments will only be generated if the point square covers the entirety of any pixel square inside the fragment area, including its edges or corners.

If the render pass has a fragment density map and VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT is enabled, fragments will only be generated if the entirety of all pixels inside the fragment area are covered by the generating primitive, line, or...
point.

For both overestimate and underestimate conservative rasterization modes a fragment has all of its pixel squares fully covered by the generating primitive must set `FullyCoveredEXT` to `VK_TRUE` if the implementation enables the `VkPhysicalDeviceConservativeRasterizationPropertiesEXT`::`fullyCoveredFragmentShaderInputVariable` feature.

When the use of a shaded rate image or setting the fragment shading rate results in fragments covering multiple pixels, coverage for conservative rasterization is still evaluated on a per-pixel basis and may result in fragments with partial coverage. For fragment shader inputs decorated with `FullyCoveredEXT`, a fragment is considered fully covered if and only if all pixels in the fragment are fully covered by the generating primitive.
Chapter 29. Fragment Operations

Fragments produced by rasterization go through a number of operations to determine whether or how values produced by fragment shading are written to the framebuffer.

The following fragment operations adhere to rasterization order, and are typically performed in this order:

1. Discard rectangles test
2. Scissor test
3. Exclusive scissor test
4. Sample mask test
5. Certain Fragment shading operations:
   - Sample Mask Accesses
   - Tile Image Reads
   - Depth Replacement
   - Stencil Reference Replacement
   - Interlocked Operations
6. Multisample coverage
7. Depth bounds test
8. Stencil test
9. Depth test
10. Representative fragment test
11. Sample counting
12. Coverage to color
13. Coverage reduction
14. Coverage modulation

The coverage mask generated by rasterization describes the initial coverage of each sample covered by the fragment. Fragment operations will update the coverage mask to add or subtract coverage where appropriate. If a fragment operation results in all bits of the coverage mask being 0, the fragment is discarded, and no further operations are performed. Fragments can also be programmatically discarded in a fragment shader by executing one of

- `OpTerminateInvocation`
- `OpDemoteToHelperInvocationEXT`
- `OpKill`.

When one of the fragment operations in this chapter is described as “replacing” a fragment shader output, that output is replaced unconditionally, even if no fragment shader previously wrote to that output.
If there is a fragment shader and it declares the PostDepthCoverage execution mode, the sample mask test is instead performed after the depth test.

If VkPhysicalDeviceMaintenance5PropertiesKHR::earlyFragmentMultisampleCoverageAfterSampleCounting is set to VK_TRUE and there is a fragment shader which declares the EarlyFragmentTests execution mode, fragment shading and multisample coverage operations must be performed after sample counting.

Otherwise, if VkPhysicalDeviceMaintenance5PropertiesKHR::earlyFragmentMultisampleCoverageAfterSampleCounting is set to VK_FALSE and there is a fragment shader which declares the EarlyFragmentTests execution mode, fragment shading and multisample coverage operations should instead be performed after sample counting, but may be performed before sample counting.

If VkPhysicalDeviceMaintenance5PropertiesKHR::earlyFragmentSampleMaskTestBeforeSampleCounting is set to VK_TRUE and there is a fragment shader which declares the EarlyFragmentTests execution mode, sample mask test operations must follow the order of fragment operations from above.

Otherwise, if VkPhysicalDeviceMaintenance5PropertiesKHR::earlyFragmentSampleMaskTestBeforeSampleCounting is set to VK_FALSE and there is a fragment shader which declares the EarlyFragmentTests execution mode, sample mask test operations should follow the order of fragment operations from above but may instead be performed after sample counting.

If there is a fragment shader which declares the EarlyAndLateFragmentTestsAMD execution mode, and it does not declare the DepthReplacing or StencilRefReplacingEXT execution mode, fragment shading and multisample coverage operations are instead be performed after sample counting.

For a pipeline with the following properties:

- a fragment shader is specified
- the fragment shader either specifies EarlyAndLateFragmentTestsAMD or does not write to storage resources;
- the fragment shader specifies the StencilRefReplacingEXT execution mode;
- either
  - the fragment shader specifies the StencilRefUnchangedFrontAMD execution mode;
  - the fragment shader specifies the StencilRefLessFrontAMD execution mode and the pipeline uses a VkPipelineDepthStencilStateCreateInfo::front.compareOp of VK_COMPARE_OP_GREATER or VK_COMPARE_OP_GREATER_OR_EQUAL; or
  - the fragment shader specifies the StencilRefGreaterFrontAMD execution mode and the pipeline uses a VkPipelineDepthStencilStateCreateInfo::front.compareOp of VK_COMPARE_OP_LESS or VK_COMPARE_OP_LESS_OR_EQUAL; and
- either
  - the fragment shader specifies the StencilRefUnchangedBackAMD execution mode;
  - the fragment shader specifies the StencilRefLessBackAMD execution mode and the pipeline uses a VkPipelineDepthStencilStateCreateInfo::back.compareOp of VK_COMPARE_OP_GREATER or VK_COMPARE_OP_GREATER_OR_EQUAL; or
the fragment shader specifies the `StencilRefGreaterBackAMD` execution mode and the pipeline uses a `VkPipelineDepthStencilStateCreateInfo::back.compareOp` of `VK_COMPARE_OP_LESS` or `VK_COMPARE_OP_LESS_OR_EQUAL`.

An additional stencil test may be performed before fragment shading, using the stencil reference value specified by `VkPipelineDepthStencilStateCreateInfo::front.reference` or `VkPipelineDepthStencilStateCreateInfo::back.reference`.

For a pipeline with the following properties:

- a fragment shader is specified
- the fragment shader either specifies `EarlyAndLateFragmentTestsAMD` or does not write to storage resources;
- the fragment shader specifies the `DepthReplacing` execution mode; and
- either
  - the fragment shader specifies the `DepthUnchanged` execution mode;
  - the fragment shader specifies the `DepthLess` execution mode and the pipeline uses a `VkPipelineDepthStencilStateCreateInfo::depthCompareOp` of `VK_COMPARE_OP_GREATER` or `VK_COMPARE_OP_GREATER_OR_EQUAL`; or
  - the fragment shader specifies the `DepthGreater` execution mode and the pipeline uses a `VkPipelineDepthStencilStateCreateInfo::depthCompareOp` of `VK_COMPARE_OP_LESS` or `VK_COMPARE_OP_LESS_OR_EQUAL`.

The implementation may perform depth bounds test before fragment shading and perform an additional depth test immediately after that using the interpolated depth value generated by rasterization.

Once all fragment operations have completed, fragment shader outputs for covered color attachment samples pass through framebuffer operations.

### 29.1. Discard Rectangles Test

The discard rectangle test compares the framebuffer coordinates \((x_f, y_f)\) of each sample covered by a fragment against a set of discard rectangles.

Each discard rectangle is defined by a `VkRect2D`. These values are either set by the `VkPipelineDiscardRectangleStateCreateInfoEXT` structure during pipeline creation, or dynamically by the `vkCmdSetDiscardRectangleEXT` command.

A given sample is considered inside a discard rectangle if the \(x_i\) is in the range \([VkRect2D::offset.x, VkRect2D::offset.x + VkRect2D::extent.x]\), and \(y_i\) is in the range \([VkRect2D::offset.y, VkRect2D::offset.y + VkRect2D::extent.y]\). If the test is set to be inclusive, samples that are not inside any of the discard rectangles will have their coverage set to 0. If the test is set to be exclusive, samples that are inside any of the discard rectangles will have their coverage set to 0.

If no discard rectangles are specified, the coverage mask is unmodified by this operation.
The `VkPipelineDiscardRectangleStateCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_discard_rectangles
typedef struct VkPipelineDiscardRectangleStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkPipelineDiscardRectangleStateCreateInfoFlagsEXT flags;
    VkDiscardRectangleModeEXT discardRectangleMode;
    uint32_t discardRectangleCount;
    const VkRect2D* pDiscardRectangles;
} VkPipelineDiscardRectangleStateCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `discardRectangleMode` is a `VkDiscardRectangleModeEXT` value determining whether the discard rectangle test is inclusive or exclusive.
- `discardRectangleCount` is the number of discard rectangles to use.
- `pDiscardRectangles` is a pointer to an array of `VkRect2D` structures defining discard rectangles.

If the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` dynamic state is enabled for a pipeline, the `pDiscardRectangles` member is ignored. If the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` dynamic state is not enabled for the pipeline the presence of this structure in the `VkGraphicsPipelineCreateInfo` chain, and a `discardRectangleCount` greater than zero, implicitly enables discard rectangles in the pipeline, otherwise discard rectangles **must** enabled or disabled by `vkCmdSetDiscardRectangleEnableEXT`. If the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT` dynamic state is enabled for the pipeline, the `discardRectangleMode` member is ignored, and the discard rectangle mode **must** be set by `vkCmdSetDiscardRectangleModeEXT`.

When this structure is included in the `pNext` chain of `VkGraphicsPipelineCreateInfo`, it defines parameters of the discard rectangle test. If the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` dynamic state is not enabled, and this structure is not included in the `pNext` chain, it is equivalent to specifying this structure with a `discardRectangleCount` of 0.

### Valid Usage

- VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-discardRectangleCount-00582
  
  `discardRectangleCount` **must** be less than or equal to `VkPhysicalDeviceDiscardRectanglePropertiesEXT::maxDiscardRectangles`

### Valid Usage (Implicit)

- VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-sType-sType
  
  `sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_DISCARD_RECTANGLE_STATE_CREATE_INFO_EXT`
• VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-flags-zerobitmask
  flags must be 0

• VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-discardRectangleMode-parameter
discardRectangleMode must be a valid VkDiscardRectangleModeEXT value

// Provided by VK_EXT_discard_rectangles
typedef VkFlags VkPipelineDiscardRectangleStateCreateFlagsEXT;

VkPipelineDiscardRectangleStateCreateFlagsEXT is a bitmask type for setting a mask, but is currently reserved for future use.

VkDiscardRectangleModeEXT values are:

// Provided by VK_EXT_discard_rectangles
typedef enum VkDiscardRectangleModeEXT {
  VK_DISCARD_RECTANGLE_MODE_INCLUSIVE_EXT = 0,
  VK_DISCARD_RECTANGLE_MODE_EXCLUSIVE_EXT = 1,
} VkDiscardRectangleModeEXT;

• VK_DISCARD_RECTANGLE_MODE_INCLUSIVE_EXT specifies that the discard rectangle test is inclusive.
• VK_DISCARD_RECTANGLE_MODE_EXCLUSIVE_EXT specifies that the discard rectangle test is exclusive.

To dynamically set the discard rectangles, call:

// Provided by VK_EXT_discard_rectangles
void vkCmdSetDiscardRectangleEXT(
  VkCommandBuffer commandBuffer,
  uint32_t firstDiscardRectangle,
  uint32_t discardRectangleCount,
  const VkRect2D* pDiscardRectangles);

• commandBuffer is the command buffer into which the command will be recorded.
• firstDiscardRectangle is the index of the first discard rectangle whose state is updated by the command.
• discardRectangleCount is the number of discard rectangles whose state are updated by the command.
• pDiscardRectangles is a pointer to an array of VkRect2D structures specifying discard rectangles.

The discard rectangle taken from element i of pDiscardRectangles replace the current state for the discard rectangle at index firstDiscardRectangle + i, for i in [0, discardRectangleCount).

This command sets the discard rectangles for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates.
Otherwise, this state is specified by the `VkPipelineDiscardRectangleStateCreateInfoEXT::pDiscardRectangles` values used to create the currently active pipeline.

**Valid Usage**

- **VUID-vkCmdSetDiscardRectangleEXT-firstDiscardRectangle-00585**
  The sum of `firstDiscardRectangle` and `discardRectangleCount` must be less than or equal to `VkPhysicalDeviceDiscardRectanglePropertiesEXT::maxDiscardRectangles`

- **VUID-vkCmdSetDiscardRectangleEXT-x-00587**
  The x and y member of `offset` in each `VkRect2D` element of `pDiscardRectangles` must be greater than or equal to 0

- **VUID-vkCmdSetDiscardRectangleEXT-offset-00588**
  Evaluation of `(offset.x + extent.width)` in each `VkRect2D` element of `pDiscardRectangles` must not cause a signed integer addition overflow

- **VUID-vkCmdSetDiscardRectangleEXT-offset-00589**
  Evaluation of `(offset.y + extent.height)` in each `VkRect2D` element of `pDiscardRectangles` must not cause a signed integer addition overflow

- **VUID-vkCmdSetDiscardRectangleEXT-viewportScissor2D-04788**
  If this command is recorded in a secondary command buffer with `VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D` enabled, then this function must not be called

**Valid Usage (Implicit)**

- **VUID-vkCmdSetDiscardRectangleEXT-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetDiscardRectangleEXT-pDiscardRectangles-parameter**
  `pDiscardRectangles` must be a valid pointer to an array of `discardRectangleCount` `VkRect2D` structures

- **VUID-vkCmdSetDiscardRectangleEXT-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdSetDiscardRectangleEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdSetDiscardRectangleEXT-videocoding**
  This command must only be called outside of a video coding scope

- **VUID-vkCmdSetDiscardRectangleEXT-discardRectangleCount-arraylength**
  `discardRectangleCount` must be greater than 0

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To dynamically set whether discard rectangles are enabled, call:

```c
// Provided by VK_EXT_discard_rectangles
void vkCmdSetDiscardRectangleEnableEXT(
    VkCommandBuffer commandBuffer,  
    VkBool32 discardRectangleEnable);
```

- commandBuffer is the command buffer into which the command will be recorded.
- discardRectangleEnable specifies whether discard rectangles are enabled or not.

This command sets the discard rectangle enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is implied by the `VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleCount` value used to create the currently active pipeline, where a non-zero `discardRectangleCount` implicitly enables discard rectangles, otherwise they are disabled.

### Valid Usage

- VUID-vkCmdSetDiscardRectangleEnableEXT-specVersion-07851
  The `VK_EXT_discard_rectangles` extension must be enabled, and the implementation must support at least `specVersion 2` of this extension

### Valid Usage (Implicit)

- VUID-vkCmdSetDiscardRectangleEnableEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetDiscardRectangleEnableEXT-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetDiscardRectangleEnableEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>

<td></td>
</tr>
</tbody>
</table>

To dynamically set the discard rectangle mode, call:

```c
// Provided by VK_EXT_discard_rectangles
void vkCmdSetDiscardRectangleModeEXT(
    VkCommandBuffer commandBuffer,
    VkDiscardRectangleModeEXT discardRectangleMode);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `discardRectangleMode` specifies the discard rectangle mode for all discard rectangles, either inclusive or exclusive.

This command sets the discard rectangle mode for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleMode` value used to create the currently active pipeline.

Valid Usage

- `VUID-vkCmdSetDiscardRectangleModeEXT-specVersion-07852`
  The `VK_EXT_discard_rectangles` extension must be enabled, and the implementation must support at least `specVersion 2` of this extension
Valid Usage (Implicit)

- VUID-vkCmdSetDiscardRectangleModeEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetDiscardRectangleModeEXT-discardRectangleMode-parameter
  discardRectangleMode must be a valid VkDiscardRectangleModeEXT value

- VUID-vkCmdSetDiscardRectangleModeEXT-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetDiscardRectangleModeEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetDiscardRectangleModeEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

29.2. Scissor Test

The scissor test compares the framebuffer coordinates \((x_f, y_f)\) of each sample covered by a fragment against a scissor rectangle at the index equal to the fragment’s ViewportIndex.

Each scissor rectangle is defined by a VkRect2D. These values are either set by the VkPipelineViewportStateCreateInfo structure during pipeline creation, or dynamically by the vkCmdSetScissor command.

A given sample is considered inside a scissor rectangle if \(x_f\) is in the range \([VkRect2D::offset.x, VkRect2D::offset.x + VkRect2D::extent.x)\), and \(y_f\) is in the range \([VkRect2D::offset.y, VkRect2D::offset.y + VkRect2D::extent.y)\). Samples with coordinates outside the scissor rectangle at the corresponding ViewportIndex will have their coverage set to 0.

If a render pass transform is enabled, the \((offset.x\) and \(offset.y\) and \(extent.width\) and \(extent.height\) of the scissor test rectangle must be transformed using the render pass transform matrix before being compared against the framebuffer coordinates.
`extent.height` values are transformed as described in render pass transform before participating in the scissor test.

To dynamically set the scissor rectangles, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetScissor(
    VkCommandBuffer commandBuffer,
    uint32_t firstScissor,
    uint32_t scissorCount,
    const VkRect2D* pScissors);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstScissor` is the index of the first scissor whose state is updated by the command.
- `scissorCount` is the number of scissors whose rectangles are updated by the command.
- `pScissors` is a pointer to an array of `VkRect2D` structures defining scissor rectangles.

The scissor rectangles taken from element `i` of `pScissors` replace the current state for the scissor index `firstScissor + i`, for `i` in `[0, scissorCount)`.

This command sets the scissor rectangles for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_SCISSOR` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineViewportStateCreateInfo::pScissors` values used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetScissor-firstScissor-00592
  The sum of `firstScissor` and `scissorCount` must be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive

- VUID-vkCmdSetScissor-firstScissor-00593
  If the multiViewport feature is not enabled, `firstScissor` must be 0

- VUID-vkCmdSetScissor-scissorCount-00594
  If the multiViewport feature is not enabled, `scissorCount` must be 1

- VUID-vkCmdSetScissor-x-00595
  The `x` and `y` members of `offset` member of any element of `pScissors` must be greater than or equal to 0

- VUID-vkCmdSetScissor-offset-00596
  Evaluation of `(offset.x + extent.width)` must not cause a signed integer addition overflow for any element of `pScissors`

- VUID-vkCmdSetScissor-offset-00597
  Evaluation of `(offset.y + extent.height)` must not cause a signed integer addition overflow for any element of `pScissors`

- VUID-vkCmdSetScissor-viewportScissor2D-04789
If this command is recorded in a secondary command buffer with `VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D` enabled, then this function must not be called.

**Valid Usage (Implicit)**

- VUID-vkCmdSetScissor-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- VUID-vkCmdSetScissor-pScissors-parameter
  
  `pScissors` must be a valid pointer to an array of `scissorCount` `VkRect2D` structures.

- VUID-vkCmdSetScissor-commandBuffer-recording
  
  `commandBuffer` must be in the recording state.

- VUID-vkCmdSetScissor-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- VUID-vkCmdSetScissor-videocoding
  
  This command must only be called outside of a video coding scope.

- VUID-vkCmdSetScissor-scissorCount-arraylength
  
  `scissorCount` must be greater than 0.

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

**Command Properties**

<table>

**29.3. Exclusive Scissor Test**

The exclusive scissor test compares the framebuffer coordinates \((x_f, y_f)\) of each sample covered by a fragment against an exclusive scissor rectangle at the index equal to the fragment's `ViewportIndex`.

Each exclusive scissor rectangle is defined by a `VkRect2D`. These values are either set by the `VkPipelineViewportExclusiveScissorStateCreateInfoNV` structure during pipeline creation, or
dynamically by the `vkCmdSetExclusiveScissorNV` command.

A given sample is considered inside an exclusive scissor rectangle if \( x \) is in the range \([\text{VkRect2D}::\text{offset.x}, \text{VkRect2D}::\text{offset.x} + \text{VkRect2D}::\text{extent.x})\), and \( y \) is in the range \([\text{VkRect2D}::\text{offset.y}, \text{VkRect2D}::\text{offset.y} + \text{VkRect2D}::\text{extent.y})\). Samples with coordinates inside the exclusive scissor rectangle at the corresponding `ViewportIndex` will have their coverage set to 0.

If no exclusive scissor rectangles are specified, the coverage mask is unmodified by this operation.

The `VkPipelineViewportExclusiveScissorStateCreateInfoNV` structure is defined as:

```c
// Provided by VK_NV_scissor_exclusive
typedef struct VkPipelineViewportExclusiveScissorStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    uint32_t exclusiveScissorCount;
    const VkRect2D* pExclusiveScissors;
} VkPipelineViewportExclusiveScissorStateCreateInfoNV;
```

- *sType* is a `VkStructureType` value identifying this structure.
- *pNext* is NULL or a pointer to a structure extending this structure.
- *exclusiveScissorCount* is the number of exclusive scissor rectangles.
- *pExclusiveScissors* is a pointer to an array of `VkRect2D` structures defining exclusive scissor rectangles.

If the `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_NV` dynamic state is enabled for a pipeline, the *pExclusiveScissors* member is ignored.

When this structure is included in the *pNext* chain of `VkGraphicsPipelineCreateInfo`, it defines parameters of the exclusive scissor test. If this structure is not included in the *pNext* chain, it is equivalent to specifying this structure with a `exclusiveScissorCount` of 0.

### Valid Usage

- VUID-VkPipelineViewportExclusiveScissorStateCreateInfoNV-exclusiveScissorCount-02027
  If the `multiViewport` feature is not enabled, `exclusiveScissorCount` must be 0 or 1
- VUID-VkPipelineViewportExclusiveScissorStateCreateInfoNV-exclusiveScissorCount-02028
  `exclusiveScissorCount` must be less than or equal to `VkPhysicalDeviceLimits::maxViewports`
- VUID-VkPipelineViewportExclusiveScissorStateCreateInfoNV-exclusiveScissorCount-02029
  `exclusiveScissorCount` must be 0 or greater than or equal to the `viewportCount` member of `VkPipelineViewportStateCreateInfo`
Valid Usage (Implicit)

- VUID-VkPipelineViewportExclusiveScissorStateCreateInfoNV-sType-sType must be
  VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_EXCLUSIVE_SCISSOR_STATE_CREATE_INFO_NV

To dynamically set the exclusive scissor rectangles, call:

```c
// Provided by VK_NV_scissor_exclusive
void vkCmdSetExclusiveScissorNV(
    VkCommandBuffer commandBuffer,
    uint32_t firstExclusiveScissor,
    uint32_t exclusiveScissorCount,
    const VkRect2D* pExclusiveScissors);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstExclusiveScissor` is the index of the first exclusive scissor rectangle whose state is updated
  by the command.
- `exclusiveScissorCount` is the number of exclusive scissor rectangles updated by the command.
- `pExclusiveScissors` is a pointer to an array of `VkRect2D` structures defining exclusive scissor
  rectangles.

The scissor rectangles taken from element i of `pExclusiveScissors` replace the current state for the
scissor index `firstExclusiveScissor + i`, for i in `[0, exclusiveScissorCount)`.

This command sets the exclusive scissor rectangles for subsequent drawing commands when
drawing using shader objects, or when the graphics pipeline is created with
`VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_NV` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`.
Otherwise, this state is specified by the `VkPipelineViewportExclusiveScissorStateCreateInfoNV`:
`pExclusiveScissors` values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetExclusiveScissorNV-None-02031
  The `exclusiveScissor` feature must be enabled

- VUID-vkCmdSetExclusiveScissorNV-firstExclusiveScissor-02034
  The sum of `firstExclusiveScissor` and `exclusiveScissorCount` must be between 1 and
  `VkPhysicalDeviceLimits::maxViewports`, inclusive

- VUID-vkCmdSetExclusiveScissorNV-firstExclusiveScissor-02035
  If the `multiViewport` feature is not enabled, `firstExclusiveScissor` must be 0

- VUID-vkCmdSetExclusiveScissorNV-exclusiveScissorCount-02036
  If the `multiViewport` feature is not enabled, `exclusiveScissorCount` must be 1

- VUID-vkCmdSetExclusiveScissorNV-x-02037
The x and y members of offset in each member of pExclusiveScissors must be greater than or equal to 0

- VUID-vkCmdSetExclusiveScissorNV-offset-02038
  Evaluation of (offset.x + extent.width) for each member of pExclusiveScissors must not cause a signed integer addition overflow

- VUID-vkCmdSetExclusiveScissorNV-offset-02039
  Evaluation of (offset.y + extent.height) for each member of pExclusiveScissors must not cause a signed integer addition overflow

Valid Usage (Implicit)

- VUID-vkCmdSetExclusiveScissorNV-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetExclusiveScissorNV-pExclusiveScissors-parameter
  pExclusiveScissors must be a valid pointer to an array of exclusiveScissorCount VkRect2D structures

- VUID-vkCmdSetExclusiveScissorNV-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetExclusiveScissorNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetExclusiveScissorNV-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdSetExclusiveScissorNV-exclusiveScissorCount-arraylength
  exclusiveScissorCount must be greater than 0

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
</tbody>
</table>

To dynamically set whether an exclusive scissor is enabled or not, call:
void vkCmdSetExclusiveScissorEnableNV(
    VkCommandBuffer commandBuffer,
    uint32_t firstExclusiveScissor,
    uint32_t exclusiveScissorCount,
    const VkBool32* pExclusiveScissorEnables);

- **commandBuffer** is the command buffer into which the command will be recorded.
- **firstExclusiveScissor** is the index of the first exclusive scissor rectangle whose state is updated by the command.
- **exclusiveScissorCount** is the number of exclusive scissor rectangles updated by the command.
- **pExclusiveScissorEnables** is a pointer to an array of `VkBool32` values defining whether the exclusive scissor is enabled.

The exclusive scissor enables taken from element `i` of `pExclusiveScissorEnables` replace the current state for the scissor index `firstExclusiveScissor + i`, for `i` in `[0, exclusiveScissorCount)`. This command sets the exclusive scissor enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_ENABLE_NV` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is implied by the `VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount` value used to create the currently active pipeline, where all `exclusiveScissorCount` exclusive scissors are implicitly enabled and the remainder up to `VkPhysicalDeviceLimits::maxViewports` are implicitly disabled.

### Valid Usage

- **VUID-vkCmdSetExclusiveScissorEnableNV-exclusiveScissor-07853**
  The `exclusiveScissor` feature **must** be enabled, and the implementation **must** support at least specVersion 2 of the `VK_NV_scissor_exclusive` extension

### Valid Usage (Implicit)

- **VUID-vkCmdSetExclusiveScissorEnableNV-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetExclusiveScissorEnableNV-pExclusiveScissorEnables-parameter**
  `pExclusiveScissorEnables` **must** be a valid pointer to an array of `exclusiveScissorCount` `VkBool32` values

- **VUID-vkCmdSetExclusiveScissorEnableNV-commandBuffer-recording**
  `commandBuffer` **must** be in the recording state

- **VUID-vkCmdSetExclusiveScissorEnableNV-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
29.4. Sample Mask Test

The sample mask test compares the coverage mask for a fragment with the sample mask defined by `VkPipelineMultisampleStateCreateInfo::pSampleMask`.

To dynamically set the sample mask, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetSampleMaskEXT(
    VkCommandBuffer commandBuffer,
    VkSampleCountFlagBits samples,
    const VkSampleMask* pSampleMask);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `samples` specifies the number of sample bits in the `pSampleMask`.
- `pSampleMask` is a pointer to an array of `VkSampleMask` values, where the array size is based on the `samples` parameter.

This command sets the sample mask for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineMultisampleStateCreateInfo::pSampleMask` value used to create the currently active pipeline.
Valid Usage

- VUID-vkCmdSetSampleMaskEXT-None-08504
  Either the `extendedDynamicState3SampleMask` feature or the `shaderObject` feature or both must be enabled.

Valid Usage (Implicit)

- VUID-vkCmdSetSampleMaskEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- VUID-vkCmdSetSampleMaskEXT-samples-parameter
  `samples` must be a valid `VkSampleCountFlagBits` value.

- VUID-vkCmdSetSampleMaskEXT-psampleMask-parameter
  `pSampleMask` must be a valid pointer to an array of \( \frac{s_{amps}}{32} \) `VkSampleMask` values.

- VUID-vkCmdSetSampleMaskEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state.

- VUID-vkCmdSetSampleMaskEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- VUID-vkCmdSetSampleMaskEXT-videocoding
  This command must only be called outside of a video coding scope.

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Each bit of the coverage mask is associated with a sample index as described in the `rasterization chapter`. If the bit in `VkPipelineMultisampleStateCreateInfo::pSampleMask` which is associated with that same sample index is set to 0, the coverage mask bit is set to 0.
29.5. Fragment Shading

Fragment shaders are invoked for each fragment, or as helper invocations.

Most operations in the fragment shader are not performed in rasterization order, with exceptions called out in the following sections.

For fragment shaders invoked by fragments, the following rules apply:

- A fragment shader must not be executed if a fragment operation that executes before fragment shading discards the fragment.
- A fragment shader may not be executed if:
  - An implementation determines that another fragment shader, invoked by a subsequent primitive in primitive order, overwrites all results computed by the shader (including writes to storage resources).
  - Any other fragment operation discards the fragment, and the shader does not write to any storage resources.
- Otherwise, at least one fragment shader must be executed.
  - If sample shading is enabled and multiple invocations per fragment are required, additional invocations must be executed as specified.
  - If a shading rate image is used and multiple invocations per fragment are required, additional invocations must be executed as specified.
  - Each covered sample must be included in at least one fragment shader invocation.

If no fragment shader is included in the pipeline, no fragment shader is executed, and undefined values may be written to all color attachment outputs during this fragment operation.

Note

Multiple fragment shader invocations may be executed for the same fragment for any number of implementation-dependent reasons. When there is more than one fragment shader invocation per fragment, the association of samples to invocations is implementation-dependent. Stores and atomics performed by these additional invocations have the normal effect.

For example, if the subpass includes multiple views in its view mask, a fragment shader may be invoked separately for each view.

Similarly, if the render pass has a fragment density map attachment, more than one fragment shader invocation may be invoked for each covered sample. Such additional invocations are only produced if VkPhysicalDeviceFragmentDensityMapPropertiesEXT::fragmentDensityInvocations is VK_TRUE. Implementations may generate these additional fragment shader invocations in order to make transitions between fragment areas with different fragment densities more smooth.
29.5.1. Sample Mask

Reading from the `SampleMask` built-in in the `Input` storage class will return the coverage mask for the current fragment as calculated by fragment operations that executed prior to fragment shading.

If `sample shading` is enabled, fragment shaders will only see values of 1 for samples being shaded - other bits will be 0.

Each bit of the coverage mask is associated with a sample index as described in the `rasterization chapter`. If the bit in `SampleMask` which is associated with that same sample index is set to 0, that coverage mask bit is set to 0.

Values written to the `SampleMask` built-in in the `Output` storage class will be used by the `multisample coverage` operation, with the same encoding as the input built-in.

29.5.2. Fragment Shader Tile Image Reads

If the `VK_EXT_shader_tile_image` extension is enabled, implementations divide the framebuffer into a grid of tiles. A `tile image` is a view of a framebuffer attachment tile for fragments with locations within the tile.

Within a render pass instance initiated by `vkCmdBeginRenderingKHR`, fragment shader invocations can read the framebuffer color, depth, and stencil values at the fragment location via tile images.

```markdown
Note
Even though fragment shader invocation can only read from the corresponding fragment location, the abstraction of a tile image is introduced for the following reasons:

- Tile dimensions will be exposed in a future extension
- Future functionality such as executing compute dispatches within render passes via tile shaders can leverage tile images.
```

Enabling `shaderTileImageColorReadAccess`, `shaderTileImageDepthReadAccess`, `shaderTileImageStencilReadAccess` enables fragment shader invocations to read from color, depth, and stencil, respectively.

Color values are read from tile image variables with `OpColorAttachmentReadEXT`. Tile image variables are linked to specific color attachments using `Location` decoration. See `Fragment Tile Image Interface` for more details.

Depth values are read with `OpDepthAttachmentReadEXT`.

Stencil values are read with `OpStencilAttachmentReadEXT`.

The sample to read is specified by a `sample index` value specified as the `Sample` operand to `OpColorAttachmentReadEXT`, `OpDepthAttachmentReadEXT`, or `OpStencilAttachmentReadEXT`.

If `sample shading` is disabled, a fragment invocation can read from all sample locations associated
with the fragment regardless of the fragment’s coverage. This functionality is supported for \text{VkPipelineMultisampleStateCreateInfo::rasterizationSamples} > 1 when \text{VkPhysicalDeviceShaderTileImagePropertiesEXT::shaderTileImageReadSampleFromPixelRateInvocation} is VK_TRUE.

If \text{sample shading} is enabled, and \text{minSampleShading} is 1.0, a fragment invocation \textbf{must} only read from the \text{coverage index} sample. Tile image access \textbf{must} not be used if the value of \text{minSampleShading} is not 1.0.

If the \text{fragment shader} declares the \text{EarlyFragmentTests} execution mode, depth reads are allowed only if depth writes are disabled and stencil reads are allowed only if stencil writes are disabled.

If \text{VkPhysicalDeviceShaderTileImagePropertiesEXT::shaderTileImageReadFromHelperInvocation} is VK_FALSE, values read from helper invocations are undefined otherwise the values read are subject to the coherency guarantees described below.

\text{OpDepthAttachmentReadEXT} returns an undefined value if no depth attachment is present. \text{OpStencilAttachmentReadEXT} returns an undefined value if no stencil attachment is present.

Tile image reads from color, depth and stencil attachments are said to be coherent when the accesses happen in raster order and without \text{data race} with respect to accesses to the attachments from framebuffer-space pipeline stages. The samples which qualify for coherent access and the enabling conditions are described below.

- Let \text{Rc} be the set of components being read from an attachment \text{A} in a draw call
- Let \text{Wc} be the set of components being written to \text{A} by the draw call

The samples which qualify for coherent tile image reads from an attachment \text{A} are:

- All samples in a pixel when \text{Rc} is disjoint with \text{Wc}.
- The samples with coverage in a fragment when \text{Rc} is not disjoint with \text{Wc}. The samples with coverage are determined by the coverage mask for the fragment as calculated by fragment operations that executed prior to fragment shading, including early fragment tests if enabled for the draw call.

A fragment shader \textbf{can} declare \text{NonCoherentColorAttachmentReadEXT}, \text{NonCoherentDepthAttachmentReadEXT}, or \text{NonCoherentStencilAttachmentReadEXT} execution modes to enable non-coherent tile image reads which requires explicit tile image synchronization for the writes to an attachment to be made visible via tile image reads.

When \text{VkPhysicalDeviceShaderTileImagePropertiesEXT::shaderTileImageCoherentReadAccelerated} is VK_TRUE, the implementation prefers that coherent tile image reads are used, otherwise the implementation prefers that non-coherent tile image reads are used.

\textit{Note}

In practice, the most common tile image reads usage patterns fall under one of the following:

- Programmable blending - each fragment reads from a single sample
At its location. Per-sample shading is typically enabled when multisampled render targets are used.

- G-buffer generation and shading in one render pass - in the shading phase a fragment reads from a single sample at its location.
- Programmatic resolve - a fragment reads from all samples at its location (per-sample shading is disabled). This requires the use of a "full-screen triangle" instead of a rectangle composed of two triangles in order to avoid data races along the shared edge of the triangles.
- 1:1 texturing with LOD - in use cases such a deferred screen space decals a fragment reads a single sample (SampleID) from depth buffer, but requires being able to read from helper threads to derive the texture LOD. This use case is supported as long as the attachment components being read are not overwritten by color, depth, or stencil attachment writes.

All of the above use cases are supported by coherent tile image reads, but only the latter three are supported when non-coherent reads are used as there is no mechanism to synchronize non-coherent reads with writes within a draw call.

### 29.5.3. Depth Replacement

Writing to the `FragDepth` built-in will replace the fragment’s calculated depth values for each sample in the input `SampleMask`. Depth testing performed after the fragment shader for this fragment will use this new value as $z_f$.

### 29.5.4. Stencil Reference Replacement

Writing to the `FragStencilRefEXT` built-in will replace the fragment’s stencil reference value for each sample in the input `SampleMask`. Stencil testing performed after the fragment shader for this fragment will use this new value as $s_r$.

### 29.5.5. Interlocked Operations

`OpBeginInvocationInterlockEXT` and `OpEndInvocationInterlockEXT` define a section of a fragment shader which imposes additional ordering constraints on operations performed within them. These operations are defined as interlocked operations. How interlocked operations are ordered against other fragment shader invocations depends on the specified execution modes.

If the `ShadingRateInterlockOrderedEXT` execution mode is specified, any interlocked operations in a fragment shader must happen before interlocked operations in fragment shader invocations that execute later in rasterization order and cover at least one sample in the same fragment area, and must happen after interlocked operations in a fragment shader that executes earlier in rasterization order and cover at least one sample in the same fragment area.

If the `ShadingRateInterlockUnorderedEXT` execution mode is specified, any interlocked operations in a fragment shader must happen before or after interlocked operations in fragment shader invocations that execute earlier or later in rasterization order and cover at least one sample in the same fragment area.
If the `PixelInterlockOrderedEXT` execution mode is specified, any interlocked operations in a fragment shader **must** happen before interlocked operations in fragment shader invocations that execute later in **rasterization order** and cover at least one sample in the same pixel, and **must** happen after interlocked operations in a fragment shader that executes earlier in **rasterization order** and cover at least one sample in the same pixel.

If the `PixelInterlockUnorderedEXT` execution mode is specified, any interlocked operations in a fragment shader **must** happen before or after interlocked operations in fragment shader invocations that execute earlier or later in **rasterization order** and cover at least one sample in the same pixel.

If the `SampleInterlockOrderedEXT` execution mode is specified, any interlocked operations in a fragment shader **must** happen before interlocked operations in fragment shader invocations that execute later in **rasterization order** and cover at least one of the same samples, and **must** happen after interlocked operations in a fragment shader that executes earlier in **rasterization order** and cover at least one of the same samples.

If the `SampleInterlockUnorderedEXT` execution mode is specified, any interlocked operations in a fragment shader **must** happen before or after interlocked operations in fragment shader invocations that execute earlier or later in **rasterization order** and cover at least one of the same samples.

### 29.6. Multisample Coverage

If a fragment shader is active and its entry point’s interface includes a built-in output variable decorated with `SampleMask`, but not `OverrideCoverageNV`, the coverage mask is **ANDed** with the bits of the `SampleMask` built-in to generate a new coverage mask. If the `SampleMask` built-in is also decorated with `OverrideCoverageNV`, the coverage mask is replaced with the mask bits set in the shader. If **sample shading** is enabled, bits written to `SampleMask` corresponding to samples that are not being shaded by the fragment shader invocation are ignored. If no fragment shader is active, or if the active fragment shader does not include `SampleMask` in its interface, the coverage mask is not modified.

Next, the fragment alpha value and coverage mask are modified based on the line coverage factor if the `lineRasterizationMode` member of the `VkPipelineRasterizationStateCreateInfo` structure is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT`, and the `alphaToCoverageEnable` and `alphaToOneEnable` members of the `VkPipelineMultisampleStateCreateInfo` structure.

To **dynamically set** the `alphaToCoverageEnable` state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetAlphaToCoverageEnableEXT(
    VkCommandBuffer commandBuffer, commandBuffer,
    VkBool32 alphaToCoverageEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `alphaToCoverageEnable` specifies the `alphaToCoverageEnable` state.
This command sets the `alphaToCoverageEnable` state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineMultisampleStateCreateInfo::alphaToCoverageEnable` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetAlphaToCoverageEnableEXT-None-08506
  Either the `extendedDynamicState3AlphaToCoverageEnable` feature or the `shaderObject` feature or both must be enabled

### Valid Usage (Implicit)

- VUID-vkCmdSetAlphaToCoverageEnableEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetAlphaToCoverageEnableEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetAlphaToCoverageEnableEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetAlphaToCoverageEnableEXT-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To dynamically set the `alphaToOneEnable` state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetAlphaToOneEnableEXT(
```
• `commandBuffer` is the command buffer into which the command will be recorded.
• `alphaToOneEnable` specifies the `alphaToOneEnable` state.

This command sets the `alphaToOneEnable` state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineMultisampleStateCreateInfo::alphaToOneEnable` value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetAlphaToOneEnableEXT-None-08508**
  Either the `extendedDynamicState3AlphaToOneEnable` feature or the `shaderObject` feature or both must be enabled

- **VUID-vkCmdSetAlphaToOneEnableEXT-alphaToOne-07607**
  If the `alphaToOne` feature is not enabled, `alphaToOneEnable` must be `VK_FALSE`

### Valid Usage (Implicit)

- **VUID-vkCmdSetAlphaToOneEnableEXT-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetAlphaToOneEnableEXT-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdSetAlphaToOneEnableEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdSetAlphaToOneEnableEXT-videocoding**
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
All alpha values in this section refer only to the alpha component of the fragment shader output that has a Location and Index decoration of zero (see the Fragment Output Interface section). If that shader output has an integer or unsigned integer type, then these operations are skipped.

If the lineRasterizationMode member of the VkPipelineRasterizationStateCreateInfo structure is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT and the fragment came from a line segment, then the alpha value is replaced by multiplying it by the coverage factor for the fragment computed during smooth line rasterization.

If alphaToCoverageEnable is enabled, a temporary coverage mask is generated where each bit is determined by the fragment's alpha value, which is ANDed with the fragment coverage mask.

No specific algorithm is specified for converting the alpha value to a temporary coverage mask. It is intended that the number of 1's in this value be proportional to the alpha value (clamped to [0,1]), with all 1's corresponding to a value of 1.0 and all 0's corresponding to 0.0. The algorithm may be different at different framebuffer coordinates.

Note
Using different algorithms at different framebuffer coordinates may help to avoid artifacts caused by regular coverage sample locations.

Finally, if alphaToOneEnable is enabled, each alpha value is replaced by the maximum representable alpha value for fixed-point color attachments, or by 1.0 for floating-point attachments. Otherwise, the alpha values are not changed.

## 29.7. Depth and Stencil Operations

Pipeline state controlling the depth bounds tests, stencil test, and depth test is specified through the members of the VkPipelineDepthStencilStateCreateInfo structure.

The VkPipelineDepthStencilStateCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineDepthStencilStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineDepthStencilStateCreateFlags flags;
    VkBool32 depthTestEnable;
    VkBool32 depthWriteEnable;
    VkBool32 stencilTestEnable;
} VkPipelineDepthStencilStateCreateInfo;
```
VkCompareOp
depthCompareOp;
VkBool32
depthBoundsTestEnable;
VkBool32
stencilTestEnable;
VkStencilOpState
front;
VkStencilOpState
back;
float
minDepthBounds;
float
maxDepthBounds;
}
VkPipelineDepthStencilStateCreateInfo;

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is a bitmask of **VkPipelineDepthStencilStateCreateFlagBits** specifying additional depth/stencil state information.
- **depthTestEnable** controls whether **depth testing** is enabled.
- **depthWriteEnable** controls whether **depth writes** are enabled when **depthTestEnable** is **VK_TRUE**. Depth writes are always disabled when **depthTestEnable** is **VK_FALSE**.
- **depthCompareOp** is a **VkCompareOp** value specifying the comparison operator to use in the **Depth Comparison** step of the **depth test**.
- **depthBoundsTestEnable** controls whether **depth bounds testing** is enabled.
- **stencilTestEnable** controls whether **stencil testing** is enabled.
- **front** and **back** are **VkStencilOpState** values controlling the corresponding parameters of the **stencil test**.
- **minDepthBounds** is the minimum depth bound used in the **depth bounds test**.
- **maxDepthBounds** is the maximum depth bound used in the **depth bounds test**.

**Valid Usage**

- **VUID-VkPipelineDepthStencilStateCreateInfo-depthBoundsTestEnable-00598**
  If the **depthBounds** feature is not enabled, **depthBoundsTestEnable** must be **VK_FALSE**.

- **VUID-VkPipelineDepthStencilStateCreateInfo-separateStencilMaskRef-04453**
  If the **VK_KHR_portability_subset** extension is enabled, and the value of **VkPipelineDepthStencilStateCreateInfo::stencilTestEnable** is **VK_TRUE**, and the value of **VkPipelineRasterizationStateCreateInfo::cullMode** is **VK_CULL_MODE_NONE**, the value of **reference** in each of the **VkStencilOpState** structs in **front** and **back** must be the same.

- **VUID-VkPipelineDepthStencilStateCreateInfo-rasterizationOrderDepthAttachmentAccess-06463**
  If the **rasterizationOrderDepthAttachmentAccess** feature is not enabled, **flags** must not include **VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT**.

- **VUID-VkPipelineDepthStencilStateCreateInfo-rasterizationOrderStencilAttachmentAccess-**
If the `rasterizationOrderStencilAttachmentAccess` feature is not enabled, flags **must** not include

`VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT`

---

### Valid Usage (Implicit)

- **VUID-VkPipelineDepthStencilStateCreateInfo-sType-sType**
  
  *sType* **must** be `VK_STRUCTURE_TYPE_PIPELINE_DEPTH_STENCIL_STATE_CREATE_INFO`

- **VUID-VkPipelineDepthStencilStateCreateInfo-pNext-pNext**
  
  *pNext* **must** be `NULL`

- **VUID-VkPipelineDepthStencilStateCreateInfo-flags-parameter**
  
  *flags* **must** be a valid combination of `VkPipelineDepthStencilStateCreateFlagBits` values

- **VUID-VkPipelineDepthStencilStateCreateInfo-depthCompareOp-parameter**
  
  *depthCompareOp* **must** be a valid `VkCompareOp` value

- **VUID-VkPipelineDepthStencilStateCreateInfo-front-parameter**
  
  *front* **must** be a valid `VkStencilOpState` structure

- **VUID-VkPipelineDepthStencilStateCreateInfo-back-parameter**
  
  *back* **must** be a valid `VkStencilOpState` structure

---

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineDepthStencilStateCreateFlags;
```

`VkPipelineDepthStencilStateCreateFlags` is a bitmask type for setting a mask of zero or more `VkPipelineDepthStencilStateCreateFlagBits`

Bits which **can** be set in the `VkPipelineDepthStencilStateCreateInfo::flags` parameter are:

```c
// Provided by VK_EXT_rasterization_order_attachment_access
typedef enum VkPipelineDepthStencilStateCreateFlagBits {
  // Provided by VK_EXT_rasterization_order_attachment_access

  VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT = 0x00000001,
  // Provided by VK_EXT_rasterization_order_attachment_access

  VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT = 0x00000002,
  // Provided by VK_ARM_rasterization_order_attachment_access

  VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_ARM =
  VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT

```
• **VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT** indicates that access to the depth aspects of depth/stencil and input attachments will have implicit framebuffer-local memory dependencies.

• **VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT** indicates that access to the stencil aspects of depth/stencil and input attachments will have implicit framebuffer-local memory dependencies.

When **VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT** is included in a pipeline, it forms a framebuffer-local memory dependency for each fragment generated by draw commands for that pipeline with the following scopes:

• The first **synchronization scope** includes **VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT** and **VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT** pipeline stages executed by all previous fragments (as defined by **primitive order**) in the corresponding **framebuffer regions** including those generated by the same draw command.

• The second **synchronization scope** includes **VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT** and **VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT** pipeline stages executed by the generated fragment.

• The first **access scope** includes all writes to the depth aspect of depth/stencil attachments.

• The second **access scope** includes all reads from the depth aspect of input attachments.

When **VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT** is included in a pipeline, it forms a framebuffer-local memory dependency for each fragment generated by draw commands for that pipeline with the following scopes:

• The first **synchronization scope** includes **VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT** and **VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT** pipeline stages executed by all previous fragments (as defined by **primitive order**) in the corresponding **framebuffer regions** including those generated by the same draw command.

• The second **synchronization scope** includes **VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT** and **VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT** pipeline stages executed by the generated fragment.

• The first **access scope** includes all writes to the stencil aspect of depth/stencil attachments.

• The second **access scope** includes all reads from the stencil aspect of input attachments.
29.8. Depth Bounds Test

The depth bounds test compares the depth value $z_a$ in the depth/stencil attachment at each sample’s framebuffer coordinates $(x_f, y_f)$ and sample index $i$ against a set of depth bounds.

The depth bounds are determined by two floating point values defining a minimum ($\text{minDepthBounds}$) and maximum ($\text{maxDepthBounds}$) depth value. These values are either set by the VkPipelineDepthStencilStateCreateInfo structure during pipeline creation, or dynamically by vkCmdSetDepthBoundsTestEnable and vkCmdSetDepthBounds.

A given sample is considered within the depth bounds if $z_a$ is in the range $[\text{minDepthBounds}, \text{maxDepthBounds}]$. Samples with depth attachment values outside of the depth bounds will have their coverage set to 0.

If the depth bounds test is disabled, or if there is no depth attachment, the coverage mask is unmodified by this operation.

To dynamically enable or disable the depth bounds test, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetDepthBoundsTestEnable(
    VkCommandBuffer commandBuffer,       // Provided by VK_VERSION_1_3
    VkBool32 depthBoundsTestEnable);     // Provided by VK_VERSION_1_3
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object
void vkCmdSetDepthBoundsTestEnableEXT(
    VkCommandBuffer commandBuffer,       // Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object
    VkBool32 depthBoundsTestEnable);     // Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthBoundsTestEnable` specifies if the depth bounds test is enabled.

This command sets the depth bounds enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineDepthStencilStateCreateInfo::depthBoundsTestEnable value used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetDepthBoundsTestEnable-None-08971
  At least one of the following must be true:
  - the extendedDynamicState feature is enabled
  - the shaderObject feature is enabled
the value of \texttt{VkApplicationInfo::apiVersion} used to create the \texttt{VkInstance} parent of \texttt{commandBuffer} is greater than or equal to Version 1.3

**Valid Usage (Implicit)**

- \textbf{VUID-vkCmdSetDepthBoundsTestEnable-commandBuffer-parameter} \texttt{commandBuffer} \textbf{must} be a valid \texttt{VkCommandBuffer} handle
- \textbf{VUID-vkCmdSetDepthBoundsTestEnable-commandBuffer-recording} \texttt{commandBuffer} \textbf{must} be in the \textit{recording} state
- \textbf{VUID-vkCmdSetDepthBoundsTestEnable-commandBuffer-cmdpool} The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \textbf{must} support graphics operations
- \textbf{VUID-vkCmdSetDepthBoundsTestEnable-videocoding} This command \textbf{must} only be called outside of a video coding scope

**Host Synchronization**

- Host access to \texttt{commandBuffer} \textbf{must} be externally synchronized
- Host access to the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \textbf{must} be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To \textit{dynamically set} the depth bounds range, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetDepthBounds(
    VkCommandBuffer commandBuffer,
    float minDepthBounds,
    float maxDepthBounds);
```

- \texttt{commandBuffer} is the command buffer into which the command will be recorded.
- \texttt{minDepthBounds} is the minimum depth bound.
- \texttt{maxDepthBounds} is the maximum depth bound.
This command sets the depth bounds range for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with \texttt{VK_DYNAMIC_STATE_DEPTH_BOUNDS} set in \texttt{VkPipelineDynamicStateCreateInfo::pDynamicStates}. Otherwise, this state is specified by the \texttt{VkPipelineDepthStencilStateCreateInfo::minDepthBounds} and \texttt{VkPipelineDepthStencilStateCreateInfo::maxDepthBounds} values used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetDepthBounds-minDepthBounds-00600**
  If the \texttt{VK_EXT_depth_range_unrestricted} extension is not enabled, \texttt{minDepthBounds} must be between 0.0 and 1.0, inclusive.

- **VUID-vkCmdSetDepthBounds-maxDepthBounds-00601**
  If the \texttt{VK_EXT_depth_range_unrestricted} extension is not enabled, \texttt{maxDepthBounds} must be between 0.0 and 1.0, inclusive.

### Valid Usage (Implicit)

- **VUID-vkCmdSetDepthBounds-commandBuffer-parameter**
  \texttt{commandBuffer} must be a valid \texttt{VkCommandBuffer} handle.

- **VUID-vkCmdSetDepthBounds-commandBuffer-recording**
  \texttt{commandBuffer} must be in the recording state.

- **VUID-vkCmdSetDepthBounds-commandBuffer-cmdpool**
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must support graphics operations.

- **VUID-vkCmdSetDepthBounds-videocoding**
  This command must only be called outside of a video coding scope.

### Host Synchronization

- Host access to \texttt{commandBuffer} must be externally synchronized.

- Host access to the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must be externally synchronized.

### Command Properties

</tbody>
</table>
29.9. Stencil Test

The stencil test compares the stencil attachment value \( s_a \) in the depth/stencil attachment at each sample’s framebuffer coordinates \((x_f, y_f)\) and sample index \( i \) against a stencil reference value.

If the render pass has a fragment density map attachment and the fragment covers multiple pixels, there is an implementation-dependent association of coverage samples to stencil attachment samples within the fragment. However, if all samples in the fragment are covered, and the stencil attachment value is updated as a result of this test, all stencil attachment samples will be updated.

If the stencil test is not enabled, as specified by \( \text{vkCmdSetStencilTestEnable} \) or \( \text{VkPipelineDepthStencilStateCreateInfo::stencilTestEnable} \), or if there is no stencil attachment, the coverage mask is unmodified by this operation.

The stencil test is controlled by one of two sets of stencil-related state, the front stencil state and the back stencil state. Stencil tests and writes use the back stencil state when processing fragments generated by back-facing polygons, and the front stencil state when processing fragments generated by front-facing polygons or any other primitives.

The comparison operation performed is determined by the \( \text{VkCompareOp} \) value set by \( \text{vkCmdSetStencilOp::compareOp} \), or by \( \text{VkStencilOpState::compareOp} \) during pipeline creation.

The compare mask \( s_c \) and stencil reference value \( s_r \) of the front or the back stencil state set determine arguments of the comparison operation. \( s_c \) is set by the \( \text{VkPipelineDepthStencilStateCreateInfo} \) structure during pipeline creation, or by the \( \text{vkCmdSetStencilCompareMask} \) command. \( s_r \) is set by \( \text{VkPipelineDepthStencilStateCreateInfo} \) or by \( \text{vkCmdSetStencilReference} \).

\( s_r \) and \( s_a \) are each independently combined with \( s_c \) using a bitwise AND operation to create masked reference and attachment values \( s'_r \) and \( s'_a \). \( s'_r \) and \( s'_a \) are used as the reference and test values, respectively, in the operation specified by the \( \text{VkCompareOp} \).

If the comparison evaluates to false, the coverage for the sample is set to 0.

A new stencil value \( s_g \) is generated according to a stencil operation defined by \( \text{VkStencilOp} \) parameters set by \( \text{vkCmdSetStencilOp} \) or \( \text{VkPipelineDepthStencilStateCreateInfo} \). If the stencil test fails, \( \text{failOp} \) defines the stencil operation used. If the stencil test passes however, the stencil op used is based on the depth test - if it passes, \( \text{VkPipelineDepthStencilStateCreateInfo::passOp} \) is used, otherwise \( \text{VkPipelineDepthStencilStateCreateInfo::depthFailOp} \) is used.

The stencil attachment value \( s_a \) is then updated with the generated stencil value \( s_g \) according to the write mask \( s_w \) defined by writeMask in \( \text{VkPipelineDepthStencilStateCreateInfo::front} \) and \( \text{VkPipelineDepthStencilStateCreateInfo::back} \) as:

\[
s_a = (s_a \& \neg s_w) \mid (s_g \& s_w)
\]

To dynamically enable or disable the stencil test, call:
// Provided by VK_VERSION_1_3
void vkCmdSetStencilTestEnable(
    VkCommandBuffer commandBuffer,
    VkBool32 stencilTestEnable);

or the equivalent command

// Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object
void vkCmdSetStencilTestEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 stencilTestEnable);

• commandBuffer is the command buffer into which the command will be recorded.
• stencilTestEnable specifies if the stencil test is enabled.

This command sets the stencil test enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineDepthStencilStateCreateInfo::stencilTestEnable value used to create the currently active pipeline.

Valid Usage

• VUID-vkCmdSetStencilTestEnable-None-08971
  At least one of the following must be true:
  ◦ the extendedDynamicState feature is enabled
  ◦ the shaderObject feature is enabled
  ◦ the value of VkApplicationInfo::apiVersion used to create the VkInstance parent of commandBuffer is greater than or equal to Version 1.3

Valid Usage (Implicit)

• VUID-vkCmdSetStencilTestEnable-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdSetStencilTestEnable-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdSetStencilTestEnable-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

• VUID-vkCmdSetStencilTestEnable-videocoding
  This command must only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To dynamically set the stencil operation, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetStencilOp(
    VkCommandBuffer
    commandBuffer,       
    VkStencilFaceFlags
    faceMask, 
    VkStencilOp
    failOp, 
    VkStencilOp
    passOp, 
    VkStencilOp
    depthFailOp, 
    VkCompareOp
    compareOp); 
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object
void vkCmdSetStencilOpEXT(
    VkCommandBuffer
    commandBuffer,       
    VkStencilFaceFlags
    faceMask, 
    VkStencilOp
    failOp, 
    VkStencilOp
    passOp, 
    VkStencilOp
    depthFailOp, 
    VkCompareOp
    compareOp); 
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `faceMask` is a bitmask of `VkStencilFaceFlagBits` specifying the set of stencil state for which to update the stencil operation.
- `failOp` is a `VkStencilOp` value specifying the action performed on samples that fail the stencil test.
- `passOp` is a `VkStencilOp` value specifying the action performed on samples that pass both the depth and stencil tests.
• **depthFailOp** is a [VkStencilOp](https://vulkan.khronos.org/standards/v1.3/vulkan-core.html#VkStencilOp) value specifying the action performed on samples that pass the stencil test and fail the depth test.

• **compareOp** is a [VkCompareOp](https://vulkan.khronos.org/standards/v1.3/vulkan-core.html#VkCompareOp) value specifying the comparison operator used in the stencil test.

This command sets the stencil operation for subsequent drawing commands when when drawing using [shader objects](https://vulkan.khronos.org/standards/v1.3/vulkan-core.html#_shader_objects), or when the graphics pipeline is created with `VK_DYNAMIC_STATE_STENCIL_OP` set in [VkPipelineDynamicStateCreateInfo](https://vulkan.khronos.org/standards/v1.3/vulkan-core.html#VkPipelineDynamicStateCreateInfo)::pDynamicStates. Otherwise, this state is specified by the corresponding [VkPipelineDepthStencilStateCreateInfo](https://vulkan.khronos.org/standards/v1.3/vulkan-core.html#VkPipelineDepthStencilStateCreateInfo)::failOp, passOp, depthFailOp, and compareOp values used to create the currently active pipeline, for both front and back faces.

**Valid Usage**

- VUID-vkCmdSetStencilOp-None-08971
  At least one of the following **must** be true:
    - the extendedDynamicState feature is enabled
    - the shaderObject feature is enabled
    - the value of VkApplicationInfo::apiVersion used to create the VkInstance parent of commandBuffer is greater than or equal to Version 1.3

**Valid Usage (Implicit)**

- VUID-vkCmdSetStencilOp-commandBuffer-parameter
  commandBuffer **must** be a valid VkCommandBuffer handle

- VUID-vkCmdSetStencilOp-faceMask-parameter
  faceMask **must** be a valid combination of VkStencilFaceFlagBits values

- VUID-vkCmdSetStencilOp-faceMask-requiredbitsetmask
  faceMask **must** not be 0

- VUID-vkCmdSetStencilOp-failOp-parameter
  failOp **must** be a valid VkStencilOp value

- VUID-vkCmdSetStencilOp-passOp-parameter
  passOp **must** be a valid VkStencilOp value

- VUID-vkCmdSetStencilOp-depthFailOp-parameter
  depthFailOp **must** be a valid VkStencilOp value

- VUID-vkCmdSetStencilOp-compareOp-parameter
  compareOp **must** be a valid VkCompareOp value

- VUID-vkCmdSetStencilOp-commandBuffer-recording
  commandBuffer **must** be in the recording state

- VUID-vkCmdSetStencilOp-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from **must** support graphics operations

- VUID-vkCmdSetStencilOp-videocoding
This command **must** only be called outside of a video coding scope

---

**Host Synchronization**

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the **VkCommandPool** that **commandBuffer** was allocated from **must** be externally synchronized

---

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The **VkStencilOpState** structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkStencilOpState {
    VkStencilOp failOp;
    VkStencilOp passOp;
    VkStencilOp depthFailOp;
    VkCompareOp compareOp;
    uint32_t compareMask;
    uint32_t writeMask;
    uint32_t reference;
} VkStencilOpState;
```

- **failOp** is a **VkStencilOp** value specifying the action performed on samples that fail the stencil test.
- **passOp** is a **VkStencilOp** value specifying the action performed on samples that pass both the depth and stencil tests.
- **depthFailOp** is a **VkStencilOp** value specifying the action performed on samples that pass the stencil test and fail the depth test.
- **compareOp** is a **VkCompareOp** value specifying the comparison operator used in the stencil test.
- **compareMask** selects the bits of the unsigned integer stencil values participating in the stencil test.
- **writeMask** selects the bits of the unsigned integer stencil values updated by the stencil test in the stencil framebuffer attachment.
- **reference** is an integer stencil reference value that is used in the unsigned stencil comparison.
To dynamically set the stencil compare mask, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetStencilCompareMask(
    VkCommandBuffer commandBuffer,
    VkStencilFaceFlags faceMask,
    uint32_t compareMask);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `faceMask` is a bitmask of `VkStencilFaceFlagBits` specifying the set of stencil state for which to update the compare mask.
- `compareMask` is the new value to use as the stencil compare mask.

This command sets the stencil compare mask for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkStencilOpState::compareMask` value used to create the currently active pipeline, for both front and back faces.
operations

- VUID-vkCmdSetStencilCompareMask-videocoding
  This command **must** only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

`VkStencilFaceFlagBits` values are:

```cpp
// Provided by VK_VERSION_1_0
typedef enum VkStencilFaceFlagBits {
    VK_STENCIL_FACE_FRONT_BIT = 0x00000001,
    VK_STENCIL_FACE_BACK_BIT = 0x00000002,
    VK_STENCIL_FACE_FRONT_AND_BACK = 0x00000003,
    VK_STENCIL_FRONT_AND_BACK = VK_STENCIL_FACE_FRONT_AND_BACK,
} VkStencilFaceFlagBits;
```

- **VK_STENCIL_FACE_FRONT_BIT** specifies that only the front set of stencil state is updated.
- **VK_STENCIL_FACE_BACK_BIT** specifies that only the back set of stencil state is updated.
- **VK_STENCIL_FACE_FRONT_AND_BACK** is the combination of **VK_STENCIL_FACE_FRONT_BIT** and **VK_STENCIL_FACE_BACK_BIT**, and specifies that both sets of stencil state are updated.

```cpp
// Provided by VK_VERSION_1_0
typedef VkFlags VkStencilFaceFlags;
```

`VkStencilFaceFlags` is a bitmask type for setting a mask of zero or more `VkStencilFaceFlagBits`.

To **dynamically set** the stencil write mask, call:

```cpp
// Provided by VK_VERSION_1_0
void vkCmdSetStencilWriteMask(
```
VkCommandBuffer commandBuffer, VkStencilFaceFlags faceMask, uint32_t writeMask);

- **commandBuffer** is the command buffer into which the command will be recorded.
- **faceMask** is a bitmask of *VkStencilFaceFlagBits* specifying the set of stencil state for which to update the write mask, as described above for *vkCmdSetStencilCompareMask*.
- **writeMask** is the new value to use as the stencil write mask.

This command sets the stencil write mask for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` set in *VkPipelineDynamicStateCreateInfo::pDynamicStates*. Otherwise, this state is specified by the `writeMask` value used to create the currently active pipeline, for both *VkPipelineDepthStencilStateCreateInfo::front* and *VkPipelineDepthStencilStateCreateInfo::back* faces.

### Valid Usage (Implicit)

- **VUID-vkCmdSetStencilWriteMask-commandBuffer-parameter**
  - `commandBuffer` must be a valid *VkCommandBuffer* handle
- **VUID-vkCmdSetStencilWriteMask-faceMask-parameter**
  - `faceMask` must be a valid combination of *VkStencilFaceFlagBits* values
- **VUID-vkCmdSetStencilWriteMask-faceMask-requiredbitmask**
  - `faceMask` must not be 0
- **VUID-vkCmdSetStencilWriteMask-commandBuffer-recording**
  - `commandBuffer` must be in the recording state
- **VUID-vkCmdSetStencilWriteMask-commandBuffer-cmdpool**
The *VkCommandPool* that `commandBuffer` was allocated from must support graphics operations
- **VUID-vkCmdSetStencilWriteMask-videocoding**
  - This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the *VkCommandPool* that `commandBuffer` was allocated from must be externally synchronized
To **dynamically set** the stencil reference value, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetStencilReference(
    VkCommandBuffer commandBuffer,
    VkStencilFaceFlags faceMask,
    uint32_t reference);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `faceMask` is a bitmask of `VkStencilFaceFlagBits` specifying the set of stencil state for which to update the reference value, as described above for `vkCmdSetStencilCompareMask`.
- `reference` is the new value to use as the stencil reference value.

This command sets the stencil reference value for subsequent drawing commands when drawing using *shader objects*, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_STENCIL_REFERENCE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::reference` value used to create the currently active pipeline, for both front and back faces.

**Valid Usage (Implicit)**

- VUID-vkCmdSetStencilReference-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetStencilReference-faceMask-parameter
  `faceMask` **must** be a valid combination of `VkStencilFaceFlagBits` values
- VUID-vkCmdSetStencilReference-faceMask-required bitmask
  `faceMask` **must** not be 0
- VUID-vkCmdSetStencilReference-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetStencilReference-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetStencilReference-vidcoding
  This command **must** only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Possible values of the `failOp`, `passOp`, and `depthFailOp` members of `VkStencilOpState`, specifying what happens to the stored stencil value if this or certain subsequent tests fail or pass, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkStencilOp {  
    VK_STENCIL_OP_KEEP = 0,  
    VK_STENCIL_OP_ZERO = 1,  
    VK_STENCIL_OP_REPLACE = 2,  
    VK_STENCIL_OP_INCREMENT_AND_CLAMP = 3,  
    VK_STENCIL_OP_DECREMENT_AND_CLAMP = 4,  
    VK_STENCIL_OP_INVERT = 5,  
    VK_STENCIL_OP_INCREMENT_AND_WRAP = 6,  
    VK_STENCIL_OP_DECREMENT_AND_WRAP = 7,  
} VkStencilOp;
```

- `VK_STENCIL_OP_KEEP` keeps the current value.
- `VK_STENCIL_OP_ZERO` sets the value to 0.
- `VK_STENCIL_OP_REPLACE` sets the value to reference.
- `VK_STENCIL_OP_INCREMENT_AND_CLAMP` increments the current value and clamps to the maximum representable unsigned value.
- `VK_STENCIL_OP_DECREMENT_AND_CLAMP` decrements the current value and clamps to 0.
- `VK_STENCIL_OP_INVERT` bitwise-inverts the current value.
- `VK_STENCIL_OP_INCREMENT_AND_WRAP` increments the current value and wraps to 0 when the maximum value would have been exceeded.
- `VK_STENCIL_OP_DECREMENT_AND_WRAP` decrements the current value and wraps to the maximum possible value when the value would go below 0.

For purposes of increment and decrement, the stencil bits are considered as an unsigned integer.
29.10. Depth Test

The depth test compares the depth value \( z_a \) in the depth/stencil attachment at each sample's framebuffer coordinates \((x_f, y_f)\) and sample index \(i\) against the sample's depth value \(z_f\). If there is no depth attachment then the depth test is skipped.

If the render pass has a fragment density map attachment and the fragment covers multiple pixels, there is an implementation-dependent association of rasterization samples to depth attachment samples within the fragment. However, if all samples in the fragment are covered, and the depth attachment value is updated as a result of this test, all depth attachment samples will be updated.

The depth test occurs in three stages, as detailed in the following sections.

29.10.1. Depth Clamping and Range Adjustment

If \( \text{VkPipelineRasterizationStateCreateInfo}::\text{depthClampEnable} \) is enabled, \(z_f\) is clamped to \([z_{\text{min}}, z_{\text{max}}]\), where \(z_{\text{min}} = \min(n,f)\), \(z_{\text{max}} = \max(n,f)\), and \(n\) and \(f\) are the \(\text{minDepth}\) and \(\text{maxDepth}\) depth range values of the viewport used by this fragment, respectively.

If \( \text{VkPhysicalDeviceDepthClampZeroOneFeaturesEXT}::\text{depthClampZeroOne} \) is enabled:

- If the depth attachment has a floating-point format and \(\text{VK_EXT_depth_range_unrestricted}\) is enabled then \(z_f\) is unchanged.

- Otherwise, \(z_f\) is clamped to the range \([0, 1]\).

Otherwise:

- If \(z_f\) is not in the range \([z_{\text{min}}, z_{\text{max}}]\), then \(z_f\) is undefined following this step.

- If the depth attachment has a fixed-point format and \(z_f\) is not in the range \([0, 1]\), then \(z_f\) is undefined following this step.

29.10.2. Depth Comparison

If the depth test is not enabled, as specified by \(\text{vkCmdSetDepthTestEnable}\) or \(\text{VkPipelineDepthStencilStateCreateInfo}::\text{depthTestEnable}\), then this step is skipped.

The comparison operation performed is determined by the \(\text{VkCompareOp}\) value set by \(\text{vkCmdSetDepthCompareOp}\), or by \(\text{VkPipelineDepthStencilStateCreateInfo}::\text{depthCompareOp}\) during pipeline creation. \(z_f\) and \(z_a\) are used as the \textit{reference} and \textit{test} values, respectively, in the operation specified by the \(\text{VkCompareOp}\).

If the comparison evaluates to false, the coverage for the sample is set to \(\theta\).

29.10.3. Depth Attachment Writes

If depth writes are enabled, as specified by \(\text{vkCmdSetDepthWriteEnable}\) or \(\text{VkPipelineDepthStencilStateCreateInfo}::\text{depthWriteEnable}\), and the comparison evaluated to true, the depth attachment value \(z_a\) is set to the sample's depth value \(z_f\). If there is no depth attachment, no value is written.
To dynamically enable or disable the depth test, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetDepthTestEnable(
    VkCommandBuffer commandBuffer,
    VkBool32 depthTestEnable);
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object
void vkCmdSetDepthTestEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 depthTestEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthTestEnable` specifies if the depth test is enabled.

This command sets the depth test enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::depthTestEnable` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetDepthTestEnable-None-08971
  At least one of the following must be true:
  - the extendedDynamicState feature is enabled
  - the shaderObject feature is enabled
  - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

### Valid Usage (Implicit)

- VUID-vkCmdSetDepthTestEnable-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDepthTestEnable-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetDepthTestEnable-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetDepthTestEnable-videocoding
This command **must** only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

</tbody>
</table>

To **dynamically set** the depth compare operator, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetDepthCompareOp(
    VkCommandBuffer commandBuffer,
    VkCompareOp depthCompareOp);
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object
void vkCmdSetDepthCompareOpEXT(
    VkCommandBuffer commandBuffer,
    VkCompareOp depthCompareOp);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthCompareOp` is a `VkCompareOp` value specifying the comparison operator used for the **Depth Comparison** step of the **depth test**.

This command sets the depth comparison operator for subsequent drawing commands when drawing using **shader objects**, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::depthCompareOp` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetDepthCompareOp-None-08971
At least one of the following must be true:

- the extendedDynamicState feature is enabled
- the shaderObject feature is enabled
- the value of VkApplicationInfo::apiVersion used to create the VkInstance parent of commandBuffer is greater than or equal to Version 1.3

Valid Usage (Implicit)

- VUID-vkCmdSetDepthCompareOp-commandBuffer-parameter commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetDepthCompareOp-depthCompareOp-parameter depthCompareOp must be a valid VkCompareOp value
- VUID-vkCmdSetDepthCompareOp-commandBuffer-recording commandBuffer must be in the recording state
- VUID-vkCmdSetDepthCompareOp-commandBuffer-cmdpool The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdSetDepthCompareOp-videocoding This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

</tbody>
</table>

To dynamically set the depth write enable, call:

```c
// Provided by VK_VERSION_1_3
def void vkCmdSetDepthWriteEnable(
      VkCommandBuffer commandBuffer,
      VkBool32 depthWriteEnable);
```
This command sets the depth write enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::depthWriteEnable` value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetDepthWriteEnable-None-08971**
  At least one of the following **must** be true:
  - the `extendedDynamicState` feature is enabled
  - the `shaderObject` feature is enabled
  - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

### Valid Usage (Implicit)

- **VUID-vkCmdSetDepthWriteEnable-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetDepthWriteEnable-commandBuffer-recording**
  `commandBuffer` **must** be in the recording state

- **VUID-vkCmdSetDepthWriteEnable-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- **VUID-vkCmdSetDepthWriteEnable-videocoding**
  This command **must** only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized
29.11. Representative Fragment Test

The representative fragment test allows implementations to reduce the amount of rasterization and fragment processing work performed for each point, line, or triangle primitive. For any primitive that produces one or more fragments that pass all prior early fragment tests, the implementation may choose one or more “representative” fragments for processing and discard all other fragments. For draw calls rendering multiple points, lines, or triangles arranged in lists, strips, or fans, the representative fragment test is performed independently for each of those primitives. The set of fragments discarded by the representative fragment test is implementation-dependent. In some cases, the representative fragment test may not discard any fragments for a given primitive.

If the `pNext` chain of `VkGraphicsPipelineCreateInfo` includes a `VkPipelineRepresentativeFragmentTestStateCreateInfoNV` structure, then that structure includes parameters controlling the representative fragment test.

The `VkPipelineRepresentativeFragmentTestStateCreateInfoNV` structure is defined as:

```c
// Provided by VK_NV_representative_fragment_test
typedef struct VkPipelineRepresentativeFragmentTestStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkBool32 representativeFragmentTestEnable;
} VkPipelineRepresentativeFragmentTestStateCreateInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `representativeFragmentTestEnable` controls whether the representative fragment test is enabled.

If this structure is not included in the `pNext` chain, `representativeFragmentTestEnable` is considered to be `VK_FALSE`, and the representative fragment test is disabled.

If the active fragment shader does not specify the `EarlyFragmentTests` execution mode, the representative fragment shader test has no effect, even if enabled.

**Valid Usage (Implicit)**

- `VUID-VkPipelineRepresentativeFragmentTestStateCreateInfoNV-sType-sType` must be
To **dynamically set** the `representativeFragmentTestEnable` state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3 with VK_NV_representative_fragment_test,
// VK_EXT_shader_object with VK_NV_representative_fragment_test
void vkCmdSetRepresentativeFragmentTestEnableNV(
    VkCommandBuffer commandBuffer,
    VkBool32 representativeFragmentTestEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `representativeFragmentTestEnable` specifies the `representativeFragmentTestEnable` state.

This command sets the `representativeFragmentTestEnable` state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_REPRESENTATIVE_FRAGMENT_TEST_ENABLE_NV` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRepresentativeFragmentTestStateCreateInfoNV::representativeFragmentTestEnable` value used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetRepresentativeFragmentTestEnableNV-None-08522
  Either the `extendedDynamicState3RepresentativeFragmentTestEnable` feature or the `shaderObject` feature or both **must** be enabled

**Valid Usage (Implicit)**

- VUID-vkCmdSetRepresentativeFragmentTestEnableNV-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetRepresentativeFragmentTestEnableNV-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetRepresentativeFragmentTestEnableNV-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetRepresentativeFragmentTestEnableNV-videocoding
  This command **must** only be called outside of a video coding scope

**Host Synchronization**

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally...

## 29.12. Sample Counting

Occlusion queries use query pool entries to track the number of samples that pass all the per-fragment tests. The mechanism of collecting an occlusion query value is described in [Occlusion Queries](#).

The occlusion query sample counter increments by one for each sample with a coverage value of 1 in each fragment that survives all the per-fragment tests, including scissor, exclusive scissor, sample mask, alpha to coverage, stencil, and depth tests.

## 29.13. Fragment Coverage To Color

The `VkPipelineCoverageToColorStateCreateInfoNV` structure is defined as:

```c
// Provided by VK_NV_fragment_coverage_to_color
typedef struct VkPipelineCoverageToColorStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCoverageToColorStateCreateFlagsNV flags;
    VkBool32 coverageToColorEnable;
    uint32_t coverageToColorLocation;
} VkPipelineCoverageToColorStateCreateInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `coverageToColorEnable` controls whether the fragment coverage value replaces a fragment color output.
- `coverageToColorLocation` controls which fragment shader color output value is replaced.

If the `pNext` chain of `VkPipelineMultisampleStateCreateInfo` includes a `VkPipelineCoverageToColorStateCreateInfoNV` structure, then that structure controls whether the fragment coverage is substituted for a fragment color output and, if so, which output is replaced.
If `coverageToColorEnable` is `VK_TRUE`, the coverage mask replaces the first component of the color value corresponding to the fragment shader output location with `Location` equal to `coverageToColorLocation` and `Index` equal to zero. If the color attachment format has fewer bits than the coverage mask, the low bits of the sample coverage mask are taken without any clamping. If the color attachment format has more bits than the coverage mask, the high bits of the sample coverage mask are filled with zeros.

If `coverageToColorEnable` is `VK_FALSE`, these operations are skipped. If this structure is not included in the `pNext` chain, it is as if `coverageToColorEnable` is `VK_FALSE`.

### Valid Usage

- VUID-VkPipelineCoverageToColorStateCreateInfoNV-coverageToColorEnable-01404
  
  If `coverageToColorEnable` is `VK_TRUE`, then the render pass subpass indicated by `VkGraphicsPipelineCreateInfo::renderPass` and `VkGraphicsPipelineCreateInfo::subpass` must have a color attachment at the location selected by `coverageToColorLocation`, with a `VkFormat` of `VK_FORMAT_R8_UINT`, `VK_FORMAT_R8_SINT`, `VK_FORMAT_R16_UINT`, `VK_FORMAT_R16_SINT`, `VK_FORMAT_R32_UINT`, or `VK_FORMAT_R32_SINT`.

### Valid Usage (Implicit)

- VUID-VkPipelineCoverageToColorStateCreateInfoNV-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_COVERAGE_TO_COLOR_STATE_CREATE_INFO_NV`.

- VUID-VkPipelineCoverageToColorStateCreateInfoNV-flags-zerobitmask
  
  `flags` must be `0`.

```c
typedef VkFlags VkPipelineCoverageToColorStateCreateFlagsNV;

// Provided by VK_NV_fragment_coverage_to_color
VkPipelineCoverageToColorStateCreateFlagsNV
```

`VkPipelineCoverageToColorStateCreateFlagsNV` is a bitmask type for setting a mask, but is currently reserved for future use.

To dynamically set the `coverageToColorEnable` state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3 with VK_NV_fragment_coverage_to_color,
// VK_EXT_shader_object with VK_NV_fragment_coverage_to_color
void vkCmdSetCoverageToColorEnableNV(
  VkCommandBuffer commandBuffer,
  VkBool32 coverageToColorEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `coverageToColorEnable` specifies the `coverageToColorEnable` state.

This command sets the `coverageToColorEnable` state for subsequent drawing commands when
drawing using shader objects, or when the graphics pipeline is created with

\texttt{VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV} set in \texttt{VkPipelineDynamicStateCreateInfo::pDynamicStates}. Otherwise, this state is specified by the \texttt{VkPipelineCoverageToColorStateCreateInfoNV::coverageToColorEnable} value used to create the currently active pipeline.

### Valid Usage

- \texttt{VUID-vkCmdSetCoverageToColorEnableNV-None-08524}
  
  Either the \texttt{extendedDynamicState3CoverageToColorEnable} feature or the \texttt{shaderObject} feature or both \textbf{must} be enabled

### Valid Usage (Implicit)

- \texttt{VUID-vkCmdSetCoverageToColorEnableNV-commandBuffer-parameter}
  
  \texttt{commandBuffer} \textbf{must} be a valid \texttt{VkCommandBuffer} handle

- \texttt{VUID-vkCmdSetCoverageToColorEnableNV-commandBuffer-recording}
  
  \texttt{commandBuffer} \textbf{must} be in the \texttt{recording state}

- \texttt{VUID-vkCmdSetCoverageToColorEnableNV-commandBuffer-cmdpool}
  
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \textbf{must} support graphics operations

- \texttt{VUID-vkCmdSetCoverageToColorEnableNV-videocoding}
  
  This command \textbf{must} only be called outside of a video coding scope

### Host Synchronization

- Host access to \texttt{commandBuffer} \textbf{must} be externally synchronized

- Host access to the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \textbf{must} be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
</tbody>
</table>

To \textbf{dynamically set} the \texttt{coverageToColorLocation} state, call:

```
// Provided by VK_EXT_extended_dynamic_state3 with VK_NV_fragment_coverage_to_color,
// VK_EXT_shader_object with VK_NV_fragment_coverage_to_color
```
```c
void vkCmdSetCoverageToColorLocationNV(
    VkCommandBuffer commandBuffer,
    uint32_t coverageToColorLocation);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `coverageToColorLocation` specifies the `coverageToColorLocation` state.

This command sets the `coverageToColorLocation` state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_LOCATION_NV` set in `VkPipelineDynamicStateCreateInfo`'s `pDynamicStates`. Otherwise, this state is specified by the `VkPipelineCoverageToColorStateCreateInfoNV`'s `coverageToColorLocation` value used to create the currently active pipeline.

**Valid Usage**

- **VUID-vkCmdSetCoverageToColorLocationNV-None-08526**
  Either the `extendedDynamicState3CoverageToColorLocation` feature or the `shaderObject` feature or both must be enabled

**Valid Usage (Implicit)**

- **VUID-vkCmdSetCoverageToColorLocationNV-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- **VUID-vkCmdSetCoverageToColorLocationNV-commandBuffer-recording**
  `commandBuffer` must be in the recording state
- **VUID-vkCmdSetCoverageToColorLocationNV-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- **VUID-vkCmdSetCoverageToColorLocationNV-videocoding**
  This command must only be called outside of a video coding scope

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Coverage reduction takes the coverage information for a fragment and converts that to a boolean coverage value for each color sample in each pixel covered by the fragment.

29.14.1. Pixel Coverage

Coverage for each pixel is first extracted from the total fragment coverage mask. This consists of `rasterizationSamples` unique coverage samples for each pixel in the fragment area, each with a unique sample index. If the fragment only contains a single pixel, coverage for the pixel is equivalent to the fragment coverage.

If the render pass has a fragment density map attachment and the fragment covers multiple pixels, pixel coverage is generated in an implementation-dependent manner. If all samples in the fragment are covered, all samples will be covered in each pixel coverage.

If a shading rate image is used, and the fragment covers multiple pixels, each pixel's coverage consists of the coverage samples corresponding to that pixel, and each sample retains its unique sample index.

If the fragment shading rate is set, and the fragment covers multiple pixels, each pixel's coverage consists of the coverage samples with a pixel index matching that pixel, and each sample retains its unique sample index.

29.14.2. Color Sample Coverage

Once pixel coverage is determined, coverage for each individual color sample corresponding to that pixel is determined.

If the number of `rasterizationSamples` is identical to the number of samples in the color attachments, a color sample is covered if the pixel coverage sample with the same sample index is covered.

Otherwise, the coverage for each color sample is computed from the pixel coverage as follows.

If the `VK_AMD_mixed_attachment_samples` extension is enabled, for color samples present in the color attachments, a color sample is covered if the pixel coverage sample with the same sample index is covered; additional pixel coverage samples are discarded.

If the `pNext` chain of `VkSubpassDescription2` or `VkRenderingInfo` includes a
VkMultisampledRenderToSingleSampledInfoEXT structure with the multisampledRenderToSingleSampledEnable field equal to VK_TRUE, sample coverage is calculated as if the attachment has VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples samples.

When the VK_NV_coverage_reduction_mode extension is enabled, the pipeline state controlling coverage reduction is specified through the members of the VkPipelineCoverageReductionStateCreateInfoNV structure.

The VkPipelineCoverageReductionStateCreateInfoNV structure is defined as:

```c
// Provided by VK_NV_coverage_reduction_mode
typedef struct VkPipelineCoverageReductionStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCoverageReductionStateCreateFlagsNV flags;
    VkCoverageReductionModeNV coverageReductionMode;
} VkPipelineCoverageReductionStateCreateInfoNV;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **coverageReductionMode** is a VkCoverageReductionModeNV value controlling how color sample coverage is generated from pixel coverage.

If this structure is not included in the pNext chain, or if the extension is not enabled, the default coverage reduction mode is inferred as follows:

- If the VK_NV_framebuffer_mixed_samples extension is enabled, then it is as if the coverageReductionMode is VK_COVERAGE_REDUCTION_MODE_MERGE_NV.
- If the VK_AMD_mixed_attachment_samples extension is enabled, then it is as if the coverageReductionMode is VK_COVERAGE_REDUCTION_MODE_TRUNCATE_NV.
- If both VK_NV_framebuffer_mixed_samples and VK_AMD_mixed_attachment_samples are enabled, then the default coverage reduction mode is implementation-dependent.

**Valid Usage (Implicit)**

- VUID-VkPipelineCoverageReductionStateCreateInfoNV-sType-sType
  **sType** must be VK_STRUCTURE_TYPE_PIPELINE_COVERAGE_REDUCTION_STATE_CREATE_INFO_NV
- VUID-VkPipelineCoverageReductionStateCreateInfoNV-flags-zerobitmask
  **flags** must be 0
- VUID-VkPipelineCoverageReductionStateCreateInfoNV-coverageReductionMode-parameter
  **coverageReductionMode** must be a valid VkCoverageReductionModeNV value
typedef VkFlags VkPipelineCoverageReductionStateCreateFlagsNV;

VkPipelineCoverageReductionStateCreateFlagsNV is a bitmask type for setting a mask, but is currently reserved for future use.

Possible values of VkPipelineCoverageReductionStateCreateInfoNV::coverageReductionMode, specifying how color sample coverage is generated from pixel coverage, are:

typedef enum VkCoverageReductionModeNV {
    VK_COVERAGE_REDUCTION_MODE_MERGE_NV = 0,
    VK_COVERAGE_REDUCTION_MODE_TRUNCATE_NV = 1,
} VkCoverageReductionModeNV;

- **VK_COVERAGE_REDUCTION_MODE_MERGE_NV** specifies that each color sample will be associated with an implementation-dependent subset of samples in the pixel coverage. If any of those associated samples are covered, the color sample is covered.

- **VK_COVERAGE_REDUCTION_MODE_TRUNCATE_NV** specifies that for color samples present in the color attachments, a color sample is covered if the pixel coverage sample with the same sample index i is covered; other pixel coverage samples are discarded.

To **dynamically set** the **coverageReductionMode** state, call:

void vkCmdSetCoverageReductionModeNV(
    VkCommandBuffer commandBuffer,
    VkCoverageReductionModeNV coverageReductionMode);

- **commandBuffer** is the command buffer into which the command will be recorded.
- **coverageReductionMode** specifies the **coverageReductionMode** state.

This command sets the **coverageReductionMode** state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_COVERAGE_REDUCTION_MODE_NV set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineCoverageReductionStateCreateInfoNV::coverageReductionMode value used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetCoverageReductionModeNV-None-08528
  Either the extendedDynamicState3CoverageReductionMode feature or the shaderObject feature or both **must** be enabled.
Valid Usage (Implicit)

- VUID-vkCmdSetCoverageReductionModeNV-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetCoverageReductionModeNV-coverageReductionMode-parameter
  
  `coverageReductionMode` must be a valid `VkCoverageReductionModeNV` value

- VUID-vkCmdSetCoverageReductionModeNV-commandBuffer-recording
  
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetCoverageReductionModeNV-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetCoverageReductionModeNV-videocoding
  
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

To query the set of mixed sample combinations of coverage reduction mode, rasterization samples and color, depth, stencil attachment sample counts that are supported by a physical device, call:

```c
// Provided by VK_NV_coverage_reduction_mode
VkResult vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV(
    VkPhysicalDevice physicalDevice,  // physicalDevice is the physical device from which to query the set of combinations.
    uint32_t* pCombinationCount,      // pCombinationCount is a pointer to an integer related to the number of combinations available or queried, as described below.
    VkFramebufferMixedSamplesCombinationNV* pCombinations); // pCombinations is either NULL or a pointer to an array of
```
VkFramebufferMixedSamplesCombinationNV values, indicating the supported combinations of coverage reduction mode, rasterization samples, and color, depth, stencil attachment sample counts.

If pCombinations is NULL, then the number of supported combinations for the given physicalDevice is returned in pCombinationCount. Otherwise, pCombinationCount must point to a variable set by the user to the number of elements in the pCombinations array, and on return the variable is overwritten with the number of values actually written to pCombinations. If the value of pCombinationCount is less than the number of combinations supported for the given physicalDevice, at most pCombinationCount values will be written to pCombinations, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the supported values were returned.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV-physicalDevice-parameter physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV-pCombinationCount-parameter pCombinationCount must be a valid pointer to a uint32_t value
- VUID-vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV-pCombinations-parameter If the value referenced by pCombinationCount is not 0, and pCombinations is not NULL, pCombinations must be a valid pointer to an array of pCombinationCount VkFramebufferMixedSamplesCombinationNV structures

Return Codes

Success
- VK_SUCCESS
- VK_INCOMPLETE

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkFramebufferMixedSamplesCombinationNV structure is defined as:

```c
// Provided by VK_NV_coverage_reduction_mode
typedef struct VkFramebufferMixedSamplesCombinationNV {
    VkStructureType sType;
    void* pNext;
    VkCoverageReductionModeNV coverageReductionMode;
    VkSampleCountFlagBits rasterizationSamples;
    VkSampleCountFlags depthStencilSamples;
} VkFramebufferMixedSamplesCombinationNV;
```
VkSampleCountFlags colorSamples;
} VkFramebufferMixedSamplesCombinationNV;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• coverageReductionMode is a VkCoverageReductionModeNV value specifying the coverage reduction mode.
• rasterizationSamples is a VkSampleCountFlagBits specifying the number of rasterization samples in the supported combination.
• depthStencilSamples specifies the number of samples in the depth stencil attachment in the supported combination. A value of 0 indicates the combination does not have a depth stencil attachment.
• colorSamples specifies the number of color samples in a color attachment in the supported combination. A value of 0 indicates the combination does not have a color attachment.

Valid Usage (Implicit)

• VUID-VkFramebufferMixedSamplesCombinationNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_FRAMEBUFFER_MIXED_SAMPLES_COMBINATION_NV
• VUID-VkFramebufferMixedSamplesCombinationNV-pNext-pNext
  pNext must be NULL

29.14.3. Coverage Modulation

As part of coverage reduction, fragment color values can also be modulated (multiplied) by a value that is a function of fraction of covered rasterization samples associated with that color sample.

Pipeline state controlling coverage modulation is specified through the members of the VkPipelineCoverageModulationStateCreateInfoNV structure.

The VkPipelineCoverageModulationStateCreateInfoNV structure is defined as:

```c
// Provided by VK_NV_framebuffer_mixed_samples
typedef struct VkPipelineCoverageModulationStateCreateInfoNV {
  VkStructureType sType;
  const void* pNext;
  VkPipelineCoverageModulationStateCreateFlagsNV flags;
  VkCoverageModulationModeNV coverageModulationMode;
  VkBool32 coverageModulationTableEnable;
  uint32_t coverageModulationTableCount;
  const float* coverageModulationTable;
} VkPipelineCoverageModulationStateCreateInfoNV;
```

• sType is a VkStructureType value identifying this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.

• `flags` is reserved for future use.

• `coverageModulationMode` is a `VkCoverageModulationModeNV` value controlling which color components are modulated.

• `coverageModulationTableEnable` controls whether the modulation factor is looked up from a table in `pCoverageModulationTable`.

• `coverageModulationTableCount` is the number of elements in `pCoverageModulationTable`.

• `pCoverageModulationTable` is a table of modulation factors containing a value for each number of covered samples.

If `coverageModulationTableEnable` is `VK_FALSE`, then for each color sample the associated bits of the pixel coverage are counted and divided by the number of associated bits to produce a modulation factor `R` in the range (0,1] (a value of zero would have been killed due to a color coverage of 0). Specifically:

• `N = value of rasterizationSamples`

• `M = value of VkAttachmentDescription::samples for any color attachments`

• `R = popcount(associated coverage bits) / (N / M)`

If `coverageModulationTableEnable` is `VK_TRUE`, the value `R` is computed using a programmable lookup table. The lookup table has `N / M` elements, and the element of the table is selected by:

• `R = pCoverageModulationTable[popcount(associated coverage bits)-1]`

Note that the table does not have an entry for `popcount(associated coverage bits) = 0`, because such samples would have been killed.

The values of `pCoverageModulationTable` may be rounded to an implementation-dependent precision, which is at least as fine as `1 / N`, and clamped to [0,1].

For each color attachment with a floating point or normalized color format, each fragment output color value is replicated to `M` values which can each be modulated (multiplied) by that color sample’s associated value of `R`. Which components are modulated is controlled by `coverageModulationMode`.

If this structure is not included in the `pNext` chain, it is as if `coverageModulationMode` is `VK_COVERAGE_MODULATION_MODE_NONE_NV`.

If the coverage reduction mode is `VK_COVERAGE_REDUCTION_MODE_TRUNCATE_NV`, each color sample is associated with only a single coverage sample. In this case, it is as if `coverageModulationMode` is `VK_COVERAGE_MODULATION_MODE_NONE_NV`.

Valid Usage

• VUID-VkPipelineCoverageModulationStateCreateInfoNV-coverageModulationTableEnable-01405
  If `coverageModulationTableEnable` is `VK_TRUE`, `coverageModulationTableCount` must be equal
to the number of rasterization samples divided by the number of color samples in the subpass

### Valid Usage (Implicit)

- **VUID-VkPipelineCoverageModulationStateCreateInfoNV-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_COVERAGE_MODULATION_STATE_CREATE_INFO_NV`

- **VUID-VkPipelineCoverageModulationStateCreateInfoNV-flags-zerobitmask**
  - `flags` must be 0

- **VUID-VkPipelineCoverageModulationStateCreateInfoNV-coverageModulationMode-parameter**
  - `coverageModulationMode` must be a valid `VkCoverageModulationModeNV` value

// Provided by VK_NV_framebuffer_mixed_samples

```c
typedef VkFlags VkPipelineCoverageModulationStateCreateFlagsNV;
```

`VkPipelineCoverageModulationStateCreateFlagsNV` is a bitmask type for setting a mask, but is currently reserved for future use.

Possible values of `VkPipelineCoverageModulationStateCreateInfoNV::coverageModulationMode`, specifying which color components are modulated, are:

// Provided by VK_NV_framebuffer_mixed_samples

```c
typedef enum VkCoverageModulationModeNV {
    VK_COVERAGE_MODULATION_MODE_NONE_NV = 0,
    VK_COVERAGE_MODULATION_MODE_RGB_NV = 1,
    VK_COVERAGE_MODULATION_MODE_ALPHA_NV = 2,
    VK_COVERAGE_MODULATION_MODE_RGBA_NV = 3,
} VkCoverageModulationModeNV;
```

- **VK_COVERAGE_MODULATION_MODE_NONE_NV** specifies that no components are multiplied by the modulation factor.
- **VK_COVERAGE_MODULATION_MODE_RGB_NV** specifies that the red, green, and blue components are multiplied by the modulation factor.
- **VK_COVERAGE_MODULATION_MODE_ALPHA_NV** specifies that the alpha component is multiplied by the modulation factor.
- **VK_COVERAGE_MODULATION_MODE_RGBA_NV** specifies that all components are multiplied by the modulation factor.

To **dynamically set** the `coverageModulationMode` state, call:

// Provided by VK_EXT_extended_dynamic_state3 with VK_NV_framebuffer_mixed_samples,
// VK_EXT_shader_object with VK_NV_framebuffer_mixed_samples
void vkCmdSetCoverageModulationModeNV(
    VkCommandBuffer commandBuffer,
    VkCoverageModulationModeNV coverageModulationMode);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `coverageModulationMode` specifies the `coverageModulationMode` state.

This command sets the `coverageModulationMode` state for subsequent drawing commands when drawing using shader objects, or the graphics pipeline is created with `VK_DYNAMIC_STATE_COVERAGE_MODULATION_MODE_NV` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineCoverageModulationStateCreateInfoNV::coverageModulationMode` value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetCoverageModulationModeNV-None-08530**
  
  Either the `extendedDynamicState3CoverageModulationMode` feature or the `shaderObject` feature or both **must** be enabled

### Valid Usage (Implicit)

- **VUID-vkCmdSetCoverageModulationModeNV-commandBuffer-parameter**
  
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetCoverageModulationModeNV-coverageModulationMode-parameter**
  
  `coverageModulationMode` **must** be a valid `VkCoverageModulationModeNV` value

- **VUID-vkCmdSetCoverageModulationModeNV-commandBuffer-recording**
  
  `commandBuffer` **must** be in the recording state

- **VUID-vkCmdSetCoverageModulationModeNV-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- **VUID-vkCmdSetCoverageModulationModeNV-videocoding**
  
  This command **must** only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized
Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

<td>State</td>
</tr>
</tbody>
</table>

To **dynamically set** the `coverageModulationTableEnable` state, call:

```c
void vkCmdSetCoverageModulationTableEnableNV(
    VkCommandBuffer commandBuffer,
    VkBool32 coverageModulationTableEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `coverageModulationTableEnable` specifies the `coverageModulationTableEnable` state.

This command sets the `coverageModulationTableEnable` state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineCoverageModulationStateCreateInfoNV::coverageModulationTableEnable` value used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetCoverageModulationTableEnableNV-None-08532
  
  Either the `extendedDynamicState3CoverageModulationTableEnable` feature or the `shaderObject` feature or both **must** be enabled

**Valid Usage (Implicit)**

- VUID-vkCmdSetCoverageModulationTableEnableNV-commandBuffer-parameter
  
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetCoverageModulationTableEnableNV-commandBuffer-recording
  
  `commandBuffer` **must** be in the `recording` state

- VUID-vkCmdSetCoverageModulationTableEnableNV-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- VUID-vkCmdSetCoverageModulationTableEnableNV-videocoding
  
  This command **must** only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

</table>

To dynamically set the `pCoverageModulationTable` state, call:

```c
void vkCmdSetCoverageModulationTableNV(
    VkCommandBuffer commandBuffer,
    uint32_t coverageModulationTableCount,
    const float* pCoverageModulationTable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `coverageModulationTableCount` specifies the number of elements in `pCoverageModulationTable`.
- `pCoverageModulationTable` specifies the table of modulation factors containing a value for each number of covered samples.

This command sets the table of modulation factors for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_NV` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineCoverageModulationStateCreateInfoNV::coverageModulationTableCount`, and `VkPipelineCoverageModulationStateCreateInfoNV::pCoverageModulationTable` values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetCoverageModulationTableNV-None-08534
  Either the extendedDynamicState3CoverageModulationTable feature or the shaderObject feature or both must be enabled
Valid Usage (Implicit)

- VUID-vkCmdSetCoverageModulationTableNV-commandBuffer-parameter
  \texttt{commandBuffer} must be a valid \texttt{VkCommandBuffer} handle

- VUID-vkCmdSetCoverageModulationTableNV-pCoverageModulationTable-parameter
  \texttt{pCoverageModulationTable} must be a valid pointer to an array of \textit{coverageModulationTableCount float} values

- VUID-vkCmdSetCoverageModulationTableNV-commandBuffer-recording
  \texttt{commandBuffer} must be in the recording state

- VUID-vkCmdSetCoverageModulationTableNV-commandBuffer-cmdpool
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must support graphics operations

- VUID-vkCmdSetCoverageModulationTableNV-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdSetCoverageModulationTableNV-coverageModulationTableCount-arraylength
  \texttt{coverageModulationTableCount} must be greater than 0

Chapter 30. The Framebuffer

30.1. Blending

Blending combines the incoming source fragment’s R, G, B, and A values with the destination R, G, B, and A values of each sample stored in the framebuffer at the fragment’s \((x_f, y_f)\) location. Blending is performed for each color sample covered by the fragment, rather than just once for each fragment.

Source and destination values are combined according to the blend operation, quadruplets of source and destination weighting factors determined by the blend factors, and a blend constant, to obtain a new set of R, G, B, and A values, as described below.

Blending is computed and applied separately to each color attachment used by the subpass, with separate controls for each attachment.

Prior to performing the blend operation, signed and unsigned normalized fixed-point color components undergo an implied conversion to floating-point as specified by Conversion from Normalized Fixed-Point to Floating-Point. Blending computations are treated as if carried out in floating-point, and basic blend operations are performed with a precision and dynamic range no lower than that used to represent destination components. Advanced blending operations are performed with a precision and dynamic range no lower than the smaller of that used to represent destination components or that used to represent 16-bit floating-point values.

Note

Blending is only defined for floating-point, UNORM, SNORM, and sRGB formats. Within those formats, the implementation may only support blending on some subset of them. Which formats support blending is indicated by VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT.

The pipeline blend state is included in the VkPipelineColorBlendStateCreateInfo structure during graphics pipeline creation:

The VkPipelineColorBlendStateCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineColorBlendStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineColorBlendStateCreateFlags flags;
    VkBool32 logicOpEnable;
    VkLogicOp logicOp;
    uint32_t attachmentCount;
    const VkPipelineColorBlendAttachmentState* pAttachments;
    float blendConstants[4];
} VkPipelineColorBlendStateCreateInfo;
```

- `sType` is a VkStructureType value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.

• **flags** is a bitmask of VkPipelineColorBlendStateCreateFlagBits specifying additional color blending information.

• **logicOpEnable** controls whether to apply Logical Operations.

• **logicOp** selects which logical operation to apply.

• **attachmentCount** is the number of VkPipelineColorBlendAttachmentState elements in pAttachments. It is ignored if the pipeline is created with VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT, VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT, and VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT dynamic states set, and either VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT set or advancedBlendCoherentOperations is not enabled on the device.

• **pAttachments** is a pointer to an array of VkPipelineColorBlendAttachmentState structures defining blend state for each color attachment. It is ignored if the pipeline is created with VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT, VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT, and VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT dynamic states set, and either VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT set or advancedBlendCoherentOperations is not enabled on the device.

• **blendConstants** is a pointer to an array of four values used as the R, G, B, and A components of the blend constant that are used in blending, depending on the blend factor.

---

### Valid Usage

• **VUID-VkPipelineColorBlendStateCreateInfo-pAttachments-00605**  
  If the independentBlend feature is not enabled, all elements of pAttachments must be identical

• **VUID-VkPipelineColorBlendStateCreateInfo-logicOpEnable-00606**  
  If the logicOp feature is not enabled, logicOpEnable must be VK_FALSE

• **VUID-VkPipelineColorBlendStateCreateInfo-logicOpEnable-00607**  
  If logicOpEnable is VK_TRUE, logicOp must be a valid VkLogicOp value

• **VUID-VkPipelineColorBlendStateCreateInfo-rasterizationOrderColorAttachmentAccess-06465**  
  If the rasterizationOrderColorAttachmentAccess feature is not enabled, flags must not include VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT

• **VUID-VkPipelineColorBlendStateCreateInfo-pAttachments-07353**  
  If attachmentCount is not 0, and any of VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT, VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT, VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT, or VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT are not set, pAttachments must be a valid pointer to an array of attachmentCount valid VkPipelineColorBlendAttachmentState structures
Valid Usage (Implicit)

- **VUID-VkPipelineColorBlendStateCreateInfo-sType-sType**
  
  The `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_COLOR_BLEND_STATE_CREATE_INFO`.

- **VUID-VkPipelineColorBlendStateCreateInfo-pNext-pNext**
  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkPipelineColorBlendAdvancedStateCreateInfoEXT` or `VkPipelineColorWriteCreateInfoEXT`.

- **VUID-VkPipelineColorBlendStateCreateInfo-sType-unique**
  
  The `sType` value of each struct in the `pNext` chain must be unique.

- **VUID-VkPipelineColorBlendStateCreateInfo-flags-parameter**
  
  The `flags` must be a valid combination of `VkPipelineColorBlendStateCreateFlagBits` values.

- **VUID-VkPipelineColorBlendStateCreateInfo-pAttachments-parameter**
  
  If `attachmentCount` is not 0, and `pAttachments` is not `NULL`, `pAttachments` must be a valid pointer to an array of `attachmentCount` valid `VkPipelineColorBlendAttachmentState` structures.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineColorBlendStateCreateFlags;

VkPipelineColorBlendStateCreateFlags is a bitmask type for setting a mask of zero or more `VkPipelineColorBlendStateCreateFlagBits`.

Bits which can be set in the `VkPipelineColorBlendStateCreateInfo::flags` parameter are:

```c
// Provided by VK_EXT_rasterization_order_attachment_access
typedef enum VkPipelineColorBlendStateCreateFlagBits {
    // Provided by VK_EXT_rasterization_order_attachment_access
    VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT = 0x00000001,
    // Provided by VK_ARM_rasterization_order_attachment_access
    VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_ARM = VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT,
} VkPipelineColorBlendStateCreateFlagBits;
```

- **VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT** indicates that access to color and input attachments will have implicit framebuffer-local memory dependencies, allowing applications to express custom blending operations in a fragment shader.

When **VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT** is included in a pipeline, it forms a framebuffer-local memory dependency for each fragment generated by draw commands for that pipeline with the following scopes:
The first synchronization scope includes the VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT pipeline stage executed by all previous fragments (as defined by primitive order) in the corresponding framebuffer regions including those generated by the same draw command.

The second synchronization scope includes the VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT pipeline stage executed by the generated fragment.

The first access scope includes all writes to color attachments.

The second access scope includes all reads from input attachments.

The VkPipelineColorBlendAttachmentState structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineColorBlendAttachmentState {
    VkBool32 blendEnable;
    VkBlendFactor srcColorBlendFactor;
    VkBlendFactor dstColorBlendFactor;
    VkBlendOp colorBlendOp;
    VkBlendFactor srcAlphaBlendFactor;
    VkBlendFactor dstAlphaBlendFactor;
    VkBlendOp alphaBlendOp;
    VkColorComponentFlags colorWriteMask;
} VkPipelineColorBlendAttachmentState;
```

- **blendEnable** controls whether blending is enabled for the corresponding color attachment. If blending is not enabled, the source fragment’s color for that attachment is passed through unmodified.

- **srcColorBlendFactor** selects which blend factor is used to determine the source factors \((S_r, S_g, S_b)\).

- **dstColorBlendFactor** selects which blend factor is used to determine the destination factors \((D_r, D_g, D_b)\).

- **colorBlendOp** selects which blend operation is used to calculate the RGB values to write to the color attachment.

- **srcAlphaBlendFactor** selects which blend factor is used to determine the source factor \(S_a\).

- **dstAlphaBlendFactor** selects which blend factor is used to determine the destination factor \(D_a\).

- **alphaBlendOp** selects which blend operation is used to calculate the alpha values to write to the color attachment.

- **colorWriteMask** is a bitmask of VkColorComponentFlagBits specifying which of the R, G, B, and/or A components are enabled for writing, as described for the Color Write Mask.

**Valid Usage**

- VUID-VkPipelineColorBlendAttachmentState-srcColorBlendFactor-00608
  If the dualSrcBlend feature is not enabled, srcColorBlendFactor must not be
  VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR,
  VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA
If the dualSrcBlend feature is not enabled, dstColorBlendFactor must not be
VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR, 
VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA

If the dualSrcBlend feature is not enabled, srcAlphaBlendFactor must not be
VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR, 
VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA

If the dualSrcBlend feature is not enabled, dstAlphaBlendFactor must not be
VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR, 
VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA

If either of colorBlendOp or alphaBlendOp is an advanced blend operation, then 
colorBlendOp must equal alphaBlendOp

If VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT::advancedBlendIndependentBlend is VK_FALSE and colorBlendOp is an advanced blend operation, then colorBlendOp must be the same for all attachments

If VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT::advancedBlendIndependentBlend is VK_FALSE and alphaBlendOp is an advanced blend operation, then alphaBlendOp must be the same for all attachments

If VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT::advancedBlendAllOperations is VK_FALSE, then colorBlendOp must not be VK_BLEND_OP_ZERO_EXT, VK_BLEND_OP_SRC_EXT, 
VK_BLEND_OP_DST_EXT, VK_BLEND_OP_SRC_OVER_EXT, VK_BLEND_OP_DST_OVER_EXT, 
VK_BLEND_OP_SRC_IN_EXT, VK_BLEND_OP_DST_IN_EXT, VK_BLEND_OP_SRC_ATOP_EXT, VK_BLEND_OP_DST_ATOP_EXT, 
VK_BLEND_OP_XOR_EXT, VK_BLEND_OP_INVERT_EXT, VK_BLEND_OP_INVERT_RGB_EXT, 
VK_BLEND_OP_LINEARDODGE_EXT, VK_BLEND_OP_LINEARBURN_EXT, VK_BLEND_OP_VIVIDLIGHT_EXT, 
VK_BLEND_OP_LINEARLIGHT_EXT, VK_BLEND_OP_PINLIGHT_EXT, VK_BLEND_OP_HARDMIX_EXT, 
VK_BLEND_OP_PLUS_EXT, VK_BLEND_OP_PLUS_CLAMPED_EXT, VK_BLEND_OP_PLUS_CLAMPED_ALPHA_EXT, 
VK_BLEND_OP_PLUS_DARKER_EXT, VK_BLEND_OP_MINUS_EXT, VK_BLEND_OP_MINUS_CLAMPED_EXT, 
VK_BLEND_OP_CONTRAST_EXT, VK_BLEND_OP_INVERT_OVG_EXT, VK_BLEND_OP_RED_EXT, 
VK_BLEND_OP_GREEN_EXT, or VK_BLEND_OP_BLUE_EXT

If colorBlendOp or alphaBlendOp is an advanced blend operation, then colorAttachmentCount of the subpass this pipeline is compiled against must be less than or equal to VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT::advancedBlendMaxColorAttachments

If the VK_KHR_portability_subset extension is enabled, and 
VkPhysicalDevicePortabilitySubsetFeaturesKHR::constantAlphaColorBlendFactors is VK_FALSE, srcColorBlendFactor must not be VK_BLEND_FACTOR_CONSTANT_ALPHA or
If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::constantAlphaColorBlendFactors` is `VK_FALSE`, `dstColorBlendFactor must not` be `VK_BLEND_FACTOR_CONSTANT_ALPHA` or `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA`.

### Valid Usage (Implicit)

- **VUID-VkPipelineColorBlendAttachmentState-srcColorBlendFactor-parameter**
  - `srcColorBlendFactor must` be a valid `VkBlendFactor` value
- **VUID-VkPipelineColorBlendAttachmentState-dstColorBlendFactor-parameter**
  - `dstColorBlendFactor must` be a valid `VkBlendFactor` value
- **VUID-VkPipelineColorBlendAttachmentState-colorBlendOp-parameter**
  - `colorBlendOp must` be a valid `VkBlendOp` value
- **VUID-VkPipelineColorBlendAttachmentState-srcAlphaBlendFactor-parameter**
  - `srcAlphaBlendFactor must` be a valid `VkBlendFactor` value
- **VUID-VkPipelineColorBlendAttachmentState-dstAlphaBlendFactor-parameter**
  - `dstAlphaBlendFactor must` be a valid `VkBlendFactor` value
- **VUID-VkPipelineColorBlendAttachmentState-alphaBlendOp-parameter**
  - `alphaBlendOp must` be a valid `VkBlendOp` value
- **VUID-VkPipelineColorBlendAttachmentState-colorWriteMask-parameter**
  - `colorWriteMask must` be a valid combination of `VkColorComponentFlagBits` values

To **dynamically set** `blendEnable`, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetColorBlendEnableEXT(
  VkCommandBuffer commandBuffer,
  uint32_t firstAttachment,
  uint32_t attachmentCount,
  const VkBool32* pColorBlendEnables);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstAttachment` the first color attachment the color blending enable applies.
- `attachmentCount` the number of color blending enables in the `pColorBlendEnables` array.
- `pColorBlendEnables` an array of booleans to indicate whether color blending is enabled for the corresponding attachment.

This command sets the color blending enable of the specified color attachments for subsequent drawing commands when drawing using **shader objects**, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo`.
To dynamically set color blend factors and operations, call:

```markdown
2650
```
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object

```c
void vkCmdSetColorBlendEquationEXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstAttachment,
    uint32_t attachmentCount,
    const VkColorBlendEquationEXT* pColorBlendEquations);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **firstAttachment** is the first color attachment the color blend factors and operations apply to.
- **attachmentCount** is the number of `VkColorBlendEquationEXT` elements in the `pColorBlendEquations` array.
- **pColorBlendEquations** is an array of `VkColorBlendEquationEXT` structs that specify the color blend factors and operations for the corresponding attachments.

This command sets the color blending factors and operations of the specified attachments for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendAttachmentState::srcColorBlendFactor`, `VkPipelineColorBlendAttachmentState::dstColorBlendFactor`, `VkPipelineColorBlendAttachmentState::colorBlendOp`, `VkPipelineColorBlendAttachmentState::srcAlphaBlendFactor`, `VkPipelineColorBlendAttachmentState::dstAlphaBlendFactor`, and `VkPipelineColorBlendAttachmentState::alphaBlendOp` values used to create the currently active pipeline.

**Valid Usage**

- **VUID-vkCmdSetColorBlendEquationEXT-None-08538**
  Either the `extendedDynamicState3ColorBlendEquation` feature or the `shaderObject` feature or both must be enabled

**Valid Usage ( Implicit )**

- **VUID-vkCmdSetColorBlendEquationEXT-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- **VUID-vkCmdSetColorBlendEquationEXT-pColorBlendEquations-parameter**
  `pColorBlendEquations` must be a valid pointer to an array of `attachmentCount` valid `VkColorBlendEquationEXT` structures
- **VUID-vkCmdSetColorBlendEquationEXT-commandBuffer-recording**
  `commandBuffer` must be in the recording state
- **VUID-vkCmdSetColorBlendEquationEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
• VUID-vkCmdSetColorBlendEquationEXT-videocoding
  This command must only be called outside of a video coding scope
• VUID-vkCmdSetColorBlendEquationEXT-attachmentCount-arraylength
  attachmentCount must be greater than 0

**Host Synchronization**

• Host access to commandBuffer must be externally synchronized
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The VkColorBlendEquationEXT structure is defined as:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
typedef struct VkColorBlendEquationEXT {
    VkBlendFactor srcColorBlendFactor;
    VkBlendFactor dstColorBlendFactor;
    VkBlendOp colorBlendOp;
    VkBlendFactor srcAlphaBlendFactor;
    VkBlendFactor dstAlphaBlendFactor;
    VkBlendOp alphaBlendOp;
} VkColorBlendEquationEXT;
```

• `srcColorBlendFactor` selects which blend factor is used to determine the source factors \((S_r, S_g, S_b)\).
• `dstColorBlendFactor` selects which blend factor is used to determine the destination factors \((D_r, D_g, D_b)\).
• `colorBlendOp` selects which blend operation is used to calculate the RGB values to write to the color attachment.
• `srcAlphaBlendFactor` selects which blend factor is used to determine the source factor \(S_a\).
• `dstAlphaBlendFactor` selects which blend factor is used to determine the destination factor \(D_a\).
• `alphaBlendOp` selects which blend operation is use to calculate the alpha values to write to the color attachment.
Valid Usage

- **VUID-VkColorBlendEquationEXT-dualSrcBlend-07357**
  If the dualSrcBlend feature is not enabled, `srcColorBlendFactor` must not be
  `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`.

- **VUID-VkColorBlendEquationEXT-dualSrcBlend-07358**
  If the dualSrcBlend feature is not enabled, `dstColorBlendFactor` must not be
  `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`.

- **VUID-VkColorBlendEquationEXT-dualSrcBlend-07359**
  If the dualSrcBlend feature is not enabled, `srcAlphaBlendFactor` must not be
  `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`.

- **VUID-VkColorBlendEquationEXT-dualSrcBlend-07360**
  If the dualSrcBlend feature is not enabled, `dstAlphaBlendFactor` must not be
  `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`.

- **VUID-VkColorBlendEquationEXT-colorBlendOp-07361**

- **VUID-VkColorBlendEquationEXT-constantAlphaColorBlendFactors-07362**
  If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::constantAlphaColorBlendFactors` is `VK_FALSE`, `srcColorBlendFactor` must not be `VK_BLEND_FACTOR_CONSTANT_ALPHA` or `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA`.

- **VUID-VkColorBlendEquationEXT-constantAlphaColorBlendFactors-07363**
  If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::constantAlphaColorBlendFactors` is `VK_FALSE`, `dstColorBlendFactor` must not be `VK_BLEND_FACTOR_CONSTANT_ALPHA` or `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA`.
Valid Usage (Implicit)

- `VUID-VkColorBlendEquationEXT-srcColorBlendFactor-parameter srcColorBlendFactor must be a valid VkBlendFactor value`
- `VUID-VkColorBlendEquationEXT-dstColorBlendFactor-parameter dstColorBlendFactor must be a valid VkBlendFactor value`
- `VUID-VkColorBlendEquationEXT-colorBlendOp-parameter colorBlendOp must be a valid VkBlendOp value`
- `VUID-VkColorBlendEquationEXT-srcAlphaBlendFactor-parameter srcAlphaBlendFactor must be a valid VkBlendFactor value`
- `VUID-VkColorBlendEquationEXT-dstAlphaBlendFactor-parameter dstAlphaBlendFactor must be a valid VkBlendFactor value`
- `VUID-VkColorBlendEquationEXT-alphaBlendOp-parameter alphaBlendOp must be a valid VkBlendOp value`

To dynamically set the color write masks, call:

```c
void vkCmdSetColorWriteMaskEXT(
    VkCommandBuffer commandBuffer, 
    uint32_t firstAttachment, 
    uint32_t attachmentCount, 
    const VkColorComponentFlags* pColorWriteMasks);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstAttachment` the first color attachment the color write masks apply to.
- `attachmentCount` the number of VkColorComponentFlags values in the `pColorWriteMasks` array.
- `pColorWriteMasks` an array of VkColorComponentFlags values that specify the color write masks of the corresponding attachments.

This command sets the color write masks of the specified attachments for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendAttachmentState::colorWriteMask` values used to create the currently active pipeline.

**Note**

Formats with bits that are shared between components specified by `VkColorComponentFlagBits`, such as `VK_FORMAT_E5B9G9R9_UFLOAT_PACK32`, cannot have their channels individually masked by this functionality; either all components that share bits have to be enabled, or none of them.
Valid Usage

• VUID-vkCmdSetColorWriteMaskEXT-None-08540
  Either the extendedDynamicState3ColorWriteMask feature or the shaderObject feature or both must be enabled

Valid Usage (Implicit)

• VUID-vkCmdSetColorWriteMaskEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdSetColorWriteMaskEXT-pColorWriteMasks-parameter
  pColorWriteMasks must be a valid pointer to an array of attachmentCount valid combinations of VkColorComponentFlagBits values

• VUID-vkCmdSetColorWriteMaskEXT-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdSetColorWriteMaskEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

• VUID-vkCmdSetColorWriteMaskEXT-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdSetColorWriteMaskEXT-attachmentCount-arraylength
  attachmentCount must be greater than 0

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

30.1.1. Blend Factors

The source and destination color and alpha blending factors are selected from the enum:
typedef enum VkBlendFactor {
    VK_BLEND_FACTOR_ZERO = 0,
    VK_BLEND_FACTOR_ONE = 1,
    VK_BLEND_FACTOR_SRC_COLOR = 2,
    VK_BLEND_FACTOR_ONE_MINUS_SRC_COLOR = 3,
    VK_BLEND_FACTOR_DST_COLOR = 4,
    VK_BLEND_FACTOR_ONE_MINUS_DST_COLOR = 5,
    VK_BLEND_FACTOR_SRC_ALPHA = 6,
    VK_BLEND_FACTOR_ONE_MINUS_SRC_ALPHA = 7,
    VK_BLEND_FACTOR_DST_ALPHA = 8,
    VK_BLEND_FACTOR_ONE_MINUS_DST_ALPHA = 9,
    VK_BLEND_FACTOR_CONSTANT_COLOR = 10,
    VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR = 11,
    VK_BLEND_FACTOR_CONSTANT_ALPHA = 12,
    VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA = 13,
    VK_BLEND_FACTOR_SRC_ALPHA_SATURATE = 14,
    VK_BLEND_FACTOR_SRC1_COLOR = 15,
    VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR = 16,
    VK_BLEND_FACTOR_SRC1_ALPHA = 17,
    VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA = 18,
} VkBlendFactor;

The semantics of the enum values are described in the table below:

<table>
<thead>
<tr>
<th>VkBlendFactor</th>
<th>RGB Blend Factors (S&lt;sub&gt;r&lt;/sub&gt;,S&lt;sub&gt;g&lt;/sub&gt;,S&lt;sub&gt;b&lt;/sub&gt;)</th>
<th>Alpha Blend Factor (S&lt;sub&gt;a&lt;/sub&gt; or D&lt;sub&gt;a&lt;/sub&gt;)</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_BLEND_FACTOR_ZERO</td>
<td>(0,0,0)</td>
<td>0</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE</td>
<td>(1,1,1)</td>
<td>1</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_SRC_COLOR</td>
<td>(R&lt;sub&gt;s0&lt;/sub&gt;,G&lt;sub&gt;s0&lt;/sub&gt;,B&lt;sub&gt;s0&lt;/sub&gt;)</td>
<td>A&lt;sub&gt;s0&lt;/sub&gt;</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE_MINUS_SRC_COLOR</td>
<td>(1-R&lt;sub&gt;s0&lt;/sub&gt;,1-G&lt;sub&gt;s0&lt;/sub&gt;,1-B&lt;sub&gt;s0&lt;/sub&gt;)</td>
<td>1-A&lt;sub&gt;s0&lt;/sub&gt;</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_DST_COLOR</td>
<td>(R&lt;sub&gt;d&lt;/sub&gt;,G&lt;sub&gt;d&lt;/sub&gt;,B&lt;sub&gt;d&lt;/sub&gt;)</td>
<td>A&lt;sub&gt;d&lt;/sub&gt;</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE_MINUS_DST_COLOR</td>
<td>(1-R&lt;sub&gt;d&lt;/sub&gt;,1-G&lt;sub&gt;d&lt;/sub&gt;,1-B&lt;sub&gt;d&lt;/sub&gt;)</td>
<td>1-A&lt;sub&gt;d&lt;/sub&gt;</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_SRC_ALPHA</td>
<td>(A&lt;sub&gt;s0&lt;/sub&gt;,A&lt;sub&gt;s0&lt;/sub&gt;,A&lt;sub&gt;s0&lt;/sub&gt;)</td>
<td>A&lt;sub&gt;s0&lt;/sub&gt;</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE_MINUS_SRC_ALPHA</td>
<td>(1-A&lt;sub&gt;s0&lt;/sub&gt;,1-A&lt;sub&gt;s0&lt;/sub&gt;,1-A&lt;sub&gt;s0&lt;/sub&gt;)</td>
<td>1-A&lt;sub&gt;s0&lt;/sub&gt;</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_DST_ALPHA</td>
<td>(A&lt;sub&gt;d&lt;/sub&gt;,A&lt;sub&gt;d&lt;/sub&gt;,A&lt;sub&gt;d&lt;/sub&gt;)</td>
<td>A&lt;sub&gt;d&lt;/sub&gt;</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE_MINUS_DST_ALPHA</td>
<td>(1-A&lt;sub&gt;d&lt;/sub&gt;,1-A&lt;sub&gt;d&lt;/sub&gt;,1-A&lt;sub&gt;d&lt;/sub&gt;)</td>
<td>1-A&lt;sub&gt;d&lt;/sub&gt;</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_CONSTANT_COLOR</td>
<td>(R&lt;sub&gt;c&lt;/sub&gt;,G&lt;sub&gt;c&lt;/sub&gt;,B&lt;sub&gt;c&lt;/sub&gt;)</td>
<td>A&lt;sub&gt;c&lt;/sub&gt;</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR</td>
<td>(1-R&lt;sub&gt;c&lt;/sub&gt;,1-G&lt;sub&gt;c&lt;/sub&gt;,1-B&lt;sub&gt;c&lt;/sub&gt;)</td>
<td>1-A&lt;sub&gt;c&lt;/sub&gt;</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_CONSTANT_ALPHA</td>
<td>(A&lt;sub&gt;c&lt;/sub&gt;,A&lt;sub&gt;c&lt;/sub&gt;,A&lt;sub&gt;c&lt;/sub&gt;)</td>
<td>A&lt;sub&gt;c&lt;/sub&gt;</td>
</tr>
</tbody>
</table>
**VkBlendFactor** | **RGB Blend Factors** \((S_r,S_g,S_b)\) or \((D_r,D_g,D_b)\) | **Alpha Blend Factor** \((S_a\text{ or } D_a)\)  
--- | --- | ---  
**VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA** | \((1-A_c,1-A_c,1-A_c)\) | \(1-A_c\)  
**VK_BLEND_FACTOR_SRC_ALPHA_SATURATE** | \((f,f); f = \min(A_s0,1-A_d)\) | \(1\)  
**VK_BLEND_FACTOR_SRC1_COLOR** | \((R_s1,G_s1,B_s1)\) | \(A_s1\)  
**VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR** | \((1-R_s1,1-G_s1,1-B_s1)\) | \(1-A_s1\)  
**VK_BLEND_FACTOR_SRC1_ALPHA** | \((A_s1,A_s1,A_s1)\) | \(A_s1\)  
**VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA** | \((1-A_s1,1-A_s1,1-A_s1)\) | \(1-A_s1\)

In this table, the following conventions are used:

- \(R_{s0},G_{s0},B_{s0}\) and \(A_{s0}\) represent the first source color R, G, B, and A components, respectively, for the fragment output location corresponding to the color attachment being blended.

- \(R_{s1},G_{s1},B_{s1}\) and \(A_{s1}\) represent the second source color R, G, B, and A components, respectively, used in dual source blending modes, for the fragment output location corresponding to the color attachment being blended.

- \(R_{d},G_{d},B_{d}\) and \(A_{d}\) represent the R, G, B, and A components of the destination color. That is, the color currently in the corresponding color attachment for this fragment/sample.

- \(R_{c},G_{c},B_{c}\) and \(A_{c}\) represent the blend constant R, G, B, and A components, respectively.

To **dynamically set and change** the blend constants, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetBlendConstants(
    VkCommandBuffer commandBuffer,  
    const float blendConstants[4]);
```

- **commandBuffer** is the command buffer into which the command will be recorded.

- **blendConstants** is a pointer to an array of four values specifying the \(R_c, G_c, B_c\), and \(A_c\) components of the blend constant color used in blending, depending on the **blend factor**.

This command sets blend constants for subsequent drawing commands when when drawing using **shader objects**, or the graphics pipeline is created with **VK_DYNAMIC_STATE_BLEND_CONSTANTS** set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**. Otherwise, this state is specified by the **VkPipelineColorBlendStateCreateInfo::blendConstants** values used to create the currently active pipeline.

---

**Valid Usage (Implicit)**

- VUID-vkCmdSetBlendConstants-commandBuffer-parameter  
  **commandBuffer** must be a valid **VkCommandBuffer** handle
• VUID-vkCmdSetBlendConstants-commandBuffer-recording
commandBuffer must be in the recording state

• VUID-vkCmdSetBlendConstants-commandBuffer-cmdpool
The VkCommandPool that commandBuffer was allocated from must support graphics operations

• VUID-vkCmdSetBlendConstants-videocoding
This command must only be called outside of a video coding scope

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

30.1.2. Dual-Source Blending

Blend factors that use the secondary color input \((R_{s1}, G_{s1}, B_{s1}, A_{s1})\) (\texttt{VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR, VK_BLEND_FACTOR_SRC1_ALPHA,} and \texttt{VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA}) may consume implementation resources that could otherwise be used for rendering to multiple color attachments. Therefore, the number of color attachments that can be used in a framebuffer may be lower when using dual-source blending.

Dual-source blending is only supported if the dualSrcBlend feature is enabled.

The maximum number of color attachments that can be used in a subpass when using dual-source blending functions is implementation-dependent and is reported as the maxFragmentDualSrcAttachments member of VkPhysicalDeviceLimits.

Color outputs can be bound to the first and second inputs of the blender using the Index decoration, as described in Fragment Output Interface. If the second color input to the blender is not written in the shader, or if no output is bound to the second input of a blender, the value of the second input is undefined.

30.1.3. Blend Operations

Once the source and destination blend factors have been selected, they along with the source and destination components are passed to the blending operations. RGB and alpha components can use
different operations. Possible values of `VkBlendOp`, specifying the operations, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkBlendOp {
    VK_BLEND_OP_ADD = 0,
    VK_BLEND_OP_SUBTRACT = 1,
    VK_BLEND_OP_REVERSE_SUBTRACT = 2,
    VK_BLEND_OP_MIN = 3,
    VK_BLEND_OP_MAX = 4,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_ZERO_EXT = 1000148000,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_SRC_EXT = 1000148001,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_DST_EXT = 1000148002,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_SRC_OVER_EXT = 1000148003,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_DST_OVER_EXT = 1000148004,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_SRC_IN_EXT = 1000148005,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_DST_IN_EXT = 1000148006,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_SRC_ATOP_EXT = 1000148009,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_DST_ATOP_EXT = 1000148010,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_XOR_EXT = 1000148011,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_MULTIPLY_EXT = 1000148012,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_SCREEN_EXT = 1000148013,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_OVERLAY_EXT = 1000148014,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_DARKEN_EXT = 1000148015,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_LIGHTEN_EXT = 1000148016,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_COLORDODGE_EXT = 1000148017,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_COLORBURN_EXT = 1000148018,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_HARDLIGHT_EXT = 1000148019,
};
```
VK_BLEND_OP_SOFTLIGHT_EXT = 1000148020,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_DIFFERENCE_EXT = 1000148021,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_EXCLUSION_EXT = 1000148022,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_INVERT_EXT = 1000148023,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_INVERT_RGB_EXT = 1000148024,

</tbody>
</table>

In this table, the following conventions are used:

- \( R_s, G_s, B_s \) and \( A_s \) represent the first source color R, G, B, and A components, respectively.
- \( R_d, G_d, B_d \) and \( A_d \) represent the R, G, B, and A components of the destination color. That is, the color currently in the corresponding color attachment for this fragment/sample.
- \( S_r, S_g, S_b \) and \( S_a \) represent the source blend factor R, G, B, and A components, respectively.
- \( D_r, D_g, D_b \) and \( D_a \) represent the destination blend factor R, G, B, and A components, respectively.

The blending operation produces a new set of values R, G, B, and A, which are written to the framebuffer attachment. If blending is not enabled for this attachment, then R, G, B and A are assigned \( R_s, G_s, B_s \) and \( A_s \), respectively.

If the color attachment is fixed-point, the components of the source and destination values and blend factors are each clamped to \([0,1]\) or \([-1,1]\) respectively for an unsigned normalized or signed normalized color attachment prior to evaluating the blend operations. If the color attachment is floating-point, no clamping occurs.

If the numeric format of a framebuffer attachment uses sRGB encoding, the R, G, and B destination color values (after conversion from fixed-point to floating-point) are considered to be encoded for the sRGB color space and hence are linearized prior to their use in blending. Each R, G, and B component is converted from nonlinear to linear as described in the “sRGB EOTF” section of the Khronos Data Format Specification. If the format is not sRGB, no linearization is performed.

If the numeric format of a framebuffer attachment uses sRGB encoding, then the final R, G and B values are converted into the nonlinear sRGB representation before being written to the framebuffer attachment as described in the “sRGB EOTF” section of the Khronos Data Format Specification.
Specification.

If the numeric format of a framebuffer color attachment is not sRGB encoded then the resulting c values for R, G and B are unmodified. The value of A is never sRGB encoded. That is, the alpha component is always stored in memory as linear.

If the framebuffer color attachment is VK_ATTACHMENT_UNUSED, no writes are performed through that attachment. Writes are not performed to framebuffer color attachments greater than or equal to the VkSubpassDescription::colorAttachmentCount or VkSubpassDescription2::colorAttachmentCount value.

30.1.4. Advanced Blend Operations

The advanced blend operations are those listed in tables f/X/Y/Z Advanced Blend Operations, Hue-Saturation-Luminosity Advanced Blend Operations, and Additional RGB Blend Operations.

If the pNext chain of VkPipelineColorBlendStateCreateInfo includes a VkPipelineColorBlendAdvancedStateCreateInfoEXT structure, then that structure includes parameters that affect advanced blend operations.

The VkPipelineColorBlendAdvancedStateCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_blend_operation_advanced
typedef struct VkPipelineColorBlendAdvancedStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 srcPremultiplied;
    VkBool32 dstPremultiplied;
    VkBlendOverlapEXT blendOverlap;
} VkPipelineColorBlendAdvancedStateCreateInfoEXT;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **srcPremultiplied** specifies whether the source color of the blend operation is treated as premultiplied.
- **dstPremultiplied** specifies whether the destination color of the blend operation is treated as premultiplied.
- **blendOverlap** is a VkBlendOverlapEXT value specifying how the source and destination sample's coverage is correlated.

If this structure is not present, srcPremultiplied and dstPremultiplied are both considered to be VK_TRUE, and blendOverlap is considered to be VK_BLEND_OVERLAP_UNCORRELATED_EXT.

**Valid Usage**

- VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-srcPremultiplied-01424
  If the non-premultiplied source color property is not supported, srcPremultiplied must be
If the non-premultiplied destination color property is not supported, `dstPremultiplied` must be `VK_TRUE`.

If the correlated overlap property is not supported, `blendOverlap` must be `VK_BLEND_OVERLAP_UNCORRELATED_EXT`.

Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_COLOR_BLEND_ADVANCED_STATE_CREATE_INFO_EXT`.
- `blendOverlap` must be a valid `VkBlendOverlapEXT` value.

To dynamically set the advanced blend state, call:

```c
void vkCmdSetColorBlendAdvancedEXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstAttachment,
    uint32_t attachmentCount,
    const VkColorBlendAdvancedEXT* pColorBlendAdvanced);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstAttachment` the first color attachment the advanced blend parameters apply to.
- `attachmentCount` the number of `VkColorBlendAdvancedEXT` elements in the `pColorBlendAdvanced` array.
- `pColorBlendAdvanced` an array of `VkColorBlendAdvancedEXT` structs that specify the advanced color blend parameters for the corresponding attachments.

This command sets the advanced blend operation parameters of the specified attachments for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendAdvancedStateCreateInfoEXT::srcPremultiplied`, `VkPipelineColorBlendAdvancedStateCreateInfoEXT::dstPremultiplied`, and `VkPipelineColorBlendAdvancedStateCreateInfoEXT::blendOverlap` values used to create the currently active pipeline.

Valid Usage

- `VUID-vkCmdSetColorBlendAdvancedEXT-None-08592`
Either the extendedDynamicState3ColorBlendAdvanced feature or the shaderObject feature or both must be enabled.

### Valid Usage (Implicit)

- VUID-vkCmdSetColorBlendAdvancedEXT-commandBuffer-parameter
  
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetColorBlendAdvancedEXT-pColorBlendAdvanced-parameter
  
  pColorBlendAdvanced must be a valid pointer to an array of attachmentCount valid VkColorBlendAdvancedEXT structures

- VUID-vkCmdSetColorBlendAdvancedEXT-commandBuffer-recording
  
  commandBuffer must be in the recording state

- VUID-vkCmdSetColorBlendAdvancedEXT-commandBuffer-cmdpool
  
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetColorBlendAdvancedEXT-videocoding
  
  This command must only be called outside of a video coding scope

- VUID-vkCmdSetColorBlendAdvancedEXT-attachmentCount-arraylength
  
  attachmentCount must be greater than 0

### Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The VkColorBlendAdvancedEXT structure is defined as:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
typedef struct VkColorBlendAdvancedEXT {
    VkBlendOp advancedBlendOp;
    VkBool32 srcPremultiplied;
    VkBool32 dstPremultiplied;
    VkBlendOverlapEXT blendOverlap;
};
```
 VkBool32 clampResults;
} VkColorBlendAdvancedEXT;

- **advancedBlendOp** selects which blend operation is used to calculate the RGB values to write to the color attachment.
- **srcPremultiplied** specifies whether the source color of the blend operation is treated as premultiplied.
- **dstPremultiplied** specifies whether the destination color of the blend operation is treated as premultiplied.
- **blendOverlap** is a VkBlendOverlapEXT value specifying how the source and destination sample’s coverage is correlated.
- **clampResults** specifies the results must be clamped to the [0,1] range before writing to the attachment, which is useful when the attachment format is not normalized fixed-point.

### Valid Usage

- **VUID-VkColorBlendAdvancedEXT-srcPremultiplied-07505**
  If the non-premultiplied source color property is not supported, **srcPremultiplied** must be **VK_TRUE**

- **VUID-VkColorBlendAdvancedEXT-dstPremultiplied-07506**
  If the non-premultiplied destination color property is not supported, **dstPremultiplied** must be **VK_TRUE**

- **VUID-VkColorBlendAdvancedEXT-blendOverlap-07507**
  If the correlated overlap property is not supported, **blendOverlap** must be **VK_BLEND_OVERLAP_UNCORRELATED_EXT**

### Valid Usage (Implicit)

- **VUID-VkColorBlendAdvancedEXT-advancedBlendOp-parameter**
  **advancedBlendOp** must be a valid VkBlendOp value

- **VUID-VkColorBlendAdvancedEXT-blendOverlap-parameter**
  **blendOverlap** must be a valid VkBlendOverlapEXT value

When using one of the operations in table f/X/Y/Z Advanced Blend Operations or Hue-Saturation-Luminosity Advanced Blend Operations, blending is performed according to the following equations:

\[
egin{align*}
R &= f(R_s', R_d') \cdot p_0(A_s, A_d) + Y \cdot R_s' \cdot p_1(A_s, A_d) + Z \cdot R_d' \cdot p_2(A_s, A_d) \\
G &= f(G_s', G_d') \cdot p_0(A_s, A_d) + Y \cdot G_s' \cdot p_1(A_s, A_d) + Z \cdot G_d' \cdot p_2(A_s, A_d) \\
B &= f(B_s', B_d') \cdot p_0(A_s, A_d) + Y \cdot B_s' \cdot p_1(A_s, A_d) + Z \cdot B_d' \cdot p_2(A_s, A_d) \\
A &= X \cdot p_0(A_s, A_d) + Y \cdot p_1(A_s, A_d) + Z \cdot p_2(A_s, A_d)
\end{align*}
\]

where the function \(f\) and terms \(X, Y, \text{ and } Z\) are specified in the table. The R, G, and B components of
the source color used for blending are derived according to srcPremultiplied. If srcPremultiplied is set to VK_TRUE, the fragment color components are considered to have been premultiplied by the A component prior to blending. The base source color \((R_s', G_s', B_s')\) is obtained by dividing through by the A component:

\[
(R_s', G_s', B_s') = \begin{cases} 
(0, 0, 0) & A_s = 0 \\
\left( \frac{R_s}{A_s'}, \frac{G_s}{A_s'}, \frac{B_s}{A_s} \right) & \text{otherwise}
\end{cases}
\]

If srcPremultiplied is VK_FALSE, the fragment color components are used as the base color:

\[
(R_s', G_s', B_s') = (R_s, G_s, B_s)
\]

The R, G, and B components of the destination color used for blending are derived according to dstPremultiplied. If dstPremultiplied is set to VK_TRUE, the destination components are considered to have been premultiplied by the A component prior to blending. The base destination color \((R_d', G_d', B_d')\) is obtained by dividing through by the A component:

\[
(R_d', G_d', B_d') = \begin{cases} 
(0, 0, 0) & A_d = 0 \\
\left( \frac{R_d}{A_d'}, \frac{G_d}{A_d'}, \frac{B_d}{A_d} \right) & \text{otherwise}
\end{cases}
\]

If dstPremultiplied is VK_FALSE, the destination color components are used as the base color:

\[
(R_d', G_d', B_d') = (R_d, G_d, B_d)
\]

When blending using advanced blend operations, we expect that the R, G, and B components of premultiplied source and destination color inputs be stored as the product of non-premultiplied R, G, and B component values and the A component of the color. If any R, G, or B component of a premultiplied input color is non-zero and the A component is zero, the color is considered ill-formed, and the corresponding component of the blend result is undefined.

All of the advanced blend operation formulas in this chapter compute the result as a premultiplied color. If dstPremultiplied is VK_FALSE, that result color’s R, G, and B components are divided by the A component before being written to the framebuffer. If any R, G, or B component of the color is non-zero and the A component is zero, the result is considered ill-formed, and the corresponding component of the blend result is undefined. If all components are zero, that value is unchanged.

If the A component of any input or result color is less than zero, the color is considered ill-formed, and all components of the blend result are undefined.

The weighting functions \(p_0\), \(p_1\), and \(p_2\) are defined in table Advanced Blend Overlap Modes. In these functions, the A components of the source and destination colors are taken to indicate the portion of the pixel covered by the fragment (source) and the fragments previously accumulated in the pixel (destination). The functions \(p_0\), \(p_1\), and \(p_2\) approximate the relative portion of the pixel covered by the intersection of the source and destination, covered only by the source, and covered only by the destination, respectively.
Possible values of `VkPipelineColorBlendAdvancedStateCreateInfoEXT::blendOverlap`, specifying the blend overlap functions, are:

```c
// Provided by VK_EXT_blend_operation_advanced
typedef enum VkBlendOverlapEXT {
    VK_BLEND_OVERLAP_UNCORRELATED_EXT = 0,
    VK_BLEND_OVERLAP_DISJOINT_EXT = 1,
    VK_BLEND_OVERLAP_CONJOINT_EXT = 2,
} VkBlendOverlapEXT;
```

- **VK_BLEND_OVERLAP_UNCORRELATED_EXT** specifies that there is no correlation between the source and destination coverage.
- **VK_BLEND_OVERLAP_CONJOINT_EXT** specifies that the source and destination coverage are considered to have maximal overlap.
- **VK_BLEND_OVERLAP_DISJOINT_EXT** specifies that the source and destination coverage are considered to have minimal overlap.

---

When using one of the HSL blend operations in table **Hue-Saturation-Luminosity Advanced Blend Operations** as the blend operation, the RGB color components produced by the function \( f \) are effectively obtained by converting both the non-premultiplied source and destination colors to the HSL (hue, saturation, luminosity) color space, generating a new HSL color by selecting \( H, S, \) and \( L \) components from the source or destination according to the blend operation, and then converting the result back to RGB. In the equations below, a blended RGB color is produced according to the following pseudocode:
float minv3(vec3 c) {
    return min(min(c.r, c.g), c.b);
}
float maxv3(vec3 c) {
    return max(max(c.r, c.g), c.b);
}
float lumv3(vec3 c) {
    return dot(c, vec3(0.30, 0.59, 0.11));
}
float satv3(vec3 c) {
    return maxv3(c) - minv3(c);
}

// If any color components are outside [0,1], adjust the color to
// get the components in range.
vec3 ClipColor(vec3 color) {
    float lum = lumv3(color);
    float mincol = minv3(color);
    float maxcol = maxv3(color);
    if (mincol < 0.0) {
        color = lum + ((color-lum)*lum) / (lum-mincol);
    }
    if (maxcol > 1.0) {
        color = lum + ((color-lum)*(1-lum)) / (maxcol-lum);
    }
    return color;
}

// Take the base RGB color <cbase> and override its luminosity
// with that of the RGB color <clum>.
vec3 SetLum(vec3 cbase, vec3 clum) {
    float lbase = lumv3(cbase);
    float llum = lumv3(clum);
    float ldiff = llum - lbase;
    vec3 color = cbase + vec3(ldiff);
    return ClipColor(color);
}

// Take the base RGB color <cbase> and override its saturation with
// that of the RGB color <csat>. The override the luminosity of the
// result with that of the RGB color <clum>.
vec3 SetLumSat(vec3 cbase, vec3 csat, vec3 clum)
{
    float minbase = minv3(cbase);
    float sbase = satv3(cbase);
    float ssat = satv3(csat);
    vec3 color;
    if (sbase > 0) {
        // Equivalent (modulo rounding errors) to setting the
        // smallest (R,G,B) component to 0, the largest to <ssat>,
        // etc.
    }
}
// and interpolating the "middle" component based on its
// original value relative to the smallest/largest.
    color = (cbase - minbase) * ssat / sbase;
  } else {
    color = vec3(0.0);
  }
  return SetLum(color, clum);
}

When using one of the operations in table Additional RGB Blend Operations as the blend operation, the source and destination colors used by these blending operations are interpreted according to srcPremultiplied and dstPremultiplied. The blending operations below are evaluated where the RGB source and destination color components are both considered to have been premultiplied by the corresponding A component.

\[
(R_s', G_s', B_s') = \begin{cases} 
(R_s, G_s, B_s) & \text{if srcPremultiplied is VK_TRUE} \\
(R_s A_s, G_s A_s, B_s A_s) & \text{if srcPremultiplied is VK_FALSE}
\end{cases}
\]

\[

### 30.2. Logical Operations

The application can enable a logical operation between the fragment’s color values and the existing value in the framebuffer attachment. This logical operation is applied prior to updating the framebuffer attachment. Logical operations are applied only for signed and unsigned integer and normalized integer framebuffers. Logical operations are not applied to floating-point or sRGB format color attachments.

Logical operations are controlled by the `logicOpEnable` and `logicOp` members of `VkPipelineColorBlendStateCreateInfo`. The `logicOpEnable` state can also be controlled by `vkCmdSetLogicOpEnableEXT` if graphics pipeline is created with `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. The `logicOp` state can also be controlled by `vkCmdSetLogicOpEXT` if graphics pipeline is created with `VK_DYNAMIC_STATE_LOGIC_OP_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. If `logicOpEnable` is `VK_TRUE`, then a logical operation selected by `logicOp` is applied between each color attachment and the fragment’s corresponding output value, and blending of all attachments is treated as if it were disabled. Any attachments using color formats for which logical operations are not supported simply pass through the color values unmodified. The logical operation is applied...
independently for each of the red, green, blue, and alpha components. The `logicOp` is selected from the following operations:

```c
// Provided by VK_VERSION_1_0
typedef enum VkLogicOp {
    VK_LOGIC_OP_CLEAR = 0,
    VK_LOGIC_OP_AND = 1,
    VK_LOGIC_OP_AND.Reverse = 2,
    VK_LOGIC_OP_COPY = 3,
    VK_LOGIC_OP_AND.INVERTED = 4,
    VK_LOGIC_OP_NO_OP = 5,
    VK_LOGIC_OP_XOR = 6,
    VK_LOGIC_OP_OR = 7,
    VK_LOGIC_OP_NOR = 8,
    VK_LOGIC_OP_Equivalent = 9,
    VK_LOGIC_OP_INVERT = 10,
    VK_LOGIC_OP_OR.Reverse = 11,
    VK_LOGIC_OP_COPY.INVERTED = 12,
    VK_LOGIC_OP_OR.INVERTED = 13,
    VK_LOGIC_OP_NAND = 14,
    VK_LOGIC_OP_SET = 15,
} VkLogicOp;
```
The logical operations supported by Vulkan are summarized in the following table in which

- \( \neg \) is bitwise invert,
- \( \& \) is bitwise and,
- \( \lor \) is bitwise or,
- \( \oplus \) is bitwise exclusive or,
- \( s \) is the fragment’s R\(_{s0}\), G\(_{s0}\), B\(_{s0}\) or A\(_{s0}\) component value for the fragment output corresponding to the color attachment being updated, and
- \( d \) is the color attachment’s R, G, B or A component value:

<table>
<thead>
<tr>
<th>Mode</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_LOGIC_OP_CLEAR</td>

</tr>
<tr>
<td>VK_LOGIC_OP_SET</td>
<td>all 1s</td>
</tr>
</tbody>
</table>

The result of the logical operation is then written to the color attachment as controlled by the component write mask, described in Blend Operations.

To dynamically set whether logical operations are enabled, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
def void vkCmdSetLogicOpEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 logicOpEnable);
```
• **commandBuffer** is the command buffer into which the command will be recorded.
• **logicOpEnable** specifies whether logical operations are enabled.

This command sets whether logical operations are enabled for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendStateCreateInfo::logicOpEnable` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetLogicOpEnableEXT-None-08542
  Either the `extendedDynamicState3LogicOpEnable` feature or the `shaderObject` feature or both must be enabled
- VUID-vkCmdSetLogicOpEnableEXT-logicOp-07366
  If the `logicOp` feature is not enabled, `logicOpEnable` must be `VK_FALSE`

### Valid Usage (Implicit)

- VUID-vkCmdSetLogicOpEnableEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetLogicOpEnableEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetLogicOpEnableEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetLogicOpEnableEXT-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
</tbody>
</table>
To *dynamically set* the logical operation to apply for blend state, call:

```c
// Provided by VK_EXT_extended_dynamic_state2, VK_EXT_shader_object
void vkCmdSetLogicOpEXT(
    VkCommandBuffer commandBuffer,
    VkLogicOp logicOp);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `logicOp` specifies the logical operation to apply for blend state.

This command sets the logical operation for blend state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_LOGIC_OP_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendStateCreateInfo::logicOp` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetLogicOpEXT-None-08544
  Either the `extendedDynamicState2LogicOp` feature or the `shaderObject` feature or both must be enabled

### Valid Usage (Implicit)

- VUID-vkCmdSetLogicOpEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetLogicOpEXT-logicOp-parameter
  `logicOp` must be a valid `VkLogicOp` value
- VUID-vkCmdSetLogicOpEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetLogicOpEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetLogicOpEXT-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
30.3. Color Write Mask

Bits which can be set in `VkPipelineColorBlendAttachmentState::colorWriteMask`, determining whether the final color values R, G, B and A are written to the framebuffer attachment, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkColorComponentFlagBits {
    VK_COLOR_COMPONENT_R_BIT = 0x00000001,
    VK_COLOR_COMPONENT_G_BIT = 0x00000002,
    VK_COLOR_COMPONENT_B_BIT = 0x00000004,
    VK_COLOR_COMPONENT_A_BIT = 0x00000008,
} VkColorComponentFlagBits;
```

- `VK_COLOR_COMPONENT_R_BIT` specifies that the R value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.
- `VK_COLOR_COMPONENT_G_BIT` specifies that the G value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.
- `VK_COLOR_COMPONENT_B_BIT` specifies that the B value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.
- `VK_COLOR_COMPONENT_A_BIT` specifies that the A value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.

The color write mask operation is applied regardless of whether blending is enabled.

The color write mask operation is applied only if `Color Write Enable` is enabled for the respective attachment. Otherwise the color write mask is ignored and writes to all components of the attachment are disabled.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkColorComponentFlags;
```

`VkColorComponentFlags` is a bitmask type for setting a mask of zero or more `VkColorComponentFlagBits`. 
30.4. Color Write Enable

The VkPipelineColorWriteCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_color_write_enable
typedef struct VkPipelineColorWriteCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t attachmentCount;
    const VkBool32* pColorWriteEnables;
} VkPipelineColorWriteCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `attachmentCount` is the number of `VkBool32` elements in `pColorWriteEnables`.
- `pColorWriteEnables` is a pointer to an array of per target attachment boolean values specifying whether color writes are enabled for the given attachment.

When this structure is included in the `pNext` chain of `VkPipelineColorBlendStateCreateInfo`, it defines per-attachment color write state. If this structure is not included in the `pNext` chain, it is equivalent to specifying this structure with `attachmentCount` equal to the `attachmentCount` member of `VkPipelineColorBlendStateCreateInfo`, and `pColorWriteEnables` pointing to an array of as many `VK_TRUE` values.

If the `colorWriteEnable` feature is not enabled on the device, all `VkBool32` elements in the `pColorWriteEnables` array must be `VK_TRUE`.

Color Write Enable interacts with the Color Write Mask as follows:

- If `colorWriteEnable` is `VK_TRUE`, writes to the attachment are determined by the `colorWriteMask`.
- If `colorWriteEnable` is `VK_FALSE`, the `colorWriteMask` is ignored and writes to all components of the attachment are disabled. This is equivalent to specifying a `colorWriteMask` of 0.

Valid Usage

- VUID-VkPipelineColorWriteCreateInfoEXT-pAttachments-04801
  If the `colorWriteEnable` feature is not enabled, all elements of `pColorWriteEnables` must be `VK_TRUE`.

- VUID-VkPipelineColorWriteCreateInfoEXT-attachmentCount-07608
  If the pipeline is being created with `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT`, `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT`, `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT`, or `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic states not set, `attachmentCount` must be equal to the `attachmentCount` member of the `VkPipelineColorBlendStateCreateInfo` structure specified during pipeline creation.

- VUID-VkPipelineColorWriteCreateInfoEXT-attachmentCount-06655
attachmentCount must be less than or equal to the maxColorAttachments member of VkPhysicalDeviceLimits

Valid Usage (Implicit)

• VUID-VkPipelineColorWriteCreateInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_COLOR_WRITE_CREATE_INFO_EXT

• VUID-VkPipelineColorWriteCreateInfoEXT-pColorWriteEnables-parameter
  If attachmentCount is not 0, pColorWriteEnables must be a valid pointer to an array of attachmentCount VkBool32 values

To dynamically enable or disable writes to a color attachment, call:

// Provided by VK_EXT_color_write_enable

```c
void vkCmdSetColorWriteEnableEXT(
    VkCommandBuffer commandBuffer,
    uint32_t attachmentCount,
    const VkBool32* pColorWriteEnables);
```

- commandBuffer is the command buffer into which the command will be recorded.
- attachmentCount is the number of VkBool32 elements in pColorWriteEnables.
- pColorWriteEnables is a pointer to an array of per target attachment boolean values specifying whether color writes are enabled for the given attachment.

This command sets the color write enables for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineColorWriteCreateInfoEXT::pColorWriteEnables values used to create the currently active pipeline.

Valid Usage

• VUID-vkCmdSetColorWriteEnableEXT-None-04803
  The colorWriteEnable feature must be enabled

• VUID-vkCmdSetColorWriteEnableEXT-attachmentCount-06656
  attachmentCount must be less than or equal to the maxColorAttachments member of VkPhysicalDeviceLimits

Valid Usage (Implicit)

• VUID-vkCmdSetColorWriteEnableEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
• VUID-vkCmdSetColorWriteEnableEXT-pColorWriteEnables-parameter
  pColorWriteEnables must be a valid pointer to an array of attachmentCount VkBool32 values

• VUID-vkCmdSetColorWriteEnableEXT-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdSetColorWriteEnableEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

• VUID-vkCmdSetColorWriteEnableEXT-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdSetColorWriteEnableEXT-attachmentCount-arraylength
  attachmentCount must be greater than 0

Host Synchronization

• Host access to commandBuffer must be externally synchronized
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

30.5. Framebuffer Query Instructions

To query the tile properties from the attachments in framebuffer, call:

```c
// Provided by VK_QCOM_tile_properties
VkResult vkGetFramebufferTilePropertiesQCOM(
  VkDevice device,
  VkFramebuffer framebuffer,
  uint32_t* pPropertiesCount,
  VkTilePropertiesQCOM* pProperties);
```

• device is a logical device associated with the framebuffer.
• framebuffer is a handle of the framebuffer to query.
• pPropertiesCount is a pointer to an integer related to the number of tile properties available or
queried, as described below.

- `pProperties` is either `NULL` or a pointer to an array of `VkTilePropertiesQCOM` structures.

If `pProperties` is `NULL`, then the number of tile properties available is returned in `pPropertiesCount`. Otherwise, `pPropertiesCount` must point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of properties actually written to `pProperties`. If `pPropertiesCount` is less than the number of tile properties available, at most `pPropertiesCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available properties were returned.

The number of tile properties available is determined by the number of merged subpasses, and each tile property is associated with a merged subpass. There will be at most as many properties as there are subpasses within the render pass. To obtain the tile properties for a given merged subpass, the `pProperties` array can be indexed using the `postMergeIndex` value provided in `VkRenderPassSubpassFeedbackInfoEXT`.

**Valid Usage (Implicit)**

- `VUID-vkGetFramebufferTilePropertiesQCOM-device-parameter`  
  `device` must be a valid `VkDevice` handle

- `VUID-vkGetFramebufferTilePropertiesQCOM-framebuffer-parameter`  
  `framebuffer` must be a valid `VkFramebuffer` handle

- `VUID-vkGetFramebufferTilePropertiesQCOM-pPropertiesCount-parameter`  
  `pPropertiesCount` must be a valid pointer to a `uint32_t` value

- `VUID-vkGetFramebufferTilePropertiesQCOM-pProperties-parameter`  
  If the value referenced by `pPropertiesCount` is not 0, and `pProperties` is not `NULL`,  
  `pProperties` must be a valid pointer to an array of `pPropertiesCount` `VkTilePropertiesQCOM` structures

- `VUID-vkGetFramebufferTilePropertiesQCOM-framebuffer-parent`  
  `framebuffer` must have been created, allocated, or retrieved from `device`

**Return Codes**

**Success**

- `VK_SUCCESS`
- `VK_INCOMPLETE`
Chapter 31. Dispatching Commands

*Dispatching commands* (commands with *Dispatch* in the name) provoke work in a compute pipeline. Dispatching commands are recorded into a command buffer and when executed by a queue, will produce work which executes according to the bound compute pipeline. A compute pipeline must be bound to a command buffer before any dispatching commands are recorded in that command buffer.

To record a dispatch, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdDispatch(
    VkCommandBuffer commandBuffer,
    uint32_t groupCountX,
    uint32_t groupCountY,
    uint32_t groupCountZ);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `groupCountX` is the number of local workgroups to dispatch in the X dimension.
- `groupCountY` is the number of local workgroups to dispatch in the Y dimension.
- `groupCountZ` is the number of local workgroups to dispatch in the Z dimension.

When the command is executed, a global workgroup consisting of \( \text{groupCountX} \times \text{groupCountY} \times \text{groupCountZ} \) local workgroups is assembled.

**Valid Usage**

- VUID-vkCmdDispatch-magFilter-04553
  If a *VkSampler* created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a *VkImageView* as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDispatch-mipmapMode-04770
  If a *VkSampler* created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a *VkImageView* as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDispatch-None-06479
  If a *VkImageView* is sampled with depth comparison, the image view’s format features must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`

- VUID-vkCmdDispatch-None-02691
  If a *VkImageView* is accessed using atomic operations as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`
If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's `format features` must contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`.

If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's `format features` must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

If the `VK_EXT_filter_cubic` extension is not enabled and any `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, it must not have a `VkImageViewType` of `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`.

Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

If the `cubicRangeClamp` feature is not enabled, then any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must not have a `VkSamplerReductionModeCreateInfo` `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM`.

Any `VkImageView` being sampled with a `VkSamplerReductionModeCreateInfo::reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM` as a result of this command must sample with `VK_FILTER_CUBIC_EXT`.

If the `selectableCubicWeights` feature is not enabled, then any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have `VkSamplerCubicWeightsCreateInfoQCOM::cubicWeights` equal to `VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM`.

Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.
For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view’s format features **must** contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`

• VUID-vkCmdDispatch-OpTypeImage-07028
  For any `VkImageView` being read as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view’s format features **must** contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`

• VUID-vkCmdDispatch-OpTypeImage-07029
  For any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, the view’s buffer features **must** contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`

• VUID-vkCmdDispatch-OpTypeImage-07030
  Any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view’s buffer features **must** contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`

• VUID-vkCmdDispatch-None-08600
  For each set `n` that is statically used by a bound shader, a descriptor set **must** have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` or `VkDescriptorSetLayout` array that was used to create the current `VkPipeline` or `VkShaderEXT`, as described in Pipeline Layout Compatibility

• VUID-vkCmdDispatch-None-08601
  For each push constant that is statically used by a bound shader, a push constant value **must** have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` or `VkDescriptorSetLayout` and `VkPushConstantRange` arrays used to create the current `VkPipeline` or `VkShaderEXT`, as described in Pipeline Layout Compatibility

• VUID-vkCmdDispatch-maintenance4-08602
  If the `maintenance4` feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value **must** have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` or `VkDescriptorSetLayout` and `VkPushConstantRange` arrays used to create the current `VkPipeline` or `VkShaderEXT`, as described in Pipeline Layout Compatibility

• VUID-vkCmdDispatch-None-08114
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, **must** be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command and the bound `VkPipeline` was not created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

• VUID-vkCmdDispatch-None-08115
  If the descriptors used by the `VkPipeline` bound to the pipeline bind point were specified via `vkCmdBindDescriptorSets`, the bound `VkPipeline` **must** have been created without `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

• VUID-vkCmdDispatch-None-08116
  Descriptors in bound descriptor buffers, specified via
**vkCmdSetDescriptorBufferOffsetsEXT**, **must** be valid if they are dynamically used by the **VkPipeline** bound to the pipeline bind point used by this command and the bound **VkPipeline** was created with **VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT**

- **VUID-vkCmdDispatch-None-08604**
  Descriptors in bound descriptor buffers, specified via **vkCmdSetDescriptorBufferOffsetsEXT**, **must** be valid if they are dynamically used by any **VkShaderEXT** bound to a stage corresponding to the pipeline bind point used by this command

- **VUID-vkCmdDispatch-None-08117**
  If the descriptors used by the **VkPipeline** bound to the pipeline bind point were specified via **vkCmdSetDescriptorBufferOffsetsEXT**, the bound **VkPipeline** **must** have been created with **VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT**

- **VUID-vkCmdDispatch-None-08119**
  If a descriptor is dynamically used with a **VkPipeline** created with **VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT**, the descriptor memory **must** be resident

- **VUID-vkCmdDispatch-None-08605**
  If a descriptor is dynamically used with a **VkShaderEXT** created with a **VkDescriptorSetLayout** that was created with **VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT**, the descriptor memory **must** be resident

- **VUID-vkCmdDispatch-None-08606**
  If the **shaderObject** feature is not enabled, a valid pipeline **must** be bound to the pipeline bind point used by this command

- **VUID-vkCmdDispatch-None-08607**
  If the **shaderObject** is enabled, either a valid pipeline **must** be bound to the pipeline bind point used by this command, or a valid combination of valid and **VK_NULL_HANDLE** shader objects **must** be bound to every supported shader stage corresponding to the pipeline bind point used by this command

- **VUID-vkCmdDispatch-None-08608**
  If a pipeline is bound to the pipeline bind point used by this command, there **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the **VkPipeline** object bound to the pipeline bind point used by this command, since that pipeline was bound

- **VUID-vkCmdDispatch-None-08609**
  If the **VkPipeline** object bound to the pipeline bind point used by this command or any **VkShaderEXT** bound to a stage corresponding to the pipeline bind point used by this command accesses a **VkSampler** object that uses unnormalized coordinates, that sampler **must** not be used to sample from any **VkImage** with a **VkImageView** of the type **VK_IMAGE_VIEW_TYPE_3D**, **VK_IMAGE_VIEW_TYPE_CUBE**, **VK_IMAGE_VIEW_TYPE_1D_ARRAY**, **VK_IMAGE_VIEW_TYPE_2D_ARRAY** or **VK_IMAGE_VIEW_TYPE_CUBE_ARRAY**, in any shader stage

- **VUID-vkCmdDispatch-None-08610**
  If the **VkPipeline** object bound to the pipeline bind point used by this command or any **VkShaderEXT** bound to a stage corresponding to the pipeline bind point used by this command accesses a **VkSampler** object that uses unnormalized coordinates, that sampler
must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage

- VUID-vkCmdDispatch-None-08611
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage

- VUID-vkCmdDispatch-uniformBuffers-06935
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDispatch-None-08612
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDispatch-storageBuffers-06936
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDispatch-None-08613
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDispatch-commandBuffer-02707
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by bound shaders must not be a protected resource

- VUID-vkCmdDispatch-None-06550
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y’C₆₉₈ conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions

- VUID-vkCmdDispatch-ConstOffset-06551
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y’C₆₉₈ conversion, that object must not use the ConstOffset and Offset operands
If a `VkImageView` is accessed as a result of this command, then the image view’s `viewType` **must** match the `Dim` operand of the `OpTypeImage` as described in Instruction/Sampler/Image View Validation.

If a `VkImageView` is accessed as a result of this command, then the `numeric type` of the image view’s `format` and the `Sampled Type` operand of the `OpTypeImage` **must** match.

If a `VkImageView` created with a format other than `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the image view’s format.

If a `VkImageView` created with the format `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have four components.

If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the buffer view’s format.

If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64.

If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32.

If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64.

If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32.

If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.
If `OpImageWeightedSampleQCOM` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM`.

If `OpImageWeightedSampleQCOM` uses a `VkImageView` as a sample weight image as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM`.

If `OpImageBoxFilterQCOM` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM`.

If `OpImageBlockMatchSSDQCOM` or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchWindowSSDQCOM`, `OpImageBlockMatchWindowSADQCOM`, `OpImageBlockMatchGatherSSDQCOM`, `OpImageBlockMatchGatherSADQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.
**must** be a single-component format.

- **VUID-vkCmdDispatch-OpImageBlockMatchWindow-09217**
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` read from a reference image as result of this command, then the specified reference coordinates **must** not fail integer texel coordinate validation

- **VUID-vkCmdDispatch-None-07288**
  Any shader invocation executed by this command **must** terminate

- **VUID-vkCmdDispatch-commandBuffer-02712**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, any resource written to by the `VkPipeline` object bound to the pipeline bind point used by this command **must** not be an unprotected resource

- **VUID-vkCmdDispatch-commandBuffer-02713**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, pipeline stages other than the framebuffer-space and compute stages in the `VkPipeline` object bound to the pipeline bind point used by this command **must** not write to any resource

- **VUID-vkCmdDispatch-commandBuffer-04617**
  If any of the shader stages of the `VkPipeline` bound to the pipeline bind point used by this command uses the `RayQueryKHR` capability, then `commandBuffer` **must** not be a protected command buffer

- **VUID-vkCmdDispatch-groupCountX-00386**
  `groupCountX` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]`

- **VUID-vkCmdDispatch-groupCountY-00387**
  `groupCountY` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]`

- **VUID-vkCmdDispatch-groupCountZ-00388**
  `groupCountZ` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]`

---

**Valid Usage (Implicit)**

- **VUID-vkCmdDispatch-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdDispatch-commandBuffer-recording**
  `commandBuffer` **must** be in the recording state

- **VUID-vkCmdDispatch-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations

- **VUID-vkCmdDispatch-renderpass**
  This command **must** only be called outside of a render pass instance

- **VUID-vkCmdDispatch-videocoding**
This command **must** only be called outside of a video coding scope.

**Host Synchronization**

- Host access to `commandBuffer` **must** be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized.

**Command Properties**

To record an indirect dispatching command, call:

```cpp
// Provided by VK_VERSION_1_0
void vkCmdDispatchIndirect(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `buffer` is the buffer containing dispatch parameters.
- `offset` is the byte offset into `buffer` where parameters begin.

`vkCmdDispatchIndirect` behaves similarly to `vkCmdDispatch` except that the parameters are read by the device from a buffer during execution. The parameters of the dispatch are encoded in a `VkDispatchIndirectCommand` structure taken from `buffer` starting at `offset`.

**Valid Usage**

- **VUID-vkCmdDispatchIndirect-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDispatchIndirect-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features **must** contain.
If a `VkImageView` is sampled with depth comparison, the image view's format features must contain `VK_FORMAT_FEATURE_2SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`.

If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`.

If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

If the `VK_EXT_filter_cubic` extension is not enabled and any `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, it must not have a `VkImageViewType` of `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`.

Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

Any `VkImageView` being sampled with a `VkSamplerReductionModeCreateInfo`: `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM` as a result of this command must sample with `VK_FILTER_CUBIC_EXT`.

If the `cubicRangeClamp` feature is not enabled, then any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must not have a `VkSamplerReductionModeCreateInfo::reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM`.

Any `VkImageView` being sampled with a `VkSamplerReductionModeCreateInfo::reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM` as a result of this command must sample with `VK_FILTER_CUBIC_EXT`.

Any `VkImageView` being sampled with a `VkSamplerReductionModeCreateInfo::reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM` as a result of this command must sample with `VK_FILTER_CUBIC_EXT`.
If the `selectableCubicWeights` feature is not enabled, then any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have `VkSamplerCubicWeightsCreateInfoQCOM::cubicWeights` equal to `VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM`

- **VUID-vkCmdDispatchIndirect-flags-02696**
  Any `VkImage` created with a `VkCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`

- **VUID-vkCmdDispatchIndirect-OpTypeImage-07027**
  For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`

- **VUID-vkCmdDispatchIndirect-OpTypeImage-07028**
  For any `VkImageView` being read as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`

- **VUID-vkCmdDispatchIndirect-OpTypeImage-07029**
  For any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`

- **VUID-vkCmdDispatchIndirect-OpTypeImage-07030**
  Any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`

- **VUID-vkCmdDispatchIndirect-None-08600**
  For each set $n$ that is statically used by a bound shader, a descriptor set must have been bound to $n$ at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set $n$, with the `VkPipelineLayout` or `VkDescriptorSetLayout` array that was used to create the current `VkPipeline` or `VkShaderEXT`, as described in Pipeline Layout Compatibility

- **VUID-vkCmdDispatchIndirect-None-08601**
  For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` or `VkDescriptorSetLayout` and `VkPushConstantRange` arrays used to create the current `VkPipeline` or `VkShaderEXT`, as described in Pipeline Layout Compatibility

- **VUID-vkCmdDispatchIndirect-maintenance4-08602**
  If the `maintenance4` feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` or `VkDescriptorSetLayout` and `VkPushConstantRange` arrays used to create the current `VkPipeline` or `VkShaderEXT`, as described in Pipeline Layout Compatibility

- **VUID-vkCmdDispatchIndirect-None-08114**
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be
valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command and the bound `VkPipeline` was not created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

- VUID-vkCmdDispatchIndirect-None-08115
  If the descriptors used by the `VkPipeline` bound to the pipeline bind point were specified via `vkCmdBindDescriptorSets`, the bound `VkPipeline` **must** have been created without `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

- VUID-vkCmdDispatchIndirect-None-08116
  Descriptors in bound descriptor buffers, specified via `vkCmdSetDescriptorBufferOffsetsEXT`, **must** be valid if they are dynamically used by the `VkPipeline` bound to the pipeline bind point used by this command and the bound `VkPipeline` was created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

- VUID-vkCmdDispatchIndirect-None-08604
  Descriptors in bound descriptor buffers, specified via `vkCmdSetDescriptorBufferOffsetsEXT`, **must** be valid if they are dynamically used by any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command

- VUID-vkCmdDispatchIndirect-None-08117
  If a descriptor is dynamically used with a `VkPipeline` created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, the descriptor memory **must** be resident

- VUID-vkCmdDispatchIndirect-None-08605
  If a descriptor is dynamically used with a `VkShaderEXT` created with a `VkDescriptorSetLayout` that was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, the descriptor memory **must** be resident

- VUID-vkCmdDispatchIndirect-None-08606
  If the `shaderObject` feature is not enabled, a valid pipeline **must** be bound to the pipeline bind point used by this command

- VUID-vkCmdDispatchIndirect-None-08607
  If the `shaderObject` is enabled, either a valid pipeline **must** be bound to the pipeline bind point used by this command, or a valid combination of valid and `VK_NULL_HANDLE` shader objects **must** be bound to every supported shader stage corresponding to the pipeline bind point used by this command

- VUID-vkCmdDispatchIndirect-None-08608
  If a pipeline is bound to the pipeline bind point used by this command, there **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound

- VUID-vkCmdDispatchIndirect-None-08609
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any
VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage.

- VUID-vkCmdDispatchIndirect-None-08610
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage.

- VUID-vkCmdDispatchIndirect-None-08611
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage.

- VUID-vkCmdDispatchIndirect-uniformBuffers-06935
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdDispatchIndirect-None-08612
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdDispatchIndirect-storageBuffers-06936
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdDispatchIndirect-None-08613
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdDispatchIndirect-commandBuffer-02707
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported,
any resource accessed by **bound shaders** must not be a protected resource

- **VUID-vkCmdDispatchIndirect-None-06550**
  If a **bound shader** accesses a **VkSampler** or **VkImageView** object that enables **sampler YC_{aC_b} conversion**, that object **must** only be used with **OpImageSample* or OpImageSparseSample*** instructions

- **VUID-vkCmdDispatchIndirect-ConstOffset-06551**
  If a **bound shader** accesses a **VkSampler** or **VkImageView** object that enables **sampler YC_{aC_b} conversion**, that object **must** not use the **ConstOffset** and **Offset** operands

- **VUID-vkCmdDispatchIndirect-viewType-07752**
  If a **VkImageView** is accessed as a result of this command, then the image view's **viewType must** match the **Dim** operand of the **OpTypeImage** as described in Instruction/Sampler/Image View Validation

- **VUID-vkCmdDispatchIndirect-format-07753**
  If a **VkImageView** is accessed as a result of this command, then the **numeric type** of the image view’s **format** and the **Sampled Type** operand of the **OpTypeImage** **must** match

- **VUID-vkCmdDispatchIndirect-OpImageWrite-08795**
  If a **VkImageView** created with a format other than **VK_FORMAT_A8_UNORM_KHR** is accessed using **OpImageWrite** as a result of this command, then the **Type** of the **Texel** operand of that instruction **must** have at least as many components as the image view’s format

- **VUID-vkCmdDispatchIndirect-OpImageWrite-08796**
  If a **VkImageView** created with the format **VK_FORMAT_A8_UNORM_KHR** is accessed using **OpImageWrite** as a result of this command, then the **Type** of the **Texel** operand of that instruction **must** have four components

- **VUID-vkCmdDispatchIndirect-OpImageWrite-04469**
  If a **VkBufferView** is accessed using **OpImageWrite** as a result of this command, then the **Type** of the **Texel** operand of that instruction **must** have at least as many components as the buffer view’s format

- **VUID-vkCmdDispatchIndirect-SampledType-04470**
  If a **VkImageView** with a **VkFormat** that has a 64-bit component width is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 64

- **VUID-vkCmdDispatchIndirect-SampledType-04471**
  If a **VkImageView** with a **VkFormat** that has a component width less than 64-bit is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 32

- **VUID-vkCmdDispatchIndirect-SampledType-04472**
  If a **VkBufferView** with a **VkFormat** that has a 64-bit component width is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 64

- **VUID-vkCmdDispatchIndirect-SampledType-04473**
  If a **VkBufferView** with a **VkFormat** that has a component width less than 64-bit is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 32
If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

If `OpImageWeightedSampleQCOM` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM`.

If `OpImageWeightedSampleQCOM` uses a `VkImageView` as a sample weight image as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM`.

If `OpImageBoxFilterQCOM` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM`.

If `OpImageBlockMatchWindowSSDQCOM` or `OpImageBlockMatchSSDQCOM` is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchWindowSSDQCOM`, `OpImageBlockMatchWindowSADQCOM`, `OpImageBlockMatchGatherSSDQCOM`, `OpImageBlockMatchGatherSADQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchWindowSSDQCOM`, `OpImageBlockMatchWindowSADQCOM`, `OpImageBlockMatchGatherSSDQCOM`, `OpImageBlockMatchGatherSADQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must not have been created with...
VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM

- VUID-vkCmdDispatchIndirect-OpImageBlockMatchWindow-09215
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

- VUID-vkCmdDispatchIndirect-OpImageBlockMatchWindow-09216
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view's format must be a single-component format.

- VUID-vkCmdDispatchIndirect-OpImageBlockMatchWindow-09217
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

- VUID-vkCmdDispatchIndirect-None-07288
  Any shader invocation executed by this command must terminate.

- VUID-vkCmdDispatchIndirect-buffer-02708
  If `buffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- VUID-vkCmdDispatchIndirect-buffer-02709
  `buffer` must have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set.

- VUID-vkCmdDispatchIndirect-offset-02710
  `offset` must be a multiple of 4.

- VUID-vkCmdDispatchIndirect-commandBuffer-02711
  `commandBuffer` must not be a protected command buffer.

- VUID-vkCmdDispatchIndirect-offset-00407
  The sum of `offset` and the size of `VkDispatchIndirectCommand` must be less than or equal to the size of `buffer`.

Valid Usage (Implicit)

- VUID-vkCmdDispatchIndirect-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- VUID-vkCmdDispatchIndirect-buffer-parameter
  `buffer` must be a valid `VkBuffer` handle.

- VUID-vkCmdDispatchIndirect-commandBuffer-recording
  `commandBuffer` must be in the recording state.

- VUID-vkCmdDispatchIndirect-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support compute operations.

- VUID-vkCmdDispatchIndirect-renderpass
  This command must only be called outside of a render pass instance.
This command must only be called outside of a video coding scope.

Both of buffer and commandBuffer must have been created, allocated, or retrieved from the same VkDevice.

Host Synchronization

• Host access to commandBuffer must be externally synchronized
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

The VkDispatchIndirectCommand structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkDispatchIndirectCommand {
    uint32_t x;
    uint32_t y;
    uint32_t z;
} VkDispatchIndirectCommand;
```

• x is the number of local workgroups to dispatch in the X dimension.
• y is the number of local workgroups to dispatch in the Y dimension.
• z is the number of local workgroups to dispatch in the Z dimension.

The members of VkDispatchIndirectCommand have the same meaning as the corresponding parameters of vkCmdDispatch.

Valid Usage

• VUID-VkDispatchIndirectCommand-x-00417
  x must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]
• VUID-VkDispatchIndirectCommand-y-00418
  y must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]
To record a dispatch using non-zero base values for the components of `WorkgroupId`, call:

```c
// Provided by VK_VERSION_1_1
void vkCmdDispatchBase(
    VkCommandBuffer commandBuffer,
    uint32_t baseGroupX,
    uint32_t baseGroupY,
    uint32_t baseGroupZ,
    uint32_t groupCountX,
    uint32_t groupCountY,
    uint32_t groupCountZ);
```

or the equivalent command

```c
// Provided by VK_KHR_device_group
void vkCmdDispatchBaseKHR(
    VkCommandBuffer commandBuffer,
    uint32_t baseGroupX,
    uint32_t baseGroupY,
    uint32_t baseGroupZ,
    uint32_t groupCountX,
    uint32_t groupCountY,
    uint32_t groupCountZ);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `baseGroupX` is the start value for the X component of `WorkgroupId`.
- `baseGroupY` is the start value for the Y component of `WorkgroupId`.
- `baseGroupZ` is the start value for the Z component of `WorkgroupId`.
- `groupCountX` is the number of local workgroups to dispatch in the X dimension.
- `groupCountY` is the number of local workgroups to dispatch in the Y dimension.
- `groupCountZ` is the number of local workgroups to dispatch in the Z dimension.

When the command is executed, a global workgroup consisting of `groupCountX` × `groupCountY` × `groupCountZ` local workgroups is assembled, with `WorkgroupId` values ranging from `[baseGroup*, baseGroup* + groupCount*]` in each component. `vkCmdDispatch` is equivalent to `vkCmdDispatchBase(0, 0, 0, groupCountX, groupCountY, groupCountZ)`.

### Valid Usage

- **VUID-vkCmdDispatchBase-magFilter-04553**
  
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and
compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

- VUID-vkCmdDispatchBase-mipmapMode-04770
  If a VkSampler created with mipmapMode equal to VK_SAMPLER_MIPMAP_MODE_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

- VUID-vkCmdDispatchBase-None-06479
  If a VkImageView is sampled with depth comparison, the image view’s format features must contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT

- VUID-vkCmdDispatchBase-None-02691
  If a VkImageView is accessed using atomic operations as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT

- VUID-vkCmdDispatchBase-None-07888
  If a VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer’s format features must contain VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT

- VUID-vkCmdDispatchBase-None-02692
  If a VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT

- VUID-vkCmdDispatchBase-filterCubic-02693
  If the VK_EXT_filter_cubic extension is not enabled and any VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, it must not have a VkImageViewType of VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY

- VUID-vkCmdDispatchBase-filterCubicMinmax-02694
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2

- VUID-vkCmdDispatchBase-filterCubicMinmax-02695
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2

- VUID-vkCmdDispatchBase-cubicRangeClamp-09212
  If the cubicRangeClamp feature is not enabled, then any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command
must not have a `VkSamplerReductionModeCreateInfo` `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGE_CLAMP_QCOM`.

- VUID-vkCmdDispatchBase-reductionMode-09213
  Any `VkImageView` being sampled with a `VkSamplerReductionModeCreateInfo` `::reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGE_CLAMP_QCOM` as a result of this command must sample with `VK_FILTER_CUBIC_EXT`.

- VUID-vkCmdDispatchBase-selectableCubicWeights-09214
  If the `selectableCubicWeights` feature is not enabled, then any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have `VkSamplerCubicWeightsCreateInfoQCOM::cubicWeights` equal to `VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM`.

- VUID-vkCmdDispatchBase-flags-02696
  Any `VkImage` created with a `VkImageCreateInfo` `::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

- VUID-vkCmdDispatchBase-OpTypeImage-07027
  For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

- VUID-vkCmdDispatchBase-OpTypeImage-07028
  For any `VkImageView` being read as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

- VUID-vkCmdDispatchBase-OpTypeImage-07029
  For any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

- VUID-vkCmdDispatchBase-OpTypeImage-07030
  Any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

- VUID-vkCmdDispatchBase-None-08600
  For each set `n` that is statically used by a bound shader, a descriptor set must have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` or `VkDescriptorSetLayout` array that was used to create the current `VkPipeline` or `VkShaderEXT`, as described in Pipeline Layout Compatibility.

- VUID-vkCmdDispatchBase-None-08601
  For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` or `VkDescriptorSetLayout` and `VkPushConstantRange` arrays used to create the current `VkPipeline` or `VkShaderEXT`, as described in Pipeline Layout Compatibility.

- VUID-vkCmdDispatchBase-maintenance4-08602
If the maintenance feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout or VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkPipeline or VkShaderEXT, as described in Pipeline Layout Compatibility.

- **VUID-vkCmdDispatchBase-None-08114**
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid if they are statically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was not created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT.

- **VUID-vkCmdDispatchBase-None-08115**
  If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdBindDescriptorSets, the bound VkPipeline must have been created without VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT.

- **VUID-vkCmdDispatchBase-None-08116**
  Descriptors in bound descriptor buffers, specified via vkCmdSetDescriptorBufferOffsetsEXT, must be valid if they are dynamically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT.

- **VUID-vkCmdDispatchBase-None-08604**
  Descriptors in bound descriptor buffers, specified via vkCmdSetDescriptorBufferOffsetsEXT, must be valid if they are dynamically used by any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command.

- **VUID-vkCmdDispatchBase-None-08117**
  If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdSetDescriptorBufferOffsetsEXT, the bound VkPipeline must have been created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT.

- **VUID-vkCmdDispatchBase-None-08119**
  If a descriptor is dynamically used with a VkPipeline created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory must be resident.

- **VUID-vkCmdDispatchBase-None-08605**
  If a descriptor is dynamically used with a VkShaderEXT created with a VkDescriptorSetLayout that was created with VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory must be resident.

- **VUID-vkCmdDispatchBase-None-08606**
  If the shaderObject feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command.

- **VUID-vkCmdDispatchBase-None-08607**
  If the shaderObject is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects must be bound to every supported shader stage corresponding to the
pipeline bind point used by this command

- **VUID-vkCmdDispatchBase-None-08608**
  If a pipeline is bound to the pipeline bind point used by this command, there **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the *VkPipeline* object bound to the pipeline bind point used by this command, since that pipeline was bound

- **VUID-vkCmdDispatchBase-None-08609**
  If the *VkPipeline* object bound to the pipeline bind point used by this command or any *VkShaderEXT* bound to a stage corresponding to the pipeline bind point used by this command accesses a *VkSampler* object that uses unnormalized coordinates, that sampler **must** not be used to sample from any *VkImage* with a *VkImageView* of the type *VK_IMAGE_VIEW_TYPE_3D*, *VK_IMAGE_VIEW_TYPE_CUBE*, *VK_IMAGE_VIEW_TYPE_1D_ARRAY*, *VK_IMAGE_VIEW_TYPE_2D_ARRAY* or *VK_IMAGE_VIEW_TYPE_CUBE_ARRAY*, in any shader stage

- **VUID-vkCmdDispatchBase-None-08610**
  If the *VkPipeline* object bound to the pipeline bind point used by this command or any *VkShaderEXT* bound to a stage corresponding to the pipeline bind point used by this command accesses a *VkSampler* object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V *OpImageSample* or *OpImageSparseSample* instructions with *ImplicitLod*, *Dref* or *Proj* in their name, in any shader stage

- **VUID-vkCmdDispatchBase-None-08611**
  If the *VkPipeline* object bound to the pipeline bind point used by this command or any *VkShaderEXT* bound to a stage corresponding to the pipeline bind point used by this command accesses a *VkSampler* object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V *OpImageSample* or *OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage

- **VUID-vkCmdDispatchBase-uniformBuffers-06935**
  If any stage of the *VkPipeline* object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either *VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT* or *VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT* for *uniformBuffers*, and the *robustBufferAccess* feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDispatchBase-None-08612**
  If the *robustBufferAccess* feature is not enabled, and any *VkShaderEXT* bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDispatchBase-storageBuffers-06936**
  If any stage of the *VkPipeline* object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either *VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT* or *VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT* for *storageBuffers*, and the *robustBufferAccess* feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same
pipeline bind point

- VUID-vkCmdDispatchBase-None-08613
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdDispatchBase-commandBuffer-02707
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by bound shaders must not be a protected resource.

- VUID-vkCmdDispatchBase-None-06550
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y'CbCr conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions.

- VUID-vkCmdDispatchBase-ConstOffset-06551
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y'CbCr conversion, that object must not use the ConstOffset and Offset operands.

- VUID-vkCmdDispatchBase-viewType-07752
  If a VkImageView is accessed as a result of this command, then the image view's viewType must match the Dim operand of the OpTypeImage as described in Instruction/Sampler/Image View Validation.

- VUID-vkCmdDispatchBase-format-07753
  If a VkImageView is accessed as a result of this command, then the numeric type of the image view's format and the Sampled Type operand of the OpTypeImage must match.

- VUID-vkCmdDispatchBase-OpImageWrite-08795
  If a VkImageView created with a format other than VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view's format.

- VUID-vkCmdDispatchBase-OpImageWrite-08796
  If a VkImageView created with the format VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have four components.

- VUID-vkCmdDispatchBase-OpImageWrite-04469
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view's format.

- VUID-vkCmdDispatchBase-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- VUID-vkCmdDispatchBase-SampledType-04471
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.
If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64.

If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32.

If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

If `OpImageWeightedSampleQCOM` is used to sample a `VkImageView` as a result of this command, then the image view’s `format features` **must** contain `VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM`.

If `OpImageWeightedSampleQCOM` uses a `VkImageView` as a sample weight image as a result of this command, then the image view’s `format features` **must** contain `VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM`.

If `OpImageBoxFilterQCOM` is used to sample a `VkImageView` as a result of this command, then the image view’s `format features` **must** contain `VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM`.

If `OpImageBlockMatchWindowSSDQCOM` or `OpImageBlockMatchSSDQCOM` or `OpImageBlockMatchSADQCOM` or `OpImageBlockMatchGatherSSDQCOM` or `OpImageBlockMatchGatherSADQCOM` is used to read from a reference image as result of this command, then the specified reference coordinates **must** not fail integer texel coordinate validation.

uses a `VkSampler` as a result of this command, then the sampler must have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`

• VUID-vkCmdDispatchBase-OpImageWeightedSampleQCOM-06978
  If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchWindowSSDQCOM`, `OpImageBlockMatchGatherSSDQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`

• VUID-vkCmdDispatchBase-OpImageBlockMatchWindow-09215
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`

• VUID-vkCmdDispatchBase-OpImageBlockMatchWindow-09216
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view's format must be a single-component format.

• VUID-vkCmdDispatchBase-OpImageBlockMatchWindow-09217
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation

• VUID-vkCmdDispatchBase-None-07288
  Any shader invocation executed by this command must terminate

• VUID-vkCmdDispatchBase-commandBuffer-02712
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, any resource written to by the `VkPipeline` object bound to the pipeline bind point used by this command must not be an unprotected resource

• VUID-vkCmdDispatchBase-commandBuffer-02713
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, pipeline stages other than the framebuffer-space and compute stages in the `VkPipeline` object bound to the pipeline bind point used by this command must not write to any resource

• VUID-vkCmdDispatchBase-commandBuffer-04617
  If any of the shader stages of the `VkPipeline` bound to the pipeline bind point used by this command uses the `RayQueryKHR` capability, then `commandBuffer` must not be a protected command buffer

• VUID-vkCmdDispatchBase-baseGroupX-00421
  `baseGroupX` must be less than `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]`

• VUID-vkCmdDispatchBase-baseGroupX-00422
  `baseGroupY` must be less than `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]`

• VUID-vkCmdDispatchBase-baseGroupX-00423
  `baseGroupZ` must be less than `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]`

• VUID-vkCmdDispatchBase-countGroupX-00424
  `2707`
groupCountX must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0] minus baseGroupX

- VUID-vkCmdDispatchBase-groupCountY-00425
  groupCountY must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1] minus baseGroupY

- VUID-vkCmdDispatchBase-groupCountZ-00426
  groupCountZ must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2] minus baseGroupZ

- VUID-vkCmdDispatchBase-baseGroupX-00427
  If any of baseGroupX, baseGroupY, or baseGroupZ are not zero, then the bound compute pipeline must have been created with the VK_PIPELINE_CREATE_DISPATCH_BASE flag

Valid Usage (Implicit)

- VUID-vkCmdDispatchBase-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdDispatchBase-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdDispatchBase-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdDispatchBase-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdDispatchBase-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>

A subpass shading dispatches a compute pipeline work with the work dimension of render area of
the calling subpass and work groups are partitioned by specified work group size. Subpass operations like subpassLoad and subpassLoadMS are allowed to be used.

To record a subpass shading, call:

```c
// Provided by VK_HUAWEI_subpass_shading
void vkCmdSubpassShadingHUAWEI(  
    VkCommandBuffer commandBuffer);
```

- `commandBuffer` is the command buffer into which the command will be recorded.

When the command is executed, a global workgroup consisting of ceil (render area size / local workgroup size) local workgroups is assembled.

**Valid Usage**

- **VUID-vkCmdSubpassShadingHUAWEI-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdSubpassShadingHUAWEI-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdSubpassShadingHUAWEI-None-06479**
  If a `VkImageView` is sampled with depth comparison, the image view's format features must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`

- **VUID-vkCmdSubpassShadingHUAWEI-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- **VUID-vkCmdSubpassShadingHUAWEI-None-07888**
  If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features must contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`

- **VUID-vkCmdSubpassShadingHUAWEI-None-02692**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`

- **VUID-vkCmdSubpassShadingHUAWEI-None-02693**
  If the `VK_EXT_filter_cubic` extension is not enabled and any `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, it must not have a `VkImageViewType` of `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`
Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by VkGetPhysicalDeviceImageFormatProperties2::filterCubic returned by VkGetPhysicalDeviceImageFormatProperties2.

Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkGetPhysicalDeviceImageFormatProperties2::filterCubicMinmax returned by VkGetPhysicalDeviceImageFormatProperties2.

If the cubicRangeClamp feature is not enabled, then any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must not have a VkSamplerReductionModeCreateInfo

reductionMode equal to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM

Any VkImageView being sampled with a VkSamplerReductionModeCreateInfo::reductionMode equal to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM as a result of this command must sample with VK_FILTER_CUBIC_EXT.

If the selectableCubicWeights feature is not enabled, then any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have VkSamplerCubicWeightsCreateInfoQCOM::cubicWeights equal to VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM.

Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE.

For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT.

For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT.

For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view's buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT.
Any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view’s buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

- **VUID-vkCmdSubpassShadingHUAWEI-None-08600**
  For each set $n$ that is statically used by a `bound shader`, a descriptor set must have been bound to $n$ at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set $n$, with the `VkPipelineLayout` or `VkDescriptorSetLayout` array that was used to create the current `VkPipeline` or `VkShaderEXT`, as described in Pipeline Layout Compatibility.

- **VUID-vkCmdSubpassShadingHUAWEI-None-08601**
  For each push constant that is statically used by a `bound shader`, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` or `VkDescriptorSetLayout` and `VkPushConstantRange` arrays used to create the current `VkPipeline` or `VkShaderEXT`, as described in Pipeline Layout Compatibility.

- **VUID-vkCmdSubpassShadingHUAWEI-maintenance4-08602**
  If the `maintenance4` feature is not enabled, then for each push constant that is statically used by a `bound shader`, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` or `VkDescriptorSetLayout` and `VkPushConstantRange` arrays used to create the current `VkPipeline` or `VkShaderEXT`, as described in Pipeline Layout Compatibility.

- **VUID-vkCmdSubpassShadingHUAWEI-None-08114**
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command and the bound `VkPipeline` was not created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.

- **VUID-vkCmdSubpassShadingHUAWEI-None-08115**
  If the descriptors used by the `VkPipeline` bound to the pipeline bind point were specified via `vkCmdBindDescriptorSets`, the bound `VkPipeline` must have been created without `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.

- **VUID-vkCmdSubpassShadingHUAWEI-None-08116**
  Descriptors in bound descriptor buffers, specified via `vkCmdSetDescriptorBufferOffsetsEXT`, must be valid if they are dynamically used by the `VkPipeline` bound to the pipeline bind point used by this command and the bound `VkPipeline` was created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.

- **VUID-vkCmdSubpassShadingHUAWEI-None-08604**
  Descriptors in bound descriptor buffers, specified via `vkCmdSetDescriptorBufferOffsetsEXT`, must be valid if they are dynamically used by any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command.

- **VUID-vkCmdSubpassShadingHUAWEI-None-08117**
  If the descriptors used by the `VkPipeline` bound to the pipeline bind point were specified via `vkCmdSetDescriptorBufferOffsetsEXT`, the bound `VkPipeline` must have been created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.
If a descriptor is dynamically used with a `VkPipeline` created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, the descriptor memory **must** be resident.

If a descriptor is dynamically used with a `VkShaderEXT` created with a `VkDescriptorSetLayout` that was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, the descriptor memory **must** be resident.

If the `shaderObject` feature is not enabled, a valid pipeline **must** be bound to the pipeline bind point used by this command.

If the `shaderObject` is enabled, either a valid pipeline **must** be bound to the pipeline bind point used by this command, or a valid combination of valid and `VK_NULL_HANDLE` shader objects **must** be bound to every supported shader stage corresponding to the pipeline bind point used by this command.

If a pipeline is bound to the pipeline bind point used by this command, there **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `uniformBuffers`,
and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdSubpassShadingHUAWEI-None-08612
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdSubpassShadingHUAWEI-storageBuffers-06936
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdSubpassShadingHUAWEI-None-08613
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdSubpassShadingHUAWEI-commandBuffer-02707
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by bound shaders must not be a protected resource

- VUID-vkCmdSubpassShadingHUAWEI-None-06550
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y’C_bC_a conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions

- VUID-vkCmdSubpassShadingHUAWEI-ConstOffset-06551
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y’C_bC_a conversion, that object must not use the ConstOffset and Offset operands

- VUID-vkCmdSubpassShadingHUAWEI-viewType-07752
  If a VkImageView is accessed as a result of this command, then the image view’s viewType must match the Dim operand of the OpTypeImage as described in Instruction/Sampler/Image View Validation

- VUID-vkCmdSubpassShadingHUAWEI-format-07753
  If a VkImageView is accessed as a result of this command, then the numeric type of the image view’s format and the Sampled Type operand of the OpTypeImage must match

- VUID-vkCmdSubpassShadingHUAWEI-OpImageWrite-08795
  If a VkImageView created with a format other than VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view’s format

- VUID-vkCmdSubpassShadingHUAWEI-OpImageWrite-08796
  If a VkImageView created with the format VK_FORMAT_A8_UNORM_KHR is accessed using
OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have four components

- VUID-vkCmdSubpassShadingHUAWEI-OpImageWrite-04469
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format

- VUID-vkCmdSubpassShadingHUAWEI-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- VUID-vkCmdSubpassShadingHUAWEI-SampledType-04471
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- VUID-vkCmdSubpassShadingHUAWEI-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- VUID-vkCmdSubpassShadingHUAWEI-SampledType-04473
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- VUID-vkCmdSubpassShadingHUAWEI-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdSubpassShadingHUAWEI-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdSubpassShadingHUAWEI-OpImageWeightedSampleQCOM-06971
  If OpImageWeightedSampleQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM

- VUID-vkCmdSubpassShadingHUAWEI-OpImageWeightedSampleQCOM-06972
  If OpImageWeightedSampleQCOM uses a VkImageView as a sample weight image as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM

- VUID-vkCmdSubpassShadingHUAWEI-OpImageBoxFilterQCOM-06973
  If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM

- VUID-vkCmdSubpassShadingHUAWEI-OpImageBoxFilterQCOM-06974
  If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM
If OpImageBlockMatchSSDQCOM is used to read from an VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

- VUID-vkCmdSubpassShadingHUAWEI-OpImageBlockMatchSADQCOM-06975
  If OpImageBlockMatchSADQCOM is used to read from an VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

- VUID-vkCmdSubpassShadingHUAWEI-OpImageBlockMatchSADQCOM-06976
  If OpImageBlockMatchSADQCOM or OpImageBlockMatchSSDQCOM is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation

- VUID-vkCmdSubpassShadingHUAWEI-OpImageWeightedSampleQCOM-06977
  If OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchWindowSSDQCOM, OpImageBlockMatchWindowSADQCOM, OpImageBlockMatchGatherSSDQCOM, OpImageBlockMatchGatherSADQCOM, or OpImageBlockMatchSSDQCOM uses a VkSampler as a result of this command, then the sampler must have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM

- VUID-vkCmdSubpassShadingHUAWEI-OpImageWeightedSampleQCOM-06978
  If any command other than OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchWindowSSDQCOM, OpImageBlockMatchWindowSADQCOM, OpImageBlockMatchGatherSSDQCOM, OpImageBlockMatchGatherSADQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must not have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM

- VUID-vkCmdSubpassShadingHUAWEI-OpImageBlockMatchWindow-09215
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM instruction is used to read from an VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

- VUID-vkCmdSubpassShadingHUAWEI-OpImageBlockMatchWindow-09216
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM instruction is used to read from an VkImageView as a result of this command, then the image view’s format must be a single-component format.

- VUID-vkCmdSubpassShadingHUAWEI-OpImageBlockMatchWindow-09217
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation

- VUID-vkCmdSubpassShadingHUAWEI-None-07288
  Any shader invocation executed by this command must terminate

- VUID-vkCmdSubpassShadingHUAWEI-None-04931
  This command must be called in a subpass with bind point VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI. No draw commands can be called in the same subpass. Only one vkCmdSubpassShadingHUAWEI command can be called in a subpass.
Valid Usage (Implicit)

- VUID-vkCmdSubpassShadingHUAWEI-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSubpassShadingHUAWEI-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSubpassShadingHUAWEI-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSubpassShadingHUAWEI-renderpass
  This command must only be called inside of a render pass instance

- VUID-vkCmdSubpassShadingHUAWEI-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Chapter 32. Device-Generated Commands

This chapter discusses the generation of command buffer content on the device, for which these principle steps are to be taken:

- Define via `VkIndirectCommandsLayoutNV` the sequence of commands which should be generated.
- Optionally make use of device-bindable Shader Groups for graphics pipelines.
- Retrieve device addresses by `vkGetBufferDeviceAddressEXT` for setting buffers on the device.
- Retrieve device addresses of compute pipelines by `vkGetPipelineIndirectDeviceAddressNV` to be able to bind it in device generated rendering.
- Fill one or more `VkBuffer` with the appropriate content that gets interpreted by `VkIndirectCommandsLayoutNV`.
- Create a preprocess `VkBuffer` using the allocation information from `vkGetGeneratedCommandsMemoryRequirementsNV`.
- Optionally preprocess the input data using `vkCmdPreprocessGeneratedCommandsNV` in a separate action.
- Generate and execute the actual commands via `vkCmdExecuteGeneratedCommandsNV` passing all required data.

`vkCmdPreprocessGeneratedCommandsNV` executes in a separate logical pipeline from either graphics or compute. When preprocessing commands in a separate step they must be explicitly synchronized against the command execution. When not preprocessing, the preprocessing is automatically synchronized against the command execution.

32.1. Indirect Commands Layout

The device-side command generation happens through an iterative processing of an atomic sequence comprised of command tokens, which are represented by:

```c
// Provided by VK_NV_device_generated_commands
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkIndirectCommandsLayoutNV)
```

32.1.1. Creation and Deletion

Indirect command layouts are created by:

```c
// Provided by VK_NV_device_generated_commands
VkResult vkCreateIndirectCommandsLayoutNV(  
    VkDevice device,  
    const VkIndirectCommandsLayoutCreateInfoNV* pCreateInfo,  
    const VkAllocationCallbacks* pAllocator,  
    VkIndirectCommandsLayoutNV* pIndirectCommandsLayout);
```
• **device** is the logical device that creates the indirect command layout.

• **pCreateInfo** is a pointer to a `VkIndirectCommandsLayoutCreateInfoNV` structure containing parameters affecting creation of the indirect command layout.

• **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

• **pIndirectCommandsLayout** is a pointer to a `VkIndirectCommandsLayoutNV` handle in which the resulting indirect command layout is returned.

### Valid Usage

- VUID-vkCreateIndirectCommandsLayoutNV-deviceGeneratedCommands-02929
  
  The `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands` feature must be enabled

### Valid Usage (Implicit)

- VUID-vkCreateIndirectCommandsLayoutNV-device-parameter
  
  `device` must be a valid `VkDevice` handle

- VUID-vkCreateIndirectCommandsLayoutNV-pCreateInfo-parameter
  
  `pCreateInfo` must be a valid pointer to a valid `VkIndirectCommandsLayoutCreateInfoNV` structure

- VUID-vkCreateIndirectCommandsLayoutNV-pAllocator-parameter
  
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateIndirectCommandsLayoutNV-pIndirectCommandsLayout-parameter
  
  `pIndirectCommandsLayout` must be a valid pointer to a `VkIndirectCommandsLayoutNV` handle

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkIndirectCommandsLayoutCreateInfoNV` structure is defined as:

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkIndirectCommandsLayoutCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
} ...
```
VkIndirectCommandsLayoutCreateInfoNV
{
    sType
    pNext
    VkPipelineBindPoint
    uint32_t
    const VkIndirectCommandsLayoutTokenNV*
    uint32_t
    const uint32_t*
} VkIndirectCommandsLayoutCreateInfoNV;

• **sType** is a *VkStructureType* value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **pipelineBindPoint** is the *VkPipelineBindPoint* that this layout targets.

• **flags** is a bitmask of *VkIndirectCommandsLayoutUsageFlagBitsNV* specifying usage hints of this layout.

• **tokenCount** is the length of the individual command sequence.

• **pTokens** is an array describing each command token in detail. See *VkIndirectCommandsTokenTypeNV* and *VkIndirectCommandsLayoutTokenNV* below for details.

• **streamCount** is the number of streams used to provide the token inputs.

• **pStreamStrides** is an array defining the byte stride for each input stream.

The following code illustrates some of the flags:

```
void cmdProcessAllSequences(cmd, pipeline, indirectCommandsLayout, pIndirectCommandsTokens, sequencesCount, indexbuffer, indexbufferOffset)
{
    for (s = 0; s < sequencesCount; s++)
    {
        sUsed = s;

        if (indirectCommandsLayout.flags & VK间接命令布局使用的索引序列位)
            sUsed = indexbuffer.load_uint32( sUsed * sizeof(uint32_t) + indexbufferOffset);

        if (indirectCommandsLayout.flags & VK间接命令布局使用的无序序列位)
            sUsed = incoherent_implementation_dependent_permutation[ sUsed ];

        cmdProcessSequence(cmd, pipeline, indirectCommandsLayout, pIndirectCommandsTokens, sUsed);
    }
}
```

When tokens are consumed, an offset is computed based on token offset and stream stride. The resulting offset is required to be aligned. The alignment for a specific token is equal to the scalar
alignment of the data type as defined in Alignment Requirements, or VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::minIndirectCommandsBufferOffsetAlignment, whichever is lower.

**Note**

A `minIndirectCommandsBufferOffsetAlignment` of 4 allows `VkDeviceAddress` to be packed as `uvec2` with scalar layout instead of `uint64_t` with 8 byte alignment. This enables direct compatibility with D3D12 command signature layouts.

### Valid Usage

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pipelineBindPoint-02930**
  The `pipelineBindPoint` must be `VK_PIPELINE_BIND_POINT_GRAPHICS` or `VK_PIPELINE_BIND_POINT_COMPUTE`.

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-tokenCount-02931**
  `tokenCount` must be greater than 0 and less than or equal to `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectCommandsTokenCount`.

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-02932**
  If `pTokens` contains an entry of `VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV` it must be the first element of the array and there must be only a single element of such token type.

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-02933**
  If `pTokens` contains an entry of `VK_INDIRECT_COMMANDS_TOKEN_TYPE_STATE_FLAGS_NV` there must be only a single element of such token type.

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-02934**
  All state tokens in `pTokens` must occur before any work provoking tokens (`VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_NV`, `VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_INDEXED_NV`, `VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_TASKS_NV`, `VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_MESH_TASKS_NV`, `VK_INDIRECT_COMMANDS_TOKEN_TYPE_DISPATCH_NV`).

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-02935**
  The content of `pTokens` must include one single work provoking token that is compatible with the `pipelineBindPoint`.

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-streamCount-02936**
  `streamCount` must be greater than 0 and less or equal to ` VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectCommandsStreamCount`.

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pStreamStrides-02937**
  Each element of `pStreamStrides` must be greater than 0 and less than or equal to `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectCommandsStreamStride`. Furthermore the alignment of each token input must be ensured.

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pipelineBindPoint-09088**
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_COMPUTE` then the `VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV::deviceGeneratedCompute`...
**Valid Usage (Implicit)**

- VUID-VkIndirectCommandsLayoutCreateInfoNV-sType-sType
  
  *sType must be* `VK_STRUCTURE_TYPE_INDIRECT_COMMANDS_LAYOUT_CREATE_INFO_NV`

- VUID-VkIndirectCommandsLayoutCreateInfoNV-pNext-pNext
  
  *pNext must be* `NULL`

- VUID-VkIndirectCommandsLayoutCreateInfoNV-flags-parameter
  
  *flags must be a valid combination of* `VkIndirectCommandsLayoutUsageFlagBitsNV` values

- VUID-VkIndirectCommandsLayoutCreateInfoNV-pipelineBindPoint-parameter
  
  *pipelineBindPoint must be a valid* `VkPipelineBindPoint` value

- VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-parameter
  
  *pTokens must be a valid pointer to an array of* `tokenCount` valid `VkIndirectCommandsLayoutTokenNV` structures

- VUID-VkIndirectCommandsLayoutCreateInfoNV-pStreamStrides-parameter
  
  *pStreamStrides must be a valid pointer to an array of* `streamCount uint32_t` values

- VUID-VkIndirectCommandsLayoutCreateInfoNV-tokenCount-arraylength
  
  *tokenCount must be greater than 0*

- VUID-VkIndirectCommandsLayoutCreateInfoNV-streamCount-arraylength
  
  *streamCount must be greater than 0*

Bits which can be set in `VkIndirectCommandsLayoutCreateInfoNV::flags`, specifying usage hints of an indirect command layout, are:

```c
// Provided by VK_NV_device_generated_commands
typedef enum VkIndirectCommandsLayoutUsageFlagBitsNV {
    VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_NV = 0x00000001,
    VK_INDIRECT_COMMANDS_LAYOUT_USAGE_INDEXED_SEQUENCES_BIT_NV = 0x00000002,
    VK_INDIRECT_COMMANDS_LAYOUT_USAGE_UNORDERED_SEQUENCES_BIT_NV = 0x00000004,
} VkIndirectCommandsLayoutUsageFlagBitsNV;
```
• **VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_NV** specifies that the layout is always used with the manual preprocessing step through calling `vkCmdPreprocessGeneratedCommandsNV` and executed by `vkCmdExecuteGeneratedCommandsNV` with `isPreprocessed` set to `VK_TRUE`.

• **VK_INDIRECT_COMMANDS_LAYOUT_USAGE_INDEXED_SEQUENCES_BIT_NV** specifies that the input data for the sequences is not implicitly indexed from 0..sequencesUsed but a user provided `VkBuffer` encoding the index is provided.

• **VK_INDIRECT_COMMANDS_LAYOUT_USAGE_UNORDERED_SEQUENCES_BIT_NV** specifies that the processing of sequences can happen at an implementation-dependent order, which is not guaranteed to be coherent using the same input data. This flag is ignored when the `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_COMPUTE` as it is implied that the dispatch sequence is always unordered.

// Provided by VK_NV_device_generated_commands

typedef VkFlags VkIndirectCommandsLayoutUsageFlagsNV;

**VkIndirectCommandsLayoutUsageFlagsNV** is a bitmask type for setting a mask of zero or more `VkIndirectCommandsLayoutUsageFlagBitsNV`.

Indirect command layouts are destroyed by:

// Provided by VK_NV_device_generated_commands

```c
void vkDestroyIndirectCommandsLayoutNV(
    VkDevice device,
    VkIndirectCommandsLayoutNV indirectCommandsLayout,
    const VkAllocationCallbacks* pAllocator);
```

• **device** is the logical device that destroys the layout.

• **indirectCommandsLayout** is the layout to destroy.

• **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

**Valid Usage**

• VUID-vkDestroyIndirectCommandsLayoutNV-indirectCommandsLayout-02938
  All submitted commands that refer to `indirectCommandsLayout` must have completed execution

• VUID-vkDestroyIndirectCommandsLayoutNV-indirectCommandsLayout-02939
  If `VkAllocationCallbacks` were provided when `indirectCommandsLayout` was created, a compatible set of callbacks must be provided here

• VUID-vkDestroyIndirectCommandsLayoutNV-indirectCommandsLayout-02940
  If no `VkAllocationCallbacks` were provided when `indirectCommandsLayout` was created, `pAllocator` must be NULL

• VUID-vkDestroyIndirectCommandsLayoutNV-deviceGeneratedCommands-02941
  The `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands` feature
must be enabled

Valid Usage (Implicit)

- VUID-vkDestroyIndirectCommandsLayoutNV-device-parameter
device must be a valid VkDevice handle

- VUID-vkDestroyIndirectCommandsLayoutNV-indirectCommandsLayout-parameter
If indirectCommandsLayout is not VK_NULL_HANDLE, indirectCommandsLayout must be a valid VkIndirectCommandsLayoutNV handle

- VUID-vkDestroyIndirectCommandsLayoutNV-pAllocator-parameter
If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroyIndirectCommandsLayoutNV-indirectCommandsLayout-parent
If indirectCommandsLayout is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to indirectCommandsLayout must be externally synchronized

32.1.2. Token Input Streams

The VkIndirectCommandsStreamNV structure specifies the input data for one or more tokens at processing time.

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkIndirectCommandsStreamNV {
    VkBuffer buffer;
    VkDeviceSize offset;
} VkIndirectCommandsStreamNV;
```

- buffer specifies the VkBuffer storing the functional arguments for each sequence. These arguments can be written by the device.
- offset specifies an offset into buffer where the arguments start.

Valid Usage

- VUID-VkIndirectCommandsStreamNV-buffer-02942
The buffer’s usage flag must have the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

- VUID-VkIndirectCommandsStreamNV-offset-02943
The offset must be aligned to VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::minIndirectCommandsBufferOffsetAlignment
If `buffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object.

### Valid Usage (Implicit)

- **VUID-VkIndirectCommandsStreamNV-buffer-parameter**
  - `buffer` **must** be a valid `VkBuffer` handle

The input streams **can** contain raw `uint32_t` values, existing indirect commands such as:

- `VkDrawIndirectCommand`
- `VkDrawIndexedIndirectCommand`
- `VkDrawMeshTasksIndirectCommandNV`
- `VkDrawMeshTasksIndirectCommandEXT`
- `VkDispatchIndirectCommand`

or additional commands as listed below. How the data is used is described in the next section.

The `VkBindShaderGroupIndirectCommandNV` structure specifies the input data for the `VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV` token.

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkBindShaderGroupIndirectCommandNV {
    uint32_t groupIndex;
} VkBindShaderGroupIndirectCommandNV;
```

- `groupIndex` specifies which shader group of the current bound graphics pipeline is used.

### Valid Usage

- **VUID-VkBindShaderGroupIndirectCommandNV-None-02944**
  - The current bound graphics pipeline, as well as the pipelines it may reference, **must** have been created with `VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV`

- **VUID-VkBindShaderGroupIndirectCommandNV-index-02945**
  - The index **must** be within range of the accessible shader groups of the current bound graphics pipeline. See `vkCmdBindPipelineShaderGroupNV` for further details

The `VkBindIndexBufferIndirectCommandNV` structure specifies the input data for the `VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_NV` token.

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkBindIndexBufferIndirectCommandNV {
    uint32_t index;
} VkBindIndexBufferIndirectCommandNV;
```
VkDeviceAddress bufferAddress;
uint32_t size;
VkIndexType indexType;
} VkBindIndexBufferIndirectCommandNV;

- **bufferAddress** specifies a physical address of the VkBuffer used as index buffer.
- **size** is the byte size range which is available for this operation from the provided address.
- **indexType** is a VkIndexType value specifying how indices are treated. Instead of the Vulkan enum values, a custom uint32_t value can be mapped to an VkIndexType by specifying the VkIndirectCommandsLayoutTokenNV::pIndexTypes and VkIndirectCommandsLayoutTokenNV::pIndexTypeValues arrays.

### Valid Usage

- **VUID-VkBindIndexBufferIndirectCommandNV-None-02946**
  The buffer’s usage flag from which the address was acquired must have the VK_BUFFER_USAGE_INDEX_BUFFER_BIT bit set

- **VUID-VkBindIndexBufferIndirectCommandNV-bufferAddress-02947**
  The bufferAddress must be aligned to the indexType used

- **VUID-VkBindIndexBufferIndirectCommandNV-None-02948**
  Each element of the buffer from which the address was acquired and that is non-sparse must be bound completely and contiguously to a single VkDeviceMemory object

### Valid Usage (Implicit)

- **VUID-VkBindIndexBufferIndirectCommandNV-indexType-parameter**
  indexType must be a valid VkIndexType value

The VkBindVertexBufferIndirectCommandNV structure specifies the input data for the VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_NV token.

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkBindVertexBufferIndirectCommandNV {
    VkDeviceAddress bufferAddress;
    uint32_t size;
    uint32_t stride;
} VkBindVertexBufferIndirectCommandNV;
```

- **bufferAddress** specifies a physical address of the VkBuffer used as vertex input binding.
- **size** is the byte size range which is available for this operation from the provided address.
- **stride** is the byte size stride for this vertex input binding as in VkVertexInputBindingDescription::stride. It is only used if VkIndirectCommandsLayoutTokenNV::vertexDynamicStride was set, otherwise the stride is inherited from the current bound graphics pipeline.
Valid Usage

- VUID-VkBindVertexBufferIndirectCommandNV-None-02949
  The buffer’s usage flag from which the address was acquired must have the VK_BUFFER_USAGE_VERTEX_BUFFER_BIT bit set

- VUID-VkBindVertexBufferIndirectCommandNV-None-02950
  Each element of the buffer from which the address was acquired and that is non-sparse must be bound completely and contiguously to a single VkDeviceMemory object

The VkSetStateFlagsIndirectCommandNV structure specifies the input data for the VK_INDIVIDUAL_INDIVIDUAL_TOKEN_TYPE_INDIVIDUAL_FLAGS_NV token. Which state is changed depends on the VkIndirectStateFlagBitsNV specified at VkIndirectCommandsLayoutNV creation time.

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkSetStateFlagsIndirectCommandNV {
    uint32_t   data;
} VkSetStateFlagsIndirectCommandNV;
```

- data encodes packed state that this command alters.
  - Bit 0: If set represents VK_FRONT_FACE_CLOCKWISE, otherwise VK_FRONT_FACE_COUNTER_CLOCKWISE

A subset of the graphics pipeline state can be altered using indirect state flags:

```c
// Provided by VK_NV_device_generated_commands
typedef enum VkIndirectStateFlagBitsNV {
    VK_INDIVIDUAL_STATE_FLAG_FRONTFACE_BIT_NV = 0x00000001,
} VkIndirectStateFlagBitsNV;
```

- VK_INDIVIDUAL_STATE_FLAG_FRONTFACE_BIT_NV allows to toggle the VkFrontFace rasterization state for subsequent drawing commands.

```c
// Provided by VK_NV_device_generated_commands
typedef VkFlags VkIndirectStateFlagsNV;
```

VkIndirectStateFlagsNV is a bitmask type for setting a mask of zero or more VkIndirectStateFlagBitsNV.

The VkBindPipelineIndirectCommandNV structure specifies the input data for the VK_INDIVIDUAL_INDIVIDUAL_TOKEN_TYPE_INDIVIDUAL_PIPELINE_NV token.

```c
// Provided by VK_NV_device_generated_commands_compute
typedef struct VkBindPipelineIndirectCommandNV {
    VkDeviceAddress pipelineAddress;
} VkBindPipelineIndirectCommandNV;
```
- `pipelineAddress` specifies the pipeline address of the compute pipeline that will be used in device generated rendering.

### Valid Usage

- **VUID-VkBindPipelineIndirectCommandNV-deviceGeneratedComputePipelines-09091**
  
  The `VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV::deviceGeneratedComputePipelines` feature must be enabled

- **VUID-VkBindPipelineIndirectCommandNV-None-09092**
  
  The referenced pipeline must have been created with `VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV`

- **VUID-VkBindPipelineIndirectCommandNV-None-09093**
  
  The referenced pipeline must have been updated with `vkCmdUpdatePipelineIndirectBufferNV`

- **VUID-VkBindPipelineIndirectCommandNV-None-09094**
  
  The referenced pipeline’s address must have been queried with `vkGetPipelineIndirectDeviceAddressNV`

### 32.1.3. Tokenized Command Processing

The processing is in principle illustrated below:

```c
void cmdProcessSequence(cmd, pipeline, indirectCommandsLayout, pIndirectCommandsStreams, s)
{
    for (t = 0; t < indirectCommandsLayout.tokenCount; t++)
    {
        uint32_t stream = indirectCommandsLayout.pTokens[t].stream;
        uint32_t offset = indirectCommandsLayout.pTokens[t].offset;
        uint32_t stride = indirectCommandsLayout.pStreamStrides[stream];
        stream = pIndirectCommandsStreams[stream];
        const void* input = stream.buffer.pointer( stream.offset + stride * s + offset )

        // further details later
        indirectCommandsLayout.pTokens[t].command (cmd, pipeline, input, s);
    }
}

void cmdProcessAllSequences(cmd, pipeline, indirectCommandsLayout, pIndirectCommandsStreams, sequencesCount)
{
    for (s = 0; s < sequencesCount; s++)
    {
        cmdProcessSequence(cmd, pipeline, indirectCommandsLayout, pIndirectCommandsStreams, s);
    }
}
```
The processing of each sequence is considered stateless, therefore all state changes must occur prior work provoking commands within the sequence. A single sequence is strictly targeting the VkPipelineBindPoint it was created with.

The primary input data for each token is provided through VkBuffer content at preprocessing using vkCmdPreprocessGeneratedCommandsNV or execution time using vkCmdExecuteGeneratedCommandsNV, however some functional arguments, for example binding sets, are specified at layout creation time. The input size is different for each token.

Possible values of those elements of the VkIndirectCommandsLayoutCreateInfoNV::pTokens array specifying command tokens (other elements of the array specify command parameters) are:

```c
// Provided by VK_NV_device_generated_commands
typedef enum VkIndirectCommandsTokenTypeNV {
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV = 0,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_STATE_FLAGS_NV = 1,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_NV = 2,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_NV = 3,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV = 4,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_INDEXED_NV = 5,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_NV = 6,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_TASKS_NV = 7,
// Provided by VK_EXT_mesh_shader with VK_NV_device_generated_commands
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_MESH_TASKS_NV = 1000328000,
// Provided by VK_NV_device_generated_commands_compute
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_PIPELINE_NV = 1000428003,
// Provided by VK_NV_device_generated_commands_compute
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DISPATCH_NV = 1000428004,
} VkIndirectCommandsTokenTypeNV;
```

Table 46. Supported indirect command tokens

<table>
<thead>
<tr>
<th>Token type</th>
<th>Equivalent command</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV</td>
<td>vkCmdBindPipelineShaderGroupNV</td>
</tr>
<tr>
<td>VK_INDIRECTCOMMANDSTOKEN_TYPE_STATE_FLAGS_NV</td>
<td>-</td>
</tr>
<tr>
<td>VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_NV</td>
<td>vkCmdBindIndexBuffer</td>
</tr>
<tr>
<td>VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_NV</td>
<td>vkCmdBindVertexBuffers</td>
</tr>
<tr>
<td>VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV</td>
<td>vkCmdPushConstants</td>
</tr>
<tr>
<td>VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_INDEXED_NV</td>
<td>vkCmdDrawIndexedIndirect</td>
</tr>
</tbody>
</table>
The `VkIndirectCommandsLayoutTokenNV` structure specifies details to the function arguments that need to be known at layout creation time:

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkIndirectCommandsLayoutTokenNV {
    VkStructureType sType;
    const void* pNext;
    VkIndirectCommandsTokenTypeNV tokenType;
    uint32_t stream;
    uint32_t offset;
    uint32_t vertexBindingUnit;
    VkBool32 vertexDynamicStride;
    VkPipelineLayout pushconstantPipelineLayout;
    VkShaderStageFlags pushconstantShaderStageFlags;
    uint32_t pushconstantOffset;
    uint32_t pushconstantSize;
    VkIndirectStateFlagsNV indirectStateFlags;
    uint32_t indexTypeCount;
    const VkIndexType* pIndexTypes;
    const uint32_t* pIndexTypeValues;
} VkIndirectCommandsLayoutTokenNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `tokenType` specifies the token command type.
- `stream` is the index of the input stream containing the token argument data.
- `offset` is a relative starting offset within the input stream memory for the token argument data.
- `vertexBindingUnit` is used for the vertex buffer binding command.
- `vertexDynamicStride` sets if the vertex buffer stride is provided by the binding command rather than the current bound graphics pipeline state.
- `pushconstantPipelineLayout` is the `VkPipelineLayout` used for the push constant command.
- `pushconstantShaderStageFlags` are the shader stage flags used for the push constant command.
- `pushconstantOffset` is the offset used for the push constant command.
- **pushconstantSize** is the size used for the push constant command.
- **indirectStateFlags** are the active states for the state flag command.
- **indexTypeCount** is the optional size of the pIndexTypes and pIndexTypeValues array pairings. If not zero, it allows to register a custom uint32_t value to be treated as specific VkIndexType.
- **pIndexTypes** is the used VkIndexType for the corresponding uint32_t value entry in pIndexTypeValues.

### Valid Usage

- **VUID-VkIndirectCommandsLayoutTokenNV-stream-02951**
  stream must be smaller than VkIndirectCommandsLayoutCreateInfoNV::streamCount

- **VUID-VkIndirectCommandsLayoutTokenNV-offset-02952**
  offset must be less than or equal to VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectCommandsTokenOffset

- **VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02976**
  If tokenType is VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_NV, vertexBindingUnit must stay within device supported limits for the appropriate commands

- **VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02977**
  If tokenType is VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV, pushconstantPipelineLayout must be valid

- **VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02978**
  If tokenType is VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV, pushconstantOffset must be a multiple of 4

- **VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02979**
  If tokenType is VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV, pushconstantSize must be a multiple of 4

- **VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02980**
  If tokenType is VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV, pushconstantOffset must be less than VkPhysicalDeviceLimits::maxPushConstantsSize

- **VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02981**
  If tokenType is VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV, pushconstantSize must be less than or equal to VkPhysicalDeviceLimits::maxPushConstantsSize minus pushconstantOffset

- **VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02982**
  If tokenType is VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV, for each byte in the range specified by pushconstantOffset and pushconstantSize and for each shader stage in pushconstantShaderStageFlags, there must be a push constant range in pushconstantPipelineLayout that includes that byte and that stage

- **VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02983**
If `tokenType` is `VK间接命令类型_PUSH_CONSTANT_NV`，对于指定的范围由`pushconstantOffset`和`pushconstantSize`，以及对于每个覆盖该字节的`push constant`范围，`pushconstantShaderStageFlags`必须包含该`push constant`范围的`VkPushConstantRange::stageFlags`。

- VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02984

如果`tokenType`是`VK间接命令类型_STATE_FLAGS_NV`，`indirectStateFlags`不得为0。

### 操作有效使用（隐式）

- VUID-VkIndirectCommandsLayoutTokenNV-sType-sType
  sType必须是`VK_STRUCTURE_TYPE间接命令布局_TOKEN_NV`。

- VUID-VkIndirectCommandsLayoutTokenNV-pNext-pNext
  pNext必须是NULL。

- VUID-VkIndirectCommandsLayoutTokenNV-tokenType-parameter
  tokenType必须是有效的`VkIndirectCommandsTokenTypeNV`值。

- VUID-VkIndirectCommandsLayoutTokenNV-pushconstantPipelineLayout-parameter
  pushconstantPipelineLayout必须是有效的`VkPipelineLayout`句柄。

- VUID-VkIndirectCommandsLayoutTokenNV-pushconstantShaderStageFlags-parameter
  pushconstantShaderStageFlags必须是有效的`VkShaderStageFlagBits`。

- VUID-VkIndirectCommandsLayoutTokenNV-indirectStateFlags-parameter
  indirectStateFlags必须是有效的`VkIndirectStateFlagBitsNV`。

- VUID-VkIndirectCommandsLayoutTokenNV-pIndexTypes-parameter
  If `indexTypeCount` 不为0，pIndexTypes必须是有效的`VkIndexType`句柄。

- VUID-VkIndirectCommandsLayoutTokenNV-pIndexTypeValues-parameter
  If `indexTypeCount` 不为0，pIndexTypeValues必须是有效的`uint32_t`。

以下代码提供了详细的信息，说明如何处理单个序列。对于有效使用，所有限制都适用于常规命令。

```c
void cmdProcessSequence(cmd, pipeline, indirectCommandsLayout, pIndirectCommandsStreams, s)
{
    for (uint32_t t = 0; t < indirectCommandsLayout.tokenCount; t++){
        token = indirectCommandsLayout.pTokens[t];

        uint32_t stride = indirectCommandsLayout.pStreamStrides[token.stream];
        stream = pIndirectCommandsStreams[token.stream];
        uint32_t offset = stream.offset + stride * s + token.offset;
```
```
const void* input = stream.buffer.pointer( offset )

switch(input.type){
    case VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV:
        VkBindShaderGroupIndirectCommandNV* bind = input;

        vkCmdBindPipelineShaderGroupNV(cmd, indirectCommandsLayout.pipelineBindPoint,
            pipeline, bind->groupIndex);
        break;

    case VK_INDIRECT_COMMANDS_TOKEN_TYPE_STATE_FLAGS_NV:
        VkSetStateFlagsIndirectCommandNV* state = input;

        if (token.indirectStateFlags & VK_INDIRECT_STATE_FLAG_FRONTFACE_BIT_NV){
            if (state.data & (1 << 0)){
                set VK_FRONT_FACE_CLOCKWISE;
            } else {
                set VK_FRONT_FACE_COUNTER_CLOCKWISE;
            }
        }
        break;

    case VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV:
        uint32_t* data = input;

        vkCmdPushConstants(cmd,
            token.pushconstantPipelineLayout,
            token.pushconstantStageFlags,
            token.pushconstantOffset,
            token.pushconstantSize, data);
        break;

    case VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_NV:
        VkBindIndexBufferIndirectCommandNV* data = input;

        // the indexType may optionally be remapped
        // from a custom uint32_t value, via
        // VkIndirectCommandsLayoutTokenNV::pIndexTypeValues

        vkCmdBindIndexBuffer(cmd,
            deriveBuffer(data->bufferAddress),
            deriveOffset(data->bufferAddress),
            data->indexType);
        break;

    case VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_NV:
        VkBindVertexBufferIndirectCommandNV* data = input;

        // if token.vertexDynamicStride is VK_TRUE
        // then the stride for this binding is set
        // using data->stride as well
```
vkCmdBindVertexBuffers(cmd, 
  token.vertexBindingUnit, 1, 
  &deriveBuffer(data->bufferAddress), 
  &deriveOffset(data->bufferAddress));
break;

case VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_INDEXED_NV: 
  vkCmdDrawIndexedIndirect(cmd, 
    stream.buffer, offset, 1, 0);
break;

case VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_NV: 
  vkCmdDrawIndirect(cmd, 
    stream.buffer, 
    offset, 1, 0);
break;

  // only available if VK_NV_mesh_shader is supported 
  case VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_TASKS_NV: 
    vkCmdDrawMeshTasksIndirectNV(cmd, 
      stream.buffer, offset, 1, 0);
break;

  // only available if VK_EXT_mesh_shader is supported 
  case VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_MESH_TASKS_NV: 
    vkCmdDrawMeshTasksIndirectEXT(cmd, 
      stream.buffer, offset, 1, 0);
break;

case VK_INDIRECT_COMMANDS_TOKEN_TYPE_PIPELINE_NV:
  VkBindPipelineIndirectCommandNV *data = input;
  VkPipeline computePipeline = deriveFromDeviceAddress(data->pipelineAddress);
  vkCmdBindPipeline(cmd, VK_PIPELINE_BIND_POINT_COMPUTE, computePipeline);
break;

case VK_INDIRECT_COMMANDS_TOKEN_TYPE_DISPATCH_NV:
  vkCmdDispatchIndirect(cmd, stream.buffer, offset);
break;
}

32.2. Indirect Commands Generation And Execution

The generation of commands on the device requires a preprocess buffer. To retrieve the memory size and alignment requirements of a particular execution state call:

// Provided by VK_NV_device_generated_commands
void vkGetGeneratedCommandsMemoryRequirementsNV(
    VkDevice device,
    const VkGeneratedCommandsMemoryRequirementsInfoNV* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);

- **device** is the logical device that owns the buffer.
- **pInfo** is a pointer to a `VkGeneratedCommandsMemoryRequirementsInfoNV` structure containing parameters required for the memory requirements query.
- **pMemoryRequirements** is a pointer to a `VkMemoryRequirements2` structure in which the memory requirements of the buffer object are returned.

### Valid Usage

- **VUID-vkGetGeneratedCommandsMemoryRequirementsNV-deviceGeneratedCommands-02906**
  
  The `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands` feature must be enabled.

- **VUID-vkGetGeneratedCommandsMemoryRequirementsNV-pInfo-09074**
  
  If `pInfo::pipelineBindPoint` is of type `VK_PIPELINE_BIND_POINT_COMPUTE`, then the `VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV::deviceGeneratedCompute` feature must be enabled.

### Valid Usage (Implicit)

- **VUID-vkGetGeneratedCommandsMemoryRequirementsNV-device-parameter**
  
  `device` must be a valid `VkDevice` handle.

- **VUID-vkGetGeneratedCommandsMemoryRequirementsNV-pInfo-parameter**
  
  `pInfo` must be a valid pointer to a valid `VkGeneratedCommandsMemoryRequirementsInfoNV` structure.

- **VUID-vkGetGeneratedCommandsMemoryRequirementsNV-pMemoryRequirements-parameter**
  
  `pMemoryRequirements` must be a valid pointer to a `VkMemoryRequirements2` structure.

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkGeneratedCommandsMemoryRequirementsInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineBindPoint pipelineBindPoint;
    VkPipeline pipeline;
    VkIndirectCommandsLayoutNV indirectCommandsLayout;
    uint32_t maxSequencesCount;
} VkGeneratedCommandsMemoryRequirementsInfoNV;
```
• **sType** is a VkStructureType value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **pipelineBindPoint** is the VkPipelineBindPoint of the pipeline that this buffer memory is intended to be used with during the execution.
• **pipeline** is the VkPipeline that this buffer memory is intended to be used with during the execution.
• **indirectCommandsLayout** is the VkIndirectCommandsLayoutNV that this buffer memory is intended to be used with.
• **maxSequencesCount** is the maximum number of sequences that this buffer memory in combination with the other state provided can be used with.

### Valid Usage

- **VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-maxSequencesCount-02907**
  maxSequencesCount must be less or equal to VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectSequenceCount

- **VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-pipelineBindPoint-09075**
  If pipelineBindPoint is of type VK_PIPELINE_BIND_POINT_GRAPHICS, then pipeline must be a valid VkPipeline handle

- **VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-pipelineBindPoint-09076**
  If pipelineBindPoint is of type VK_PIPELINE_BIND_POINT_COMPUTE, and the indirectCommandsLayout was not created with a VK_INDIRECT_COMMANDS_TOKEN_TYPE_PIPELINE_NV token, then the pipeline must be a valid VkPipeline handle

- **VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-pipelineBindPoint-09077**
  If pipelineBindPoint is of type VK_PIPELINE_BIND_POINT_COMPUTE, and the indirectCommandsLayout contains a VK_INDIRECT_COMMANDS_TOKEN_TYPE_PIPELINE_NV token, then the pipeline must be NULL

### Valid Usage (Implicit)

- **VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-sType-sType**
  sType must be VK_STRUCTURE_TYPE_GENERATED_COMMANDS_MEMORY_REQUIREMENTS_INFO_NV

- **VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-pNext-pNext**
  pNext must be NULL

- **VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-pipelineBindPoint-parameter pipelineBindPoint must** be a valid VkPipelineBindPoint value

- **VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-pipeline-parameter pipeline** is not VK_NULL_HANDLE, pipeline must be a valid VkPipeline handle

- **VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-indirectCommandsLayout-parameter indirectCommandsLayout must** be a valid VkIndirectCommandsLayoutNV handle
To bind a compute pipeline in Device-Generated Commands, an application must query the pipeline’s device address.

To query a compute pipeline’s 64-bit device address, call:

```c
// Provided by VK_NV_device_generated_commands_compute
VkDeviceAddress vkGetPipelineIndirectDeviceAddressNV(
    VkDevice device,
    const VkPipelineIndirectDeviceAddressInfoNV* pInfo);
```

- `device` is the logical device on which the pipeline was created.
- `pInfo` is a pointer to a `VkPipelineIndirectDeviceAddressInfoNV` structure specifying the pipeline to retrieve the address for.

**Valid Usage**

- VUID-vkGetPipelineIndirectDeviceAddressNV-deviceGeneratedComputePipelines-09078
  The `VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV::deviceGeneratedComputePipelines` feature must be enabled

**Valid Usage (Implicit)**

- VUID-vkGetPipelineIndirectDeviceAddressNV-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkGetPipelineIndirectDeviceAddressNV-pInfo-parameter
  `pInfo` must be a valid pointer to a valid `VkPipelineIndirectDeviceAddressInfoNV` structure

The `VkPipelineIndirectDeviceAddressInfoNV` structure is defined as:

```c
// Provided by VK_NV_device_generated_commands_compute
typedef struct VkPipelineIndirectDeviceAddressInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineBindPoint pipelineBindPoint;
    VkPipeline pipeline;
} VkPipelineIndirectDeviceAddressInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
pipelineBindPoint is a VkPipelineBindPoint value specifying the type of pipeline whose device address is being queried.

pipeline specifies the pipeline whose device address is being queried.

Valid Usage

- VUID-VkPipelineIndirectDeviceAddressInfoNV-pipelineBindPoint-09079
  The provided pipelineBindPoint must be of type VK_PIPELINE_BIND_POINT_COMPUTE
- VUID-VkPipelineIndirectDeviceAddressInfoNV-pipeline-09080
  pipeline must have been created with flag VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV set
- VUID-VkPipelineIndirectDeviceAddressInfoNV-pipeline-09081
  pipeline must have been created with a VkComputePipelineIndirectBufferInfoNV structure specifying a valid address where its metadata will be saved

Valid Usage (Implicit)

- VUID-VkPipelineIndirectDeviceAddressInfoNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_INDIRECT_DEVICE_ADDRESS_INFO_NV
- VUID-VkPipelineIndirectDeviceAddressInfoNV-pNext-pNext
  pNext must be NULL
- VUID-VkPipelineIndirectDeviceAddressInfoNV-pipelineBindPoint-parameter
  pipelineBindPoint must be a valid VkPipelineBindPoint value
- VUID-VkPipelineIndirectDeviceAddressInfoNV-pipeline-parameter
  pipeline must be a valid VkPipeline handle

To determine the memory requirements for a compute pipeline's metadata, call:

```c
// Provided by VK_NV_device_generated_commands_compute
define void vkGetPipelineIndirectMemoryRequirementsNV(
    VkDevice device,
    const VkComputePipelineCreateInfo* pCreateInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

- device is the logical device that owns the buffer.
- pCreateInfo is a VkComputePipelineCreateInfo structure specifying the creation parameters of the compute pipeline whose memory requirements are being queried.
- pMemoryRequirements is a pointer to a VkMemoryRequirements2 structure in which the requested pipeline’s memory requirements are returned.

If pCreateInfo::pNext chain includes a pointer to a VkComputePipelineIndirectBufferInfoNV structure, then the contents of that structure are ignored.
Valid Usage

- VUID-vkGetPipelineIndirectMemoryRequirementsNV-deviceGeneratedComputePipelines-09082
  The `VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV::deviceGeneratedComputePipelines` feature must be enabled.

- VUID-vkGetPipelineIndirectMemoryRequirementsNV-pCreateInfo-09083
  `pCreateInfo::flags` must include `VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV`.

Valid Usage (Implicit)

- VUID-vkGetPipelineIndirectMemoryRequirementsNV-device-parameter
  `device` must be a valid `VkDevice` handle.

- VUID-vkGetPipelineIndirectMemoryRequirementsNV-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid `VkComputePipelineCreateInfo` structure.

- VUID-vkGetPipelineIndirectMemoryRequirementsNV-pMemoryRequirements-parameter
  `pMemoryRequirements` must be a valid pointer to a `VkMemoryRequirements2` structure.

The actual generation of commands as well as their execution on the device is handled as single action with:

```c
// Provided by VK_NV_device_generated_commands
void vkCmdExecuteGeneratedCommandsNV(
    VkCommandBuffer commandBuffer,       // Provided by VK_NV_device_generated_commands
    VkBool32 isPreprocessed,              // Provided by VK_NV_device_generated_commands
    const VkGeneratedCommandsInfoNV* pGeneratedCommandsInfo); // Provided by VK_NV_device_generated_commands
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `isPreprocessed` represents whether the input data has already been preprocessed on the device. If it is `VK_FALSE` this command will implicitly trigger the preprocessing step, otherwise not.
- `pGeneratedCommandsInfo` is a pointer to a `VkGeneratedCommandsInfoNV` structure containing parameters affecting the generation of commands.

If the `VK_INDIRECT_COMMANDS_LAYOUT_USAGE_UNORDEREDSEQUENCES_BIT_NV` flag was used to create the `VkGeneratedCommandsInfoNV::indirectCommandsLayout` then the order of execution of individual draws through this command may execute in any order, and may not necessarily be in the same order as specified in `VkGeneratedCommandsInfoNV::pStreams`.

The order of execution of individual dispatches through this command may execute in any order and may not necessarily be in the same order as specified in `VkGeneratedCommandsInfoNV::pStreams`.  

2738
Valid Usage

- VUID-vkCmdExecuteGeneratedCommandsNV-magFilter-04553
  If a VkSampler created with magFilter or minFilter equal to VK_FILTER_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

- VUID-vkCmdExecuteGeneratedCommandsNV-mipmapMode-04770
  If a VkSampler created with mipmapMode equal to VK_SAMPLER_MIPMAP_MODE_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

- VUID-vkCmdExecuteGeneratedCommandsNV-None-06479
  If a VkImageView is sampled with depth comparison, the image view’s format features must contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT

- VUID-vkCmdExecuteGeneratedCommandsNV-None-02691
  If a VkImageView is accessed using atomic operations as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT

- VUID-vkCmdExecuteGeneratedCommandsNV-None-02692
  If a VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer’s format features must contain VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT

- VUID-vkCmdExecuteGeneratedCommandsNV-None-02693
  If the VK_EXT_filter_cubic extension is not enabled and any VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, it must not have a VkImageViewType of VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY

- VUID-vkCmdExecuteGeneratedCommandsNV-filterCubic-02694
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2

- VUID-vkCmdExecuteGeneratedCommandsNV-filterCubicMinmax-02695
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2

- VUID-vkCmdExecuteGeneratedCommandsNV-cubicRangeClamp-09212
If the `cubicRangeClamp` feature is not enabled, then any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must not have a `VkSamplerReductionModeCreateInfo` `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM`.

- VUID-vkCmdExecuteGeneratedCommandsNV-reductionMode-09213
  Any `VkImageView` being sampled with a `VkSamplerReductionModeCreateInfo` `::reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM` as a result of this command must sample with `VK_FILTER_CUBIC_EXT`.

- VUID-vkCmdExecuteGeneratedCommandsNV-selectableCubicWeights-09214
  Any `VkImageView` being sampled with a `VkSamplerReductionModeCreateInfo` `::reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM` as a result of this command must sample with `VK_FILTER_CUBIC_EXT`.

- VUID-vkCmdExecuteGeneratedCommandsNV-flags-02696
  Any `VkImage` created with a `VkImageCreateInfo` `::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

- VUID-vkCmdExecuteGeneratedCommandsNV-OpTypeImage-07027
  For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view’s format features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

- VUID-vkCmdExecuteGeneratedCommandsNV-OpTypeImage-07028
  For any `VkImageView` being read as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view’s format features must contain `VK_FORMAT_FEATURE_2_STORAGE_READWITHOUT_FORMAT_BIT`.

- VUID-vkCmdExecuteGeneratedCommandsNV-OpTypeImage-07029
  For any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, the view’s buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITEWITHOUT_FORMAT_BIT`.

- VUID-vkCmdExecuteGeneratedCommandsNV-OpTypeImage-07030
  Any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view’s buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_READWITHOUT_FORMAT_BIT`.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08600
  For each set `n` that is statically used by a bound shader, a descriptor set must have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` or `VkDescriptorSetLayout` array that was used to create the current `VkPipeline` or `VkShaderEXT`, as described in `Pipeline Layout Compatibility`.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08601
  For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` or `VkDescriptorSetLayout` and `VkPushConstantRange` arrays used to create the current `VkPipeline` or `VkShaderEXT`, as
described in [Pipeline Layout Compatibility](#).

- **VUID-vkCmdExecuteGeneratedCommandsNV-maintenance4-08602**
  If the `maintenance4` feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` or `VkDescriptorSetLayout` and `VkPushConstantRange` arrays used to create the current `VkPipeline` or `VkShaderEXT`, as described in [Pipeline Layout Compatibility](#).

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08114**
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command and the bound `VkPipeline` was not created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08115**
  If the descriptors used by the `VkPipeline` bound to the pipeline bind point were specified via `vkCmdBindDescriptorSets`, the bound `VkPipeline` must have been created without `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08116**
  Descriptors in bound descriptor buffers, specified via `vkCmdSetDescriptorBufferOffsetsEXT`, must be valid if they are dynamically used by the `VkPipeline` bound to the pipeline bind point used by this command and the bound `VkPipeline` was created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08604**
  Descriptors in bound descriptor buffers, specified via `vkCmdSetDescriptorBufferOffsetsEXT`, must be valid if they are dynamically used by any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08117**
  If the descriptors used by the `VkPipeline` bound to the pipeline bind point were specified via `vkCmdSetDescriptorBufferOffsetsEXT`, the bound `VkPipeline` must have been created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08119**
  If a descriptor is dynamically used with a `VkPipeline` created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, the descriptor memory must be resident.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08605**
  If a descriptor is dynamically used with a `VkShaderEXT` created with a `VkDescriptorSetLayout` that was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, the descriptor memory must be resident.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08606**
  If the `shaderObject` feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08607**
  If the `shaderObject` is enabled, either a valid pipeline must be bound to the pipeline bind
point used by this command, or a valid combination of valid and `VK_NULL_HANDLE` shader objects **must** be bound to every supported shader stage corresponding to the pipeline bind point used by this command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08608**
  If a pipeline is bound to the pipeline bind point used by this command, there **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08609**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08610**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08611**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

- **VUID-vkCmdExecuteGeneratedCommandsNV-uniformBuffers-06935**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `uniformBuffers`, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08612**
  If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdExecuteGeneratedCommandsNV-storageBuffers-06936**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `storageBuffers`,
and the `robustBufferAccess` feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08613**
  If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdExecuteGeneratedCommandsNV-commandBuffer-02707**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by bound shaders must not be a protected resource

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-06550**
  If a bound shader accesses a `VkSampler` or `VkImageView` object that enables sampler Y'CbCr conversion, that object must only be used with `OpImageSample*` or `OpImageSparseSample*` instructions

- **VUID-vkCmdExecuteGeneratedCommandsNV-ConstOffset-06551**
  If a bound shader accesses a `VkSampler` or `VkImageView` object that enables sampler Y'CbCr conversion, that object must not use the `ConstOffset` and `Offset` operands

- **VUID-vkCmdExecuteGeneratedCommandsNV-viewType-07752**
  If a `VkImageView` is accessed as a result of this command, then the image view's `viewType` must match the `Dim` operand of the `OpTypeImage` as described in Instruction/Sampler/Image View Validation

- **VUID-vkCmdExecuteGeneratedCommandsNV-format-07753**
  If a `VkImageView` is accessed as a result of this command, then the numeric type of the image view's `format` and the Sampled Type operand of the `OpTypeImage` must match

- **VUID-vkCmdExecuteGeneratedCommandsNV-OpImageWrite-08795**
  If a `VkImageView` created with a format other than `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as the image view's `format`

- **VUID-vkCmdExecuteGeneratedCommandsNV-OpImageWrite-08796**
  If a `VkImageView` created with the format `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have four components

- **VUID-vkCmdExecuteGeneratedCommandsNV-OpImageWrite-04469**
  If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as the buffer view's `format`

- **VUID-vkCmdExecuteGeneratedCommandsNV-SampledType-04470**
  If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 64

- **VUID-vkCmdExecuteGeneratedCommandsNV-SampledType-04471**
  If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is
accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- VUID-vkCmdExecuteGeneratedCommandsNV-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- VUID-vkCmdExecuteGeneratedCommandsNV-SampledType-04473
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- VUID-vkCmdExecuteGeneratedCommandsNV-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdExecuteGeneratedCommandsNV-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdExecuteGeneratedCommandsNV-OpImageWeightedSampleQCOM-06971
  If OpImageWeightedSampleQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM

- VUID-vkCmdExecuteGeneratedCommandsNV-OpImageWeightedSampleQCOM-06972
  If OpImageWeightedSampleQCOM uses a VkImageView as a sample weight image as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM

- VUID-vkCmdExecuteGeneratedCommandsNV-OpImageBoxFilterQCOM-06973
  If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM

- VUID-vkCmdExecuteGeneratedCommandsNV-OpImageBoxFilterQCOM-06974
  If OpImageBoxFilterQCOM is used to read from a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_MATCHED_BIT_QCOM

- VUID-vkCmdExecuteGeneratedCommandsNV-OpImageBlockMatchSSDQCOM-06975
  If OpImageBlockMatchSSDQCOM is used to read from a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

- VUID-vkCmdExecuteGeneratedCommandsNV-OpImageBlockMatchSADQCOM-06976
  If OpImageBlockMatchSADQCOM or OpImageBlockMatchSSDQCOM is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation

- VUID-vkCmdExecuteGeneratedCommandsNV-OpImageWeightedSampleQCOM-06977
If `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchWindowSSDQCOM`, `OpImageBlockMatchWindowSADQCOM`, `OpImageBlockMatchGatherSSDQCOM`, `OpImageBlockMatchGatherSADQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler **must** have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

- VUID-vkCmdExecuteGeneratedCommandsNV-OpImageWeightedSampleQCOM-06978
  If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchWindowSSDQCOM`, `OpImageBlockMatchWindowSADQCOM`, `OpImageBlockMatchGatherSSDQCOM`, `OpImageBlockMatchGatherSADQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler **must** not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

- VUID-vkCmdExecuteGeneratedCommandsNV-OpImageBlockMatchWindow-09215
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

- VUID-vkCmdExecuteGeneratedCommandsNV-OpImageBlockMatchWindow-09216
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view's format **must** be a single-component format.

- VUID-vkCmdExecuteGeneratedCommandsNV-OpImageBlockMatchWindow-09217
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from a reference image as a result of this command, then the specified reference coordinates **must** not fail integer texel coordinate validation.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07288
  Any shader invocation executed by this command **must** terminate.

- VUID-vkCmdExecuteGeneratedCommandsNV-renderPass-02684
  The current render pass **must** be compatible with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

- VUID-vkCmdExecuteGeneratedCommandsNV-subpass-02685
  The subpass index of the current render pass **must** be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07748
  If any shader statically accesses an input attachment, a valid descriptor **must** be bound to the pipeline via a descriptor set.

- VUID-vkCmdExecuteGeneratedCommandsNV-OpTypeImage-07468
  If any shader executed by this pipeline accesses an `OpTypeImage` variable with a `Dim` operand of `SubpassData`, it **must** be decorated with an `InputAttachmentIndex` that corresponds to a valid input attachment in the current subpass.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07469
  Input attachment views accessed in a subpass **must** be created with the same `VkFormat` as the corresponding subpass definition, and be created with a `VkImageView` that is
compatible with the attachment referenced by the subpass’ \texttt{pInputAttachments[InputAttachmentIndex]} in the currently bound \texttt{VkFramebuffer} as specified by \texttt{Fragment Input Attachment Compatibility}

- \texttt{VUID-vkCmdExecuteGeneratedCommandsNV-None-06537}
  Memory backing image subresources used as attachments in the current render pass \textbf{must} not be written in any way other than as an attachment by this command

- \texttt{VUID-vkCmdExecuteGeneratedCommandsNV-None-09000}
  If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the \texttt{VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT} image layout, and either:
   - the \texttt{VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT} is set on the currently bound pipeline or
   - the last call to \texttt{vkCmdSetAttachmentFeedbackLoopEnableEXT} included \texttt{VK_IMAGE_ASPECT_COLOR_BIT} and
     - there is no currently bound graphics pipeline or
     - the currently bound graphics pipeline was created with \texttt{VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT} it \textbf{must} not be accessed in any way other than as an attachment by this command

- \texttt{VUID-vkCmdExecuteGeneratedCommandsNV-None-09001}
  If a depth attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the \texttt{VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT} image layout, and either:
   - the \texttt{VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT} is set on the currently bound pipeline or
   - the last call to \texttt{vkCmdSetAttachmentFeedbackLoopEnableEXT} included \texttt{VK_IMAGE_ASPECT_DEPTH_BIT} and
     - there is no currently bound graphics pipeline or
     - the currently bound graphics pipeline was created with \texttt{VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT} it \textbf{must} not be accessed in any way other than as an attachment by this command

- \texttt{VUID-vkCmdExecuteGeneratedCommandsNV-None-09002}
  If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the \texttt{VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT} image layout, and either:
   - the \texttt{VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT} is set on the currently bound pipeline or
   - the last call to \texttt{vkCmdSetAttachmentFeedbackLoopEnableEXT} included \texttt{VK_IMAGE_ASPECT_STENCIL_BIT} and
     - there is no currently bound graphics pipeline or
     - the currently bound graphics pipeline was created with \texttt{VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT} it \textbf{must} not be accessed in
any way other than as an attachment by this command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-09003**
  If an attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it **must** not be accessed in any way other than as an attachment, storage image, or sampled image by this command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-06539**
  If any previously recorded command in the current subpass accessed an image subresource used as an attachment in this subpass in any way other than as an attachment, this command **must** not write to that image subresource as an attachment.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-06886**
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, **depth writes must** be disabled.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-06887**
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect, both front and back writeMask are not zero, and stencil test is enabled, **all stencil ops must** be **VK_STENCIL_OP_KEEP**.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07831**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_VIEWPORT** dynamic state enabled then **vkCmdSetViewport must** have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07832**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_SCISSOR** dynamic state enabled then **vkCmdSetScissor must** have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07833**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_LINE_WIDTH** dynamic state enabled then **vkCmdSetLineWidth must** have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08617**
  If a shader object is bound to any graphics stage, and the most recent call to **vkCmdSetPolygonModeEXT** in the current command buffer set **polygonMode** to **VK_POLYGON_MODE_LINE**, **vkCmdSetLineWidth must** have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08618**
  If a shader object is bound to the **VK_SHADER_STAGE_VERTEX_BIT** stage, and the most recent call to **vkCmdSetPrimitiveTopology** in the current command buffer set **primitiveTopology** to any line topology, **vkCmdSetLineWidth must** have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08619**
  If a shader object that outputs line primitives is bound to the **VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT** or **VK_SHADER_STAGE_GEOMETRY_BIT** stage, **vkCmdSetLineWidth must** have been called in the current command buffer prior to this drawing command.
• VUID-vkCmdExecuteGeneratedCommandsNV-None-07834
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BIAS dynamic state enabled then vkCmdSetDepthBias or vkCmdSetDepthBias2EXT must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08620
If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetDepthBiasEnable in the current command buffer set depthBiasEnable to VK_TRUE, vkCmdSetDepthBias or vkCmdSetDepthBias2EXT must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdExecuteGeneratedCommandsNV-None-07835
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_BLEND_CONSTANTS dynamic state enabled then vkCmdSetBlendConstants must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08621
If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetColorBlendEnableEXT in the current command buffer set any element of pColorBlendEnables to VK_TRUE, and the most recent call to vkCmdSetColorBlendEquationEXT in the current command buffer set the same element of pColorBlendEquations to a VkColorBlendEquationEXT structure with any VkBlendFactor member with a value of VK_BLEND_FACTOR_CONSTANT_COLOR, VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR, VK_BLEND_FACTOR_CONSTANT_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA, vkCmdSetBlendConstants must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdExecuteGeneratedCommandsNV-None-07836
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BOUNDS dynamic state enabled then vkCmdSetDepthBounds must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08622
If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetDepthBoundsTestEnable in the current command buffer set depthBoundsTestEnable to VK_TRUE, then vkCmdSetDepthBounds must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdExecuteGeneratedCommandsNV-None-07837
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK dynamic state enabled then vkCmdSetStencilCompareMask must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08623
If a shader object is bound to any graphics stage, and the most recent call to
vkCmdSetStencilTestEnable in the current command buffer set stencilTestEnable to VK_TRUE, vkCmdSetStencilCompareMask must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07838
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_WRITE_MASK dynamic state enabled then vkCmdSetStencilWriteMask must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08624
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetStencilTestEnable in the current command buffer set stencilTestEnable to VK_TRUE, vkCmdSetStencilWriteMask must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07839
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_REFERENCE dynamic state enabled then vkCmdSetStencilReference must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08625
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetStencilTestEnable in the current command buffer set stencilTestEnable to VK_TRUE, vkCmdSetStencilReference must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-maxMultiviewInstanceIndex-02689
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex

- VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsEnable-02689
  If the bound graphics pipeline was created with VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable set to VK_TRUE and the current subpass has a depth/stencil attachment, then that attachment must have been created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set

- VUID-vkCmdExecuteGeneratedCommandsNV-None-06666
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT dynamic state enabled then vkCmdSetSampleLocationsEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08626
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetSampleLocationsEnableEXT in the current command buffer set sampleLocationsEnable to VK_TRUE, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetSampleLocationsEXT must have been called in the current command buffer prior to this drawing command
If the bound graphics pipeline state was created with the \texttt{VK\_DYNAMIC\_STATE\_SAMPLE\_LOCATIONS\_EXT} state enabled, then the \texttt{sampleLocationsPerPixel} member of \texttt{pSampleLocationsInfo} in the last call to \texttt{vkCmdSetSampleLocationsEXT} must equal the \texttt{rasterizationSamples} member of the \texttt{VkPipelineMultisampleStateCreateInfo} structure the bound graphics pipeline has been created with.

If the bound graphics pipeline state was created with the \texttt{VK\_DYNAMIC\_STATE\_CULL\_MODE} dynamic state enabled then \texttt{vkCmdSetCullMode} must have been called in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK\_FALSE}, then \texttt{vkCmdSetCullMode} must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the \texttt{VK\_DYNAMIC\_STATE\_FRONT\_FACE} dynamic state enabled then \texttt{vkCmdSetFrontFace} must have been called in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK\_FALSE}, then \texttt{vkCmdSetFrontFace} must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the \texttt{VK\_DYNAMIC\_STATE\_DEPTH\_TEST\_ENABLE} dynamic state enabled then \texttt{vkCmdSetDepthTestEnable} must have been called in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK\_FALSE}, then \texttt{vkCmdSetDepthTestEnable} must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the \texttt{VK\_DYNAMIC\_STATE\_DEPTH\_WRITE\_ENABLE} dynamic state enabled then \texttt{vkCmdSetDepthWriteEnable} must have been called in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK\_FALSE}, then \texttt{vkCmdSetDepthWriteEnable} must have been called in the current command buffer prior to this drawing command.
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP` dynamic state enabled then `vkCmdSetDepthCompareOp` must have been called in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDepthTestEnable` in the current command buffer set `depthTestEnable` to `VK_TRUE`, then `vkCmdSetDepthCompareOp` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE` dynamic state enabled then `vkCmdSetDepthBoundsTestEnable` must have been called in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the `depthBounds` feature is enabled, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then the `vkCmdSetDepthBoundsTestEnable` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE` dynamic state enabled then `vkCmdSetStencilTestEnable` must have been called in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then the `vkCmdSetStencilTestEnable` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_OP` dynamic state enabled then `vkCmdSetStencilOp` must have been called in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set `stencilTestEnable` to `VK_TRUE`, then `vkCmdSetStencilOp` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE` dynamic state enabled then `vkCmdSetStencilTestEnable` must have been called in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set `stencilTestEnable` to `VK_TRUE`, then `vkCmdSetStencilOp` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_OP` dynamic state enabled then `vkCmdSetStencilOp` must have been called in the current command buffer prior to this drawing command.
If the bound graphics pipeline state was created with the
\texttt{VK_DYNAMIC_STATE_VIEWPORT\_WITH\_COUNT} dynamic state enabled, but not the
\texttt{VK_DYNAMIC_STATE_\_SCISSOR\_WITH\_COUNT} dynamic state enabled, then
\texttt{vkCmdSetViewportWithCount} must have been called in the current command buffer
prior to this drawing command, and the \texttt{viewportCount} parameter of
\texttt{vkCmdSetViewportWithCount} must match the \texttt{VkPipelineViewportStateCreateInfo}::\texttt{viewportCount} of the pipeline

- \texttt{VUID-vkCmdExecuteGeneratedCommandsNV-scissorCount-03418}
  If the bound graphics pipeline state was created with the
  \texttt{VK_DYNAMIC_STATE_\_SCISSOR\_WITH\_COUNT} dynamic state enabled, but not the
  \texttt{VK_DYNAMIC_STATE_VIEWPORT\_WITH\_COUNT} dynamic state enabled, then
  \texttt{vkCmdSetScissorWithCount} must have been called in the current command buffer prior
to this drawing command, and the \texttt{scissorCount} parameter of \texttt{vkCmdSetScissorWithCount} must match the \texttt{VkPipelineViewportStateCreateInfo}::\texttt{scissorCount} of the pipeline

- \texttt{VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-03419}
  If the bound graphics pipeline state was created with both the
  \texttt{VK_DYNAMIC_STATE_\_SCISSOR\_WITH\_COUNT} and \texttt{VK_DYNAMIC_STATE_VIEWPORT\_WITH\_COUNT} dynamic states enabled then both \texttt{vkCmdSetViewportWithCount} and \texttt{vkCmdSetScissorWithCount} must have been called in the current command buffer prior to this drawing command, and the \texttt{viewportCount} parameter of \texttt{vkCmdSetViewportWithCount} must match the \texttt{scissorCount} parameter of \texttt{vkCmdSetScissorWithCount}

- \texttt{VUID-vkCmdExecuteGeneratedCommandsNV-None-08635}
  If a shader object is bound to any graphics stage, then both \texttt{vkCmdSetViewportWithCount}
  and \texttt{vkCmdSetScissorWithCount} must have been called in the current command buffer prior
to this drawing command, and the \texttt{viewportCount} parameter of \texttt{vkCmdSetViewportWithCount} must match the \texttt{scissorCount} parameter of \texttt{vkCmdSetScissorWithCount}

- \texttt{VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-04137}
  If the bound graphics pipeline state was created with the
  \texttt{VK_DYNAMIC_STATE_VIEWPORT\_WITH\_COUNT} dynamic state enabled, but not the
  \texttt{VK_DYNAMIC_STATE_VIEWPORT\_W\_SCALING\_NV} dynamic state enabled, then the bound graphics
  pipeline must have been created with \texttt{VkPipelineViewportWScalingStateCreateInfoNV}::\texttt{viewportCount} greater or equal to the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportWithCount}

- \texttt{VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-04138}
  If the bound graphics pipeline state was created with the
  \texttt{VK_DYNAMIC_STATE_VIEWPORT\_WITH\_COUNT} and \texttt{VK_DYNAMIC_STATE_VIEWPORT\_W\_SCALING\_NV} dynamic states enabled then the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportWScalingNV} must be greater than or equal to the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportWithCount}

- \texttt{VUID-vkCmdExecuteGeneratedCommandsNV-None-09232}
  If a shader object is bound to any graphics stage, and the \texttt{VK_NV_clip_space_w_scaling}
  extension is enabled on the device, then \texttt{vkCmdSetViewportWScalingNV} must have been
called in the current command buffer prior to this drawing command

- \texttt{VUID-vkCmdExecuteGeneratedCommandsNV-None-08636}
  If a shader object is bound to any graphics stage, and the \texttt{VK_NV_clip_space_w_scaling}
extension is enabled on the device, then the `viewportCount` parameter in the last call to `vkCmdSetViewportWSCalingNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-04139**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-04140**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportShadingRatePaletteNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-shadingRateImage-09233**
  If the shadingRateImage feature is enabled, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set rasterizerDiscardEnable to `VK_FALSE`, then `vkCmdSetCoarseSampleOrderNV` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-shadingRateImage-09234**
  If a shader object is bound to any graphics stage, and the shadingRateImage feature is enabled on the device, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set rasterizerDiscardEnable to `VK_FALSE`, and the most recent call to `vkCmdSetShadingRateImageEnableNV` in the current command buffer set shadingRateImageEnable to `VK_TRUE`, then `vkCmdSetViewportShadingRatePaletteNV` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08637**
  If a shader object is bound to any graphics stage, and the shadingRateImage feature is enabled on the device, then the `viewportCount` parameter in the last call to `vkCmdSetViewportShadingRatePaletteNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-VkPipelineViewportCreateInfo-04141**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportSwizzleStateCreateInfoNV` structure chained from `VkPipelineViewportStateCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-VkPipelineViewportCreateInfo-04142**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportExclusiveScissorStateCreateInfoNV` structure chained from
VkPipelineViewportStateCreateInfo, then the bound graphics pipeline must have been created with VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07878
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_ENABLE_NV dynamic state enabled then vkCmdSetExclusiveScissorEnableNV must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07879
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_NV dynamic state enabled then vkCmdSetExclusiveScissorNV must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-exclusiveScissor-09235
  If a shader object is bound to any graphics stage, and the exclusiveScissor feature is enabled, then vkCmdSetExclusiveScissorEnableNV must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08638
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetExclusiveScissorEnableNV in the current command buffer set any element of pExclusiveScissorEnables to VK_TRUE, then vkCmdSetExclusiveScissorNV must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-04876
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE dynamic state enabled then vkCmdSetRasterizerDiscardEnable must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08639
  If a shader object is bound to any graphics stage, then vkCmdSetRasterizerDiscardEnable must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-04877
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE dynamic state enabled then vkCmdSetDepthBiasEnable must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08640
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetDepthBiasEnable must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-logicOp-04878
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LOGIC_OP_EXT dynamic state enabled then vkCmdSetLogicOpEXT must have been called in the current
command buffer prior to this drawing command and the logicOp must be a valid VkLogicOp value

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08641
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the logicOp feature is enabled on the device, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetLogicOpEXT must have been called in the current command buffer prior to this drawing command and the logicOp must be a valid VkLogicOp value

- VUID-vkCmdExecuteGeneratedCommandsNV-primitiveFragmentShadingRateWithMultipleViewports-04552
  If the primitiveFragmentShadingRateWithMultipleViewports limit is not supported, the bound graphics pipeline was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the PrimitiveShadingRateKHR built-in, then vkCmdSetViewportWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must be 1

- VUID-vkCmdExecuteGeneratedCommandsNV-primitiveFragmentShadingRateWithMultipleViewports-08642
  If the primitiveFragmentShadingRateWithMultipleViewports limit is not supported, and any shader object bound to a graphics stage writes to the PrimitiveShadingRateKHR built-in, then vkCmdSetViewportWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must be 1

- VUID-vkCmdExecuteGeneratedCommandsNV-blendEnable-04727
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view's format features do not contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the blendEnable member of the corresponding element of the pAttachments member of pColorBlendState must be VK_FALSE

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08643
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then for each color attachment in the render pass, if the corresponding image view's format features do not contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the corresponding member of pColorBlendEnables in the most recent call to vkCmdSetColorBlendEnableEXT in the current command buffer that affected that attachment index must have been VK_FALSE

- VUID-vkCmdExecuteGeneratedCommandsNV-multisampledRenderToSingleSampled-07284
  If rasterization is not disabled in the bound graphics pipeline, and none of the VK_AMD_mixed_attachment_samples extension, the VK_NV_framebuffer_mixed_samples extension, or the multisampledRenderToSingleSampled feature is enabled, then rasterizationSamples for the currently bound graphics pipeline must be the same as the current subpass color and/or depth/stencil attachments
If a shader object is bound to any graphics stage, and the most recent call to
\texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set
\texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, and none of the \texttt{VK_AMD_mixed_attachment_samples}
extension, the \texttt{VK_NV_framebuffer_mixed_samples} extension, or the
\texttt{multisampledRenderToSingleSampled} feature is enabled, then the most recent call to
\texttt{vkCmdSetRasterizationSamplesEXT} in the current command buffer \textbf{must} have set
\texttt{rasterizationSamples} to be the same as the number of samples for the current render pass
color and/or depth/stencil attachments.

If a shader object is bound to any graphics stage, the current render pass instance \textbf{must}
have been begun with \texttt{vkCmdBeginRendering}.

If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, the \texttt{imageView}
member of \texttt{pDepthAttachment} is not \texttt{VK_NULL_HANDLE}, and the \texttt{layout} member of
\texttt{pDepthAttachment} is \texttt{VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL}, this command \textbf{must}
not write any values to the depth attachment.

If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, the \texttt{imageView}
member of \texttt{pStencilAttachment} is not \texttt{VK_NULL_HANDLE}, and the \texttt{layout} member of
\texttt{pStencilAttachment} is \texttt{VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL}, this command \textbf{must}
not write any values to the stencil attachment.

If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, the \texttt{imageView}
member of \texttt{pDepthAttachment} is not \texttt{VK_NULL_HANDLE}, and the \texttt{layout} member of
\texttt{pDepthAttachment} is \texttt{VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL}, this
command \textbf{must} not write any values to the depth attachment.

If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, the \texttt{imageView}
member of \texttt{pStencilAttachment} is not \texttt{VK_NULL_HANDLE}, and the \texttt{layout} member of
\texttt{pStencilAttachment} is \texttt{VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL}, this command \textbf{must}
not write any values to the stencil attachment.

If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, the currently
bound graphics pipeline \textbf{must} have been created with a \texttt{VkPipelineRenderingCreateInfo}.
::viewMask equal to VkRenderingInfo::viewMask

- **VUID-vkCmdExecuteGeneratedCommandsNV-colorAttachmentCount-06179**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo` `::colorAttachmentCount` equal to `VkRenderingInfo::colorAttachmentCount`

- **VUID-vkCmdExecuteGeneratedCommandsNV-dynamicRenderingUnusedAttachments-08910**
  If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the currently bound graphics pipeline

- **VUID-vkCmdExecuteGeneratedCommandsNV-dynamicRenderingUnusedAttachments-08911**
  If the `dynamicRenderingUnusedAttachments` feature is enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the currently bound graphics pipeline, or the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats`, if it exists, **must** be `VK_FORMAT_UNDEFINED`

- **VUID-vkCmdExecuteGeneratedCommandsNV-dynamicRenderingUnusedAttachments-08912**
  If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` equal to `VK_NULL_HANDLE` **must** have the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the currently bound pipeline equal to `VK_FORMAT_UNDEFINED`

- **VUID-vkCmdExecuteGeneratedCommandsNV-attachmentCount-07750**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` **must** have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-attachmentCount-07750**
  If the `colorWriteEnable` feature is enabled on the device, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorWriteEnableEXT` **must** have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-attachmentCount-07750**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` **must** have been called in the current command buffer prior to this drawing command
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be greater than or equal to the `VkPipelineColorBlendStateCreateInfo::attachmentCount` of the currently bound graphics pipeline

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08647**
  If the `colorWriteEnable` feature is enabled on the device, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then the `attachmentCount` parameter of most recent call to `vkCmdSetColorWriteEnableEXT` in the current command buffer must be greater than or equal to the number of color attachments in the current render pass instance

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07751**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` dynamic state enabled then `vkCmdSetDiscardRectangleEXT` must have been called in the current command buffer prior to this drawing command for each discard rectangle in `VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleCount`

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07880**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` dynamic state enabled then `vkCmdSetDiscardRectangleEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-rasterizerDiscardEnable-09236**
  If the `VK_EXT_discard_rectangles` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDiscardRectangleEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08648**
  If the `VK_EXT_discard_rectangles` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDiscardRectangleEnableEXT` in the current command buffer set

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07881**
  If the `VK_EXT_discard_rectangles` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDiscardRectangleModeEXT` in the current command buffer set
discardRectangleEnable to VK_TRUE, then vkCmdSetDiscardRectangleModeEXT must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-dynamicRenderingUnusedAttachments-08913**
  If the current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is not enabled, and VkRenderingInfo::pDepthAttachment->imageView was VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the currently bound graphics pipeline must be equal to VK_FORMAT_UNDEFINED.

- **VUID-vkCmdExecuteGeneratedCommandsNV-dynamicRenderingUnusedAttachments-08914**
  If current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is not enabled, and VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the currently bound graphics pipeline must be equal to the VkFormat used to create VkRenderingInfo::pDepthAttachment->imageView.

- **VUID-vkCmdExecuteGeneratedCommandsNV-dynamicRenderingUnusedAttachments-08915**
  If the current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is enabled, VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, and the value of VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the currently bound graphics pipeline was not equal to the VkFormat used to create VkRenderingInfo::pDepthAttachment->imageView, the value of the format must be VK_FORMAT_UNDEFINED.

- **VUID-vkCmdExecuteGeneratedCommandsNV-dynamicRenderingUnusedAttachments-08916**
  If the current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is not enabled, and VkRenderingInfo::pStencilAttachment->imageView was VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the currently bound graphics pipeline must be equal to VK_FORMAT_UNDEFINED.

- **VUID-vkCmdExecuteGeneratedCommandsNV-dynamicRenderingUnusedAttachments-08917**
  If current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is not enabled, and VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the currently bound graphics pipeline must be equal to the VkFormat used to create VkRenderingInfo::pStencilAttachment->imageView.

- **VUID-vkCmdExecuteGeneratedCommandsNV-dynamicRenderingUnusedAttachments-08918**
  If the current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is enabled, VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, and the value of
VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the currently bound graphics pipeline was not equal to the VkFormat used to create VkRenderingInfo::pStencilAttachment->imageView, the value of the format must be VK_FORMAT_UNDEFINED

- VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06183
  If the current render pass instance was begun with vkCmdBeginRendering and VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView was not VK_NULL_HANDLE, the currently bound graphics pipeline must have been created with VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06184
  If the current render pass instance was begun with vkCmdBeginRendering and VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView was not VK_NULL_HANDLE, the currently bound graphics pipeline must have been created with VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT

- VUID-vkCmdExecuteGeneratedCommandsNV-colorAttachmentCount-06185
  If the currently bound pipeline was created with a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the current render pass instance was begun with VkRenderingInfo::colorAttachmentCount parameter greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with an imageView not equal to VK_NULL_HANDLE must have been created with a sample count equal to the corresponding element of the pColorAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline

- VUID-vkCmdExecuteGeneratedCommandsNV-pDepthAttachment-06186
  If the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the multisampledRenderToSingleSampled feature is not enabled, and the current render pass instance was begun with VkCmdBeginRendering with a VkRenderingInfo::colorAttachmentCount parameter greater than 0, then each element of the
VkRenderingInfo::pColorAttachments array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the value of `rasterizationSamples` for the currently bound graphics pipeline.

- **VUID-vkCmdExecuteGeneratedCommandsNV-multisampledRenderToSingleSampled-07286**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-multisampledRenderToSingleSampled-07287**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-pNext-07935**
  If this command has been called inside a render pass instance started with `vkCmdBeginRendering`, and the `pNext` chain of `VkRenderingInfo` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure with `multisampledRenderToSingleSampledEnable` equal to `VK_TRUE`, then the value of `rasterizationSamples` for the currently bound graphics pipeline must be equal to `VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-renderPass-06198**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline must have been created with a `VkGraphicsPipelineCreateInfo::renderPass` equal to `VK_NULL_HANDLE`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-pColorAttachments-08963**
  If the current render pass instance was begun with `vkCmdBeginRendering`, there is a graphics pipeline bound with a fragment shader that statically writes to a color attachment, the color write mask is not zero, color writes are enabled, and the corresponding element of the `VkRenderingInfo::pColorAttachments->imageView` was not `VK_NULL_HANDLE`, then the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the pipeline must not be `VK_FORMAT_UNDEFINED`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-pDepthAttachment-08964**
  If the current render pass instance was begun with `vkCmdBeginRendering`, there is a graphics pipeline bound, depth test is enabled, depth write is enabled, and the `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, then the `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the pipeline must not be `VK_FORMAT_UNDEFINED`. 

2761
If the current render pass instance was begun with `vkCmdBeginRendering`, there is a graphics pipeline bound, stencil test is enabled and the `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, then the `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the pipeline must not be `VK_FORMAT_UNDEFINED`.

If the `primitivesGeneratedQueryWithRasterizerDiscard` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, rasterization discard must not be enabled.

If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, the bound graphics pipeline must not have been created with a non-zero value in `VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT` dynamic state enabled then `vkCmdSetTessellationDomainOriginEXT` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthClampEnableEXT` must have been called in the current command buffer prior to this drawing command.

If a shader object is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` stage, then `vkCmdSetTessellationDomainOriginEXT` must have been called in the current command buffer prior to this drawing command.

If the `depthClamp` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthClampEnableEXT` must have been called in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetPolygonModeEXT` must have been called in the current command buffer prior to this drawing command.
called in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-07622
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT dynamic state enabled then
  vkCmdSetRasterizationSamplesEXT must have been called in the current command
  buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08652
  If a shader object is bound to any graphics stage, and the most recent call to
  vkCmdSetRasterizerDiscardEnable in the current command buffer set
  rasterizerDiscardEnable to VK_FALSE, then vkCmdSetRasterizationSamplesEXT must have
  been called in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-07623
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_SAMPLE_MASK_EXT dynamic state enabled then vkCmdSetSampleMaskEXT
  must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08653
  If a shader object is bound to any graphics stage, and the most recent call to
  vkCmdSetRasterizerDiscardEnable in the current command buffer set
  rasterizerDiscardEnable to VK_FALSE, then vkCmdSetSampleMaskEXT must have
  been called in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-07624
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT dynamic state enabled then
  vkCmdSetAlphaToCoverageEnableEXT must have been called in the current command
  buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-alphaToCoverageEnable-08919
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT dynamic state enabled, and
  alphaToCoverageEnable was VK_TRUE in the last call to
  vkCmdSetAlphaToCoverageEnableEXT, then the Fragment Output Interface must contain
  a variable for the alpha Component word in Location 0 at Index 0

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08654
  If a shader object is bound to any graphics stage, and the most recent call to
  vkCmdSetRasterizerDiscardEnable in the current command buffer set
  rasterizerDiscardEnable to VK_FALSE, then vkCmdSetAlphaToCoverageEnableEXT must
  have been called in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-alphaToCoverageEnable-08920
  If a shader object is bound to any graphics stage, and the most recent call to
  vkCmdSetAlphaToCoverageEnableEXT in the current command buffer set
  alphaToCoverageEnable to VK_TRUE, then the Fragment Output Interface must contain a
  variable for the alpha Component word in Location 0 at Index 0

• VUID-vkCmdExecuteGeneratedCommandsNV-None-07625
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT dynamic state enabled then
vkCmdSetAlphaToOneEnableEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08655
  If the alphaToOne feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetAlphaToOneEnableEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07626
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT dynamic state enabled then vkCmdSetLogicOpEnableEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08656
  If the logicOp feature is enabled, and a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetLogicOpEnableEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07627
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT dynamic state enabled then vkCmdSetColorBlendEnableEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08657
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetColorBlendEnableEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07628
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT dynamic state enabled then vkCmdSetColorBlendEquationEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08658
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetColorBlendEnableEXT for any attachment set that attachment's value in pColorBlendEnables to VK_TRUE, then vkCmdSetColorBlendEquationEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07629
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT dynamic state enabled then vkCmdSetColorWriteMaskEXT must have been called in the current command buffer prior to this drawing command
If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorWriteMaskEXT` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT` dynamic state enabled then `vkCmdSetRasterizationStreamEXT` must have been called in the current command buffer prior to this drawing command.

If the `geometryStreams` feature is enabled, and a shader object is bound to the `VK_SHADER_STAGE_GEOMETRY_BIT` stage, then `vkCmdSetRasterizationStreamEXT` must have been called in the current command buffer prior to this drawing command.

If the `geometryStreams` feature is enabled, and a shader object is bound to the `VK_SHADER_STAGE_GEOMETRY_BIT` stage, then `vkCmdSetRasterizationStreamEXT` must have been called in the current command buffer prior to this drawing command.

If the `VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT` dynamic state enabled then `vkCmdSetConservativeRasterizationModeEXT` must have been called in the current command buffer prior to this drawing command.

If the `VK_EXT_conservative_rasterization` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetConservativeRasterizationModeEXT` must have been called in the current command buffer prior to this drawing command.

If the `VK_EXT_conservative_rasterization` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetConservativeRasterizationModeEXT` in the current command buffer set `conservativeRasterizationMode` to `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT`, then `vkCmdSetExtraPrimitiveOverestimationSizeEXT` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthClipEnableEXT` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT` dynamic state enabled then `vkCmdSetExtraPrimitiveOverestimationSizeEXT` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthClipEnableEXT` must have been called in the current command buffer prior to this drawing command.
If the `depthClipEnable` feature is enabled, and a shader object is bound to any graphics stage, then `vkCmdSetDepthClipEnableEXT` must have been called in the current command buffer prior to this drawing command.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07634
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` dynamic state enabled then `vkCmdSetSampleLocationsEnableEXT` must have been called in the current command buffer prior to this drawing command.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08664
  If the `VK_EXT_sample_locations` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetSampleLocationsEnableEXT` must have been called in the current command buffer prior to this drawing command.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07635
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` dynamic state enabled then `vkCmdSetColorBlendAdvancedEXT` must have been called in the current command buffer prior to this drawing command.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07636
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT` dynamic state enabled then `vkCmdSetProvokingVertexModeEXT` must have been called in the current command buffer prior to this drawing command.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08665
  If the `VK_EXT_provoking_vertex` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage, then `vkCmdSetProvokingVertexModeEXT` must have been called in the current command buffer prior to this drawing command.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07637
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic state enabled then `vkCmdSetLineRasterizationModeEXT` must have been called in the current command buffer prior to this drawing command.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08666
  If the `VK_EXT_line_rasterization` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetPolygonModeEXT` in the current command buffer set `polygonMode` to `VK_POLYGON_MODE_LINE`, then `vkCmdSetLineRasterizationModeEXT` must have been called in the current command buffer prior to this drawing command.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08667
  If the `VK_EXT_line_rasterization` extension is enabled, and a shader object is bound to the vertex stage, and the most recent call to `vkCmdSetPrimitiveTopology` in the current command buffer set `primitiveTopology` to any line topology, then `vkCmdSetLineRasterizationModeEXT` must have been called in the current command buffer prior to this drawing command.
If the **VK_EXT_line_rasterization** extension is enabled, and a shader object that outputs line primitives is bound to the tessellation evaluation or geometry stage, then *vkCmdSetLineRasterizationModeEXT* must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT** dynamic state enabled then *vkCmdSetLineStippleEnableEXT* must have been called in the current command buffer prior to this drawing command.

If the **VK_EXT_line_rasterization** extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to *vkCmdSetPolygonModeEXT* in the current command buffer set *polygonMode* to **VK_POLYGON_MODE_LINE**, then *vkCmdSetLineStippleEnableEXT* must have been called in the current command buffer prior to this drawing command.

If the **VK_EXT_line_rasterization** extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to *vkCmdSetPolygonModeEXT* in the current command buffer set *stippledLineEnable* to **VK_TRUE**, then *vkCmdSetLineStippleEXT* must have been called in the current command buffer prior to this drawing command.

If the **VK_EXT_line_rasterization** extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to *vkCmdSetDepthClipNegativeOneToOneEXT* in the current command buffer set *depthClipEnable* to **VK_TRUE**, then *vkCmdSetDepthClipNegativeOneToOneEXT* must have been called in the current command buffer prior to this drawing command.
• VUID-vkCmdExecuteGeneratedCommandsNV-None-07640
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_ENABLE_NV` dynamic state enabled then `vkCmdSetViewportWScalingEnableNV` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08674
If the `VK_NV_clip_space_w_scaling` extension is enabled, and a shader object is bound to any graphics stage, then `vkCmdSetViewportWScalingEnableNV` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdExecuteGeneratedCommandsNV-None-07641
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV` dynamic state enabled then `vkCmdSetViewportSwizzleNV` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08675
If the `VK_NV_viewport_swizzle` extension is enabled, and a shader object is bound to any graphics stage, then `vkCmdSetViewportSwizzleNV` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdExecuteGeneratedCommandsNV-None-07642
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV` dynamic state enabled then `vkCmdSetCoverageToColorEnableNV` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08676
If the `VK_NV_fragment_coverage_to_color` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetCoverageToColorEnableNV` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdExecuteGeneratedCommandsNV-None-07643
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_LOCATION_NV` dynamic state enabled then `vkCmdSetCoverageToColorLocationNV` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08677
If the `VK_NV_fragment_coverage_to_color` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetCoverageToColorEnableNV` in the current command buffer set `coverageToColorEnable` to `VK_TRUE`, then `vkCmdSetCoverageToColorLocationNV` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdExecuteGeneratedCommandsNV-None-07644
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_MODULATION_MODE_NV` dynamic state enabled then `vkCmdSetCoverageModulationModeNV` must have been called in the current command buffer prior to this drawing command.

2768
If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetCoverageModulationModeNV` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV` dynamic state enabled then `vkCmdSetCoverageModulationTableEnableNV` must have been called in the current command buffer prior to this drawing command.

If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetCoverageModulationModeNV` in the current command buffer set `coverageModulationMode` to any value other than `VK_COVERAGE_MODULATION_MODE_NONE_NV`, then `vkCmdSetCoverageModulationTableEnableNV` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_NV` dynamic state enabled then `vkCmdSetCoverageModulationTableNV` must have been called in the current command buffer prior to this drawing command.

If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetCoverageModulationTableEnableNV` in the current command buffer set `coverageModulationTableEnable` to `VK_TRUE`, then `vkCmdSetCoverageModulationTableNV` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SHADING_RATE_IMAGE_ENABLE_NV` dynamic state enabled then `vkCmdSetShadingRateImageEnableNV` must have been called in the current command buffer prior to this drawing command.

If the `pipelineFragmentShadingRate` feature is enabled, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetFragmentShadingRateKHR` must have been called in the current command buffer prior to this drawing command.

If the `shadingRateImage` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetFragmentShadingRateKHR` must have been called in the current command buffer prior to this drawing command.
command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then \texttt{vkCmdSetShadingRateImageEnableNV} \textbf{must} have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07648
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_REPRESENTATIVE_FRAGMENT_TEST_ENABLE_NV} dynamic state enabled then \texttt{vkCmdSetRepresentativeFragmentTestEnableNV} \textbf{must} have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08682
  If the \texttt{representativeFragmentTest} feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then \texttt{vkCmdSetRepresentativeFragmentTestEnableNV} \textbf{must} have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07649
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_COVERAGE_REDUCTION_MODE_NV} dynamic state enabled then \texttt{vkCmdSetCoverageReductionModeNV} \textbf{must} have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08683
  If the \texttt{coverageReductionMode} feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then \texttt{vkCmdSetCoverageReductionModeNV} \textbf{must} have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-pColorBlendEnables-07470
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT} state enabled and the last call to \texttt{vkCmdSetColorBlendEnableEXT} set \texttt{pColorBlendEnables} for any attachment to \texttt{VK_TRUE}, then for those attachments in the subpass the corresponding image view's \texttt{format features} \textbf{must} contain \texttt{VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT}

- VUID-vkCmdExecuteGeneratedCommandsNV-rasterizationSamples-07471
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT} state enabled, and the current subpass does not use any color and/or depth/stencil attachments, then the \texttt{rasterizationSamples} in the last call to \texttt{vkCmdSetRasterizationSamplesEXT} \textbf{must} follow the rules for a zero-attachment subpass

- VUID-vkCmdExecuteGeneratedCommandsNV-samples-07472
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_SAMPLE_MASK_EXT} state enabled and the \texttt{VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT} state disabled, then the \texttt{samples} parameter in the last call to \texttt{vkCmdSetSampleMaskEXT} \textbf{must} be greater or equal to the \texttt{VkPipelineMultisampleStateCreateInfo::rasterizationSamples} parameter used to create the bound graphics pipeline

- VUID-vkCmdExecuteGeneratedCommandsNV-samples-07473

2770
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` state and `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` states enabled, then the `samples` parameter in the last call to `vkCmdSetSampleMaskEXT` must be greater or equal to the `rasterizationSamples` parameter in the last call to `vkCmdSetRasterizationSamplesEXT`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-rasterizationSamples-07474**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are enabled, then the `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT` must be the same as the current subpass color and/or depth/stencil attachments.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-09211**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, or a shader object is bound to any graphics stage, and the current render pass instance includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure with `multisampledRenderToSingleSampledEnable` equal to `VK_TRUE`, then the `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT` must be the same as the `rasterizationSamples` member of that structure.

- **VUID-vkCmdExecuteGeneratedCommandsNV-firstAttachment-07476**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorBlendEnableEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEnableEXT` calls must specify an enable for all active color attachments in the current subpass.

- **VUID-vkCmdExecuteGeneratedCommandsNV-firstAttachment-07477**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` dynamic state enabled then `vkCmdSetColorBlendEquationEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEquationEXT` calls must specify the blend equations for all active color attachments in the current subpass where blending is enabled.

- **VUID-vkCmdExecuteGeneratedCommandsNV-firstAttachment-07478**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic state enabled then `vkCmdSetColorWriteMaskEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorWriteMaskEXT` calls must specify the color write mask for all active color attachments in the current subpass.

- **VUID-vkCmdExecuteGeneratedCommandsNV-firstAttachment-07479**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` dynamic state enabled then
**vkCmdSetColorBlendAdvancedEXT** must have been called in the current command buffer prior to this drawing command, and the attachments specified by the **firstAttachment** and **attachmentCount** parameters of **vkCmdSetColorBlendAdvancedEXT** calls must specify the advanced blend equations for all active color attachments in the current subpass where blending is enabled.

- **VUID-vkCmdExecuteGeneratedCommandsNV-advancedBlendMaxColorAttachments-07480**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT** and **VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT** dynamic states enabled and the last calls to **vkCmdSetColorBlendEnableEXT** and **vkCmdSetColorBlendAdvancedEXT** have enabled advanced blending, then the number of active color attachments in the current subpass must not exceed **advancedBlendMaxColorAttachments**.

- **VUID-vkCmdExecuteGeneratedCommandsNV-primitivesGeneratedQueryWithNonZeroStreams-07481**
  If the **primitivesGeneratedQueryWithNonZeroStreams** feature is not enabled and the **VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT** query is active, and the bound graphics pipeline was created with **VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT** state enabled, the last call to **vkCmdSetRasterizationStreamEXT** must have set the **rasterizationStream** to zero.

- **VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsPerPixel-07482**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT** state enabled and the **VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT** state disabled, then the **sampleLocationsPerPixel** member of **pSampleLocationsInfo** in the last call to **vkCmdSetSampleLocationsEXT** must equal the **rasterizationSamples** member of the **VkPipelineMultisampleStateCreateInfo** structure the bound graphics pipeline has been created with.

- **VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsPerPixel-07483**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT** state enabled and the **VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT** state enabled, then the **sampleLocationsPerPixel** member of **pSampleLocationsInfo** in the last call to **vkCmdSetSampleLocationsEXT** must equal the **rasterizationSamples** parameter of the last call to **vkCmdSetRasterizationSamplesEXT**.

- **VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsEnable-07484**
  If the bound graphics pipeline was created with the **VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT** state enabled, and **sampleLocationsEnable** was **VK_TRUE** in the last call to **vkCmdSetSampleLocationsEnableEXT**, and the current subpass has a depth/stencil attachment, then that attachment must have been created with the **VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT** bit set.

- **VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsEnable-07485**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT** state enabled, and if **sampleLocationsEnable** was **VK_TRUE** in the last call to **vkCmdSetSampleLocationsEnableEXT**, then the
sampleLocationsInfo.sampleLocationGridSize.width in the last call to 
vkCmdSetSampleLocationsEXT must evenly divide VkMultisamplePropertiesEXT ::sampleLocationGridSize.width as returned by 
vkGetPhysicalDeviceMultisamplePropertiesEXT with a samples parameter equaling rasterizationSamples

• VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsEnable-07486  
If the bound graphics pipeline state was created with the 
VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state enabled and the 
VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, and if sampleLocationsEnable was VK_TRUE in the last call to vkCmdSetSampleLocationsEnableEXT, then the 
sampleLocationsInfo.sampleLocationGridSize.height in the last call to 
vkCmdSetSampleLocationsEXT must evenly divide VkMultisamplePropertiesEXT ::sampleLocationGridSize.height as returned by 
vkGetPhysicalDeviceMultisamplePropertiesEXT with a samples parameter equaling rasterizationSamples

• VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsEnable-07487  
If the bound graphics pipeline state was created with the 
VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, and if sampleLocationsEnable was VK_TRUE in the last call to vkCmdSetSampleLocationsEnableEXT, the fragment shader code must not statically use the extended instruction InterpolateAtSample

• VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsEnable-07936  
If the bound graphics pipeline state was created with the 
VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state disabled and the 
VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, the sampleLocationsEnable member of a VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable in the bound graphics pipeline is VK_TRUE or VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, then, sampleLocationsInfo.sampleLocationGridSize.width must evenly divide VkMultisamplePropertiesEXT::sampleLocationGridSize.width as returned by 
vkGetPhysicalDeviceMultisamplePropertiesEXT with a samples parameter equaling the value of rasterizationSamples in the last call to vkCmdSetRasterizationSamplesEXT

• VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsEnable-07937  
If the bound graphics pipeline state was created with the 
VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state disabled and the 
VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, the sampleLocationsEnable member of a VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable in the bound graphics pipeline is VK_TRUE or VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, then, sampleLocationsInfo.sampleLocationGridSize.height must evenly divide VkMultisamplePropertiesEXT::sampleLocationGridSize.height as returned by 
vkGetPhysicalDeviceMultisamplePropertiesEXT with a samples parameter equaling the value of rasterizationSamples in the last call to vkCmdSetRasterizationSamplesEXT

• VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsEnable-07938  
If the bound graphics pipeline state was created with the 
VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state disabled and the 
VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, the sampleLocationsEnable member of a VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable in the bound graphics pipeline is VK_TRUE or VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, then, sampleLocationsInfo.sampleLocationGridSize.height must evenly divide VkMultisamplePropertiesEXT::sampleLocationGridSize.height as returned by 
vkGetPhysicalDeviceMultisamplePropertiesEXT with a samples parameter equaling the value of rasterizationSamples in the last call to vkCmdSetRasterizationSamplesEXT
enabled, then, \( \text{sampleLocationsInfo.sampleLocationsPerPixel} \) must equal \( \text{rasterizationSamples} \) in the last call to `vkCmdSetRasterizationSamplesEXT`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-coverageModulationTableEnable-07488**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV` state enabled and the last call to `vkCmdSetCoverageModulationTableEnableNV` set `coverageModulationTableEnable` to `VK_TRUE`, then the `coverageModulationTableCount` parameter in the last call to `vkCmdSetCoverageModulationTableNV` must equal the current `rasterizationSamples` divided by the number of color samples in the current subpass.

- **VUID-vkCmdExecuteGeneratedCommandsNV-rasterizationSamples-07489**
  If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and if current subpass has a depth/stencil attachment and depth test, stencil test, or depth bounds test are enabled in the currently bound pipeline state, then the current `rasterizationSamples` must be the same as the sample count of the depth/stencil attachment.

- **VUID-vkCmdExecuteGeneratedCommandsNV-coverageToColorEnable-07490**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV` state enabled and the last call to `vkCmdSetCoverageToColorEnableNV` set `coverageToColorEnable` to `VK_TRUE`, then the current subpass must have a color attachment at the location selected by the last call to `vkCmdSetCoverageToColorLocationNV` `coverageToColorLocation`, with a `VkFormat` of `VK_FORMAT_R8_UINT`, `VK_FORMAT_R8_SINT`, `VK_FORMAT_R16_UINT`, `VK_FORMAT_R16_SINT`, `VK_FORMAT_R32_UINT`, or `VK_FORMAT_R32_SINT`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-coverageReductionMode-07491**
  If this `VK_NV_coverage_reduction_mode` extension is enabled, the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV` and `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` states enabled, the current coverage reduction mode `coverageReductionMode`, then the current `rasterizationSamples`, and the sample counts for the color and depth/stencil attachments (if the subpass has them) must be a valid combination returned by `vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-07492**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV` dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-07493**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportSwizzleNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportSwizzleWithCount`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-rasterizationSamples-07494**
  If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and if the current subpass...
has any color attachments and \texttt{rasterizationSamples} of the last call to \texttt{vkCmdSetRasterizationSamplesEXT} is greater than the number of color samples, then the pipeline \texttt{sampleShadingEnable} must be \texttt{VK_FALSE}.

- **VUID-vkCmdExecuteGeneratedCommandsNV-stippledLineEnable-07495**
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT} or \texttt{VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT} dynamic states enabled, and if the current \texttt{stippledLineEnable} state is \texttt{VK_TRUE} and the current \texttt{lineRasterizationMode} state is \texttt{VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT}, then the \texttt{stippledRectangularLines} feature must be enabled.

- **VUID-vkCmdExecuteGeneratedCommandsNV-stippledLineEnable-07496**
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT} or \texttt{VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT} dynamic states enabled, and if the current \texttt{stippledLineEnable} state is \texttt{VK_TRUE} and the current \texttt{lineRasterizationMode} state is \texttt{VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT}, then the \texttt{stippledBresenhamLines} feature must be enabled.

- **VUID-vkCmdExecuteGeneratedCommandsNV-stippledLineEnable-07497**
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT} or \texttt{VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT} dynamic states enabled, and if the current \texttt{stippledLineEnable} state is \texttt{VK_TRUE} and the current \texttt{lineRasterizationMode} state is \texttt{VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT}, then the \texttt{stippledSmoothLines} feature must be enabled.

- **VUID-vkCmdExecuteGeneratedCommandsNV-stippledLineEnable-07498**
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT} or \texttt{VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT} dynamic states enabled, and if the current \texttt{stippledLineEnable} state is \texttt{VK_TRUE} and the current \texttt{lineRasterizationMode} state is \texttt{VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT}, then the \texttt{stippledRectangularLines} feature must be enabled and \texttt{VkPhysicalDeviceLimits::strictLines} must be \texttt{VK_TRUE}.

- **VUID-vkCmdExecuteGeneratedCommandsNV-conservativePointAndLineRasterization-07499**
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT} dynamic state enabled, \texttt{conservativePointAndLineRasterization} is not supported, and the effective primitive topology output by the last pre-rasterization shader stage is a line or point, then the \texttt{conservativeRasterizationMode} set by the last call to \texttt{vkCmdSetConservativeRasterizationModeEXT} must be \texttt{VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT}.

- **VUID-vkCmdExecuteGeneratedCommandsNV-stage-07073**
  If the currently bound pipeline was created with the \texttt{VkPipelineShaderStageCreateInfo::stage} member of an element of \texttt{VkGraphicsPipelineCreateInfo::pStages} set to \texttt{VK_SHADER_STAGE_VERTEX_BIT}, \texttt{VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT}, \texttt{VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT} or \texttt{VK_SHADER_STAGE_GEOMETRY_BIT}, then \texttt{Mesh}
Shader Queries must not be active

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08877**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` dynamic state, `vkCmdSetAttachmentFeedbackLoopEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07850**
  If dynamic state was inherited from `VkCommandBufferInheritanceViewportScissorInfoNV`, it must be set in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08684**
  If there is no bound graphics pipeline, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_VERTEX_BIT`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08685**
  If there is no bound graphics pipeline, and the `tessellationShader` feature is enabled, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08686**
  If there is no bound graphics pipeline, and the `tessellationShader` feature is enabled, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08687**
  If there is no bound graphics pipeline, and the `geometryShader` feature is enabled, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_GEOMETRY_BIT`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08688**
  If there is no bound graphics pipeline, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_FRAGMENT_BIT`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08689**
  If there is no bound graphics pipeline, and the `taskShader` feature is enabled, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_TASK_BIT_EXT`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08690**
  If there is no bound graphics pipeline, and the `meshShader` feature is enabled, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_MESH_BIT_EXT`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08693**
  If there is no bound graphics pipeline, and at least one of the `taskShader` and `meshShader` features is enabled, one of the `VK_SHADER_STAGE_VERTEX_BIT` or `VK_SHADER_STAGE_MESH_BIT_EXT` stages must have a valid `VkShaderEXT` bound, and the other must have no `VkShaderEXT` bound.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08694**
  If there is no bound graphics pipeline, and both the `taskShader` and `meshShader` features...
are enabled, and a valid VkShaderEXT is bound to the VK_SHADER_STAGE_MESH_BIT_EXT stage, and that VkShaderEXT was created without the VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT flag, a valid VkShaderEXT must be bound to the VK_SHADER_STAGE_TASK_BIT_EXT stage

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08695
  If there is no bound graphics pipeline, and both the taskShader and meshShader features are enabled, and a valid VkShaderEXT is bound to the VK_SHADER_STAGE_MESH_BIT_EXT stage, and that VkShaderEXT was created with the VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT flag, there must be no VkShaderEXT bound to the VK_SHADER_STAGE_TASK_BIT_EXT stage

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08696
  If there is no bound graphics pipeline, and a valid VkShaderEXT is bound to the VK_SHADER_STAGE_VERTEX_BIT stage, there must be no VkShaderEXT bound to either the VK_SHADER_STAGE_TASK_BIT_EXT stage or the VK_SHADER_STAGE_MESH_BIT_EXT stage

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08698
  If any graphics shader is bound which was created with the VK_SHADER_CREATE_LINK_STAGE_BIT_EXT flag, then all shaders created with the VK_SHADER_CREATE_LINK_STAGE_BIT_EXT flag in the same vkCreateShadersEXT call must also be bound

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08699
  If any graphics shader is bound which was created with the VK_SHADER_CREATE_LINK_STAGE_BIT_EXT flag, any stages in between stages whose shaders which did not create a shader with the VK_SHADER_CREATE_LINK_STAGE_BIT_EXT flag as part of the same vkCreateShadersEXT call must not have any VkShaderEXT bound

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08878
  All bound graphics shader objects must have been created with identical or identically defined push constant ranges

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08879
  All bound graphics shader objects must have been created with identical or identically defined arrays of descriptor set layouts

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08880
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage and the attachmentFeedbackLoopDynamicState feature is enabled on the device, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE vkCmdSetAttachmentFeedbackLoopEnableEXT must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-pDynamicStates-08715
  If the bound graphics pipeline state includes a fragment shader stage, was created with VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE set in VkPipelineDynamicStateCreateInfo::pDynamicStates, and the fragment shader declares the EarlyFragmentTests execution mode and uses OpDepthAttachmentReadEXT, the depthWriteEnable parameter in the last call to vkCmdSetDepthWriteEnable must be VK_FALSE

• VUID-vkCmdExecuteGeneratedCommandsNV-pDynamicStates-08716
  If the bound graphics pipeline state includes a fragment shader stage, was created with VK_DYNAMIC_STATE_STENCIL_WRITE_MASK set in VkPipelineDynamicStateCreateInfo::pDynamicStates
::pDynamicStates, and the fragment shader declares the EarlyFragmentTests execution mode and uses OpStencilAttachmentReadEXT, the writeMask parameter in the last call to vkCmdSetStencilWriteMask must be 0.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-09116
  If a shader object is bound to any graphics stage or the currently bound graphics pipeline was created with VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT, and the format of any color attachment is VK_FORMAT_E5B9G9R9_UFLOAT_PACK32, the corresponding element of the pColorWriteMasks parameter of vkCmdSetColorWriteMaskEXT must either include all of VK_COLOR_COMPONENT_R_BIT, VK_COLOR_COMPONENT_G_BIT, and VK_COLOR_COMPONENT_B_BIT, or none of them.

- VUID-vkCmdExecuteGeneratedCommandsNV-maxFragmentDualSrcAttachments-09239
  If blending is enabled for any attachment where either the source or destination blend factors for that attachment use the secondary color input, the maximum value of Location for any output attachment statically used in the Fragment Execution Model executed by this command must be less than maxFragmentDualSrcAttachments.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-04007
  All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must have either valid or VK_NULL_HANDLE buffers bound.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-04008
  If the nullDescriptor feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must not be VK_NULL_HANDLE.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-02721
  For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07842
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY dynamic state enabled then vkCmdSetPrimitiveTopology must have been called in the current command buffer prior to this drawing command.

- VUID-vkCmdExecuteGeneratedCommandsNV-dynamicPrimitiveTopologyUnrestricted-07500
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY dynamic state enabled and the dynamicPrimitiveTopologyUnrestricted is VK_FALSE, then the primitiveTopology parameter of vkCmdSetPrimitiveTopology must be of the same topology class as the pipeline VkPipelineInputAssemblyStateCreateInfo::topology state.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-04912
  If the bound graphics pipeline was created with both the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT and VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT dynamic states enabled, then vkCmdSetVertexInputEXT must have been called in the current command buffer prior to this draw command.

- VUID-vkCmdExecuteGeneratedCommandsNV-pStrides-04913
If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdBindVertexBuffers2EXT` must have been called in the current command buffer prior to this draw command, and the `pStrides` parameter of `vkCmdBindVertexBuffers2EXT` must not be `NULL`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08881**
  If a shader object is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage, then `vkCmdSetPrimitiveTopology` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-04914**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-Input-07939**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then all variables with the `Input` storage class decorated with `Location` in the `Vertex Execution Model OpEntryPoint` must contain a location in `VkVertexInputAttributeDescription2EXT::location`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-Input-08734**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then the numeric type associated with all `Input` variables of the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` must be the same as `VkVertexInputAttributeDescription2EXT::format`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-format-08936**
  If there is a shader object bound to a graphics stage or the currently bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, and `VkVertexInputAttributeDescription2EXT::format` has a 64-bit component, then the scalar width associated with all `Input` variables of the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` must be 64-bit.

- **VUID-vkCmdExecuteGeneratedCommandsNV-format-08937**
  If there is a shader object bound to a graphics stage or the currently bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, and the scalar width associated with a `Location` decorated `Input` variable in the `Vertex Execution Model OpEntryPoint` is 64-bit, then the corresponding `VkVertexInputAttributeDescription2EXT::format` must have a 64-bit component.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-09203**
  If there is a shader object bound to a graphics stage or the currently bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, and `VkVertexInputAttributeDescription2EXT::format` has a 64-bit component, then all `Input` variables at the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` must not use components that are not present in the format.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08882**
  If a shader object is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to
this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-04875
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT dynamic state enabled then
  vkCmdSetPatchControlPointsEXT must have been called in the current command buffer
  prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08883
  If a shader object is bound to the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT stage, then
  vkCmdSetPatchControlPointsEXT must have been called in the current command buffer
  prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-04879
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE dynamic state enabled then
  vkCmdSetPrimitiveRestartEnable must have been called in the current command buffer
  prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-rasterizerDiscardEnable-08884
  If a shader object is bound to any graphics stage, and the most recent call to
  vkCmdSetRasterizerDiscardEnable in the current command buffer set
  rasterizerDiscardEnable to VK_FALSE, vkCmdSetPrimitiveRestartEnable must have been
  called in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-stage-06481
  The bound graphics pipeline must not have been created with the
  VkPipelineShaderStageCreateInfo::stage member of an element of
  VkGraphicsPipelineCreateInfo::pStages set to VK_SHADER_STAGE_TASK_BIT_EXT or
  VK_SHADER_STAGE_MESH_BIT_EXT

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08885
  There must be no shader object bound to either of the VK_SHADER_STAGE_TASK_BIT_EXT or
  VK_SHADER_STAGE_MESH_BIT_EXT stages

• VUID-vkCmdExecuteGeneratedCommandsNV-commandBuffer-02970
  commandBuffer must not be a protected command buffer

• VUID-vkCmdExecuteGeneratedCommandsNV-isPreprocessed-02908
  If isPreprocessed is VK_TRUE then vkCmdPreprocessGeneratedCommandsNV must have
  already been executed on the device, using the same pGeneratedCommandsInfo content as
  well as the content of the input buffers it references (all except
  VkGeneratedCommandsInfoNV::preprocessBuffer). Furthermore pGeneratedCommandsInfo’s
  indirectCommandsLayout must have been created with the
  VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_NV bit set

• VUID-vkCmdExecuteGeneratedCommandsNV-pipeline-02909
  VkGeneratedCommandsInfoNV::pipeline must match the current bound pipeline at
  VkGeneratedCommandsInfoNV::pipelineBindPoint

• VUID-vkCmdExecuteGeneratedCommandsNV-None-02910
  Transform feedback must not be active

• VUID-vkCmdExecuteGeneratedCommandsNV-deviceGeneratedCommands-02911
The `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands` feature must be enabled.

**Valid Usage (Implicit)**
- VUID-vkCmdExecuteGeneratedCommandsNV-commandBuffer-parameter `commandBuffer` must be a valid `VkCommandBuffer` handle.
- VUID-vkCmdExecuteGeneratedCommandsNV-pGeneratedCommandsInfo-parameter `pGeneratedCommandsInfo` must be a valid pointer to a valid `VkGeneratedCommandsInfoNV` structure.
- VUID-vkCmdExecuteGeneratedCommandsNV-commandBuffer-recording `commandBuffer` must be in the recording state.
- VUID-vkCmdExecuteGeneratedCommandsNV-commandBuffer-cmdpool The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations.
- VUID-vkCmdExecuteGeneratedCommandsNV-renderpass This command must only be called inside of a render pass instance.
- VUID-vkCmdExecuteGeneratedCommandsNV-videocoding This command must only be called outside of a video coding scope.

**Host Synchronization**
- Host access to `commandBuffer` must be externally synchronized.
- Host access to the ` VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

// Provided by VK_NV_device_generated_commands
typedef struct VkGeneratedCommandsInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineBindPoint pipelineBindPoint;
    VkPipeline pipeline;
    VkIndirectCommandsLayoutNV indirectCommandsLayout;
    uint32_t streamCount;
};
constVkIndirectCommandsStreamNV*pStreams;
uint32_t sequencesCount;
VkBuffer preprocessBuffer;
VkDeviceSize preprocessOffset;
VkDeviceSize preprocessSize;
VkBuffer sequencesCountBuffer;
VkDeviceSize sequencesCountOffset;
VkBuffer sequencesIndexBuffer;
VkDeviceSize sequencesIndexOffset;
}VkGeneratedCommandsInfoNV;

• **sType** is a VkStructureType value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **pipelineBindPoint** is the VkPipelineBindPoint used for the pipeline.

• **pipeline** is the VkPipeline used in the generation and execution process.

• **indirectCommandsLayout** is the VkIndirectCommandsLayoutNV that provides the command sequence to generate.

• **streamCount** defines the number of input streams

• **pStreams** is a pointer to an array of streamCount VkIndirectCommandsStreamNV structures providing the input data for the tokens used in indirectCommandsLayout.

• **sequencesCount** is the maximum number of sequences to reserve. If sequencesCountBuffer is VK_NULL_HANDLE, this is also the actual number of sequences generated.

• **preprocessBuffer** is the VkBuffer that is used for preprocessing the input data for execution. If this structure is used with vkCmdExecuteGeneratedCommandsNV with its isPreprocessed set to VK_TRUE, then the preprocessing step is skipped and data is only read from this buffer. The contents and the layout of this buffer is opaque to applications and must not be modified or copied to another buffer for reuse.

• **preprocessOffset** is the byte offset into preprocessBuffer where the preprocessed data is stored.

• **preprocessSize** is the maximum byte size within the preprocessBuffer after the preprocessOffset that is available for preprocessing.

• **sequencesCountBuffer** is a VkBuffer in which the actual number of sequences is provided as single uint32_t value.

• **sequencesCountOffset** is the byte offset into sequencesCountBuffer where the count value is stored.

• **sequencesIndexBuffer** is a VkBuffer that encodes the used sequence indices as uint32_t array.

• **sequencesIndexOffset** is the byte offset into sequencesIndexBuffer where the index values start.

**Valid Usage**

• VUID-VkGeneratedCommandsInfoNV-pipeline-02912
  The provided pipeline must match the pipeline bound at execution time

• VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-02913
If the indirectCommandsLayout uses a token of VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV, then the pipeline must have been created with multiple shader groups.

- VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-02914
  If the indirectCommandsLayout uses a token of VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV, then the pipeline must have been created with VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV set in VkGraphicsPipelineCreateInfo::flags.

- VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-02915
  If the indirectCommandsLayout uses a token of VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV, then the pipeline must have been created with multiple shader groups.

- VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-02916
  streamCount must match the indirectCommandsLayout's streamCount.

- VUID-VkGeneratedCommandsInfoNV-pipelineBindPoint-09084
  If pipelineBindPoint is of type VK_PIPELINE_BIND_POINT_COMPUTE, then the pipeline must have been created with the flag VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV.

- VUID-VkGeneratedCommandsInfoNV-pipelineBindPoint-09085
  If pipelineBindPoint is of type VK_PIPELINE_BIND_POINT_COMPUTE, then the pipeline must have been created with a VkComputePipelineIndirectBufferInfoNV structure specifying a valid address where its metadata will be saved.

- VUID-VkGeneratedCommandsInfoNV-pipelineBindPoint-09086
  If pipelineBindPoint is of type VK_PIPELINE_BIND_POINT_COMPUTE, then vkCmdUpdatePipelineIndirectBufferNV must have been called on that pipeline to save its metadata to a device address.

- VUID-VkGeneratedCommandsInfoNV-pipelineBindPoint-09087
  If pipelineBindPoint is of type VK_PIPELINE_BIND_POINT_COMPUTE, and if VK_INDIRECT_COMMANDS_TOKEN_TYPE_PIPELINE_NV is used, then pipeline must be VK_NULL_HANDLE.

- VUID-VkGeneratedCommandsInfoNV-sequencesCount-02917
  sequencesCount must be less or equal to VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectSequenceCount and VkGeneratedCommandsMemoryRequirementsInfoNV::maxSequencesCount that was used to determine the preprocessSize.

- VUID-VkGeneratedCommandsInfoNV-preprocessBuffer-02918
  preprocessBuffer must have the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set in its usage flag.

- VUID-VkGeneratedCommandsInfoNV-preprocessOffset-02919
  preprocessOffset must be aligned to VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::minIndirectCommandsBufferOffsetAlignment.

- VUID-VkGeneratedCommandsInfoNV-preprocessBuffer-02971
  If preprocessBuffer is non-sparse then it must be bound completely and contiguously to a
single VkDeviceMemory object

- **VUID-VkGeneratedCommandsInfoNV-preprocessSize-02920**
  preprocessSize must be at least equal to the memory requirement’s size returned by vkGetGeneratedCommandsMemoryRequirementsNV using the matching inputs (indirectCommandsLayout, ...) as within this structure

- **VUID-VkGeneratedCommandsInfoNV-sequencesCountBuffer-02921**
  sequencesCountBuffer can be set if the actual used count of sequences is sourced from the provided buffer. In that case the sequencesCount serves as upper bound

- **VUID-VkGeneratedCommandsInfoNV-sequencesCountBuffer-02922**
  If sequencesCountBuffer is not VK_NULL_HANDLE, its usage flag must have the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

- **VUID-VkGeneratedCommandsInfoNV-sequencesCountBuffer-02923**
  If sequencesCountBuffer is not VK_NULL_HANDLE, sequencesCountOffset must be aligned to VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::minSequencesCountBufferOffsetAlignment

- **VUID-VkGeneratedCommandsInfoNV-sequencesCountBuffer-02924**
  If sequencesCountBuffer is not VK_NULL_HANDLE and is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- **VUID-VkGeneratedCommandsInfoNV-sequencesIndexBuffer-02924**
  If indirectCommandsLayout's VK_INDIRECT_COMMANDS_LAYOUT_USAGE_INDEXED_SEQUENCES_BIT_NV is set, sequencesIndexBuffer must be set otherwise it must be VK_NULL_HANDLE

- **VUID-VkGeneratedCommandsInfoNV-sequencesIndexBuffer-02925**
  If sequencesIndexBuffer is not VK_NULL_HANDLE, its usage flag must have the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

- **VUID-VkGeneratedCommandsInfoNV-sequencesIndexBuffer-02926**
  If sequencesIndexBuffer is not VK_NULL_HANDLE, sequencesIndexOffset must be aligned to VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::minSequencesIndexBufferOffsetAlignment

- **VUID-VkGeneratedCommandsInfoNV-sequencesIndexBuffer-02927**
  If sequencesIndexBuffer is not VK_NULL_HANDLE and is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- **VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-07078**
  If the indirectCommandsLayout uses a token of VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_TASKS_NV, then the pipeline must contain a shader stage using the MeshNV Execution Model

- **VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-07079**
  If the indirectCommandsLayout uses a token of VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_MESH_TASKS_NV, then the pipeline must contain a shader stage using the MeshEXT Execution Model
Valid Usage (Implicit)

- VUID-VkGeneratedCommandsInfoNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_GENERATED_COMMANDS_INFO_NV

- VUID-VkGeneratedCommandsInfoNV-pNext-pNext
  pNext must be NULL

- VUID-VkGeneratedCommandsInfoNV-pipelineBindPoint-parameter
  pipelineBindPoint must be a valid VkPipelineBindPoint value

- VUID-VkGeneratedCommandsInfoNV-pipeline-parameter
  pipeline must be a valid VkPipeline handle

- VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-parameter
  indirectCommandsLayout must be a valid VkIndirectCommandsLayoutNV handle

- VUID-VkGeneratedCommandsInfoNV-pStreams-parameter
  pStreams must be a valid pointer to an array of streamCount valid
  VkIndirectCommandsStreamNV structures

- VUID-VkGeneratedCommandsInfoNV-preprocessBuffer-parameter
  preprocessBuffer must be a valid VkBuffer handle

- VUID-VkGeneratedCommandsInfoNV-sequencesCountBuffer-parameter
  If sequencesCountBuffer is not VK_NULL_HANDLE, sequencesCountBuffer must be a valid
  VkBuffer handle

- VUID-VkGeneratedCommandsInfoNV-sequencesIndexBuffer-parameter
  If sequencesIndexBuffer is not VK_NULL_HANDLE, sequencesIndexBuffer must be a valid
  VkBuffer handle

- VUID-VkGeneratedCommandsInfoNV-streamCount-arraylength
  streamCount must be greater than 0

- VUID-VkGeneratedCommandsInfoNV-commonparent
  Each of indirectCommandsLayout, pipeline, preprocessBuffer, sequencesCountBuffer, and
  sequencesIndexBuffer that are valid handles of non-ignored parameters must have been
  created, allocated, or retrieved from the same VkDevice

Referencing the functions defined in Indirect Commands Layout, vkCmdExecuteGeneratedCommandsNV
behaves as:

```c
uint32_t sequencesCount = sequencesCountBuffer ?
    min(maxSequencesCount, sequencesCountBuffer.load_uint32(sequencesCountOffset)) :
    maxSequencesCount;

cmdProcessAllSequences(commandBuffer, pipeline,
    indirectCommandsLayout, pIndirectCommandsStreams,
    sequencesCount,
    sequencesIndexBuffer, sequencesIndexOffset);
```
The stateful commands within indirectCommandsLayout will not affect the state of subsequent commands in the target command buffer (cmd).

**Note**

It is important to note that the values of all state related to the pipelineBindPoint used are undefined after this command.

Commands can be preprocessed prior execution using the following command:

```c
// Provided by VK_NV_device_generated_commands
void vkCmdPreprocessGeneratedCommandsNV(
    VkCommandBuffer commandBuffer,
    const VkGeneratedCommandsInfoNV* pGeneratedCommandsInfo);
```

- `commandBuffer` is the command buffer which does the preprocessing.
- `pGeneratedCommandsInfo` is a pointer to a `VkGeneratedCommandsInfoNV` structure containing parameters affecting the preprocessing step.

**Valid Usage**

- VUID-vkCmdPreprocessGeneratedCommandsNV-commandBuffer-02974 `commandBuffer` must not be a protected command buffer
- VUID-vkCmdPreprocessGeneratedCommandsNV-pGeneratedCommandsInfo-02927 `pGeneratedCommandsInfo`'s indirectCommandsLayout must have been created with the `VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_NV` bit set
- VUID-vkCmdPreprocessGeneratedCommandsNV-deviceGeneratedCommands-02928 The `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands` feature must be enabled

**Valid Usage (Implicit)**

- VUID-vkCmdPreprocessGeneratedCommandsNV-commandBuffer-parameter `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdPreprocessGeneratedCommandsNV-pGeneratedCommandsInfo-parameter `pGeneratedCommandsInfo` must be a valid pointer to a valid `VkGeneratedCommandsInfoNV` structure
- VUID-vkCmdPreprocessGeneratedCommandsNV-commandBuffer-recording `commandBuffer` must be in the recording state
- VUID-vkCmdPreprocessGeneratedCommandsNV-commandBuffer-cmdpool The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations
Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

The bound descriptor sets and push constants that will be used with indirect command generation for the compute pipelines must already be specified at the time of preprocessing commands with vkCmdPreprocessGeneratedCommandsNV. They must not change until the execution of indirect commands is submitted with vkCmdExecuteGeneratedCommandsNV.

If push constants for the compute pipeline are also specified in the VkGeneratedCommandsInfoNV::indirectCommandsLayout with VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV token, then those values override the push constants that were previously pushed for the compute pipeline.
Chapter 33. Sparse Resources

As documented in Resource Memory Association, VkBuffer and VkImage resources in Vulkan must be bound completely and contiguously to a single VkDeviceMemory object. This binding must be done before the resource is used, and the binding is immutable for the lifetime of the resource.

Sparse resources relax these restrictions and provide these additional features:

- Sparse resources can be bound non-contiguously to one or more VkDeviceMemory allocations.
- Sparse resources can be re-bound to different memory allocations over the lifetime of the resource.
- Sparse resources can have descriptors generated and used orthogonally with memory binding commands.

33.1. Sparse Resource Features

Sparse resources have several features that must be enabled explicitly at resource creation time. The features are enabled by including bits in the flags parameter of VkImageCreateInfo or VkBufferCreateInfo. Each feature also has one or more corresponding feature enables specified in VkPhysicalDeviceFeatures.

- The sparseBinding feature is the base, and provides the following capabilities:
  ◦ Resources can be bound at some defined (sparse block) granularity.
  ◦ The entire resource must be bound to memory before use regardless of regions actually accessed.
  ◦ No specific mapping of image region to memory offset is defined, i.e. the location that each texel corresponds to in memory is implementation-dependent.
  ◦ Sparse buffers have a well-defined mapping of buffer range to memory range, where an offset into a range of the buffer that is bound to a single contiguous range of memory corresponds to an identical offset within that range of memory.
  ◦ Requested via the VK_IMAGE_CREATE_SPARSE_BINDING_BIT and VK_BUFFER_CREATE_SPARSE_BINDING_BIT bits.
  ◦ A sparse image created using VK_IMAGE_CREATE_SPARSE_BINDING_BIT (but not VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT) supports all formats that non-sparse usage supports, and supports both VK_IMAGE_TILING_OPTIMAL and VK_IMAGE_TILING_LINEAR tiling.

- Sparse Residency builds on (and requires) the sparseBinding feature. It includes the following capabilities:
  ◦ Resources do not have to be completely bound to memory before use on the device.
  ◦ Images have a prescribed sparse image block layout, allowing specific rectangular regions of the image to be bound to specific offsets in memory allocations.
  ◦ Consistency of access to unbound regions of the resource is defined by the absence or presence of VkPhysicalDeviceSparseProperties::residencyNonResidentStrict. If this property is present, accesses to unbound regions of the resource are well defined and behave as if the
data bound is populated with all zeros; writes are discarded. When this property is absent, accesses are considered safe, but reads will return undefined values.

- Requested via the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` and `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` bits.
- Sparse residency support is advertised on a finer grain via the following features:
  
  - The `sparseResidencyBuffer` feature provides support for creating `VkBuffer` objects with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT`.
  - The `sparseResidencyImage2D` feature provides support for creating 2D single-sampled `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  - The `sparseResidencyImage3D` feature provides support for creating 3D `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  - The `sparseResidency2Samples` feature provides support for creating 2D `VkImage` objects with 2 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  - The `sparseResidency4Samples` feature provides support for creating 2D `VkImage` objects with 4 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  - The `sparseResidency8Samples` feature provides support for creating 2D `VkImage` objects with 8 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  - The `sparseResidency16Samples` feature provides support for creating 2D `VkImage` objects with 16 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.

Implementations supporting `sparseResidencyImage2D` are only required to support sparse 2D, single-sampled images. Support for sparse 3D and MSAA images is optional and can be enabled via `sparseResidencyImage3D`, `sparseResidency2Samples`, `sparseResidency4Samples`, `sparseResidency8Samples`, and `sparseResidency16Samples`.

- A sparse image created using `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` supports all non-compressed color formats with power-of-two element size that non-sparse usage supports. Additional formats may also be supported and can be queried via `vkGetPhysicalDeviceSparseImageFormatProperties`. `VK_IMAGE_TILING_LINEAR` tiling is not supported.

- The `sparseResidencyAliased` feature provides the following capability that can be enabled per resource:

  Allows physical memory ranges to be shared between multiple locations in the same sparse resource or between multiple sparse resources, with each binding of a memory location observing a consistent interpretation of the memory contents.

See Sparse Memory Aliasing for more information.

### 33.2. Sparse Buffers and Fully-Resident Images

Both `VkBuffer` and `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` or `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` bits can be thought of as a linear region of address space. In the `VkImage` case if `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` is not used, this linear region is entirely...
opaque, meaning that there is no application-visible mapping between texel location and memory offset.

Unless `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` or `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` are also used, the entire resource must be bound to one or more `VkDeviceMemory` objects before use.

### 33.2.1. Sparse Buffer and Fully-Resident Image Block Size

The sparse block size in bytes for sparse buffers and fully-resident images is reported as `VkMemoryRequirements::alignment`. `alignment` represents both the memory alignment requirement and the binding granularity (in bytes) for sparse resources.

### 33.3. Sparse Partially-Resident Buffers

`VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` bit allow the buffer to be made only partially resident. Partially resident `VkBuffer` objects are allocated and bound identically to `VkBuffer` objects using only the `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` feature. The only difference is the ability for some regions of the buffer to be unbound during device use.

### 33.4. Sparse Partially-Resident Images

`VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` bit allow specific rectangular regions of the image called sparse image blocks to be bound to specific ranges of memory. This allows the application to manage residency at either image subresource or sparse image block granularity. Each image subresource (outside of the mip tail) starts on a sparse block boundary and has dimensions that are integer multiples of the corresponding dimensions of the sparse image block.

**Note**

Applications can use these types of images to control LOD based on total memory consumption. If memory pressure becomes an issue the application can unbind and disable specific mipmap levels of images without having to recreate resources or modify texel data of unaffected levels.

The application can also use this functionality to access subregions of the image in a “megatexture” fashion. The application can create a large image and only populate the region of the image that is currently being used in the scene.

### 33.4.1. Accessing Unbound Regions

The following member of `VkPhysicalDeviceSparseProperties` affects how data in unbound regions of sparse resources are handled by the implementation:

- `residencyNonResidentStrict`

If this property is not present, reads of unbound regions of the image will return undefined values. Both reads and writes are still considered safe and will not affect other resources or populated regions of the image.
If this property is present, all reads of unbound regions of the image will behave as if the region was bound to memory populated with all zeros; writes will be discarded.

**Image operations** performed on unbound memory **may** still alter some component values in the natural way for those accesses, e.g. substituting a value of one for alpha in formats that do not have an alpha component.

Example: Reading the alpha component of an unbacked `VK_FORMAT_R8_UNORM` image will return a value of 1.0f.

See **Physical Device Enumeration** for instructions for retrieving physical device properties.

---

**Implementor’s Note**

For implementations that **cannot** natively handle access to unbound regions of a resource, the implementation **may** allocate and bind memory to the unbound regions. Reads and writes to unbound regions will access the implementation-managed memory instead.

Given that the values resulting from reads of unbound regions are undefined in this scenario, implementations **may** use the same physical memory for all unbound regions of multiple resources within the same process.

---

### 33.4.2. Mip Tail Regions

Sparse images created using `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` (without also using `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`) have no specific mapping of image region or image subresource to memory offset defined, so the entire image can be thought of as a linear opaque address region. However, images created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` do have a prescribed sparse image block layout, and hence each image subresource must start on a sparse block boundary. Within each array layer, the set of mip levels that have a smaller size than the sparse block size in bytes are grouped together into a **mip tail region**.

If the `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` flag is present in the `flags` member of `VkSparseImageFormatProperties`, for the image's `format`, then any mip level which has dimensions that are not integer multiples of the corresponding dimensions of the sparse image block, and all subsequent mip levels, are also included in the mip tail region.

The following member of `VkPhysicalDeviceSparseProperties` may affect how the implementation places mip levels in the mip tail region:

- `residencyAlignedMipSize`

Each mip tail region is bound to memory as an opaque region (i.e. **must** be bound using a `VkSparseImageOpaqueMemoryBindInfo` structure) and **may** be of a size greater than or equal to the sparse block size in bytes. This size is guaranteed to be an integer multiple of the sparse block size in bytes.
An implementation **may** choose to allow each array-layer's mip tail region to be bound to memory independently or require that all array-layer's mip tail regions be treated as one. This is dictated by `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` in `VkSparseImageMemoryRequirements::flags`.

The following diagrams depict how `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` and `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` alter memory usage and requirements.

![Figure 22. Sparse Image](image)

In the absence of `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` and `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT`, each array layer contains a mip tail region containing texel data for all mip levels smaller than the sparse image block in any dimension.

Mip levels that are as large or larger than a sparse image block in all dimensions **can** be bound individually. Right-edges and bottom-edges of each level are allowed to have partially used sparse blocks. Any bound partially-used-sparse-blocks **must** still have their full sparse block size in bytes allocated in memory.
Figure 23. Sparse Image with Single Mip Tail

When `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` is present all array layers will share a single mip tail region.

Figure 24. Sparse Image with Aligned Mip Size

### Note
The mip tail regions are presented here in 2D arrays simply for figure size reasons. Each mip tail is logically a single array of sparse blocks with an implementation-dependent mapping of texels or compressed texel blocks to sparse blocks.

When `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` is present the first mip level that would contain partially used sparse blocks begins the mip tail region. This level and all subsequent levels are placed in the mip tail. Only the first $N$ mip levels whose dimensions are an exact multiple of the sparse image block dimensions can be bound and unbound on a sparse block basis.

![Figure 25. Sparse Image with Aligned Mip Size and Single Mip Tail](image)

**Note**
The mip tail region is presented here in a 2D array simply for figure size reasons. It is logically a single array of sparse blocks with an implementation-dependent mapping of texels or compressed texel blocks to sparse blocks.

When both `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` and `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` are present the constraints from each of these flags are in effect.

### 33.4.3. Standard Sparse Image Block Shapes

Standard sparse image block shapes define a standard set of dimensions for sparse image blocks that depend on the format of the image. Layout of texels or compressed texel blocks within a sparse image block is implementation-dependent. All currently defined standard sparse image block shapes are 64 KB in size.

For block-compressed formats (e.g. `VK_FORMAT_BC5_UNORM_BLOCK`), the texel size is the size of the compressed texel block (e.g. 128-bit for BC5) thus the dimensions of the standard sparse image block...
shapes apply in terms of compressed texel blocks.

Note

For block-compressed formats, the dimensions of a sparse image block in terms of texels can be calculated by multiplying the sparse image block dimensions by the compressed texel block dimensions.

<td>32 × 32 × 1</td>
<td>16 × 32 × 1</td>
<td>16 × 16 × 1</td>
</tr>
</tbody>
</table>

Implementations that support the standard sparse image block shape for all formats listed in the Standard Sparse Image Block Shapes (Single Sample) and Standard Sparse Image Block Shapes (MSAA) tables may advertise the following VkPhysicalDeviceSparseProperties:

- residencyStandard2DBlockShape
- residencyStandard2DMultisampleBlockShape
- residencyStandard3DBlockShape

Reporting each of these features does not imply that all possible image types are supported as sparse. Instead, this indicates that no supported sparse image of the corresponding type will use custom sparse image block dimensions for any formats that have a corresponding standard sparse image block shape.

### 33.4.4. Custom Sparse Image Block Shapes

An implementation that does not support a standard image block shape for a particular sparse partially-resident image may choose to support a custom sparse image block shape for it instead. The dimensions of such a custom sparse image block shape are reported in VkSparseImageFormatProperties::imageGranularity. As with standard sparse image block shapes, the size in bytes of the custom sparse image block shape will be reported in VkMemoryRequirements::alignment.

Custom sparse image block dimensions are reported through vkGetPhysicalDeviceSparseImageFormatProperties and vkGetImageSparseMemoryRequirements.

An implementation must not support both the standard sparse image block shape and a custom...
33.4.5. Multiple Aspects

Partially resident images are allowed to report separate sparse properties for different aspects of the image. One example is for depth/stencil images where the implementation separates the depth and stencil data into separate planes. Another reason for multiple aspects is to allow the application to manage memory allocation for implementation-private metadata associated with the image. See the figure below:

![Multiple Aspect Sparse Image](image)

*Figure 26. Multiple Aspect Sparse Image*

**Note**

The mip tail regions are presented here in 2D arrays simply for figure size reasons. Each mip tail is logically a single array of sparse blocks with an implementation-dependent mapping of texels or compressed texel blocks to sparse blocks.

In the figure above the depth, stencil, and metadata aspects all have unique sparse properties. The sparse image block shape for the same image. The standard sparse image block shape must be used if it is supported.
per-texel stencil data is \( \frac{1}{4} \) the size of the depth data, hence the stencil sparse blocks include \( 4 \times \) the number of texels. The sparse block size in bytes for all of the aspects is identical and defined by \( \text{VkMemoryRequirements::alignment} \).

**Metadata**

The metadata aspect of an image has the following constraints:

- All metadata is reported in the mip tail region of the metadata aspect.
- All metadata **must** be bound prior to device use of the sparse image.

### 33.5. Sparse Memory Aliasing

By default sparse resources have the same aliasing rules as non-sparse resources. See [Memory Aliasing](#) for more information.

\texttt{VkDevice} objects that have the \texttt{sparseResidencyAliased} feature enabled are able to use the \texttt{VK_BUFFER_CREATE_SPARSE_ALIASED_BIT} and \texttt{VK_IMAGE_CREATE_SPARSE_ALIASED_BIT} flags for resource creation. These flags allow resources to access physical memory bound into multiple locations within one or more sparse resources in a *data consistent* fashion. This means that reading physical memory from multiple aliased locations will return the same value.

Care **must** be taken when performing a write operation to aliased physical memory. Memory dependencies **must** be used to separate writes to one alias from reads or writes to another alias. Writes to aliased memory that are not properly guarded against accesses to different aliases will have undefined results for all accesses to the aliased memory.

Applications that wish to make use of data consistent sparse memory aliasing **must** abide by the following guidelines:

- All sparse resources that are bound to aliased physical memory **must** be created with the \texttt{VK_BUFFER_CREATE_SPARSE_ALIASED_BIT} / \texttt{VK_IMAGE_CREATE_SPARSE_ALIASED_BIT} flag.
- All resources that access aliased physical memory **must** interpret the memory in the same way. This implies the following:
  - Buffers and images **cannot** alias the same physical memory in a data consistent fashion. The physical memory ranges **must** be used exclusively by buffers or used exclusively by images for data consistency to be guaranteed.
  - Memory in sparse image mip tail regions **cannot** access aliased memory in a data consistent fashion.
  - Sparse images that alias the same physical memory **must** have compatible formats and be using the same sparse image block shape in order to access aliased memory in a data consistent fashion.

Failure to follow any of the above guidelines will require the application to abide by the normal, non-sparse resource aliasing rules. In this case memory **cannot** be accessed in a data consistent fashion.
Enabling sparse resource memory aliasing can be a way to lower physical memory use, but it may reduce performance on some implementations. An application developer can test on their target HW and balance the memory / performance trade-offs measured.

### 33.6. Sparse Resource Implementation Guidelines (Informative)

This section is Informative. It is included to aid in implementors’ understanding of sparse resources.

**Device Virtual Address**

The basic `sparseBinding` feature allows the resource to reserve its own device virtual address range at resource creation time rather than relying on a bind operation to set this. Without any other creation flags, no other constraints are relaxed compared to normal resources. All pages **must** be bound to physical memory before the device accesses the resource.

The `sparseResidency` features allow sparse resources to be used even when not all pages are bound to memory. Implementations that support access to unbound pages without causing a fault **may** support `residencyNonResidentStrict`.

Not faulting on access to unbound pages is not enough to support `residencyNonResidentStrict`. An implementation **must** also guarantee that reads after writes to unbound regions of the resource always return data for the read as if the memory contains zeros. Depending on any caching hierarchy of the implementation this **may** not always be possible.

Any implementation that does not fault, but does not guarantee correct read values **must** not support `residencyNonResidentStrict`.

Any implementation that **cannot** access unbound pages without causing a fault will require the implementation to bind the entire device virtual address range to physical memory. Any pages that the application does not bind to memory **may** be bound to one (or more) "placeholder" physical page(s) allocated by the implementation. Given the following properties:

- A process **must** not access memory from another process
- Reads return undefined values

It is sufficient for each host process to allocate these placeholder pages and use them for all resources in that process. Implementations **may** allocate more often (per instance, per device, or per resource).

**Binding Memory**

The byte size reported in `VkMemoryRequirements::size` **must** be greater than or equal to the amount of physical memory **required** to fully populate the resource. Some implementations
require “holes” in the device virtual address range that are never accessed. These holes may be included in the size reported for the resource.

Including or not including the device virtual address holes in the resource size will alter how the implementation provides support for VkSparseImageOpaqueMemoryBindInfo. This operation must be supported for all sparse images, even ones created with VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.

- If the holes are included in the size, this bind function becomes very easy. In most cases the resourceOffset is simply a device virtual address offset and the implementation can easily determine what device virtual address to bind. The cost is that the application may allocate more physical memory for the resource than it needs.

- If the holes are not included in the size, the application can allocate less physical memory than otherwise for the resource. However, in this case the implementation must account for the holes when mapping resourceOffset to the actual device virtual address intended to be mapped.

**Note**

If the application always uses VkSparseImageMemoryBindInfo to bind memory for the non-tail mip levels, any holes that are present in the resource size may never be bound.

Since VkSparseImageMemoryBindInfo uses texel locations to determine which device virtual addresses to bind, it is impossible to bind device virtual address holes with this operation.

**Binding Metadata Memory**

All metadata for sparse images have their own sparse properties and are embedded in the mip tail region for said properties. See the Multiaspect section for details.

Given that metadata is in a mip tail region, and the mip tail region must be reported as contiguous (either globally or per-array-layer), some implementations will have to resort to complicated offset → device virtual address mapping for handling VkSparseImageOpaqueMemoryBindInfo.

To make this easier on the implementation, the VK_SPARSE_MEMORY_BIND_METADATA_BIT explicitly specifies when metadata is bound with VkSparseImageOpaqueMemoryBindInfo. When this flag is not present, the resourceOffset may be treated as a strict device virtual address offset.

When VK_SPARSE_MEMORY_BIND_METADATA_BIT is present, the resourceOffset must have been derived explicitly from the imageMipTailOffset in the sparse resource properties returned for the metadata aspect. By manipulating the value returned for imageMipTailOffset, the resourceOffset does not have to correlate directly to a device virtual address offset, and may instead be whatever value makes it easiest for the implementation to derive the correct device virtual address.
33.7. Sparse Resource API

The APIs related to sparse resources are grouped into the following categories:

- Physical Device Features
- Physical Device Sparse Properties
- Sparse Image Format Properties
- Sparse Resource Creation
- Sparse Resource Memory Requirements
- Binding Resource Memory

33.7.1. Physical Device Features

Some sparse-resource related features are reported and enabled in VkPhysicalDeviceFeatures. These features must be supported and enabled on the VkDevice object before applications can use them. See Physical Device Features for information on how to get and set enabled device features, and for more detailed explanations of these features.

Sparse Physical Device Features

- **sparseBinding**: Support for creating VkBuffer and VkImage objects with the VK_BUFFER_CREATE_SPARSE_BINDING_BIT and VK_IMAGE_CREATE_SPARSE_BINDING_BIT flags, respectively.
- **sparseResidencyBuffer**: Support for creating VkBuffer objects with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag.
- **sparseResidencyImage2D**: Support for creating 2D single-sampled VkImage objects with VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
- **sparseResidencyImage3D**: Support for creating 3D VkImage objects with VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
- **sparseResidency2Samples**: Support for creating 2D VkImage objects with 2 samples and VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
- **sparseResidency4Samples**: Support for creating 2D VkImage objects with 4 samples and VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
- **sparseResidency8Samples**: Support for creating 2D VkImage objects with 8 samples and VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
- **sparseResidency16Samples**: Support for creating 2D VkImage objects with 16 samples and VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
- **sparseResidencyAliased**: Support for creating VkBuffer and VkImage objects with the VK_BUFFER_CREATE_SPARSE_ALIASED_BIT and VK_IMAGE_CREATE_SPARSE_ALIASED_BIT flags, respectively.

33.7.2. Physical Device Sparse Properties

Some features of the implementation are not possible to disable, and are reported to allow applications to alter their sparse resource usage accordingly. These read-only capabilities are...
reported in the `VkPhysicalDeviceProperties::sparseProperties` member, which is a `VkPhysicalDeviceSparseProperties` structure.

The `VkPhysicalDeviceSparseProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPhysicalDeviceSparseProperties {
    VkBool32 residencyStandard2DBlockShape;
    VkBool32 residencyStandard2DMultisampleBlockShape;
    VkBool32 residencyStandard3DBlockShape;
    VkBool32 residencyAlignedMipSize;
    VkBool32 residencyNonResidentStrict;
} VkPhysicalDeviceSparseProperties;
```

- `residencyStandard2DBlockShape` is `VK_TRUE` if the physical device will access all single-sample 2D sparse resources using the standard sparse image block shapes (based on image format), as described in the Standard Sparse Image Block Shapes (Single Sample) table. If this property is not supported, the value returned in the `imageGranularity` member of the `VkSparseImageFormatProperties` structure for single-sample 2D images is not required to match the standard sparse image block dimensions listed in the table.

- `residencyStandard2DMultisampleBlockShape` is `VK_TRUE` if the physical device will access all multisample 2D sparse resources using the standard sparse image block shapes (based on image format), as described in the Standard Sparse Image Block Shapes (MSAA) table. If this property is not supported, the value returned in the `imageGranularity` member of the `VkSparseImageFormatProperties` structure for multisample 2D images is not required to match the standard sparse image block dimensions listed in the table.

- `residencyStandard3DBlockShape` is `VK_TRUE` if the physical device will access all 3D sparse resources using the standard sparse image block shapes (based on image format), as described in the Standard Sparse Image Block Shapes (Single Sample) table. If this property is not supported, the value returned in the `imageGranularity` member of the `VkSparseImageFormatProperties` structure for 3D images is not required to match the standard sparse image block dimensions listed in the table.

- `residencyAlignedMipSize` is `VK_TRUE` if images with mip level dimensions that are not integer multiples of the corresponding dimensions of the sparse image block may be placed in the mip tail. If this property is not reported, only mip levels with dimensions smaller than the `imageGranularity` member of the `VkSparseImageFormatProperties` structure will be placed in the mip tail. If this property is reported the implementation is allowed to return `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` in the `flags` member of `VkSparseImageFormatProperties`, indicating that mip level dimensions that are not integer multiples of the corresponding dimensions of the sparse image block will be placed in the mip tail.

- `residencyNonResidentStrict` specifies whether the physical device can consistently access non-resident regions of a resource. If this property is `VK_TRUE`, access to non-resident regions of resources will be guaranteed to return values as if the resource was populated with 0; writes to non-resident regions will be discarded.
33.7.3. Sparse Image Format Properties

Given that certain aspects of sparse image support, including the sparse image block dimensions, may be implementation-dependent, `vkGetPhysicalDeviceSparseImageFormatProperties` can be used to query for sparse image format properties prior to resource creation. This command is used to check whether a given set of sparse image parameters is supported and what the sparse image block shape will be.

Sparse Image Format Properties API

The `VkSparseImageFormatProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageFormatProperties {
    VkImageAspectFlags aspectMask;
    VkExtent3D imageGranularity;
    VkSparseImageFormatFlags flags;
} VkSparseImageFormatProperties;
```

- `aspectMask` is a bitmask `VkImageAspectFlagBits` specifying which aspects of the image the properties apply to.
- `imageGranularity` is the width, height, and depth of the sparse image block in texels or compressed texel blocks.
- `flags` is a bitmask of `VkSparseImageFormatFlagBits` specifying additional information about the sparse resource.

Bits which may be set in `VkSparseImageFormatProperties::flags`, specifying additional information about the sparse resource, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSparseImageFormatFlagBits {
    VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT = 0x00000001,
    VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT = 0x00000002,
    VK_SPARSE_IMAGE_FORMAT_NONSTANDARD_BLOCK_SIZE_BIT = 0x00000004,
} VkSparseImageFormatFlagBits;
```

- `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` specifies that the image uses a single mip tail region for all array layers.
- `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` specifies that the first mip level whose dimensions are not integer multiples of the corresponding dimensions of the sparse image block begins the mip tail region.
- `VK_SPARSE_IMAGE_FORMAT_NONSTANDARD_BLOCK_SIZE_BIT` specifies that the image uses non-standard sparse image block dimensions, and the `imageGranularity` values do not match the standard sparse image block dimensions for the given format.
**VkSparseImageFormatFlags** is a bitmask type for setting a mask of zero or more

**VkSparseImageFormatFlagBits**.

**vkGetPhysicalDeviceSparseImageFormatProperties** returns an array of

**VkSparseImageFormatProperties**. Each element will describe properties for one set of image aspects that are bound simultaneously in the image. This is usually one element for each aspect in the image, but for interleaved depth/stencil images there is only one element describing the combined aspects.

```c
// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceSparseImageFormatProperties(
    VkPhysicalDevice physicalDevice,
    VkFormat format,
    VkImageType type,
    VkSampleCountFlagBits samples,
    VkImageUsageFlags usage,
    VkImageTiling tiling,
    uint32_t* pPropertyCount,
    VkSparseImageFormatProperties* pProperties);
```

- **physicalDevice** is the physical device from which to query the sparse image format properties.
- **format** is the image format.
- **type** is the dimensionality of image.
- **samples** is a **VkSampleCountFlagBits** value specifying the number of samples per texel.
- **usage** is a bitmask describing the intended usage of the image.
- **tiling** is the tiling arrangement of the texel blocks in memory.
- **pPropertyCount** is a pointer to an integer related to the number of sparse format properties available or queried, as described below.
- **pProperties** is either **NULL** or a pointer to an array of **VkSparseImageFormatProperties** structures.

If **pProperties** is **NULL**, then the number of sparse format properties available is returned in **pPropertyCount**. Otherwise, **pPropertyCount** must point to a variable set by the user to the number of elements in the **pProperties** array, and on return the variable is overwritten with the number of structures actually written to **pProperties**. If **pPropertyCount** is less than the number of sparse format properties available, at most **pPropertyCount** structures will be written.

If **VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT** is not supported for the given arguments, **pPropertyCount** will be set to zero upon return, and no data will be written to **pProperties**.

Multiple aspects are returned for depth/stencil images that are implemented as separate planes by the implementation. The depth and stencil data planes each have unique
VkSparseImageFormatProperties data.

Depth/stencil images with depth and stencil data interleaved into a single plane will return a single VkSparseImageFormatProperties structure with the aspectMask set to VK_IMAGE_ASPECT_DEPTH_BIT | VK_IMAGE_ASPECT_STENCIL_BIT.

**Valid Usage**

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-samples-01094 samples must be a bit value that is set in VkImageFormatProperties::sampleCounts returned by vkGetPhysicalDeviceImageFormatProperties with format, type, tiling, and usage equal to those in this command and flags equal to the value that is set in VkImageCreateInfo ::flags when the image is created

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-physicalDevice-parameter physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-format-parameter format must be a valid VkFormat value
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-type-parameter type must be a valid VkImageType value
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-samples-parameter samples must be a valid VkSampleCountFlagBits value
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-usage-parameter usage must be a valid combination of VkImageUsageFlagBits values
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-usage-requiredbitmask usage must not be 0
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-tiling-parameter tiling must be a valid VkImageTiling value
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-pPropertyCount-parameter pPropertyCount must be a valid pointer to a uint32_t value
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-pProperties-parameter If the value referenced by pPropertyCount is not 0, and pProperties is not NULL, pProperties must be a valid pointer to an array of pPropertyCount VkSparseImageFormatProperties structures

vkGetPhysicalDeviceSparseImageFormatProperties2 returns an array of VkSparseImageFormatProperties2. Each element will describe properties for one set of image aspects that are bound simultaneously in the image. This is usually one element for each aspect in the image, but for interleaved depth/stencil images there is only one element describing the combined aspects.
or the equivalent command

```c
void vkGetPhysicalDeviceSparseImageFormatProperties2KHR(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceSparseImageFormatInfo2* pFormatInfo,
    uint32_t* pPropertyCount,
    VkSparseImageFormatProperties2* pProperties);
```

- `physicalDevice` is the physical device from which to query the sparse image format properties.
- `pFormatInfo` is a pointer to a `VkPhysicalDeviceSparseImageFormatInfo2` structure containing input parameters to the command.
- `pPropertyCount` is a pointer to an integer related to the number of sparse format properties available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkSparseImageFormatProperties2` structures.

`vkGetPhysicalDeviceSparseImageFormatProperties2` behaves identically to `vkGetPhysicalDeviceSparseImageFormatProperties`, with the ability to return extended information by adding extending structures to the `pNext` chain of its `pProperties` parameter.

### Valid Usage (Implicit)

- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-physicalDevice-parameter** physicalDevice must be a valid `VkPhysicalDevice` handle
- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-pFormatInfo-parameter** `pFormatInfo` must be a valid pointer to a valid `VkPhysicalDeviceSparseImageFormatInfo2` structure
- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-pPropertyCount-parameter** `pPropertyCount` must be a valid pointer to a `uint32_t` value
- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-pProperties-parameter** If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkSparseImageFormatProperties2` structures

The `VkPhysicalDeviceSparseImageFormatInfo2` structure is defined as:
// Provided by VK_VERSION_1_1

typedef struct VkPhysicalDeviceSparseImageFormatInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkFormat format;
    VkImageType type;
    VkSampleCountFlagBits samples;
    VkImageUsageFlags usage;
    VkImageTiling tiling;
} VkPhysicalDeviceSparseImageFormatInfo2;

or the equivalent

// Provided by VK_KHR_get_physical_device_properties2

typedef VkPhysicalDeviceSparseImageFormatInfo2 VkPhysicalDeviceSparseImageFormatInfo2KHR;

• **sType** is a *VkStructureType* value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **format** is the image format.

• **type** is the dimensionality of image.

• **samples** is a *VkSampleCountFlagBits* value specifying the number of samples per texel.

• **usage** is a bitmask describing the intended usage of the image.

• **tiling** is the tiling arrangement of the texel blocks in memory.

**Valid Usage**

• VUID-VkPhysicalDeviceSparseImageFormatInfo2-samples-01095 samples must be a bit value that is set in *VkImageFormatProperties::sampleCounts* returned by *vkGetPhysicalDeviceImageFormatProperties* with format, type, tiling, and usage equal to those in this command and flags equal to the value that is set in *VkImageCreateInfo::flags* when the image is created.

**Valid Usage (Implicit)**

• VUID-VkPhysicalDeviceSparseImageFormatInfo2-sType-sType sType must be *VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SPARSE_IMAGE_FORMAT_INFO_2*

• VUID-VkPhysicalDeviceSparseImageFormatInfo2-pNext-pNext pNext must be NULL

• VUID-VkPhysicalDeviceSparseImageFormatInfo2-format-parameter format must be a valid *VkFormat* value

• VUID-VkPhysicalDeviceSparseImageFormatInfo2-type-parameter
**type** must be a valid *VkImageType* value

- **VUID-VkPhysicalDeviceSparseImageFormatInfo2-samples-parameter**
  **samples** must be a valid *VkSampleCountFlagBits* value

- **VUID-VkPhysicalDeviceSparseImageFormatInfo2-usage-parameter**
  **usage** must be a valid combination of *VkImageUsageFlagBits* values

- **VUID-VkPhysicalDeviceSparseImageFormatInfo2-usage-requiredbitmask**
  **usage** must not be 0

- **VUID-VkPhysicalDeviceSparseImageFormatInfo2-tiling-parameter**
  **tiling** must be a valid *VkImageTiling* value

The **VkSparseImageFormatProperties2** structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkSparseImageFormatProperties2 {
  VkStructureType sType;
  void* pNext;
  VkSparseImageFormatProperties properties;
} VkSparseImageFormatProperties2;
```

or the equivalent

```c
// Provided by VK_KHR_get_physical_device_properties2
typedef VkSparseImageFormatProperties2 VkSparseImageFormatProperties2KHR;
```

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **properties** is a **VkSparseImageFormatProperties** structure which is populated with the same values as in **vkGetPhysicalDeviceSparseImageFormatProperties**.

### Valid Usage (Implicit)

- **VUID-VkSparseImageFormatProperties2-sType-sType**
  **sType** must be **VK_STRUCTURE_TYPE_SPARSE_IMAGE_FORMAT_PROPERTIES_2**

- **VUID-VkSparseImageFormatProperties2-pNext-pNext**
  **pNext** must be **NULL**

### 33.7.4. Sparse Resource Creation

Sparse resources require that one or more sparse feature flags be specified (as part of the **VkPhysicalDeviceFeatures** structure described previously in the **Physical Device Features** section) when calling **vkCreateDevice**. When the appropriate device features are enabled, the **VK_BUFFER_CREATE_SPARSE_** and **VK_IMAGE_CREATE_SPARSE_** flags can be used. See **vkCreateBuffer** and
vkCreateImage for details of the resource creation APIs.

Note
Specifying VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT or VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT requires specifying VK_BUFFER_CREATE_SPARSE_BINDING_BIT or VK_IMAGE_CREATE_SPARSE_BINDING_BIT, respectively, as well. This means that resources must be created with the appropriate *_SPARSE_BINDING_BIT to be used with the sparse binding command (vkQueueBindSparse).

33.7.5. Sparse Resource Memory Requirements

Sparse resources have specific memory requirements related to binding sparse memory. These memory requirements are reported differently for VkBuffer objects and VkImage objects.

Buffer and Fully-Resident Images

Buffers (both fully and partially resident) and fully-resident images can be bound to memory using only the data from VkMemoryRequirements. For all sparse resources the VkMemoryRequirements::alignment member specifies both the bindable sparse block size in bytes and required alignment of VkDeviceMemory.

Partially Resident Images

Partially resident images have a different method for binding memory. As with buffers and fully resident images, the VkMemoryRequirements::alignment field specifies the bindable sparse block size in bytes for the image.

Requesting sparse memory requirements for VkImage objects using vkGetImageSparseMemoryRequirements will return an array of one or more VkSparseImageMemoryRequirements structures. Each structure describes the sparse memory requirements for a group of aspects of the image.

The sparse image must have been created using the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag to retrieve valid sparse image memory requirements.

Sparse Image Memory Requirements

The VkSparseImageMemoryRequirements structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageMemoryRequirements {
    VkSparseImageFormatProperties formatProperties;
    uint32_t imageMipTailFirstLod;
    VkDeviceSize imageMipTailSize;
    VkDeviceSize imageMipTailOffset;
    VkDeviceSize imageMipTailStride;
} VkSparseImageMemoryRequirements;
```
- `formatProperties` is a `VkSparseImageFormatProperties` structure specifying properties of the image format.

- `imageMipTailFirstLod` is the first mip level at which image subresources are included in the mip tail region.

- `imageMipTailSize` is the memory size (in bytes) of the mip tail region. If `formatProperties.flags` contains `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT`, this is the size of the whole mip tail, otherwise this is the size of the mip tail of a single array layer. This value is guaranteed to be a multiple of the sparse block size in bytes.

- `imageMipTailOffset` is the opaque memory offset used with `VkSparseImageOpaqueMemoryBindInfo` to bind the mip tail region(s).

- `imageMipTailStride` is the offset stride between each array-layer’s mip tail, if `formatProperties.flags` does not contain `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` (otherwise the value is undefined).

To query sparse memory requirements for an image, call:

```c
// Provided by VK_VERSION_1_0
void vkGetImageSparseMemoryRequirements(
    VkDevice device,
    VkImage image,
    uint32_t* pSparseMemoryRequirementCount,  // pSparseMemoryRequirementCount is a pointer to an integer related to the number of sparse memory requirements available or queried, as described below.
    VkSparseImageMemoryRequirements* pSparseMemoryRequirements,  // pSparseMemoryRequirements is either NULL or a pointer to an array of VkSparseImageMemoryRequirements structures.
);
```

- `device` is the logical device that owns the image.

- `image` is the `VkImage` object to get the memory requirements for.

- `pSparseMemoryRequirementCount` is a pointer to an integer related to the number of sparse memory requirements available or queried, as described below.

- `pSparseMemoryRequirements` is either `NULL` or a pointer to an array of `VkSparseImageMemoryRequirements` structures.

If `pSparseMemoryRequirements` is `NULL`, then the number of sparse memory requirements available is returned in `pSparseMemoryRequirementCount`. Otherwise, `pSparseMemoryRequirementCount` must point to a variable set by the user to the number of elements in the `pSparseMemoryRequirements` array, and on return the variable is overwritten with the number of structures actually written to `pSparseMemoryRequirements`. If `pSparseMemoryRequirementCount` is less than the number of sparse memory requirements available, at most `pSparseMemoryRequirementCount` structures will be written.

If the image was not created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` then `pSparseMemoryRequirementCount` will be set to zero and `pSparseMemoryRequirements` will not be written to.

**Note**

It is legal for an implementation to report a larger value in `VkMemoryRequirements::size` than would be obtained by adding together memory sizes for all `VkSparseImageMemoryRequirements` returned by `vkGetImageSparseMemoryRequirements`. 

2810
This may occur when the implementation requires unused padding in the address range describing the resource.

Valid Usage (Implicit)

- VUID-vkGetImageSparseMemoryRequirements-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetImageSparseMemoryRequirements-image-parameter
  image must be a valid VkImage handle

- VUID-vkGetImageSparseMemoryRequirements-pSparseMemoryRequirementCount-parameter
  pSparseMemoryRequirementCount must be a valid pointer to a uint32_t value

- VUID-vkGetImageSparseMemoryRequirements-pSparseMemoryRequirements-parameter
  If the value referenced by pSparseMemoryRequirementCount is not 0, and pSparseMemoryRequirements is not NULL, pSparseMemoryRequirements must be a valid pointer to an array of pSparseMemoryRequirementCount VkSparseImageMemoryRequirements structures

- VUID-vkGetImageSparseMemoryRequirements-image-parent
  image must have been created, allocated, or retrieved from device

To query sparse memory requirements for an image, call:

```c
// Provided by VK_VERSION_1_1
void vkGetImageSparseMemoryRequirements2(
  VkDevice device,
  const VkImageSparseMemoryRequirementsInfo2* pInfo,
  uint32_t* pSparseMemoryRequirementCount,
  VkSparseImageMemoryRequirements2* pSparseMemoryRequirements);
```

or the equivalent command

```c
// Provided by VK_KHR_get_memory_requirements2
void vkGetImageSparseMemoryRequirements2KHR(
  VkDevice device,
  const VkImageSparseMemoryRequirementsInfo2* pInfo,
  uint32_t* pSparseMemoryRequirementCount,
  VkSparseImageMemoryRequirements2* pSparseMemoryRequirements);
```

- device is the logical device that owns the image.
- pInfo is a pointer to a VkImageSparseMemoryRequirementsInfo2 structure containing parameters required for the memory requirements query.
- pSparseMemoryRequirementCount is a pointer to an integer related to the number of sparse memory requirements available or queried, as described below.
• `pSparseMemoryRequirements` is either NULL or a pointer to an array of `VkSparseImageMemoryRequirements2` structures.

## Valid Usage (Implicit)

- VUID-vkGetImageSparseMemoryRequirements2-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkGetImageSparseMemoryRequirements2-pInfo-parameter
  `pInfo` must be a valid pointer to a valid `VkImageSparseMemoryRequirementsInfo2` structure

- VUID-vkGetImageSparseMemoryRequirements2-pSparseMemoryRequirementCount-parameter
  `pSparseMemoryRequirementCount` must be a valid pointer to a `uint32_t` value

- VUID-vkGetImageSparseMemoryRequirements2-pSparseMemoryRequirements-parameter
  If the value referenced by `pSparseMemoryRequirementCount` is not 0, and `pSparseMemoryRequirements` is not NULL, `pSparseMemoryRequirements` must be a valid pointer to an array of `pSparseMemoryRequirementCount` `VkSparseImageMemoryRequirements2` structures

To determine the sparse memory requirements for an image resource without creating an object, call:

```c
// Provided by VK_VERSION_1_3
void vkGetDeviceImageSparseMemoryRequirements(
    VkDevice device,
    const VkDeviceImageMemoryRequirements* pInfo,
    uint32_t* pSparseMemoryRequirementCount,
    VkSparseImageMemoryRequirements2* pSparseMemoryRequirements);
```

or the equivalent command

```c
// Provided by VK_KHR_maintenance4
void vkGetDeviceImageSparseMemoryRequirementsKHR(
    VkDevice device,
    const VkDeviceImageMemoryRequirements* pInfo,
    uint32_t* pSparseMemoryRequirementCount,
    VkSparseImageMemoryRequirements2* pSparseMemoryRequirements);
```

- `device` is the logical device intended to own the image.
- `pInfo` is a pointer to a `VkDeviceImageMemoryRequirements` structure containing parameters required for the memory requirements query.
- `pSparseMemoryRequirementCount` is a pointer to an integer related to the number of sparse memory requirements available or queried, as described below.
pSparseMemoryRequirements is either NULL or a pointer to an array of VkSparseImageMemoryRequirements2 structures.

Valid Usage (Implicit)

- VUID-vkGetDeviceImageSparseMemoryRequirements-device-parameter device must be a valid VkDevice handle
- VUID-vkGetDeviceImageSparseMemoryRequirements-pInfo-parameter pInfo must be a valid pointer to a valid VkDeviceImageMemoryRequirements structure
- VUID-vkGetDeviceImageSparseMemoryRequirements-pSparseMemoryRequirementCount-parameter pSparseMemoryRequirementCount must be a valid pointer to a uint32_t value
- VUID-vkGetDeviceImageSparseMemoryRequirements-pSparseMemoryRequirements- parameter If the value referenced by pSparseMemoryRequirementCount is not 0, and pSparseMemoryRequirements is not NULL, pSparseMemoryRequirements must be a valid pointer to an array of pSparseMemoryRequirementCount VkSparseImageMemoryRequirements2 structures

The VkImageSparseMemoryRequirementsInfo2 structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkImageSparseMemoryRequirementsInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkImage image;
} VkImageSparseMemoryRequirementsInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_get_memory_requirements2
typedef VkImageSparseMemoryRequirementsInfo2 VkImageSparseMemoryRequirementsInfo2KHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- image is the image to query.

Valid Usage (Implicit)

- VUID-VkImageSparseMemoryRequirementsInfo2-sType-sType sType must be VK_STRUCTURE_TYPE_IMAGE_SPARSE_MEMORY_REQUIREMENTS_INFO_2
- VUID-VkImageSparseMemoryRequirementsInfo2-pNext-pNext pNext must be NULL
The `VkSparseImageMemoryRequirements2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkSparseImageMemoryRequirements2 {
    VkStructureType sType;
    void* pNext;
    VkSparseImageMemoryRequirements memoryRequirements;
} VkSparseImageMemoryRequirements2;
```

or the equivalent

```c
// Provided by VK_KHR_get_memory_requirements2
typedef VkSparseImageMemoryRequirements2 VkSparseImageMemoryRequirements2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memoryRequirements` is a `VkSparseImageMemoryRequirements` structure describing the memory requirements of the sparse image.

### Valid Usage (Implicit)

- `VUID-VkSparseImageMemoryRequirements2-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_SPARSE_IMAGE_MEMORY_REQUIREMENTS_2`
- `VUID-VkSparseImageMemoryRequirements2-pNext-pNext`  
  `pNext` must be `NULL`

### 33.7.6. Binding Resource Memory

Non-sparse resources are backed by a single physical allocation prior to device use (via `vkBindImageMemory` or `vkBindBufferMemory`), and their backing must not be changed. On the other hand, sparse resources can be bound to memory non-contiguously and these bindings can be altered during the lifetime of the resource.

> **Note**
> It is important to note that freeing a `VkDeviceMemory` object with `vkFreeMemory` will not cause resources (or resource regions) bound to the memory object to become unbound. Applications must not access resources bound to memory that has been freed.

Sparse memory bindings execute on a queue that includes the `VK_QUEUE_SPARSE_BINDING_BIT` bit.
Applications **must** use synchronization primitives to guarantee that other queues do not access ranges of memory concurrently with a binding change. Applications **can** access other ranges of the same resource while a bind operation is executing.

**Note**

Implementations **must** provide a guarantee that simultaneously binding sparse blocks while another queue accesses those same sparse blocks via a sparse resource **must** not access memory owned by another process or otherwise corrupt the system.

While some implementations **may** include `VK_QUEUE_SPARSE_BINDING_BIT` support in queue families that also include graphics and compute support, other implementations **may** only expose a `VK_QUEUE_SPARSE_BINDING_BIT`-only queue family. In either case, applications **must** use synchronization primitives to explicitly request any ordering dependencies between sparse memory binding operations and other graphics/compute/transfer operations, as sparse binding operations are not automatically ordered against command buffer execution, even within a single queue.

When binding memory explicitly for the `VK_IMAGE_ASPECT_METADATA_BIT` the application **must** use the `VK_SPARSE_MEMORY_BIND_METADATA_BIT` in the `VkSparseMemoryBind::flags` field when binding memory. Binding memory for metadata is done the same way as binding memory for the mip tail, with the addition of the `VK_SPARSE_MEMORY_BIND_METADATA_BIT` flag.

Binding the mip tail for any aspect **must** only be performed using `VkSparseImageOpaqueMemoryBindInfo`. If `formatProperties.flags` contains `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT`, then it **can** be bound with a single `VkSparseMemoryBind` structure, with `resourceOffset = imageMipTailOffset` and `size = imageMipTailSize`.

If `formatProperties.flags` does not contain `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` then the offset for the mip tail in each array layer is given as:

\[
\text{arrayMipTailOffset} = \text{imageMipTailOffset} + \text{arrayLayer} \times \text{imageMipTailStride};
\]

and the mip tail **can** be bound with `layerCount` `VkSparseMemoryBind` structures, each using `size = imageMipTailSize` and `resourceOffset = arrayMipTailOffset` as defined above.

Sparse memory binding is handled by the following APIs and related data structures.

**Sparse Memory Binding Functions**

The `VkSparseMemoryBind` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSparseMemoryBind {
    VkDeviceSize resourceOffset;
    VkDeviceSize size;
    VkDeviceMemory memory;
} VkSparseMemoryBind;
```
VkDeviceSize memoryOffset;
VkSparseMemoryBindFlags flags;
} VkSparseMemoryBind;

- **resourceOffset** is the offset into the resource.
- **size** is the size of the memory region to be bound.
- **memory** is the `VkDeviceMemory` object that the range of the resource is bound to. If `memory` is `VK_NULL_HANDLE`, the range is unbound.
- **memoryOffset** is the offset into the `VkDeviceMemory` object to bind the resource range to. If `memory` is `VK_NULL_HANDLE`, this value is ignored.
- **flags** is a bitmask of `VkSparseMemoryBindFlagBits` specifying usage of the binding operation.

The **binding range** \([\text{resourceOffset}, \text{resourceOffset} + \text{size})\) has different constraints based on **flags**. If **flags** contains `VK_SPARSE_MEMORY_BIND_METADATA_BIT`, the binding range **must** be within the mip tail region of the metadata aspect. This metadata region is defined by:

\[
\text{metadataRegion} = [\text{base}, \text{base} + \text{imageMipTailSize})
\]

\[
\text{base} = \text{imageMipTailOffset} + \text{imageMipTailStride} \times n
\]

and **imageMipTailOffset**, **imageMipTailSize**, and **imageMipTailStride** values are from the `VkSparseImageMemoryRequirements` corresponding to the metadata aspect of the image, and **n** is a valid array layer index for the image,

**imageMipTailStride** is considered to be zero for aspects where `VkSparseImageMemoryRequirements::formatProperties.flags` contains `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT`.

If **flags** does not contain `VK_SPARSE_MEMORY_BIND_METADATA_BIT`, the binding range **must** be within the range \([0, \text{VkMemoryRequirements::size})\).

### Valid Usage

- **VUID-VkSparseMemoryBind-memory-01096**
  - If `memory` is not `VK_NULL_HANDLE`, `memory` and `memoryOffset` **must** match the memory requirements of the resource, as described in section **Resource Memory Association**
- **VUID-VkSparseMemoryBind-memory-01097**
  - If `memory` is not `VK_NULL_HANDLE`, `memory` **must** not have been created with a memory type that reports `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT` bit set
- **VUID-VkSparseMemoryBind-size-01098**
  - **size** **must** be greater than 0
- **VUID-VkSparseMemoryBind-resourceOffset-01099**
  - **resourceOffset** **must** be less than the size of the resource
- **VUID-VkSparseMemoryBind-size-01100**
size must be less than or equal to the size of the resource minus resourceOffset

- VUID-VkSparseMemoryBind-memoryOffset-01101
  memoryOffset must be less than the size of memory

- VUID-VkSparseMemoryBind-size-01102
  size must be less than or equal to the size of memory minus memoryOffset

- VUID-VkSparseMemoryBind-memory-02730
  If memory was created with VkExportMemoryAllocateInfo::handleTypes not equal to 0, at least one handle type it contained must also have been set in VkExternalMemoryBufferCreateInfo::handleTypes or VkExternalMemoryImageCreateInfo::handleTypes when the resource was created

- VUID-VkSparseMemoryBind-memory-02731
  If memory was created by a memory import operation, the external handle type of the imported memory must also have been set in VkExternalMemoryBufferCreateInfo::handleTypes or VkExternalMemoryImageCreateInfo::handleTypes when the resource was created

Valid Usage (Implicit)

- VUID-VkSparseMemoryBind-memory-parameter
  If memory is not VK_NULL_HANDLE, memory must be a valid VkDeviceMemory handle

- VUID-VkSparseMemoryBind-flags-parameter
  flags must be a valid combination of VkSparseMemoryBindFlagBits values

Bits which can be set in VkSparseMemoryBind::flags, specifying usage of a sparse memory binding operation, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSparseMemoryBindFlagBits {
    VK_SPARSE_MEMORY_BIND_METADATA_BIT = 0x00000001,
} VkSparseMemoryBindFlagBits;
```

- VK_SPARSE_MEMORY_BIND_METADATA_BIT specifies that the memory being bound is only for the metadata aspect.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkSparseMemoryBindFlags;
```

VkSparseMemoryBindFlags is a bitmask type for setting a mask of zero or more VkSparseMemoryBindFlagBits.

Memory is bound to VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_BINDING_BIT flag using the following structure:
typedef struct VkSparseBufferMemoryBindInfo {
    VkBuffer buffer;
    uint32_t bindCount;
    const VkSparseMemoryBind* pBinds;
} VkSparseBufferMemoryBindInfo;

- **buffer** is the VkBuffer object to be bound.
- **bindCount** is the number of VkSparseMemoryBind structures in the pBinds array.
- **pBinds** is a pointer to an array of VkSparseMemoryBind structures.

Valid Usage (Implicit)

- VUID-VkSparseBufferMemoryBindInfo-buffer-parameter buffer must be a valid VkBuffer handle
- VUID-VkSparseBufferMemoryBindInfo-pBinds-parameter pBinds must be a valid pointer to an array of bindCount valid VkSparseMemoryBind structures
- VUID-VkSparseBufferMemoryBindInfo-bindCount-arraylength bindCount must be greater than 0

Memory is bound to opaque regions of VkImage objects created with the VK_IMAGE_CREATE_SPARSE_BINDING_BIT flag using the following structure:

typedef struct VkSparseImageOpaqueMemoryBindInfo {
    VkImage image;
    uint32_t bindCount;
    const VkSparseMemoryBind* pBinds;
} VkSparseImageOpaqueMemoryBindInfo;

- **image** is the VkImage object to be bound.
- **bindCount** is the number of VkSparseMemoryBind structures in the pBinds array.
- **pBinds** is a pointer to an array of VkSparseMemoryBind structures.

Valid Usage

- VUID-VkSparseImageOpaqueMemoryBindInfo-pBinds-01103 If the flags member of any element of pBinds contains VK_SPARSE_MEMORY_BIND_METADATA_BIT, the binding range defined must be within the mip tail region of the metadata aspect of image
Valid Usage (Implicit)

- VUID-VkSparseImageOpaqueMemoryBindInfo-image-parameter
  image must be a valid VkImage handle

- VUID-VkSparseImageOpaqueMemoryBindInfo-pBinds-parameter
  pBinds must be a valid pointer to an array of bindCount valid VkSparseMemoryBind structures

- VUID-VkSparseImageOpaqueMemoryBindInfo-bindCount-arraylength
  bindCount must be greater than 0

Note

This operation is normally used to bind memory to fully-resident sparse images or for mip tail regions of partially resident images. However, it can also be used to bind memory for the entire binding range of partially resident images.

In case flags does not contain VK_SPARSE_MEMORY_BIND_METADATA_BIT, the resourceOffset is in the range [0, VkMemoryRequirements::size), This range includes data from all aspects of the image, including metadata. For most implementations this will probably mean that the resourceOffset is a simple device address offset within the resource. It is possible for an application to bind a range of memory that includes both resource data and metadata. However, the application would not know what part of the image the memory is used for, or if any range is being used for metadata.

When flags contains VK_SPARSE_MEMORY_BIND_METADATA_BIT, the binding range specified must be within the mip tail region of the metadata aspect. In this case the resourceOffset is not required to be a simple device address offset within the resource. However, it is defined to be within [imageMipTailOffset, imageMipTailOffset + imageMipTailSize) for the metadata aspect. See VkSparseMemoryBind for the full constraints on binding region with this flag present.

Memory can be bound to sparse image blocks of VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag using the following structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageMemoryBindInfo {
    VkImage image;
    uint32_t bindCount;
    const VkSparseImageMemoryBind* pBinds;
} VkSparseImageMemoryBindInfo;
```

- image is the VkImage object to be bound
- bindCount is the number of VkSparseImageMemoryBind structures in pBinds array
• \textit{pBinds} is a pointer to an array of \texttt{VkSparseImageMemoryBind} structures

### Valid Usage

- VUID-VkSparseImageMemoryBindInfo-subresource-01722
  The \texttt{subresource.mipLevel} member of each element of \textit{pBinds} \textbf{must} be less than the \texttt{mipLevels} specified in \texttt{VkImageCreateInfo} when \textit{image} was created.

- VUID-VkSparseImageMemoryBindInfo-subresource-01723
  The \texttt{subresource.arrayLayer} member of each element of \textit{pBinds} \textbf{must} be less than the \texttt{arrayLayers} specified in \texttt{VkImageCreateInfo} when \textit{image} was created.

- VUID-VkSparseImageMemoryBindInfo-image-02901
  \textit{image} \textbf{must} have been created with \texttt{VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT} set.

### Valid Usage (Implicit)

- VUID-VkSparseImageMemoryBindInfo-image-parameter
  \textit{image} \textbf{must} be a valid \texttt{VkImage} handle.

- VUID-VkSparseImageMemoryBindInfo-pBinds-parameter
  \textit{pBinds} \textbf{must} be a valid pointer to an array of \texttt{bindCount} valid \texttt{VkSparseImageMemoryBind} structures.

- VUID-VkSparseImageMemoryBindInfo-bindCount-arraylength
  \texttt{bindCount} \textbf{must} be greater than 0.

The \texttt{VkSparseImageMemoryBind} structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageMemoryBind {
    VkImageSubresource subresource;
    VkOffset3D offset;
    VkExtent3D extent;
    VkDeviceMemory memory;
    VkDeviceSize memoryOffset;
    VkSparseMemoryBindFlags flags;
} VkSparseImageMemoryBind;
```

- \texttt{subresource} is the image \textit{aspect} and region of interest in the image.

- \texttt{offset} are the coordinates of the first texel within the image subresource to bind.

- \texttt{extent} is the size in texels of the region within the image subresource to bind. The extent \textbf{must} be a multiple of the sparse image block dimensions, except when binding sparse image blocks along the edge of an image subresource it \textbf{can} instead be such that any coordinate of \texttt{offset + extent} equals the corresponding dimensions of the image subresource.

- \texttt{memory} is the \texttt{VkDeviceMemory} object that the sparse image blocks of the image are bound to. If \texttt{memory} is \texttt{VK_NULL_HANDLE}, the sparse image blocks are unbound.
- `memoryOffset` is an offset into `VkDeviceMemory` object. If `memory` is `VK_NULL_HANDLE`, this value is ignored.

- `flags` are sparse memory binding flags.

## Valid Usage

- **VUID-VkSparseImageMemoryBind-memory-01104**
  If the `sparseResidencyAliased` feature is not enabled, and if any other resources are bound to ranges of `memory`, the range of `memory` being bound **must** not overlap with those bound ranges.

- **VUID-VkSparseImageMemoryBind-memory-01105**
  `memory` and `memoryOffset` **must** match the memory requirements of the calling command’s `image`, as described in section Resource Memory Association.

- **VUID-VkSparseImageMemoryBind-subresource-01106**
  `subresource` **must** be a valid image subresource for `image` (see Image Views).

- **VUID-VkSparseImageMemoryBind-offset-01107**
  `offset.x` **must** be a multiple of the sparse image block width (`VkSparseImageFormatProperties::imageGranularity.width`) of the image.

- **VUID-VkSparseImageMemoryBind-offset-01110**
  `extent.width` **must** either be a multiple of the sparse image block width of the image, or else `(extent.width + offset.x)` **must** equal the width of the image subresource.

- **VUID-VkSparseImageMemoryBind-offset-01109**
  `offset.y` **must** be a multiple of the sparse image block height (`VkSparseImageFormatProperties::imageGranularity.height`) of the image.

- **VUID-VkSparseImageMemoryBind-extent-01110**
  `extent.height` **must** either be a multiple of the sparse image block height of the image, or else `(extent.height + offset.y)` **must** equal the height of the image subresource.

- **VUID-VkSparseImageMemoryBind-offset-01111**
  `offset.z` **must** be a multiple of the sparse image block depth (`VkSparseImageFormatProperties::imageGranularity.depth`) of the image.

- **VUID-VkSparseImageMemoryBind-extent-01112**
  `extent.depth` **must** either be a multiple of the sparse image block depth of the image, or else `(extent.depth + offset.z)` **must** equal the depth of the image subresource.

- **VUID-VkSparseImageMemoryBind-memory-02732**
  If `memory` was created with `VkExportMemoryAllocateInfo::handleTypes` not equal to 0, at least one handle type it contained **must** also have been set in `VkExternalMemoryImageCreateInfo::handleTypes` when the image was created.

- **VUID-VkSparseImageMemoryBind-memory-02733**
  If `memory` was created by a memory import operation, the external handle type of the imported memory **must** also have been set in `VkExternalMemoryImageCreateInfo::handleTypes` when `image` was created.
Valid Usage (Implicit)

- VUID-VkSparseImageMemoryBind-subresource-parameter
  subresource **must** be a valid VkImageSubresource structure

- VUID-VkSparseImageMemoryBind-memory-parameter
  If **memory** is not VK_NULL_HANDLE, **memory** **must** be a valid VkDeviceMemory handle

- VUID-VkSparseImageMemoryBind-flags-parameter
  flags **must** be a valid combination of VkSparseMemoryBindFlagBits values

To submit sparse binding operations to a queue, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkQueueBindSparse(
    VkQueue queue,                          // Provided by VK_VERSION_1_0
    uint32_t bindInfoCount,                 // Provided by VK_VERSION_1_0
    const VkBindSparseInfo* pBindInfo,      // Provided by VK_VERSION_1_0
    VkFence fence);                         // Provided by VK_VERSION_1_0
```

- **queue** is the queue that the sparse binding operations will be submitted to.
- **bindInfoCount** is the number of elements in the **pBindInfo** array.
- **pBindInfo** is a pointer to an array of VkBindSparseInfo structures, each specifying a sparse binding submission batch.
- **fence** is an **optional** handle to a fence to be signaled. If **fence** is not VK_NULL_HANDLE, it defines a fence signal operation.

*vkQueueBindSparse* is a **queue submission command**, with each batch defined by an element of **pBindInfo** as a VkBindSparseInfo structure. Batches begin execution in the order they appear in **pBindInfo**, but may complete out of order.

Within a batch, a given range of a resource **must** not be bound more than once. Across batches, if a range is to be bound to one allocation and offset and then to another allocation and offset, then the application **must** guarantee (usually using semaphores) that the binding operations are executed in the correct order, as well as to order binding operations against the execution of command buffer submissions.

As no operation to *vkQueueBindSparse* causes any pipeline stage to access memory, synchronization primitives used in this command effectively only define execution dependencies.

Additional information about fence and semaphore operation is described in the synchronization chapter.

Valid Usage

- VUID-vkQueueBindSparse-fence-01113
  If **fence** is not VK_NULL_HANDLE, **fence** **must** be unsignaled
• **VUID-vkQueueBindSparse-fence-01114**
  If fence is not VK_NULL_HANDLE, fence **must** not be associated with any other queue command that has not yet completed execution on that queue.

• **VUID-vkQueueBindSparse-pSignalSemaphores-01115**
  Each element of the pSignalSemaphores member of each element of pBindInfo **must** be unsignaled when the semaphore signal operation it defines is executed on the device.

• **VUID-vkQueueBindSparse-pWaitSemaphores-01116**
  When a semaphore wait operation referring to a binary semaphore defined by any element of the pWaitSemaphores member of any element of pBindInfo executes on queue, there **must** be no other queues waiting on the same semaphore.

• **VUID-vkQueueBindSparse-pWaitSemaphores-03245**
  All elements of the pWaitSemaphores member of all elements of pBindInfo created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_BINARY **must** reference a semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends (if any) **must** have also been submitted for execution.

---

**Valid Usage (Implicit)**

• **VUID-vkQueueBindSparse-queue-parameter**
  queue **must** be a valid VkQueue handle.

• **VUID-vkQueueBindSparse-pBindInfo-parameter**
  If bindInfoCount is not 0, pBindInfo **must** be a valid pointer to an array of bindInfoCount valid VkBindSparseInfo structures.

• **VUID-vkQueueBindSparse-fence-parameter**
  If fence is not VK_NULL_HANDLE, fence **must** be a valid VkFence handle.

• **VUID-vkQueueBindSparse-queuetype**
  The queue **must** support sparse binding operations.

• **VUID-vkQueueBindSparse-commonparent**
  Both of fence, and queue that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same VkDevice.

---

**Host Synchronization**

• Host access to queue **must** be externally synchronized.

• Host access to fence **must** be externally synchronized.
Command Properties

<table>

Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST

The `VkBindSparseInfo` structure is defined as:

```c
typedef struct VkBindSparseInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreCount;
    const VkSemaphore* pWaitSemaphores;
    uint32_t bufferBindCount;
    const VkSparseBufferMemoryBindInfo* pBufferBinds;
    uint32_t imageOpaqueBindCount;
    const VkSparseImageOpaqueMemoryBindInfo* pImageOpaqueBinds;
    uint32_t signalSemaphoreCount;
    const VkSemaphore* pSignalSemaphores;
} VkBindSparseInfo;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **waitSemaphoreCount** is the number of semaphores upon which to wait before executing the sparse binding operations for the batch.
- **pWaitSemaphores** is a pointer to an array of semaphores upon which to wait on before the sparse binding operations for this batch begin execution. If semaphores to wait on are provided, they define a semaphore wait operation.
- **bufferBindCount** is the number of sparse buffer bindings to perform in the batch.
- `pBufferBinds` is a pointer to an array of `VkSparseBufferMemoryBindInfo` structures.
- `imageOpaqueBindCount` is the number of opaque sparse image bindings to perform.
- `pImageOpaqueBinds` is a pointer to an array of `VkSparseImageOpaqueMemoryBindInfo` structures, indicating opaque sparse image bindings to perform.
- `imageBindCount` is the number of sparse image bindings to perform.
- `pImageBinds` is a pointer to an array of `VkSparseImageMemoryBindInfo` structures, indicating sparse image bindings to perform.
- `signalSemaphoreCount` is the number of semaphores to be signaled once the sparse binding operations specified by the structure have completed execution.
- `pSignalSemaphores` is a pointer to an array of semaphores which will be signaled when the sparse binding operations for this batch have completed execution. If semaphores to be signaled are provided, they define a semaphore signal operation.

### Valid Usage

- VUID-VkBindSparseInfo-pWaitSemaphores-03246
  If any element of `pWaitSemaphores` or `pSignalSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` then the `pNext` chain must include a `VkTimelineSemaphoreSubmitInfo` structure.

- VUID-VkBindSparseInfo-pNext-03247
  If the `pNext` chain of this structure includes a `VkTimelineSemaphoreSubmitInfo` structure and any element of `pWaitSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` then its `waitSemaphoreValueCount` member must equal `waitSemaphoreCount`.

- VUID-VkBindSparseInfo-pNext-03248
  If the `pNext` chain of this structure includes a `VkTimelineSemaphoreSubmitInfo` structure and any element of `pSignalSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` then its `signalSemaphoreValueCount` member must equal `signalSemaphoreCount`.

- VUID-VkBindSparseInfo-pSignalSemaphores-03249
  For each element of `pSignalSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the corresponding element of `VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues` must have a value greater than the current value of the semaphore when the semaphore signal operation is executed.

- VUID-VkBindSparseInfo-pWaitSemaphores-03250
  For each element of `pWaitSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the corresponding element of `VkTimelineSemaphoreSubmitInfo::pWaitSemaphoreValues` must have a value which does not differ from the current value of the semaphore or from the value of any outstanding semaphore wait or signal operation on that semaphore by more than `maxTimelineSemaphoreValueDifference`.

- VUID-VkBindSparseInfo-pSignalSemaphores-03251
For each element of `pSignalSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the corresponding element of `VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues` must have a value which does not differ from the current value of the semaphore or from the value of any outstanding semaphore wait or signal operation on that semaphore by more than `maxTimelineSemaphoreValueDifference`.

Valid Usage (Implicit)

- VUID-VkBindSparseInfo-sType-sType
  
  The `sType` value of each struct in the `pNext` chain must be unique.

- VUID-VkBindSparseInfo-pNext-pNext
  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkDeviceGroupBindSparseInfo`, `VkFrameBoundaryEXT`, or `VkTimelineSemaphoreSubmitInfo`.

- VUID-VkBindSparseInfo-sType-unique
  
  The `sType` value of each struct in the `pNext` chain must be unique.

- VUID-VkBindSparseInfo-pWaitSemaphores-parameter
  
  If `waitSemaphoreCount` is not 0, `pWaitSemaphores` must be a valid pointer to an array of `VkSemaphore` handles.

- VUID-VkBindSparseInfo-pBufferBinds-parameter
  
  If `bufferBindCount` is not 0, `pBufferBinds` must be a valid pointer to an array of `VkSparseBufferMemoryBindInfo` structures.

- VUID-VkBindSparseInfo-pImageOpaqueBinds-parameter
  
  If `imageOpaqueBindCount` is not 0, `pImageOpaqueBinds` must be a valid pointer to an array of `VkSparseImageOpaqueMemoryBindInfo` structures.

- VUID-VkBindSparseInfo-pImageBinds-parameter
  
  If `imageBindCount` is not 0, `pImageBinds` must be a valid pointer to an array of `VkSparseImageMemoryBindInfo` structures.

To specify the values to use when waiting for and signaling semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`, add a `VkTimelineSemaphoreSubmitInfo` structure to the `pNext` chain of the `VkBindSparseInfo` structure.

If the `pNext` chain of `VkBindSparseInfo` includes a `VkDeviceGroupBindSparseInfo` structure, then that structure includes device indices specifying which instance of the resources and memory are
The `VkDeviceGroupBindSparseInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupBindSparseInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t resourceDeviceIndex;
    uint32_t memoryDeviceIndex;
} VkDeviceGroupBindSparseInfo;
```

or the equivalent

```c
// Provided by VK_KHR_device_group
typedef VkDeviceGroupBindSparseInfo VkDeviceGroupBindSparseInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `resourceDeviceIndex` is a device index indicating which instance of the resource is bound.
- `memoryDeviceIndex` is a device index indicating which instance of the memory the resource instance is bound to.

These device indices apply to all buffer and image memory binds included in the batch pointing to this structure. The semaphore waits and signals for the batch are executed only by the physical device specified by the `resourceDeviceIndex`.

If this structure is not present, `resourceDeviceIndex` and `memoryDeviceIndex` are assumed to be zero.

### Valid Usage

- VUID-VkDeviceGroupBindSparseInfo-resourceDeviceIndex-01118  
  `resourceDeviceIndex` and `memoryDeviceIndex` must both be valid device indices

- VUID-VkDeviceGroupBindSparseInfo-memoryDeviceIndex-01119  
  Each memory allocation bound in this batch must have allocated an instance for `memoryDeviceIndex`

### Valid Usage (Implicit)

- VUID-VkDeviceGroupBindSparseInfo-sType-sType  
  `sType` must be `VK_STRUCTURE_TYPE_DEVICE_GROUP_BIND_SPARSE_INFO`
Chapter 34. Window System Integration (WSI)

This chapter discusses the window system integration (WSI) between the Vulkan API and the various forms of displaying the results of rendering to a user. Since the Vulkan API can be used without displaying results, WSI is provided through the use of optional Vulkan extensions. This chapter provides an overview of WSI. See the appendix for additional details of each WSI extension, including which extensions must be enabled in order to use each of the functions described in this chapter.

34.1. WSI Platform

A platform is an abstraction for a window system, OS, etc. Some examples include MS Windows, Android, and Wayland. The Vulkan API may be integrated in a unique manner for each platform.

The Vulkan API does not define any type of platform object. Platform-specific WSI extensions are defined, each containing platform-specific functions for using WSI. Use of these extensions is guarded by preprocessor symbols as defined in the Window System-Specific Header Control appendix.

In order for an application to be compiled to use WSI with a given platform, it must either:

• define the appropriate preprocessor symbol prior to including the vulkan.h header file, or
• include vulkan_core.h and any native platform headers, followed by the appropriate platform-specific header.

The preprocessor symbols and platform-specific headers are defined in the Window System Extensions and Headers table.

Each platform-specific extension is an instance extension. The application must enable instance extensions with vkCreateInstance before using them.

34.2. WSI Surface

Native platform surface or window objects are abstracted by surface objects, which are represented by VkSurfaceKHR handles:

```
// Provided by VK_KHR_surface
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSurfaceKHR)
```

The VK_KHR_surface extension declares the VkSurfaceKHR object, and provides a function for destroying VkSurfaceKHR objects. Separate platform-specific extensions each provide a function for creating a VkSurfaceKHR object for the respective platform. From the application's perspective this is an opaque handle, just like the handles of other Vulkan objects.

Note
34.2.1. Android Platform

To create a VkSurfaceKHR object for an Android native window, call:

```c
// Provided by VK_KHR_android_surface
VkResult vkCreateAndroidSurfaceKHR(
    VkInstance instance,
    const VkAndroidSurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a VkAndroidSurfaceCreateInfoKHR structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.

During the lifetime of a surface created using a particular ANativeWindow handle any attempts to create another surface for the same ANativeWindow and any attempts to connect to the same ANativeWindow through other platform mechanisms will fail.

**Note**

In particular, only one VkSurfaceKHR can exist at a time for a given window. Similarly, a native window cannot be used by both a VkSurfaceKHR and EGLSurface simultaneously.

If successful, vkCreateAndroidSurfaceKHR increments the ANativeWindow's reference count, and vkDestroySurfaceKHR will decrement it.

On Android, when a swapchain's imageExtent does not match the surface's currentExtent, the presentable images will be scaled to the surface's dimensions during presentation. minImageExtent is (1,1), and maxImageExtent is the maximum image size supported by the consumer. For the system compositor, currentExtent is the window size (i.e. the consumer's preferred size).

**Valid Usage (Implicit)**

- VUID-vkCreateAndroidSurfaceKHR-instance-parameter
  instance must be a valid VkInstance handle
• VUID-vkCreateAndroidSurfaceKHR-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkAndroidSurfaceCreateInfoKHR structure

• VUID-vkCreateAndroidSurfaceKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkCreateAndroidSurfaceKHR-pSurface-parameter
  pSurface must be a valid pointer to a VkSurfaceKHR handle

Return Codes

Success
  • VK_SUCCESS

Failure
  • VK_ERROR_OUT_OF_HOST_MEMORY
  • VK_ERROR_OUT_OF_DEVICE_MEMORY
  • VK_ERROR_NATIVE_WINDOW_IN_USE_KHR

The VkAndroidSurfaceCreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_android_surface
typedef struct VkAndroidSurfaceCreateInfoKHR {
  VkStructureType sType;
  const void* pNext;
  VkAndroidSurfaceCreateFlagsKHR flags;
  struct ANativeWindow* window;
} VkAndroidSurfaceCreateInfoKHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• flags is reserved for future use.
• window is a pointer to the ANativeWindow to associate the surface with.

Valid Usage

• VUID-VkAndroidSurfaceCreateInfoKHR-window-01248
  window must point to a valid Android ANativeWindow

Valid Usage (Implicit)

• VUID-VkAndroidSurfaceCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_ANDROID_SURFACE_CREATE_INFO_KHR
To remove an unnecessary compile time dependency, an incomplete type definition of `ANativeWindow` is provided in the Vulkan headers:

```c
// Provided by VK_KHR_android_surface
struct ANativeWindow;
```

The actual `ANativeWindow` type is defined in Android NDK headers.

```c
// Provided by VK_KHR_android_surface
typedef VkFlags VkAndroidSurfaceCreateFlagsKHR;
```

`VkAndroidSurfaceCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

### 34.2.2. Wayland Platform

To create a `VkSurfaceKHR` object for a Wayland surface, call:

```c
// Provided by VK_KHR_wayland_surface
VkResult vkCreateWaylandSurfaceKHR(
    VkInstance instance,
    const VkWaylandSurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkWaylandSurfaceCreateInfoKHR` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

#### Valid Usage (Implicit)

- VUID-vkCreateWaylandSurfaceKHR-instance-parameter
  `instance` must be a valid `VkInstance` handle
- VUID-vkCreateWaylandSurfaceKHR-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid `VkWaylandSurfaceCreateInfoKHR` structure
If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.

`pSurface` must be a valid pointer to a `VkSurfaceKHR` handle.

Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkWaylandSurfaceCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_wayland_surface
typedef struct VkWaylandSurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkWaylandSurfaceCreateFlagsKHR flags;
    struct wl_display* display;
    struct wl_surface* surface;
} VkWaylandSurfaceCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `display` and `surface` are pointers to the Wayland `wl_display` and `wl_surface` to associate the surface with.

Valid Usage

- VUID-VkWaylandSurfaceCreateInfoKHR-display-01304 display must point to a valid Wayland `wl_display`
- VUID-VkWaylandSurfaceCreateInfoKHR-surface-01305 surface must point to a valid Wayland `wl_surface`

Valid Usage (Implicit)

- VUID-VkWaylandSurfaceCreateInfoKHR-sType-sType
sType must be VK_STRUCTURE_TYPE_WAYLAND_SURFACE_CREATE_INFO_KHR

- VUID-VkWaylandSurfaceCreateInfoKHR-pNext-pNext
  pNext must be NULL

- VUID-VkWaylandSurfaceCreateInfoKHR-flags-zero bitmask
  flags must be 0

On Wayland, currentExtent is the special value (0xFFFFFFFF, 0xFFFFFFFF), indicating that the surface size will be determined by the extent of a swapchain targeting the surface. Whatever the application sets a swapchain's imageExtent to will be the size of the window, after the first image is presented. minImageExtent is (1,1), and maxImageExtent is the maximum supported surface size. Any calls to vkGetPhysicalDeviceSurfacePresentModesKHR on a surface created with vkCreateWaylandSurfaceKHR are required to return VK_PRESENT_MODE_MAILBOX_KHR as one of the valid present modes.

Some Vulkan functions may send protocol over the specified wl_display connection when using a swapchain or presentable images created from a VkSurfaceKHR referring to a wl_surface. Applications must therefore ensure that both the wl_display and the wl_surface remain valid for the lifetime of any VkSwapchainKHR objects created from a particular wl_display and wl_surface. Also, calling vkQueuePresentKHR will result in Vulkan sending wl_surface.commit requests to the underlying wl_surface of each. The wl_surface.attach, wl_surface.damage, and wl_surface.commit requests must be issued by the implementation during the call to vkQueuePresentKHR and must not be issued by the implementation outside of vkQueuePresentKHR. This ensures that any Wayland requests sent by the client after the call to vkQueuePresentKHR returns will be received by the compositor after the wl_surface.commit. Regardless of the mode of swapchain creation, a new wl_event_queue must be created for each successful vkCreateWaylandSurfaceKHR call, and every Wayland object created by the implementation must be assigned to this event queue. If the platform provides Wayland 1.11 or greater, this must be implemented by the use of Wayland proxy object wrappers, to avoid race conditions.

If the application wishes to synchronize any window changes with a particular frame, such requests must be sent to the Wayland display server prior to calling vkQueuePresentKHR.

```c
// Provided by VK_KHR_wayland_surface
typedef VkFlags VkWaylandSurfaceCreateFlagsKHR;
```

VkWaylandSurfaceCreateFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.

### 34.2.3. Win32 Platform

To create a VkSurfaceKHR object for a Win32 window, call:

```c
// Provided by VK_KHR_win32_surface
VkResult vkCreateWin32SurfaceKHR(
    VkInstance instance,
    const VkWin32SurfaceCreateInfoKHR* pCreateInfo,
);```
const VkAllocationCallbacks* pAllocator,
VkSurfaceKHR* pSurface);

• **instance** is the instance to associate the surface with.

• **pCreateInfo** is a pointer to a VkWin32SurfaceCreateInfoKHR structure containing parameters affecting the creation of the surface object.

• **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).

• **pSurface** is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateWin32SurfaceKHR-instance-parameter
  instance must be a valid VkInstance handle

- VUID-vkCreateWin32SurfaceKHR-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkWin32SurfaceCreateInfoKHR structure

- VUID-vkCreateWin32SurfaceKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateWin32SurfaceKHR-pSurface-parameter
  pSurface must be a valid pointer to a VkSurfaceKHR handle

### Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkWin32SurfaceCreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_win32_surface
typedef struct VkWin32SurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkWin32SurfaceCreateFlagsKHR flags;
    HINSTANCE hinstance;
    HWND hwnd;
} VkWin32SurfaceCreateInfoKHR;
```
• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is `NULL` or a pointer to a structure extending this structure.

• **flags** is reserved for future use.

• **hinstance** is the Win32 `HINSTANCE` for the window to associate the surface with.

• **hwnd** is the Win32 `HWND` for the window to associate the surface with.

### Valid Usage

- VUID-VkWin32SurfaceCreateInfoKHR-hinstance-01307
  
  **hinstance** **must** be a valid Win32 `HINSTANCE`

- VUID-VkWin32SurfaceCreateInfoKHR-hwnd-01308
  
  **hwnd** **must** be a valid Win32 `HWND`

### Valid Usage (Implicit)

- VUID-VkWin32SurfaceCreateInfoKHR-sType-sType
  
  **sType** **must** be `VK_STRUCTURE_TYPE_WIN32_SURFACE_CREATE_INFO_KHR`

- VUID-VkWin32SurfaceCreateInfoKHR-pNext-pNext
  
  **pNext** **must** be `NULL`

- VUID-VkWin32SurfaceCreateInfoKHR-flags-zerobitmask
  
  **flags** **must** be `0`

With Win32, **minImageExtent**, **maxImageExtent**, and **currentExtent** **must** always equal the window size.

The **currentExtent** of a Win32 surface **must** have both **width** and **height** greater than 0, or both of them 0.

### Note

Due to above restrictions, unless `VkSwapchainPresentScalingCreateInfoEXT` is used to specify handling of disparities between surface and swapchain dimensions, it is only possible to create a new swapchain on this platform with **imageExtent** being equal to the current size of the window, as reported in `VkSurfaceCapabilitiesKHR::currentExtent`.

The window size **may** become (0, 0) on this platform (e.g. when the window is minimized), and so a swapchain **cannot** be created until the size changes.

```c
// Provided by VK_KHR_win32_surface
typedef VkFlags VkWin32SurfaceCreateFlagsKHR;
```

`VkWin32SurfaceCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.
34.2.4. XCB Platform

To create a VkSurfaceKHR object for an X11 window, using the XCB client-side library, call:

```c
// Provided by VK_KHR_xcb_surface
VkResult vkCreateXcbSurfaceKHR(
    VkInstance instance,
    const VkXcbSurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a VkXcbSurfaceCreateInfoKHR structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateXcbSurfaceKHR-instance-parameter  
  `instance` must be a valid VkInstance handle
- VUID-vkCreateXcbSurfaceKHR-pCreateInfo-parameter  
  `pCreateInfo` must be a valid pointer to a valid VkXcbSurfaceCreateInfoKHR structure

- VUID-vkCreateXcbSurfaceKHR-pAllocator-parameter  
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateXcbSurfaceKHR-pSurface-parameter  
  `pSurface` must be a valid pointer to a VkSurfaceKHR handle

### Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkXcbSurfaceCreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_xcb_surface
typedef struct VkXcbSurfaceCreateInfoKHR {
```
VkStructureType         sType;
const void*              pNext;
VkXcbSurfaceCreateFlagsKHR flags;
xcb_connection_t*        connection;
xcb_window_t             window;
} VkXcbSurfaceCreateInfoKHR;

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **connection** is a pointer to an **xcb_connection_t** to the X server.
- **window** is the **xcb_window_t** for the X11 window to associate the surface with.

**Valid Usage**

- VUID-VkXcbSurfaceCreateInfoKHR-connection-01310
  connection must point to a valid X11 **xcb_connection_t**
- VUID-VkXcbSurfaceCreateInfoKHR-window-01311
  window must be a valid X11 **xcb_window_t**

**Valid Usage (Implicit)**

- VUID-VkXcbSurfaceCreateInfoKHR-sType-sType
  sType must be **VK_STRUCTURE_TYPE_XCB_SURFACE_CREATE_INFO_KHR**
- VUID-VkXcbSurfaceCreateInfoKHR-pNext-pNext
  pNext must be NULL
- VUID-VkXcbSurfaceCreateInfoKHR-flags-zerobitmask
  flags must be 0

With Xcb, **minImageExtent**, **maxImageExtent**, and **currentExtent** must always equal the window size.

The **currentExtent** of an Xcb surface must have both **width** and **height** greater than 0, or both of them 0.

**Note**

Due to above restrictions, unless **VkSwapchainPresentScalingCreateInfoEXT** is used to specify handling of disparities between surface and swapchain dimensions, it is only possible to create a new swapchain on this platform with **imageExtent** being equal to the current size of the window, as reported in **VkSurfaceCapabilitiesKHR::currentExtent**.

The window size may become (0, 0) on this platform (e.g. when the window is minimized), and so a swapchain cannot be created until the size changes.
Some Vulkan functions **may** send protocol over the specified xcb connection when using a swapchain or presentable images created from a VkSurfaceKHR referring to an xcb window. Applications **must** therefore ensure the xcb connection is available to Vulkan for the duration of any functions that manipulate such swapchains or their presentable images, and any functions that build or queue command buffers that operate on such presentable images. Specifically, applications using Vulkan with xcb-based swapchains **must**

- Avoid holding a server grab on an xcb connection while waiting for Vulkan operations to complete using a swapchain derived from a different xcb connection referring to the same X server instance. Failing to do so **may** result in deadlock.

```c
// Provided by VK_KHR_xcb_surface
typedef VkFlags VkXcbSurfaceCreateFlagsKHR;
```

VkXcbSurfaceCreateFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.

### 34.2.5. Xlib Platform

To create a VkSurfaceKHR object for an X11 window, using the Xlib client-side library, call:

```c
// Provided by VK_KHR_xlib_surface
VkResult vkCreateXlibSurfaceKHR(
    VkInstance instance,
    const VkXlibSurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- **instance** is the instance to associate the surface with.
- **pCreateInfo** is a pointer to a VkXlibSurfaceCreateInfoKHR structure containing the parameters affecting the creation of the surface object.
- **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- **pSurface** is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.

**Valid Usage (Implicit)**

- VUID-vkCreateXlibSurfaceKHR-instance-parameter
  instance **must** be a valid VkInstance handle
- VUID-vkCreateXlibSurfaceKHR-pCreateInfo-parameter
  pCreateInfo **must** be a valid pointer to a valid VkXlibSurfaceCreateInfoKHR structure
- VUID-vkCreateXlibSurfaceKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator **must** be a valid pointer to a valid VkAllocationCallbacks structure
• VUID-vkCreateXlibSurfaceKHR-pSurface-parameter
  pSurface must be a valid pointer to a VkSurfaceKHR handle

Return Codes

Success
  • VK_SUCCESS

Failure
  • VK_ERROR_OUT_OF_HOST_MEMORY
  • VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkXlibSurfaceCreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_xlib_surface
typedef struct VkXlibSurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkXlibSurfaceCreateFlagsKHR flags;
    Display* dpy;
    Window window;
} VkXlibSurfaceCreateInfoKHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• flags is reserved for future use.
• dpy is a pointer to an Xlib Display connection to the X server.
• window is an Xlib Window to associate the surface with.

Valid Usage

• VUID-VkXlibSurfaceCreateInfoKHR-dpy-01313
dpy must point to a valid Xlib Display

• VUID-VkXlibSurfaceCreateInfoKHR-window-01314
  window must be a valid Xlib Window

Valid Usage (Implicit)

• VUID-VkXlibSurfaceCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_XLIB_SURFACE_CREATE_INFO_KHR

• VUID-VkXlibSurfaceCreateInfoKHR-pNext-pNext
  pNext must be NULL
With Xlib, `minImageExtent`, `maxImageExtent`, and `currentExtent` **must** always equal the window size.

The `currentExtent` of an Xlib surface **must** have both `width` and `height` greater than 0, or both of them 0.

**Note**

Due to above restrictions, unless `VkSwapchainPresentScalingCreateInfoEXT` is used to specify handling of disparities between surface and swapchain dimensions, it is only possible to create a new swapchain on this platform with `imageExtent` being equal to the current size of the window, as reported in `VkSurfaceCapabilitiesKHR::currentExtent`.

The window size **may** become (0, 0) on this platform (e.g. when the window is minimized), and so a swapchain **cannot** be created until the size changes.

Some Vulkan functions **may** send protocol over the specified Xlib `Display` connection when using a swapchain or presentable images created from a `VkSurfaceKHR` referring to an Xlib window. Applications **must** therefore ensure the display connection is available to Vulkan for the duration of any functions that manipulate such swapchains or their presentable images, and any functions that build or queue command buffers that operate on such presentable images. Specifically, applications using Vulkan with Xlib-based swapchains **must**

- Avoid holding a server grab on a display connection while waiting for Vulkan operations to complete using a swapchain derived from a different display connection referring to the same X server instance. Failing to do so may result in deadlock.

Some implementations may require threads to implement some presentation modes so applications **must** call `XInitThreads()` before calling any other Xlib functions.

```c
// Provided by VK_KHR_xlib_surface
typedef VkFlags VkXlibSurfaceCreateFlagsKHR;
```

`VkXlibSurfaceCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

### 34.2.6. DirectFB Platform

To create a `VkSurfaceKHR` object for a DirectFB surface, call:

```c
// Provided by VK_EXT_directfb_surface
VkResult vkCreateDirectFBSurfaceEXT(  
    VkInstance instance,  
    const VkDirectFBSurfaceCreateInfoEXT* pCreateInfo,  
    const VkAllocationCallbacks* pAllocator,  
    VkSurfaceKHR* pSurface)
```

2840
• **instance** is the instance to associate the surface with.

• **pCreateInfo** is a pointer to a `VkDirectFBSurfaceCreateInfoEXT` structure containing parameters affecting the creation of the surface object.

• **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).

• **pSurface** is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateDirectFBSurfaceEXT-instance-parameter
  
  `instance` must be a valid `VkInstance` handle

- VUID-vkCreateDirectFBSurfaceEXT-pCreateInfo-parameter
  
  `pCreateInfo` must be a valid pointer to a valid `VkDirectFBSurfaceCreateInfoEXT` structure

- VUID-vkCreateDirectFBSurfaceEXT-pAllocator-parameter
  
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateDirectFBSurfaceEXT-pSurface-parameter
  
  `pSurface` must be a valid pointer to a `VkSurfaceKHR` handle

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDirectFBSurfaceCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_directfb_surface
typedef struct VkDirectFBSurfaceCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDirectFBSurfaceCreateFlagsEXT flags;
    IDirectFB* dfb;
    IDirectFBSurface* surface;
} VkDirectFBSurfaceCreateInfoEXT;
```

• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **flags** is reserved for future use.
• **dfb** is a pointer to the **IDirectFB** main interface of DirectFB.
• **surface** is a pointer to a **IDirectFBSurface** surface interface.

### Valid Usage

- **VUID-VkDirectFBSurfaceCreateInfoEXT-dfb-04117**
  
  **dfb** must point to a valid DirectFB **IDirectFB**

- **VUID-VkDirectFBSurfaceCreateInfoEXT-surface-04118**
  
  **surface** must point to a valid DirectFB **IDirectFBSurface**

### Valid Usage (Implicit)

- **VUID-VkDirectFBSurfaceCreateInfoEXT-sType-sType**
  
  **sType** must be **VK_STRUCTURE_TYPE_DIRECTFB_SURFACE_CREATE_INFO_EXT**

- **VUID-VkDirectFBSurfaceCreateInfoEXT-pNext-pNext**
  
  **pNext** must be **NULL**

- **VUID-VkDirectFBSurfaceCreateInfoEXT-flags-zerobitmask**
  
  **flags** must be **0**

With DirectFB, **minImageExtent**, **maxImageExtent**, and **currentExtent** must always equal the surface size.

```c
// Provided by VK_EXT_directfb_surface
typedef VkFlags VkDirectFBSurfaceCreateFlagsEXT;
```

**VkDirectFBSurfaceCreateFlagsEXT** is a bitmask type for setting a mask, but is currently reserved for future use.

### 34.2.7. Fuchsia Platform

To create a **VkSurfaceKHR** object for a Fuchsia ImagePipe, call:

```c
// Provided by VK_FUCHSIA_imagepipe_surface
VkResult vkCreateImagePipeSurfaceFUCHSIA(
   VkInstance instance,
    const VkImagePipeSurfaceCreateInfoFUCHSIA* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

• **instance** is the instance to associate with the surface.
• **pCreateInfo** is a pointer to a `VkImagePipeSurfaceCreateInfoFUCHSIA` structure containing parameters affecting the creation of the surface object.

• **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).

• **pSurface** is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

---

### Valid Usage (Implicit)

- VUID-vkCreateImagePipeSurfaceFUCHSIA-instance-parameter
  - `instance` must be a valid `VkInstance` handle

- VUID-vkCreateImagePipeSurfaceFUCHSIA-pCreateInfo-parameter
  - `pCreateInfo` must be a valid pointer to a valid `VkImagePipeSurfaceCreateInfoFUCHSIA` structure

- VUID-vkCreateImagePipeSurfaceFUCHSIA-pAllocator-parameter
  - If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateImagePipeSurfaceFUCHSIA-pSurface-parameter
  - `pSurface` must be a valid pointer to a `VkSurfaceKHR` handle

---

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

---

The `VkImagePipeSurfaceCreateInfoFUCHSIA` structure is defined as:

```c
// Provided by VK_FUCHSIA_imagepipe_surface
typedef struct VkImagePipeSurfaceCreateInfoFUCHSIA {
    VkStructureType          sType;
    const void*              pNext;
    VkImagePipeSurfaceCreateFlagsFUCHSIA flags;
    zx_handle_t              imagePipeHandle;
} VkImagePipeSurfaceCreateInfoFUCHSIA;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **imagePipeHandle** is a `zx_handle_t` referring to the ImagePipe to associate with the surface.
Valid Usage

- VUID-VkImagePipeSurfaceCreateInfoFUCHSIA-imagePipeHandle-04863
  \textit{imagePipeHandle} must be a valid \texttt{zx}_handle_t

Valid Usage (Implicit)

- VUID-VkImagePipeSurfaceCreateInfoFUCHSIA-sType-sType
  \textit{sType} must be \texttt{VK}_\texttt{STRUCTURE}_\texttt{TYPE}_\texttt{IMAGEPIPE}_\texttt{SURFACE}_\texttt{CREATE}_\texttt{INFO}_\texttt{FUCHSIA}

- VUID-VkImagePipeSurfaceCreateInfoFUCHSIA-pNext-pNext
  \textit{pNext} must be NULL

- VUID-VkImagePipeSurfaceCreateInfoFUCHSIA-flags-zerobitmask
  \textit{flags} must be 0

On Fuchsia, the surface \texttt{currentExtent} is the special value (0xFFFFFFFF, 0xFFFFFFFF), indicating that the surface size will be determined by the extent of a swapchain targeting the surface.

```c
// Provided by VK_FUCHSIA_imagepipe_surface
typedef VkFlags VkImagePipeSurfaceCreateFlagsFUCHSIA;
```

\texttt{VkImagePipeSurfaceCreateFlagsFUCHSIA} is a bitmask type for setting a mask, but is currently reserved for future use.

34.2.8. Google Games Platform

To create a \texttt{VkSurfaceKHR} object for a Google Games Platform stream descriptor, call:

```c
// Provided by VK_GGP_stream_descriptor_surface
VkResult vkCreateStreamDescriptorSurfaceGGP(
    VkInstance instance,
    const VkStreamDescriptorSurfaceCreateInfoGGP* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- \texttt{instance} is the instance to associate with the surface.
- \texttt{pCreateInfo} is a pointer to a \texttt{VkStreamDescriptorSurfaceCreateInfoGGP} structure containing parameters that affect the creation of the surface object.
- \texttt{pAllocator} is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- \texttt{pSurface} is a pointer to a \texttt{VkSurfaceKHR} handle in which the created surface object is returned.
Valid Usage (Implicit)

- VUID-vkCreateStreamDescriptorSurfaceGGP-instance-parameter
  instance must be a valid VkInstance handle

- VUID-vkCreateStreamDescriptorSurfaceGGP-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkStreamDescriptorSurfaceCreateInfoGGP structure

- VUID-vkCreateStreamDescriptorSurfaceGGP-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateStreamDescriptorSurfaceGGP-pSurface-parameter
  pSurface must be a valid pointer to a VkSurfaceKHR handle

Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_NATIVE_WINDOW_IN_USE_KHR

The VkStreamDescriptorSurfaceCreateInfoGGP structure is defined as:

```c
// Provided by VK_GGP_stream_descriptor_surface
typedef struct VkStreamDescriptorSurfaceCreateInfoGGP {
    VkStructureType sType;
    const void* pNext;
    VkStreamDescriptorSurfaceCreateFlagsGGP flags;
    GgpStreamDescriptor streamDescriptor;
} VkStreamDescriptorSurfaceCreateInfoGGP;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **streamDescriptor** is a GgpStreamDescriptor referring to the GGP stream descriptor to associate with the surface.

Valid Usage

- VUID-VkStreamDescriptorSurfaceCreateInfoGGP-streamDescriptor-02681
streamDescriptor must be a valid GgpStreamDescriptor

Valid Usage (Implicit)

- VUID-VkStreamDescriptorSurfaceCreateInfoGGP-sType-sType
  sType must be VK_STRUCTURE_TYPE_STREAM_DESCRIPTOR_SURFACE_CREATE_INFO_GGP
- VUID-VkStreamDescriptorSurfaceCreateInfoGGP-pNext-pNext
  pNext must be NULL
- VUID-VkStreamDescriptorSurfaceCreateInfoGGP-flags-zerobitmask
  flags must be 0

On Google Games Platform, the surface extents are dynamic. The minImageExtent will never be greater than 1080p and the maxImageExtent will never be less than 1080p. The currentExtent will reflect the current optimal resolution.

Applications are expected to choose an appropriate size for the swapchain’s imageExtent, within the bounds of the surface. Using the surface’s currentExtent will offer the best performance and quality. When a swapchain’s imageExtent does not match the surface’s currentExtent, the presentable images are scaled to the surface’s dimensions during presentation if possible and VK_SUBOPTIMAL_KHR is returned, otherwise presentation fails with VK_ERROR_OUT_OF_DATE_KHR.

// Provided by VK_GGP_stream_descriptor_surface
typedef VkFlags VkStreamDescriptorSurfaceCreateFlagsGGP;

VkStreamDescriptorSurfaceCreateFlagsGGP is a bitmask type for setting a mask, but is currently reserved for future use.

34.2.9. iOS Platform

To create a VkSurfaceKHR object for an iOS UIView or CAMetalLayer, call:

// Provided by VK_MVK_ios_surface
VkResult vkCreateIOSSurfaceMVK(
    VkInstance instance,
    const VkIOSSurfaceCreateInfoMVK* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);

Note

The vkCreateIOSSurfaceMVK function is considered deprecated and has been superseded by vkCreateMetalSurfaceEXT from the VK_EXT_metal_surface extension.

- instance is the instance with which to associate the surface.
• `pCreateInfo` is a pointer to a `VkIOSSurfaceCreateInfoMVK` structure containing parameters affecting the creation of the surface object.

• `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).

• `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateIOSSurfaceMVK-instance-parameter
  instance must be a valid `VkInstance` handle

- VUID-vkCreateIOSSurfaceMVK-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid `VkIOSSurfaceCreateInfoMVK` structure

- VUID-vkCreateIOSSurfaceMVK-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateIOSSurfaceMVK-pSurface-parameter
  `pSurface` must be a valid pointer to a `VkSurfaceKHR` handle

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_NATIVE_WINDOW_IN_USE_KHR`

The `VkIOSSurfaceCreateInfoMVK` structure is defined as:

```c
// Provided by VK_MVK_ios_surface
typedef struct VkIOSSurfaceCreateInfoMVK {
    VkStructureType sType;
    const void* pNext;
    VkIOSSurfaceCreateFlagsMVK flags;
    const void* pView;
} VkIOSSurfaceCreateInfoMVK;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `pView` is a reference to either a `CAMetalLayer` object or a `UIView` object.
Valid Usage

- VUID-VkIOSSurfaceCreateInfoMVK-pView-04143
  If `pView` is a `CAMetalLayer` object, it **must** be a valid `CAMetalLayer`

- VUID-VkIOSSurfaceCreateInfoMVK-pView-01316
  If `pView` is a `UIView` object, it **must** be a valid `UIView`, **must** be backed by a `CALayer` object of type `CAMetalLayer`, and `vkCreateIOSSurfaceMVK` **must** be called on the main thread

Valid Usage (Implicit)

- VUID-VkIOSSurfaceCreateInfoMVK-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_IOS_SURFACE_CREATE_INFO_MVK`

- VUID-VkIOSSurfaceCreateInfoMVK-pNext-pNext
  `pNext` **must** be `NULL`

- VUID-VkIOSSurfaceCreateInfoMVK-flags-zerobitmask
  `flags` **must** be `0`

// Provided by VK_MVK_ios_surface
typedef VkFlags VkIOSurfaceCreateFlagsMVK;

`VkIOSurfaceCreateFlagsMVK` is a bitmask type for setting a mask, but is currently reserved for future use.

34.2.10. macOS Platform

To create a `VkSurfaceKHR` object for a macOS `NSView` or `CAMetalLayer`, call:

// Provided by VK_MVK_macos_surface
VkResult vkCreateMacOSSurfaceMVK(
    VkInstance instance,
    const VkMacOSSurfaceCreateInfoMVK* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);

**Note**

The `vkCreateMacOSSurfaceMVK` function is considered deprecated and has been superseded by `vkCreateMetalSurfaceEXT` from the `VK_EXT_metal_surface` extension.

- `instance` is the instance with which to associate the surface.
- `pCreateInfo` is a pointer to a `VkMacOSSurfaceCreateInfoMVK` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is
no more specific allocator available (see Memory Allocation).

• pSurface is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.

Valid Usage (Implicit)

- VUID-vkCreateMacOSSurfaceMVK-instance-parameter
  instance must be a valid VkInstance handle
- VUID-vkCreateMacOSSurfaceMVK-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkMacOSSurfaceCreateInfoMVK structure
- VUID-vkCreateMacOSSurfaceMVK-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateMacOSSurfaceMVK-pSurface-parameter
  pSurface must be a valid pointer to a VkSurfaceKHR handle

Return Codes

Success
  • VK_SUCCESS

Failure
  • VK_ERROR_OUT_OF_HOST_MEMORY
  • VK_ERROR_OUT_OF_DEVICE_MEMORY
  • VK_ERROR_NATIVE_WINDOW_IN_USE_KHR

The VkMacOSSurfaceCreateInfoMVK structure is defined as:

```c
// Provided by VK_MVK_macos_surface
typedef struct VkMacOSSurfaceCreateInfoMVK {
    VkStructureType sType;
    const void* pNext;
    VkMacOSSurfaceCreateFlagsMVK flags;
    const void* pView;
} VkMacOSSurfaceCreateInfoMVK;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• flags is reserved for future use.
• pView is a reference to either a CAMetalLayer object or an NSView object.
Valid Usage

- VUID-VkMacOSSurfaceCreateInfoMVK-pView-04144
  If `pView` is a `CAMetalLayer` object, it **must** be a valid `CAMetalLayer`.

- VUID-VkMacOSSurfaceCreateInfoMVK-pView-01317
  If `pView` is an `NSView` object, it **must** be a valid `NSView`, **must** be backed by a `CALayer` object of type `CAMetalLayer`, and `vkCreateMacOSSurfaceMVK` **must** be called on the main thread.

Valid Usage (Implicit)

- VUID-VkMacOSSurfaceCreateInfoMVK-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_MACOS_SURFACE_CREATE_INFO_MVK`.

- VUID-VkMacOSSurfaceCreateInfoMVK-pNext-pNext
  `pNext` **must** be `NULL`.

- VUID-VkMacOSSurfaceCreateInfoMVK-flags-zero bitmask
  `flags` **must** be `0`.

----

```c
// Provided by VK_MVK_macos_surface
typedef VkFlags VkMacOSSurfaceCreateFlagsMVK;
```

**VkMacOSSurfaceCreateFlagsMVK** is a bitmask type for setting a mask, but is currently reserved for future use.

### 34.2.11. VI Platform

To create a `VkSurfaceKHR` object for an `nn::vi::Layer`, query the layer's native handle using `nn::vi::GetNativeWindow`, and then call:

```c
// Provided by VK_NN_vi_surface
VkResult vkCreateViSurfaceNN(
    VkInstance instance,
    const VkViSurfaceCreateInfoNN* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance with which to associate the surface.
- `pCreateInfo` is a pointer to a `VkViSurfaceCreateInfoNN` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.
During the lifetime of a surface created using a particular `nn::vi::NativeWindowHandle`, applications must not attempt to create another surface for the same `nn::vi::Layer` or attempt to connect to the same `nn::vi::Layer` through other platform mechanisms.

If the native window is created with a specified size, `currentExtent` will reflect that size. In this case, applications should use the same size for the swapchain's `imageExtent`. Otherwise, the `currentExtent` will have the special value (0xFFFFFFFF, 0xFFFFFFFF), indicating that applications are expected to choose an appropriate size for the swapchain's `imageExtent` (e.g., by matching the result of a call to `nn::vi::GetDisplayResolution`).

Valid Usage (Implicit)

- VUID-vkCreateViSurfaceNN-instance-parameter
  instance must be a valid `VkInstance` handle
- VUID-vkCreateViSurfaceNN-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid `VkViSurfaceCreateInfoNN` structure
- VUID-vkCreateViSurfaceNN-pAllocator-parameter
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateViSurfaceNN-pSurface-parameter
  `pSurface` must be a valid pointer to a `VkSurfaceKHR` handle

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_NATIVE_WINDOW_IN_USE_KHR

The `VkViSurfaceCreateInfoNN` structure is defined as:

```c
// Provided by VK_NN_vi_surface
typedef struct VkViSurfaceCreateInfoNN {
    VkStructureType sType;
    const void* pNext;
    VkViSurfaceCreateFlagsNN flags;
    void* window;
} VkViSurfaceCreateInfoNN;
```

- `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.
• `flags` is reserved for future use.
• `window` is the `nn::vi::NativeWindowHandle` for the `nn::vi::Layer` with which to associate the surface.

**Valid Usage**

- VUID-VkViSurfaceCreateInfoNN-window-01318  
  `window` must be a valid `nn::vi::NativeWindowHandle`

**Valid Usage (Implicit)**

- VUID-VkViSurfaceCreateInfoNN-sType-sType  
  `sType` must be `VK_STRUCTURE_TYPE_VI_SURFACE_CREATE_INFO_NN`
- VUID-VkViSurfaceCreateInfoNN-pNext-pNext  
  `pNext` must be NULL
- VUID-VkViSurfaceCreateInfoNN-flags-zerobitmask  
  `flags` must be 0

// Provided by VK_NN_vi_surface  
typedef VkFlags VkViSurfaceCreateFlagsNN;

`VkViSurfaceCreateFlagsNN` is a bitmask type for setting a mask, but is currently reserved for future use.

### 34.2.12. Metal Platform

To create a `VkSurfaceKHR` object for a `CAMetalLayer`, call:

// Provided by VK_EXT_metal_surface  
VkResult vkCreateMetalSurfaceEXT(  
   VkInstance instance,  
   const VkMetalSurfaceCreateInfoEXT* pCreateInfo,  
   const VkAllocationCallbacks* pAllocator,  
   VkSurfaceKHR* pSurface);

- `instance` is the instance with which to associate the surface.
- `pCreateInfo` is a pointer to a `VkMetalSurfaceCreateInfoEXT` structure specifying parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.
Valid Usage (Implicit)

- VUID-vkCreateMetalSurfaceEXT-instance-parameter
  instance must be a valid VkInstance handle

- VUID-vkCreateMetalSurfaceEXT-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkMetalSurfaceCreateInfoEXT structure

- VUID-vkCreateMetalSurfaceEXT-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateMetalSurfaceEXT-pSurface-parameter
  pSurface must be a valid pointer to a VkSurfaceKHR handle

Return Codes

Success
  - VK_SUCCESS

Failure
  - VK_ERROR_OUT_OF_HOST_MEMORY
  - VK_ERROR_OUT_OF_DEVICE_MEMORY
  - VK_ERROR_NATIVE_WINDOW_IN_USE_KHR

The VkMetalSurfaceCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_metal_surface
typedef struct VkMetalSurfaceCreateInfoEXT {
  VkStructureType sType;
  const void* pNext;
  VkMetalSurfaceCreateFlagsEXT flags;
  const CAMetalLayer* pLayer;
} VkMetalSurfaceCreateInfoEXT;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **pLayer** is a reference to a CAMetalLayer object representing a renderable surface.

Valid Usage (Implicit)

- VUID-VkMetalSurfaceCreateInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_METAL_SURFACE_CREATE_INFO_EXT
To remove an unnecessary compile time dependency, an incomplete type definition of `CAMetalLayer` is provided in the Vulkan headers:

```c
// Provided by VK_EXT_metal_surface
#ifdef __OBJC__
@class CAMetalLayer;
#else
typedef void CAMetalLayer;
#endif
```

The actual `CAMetalLayer` type is defined in the QuartzCore framework.

```c
// Provided by VK_EXT_metal_surface
typedef VkFlags VkMetalSurfaceCreateFlagsEXT;
```

`VkMetalSurfaceCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

### 34.2.13. QNX Screen Platform

To create a `VkSurfaceKHR` object for a QNX Screen surface, call:

```c
// Provided by VK_QNX_screen_surface
VkResult vkCreateScreenSurfaceQNX(
    VkInstance instance, const VkScreenSurfaceCreateInfoQNX* pCreateInfo, const VkAllocationCallbacks* pAllocator, VkSurfaceKHR* pSurface);
```

- **instance** is the instance to associate the surface with.
- **pCreateInfo** is a pointer to a `VkScreenSurfaceCreateInfoQNX` structure containing parameters affecting the creation of the surface object.
- **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- **pSurface** is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateScreenSurfaceQNX-instance-parameter

---

2854
instance must be a valid VkInstance handle

- VUID-vkCreateScreenSurfaceQNX-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkScreenSurfaceCreateInfoQNX structure

- VUID-vkCreateScreenSurfaceQNX-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateScreenSurfaceQNX-pSurface-parameter
  pSurface must be a valid pointer to a VkSurfaceKHR handle

**Return Codes**

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkScreenSurfaceCreateInfoQNX structure is defined as:

```c
typedef struct VkScreenSurfaceCreateInfoQNX {
    VkStructureType sType;
    const void* pNext;
    VkScreenSurfaceCreateFlagsQNX flags;
    struct _screen_context* context;
    struct _screen_window* window;
} VkScreenSurfaceCreateInfoQNX;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is reserved for future use.
- context and window are QNX Screen context and window to associate the surface with.

**Valid Usage**

- VUID-VkScreenSurfaceCreateInfoQNX-context-04741
  context must point to a valid QNX Screen struct _screen_context

- VUID-VkScreenSurfaceCreateInfoQNX-window-04742
  window must point to a valid QNX Screen struct _screen_window
Valid Usage (Implicit)

- VUID-VkScreenSurfaceCreateInfoQNX-sType-sType
  sType must be VK_STRUCTURE_TYPE_SCREEN_SURFACE_CREATE_INFO_QNX
- VUID-VkScreenSurfaceCreateInfoQNX-pNext-pNext
  pNext must be NULL
- VUID-VkScreenSurfaceCreateInfoQNX-flags-zerobitmask
  flags must be 0

```c
// Provided by VK_QNX_screen_surface
typedef VkFlags VkScreenSurfaceCreateFlagsQNX;
```

VkScreenSurfaceCreateFlagsQNX is a bitmask type for setting a mask, but is currently reserved for future use.

### 34.2.14. Platform-Independent Information

Once created, VkSurfaceKHR objects can be used in this and other extensions, in particular the VK_KHR_swapchain extension.

Several WSI functions return VK_ERROR_SURFACE_LOST_KHR if the surface becomes no longer available. After such an error, the surface (and any child swapchain, if one exists) should be destroyed, as there is no way to restore them to a not-lost state. Applications may attempt to create a new VkSurfaceKHR using the same native platform window object, but whether such re-creation will succeed is platform-dependent and may depend on the reason the surface became unavailable. A lost surface does not otherwise cause devices to be lost.

To destroy a VkSurfaceKHR object, call:

```c
// Provided by VK_KHR_surface
void vkDestroySurfaceKHR(  
    VkInstance instance,  
    VkSurfaceKHR surface,  
    const VkAllocationCallbacks* pAllocator);
```

- instance is the instance used to create the surface.
- surface is the surface to destroy.
- pAllocator is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).

Destroying a VkSurfaceKHR merely severs the connection between Vulkan and the native surface, and does not imply destroying the native surface, closing a window, or similar behavior.
Valid Usage

- VUID-vkDestroySurfaceKHR-surface-01266
  All VkSwapchainKHR objects created for surface must have been destroyed prior to destroying surface

- VUID-vkDestroySurfaceKHR-surface-01267
  If VkAllocationCallbacks were provided when surface was created, a compatible set of callbacks must be provided here

- VUID-vkDestroySurfaceKHR-surface-01268
  If no VkAllocationCallbacks were provided when surface was created, pAllocator must be NULL

Valid Usage (Implicit)

- VUID-vkDestroySurfaceKHR-instance-parameter
  instance must be a valid VkInstance handle

- VUID-vkDestroySurfaceKHR-surface-parameter
  If surface is not VK_NULL_HANDLE, surface must be a valid VkSurfaceKHR handle

- VUID-vkDestroySurfaceKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroySurfaceKHR-surface-parent
  If surface is a valid handle, it must have been created, allocated, or retrieved from instance

Host Synchronization

- Host access to surface must be externally synchronized

34.3. Presenting Directly to Display Devices

In some environments applications can also present Vulkan rendering directly to display devices without using an intermediate windowing system. This can be useful for embedded applications, or implementing the rendering/presentation backend of a windowing system using Vulkan. The VK_KHR_display extension provides the functionality necessary to enumerate display devices and create VkSurfaceKHR objects that target displays.

34.3.1. Display Enumeration

Displays are represented by VkDisplayKHR handles:

```// Provided by VK_KHR_display```
Various functions are provided for enumerating the available display devices present on a Vulkan physical device. To query information about the available displays, call:

```c
// Provided by VK_KHR_display
VkResult vkGetPhysicalDeviceDisplayPropertiesKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pPropertyCount,
    VkDisplayPropertiesKHR* pProperties);
```

- `physicalDevice` is a physical device.
- `pPropertyCount` is a pointer to an integer related to the number of display devices available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayPropertiesKHR` structures.

If `pProperties` is `NULL`, then the number of display devices available for `physicalDevice` is returned in `pPropertyCount`. Otherwise, `pPropertyCount` must point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If the value of `pPropertyCount` is less than the number of display devices for `physicalDevice`, at most `pPropertyCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available properties were returned.

### Valid Usage (Implicit)
- `VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-physicalDevice-parameter` `physicalDevice` must be a valid `VkPhysicalDevice` handle
- `VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-pPropertyCount-parameter` `pPropertyCount` must be a valid pointer to a `uint32_t` value
- `VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-pProperties-parameter` If the value referenced by `pPropertyCount` is not `0`, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkDisplayPropertiesKHR` structures

### Return Codes

**Success**
- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
The `VkDisplayPropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayPropertiesKHR {
    VkDisplayKHR display;
    const char* displayName;
    VkExtent2D physicalDimensions;
    VkExtent2D physicalResolution;
    VkSurfaceTransformFlagsKHR supportedTransforms;
    VkBool32 planeReorderPossible;
    VkBool32 persistentContent;
} VkDisplayPropertiesKHR;
```

- **display** is a handle that is used to refer to the display described here. This handle will be valid for the lifetime of the Vulkan instance.

- **displayName** is NULL or a pointer to a null-terminated UTF-8 string containing the name of the display. Generally, this will be the name provided by the display’s EDID. If NULL, no suitable name is available. If not NULL, the string pointed to must remain accessible and unmodified as long as display is valid.

- **physicalDimensions** describes the physical width and height of the visible portion of the display, in millimeters.

- **physicalResolution** describes the physical, native, or preferred resolution of the display.

  **Note**
  For devices which have no natural value to return here, implementations should return the maximum resolution supported.

- **supportedTransforms** is a bitmask of `VkSurfaceTransformFlagBitsKHR` describing which transforms are supported by this display.

- **planeReorderPossible** tells whether the planes on this display can have their z order changed. If this is VK_TRUE, the application can re-arrange the planes on this display in any order relative to each other.

- **persistentContent** tells whether the display supports self-refresh/internal buffering. If this is true, the application can submit persistent present operations on swapchains created against this display.

  **Note**
  Persistent presents may have higher latency, and may use less power when the screen content is updated infrequently, or when only a portion of the screen needs to be updated in most frames.

To query information about the available displays, call:

```c
// Provided by VK_KHR_get_display_properties2
VkResult vkGetPhysicalDeviceDisplayProperties2KHR(
```

```c```
VkPhysicalDevice
uint32_t*
pPropertyCount,
VkDisplayProperties2KHR*
pProperties);

- `physicalDevice` is a physical device.
- `pPropertyCount` is a pointer to an integer related to the number of display devices available or queried, as described below.
- `pProperties` is either NULL or a pointer to an array of `VkDisplayProperties2KHR` structures.

`vkGetPhysicalDeviceDisplayProperties2KHR` behaves similarly to `vkGetPhysicalDeviceDisplayPropertiesKHR`, with the ability to return extended information via chained output structures.

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDisplayProperties2KHR-physicalDevice-parameter `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceDisplayProperties2KHR-pPropertyCount-parameter `pPropertyCount` must be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceDisplayProperties2KHR-pProperties-parameter If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not NULL, `pProperties` must be a valid pointer to an array of `VkDisplayProperties2KHR` structures

### Return Codes

**Success**
- VK_SUCCESS
- VK_INCOMPLETE

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkDisplayProperties2KHR` structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayProperties2KHR {
    VkStructureType sType;
    void* pNext;
    VkDisplayPropertiesKHR displayProperties;
} VkDisplayProperties2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.

• displayProperties is a VkDisplayPropertiesKHR structure.

Valid Usage (Implicit)

• VUID-VkDisplayProperties2KHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DISPLAY_PROPERTIES_2_KHR

• VUID-VkDisplayProperties2KHR-pNext-pNext
  pNext must be NULL

Acquiring and Releasing Displays

On some platforms, access to displays is limited to a single process or native driver instance. On such platforms, some or all of the displays may not be available to Vulkan if they are already in use by a native windowing system or other application.

To acquire permission to directly access a display in Vulkan from an X11 server, call:

```c
// Provided by VK_EXT_acquire_xlib_display
VkResult vkAcquireXlibDisplayEXT(
  VkPhysicalDevice physicalDevice,  // The physical device the display is on.
  Display* dpy,                     // A connection to the X11 server that currently owns display.
  VkDisplayKHR display);            // The display the caller wishes to control in Vulkan.
```

All permissions necessary to control the display are granted to the Vulkan instance associated with `physicalDevice` until the display is released or the X11 connection specified by `dpy` is terminated. Permission to access the display may be temporarily revoked during periods when the X11 server from which control was acquired itself loses access to `display`. During such periods, operations which require access to the display must fail with an appropriate error code. If the X11 server associated with `dpy` does not own `display`, or if permission to access it has already been acquired by another entity, the call must return the error code `VK_ERROR_INITIALIZATION_FAILED`.

**Note**

One example of when an X11 server loses access to a display is when it loses ownership of its virtual terminal.

Valid Usage (Implicit)

• VUID-vkAcquireXlibDisplayEXT-physicalDevice-parameter
  `physicalDevice` must be a valid VkPhysicalDevice handle
Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_INITIALIZATION_FAILED

When acquiring displays from an X11 server, an application may also wish to enumerate and identify them using a native handle rather than a VkDisplayKHR handle. To determine the VkDisplayKHR handle corresponding to an X11 RandR Output, call:

```c
// Provided by VK_EXT_acquire_xlib_display
VkResult vkGetRandROutputDisplayEXT(
    VkPhysicalDevice physicalDevice,
    Display* dpy,
    RROutput rrOutput,
    VkDisplayKHR* pDisplay);
```

- `physicalDevice` The physical device to query the display handle on.
- `dpy` A connection to the X11 server from which `rrOutput` was queried.
- `rrOutput` An X11 RandR output ID.
- `pDisplay` The corresponding VkDisplayKHR handle will be returned here.

If there is no VkDisplayKHR corresponding to `rrOutput` on `physicalDevice`, `VK_NULL_HANDLE` must be returned in `pDisplay`.

Valid Usage (Implicit)

- VUID-vkGetRandROutputDisplayEXT-physicalDevice-parameter `physicalDevice` must be a valid VkPhysicalDevice handle
- VUID-vkGetRandROutputDisplayEXT-dpy-parameter `dpy` must be a valid pointer to a Display value
- VUID-vkGetRandROutputDisplayEXT-pDisplay-parameter `pDisplay` must be a valid pointer to a VkDisplayKHR handle
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY

To acquire permission to directly access a display in Vulkan on Windows 10, call:

```c
// Provided by VK_NV_acquire_winrt_display
VkResult vkAcquireWinrtDisplayNV(
    VkPhysicalDevice physicalDevice,
    VkDisplayKHR display);
```

• physicalDevice The physical device the display is on.
• display The display the caller wishes to control in Vulkan.

All permissions necessary to control the display are granted to the Vulkan instance associated with `physicalDevice` until the display is released or the application is terminated. Permission to access the display may be revoked by events that cause Windows 10 itself to lose access to `display`. If this has happened, operations which require access to the display must fail with an appropriate error code. If permission to access `display` has already been acquired by another entity, the call must return the error code `VK_ERROR_INITIALIZATION_FAILED`.

**Note**
The Vulkan instance acquires control of a “winrt::Windows::Devices::Display::Core::DisplayTarget” by performing an operation equivalent to “winrt::Windows::Devices::Display::Core::DisplayManager.TryAcquireTarget()” on the “DisplayTarget”.

**Note**
One example of when Windows 10 loses access to a display is when the display is hot-unplugged.

**Note**
One example of when a display has already been acquired by another entity is when the Windows desktop compositor (DWM) is in control of the display. Beginning with Windows 10 version 2004 it is possible to cause DWM to release a display by using the “Advanced display settings” sub-page of the “Display settings” control panel. `vkAcquireWinrtDisplayNV` does not itself cause DWM to release a display; this action must be performed outside of Vulkan.
Valid Usage (Implicit)

• VUID-vkAcquireWinrtDisplayNV-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

• VUID-vkAcquireWinrtDisplayNV-display-parameter
  display must be a valid VkDisplayKHR handle

• VUID-vkAcquireWinrtDisplayNV-display-parent
  display must have been created, allocated, or retrieved from physicalDevice

Return Codes

Success
  • VK_SUCCESS

Failure
  • VK_ERROR_OUT_OF_HOST_MEMORY
  • VK_ERROR_DEVICE_LOST
  • VK_ERROR_INITIALIZATION_FAILED

When acquiring displays on Windows 10, an application may also wish to enumerate and identify them using a native handle rather than a VkDisplayKHR handle.

To determine the VkDisplayKHR handle corresponding to a “winrt::Windows::Devices::Display::Core::DisplayTarget”, call:

```c
// Provided by VK_NV_acquire_winrt_display
VkResult vkGetWinrtDisplayNV(
    VkPhysicalDevice physicalDevice,
    uint32_t deviceRelativeId,
    VkDisplayKHR* pDisplay);
```

• physicalDevice The physical device on which to query the display handle.

• deviceRelativeId The value of the “AdapterRelativeId” property of a “DisplayTarget” that is enumerated by a “DisplayAdapter” with an “Id” property matching the deviceId property of a VkPhysicalDeviceIDProperties for physicalDevice.

• pDisplay The corresponding VkDisplayKHR handle will be returned here.

If there is no VkDisplayKHR corresponding to deviceRelativeId on physicalDevice, VK_NULL_HANDLE must be returned in pDisplay.

Valid Usage (Implicit)

• VUID-vkGetWinrtDisplayNV-physicalDevice-parameter
physicalDevice must be a valid VkPhysicalDevice handle

- VUID-vkGetWinrtDisplayNV-pDisplay-parameter
  pDisplay must be a valid pointer to a VkDisplayKHR handle

## Return Codes

### Success
- VK_SUCCESS

### Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_INITIALIZATION_FAILED

To acquire permission to directly a display in Vulkan from the Direct Rendering Manager (DRM) interface, call:

```c
// Provided by VK_EXT_acquire_drm_display
VkResult vkAcquireDrmDisplayEXT(VkPhysicalDevice physicalDevice,
                                 int32_t drmFd,
                                 VkDisplayKHR display);
```

- **physicalDevice** The physical device the display is on.
- **drmFd** DRM primary file descriptor.
- **display** The display the caller wishes Vulkan to control.

All permissions necessary to control the display are granted to the Vulkan instance associated with the provided **physicalDevice** until the display is either released or the connector is unplugged. The provided **drmFd** must correspond to the one owned by the **physicalDevice**. If not, the error code **VK_ERROR_UNKNOWN** must be returned. The DRM FD must have DRM master permissions. If any error is encountered during the acquisition of the display, the call must return the error code **VK_ERROR_INITIALIZATION_FAILED**.

The provided DRM fd should not be closed before the display is released, attempting to do it may result in undefined behaviour.

## Valid Usage (Implicit)

- VUID-vkAcquireDrmDisplayEXT-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

- VUID-vkAcquireDrmDisplayEXT-display-parameter
  display must be a valid VkDisplayKHR handle
Before acquiring a display from the DRM interface, the caller may want to select a specific VkDisplayKHR handle by identifying it using a connectorId. To do so, call:

```c
// Provided by VK_EXT_acquire_drm_display
VkResult vkGetDrmDisplayEXT(
    VkPhysicalDevice physicalDevice,  
    int32_t drmFd,  
    uint32_t connectorId,  
    VkDisplayKHR* display);
```

- **physicalDevice** The physical device to query the display from.
- **drmFd** DRM primary file descriptor.
- **connectorId** Identifier of the specified DRM connector.
- **display** The corresponding VkDisplayKHR handle will be returned here.

If there is no VkDisplayKHR corresponding to the connectorId on the physicalDevice, the returning display must be set to VK_NULL_HANDLE. The provided drmFd must correspond to the one owned by the physicalDevice. If not, the error code VK_ERROR_UNKNOWN must be returned. Master permissions are not required, because the file descriptor is just used for information gathering purposes. The given connectorId must be a resource owned by the provided drmFd. If not, the error code VK_ERROR_UNKNOWN must be returned. If any error is encountered during the identification of the display, the call must return the error code VK_ERROR_INITIALIZATION_FAILED.

### Valid Usage (Implicit)

- VUID-vkAcquireDrmDisplayEXT-display-parent
  display **must** have been created, allocated, or retrieved from physicalDevice

### Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_INITIALIZATION_FAILED

Valid Usage (Implicit)

- VUID-vkGetDrmDisplayEXT-physicalDevice-parameter
  physicalDevice **must** be a valid VkPhysicalDevice handle

- VUID-vkGetDrmDisplayEXT-display-parameter
  display **must** be a valid pointer to a VkDisplayKHR handle
Return Codes

Success
  • VK_SUCCESS

Failure
  • VK_ERROR_INITIALIZATION_FAILED
  • VK_ERROR_OUT_OF_HOST_MEMORY

To release a previously acquired display, call:

```cpp
// Provided by VK_EXT_direct_mode_display
VkResult vkReleaseDisplayEXT(
    VkPhysicalDevice physicalDevice,
    VkDisplayKHR display);
```

- `physicalDevice` The physical device the display is on.
- `display` The display to release control of.

Valid Usage (Implicit)

- VUID-vkReleaseDisplayEXT-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- VUID-vkReleaseDisplayEXT-display-parameter
  `display` must be a valid `VkDisplayKHR` handle

- VUID-vkReleaseDisplayEXT-display-parent
  `display` must have been created, allocated, or retrieved from `physicalDevice`

Return Codes

Success
  • VK_SUCCESS

Display Planes

Images are presented to individual planes on a display. Devices **must** support at least one plane on each display. Planes **can** be stacked and blended to composite multiple images on one display. Devices **may** support only a fixed stacking order and fixed mapping between planes and displays, or they **may** allow arbitrary application specified stacking orders and mappings between planes and displays. To query the properties of device display planes, call:

```cpp
// Provided by VK_KHR_display
```
VkResult vkGetPhysicalDeviceDisplayPlanePropertiesKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pPropertyCount,
    VkDisplayPlanePropertiesKHR* pProperties);

- `physicalDevice` is a physical device.
- `pPropertyCount` is a pointer to an integer related to the number of display planes available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayPlanePropertiesKHR` structures.

If `pProperties` is `NULL`, then the number of display planes available for `physicalDevice` is returned in `pPropertyCount`. Otherwise, `pPropertyCount` must point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If the value of `pPropertyCount` is less than the number of display planes for `physicalDevice`, at most `pPropertyCount` structures will be written.

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-physicalDevice-parameter `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-pPropertyCount-parameter `pPropertyCount` must be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-pProperties-parameter If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkDisplayPlanePropertiesKHR` structures

**Return Codes**

**Success**
- VK_SUCCESS
- VK_INCOMPLETE

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkDisplayPlanePropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayPlanePropertiesKHR {
    VkDisplayKHR currentDisplay;
    uint32_t currentStackIndex;
} VkDisplayPlanePropertiesKHR;
```
VkDisplayPlanePropertiesKHR;

- `currentDisplay` is the handle of the display the plane is currently associated with. If the plane is not currently attached to any displays, this will be `VK_NULL_HANDLE`.
- `currentStackIndex` is the current z-order of the plane. This will be between 0 and the value returned by `vkGetPhysicalDeviceDisplayPlanePropertiesKHR` in `pPropertyCount`.

To query the properties of a device's display planes, call:

```c
// Provided by VK_KHR_get_display_properties2
VkResult vkGetPhysicalDeviceDisplayPlaneProperties2KHR(
    VkPhysicalDevice physicalDevice,  
    uint32_t* pPropertyCount,         
    VkDisplayPlaneProperties2KHR* pProperties);
```

- `physicalDevice` is a physical device.
- `pPropertyCount` is a pointer to an integer related to the number of display planes available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayPlaneProperties2KHR` structures.

`vkGetPhysicalDeviceDisplayPlaneProperties2KHR` behaves similarly to `vkGetPhysicalDeviceDisplayPlanePropertiesKHR`, with the ability to return extended information via chained output structures.

**Valid Usage (Implicit)**

- `VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-physicalDevice-parameter` physicalDevice must be a valid `VkPhysicalDevice` handle
- `VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-pPropertyCount-parameter` pPropertyCount must be a valid pointer to a `uint32_t` value
- `VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-pProperties-parameter` If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkDisplayPlaneProperties2KHR` structures

**Return Codes**

**Success**
- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
The `VkDisplayPlaneProperties2KHR` structure is defined as:

```c
typedef struct VkDisplayPlaneProperties2KHR {
    VkStructureType sType;
    void* pNext;
    VkDisplayPlanePropertiesKHR displayPlaneProperties;
} VkDisplayPlaneProperties2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `displayPlaneProperties` is a `VkDisplayPlanePropertiesKHR` structure.

### Valid Usage (Implicit)

- `VUID-VkDisplayPlaneProperties2KHR-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_DISPLAY_PLANE_PROPERTIES_2_KHR`

- `VUID-VkDisplayPlaneProperties2KHR-pNext-pNext`  
  `pNext` must be `NULL`

To determine which displays a plane is usable with, call

```c
// Provided by VK_KHR_display
VkResult vkGetDisplayPlaneSupportedDisplaysKHR(
    VkPhysicalDevice           physicalDevice,
    uint32_t                   planeIndex,
    uint32_t*                  pDisplayCount,
    VkDisplayKHR*              pDisplays);
```

- `physicalDevice` is a physical device.
- `planeIndex` is the plane which the application wishes to use, and **must** be in the range [0, physical device plane count - 1].
- `pDisplayCount` is a pointer to an integer related to the number of displays available or queried, as described below.
- `pDisplays` is either `NULL` or a pointer to an array of `VkDisplayKHR` handles.

If `pDisplays` is `NULL`, then the number of displays usable with the specified `planeIndex` for `physicalDevice` is returned in `pDisplayCount`. Otherwise, `pDisplayCount` **must** point to a variable set by the user to the number of elements in the `pDisplays` array, and on return the variable is overwritten with the number of handles actually written to `pDisplays`. If the value of `pDisplayCount` is less than the number of usable display-plane pairs for `physicalDevice`, at most `pDisplayCount`
handles will be written, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available pairs were returned.

### Valid Usage

- **VUID-vkGetDisplayPlaneSupportedDisplaysKHR-planeIndex-01249**
  
  `planeIndex` **must** be less than the number of display planes supported by the device as determined by calling `vkGetPhysicalDeviceDisplayPlanePropertiesKHR`.

### Valid Usage (Implicit)

- **VUID-vkGetDisplayPlaneSupportedDisplaysKHR-physicalDevice-parameter**
  
  `physicalDevice` **must** be a valid `VkPhysicalDevice` handle.

- **VUID-vkGetDisplayPlaneSupportedDisplaysKHR-pDisplayCount-parameter**
  
  `pDisplayCount` **must** be a valid pointer to a `uint32_t` value.

- **VUID-vkGetDisplayPlaneSupportedDisplaysKHR-pDisplays-parameter**
  
  If the value referenced by `pDisplayCount` is not `0`, and `pDisplays` is not `NULL`, `pDisplays` **must** be a valid pointer to an array of `pDisplayCount` `VkDisplayKHR` handles.

### Return Codes

#### Success

- **VK_SUCCESS**
- **VK_INCOMPLETE**

#### Failure

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

Additional properties of displays are queried using specialized query functions.

### Display Modes

Display modes are represented by `VkDisplayModeKHR` handles:

```c
// Provided by VK_KHR_display
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDisplayModeKHR)
```

Each display has one or more supported modes associated with it by default. These built-in modes are queried by calling:

```c
// Provided by VK_KHR_display
VkResult vkGetDisplayModePropertiesKHR(
```
VkPhysicalDevice
VkDisplayKHR
uint32_t*
VkDisplayModePropertiesKHR*

• **physicalDevice** is the physical device associated with **display**.
• **display** is the display to query.
• **pPropertyCount** is a pointer to an integer related to the number of display modes available or queried, as described below.
• **pProperties** is either **NULL** or a pointer to an array of **VkDisplayModePropertiesKHR** structures.

If **pProperties** is **NULL**, then the number of display modes available on the specified **display** for **physicalDevice** is returned in **pPropertyCount**. Otherwise, **pPropertyCount** must point to a variable set by the user to the number of elements in the **pProperties** array, and on return the variable is overwritten with the number of structures actually written to **pProperties**. If the value of **pPropertyCount** is less than the number of display modes for **physicalDevice**, at most **pPropertyCount** structures will be written, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available display modes were returned.

**Valid Usage (Implicit)**

- VUID-vkGetDisplayModePropertiesKHR-physicalDevice-parameter **physicalDevice** must be a valid **VkPhysicalDevice** handle
- VUID-vkGetDisplayModePropertiesKHR-display-parameter **display** must be a valid **VkDisplayKHR** handle
- VUID-vkGetDisplayModePropertiesKHR-pPropertyCount-parameter **pPropertyCount** must be a valid pointer to a **uint32_t** value
- VUID-vkGetDisplayModePropertiesKHR-pProperties-parameter If the value referenced by **pPropertyCount** is not 0, and **pProperties** is not **NULL**, **pProperties** must be a valid pointer to an array of **pPropertyCount** **VkDisplayModePropertiesKHR** structures
- VUID-vkGetDisplayModePropertiesKHR-display-parent **display** must have been created, allocated, or retrieved from **physicalDevice**

**Return Codes**

**Success**
- **VK_SUCCESS**
- **VK_INCOMPLETE**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
The `VkDisplayModePropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayModePropertiesKHR {
    VkDisplayModeKHR displayMode;
    VkDisplayModeParametersKHR parameters;
} VkDisplayModePropertiesKHR;
```

- `displayMode` is a handle to the display mode described in this structure. This handle will be valid for the lifetime of the Vulkan instance.
- `parameters` is a `VkDisplayModeParametersKHR` structure describing the display parameters associated with `displayMode`.

`VkDisplayModeCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

To query the properties of a device’s built-in display modes, call:

```c
// Provided by VK_KHR_get_display_properties2
VkResult vkGetDisplayModeProperties2KHR(
    VkPhysicalDevice physicalDevice,
    VkDisplayKHR display,
    uint32_t* pPropertyCount,  // pPropertyCount is a pointer to an integer related to the number of display modes available or queried, as described below.
    VkDisplayModeProperties2KHR* pProperties);  // pProperties is either NULL or a pointer to an array of VkDisplayModeProperties2KHR structures.
```

- `physicalDevice` is the physical device associated with `display`.
- `display` is the display to query.
- `pPropertyCount` is a pointer to an integer related to the number of display modes available or queried, as described below.
- `pProperties` is either NULL or a pointer to an array of `VkDisplayModeProperties2KHR` structures.

`vkGetDisplayModeProperties2KHR` behaves similarly to `vkGetDisplayModePropertiesKHR`, with the ability to return extended information via chained output structures.

### Valid Usage (Implicit)

- VUID-vkGetDisplayModeProperties2KHR-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetDisplayModeProperties2KHR-display-parameter
  `display` must be a valid `VkDisplayKHR` handle
- VUID-vkGetDisplayModeProperties2KHR-pPropertyCount-parameter
  `pPropertyCount` must be a valid integer value
pPropertyCount must be a valid pointer to a uint32_t value

• VUID-vkGetDisplayModeProperties2KHR-pProperties-parameter
  If the value referenced by pPropertyCount is not 0, and pProperties is not NULL, pProperties must be a valid pointer to an array of pPropertyCount VkDisplayModeProperties2KHR structures

• VUID-vkGetDisplayModeProperties2KHR-display-parent
display must have been created, allocated, or retrieved from physicalDevice

Return Codes

Success
• VK_SUCCESS
• VK_INCOMPLETE

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkDisplayModeProperties2KHR structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayModeProperties2KHR {
    VkStructureType sType;
    void* pNext;
    VkDisplayModePropertiesKHR displayModeProperties;
} VkDisplayModeProperties2KHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• displayModeProperties is a VkDisplayModePropertiesKHR structure.

Valid Usage (Implicit)

• VUID-VkDisplayModeProperties2KHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DISPLAY_MODE_PROPERTIES_2_KHR

• VUID-VkDisplayModeProperties2KHR-pNext-pNext
  pNext must be NULL

The VkDisplayModeParametersKHR structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayModeParametersKHR {
```
• `visibleRegion` is the 2D extents of the visible region.
• `refreshRate` is a `uint32_t` that is the number of times the display is refreshed each second multiplied by 1000.

**Note**
For example, a 60Hz display mode would report a `refreshRate` of 60,000.

### Valid Usage

- VUID-VkDisplayModeParametersKHR-width-01990
  The `width` member of `visibleRegion` must be greater than 0
- VUID-VkDisplayModeParametersKHR-height-01991
  The `height` member of `visibleRegion` must be greater than 0
- VUID-VkDisplayModeParametersKHR-refreshRate-01992
  `refreshRate` must be greater than 0

Additional modes may also be created by calling:

```c
// Provided by VK_KHR_display
VkResult vkCreateDisplayModeKHR(
    VkPhysicalDevice physicalDevice, 
    VkDisplayKHR display, 
    const VkDisplayModeCreateInfoKHR* pCreateInfo, 
    const VkAllocationCallbacks* pAllocator, 
    VkDisplayModeKHR* pMode);
```

- `physicalDevice` is the physical device associated with `display`.
- `display` is the display to create an additional mode for.
- `pCreateInfo` is a pointer to a `VkDisplayModeCreateInfoKHR` structure describing the new mode to create.
- `pAllocator` is the allocator used for host memory allocated for the display mode object when there is no more specific allocator available (see Memory Allocation).
- `pMode` is a pointer to a `VkDisplayModeKHR` handle in which the mode created is returned.

### Valid Usage (Implicit)

- VUID-vkCreateDisplayModeKHR-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle
• VUID-vkCreateDisplayModeKHR-display-parameter
display must be a valid VkDisplayKHR handle

• VUID-vkCreateDisplayModeKHR-pCreateInfo-parameter
pCreateInfo must be a valid pointer to a valid VkDisplayModeCreateInfoKHR structure

• VUID-vkCreateDisplayModeKHR-pAllocator-parameter
If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkCreateDisplayModeKHR-pMode-parameter
pMode must be a valid pointer to a VkDisplayModeKHR handle

• VUID-vkCreateDisplayModeKHR-display-parent
display must have been created, allocated, or retrieved from physicalDevice

**Host Synchronization**

• Host access to display must be externally synchronized

**Return Codes**

**Success**

• VK_SUCCESS

**Failure**

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_INITIALIZATION_FAILED

The VkDisplayModeCreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayModeCreateInfoKHR {
    VkStructureType sType;
    const void*pNext;
    VkDisplayModeCreateFlagsKHR flags;
    VkDisplayModeParametersKHR parameters;
} VkDisplayModeCreateInfoKHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• flags is reserved for future use, and must be zero.
• parameters is a VkDisplayModeParametersKHR structure describing the display parameters to use in creating the new mode. If the parameters are not compatible with the specified display,
the implementation must return VK_ERROR_INITIALIZATION_FAILED.

Valid Usage (Implicit)

- VUID-VkDisplayModeCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DISPLAY_MODE_CREATE_INFO_KHR

- VUID-VkDisplayModeCreateInfoKHR-pNext-pNext
  pNext must be NULL

- VUID-VkDisplayModeCreateInfoKHR-flags-zerobitmask
  flags must be 0

- VUID-VkDisplayModeCreateInfoKHR-parameters-parameter
  parameters must be a valid VkDisplayModeParametersKHR structure

Applications that wish to present directly to a display must select which layer, or “plane” of the display they wish to target, and a mode to use with the display. Each display supports at least one plane. The capabilities of a given mode and plane combination are determined by calling:

```c
// Provided by VK_KHR_display
VkResult vkGetDisplayPlaneCapabilitiesKHR(
    VkPhysicalDevice physicalDevice,
    VkDisplayModeKHR mode,
    uint32_t planeIndex,
    VkDisplayPlaneCapabilitiesKHR* pCapabilities);
```

- physicalDevice is the physical device associated with the display specified by mode
- mode is the display mode the application intends to program when using the specified plane. Note this parameter also implicitly specifies a display.
- planeIndex is the plane which the application intends to use with the display, and is less than the number of display planes supported by the device.
- pCapabilities is a pointer to a VkDisplayPlaneCapabilitiesKHR structure in which the capabilities are returned.

Valid Usage (Implicit)

- VUID-vkGetDisplayPlaneCapabilitiesKHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

- VUID-vkGetDisplayPlaneCapabilitiesKHR-mode-parameter
  mode must be a valid VkDisplayModeKHR handle

- VUID-vkGetDisplayPlaneCapabilitiesKHR-pCapabilities-parameter
  pCapabilities must be a valid pointer to a VkDisplayPlaneCapabilitiesKHR structure

- VUID-vkGetDisplayPlaneCapabilitiesKHR-mode-parent
  mode must have been created, allocated, or retrieved from physicalDevice
Host Synchronization

- Host access to mode must be externally synchronized

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkDisplayPlaneCapabilitiesKHR structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayPlaneCapabilitiesKHR {
    VkDisplayPlaneAlphaFlagsKHR supportedAlpha;
    VkOffset2D minSrcPosition;
    VkOffset2D maxSrcPosition;
    VkOffset2D minSrcExtent;
    VkOffset2D maxSrcExtent;
    VkOffset2D minDstPosition;
    VkOffset2D maxDstPosition;
    VkExtent2D minSrcExtent;
    VkExtent2D maxSrcExtent;
    VkExtent2D minDstExtent;
    VkExtent2D maxDstExtent;
} VkDisplayPlaneCapabilitiesKHR;
```

- supportedAlpha is a bitmask of VkDisplayPlaneAlphaFlagBitsKHR describing the supported alpha blending modes.

- minSrcPosition is the minimum source rectangle offset supported by this plane using the specified mode.

- maxSrcPosition is the maximum source rectangle offset supported by this plane using the specified mode. The x and y components of maxSrcPosition must each be greater than or equal to the x and y components of minSrcPosition, respectively.

- minSrcExtent is the minimum source rectangle size supported by this plane using the specified mode.

- maxSrcExtent is the maximum source rectangle size supported by this plane using the specified mode.

- minDstPosition, maxDstPosition, minDstExtent, maxDstExtent all have similar semantics to their corresponding *Src* equivalents, but apply to the output region within the mode rather than the input region within the source image. Unlike the *Src* offsets, minDstPosition and maxDstPosition may contain negative values.
The minimum and maximum position and extent fields describe the implementation limits, if any, as they apply to the specified display mode and plane. Vendors may support displaying a subset of a swapchain's presentable images on the specified display plane. This is expressed by returning \texttt{minSrcPosition}, \texttt{maxSrcPosition}, \texttt{minSrcExtent}, and \texttt{maxSrcExtent} values that indicate a range of possible positions and sizes which may be used to specify the region within the presentable images that source pixels will be read from when creating a swapchain on the specified display mode and plane.

Vendors may also support mapping the presentable images' content to a subset or superset of the visible region in the specified display mode. This is expressed by returning \texttt{minDstPosition}, \texttt{maxDstPosition}, \texttt{minDstExtent} and \texttt{maxDstExtent} values that indicate a range of possible positions and sizes which may be used to describe the region within the display mode that the source pixels will be mapped to.

Other vendors may support only a 1-1 mapping between pixels in the presentable images and the display mode. This may be indicated by returning (0,0) for \texttt{minSrcPosition}, \texttt{maxSrcPosition}, \texttt{minDstPosition}, and \texttt{maxDstPosition}, and (display mode width, display mode height) for \texttt{minSrcExtent}, \texttt{maxSrcExtent}, \texttt{minDstExtent}, and \texttt{maxDstExtent}.

The value \texttt{supportedAlpha} must contain at least one valid \texttt{VkDisplayPlaneAlphaFlagBitsKHR} bit.

These values indicate the limits of the implementation's individual fields. Not all combinations of values within the offset and extent ranges returned in \texttt{VkDisplayPlaneCapabilitiesKHR} are guaranteed to be supported. Presentation requests specifying unsupported combinations may fail.

To query the capabilities of a given mode and plane combination, call:

```c
// Provided by VK_KHR_get_display_properties2
VkResult vkGetDisplayPlaneCapabilities2KHR(
    VkPhysicalDevice physicalDevice,
    const VkDisplayPlaneInfo2KHR* pDisplayPlaneInfo,
    VkDisplayPlaneCapabilities2KHR* pCapabilities);
```

- \texttt{physicalDevice} is the physical device associated with \texttt{pDisplayPlaneInfo}.
- \texttt{pDisplayPlaneInfo} is a pointer to a \texttt{VkDisplayPlaneInfo2KHR} structure describing the plane and mode.
- \texttt{pCapabilities} is a pointer to a \texttt{VkDisplayPlaneCapabilities2KHR} structure in which the capabilities are returned.

\texttt{vkGetDisplayPlaneCapabilities2KHR} behaves similarly to \texttt{vkGetDisplayPlaneCapabilitiesKHR}, with the ability to specify extended inputs via chained input structures, and to return extended information via chained output structures.

**Valid Usage (Implicit)**

- VUID-vkGetDisplayPlaneCapabilities2KHR-physicalDevice-parameter \texttt{physicalDevice} must be a valid \texttt{VkPhysicalDevice} handle
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkDisplayPlaneInfo2KHR structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayPlaneInfo2KHR {
    VkStructureType sType;
    const void* pNext;
    VkDisplayModeKHR mode;
    uint32_t planeIndex;
} VkDisplayPlaneInfo2KHR;
```

• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `mode` is the display mode the application intends to program when using the specified plane.

**Note**
This parameter also implicitly specifies a display.

• `planeIndex` is the plane which the application intends to use with the display.

The members of `VkDisplayPlaneInfo2KHR` correspond to the arguments to `vkGetDisplayPlaneCapabilitiesKHR`, with `sType` and `pNext` added for extensibility.

Valid Usage (Implicit)

• VUID-VkDisplayPlaneInfo2KHR-sType-sType
  `sType must` be `VK_STRUCTURE_TYPE_DISPLAY_PLANE_INFO_2_KHR`

• VUID-VkDisplayPlaneInfo2KHR-pNext-pNext
  `pNext must` be `NULL`

• VUID-VkDisplayPlaneInfo2KHR-mode-parameter
mode must be a valid VkDisplayModeKHR handle

Host Synchronization

• Host access to mode must be externally synchronized.

The VkDisplayPlaneCapabilities2KHR structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayPlaneCapabilities2KHR {
    VkStructureType sType;
    void* pNext;
    VkDisplayPlaneCapabilitiesKHR capabilities;
} VkDisplayPlaneCapabilities2KHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• capabilities is a VkDisplayPlaneCapabilitiesKHR structure.

Valid Usage (Implicit)

• VUID-VkDisplayPlaneCapabilities2KHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DISPLAY_PLANE_CAPABILITIES_2_KHR
• VUID-VkDisplayPlaneCapabilities2KHR-pNext-pNext
  pNext must be NULL

34.3.2. Display Control

To set the power state of a display, call:

```c
// Provided by VK_EXT_display_control
VkResult vkDisplayPowerControlEXT(
    VkDevice device,
    VkDisplayKHR display,
    const VkDisplayPowerInfoEXT* pDisplayPowerInfo);
```

• device is a logical device associated with display.
• display is the display whose power state is modified.
• pDisplayPowerInfo is a pointer to a VkDisplayPowerInfoEXT structure specifying the new power state of display.
Valid Usage (Implicit)

- VUID-vkDisplayPowerControlEXT-device-parameter
device must be a valid VkDevice handle

- VUID-vkDisplayPowerControlEXT-display-parameter
display must be a valid VkDisplayKHR handle

- VUID-vkDisplayPowerControlEXT-pDisplayPowerInfo-parameter
pDisplayPowerInfo must be a valid pointer to a valid VkDisplayPowerInfoEXT structure

- VUID-vkDisplayPowerControlEXT-commonparent
Both of device, and display must have been created, allocated, or retrieved from the same VkPhysicalDevice

Valid Usage (Implicit)

- VUID-VkDisplayPowerInfoEXT-sType-sType
sType must be VK_STRUCTURE_TYPE_DISPLAY_POWER_INFO_EXT

- VUID-VkDisplayPowerInfoEXT-pNext-pNext
pNext must be NULL

- VUID-VkDisplayPowerInfoEXT-powerState-parameter
powerState must be a valid VkDisplayPowerStateEXT value

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY

The VkDisplayPowerInfoEXT structure is defined as:

```c
typedef struct VkDisplayPowerInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDisplayPowerStateEXT powerState;
} VkDisplayPowerInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- powerState is a VkDisplayPowerStateEXT value specifying the new power state of the display.
Possible values of `VkDisplayPowerInfoEXT::powerState`, specifying the new power state of a display, are:

```c
// Provided by VK_EXT_display_control
typedef enum VkDisplayPowerStateEXT {
    VK_DISPLAY_POWER_STATE_OFF_EXT = 0,
    VK_DISPLAY_POWER_STATE_SUSPEND_EXT = 1,
    VK_DISPLAY_POWER_STATE_ON_EXT = 2,
} VkDisplayPowerStateEXT;
```

- **VK_DISPLAY_POWER_STATE_OFF_EXT** specifies that the display is powered down.
- **VK_DISPLAY_POWER_STATE_SUSPEND_EXT** specifies that the display is put into a low power mode, from which it may be able to transition back to **VK_DISPLAY_POWER_STATE_ON_EXT** more quickly than if it were in **VK_DISPLAY_POWER_STATE_OFF_EXT**. This state may be the same as **VK_DISPLAY_POWER_STATE_OFF_EXT**.
- **VK_DISPLAY_POWER_STATE_ON_EXT** specifies that the display is powered on.

### 34.3.3. Display Surfaces

A complete display configuration includes a mode, one or more display planes and any parameters describing their behavior, and parameters describing some aspects of the images associated with those planes. Display surfaces describe the configuration of a single plane within a complete display configuration. To create a `VkSurfaceKHR` object for a display plane, call:

```c
// Provided by VK_KHR_display
VkResult vkCreateDisplayPlaneSurfaceKHR(
    VkInstance instance, const VkDisplaySurfaceCreateInfoKHR* pCreateInfo, const VkAllocationCallbacks* pAllocator, VkSurfaceKHR* pSurface);
```

- **instance** is the instance corresponding to the physical device the targeted display is on.
- **pCreateInfo** is a pointer to a `VkDisplaySurfaceCreateInfoKHR` structure specifying which mode, plane, and other parameters to use, as described below.
- **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- **pSurface** is a pointer to a `VkSurfaceKHR` handle in which the created surface is returned.

### Valid Usage (Implicit)

- **VUID-vkCreateDisplayPlaneSurfaceKHR-instance-parameter**
  - **instance** must be a valid `VkInstance` handle
- **VUID-vkCreateDisplayPlaneSurfaceKHR-pCreateInfo-parameter**
  - **pCreateInfo** must be a valid pointer to a valid `VkDisplaySurfaceCreateInfoKHR` structure
• VUID-vkCreateDisplayPlaneSurfaceKHR-pAllocator-parameter
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.

• VUID-vkCreateDisplayPlaneSurfaceKHR-pSurface-parameter
  `pSurface` must be a valid pointer to a `VkSurfaceKHR` handle.

## Return Codes

**Success**
- *VK_SUCCESS*

**Failure**
- *VK_ERROR_OUT_OF_HOST_MEMORY*
- *VK_ERROR_OUT_OF_DEVICE_MEMORY*

The `VkDisplaySurfaceCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplaySurfaceCreateInfoKHR {
    VkStructureType             sType;
    const void*                 pNext;
    VkDisplaySurfaceCreateFlagsKHR flags;
    VkDisplayModeKHR            displayMode;
    uint32_t                     planeIndex;
    uint32_t                     planeStackIndex;
    VkSurfaceTransformFlagBitsKHR transform;
    float                        globalAlpha;
    VkDisplayPlaneAlphaFlagBitsKHR alphaMode;
    VkExtent2D                   imageExtent;
} VkDisplaySurfaceCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is reserved for future use, and must be zero.
- `displayMode` is a `VkDisplayModeKHR` handle specifying the mode to use when displaying this surface.
- `planeIndex` is the plane on which this surface appears.
- `planeStackIndex` is the z-order of the plane.
- `transform` is a `VkSurfaceTransformFlagBitsKHR` value specifying the transformation to apply to images as part of the scanout operation.
- `globalAlpha` is the global alpha value. This value is ignored if `alphaMode` is not `VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR`.
• **alphaMode** is a `VkDisplayPlaneAlphaFlagBitsKHR` value specifying the type of alpha blending to use.

• **imageExtent** is the size of the presentable images to use with the surface.

---

**Note**

Creating a display surface **must** not modify the state of the displays, planes, or other resources it names. For example, it **must** not apply the specified mode to be set on the associated display. Application of display configuration occurs as a side effect of presenting to a display surface.

---

### Valid Usage

- **VUID-VkDisplaySurfaceCreateInfoKHR-planeIndex-01252**
  - `planeIndex` **must** be less than the number of display planes supported by the device as determined by calling `vkGetPhysicalDeviceDisplayPlanePropertiesKHR`.

- **VUID-VkDisplaySurfaceCreateInfoKHR-planeReorderPossible-01253**
  - If the `planeReorderPossible` member of the `VkDisplayPropertiesKHR` structure returned by `vkGetPhysicalDeviceDisplayPropertiesKHR` for the display corresponding to `displayMode` is `VK_TRUE` then `planeStackIndex` **must** be less than the number of display planes supported by the device as determined by calling `vkGetPhysicalDeviceDisplayPlanePropertiesKHR`; otherwise `planeStackIndex` **must** equal the `currentStackIndex` member of `VkDisplayPlanePropertiesKHR` returned by `vkGetPhysicalDeviceDisplayPlanePropertiesKHR` for the display plane corresponding to `displayMode`.

- **VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-01254**
  - If `alphaMode` is `VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR` then `globalAlpha` **must** be between 0 and 1, inclusive.

- **VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-01255**
  - `alphaMode` **must** be one of the bits present in the `supportedAlpha` member of `VkDisplayPlaneCapabilitiesKHR` for the display plane corresponding to `displayMode`.

- **VUID-VkDisplaySurfaceCreateInfoKHR-transform-06740**
  - `transform` **must** be one of the bits present in the `supportedTransforms` member of `VkDisplayPropertiesKHR` for the display corresponding to `displayMode`.

- **VUID-VkDisplaySurfaceCreateInfoKHR-width-01256**
  - The `width` and `height` members of `imageExtent` **must** be less than or equal to `VkPhysicalDeviceLimits::maxImageDimension2D`.

---

### Valid Usage (Implicit)

- **VUID-VkDisplaySurfaceCreateInfoKHR-sType-sType**
  - `sType` **must** be `VK_STRUCTURE_TYPE_DISPLAY_SURFACE_CREATE_INFO_KHR`.

- **VUID-VkDisplaySurfaceCreateInfoKHR-pNext-pNext**
  - `pNext` **must** be `NULL`.

- **VUID-VkDisplaySurfaceCreateInfoKHR-flags-zerobitmask**
  - `flags` **must** be a zero bit mask.
flags must be 0

- VUID-VkDisplaySurfaceCreateInfoKHR-displayMode-parameter
displayMode must be a valid VkDisplayModeKHR handle

- VUID-VkDisplaySurfaceCreateInfoKHR-transform-parameter
transform must be a valid VkSurfaceTransformFlagBitsKHR value

- VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-parameter
alphaMode must be a valid VkDisplayPlaneAlphaFlagBitsKHR value

// Provided by VK_KHR_display

typedef VkFlags VkDisplaySurfaceCreateFlagsKHR;

VkDisplaySurfaceCreateFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.

Bits which can be set in VkDisplaySurfaceCreateInfoKHR::alphaMode, specifying the type of alpha blending to use on a display, are:

// Provided by VK_KHR_display

typedef enum VkDisplayPlaneAlphaFlagBitsKHR {
    VK_DISPLAY_PLANE_ALPHA_OPAQUE_BIT_KHR = 0x00000001,
    VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR = 0x00000002,
    VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR = 0x00000004,
    VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_PREMULTIPLIED_BIT_KHR = 0x00000008,
} VkDisplayPlaneAlphaFlagBitsKHR;

- VK_DISPLAY_PLANE_ALPHA_OPAQUE_BIT_KHR specifies that the source image will be treated as opaque.
- VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR specifies that a global alpha value must be specified that will be applied to all pixels in the source image.
- VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR specifies that the alpha value will be determined by the alpha component of the source image's pixels. If the source format contains no alpha values, no blending will be applied. The source alpha values are not premultiplied into the source image's other color components.
- VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_PREMULTIPLIED_BIT_KHR is equivalent to VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR, except the source alpha values are assumed to be premultiplied into the source image's other color components.

// Provided by VK_KHR_display

typedef VkFlags VkDisplayPlaneAlphaFlagsKHR;

VkDisplayPlaneAlphaFlagsKHR is a bitmask type for setting a mask of zero or more VkDisplayPlaneAlphaFlagBitsKHR.
34.3.4. Presenting to headless surfaces

Vulkan rendering can be presented to a headless surface, where the presentation operation is a no-op producing no externally-visible result.

**Note**

Because there is no real presentation target, the headless presentation engine may be extended to impose an arbitrary or customisable set of restrictions and features. This makes it a useful portable test target for applications targeting a wide range of presentation engines where the actual target presentation engines might be scarce, unavailable or otherwise undesirable or inconvenient to use for general Vulkan application development.

The usual surface query mechanisms must be used to determine the actual restrictions and features of the implementation.

To create a headless `VkSurfaceKHR` object, call:

```c
// Provided by VK_EXT_headless_surface
VkResult vkCreateHeadlessSurfaceEXT(
    VkInstance instance,           // Provided by VK_EXT_headless_surface
    const VkHeadlessSurfaceCreateInfoEXT* pCreateInfo,   // Provided by VK_EXT_headless_surface
    const VkAllocationCallbacks* pAllocator,              // Provided by VK_EXT_headless_surface
    VkSurfaceKHR* pSurface);                               // Provided by VK_EXT_headless_surface
```

- **instance** is the instance to associate the surface with.
- **pCreateInfo** is a pointer to a `VkHeadlessSurfaceCreateInfoEXT` structure containing parameters affecting the creation of the surface object.
- **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- **pSurface** is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

**Valid Usage (Implicit)**

- **VUID-vkCreateHeadlessSurfaceEXT-instance-parameter**
  instance must be a valid `VkInstance` handle
- **VUID-vkCreateHeadlessSurfaceEXT-pCreateInfo-parameter**
  pCreateInfo must be a valid pointer to a valid ` VkHeadlessSurfaceCreateInfoEXT` structure
- **VUID-vkCreateHeadlessSurfaceEXT-pAllocator-parameter**
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid `VkAllocationCallbacks` structure
- **VUID-vkCreateHeadlessSurfaceEXT-pSurface-parameter**
  pSurface must be a valid pointer to a `VkSurfaceKHR` handle
Return Codes

Success
  • VK_SUCCESS

Failure
  • VK_ERROR_OUT_OF_HOST_MEMORY
  • VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkHeadlessSurfaceCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_headless_surface
typedef struct VkHeadlessSurfaceCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkHeadlessSurfaceCreateFlagsEXT flags;
} VkHeadlessSurfaceCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.

Valid Usage (Implicit)

- `VUID-VkHeadlessSurfaceCreateInfoEXT-sType-sType` `sType` must be `VK_STRUCTURE_TYPE_HEADLESS_SURFACE_CREATE_INFO_EXT`
- `VUID-VkHeadlessSurfaceCreateInfoEXT-pNext-pNext` `pNext` must be `NULL`
- `VUID-VkHeadlessSurfaceCreateInfoEXT-flags-zerobitmask` `flags` must be `0`

For headless surfaces, `currentExtent` is the reserved value (0xFFFFFFFF, 0xFFFFFFFF). Whatever the application sets a swapchain's `imageExtent` to will be the size of the surface, after the first image is presented.

```c
// Provided by VK_EXT_headless_surface
typedef VkFlags VkHeadlessSurfaceCreateFlagsEXT;
```

`VkHeadlessSurfaceCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.
34.4. Querying for WSI Support

Not all physical devices will include WSI support. Within a physical device, not all queue families will support presentation. WSI support and compatibility can be determined in a platform-neutral manner (which determines support for presentation to a particular surface object) and additionally may be determined in platform-specific manners (which determine support for presentation on the specified physical device but do not guarantee support for presentation to a particular surface object).

To determine whether a queue family of a physical device supports presentation to a given surface, call:

```cpp
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfaceSupportKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    VkSurfaceKHR surface,
    VkBool32* pSupported);
```

- **physicalDevice** is the physical device.
- **queueFamilyIndex** is the queue family.
- **surface** is the surface.
- **pSupported** is a pointer to a `VkBool32`, which is set to `VK_TRUE` to indicate support, and `VK_FALSE` otherwise.

### Valid Usage

- **VUID-vkGetPhysicalDeviceSurfaceSupportKHR-queueFamilyIndex-01269**
  `queueFamilyIndex` must be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`

### Valid Usage (Implicit)

- **VUID-vkGetPhysicalDeviceSurfaceSupportKHR-physicalDevice-parameter**
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- **VUID-vkGetPhysicalDeviceSurfaceSupportKHR-surface-parameter**
  `surface` must be a valid `VkSurfaceKHR` handle

- **VUID-vkGetPhysicalDeviceSurfaceSupportKHR-pSupported-parameter**
  `pSupported` must be a valid pointer to a `VkBool32` value

- **VUID-vkGetPhysicalDeviceSurfaceSupportKHR-commonparent**
  Both of `physicalDevice`, and `surface` must have been created, allocated, or retrieved from the same `VkInstance`
Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

34.4.1. Android Platform

On Android, all physical devices and queue families must be capable of presentation with any native window. As a result there is no Android-specific query for these capabilities.

34.4.2. Wayland Platform

To determine whether a queue family of a physical device supports presentation to a Wayland compositor, call:

```c
// Provided by VK_KHR_wayland_surface
VkBool32 vkGetPhysicalDeviceWaylandPresentationSupportKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    struct wl_display* display);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.
- `display` is a pointer to the `wl_display` associated with a Wayland compositor.

This platform-specific function can be called prior to creating a surface.

Valid Usage

- VUID-vkGetPhysicalDeviceWaylandPresentationSupportKHR-queueFamilyIndex-01306
  - `queueFamilyIndex` must be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceWaylandPresentationSupportKHR-physicalDevice-parameter
  - `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceWaylandPresentationSupportKHR-display-parameter
display must be a valid pointer to a \texttt{wl\_display} value

### 34.4.3. Win32 Platform

To determine whether a queue family of a physical device supports presentation to the Microsoft Windows desktop, call:

```c
// Provided by VK_KHR_win32_surface
VkBool32 vkGetPhysicalDeviceWin32PresentationSupportKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex);
```

- \texttt{physicalDevice} is the physical device.
- \texttt{queueFamilyIndex} is the queue family index.

This platform-specific function can be called prior to creating a surface.

### Valid Usage

- VUID-vkGetPhysicalDeviceWin32PresentationSupportKHR-queueFamilyIndex-01309 queueFamilyIndex must be less than \texttt{pQueueFamilyPropertyCount} returned by \texttt{vkGetPhysicalDeviceQueueFamilyProperties} for the given \texttt{physicalDevice}

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceWin32PresentationSupportKHR-physicalDevice-parameter physicalDevice must be a valid \texttt{VkPhysicalDevice} handle

### 34.4.4. XCB Platform

To determine whether a queue family of a physical device supports presentation to an X11 server, using the XCB client-side library, call:

```c
// Provided by VK_KHR_xcb_surface
VkBool32 vkGetPhysicalDeviceXcbPresentationSupportKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    xcb_connection_t* connection,
    xcb_visualid_t visual_id);
```

- \texttt{physicalDevice} is the physical device.
- \texttt{queueFamilyIndex} is the queue family index.
- \texttt{connection} is a pointer to an \texttt{xcb\_connection\_t} to the X server.
• `visual_id` is an X11 visual (`xcb_visualid_t`).

This platform-specific function **can** be called prior to creating a surface.

### Valid Usage

- VUID-vkGetPhysicalDeviceXcbPresentationSupportKHR-queueFamilyIndex-01312
  
  `queueFamilyIndex` **must** be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`.

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceXcbPresentationSupportKHR-physicalDevice-parameter
  
  `physicalDevice` **must** be a valid `VkPhysicalDevice` handle.

- VUID-vkGetPhysicalDeviceXcbPresentationSupportKHR-connection-parameter
  
  `connection` **must** be a valid pointer to an `xcb_connection_t` value.

### 34.4.5. Xlib Platform

To determine whether a queue family of a physical device supports presentation to an X11 server, using the Xlib client-side library, call:

```c
// Provided by VK_KHR_xlib_surface
VkBool32 vkGetPhysicalDeviceXcbPresentationSupportKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    Display* dpy,
    VisualID visualID);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.
- `dpy` is a pointer to an Xlib `Display` connection to the server.
- `visualID` is an X11 visual (`VisualID`).

This platform-specific function **can** be called prior to creating a surface.

### Valid Usage

- VUID-vkGetPhysicalDeviceXcbPresentationSupportKHR-queueFamilyIndex-01315
  
  `queueFamilyIndex` **must** be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`.
34.4.6. DirectFB Platform

To determine whether a queue family of a physical device supports presentation with DirectFB library, call:

```c
// Provided by VK_EXT_directfb_surface
VkBool32 vkGetPhysicalDeviceDirectFBPresentationSupportEXT(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    IDirectFB* dfb);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.
- `dfb` is a pointer to the IDirectFB main interface of DirectFB.

This platform-specific function can be called prior to creating a surface.

34.4.7. Fuchsia Platform

On Fuchsia, all physical devices and queue families **must** be capable of presentation with any ImagePipe. As a result there is no Fuchsia-specific query for these capabilities.
34.4.8. Google Games Platform

On Google Games Platform, all physical devices and queue families with the `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT` capabilities must be capable of presentation with any Google Games Platform stream descriptor. As a result, there is no query specific to Google Games Platform for these capabilities.

34.4.9. iOS Platform

On iOS, all physical devices and queue families must be capable of presentation with any layer. As a result there is no iOS-specific query for these capabilities.

34.4.10. macOS Platform

On macOS, all physical devices and queue families must be capable of presentation with any layer. As a result there is no macOS-specific query for these capabilities.

34.4.11. VI Platform

On VI, all physical devices and queue families must be capable of presentation with any layer. As a result there is no VI-specific query for these capabilities.

34.4.12. QNX Screen Platform

To determine whether a queue family of a physical device supports presentation to a QNX Screen compositor, call:

```c
// Provided by VK_QNX_screen_surface
VkBool32 vkGetPhysicalDeviceScreenPresentationSupportQNX(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    struct _screen_window* window);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.
- `window` is the QNX Screen `window` object.

This platform-specific function can be called prior to creating a surface.

**Valid Usage**

- VUID-vkGetPhysicalDeviceScreenPresentationSupportQNX-queueFamilyIndex-04743: queueFamilyIndex must be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`. 
34.5. Surface Queries

The capabilities of a swapchain targeting a surface are the intersection of the capabilities of the WSI platform, the native window or display, and the physical device. The resulting capabilities can be obtained with the queries listed below in this section.

**Note**

In addition to the surface capabilities as obtained by surface queries below, swapchain images are also subject to ordinary image creation limits as reported by `vkGetPhysicalDeviceImageFormatProperties`. As an application is instructed by the appropriate Valid Usage sections, both the surface capabilities and the image creation limits have to be satisfied whenever swapchain images are created.

34.5.1. Surface Capabilities

To query the basic capabilities of a surface, needed in order to create a swapchain, call:

```c
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfaceCapabilitiesKHR(
    VkPhysicalDevice physicalDevice,
    VkSurfaceKHR surface,
    VkSurfaceCapabilitiesKHR* pSurfaceCapabilities);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.
- `surface` is the surface that will be associated with the swapchain.
- `pSurfaceCapabilities` is a pointer to a `VkSurfaceCapabilitiesKHR` structure in which the capabilities are returned.

**Valid Usage**

- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-surface-06523
  `surface` must be a valid `VkSurfaceKHR` handle

- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-surface-06211
  `surface` must be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism
Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-surface-parameter
  surface must be a valid VkSurfaceKHR handle

- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-pSurfaceCapabilities-parameter
  pSurfaceCapabilities must be a valid pointer to a VkSurfaceCapabilitiesKHR structure

- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-commonparent
  Both of physicalDevice, and surface must have been created, allocated, or retrieved from
  the same VkInstance

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

The VkSurfaceCapabilitiesKHR structure is defined as:

```c
// Provided by VK_KHR_surface
typedef struct VkSurfaceCapabilitiesKHR {
    uint32_t minImageCount;
    uint32_t maxImageCount;
    VkExtent2D currentExtent;
    VkExtent2D minImageExtent;
    VkExtent2D maxImageExtent;
    uint32_t maxImageArrayLayers;
    VkSurfaceTransformFlagsKHR supportedTransforms;
    VkSurfaceTransformFlagBitsKHR currentTransform;
    VkCompositeAlphaFlagsKHR supportedCompositeAlpha;
    VkImageUsageFlags supportedUsageFlags;
} VkSurfaceCapabilitiesKHR;
```

- **minImageCount** is the minimum number of images the specified device supports for a swapchain
  created for the surface, and will be at least one.

- **maxImageCount** is the maximum number of images the specified device supports for a swapchain
  created for the surface, and will be either 0, or greater than or equal to **minImageCount**. A value of
  0 means that there is no limit on the number of images, though there **may** be limits related to
the total amount of memory used by presentable images.

- **currentExtent** is the current width and height of the surface, or the special value (0xFFFFFFFF, 0xFFFFFFFF) indicating that the surface size will be determined by the extent of a swapchain targeting the surface.

- **minImageExtent** contains the smallest valid swapchain extent for the surface on the specified device. The *width* and *height* of the extent will each be less than or equal to the corresponding *width* and *height* of *currentExtent*, unless *currentExtent* has the special value described above.

- **maxImageExtent** contains the largest valid swapchain extent for the surface on the specified device. The *width* and *height* of the extent will each be greater than or equal to the corresponding *width* and *height* of *minImageExtent*. The *width* and *height* of the extent will each be greater than or equal to the corresponding *width* and *height* of *currentExtent*, unless *currentExtent* has the special value described above.

- **maxImageArrayLayers** is the maximum number of layers presentable images can have for a swapchain created for this device and surface, and will be at least one.

- **supportedTransforms** is a bitmask of `VkSurfaceTransformFlagBitsKHR` indicating the presentation transforms supported for the surface on the specified device. At least one bit will be set.

- **currentTransform** is `VkSurfaceTransformFlagBitsKHR` value indicating the surface’s current transform relative to the presentation engine’s natural orientation.

- **supportedCompositeAlpha** is a bitmask of `VkCompositeAlphaFlagBitsKHR`, representing the alpha compositing modes supported by the presentation engine for the surface on the specified device, and at least one bit will be set. Opaque composition can be achieved in any alpha compositing mode by either using an image format that has no alpha component, or by ensuring that all pixels in the presentable images have an alpha value of 1.0.

- **supportedUsageFlags** is a bitmask of `VkImageUsageFlagBits` representing the ways the application can use the presentable images of a swapchain created with `VkPresentModeKHR` set to `VK_PRESENT_MODE_IMMEDIATE_KHR`, `VK_PRESENT_MODE_MAILBOX_KHR`, `VK_PRESENT_MODE_FIFO_KHR` or `VK_PRESENT_MODE_FIFO_RELAXED_KHR` for the surface on the specified device. `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` must be included in the set. Implementations may support additional usages.

```plaintext
Note
Supported usage flags of a presentable image when using `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR` presentation mode are provided by `VkSharedPresentSurfaceCapabilitiesKHR::sharedPresentSupportedUsageFlags`.

Note
Formulas such as min(N, maxImageCount) are not correct, since maxImageCount may be zero.
```

To query the basic capabilities of a surface defined by the core or extensions, call:
VkResult vkGetPhysicalDeviceSurfaceCapabilities2KHR(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceSurfaceInfo2KHR* pSurfaceInfo,
    VkSurfaceCapabilities2KHR* pSurfaceCapabilities);

- **physicalDevice** is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.

- **pSurfaceInfo** is a pointer to a `VkPhysicalDeviceSurfaceInfo2KHR` structure describing the surface and other fixed parameters that would be consumed by `vkCreateSwapchainKHR`.

- **pSurfaceCapabilities** is a pointer to a `VkSurfaceCapabilities2KHR` structure in which the capabilities are returned.

`vkGetPhysicalDeviceSurfaceCapabilities2KHR` behaves similarly to `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`, with the ability to specify extended inputs via chained input structures, and to return extended information via chained output structures.

### Valid Usage

- **VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-06521**
  If the `VK_GOOGLE_surfaceless_query` extension is not enabled, `pSurfaceInfo->surface` must be a valid `VkSurfaceKHR` handle.

- **VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-06522**
  If `pSurfaceInfo->surface` is not `VK_NULL_HANDLE`, it must be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism.

- **VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pNext-02671**
  If a `VkSurfaceCapabilitiesFullScreenExclusiveEXT` structure is included in the `pNext` chain of `pSurfaceCapabilities`, a `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure must be included in the `pNext` chain of `pSurfaceInfo`.

- **VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pNext-07776**
  If a `VkSurfacePresentModeCompatibilityEXT` structure is included in the `pNext` chain of `pSurfaceCapabilities`, a `VkSurfacePresentModeEXT` structure must be included in the `pNext` chain of `pSurfaceInfo`.

- **VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pNext-07777**
  If a `VkSurfacePresentScalingCapabilitiesEXT` structure is included in the `pNext` chain of `pSurfaceCapabilities`, a `VkSurfacePresentModeEXT` structure must be included in the `pNext` chain of `pSurfaceInfo`.

- **VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pNext-07778**
  If a `VkSurfacePresentModeCompatibilityEXT` structure is included in the `pNext` chain of `pSurfaceCapabilities`, `pSurfaceInfo->surface` must be a valid `VkSurfaceKHR` handle.

- **VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pNext-07779**
  If a `VkSurfacePresentScalingCapabilitiesEXT` structure is included in the `pNext` chain of
pSurfaceCapabilities, pSurfaceInfo->surface must be a valid VkSurfaceKHR handle

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-physicalDevice-parameter
  
it must be a valid VkPhysicalDevice handle

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-parameter
  
pSurfaceInfo must be a valid pointer to a valid VkPhysicalDeviceSurfaceInfo2KHR structure

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceCapabilities-parameter
  
pSurfaceCapabilities must be a valid pointer to a VkSurfaceCapabilities2KHR structure

Return Codes

Success

• VK_SUCCESS

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_SURFACE_LOST_KHR

The VkPhysicalDeviceSurfaceInfo2KHR structure is defined as:

```c
typedef struct VkPhysicalDeviceSurfaceInfo2KHR {
    VkStructureType sType;
    const void* pNext;
    VkSurfaceKHR surface;
} VkPhysicalDeviceSurfaceInfo2KHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- surface is the surface that will be associated with the swapchain.

The members of VkPhysicalDeviceSurfaceInfo2KHR correspond to the arguments to
vkGetPhysicalDeviceSurfaceCapabilitiesKHR, with sType and pNext added for extensibility.

Additional capabilities of a surface may be available to swapchains created with different full-screen exclusive settings - particularly if exclusive full-screen access is application controlled. These additional capabilities can be queried by adding a VkSurfaceFullScreenExclusiveInfoEXT structure to the pNext chain of this structure when used to query surface properties. Additionally, for Win32 surfaces with application controlled exclusive full-screen access, chaining a
The `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure may also report additional surface capabilities. These additional capabilities only apply to swapchains created with the same parameters included in the `pNext` chain of `VkSwapchainCreateInfoKHR`.

### Valid Usage

- **VUID-VkPhysicalDeviceSurfaceInfo2KHR-pNext-02672**
  If the `pNext` chain includes a `VkSurfaceFullScreenExclusiveInfoEXT` structure with its `fullScreenExclusive` member set to `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT`, and the surface was created using `vkCreateWin32SurfaceKHR`, a `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure must be included in the `pNext` chain.

- **VUID-VkPhysicalDeviceSurfaceInfo2KHR-surface-07919**
  If the `VK_GOOGLE_surfaceless_query` extension is not enabled, the `surface` must be a valid `VkSurfaceKHR` handle.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceSurfaceInfo2KHR-sType-sType**
  The `sType` value of each struct in the `pNext` chain must be unique.

- **VUID-VkPhysicalDeviceSurfaceInfo2KHR-surface-parameter**
  If `surface` is not `VK_NULL_HANDLE`, the `surface` must be a valid `VkSurfaceKHR` handle.

If the `pNext` chain of `VkSwapchainCreateInfoKHR` includes a `VkSurfaceFullScreenExclusiveInfoEXT` structure, then that structure specifies the application’s preferred full-screen transition behavior.

The `VkSurfaceFullScreenExclusiveInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_full_screen_exclusive
typedef struct VkSurfaceFullScreenExclusiveInfoEXT {
    VkStructureType sType;
    void* pNext;
    VkFullScreenExclusiveEXT fullScreenExclusive;
} VkSurfaceFullScreenExclusiveInfoEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
• **fullScreenExclusive** is a VkFullScreenExclusiveEXT value specifying the preferred full-screen transition behavior.

If this structure is not present, **fullScreenExclusive** is considered to be **VK_FULL_SCREEN_EXCLUSIVE_DEFAULT_EXT**.

### Valid Usage (Implicit)

- VUID-VkSurfaceFullScreenExclusiveInfoEXT-sType-sType
  
  *sType* **must** be **VK_STRUCTURE_TYPE_SURFACE_FULLSCREEN_EXCLUSIVE_INFO_EXT**

- VUID-VkSurfaceFullScreenExclusiveInfoEXT-fullScreenExclusive-parameter
  
  **fullScreenExclusive** **must** be a valid VkFullScreenExclusiveEXT value

Possible values of VkSurfaceFullScreenExclusiveInfoEXT::fullScreenExclusive are:

```c
// Provided by VK_EXT_full_screen_exclusive
typedef enum VkFullScreenExclusiveEXT {
    VK_FULL_SCREEN_EXCLUSIVE_DEFAULT_EXT = 0,
    VK_FULL_SCREEN_EXCLUSIVE_ALLOWED_EXT = 1,
    VK_FULL_SCREEN_EXCLUSIVE_DISALLOWED_EXT = 2,
    VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT = 3,
} VkFullScreenExclusiveEXT;
```

- **VK_FULL_SCREEN_EXCLUSIVE_DEFAULT_EXT** indicates the implementation **should** determine the appropriate full-screen method by whatever means it deems appropriate.

- **VK_FULL_SCREEN_EXCLUSIVE_ALLOWED_EXT** indicates the implementation **may** use full-screen exclusive mechanisms when available. Such mechanisms **may** result in better performance and/or the availability of different presentation capabilities, but **may** require a more disruptive transition during swapchain initialization, first presentation and/or destruction.

- **VK_FULL_SCREEN_EXCLUSIVE_DISALLOWED_EXT** indicates the implementation **should** avoid using full-screen mechanisms which rely on disruptive transitions.

- **VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT** indicates the application will manage full-screen exclusive mode by using the vkAcquireFullScreenExclusiveModeEXT and vkReleaseFullScreenExclusiveModeEXT commands.

The VkSurfaceFullScreenExclusiveWin32InfoEXT structure is defined as:

```c
// Provided by VK_KHR_win32_surface with VK_EXT_full_screen_exclusive
typedef struct VkSurfaceFullScreenExclusiveWin32InfoEXT {
    VkStructureType sType;
    const void* pNext;
    HMONITOR hmonitor;
} VkSurfaceFullScreenExclusiveWin32InfoEXT;
```

- **sType** is a VkStructureType value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `hmonitor` is the Win32 `HMONITOR` handle identifying the display to create the surface with.

**Note**
If `hmonitor` is invalidated (e.g. the monitor is unplugged) during the lifetime of a swapchain created with this structure, operations on that swapchain will return `VK_ERROR_OUT_OF_DATE_KHR`.

**Note**
It is the responsibility of the application to change the display settings of the targeted Win32 display using the appropriate platform APIs. Such changes may alter the surface capabilities reported for the created surface.

---

### Valid Usage

- VUID-VkSurfaceFullScreenExclusiveWin32InfoEXT-hmonitor-02673
  
  `hmonitor` must be a valid `HMONITOR`

---

### Valid Usage (Implicit)

- VUID-VkSurfaceFullScreenExclusiveWin32InfoEXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_SURFACE_FULLSCREEN_EXCLUSIVE_WIN32_INFO_EXT`

---

The `VkSurfaceCapabilities2KHR` structure is defined as:

```c
// Provided by VK_KHR_get_surface_capabilities2
typedef struct VkSurfaceCapabilities2KHR {
    VkStructureType sType;
    void* pNext;
    VkSurfaceCapabilitiesKHR surfaceCapabilities;
} VkSurfaceCapabilities2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `surfaceCapabilities` is a `VkSurfaceCapabilitiesKHR` structure describing the capabilities of the specified surface.

If the `VK_GOOGLE_surfaceless_query` extension is enabled and `VkPhysicalDeviceSurfaceInfo2KHR::surface` in the `vkGetPhysicalDeviceSurfaceCapabilities2KHR` call is `VK_NULL_HANDLE`, the values returned in `minImageCount`, `maxImageCount`, `currentExtent`, and `currentTransform` will not reflect that of any surface and will instead be as such:

- `minImageCount` and `maxImageCount` will be `0xFFFFFFFF`
• `currentExtent` will be (0xFFFFFFFF, 0xFFFFFFFF)
• `currentTransform` will be `VK_SURFACE_TRANSFORM_INHERIT_BIT_KHR`

## Valid Usage (Implicit)

- **VUID-VkSurfaceCapabilities2KHR-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_2_KHR`
- **VUID-VkSurfaceCapabilities2KHR-pNext-pNext**
  - Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkDisplayNativeHdrSurfaceCapabilitiesAMD`, `VkSharedPresentSurfaceCapabilitiesKHR`, `VkSurfaceCapabilitiesFullScreenExclusiveEXT`, `VkSurfaceCapabilitiesPresentBarrierNV`, `VkSurfacePresentModeCompatibilityEXT`, `VkSurfacePresentScalingCapabilitiesEXT`, or `VkSurfaceProtectedCapabilitiesKHR`
- **VUID-VkSurfaceCapabilities2KHR-sType-unique**
  - The `sType` value of each struct in the `pNext` chain must be unique

An application queries if a protected `VkSurfaceKHR` is displayable on a specific windowing system using `VkSurfaceProtectedCapabilitiesKHR`, which can be passed in `pNext` parameter of `VkSurfaceCapabilities2KHR`.

The `VkSurfaceProtectedCapabilitiesKHR` structure is defined as:

```c
// Provided by VK_KHR_surface_protected_capabilities
typedef struct VkSurfaceProtectedCapabilitiesKHR {
  VkStructureType sType;
  const void* pNext;
  VkBool32 supportsProtected;
} VkSurfaceProtectedCapabilitiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `supportsProtected` specifies whether a protected swapchain created from `VkPhysicalDeviceSurfaceInfo2KHR::surface` for a particular windowing system can be displayed on screen or not. If `supportsProtected` is `VK_TRUE`, then creation of swapchains with the `VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR` flag set must be supported for `surface`.

If the `VK_GOOGLE_surfaceless_query` extension is enabled, the value returned in `supportsProtected` will be identical for every valid surface created on this physical device, and so in the `vkGetPhysicalDeviceSurfaceCapabilities2KHR::surface` for a particular windowing system can be `VK_NULL_HANDLE`. In that case, the contents of `VkSurfaceCapabilities2KHR::surfaceCapabilities` as well as any other struct chained to it will be undefined.
Valid Usage (Implicit)

- **VUID-VkSurfaceProtectedCapabilitiesKHR-sType-sType**
  
  `sType` **must** be `VK_STRUCTURE_TYPE_SURFACE_PROTECTED_CAPABILITIES_KHR`.

The `VkSurfacePresentScalingCapabilitiesEXT` structure is defined as:

```c
// Provided by VK_EXT_surface_maintenance1
typedef struct VkSurfacePresentScalingCapabilitiesEXT {
    VkStructureType sType;
    void* pNext;
    VkPresentScalingFlagsEXT supportedPresentScaling;
    VkPresentGravityFlagsEXT supportedPresentGravityX;
    VkPresentGravityFlagsEXT supportedPresentGravityY;
    VkExtent2D minScaledImageExtent;
    VkExtent2D maxScaledImageExtent;
} VkSurfacePresentScalingCapabilitiesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `supportedPresentScaling` is a bitmask of `VkPresentScalingFlagBitsEXT` representing the scaling methods supported by the surface, or `0` if application-defined scaling is not supported.
- `supportedPresentGravityX` is a bitmask of `VkPresentGravityFlagBitsEXT` representing the X-axis pixel gravity supported by the surface, or `0` if Vulkan-defined pixel gravity is not supported for the X axis.
- `supportedPresentGravityY` is a bitmask of `VkPresentGravityFlagBitsEXT` representing the Y-axis pixel gravity supported by the surface, or `0` if Vulkan-defined pixel gravity is not supported for the Y axis.
- `minScaledImageExtent` contains the smallest valid swapchain extent for the surface on the specified device when one of the scaling methods specified in `supportedPresentScaling` is used, or the special value (0xFFFFFFFF, 0xFFFFFFFF) indicating that the surface size will be determined by the extent of a swapchain targeting the surface. The width and height of the extent will each be smaller than or equal to the corresponding width and height of `VkSurfaceCapabilitiesKHR::minImageExtent`.
- `maxScaledImageExtent` contains the largest valid swapchain extent for the surface on the specified device when one of the scaling methods specified in `supportedPresentScaling` is used, or the special value described above for `minScaledImageExtent`. The width and height of the extent will each be greater than or equal to the corresponding width and height of `VkSurfaceCapabilitiesKHR::maxImageExtent`.

Before creating a swapchain whose scaling mode **can** be specified through the use of `VkSwapchainPresentScalingCreateInfoEXT`, obtain the set of supported scaling modes by including a `VkSurfacePresentModeEXT` structure in the `pNext` chain of `VkPhysicalDeviceSurfaceInfo2KHR` when calling `vkGetPhysicalDeviceSurfaceCapabilities2KHR`. The implementation **must** return the
same values in `VkSurfacePresentScalingCapabilitiesEXT` for any of the compatible present modes as obtained through `VkSurfacePresentModeCompatibilityEXT`.

### Valid Usage (Implicit)

- VUID-VkSurfacePresentScalingCapabilitiesEXT-sType-sType
  sType **must** be `VK_STRUCTURE_TYPE_SURFACE_PRESENT_SCALING_CAPABILITIES_EXT`

- VUID-VkSurfacePresentScalingCapabilitiesEXT-supportedPresentScaling-parameter
  supportedPresentScaling **must** be a valid combination of `VkPresentScalingFlagBitsEXT` values

- VUID-VkSurfacePresentScalingCapabilitiesEXT-supportedPresentGravityX-parameter
  supportedPresentGravityX **must** be a valid combination of `VkPresentGravityFlagBitsEXT` values

- VUID-VkSurfacePresentScalingCapabilitiesEXT-supportedPresentGravityY-parameter
  supportedPresentGravityY **must** be a valid combination of `VkPresentGravityFlagBitsEXT` values

Bits which **may** be set in `VkSurfacePresentScalingCapabilitiesEXT::supportedPresentScaling`, specifying scaling modes supported by the surface, are:

```c
// Provided by VK_EXT_surface_maintenance1
typedef enum VkPresentScalingFlagBitsEXT {
    VK_PRESENT_SCALING_ONE_TO_ONE_BIT_EXT = 0x00000001,
    VK_PRESENT_SCALING_ASPECT_RATIO_STRETCH_BIT_EXT = 0x00000002,
    VK_PRESENT_SCALING_STRETCH_BIT_EXT = 0x00000004,
} VkPresentScalingFlagBitsEXT;
```

- `VK_PRESENT_SCALING_ONE_TO_ONE_BIT_EXT` specifies that no scaling occurs, and pixels in the swapchain image are mapped to one and only one pixel in the surface. The mapping between pixels is defined by the chosen presentation gravity.

- `VK_PRESENT_SCALING_ASPECT_RATIO_STRETCH_BIT_EXT` specifies that the swapchain image will be minified or magnified such that at least one of the resulting width or height is equal to the corresponding surface dimension, and the other resulting dimension is less than or equal to the corresponding surface dimension, with the aspect ratio of the resulting image being identical to that of the original swapchain image.

- `VK_PRESENT_SCALING_STRETCH_BIT_EXT` specifies that the swapchain image will be minified or magnified such that the resulting image dimensions are equal to those of the surface.

```c
// Provided by VK_EXT_surface_maintenance1
typedef VkFlags VkPresentScalingFlagsEXT;
```

`VkPresentScalingFlagsEXT` is a bitmask type for setting a mask of zero or more `VkPresentScalingFlagBitsEXT`. 
Bits which **may** be set in the `VkSurfacePresentScalingCapabilitiesEXT::supportedPresentGravityX` or `supportedPresentGravityY` fields, specifying the gravity of presented pixels supported by the surface, are:

```cpp
// Provided by VK_EXT_surface_maintenance1
typedef enum VkPresentGravityFlagBitsEXT {
    VK_PRESENT_GRAVITY_MIN_BIT_EXT = 0x00000001,
    VK_PRESENT_GRAVITY_MAX_BIT_EXT = 0x00000002,
    VK_PRESENT_GRAVITY_CENTERED_BIT_EXT = 0x00000004,
} VkPresentGravityFlagBitsEXT;
```

- **VK_PRESENT_GRAVITY_MIN_BIT_EXT** means that the pixels will gravitate towards the top or left side of the surface.
- **VK_PRESENT_GRAVITY_MAX_BIT_EXT** means that the pixels will gravitate towards the bottom or right side of the surface.
- **VK_PRESENT_GRAVITY_CENTERED_BIT_EXT** means that the pixels will be centered in the surface.

If the value in `VkSurfaceCapabilitiesKHR::currentTransform` is not `VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR`, it is implementation-defined whether the gravity configuration applies to the presented image before or after transformation.

```cpp
// Provided by VK_EXT_surface_maintenance1
typedef VkFlags VkPresentGravityFlagsEXT;
```

`VkPresentGravityFlagsEXT` is a bitmask type for setting a mask of zero or more `VkPresentGravityFlagBitsEXT`.

The `VkSurfacePresentModeEXT` structure is defined as:

```cpp
// Provided by VK_EXT_surface_maintenance1
typedef struct VkSurfacePresentModeEXT {
    VkStructureType sType;
    void* pNext;
    VkPresentModeKHR presentMode;
} VkSurfacePresentModeEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **presentMode** is the presentation mode the swapchain will use.

If the `VkSurfacePresentModeEXT` structure is included in the `pNext` chain of `VkPhysicalDeviceSurfaceInfo2KHR`, the values returned in `VkSurfaceCapabilitiesKHR::minImageCount`, `VkSurfaceCapabilitiesKHR::maxImageCount`, `VkSurfacePresentScalingCapabilitiesEXT::minScaledImageExtent`, and `VkSurfacePresentScalingCapabilitiesEXT::maxScaledImageExtent` are valid only for the specified
If `presentMode` is `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`, the per-present mode image counts must both be one. The per-present mode image counts may be less-than or greater-than the image counts returned when `VkSurfacePresentModeEXT` is not provided.

**Note**

If `VkSwapchainPresentModesCreateInfoEXT` is provided to swapchain creation, the requirements for forward progress may be less strict. For example, a FIFO swapchain might only require 2 images to guarantee forward progress, but a MAILBOX one might require 4. Without the per-present image counts, such an implementation would have to return 4 in `VkSurfaceCapabilitiesKHR::minImageCount`, which pessimizes FIFO. Conversely, an implementation may return a low number for `minImageCount`, but internally bump the image count when application queries `vkGetSwapchainImagesKHR`, which can surprise applications, and is not discoverable until swapchain creation. Using `VkSurfacePresentModeEXT` and `VkSwapchainPresentModesCreateInfoEXT` together effectively removes this problem.

`VkSwapchainPresentModesCreateInfoEXT` is required for the specification to be backwards compatible with applications that do not know about, or make use of this feature.

**Valid Usage**

- VUID-VkSurfacePresentModeEXT-presentMode-07780

`presentMode` must be a value reported by `vkGetPhysicalDeviceSurfacePresentModesKHR` for the specified surface.

**Valid Usage (Implicit)**

- VUID-VkSurfacePresentModeEXT-sType-sType

`sType` must be `VK_STRUCTURE_TYPE_SURFACE_PRESENT_MODE_EXT`

- VUID-VkSurfacePresentModeEXT-presentMode-parameter

`presentMode` must be a valid `VkPresentModeKHR` value

The `VkSurfacePresentModeCompatibilityEXT` structure is defined as:

```c
// Provided by VK_EXT_surface_maintenance1
typedef struct VkSurfacePresentModeCompatibilityEXT {
    VkStructureType sType;
    void* pNext;
    uint32_t presentModeCount;
    VkPresentModeKHR* pPresentModes;
} VkSurfacePresentModeCompatibilityEXT;
```
sType is a VkStructureType value identifying this structure.

pNext is NULL or a pointer to a structure extending this structure.

presentModeCount is an integer related to the number of present modes available or queried, as described below.

pPresentModes is a pointer to an array of VkPresentModeKHR in which present modes compatible with a given present mode are returned.

If pPresentModes is NULL, then the number of present modes that are compatible with the one specified in VkSurfacePresentModeEXT is returned in presentModeCount. Otherwise, presentModeCount must be set by the user to the number of elements in the pPresentModes array, and on return the variable is overwritten with the number of values actually written to pPresentModes. If the value of presentModeCount is less than the number of compatible present modes that are supported, at most presentModeCount values will be written to pPresentModes. The implementation must include the present mode passed to VkSurfacePresentModeEXT in pPresentModes, unless presentModeCount is zero.

Before creating a swapchain whose present modes can be modified through the use of VkSwapchainPresentModesCreateInfoEXT, obtain the set of present modes compatible with a given initial present mode by including a VkSurfacePresentModeEXT structure in the pNext chain of VkPhysicalDeviceSurfaceInfo2KHR when calling vkGetPhysicalDeviceSurfaceCapabilities2KHR.

Valid Usage (Implicit)

- VUID-VkSurfacePresentModeCompatibilityEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_SURFACE_PRESENT_MODE_COMPATIBILITY_EXT

- VUID-VkSurfacePresentModeCompatibilityEXT-pPresentModes-parameter
  If presentModeCount is not 0, and pPresentModes is not NULL, pPresentModes must be a valid pointer to an array of presentModeCount VkPresentModeKHR values

The VkSharedPresentSurfaceCapabilitiesKHR structure is defined as:

```c
// Provided by VK_KHR_shared_presentable_image
typedef struct VkSharedPresentSurfaceCapabilitiesKHR {
    VkStructureType sType;
    void* pNext;
    VkImageUsageFlags sharedPresentSupportedUsageFlags;
} VkSharedPresentSurfaceCapabilitiesKHR;
```

- sType is a VkStructureType value identifying this structure.

- pNext is NULL or a pointer to a structure extending this structure.

- sharedPresentSupportedUsageFlags is a bitmask of VkImageUsageFlagBits representing the ways the application can use the shared presentable image from a swapchain created with VkPresentModeKHR set to VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR or VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR for the surface on the specified device.
VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT must be included in the set but implementations may support additional usages.

Valid Usage (Implicit)

- VUID-VkSharedPresentSurfaceCapabilitiesKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_SHARED_PRESENT_SURFACE_CAPABILITIES_KHR

The VkDisplayNativeHdrSurfaceCapabilitiesAMD structure is defined as:

```c
// Provided by VK_AMD_display_native_hdr
typedef struct VkDisplayNativeHdrSurfaceCapabilitiesAMD {
    VkStructureType sType;
    void* pNext;
    VkBool32 localDimmingSupport;
} VkDisplayNativeHdrSurfaceCapabilitiesAMD;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **localDimmingSupport** specifies whether the surface supports local dimming. If this is VK_TRUE, VkSwapchainDisplayNativeHdrCreateInfoAMD can be used to explicitly enable or disable local dimming for the surface. Local dimming may also be overridden by vkSetLocalDimmingAMD during the lifetime of the swapchain.

Valid Usage (Implicit)

- VUID-VkDisplayNativeHdrSurfaceCapabilitiesAMD-sType-sType
  sType must be VK_STRUCTURE_TYPE_DISPLAY_NATIVE_HDR_SURFACE_CAPABILITIES_AMD

The VkSurfaceCapabilitiesFullScreenExclusiveEXT structure is defined as:

```c
// Provided by VK_EXT_full_screen_exclusive
typedef struct VkSurfaceCapabilitiesFullScreenExclusiveEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 fullScreenExclusiveSupported;
} VkSurfaceCapabilitiesFullScreenExclusiveEXT;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **fullScreenExclusiveControlSupported** is a boolean describing whether the surface is able to make use of exclusive full-screen access.

This structure can be included in the **pNext** chain of VkSurfaceCapabilities2KHR to determine
support for exclusive full-screen access. If `fullScreenExclusiveSupported` is `VK_FALSE`, it indicates that exclusive full-screen access is not obtainable for this surface.

Applications **must** not attempt to create swapchains with `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT` set if `fullScreenExclusiveSupported` is `VK_FALSE`.

### Valid Usage (Implicit)

- VUID-VkSurfaceCapabilitiesFullScreenExclusiveEXT-sType-sType
  
  `sType` **must** be `VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_FULL_SCREEN_EXCLUSIVE_EXT`

The `VkSurfaceCapabilitiesPresentBarrierNV` structure is defined as:

```c
typedef struct VkSurfaceCapabilitiesPresentBarrierNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 presentBarrierSupported;
} VkSurfaceCapabilitiesPresentBarrierNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `presentBarrierSupported` is a boolean describing whether the surface is able to make use of the present barrier feature.

This structure **can** be included in the `pNext` chain of `VkSurfaceCapabilities2KHR` to determine support for present barrier access. If `presentBarrierSupported` is `VK_FALSE`, it indicates that the present barrier feature is not obtainable for this surface.

### Valid Usage (Implicit)

- VUID-VkSurfaceCapabilitiesPresentBarrierNV-sType-sType
  
  `sType` **must** be `VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_PRESENT_BARRIER_NV`

To query the basic capabilities of a surface, needed in order to create a swapchain, call:

```c
// Provided by VK_EXT_display_surface_counter
VkResult vkGetPhysicalDeviceSurfaceCapabilities2EXT(
    VkPhysicalDevice physicalDevice,  // physical device
    VkSurfaceKHR surface,              // surface
    VkSurfaceCapabilities2EXT* pSurfaceCapabilities);  // pSurfaceCapabilities
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as
described for \texttt{vkCreateSwapchainKHR}.

- \texttt{surface} is the surface that will be associated with the swapchain.
- \texttt{pSurfaceCapabilities} is a pointer to a \texttt{VkSurfaceCapabilities2EXT} structure in which the capabilities are returned.

\texttt{vkGetPhysicalDeviceSurfaceCapabilities2EXT} behaves similarly to \texttt{vkGetPhysicalDeviceSurfaceCapabilitiesKHR}, with the ability to return extended information by adding extending structures to the \texttt{pNext} chain of its \texttt{pSurfaceCapabilities} parameter.

### Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-surface-06523 \texttt{surface} \textbf{must} be a valid \texttt{VkSurfaceKHR} handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-surface-06211 \texttt{surface} \textbf{must} be supported by \texttt{physicalDevice}, as reported by \texttt{vkGetPhysicalDeviceSurfaceSupportKHR} or an equivalent platform-specific mechanism

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-physicalDevice-parameter \texttt{physicalDevice} \textbf{must} be a valid \texttt{VkPhysicalDevice} handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-surface-parameter \texttt{surface} \textbf{must} be a valid \texttt{VkSurfaceKHR} handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-pSurfaceCapabilities-parameter \texttt{pSurfaceCapabilities} \textbf{must} be a valid pointer to a \texttt{VkSurfaceCapabilities2EXT} structure
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-commonparent Both of \texttt{physicalDevice}, and \texttt{surface} \textbf{must} have been created, allocated, or retrieved from the same \texttt{VkInstance}

### Return Codes

**Success**
- \texttt{VK_SUCCESS}

**Failure**
- \texttt{VK_ERROR_OUT_OF_HOST_MEMORY}
- \texttt{VK_ERROR_OUT_OF_DEVICE_MEMORY}
- \texttt{VK_ERROR_SURFACE_LOST_KHR}

The \texttt{VkSurfaceCapabilities2EXT} structure is defined as:

```c
// Provided by VK_EXT_display_surface_counter
```
typedef struct VkSurfaceCapabilities2EXT {
    VkStructureType sType;
    void* pNext;
    uint32_t minImageCount;
    uint32_t maxImageCount;
    VkExtent2D currentExtent;
    VkExtent2D minImageExtent;
    VkExtent2D maxImageExtent;
    uint32_t maxImageArrayLayers;
    VkSurfaceTransformFlagsKHR supportedTransforms;
    VkSurfaceTransformFlagBitsKHR currentTransform;
    VkCompositeAlphaFlagsKHR supportedCompositeAlpha;
    VkImageUsageFlags supportedUsageFlags;
    VkSurfaceCounterFlagsEXT supportedSurfaceCounters;
} VkSurfaceCapabilities2EXT;

• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is `NULL` or a pointer to a structure extending this structure.

• **minImageCount** is the minimum number of images the specified device supports for a swapchain created for the surface, and will be at least one.

• **maxImageCount** is the maximum number of images the specified device supports for a swapchain created for the surface, and will be either 0, or greater than or equal to `minImageCount`. A value of 0 means that there is no limit on the number of images, though there may be limits related to the total amount of memory used by presentable images.

• **currentExtent** is the current width and height of the surface, or the special value (0xFFFFFFFF, 0xFFFFFFFF) indicating that the surface size will be determined by the extent of a swapchain targeting the surface.

• **minImageExtent** contains the smallest valid swapchain extent for the surface on the specified device. The width and height of the extent will each be less than or equal to the corresponding width and height of `currentExtent`, unless `currentExtent` has the special value described above.

• **maxImageExtent** contains the largest valid swapchain extent for the surface on the specified device. The width and height of the extent will each be greater than or equal to the corresponding width and height of `minImageExtent`. The width and height of the extent will each be greater than or equal to the corresponding width and height of `currentExtent`, unless `currentExtent` has the special value described above.

• **maxImageArrayLayers** is the maximum number of layers presentable images can have for a swapchain created for this device and surface, and will be at least one.

• **supportedTransforms** is a bitmask of `VkSurfaceTransformFlagBitsKHR` indicating the presentation transforms supported for the surface on the specified device. At least one bit will be set.

• **currentTransform** is `VkSurfaceTransformFlagBitsKHR` value indicating the surface's current transform relative to the presentation engine's natural orientation.

• **supportedCompositeAlpha** is a bitmask of `VkCompositeAlphaFlagBitsKHR`, representing the alpha compositing modes supported by the presentation engine for the surface on the specified
device, and at least one bit will be set. Opaque composition can be achieved in any alpha compositing mode by either using an image format that has no alpha component, or by ensuring that all pixels in the presentable images have an alpha value of 1.0.

- supportedUsageFlags is a bitmask of VkImageUsageFlagBits representing the ways the application can use the presentable images of a swapchain created with VkPresentModeKHR set to VK_PRESENT_MODE_IMMEDIATE_KHR, VK_PRESENT_MODE_MAILBOX_KHR, VK_PRESENT_MODE_FIFO_KHR or VK_PRESENT_MODE_FIFO_RELAXED_KHR for the surface on the specified device. VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT must be included in the set. Implementations may support additional usages.

- supportedSurfaceCounters is a bitmask of VkSurfaceCounterFlagBitsEXT indicating the supported surface counter types.

Valid Usage

- VUID-VkSurfaceCapabilities2EXT-supportedSurfaceCounters-01246
  supportedSurfaceCounters must not include VK_SURFACE_COUNTER_VBLANK_BIT_EXT unless the surface queried is a display surface

Valid Usage (Implicit)

- VUID-VkSurfaceCapabilities2EXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_2_EXT

- VUID-VkSurfaceCapabilities2EXT-pNext-pNext
  pNext must be NULL

Bits which can be set in VkSurfaceCapabilities2EXT::supportedSurfaceCounters, indicating supported surface counter types, are:

```c
// Provided by VK_EXT_display_surface_counter
typedef enum VkSurfaceCounterFlagBitsEXT {
    VK_SURFACE_COUNTER_VBLANK_BIT_EXT = 0x00000001,
    VK_SURFACE_COUNTER_VBLANK_EXT = VK_SURFACE_COUNTER_VBLANK_BIT_EXT,
} VkSurfaceCounterFlagBitsEXT;
```

- VK_SURFACE_COUNTER_VBLANK_BIT_EXT specifies a counter incrementing once every time a vertical blanking period occurs on the display associated with the surface.

```c
// Provided by VK_EXT_display_surface_counter
typedef VkFlags VkSurfaceCounterFlagsEXT;
```

VkSurfaceCounterFlagsEXT is a bitmask type for setting a mask of zero or more VkSurfaceCounterFlagBitsEXT.
Bits which may be set in `VkSurfaceCapabilitiesKHR::supportedTransforms` indicating the presentation transforms supported for the surface on the specified device, and possible values of `VkSurfaceCapabilitiesKHR::currentTransform` indicating the surface’s current transform relative to the presentation engine’s natural orientation, are:

```c
// Provided by VK_KHR_surface
typedef enum VkSurfaceTransformFlagBitsKHR {
    VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR = 0x00000001,
    VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR = 0x00000002,
    VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR = 0x00000004,
    VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR = 0x00000008,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_BIT_KHR = 0x00000010,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_90_BIT_KHR = 0x00000020,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_180_BIT_KHR = 0x00000040,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_270_BIT_KHR = 0x00000080,
    VK_SURFACE_TRANSFORM_INHERIT_BIT_KHR = 0x00000100,
} VkSurfaceTransformFlagBitsKHR;
```

- **VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR** specifies that image content is presented without being transformed.
- **VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR** specifies that image content is rotated 90 degrees clockwise.
- **VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR** specifies that image content is rotated 180 degrees clockwise.
- **VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR** specifies that image content is rotated 270 degrees clockwise.
- **VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_BIT_KHR** specifies that image content is mirrored horizontally.
- **VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_90_BIT_KHR** specifies that image content is mirrored horizontally, then rotated 90 degrees clockwise.
- **VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_180_BIT_KHR** specifies that image content is mirrored horizontally, then rotated 180 degrees clockwise.
- **VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_270_BIT_KHR** specifies that image content is mirrored horizontally, then rotated 270 degrees clockwise.
- **VK_SURFACE_TRANSFORM_INHERIT_BIT_KHR** specifies that the presentation transform is not specified, and is instead determined by platform-specific considerations and mechanisms outside Vulkan.

```c
// Provided by VK_KHR_display
typedef VkFlags VkSurfaceTransformFlagsKHR;
```

`VkSurfaceTransformFlagsKHR` is a bitmask type for setting a mask of zero or more `VkSurfaceTransformFlagBitsKHR`.

The `supportedCompositeAlpha` member is of type `VkCompositeAlphaFlagBitsKHR`, containing the
following values:

```c
// Provided by VK_KHR_surface
typedef enum VkCompositeAlphaFlagBitsKHR {
    VK_COMPOSITE_ALPHA_OPAQUE_BIT_KHR = 0x00000001,
    VK_COMPOSITE_ALPHA_PRE_MULTIPLIED_BIT_KHR = 0x00000002,
    VK_COMPOSITE_ALPHA_POST_MULTIPLIED_BIT_KHR = 0x00000004,
    VK_COMPOSITE_ALPHA_INHERIT_BIT_KHR = 0x00000008,
} VkCompositeAlphaFlagBitsKHR;
```

These values are described as follows:

- **VK_COMPOSITE_ALPHA_OPAQUE_BIT_KHR**: The alpha component, if it exists, of the images is ignored in the compositing process. Instead, the image is treated as if it has a constant alpha of 1.0.

- **VK_COMPOSITE_ALPHA_PRE_MULTIPLIED_BIT_KHR**: The alpha component, if it exists, of the images is respected in the compositing process. The non-alpha components of the image are expected to already be multiplied by the alpha component by the application.

- **VK_COMPOSITE_ALPHA_POST_MULTIPLIED_BIT_KHR**: The alpha component, if it exists, of the images is respected in the compositing process. The non-alpha components of the image are not expected to already be multiplied by the alpha component by the application; instead, the compositor will multiply the non-alpha components of the image by the alpha component during compositing.

- **VK_COMPOSITE_ALPHA_INHERIT_BIT_KHR**: The way in which the presentation engine treats the alpha component in the images is unknown to the Vulkan API. Instead, the application is responsible for setting the composite alpha blending mode using native window system commands. If the application does not set the blending mode using native window system commands, then a platform-specific default will be used.

```c
// Provided by VK_KHR_surface
typedef VkFlags VkCompositeAlphaFlagsKHR;
```

**VkCompositeAlphaFlagsKHR** is a bitmask type for setting a mask of zero or more **VkCompositeAlphaFlagBitsKHR**.

### 34.5.2. Surface Format Support

To query the supported swapchain format-color space pairs for a surface, call:

```c
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfaceFormatsKHR(
    VkPhysicalDevice physicalDevice,      // Physical device
    VkSurfaceKHR surface,                 // Surface
    uint32_t* pSurfaceFormatCount,        // Count of surface formats
    VkSurfaceFormatKHR* pSurfaceFormats   // Surface formats
);
```

- **physicalDevice** is the physical device that will be associated with the swapchain to be created, as
described for `vkCreateSwapchainKHR`.

- `surface` is the surface that will be associated with the swapchain.
- `pSurfaceFormatCount` is a pointer to an integer related to the number of format pairs available or queried, as described below.
- `pSurfaceFormats` is either `NULL` or a pointer to an array of `VkSurfaceFormatKHR` structures.

If `pSurfaceFormats` is `NULL`, then the number of format pairs supported for the given `surface` is returned in `pSurfaceFormatCount`. Otherwise, `pSurfaceFormatCount` must point to a variable set by the user to the number of elements in the `pSurfaceFormats` array, and on return the variable is overwritten with the number of structures actually written to `pSurfaceFormats`. If the value of `pSurfaceFormatCount` is less than the number of format pairs supported, at most `pSurfaceFormatCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available format pairs were returned.

The number of format pairs supported must be greater than or equal to 1. `pSurfaceFormats` must not contain an entry whose value for `format` is `VK_FORMAT_UNDEFINED`.

If `pSurfaceFormats` includes an entry whose value for `colorSpace` is `VK_COLOR_SPACE_SRGB_NONLINEAR_KHR` and whose value for `format` is a UNORM (or SRGB) format and the corresponding SRGB (or UNORM) format is a color renderable format for `VK_IMAGE_TILING_OPTIMAL`, then `pSurfaceFormats` must also contain an entry with the same value for `colorSpace` and `format` equal to the corresponding SRGB (or UNORM) format.

If the `VK_GOOGLE_surfaceless_query` extension is enabled, the values returned in `pSurfaceFormats` will be identical for every valid surface created on this physical device, and so `surface` can be `VK_NULL_HANDLE`.

---

**Valid Usage**

- **VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-surface-06524**
  If the `VK_GOOGLE_surfaceless_query` extension is not enabled, `surface` must be a valid `VkSurfaceKHR` handle

- **VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-surface-06525**
  If `surface` is not `VK_NULL_HANDLE`, it must be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

---

**Valid Usage (Implicit)**

- **VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-physicalDevice-parameter**
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- **VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-surface-parameter**
  If `surface` is not `VK_NULL_HANDLE`, `surface` must be a valid `VkSurfaceKHR` handle

- **VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-pSurfaceFormatCount-parameter**
  `pSurfaceFormatCount` must be a valid pointer to a `uint32_t` value
If the value referenced by `pSurfaceFormatCount` is not 0, and `pSurfaceFormats` is not NULL, `pSurfaceFormats` must be a valid pointer to an array of `pSurfaceFormatCount` `VkSurfaceFormatKHR` structures.

Both of `physicalDevice`, and `surface` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkInstance`.

**Return Codes**

**Success**
- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`

The `VkSurfaceFormatKHR` structure is defined as:

```c
typedef struct VkSurfaceFormatKHR {
    VkFormat format;
    VkColorSpaceKHR colorSpace;
} VkSurfaceFormatKHR;
```

- `format` is a `VkFormat` that is compatible with the specified surface.
- `colorSpace` is a presentation `VkColorSpaceKHR` that is compatible with the surface.

To query the supported swapchain format tuples for a surface, call:

```c
VKResult vkGetPhysicalDeviceSurfaceFormats2KHR(
    VkPhysicalDevice physicalDevice,    
    const VkPhysicalDeviceSurfaceInfo2KHR* pSurfaceInfo,    
    uint32_t* pSurfaceFormatCount,    
    VkSurfaceFormat2KHR* pSurfaceFormats);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.
- `pSurfaceInfo` is a pointer to a `VkPhysicalDeviceSurfaceInfo2KHR` structure describing the surface and other fixed parameters that would be consumed by `vkCreateSwapchainKHR`. 
- \texttt{pSurfaceFormatCount} is a pointer to an integer related to the number of format tuples available or queried, as described below.
- \texttt{pSurfaceFormats} is either \texttt{NULL} or a pointer to an array of \texttt{VkSurfaceFormat2KHR} structures.

\texttt{vkGetPhysicalDeviceSurfaceFormats2KHR} behaves similarly to \texttt{vkGetPhysicalDeviceSurfaceFormatsKHR}, with the ability to be extended via \texttt{pNext} chains.

If \texttt{pSurfaceFormats} is \texttt{NULL}, then the number of format tuples supported for the given \texttt{surface} is returned in \texttt{pSurfaceFormatCount}. Otherwise, \texttt{pSurfaceFormatCount} must point to a variable set by the user to the number of elements in the \texttt{pSurfaceFormats} array, and on return the variable is overwritten with the number of structures actually written to \texttt{pSurfaceFormats}. If the value of \texttt{pSurfaceFormatCount} is less than the number of format tuples supported, at most \texttt{pSurfaceFormatCount} structures will be written, and \texttt{VK_INCOMPLETE} will be returned instead of \texttt{VK_SUCCESS}, to indicate that not all the available values were returned.

### Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceInfo-06521
  If the \texttt{VK_GOOGLE_surfaceless_query} extension is not enabled, \texttt{pSurfaceInfo->surface} must be a valid \texttt{VkSurfaceKHR} handle

- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceInfo-06522
  If \texttt{pSurfaceInfo->surface} is not \texttt{VK_NULL_HANDLE}, it must be supported by \texttt{physicalDevice}, as reported by \texttt{vkGetPhysicalDeviceSurfaceSupportKHR} or an equivalent platform-specific mechanism

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-physicalDevice-parameter
  \texttt{physicalDevice} must be a valid \texttt{VkPhysicalDevice} handle

- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceInfo-parameter
  \texttt{pSurfaceInfo} must be a valid pointer to a valid \texttt{VkPhysicalDeviceSurfaceInfo2KHR} structure

- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceFormatCount-parameter
  \texttt{pSurfaceFormatCount} must be a valid pointer to a \texttt{uint32_t} value

- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceFormats-parameter
  If the value referenced by \texttt{pSurfaceFormatCount} is not \texttt{0}, and \texttt{pSurfaceFormats} is not \texttt{NULL}, \texttt{pSurfaceFormats} must be a valid pointer to an array of \texttt{pSurfaceFormatCount} \texttt{VkSurfaceFormat2KHR} structures

### Return Codes

**Success**
- \texttt{VK_SUCCESS}
The `VkSurfaceFormat2KHR` structure is defined as:

```c
// Provided by VK_KHR_get_surface_capabilities2
typedef struct VkSurfaceFormat2KHR {
    VkStructureType sType;
    void* pNext;
    VkSurfaceFormatKHR surfaceFormat;
} VkSurfaceFormat2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `surfaceFormat` is a `VkSurfaceFormatKHR` structure describing a format-color space pair that is compatible with the specified surface.

If the `imageCompressionControlSwapchain` feature is supported and a `VkImageCompressionPropertiesEXT` structure is included in the `pNext` chain of this structure, then it will be filled with the compression properties that are supported for the `surfaceFormat`.

### Valid Usage

- VUID-VkSurfaceFormat2KHR-pNext-06750
  If the `imageCompressionControlSwapchain` feature is not enabled, the `pNext` chain must not include an `VkImageCompressionPropertiesEXT` structure

### Valid Usage (Implicit)

- VUID-VkSurfaceFormat2KHR-sType-sType
  The `sType` value of each struct in the `pNext` chain must be unique

While the `format` of a presentable image refers to the encoding of each pixel, the `colorSpace` determines how the presentation engine interprets the pixel values. A color space in this document refers to a specific color space (defined by the chromaticities of its primaries and a white point in...
CIE Lab), and a transfer function that is applied before storing or transmitting color data in the
given color space.

Possible values of `VkSurfaceFormatKHR::colorSpace`, specifying supported color spaces of a
presentation engine, are:

```c
// Provided by VK_KHR_surface
typedef enum VkColorSpaceKHR {
  VK_COLOR_SPACE_SRGB_NONLINEAR_KHR = 0,
  // Provided by VK_EXT_swapchain_colorspace
  VK_COLOR_SPACE_DISPLAY_P3_NONLINEAR_EXT = 1000104001,
  // Provided by VK_EXT_swapchain_colorspace
  VK_COLOR_SPACE_EXTENDED_SRGB_LINEAR_EXT = 1000104002,
  // Provided by VK_EXT_swapchain_colorspace
  VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT = 1000104003,
  // Provided by VK_EXT_swapchain_colorspace
  VK_COLOR_SPACE_DCI_P3_LINEAR_EXT = 1000104004,
  // Provided by VK_EXT_swapchain_colorspace
  VK_COLOR_SPACE_BT709_LINEAR_EXT = 1000104005,
  // Provided by VK_EXT_swapchain_colorspace
  VK_COLOR_SPACE_BT709_NONLINEAR_EXT = 1000104006,
  // Provided by VK_EXT_swapchain_colorspace
  VK_COLOR_SPACE_BT2020_LINEAR_EXT = 1000104007,
  // Provided by VK_EXT_swapchain_colorspace
  VK_COLOR_SPACE_HDR10_ST2084_EXT = 1000104008,
  // Provided by VK_EXT_swapchain_colorspace
  VK_COLOR_SPACE_DOLBYVISION_EXT = 1000104009,
  // Provided by VK_EXT_swapchain_colorspace
  VK_COLOR_SPACE_HDR10_HLG_EXT = 1000104010,
  // Provided by VK_EXT_swapchain_colorspace
  VK_COLOR_SPACE_ADOBERGB_LINEAR_EXT = 1000104011,
  // Provided by VK_EXT_swapchain_colorspace
  VK_COLOR_SPACE_ADOBERGB_NONLINEAR_EXT = 1000104012,
  // Provided by VK_EXT_swapchain_colorspace
  VK_COLOR_SPACE_PASS_THROUGH_EXT = 1000104013,
  // Provided by VK_EXT_swapchain_colorspace
  VK_COLOR_SPACE_EXTENDED_SRGB_NONLINEAR_EXT = 1000104014,
  // Provided by VK_AMD_display_native_hdr
  VK_COLOR_SPACE_DISPLAY_NATIVE_AMD = 1000213000,
  VK_COLORSPACE_SRGB_NONLINEAR_KHR = VK_COLOR_SPACE_SRGB_NONLINEAR_KHR,
  // Provided by VK_EXT_swapchain_colorspace
  VK_COLOR_SPACE_DCI_P3_LINEAR_EXT = VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT,
} VkColorSpaceKHR;
```

- `VK_COLOR_SPACE_SRGB_NONLINEAR_KHR` specifies support for the sRGB color space.
- `VK_COLOR_SPACE_DISPLAY_P3_NONLINEAR_EXT` specifies support for the Display-P3 color space to be
displayed using an sRGB-like EOTF (defined below).
- `VK_COLOR_SPACE_EXTENDED_SRGB_LINEAR_EXT` specifies support for the extended sRGB color space to be
displayed using a linear EOTF.
• **VK_COLOR_SPACE_EXTENDED_SRGB_NONLINEAR_EXT** specifies support for the extended sRGB color space to be displayed using an sRGB EOTF.

• **VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT** specifies support for the Display-P3 color space to be displayed using a linear EOTF.

• **VK_COLOR_SPACE_DCI_P3_NONLINEAR_EXT** specifies support for the DCI-P3 color space to be displayed using the DCI-P3 EOTF. Note that values in such an image are interpreted as XYZ encoded color data by the presentation engine.

• **VK_COLOR_SPACE_BT709_LINEAR_EXT** specifies support for the BT709 color space to be displayed using a linear EOTF.

• **VK_COLOR_SPACE_BT709_NONLINEAR_EXT** specifies support for the BT709 color space to be displayed using the SMPTE 170M EOTF.

• **VK_COLOR_SPACE_BT2020_LINEAR_EXT** specifies support for the BT2020 color space to be displayed using a linear EOTF.

• **VK_COLOR_SPACE_HDR10_ST2084_EXT** specifies support for the HDR10 (BT2020 color) space to be displayed using the SMPTE ST2084 Perceptual Quantizer (PQ) EOTF.

• **VK_COLOR_SPACE_DOLBYVISION_EXT** specifies support for the Dolby Vision (BT2020 color space), proprietary encoding, to be displayed using the SMPTE ST2084 EOTF.

• **VK_COLOR_SPACE_HDR10_HLG_EXT** specifies support for the HDR10 (BT2020 color space) to be displayed using the Hybrid Log Gamma (HLG) EOTF.

• **VK_COLOR_SPACE_ADOBERGB_LINEAR_EXT** specifies support for the AdobeRGB color space to be displayed using a linear EOTF.

• **VK_COLOR_SPACE_ADOBERGB_NONLINEAR_EXT** specifies support for the AdobeRGB color space to be displayed using the Gamma 2.2 EOTF.

• **VK_COLOR_SPACE_PASS_THROUGH_EXT** specifies that color components are used “as is”. This is intended to allow applications to supply data for color spaces not described here.

• **VK_COLOR_SPACE_DISPLAY_NATIVE_AMD** specifies support for the display’s native color space. This matches the color space expectations of AMD’s FreeSync2 standard, for displays supporting it.

---

**Note**

In the initial release of the [VK_KHR_surface](https://www.khronos.org/registry/vulkan/specs/1.2-extensions/man/html/vk_KHR_surface.html) and [VK_KHR_swapchain](https://www.khronos.org/registry/vulkan/specs/1.2-extensions/man/html/vk_KHR_swapchain.html) extensions, the token **VK_COLORSPACE_SRGB_NONLINEAR_KHR** was used. Starting in the 2016-05-13 updates to the extension branches, matching release 1.0.13 of the core API specification, **VK_COLOR_SPACE_SRGB_NONLINEAR_KHR** is used instead for consistency with Vulkan naming rules. The older enum is still available for backwards compatibility.

---

**Note**

In older versions of this extension [VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT](https://www.khronos.org/registry/vulkan/specs/1.2-extensions/man/html/vk_KHR_swapchain.html) was misnamed **VK_COLOR_SPACE_DCI_P3_LINEAR_EXT**. This has been updated to indicate that it uses RGB color encoding, not XYZ. The old name is deprecated but is maintained for backwards compatibility.
Note
For a traditional “Linear” or non-gamma transfer function color space use
\texttt{VK\_COLOR\_SPACE\_PASS\_THROUGH\_EXT}.

The color components of non-linear color space swapchain images \textbf{must} have had the appropriate transfer function applied. The color space selected for the swapchain image will not affect the processing of data written into the image by the implementation. Vulkan requires that all implementations support the sRGB transfer function by use of an SRGB pixel format. Other transfer functions, such as SMPTE 170M or SMPTE2084, can be performed by the application shader. This extension defines enums for \texttt{VkColorSpaceKHR} that correspond to the following color spaces:

</table>

The transfer functions are described in the “Transfer Functions” chapter of the Khronos Data Format Specification.

Except Display-P3 OETF, which is:

\[
E = \begin{cases} 
1.055 \times L^{0.4} - 0.055 & \text{for } 0.0030186 \leq L \leq 1 \\
12.92 \times L & \text{for } 0 \leq L < 0.0030186 
\end{cases}
\]

where L is the linear value of a color component and E is the encoded value (as stored in the image in memory).
Note
For most uses, the sRGB OETF is equivalent.

34.5.3. Surface Presentation Mode Support

To query the supported presentation modes for a surface, call:

```c
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfacePresentModesKHR(
    VkPhysicalDevice physicalDevice,
    VkSurfaceKHR surface,
    uint32_t* pPresentModeCount,
    VkPresentModeKHR* pPresentModes);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.
- `surface` is the surface that will be associated with the swapchain.
- `pPresentModeCount` is a pointer to an integer related to the number of presentation modes available or queried, as described below.
- `pPresentModes` is either `NULL` or a pointer to an array of `VkPresentModeKHR` values, indicating the supported presentation modes.

If `pPresentModes` is `NULL`, then the number of presentation modes supported for the given `surface` is returned in `pPresentModeCount`. Otherwise, `pPresentModeCount` must point to a variable set by the user to the number of elements in the `pPresentModes` array, and on return the variable is overwritten with the number of values actually written to `pPresent Modes`. If the value of `pPresentModeCount` is less than the number of presentation modes supported, at most `pPresentModeCount` values will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available modes were returned.

If the `VK_GOOGLE_surfaceless_query` extension is enabled and `surface` is `VK_NULL_HANDLE`, the values returned in `pPresentModes` will only indicate support for `VK_PRESENT_MODE_FIFO_KHR`, `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR`, and `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`. To query support for any other present mode, a valid handle must be provided in `surface`.

Valid Usage

- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-surface-06524
  If the `VK_GOOGLE_surfaceless_query` extension is not enabled, `surface` must be a valid `VkSurfaceKHR` handle

- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-surface-06525
  If `surface` is not `VK_NULL_HANDLE`, it must be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism
Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-surface-parameter
  If surface is not VK_NULL_HANDLE, surface must be a valid VkSurfaceKHR handle

- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-pPresentModeCount-parameter
  pPresentModeCount must be a valid pointer to a uint32_t value

- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-pPresentModes-parameter
  If the value referenced by pPresentModeCount is not 0, and pPresentModes is not NULL,
  pPresentModes must be a valid pointer to an array of pPresentModeCount VkPresentModeKHR values

- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-commonparent
  Both of physicalDevice, and surface that are valid handles of non-ignored parameters
  must have been created, allocated, or retrieved from the same VkInstance

Return Codes

Success

- VK_SUCCESS
- VK_INCOMPLETE

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

Alternatively, to query the supported presentation modes for a surface combined with select other
fixed swapchain creation parameters, call:

```c
// Provided by VK_EXT_full_screen_exclusive
VkResult vkGetPhysicalDeviceSurfacePresentModes2EXT(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceSurfaceInfo2KHR* pSurfaceInfo,
    uint32_t* pPresentModeCount,
    VkPresentModeKHR* pPresentModes);
```

- physicalDevice is the physical device that will be associated with the swapchain to be created, as
described for vkCreateSwapchainKHR.

- pSurfaceInfo is a pointer to a VkPhysicalDeviceSurfaceInfo2KHR structure describing the
  surface and other fixed parameters that would be consumed by vkCreateSwapchainKHR.

- pPresentModeCount is a pointer to an integer related to the number of presentation modes
available or queried, as described below.

- **pPresentModes** is either **NULL** or a pointer to an array of **VkPresentModeKHR** values, indicating the supported presentation modes.

vkGetPhysicalDeviceSurfacePresentModes2EXT behaves similarly to vkGetPhysicalDeviceSurfacePresentModesKHR, with the ability to specify extended inputs via chained input structures.

**Valid Usage**

- **VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pSurfaceInfo-06521**
  If the **VK_GOOGLE_surfaceless_query** extension is not enabled, **pSurfaceInfo->surface** must be a valid **VkSurfaceKHR** handle

- **VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pSurfaceInfo-06522**
  If **pSurfaceInfo->surface** is not **VK_NULL_HANDLE**, it must be supported by **physicalDevice**, as reported by vkGetPhysicalDeviceSurfaceSupportKHR or an equivalent platform-specific mechanism

**Valid Usage (Implicit)**

- **VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-physicalDevice-parameter**
  **physicalDevice** must be a valid **VkPhysicalDevice** handle

- **VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pSurfaceInfo-parameter**
  **pSurfaceInfo** must be a valid pointer to a valid **VkPhysicalDeviceSurfaceInfo2KHR** structure

- **VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pPresentModeCount-parameter**
  **pPresentModeCount** must be a valid pointer to a **uint32_t** value

- **VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pPresentModes-parameter**
  If the value referenced by **pPresentModeCount** is not 0, and **pPresentModes** is not **NULL**, **pPresentModes** must be a valid pointer to an array of **pPresentModeCount** **VkPresentModeKHR** values

**Return Codes**

**Success**

- **VK_SUCCESS**
- **VK_INCOMPLETE**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_SURFACE_LOST_KHR**
Possible values of elements of the `vkGetPhysicalDeviceSurfacePresentModesKHR::pPresentModes` array, indicating the supported presentation modes for a surface, are:

```c
// Provided by VK_KHR_surface
typedef enum VkPresentModeKHR {
    VK_PRESENT_MODE_IMMEDIATE_KHR = 0,
    VK_PRESENT_MODE_MAILBOX_KHR = 1,
    VK_PRESENT_MODE_FIFO_KHR = 2,
    VK_PRESENT_MODE_FIFO_RELAXED_KHR = 3,
    // Provided by VK_KHR_shared_presentable_image
    VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR = 1000111000,
    // Provided by VK_KHR_shared_presentable_image
    VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR = 1000111001,
} VkPresentModeKHR;
```

- **VK_PRESENT_MODE_IMMEDIATE_KHR** specifies that the presentation engine does not wait for a vertical blanking period to update the current image, meaning this mode may result in visible tearing. No internal queuing of presentation requests is needed, as the requests are applied immediately.

- **VK_PRESENT_MODE_MAILBOX_KHR** specifies that the presentation engine waits for the next vertical blanking period to update the current image. Tearing cannot be observed. An internal single-entry queue is used to hold pending presentation requests. If the queue is full when a new presentation request is received, the new request replaces the existing entry, and any images associated with the prior entry become available for reuse by the application. One request is removed from the queue and processed during each vertical blanking period in which the queue is non-empty.

- **VK_PRESENT_MODE_FIFO_KHR** specifies that the presentation engine waits for the next vertical blanking period to update the current image. Tearing cannot be observed. An internal queue is used to hold pending presentation requests. New requests are appended to the end of the queue, and one request is removed from the beginning of the queue and processed during each vertical blanking period in which the queue is non-empty. This is the only value of `presentMode` that is required to be supported.

- **VK_PRESENT_MODE_FIFO_RELAXED_KHR** specifies that the presentation engine generally waits for the next vertical blanking period to update the current image. If a vertical blanking period has already passed since the last update of the current image then the presentation engine does not wait for another vertical blanking period for the update, meaning this mode may result in visible tearing in this case. This mode is useful for reducing visual stutter with an application that will mostly present a new image before the next vertical blanking period, but may occasionally be late, and present a new image just after the next vertical blanking period. An internal queue is used to hold pending presentation requests. New requests are appended to the end of the queue, and one request is removed from the beginning of the queue and processed during or after each vertical blanking period in which the queue is non-empty.

- **VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR** specifies that the presentation engine and application have concurrent access to a single image, which is referred to as a shared presentable image. The presentation engine is only required to update the current image after a new presentation request is received. Therefore the application must make a presentation
request whenever an update is required. However, the presentation engine may update the current image at any point, meaning this mode may result in visible tearing.

- **VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR** specifies that the presentation engine and application have concurrent access to a single image, which is referred to as a *shared presentable image*. The presentation engine periodically updates the current image on its regular refresh cycle. The application is only required to make one initial presentation request, after which the presentation engine must update the current image without any need for further presentation requests. The application can indicate the image contents have been updated by making a presentation request, but this does not guarantee the timing of when it will be updated. This mode may result in visible tearing if rendering to the image is not timed correctly.

The supported VkImageUsageFlagBits of the presentable images of a swapchain created for a surface may differ depending on the presentation mode, and can be determined as per the table below:

<table>
<thead>
<tr>
<th>Presentation mode</th>
<th>Image usage flags</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_PRESENT_MODE_IMMEDIATE_KHR</td>
<td>VkSurfaceCapabilitiesKHR::supportedUsageFlags</td>
</tr>
<tr>
<td>VK_PRESENT_MODE_MAILBOX_KHR</td>
<td>VkSurfaceCapabilitiesKHR::supportedUsageFlags</td>
</tr>
<tr>
<td>VK_PRESENT_MODE_FIFO_KHR</td>
<td>VkSurfaceCapabilitiesKHR::supportedUsageFlags</td>
</tr>
<tr>
<td>VK_PRESENT_MODE_FIFO_RELAXED_KHR</td>
<td>VkSurfaceCapabilitiesKHR::supportedUsageFlags</td>
</tr>
<tr>
<td>VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR</td>
<td>VkSharedPresentSurfaceCapabilitiesKHR::sharedPresentSupportedUsageFlags</td>
</tr>
<tr>
<td>VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR</td>
<td>VkSharedPresentSurfaceCapabilitiesKHR::sharedPresentSupportedUsageFlags</td>
</tr>
</tbody>
</table>

**Note**

For reference, the mode indicated by **VK_PRESENT_MODE_FIFO_KHR** is equivalent to the behavior of {wgl|glX|egl}SwapBuffers with a swap interval of 1, while the mode indicated by **VK_PRESENT_MODE_FIFO_RELAXED_KHR** is equivalent to the behavior of {wgl|glX}SwapBuffers with a swap interval of -1 (from the {WGL|GLX}_EXT_swap_control_tear extensions).

### 34.6. Full Screen Exclusive Control

Swapchains created with **fullScreenExclusive** set to **VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT** must acquire and release exclusive full-screen access explicitly, using the following commands.

To acquire exclusive full-screen access for a swapchain, call:

```c
// Provided by VK_EXT_full_screen-exclusive
VkResult vkAcquireFullScreenExclusiveModeEXT(
```
VkDevice device, VkSwapchainKHR swapchain);

- *device* is the device associated with *swapchain*.
- *swapchain* is the swapchain to acquire exclusive full-screen access for.

### Valid Usage

- VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-02674
  - *swapchain* must not be in the retired state
- VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-02675
  - *swapchain* must be a swapchain created with a *VkSurfaceFullScreenExclusiveInfoEXT* structure, with *fullScreenExclusive* set to *VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT*
- VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-02676
  - *swapchain* must not currently have exclusive full-screen access

A return value of *VK_SUCCESS* indicates that the *swapchain* successfully acquired exclusive full-screen access. The swapchain will retain this exclusivity until either the application releases exclusive full-screen access with *vkReleaseFullScreenExclusiveModeEXT*, destroys the swapchain, or if any of the swapchain commands return *VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT* indicating that the mode was lost because of platform-specific changes.

If the swapchain was unable to acquire exclusive full-screen access to the display then *VK_ERROR_INITIALIZATION_FAILED* is returned. An application can attempt to acquire exclusive full-screen access again for the same swapchain even if this command fails, or if *VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT* has been returned by a swapchain command.

### Valid Usage (Implicit)

- VUID-vkAcquireFullScreenExclusiveModeEXT-device-parameter
  - *device* must be a valid *VkDevice* handle
- VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-parameter
  - *swapchain* must be a valid *VkSwapchainKHR* handle
- VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-parent
  - *swapchain* must have been created, allocated, or retrieved from *device*

### Return Codes

**Success**
- *VK_SUCCESS*

**Failure**
- *VK_ERROR_OUT_OF_HOST_MEMORY*
To release exclusive full-screen access from a swapchain, call:

```c
// Provided by VK_EXT_full_screen_exclusive
VkResult vkReleaseFullScreenExclusiveModeEXT(
    VkDevice device,
    VkSwapchainKHR swapchain);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the swapchain to release exclusive full-screen access from.

**Note**
Applications will not be able to present to `swapchain` after this call until exclusive full-screen access is reacquired. This is usually useful to handle when an application is minimised or otherwise intends to stop presenting for a time.

**Valid Usage**

- VUID-vkReleaseFullScreenExclusiveModeEXT-swapchain-02677 `swapchain` must not be in the retired state
- VUID-vkReleaseFullScreenExclusiveModeEXT-swapchain-02678 `swapchain` must be a swapchain created with a `VkSurfaceFullScreenExclusiveInfoEXT` structure, with `fullScreenExclusive` set to `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT`

### 34.7. Device Group Queries

A logical device that represents multiple physical devices may support presenting from images on more than one physical device, or combining images from multiple physical devices.

To query these capabilities, call:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_surface
VkResult vkGetDeviceGroupPresentCapabilitiesKHR(
    VkDevice device,
    VkDeviceGroupPresentCapabilitiesKHR* pDeviceGroupPresentCapabilities);
```

- `device` is the logical device.
• `pDeviceGroupPresentCapabilities` is a pointer to a `VkDeviceGroupPresentCapabilitiesKHR` structure in which the device's capabilities are returned.

### Valid Usage (Implicit)

- `VUID-vkGetDeviceGroupPresentCapabilitiesKHR-device-parameter`
  - `device` must be a valid `VkDevice` handle
- `VUID-vkGetDeviceGroupPresentCapabilitiesKHR-pDeviceGroupPresentCapabilities-parameter`
  - `pDeviceGroupPresentCapabilities` must be a valid pointer to a `VkDeviceGroupPresentCapabilitiesKHR` structure

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDeviceGroupPresentCapabilitiesKHR` structure is defined as:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_surface
typedef struct VkDeviceGroupPresentCapabilitiesKHR {
  VkStructureType sType;
  void* pNext;
  uint32_t presentMask[VK_MAX_DEVICE_GROUP_SIZE];
  VkDeviceGroupPresentModeFlagsKHR modes;
} VkDeviceGroupPresentCapabilitiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `presentMask` is an array of `VK_MAX_DEVICE_GROUP_SIZE` `uint32_t` masks, where the mask at element `i` is non-zero if physical device `i` has a presentation engine, and where bit `j` is set in element `i` if physical device `i` can present swapchain images from physical device `j`. If element `i` is non-zero, then bit `i` must be set.
- `modes` is a bitmask of `VkDeviceGroupPresentModeFlagBitsKHR` indicating which device group presentation modes are supported.

`modes` always has `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR` set.

The present mode flags are also used when presenting an image, in
VkDeviceGroupPresentInfoKHR::mode.

If a device group only includes a single physical device, then modes must equal VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR.

Valid Usage (Implicit)

- VUID-VkDeviceGroupPresentCapabilitiesKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENTCapabilities_KHR
- VUID-VkDeviceGroupPresentCapabilitiesKHR-pNext-pNext
  pNext must be NULL

Bits which may be set in VkDeviceGroupPresentCapabilitiesKHR::modes, indicating which device group presentation modes are supported, are:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_surface
typedef enum VkDeviceGroupPresentModeFlagBitsKHR {
  VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR = 0x00000001,
  VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR = 0x00000002,
  VKDEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR = 0x00000004,
  VKDEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR = 0x00000008,
} VkDeviceGroupPresentModeFlagBitsKHR;
```

- VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR specifies that any physical device with a presentation engine can present its own swapchain images.
- VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR specifies that any physical device with a presentation engine can present swapchain images from any physical device in its presentMask.
- VKDEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR specifies that any physical device with a presentation engine can present the sum of swapchain images from any physical devices in its presentMask.
- VKDEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR specifies that multiple physical devices with a presentation engine can each present their own swapchain images.

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_surface
typedef VkFlags VkDeviceGroupPresentModeFlagsKHR;
```

VkDeviceGroupPresentModeFlagsKHR is a bitmask type for setting a mask of zero or more VkDeviceGroupPresentModeFlagBitsKHR.

Some surfaces may not be capable of using all the device group present modes.

To query the supported device group present modes for a particular surface, call:
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_surface

VkResult vkGetDeviceGroupSurfacePresentModesKHR(
    VkDevice device,
    VkSurfaceKHR surface,
    VkDeviceGroupPresentModeFlagsKHR* pModes);

- **device** is the logical device.
- **surface** is the surface.
- **pModes** is a pointer to a `VkDeviceGroupPresentModeFlagsKHR` in which the supported device group present modes for the surface are returned.

The modes returned by this command are not invariant, and **may** change in response to the surface being moved, resized, or occluded. These modes **must** be a subset of the modes returned by `vkGetDeviceGroupPresentCapabilitiesKHR`.

**Valid Usage**

- VUID-vkGetDeviceGroupSurfacePresentModesKHR-surface-06212
  - **surface** must be supported by all physical devices associated with **device**, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

**Valid Usage (Implicit)**

- VUID-vkGetDeviceGroupSurfacePresentModesKHR-device-parameter
  - **device** must be a valid `VkDevice` handle
- VUID-vkGetDeviceGroupSurfacePresentModesKHR-surface-parameter
  - **surface** must be a valid `VkSurfaceKHR` handle
- VUID-vkGetDeviceGroupSurfacePresentModesKHR-pModes-parameter
  - **pModes** must be a valid pointer to a `VkDeviceGroupPresentModeFlagsKHR` value
- VUID-vkGetDeviceGroupSurfacePresentModesKHR-commonparent
  - Both of **device**, and **surface** must have been created, allocated, or retrieved from the same `VkInstance`

**Host Synchronization**

- Host access to **surface** must be externally synchronized
Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

Alternatively, to query the supported device group presentation modes for a surface combined with select other fixed swapchain creation parameters, call:

```c
// Provided by VK_VERSION_1_1 with VK_EXT_full_screen_exclusive, VK_KHR_device_group
// with VK_EXT_full_screen_exclusive
VkResult vkGetDeviceGroupSurfacePresentModes2EXT(
    VkDevice device,
    const VkPhysicalDeviceSurfaceInfo2KHR* pSurfaceInfo,
    VkDeviceGroupPresentModeFlagsKHR* pModes);
```

- `device` is the logical device.
- `pSurfaceInfo` is a pointer to a `VkPhysicalDeviceSurfaceInfo2KHR` structure describing the surface and other fixed parameters that would be consumed by `vkCreateSwapchainKHR`.
- `pModes` is a pointer to a `VkDeviceGroupPresentModeFlagsKHR` in which the supported device group present modes for the surface are returned.

`vkGetDeviceGroupSurfacePresentModes2EXT` behaves similarly to `vkGetDeviceGroupSurfacePresentModesKHR`, with the ability to specify extended inputs via chained input structures.

**Valid Usage**

- **VUID-vkGetDeviceGroupSurfacePresentModes2EXT-pSurfaceInfo-06213**
  - `pSurfaceInfo->surface` must be supported by all physical devices associated with `device`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

**Valid Usage (Implicit)**

- **VUID-vkGetDeviceGroupSurfacePresentModes2EXT-device-parameter**
  - `device` must be a valid `VkDevice` handle
- **VUID-vkGetDeviceGroupSurfacePresentModes2EXT-pSurfaceInfo-parameter**
  - `pSurfaceInfo` must be a valid pointer to a valid `VkPhysicalDeviceSurfaceInfo2KHR`
structure

- VUID-vkGetDeviceGroupSurfacePresentModes2EXT-pModes-parameter
  pModes must be a valid pointer to a VkDeviceGroupPresentModeFlagsKHR value

**Return Codes**

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

When using VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR, the application may need to know which regions of the surface are used when presenting locally on each physical device. Presentation of swapchain images to this surface need only have valid contents in the regions returned by this command.

To query a set of rectangles used in presentation on the physical device, call:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_surface
VkResult vkGetPhysicalDevicePresentRectanglesKHR(
    VkPhysicalDevice physicalDevice,
    VkSurfaceKHR surface,
    uint32_t* pRectCount,
    VkRect2D* pRects);
```

- `physicalDevice` is the physical device.
- `surface` is the surface.
- `pRectCount` is a pointer to an integer related to the number of rectangles available or queried, as described below.
- `pRects` is either NULL or a pointer to an array of VkRect2D structures.

If `pRects` is NULL, then the number of rectangles used when presenting the given `surface` is returned in `pRectCount`. Otherwise, `pRectCount` must point to a variable set by the user to the number of elements in the `pRects` array, and on return the variable is overwritten with the number of structures actually written to `pRects`. If the value of `pRectCount` is less than the number of rectangles, at most `pRectCount` structures will be written, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available rectangles were returned.

The values returned by this command are not invariant, and may change in response to the surface being moved, resized, or occluded.
The rectangles returned by this command must not overlap.

### Valid Usage

- **VUID-vkGetPhysicalDevicePresentRectanglesKHR-surface-06523**
  - `surface` must be a valid `VkSurfaceKHR` handle
- **VUID-vkGetPhysicalDevicePresentRectanglesKHR-surface-06211**
  - `surface` must be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

### Valid Usage (Implicit)

- **VUID-vkGetPhysicalDevicePresentRectanglesKHR-physicalDevice-parameter**
  - `physicalDevice` must be a valid `VkPhysicalDevice` handle
- **VUID-vkGetPhysicalDevicePresentRectanglesKHR-surface-parameter**
  - `surface` must be a valid `VkSurfaceKHR` handle
- **VUID-vkGetPhysicalDevicePresentRectanglesKHR-pRectCount-parameter**
  - `pRectCount` must be a valid pointer to a `uint32_t` value
- **VUID-vkGetPhysicalDevicePresentRectanglesKHR-pRects-parameter**
  - If the value referenced by `pRectCount` is not 0, and `pRects` is not NULL, `pRects` must be a valid pointer to an array of `VkRect2D` structures
- **VUID-vkGetPhysicalDevicePresentRectanglesKHR-commonparent**
  - Both of `physicalDevice`, and `surface` must have been created, allocated, or retrieved from the same `VkInstance`

### Host Synchronization

- Host access to `surface` must be externally synchronized

### Return Codes

**Success**

- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
34.8. Display Timing Queries

Traditional game and real-time-animation applications frequently use VK_PRESENT_MODE_FIFO_KHR so that presentable images are updated during the vertical blanking period of a given refresh cycle (RC) of the presentation engine’s display. This avoids the visual anomaly known as tearing.

However, synchronizing the presentation of images with the RC does not prevent all forms of visual anomalies. Stuttering occurs when the geometry for each presentable image is not accurately positioned for when that image will be displayed. The geometry may appear to move too little some RCs, and too much for others. Sometimes the animation appears to freeze, when the same image is used for more than one RC.

In order to minimize stuttering, an application needs to correctly position their geometry for when the presentable image will be displayed to the user. To accomplish this, applications need various timing information about the presentation engine’s display. They need to know when presentable images were actually presented, and when they could have been presented. Applications also need to tell the presentation engine to display an image no sooner than a given time. This can allow the application’s animation to look smooth to the user, with no stuttering. The VK_GOOGLE_display_timing extension allows an application to satisfy these needs.

The presentation engine’s display typically refreshes the pixels that are displayed to the user on a periodic basis. The period may be fixed or variable. In many cases, the presentation engine is associated with fixed refresh rate (FRR) display technology, with a fixed refresh rate (RR, e.g. 60Hz). In some cases, the presentation engine is associated with variable refresh rate (VRR) display technology, where each refresh cycle (RC) can vary in length. This extension treats VRR displays as if they are FRR.

To query the duration of a refresh cycle (RC) for the presentation engine’s display, call:

```c
// Provided by VK_GOOGLE_display_timing
VkResult vkGetRefreshCycleDurationGOOGLE(
    VkDevice device,
    VkSwapchainKHR swapchain,
    VkRefreshCycleDurationGOOGLE* pDisplayTimingProperties);
```

- **device** is the device associated with **swapchain**.
- **swapchain** is the swapchain to obtain the refresh duration for.
- **pDisplayTimingProperties** is a pointer to a VkRefreshCycleDurationGOOGLE structure.

**Valid Usage (Implicit)**

- VUID-vkGetRefreshCycleDurationGOOGLE-device-parameter **device** must be a valid VkDevice handle
- VUID-vkGetRefreshCycleDurationGOOGLE-swapchain-parameter **swapchain** must be a valid VkSwapchainKHR handle
- VUID-vkGetRefreshCycleDurationGOOGLE-pDisplayTimingProperties-parameter
pDisplayTimingProperties must be a valid pointer to a VkRefreshCycleDurationGOOGLE structure

- VUID-vkGetRefreshCycleDurationGOOGLE-swapchain-parent swapchain must have been created, allocated, or retrieved from device

### Host Synchronization

- Host access to swapchain must be externally synchronized

### Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_SURFACE_LOST_KHR

The VkRefreshCycleDurationGOOGLE structure is defined as:

```c
// Provided by VK_GOOGLE_display_timing
typedef struct VkRefreshCycleDurationGOOGLE {
    uint64_t refreshDuration;
} VkRefreshCycleDurationGOOGLE;
```

- refreshDuration is the number of nanoseconds from the start of one refresh cycle to the next.

**Note**

The rate at which an application renders and presents new images is known as the image present rate (IPR, aka frame rate). The inverse of IPR, or the duration between each image present, is the image present duration (IPD). In order to provide a smooth, stutter-free animation, an application will want its IPD to be a multiple of refreshDuration. For example, if a display has a 60Hz refresh rate, refreshDuration will be a value in nanoseconds that is approximately equal to 16.67ms. In such a case, an application will want an IPD of 16.67ms (1X multiplier of refreshDuration), or 33.33ms (2X multiplier of refreshDuration), or 50.0ms (3X multiplier of refreshDuration), etc.

In order to determine a target IPD for a display (i.e. a multiple of refreshDuration), an application needs to determine when its images are actually displayed. Suppose an application has an initial target IPD of 16.67ms (1X multiplier of refreshDuration). It will therefore position the geometry of a new image 16.67ms...
later than the previous image. But suppose this application is running on slower hardware, so that it actually takes 20ms to render each new image. This will create visual anomalies, because the images will not be displayed to the user every 16.67ms, nor every 20ms. In this case, it is better for the application to adjust its target IPD to 33.33ms (i.e. a 2X multiplier of refreshDuration), and tell the presentation engine not to present images any sooner than every 33.33ms. This will allow the geometry to be correctly positioned for each presentable image.

Adjustments to an application’s IPD may be needed because different views of an application’s geometry can take different amounts of time to render. For example, looking at the sky may take less time to render than looking at multiple, complex items in a room. In general, it is good to not frequently change IPD, as that can cause visual anomalies. Adjustments to a larger IPD because of late images should happen quickly, but adjustments to a smaller IPD should only happen if the actualPresentTime and earliestPresentTime members of the VkPastPresentationTimingGOOGLE structure are consistently different, and if presentMargin is consistently large, over multiple images.

The implementation will maintain a limited amount of history of timing information about previous presents. Because of the asynchronous nature of the presentation engine, the timing information for a given vkQueuePresentKHR command will become available some time later. These time values can be asynchronously queried, and will be returned if available. All time values are in nanoseconds, relative to a monotonically-increasing clock (e.g. CLOCK_MONOTONIC (see clock_gettime(2)) on Android and Linux).

To asynchronously query the presentation engine, for newly-available timing information about one or more previous presents to a given swapchain, call:

```c
// Provided by VK_GOOGLE_display_timing
VkResult vkGetPastPresentationTimingGOOGLE(  
    VkDevice device,  
    VkSwapchainKHR swapchain,  
    uint32_t* pPresentationTimingCount,  
    VkPastPresentationTimingGOOGLE* pPresentationTimings);
```

- **device** is the device associated with **swapchain**.
- **swapchain** is the swapchain to obtain presentation timing information duration for.
- **pPresentationTimingCount** is a pointer to an integer related to the number of VkPastPresentationTimingGOOGLE structures to query, as described below.
- **pPresentationTimings** is either NULL or a pointer to an array of VkPastPresentationTimingGOOGLE structures.

If **pPresentationTimings** is NULL, then the number of newly-available timing records for the given swapchain is returned in **pPresentationTimingCount**. Otherwise, **pPresentationTimingCount** must point to a variable set by the user to the number of elements in the **pPresentationTimings** array, and on return the variable is overwritten with the number of structures actually written to **pPresentationTimings**. If the value of **pPresentationTimingCount** is less than the number of newly-
available timing records, at most \texttt{pPresentationTimingCount} structures will be written, and \texttt{VK_INCOMPLETE} will be returned instead of \texttt{VK_SUCCESS}, to indicate that not all the available timing records were returned.

### Valid Usage (Implicit)

- VUID-vkGetPastPresentationTimingGOOGLE-device-parameter \texttt{device} \textbf{must} be a valid \texttt{VkDevice} handle
- VUID-vkGetPastPresentationTimingGOOGLE-swapchain-parameter \texttt{swapchain} \textbf{must} be a valid \texttt{VkSwapchainKHR} handle
- VUID-vkGetPastPresentationTimingGOOGLE-pPresentationTimingCount-parameter \texttt{pPresentationTimingCount} \textbf{must} be a valid pointer to a \texttt{uint32_t} value
- VUID-vkGetPastPresentationTimingGOOGLE-pPresentationTimings-parameter If the value referenced by \texttt{pPresentationTimingCount} is not 0, and \texttt{pPresentationTimings} is not \texttt{NULL}, \texttt{pPresentationTimings} \textbf{must} be a valid pointer to an array of \texttt{pPresentationTimingCount} \texttt{VkPastPresentationTimingGOOGLE} structures
- VUID-vkGetPastPresentationTimingGOOGLE-swapchain-parent \texttt{swapchain} \textbf{must} have been created, allocated, or retrieved from \texttt{device}

### Host Synchronization

- Host access to \texttt{swapchain} \textbf{must} be externally synchronized

### Return Codes

#### Success
- \texttt{VK_SUCCESS}
- \texttt{VK_INCOMPLETE}

#### Failure
- \texttt{VK_ERROR_OUT_OF_HOST_MEMORY}
- \texttt{VK_ERROR_DEVICE_LOST}
- \texttt{VK_ERROR_OUT_OF_DATE_KHR}
- \texttt{VK_ERROR_SURFACE_LOST_KHR}

The \texttt{VkPastPresentationTimingGOOGLE} structure is defined as:

```c
// Provided by VK_GOOGLE_display_timing
typedef struct VkPastPresentationTimingGOOGLE { uint32_t presentID;
    uint64_t desiredPresentTime;
    uint64_t actualPresentTime;
} VkPastPresentationTimingGOOGLE;
```
uint64_t earliestPresentTime;
uint64_t presentMargin;
} VkPastPresentationTimingGOOGLE;

• presentID is an application-provided value that was given to a previous vkQueuePresentKHR command via VkPresentTimeGOOGLE::presentID (see below). It can be used to uniquely identify a previous present with the vkQueuePresentKHR command.

• desiredPresentTime is an application-provided value that was given to a previous vkQueuePresentKHR command via VkPresentTimeGOOGLE::desiredPresentTime. If non-zero, it was used by the application to indicate that an image not be presented any sooner than desiredPresentTime.

• actualPresentTime is the time when the image of the swapchain was actually displayed.

• earliestPresentTime is the time when the image of the swapchain could have been displayed. This may differ from actualPresentTime if the application requested that the image be presented no sooner than VkPresentTimeGOOGLE::desiredPresentTime.

• presentMargin is an indication of how early the vkQueuePresentKHR command was processed compared to how soon it needed to be processed, and still be presented at earliestPresentTime.

The results for a given swapchain and presentID are only returned once from vkGetPastPresentationTimingGOOGLE.

The application can use the VkPastPresentationTimingGOOGLE values to occasionally adjust its timing. For example, if actualPresentTime is later than expected (e.g. one refreshDuration late), the application may increase its target IPD to a higher multiple of refreshDuration (e.g. decrease its frame rate from 60Hz to 30Hz). If actualPresentTime and earliestPresentTime are consistently different, and if presentMargin is consistently large enough, the application may decrease its target IPD to a smaller multiple of refreshDuration (e.g. increase its frame rate from 30Hz to 60Hz). If actualPresentTime and earliestPresentTime are same, and if presentMargin is consistently high, the application may delay the start of its input-render-present loop in order to decrease the latency between user input and the corresponding present (always leaving some margin in case a new image takes longer to render than the previous image). An application that desires its target IPD to always be the same as refreshDuration, can also adjust features until actualPresentTime is never late and presentMargin is satisfactory.

The full VK_GOOGLE_display_timing extension semantics are described for swapchains created with VK_PRESENT_MODE_FIFO_KHR. For example, non-zero values of VkPresentTimeGOOGLE::desiredPresentTime must be honored, and vkGetPastPresentationTimingGOOGLE should return a VkPastPresentationTimingGOOGLE structure with valid values for all images presented with vkQueuePresentKHR. The semantics for other present modes are as follows:

• VK_PRESENT_MODE_IMMEDIATE_KHR. The presentation engine may ignore non-zero values of VkPresentTimeGOOGLE::desiredPresentTime in favor of presenting immediately. The value of VkPastPresentationTimingGOOGLE::earliestPresentTime must be the same as VkPastPresentationTimingGOOGLE::actualPresentTime, which should be when the presentation engine displayed the image.

• VK_PRESENT_MODE_MAILBOX_KHR. The intention of using this present mode with this extension is to
handle cases where an image is presented late, and the next image is presented soon enough to replace it at the next vertical blanking period. For images that are displayed to the user, the value of `VkPastPresentationTimingGOOGLE::actualPresentTime` **must** be when the image was displayed. For images that are not displayed to the user, `vkGetPastPresentationTimingGOOGLE` *may* not return a `VkPastPresentationTimingGOOGLE` structure, or it *may* return a `VkPastPresentationTimingGOOGLE` structure with the value of zero for both `VkPastPresentationTimingGOOGLE::actualPresentTime` and `VkPastPresentationTimingGOOGLE::earliestPresentTime`. It is possible that an application *can* submit images with `VkPresentTimeGOOGLE::desiredPresentTime` values such that new images *may* not be displayed. For example, if `VkPresentTimeGOOGLE::desiredPresentTime` is far enough in the future that an image is not presented before `vkQueuePresentKHR` is called to present another image, the first image will not be displayed to the user. If the application continues to do that, the presentation *may* not display new images.

- **VK_PRESENT_MODE_FIFO_RELAXED_KHR.** For images that are presented in time to be displayed at the next vertical blanking period, the semantics are identical as for **VK_PRESENT_MODE_FIFO_RELAXED_KHR.** For images that are presented late, and are displayed after the start of the vertical blanking period (i.e. with tearing), the values of `VkPastPresentationTimingGOOGLE` *may* be treated as if the image was displayed at the start of the vertical blanking period, or *may* be treated the same as for **VK_PRESENT_MODE_IMMEDIATE_KHR.**

### 34.9. Present Wait

Applications wanting to control the pacing of the application by monitoring when presentation processes have completed to limit the number of outstanding images queued for presentation, need to have a method of being signaled during the presentation process.

Using the **VK_GOOGLE_display_timing** extension applications can discover when images were presented, but only asynchronously.

Providing a mechanism which allows applications to block, waiting for a specific step of the presentation process to complete allows them to control the amount of outstanding work (and hence the potential lag in responding to user input or changes in the rendering environment).

The **VK_KHR_present_wait** extension allows applications to tell the presentation engine at the `vkQueuePresentKHR` call that it plans on waiting for presentation by passing a `VkPresentIdKHR` structure. The `presentId` passed in that structure may then be passed to a future `vkWaitForPresentKHR` call to cause the application to block until that presentation is finished.

### 34.10. WSI Swapchain

A swapchain object (a.k.a. swapchain) provides the ability to present rendering results to a surface. Swapchain objects are represented by `VkSwapchainKHR` handles:

```c
// Provided by VK_KHR_swapchain
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSwapchainKHR)
```

A swapchain is an abstraction for an array of presentable images that are associated with a surface.
The presentable images are represented by \texttt{VkImage} objects created by the platform. One image (which \textbf{can} be an array image for multiview/stereoscopic-3D surfaces) is displayed at a time, but multiple images \textbf{can} be queued for presentation. An application renders to the image, and then queues the image for presentation to the surface.

A native window \textbf{cannot} be associated with more than one non-retired swapchain at a time. Further, swapchains \textbf{cannot} be created for native windows that have a non-Vulkan graphics API surface associated with them.

\begin{itemize}
\item The presentation engine is an abstraction for the platform's compositor or display engine.
\item The presentation engine \textbf{may} be synchronous or asynchronous with respect to the application and/or logical device.
\item Some implementations \textbf{may} use the device's graphics queue or dedicated presentation hardware to perform presentation.
\end{itemize}

The presentable images of a swapchain are owned by the presentation engine. An application \textbf{can} acquire use of a presentable image from the presentation engine. Use of a presentable image \textbf{must} occur only after the image is returned by \texttt{vkAcquireNextImageKHR}, and before it is released by \texttt{vkQueuePresentKHR}. This includes transitioning the image layout and rendering commands.

An application \textbf{can} acquire use of a presentable image with \texttt{vkAcquireNextImageKHR}. After acquiring a presentable image and before modifying it, the application \textbf{must} use a synchronization primitive to ensure that the presentation engine has finished reading from the image. The application \textbf{can} then transition the image's layout, queue rendering commands to it, etc. Finally, the application presents the image with \texttt{vkQueuePresentKHR}, which releases the acquisition of the image. The application \textbf{can} also release the acquisition of the image through \texttt{vkReleaseSwapchainImagesEXT}, if the image is not in use by the device, and skip the present operation.

The presentation engine controls the order in which presentable images are acquired for use by the application.

\begin{itemize}
\item This allows the platform to handle situations which require out-of-order return of images after presentation. At the same time, it allows the application to generate command buffers referencing all of the images in the swapchain at initialization time, rather than in its main loop.
\end{itemize}

How this all works is described below.

If a swapchain is created with \texttt{presentMode} set to either \texttt{VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR} or \texttt{VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR}, a single presentable image \textbf{can} be acquired, referred to as a shared presentable image. A shared presentable image \textbf{may} be concurrently accessed by the application and the presentation engine, without transitioning the image's layout after it is initially presented.
• With `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR`, the presentation engine is only required to update to the latest contents of a shared presentable image after a present. The application must call `vkQueuePresentKHR` to guarantee an update. However, the presentation engine may update from it at any time.

• With `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`, the presentation engine will automatically present the latest contents of a shared presentable image during every refresh cycle. The application is only required to make one initial call to `vkQueuePresentKHR`, after which the presentation engine will update from it without any need for further present calls. The application can indicate the image contents have been updated by calling `vkQueuePresentKHR`, but this does not guarantee the timing of when updates will occur.

The presentation engine may access a shared presentable image at any time after it is first presented. To avoid tearing, an application should coordinate access with the presentation engine. This requires presentation engine timing information through platform-specific mechanisms and ensuring that color attachment writes are made available during the portion of the presentation engine’s refresh cycle they are intended for.

Note
The `VK_KHR_shared_presentable_image` extension does not provide functionality for determining the timing of the presentation engine’s refresh cycles.

In order to query a swapchain’s status when rendering to a shared presentable image, call:

```c
// Provided by VK_KHR_shared_presentable_image
VkResult vkGetSwapchainStatusKHR(VkDevice device, VkSwapchainKHR swapchain);
```

• `device` is the device associated with `swapchain`.

• `swapchain` is the swapchain to query.

**Valid Usage (Implicit)**

• VUID-vkGetSwapchainStatusKHR-device-parameter
  `device` must be a valid `VkDevice` handle

• VUID-vkGetSwapchainStatusKHR-swapchain-parameter
  `swapchain` must be a valid `VkSwapchainKHR` handle

• VUID-vkGetSwapchainStatusKHR-swapchain-parent
  `swapchain` must have been created, allocated, or retrieved from `device`

**Host Synchronization**

• Host access to `swapchain` must be externally synchronized
The possible return values for `vkGetSwapchainStatusKHR` should be interpreted as follows:

- **VK_SUCCESS** specifies the presentation engine is presenting the contents of the shared presentable image, as per the swapchain’s `VkPresentModeKHR`.

- **VK_SUBOPTIMAL_KHR** the swapchain no longer matches the surface properties exactly, but the presentation engine is presenting the contents of the shared presentable image, as per the swapchain’s `VkPresentModeKHR`.

- **VK_ERROR_OUT_OF_DATE_KHR** the surface has changed in such a way that it is no longer compatible with the swapchain.

- **VK_ERROR_SURFACE_LOST_KHR** the surface is no longer available.

- **VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT**

---

Note

The swapchain state may be cached by implementations, so applications should regularly call `vkGetSwapchainStatusKHR` when using a swapchain with `VkPresentModeKHR` set to `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`.

To create a swapchain, call:

```c
// Provided by VK_KHR_swapchain
VkResult vkCreateSwapchainKHR(
    VkDevice device,
    const VkSwapchainCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSwapchainKHR* pSwapchain);
```

- **device** is the device to create the swapchain for.

- **pCreateInfo** is a pointer to a `VkSwapchainCreateInfoKHR` structure specifying the parameters of the created swapchain.
- **pAllocator** is the allocator used for host memory allocated for the swapchain object when there is no more specific allocator available (see Memory Allocation).

- **pSwapchain** is a pointer to a VkSwapchainKHR handle in which the created swapchain object will be returned.

As mentioned above, if vkCreateSwapchainKHR succeeds, it will return a handle to a swapchain containing an array of at least pCreateInfo->minImageCount presentable images.

While acquired by the application, presentable images can be used in any way that equivalent non-presentable images can be used. A presentable image is equivalent to a non-presentable image created with the following VkImageCreateInfo parameters:

<table>
<thead>
<tr>
<th>VkImageCreateInfo Field</th>

</tbody>
</table>

The pCreateInfo->surface must not be destroyed until after the swapchain is destroyed.

If oldSwapchain is VK_NULL_HANDLE, and the native window referred to by pCreateInfo->surface is
already associated with a Vulkan swapchain, **VK_ERROR_NATIVE_WINDOW_IN_USE_KHR** must be returned.

If the native window referred to by `pCreateInfo->surface` is already associated with a non-Vulkan graphics API surface, **VK_ERROR_NATIVE_WINDOW_IN_USE_KHR** must be returned.

The native window referred to by `pCreateInfo->surface` must not become associated with a non-Vulkan graphics API surface before all associated Vulkan swapchains have been destroyed.

`vkCreateSwapchainKHR` will return **VK_ERROR_DEVICE_LOST** if the logical device was lost. The `VkSwapchainKHR` is a child of the device, and must be destroyed before the device. However, `VkSurfaceKHR` is not a child of any `VkDevice` and is not affected by the lost device. After successfully recreating a `VkDevice`, the same `VkSurfaceKHR` can be used to create a new `VkSwapchainKHR`, provided the previous one was destroyed.

If the `oldSwapchain` parameter of `pCreateInfo` is a valid swapchain, which has exclusive full-screen access, that access is released from `pCreateInfo->oldSwapchain`. If the command succeeds in this case, the newly created swapchain will automatically acquire exclusive full-screen access from `pCreateInfo->oldSwapchain`.

**Note**

This implicit transfer is intended to avoid exiting and entering full-screen exclusive mode, which may otherwise cause unwanted visual updates to the display.

In some cases, swapchain creation may fail if exclusive full-screen mode is requested for application control, but for some implementation-specific reason exclusive full-screen access is unavailable for the particular combination of parameters provided. If this occurs, **VK_ERROR_INITIALIZATION_FAILED** will be returned.

**Note**

In particular, it will fail if the `imageExtent` member of `pCreateInfo` does not match the extents of the monitor. Other reasons for failure may include the app not being set as high-dpi aware, or if the physical device and monitor are not compatible in this mode.

If the `pNext` chain of `VkSwapchainCreateInfoKHR` includes a `VkSwapchainPresentBarrierCreateInfoNV` structure, then that structure includes additional swapchain creation parameters specific to the present barrier. Swapchain creation may fail if the state of the current system restricts the usage of the present barrier feature `VkSurfaceCapabilitiesPresentBarrierNV`, or a swapchain itself does not satisfy all the required conditions. In this scenario **VK_ERROR_INITIALIZATION_FAILED** is returned.

When the `VkSurfaceKHR` in `VkSwapchainCreateInfoKHR` is a display surface, then the `VkDisplayModeKHR` in display surface’s `VkDisplaySurfaceCreateInfoKHR` is associated with a particular `VkDisplayKHR`. Swapchain creation may fail if that `VkDisplayKHR` is not acquired by the application. In this scenario **VK_ERROR_INITIALIZATION_FAILED** is returned.
Valid Usage (Implicit)

- VUID-vkCreateSwapchainKHR-device-parameter
device must be a valid VkDevice handle

- VUID-vkCreateSwapchainKHR-pCreateInfo-parameter
pCreateInfo must be a valid pointer to a valid VkSwapchainCreateInfoKHR structure

- VUID-vkCreateSwapchainKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateSwapchainKHR-pSwapchain-parameter
pSwapchain must be a valid pointer to a VkSwapchainKHR handle

Host Synchronization

- Host access to pCreateInfo->surface must be externally synchronized
- Host access to pCreateInfo->oldSwapchain must be externally synchronized

Return Codes

Success
  - VK_SUCCESS

Failure
  - VK_ERROR_OUT_OF_HOST_MEMORY
  - VK_ERROR_OUT_OF_DEVICE_MEMORY
  - VK_ERROR_DEVICE_LOST
  - VK_ERROR_SURFACE_LOST_KHR
  - VK_ERROR_NATIVE_WINDOW_IN_USE_KHR
  - VK_ERROR_INITIALIZATION_FAILED
  - VK_ERROR_COMPRESSION_EXHAUSTED_EXT

The VkSwapchainCreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_swapchain
typedef struct VkSwapchainCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSwapchainCreateFlagsKHR flags;
    VkSurfaceKHR surface;
    uint32_t minImageCount;
    VkFormat imageFormat;
} VkSwapchainCreateInfoKHR;
```
VkColorSpaceKHR
VkExtent2D
uint32_t
VkImageUsageFlags
VkSharingMode
const uint32_t*
VkSurfaceTransformFlagBitsKHR
VkCompositeAlphaFlagBitsKHR
VkPresentModeKHR
VkBool32
VkSwapchainKHR
} VkSwapchainCreateInfoKHR;

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is a bitmask of *VkSwapchainCreateFlagBitsKHR* indicating parameters of the swapchain creation.
- **surface** is the surface onto which the swapchain will present images. If the creation succeeds, the swapchain becomes associated with *surface*.
- **minImageCount** is the minimum number of presentable images that the application needs. The implementation will either create the swapchain with at least that many images, or it will fail to create the swapchain.
- **imageFormat** is a *VkFormat* value specifying the format the swapchain image(s) will be created with.
- **imageColorSpace** is a *VkColorSpaceKHR* value specifying the way the swapchain interprets image data.
- **imageExtent** is the size (in pixels) of the swapchain image(s). The behavior is platform-dependent if the image extent does not match the surface’s *currentExtent* as returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`.

**Note**

On some platforms, it is normal that *maxImageExtent* may become (0, 0), for example when the window is minimized. In such a case, it is not possible to create a swapchain due to the Valid Usage requirements, unless scaling is selected through *VkSwapchainPresentScalingCreateInfoEXT*, if supported.

- **imageArrayLayers** is the number of views in a multiview/stereo surface. For non-stereoscopic-3D applications, this value is 1.
- **imageUsage** is a bitmask of *VkImageUsageFlagBits* describing the intended usage of the (acquired) swapchain images.
- **imageSharingMode** is the sharing mode used for the image(s) of the swapchain.
- **queueFamilyIndexCount** is the number of queue families having access to the image(s) of the swapchain when imageSharingMode is *VK_SHARING_MODE_CONCURRENT*. 
• `pQueueFamilyIndices` is a pointer to an array of queue family indices having access to the images(s) of the swapchain when `imageSharingMode` is `VK_SHARING_MODE_CONCURRENT`.

• `preTransform` is a `VkSurfaceTransformFlagBitsKHR` value describing the transform, relative to the presentation engine's natural orientation, applied to the image content prior to presentation. If it does not match the `currentTransform` value returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`, the presentation engine will transform the image content as part of the presentation operation.

• `compositeAlpha` is a `VkCompositeAlphaFlagBitsKHR` value indicating the alpha compositing mode to use when this surface is composited together with other surfaces on certain window systems.

• `presentMode` is the presentation mode the swapchain will use. A swapchain's present mode determines how incoming present requests will be processed and queued internally.

• `clipped` specifies whether the Vulkan implementation is allowed to discard rendering operations that affect regions of the surface that are not visible.
  
  ◦ If set to `VK_TRUE`, the presentable images associated with the swapchain may not own all of their pixels. Pixels in the presentable images that correspond to regions of the target surface obscured by another window on the desktop, or subject to some other clipping mechanism will have undefined content when read back. Fragment shaders may not execute for these pixels, and thus any side effects they would have had will not occur. Setting `VK_TRUE` does not guarantee any clipping will occur, but allows more efficient presentation methods to be used on some platforms.
  
  ◦ If set to `VK_FALSE`, presentable images associated with the swapchain will own all of the pixels they contain.

  **Note**
  Applications should set this value to `VK_TRUE` if they do not expect to read back the content of presentable images before presenting them or after reacquiring them, and if their fragment shaders do not have any side effects that require them to run for all pixels in the presentable image.

• `oldSwapchain` is `VK_NULL_HANDLE`, or the existing non-retired swapchain currently associated with `surface`. Providing a valid `oldSwapchain` may aid in the resource reuse, and also allows the application to still present any images that are already acquired from it.

Upon calling `vkCreateSwapchainKHR` with an `oldSwapchain` that is not `VK_NULL_HANDLE`, `oldSwapchain` is retired — even if creation of the new swapchain fails. The new swapchain is created in the non-retired state whether or not `oldSwapchain` is `VK_NULL_HANDLE`.

Upon calling `vkCreateSwapchainKHR` with an `oldSwapchain` that is not `VK_NULL_HANDLE`, any images from `oldSwapchain` that are not acquired by the application may be freed by the implementation, which may occur even if creation of the new swapchain fails. The application can destroy `oldSwapchain` to free all memory associated with `oldSwapchain`.

  **Note**
  Multiple retired swapchains can be associated with the same `VkSurfaceKHR` through multiple uses of `oldSwapchain` that outnumber calls to `vkDestroySwapchainKHR`.
After oldSwapchain is retired, the application can pass to vkQueuePresentKHR any images it had already acquired from oldSwapchain. E.g., an application may present an image from the old swapchain before an image from the new swapchain is ready to be presented. As usual, vkQueuePresentKHR may fail if oldSwapchain has entered a state that causes VK_ERROR_OUT_OF_DATE_KHR to be returned.

The application can continue to use a shared presentable image obtained from oldSwapchain until a presentable image is acquired from the new swapchain, as long as it has not entered a state that causes it to return VK_ERROR_OUT_OF_DATE_KHR.

Valid Usage

- VUID-VkSwapchainCreateInfoKHR-surface-01270
  surface must be a surface that is supported by the device as determined using vkGetPhysicalDeviceSurfaceSupportKHR

- VUID-VkSwapchainCreateInfoKHR-minImageCount-01272
  minImageCount must be less than or equal to the value returned in the maxImageCount member of the VkSurfaceCapabilitiesKHR structure returned by vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface if the returned maxImageCount is not zero

- VUID-VkSwapchainCreateInfoKHR-presentMode-02839
  If presentMode is not VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR nor VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR, then minImageCount must be greater than or equal to the value returned in the minImageCount member of theVkSurfaceCapabilitiesKHR structure returned by vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface

- VUID-VkSwapchainCreateInfoKHR-minImageCount-01383
  minImageCount must be 1 if presentMode is either VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR or VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR

- VUID-VkSwapchainCreateInfoKHR-imageFormat-01273
  imageFormat and imageColorSpace must match the format and colorSpace members, respectively, of one of the VkSurfaceFormatKHR structures returned by vkGetPhysicalDeviceSurfaceFormatsKHR for the surface

- VUID-VkSwapchainCreateInfoKHR-pNext-07781
  If a VkSwapchainPresentScalingCreateInfoEXT structure was not included in the pNext chain, or it is included and VkSwapchainPresentScalingCreateInfoEXT::scalingBehavior is zero then imageExtent must be between minImageExtent and maxImageExtent, inclusive, where minImageExtent and maxImageExtent are members of the VkSurfaceCapabilitiesKHR structure returned by vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface

- VUID-VkSwapchainCreateInfoKHR-pNext-07782
  If a VkSwapchainPresentScalingCreateInfoEXT structure was included in the pNext chain and VkSwapchainPresentScalingCreateInfoEXT::scalingBehavior is not zero then imageExtent must be between minScaledImageExtent and maxScaledImageExtent, inclusive, where minScaledImageExtent and maxScaledImageExtent are members of the
VkSurfacePresentScalingCapabilitiesEXT structure returned by
vkGetPhysicalDeviceSurfaceCapabilities2KHR for the surface and presentMode

• VUID-VkSwapchainCreateInfoKHR-imageExtent-01689
  imageExtent members width and height must both be non-zero

• VUID-VkSwapchainCreateInfoKHR-imageArrayLayers-01275
  imageArrayLayers must be greater than 0 and less than or equal to the maxImageArrayLayers
  member of the VkSurfaceCapabilitiesKHR structure returned by
  vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface

• VUID-VkSwapchainCreateInfoKHR-presentMode-01427
  If presentMode is VK_PRESENT_MODE_IMMEDIATE_KHR, VK_PRESENT_MODE_MAILBOX_KHR,
  VK_PRESENT_MODE_FIFO_KHR or VK_PRESENT_MODE_FIFO_RELAXED_KHR, imageUsage must be a
  subset of the supported usage flags present in the supportedUsageFlags member of the
  VkSurfaceCapabilitiesKHR structure returned by
  vkGetPhysicalDeviceSurfaceCapabilitiesKHR for surface

• VUID-VkSwapchainCreateInfoKHR-imageUsage-01384
  If presentMode is VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR or
  VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR, imageUsage must be a subset of the
  supported usage flags present in the sharedPresentSupportedUsageFlags member of the
  VkSharedPresentSurfaceCapabilitiesKHR structure returned by
  vkGetPhysicalDeviceSurfaceCapabilities2KHR for surface

• VUID-VkSwapchainCreateInfoKHR-imageSharingMode-01277
  If imageSharingMode is VK_SHARING_MODE_CONCURRENT, pQueueFamilyIndices must be a valid
  pointer to an array of queueFamilyIndexCount uint32_t values

• VUID-VkSwapchainCreateInfoKHR-imageSharingMode-01278
  If imageSharingMode is VK_SHARING_MODE_CONCURRENT, queueFamilyIndexCount must be greater
  than 1

• VUID-VkSwapchainCreateInfoKHR-imageSharingMode-01428
  If imageSharingMode is VK_SHARING_MODE_CONCURRENT, each element of pQueueFamilyIndices
  must be unique and must be less than pQueueFamilyPropertyCount returned by either
  vkGetPhysicalDeviceQueueFamilyProperties
  or
  vkGetPhysicalDeviceQueueFamilyProperties2 for the physicalDevice that was used to
  create device

• VUID-VkSwapchainCreateInfoKHR-preTransform-01279
  preTransform must be one of the bits present in the supportedTransforms member of the
  VkSurfaceCapabilitiesKHR structure returned by
  vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface

• VUID-VkSwapchainCreateInfoKHR-compositeAlpha-01280
  compositeAlpha must be one of the bits present in the supportedCompositeAlpha member of
  the VkSurfaceCapabilitiesKHR structure returned by
  vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface

• VUID-VkSwapchainCreateInfoKHR-presentMode-01281
  presentMode must be one of the VkPresentModeKHR values returned by
  vkGetPhysicalDeviceSurfacePresentModesKHR for the surface
If the logical device was created with `VkDeviceGroupDeviceCreateInfo`::physicalDeviceCount equal to 1, flags must not contain `VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR`.

If `oldSwapchain` is not `VK_NULL_HANDLE`, `oldSwapchain` must be a non-retired swapchain associated with native window referred to by `surface`.

The implied image creation parameters of the swapchain must be supported as reported by `vkGetPhysicalDeviceImageFormatProperties`.

If `flags` contains `VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR` then the `pNext` chain must include a `VkImageFormatListCreateInfo` structure with a `viewFormatCount` greater than zero and `pViewFormats` must have an element equal to `imageFormat`.

If a `VkImageFormatListCreateInfo` structure was included in the `pNext` chain and `VkImageFormatListCreateInfo`::`viewFormatCount` is not zero then all of the formats in `VkImageFormatListCreateInfo`::`pViewFormats` must be compatible with the `format` as described in the compatibility table.

If `flags` do not contain `VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR` and the `pNext` chain include a `VkImageFormatListCreateInfo` structure then `VkImageFormatListCreateInfo`::`viewFormatCount` must be 0 or 1.

If `flags` contains `VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR`, then `VkSurfaceProtectedCapabilitiesKHR`::`supportsProtected` must be `VK_TRUE` in the `VkSurfaceProtectedCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilities2KHR` for `surface`.

If the `pNext` chain includes a `VkSurfaceFullScreenExclusiveInfoEXT` structure with its `fullScreenExclusive` member set to `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT`, and `surface` was created using `vkCreateWin32SurfaceKHR`, a `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure must be included in the `pNext` chain.

If the `imageCompressionControlSwapchain` feature is not enabled, the `pNext` chain must not include an `VkImageCompressionControlEXT` structure.

**Valid Usage (Implicit)**

- `VK_STRUCTURE_TYPE_SWAPCHAIN_CREATE_INFO_KHR` must be `sType`.
- `VK_STRUCTURE_TYPE_SWAPCHAIN_CREATE_INFO_KHR` must be `pNext`.
- `VK_STRUCTURE_TYPE_SWAPCHAIN_CREATE_INFO_KHR` must be `sType`.
- `VK_STRUCTURE_TYPE_SWAPCHAIN_CREATE_INFO_KHR` must be `pNext`.
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkDeviceGroupSwapchainCreateInfoKHR`, `VkImageCompressionControlEXT`, `VkImageFormatListCreateInfo`, `VkSurfaceFullScreenExclusiveInfoEXT`, `VkSurfaceFullScreenExclusiveWin32InfoEXT`, `VkSwapchainCounterCreateInfoEXT`, `VkSwapchainDisplayNativeHdrCreateInfoAMD`, `VkSwapchainPresentBarrierCreateInfoNV`, `VkSwapchainPresentModesCreateInfoEXT`, or `VkSwapchainPresentScalingCreateInfoEXT`.

- **VUID-VkSwapchainCreateInfoKHR-sType-unique**
  The `sType` value of each struct in the `pNext` chain **must** be unique.

- **VUID-VkSwapchainCreateInfoKHR-flags-parameter**
  `flags` **must** be a valid combination of `VkSwapchainCreateFlagBitsKHR` values.

- **VUID-VkSwapchainCreateInfoKHR-surface-parameter**
  `surface` **must** be a valid `VkSurfaceKHR` handle.

- **VUID-VkSwapchainCreateInfoKHR-imageFormat-parameter**
  `imageFormat` **must** be a valid `VkFormat` value.

- **VUID-VkSwapchainCreateInfoKHR-imageColorSpace-parameter**
  `imageColorSpace` **must** be a valid `VkColorSpaceKHR` value.

- **VUID-VkSwapchainCreateInfoKHR-imageUsage-parameter**
  `imageUsage` **must** be a valid combination of `VkImageUsageFlagBits` values.

- **VUID-VkSwapchainCreateInfoKHR-imageUsage-requiredbitmask**
  `imageUsage` **must** not be `0`.

- **VUID-VkSwapchainCreateInfoKHR-imageSharingMode-parameter**
  `imageSharingMode` **must** be a valid `VkSharingMode` value.

- **VUID-VkSwapchainCreateInfoKHR-preTransform-parameter**
  `preTransform` **must** be a valid `VkSurfaceTransformFlagBitsKHR` value.

- **VUID-VkSwapchainCreateInfoKHR-compositeAlpha-parameter**
  `compositeAlpha` **must** be a valid `VkCompositeAlphaFlagBitsKHR` value.

- **VUID-VkSwapchainCreateInfoKHR-presentMode-parameter**
  `presentMode` **must** be a valid `VkPresentModeKHR` value.

- **VUID-VkSwapchainCreateInfoKHR-oldSwapchain-parameter**
  If `oldSwapchain` is not `VK_NULL_HANDLE`, `oldSwapchain` **must** be a valid `VkSwapchainKHR` handle.

- **VUID-VkSwapchainCreateInfoKHR-commonparent**
  Both of `oldSwapchain`, and `surface` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkInstance`.

Bits which **can** be set in `VkSwapchainCreateInfoKHR::flags`, specifying parameters of swapchain creation, are:

```c
// Provided by VK_KHR_swapchain
typedef enum VkSwapchainCreateFlagBitsKHR {
    // Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
```

2953
VK_KHR_swapchain

VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR = 0x00000001,
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain
VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR = 0x00000002,
// Provided by VK_KHR_swapchain_mutable_format
VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR = 0x00000004,
// Provided by VK_EXT_swapchain_maintenance1
VK_SWAPCHAIN_CREATE_DEFERRED_MEMORY_ALLOCATION_BIT_EXT = 0x00000008,
} VkSwapchainCreateFlagBitsKHR;

- VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR specifies that images created from the swapchain (i.e. with the swapchain member of VkImageSwapchainCreateInfoKHR set to this swapchain's handle) must use VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT.
- VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR specifies that images created from the swapchain are protected images.
- VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR specifies that the images of the swapchain can be used to create a VkImageView with a different format than what the swapchain was created with. The list of allowed image view formats is specified by adding a VkImageFormatListCreateInfo structure to the pNext chain of VkSwapchainCreateInfoKHR. In addition, this flag also specifies that the swapchain can be created with usage flags that are not supported for the format the swapchain is created with but are supported for at least one of the allowed image view formats.
- VK_SWAPCHAIN_CREATE_DEFERRED_MEMORY_ALLOCATION_BIT_EXT specifies that the implementation may defer allocation of memory associated with each swapchain image until its index is to be returned from vkAcquireNextImageKHR or vkAcquireNextImage2KHR for the first time.

typedef VkFlags VkSwapchainCreateFlagsKHR;

VkSwapchainCreateFlagsKHR is a bitmask type for setting a mask of zero or more VkSwapchainCreateFlagBitsKHR.

If the pNext chain of VkSwapchainCreateInfoKHR includes a VkDeviceGroupSwapchainCreateInfoKHR structure, then that structure includes a set of device group present modes that the swapchain can be used with.

The VkDeviceGroupSwapchainCreateInfoKHR structure is defined as:

typedef struct VkDeviceGroupSwapchainCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceGroupPresentModeFlagsKHR modes;
} VkDeviceGroupSwapchainCreateInfoKHR;

- sType is a VkStructureType value identifying this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.

• `modes` is a bitfield of modes that the swapchain can be used with.

If this structure is not present, `modes` is considered to be `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR`.

### Valid Usage (Implicit)

- **VUID-VkDeviceGroupSwapchainCreateInfoKHR-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_DEVICE_GROUP_SWAPCHAIN_CREATE_INFO_KHR`

- **VUID-VkDeviceGroupSwapchainCreateInfoKHR-modes-parameter**
  
  `modes` must be a valid combination of `VkDeviceGroupPresentModeFlagBitsKHR` values

- **VUID-VkDeviceGroupSwapchainCreateInfoKHR-modes-requiredbitset**
  
  `modes` must not be 0

If the `pNext` chain of `VkSwapchainCreateInfoKHR` includes a `VkSwapchainDisplayNativeHdrCreateInfoAMD` structure, then that structure includes additional swapchain creation parameters specific to display native HDR support.

The `VkSwapchainDisplayNativeHdrCreateInfoAMD` structure is defined as:

```c
// Provided by VK_AMD_display_native_hdr
typedef struct VkSwapchainDisplayNativeHdrCreateInfoAMD {
    VkStructureType sType;
    const void* pNext;
    VkBool32 localDimmingEnable;
} VkSwapchainDisplayNativeHdrCreateInfoAMD;
```

- `sType` is a `VkStructureType` value identifying this structure.

- `pNext` is NULL or a pointer to a structure extending this structure.

- `localDimmingEnable` specifies whether local dimming is enabled for the swapchain.

If the `pNext` chain of `VkSwapchainCreateInfoKHR` does not include this structure, the default value for `localDimmingEnable` is `VK_TRUE`, meaning local dimming is initially enabled for the swapchain.

### Valid Usage (Implicit)

- **VUID-VkSwapchainDisplayNativeHdrCreateInfoAMD-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_SWAPCHAIN_DISPLAY_NATIVE_HDR_CREATE_INFO_AMD`

### Valid Usage

- **VUID-VkSwapchainDisplayNativeHdrCreateInfoAMD-localDimmingEnable-04449**
  
  It is only valid to set `localDimmingEnable` to `VK_TRUE` if
The local dimming HDR setting may also be changed over the life of a swapchain by calling:

```c
// Provided by VK_AMD_display_native_hdr
void vkSetLocalDimmingAMD(
    VkDevice device,
    VkSwapchainKHR swapChain,
    VkBool32 localDimmingEnable);
```

- `device` is the device associated with `swapChain`.
- `swapChain` handle to enable local dimming.
- `localDimmingEnable` specifies whether local dimming is enabled for the swapchain.

### Valid Usage (Implicit)

- VUID-vkSetLocalDimmingAMD-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkSetLocalDimmingAMD-swapChain-parameter
  - `swapChain` must be a valid `VkSwapchainKHR` handle
- VUID-vkSetLocalDimmingAMD-swapChain-parent
  - `swapChain` must have been created, allocated, or retrieved from `device`

### Valid Usage

- VUID-vkSetLocalDimmingAMD-localDimmingSupport-04618
  - ` VkDisplayNativeHdrSurfaceCapabilitiesAMD::localDimmingSupport` must be supported

If the `pNext` chain of `VkSwapchainCreateInfoKHR` includes a `VkSurfaceFullScreenExclusiveInfoEXT` structure, then that structure specifies the application’s preferred full-screen presentation behavior. If this structure is not present, `fullscreenExclusive` is considered to be `VK_FULL_SCREEN_EXCLUSIVE_DEFAULT_EXT`.

To enable surface counters when creating a swapchain, add a `VkSwapchainCounterCreateInfoEXT` structure to the `pNext` chain of `VkSwapchainCreateInfoKHR`. `VkSwapchainCounterCreateInfoEXT` is defined as:

```c
// Provided by VK_EXT_display_control
typedef struct VkSwapchainCounterCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkSurfaceCounterFlagsEXT surfaceCounters;
} VkSwapchainCounterCreateInfoEXT;
```
• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is `NULL` or a pointer to a structure extending this structure.

• **surfaceCounters** is a bitmask of `VkSurfaceCounterFlagBitsEXT` specifying surface counters to enable for the swapchain.

---

**Valid Usage**

- VUID-VkSwapchainCounterCreateInfoEXT-surfaceCounters-01244
  The bits in `surfaceCounters` must be supported by `VkSwapchainCreateInfoKHR::surface`, as reported by `vkGetPhysicalDeviceSurfaceCapabilities2EXT`.

---

**Valid Usage (Implicit)**

- VUID-VkSwapchainCounterCreateInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_SWAPCHAIN_COUNTER_CREATE_INFO_EXT`.

- VUID-VkSwapchainCounterCreateInfoEXT-surfaceCounters-parameter
  `surfaceCounters` must be a valid combination of `VkSurfaceCounterFlagBitsEXT` values.

---

The requested counters become active when the first presentation command for the associated swapchain is processed by the presentation engine. To query the value of an active counter, use:

```c
// Provided by VK_EXT_display_control
VkResult vkGetSwapchainCounterEXT(
    VkDevice device,
    VkSwapchainKHR swapchain,
    VkSurfaceCounterFlagBitsEXT counter,
    uint64_t* pCounterValue);
```

• **device** is the `VkDevice` associated with `swapchain`.

• **swapchain** is the swapchain from which to query the counter value.

• **counter** is a `VkSurfaceCounterFlagBitsEXT` value specifying the counter to query.

• **pCounterValue** will return the current value of the counter.

If a counter is not available because the swapchain is out of date, the implementation may return `VK_ERROR_OUT_OF_DATE_KHR`.

---

**Valid Usage**

- VUID-vkGetSwapchainCounterEXT-swapchain-01245
  One or more present commands on `swapchain` must have been processed by the presentation engine.
Valid Usage (Implicit)

- VUID-vkGetSwapchainCounterEXT-device-parameter
  
  *device must* be a valid `VkDevice` handle

- VUID-vkGetSwapchainCounterEXT-swapchain-parameter
  
  *swapchain must* be a valid `VkSwapchainKHR` handle

- VUID-vkGetSwapchainCounterEXT-counter-parameter
  
  *counter must* be a valid `VkSurfaceCounterFlagBitsEXT` value

- VUID-vkGetSwapchainCounterEXT-pCounterValue-parameter
  
  *pCounterValue must* be a valid pointer to a `uint64_t` value

- VUID-vkGetSwapchainCounterEXT-swapchain-parent
  
  *swapchain must* have been created, allocated, or retrieved from `device`

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_OUT_OF_DATE_KHR`

To specify compression properties for the swapchain images in this swapchain, add a `VkImageCompressionControlEXT` structure to the `pNext` chain of the `VkSwapchainCreateInfoKHR` structure.

Applications can modify the presentation mode used by the swapchain on a per-presentation basis. However, all presentation modes the application intends to use with the swapchain must be specified at swapchain creation time. To specify more than one presentation mode when creating a swapchain, include the `VkSwapchainPresentModesCreateInfoEXT` structure in the `pNext` chain of the `VkSwapchainCreateInfoKHR` structure.

The `VkSwapchainPresentModesCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_swapchain_maintenance1
typedef struct VkSwapchainPresentModesCreateInfoEXT {
    VkStructureType          sType;
    const void*              pNext;
    uint32_t                 presentModeCount;
    const VkPresentModeKHR*   pPresentModes;
} VkSwapchainPresentModesCreateInfoEXT;
```
• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is `NULL` or a pointer to a structure extending this structure.
• **presentModeCount** is the number of presentation modes provided.
• **pPresentModes** is a list of presentation modes with `presentModeCount` entries

### Valid Usage

- **VUID-VkSwapchainPresentModesCreateInfoEXT-None-07762**
  Each entry in `pPresentModes` **must** be one of the `VkPresentModeKHR` values returned by `vkGetPhysicalDeviceSurfacePresentModesKHR` for the surface.

- **VUID-VkSwapchainPresentModesCreateInfoEXT-pPresentModes-07763**
  The entries in `pPresentModes` **must** be a subset of the present modes returned in `VkSurfacePresentModeCompatibilityEXT::pPresentModes`, given `VkSwapchainCreateInfoKHR::presentMode` in `VkSurfacePresentModeEXT`.

- **VUID-VkSwapchainPresentModesCreateInfoEXT-presentMode-07764**
  `VkSwapchainCreateInfoKHR::presentMode` **must** be included in `pPresentModes`.

### Valid Usage (Implicit)

- **VUID-VkSwapchainPresentModesCreateInfoEXT-sType-sType**
  `sType` **must** be `VK_STRUCTURE_TYPE_SWAPCHAIN_PRESENT_MODES_CREATE_INFO_EXT`.

- **VUID-VkSwapchainPresentModesCreateInfoEXT-pPresentModes-parameter**
  `pPresentModes` **must** be a valid pointer to an array of `presentModeCount` valid `VkPresentModeKHR` values.

- **VUID-VkSwapchainPresentModesCreateInfoEXT-presentModeCount-arraylength**
  `presentModeCount` **must** be greater than `0`.

When an application presents a swapchain image with dimensions different than those of the target surface, different behavior is possible on different platforms per their respective specifications:

- Presentation fails and `VK_ERROR_OUT_OF_DATE_KHR` is returned.
- Scaling is done and `VK_SUCCESS` or `VK_SUBOPTIMAL_KHR` is returned.
- Unspecified scaling using an arbitrary combination of stretching, centering and/or clipping.

Applications **can** define specific behavior when creating a swapchain by including the `VkSwapchainPresentScalingCreateInfoEXT` structure in the `pNext` chain of the `VkSwapchainCreateInfoKHR` structure.

The `VkSwapchainPresentScalingCreateInfoEXT` structure is defined as:

```c
typedef struct VkSwapchainPresentScalingCreateInfoEXT {
```
VkStructureType sType;
const void* pNext;
VkPresentScalingFlagsEXT scalingBehavior;
VkPresentGravityFlagsEXT presentGravityX;
VkPresentGravityFlagsEXT presentGravityY;
} VkSwapchainPresentScalingCreateInfoEXT;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **scalingBehavior** is 0 or the scaling method to use when the dimensions of the surface and swapchain images differ.
- **presentGravityX** is 0 or the x-axis direction in which swapchain image pixels gravitate relative to the surface when **scalingBehavior** does not result in a one-to-one pixel mapping between the scaled swapchain image and the surface.
- **presentGravityY** is 0 or the y-axis direction in which swapchain image pixels gravitate relative to the surface when **scalingBehavior** does not result in a one-to-one pixel mapping between the scaled swapchain image and the surface.

If **scalingBehavior** is 0, the result of presenting a swapchain image with dimensions that do not match the surface dimensions is implementation and platform-dependent. If **presentGravityX** or **presentGravityY** are 0, the presentation gravity must match that defined by the native platform surface on platforms which define surface gravity.

### Valid Usage

- VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityX-07765
  If **presentGravityX** is 0, **presentGravityY** must be 0
- VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityX-07766
  If **presentGravityX** is not 0, **presentGravityY** must not be 0
- VUID-VkSwapchainPresentScalingCreateInfoEXT-scalingBehavior-07767
  **scalingBehavior** must not have more than one bit set
- VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityX-07768
  **presentGravityX** must not have more than one bit set
- VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityY-07769
  **presentGravityY** must not have more than one bit set
- VUID-VkSwapchainPresentScalingCreateInfoEXT-scalingBehavior-07770
  **scalingBehavior** must be a valid scaling method for the surface as returned in VkSurfacePresentScalingCapabilitiesEXT::supportedPresentScaling, given VkSwapchainCreateInfoKHR::presentMode in VkSurfacePresentModeEXT
- VUID-VkSwapchainPresentScalingCreateInfoEXT-scalingBehavior-07771
  If the swapchain is created with VkSwapchainPresentModesCreateInfoEXT, **scalingBehavior** must be a valid scaling method for the surface as returned in VkSurfacePresentScalingCapabilitiesEXT::supportedPresentScaling, given each present mode in VkSwapchainPresentModesCreateInfoEXT::pPresentModes in
**VkSurfacePresentModeEXT**

- VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityX-07772
  `presentGravityX` **must** be a valid x-axis present gravity for the surface as returned in `VkSurfacePresentScalingCapabilitiesEXT::supportedPresentGravityX`, given `VkSwapchainCreateInfoKHR::presentMode` in `VkSurfacePresentModeEXT`

- VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityX-07773
  If the swapchain is created with `VkSwapchainPresentModesCreateInfoEXT`, `presentGravityX` **must** be a valid x-axis present gravity for the surface as returned in `VkSurfacePresentScalingCapabilitiesEXT::supportedPresentGravityX`, given each present mode in `VkSwapchainPresentModesCreateInfoEXT::pPresentModes` in `VkSurfacePresentModeEXT`

- VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityY-07774
  `presentGravityY` **must** be a valid y-axis present gravity for the surface as returned in `VkSurfacePresentScalingCapabilitiesEXT::supportedPresentGravityY`, given `VkSwapchainCreateInfoKHR::presentMode` in `VkSurfacePresentModeEXT`

- VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityY-07775
  If the swapchain is created with `VkSwapchainPresentModesCreateInfoEXT`, `presentGravityY` **must** be a valid y-axis present gravity for the surface as returned in `VkSurfacePresentScalingCapabilitiesEXT::supportedPresentGravityY`, given each present mode in `VkSwapchainPresentModesCreateInfoEXT::pPresentModes` in `VkSurfacePresentModeEXT`

**Valid Usage (Implicit)**

- VUID-VkSwapchainPresentScalingCreateInfoEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_SWAPCHAIN_PRESENT_SCALING_CREATE_INFO_EXT`

- VUID-VkSwapchainPresentScalingCreateInfoEXT-scalingBehavior-parameter
  `scalingBehavior` **must** be a valid combination of `VkPresentScalingFlagBitsEXT` values

- VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityX-parameter
  `presentGravityX` **must** be a valid combination of `VkPresentGravityFlagBitsEXT` values

- VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityY-parameter
  `presentGravityY` **must** be a valid combination of `VkPresentGravityFlagBitsEXT` values

To destroy a swapchain object call:

```c
// Provided by VK_KHR_swapchain
void vkDestroySwapchainKHR(
  VkDevice device,
  VkSwapchainKHR swapchain,
  const VkAllocationCallbacks* pAllocator);
```

- `device` is the `VkDevice` associated with `swapchain`. 
• **swapchain** is the swapchain to destroy.
• **pAllocator** is the allocator used for host memory allocated for the swapchain object when there is no more specific allocator available (see Memory Allocation).

The application **must** not destroy a swapchain until after completion of all outstanding operations on images that were acquired from the swapchain. **swapchain** and all associated VkImage handles are destroyed, and **must** not be acquired or used any more by the application. The memory of each VkImage will only be freed after that image is no longer used by the presentation engine. For example, if one image of the swapchain is being displayed in a window, the memory for that image **may** not be freed until the window is destroyed, or another swapchain is created for the window. Destroying the swapchain does not invalidate the parent VkSurfaceKHR, and a new swapchain **can** be created with it.

When a swapchain associated with a display surface is destroyed, if the image most recently presented to the display surface is from the swapchain being destroyed, then either any display resources modified by presenting images from any swapchain associated with the display surface **must** be reverted by the implementation to their state prior to the first present performed on one of these swapchains, or such resources **must** be left in their current state.

If **swapchain** has exclusive full-screen access, it is released before the swapchain is destroyed.

### Valid Usage

- VUID-vkDestroySwapchainKHR-swapchain-01282
  All uses of presentable images acquired from **swapchain** **must** have completed execution

- VUID-vkDestroySwapchainKHR-swapchain-01283
  If VkAllocationCallbacks were provided when **swapchain** was created, a compatible set of callbacks **must** be provided here

- VUID-vkDestroySwapchainKHR-swapchain-01284
  If no VkAllocationCallbacks were provided when **swapchain** was created, **pAllocator** **must** be NULL

### Valid Usage (Implicit)

- VUID-vkDestroySwapchainKHR-device-parameter
  **device** **must** be a valid VkDevice handle

- VUID-vkDestroySwapchainKHR-swapchain-parameter
  If **swapchain** is not VK_NULL_HANDLE, **swapchain** **must** be a valid VkSwapchainKHR handle

- VUID-vkDestroySwapchainKHR-pAllocator-parameter
  If **pAllocator** is not NULL, **pAllocator** **must** be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroySwapchainKHR-swapchain-parent
  If **swapchain** is a valid handle, it **must** have been created, allocated, or retrieved from **device**
Host Synchronization

- Host access to swapchain must be externally synchronized

When the VK_KHR_display_swapchain extension is enabled, multiple swapchains that share presentable images are created by calling:

```c
// Provided by VK_KHR_display_swapchain
VkResult vkCreateSharedSwapchainsKHR(
    VkDevice device,
    uint32_t swapchainCount,
    const VkSwapchainCreateInfoKHR* pCreateInfos,
    const VkAllocationCallbacks* pAllocator,
    VkSwapchainKHR* pSwapchains);
```

- device is the device to create the swapchains for.
- swapchainCount is the number of swapchains to create.
- pCreateInfos is a pointer to an array of VkSwapchainCreateInfoKHR structures specifying the parameters of the created swapchains.
- pAllocator is the allocator used for host memory allocated for the swapchain objects when there is no more specific allocator available (see Memory Allocation).
- pSwapchains is a pointer to an array of VkSwapchainKHR handles in which the created swapchain objects will be returned.

vkCreateSharedSwapchainsKHR is similar to vkCreateSwapchainKHR, except that it takes an array of VkSwapchainCreateInfoKHR structures, and returns an array of swapchain objects.

The swapchain creation parameters that affect the properties and number of presentable images must match between all the swapchains. If the displays used by any of the swapchains do not use the same presentable image layout or are incompatible in a way that prevents sharing images, swapchain creation will fail with the result code VK_ERROR_INCOMPATIBLE_DISPLAY_KHR. If any error occurs, no swapchains will be created. Images presented to multiple swapchains must be re-acquired from all of them before being modified. After destroying one or more of the swapchains, the remaining swapchains and the presentable images can continue to be used.

Valid Usage (Implicit)

- VUID-vkCreateSharedSwapchainsKHR-device-parameter
  device must be a valid VkDevice handle
- VUID-vkCreateSharedSwapchainsKHR-pCreateInfos-parameter
  pCreateInfos must be a valid pointer to an array of swapchainCount valid VkSwapchainCreateInfoKHR structures
- VUID-vkCreateSharedSwapchainsKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid
**VkAllocationCallbacks** structure

- VUID-vkCreateSharedSwapchainsKHR-pSwapchains-parameter
  
  pSwapchains **must** be a valid pointer to an array of `swapchainCount` `VkSwapchainKHR` handles

- VUID-vkCreateSharedSwapchainsKHR-swapchainCount-arraylength
  
  `swapchainCount` **must** be greater than 0

---

### Host Synchronization

- Host access to `pCreateInfos[].surface` **must** be externally synchronized
- Host access to `pCreateInfos[].oldSwapchain` **must** be externally synchronized

---

### Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INCOMPATIBLE_DISPLAY_KHR
- VK_ERROR_DEVICE_LOST
- VK_ERROR_SURFACE_LOST_KHR

---

To obtain the array of presentable images associated with a swapchain, call:

```c
// Provided by VK_KHR_swapchain

VkResult vkGetSwapchainImagesKHR(
    VkDevice device,          
    VkSwapchainKHR swapchain, 
    uint32_t* pSwapchainImageCount, 
    VkImage* pSwapchainImages);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the swapchain to query.
- `pSwapchainImageCount` is a pointer to an integer related to the number of presentable images available or queried, as described below.
- `pSwapchainImages` is either `NULL` or a pointer to an array of `VkImage` handles.

If `pSwapchainImages` is `NULL`, then the number of presentable images for `swapchain` is returned in `pSwapchainImageCount`. Otherwise, `pSwapchainImageCount` **must** point to a variable set by the user to
the number of elements in the `pSwapchainImages` array, and on return the variable is overwritten with the number of structures actually written to `pSwapchainImages`. If the value of `pSwapchainImageCount` is less than the number of presentable images for `swapchain`, at most `pSwapchainImageCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available presentable images were returned.

### Valid Usage (Implicit)

- **VUID-vkGetSwapchainImagesKHR-device-parameter**
  - `device` must be a valid `VkDevice` handle
- **VUID-vkGetSwapchainImagesKHR-swapchain-parameter**
  - `swapchain` must be a valid `VkSwapchainKHR` handle
- **VUID-vkGetSwapchainImagesKHR-pSwapchainImageCount-parameter**
  - `pSwapchainImageCount` must be a valid pointer to a `uint32_t` value
- **VUID-vkGetSwapchainImagesKHR-pSwapchainImages-parameter**
  - If the value referenced by `pSwapchainImageCount` is not 0, and `pSwapchainImages` is not NULL, `pSwapchainImages` must be a valid pointer to an array of `pSwapchainImageCount` `VkImage` handles
- **VUID-vkGetSwapchainImagesKHR-swapchain-parent**
  - `swapchain` must have been created, allocated, or retrieved from `device`

### Return Codes

**Success**

- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

**Note**

By knowing all presentable images used in the swapchain, the application can create command buffers that reference these images prior to entering its main rendering loop. However, command buffers are not allowed to reference presentable images created with `VK_SWAPCHAIN_CREATE_DEFERRED_MEMORY_ALLOCATION_BIT_EXT` until their indices have been returned from `vkAcquireNextImageKHR` at least once.

Images returned by `vkGetSwapchainImagesKHR` are fully backed by memory before they are passed to the application, as if they are each bound completely and contiguously to a single `VkDeviceMemory` object, unless the swapchain is created with the `VK_SWAPCHAIN_CREATE_DEFERRED_MEMORY_ALLOCATION_BIT_EXT` flag. All presentable images are initially...
in the `VK_IMAGE_LAYOUT_UNDEFINED` layout, thus before using presentable images, the application must transition them to a valid layout for the intended use.

Further, the lifetime of presentable images is controlled by the implementation, so applications must not destroy a presentable image. See `vkDestroySwapchainKHR` for further details on the lifetime of presentable images.

Images can also be created by using `vkCreateImage` with `VkImageSwapchainCreateInfoKHR` and bound to swapchain memory using `vkBindImageMemory2` with `VkBindImageMemorySwapchainInfoKHR`. These images can be used anywhere swapchain images are used, and are useful in logical devices with multiple physical devices to create peer memory bindings of swapchain memory. These images and bindings have no effect on what memory is presented. Unlike images retrieved from `vkGetSwapchainImagesKHR`, these images must be destroyed with `vkDestroyImage`.

To acquire an available presentable image to use, and retrieve the index of that image, call:

```c
// Provided by VK_KHR_swapchain
VkResult vkAcquireNextImageKHR(
    VkDevice device,
    VkSwapchainKHR swapchain,
    uint64_t timeout,
    VkSemaphore semaphore,
    VkFence fence,
    uint32_t* pImageIndex);
```

- **device** is the device associated with **swapchain**.
- **swapchain** is the non-retired swapchain from which an image is being acquired.
- **timeout** specifies how long the function waits, in nanoseconds, if no image is available.
- **semaphore** is **VK_NULL_HANDLE** or a semaphore to signal.
- **fence** is **VK_NULL_HANDLE** or a fence to signal.
- **pImageIndex** is a pointer to a `uint32_t` in which the index of the next image to use (i.e. an index into the array of images returned by `vkGetSwapchainImagesKHR`) is returned.

If the **swapchain** has been created with the `VK_SWAPCHAIN_CREATE_DEFERRED_MEMORY_ALLOCATION_BIT_EXT` flag, the image whose index is returned in **pImageIndex** will be fully backed by memory before this call returns to the application, as if it is bound completely and contiguously to a single `VkDeviceMemory` object.

**Valid Usage**

- VUID-vkAcquireNextImageKHR-swapchain-01285
  **swapchain** must not be in the retired state

- VUID-vkAcquireNextImageKHR-semaphore-01286
  If **semaphore** is not **VK_NULL_HANDLE** it must be unsigned
• VUID-vkAcquireNextImageKHR-semaphore-01779
  If semaphore is not VK_NULL_HANDLE it must not have any uncompleted signal or wait operations pending

• VUID-vkAcquireNextImageKHR-fence-01287
  If fence is not VK_NULL_HANDLE it must be unsignaled and must not be associated with any other queue command that has not yet completed execution on that queue

• VUID-vkAcquireNextImageKHR-semaphore-01780
  semaphore and fence must not both be equal to VK_NULL_HANDLE

• VUID-vkAcquireNextImageKHR-surface-07783
  If forward progress cannot be guaranteed for the surface used to create the swapchain member of pAcquireInfo, the timeout member of pAcquireInfo must not be UINT64_MAX

• VUID-vkAcquireNextImageKHR-semaphore-03265
  semaphore must have a VkSemaphoreType of VK_SEMAPHORE_TYPE_BINARY

Valid Usage (Implicit)

• VUID-vkAcquireNextImageKHR-device-parameter
  device must be a valid VkDevice handle

• VUID-vkAcquireNextImageKHR-swapchain-parameter
  swapchain must be a valid VkSwapchainKHR handle

• VUID-vkAcquireNextImageKHR-semaphore-parameter
  If semaphore is not VK_NULL_HANDLE, semaphore must be a valid VkSemaphore handle

• VUID-vkAcquireNextImageKHR-fence-parameter
  If fence is not VK_NULL_HANDLE, fence must be a valid VkFence handle

• VUID-vkAcquireNextImageKHR-pImageIndex-parameter
  pImageIndex must be a valid pointer to a uint32_t value

• VUID-vkAcquireNextImageKHR-swapchain-parent
  swapchain must have been created, allocated, or retrieved from device

• VUID-vkAcquireNextImageKHR-semaphore-parent
  If semaphore is a valid handle, it must have been created, allocated, or retrieved from device

• VUID-vkAcquireNextImageKHR-fence-parent
  If fence is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

• Host access to swapchain must be externally synchronized
• Host access to semaphore must be externally synchronized
• Host access to fence must be externally synchronized
Return Codes

Success
- VK_SUCCESS
- VK_TIMEOUT
- VK_NOT_READY
- VK_SUBOPTIMAL_KHR

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_OUT_OF_DATE_KHR
- VK_ERROR_SURFACE_LOST_KHR
- VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT

If an image is acquired successfully, `vkAcquireNextImageKHR` must either return VK_SUCCESS or VK_SUBOPTIMAL_KHR. The implementation may return VK_SUBOPTIMAL_KHR if the swapchain no longer matches the surface properties exactly, but can still be used for presentation.

When successful, `vkAcquireNextImageKHR` acquires a presentable image from `swapchain` that an application can use, and sets `pImageIndex` to the index of that image within the swapchain. The presentation engine may not have finished reading from the image at the time it is acquired, so the application must use `semaphore` and/or `fence` to ensure that the image layout and contents are not modified until the presentation engine reads have completed. Once `vkAcquireNextImageKHR` successfully acquires an image, the semaphore signal operation referenced by `semaphore`, if not VK_NULL_HANDLE, and the fence signal operation referenced by `fence`, if not VK_NULL_HANDLE, are submitted for execution. If `vkAcquireNextImageKHR` does not successfully acquire an image, `semaphore` and `fence` are unaffected. The order in which images are acquired is implementation-dependent, and may be different than the order the images were presented.

If `timeout` is zero, then `vkAcquireNextImageKHR` does not wait, and will either successfully acquire an image, or fail and return VK_NOT_READY if no image is available.

If the specified timeout period expires before an image is acquired, `vkAcquireNextImageKHR` returns VK_TIMEOUT. If `timeout` is UINT64_MAX, the timeout period is treated as infinite, and `vkAcquireNextImageKHR` will block until an image is acquired or an error occurs.

Let S be the number of images in `swapchain`. If `swapchain` is created with VkSwapchainPresentModesCreateInfoEXT, let M be the maximum of the values in VkSurfaceCapabilitiesKHR::minImageCount when queried with each present mode in VkSwapchainPresentModesCreateInfoEXT::pPresentModes in VkSurfacePresentModeEXT. Otherwise, let M be the value of VkSurfaceCapabilitiesKHR::minImageCount without a VkSurfacePresentModeEXT as part of the query input.
vkAcquireNextImageKHR **should** not be called if the number of images that the application has currently acquired is greater than \( S-M \). If \( \text{vkAcquireNextImageKHR} \) is called when the number of images that the application has currently acquired is less than or equal to \( S-M \), \( \text{vkAcquireNextImageKHR} \) **must** return in finite time with an allowed VkResult code.

**Note**

Returning a result in finite time guarantees that the implementation cannot deadlock an application, or suspend its execution indefinitely with correct API usage. Acquiring too many images at once may block indefinitely, which is covered by valid usage when attempting to use UINT64_MAX. For example, a scenario here is when a compositor holds on to images which are currently being presented, and there are not any vacant images left to be acquired.

**Note**

\( \text{VK_SUBOPTIMAL_KHR} \) **may** happen, for example, if the platform surface has been resized but the platform is able to scale the presented images to the new size to produce valid surface updates. It is up to the application to decide whether it prefers to continue using the current swapchain in this state, or to re-create the swapchain to better match the platform surface properties.

If the swapchain images no longer match native surface properties, either \( \text{VK_SUBOPTIMAL_KHR} \) or \( \text{VK_ERROR_OUT_OF_DATE_KHR} \) **must** be returned. If \( \text{VK_ERROR_OUT_OF_DATE_KHR} \) is returned, no image is acquired and attempts to present previously acquired images to the swapchain will also fail with \( \text{VK_ERROR_OUT_OF_DATE_KHR} \). Applications need to create a new swapchain for the surface to continue presenting if \( \text{VK_ERROR_OUT_OF_DATE_KHR} \) is returned.

If device loss occurs (see Lost Device) before the timeout has expired, \( \text{vkAcquireNextImageKHR} \) **must** return in finite time with either one of the allowed success codes, or \( \text{VK_ERROR_DEVICE_LOST} \).

If semaphore is not \( \text{VK_NULL_HANDLE} \), the semaphore **must** be unsignaled, with no signal or wait operations pending. It will become signaled when the application can use the image.

**Note**

Use of semaphore allows rendering operations to be recorded and submitted before the presentation engine has completed its use of the image.

If fence is not equal to \( \text{VK_NULL_HANDLE} \), the fence **must** be unsignaled, with no signal operations pending. It will become signaled when the application can use the image.

**Note**

Applications **should** not rely on \( \text{vkAcquireNextImageKHR} \) blocking in order to meter their rendering speed. The implementation **may** return from this function immediately regardless of how many presentation requests are queued, and regardless of when queued presentation requests will complete relative to the call. Instead, applications **can** use fence to meter their frame generation work to match the presentation rate.
An application must wait until either the semaphore or fence is signaled before accessing the image’s data.

**Note**

When the presentable image will be accessed by some stage S, the recommended idiom for ensuring correct synchronization is:

- The VkSubmitInfo used to submit the image layout transition for execution includes vkAcquireNextImageKHR:semaphore in its pWaitSemaphores member, with the corresponding element of pWaitDstStageMask including S.
- The synchronization command that performs any necessary image layout transition includes S in both the srcStageMask and dstStageMask.

After a successful return, the image indicated by pImageIndex and its data will be unmodified compared to when it was presented.

**Note**

Exclusive ownership of presentable images corresponding to a swapchain created with VK_SHARING_MODE_EXCLUSIVE as defined in Resource Sharing is not altered by a call to vkAcquireNextImageKHR. That means upon the first acquisition from such a swapchain presentable images are not owned by any queue family, while at subsequent acquisitions the presentable images remain owned by the queue family the image was previously presented on.

The possible return values for vkAcquireNextImageKHR depend on the timeout provided:

- **VK_SUCCESS** is returned if an image became available.
- **VK_ERROR_SURFACE_LOST_KHR** is returned if the surface becomes no longer available.
- **VK_NOT_READY** is returned if timeout is zero and no image was available.
- **VK_TIMEOUT** is returned if timeout is greater than zero and less than UINT64_MAX, and no image became available within the time allowed.
- **VK_SUBOPTIMAL_KHR** is returned if an image became available, and the swapchain no longer matches the surface properties exactly, but can still be used to present to the surface successfully.

**Note**

This may happen, for example, if the platform surface has been resized but the platform is able to scale the presented images to the new size to produce valid surface updates. It is up to the application to decide whether it prefers to continue using the current swapchain indefinitely or temporarily in this state, or to re-create the swapchain to better match the platform surface properties.

- **VK_ERROR_OUT_OF_DATE_KHR** is returned if the surface has changed in such a way that it is no longer compatible with the swapchain, and further presentation requests using the swapchain will fail. Applications must query the new surface properties and recreate their swapchain if
they wish to continue presenting to the surface.

If the native surface and presented image sizes no longer match, presentation may fail unless the swapchain is created with a non-zero value in `VkSwapchainPresentScalingCreateInfoEXT::scalingBehavior`. If presentation does succeed, the mapping from the presented image to the native surface is defined by the `VkSwapchainPresentScalingCreateInfoEXT` structure if provided. Otherwise it is implementation-defined. It is the application’s responsibility to detect surface size changes and react appropriately. If presentation fails because of a mismatch in the surface and presented image sizes, a `VK_ERROR_OUT_OF_DATE_KHR` error will be returned.

Note

For example, consider a 4x3 window/surface that gets resized to be 3x4 (taller than wider). On some window systems, the portion of the window/surface that was previously and still is visible (the 3x3 part) will contain the same contents as before, while the remaining parts of the window will have undefined contents. Other window systems may squash/stretch the image to fill the new window size without any undefined contents, or apply some other mapping.

To acquire an available presentable image to use, and retrieve the index of that image, call:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_swapchain
VkResult vkAcquireNextImage2KHR(
    VkDevice device,
    const VkAcquireNextImageInfoKHR* pAcquireInfo,
    uint32_t* pImageIndex);
```

- `device` is the device associated with `swapchain`.
- `pAcquireInfo` is a pointer to a `VkAcquireNextImageInfoKHR` structure containing parameters of the acquire.
- `pImageIndex` is a pointer to a `uint32_t` that is set to the index of the next image to use.

If the `swapchain` has been created with the `VK_SWAPCHAIN_CREATE_DEFERRED_MEMORY_ALLOCATION_BIT_EXT` flag, the image whose index is returned in `pImageIndex` will be fully backed by memory before this call returns to the application.

**Valid Usage**

- VUID-vkAcquireNextImage2KHR-surface-07784
  If forward progress cannot be guaranteed for the surface used to create `swapchain`, the `timeout` member of `pAcquireInfo` must not be `UINT64_MAX`

**Valid Usage (Implicit)**

- VUID-vkAcquireNextImage2KHR-device-parameter
device must be a valid VkDevice handle

- VUID-vkAcquireNextImage2KHR-pAcquireInfo-parameter
  pAcquireInfo must be a valid pointer to a valid VkAcquireNextImageInfoKHR structure

- VUID-vkAcquireNextImage2KHR-pImageIndex-parameter
  pImageIndex must be a valid pointer to a uint32_t value

### Return Codes

**Success**
- VK_SUCCESS
- VK_TIMEOUT
- VK_NOT_READY
- VK_SUBOPTIMAL_KHR

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_OUT_OF_DATE_KHR
- VK_ERROR_SURFACE_LOST_KHR
- VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT

The VkAcquireNextImageInfoKHR structure is defined as:

```c
typedef struct VkAcquireNextImageInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSwapchainKHR swapchain;
    uint64_t timeout;
    VkSemaphore semaphore;
    VkFence fence;
    uint32_t deviceMask;
} VkAcquireNextImageInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **swapchain** is a non-retired swapchain from which an image is acquired.
- **timeout** specifies how long the function waits, in nanoseconds, if no image is available.
- **semaphore** is VK_NULL_HANDLE or a semaphore to signal.
• fence is VK_NULL_HANDLE or a fence to signal.
• deviceMask is a mask of physical devices for which the swapchain image will be ready to use when the semaphore or fence is signaled.

If vkAcquireNextImageKHR is used, the device mask is considered to include all physical devices in the logical device.

Note

vkAcquireNextImage2KHR signals at most one semaphore, even if the application requests waiting for multiple physical devices to be ready via the deviceMask. However, only a single physical device can wait on that semaphore, since the semaphore becomes unsignaled when the wait succeeds. For other physical devices to wait for the image to be ready, it is necessary for the application to submit semaphore signal operation(s) to that first physical device to signal additional semaphore(s) after the wait succeeds, which the other physical device(s) can wait upon.

Valid Usage

• VUID-VkAcquireNextImageInfoKHR-swapchain-01675
  swapchain must not be in the retired state

• VUID-VkAcquireNextImageInfoKHR-semaphore-01288
  If semaphore is not VK_NULL_HANDLE it must be unsignaled

• VUID-VkAcquireNextImageInfoKHR-semaphore-01781
  If semaphore is not VK_NULL_HANDLE it must not have any uncompleted signal or wait operations pending

• VUID-VkAcquireNextImageInfoKHR-fence-01289
  If fence is not VK_NULL_HANDLE it must be unsignaled and must not be associated with any other queue command that has not yet completed execution on that queue

• VUID-VkAcquireNextImageInfoKHR-semaphore-01782
  semaphore and fence must not both be equal to VK_NULL_HANDLE

• VUID-VkAcquireNextImageInfoKHR-deviceMask-01290
  deviceMask must be a valid device mask

• VUID-VkAcquireNextImageInfoKHR-deviceMask-01291
  deviceMask must not be zero

• VUID-VkAcquireNextImageInfoKHR-semaphore-03266
  semaphore must have a VkSemaphoreType of VK_SEMAPHORE_TYPE_BINARY

Valid Usage (Implicit)

• VUID-VkAcquireNextImageInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_ACQUIRE_NEXT_IMAGE_INFO_KHR
• VUID-VkAcquireNextImageInfoKHR-pNext-pNext
  pNext must be NULL

• VUID-VkAcquireNextImageInfoKHR-swapchain-parameter
  swapchain must be a valid VkSwapchainKHR handle

• VUID-VkAcquireNextImageInfoKHR-semaphore-parameter
  If semaphore is not VK_NULL_HANDLE, semaphore must be a valid VkSemaphore handle

• VUID-VkAcquireNextImageInfoKHR-fence-parameter
  If fence is not VK_NULL_HANDLE, fence must be a valid VkFence handle

• VUID-VkAcquireNextImageInfoKHR-commonparent
  Each of fence, semaphore, and swapchain that are valid handles of non-ignored parameters
  must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

• Host access to swapchain must be externally synchronized
• Host access to semaphore must be externally synchronized
• Host access to fence must be externally synchronized

After queueing all rendering commands and transitioning the image to the correct layout, to queue
an image for presentation, call:

// Provided by VK_KHR_swapchain
VkResult vkQueuePresentKHR(
  VkQueue queue,
  const VkPresentInfoKHR* pPresentInfo);

• queue is a queue that is capable of presentation to the target surface’s platform on the same
device as the image’s swapchain.
• pPresentInfo is a pointer to a VkPresentInfoKHR structure specifying parameters of the
  presentation.

Note
There is no requirement for an application to present images in the same order
that they were acquired - applications can arbitrarily present any image that is
currently acquired.

Valid Usage

• VUID-vkQueuePresentKHR-pSwapchains-01292
  Each element of pSwapchains member of pPresentInfo must be a swapchain that is created
  for a surface for which presentation is supported from queue as determined using a call to
  vkGetPhysicalDeviceSurfaceSupportKHR
Any writes to memory backing the images referenced by the `pImageIndices` and `pSwapchains` members of `pPresentInfo`, that are available before `vkQueuePresentKHR` is executed, are automatically made visible to the read access performed by the presentation engine. This automatic visibility operation for an image happens-after the semaphore signal operation, and happens-before the presentation engine accesses the image.

Queueing an image for presentation defines a set of queue operations, including waiting on the semaphores and submitting a presentation request to the presentation engine. However, the scope of this set of queue operations does not include the actual processing of the image by the presentation engine.

**Note**

The origin of the native orientation of the surface coordinate system is not specified in the Vulkan specification; it depends on the platform. For most platforms the origin is by default upper-left, meaning the pixel of the presented `VkImage` at coordinates (0,0) would appear at the upper left pixel of the platform surface (assuming `VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR`, and the display standing the right way up).

If `vkQueuePresentKHR` fails to enqueue the corresponding set of queue operations, it may return `VK_ERROR_OUT_OF_HOST_MEMORY` or `VK_ERROR_OUT_OF_DEVICE_MEMORY`. If it does, the implementation must ensure that the state and contents of any resources or synchronization primitives referenced is unaffected by the call or its failure.

If `vkQueuePresentKHR` fails in such a way that the implementation is unable to make that guarantee, the implementation must return `VK_ERROR_DEVICE_LOST`.

However, if the presentation request is rejected by the presentation engine with an error `VK_ERROR_OUT_OF_DATE_KHR`, `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT`, or `VK_ERROR_SURFACE_LOST_KHR`, the set of queue operations are still considered to be enqueued and thus any semaphore wait operation specified in `VkPresentInfoKHR` will execute when the corresponding
queue operation is complete.

Calls to `vkQueuePresentKHR` may block, but must return in finite time.

If any swapchain member of `pPresentInfo` was created with `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT`, `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT` will be returned if that swapchain does not have exclusive full-screen access, possibly for implementation-specific reasons outside of the application’s control.

---

**Valid Usage (Implicit)**

- VUID-vkQueuePresentKHR-queue-parameter
  queue must be a valid `VkQueue` handle
- VUID-vkQueuePresentKHR-pPresentInfo-parameter
  `pPresentInfo` must be a valid pointer to a valid `VkPresentInfoKHR` structure

---

**Host Synchronization**

- Host access to queue must be externally synchronized
- Host access to `pPresentInfo->pWaitSemaphores[]` must be externally synchronized
- Host access to `pPresentInfo->pSwapchains[]` must be externally synchronized

---

**Command Properties**

<table>
<thead>
<tr>

</tbody>
</table>

---

**Return Codes**

**Success**

- `VK_SUCCESS`
- `VK_SUBOPTIMAL_KHR`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_OUT_OF_DATE_KHR`
- `VK_ERROR_SURFACE_LOST_KHR`
The `VkPresentInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_swapchain
typedef struct VkPresentInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreCount;
    const VkSemaphore* pWaitSemaphores;
    uint32_t swapchainCount;
    const VkSwapchainKHR* pSwapchains;
    const uint32_t* pImageIndices;
    VkResult* pResults;
} VkPresentInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **waitSemaphoreCount** is the number of semaphores to wait for before issuing the present request. The number may be zero.
- **pWaitSemaphores** is NULL or a pointer to an array of `VkSemaphore` objects with `waitSemaphoreCount` entries, and specifies the semaphores to wait for before issuing the present request.
- **swapchainCount** is the number of swapchains being presented to by this command.
- **pSwapchains** is a pointer to an array of `VkSwapchainKHR` objects with `swapchainCount` entries.
- **pImageIndices** is a pointer to an array of indices into the array of each swapchain’s presentable images, with `swapchainCount` entries. Each entry in this array identifies the image to present on the corresponding entry in the `pSwapchains` array.
- **pResults** is a pointer to an array of `VkResult` typed elements with `swapchainCount` entries. Applications that do not need per-swapchain results can use NULL for `pResults`. If non-NULL, each entry in `pResults` will be set to the `VkResult` for presenting the swapchain corresponding to the same index in `pSwapchains`.

Before an application can present an image, the image’s layout must be transitioned to the `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR` layout, or for a shared presentable image the `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR` layout.

**Note**

When transitioning the image to `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR` or `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`, there is no need to delay subsequent processing, or perform any visibility operations (as `vkQueuePresentKHR` performs automatic visibility operations). To achieve this, the `dstAccessMask` member of the `VkImageMemoryBarrier` should be set to 0, and the `dstStageMask` parameter should be set to `VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT`.
Valid Usage

- **VUID-VkPresentInfoKHR-pSwapchain-09231**
  Elements of `pSwapchain` must be unique

- **VUID-VkPresentInfoKHR-pImageIndices-01430**
  Each element of `pImageIndices` must be the index of a presentable image acquired from the swapchain specified by the corresponding element of the `pSwapchains` array, and the presented image subresource must be in the `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR` or `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR` layout at the time the operation is executed on a `VkDevice`

- **VUID-VkPresentInfoKHR-pNext-06235**
  If a `VkPresentIdKHR` structure is included in the `pNext` chain, and the `presentId` feature is not enabled, each `presentIds` entry in that structure must be NULL

- **VUID-VkPresentInfoKHR-pSwapchains-09199**
  If any element of the `pSwapchains` array has been created with `VkSwapchainPresentModesCreateInfoEXT`, all of the elements of this array must be created with `VkSwapchainPresentModesCreateInfoEXT`

Valid Usage (Implicit)

- **VUID-VkPresentInfoKHR-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_PRESENT_INFO_KHR`

- **VUID-VkPresentInfoKHR-pNext-pNext**
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either NULL or a pointer to a valid instance of `VkDeviceGroupPresentInfoKHR`, `VkDisplayPresentInfoKHR`, `VkFrameBoundaryEXT`, `VkPresentFrameTokenGGP`, `VkPresentIdKHR`, `VkPresentRegionsKHR`, `VkPresentTimesInfoGOOGLE`, `VkSwapchainPresentFenceInfoEXT`, or `VkSwapchainPresentModeInfoEXT`

- **VUID-VkPresentInfoKHR-sType-unique**
  The `sType` value of each struct in the `pNext` chain must be unique

- **VUID-VkPresentInfoKHR-pWaitSemaphores-parameter**
  If `waitSemaphoreCount` is not 0, `pWaitSemaphores` must be a valid pointer to an array of `waitSemaphoreCount` valid `VkSemaphore` handles

- **VUID-VkPresentInfoKHR-pSwapchains-parameter**
  `pSwapchains` must be a valid pointer to an array of `swapchainCount` valid `VkSwapchainKHR` handles

- **VUID-VkPresentInfoKHR-pImageIndices-parameter**
  `pImageIndices` must be a valid pointer to an array of `swapchainCount` `uint32_t` values

- **VUID-VkPresentInfoKHR-pResults-parameter**
  If `pResults` is not NULL, `pResults` must be a valid pointer to an array of `swapchainCount` `VkResult` values

- **VUID-VkPresentInfoKHR-swapchainCount-arraylength**
  2978
**swapchainCount** must be greater than 0

- VUID-VkPresentInfoKHR-commonparent
  Both of the elements of `pSwapchains`, and the elements of `pWaitSemaphores` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

When the `VK_KHR_incremental_present` extension is enabled, additional fields can be specified that allow an application to specify that only certain rectangular regions of the presentable images of a swapchain are changed. This is an optimization hint that a presentation engine may use to only update the region of a surface that is actually changing. The application still must ensure that all pixels of a presented image contain the desired values, in case the presentation engine ignores this hint. An application can provide this hint by adding a `VkPresentRegionsKHR` structure to the `pNext` chain of the `VkPresentInfoKHR` structure.

The ` VkPresentRegionsKHR` structure is defined as:

```c
// Provided by VK_KHR_incremental_present
typedef struct VkPresentRegionsKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t swapchainCount;
    const VkPresentRegionKHR* pRegions;
} VkPresentRegionsKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `swapchainCount` is the number of swapchains being presented to by this command.
- `pRegions` is `NULL` or a pointer to an array of `VkPresentRegionKHR` elements with `swapchainCount` entries. If not `NULL`, each element of `pRegions` contains the region that has changed since the last present to the swapchain in the corresponding entry in the `VkPresentInfoKHR::pSwapchains` array.

### Valid Usage

- VUID-VkPresentRegionsKHR-swapchainCount-01260
  `swapchainCount` must be the same value as `VkPresentInfoKHR::swapchainCount`, where `VkPresentInfoKHR` is included in the `pNext` chain of this `VkPresentRegionsKHR` structure

### Valid Usage (Implicit)

- VUID-VkPresentRegionsKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PRESENT_REGIONS_KHR`

- VUID-VkPresentRegionsKHR-pRegions-parameter
  If `pRegions` is not `NULL`, `pRegions` must be a valid pointer to an array of `swapchainCount` valid `VkPresentRegionKHR` structures
For a given image and swapchain, the region to present is specified by the `VkPresentRegionKHR` structure, which is defined as:

```c
// Provided by VK_KHR_incremental_present
typedef struct VkPresentRegionKHR {
    uint32_t rectangleCount;
    const VkRectLayerKHR* pRectangles;
} VkPresentRegionKHR;
```

- `rectangleCount` is the number of rectangles in `pRectangles`, or zero if the entire image has changed and should be presented.
- `pRectangles` is either `NULL` or a pointer to an array of `VkRectLayerKHR` structures. The `VkRectLayerKHR` structure is the framebuffer coordinates, plus layer, of a portion of a presentable image that has changed and must be presented. If non-`NULL`, each entry in `pRectangles` is a rectangle of the given image that has changed since the last image was presented to the given swapchain. The rectangles must be specified relative to `VkSurfaceCapabilitiesKHR::currentTransform`, regardless of the swapchain’s `preTransform`. The presentation engine will apply the `preTransform` transformation to the rectangles, along with any further transformation it applies to the image content.

### Valid Usage (Implicit)

- VUID-VkPresentRegionKHR-pRectangles-parameter
  
  If `rectangleCount` is not 0, and `pRectangles` is not `NULL`, `pRectangles` must be a valid pointer to an array of `rectangleCount` valid `VkRectLayerKHR` structures.

The `VkRectLayerKHR` structure is defined as:

```c
// Provided by VK_KHR_incremental_present
typedef struct VkRectLayerKHR {
    VkOffset2D offset;
    VkExtent2D extent;
    uint32_t layer;
} VkRectLayerKHR;
```

- `offset` is the origin of the rectangle, in pixels.
- `extent` is the size of the rectangle, in pixels.
- `layer` is the layer of the image. For images with only one layer, the value of `layer` must be 0.

Some platforms allow the size of a surface to change, and then scale the pixels of the image to fit the surface. `VkRectLayerKHR` specifies pixels of the swapchain’s image(s), which will be constant for
the life of the swapchain.

Valid Usage

- VUID-VkRectLayerKHR-offset-04864
  The sum of `offset` and `extent`, after being transformed according to the `preTransform` member of the `VkSwapchainCreateInfoKHR` structure, **must** be no greater than the `imageExtent` member of the `VkSwapchainCreateInfoKHR` structure passed to `vkCreateSwapchainKHR`

- VUID-VkRectLayerKHR-layer-01262
  `layer` **must** be less than the `imageArrayLayers` member of the `VkSwapchainCreateInfoKHR` structure passed to `vkCreateSwapchainKHR`

When the `VK_KHR_display_swapchain` extension is enabled, additional fields **can** be specified when presenting an image to a swapchain by setting `VkPresentInfoKHR::pNext` to point to a `VkDisplayPresentInfoKHR` structure.

The `VkDisplayPresentInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_display_swapchain
typedef struct VkDisplayPresentInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkRect2D srcRect;
    VkRect2D dstRect;
    VkBool32 persistent;
} VkDisplayPresentInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcRect` is a rectangular region of pixels to present. It **must** be a subset of the image being presented. If `VkDisplayPresentInfoKHR` is not specified, this region will be assumed to be the entire presentable image.
- `dstRect` is a rectangular region within the visible region of the swapchain’s display mode. If `VkDisplayPresentInfoKHR` is not specified, this region will be assumed to be the entire visible region of the swapchain’s mode. If the specified rectangle is a subset of the display mode’s visible region, content from display planes below the swapchain’s plane will be visible outside the rectangle. If there are no planes below the swapchain’s, the area outside the specified rectangle will be black. If portions of the specified rectangle are outside of the display’s visible region, pixels mapping only to those portions of the rectangle will be discarded.
- `persistent`: If this is `VK_TRUE`, the display engine will enable buffered mode on displays that support it. This allows the display engine to stop sending content to the display until a new image is presented. The display will instead maintain a copy of the last presented image. This allows less power to be used, but **may** increase presentation latency. If `VkDisplayPresentInfoKHR` is not specified, persistent mode will not be used.
If the extent of the `srcRect` and `dstRect` are not equal, the presented pixels will be scaled accordingly.

### Valid Usage

- **VUID-VkDisplayPresentInfoKHR-srcRect-01257**
  `srcRect` **must** specify a rectangular region that is a subset of the image being presented

- **VUID-VkDisplayPresentInfoKHR-dstRect-01258**
  `dstRect` **must** specify a rectangular region that is a subset of the `visibleRegion` parameter of the display mode the swapchain being presented uses

- **VUID-VkDisplayPresentInfoKHR-persistentContent-01259**
  If the `persistentContent` member of the `VkDisplayPropertiesKHR` structure returned by `vkGetPhysicalDeviceDisplayPropertiesKHR` for the display the present operation targets is `VK_FALSE`, then `persistent` **must** be `VK_FALSE`

### Valid Usage (Implicit)

- **VUID-VkDisplayPresentInfoKHR-sType-sType**
  `sType` **must** be `VK_STRUCTURE_TYPE_DISPLAY_PRESENT_INFO_KHR`

If the `pNext` chain of `VkPresentInfoKHR` includes a `VkDeviceGroupPresentInfoKHR` structure, then that structure includes an array of device masks and a device group present mode.

The `VkDeviceGroupPresentInfoKHR` structure is defined as:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_swapchain
typedef struct VkDeviceGroupPresentInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t swapchainCount;
    const uint32_t* pDeviceMasks;
    VkDeviceGroupPresentModeFlagBitsKHR mode;
} VkDeviceGroupPresentInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `swapchainCount` is zero or the number of elements in `pDeviceMasks`.
- `pDeviceMasks` is a pointer to an array of device masks, one for each element of `VkPresentInfoKHR::pSwapchains`.
- `mode` is a `VkDeviceGroupPresentModeFlagBitsKHR` value specifying the device group present mode that will be used for this present.

If `mode` is `VKDEVICEGROUP_PRESENTMODE_LOCAL_BIT_KHR`, then each element of `pDeviceMasks` selects
which instance of the swapchain image is presented. Each element of \texttt{pDeviceMasks} must have exactly one bit set, and the corresponding physical device must have a presentation engine as reported by \texttt{VkDeviceGroupPresentCapabilitiesKHR}.

If \texttt{mode} is \texttt{VK\_DEVICE\_GROUP\_PRESENT\_MODE\_REMOTE\_BIT\_KHR}, then each element of \texttt{pDeviceMasks} selects which instance of the swapchain image is presented. Each element of \texttt{pDeviceMasks} must have exactly one bit set, and some physical device in the logical device must include that bit in its \texttt{VkDeviceGroupPresentCapabilitiesKHR::presentMask}.

If \texttt{mode} is \texttt{VK\_DEVICE\_GROUP\_PRESENT\_MODE\_SUM\_BIT\_KHR}, then each element of \texttt{pDeviceMasks} selects which instances of the swapchain image are component-wise summed and the sum of those images is presented. If the sum in any component is outside the representable range, the value of that component is undefined. Each element of \texttt{pDeviceMasks} must have a value for which all set bits are set in one of the elements of \texttt{VkDeviceGroupPresentCapabilitiesKHR::presentMask}.

If \texttt{mode} is \texttt{VK\_DEVICE\_GROUP\_PRESENT\_MODE\_LOCAL\_MULTI\_DEVICE\_BIT\_KHR}, then each element of \texttt{pDeviceMasks} selects which instance(s) of the swapchain images are presented. For each bit set in each element of \texttt{pDeviceMasks}, the corresponding physical device must have a presentation engine as reported by \texttt{VkDeviceGroupPresentCapabilitiesKHR}.

If \texttt{VkDeviceGroupPresentInfoKHR} is not provided or \texttt{swapchainCount} is zero then the masks are considered to be 1. If \texttt{VkDeviceGroupPresentInfoKHR} is not provided, \texttt{mode} is considered to be \texttt{VK\_DEVICE\_GROUP\_PRESENT\_MODE\_LOCAL\_BIT\_KHR}.

### Valid Usage

- **VUID-VkDeviceGroupPresentInfoKHR-swapchainCount-01297**
  \texttt{swapchainCount} must equal 0 or \texttt{VkPresentInfoKHR::swapchainCount}

- **VUID-VkDeviceGroupPresentInfoKHR-mode-01298**
  If \texttt{mode} is \texttt{VK\_DEVICE\_GROUP\_PRESENT\_MODE\_LOCAL\_BIT\_KHR}, then each element of \texttt{pDeviceMasks} must have exactly one bit set, and the corresponding element of \texttt{VkDeviceGroupPresentCapabilitiesKHR::presentMask} must be non-zero

- **VUID-VkDeviceGroupPresentInfoKHR-mode-01299**
  If \texttt{mode} is \texttt{VK\_DEVICE\_GROUP\_PRESENT\_MODE\_REMOTE\_BIT\_KHR}, then each element of \texttt{pDeviceMasks} must have exactly one bit set, and some physical device in the logical device must include that bit in its \texttt{VkDeviceGroupPresentCapabilitiesKHR::presentMask}

- **VUID-VkDeviceGroupPresentInfoKHR-mode-01300**
  If \texttt{mode} is \texttt{VK\_DEVICE\_GROUP\_PRESENT\_MODE\_SUM\_BIT\_KHR}, then each element of \texttt{pDeviceMasks} must have a value for which all set bits are set in one of the elements of \texttt{VkDeviceGroupPresentCapabilitiesKHR::presentMask}

- **VUID-VkDeviceGroupPresentInfoKHR-mode-01301**
  If \texttt{mode} is \texttt{VK\_DEVICE\_GROUP\_PRESENT\_MODE\_LOCAL\_MULTI\_DEVICE\_BIT\_KHR}, then for each bit set in each element of \texttt{pDeviceMasks}, the corresponding element of \texttt{VkDeviceGroupPresentCapabilitiesKHR::presentMask} must be non-zero

- **VUID-VkDeviceGroupPresentInfoKHR-pDeviceMasks-01302**
  The value of each element of \texttt{pDeviceMasks} must be equal to the device mask passed in
VkAcquireNextImageInfoKHR::deviceMask when the image index was last acquired

- VUID-VkDeviceGroupPresentInfoKHR-mode-01303
  mode must have exactly one bit set, and that bit must have been included in VkDeviceGroupSwapchainCreateInfoKHR::modes

Valid Usage (Implicit)

- VUID-VkDeviceGroupPresentInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_INFO_KHR

- VUID-VkDeviceGroupPresentInfoKHR-pDeviceMasks-parameter
  If swapchainCount is not 0, pDeviceMasks must be a valid pointer to an array of swapchainCount uint32_t values

- VUID-VkDeviceGroupPresentInfoKHR-mode-parameter
  mode must be a valid VkDeviceGroupPresentModeFlagBitsKHR value

When the VK_GOOGLE_display_timing extension is enabled, additional fields can be specified that allow an application to specify the earliest time that an image should be displayed. This allows an application to avoid stutter that is caused by an image being displayed earlier than planned. Such stuttering can occur with both fixed and variable-refresh-rate displays, because stuttering occurs when the geometry is not correctly positioned for when the image is displayed. An application can instruct the presentation engine that an image should not be displayed earlier than a specified time by adding a VkPresentTimesInfoGOOGLE structure to the pNext chain of the VkPresentInfoKHR structure.

The VkPresentTimesInfoGOOGLE structure is defined as:

```c
// Provided by VK_GOOGLE_display_timing
typedef struct VkPresentTimesInfoGOOGLE {
    VkStructureType sType;
    const void* pNext;
    uint32_t swapchainCount;
    const VkPresentTimeGOOGLE* pTimes;
} VkPresentTimesInfoGOOGLE;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- swapchainCount is the number of swapchains being presented to by this command.
- pTimes is NULL or a pointer to an array of VkPresentTimeGOOGLE elements with swapchainCount entries. If not NULL, each element of pTimes contains the earliest time to present the image corresponding to the entry in the VkPresentInfoKHR::pImageIndices array.

Valid Usage

- VUID-VkPresentTimesInfoGOOGLE-swapchainCount-01247
The `VkPresentTimeGOOGLE` structure is defined as:

```c
// Provided by VK_GOOGLE_display_timing
typedef struct VkPresentTimeGOOGLE {
    uint32_t presentID;
    uint64_t desiredPresentTime;
} VkPresentTimeGOOGLE;
```

- **presentID** is an application-provided identification value, that can be used with the results of `vkGetPastPresentationTimingGOOGLE`, in order to uniquely identify this present. In order to be useful to the application, it should be unique within some period of time that is meaningful to the application.

- **desiredPresentTime** specifies that the image given should not be displayed to the user any earlier than this time. `desiredPresentTime` is a time in nanoseconds, relative to a monotonically-increasing clock (e.g. `CLOCK_MONOTONIC` (see `clock_gettime(2)`) on Android and Linux). A value of zero specifies that the presentation engine may display the image at any time. This is useful when the application desires to provide `presentID`, but does not need a specific `desiredPresentTime`.

The `VkPresentIdKHR` structure is defined as:

```c
// Provided by VK_KHR_present_id
typedef struct VkPresentIdKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t swapchainCount;
    const uint64_t* pPresentIds;
} VkPresentIdKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.

- **pNext** is `NULL` or a pointer to a structure extending this structure.
• **swapchainCount** is the number of swapchains being presented to the `vkQueuePresentKHR` command.

• **pPresentIds** is NULL or a pointer to an array of `uint64_t` with `swapchainCount` entries. If not NULL, each non-zero value in `pPresentIds` specifies the present id to be associated with the presentation of the swapchain with the same index in the `vkQueuePresentKHR` call.

For applications to be able to reference specific presentation events queued by a call to `vkQueuePresentKHR`, an identifier needs to be associated with them. When the `presentId` feature is enabled, applications **can** include the `VkPresentIdKHR` structure in the `pNext` chain of the `VkPresentInfoKHR` structure to supply identifiers.

Each `VkSwapchainKHR` has a `presentId` associated with it. This value is initially set to zero when the `VkSwapchainKHR` is created.

When a `VkPresentIdKHR` structure with a non-NULL `pPresentIds` is included in the `pNext` chain of a `VkPresentInfoKHR` structure, each `pSwapchains` entry has a presentId associated in the `pPresentIds` array at the same index as the swapchain in the `pSwapchains` array. If this `presentId` is non-zero, then the application **can** later use this value to refer to that image presentation. A value of zero indicates that this presentation has no associated `presentId`. A non-zero `presentId` **must** be greater than any non-zero `presentId` passed previously by the application for the same swapchain.

There is no requirement for any precise timing relationship between the presentation of the image to the user and the update of the `presentId` value, but implementations **should** make this as close as possible to the presentation of the first pixel in the new image to the user.

---

### Valid Usage

- **VUID-VkPresentIdKHR-swapchainCount-04998**
  - `swapchainCount` **must** be the same value as `VkPresentInfoKHR::swapchainCount`, where this `VkPresentIdKHR` is in the `pNext` chain of the `VkPresentInfoKHR` structure

- **VUID-VkPresentIdKHR-presentIds-04999**
  - Each `presentIds` entry **must** be greater than any previous `presentIds` entry passed for the associated `pSwapchains` entry

---

### Valid Usage (Implicit)

- **VUID-VkPresentIdKHR-sType-sType**
  - `sType` **must** be `VK_STRUCTURE_TYPE_PRESENT_ID_KHR`

- **VUID-VkPresentIdKHR-pPresentIds-parameter**
  - If `pPresentIds` is not NULL, `pPresentIds` **must** be a valid pointer to an array of `swapchainCount uint64_t` values

- **VUID-VkPresentIdKHR-swapchainCount-arraylength**
  - `swapchainCount` **must** be greater than 0

---

When the `presentWait` feature is enabled, an application **can** wait for an image to be presented to
the user by first specifying a presentId for the target presentation by adding a `VkPresentIdKHR` structure to the `pNext` chain of the `VkPresentInfoKHR` structure and then waiting for that presentation to complete by calling:

```c
// Provided by VK_KHR_present_wait
VkResult vkWaitForPresentKHR(
    VkDevice device,
    VkSwapchainKHR swapchain,
    uint64_t presentId,
    uint64_t timeout);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the non-retired swapchain on which an image was queued for presentation.
- `presentId` is the presentation presentId to wait for.
- `timeout` is the timeout period in units of nanoseconds. `timeout` is adjusted to the closest value allowed by the implementation-dependent timeout accuracy, which may be substantially longer than one nanosecond, and may be longer than the requested period.

`vkWaitForPresentKHR` waits for the presentId associated with `swapchain` to be increased in value so that it is at least equal to `presentId`.

For `VK_PRESENT_MODE_MAILBOX_KHR` (or other present mode where images may be replaced in the presentation queue) any wait of this type associated with such an image must be signaled no later than a wait associated with the replacing image would be signaled.

When the presentation has completed, the presentId associated with the related `pSwapchains` entry will be increased in value so that it is at least equal to the value provided in the `VkPresentIdKHR` structure.

There is no requirement for any precise timing relationship between the presentation of the image to the user and the update of the presentId value, but implementations should make this as close as possible to the presentation of the first pixel in the next image being presented to the user.

The call to `vkWaitForPresentKHR` will block until either the presentId associated with `swapchain` is greater than or equal to `presentId`, or `timeout` nanoseconds passes. When the swapchain becomes OUT_OF_DATE, the call will either return `VK_SUCCESS` (if the image was delivered to the presentation engine and may have been presented to the user) or will return early with status `VK_ERROR_OUT_OF_DATE_KHR` (if the image was not presented to the user).

As an exception to the normal rules for objects which are externally synchronized, the `swapchain` passed to `vkWaitForPresentKHR` may be simultaneously used by other threads in calls to functions other than `vkDestroySwapchainKHR`. Access to the swapchain data associated with this extension must be atomic within the implementation.

**Valid Usage**

- VUID-vkWaitForPresentKHR-swapchain-04997
**swapchain** must not be in the retired state

- VUID-vkWaitForPresentKHR-presentWait-06234
  The `presentWait` feature must be enabled

---

### Valid Usage (Implicit)

- VUID-vkWaitForPresentKHR-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkWaitForPresentKHR-swapchain-parameter
  `swapchain` must be a valid `VkSwapchainKHR` handle

- VUID-vkWaitForPresentKHR-swapchain-parent
  `swapchain` must have been created, allocated, or retrieved from `device`

---

### Host Synchronization

- Host access to `swapchain` must be externally synchronized

---

### Return Codes

#### Success

- `VK_SUCCESS`
- `VK_TIMEOUT`
- `VK_SUBOPTIMAL_KHR`

#### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_OUT_OF_DATE_KHR`
- `VK_ERROR_SURFACE_LOST_KHR`
- `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT`

---

When the `VK_GGP_frame_token` extension is enabled, a Google Games Platform frame token can be specified when presenting an image to a swapchain by adding a `VkPresentFrameTokenGGP` structure to the `pNext` chain of the `VkPresentInfoKHR` structure.

The `VkPresentFrameTokenGGP` structure is defined as:

```c
// Provided by VK_GGP_frame_token
typedef struct VkPresentFrameTokenGGP {
```
The `VkPresentFrameTokenGGP` structure is defined as:

```c
typedef struct VkPresentFrameTokenGGP {
    VkStructureType sType;
    const void* pNext;
    GgpFrameToken frameToken;
} VkPresentFrameTokenGGP;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **frameToken** is the Google Games Platform frame token.

### Valid Usage

- VUID-VkPresentFrameTokenGGP-frameToken-02680
  frameToken must be a valid `GgpFrameToken`

### Valid Usage (Implicit)

- VUID-VkPresentFrameTokenGGP-sType-sType
  **sType** must be `VK_STRUCTURE_TYPE_PRESENT_FRAME_TOKEN_GGP`

The `VkSwapchainPresentModeInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_swapchain_maintenance1
typedef struct VkSwapchainPresentModeInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t swapchainCount;
    const VkPresentModeKHR* pPresentModes;
} VkSwapchainPresentModeInfoEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **swapchainCount** is the number of swapchains being presented to by this command.
- **pPresentModes** is a list of presentation modes with `swapchainCount` entries.

If the **pNext** chain of `VkPresentInfoKHR` includes a `VkSwapchainPresentModeInfoEXT` structure, then that structure defines the presentation modes used for the current and subsequent presentation operations.

When the application changes present modes with `VkSwapchainPresentModeInfoEXT`, images that have already been queued for presentation will continue to be presented according to the previous present mode. The current image being queued for presentation and subsequent images will be presented according to the new present mode. The behavior during the transition between the two modes is defined as follows.
• Transition from VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR to VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR: the presentation engine updates the shared presentable image according to the behavior of VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR.

• Transition from VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR to VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR: the presentation engine may update the shared presentable image or defer that to its regular refresh cycle, according to the behavior of VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR.

• Transition between VK_PRESENT_MODE_FIFO_KHR and VK_PRESENT_MODE_FIFO_RELAXED_KHR: Images continue to be appended to the same FIFO queue, and the behavior with respect to waiting for vertical blanking period will follow the new mode for current and subsequent images.

• Transition from VK_PRESENT_MODE_IMMEDIATE_KHR to VK_PRESENT_MODE_FIFO_KHR or VK_PRESENT_MODE_FIFO_RELAXED_KHR: As all prior present requests in the VK_PRESENT_MODE_IMMEDIATE_KHR mode are applied immediately, there are no outstanding present operations in this mode, and current and subsequent images are appended to the FIFO queue and presented according to the new mode.

• Transition from VK_PRESENT_MODE_MAILBOX_KHR to VK_PRESENT_MODE_FIFO_KHR or VK_PRESENT_MODE_FIFO_RELAXED_KHR: Presentation in both modes require waiting for the next vertical blanking period, with VK_PRESENT_MODE_MAILBOX_KHR allowing the pending present operation to be replaced by a new one. In this case, the current present operation will replace the pending present operation and is applied according to the new mode.

• Transition from VK_PRESENT_MODE_FIFO_KHR or VK_PRESENT_MODE_FIFO_RELAXED_KHR to VK_PRESENT_MODE_IMMEDIATE_KHR or VK_PRESENT_MODE_MAILBOX_KHR: If the FIFO queue is empty, presentation is done according to the behavior of the new mode. If there are present operations in the FIFO queue, once the last present operation is performed based on the respective vertical blanking period, the current and subsequent updates are applied according to the new mode.

• The behavior during transition between any other present modes, if possible, is implementation defined.

Valid Usage

• VUID-VkSwapchainPresentModeInfoEXT-swapchainCount-07760
  swapchainCount must be equal to VkPresentInfoKHR::swapchainCount

• VUID-VkSwapchainPresentModeInfoEXT-pPresentModes-07761
  Each entry in pPresentModes must be a presentation mode specified in VkSwapchainPresentModesCreateInfoEXT::pPresentModes when creating the entry’s corresponding swapchain

Valid Usage (Implicit)

• VUID-VkSwapchainPresentModeInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_SWAPCHAIN_PRESENT_MODE_INFO_EXT

• VUID-VkSwapchainPresentModeInfoEXT-pPresentModes-parameter
  pPresentModes must be a valid pointer to an array of swapchainCount valid
The `VkSwapchainPresentFenceInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_swapchain_maintenance1
typedef struct VkSwapchainPresentFenceInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t swapchainCount;
    const VkFence* pFences;
} VkSwapchainPresentFenceInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `swapchainCount` is the number of swapchains being presented to by this command.
- `pFences` is a list of fences with `swapchainCount` entries. Each entry must be `VK_NULL_HANDLE` or the handle of a fence to signal when the relevant operations on the associated swapchain have completed.

The set of *queue operations* defined by queuing an image for presentation, as well as operations performed by the presentation engine access the payloads of objects associated with the presentation operation. The associated objects include:

- The swapchain image, its implicitly bound memory, and any other resources bound to that memory.
- The wait semaphores specified when queuing the image for presentation.

The application can provide a fence that the implementation will signal when all such queue operations have completed and the presentation engine has taken a reference to the payload of any objects it accesses as part of the present operation. For all binary wait semaphores imported by the presentation engine using the equivalent of reference transference, as described in *Importing Semaphore Payloads*, this fence must not signal until all such semaphore payloads have been reset by the presentation engine.

The application can destroy the wait semaphores associated with a given presentation operation when at least one of the associated fences is signaled, and can destroy the swapchain when the fences associated with all past presentation requests referring to that swapchain have signaled.

Fences associated with presentations to the same swapchain on the same `VkQueue` must be signaled in the same order as the present operations.

To specify a fence for each swapchain in a present operation, include the `VkSwapchainPresentFenceInfoEXT` structure in the `pNext` chain of the `VkPresentInfoKHR` structure.
Valid Usage

• VUID-VkSwapchainPresentFenceInfoEXT-swapchainCount-07757
  swapchainCount must be equal to VkPresentInfoKHR::swapchainCount

• VUID-VkSwapchainPresentFenceInfoEXT-pFences-07758
  Each element of pFences must be unsignaled

• VUID-VkSwapchainPresentFenceInfoEXT-pFences-07759
  Each element of pFences must not be associated with any other queue command that has not yet completed execution on that queue

Valid Usage (Implicit)

• VUID-VkSwapchainPresentFenceInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_SWAPCHAIN_PRESENT_FENCE_INFO_EXT

• VUID-VkSwapchainPresentFenceInfoEXT-pFences-parameter
  pFences must be a valid pointer to an array of swapchainCount valid VkFence handles

• VUID-VkSwapchainPresentFenceInfoEXT-swapchainCount-arraylength
  swapchainCount must be greater than 0

vkQueuePresentKHR releases the acquisition of the images referenced by imageIndices. The queue family corresponding to the queue vkQueuePresentKHR is executed on must have ownership of the presented images as defined in Resource Sharing. vkQueuePresentKHR does not alter the queue family ownership, but the presented images must not be used again before they have been reacquired using vkAcquireNextImageKHR.

The processing of the presentation happens in issue order with other queue operations, but semaphores have to be used to ensure that prior rendering and other commands in the specified queue complete before the presentation begins. The presentation command itself does not delay processing of subsequent commands on the queue, however, presentation requests sent to a particular queue are always performed in order. Exact presentation timing is controlled by the semantics of the presentation engine and native platform in use.

If an image is presented to a swapchain created from a display surface, the mode of the associated display will be updated, if necessary, to match the mode specified when creating the display surface. The mode switch and presentation of the specified image will be performed as one atomic operation.

The result codes VK_ERROR_OUT_OF_DATE_KHR and VK_SUBOPTIMAL_KHR have the same meaning when returned by vkQueuePresentKHR as they do when returned by vkAcquireNextImageKHR. If multiple swapchains are presented, the result code is determined applying the following rules in order:

• If the device is lost, VK_ERROR_DEVICE_LOST is returned.

• If any of the target surfaces are no longer available the error VK_ERROR_SURFACE_LOST_KHR is returned.
• If any of the presents would have a result of `VK_ERROR_OUT_OF_DATE_KHR` if issued separately then `VK_ERROR_OUT_OF_DATE_KHR` is returned.

• If any of the presents would have a result of `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT` if issued separately then `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT` is returned.

• If any of the presents would have a result of `VK_SUBOPTIMAL_KHR` if issued separately then `VK_SUBOPTIMAL_KHR` is returned.

• Otherwise `VK_SUCCESS` is returned.

Presentation is a read-only operation that will not affect the content of the presentable images. Upon reacquiring the image and transitioning it away from the `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR` layout, the contents will be the same as they were prior to transitioning the image to the present source layout and presenting it. However, if a mechanism other than Vulkan is used to modify the platform window associated with the swapchain, the content of all presentable images in the swapchain becomes undefined.

**Note**
The application can continue to present any acquired images from a retired swapchain as long as the swapchain has not entered a state that causes `vkQueuePresentKHR` to return `VK_ERROR_OUT_OF_DATE_KHR`.

To release images previously acquired through `vkAcquireNextImage2KHR` or `vkAcquireNextImageKHR`, call:

```c
// Provided by VK_EXT_swapchain_maintenance1
VkResult vkReleaseSwapchainImagesEXT(
    VkDevice device,
    const VkReleaseSwapchainImagesInfoEXT* pReleaseInfo);
```

• `device` is the device associated with `VkReleaseSwapchainImagesInfoEXT::swapchain`.

• `pReleaseInfo` is a pointer to a `VkReleaseSwapchainImagesInfoEXT` structure containing parameters of the release.

Only images that are not in use by the device can be released.

Releasing images is a read-only operation that will not affect the content of the released images. Upon reacquiring the image, the image contents and its layout will be the same as they were prior to releasing it. However, if a mechanism other than Vulkan is used to modify the platform window associated with the swapchain, the content of all presentable images in the swapchain becomes undefined.

**Note**
This functionality is useful during swapchain recreation, where acquired images from the old swapchain can be released instead of presented.
Valid Usage (Implicit)

- VUID-vkReleaseSwapchainImagesEXT-device-parameter
device must be a valid VkDevice handle

- VUID-vkReleaseSwapchainImagesEXT-pReleaseInfo-parameter
pReleaseInfo must be a valid pointer to a valid VkReleaseSwapchainImagesInfoEXT structure

Return Codes

Success
  - VK_SUCCESS

Failure
  - VK_ERROR_SURFACE_LOST_KHR

The VkReleaseSwapchainImagesInfoEXT structure is defined as:

```c
// Provided by VK_EXT_swapchain_maintenance1
typedef struct VkReleaseSwapchainImagesInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkSwapchainKHR swapchain;
    uint32_t imageIndexCount;
    const uint32_t* pImageIndices;
} VkReleaseSwapchainImagesInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- swapchain is a swapchain to which images are being released.
- imageIndexCount is the number of image indices to be released.
- pImageIndices is a pointer to an array of indices into the array of swapchain's presentable images, with imageIndexCount entries.

Valid Usage

- VUID-VkReleaseSwapchainImagesInfoEXT-pImageIndices-07785
  Each element of pImageIndices must be the index of a presentable image acquired from the swapchain specified by swapchain

- VUID-VkReleaseSwapchainImagesInfoEXT-pImageIndices-07786
  All uses of presentable images identified by elements of pImageIndices must have completed execution
Valid Usage (Implicit)

- VUID-VkReleaseSwapchainImagesInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_RELEASE_SWAPCHAIN_IMAGES_INFO_EXT
- VUID-VkReleaseSwapchainImagesInfoEXT-pNext-pNext
  pNext must be NULL
- VUID-VkReleaseSwapchainImagesInfoEXT-swapchain-parameter
  swapchain must be a valid VkSwapchainKHR handle
- VUID-VkReleaseSwapchainImagesInfoEXT-pImageIndices-parameter
  pImageIndices must be a valid pointer to an array of imageIndexCount uint32_t values
- VUID-VkReleaseSwapchainImagesInfoEXT-imageIndexCount-arraylength
  imageIndexCount must be greater than 0

Host Synchronization

- Host access to swapchain must be externally synchronized

34.11. Hdr Metadata

This section describes how to improve color reproduction of content to better reproduce colors as seen on the reference monitor. Definitions below are from the associated SMPTE 2086, CTA 861.3 and CIE 15:2004 specifications.

To provide Hdr metadata to an implementation, call:

```c
// Provided by VK_EXT_hdr_metadata
void vkSetHdrMetadataEXT(  
    VkDevice          device,  
    uint32_t          swapchainCount,  
    const VkSwapchainKHR* pSwapchains,  
    const VkHdrMetadataEXT* pMetadata);
```

- `device` is the logical device where the swapchain(s) were created.
- `swapchainCount` is the number of swapchains included in `pSwapchains`.
- `pSwapchains` is a pointer to an array of `swapchainCount` VkSwapchainKHR handles.
- `pMetadata` is a pointer to an array of `swapchainCount` VkHdrMetadataEXT structures.

The metadata will be applied to the specified VkSwapchainKHR objects at the next vkQueuePresentKHR call using that VkSwapchainKHR object. The metadata will persist until a subsequent vkSetHdrMetadataEXT changes it.
Valid Usage (Implicit)

- VUID-vkSetHdrMetadataEXT-device-parameter
  
  `device` must be a valid `VkDevice` handle

- VUID-vkSetHdrMetadataEXT-pSwapchains-parameter
  
  `pSwapchains` must be a valid pointer to an array of `swapchainCount` valid `VkSwapchainKHR` handles

- VUID-vkSetHdrMetadataEXT-pMetadata-parameter
  
  `pMetadata` must be a valid pointer to an array of `swapchainCount` valid `VkHdrMetadataEXT` structures

- VUID-vkSetHdrMetadataEXT-swapchainCount-arraylength
  
  `swapchainCount` must be greater than 0

- VUID-vkSetHdrMetadataEXT-pSwapchains-parent
  
  Each element of `pSwapchains` must have been created, allocated, or retrieved from `device`

The `VkHdrMetadataEXT` structure is defined as:

```c
// Provided by VK_EXT_hdr_metadata
typedef struct VkHdrMetadataEXT {
    VkStructureType sType;
    const void* pNext;
    VkXYColorEXT displayPrimaryRed;
    VkXYColorEXT displayPrimaryGreen;
    VkXYColorEXT displayPrimaryBlue;
    VkXYColorEXT whitePoint;
    float maxLuminance;
    float minLuminance;
    float maxContentLightLevel;
    float maxFrameAverageLightLevel;
} VkHdrMetadataEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `displayPrimaryRed` is a `VkXYColorEXT` structure specifying the reference monitor’s red primary in chromaticity coordinates
- `displayPrimaryGreen` is a `VkXYColorEXT` structure specifying the reference monitor’s green primary in chromaticity coordinates
- `displayPrimaryBlue` is a `VkXYColorEXT` structure specifying the reference monitor’s blue primary in chromaticity coordinates
- `whitePoint` is a `VkXYColorEXT` structure specifying the reference monitor’s white-point in chromaticity coordinates
- `maxLuminance` is the maximum luminance of the reference monitor in nits
• **minLuminance** is the minimum luminance of the reference monitor in nits
• **maxContentLightLevel** is content’s maximum luminance in nits
• **maxFrameAverageLightLevel** is the maximum frame average light level in nits

### Valid Usage (Implicit)

- VUID-VkHdrMetadataEXT-sType-sType
  - `sType` **must** be `VK_STRUCTURE_TYPE_HDR_METADATA_EXT`
- VUID-VkHdrMetadataEXT-pNext-pNext
  - `pNext` **must** be `NULL`

![Note]
The validity and use of this data is outside the scope of Vulkan.

The **VkXYColorEXT** structure is defined as:

```c
// Provided by VK_EXT_hdr_metadata
typedef struct VkXYColorEXT {
  float x;
  float y;
} VkXYColorEXT;
```

- **x** is the x chromaticity coordinate.
- **y** is the y chromaticity coordinate.

Chromaticity coordinates are as specified in CIE 15:2004 “Calculation of chromaticity coordinates” (Section 7.3) and are limited to between 0 and 1 for real colors for the reference monitor.

### 34.12. Present Barrier

The **VK_NV_present_barrier** extension allows applications to synchronize corresponding presentation requests across multiple swapchains using the **present barrier**. A swapchain is said to be using the **present barrier** if the swapchain is created by adding a `VkSwapchainPresentBarrierCreateInfoNV` structure to the `pNext` chain of the `VkSwapchainCreateInfoKHR` structure, and setting `VkSwapchainPresentBarrierCreateInfoNV::presentBarrierEnable` to true.

A set of corresponding presentation requests is defined as exactly one queued presentation request associated with each swapchain using the present barrier, whether or not that queued request has executed. A given presentation request is added, when created by calling `vkQueuePresentKHR` and specifying a swapchain using the present barrier, either to the oldest existing set of corresponding requests for which there is no existing member associated with the request’s swapcahin, or to a new set of corresponding requests if no such set exists.

A set of corresponding requests is said to be **full** when it contains one request from each swapchain.
using the present barrier. Queued presentation of an image to a swapchain using the present barrier is deferred by the implementation until the set of corresponding requests is full, and the visibility operations associated with all requests in that set, as described by vkQueuePresentKHR, have completed.

Additionally, the set of swapchains using the present barrier can be in the same process, or different processes running under the same operating system. And if the required synchronization hardware is connected and correctly configured, this extension also supports applications to synchronize corresponding presentation requests using the present barrier across distributed systems. However, the configuration mechanism of the required hardware is outside the scope of the Vulkan specification and this extension.

The VkSwapchainPresentBarrierCreateInfoNV structure is defined as:

```c
// Provided by VK_NV_present_barrier
typedef struct VkSwapchainPresentBarrierCreateInfoNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 presentBarrierEnable;
} VkSwapchainPresentBarrierCreateInfoNV;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **presentBarrierEnable** is a boolean value indicating a request for using the present barrier.

If the pNext chain of VkSwapchainCreateInfoKHR does not include this structure, the default value for presentBarrierEnable is VK_FALSE, meaning the swapchain does not request to use the present barrier. Additionally, when recreating a swapchain that was using the present barrier, and the pNext chain of VkSwapchainCreateInfoKHR does not include this structure, it means the swapchain will stop using the present barrier.

**Valid Usage (Implicit)**

- VUID-VkSwapchainPresentBarrierCreateInfoNV-sType-sType
  
  **sType** must be VK_STRUCTURE_TYPE_SWAPCHAIN_PRESENT_BARRIER_CREATE_INFO_NV

2998
Chapter 35. Deferred Host Operations

Certain Vulkan commands are inherently expensive for the host CPU to execute. It is often desirable to offload such work onto background threads, and to parallelize the work across multiple CPUs. The concept of deferred operations allows applications and drivers to coordinate the execution of expensive host commands using an application-managed thread pool.

The VK_KHR_deferred_host_operations extension defines the infrastructure and usage patterns for deferrable commands, but does not specify any commands as deferrable. This is left to additional dependent extensions. Commands must not be deferred unless the deferral is specifically allowed by another extension which depends on VK_KHR_deferred_host_operations. This specification will refer to such extensions as deferral extensions.

35.1. Requesting Deferral

When an application requests an operation deferral, the implementation may defer the operation. When deferral is requested and the implementation defers any operation, the implementation must return VK_OPERATION_DEFERRED_KHR as the success code if no errors occurred. When deferral is requested, the implementation should defer the operation when the workload is significant, however if the implementation chooses not to defer any of the requested operations and instead executes all of them immediately, the implementation must return VK_OPERATION_NOT_DEFERRED_KHR as the success code if no errors occurred.

A deferred operation is created complete with an initial result value of VK_SUCCESS. The deferred operation becomes pending when an operation has been successfully deferred with that deferred operation object.

A deferred operation is considered pending until the deferred operation completes. A pending deferred operation becomes complete when it has been fully executed by one or more threads. Pending deferred operations will never complete until they are joined by an application thread, using vkDeferredOperationJoinKHR. Applications can join multiple threads to the same deferred operation, enabling concurrent execution of subtasks within that operation.

The application can query the status of a VkDeferredOperationKHR using the vkGetDeferredOperationMaxConcurrencyKHR or vkGetDeferredOperationResultKHR commands.

Parameters to the command requesting a deferred operation may be accessed by the implementation at any time until the deferred operation enters the complete state. The application must obey the following rules while a deferred operation is pending:

- Externally synchronized parameters must not be accessed.
- Pointer parameters must not be modified (e.g. reallocated/freed).
- The contents of pointer parameters which may be read by the command must not be modified.
- The contents of pointer parameters which may be written by the command must not be read.
- Vulkan object parameters must not be passed as externally synchronized parameters to any other command.
When the deferred operation is complete, the application should call `vkGetDeferredOperationResultKHR` to obtain the `VkResult` indicating success or failure of the operation. The `VkResult` value returned will be one of the values that the command requesting the deferred operation is able to return. Writes to output parameters of the requesting command will happen-before the deferred operation is complete.

When a deferral is requested for a command, the implementation may perform memory management operations on the allocator supplied to `vkCreateDeferredOperationKHR` for the deferred operation object, as described in the Memory Allocation chapter. Such allocations must occur on the thread which requests deferral.

If an allocator was supplied for the deferred command at the time of the deferral request, then the implementation may perform memory management operations on this allocator during the execution of `vkDeferredOperationJoinKHR`. These operations may occur concurrently and may be performed by any joined thread. The application must ensure that the supplied allocator is able to operate correctly under these conditions.

### 35.2. Deferred Host Operations API

The `VkDeferredOperationKHR` handle is defined as:

```c
// Provided by VK_KHR_deferred_host_operations
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDeferredOperationKHR)
```

This handle refers to a tracking structure which manages the execution state for a deferred command.

To construct the tracking object for a deferred command, call:

```c
// Provided by VK_KHR_deferred_host_operations
VkResult vkCreateDeferredOperationKHR(
    VkDevice device,
    const VkAllocationCallbacks* pAllocator,
    VkDeferredOperationKHR* pDeferredOperation);
```

- `device` is the device which owns operation.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pDeferredOperation` is a pointer to a handle in which the created `VkDeferredOperationKHR` is returned.

#### Valid Usage (Implicit)

- VUID-vkCreateDeferredOperationKHR-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkCreateDeferredOperationKHR-pAllocator-parameter
If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateDeferredOperationKHR-pDeferredOperation-parameter pDeferredOperation must be a valid pointer to a VkDeferredOperationKHR handle

---

## Return Codes

### Success
- VK_SUCCESS

### Failure
- VK_ERROR_OUT_OF_HOST_MEMORY

To assign a thread to a deferred operation, call:

```c
// Provided by VK_KHR_deferred_host_operations
VkResult vkDeferredOperationJoinKHR(
    VkDevice device,
    VkDeferredOperationKHR operation);
```

- `device` is the device which owns `operation`.
- `operation` is the deferred operation that the calling thread should work on.

The `vkDeferredOperationJoinKHR` command will execute a portion of the deferred operation on the calling thread.

The return value will be one of the following:

- A return value of `VK_SUCCESS` indicates that `operation` is complete. The application should use `vkGetDeferredOperationResultKHR` to retrieve the result of `operation`.
- A return value of `VK_THREAD_DONE_KHR` indicates that the deferred operation is not complete, but there is no work remaining to assign to threads. Future calls to `vkDeferredOperationJoinKHR` are not necessary and will simply harm performance. This situation may occur when other threads executing `vkDeferredOperationJoinKHR` are about to complete `operation`, and the implementation is unable to partition the workload any further.
- A return value of `VK_THREAD_IDLE_KHR` indicates that the deferred operation is not complete, and there is no work for the thread to do at the time of the call. This situation may occur if the operation encounters a temporary reduction in parallelism. By returning `VK_THREAD_IDLE_KHR`, the implementation is signaling that it expects that more opportunities for parallelism will emerge as execution progresses, and that future calls to `vkDeferredOperationJoinKHR` can be beneficial. In the meantime, the application can perform other work on the calling thread.

Implementations must guarantee forward progress by enforcing the following invariants:

1. If only one thread has invoked `vkDeferredOperationJoinKHR` on a given operation, that thread
**Valid Usage (Implicit)**

- VUID-vkDeferredOperationJoinKHR-device-parameter
  
  *device* must be a valid *VkDevice* handle

- VUID-vkDeferredOperationJoinKHR-operation-parameter
  
  *operation* must be a valid *VkDeferredOperationKHR* handle

- VUID-vkDeferredOperationJoinKHR-operation-parent
  
  *operation* must have been created, allocated, or retrieved from *device*

**Return Codes**

**Success**

- VK_SUCCESS
- VK_THREAD_DONE_KHR
- VK_THREAD_IDLE_KHR

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

When a deferred operation is completed, the application can destroy the tracking object by calling:

```
// Provided by VK_KHR_deferred_host_operations
void vkDestroyDeferredOperationKHR(
    VkDevice device,  // device is the device which owns operation.
    VkDeferredOperationKHR operation,  // operation is the completed operation to be destroyed.
    const VkAllocationCallbacks* pAllocator);  // pAllocator controls host memory allocation as described in the Memory Allocation chapter.
```

**Valid Usage**

- VUID-vkDestroyDeferredOperationKHR-operation-03434
  
  If *VkAllocationCallbacks* were provided when *operation* was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyDeferredOperationKHR-operation-03435
If no `VkAllocationCallbacks` were provided when `operation` was created, `pAllocator` must be `NULL`.

- VUID-vkDestroyDeferredOperationKHR-operation-03436
  `operation` must be completed

Valid Usage (Implicit)

- VUID-vkDestroyDeferredOperationKHR-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkDestroyDeferredOperationKHR-operation-parameter
  If `operation` is not `VK_NULL_HANDLE`, `operation` must be a valid `VkDeferredOperationKHR` handle

- VUID-vkDestroyDeferredOperationKHR-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkDestroyDeferredOperationKHR-operation-parent
  If `operation` is a valid handle, it must have been created, allocated, or retrieved from `device`.

Host Synchronization

- Host access to `operation` must be externally synchronized.

To query the number of additional threads that can usefully be joined to a deferred operation, call:

```c
// Provided by VK_KHR_deferred_host_operations
uint32_t vkGetDeferredOperationMaxConcurrencyKHR(
    VkDevice device,
    VkDeferredOperationKHR operation);
```

- `device` is the device which owns `operation`.
- `operation` is the deferred operation to be queried.

The returned value is the maximum number of threads that can usefully execute a deferred operation concurrently, reported for the state of the deferred operation at the point this command is called. This value is intended to be used to better schedule work onto available threads. Applications can join any number of threads to the deferred operation and expect it to eventually complete, though excessive joins may return `VK_THREAD_DONE_KHR` immediately, performing no useful work.

If `operation` is complete, `vkGetDeferredOperationMaxConcurrencyKHR` returns zero.

If `operation` is currently joined to any threads, the value returned by this command may
immediately be out of date.

If operation is pending, implementations **must** not return zero unless at least one thread is currently executing `vkDeferredOperationJoinKHR` on operation. If there are such threads, the implementation **should** return an estimate of the number of additional threads which it could profitably use.

Implementations **may** return 2\(^{32}\)-1 to indicate that the maximum concurrency is unknown and cannot be easily derived. Implementations **may** return values larger than the maximum concurrency available on the host CPU. In these situations, an application **should** clamp the return value rather than oversubscribing the machine.

**Note**

The recommended usage pattern for applications is to query this value once, after deferral, and schedule no more than the specified number of threads to join the operation. Each time a joined thread receives `VK_THREAD_IDLE_KHR`, the application should schedule an additional join at some point in the future, but is not required to do so.

---

**Valid Usage (Implicit)**

- VUID-vkGetDeferredOperationMaxConcurrencyKHR-device-parameter
  - `device` **must** be a valid `VkDevice` handle
- VUID-vkGetDeferredOperationMaxConcurrencyKHR-operation-parameter
  - `operation` **must** be a valid `VkDeferredOperationKHR` handle
- VUID-vkGetDeferredOperationMaxConcurrencyKHR-operation-parent
  - `operation` **must** have been created, allocated, or retrieved from `device`

---

The `vkGetDeferredOperationResultKHR` function is defined as:

```c
// Provided by VK_KHR_deferred_host_operations
VkResult vkGetDeferredOperationResultKHR(
    VkDevice device,
    VkDeferredOperationKHR operation);
```

- `device` is the device which owns `operation`.
- `operation` is the operation whose deferred result is being queried.

If no command has been deferred on `operation`, `vkGetDeferredOperationResultKHR` returns `VK_SUCCESS`.

If the deferred operation is pending, `vkGetDeferredOperationResultKHR` returns `VK_NOT_READY`.

If the deferred operation is complete, it returns the appropriate return value from the original command. This value **must** be one of the `VkResult` values which could have been returned by the original command if the operation had not been deferred.
Valid Usage (Implicit)

- VUID-vkGetDeferredOperationResultKHR-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetDeferredOperationResultKHR-operation-parameter
  operation must be a valid VkDeferredOperationKHR handle

- VUID-vkGetDeferredOperationResultKHR-operation-parent
  operation must have been created, allocated, or retrieved from device

Return Codes

Success
- VK_SUCCESS
- VK_NOT_READY
Chapter 36. Private Data

The private data extension provides a way for users to associate arbitrary user-defined data with Vulkan objects. This association is accomplished by storing 64-bit unsigned integers of user-defined data in private data slots. A private data slot represents a storage allocation for one data item for each child object of the device.

An application can reserve private data slots at device creation. To reserve private data slots, insert a `VkDevicePrivateDataCreateInfo` in the `pNext` chain in `VkDeviceCreateInfo` before device creation. Multiple `VkDevicePrivateDataCreateInfo` structures can be chained together, and the sum of the requested slots will be reserved. This is an exception to the specified valid usage for structure pointer chains. Reserving slots in this manner is not strictly necessary but it may improve performance.

Private data slots are represented by `VkPrivateDataSlot` handles:

```c
// Provided by VK_VERSION_1_3
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPrivateDataSlot)
```

or the equivalent

```c
// Provided by VK_EXT_private_data
typedef VkPrivateDataSlot VkPrivateDataSlotEXT;
```

To create a private data slot, call:

```c
// Provided by VK_VERSION_1_3
VkResult vkCreatePrivateDataSlot(
    VkDevice device,
    const VkPrivateDataSlotCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
   VkPrivateDataSlot* pPrivateDataSlot);
```

or the equivalent command

```c
// Provided by VK_EXT_private_data
VkResult vkCreatePrivateDataSlotEXT( 
    VkDevice device, 
    const VkPrivateDataSlotCreateInfo* pCreateInfo, 
    const VkAllocationCallbacks* pAllocator, 
    VkPrivateDataSlot* pPrivateDataSlot);
```

- `device` is the logical device associated with the creation of the object(s) holding the private data slot.
• `pCreateInfo` is a pointer to a `VkPrivateDataSlotCreateInfo`.
• `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
• `pPrivateDataSlot` is a pointer to a `VkPrivateDataSlot` handle in which the resulting private data slot is returned.

### Valid Usage

- **VUID-vkCreatePrivateDataSlot-privateData-04564**
  The privateData feature must be enabled.

### Valid Usage (Implicit)

- **VUID-vkCreatePrivateDataSlot-device-parameter**
  `device` must be a valid `VkDevice` handle.
- **VUID-vkCreatePrivateDataSlot-pCreateInfo-parameter**
  `pCreateInfo` must be a valid pointer to a valid `VkPrivateDataSlotCreateInfo` structure.
- **VUID-vkCreatePrivateDataSlot-pAllocator-parameter**
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.
- **VUID-vkCreatePrivateDataSlot-pPrivateDataSlot-parameter**
  `pPrivateDataSlot` must be a valid pointer to a `VkPrivateDataSlot` handle.

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkPrivateDataSlotCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPrivateDataSlotCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPrivateDataSlotCreateFlags flags;
} VkPrivateDataSlotCreateInfo;
```

or the equivalent

```c
// Provided by VK_EXT_private_data
```
typedef VkPrivateDataSlotCreateInfo VkPrivateDataSlotCreateInfoEXT;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.

**Valid Usage (Implicit)**

- VUID-VkPrivateDataSlotCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_PRIVATE_DATA_SLOT_CREATE_INFO
- VUID-VkPrivateDataSlotCreateInfo-pNext-pNext
  pNext must be NULL
- VUID-VkPrivateDataSlotCreateInfo-flags-zerobitmask
  flags must be 0

// Provided by VK_VERSION_1_3
typedef VkFlags VkPrivateDataSlotCreateFlags;

or the equivalent

// Provided by VK_EXT_private_data
typedef VkPrivateDataSlotCreateFlags VkPrivateDataSlotCreateFlagsEXT;

**VkPrivateDataSlotCreateFlags** is a bitmask type for setting a mask, but is currently reserved for future use.

To destroy a private data slot, call:

// Provided by VK_VERSION_1_3
void vkDestroyPrivateDataSlot(
    VkDevice device,
    VkPrivateDataSlot privateDataSlot,
    const VkAllocationCallbacks* pAllocator);

or the equivalent command

// Provided by VK_EXT_private_data
void vkDestroyPrivateDataSlotEXT(
    VkDevice device,
    VkPrivateDataSlot privateDataSlot,
    const VkAllocationCallbacks* pAllocator);
• **device** is the logical device associated with the creation of the object(s) holding the private data slot.
• **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
• **privateDataSlot** is the private data slot to destroy.

### Valid Usage

- **VUID-vkDestroyPrivateDataSlot-privateDataSlot-04062**
  If `VkAllocationCallbacks` were provided when `privateDataSlot` was created, a compatible set of callbacks **must** be provided here.

- **VUID-vkDestroyPrivateDataSlot-privateDataSlot-04063**
  If no `VkAllocationCallbacks` were provided when `privateDataSlot` was created, `pAllocator` **must** be `NULL`.

### Valid Usage (Implicit)

- **VUID-vkDestroyPrivateDataSlot-device-parameter**
  `device` **must** be a valid `VkDevice` handle.

- **VUID-vkDestroyPrivateDataSlot-privateDataSlot-parameter**
  If `privateDataSlot` is not `VK_NULL_HANDLE`, `privateDataSlot` **must** be a valid `VkPrivateDataSlot` handle.

- **VUID-vkDestroyPrivateDataSlot-pAllocator-parameter**
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure.

- **VUID-vkDestroyPrivateDataSlot-privateDataSlot-parent**
  If `privateDataSlot` is a valid handle, it **must** have been created, allocated, or retrieved from `device`.

### Host Synchronization

- Host access to `privateDataSlot` **must** be externally synchronized.

To store user defined data in a slot associated with a Vulkan object, call:

```c
// Provided by VK_VERSION_1_3
VkResult vkSetPrivateData(
    VkDevice device,
    VkObjectType objectType,
    uint64_t objectHandle,
    VkPrivateDataSlot privateDataSlot,
    uint64_t data);
```
or the equivalent command

```c
// Provided by VK_EXT_private_data
VkResult vkSetPrivateDataEXT(
    VkDevice device,
    VkObjectType objectType,
    uint64_t objectHandle,
    VkPrivateDataSlot privateDataSlot,
    uint64_t data);
```

- `device` is the device that created the object.
- `objectType` is a `VkObjectType` specifying the type of object to associate data with.
- `objectHandle` is a handle to the object to associate data with.
- `privateDataSlot` is a handle to a `VkPrivateDataSlot` specifying location of private data storage.
- `data` is user defined data to associate the object with. This data will be stored at `privateDataSlot`.

### Valid Usage

- **VUID-vkSetPrivateData-objectHandle-04016**
  - `objectHandle` must be `device` or a child of `device`

- **VUID-vkSetPrivateData-objectHandle-04017**
  - `objectHandle` must be a valid handle to an object of type `objectType`

### Valid Usage (Implicit)

- **VUID-vkSetPrivateData-device-parameter**
  - `device` must be a valid `VkDevice` handle

- **VUID-vkSetPrivateData-objectType-parameter**
  - `objectType` must be a valid `VkObjectType` value

- **VUID-vkSetPrivateData-privateDataSlot-parameter**
  - `privateDataSlot` must be a valid `VkPrivateDataSlot` handle

- **VUID-vkSetPrivateData-privateDataSlot-parent**
  - `privateDataSlot` must have been created, allocated, or retrieved from `device`

### Return Codes

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
To retrieve user defined data from a slot associated with a Vulkan object, call:

```c
// Provided by VK_VERSION_1_3
void vkGetPrivateData(
    VkDevice device,
    VkObjectType objectType,
    uint64_t objectHandle,
    VkPrivateDataSlot privateDataSlot,
    uint64_t* pData);
```

or the equivalent command

```c
// Provided by VK_EXT_private_data
void vkGetPrivateDataEXT(
    VkDevice device,
    VkObjectType objectType,
    uint64_t objectHandle,
    VkPrivateDataSlot privateDataSlot,
    uint64_t* pData);
```

- `device` is the device that created the object
- `objectType` is a `VkObjectType` specifying the type of object data is associated with.
- `objectHandle` is a handle to the object data is associated with.
- `privateDataSlot` is a handle to a `VkPrivateDataSlot` specifying location of private data pointer storage.
- `pData` is a pointer to specify where user data is returned. 0 will be written in the absence of a previous call to `vkSetPrivateData` using the object specified by `objectHandle`.

**Note**
Due to platform details on Android, implementations might not be able to reliably return 0 from calls to `vkGetPrivateData` for `VkSwapchainKHR` objects on which `vkSetPrivateData` has not previously been called. This erratum is exclusive to the Android platform and objects of type `VkSwapchainKHR`.

**Valid Usage**

- VUID-vkGetPrivateData-objectType-04018
  `objectType` must be `VK_OBJECT_TYPE_DEVICE`, or an object type whose parent is `VkDevice`

**Valid Usage (Implicit)**

- VUID-vkGetPrivateData-device-parameter
  `device` must be a valid `VkDevice` handle
• VUID-vkGetPrivateData-objectType-parameter
  
  **objectType** must be a valid **VkObjectType** value

• VUID-vkGetPrivateData-privateDataSlot-parameter
  
  **privateDataSlot** must be a valid **VkPrivateDataSlot** handle

• VUID-vkGetPrivateData-pData-parameter
  
  **pData** must be a valid pointer to a **uint64_t** value

• VUID-vkGetPrivateData-privateDataSlot-parent
  
  **privateDataSlot** must have been created, allocated, or retrieved from **device**
Chapter 37. Acceleration Structures

37.1. Acceleration Structures

 Acceleration structures are data structures used by the implementation to efficiently manage scene geometry as it is traversed during a ray tracing query. The application is responsible for managing acceleration structure objects (see Acceleration Structures), including allocation, destruction, executing builds or updates, and synchronizing resources used during ray tracing queries.

There are two types of acceleration structures, top level acceleration structures and bottom level acceleration structures.

An acceleration structure is considered to be constructed if an acceleration structure build command or copy command has been executed with the given acceleration structure as the destination.

![Diagram showing the relationship between top and bottom level acceleration structures.](image)

Figure 27. Acceleration Structure

**Caption**

The diagram shows the relationship between top and bottom level acceleration structures.

37.1.1. Geometry

Geometries refer to a triangle or axis-aligned bounding box.
37.1.2. Top Level Acceleration Structures

Opaque acceleration structure for an array of instances. The descriptor or device address referencing this is the starting point for traversal.

The top level acceleration structure takes a reference to any bottom level acceleration structure referenced by its instances. Those bottom level acceleration structure objects must be valid when the top level acceleration structure is accessed.

37.1.3. Bottom Level Acceleration Structures

Opaque acceleration structure for an array of geometries.

37.1.4. Acceleration Structure Update Rules

The API defines two types of operations to produce acceleration structures from geometry:

- A build operation is used to construct an acceleration structure.
- An update operation is used to modify an existing acceleration structure.

An update operation imposes certain constraints on the input, in exchange for considerably faster execution. When performing an update, the application is required to provide a full description of the acceleration structure, but is prohibited from changing anything other than instance definitions, transform matrices, and vertex or AABB positions. All other aspects of the description must exactly match the one from the original build.

More precisely, the application must not use an update operation to do any of the following:

- Change primitives or instances from active to inactive, or vice versa (as defined in Inactive Primitives and Instances).
- Change the index or vertex formats of triangle geometry.
- Change triangle geometry transform pointers from null to non-null or vice versa.
- Change the number of geometries or instances in the structure.
- Change the geometry flags for any geometry in the structure.
- Change the number of vertices or primitives for any geometry in the structure.

If the original acceleration structure was built using opacity micromaps and VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_DATA_UPDATE_EXT was set in flags, the application must provide the corresponding micromap information to the update operation. The application is prohibited from changing anything other than the specific opacity values assigned to the triangles.

More precisely, the application must not use an update operation to do any of the following:

- Remove micromaps or VkOpacityMicromapSpecialIndexEXT values from a geometry which previously had them, or vice versa.
- Change between use of VkOpacityMicromapSpecialIndexEXT values and explicit micro-map
triangles.

• Change the subdivision level or format of the micromap triangle associated with any acceleration-structure triangle.

If the original acceleration structure was built using opacity micromaps and VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_UPDATE_EXT was set in flags, the application must provide a micromap to the update operation.

If the original acceleration structure was built using opacity micromaps and neither opacity micromap update flag is set the application must provide the original micromap to the update operation.

If the original acceleration structure was built using displacement micromaps and VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DISPLACEMENT_MICROMAP_UPDATE_NV was set in flags, the application must provide a displacement micromap to the update operation.

If the original acceleration structure was built using displacement micromaps and the displacement micromap update flag is not set the application must provide the original micromap to the update operation.

37.1.5. Inactive Primitives and Instances

Acceleration structures allow the use of particular input values to signal inactive primitives or instances.

An inactive triangle is one for which the first (X) component of any vertex is NaN. If any other vertex component is NaN, and the first is not, the behavior is undefined. If the vertex format does not have a NaN representation, then all triangles are considered active.

An inactive instance is one whose acceleration structure reference is 0.

An inactive AABB is one for which the minimum X coordinate is NaN. If any other component is NaN, and the first is not, the behavior is undefined.

In the above definitions, “NaN” refers to any type of NaN. Signaling, non-signaling, quiet, loud, or otherwise.

An inactive object is considered invisible to all rays, and should not be represented in the acceleration structure. Implementations should ensure that the presence of inactive objects does not seriously degrade traversal performance.

Inactive objects are counted in the auto-generated index sequences which are provided to shaders via InstanceId and PrimitiveId SPIR-V decorations. This allows objects in the scene to change freely between the active and inactive states, without affecting the layout of any arrays which are being indexed using the ID values.

Any transition between the active and inactive states requires a full acceleration structure rebuild. Applications must not perform an acceleration structure update where an object is active in the source acceleration structure but would be inactive in the destination, or vice versa.
37.1.6. Building Acceleration Structures

To build an acceleration structure call:

```c
// Provided by VK_NV_ray_tracing
void vkCmdBuildAccelerationStructureNV(
    VkCommandBuffer commandBuffer,
    const VkAccelerationStructureInfoNV* pInfo,
    VkBuffer instanceData,
    VkDeviceSize instanceOffset,
    VkBool32 update,
    VkAccelerationStructureNV dst,
    VkAccelerationStructureNV src,
    VkBuffer scratch,
    VkDeviceSize scratchOffset);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pInfo` contains the shared information for the acceleration structure's structure.
- `instanceData` is the buffer containing an array of `VkAccelerationStructureInstanceKHR` structures defining acceleration structures. This parameter must be `NULL` for bottom level acceleration structures.
- `instanceOffset` is the offset in bytes (relative to the start of `instanceData`) at which the instance data is located.
- `update` specifies whether to update the `dst` acceleration structure with the data in `src`.
- `dst` is a pointer to the target acceleration structure for the build.
- `src` is a pointer to an existing acceleration structure that is to be used to update the `dst` acceleration structure.
- `scratch` is the `VkBuffer` that will be used as scratch memory for the build.
- `scratchOffset` is the offset in bytes relative to the start of `scratch` that will be used as a scratch memory.

Accesses to `dst`, `src`, and `scratch` must be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR` or `VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR`.

**Valid Usage**

- VUID-vkCmdBuildAccelerationStructureNV-geometryCount-02241
  
  `geometryCount` must be less than or equal to `VkPhysicalDeviceRayTracingPropertiesNV::maxGeometryCount`

- VUID-vkCmdBuildAccelerationStructureNV-dst-02488
  
  `dst` must have been created with compatible `VkAccelerationStructureInfoNV` where `VkAccelerationStructureInfoNV::type` and `VkAccelerationStructureInfoNV::flags` are identical, and `VkAccelerationStructureInfoNV::instanceCount`
**VkAccelerationStructureInfoNV**::`geometryCount` for `dst` are greater than or equal to the build size and each geometry in `VkAccelerationStructureInfoNV`::`pGeometries` for `dst` has greater than or equal to the number of vertices, indices, and AABBs

- **VUID-vkCmdBuildAccelerationStructureNV-update-02489**
  If `update` is `VK_TRUE`, `src` **must** not be `VK_NULL_HANDLE`

- **VUID-vkCmdBuildAccelerationStructureNV-update-02490**
  If `update` is `VK_TRUE`, `src` **must** have previously been constructed with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_NV` set in `VkAccelerationStructureInfoNV`::`flags` in the original build

- **VUID-vkCmdBuildAccelerationStructureNV-update-02491**
  If `update` is `VK_FALSE`, the `size` member of the `VkMemoryRequirements` structure returned from a call to `vkGetAccelerationStructureMemoryRequirementsNV` with `VkAccelerationStructureMemoryRequirementsInfoNV`::`accelerationStructure` set to `dst` and `VkAccelerationStructureMemoryRequirementsInfoNV`::`type` set to `VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_BUILD_SCRATCH_NV` **must** be less than or equal to the size of `scratch` minus `scratchOffset`

- **VUID-vkCmdBuildAccelerationStructureNV-update-02492**
  If `update` is `VK_TRUE`, the `size` member of the `VkMemoryRequirements` structure returned from a call to `vkGetAccelerationStructureMemoryRequirementsNV` with `VkAccelerationStructureMemoryRequirementsInfoNV`::`accelerationStructure` set to `dst` and `VkAccelerationStructureMemoryRequirementsInfoNV`::`type` set to `VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_UPDATE_SCRATCH_NV` **must** be less than or equal to the size of `scratch` minus `scratchOffset`

- **VUID-vkCmdBuildAccelerationStructureNV-scratch-03522**
  `scratch` **must** have been created with `VK_BUFFER_USAGE_RAY_TRACING_BIT_NV` usage flag

- **VUID-vkCmdBuildAccelerationStructureNV-instanceData-03523**
  If `instanceData` is not `VK_NULL_HANDLE`, `instanceData` **must** have been created with `VK_BUFFER_USAGE_RAY_TRACING_BIT_NV` usage flag

- **VUID-vkCmdBuildAccelerationStructureNV-accelerationStructureReference-03786**
  Each `VkAccelerationStructureInstanceKHR`::`accelerationStructureReference` value in `instanceData` **must** be a valid device address containing a value obtained from `vkGetAccelerationStructureHandleNV`

- **VUID-vkCmdBuildAccelerationStructureNV-update-03524**
  If `update` is `VK_TRUE`, then objects that were previously active **must** not be made inactive as per **Inactive Primitives and Instances**

- **VUID-vkCmdBuildAccelerationStructureNV-update-03525**
  If `update` is `VK_TRUE`, then objects that were previously inactive **must** not be made active as per **Inactive Primitives and Instances**

- **VUID-vkCmdBuildAccelerationStructureNV-update-03526**
  If `update` is `VK_TRUE`, the `src` and `dst` objects **must** either be the same object or not have any memory aliasing

- **VUID-vkCmdBuildAccelerationStructureNV-dst-07787**
  `dst` **must** be bound completely and contiguously to a single `VkDeviceMemory` object via
Valid Usage (Implicit)

- VUID-vkCmdBuildAccelerationStructureNV-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdBuildAccelerationStructureNV-pInfo-parameter
  pInfo must be a valid pointer to a valid VkAccelerationStructureInfoNV structure

- VUID-vkCmdBuildAccelerationStructureNV-instanceData-parameter
  If instanceData is not VK_NULL_HANDLE, instanceData must be a valid VkBuffer handle

- VUID-vkCmdBuildAccelerationStructureNV-dst-parameter
  dst must be a valid VkAccelerationStructureNV handle

- VUID-vkCmdBuildAccelerationStructureNV-src-parameter
  If src is not VK_NULL_HANDLE, src must be a valid VkAccelerationStructureNV handle

- VUID-vkCmdBuildAccelerationStructureNV-scratch-parameter
  scratch must be a valid VkBuffer handle

- VUID-vkCmdBuildAccelerationStructureNV-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdBuildAccelerationStructureNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdBuildAccelerationStructureNV-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdBuildAccelerationStructureNV-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdBuildAccelerationStructureNV-commonparent
  Each of commandBuffer, dst, instanceData, scratch, and src that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
To build acceleration structures call:

```c
void vkCmdBuildAccelerationStructuresKHR(
    VkCommandBuffer commandBuffer,
    uint32_t infoCount,
    const VkAccelerationStructureBuildGeometryInfoKHR* pInfos,
    const VkAccelerationStructureBuildRangeInfoKHR* const* ppBuildRangeInfos);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `infoCount` is the number of acceleration structures to build. It specifies the number of the `pInfos` structures and `ppBuildRangeInfos` pointers that must be provided.
- `pInfos` is a pointer to an array of `infoCount` `VkAccelerationStructureBuildGeometryInfoKHR` structures defining the geometry used to build each acceleration structure.
- `ppBuildRangeInfos` is a pointer to an array of `infoCount` pointers to arrays of `VkAccelerationStructureBuildRangeInfoKHR` structures. Each `ppBuildRangeInfos[i]` is a pointer to an array of `pInfos[i].geometryCount` `VkAccelerationStructureBuildRangeInfoKHR` structures defining dynamic offsets to the addresses where geometry data is stored, as defined by `pInfos[i].`.

The `vkCmdBuildAccelerationStructuresKHR` command provides the ability to initiate multiple acceleration structures builds, however there is no ordering or synchronization implied between any of the individual acceleration structure builds.

**Note**

This means that an application cannot build a top-level acceleration structure in the same `vkCmdBuildAccelerationStructuresKHR` call as the associated bottom-level or instance acceleration structures are being built. There also cannot be any memory aliasing between any acceleration structure memories or scratch memories being used by any of the builds.

Accesses to the acceleration structure scratch buffers as identified by the `VkAccelerationStructureBuildGeometryInfoKHR::scratchData` buffer device addresses must be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `(VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR | VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR)`. Accesses to each `VkAccelerationStructureBuildGeometryInfoKHR::srcAccelerationStructure` and `VkAccelerationStructureBuildGeometryInfoKHR::dstAccelerationStructure` must be synchronized.
with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR` or `VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR`, as appropriate.

Accesses to other input buffers as identified by any used values of `VkAccelerationStructureGeometryMotionTrianglesDataNV::vertexData`, `VkAccelerationStructureGeometryTrianglesDataKHR::vertexData`, `VkAccelerationStructureGeometryTrianglesDataKHR::indexData`, `VkAccelerationStructureGeometryTrianglesDataKHR::transformData`, `VkAccelerationStructureGeometryAabbsDataKHR::data`, and `VkAccelerationStructureGeometryInstancesDataKHR::data` must be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_SHADER_READ_BIT`.

### Valid Usage

- **VUID-vkCmdBuildAccelerationStructuresKHR-accelerationStructure-08923**
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure` feature must be enabled.

- **VUID-vkCmdBuildAccelerationStructuresKHR-mode-04628**
  The `mode` member of each element of `pInfos` must be a valid `VkBuildAccelerationStructureModeKHR` value.

- **VUID-vkCmdBuildAccelerationStructuresKHR-srcAccelerationStructure-04629**
  If the `srcAccelerationStructure` member of any element of `pInfos` is not `VK_NULL_HANDLE`, the `srcAccelerationStructure` member must be a valid `VkAccelerationStructureKHR` handle.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-04630**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` member must not be `VK_NULL_HANDLE`.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03403**
  The `srcAccelerationStructure` member of any element of `pInfos` must not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of `pInfos`.

- **VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03698**
  The `dstAccelerationStructure` member of any element of `pInfos` must not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of `pInfos`.

- **VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03800**
  The `dstAccelerationStructure` member of any element of `pInfos` must be a valid `VkAccelerationStructureKHR` handle.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03699**
  For each element of `pInfos`, if its `type` member is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR`, its `dstAccelerationStructure` member...
must have been created with a value of VkAccelerationStructureCreateInfoKHR::type equal to either VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR or VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR

• VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03700
  For each element of pInfos, if its type member is VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR, its dstAccelerationStructure member must have been created with a value of VkAccelerationStructureCreateInfoKHR::type equal to either VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR or VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR

• VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03663
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, inactive primitives in its srcAccelerationStructure member must not be made active

• VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03664
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, active primitives in its srcAccelerationStructure member must not be made inactive

• VUID-vkCmdBuildAccelerationStructuresKHR-None-03407
  The dstAccelerationStructure member of any element of pInfos must not be referenced by the geometry.instances.data member of any element of pGeometries or ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR in any other element of pInfos

• VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03701
  The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command must not overlap the memory backing the srcAccelerationStructure member of any other element of pInfos with a mode equal to VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, which is accessed by this command

• VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03702
  The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command must not overlap the memory backing the dstAccelerationStructure member of any other element of pInfos, which is accessed by this command

• VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03703
  The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command must not overlap the memory backing the scratchData member of any element of pInfos (including the same element), which is accessed by this command

• VUID-vkCmdBuildAccelerationStructuresKHR-scratchData-03704
  The range of memory backing the scratchData member of any element of pInfos that is accessed by this command must not overlap the memory backing the scratchData member of any other element of pInfos, which is accessed by this command

• VUID-vkCmdBuildAccelerationStructuresKHR-scratchData-03705
  The range of memory backing the scratchData member of any element of pInfos that is accessed by this command must not overlap the memory backing the srcAccelerationStructure member of any element of pInfos with a mode equal to
VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR (including the same element), which is accessed by this command

- **VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03706**
The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command must not overlap the memory backing any acceleration structure referenced by the geometry.instances.data member of any element of pGeometries or ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR in any other element of pInfos, which is accessed by this command

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03667**
For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its srcAccelerationStructure member must have previously been constructed with VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR set in VkAccelerationStructureBuildGeometryInfoKHR::flags in the build

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03668**
For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its srcAccelerationStructure and dstAccelerationStructure members must either be the same VkAccelerationStructureKHR, or not have any memory aliasing

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03758**
For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its geometryCount member must have the same value which was specified when srcAccelerationStructure was last built

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03759**
For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its flags member must have the same value which was specified when srcAccelerationStructure was last built

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03760**
For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its type member must have the same value which was specified when srcAccelerationStructure was last built

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03761**
For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, its geometryType member must have the same value which was specified when srcAccelerationStructure was last built

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03762**
For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, its flags member must have the same value which was specified when srcAccelerationStructure was last built

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03763**
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.vertexFormat` member **must** have the same value which was specified when `srcAccelerationStructure` was last built

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03764**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.maxVertex` member **must** have the same value which was specified when `srcAccelerationStructure` was last built

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03765**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.transformData` address was NULL when `srcAccelerationStructure` was last built, then it **must** be NULL

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03766**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if its `geometry.triangles.transformData` address was not NULL when `srcAccelerationStructure` was last built, then it **must** not be NULL

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03767**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, and `geometry.triangles.indexType` is not `VK_INDEX_TYPE_NONE_KHR`, then the value of each index referenced **must** be the same as the corresponding index value when `srcAccelerationStructure` was last built

- **VUID-vkCmdBuildAccelerationStructuresKHR-primitiveCount-03769**
  For each `VkAccelerationStructureBuildRangeInfoKHR` referenced by this command, its `primitiveCount` member **must** have the same value which was specified when
**srcAccelerationStructure** was last built

- **VUID-vkCmdBuildAccelerationStructuresKHR-firstVertex-03770**
  For each `VkAccelerationStructureBuildRangeInfoKHR` referenced by this command, if the corresponding geometry uses indices, its `firstVertex` member must have the same value which was specified when `srcAccelerationStructure` was last built

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03801**
  For each element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, the corresponding `ppBuildRangeInfos[i][j].primitiveCount` must be less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxInstanceCount`

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03707**
  For each element of `pInfos`, the buffer used to create its `dstAccelerationStructure` member must be bound to device memory

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03708**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` the buffer used to create its `srcAccelerationStructure` member must be bound to device memory

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03709**
  For each element of `pInfos`, the buffer used to create each acceleration structure referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` must be bound to device memory

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03671**
  If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR`, all addresses between `pInfos[i].scratchData.deviceAddress` and `pInfos[i].scratchData.deviceAddress + N - 1` must be in the buffer device address range of the same buffer, where N is given by the `buildScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03672**
  If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, all addresses between `pInfos[i].scratchData.deviceAddress` and `pInfos[i].scratchData.deviceAddress + N - 1` must be in the buffer device address range of the same buffer, where N is given by the `updateScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count

- **VUID-vkCmdBuildAccelerationStructuresKHR-geometry-03673**
  The buffers from which the buffer device addresses for all of the `geometry.triangles.vertexData`, `geometry.triangles.indexData`, `geometry.triangles.transformData`, `geometry.aabbs.data`, and `geometry.instances.data` members of all `pInfos[i].pGeometries` and `pInfos[i].ppGeometries` are queried must have been created with the `VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR` usage flag
The buffer from which the buffer device address `pInfos[i].scratchData.deviceAddress` is queried **must** have been created with `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT` usage flag

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03802**  
  For each element of `pInfos`, its `scratchData.deviceAddress` member **must** be a valid device address obtained from `vkGetBufferDeviceAddress`

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03803**  
  For each element of `pInfos`, if `scratchData.deviceAddress` is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03710**  
  For each element of `pInfos`, its `scratchData.deviceAddress` member **must** be a multiple of `VkPhysicalDeviceAccelerationStructurePropertiesKHR::minAccelerationStructureScratchOffsetAlignment`

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03804**  
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, `geometry.triangles.vertexData.deviceAddress` **must** be a valid device address obtained from `vkGetBufferDeviceAddress`

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03805**  
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.vertexData.deviceAddress` is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03806**  
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.indexType` is not `VK_INDEX_TYPE_NONE_KHR`, `geometry.triangles.indexData.deviceAddress` **must** be aligned to the size in bytes of the type in `indexType`

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03807**  
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.indexType` is not `VK_INDEX_TYPE_NONE_KHR`, if `geometry.triangles.indexData.deviceAddress` is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03712**  
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, and with `geometry.triangles.indexType` not equal to `VK_INDEX_TYPE_NONE_KHR`, `geometry.triangles.indexData.deviceAddress` **must** be aligned to the size in bytes of the type in `indexType`

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03808**  
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of...
VK_GEOMETRY_TYPE_TRIANGLES_KHR, if `geometry.triangles.transformData.deviceAddress` is not 0, it **must** be a valid device address obtained from `vkGetBufferDeviceAddress`

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03809**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.transformData.deviceAddress` is not 0, it **must** be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03810**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.transformData.deviceAddress` is not 0, it **must** be aligned to 16 bytes.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03811**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR`, `geometry.aabbs.data.deviceAddress` **must** be a valid device address obtained from `vkGetBufferDeviceAddress`.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03812**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR`, if `geometry.aabbs.data.deviceAddress` is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03714**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, if `geometry.arrayOfPointers` is `VK_FALSE`, `geometry.instances.data.deviceAddress` **must** be aligned to 16 bytes.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03715**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, if `geometry.arrayOfPointers` is `VK_TRUE`, each element of `geometry.instances.data.deviceAddress` in device memory **must** be aligned to 16 bytes.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03813**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, if `geometry.instances.data.deviceAddress` is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object.
For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, each `VkAccelerationStructureInstanceKHR::accelerationStructureReference` value in `geometry.instances.data.deviceAddress` must be a valid device address containing a value obtained from `vkGetAccelerationStructureDeviceAddressKHR` or 0.

For each `pInfos[i]`, `dstAccelerationStructure` must have been created with a value of `VkAccelerationStructureCreateInfoKHR::size` greater than or equal to the memory size required by the build operation, as returned by `vkGetAccelerationStructureBuildSizesKHR` with `pBuildInfo = pInfos[i]` and with each element of the `pMaxPrimitiveCounts` array greater than or equal to the equivalent `ppBuildRangeInfos[i][j].primitiveCount` values for `j` in `[0, pInfos[i].geometryCount)`.

Each element of `ppBuildRangeInfos[i]` must be a valid pointer to an array of `pInfos[i].geometryCount` `VkAccelerationStructureBuildRangeInfoKHR` structures.

**Valid Usage (Implicit)**

- `commandBuffer` must be a valid `VkCommandBuffer` handle.
- `pInfos` must be a valid pointer to an array of `infoCount` valid `VkAccelerationStructureBuildGeometryInfoKHR` structures.
- `ppBuildRangeInfos` must be a valid pointer to an array of `infoCount` `VkAccelerationStructureBuildRangeInfoKHR` structures.
- `commandBuffer` must be in the recording state.
- The `VkCommandPool` that `commandBuffer` was allocated from must support compute operations.
- This command must only be called outside of a render pass instance.
- This command must only be called outside of a video coding scope.
- `infoCount` must be greater than 0.

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized.
Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized.

To build acceleration structures with some parameters sourced on the device call:

```c
// Provided by VK_KHR_acceleration_structure
void vkCmdBuildAccelerationStructuresIndirectKHR(
    VkCommandBuffer commandBuffer,
    uint32_t infoCount,
    const VkAccelerationStructureBuildGeometryInfoKHR* pInfos,
    const VkDeviceAddress* pIndirectDeviceAddresses,
    const uint32_t* pIndirectStrides,
    const uint32_t* const* ppMaxPrimitiveCounts);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **infoCount** is the number of acceleration structures to build.
- **pInfos** is a pointer to an array of **infoCount** VkAccelerationStructureBuildGeometryInfoKHR structures defining the geometry used to build each acceleration structure.
- **pIndirectDeviceAddresses** is a pointer to an array of **infoCount** buffer device addresses which point to pInfos[i].geometryCount VkAccelerationStructureBuildRangeInfoKHR structures defining dynamic offsets to the addresses where geometry data is stored, as defined by pInfos[i].
- **pIndirectStrides** is a pointer to an array of **infoCount** byte strides between elements of pIndirectDeviceAddresses.
- **ppMaxPrimitiveCounts** is a pointer to an array of **infoCount** pointers to arrays of pInfos[i].geometryCount values indicating the maximum number of primitives that will be built by this command for each geometry.

Accesses to acceleration structures, scratch buffers, vertex buffers, index buffers, and instance buffers must be synchronized as with vkCmdBuildAccelerationStructuresKHR.

Accesses to any element of pIndirectDeviceAddresses must be synchronized with the VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage and an access type of VK_ACCESS_INDIRECT_COMMAND_READ_BIT.

3028
Valid Usage

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-accelerationStructureIndirectBuild-03650**
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureIndirectBuild` feature must be enabled.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-mode-04628**
  The `mode` member of each element of `pInfos` must be a valid `VkBuildAccelerationStructureModeKHR` value.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-srcAccelerationStructure-04629**
  If the `srcAccelerationStructure` member of any element of `pInfos` is not `VK_NULL_HANDLE`, the `srcAccelerationStructure` member must be a valid `VkAccelerationStructureKHR` handle.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-04630**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` member must not be `VK_NULL_HANDLE`.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03403**
  The `srcAccelerationStructure` member of any element of `pInfos` must not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of `pInfos`.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03698**
  The `dstAccelerationStructure` member of any element of `pInfos` must not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of `pInfos`.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03800**
  The `dstAccelerationStructure` member of any element of `pInfos` must be a valid `VkAccelerationStructureKHR` handle.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03699**
  For each element of `pInfos`, if its `type` member is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR`, its `dstAccelerationStructure` member must have been created with a value of `VkAccelerationStructureCreateInfoKHR::type` equal to either `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR` or `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03700**
  For each element of `pInfos`, if its `type` member is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR`, its `dstAccelerationStructure` member must have been created with a value of `VkAccelerationStructureCreateInfoKHR::type` equal to either `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` or `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03663**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, inactive primitives in its
srcAccelerationStructure member must not be made active

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03664
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, active primitives in its srcAccelerationStructure member must not be made inactive.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-None-03407
  The dstAccelerationStructure member of any element of pInfos must not be referenced by the geometry.instances.data member of any element of pGeometries or ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR in any other element of pInfos.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03701
  The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command must not overlap the memory backing the srcAccelerationStructure member of any other element of pInfos with a mode equal to VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, which is accessed by this command.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03702
  The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command must not overlap the memory backing the dstAccelerationStructure member of any other element of pInfos, which is accessed by this command.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03703
  The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command must not overlap the memory backing the scratchData member of any element of pInfos (including the same element), which is accessed by this command.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-scratchData-03704
  The range of memory backing the scratchData member of any element of pInfos that is accessed by this command must not overlap the memory backing the scratchData member of any other element of pInfos, which is accessed by this command.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-scratchData-03705
  The range of memory backing the scratchData member of any element of pInfos that is accessed by this command must not overlap the memory backing the srcAccelerationStructure member of any element of pInfos with a mode equal to VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR (including the same element), which is accessed by this command.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03706
  The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command must not overlap the memory backing any acceleration structure referenced by the geometry.instances.data member of any element of pGeometries or ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR in any other element of pInfos, which is accessed by this command.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03667
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its srcAccelerationStructure member must have previously been constructed with
VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR set in VkAccelerationStructureBuildGeometryInfoKHR::flags in the build

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03668
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its srcAccelerationStructure and dstAccelerationStructure members must either be the same VkAccelerationStructureKHR, or not have any memory aliasing.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03758
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its geometryCount member must have the same value which was specified when srcAccelerationStructure was last built.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03759
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its flags member must have the same value which was specified when srcAccelerationStructure was last built.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03760
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its type member must have the same value which was specified when srcAccelerationStructure was last built.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03761
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, its geometryType member must have the same value which was specified when srcAccelerationStructure was last built.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03762
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, its flags member must have the same value which was specified when srcAccelerationStructure was last built.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03763
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its geometry.triangles.vertexFormat member must have the same value which was specified when srcAccelerationStructure was last built.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03764
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its geometry.triangles.maxVertex member must have the same value which was specified when srcAccelerationStructure was last built.
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.indexType` member **must** have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.transformData` address was **NULL** when `srcAccelerationStructure` was last built, then it **must** be **NULL**.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if its `geometry.triangles.transformData` address was not **NULL** when `srcAccelerationStructure` was last built, then it **must** not be **NULL**.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, and `geometry.triangles.indexType` is not `VK_INDEX_TYPE_NONE_KHR`, then the value of each index referenced **must** be the same as the corresponding index value when `srcAccelerationStructure` was last built.

For each `VkAccelerationStructureBuildRangeInfoKHR` referenced by this command, its `primitiveCount` member **must** have the same value which was specified when `srcAccelerationStructure` was last built.

For each `VkAccelerationStructureBuildRangeInfoKHR` referenced by this command, if the corresponding geometry uses indices, its `firstVertex` member **must** have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, the corresponding `ppMaxPrimitiveCounts[i][j]` **must** be less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxInstanceCount`.

For each element of `pInfos`, the buffer used to create its `dstAccelerationStructure` member **must** be bound to device memory.
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` the buffer used to create its `srcAccelerationStructure` member must be bound to device memory.

For each element of `pInfos`, the buffer used to create each acceleration structure referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` must be bound to device memory.

If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR`, all addresses between `pInfos[i].scratchData.deviceAddress` and `pInfos[i].scratchData.deviceAddress + N - 1` must be in the buffer device address range of the same buffer, where `N` is given by the `buildScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count.

If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, all addresses between `pInfos[i].scratchData.deviceAddress` and `pInfos[i].scratchData.deviceAddress + N - 1` must be in the buffer device address range of the same buffer, where `N` is given by the `updateScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count.

The buffers from which the buffer device addresses for all of the `geometry.triangles.vertexData`, `geometry.triangles.indexData`, `geometry.triangles.transformData`, `geometry.aabbs.data`, and `geometry.instances.data` members of all `pInfos[i].pGeometries` and `pInfos[i].ppGeometries` are queried must have been created with the `VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR` usage flag.

The buffer from which the buffer device address `pInfos[i].scratchData.deviceAddress` is queried must have been created with `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT` usage flag.

For each element of `pInfos`, its `scratchData.deviceAddress` member must be a valid device address obtained from `vkGetBufferDeviceAddress`.

For each element of `pInfos`, if `scratchData.deviceAddress` is the address of a non-sparse buffer then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

For each element of `pInfos`, its `scratchData.deviceAddress` member must be a multiple of `VkPhysicalDeviceAccelerationStructurePropertiesKHR::minAccelerationStructureScratchOffsetAlignment`.

```
• **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03804**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, `geometry.triangles.vertexData.deviceAddress` must be a valid device address obtained from `vkGetBufferDeviceAddress`.

• **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03805**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.vertexData.deviceAddress` is the address of a non-sparse buffer then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

• **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03711**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, `geometry.triangles.vertexData.deviceAddress` must be aligned to the size in bytes of the smallest component of the format in `vertexFormat`.

• **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03806**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.indexData.deviceAddress` is not `VK_INDEX_TYPE_NONE_KHR`, `geometry.triangles.indexData.deviceAddress` must be a valid device address obtained from `vkGetBufferDeviceAddress`.

• **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03807**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.indexData.deviceAddress` is the address of a non-sparse buffer then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

• **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03808**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.transformData.deviceAddress` is not `0`, it must be a valid device address obtained from `vkGetBufferDeviceAddress`.

• **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03809**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.transformData.deviceAddress` is the address of a non-sparse buffer then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

• **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03810**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.transformData.deviceAddress` is not `0`, it must be aligned to 16 bytes.

• **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03811**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of...
VK_GEOMETRY_TYPE_AABBS_KHR, geometry.aabbs.data.deviceAddress must be a valid device address obtained from vkGetBufferDeviceAddress

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03812
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_AABBS_KHR, if geometry.aabbs.data.deviceAddress is the address of a non-sparse buffer then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03714
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_AABBS_KHR, geometry.aabbs.data.deviceAddress must be aligned to 8 bytes

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03715
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, if geometry.arrayOfPointers is VK_FALSE, geometry.instances.data.deviceAddress must be aligned to 16 bytes

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03716
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, if geometry.arrayOfPointers is VK_TRUE, geometry.instances.data.deviceAddress must be aligned to 8 bytes

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03717
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, if geometry.arrayOfPointers is VK_TRUE, each element of geometry.instances.data.deviceAddress in device memory must be aligned to 16 bytes

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03813
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, geometry.instances.data.deviceAddress must be a valid device address obtained from vkGetBufferDeviceAddress

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03814
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, if geometry.instances.data.deviceAddress is the address of a non-sparse buffer then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-06707
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, each VkAccelerationStructureInstanceKHR::accelerationStructureReference value in geometry.instances.data.deviceAddress must be a valid device address containing a value obtained from vkGetAccelerationStructureDeviceAddressKHR or 0

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-03645
  For any element of pIndirectDeviceAddresses, if the buffer from which it was queried is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-03646
  For any element of pIndirectDeviceAddresses[i], all device addresses between pIndirectDeviceAddresses[i] and pIndirectDeviceAddresses[i] + (pInfos[i].geometryCount × 3035) must be valid.
pIndirectStrides[i]) - 1 must be in the buffer device address range of the same buffer

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-03647
  For any element of pIndirectDeviceAddresses, the buffer from which it was queried must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-03648
  Each element of pIndirectDeviceAddresses must be a multiple of 4

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-03649
  Each element of pIndirectDeviceAddresses must be a multiple of 4

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-03651
  Each VkAccelerationStructureBuildRangeInfoKHR structure referenced by any element of pIndirectDeviceAddresses must be a valid VkAccelerationStructureBuildRangeInfoKHR structure

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03652
  pInfos[i].dstAccelerationStructure must have been created with a value of VkAccelerationStructureCreateInfoKHR::size greater than or equal to the memory size required by the build operation, as returned by vkGetAccelerationStructureBuildSizesKHR with pBuildInfo = pInfos[i] and pMaxPrimitiveCounts = ppMaxPrimitiveCounts[i]

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-ppMaxPrimitiveCounts-03653
  Each ppMaxPrimitiveCounts[i][j][] must be greater than or equal to the primitiveCount value specified by the VkAccelerationStructureBuildRangeInfoKHR structure located at pIndirectDeviceAddresses[i] + (j × pIndirectStrides[i])

Valid Usage (Implicit)

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-parameter
  pInfos must be a valid pointer to an array of infoCount valid VkAccelerationStructureBuildGeometryInfoKHR structures

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-parameter
  pIndirectDeviceAddresses must be a valid pointer to an array of infoCount VkDeviceAddress values

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectStrides-parameter
  pIndirectStrides must be a valid pointer to an array of infoCount uint32_t values

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-ppMaxPrimitiveCounts-parameter
  ppMaxPrimitiveCounts must be a valid pointer to an array of infoCount uint32_t values

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-commandBuffer-recording
  commandBuffer must be in the recording state
The \textit{VkCommandPool} that \textit{commandBuffer} was allocated from \textbf{must} support compute operations.

This command \textbf{must} only be called outside of a render pass instance.

This command \textbf{must} only be called outside of a video coding scope.

\textbf{infoCount} \textbf{must} be greater than 0.

\begin{table}[h]

\end{tabular}
\end{table}

The \textit{VkAccelerationStructureBuildGeometryInfoKHR} structure is defined as:

\begin{verbatim}
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureBuildGeometryInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkAccelerationStructureTypeKHR type;
    VkBuildAccelerationStructureFlagsKHR flags;
    VkBuildAccelerationStructureModeKHR mode;
    VkAccelerationStructureKHR srcAccelerationStructure;
    VkAccelerationStructureKHR dstAccelerationStructure;
    uint32_t geometryCount;
    const VkAccelerationStructureGeometryKHR* pGeometries;
    const VkAccelerationStructureGeometryKHR* const* ppGeometries;
    VkDeviceOrHostAddressKHR scratchData;
} VkAccelerationStructureBuildGeometryInfoKHR;
\end{verbatim}

- \textbf{sType} is a \textit{VkStructureType} value identifying this structure.
- \textbf{pNext} is \textbf{NULL} or a pointer to a structure extending this structure.
• **type** is a `VkAccelerationStructureTypeKHR` value specifying the type of acceleration structure being built.

• **flags** is a bitmask of `VkBuildAccelerationStructureFlagBitsKHR` specifying additional parameters of the acceleration structure.

• **mode** is a `VkBuildAccelerationStructureModeKHR` value specifying the type of operation to perform.

• **srcAccelerationStructure** is a pointer to an existing acceleration structure that is to be used to update the `dst` acceleration structure when `mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`.

• **dstAccelerationStructure** is a pointer to the target acceleration structure for the build.

• **geometryCount** specifies the number of geometries that will be built into `dstAccelerationStructure`.

• **pGeometries** is a pointer to an array of `VkAccelerationStructureGeometryKHR` structures.

• **ppGeometries** is a pointer to an array of pointers to `VkAccelerationStructureGeometryKHR` structures.

• **scratchData** is the device or host address to memory that will be used as scratch memory for the build.

Only one of `pGeometries` or `ppGeometries` can be a valid pointer, the other must be NULL. Each element of the non-NULL array describes the data used to build each acceleration structure geometry.

The index of each element of the `pGeometries` or `ppGeometries` members of `VkAccelerationStructureBuildGeometryInfoKHR` is used as the geometry index during ray traversal. The geometry index is available in ray shaders via the `RayGeometryIndexKHR` built-in, and is used to determine hit and intersection shaders executed during traversal. The geometry index is available to ray queries via the `OpRayQueryGetIntersectionGeometryIndexKHR` instruction.

Setting `VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV` in `flags` indicates that this build is a motion top level acceleration structure. A motion top level uses instances of format `VkAccelerationStructureMotionInstanceNV` if `VkAccelerationStructureGeometryInstancesDataKHR::arrayOfPointers` is `VK_FALSE`.

If `VkAccelerationStructureGeometryInstancesDataKHR::arrayOfPointers` is `VK_TRUE`, the pointer for each element of the array of instance pointers consists of 4 bits of `VkAccelerationStructureMotionInstanceTypeNV` in the low 4 bits of the pointer identifying the type of structure at the pointer. The device address accessed is the value in the array with the low 4 bits set to zero. The structure at the pointer is one of `VkAccelerationStructureInstanceKHR`, `VkAccelerationStructureMatrixMotionInstanceNV` or `VkAccelerationStructureSRTMotionInstanceNV`, depending on the type value encoded in the low 4 bits.

A top level acceleration structure with either motion instances or vertex motion in its instances must set `VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV` in `flags`.

Members `srcAccelerationStructure` and `dstAccelerationStructure` may be the same or different for
an update operation (when `mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`). If they are the same, the update happens in-place. Otherwise, the target acceleration structure is updated and the source is not modified.

### Valid Usage

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03654**
  - `type` must not be `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-pGeometries-03788**
  - Only one of `pGeometries` or `ppGeometries` can be a valid pointer, the other must be `NULL`

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03789**
  - If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR`, the `geometryType` member of elements of either `pGeometries` or `ppGeometries` must be `VK_GEOMETRY_TYPE_INSTANCES_KHR`

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03790**
  - If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR`, `geometryCount` must be `1`

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03791**
  - If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR`, the `geometryType` member of each geometry in either `pGeometries` or `ppGeometries` must not be `VK_GEOMETRY_TYPE_INSTANCES_KHR`

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03792**
  - If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR`, then `geometryType` member of each geometry in either `pGeometries` or `ppGeometries` must be the same

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03793**
  - If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR`, then `geometryCount` must be less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxGeometryCount`

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03794**
  - If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` and the `geometryType` member of either `pGeometries` or `ppGeometries` is `VK_GEOMETRY_TYPE_AABBS_KHR`, the total number of AABBs in all geometries must be less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxPrimitiveCount`

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03795**
  - If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` and the `geometryType` member of either `pGeometries` or `ppGeometries` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, the total number of triangles in all geometries must be less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxPrimitiveCount`

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-flags-03796**
  - If `flags` has the `VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_TRACE_BIT_KHR` bit set, then it must not have the `VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_BUILD_BIT_KHR` bit set

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-dstAccelerationStructure-04927**
  - If `dstAccelerationStructure` was created with `VK_ACCELERATION_STRUCTURE_CREATE_MOTION_BIT_NV` set in `VkAccelerationStructureCreateInfoKHR::flags`,
**Valid Usage (Implicit)**

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-sType-sType**  
  
  *sType* **must** be *VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_BUILD_GEOMETRY_INFO_KHR*

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-pNext-pNext**  
  
  *pNext* **must** be NULL

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-parameter**  
  
  *type* **must** be a valid *VkAccelerationStructureTypeKHR* value

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-flags-parameter**  
  
  *flags* **must** be a valid combination of *VkBuildAccelerationStructureFlagBitsKHR* values

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-pGeometries-parameter**  
  
  If *geometryCount* is not 0, and *pGeometries* is not NULL, *pGeometries* **must** be a valid pointer to an array of *geometryCount* valid *VkAccelerationStructureGeometryKHR* structures

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-ppGeometries-parameter**  
  
  If *geometryCount* is not 0, and *ppGeometries* is not NULL, *ppGeometries* **must** be a valid pointer to an array of *geometryCount* valid pointers to valid *VkAccelerationStructureGeometryKHR* structures

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-commonparent**  
  
  Both of *dstAccelerationStructure*, and *srcAccelerationStructure* that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same *VkDevice*

The *VkBuildAccelerationStructureModeKHR* enumeration is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkBuildAccelerationStructureModeKHR {
    VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR = 0,
    VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR = 1,
} VkBuildAccelerationStructureModeKHR;
```
• \texttt{VK\_BUILD\_ACCELERATION\_STRUCTURE\_MODE\_BUILD\_KHR} specifies that the destination acceleration structure will be built using the specified geometries.

• \texttt{VK\_BUILD\_ACCELERATION\_STRUCTURE\_MODE\_UPDATE\_KHR} specifies that the destination acceleration structure will be built using data in a source acceleration structure, updated by the specified geometries.

The \texttt{VkDeviceOrHostAddressKHR} union is defined as:

\begin{verbatim}
// Provided by VK_KHR_acceleration_structure
typedef union VkDeviceOrHostAddressKHR {
    VkDeviceAddress deviceAddress;
    void* hostAddress;
} VkDeviceOrHostAddressKHR;
\end{verbatim}

• \texttt{deviceAddress} is a buffer device address as returned by the \texttt{vkGetBufferDeviceAddressKHR} command.

• \texttt{hostAddress} is a host memory address.

The \texttt{VkDeviceOrHostAddressConstKHR} union is defined as:

\begin{verbatim}
// Provided by VK_KHR_acceleration_structure
typedef union VkDeviceOrHostAddressConstKHR {
    VkDeviceAddress deviceAddress;
    const void* hostAddress;
} VkDeviceOrHostAddressConstKHR;
\end{verbatim}

• \texttt{deviceAddress} is a buffer device address as returned by the \texttt{vkGetBufferDeviceAddressKHR} command.

• \texttt{hostAddress} is a const host memory address.

The \texttt{VkAccelerationStructureGeometryKHR} structure is defined as:

\begin{verbatim}
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureGeometryKHR {
    VkStructureType sType;
    const void* pNext;
    VkGeometryTypeKHR geometryType;
    VkAccelerationStructureGeometryDataKHR geometry;
    VkGeometryFlagsKHR flags;
} VkAccelerationStructureGeometryKHR;
\end{verbatim}

• \texttt{sType} is a \texttt{VkStructureType} value identifying this structure.

• \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.

• \texttt{geometryType} describes which type of geometry this \texttt{VkAccelerationStructureGeometryKHR} refers to.
• **geometry** is a `VkAccelerationStructureGeometryDataKHR` union describing the geometry data for the relevant geometry type.

• **flags** is a bitmask of `VkGeometryFlagBitsKHR` values describing additional properties of how the geometry should be built.

### Valid Usage (Implicit)

- **VUID-VkAccelerationStructureGeometryKHR-sType-sType**
  
  - *sType must be* `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_KHR`

- **VUID-VkAccelerationStructureGeometryKHR-pNext-pNext**
  
  - *pNext must be* `NULL`

- **VUID-VkAccelerationStructureGeometryKHR-geometryType-parameter**
  
  - *geometryType must be a valid `VkGeometryTypeKHR` value*

- **VUID-VkAccelerationStructureGeometryKHR-triangles-parameter**
  
  - If `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, the `triangles` member of `geometry` must be a valid `VkAccelerationStructureGeometryTrianglesDataKHR` structure

- **VUID-VkAccelerationStructureGeometryKHR-aabbs-parameter**
  
  - If `geometryType` is `VK_GEOMETRY_TYPE_AABBS_KHR`, the `aabbs` member of `geometry` must be a valid `VkAccelerationStructureGeometryAabbsDataKHR` structure

- **VUID-VkAccelerationStructureGeometryKHR-instances-parameter**
  
  - If `geometryType` is `VK_GEOMETRY_TYPE_INSTANCES_KHR`, the `instances` member of `geometry` must be a valid `VkAccelerationStructureGeometryInstancesDataKHR` structure

- **VUID-VkAccelerationStructureGeometryKHR-flags-parameter**
  
  - *flags must be a valid combination of `VkGeometryFlagBitsKHR` values*

The `VkAccelerationStructureGeometryDataKHR` union is defined as:

```cpp
// Provided by VK_KHR_acceleration_structure
typedef union VkAccelerationStructureGeometryDataKHR {
  VkAccelerationStructureGeometryTrianglesDataKHR triangles;
  VkAccelerationStructureGeometryAabbsDataKHR aabbs;
  VkAccelerationStructureGeometryInstancesDataKHR instances;
} VkAccelerationStructureGeometryDataKHR;
```

• **triangles** is a `VkAccelerationStructureGeometryTrianglesDataKHR` structure.

• **aabbs** is a `VkAccelerationStructureGeometryAabbsDataKHR` structure.

• **instances** is a `VkAccelerationStructureGeometryInstancesDataKHR` structure.

The `VkAccelerationStructureGeometryTrianglesDataKHR` structure is defined as:

```cpp
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureGeometryTrianglesDataKHR {
  VkStructureType sType;
} VkAccelerationStructureGeometryTrianglesDataKHR;
```
const void* getNext;
VkFormat vertexFormat;
VkDeviceOrHostAddressConstKHR vertexData;
VkDeviceSize vertexStride;
uint32_t maxVertex;
VkIndexType indexType;
VkDeviceOrHostAddressConstKHR indexData;
VkDeviceOrHostAddressConstKHR transformData;
} VkAccelerationStructureGeometryTrianglesDataKHR;

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **vertexFormat** is the *VkFormat* of each vertex element.
- **vertexData** is a device or host address to memory containing vertex data for this geometry.
- **maxVertex** is the highest index of a vertex that will be addressed by a build command using this structure.
- **vertexStride** is the stride in bytes between each vertex.
- **indexType** is the *VkIndexType* of each index element.
- **indexData** is a device or host address to memory containing index data for this geometry.
- **transformData** is a device or host address to memory containing an optional reference to a *VkTransformMatrixKHR* structure describing a transformation from the space in which the vertices in this geometry are described to the space in which the acceleration structure is defined.

**Note**

Unlike the stride for vertex buffers in *VkVertexInputBindingDescription* for graphics pipelines which must not exceed *maxVertexInputBindingStride*, **vertexStride** for acceleration structure geometry is instead restricted to being a 32-bit value.

**Valid Usage**

- **VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexStride-03735**
  vertexStride **must** be a multiple of the size in bytes of the smallest component of vertexFormat

- **VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexStride-03819**
  vertexStride **must** be less than or equal to $2^{32} - 1$

- **VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexFormat-03797**
  The format features of vertexFormat **must** contain VK_FORMAT_FEATURE_ACCELERATION_STRUCTURE_VERTEX_BUFFER_BIT_KHR

- **VUID-VkAccelerationStructureGeometryTrianglesDataKHR-indexType-03798**
  indexType **must** be VK_INDEX_TYPE_UINT16, VK_INDEX_TYPE_UINT32, or VK_INDEX_TYPE_NONE_KHR
Valid Usage (Implicit)

- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_TRIANGLES_DATA_KHR

- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkAccelerationStructureGeometryMotionTrianglesDataNV, VkAccelerationStructureTrianglesDisplacementMicromapNV, VkAccelerationStructureTrianglesOpacityMicromapEXT

- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexFormat-parameter
  vertexFormat must be a valid VkFormat value

- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-indexType-parameter
  indexType must be a valid VkIndexType value

The VkAccelerationStructureGeometryMotionTrianglesDataNV structure is defined as:

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef struct VkAccelerationStructureGeometryMotionTrianglesDataNV {
    VkStructureType sType;
    const void* pNext;
    VkDeviceOrHostAddressConstKHR vertexData;
} VkAccelerationStructureGeometryMotionTrianglesDataNV;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- vertexData is a pointer to vertex data for this geometry at time 1.0

If VkAccelerationStructureGeometryMotionTrianglesDataNV is included in the pNext chain of a VkAccelerationStructureGeometryTrianglesDataKHR structure, the basic vertex positions are used for the position of the triangles in the geometry at time 0.0 and the vertexData in VkAccelerationStructureGeometryMotionTrianglesDataNV is used for the vertex positions at time 1.0, with positions linearly interpolated at intermediate times.

Indexing for VkAccelerationStructureGeometryMotionTrianglesDataNV vertexData is equivalent to the basic vertex position data.

Valid Usage (Implicit)

- VUID-VkAccelerationStructureGeometryMotionTrianglesDataNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_MOTION_TRIANGLES_DATA_NV
The `VkAccelerationStructureTrianglesOpacityMicromapEXT` structure is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkAccelerationStructureTrianglesOpacityMicromapEXT {
    VkStructureType sType;
    void* pNext;
    VkIndexType indexType;
    VkDeviceOrHostAddressConstKHR indexBuffer;
    VkDeviceSize indexStride;
    uint32_t baseTriangle;
    uint32_t usageCountsCount;
    const VkMicromapUsageEXT* pUsageCounts;
    const VkMicromapUsageEXT* const* ppUsageCounts;
    VkMicromapEXT micromap;
} VkAccelerationStructureTrianglesOpacityMicromapEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **indexType** is the type of triangle indices used when indexing this micromap.
- **indexBuffer** is the address containing the triangle indices.
- **indexStride** is the byte stride between triangle indices.
- **baseTriangle** is the base value added to the non-negative triangle indices.
- **usageCountsCount** specifies the number of usage counts structures that will be used to determine the size of this micromap.
- **pUsageCounts** is a pointer to an array of `VkMicromapUsageEXT` structures.
- **ppUsageCounts** is a pointer to an array of pointers to `VkMicromapUsageEXT` structures.
- **micromap** is the handle to the micromap object to include in this geometry.

If `VkAccelerationStructureTrianglesOpacityMicromapEXT` is included in the `pNext` chain of a `VkAccelerationStructureGeometryTrianglesDataKHR` structure, that geometry will reference that micromap.

For each triangle in the geometry, the acceleration structure build fetches an index from `indexBuffer` using `indexType` and `indexStride`. If that value is the unsigned cast of one of the values from `VkOpacityMicromapSpecialIndexEXT` then that triangle behaves as described for that special value in Ray Opacity Micromap. Otherwise that triangle uses the opacity micromap information from `micromap` at that index plus `baseTriangle`.

Only one of `pUsageCounts` or `ppUsageCounts` can be a valid pointer, the other must be `NULL`. The elements of the non-`NULL` array describe the total count used to build this geometry. For a given format and subdivisionLevel the number of triangles in this geometry matching those values after indirection and special index handling must be equal to the sum of matching `count` provided.

If `micromap` is `VK_NULL_HANDLE`, then every value read from `indexBuffer` must be one of the values in `VkOpacityMicromapSpecialIndexEXT`. 

Valid Usage

- VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-pUsageCounts-07335
  Only one of `pUsageCounts` or `ppUsageCounts` can be a valid pointer, the other must be `NULL`.

Valid Usage (Implicit)

- VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_TRIANGLES_OPACITY_MICROMAP_EXT`.
- VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-indexType-parameter
  `indexType` must be a valid `VkIndexType` value.
- VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-pUsageCounts-parameter
  If `usageCountsCount` is not 0, and `pUsageCounts` is not `NULL`, `pUsageCounts` must be a valid pointer to an array of `usageCountsCount` `VkMicromapUsageEXT` structures.
- VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-ppUsageCounts-parameter
  If `usageCountsCount` is not 0, and `ppUsageCounts` is not `NULL`, `ppUsageCounts` must be a valid pointer to an array of `usageCountsCount` valid pointers to `VkMicromapUsageEXT` structures.
- VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-micromap-parameter
  If `micromap` is not `VK_NULL_HANDLE`, `micromap` must be a valid `VkMicromapEXT` handle.

The `VkOpacityMicromapSpecialIndexEXT` enumeration is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef enum VkOpacityMicromapSpecialIndexEXT {
    VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_TRANSPARENT_EXT = -1,
    VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_OPAQUE_EXT = -2,
    VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_UNKNOWN_TRANSPARENT_EXT = -3,
    VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_UNKNOWN_OPAQUE_EXT = -4,
} VkOpacityMicromapSpecialIndexEXT;
```

- `VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_TRANSPARENT_EXT` specifies that the entire triangle is fully transparent.
- `VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_OPAQUE_EXT` specifies that the entire triangle is fully opaque.
- `VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_UNKNOWN_TRANSPARENT_EXT` specifies that the entire triangle is unknown-transparent.
- `VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_UNKNOWN_OPAQUE_EXT` specifies that the entire triangle is unknown-opaque.

The `VkAccelerationStructureTrianglesDisplacementMicromapNV` structure is defined as:

```c
// Provided by VK_NV_displacement_micromap
```
typedef struct VkAccelerationStructureTrianglesDisplacementMicromapNV {
    VkStructureType sType;
    void* pNext;
    VkFormat displacementBiasAndScaleFormat;
    VkFormat displacementVectorFormat;
    VkDeviceOrHostAddressConstKHR displacementBiasAndScaleBuffer;
    VkDeviceSize displacementBiasAndScaleStride;
    VkDeviceOrHostAddressConstKHR displacementVectorBuffer;
    VkDeviceSize displacementVectorStride;
    VkDeviceOrHostAddressConstKHR displacedMicromapPrimitiveFlags;
    VkDeviceSize displacedMicromapPrimitiveFlagsStride;
    VkIndexType indexType;
    VkDeviceOrHostAddressConstKHR indexBuffer;
    VkDeviceSize indexStride;
    uint32_t baseTriangle;
    uint32_t usageCountsCount;
    const VkMicromapUsageEXT* pUsageCounts;
    const VkMicromapUsageEXT* const* ppUsageCounts;
    VkMicromapEXT micromap;
} VkAccelerationStructureTrianglesDisplacementMicromapNV;

• **sType** is a **VkStructureType** value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **displacementBiasAndScaleFormat** is the format of displacement bias and scale used in this displacement micromap reference.
• **displacementVectorFormat** is the format of displacement vector used in this displacement micromap reference.
• **displacementBiasAndScaleBuffer** is the address containing the bias and scale.
• **displacementBiasAndScaleStride** is the byte stride between bias and scale values.
• **displacementVectorBuffer** is the address containing the displacement vector values.
• **displacementVectorStride** is the byte stride between displacement vector values.
• **displacedMicromapPrimitiveFlags** is the address containing the primitive flags.
• **displacedMicromapPrimitiveFlagsStride** is the byte stride between primitive flag values.
• **indexType** is the type of triangle indices used when indexing this micromap.
• **indexBuffer** is the address containing the triangle indices.
• **indexStride** is the byte stride between triangle indices.
• **baseTriangle** is the base value added to the non-negative triangle indices.
• **usageCountsCount** specifies the number of usage counts structures that will be used to determine the size of this micromap.
• **pUsageCounts** is a pointer to an array of **VkMicromapUsageEXT** structures.
• **ppUsageCounts** is a pointer to an array of pointers to **VkMicromapUsageEXT** structures.
• **micromap** is the handle to the micromap object to include in this geometry.
If `VkAccelerationStructureTrianglesDisplacementMicromapNV` is included in the `pNext` chain of a `VkAccelerationStructureGeometryTrianglesDataKHR` structure, that geometry will reference that micromap.

For each triangle in the geometry, the acceleration structure build fetches an index from `indexBuffer` using `indexType` and `indexStride`. That triangle uses the displacement micromap information from `micromap` at that index plus `baseTriangle`.

Only one of `pUsageCounts` or `ppUsageCounts` can be a valid pointer, the other must be `NULL`. The elements of the non-`NULL` array describe the total count used to build this geometry. For a given `format` and `subdivisionLevel` the number of triangles in this geometry matching those values after indirection must be equal to the sum of matching `count` provided.

**Valid Usage**

- VUID-VkAccelerationStructureTrianglesDisplacementMicromapNV-pUsageCounts-07992
  Only one of `pUsageCounts` or `ppUsageCounts` can be a valid pointer, the other must be `NULL`.

**Valid Usage (Implicit)**

- VUID-VkAccelerationStructureTrianglesDisplacementMicromapNV-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_TRIANGLES_DISPLACEMENT_MICROMAP_NV`.

- VUID-VkAccelerationStructureTrianglesDisplacementMicromapNV-displacementBiasAndScaleFormat-parameter
  `displacementBiasAndScaleFormat` must be a valid `VkFormat` value.

- VUID-VkAccelerationStructureTrianglesDisplacementMicromapNV-displacementVectorFormat-parameter
  `displacementVectorFormat` must be a valid `VkFormat` value.

- VUID-VkAccelerationStructureTrianglesDisplacementMicromapNV-indexType-parameter
  `indexType` must be a valid `VkIndexType` value.

- VUID-VkAccelerationStructureTrianglesDisplacementMicromapNV-pUsageCounts-parameter
  If `usageCountsCount` is not `0`, and `pUsageCounts` is not `NULL`, `pUsageCounts` must be a valid pointer to an array of `usageCountsCount` `VkMicromapUsageEXT` structures.

- VUID-VkAccelerationStructureTrianglesDisplacementMicromapNV-ppUsageCounts-parameter
  If `usageCountsCount` is not `0`, and `ppUsageCounts` is not `NULL`, `ppUsageCounts` must be a valid pointer to an array of `usageCountsCount` valid pointers to `VkMicromapUsageEXT` structures.

- VUID-VkAccelerationStructureTrianglesDisplacementMicromapNV-micromap-parameter
  If `micromap` is not `VK_NULL_HANDLE`, `micromap` must be a valid `VkMicromapEXT` handle.

The `VkTransformMatrixKHR` structure is defined as:

---

3048
// Provided by VK_KHR_acceleration_structure

typedef struct VkTransformMatrixKHR {
    float matrix[3][4];
} VkTransformMatrixKHR;

or the equivalent

// Provided by VK_NV_ray_tracing

typedef VkTransformMatrixKHR VkTransformMatrixNV;

• matrix is a 3x4 row-major affine transformation matrix.

Valid Usage

• VUID-VkTransformMatrixKHR-matrix-03799
The first three columns of matrix must define an invertible 3x3 matrix

The VkAccelerationStructureGeometryAabbsDataKHR structure is defined as:

// Provided by VK_KHR_acceleration_structure

typedef struct VkAccelerationStructureGeometryAabbsDataKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceOrHostAddressConstKHR data;
    VkDeviceSize stride;
} VkAccelerationStructureGeometryAabbsDataKHR;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• data is a device or host address to memory containing VkAabbPositionsKHR structures containing position data for each axis-aligned bounding box in the geometry.
• stride is the stride in bytes between each entry in data. The stride must be a multiple of 8.

Valid Usage

• VUID-VkAccelerationStructureGeometryAabbsDataKHR-stride-03545
  stride must be a multiple of 8
• VUID-VkAccelerationStructureGeometryAabbsDataKHR-stride-03820
  stride must be less than or equal to $2^{32} - 1$
Valid Usage (Implicit)

• VUID-VkAccelerationStructureGeometryAabbsDataKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_AABBS_DATA_KHR

• VUID-VkAccelerationStructureGeometryAabbsDataKHR-pNext-pNext
  pNext must be NULL

The VkAabbPositionsKHR structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAabbPositionsKHR {
    float minX;
    float minY;
    float minZ;
    float maxX;
    float maxY;
    float maxZ;
} VkAabbPositionsKHR;
```

or the equivalent

```c
// Provided by VK_NV_ray_tracing
typedef VkAabbPositionsKHR VkAabbPositionsNV;
```

• minX is the x position of one opposing corner of a bounding box.
• minY is the y position of one opposing corner of a bounding box.
• minZ is the z position of one opposing corner of a bounding box.
• maxX is the x position of the other opposing corner of a bounding box.
• maxY is the y position of the other opposing corner of a bounding box.
• maxZ is the z position of the other opposing corner of a bounding box.

Valid Usage

• VUID-VkAabbPositionsKHR-minX-03546
  minX must be less than or equal to maxX

• VUID-VkAabbPositionsKHR-minY-03547
  minY must be less than or equal to maxY

• VUID-VkAabbPositionsKHR-minZ-03548
  minZ must be less than or equal to maxZ

The VkAccelerationStructureGeometryInstancesDataKHR structure is defined as:
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureGeometryInstancesDataKHR {
    VkStructureType sType;
    const void* pNext;
    VkBool32 arrayOfPointers;
    VkDeviceOrHostAddressConstKHR data;
} VkAccelerationStructureGeometryInstancesDataKHR;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **arrayOfPointers** specifies whether **data** is used as an array of addresses or just an array.
- **data** is either the address of an array of device or host addresses referencing individual VkAccelerationStructureInstanceKHR structures or packed motion instance information as described in motion instances if **arrayOfPointers** is VK_TRUE, or the address of an array of VkAccelerationStructureInstanceKHR or VkAccelerationStructureMotionInstanceNV structures. Addresses and VkAccelerationStructureInstanceKHR structures are tightly packed. VkAccelerationStructureMotionInstanceNV structures have a stride of 160 bytes.

Valid Usage (Implicit)
- VUID-VkAccelerationStructureGeometryInstancesDataKHR-sType-sType
  **sType** must be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_INSTANCES_DATA_KHR
- VUID-VkAccelerationStructureGeometryInstancesDataKHR-pNext-pNext
  **pNext** must be NULL

Acceleration structure instances **can** be built into top-level acceleration structures. Each acceleration structure instance is a separate entry in the top-level acceleration structure which includes all the geometry of a bottom-level acceleration structure at a transformed location. Multiple instances **can** point to the same bottom level acceleration structure.

An acceleration structure instance is defined by the structure:

// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureInstanceKHR {
    VkTransformMatrixKHR transform;
    uint32_t instanceCustomIndex:24;
    uint32_t mask:8;
    uint32_t instanceShaderBindingTableRecordOffset:24;
    VkGeometryInstanceFlagsKHR flags:8;
    uint64_t accelerationStructureReference;
} VkAccelerationStructureInstanceKHR;

or the equivalent
typedef VkAccelerationStructureInstanceKHR VkAccelerationStructureInstanceNV;

- **transform** is a `VkTransformMatrixKHR` structure describing a transformation to be applied to the acceleration structure.

- **instanceCustomIndex** is a 24-bit user-specified index value accessible to ray shaders in the `InstanceCustomIndexKHR` built-in.

- **mask** is an 8-bit visibility mask for the geometry. The instance may only be hit if `Cull Mask & instance.mask != 0`

- **instanceShaderBindingTableRecordOffset** is a 24-bit offset used in calculating the hit shader binding table index.

- **flags** is an 8-bit mask of `VkGeometryInstanceFlagBitsKHR` values to apply to this instance.

- **accelerationStructureReference** is either:
  - a device address containing the value obtained from `vkGetAccelerationStructureDeviceAddressKHR` or `vkGetAccelerationStructureHandleNV` (used by device operations which reference acceleration structures) or,
  - a ` VkAccelerationStructureKHR` object (used by host operations which reference acceleration structures).

The C language specification does not define the ordering of bit-fields, but in practice, this struct produces the correct layout with existing compilers. The intended bit pattern is for the following:

- **instanceCustomIndex** and **mask** occupy the same memory as if a single `uint32_t` was specified in their place
  - **instanceCustomIndex** occupies the 24 least significant bits of that memory
  - **mask** occupies the 8 most significant bits of that memory

- **instanceShaderBindingTableRecordOffset** and **flags** occupy the same memory as if a single `uint32_t` was specified in their place
  - **instanceShaderBindingTableRecordOffset** occupies the 24 least significant bits of that memory
  - **flags** occupies the 8 most significant bits of that memory

If a compiler produces code that diverges from that pattern, applications must employ another method to set values according to the correct bit pattern.

### Valid Usage (Implicit)

- **VUID-VkAccelerationStructureInstanceKHR-flags-parameter**
  - **flags** must be a valid combination of `VkGeometryInstanceFlagBitsKHR` values

Possible values of **flags** in the instance modifying the behavior of that instance are:
typedef enum VkGeometryInstanceFlagBitsKHR {
    VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR = 0x00000001,
    VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR = 0x00000002,
    VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR = 0x00000004,
    VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR = 0x00000008,
    VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_NV
        = VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR,
    VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_NV
        = VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR,
    VK_GEOMETRY_INSTANCE_DISABLE_OPACITY_MICROMAPS_EXT = 0x00000020,
    VK_GEOMETRY_INSTANCE_FORCE_OPACITY_MICROMAP_2_STATE_EXT = 0x00000010,
    VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR
        = VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR,
    VK_GEOMETRY_INSTANCE_TRIANGLE_FRONT_COUNTERCLOCKWISE_BIT_NV
        = VK_GEOMETRY_INSTANCE_TRIANGLE_FRONT_COUNTERCLOCKWISE_BIT_KHR,
    VK_GEOMETRY_INSTANCE_TRIANGLE_FRONT_COUNTERCLOCKWISE_BIT_KHR
        = VK_GEOMETRY_INSTANCE_TRIANGLE_FRONT_COUNTERCLOCKWISE_BIT_KHR,
    VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_NV
        = VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR,
    VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_NV
        = VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR,
} VkGeometryInstanceFlagBitsKHR;

• VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR disables face culling for this instance.

• VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR indicates that the facing determination for geometry in this instance is inverted. Because the facing is determined in object space, an instance transform does not change the winding, but a geometry transform does.

• VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR causes this instance to act as though VK_GEOMETRY_OPAQUE_BIT_KHR were specified on all geometries referenced by this instance. This behavior can be overridden by the SPIR-V NoOpaqueKHR ray flag.

• VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR causes this instance to act as though VK_GEOMETRY_OPAQUE_BIT_KHR were not specified on all geometries referenced by this instance. This behavior can be overridden by the SPIR-V OpaqueKHR ray flag.

VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR and VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR must not be used in the same flag.
VkGeometryInstanceFlagsKHR is a bitmask type for setting a mask of zero or more VkGeometryInstanceFlagBitsKHR.

Acceleration structure motion instances can be built into top-level acceleration structures. Each acceleration structure instance is a separate entry in the top-level acceleration structure which includes all the geometry of a bottom-level acceleration structure at a transformed location including a type of motion and parameters to determine the motion of the instance over time.

An acceleration structure motion instance is defined by the structure:

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef struct VkAccelerationStructureMotionInstanceNV {
    VkAccelerationStructureMotionInstanceTypeNV type;
    VkAccelerationStructureMotionInstanceFlagsNV flags;
    VkAccelerationStructureMotionInstanceDataNV data;
} VkAccelerationStructureMotionInstanceNV;
```

- **type** is a VkAccelerationStructureMotionInstanceTypeNV enumerant identifying which type of motion instance this is and which type of the union is valid.
- **flags** is currently unused, but is required to keep natural alignment of **data**.
- **data** is a VkAccelerationStructureMotionInstanceDataNV containing motion instance data for this instance.

**Note**

If writing this other than with a standard C compiler, note that the final structure should be 152 bytes in size.

**Valid Usage (Implicit)**

- **VUID-VkAccelerationStructureMotionInstanceNV-type-parameter**
  type must be a valid VkAccelerationStructureMotionInstanceTypeNV value
- **VUID-VkAccelerationStructureMotionInstanceNV-flags-zerobitmask**
  flags must be 0
- **VUID-VkAccelerationStructureMotionInstanceNV-staticInstance-parameter**
  If type is VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_STATIC_NV, the staticInstance...
member of `data` must be a valid `VkAccelerationStructureInstanceKHR` structure

- VUID-VkAccelerationStructureMotionInstanceNV-matrixMotionInstance-parameter
  If `type` is `VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_MATRIX_MOTION_NV`, the `matrixMotionInstance` member of `data` must be a valid `VkAccelerationStructureMatrixMotionInstanceNV` structure

- VUID-VkAccelerationStructureMotionInstanceNV-srtMotionInstance-parameter
  If `type` is `VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_SRT_MOTION_NV`, the `srtMotionInstance` member of `data` must be a valid `VkAccelerationStructureSRTMotionInstanceNV` structure

Acceleration structure motion instance is defined by the union:

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef union VkAccelerationStructureMotionInstanceDataNV {
    VkAccelerationStructureInstanceKHR staticInstance;
    VkAccelerationStructureMatrixMotionInstanceNV matrixMotionInstance;
    VkAccelerationStructureSRTMotionInstanceNV srtMotionInstance;
} VkAccelerationStructureMotionInstanceDataNV;
```

- `staticInstance` is a `VkAccelerationStructureInstanceKHR` structure containing data for a static instance.
- `matrixMotionInstance` is a `VkAccelerationStructureMatrixMotionInstanceNV` structure containing data for a matrix motion instance.
- `srtMotionInstance` is a `VkAccelerationStructureSRTMotionInstanceNV` structure containing data for an SRT motion instance.

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef VkFlags VkAccelerationStructureMotionInstanceFlagsNV;
```

`VkAccelerationStructureMotionInstanceFlagsNV` is a bitmask type for setting a mask, but is currently reserved for future use.

The `VkAccelerationStructureMotionInstanceTypeNV` enumeration is defined as:

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef enum VkAccelerationStructureMotionInstanceTypeNV {
    VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_STATIC_NV = 0,
    VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_MATRIX_MOTION_NV = 1,
    VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_SRT_MOTION_NV = 2,
} VkAccelerationStructureMotionInstanceTypeNV;
```

- `VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_STATIC_NV` specifies that the instance is a static instance with no instance motion.
- `VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_MATRIX_MOTION_NV` specifies that the instance is
a motion instance with motion specified by interpolation between two matrices.

- **VK_ACCELERATION_STRUCTURE MOTION INSTANCE TYPE SRT MOTION NV** specifies that the instance is a motion instance with motion specified by interpolation in the SRT decomposition.

An acceleration structure matrix motion instance is defined by the structure:

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef struct VkAccelerationStructureMatrixMotionInstanceNV {
    VkTransformMatrixKHR transformT0;
    VkTransformMatrixKHR transformT1;
    uint32_t instanceCustomIndex:24;
    uint32_t mask:8;
    uint32_t instanceShaderBindingTableRecordOffset:24;
    VkGeometryInstanceFlagsKHR flags:8;
    uint64_t accelerationStructureReference;
} VkAccelerationStructureMatrixMotionInstanceNV;
```

- **transformT0** is a VkTransformMatrixKHR structure describing a transformation to be applied to the acceleration structure at time 0.

- **transformT1** is a VkTransformMatrixKHR structure describing a transformation to be applied to the acceleration structure at time 1.

- **instanceCustomIndex** is a 24-bit user-specified index value accessible to ray shaders in the InstanceCustomIndexKHR built-in.

- **mask** is an 8-bit visibility mask for the geometry. The instance may only be hit if Cull Mask & instance.mask != 0

- **instanceShaderBindingTableRecordOffset** is a 24-bit offset used in calculating the hit shader binding table index.

- **flags** is an 8-bit mask of VkGeometryInstanceFlagBitsKHR values to apply to this instance.

- **accelerationStructureReference** is either:
  - a device address containing the value obtained from vkGetAccelerationStructureDeviceAddressKHR or vkGetAccelerationStructureHandleNV (used by device operations which reference acceleration structures) or,
  - a VkAccelerationStructureKHR object (used by host operations which reference acceleration structures).

The C language specification does not define the ordering of bit-fields, but in practice, this struct produces the correct layout with existing compilers. The intended bit pattern is for the following:

- **instanceCustomIndex** and **mask** occupy the same memory as if a single uint32_t was specified in their place
  - **instanceCustomIndex** occupies the 24 least significant bits of that memory
  - **mask** occupies the 8 most significant bits of that memory

- **instanceShaderBindingTableRecordOffset** and **flags** occupy the same memory as if a single
If a compiler produces code that diverges from that pattern, applications must employ another method to set values according to the correct bit pattern.

The transform for a matrix motion instance at a point in time is derived by component-wise linear interpolation of the two transforms. That is, for a time in [0,1] the resulting transform is

\[
\text{transformT0} \times (1 - \text{time}) + \text{transformT1} \times \text{time}
\]

Valid Usage (Implicit)

- VUID-VkAccelerationStructureMatrixMotionInstanceNV-flags-parameter
  - flags must be a valid combination of \text{VkGeometryInstanceFlagBitsKHR} values

An acceleration structure SRT motion instance is defined by the structure:

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef struct VkAccelerationStructureSRTMotionInstanceNV {
    VkSRTDataNV transformT0;
    VkSRTDataNV transformT1;
    uint32_t instanceCustomIndex:24;
    uint32_t mask:8;
    uint32_t instanceShaderBindingTableRecordOffset:24;
    VkGeometryInstanceFlagsKHR flags:8;
    uint64_t accelerationStructureReference;
} VkAccelerationStructureSRTMotionInstanceNV;
```

- transformT0 is a \text{VkSRTDataNV} structure describing a transformation to be applied to the acceleration structure at time 0.
- transformT1 is a \text{VkSRTDataNV} structure describing a transformation to be applied to the acceleration structure at time 1.
- instanceCustomIndex is a 24-bit user-specified index value accessible to ray shaders in the \text{InstanceCustomIndexKHR} built-in.
- mask is an 8-bit visibility mask for the geometry. The instance may only be hit if \text{Cull Mask} & instance.mask != 0
- instanceShaderBindingTableRecordOffset is a 24-bit offset used in calculating the hit shader binding table index.
- flags is an 8-bit mask of \text{VkGeometryInstanceFlagBitsKHR} values to apply to this instance.
- accelerationStructureReference is either:
  - a device address containing the value obtained from
The C language specification does not define the ordering of bit-fields, but in practice, this struct produces the correct layout with existing compilers. The intended bit pattern is for the following:

- **instanceCustomIndex** and **mask** occupy the same memory as if a single **uint32_t** was specified in their place
  - **instanceCustomIndex** occupies the 24 least significant bits of that memory
  - **mask** occupies the 8 most significant bits of that memory

- **instanceShaderBindingTableRecordOffset** and **flags** occupy the same memory as if a single **uint32_t** was specified in their place
  - **instanceShaderBindingTableRecordOffset** occupies the 24 least significant bits of that memory
  - **flags** occupies the 8 most significant bits of that memory

If a compiler produces code that diverges from that pattern, applications **must** employ another method to set values according to the correct bit pattern.

The transform for a SRT motion instance at a point in time is derived from component-wise linear interpolation of the two SRT transforms. That is, for a **time** in [0,1] the resulting transform is

\[
\text{transformT0} \times (1 - \text{time}) + \text{transformT1} \times \text{time}
\]

**Valid Usage (Implicit)**

- VUID-VkAccelerationStructureSRTMotionInstanceNV-flags-parameter
  - **flags** must be a valid combination of **VkGeometryInstanceFlagBitsKHR** values

An acceleration structure SRT transform is defined by the structure:

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef struct VkSRTDataNV {
    float sx;
    float a;
    float b;
    float pxv;
    float sy;
    float c;
    float pvy;
    float sz;
    float pvz;
    float qx;
    float qy;
};
```
float qz;
float qw;
float tx;
float ty;
float tz;
} VkSRTDataNV;

- sx is the x component of the scale of the transform
- a is one component of the shear for the transform
- b is one component of the shear for the transform
- px is the x component of the pivot point of the transform
- sy is the y component of the scale of the transform
- c is one component of the shear for the transform
- pv is the y component of the pivot point of the transform
- sz is the z component of the scale of the transform
- pvz is the z component of the pivot point of the transform
- qx is the x component of the rotation quaternion
- qy is the y component of the rotation quaternion
- qz is the z component of the rotation quaternion
- qw is the w component of the rotation quaternion
- tx is the x component of the post-rotation translation
- ty is the y component of the post-rotation translation
- tz is the z component of the post-rotation translation

This transform decomposition consists of three elements. The first is a matrix S, consisting of a scale, shear, and translation, usually used to define the pivot point of the following rotation. This matrix is constructed from the parameters above by:

\[
S = \begin{pmatrix}
sx & a & b & px \\
0 & sy & c & pv \\
0 & 0 & sz & pvz \\
\end{pmatrix}
\]

The rotation quaternion is defined as:

\[
R = [ qx, qy, qz, qw ]
\]

This is a rotation around a conceptual normalized axis [ ax, ay, az ] of amount theta such that:

\[
[ qx, qy, qz ] = \sin(\theta/2) \times [ ax, ay, az ]
\]

and
qw = \cos(\theta/2)

Finally, the transform has a translation \( T \) constructed from the parameters above by:

\[
T = \begin{pmatrix}
1 & 0 & 0 & tx \\
0 & 1 & 0 & ty \\
0 & 0 & 1 & tz
\end{pmatrix}
\]

The effective derived transform is then given by

\( T \times R \times S \)

\textit{VkAccelerationStructureBuildRangeInfoKHR} is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureBuildRangeInfoKHR {
    uint32_t primitiveCount;
    uint32_t primitiveOffset;
    uint32_t firstVertex;
    uint32_t transformOffset;
} VkAccelerationStructureBuildRangeInfoKHR;
```

- \texttt{primitiveCount} defines the number of primitives for a corresponding acceleration structure geometry.
- \texttt{primitiveOffset} defines an offset in bytes into the memory where primitive data is defined.
- \texttt{firstVertex} is the index of the first vertex to build from for triangle geometry.
- \texttt{transformOffset} defines an offset in bytes into the memory where a transform matrix is defined.

The primitive count and primitive offset are interpreted differently depending on the \textit{VkGeometryTypeKHR} used:

- For geometries of type \texttt{VK_GEOMETRY_TYPE_TRIANGLES_KHR}, \texttt{primitiveCount} is the number of triangles to be built, where each triangle is treated as 3 vertices.
  - If the geometry uses indices, \texttt{primitiveCount} \times 3 indices are consumed from \texttt{VkAccelerationStructureGeometryTrianglesDataKHR::indexData}, starting at an offset of \texttt{primitiveOffset}. The value of \texttt{firstVertex} is added to the index values before fetching vertices.
  - If the geometry does not use indices, \texttt{primitiveCount} \times 3 vertices are consumed from \texttt{VkAccelerationStructureGeometryTrianglesDataKHR::vertexData}, starting at an offset of \texttt{primitiveOffset} + \texttt{VkAccelerationStructureGeometryTrianglesDataKHR::vertexStride} \times \texttt{firstVertex}.
  - If \texttt{VkAccelerationStructureGeometryTrianglesDataKHR::transformData} is not \texttt{NULL}, a single \texttt{VkTransformMatrixKHR} structure is consumed from \texttt{VkAccelerationStructureGeometryTrianglesDataKHR::transformData}, at an offset of
transformOffset. This matrix describes a transformation from the space in which the vertices for all triangles in this geometry are described to the space in which the acceleration structure is defined.

- For geometries of type `VK_GEOMETRY_TYPE_AABBS_KHR`, `primitiveCount` is the number of axis-aligned bounding boxes. `primitiveCount` `VkAabbPositionsKHR` structures are consumed from `VkAccelerationStructureGeometryAabbsDataKHR::data`, starting at an offset of `primitiveOffset`.

- For geometries of type `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, `primitiveCount` is the number of acceleration structures. `primitiveCount` `VkAccelerationStructureInstanceKHR` or `VkAccelerationStructureMotionInstanceNV` structures are consumed from `VkAccelerationStructureGeometryInstancesDataKHR::data`, starting at an offset of `primitiveOffset`.

**Valid Usage**

- VUID-VkAccelerationStructureBuildRangeInfoKHR-primitiveOffset-03656
  For geometries of type `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if the geometry uses indices, the offset `primitiveOffset` from `VkAccelerationStructureGeometryTrianglesDataKHR::indexData` must be a multiple of the element size of `VkAccelerationStructureGeometryTrianglesDataKHR::indexType`

- VUID-VkAccelerationStructureBuildRangeInfoKHR-primitiveOffset-03657
  For geometries of type `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if the geometry does not use indices, the offset `primitiveOffset` from `VkAccelerationStructureGeometryTrianglesDataKHR::vertexData` must be a multiple of the component size of `VkAccelerationStructureGeometryTrianglesDataKHR::vertexFormat`

- VUID-VkAccelerationStructureBuildRangeInfoKHR-transformOffset-03658
  For geometries of type `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, the offset `transformOffset` from `VkAccelerationStructureGeometryTrianglesDataKHR::transformData` must be a multiple of 16

- VUID-VkAccelerationStructureBuildRangeInfoKHR-primitiveOffset-03659
  For geometries of type `VK_GEOMETRY_TYPE_AABBS_KHR`, the offset `primitiveOffset` from `VkAccelerationStructureGeometryAabbsDataKHR::data` must be a multiple of 8

- VUID-VkAccelerationStructureBuildRangeInfoKHR-primitiveOffset-03660
  For geometries of type `VK_GEOMETRY_TYPE_INSTANCES_KHR`, the offset `primitiveOffset` from `VkAccelerationStructureGeometryInstancesDataKHR::data` must be a multiple of 16

### 37.1.7. Copying Acceleration Structures

An additional command exists for copying acceleration structures without updating their contents. The acceleration structure object can be compacted in order to improve performance. Before copying, an application must query the size of the resulting acceleration structure.

To query acceleration structure size parameters call:

```c
// Provided by VK_KHR_acceleration_structure
```
void vkCmdWriteAccelerationStructuresPropertiesKHR(
    VkCommandBuffer commandBuffer,
    uint32_t accelerationStructureCount,
    const VkAccelerationStructureKHR* pAccelerationStructures,
    VkQueryType queryType,
    VkQueryPool queryPool,
    uint32_t firstQuery);

- commandBuffer is the command buffer into which the command will be recorded.
- accelerationStructureCount is the count of acceleration structures for which to query the property.
- pAccelerationStructures is a pointer to an array of existing previously built acceleration structures.
- queryType is a VkQueryType value specifying the type of queries managed by the pool.
- queryPool is the query pool that will manage the results of the query.
- firstQuery is the first query index within the query pool that will contain the accelerationStructureCount number of results.

Accesses to any of the acceleration structures listed in pAccelerationStructures must be synchronized with the VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR pipeline stage or the VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage, and an access type of VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR.

- If queryType is VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR, then the value written out is the number of bytes required by a compacted acceleration structure.
- If queryType is VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR, then the value written out is the number of bytes required by a serialized acceleration structure.

Valid Usage

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-accelerationStructure-08924
  The VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure feature must be enabled
- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-queryPool-02493
  queryPool must have been created with a queryType matching queryType
- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-queryPool-02494
  The queries identified by queryPool and firstQuery must be unavailable
- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-buffer-03736
  The buffer used to create each acceleration structure in pAccelerationStructures must be bound to device memory
- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-query-04880
  The sum of query plus accelerationStructureCount must be less than or equal to the number of queries in queryPool
All acceleration structures in `pAccelerationStructures` must have been built prior to the execution of this command.

All acceleration structures in `pAccelerationStructures` must have been built with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR` if `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR`.

`queryType` must be `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR`, `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR`, `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR` or `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR`.

Valid Usage (Implicit)

- `commandBuffer` must be a valid `VkCommandBuffer` handle.
- `pAccelerationStructures` must be a valid pointer to an array of `accelerationStructureCount` valid `VkAccelerationStructureKHR` handles.
- `queryType` must be a valid `VkQueryType` value.
- `queryPool` must be a valid `VkQueryPool` handle.
- `commandBuffer` must be in the recording state.
- The `VkCommandPool` that `commandBuffer` was allocated from must support compute operations.
- This command must only be called outside of a render pass instance.
- This command must only be called outside of a video coding scope.
- `accelerationStructureCount` must be greater than 0.
- Each of `commandBuffer`, `queryPool`, and the elements of `pAccelerationStructures` must have been created, allocated, or retrieved from the same `VkDevice`.

3063
Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>

To query acceleration structure size parameters call:

```c
// Provided by VK_NV_ray_tracing
void vkCmdWriteAccelerationStructuresPropertiesNV(
    VkCommandBuffer commandBuffer,
    uint32_t accelerationStructureCount,
    const VkAccelerationStructureNV* pAccelerationStructures,
    VkQueryType queryType,
    VkQueryPool queryPool,
    uint32_t firstQuery);
```

- commandBuffer is the command buffer into which the command will be recorded.
- accelerationStructureCount is the count of acceleration structures for which to query the property.
- pAccelerationStructures is a pointer to an array of existing previously built acceleration structures.
- queryType is a VkQueryType value specifying the type of queries managed by the pool.
- queryPool is the query pool that will manage the results of the query.
- firstQuery is the first query index within the query pool that will contain the accelerationStructureCount number of results.

Accesses to any of the acceleration structures listed in pAccelerationStructures must be synchronized with the VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage and an access type of VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR.

Valid Usage

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-queryPool-03755 queryPool must have been created with a queryType matching queryType
The queries identified by `queryPool` and `firstQuery` **must** be unavailable.

`accelerationStructure` **must** be bound completely and contiguously to a single `VkDeviceMemory` object via `vkBindAccelerationStructureMemoryNV`.

All acceleration structures in `pAccelerationStructures` **must** have been built prior to the execution of this command.

All acceleration structures in `pAccelerationStructures` **must** have been built with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR` if `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_NV`.

`queryType` **must** be `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_NV`.

---

**Valid Usage (Implicit)**

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle.
- `pAccelerationStructures` **must** be a valid pointer to an array of `accelerationStructureCount` valid `VkAccelerationStructureNV` handles.
- `queryType` **must** be a valid `VkQueryType` value.
- `queryPool` **must** be a valid `VkQueryPool` handle.
- `commandBuffer` **must** be in the recording state.
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations.
- This command **must** only be called outside of a render pass instance.
- This command **must** only be called outside of a video coding scope.
- `accelerationStructureCount` **must** be greater than 0.
- Each of `commandBuffer`, `queryPool`, and the elements of `pAccelerationStructures` **must** have been created, allocated, or retrieved from the same `VkDevice`.
Host Synchronization

• Host access to `commandBuffer` must be externally synchronized
• Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

To copy an acceleration structure call:

```c
// Provided by VK_NV_ray_tracing
void vkCmdCopyAccelerationStructureNV(
    VkCommandBuffer commandBuffer,
    VkAccelerationStructureNV dst,
    VkAccelerationStructureNV src,
    VkCopyAccelerationStructureModeKHR mode);
```

• `commandBuffer` is the command buffer into which the command will be recorded.
• `dst` is the target acceleration structure for the copy.
• `src` is the source acceleration structure for the copy.
• `mode` is a `VkCopyAccelerationStructureModeKHR` value specifying additional operations to perform during the copy.

Accesses to `src` and `dst` must be synchronized with the `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR` pipeline stage or the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage, and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR` or `VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR` as appropriate.

Valid Usage

• VUID-vkCmdCopyAccelerationStructureNV-mode-03410
  `mode` must be `VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR` or `VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_KHR`

• VUID-vkCmdCopyAccelerationStructureNV-src-04963
  The source acceleration structure `src` must have been constructed prior to the execution of this command
• VUID-vkCmdCopyAccelerationStructureNV-src-03411
  If \texttt{mode} is \texttt{VK\_COPY\_ACCELERATION\_STRUCTURE\_MODE\_COMPACT\_KHR}, \texttt{src} must have been constructed with \texttt{VK\_BUILD\_ACCELERATION\_STRUCTURE\_ALLOW\_COMPACT\_BIT\_KHR} in the build.

• VUID-vkCmdCopyAccelerationStructureNV-buffer-03718
  The \texttt{buffer} used to create \texttt{src} must be bound to device memory.

• VUID-vkCmdCopyAccelerationStructureNV-buffer-03719
  The \texttt{buffer} used to create \texttt{dst} must be bound to device memory.

• VUID-vkCmdCopyAccelerationStructureNV-dst-07791
  The range of memory backing \texttt{dst} that is accessed by this command must not overlap the memory backing \texttt{src} that is accessed by this command.

• VUID-vkCmdCopyAccelerationStructureNV-dst-07792
  \texttt{dst} must be bound completely and contiguously to a single \texttt{VkDeviceMemory} object via \texttt{vkBindAccelerationStructureMemoryNV}.

\begin{section}{Valid Usage (Implicit)}

• VUID-vkCmdCopyAccelerationStructureNV-commandBuffer-parameter
  \texttt{commandBuffer} must be a valid \texttt{VkCommandBuffer} handle.

• VUID-vkCmdCopyAccelerationStructureNV-dst-parameter
  \texttt{dst} must be a valid \texttt{VkAccelerationStructureNV} handle.

• VUID-vkCmdCopyAccelerationStructureNV-src-parameter
  \texttt{src} must be a valid \texttt{VkAccelerationStructureNV} handle.

• VUID-vkCmdCopyAccelerationStructureNV-mode-parameter
  \texttt{mode} must be a valid \texttt{VkCopyAccelerationStructureModeKHR} value.

• VUID-vkCmdCopyAccelerationStructureNV-commandBuffer-recording
  \texttt{commandBuffer} must be in the recording state.

• VUID-vkCmdCopyAccelerationStructureNV-commandBuffer-cmdpool
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must support compute operations.

• VUID-vkCmdCopyAccelerationStructureNV-renderpass
  This command must only be called outside of a render pass instance.

• VUID-vkCmdCopyAccelerationStructureNV-videocoding
  This command must only be called outside of a video coding scope.

• VUID-vkCmdCopyAccelerationStructureNV-commonparent
  Each of \texttt{commandBuffer}, \texttt{dst}, and \texttt{src} must have been created, allocated, or retrieved from the same \texttt{VkDevice}.
\end{section}

\begin{section}{Host Synchronization}

• Host access to \texttt{commandBuffer} must be externally synchronized.
\end{section}
Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized.

To copy an acceleration structure call:

```c
// Provided by VK_KHR_acceleration_structure
void vkCmdCopyAccelerationStructureKHR(
    VkCommandBuffer commandBuffer,
    const VkCopyAccelerationStructureInfoKHR* pInfo);
```

- commandBuffer is the command buffer into which the command will be recorded.
- pInfo is a pointer to a VkCopyAccelerationStructureInfoKHR structure defining the copy operation.

This command copies the pInfo->src acceleration structure to the pInfo->dst acceleration structure in the manner specified by pInfo->mode.

Accesses to pInfo->src and pInfo->dst must be synchronized with the VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR pipeline stage or the VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage, and an access type of VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR or VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR as appropriate.

---

### Valid Usage

- VUID-vkCmdCopyAccelerationStructureKHR-accelerationStructure-08925
  - The VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure feature must be enabled

- VUID-vkCmdCopyAccelerationStructureKHR-buffer-03737
  - The buffer used to create pInfo->src must be bound to device memory

- VUID-vkCmdCopyAccelerationStructureKHR-buffer-03738
  - The buffer used to create pInfo->dst must be bound to device memory

---

### Valid Usage (Implicit)

---

3068
- **VUID-vkCmdCopyAccelerationStructureKHR-commandBuffer-parameter**
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdCopyAccelerationStructureKHR-pInfo-parameter**
  
  `pInfo` must be a valid pointer to a valid `VkCopyAccelerationStructureInfoKHR` structure.

- **VUID-vkCmdCopyAccelerationStructureKHR-commandBuffer-recording**
  
  `commandBuffer` must be in the recording state.

- **VUID-vkCmdCopyAccelerationStructureKHR-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support compute operations.

- **VUID-vkCmdCopyAccelerationStructureKHR-renderpass**
  
  This command must only be called outside of a render pass instance.

- **VUID-vkCmdCopyAccelerationStructureKHR-videocoding**
  
  This command must only be called outside of a video coding scope.

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>

The `VkCopyAccelerationStructureInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkCopyAccelerationStructureInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkAccelerationStructureKHR src;
    VkAccelerationStructureKHR dst;
    VkCopyAccelerationStructureModeKHR mode;
} VkCopyAccelerationStructureInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `src` is the source acceleration structure for the copy.
• ```dst``` is the target acceleration structure for the copy.
• ```mode``` is a ```VkCopyAccelerationStructureModeKHR``` value specifying additional operations to perform during the copy.

### Valid Usage

- **VUID-VkCopyAccelerationStructureInfoKHR-mode-03410**
  ```mode``` **must** be ```VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR``` or ```VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_KHR```.

- **VUID-VkCopyAccelerationStructureInfoKHR-src-04963**
The source acceleration structure ```src``` **must** have been constructed prior to the execution of this command.

- **VUID-VkCopyAccelerationStructureInfoKHR-src-03411**
  If ```mode``` is ```VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR```, ```src``` **must** have been constructed with ```VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR``` in the build.

- **VUID-VkCopyAccelerationStructureInfoKHR-buffer-03718**
The buffer used to create ```src``` **must** be bound to device memory.

- **VUID-VkCopyAccelerationStructureInfoKHR-buffer-03719**
The buffer used to create ```dst``` **must** be bound to device memory.

- **VUID-VkCopyAccelerationStructureInfoKHR-dst-07791**
The range of memory backing ```dst``` that is accessed by this command **must** not overlap the memory backing ```src``` that is accessed by this command.

- **VUID-VkCopyAccelerationStructureInfoKHR-dst-07792**
  ```dst``` **must** be bound completely and contiguously to a single ```VkDeviceMemory``` object via ```vkBindAccelerationStructureMemoryNV```.

### Valid Usage (Implicit)

- **VUID-VkCopyAccelerationStructureInfoKHR-sType-sType**
  ```sType``` **must** be ```VK_STRUCTURE_TYPE_COPY_ACCELERATION_STRUCTURE_INFO_KHR```.

- **VUID-VkCopyAccelerationStructureInfoKHR-pNext-pNext**
  ```pNext``` **must** be ```NULL```.

- **VUID-VkCopyAccelerationStructureInfoKHR-src-parameter**
  ```src``` **must** be a valid ```VkAccelerationStructureKHR``` handle.

- **VUID-VkCopyAccelerationStructureInfoKHR-dst-parameter**
  ```dst``` **must** be a valid ```VkAccelerationStructureKHR``` handle.

- **VUID-VkCopyAccelerationStructureInfoKHR-mode-parameter**
  ```mode``` **must** be a valid ```VkCopyAccelerationStructureModeKHR``` value.

- **VUID-VkCopyAccelerationStructureInfoKHR-commonparent**
  Both of ```dst```, and ```src``` **must** have been created, allocated, or retrieved from the same ```VkDevice```.
Possible values of `mode` specifying additional operations to perform during the copy, are:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkCopyAccelerationStructureModeKHR {
    VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_KHR = 0,
    VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR = 1,
    VK_COPY_ACCELERATION_STRUCTURE_MODE_SERIALIZE_KHR = 2,
    VK_COPY_ACCELERATION_STRUCTURE_MODE_DESERIALIZE_KHR = 3,
} VkCopyAccelerationStructureModeKHR;
```

or the equivalent

```c
// Provided by VK_NV_ray_tracing
typedef VkCopyAccelerationStructureModeKHR VkCopyAccelerationStructureModeNV;
```

- **VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_KHR** creates a direct copy of the acceleration structure specified in `src` into the one specified by `dst`. The `dst` acceleration structure **must** have been created with the same parameters as `src`. If `src` contains references to other acceleration structures, `dst` will reference the same acceleration structures.

- **VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR** creates a more compact version of an acceleration structure `src` into `dst`. The acceleration structure `dst` **must** have been created with a size at least as large as that returned by `vkCmdWriteAccelerationStructuresPropertiesKHR` or `vkWriteAccelerationStructuresPropertiesKHR` after the build of the acceleration structure specified by `src`. If `src` contains references to other acceleration structures, `dst` will reference the same acceleration structures.

- **VK_COPY_ACCELERATION_STRUCTURE_MODE_SERIALIZE_KHR** serializes the acceleration structure to a semi-opaque format which can be reloaded on a compatible implementation.

- **VK_COPY_ACCELERATION_STRUCTURE_MODE_DESERIALIZE_KHR** deserializes the semi-opaque serialization format in the buffer to the acceleration structure.

To copy an acceleration structure to device memory call:

```c
// Provided by VK_KHR_acceleration_structure
void vkCmdCopyAccelerationStructureToMemoryKHR(
    VkCommandBuffer commandBuffer, 
    const VkCopyAccelerationStructureToMemoryInfoKHR* pInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pInfo` is an a pointer to a `VkCopyAccelerationStructureToMemoryInfoKHR` structure defining
the copy operation.

Accesses to pInfo->src must be synchronized with the 
VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR pipeline stage or the 
VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage, and an access type of 
VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR. Accesses to the buffer indicated by pInfo->dst.deviceAddress must be synchronized with the 
VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR pipeline stage or the 
VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage, and an and an access type of VK_ACCESS_TRANSFER_WRITE_BIT.

This command produces the same results as vkCopyAccelerationStructureToMemoryKHR, but writes its result to a device address, and is executed on the device rather than the host. The output may not necessarily be bit-for-bit identical, but it can be equally used by either vkCmdCopyMemoryToAccelerationStructureKHR or vkCopyMemoryToAccelerationStructureKHR.

The defined header structure for the serialized data consists of:

- VK_UUID_SIZE bytes of data matching VkPhysicalDeviceIDProperties::driverUUID
- VK_UUID_SIZE bytes of data identifying the compatibility for comparison using vkGetDeviceAccelerationStructureCompatibilityKHR
- A 64-bit integer of the total size matching the value queried using VK_QUERY_TYPE_ACCELERATION_STRUCTURE.Serialization_SIZE_KHR
- A 64-bit integer of the deserialized size to be passed in to VkAccelerationStructureCreateInfoKHR::size
- A 64-bit integer of the count of the number of acceleration structure handles following. This value matches the value queried using VK_QUERY_TYPE_ACCELERATION_STRUCTURE.Serialization.BOTTOMLEVEL.POINTERS_KHR. This will be zero for a bottom-level acceleration structure. For top-level acceleration structures this number is implementation-dependent; the number of and ordering of the handles may not match the instance descriptions which were used to build the acceleration structure.

The corresponding handles matching the values returned by vkGetAccelerationStructureDeviceAddressKHR or vkGetAccelerationStructureHandleNV are tightly packed in the buffer following the count. The application is expected to store a mapping between those handles and the original application-generated bottom-level acceleration structures to provide when deserializing. The serialized data is written to the buffer (or read from the buffer) according to the host endianness.

Valid Usage

- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-accelerationStructure-08926
  The VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure feature must be enabled
- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-pInfo-03739
  pInfo->dst.deviceAddress must be a valid device address for a buffer bound to device memory
• VUID-vkCmdCopyAccelerationStructureToMemoryKHR-pInfo-03740
  pInfo->dst.deviceAddress must be aligned to 256 bytes

• VUID-vkCmdCopyAccelerationStructureToMemoryKHR-pInfo-03741
  If the buffer pointed to by pInfo->dst.deviceAddress is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-vkCmdCopyAccelerationStructureToMemoryKHR-None-03559
  The buffer used to create pInfo->src must be bound to device memory

**Valid Usage (Implicit)**

• VUID-vkCmdCopyAccelerationStructureToMemoryKHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdCopyAccelerationStructureToMemoryKHR-pInfo-parameter
  pInfo must be a valid pointer to a valid VkCopyAccelerationStructureToMemoryInfoKHR structure

• VUID-vkCmdCopyAccelerationStructureToMemoryKHR-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdCopyAccelerationStructureToMemoryKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

• VUID-vkCmdCopyAccelerationStructureToMemoryKHR-renderpass
  This command must only be called outside of a render pass instance

• VUID-vkCmdCopyAccelerationStructureToMemoryKHR-videocoding
  This command must only be called outside of a video coding scope

**Host Synchronization**

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>

// Provided by VK_KHR_acceleration_structure
typedef struct VkCopyAccelerationStructureToMemoryInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkAccelerationStructureKHR src;
    VkDeviceOrHostAddressKHR dst;
    VkCopyAccelerationStructureModeKHR mode;
} VkCopyAccelerationStructureToMemoryInfoKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **src** is the source acceleration structure for the copy
- **dst** is the device or host address to memory which is the target for the copy
- **mode** is a `VkCopyAccelerationStructureModeKHR` value specifying additional operations to perform during the copy.

### Valid Usage

- **VUID-VkCopyAccelerationStructureToMemoryInfoKHR-src-04959**
  The source acceleration structure `src` must have been constructed prior to the execution of this command

- **VUID-VkCopyAccelerationStructureToMemoryInfoKHR-dst-03561**
  The memory pointed to by `dst` must be at least as large as the serialization size of `src`, as reported by `vkWriteAccelerationStructuresPropertiesKHR` or `vkCmdWriteAccelerationStructuresPropertiesKHR` with a query type of `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR`

- **VUID-VkCopyAccelerationStructureToMemoryInfoKHR-mode-03412**
  `mode` must be `VK_COPY_ACCELERATION_STRUCTURE_MODE_SERIALIZE_KHR`

### Valid Usage (Implicit)

- **VUID-VkCopyAccelerationStructureToMemoryInfoKHR-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_COPY_ACCELERATION_STRUCTURE_TO_MEMORY_INFO_KHR`

- **VUID-VkCopyAccelerationStructureToMemoryInfoKHR-pNext-pNext**
  `pNext` must be NULL

- **VUID-VkCopyAccelerationStructureToMemoryInfoKHR-src-parameter**
  `src` must be a valid `VkAccelerationStructureKHR` handle

- **VUID-VkCopyAccelerationStructureToMemoryInfoKHR-mode-parameter**
  `mode` must be a valid `VkCopyAccelerationStructureModeKHR` value

To copy device memory to an acceleration structure call:

```c
// Provided by VK_KHR_acceleration_structure
```
void vkCmdCopyMemoryToAccelerationStructureKHR(
    VkCommandBuffer commandBuffer,
    const VkCopyMemoryToAccelerationStructureInfoKHR* pInfo);

- **commandBuffer** is the command buffer into which the command will be recorded.
- **pInfo** is a pointer to a `VkCopyMemoryToAccelerationStructureInfoKHR` structure defining the copy operation.

Accesses to `pInfo->dst` must be synchronized with the `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR` pipeline stage or the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage, and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR`. Accesses to the buffer indicated by `pInfo->src.deviceAddress` must be synchronized with the `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR` pipeline stage or the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage, and an access type of `VK_ACCESS_TRANSFER_READ_BIT`.

This command can accept acceleration structures produced by either `vkCmdCopyAccelerationStructureToMemoryKHR` or `vkCopyAccelerationStructureToMemoryKHR`.

The structure provided as input to deserialize is as described in `vkCmdCopyAccelerationStructureToMemoryKHR`, with any acceleration structure handles filled in with the newly-queried handles to bottom level acceleration structures created before deserialization. These do not need to be built at deserialize time, but must be created.

### Valid Usage

- **VUID-vkCmdCopyMemoryToAccelerationStructureKHR-accelerationStructure-08927**
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure` feature must be enabled

- **VUID-vkCmdCopyMemoryToAccelerationStructureKHR-pInfo-03742**
  `pInfo->src.deviceAddress` must be a valid device address for a buffer bound to device memory

- **VUID-vkCmdCopyMemoryToAccelerationStructureKHR-pInfo-03743**
  `pInfo->src.deviceAddress` must be aligned to 256 bytes

- **VUID-vkCmdCopyMemoryToAccelerationStructureKHR-pInfo-03744**
  If the buffer pointed to by `pInfo->src.deviceAddress` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdCopyMemoryToAccelerationStructureKHR-buffer-03745**
  The buffer used to create `pInfo->dst` must be bound to device memory

### Valid Usage (Implicit)

- **VUID-vkCmdCopyMemoryToAccelerationStructureKHR-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle
• VUID-vkCmdCopyMemoryToAccelerationStructureKHR-pInfo-parameter pInfo must be a valid pointer to a valid VkCopyMemoryToAccelerationStructureInfoKHR structure

• VUID-vkCmdCopyMemoryToAccelerationStructureKHR-commandBuffer-recording commandBuffer must be in the recording state

• VUID-vkCmdCopyMemoryToAccelerationStructureKHR-commandBuffer-cmdpool The VkCommandPool that commandBuffer was allocated from must support compute operations

• VUID-vkCmdCopyMemoryToAccelerationStructureKHR-renderpass This command must only be called outside of a render pass instance

• VUID-vkCmdCopyMemoryToAccelerationStructureKHR-videocoding This command must only be called outside of a video coding scope

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Compute</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The VkCopyMemoryToAccelerationStructureInfoKHR structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkCopyMemoryToAccelerationStructureInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceOrHostAddressConstKHR src;
    VkAccelerationStructureKHR dst;
    VkCopyAccelerationStructureModeKHR mode;
} VkCopyMemoryToAccelerationStructureInfoKHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• src is the device or host address to memory containing the source data for the copy.
• dst is the target acceleration structure for the copy.
• mode is a VkCopyAccelerationStructureModeKHR value specifying additional operations to perform during the copy.

Valid Usage

• VUID-VkCopyMemoryToAccelerationStructureInfoKHR-src-04960
The source memory pointed to by src must contain data previously serialized using vkCmdCopyAccelerationStructureToMemoryKHR, potentially modified to relocate acceleration structure references as described in that command

• VUID-VkCopyMemoryToAccelerationStructureInfoKHR-mode-03413
mode must be VK_COPY_ACCELERATION_STRUCTURE_MODE_DESERIALIZE_KHR

• VUID-VkCopyMemoryToAccelerationStructureInfoKHR-pInfo-03414
The data in src must have a format compatible with the destination physical device as returned by vkGetDeviceAccelerationStructureCompatibilityKHR

• VUID-VkCopyMemoryToAccelerationStructureInfoKHR-dst-03746
dst must have been created with a size greater than or equal to that used to serialize the data in src

Valid Usage (Implicit)

• VUID-VkCopyMemoryToAccelerationStructureInfoKHR-sType-sType
sType must be VK_STRUCTURE_TYPE_COPY_MEMORY_TO_ACCELERATION_STRUCTURE_INFO_KHR

• VUID-VkCopyMemoryToAccelerationStructureInfoKHR-pNext-pNext
pNext must be NULL

• VUID-VkCopyMemoryToAccelerationStructureInfoKHR-dst-parameter
dst must be a valid VkAccelerationStructureKHR handle

• VUID-VkCopyMemoryToAccelerationStructureInfoKHR-mode-parameter
mode must be a valid VkCopyAccelerationStructureModeKHR value

To check if a serialized acceleration structure is compatible with the current device call:

```c
// Provided by VK_KHR_acceleration_structure
void vkGetDeviceAccelerationStructureCompatibilityKHR(
    VkDevice device,
    const VkAccelerationStructureVersionInfoKHR* pVersionInfo,
    VkAccelerationStructureCompatibilityKHR* pCompatibility);
```

• device is the device to check the version against.

• pVersionInfo is a pointer to a VkAccelerationStructureVersionInfoKHR structure specifying version information to check against the device.

• pCompatibility is a pointer to a VkAccelerationStructureCompatibilityKHR value in which compatibility information is returned.
Valid Usage

- VUID-vkGetDeviceAccelerationStructureCompatibilityKHR-accelerationStructure-08928
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure` feature must be enabled.

Valid Usage (Implicit)

- VUID-vkGetDeviceAccelerationStructureCompatibilityKHR-device-parameter
device must be a valid `VkDevice` handle

- VUID-vkGetDeviceAccelerationStructureCompatibilityKHR-pVersionInfo-parameter
  pVersionInfo must be a valid pointer to a valid `VkAccelerationStructureVersionInfoKHR` structure

- VUID-vkGetDeviceAccelerationStructureCompatibilityKHR-pCompatibility-parameter
  pCompatibility must be a valid pointer to a `VkAccelerationStructureCompatibilityKHR` value

The `VkAccelerationStructureVersionInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureVersionInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const uint8_t* pVersionData;
} VkAccelerationStructureVersionInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `pVersionData` is a pointer to the version header of an acceleration structure as defined in `vkCmdCopyAccelerationStructureToMemoryKHR`

Note

`pVersionData` is a pointer to an array of 2×`VK_UUID_SIZE` uint8_t values instead of two `VK_UUID_SIZE` arrays as the expected use case for this member is to be pointed at the header of a previously serialized acceleration structure (via `vkCmdCopyAccelerationStructureToMemoryKHR` or `vkCopyAccelerationStructureToMemoryKHR`) that is loaded in memory. Using arrays would necessitate extra memory copies of the UUIDs.

Valid Usage (Implicit)

- VUID-VkAccelerationStructureVersionInfoKHR-sType-sType
  sType must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_VERSION_INFO_KHR`
Possible values of \texttt{pCompatibility} returned by \texttt{vkGetDeviceAccelerationStructureCompatibilityKHR} are:

// Provided by VK_KHR_acceleration_structure

typedef enum VkAccelerationStructureCompatibilityKHR {
  VK_ACCELERATION_STRUCTURE_COMPATIBILITY_COMPATIBLE_KHR = 0,
  VK_ACCELERATION_STRUCTURE_COMPATIBILITY_INCOMPATIBLE_KHR = 1,
} VkAccelerationStructureCompatibilityKHR;

- \texttt{VK_ACCELERATION_STRUCTURE_COMPATIBILITY_COMPATIBLE_KHR} if the \texttt{pVersionData} version acceleration structure is compatible with \texttt{device}.
- \texttt{VK_ACCELERATION_STRUCTURE_COMPATIBILITY_INCOMPATIBLE_KHR} if the \texttt{pVersionData} version acceleration structure is not compatible with \texttt{device}.

### 37.2. Host Acceleration Structure Operations

Implementations are also required to provide host implementations of the acceleration structure operations if the \texttt{accelerationStructureHostCommands} feature is enabled:

- \texttt{vkBuildAccelerationStructuresKHR} corresponding to \texttt{vkCmdBuildAccelerationStructuresKHR}
- \texttt{vkCopyAccelerationStructureKHR} corresponding to \texttt{vkCmdCopyAccelerationStructureKHR}
- \texttt{vkCopyAccelerationStructureToMemoryKHR} corresponding to \texttt{vkCmdCopyAccelerationStructureToMemoryKHR}
- \texttt{vkCopyMemoryToAccelerationStructureKHR} corresponding to \texttt{vkCmdCopyMemoryToAccelerationStructureKHR}
- \texttt{vkWriteAccelerationStructuresPropertiesKHR} corresponding to \texttt{vkCmdWriteAccelerationStructuresPropertiesKHR}

These commands are functionally equivalent to their device counterparts, except that they are executed on the host timeline, rather than being enqueued into command buffers.

All acceleration structures used by the host commands \textbf{must} be bound to host-visible memory, and all input data for acceleration structure builds \textbf{must} be referenced using host addresses instead of device addresses. Applications are not required to map acceleration structure memory when using the host commands.

\textit{Note}

The \texttt{vkBuildAccelerationStructuresKHR} and \texttt{vkCmdBuildAccelerationStructuresKHR} \textbf{may} use different algorithms, and thus
are not required to produce identical structures. The structures produced by these two commands may exhibit different memory footprints or traversal performance, but should strive to be similar where possible.

Apart from these details, the host and device operations are interchangeable. For example, an application can use `vkBuildAccelerationStructuresKHR` to build a structure, compact it on the device using `vkCmdCopyAccelerationStructureKHR`, and serialize the result using `vkCopyAccelerationStructureToMemoryKHR`.

**Note**
For efficient execution, acceleration structures manipulated using these commands should always be bound to host cached memory, as the implementation may need to repeatedly read and write this memory during the execution of the command.

To build acceleration structures on the host, call:

```c
// Provided by VK_KHR_acceleration_structure
VkResult vkBuildAccelerationStructuresKHR(
    VkDevice device,               // VkDevice for which the acceleration structures are being built.
    VkDeferredOperationKHR deferredOperation, // Optional VkDeferredOperationKHR to request deferral for this command.
    uint32_t infoCount,            // Number of acceleration structures to build. Specifies the number of the pInfos structures and ppBuildRangeInfos pointers that must be provided.
    const VkAccelerationStructureBuildGeometryInfoKHR* pInfos,  // Pointer to an array of infoCount VkAccelerationStructureBuildGeometryInfoKHR structures defining the geometry used to build each acceleration structure.
    const VkAccelerationStructureBuildRangeInfoKHR* const* ppBuildRangeInfos); // Pointer to an array of infoCount pointers to arrays of VkAccelerationStructureBuildRangeInfoKHR structures defining dynamic offsets to the addresses where geometry data is stored, as defined by pInfos[i].
```

- `device` is the `VkDevice` for which the acceleration structures are being built.
- `deferredOperation` is an optional `VkDeferredOperationKHR` to request deferral for this command.
- `infoCount` is the number of acceleration structures to build. It specifies the number of the `pInfos` structures and `ppBuildRangeInfos` pointers that must be provided.
- `pInfos` is a pointer to an array of `infoCount` `VkAccelerationStructureBuildGeometryInfoKHR` structures defining the geometry used to build each acceleration structure.
- `ppBuildRangeInfos` is a pointer to an array of `infoCount` pointers to arrays of `VkAccelerationStructureBuildRangeInfoKHR` structures. Each `ppBuildRangeInfos[i]` is a pointer to an array of `pInfos[i].geometryCount` `VkAccelerationStructureBuildRangeInfoKHR` structures defining dynamic offsets to the addresses where geometry data is stored, as defined by `pInfos[i]`.

This command fulfills the same task as `vkCmdBuildAccelerationStructuresKHR` but is executed by the host.

The `vkBuildAccelerationStructuresKHR` command provides the ability to initiate multiple acceleration structures builds, however there is no ordering or synchronization implied between any of the individual acceleration structure builds.

**Note**
This means that an application cannot build a top-level acceleration structure in
the same `vkBuildAccelerationStructuresKHR` call as the associated bottom-level or instance acceleration structures are being built. There also cannot be any memory aliasing between any acceleration structure memories or scratch memories being used by any of the builds.

### Valid Usage

- **VUID-vkBuildAccelerationStructuresKHR-accelerationStructureHostCommands-03581**
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureHostCommands` feature must be enabled.

- **VUID-vkBuildAccelerationStructuresKHR-mode-04628**
  The `mode` member of each element of `pInfos` must be a valid `VkBuildAccelerationStructureModeKHR` value.

- **VUID-vkBuildAccelerationStructuresKHR-srcAccelerationStructure-04629**
  If the `srcAccelerationStructure` member of any element of `pInfos` is not `VK_NULL_HANDLE`, the `srcAccelerationStructure` member must be a valid `VkAccelerationStructureKHR` handle.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-04630**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` member must not be `VK_NULL_HANDLE`.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03403**
  The `srcAccelerationStructure` member of any element of `pInfos` must not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of `pInfos`.

- **VUID-vkBuildAccelerationStructuresKHR-dstAccelerationStructure-03698**
  The `dstAccelerationStructure` member of any element of `pInfos` must not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of `pInfos`.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03699**
  For each element of `pInfos`, if its `type` member is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR`, its `dstAccelerationStructure` member must have been created with a value of `VkAccelerationStructureCreateInfoKHR::type` equal to either `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR` or `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03700**
  For each element of `pInfos`, if its `type` member is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR`, its `dstAccelerationStructure` member must have been created with a value of `VkAccelerationStructureCreateInfoKHR::type` equal to either `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` or `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`.
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, inactive primitives in its `srcAccelerationStructure` member must not be made active.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, active primitives in its `srcAccelerationStructure` member must not be made inactive.

The `dstAccelerationStructure` member of any element of `pInfos` must not be referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` in any other element of `pInfos`.

The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `srcAccelerationStructure` member of any other element of `pInfos` with a `mode` equal to `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, which is accessed by this command.

The range of memory backing the `dstAccelerationStructure` member of any other element of `pInfos` that is accessed by this command must not overlap the memory backing the `dstAccelerationStructure` member of any other element of `pInfos`, which is accessed by this command.

The range of memory backing the `scratchData` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `scratchData` member of any other element of `pInfos`, which is accessed by this command.

The range of memory backing the `scratchData` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `scratchData` member of any other element of `pInfos`, which is accessed by this command.

The range of memory backing the `scratchData` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing any acceleration structure referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` in any other element of `pInfos`, which is accessed by this command.

The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing any acceleration structure referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` in any other element of `pInfos`, which is accessed by this command.
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` member must have previously been constructed with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR` set in `VkAccelerationStructureBuildGeometryInfoKHR::flags` in the build.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03668**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` and `dstAccelerationStructure` members must either be the same `VkAccelerationStructureKHR`, or not have any memory aliasing.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03758**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `geometryCount` member must have the same value which was specified when `srcAccelerationStructure` was last built.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03759**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `flags` member must have the same value which was specified when `srcAccelerationStructure` was last built.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03760**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `type` member must have the same value which was specified when `srcAccelerationStructure` was last built.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03761**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, its `geometryType` member must have the same value which was specified when `srcAccelerationStructure` was last built.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03762**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, its `flags` member must have the same value which was specified when `srcAccelerationStructure` was last built.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03763**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.vertexFormat` member must have the same value which was specified when `srcAccelerationStructure` was last built.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03764**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or...
ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its geometry.triangles.maxVertex member must have the same value which was specified when srcAccelerationStructure was last built.

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03765
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its geometry.triangles.indexType member must have the same value which was specified when srcAccelerationStructure was last built.

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03766
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its geometry.triangles.transformData address was NULL when srcAccelerationStructure was last built, then it must be NULL.

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03767
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, if its geometry.triangles.transformData address was not NULL when srcAccelerationStructure was last built, then it must not be NULL.

- VUID-vkBuildAccelerationStructuresKHR-primitiveCount-03769
  For each VkAccelerationStructureBuildRangeInfoKHR referenced by this command, its primitiveCount member must have the same value which was specified when srcAccelerationStructure was last built.

- VUID-vkBuildAccelerationStructuresKHR-firstVertex-03770
  For each VkAccelerationStructureBuildRangeInfoKHR referenced by this command, if the corresponding geometry uses indices, its firstVertex member must have the same value which was specified when srcAccelerationStructure was last built.

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03801
  For each element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, the corresponding ppBuildRangeInfos[i][j].primitiveCount must be less than or equal to VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxInstanceCount.
For each `pInfos[i]`, `dstAccelerationStructure` must have been created with a value of `VkAccelerationStructureCreateInfoKHR::size` greater than or equal to the memory size required by the build operation, as returned by `vkGetAccelerationStructureBuildSizesKHR` with `pBuildInfo = pInfos[i]` and with each element of the `pMaxPrimitiveCounts` array greater than or equal to the equivalent `ppBuildRangeInfos[i][j].primitiveCount` values for `j` in `[0, pInfos[i].geometryCount)`

Each element of `ppBuildRangeInfos[i]` must be a valid pointer to an array of `pInfos[i].geometryCount` `VkAccelerationStructureBuildRangeInfoKHR` structures.

If `deferredOperation` is not `VK_NULL_HANDLE`, it must be a valid `VkDeferredOperationKHR` object.

Any previous deferred operation that was associated with `deferredOperation` must be complete.

For each element of `pInfos`, the buffer used to create its `dstAccelerationStructure` member must be bound to host-visible device memory.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` the buffer used to create its `srcAccelerationStructure` member must be bound to host-visible device memory.

For each element of `pInfos`, the buffer used to create each acceleration structure referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` must be bound to host-visible device memory.

If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR`, all addresses between `pInfos[i].scratchData.hostAddress` and `pInfos[i].scratchData.hostAddress + N - 1` must be valid host memory, where `N` is given by the `build ScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count.

If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, all addresses between `pInfos[i].scratchData.hostAddress` and `pInfos[i].scratchData.hostAddress + N - 1` must be valid host memory, where `N` is given by the `updateScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count.

For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of
VK_GEOMETRY_TYPE_TRIANGLES_KHR, geometry.triangles.vertexData.hostAddress must be a valid host address

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03772
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.indexType is not VK_INDEX_TYPE_NONE_KHR, geometry.triangles.indexData.hostAddress must be a valid host address

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03773
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.transformData.hostAddress is not 0, it must be a valid host address

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03774
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_AABBS_KHR, geometry.aabbs.data.hostAddress must be a valid host address

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03775
  For each element of pInfos, the buffer used to create its dstAccelerationStructure member must be bound to memory that was not allocated with multiple instances

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03776
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR the buffer used to create its srcAccelerationStructure member must be bound to memory that was not allocated with multiple instances

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03777
  For each element of pInfos, the buffer used to create each acceleration structure referenced by the geometry.instances.data member of any element of pGeometries or ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR must be bound to memory that was not allocated with multiple instances

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03778
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, geometry.instances.data.hostAddress must be a valid host address

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03779
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, each VkAccelerationStructureInstanceKHR::accelerationStructureReference value in geometry.instances.data.hostAddress must be a valid VkAccelerationStructureKHR object

- VUID-vkBuildAccelerationStructuresKHR-pInfos-04930
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR with VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV set, each accelerationStructureReference in any structure in VkAccelerationStructureMotionInstanceNV value in geometry.instances.data.hostAddress must be a valid VkAccelerationStructureKHR object
Valid Usage (Implicit)

- VUID-vkBuildAccelerationStructuresKHR-device-parameter
  device must be a valid VkDevice handle

- VUID-vkBuildAccelerationStructuresKHR-deferredOperation-parameter
  If deferredOperation is not VK_NULL_HANDLE, deferredOperation must be a valid VkDeferredOperationKHR handle

- VUID-vkBuildAccelerationStructuresKHR-pInfos-parameter
  pInfos must be a valid pointer to an array of infoCount valid VkAccelerationStructureBuildGeometryInfoKHR structures

- VUID-vkBuildAccelerationStructuresKHR-ppBuildRangeInfos-parameter
  ppBuildRangeInfos must be a valid pointer to an array of infoCount VkAccelerationStructureBuildRangeInfoKHR structures

- VUID-vkBuildAccelerationStructuresKHR-infoCount-arraylength
  infoCount must be greater than 0

- VUID-vkBuildAccelerationStructuresKHR-deferredOperation-parent
  If deferredOperation is a valid handle, it must have been created, allocated, or retrieved from device

Return Codes

Success

- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To copy or compact an acceleration structure on the host, call:

```c
// Provided by VK_KHR_acceleration_structure
VkResult vkCopyAccelerationStructureKHR(
    VkDevice device,
    VkDeferredOperationKHR deferredOperation,
    const VkCopyAccelerationStructureInfoKHR* pInfo);
```

- device is the device which owns the acceleration structures.
- deferredOperation is an optional VkDeferredOperationKHR to request deferral for this command.
• pInfo is a pointer to a VkCopyAccelerationStructureInfoKHR structure defining the copy operation.

This command fulfills the same task as vkCmdCopyAccelerationStructureKHR but is executed by the host.

Valid Usage

• VUID-vkCopyAccelerationStructureKHR-accelerationStructureHostCommands-03582
  The VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureHostCommands

• VUID-vkCopyAccelerationStructureKHR-deferredOperation-03677
  If deferredOperation is not VK_NULL_HANDLE, it must be a valid VkDeferredOperationKHR object

• VUID-vkCopyAccelerationStructureKHR-deferredOperation-03678
  Any previous deferred operation that was associated with deferredOperation must be complete

• VUID-vkCopyAccelerationStructureKHR-buffer-03727
  The buffer used to create pInfo->src must be bound to host-visible device memory

• VUID-vkCopyAccelerationStructureKHR-buffer-03728
  The buffer used to create pInfo->dst must be bound to host-visible device memory feature must be enabled

• VUID-vkCopyAccelerationStructureKHR-buffer-03780
  The buffer used to create pInfo->src must be bound to memory that was not allocated with multiple instances

• VUID-vkCopyAccelerationStructureKHR-buffer-03781
  The buffer used to create pInfo->dst must be bound to memory that was not allocated with multiple instances

Valid Usage (Implicit)

• VUID-vkCopyAccelerationStructureKHR-device-parameter
  device must be a valid VkDevice handle

• VUID-vkCopyAccelerationStructureKHR-deferredOperation-parameter
  If deferredOperation is not VK_NULL_HANDLE, deferredOperation must be a valid VkDeferredOperationKHR handle

• VUID-vkCopyAccelerationStructureKHR-pInfo-parameter
  pInfo must be a valid pointer to a valid VkCopyAccelerationStructureInfoKHR structure

• VUID-vkCopyAccelerationStructureKHR-deferredOperation-parent
  If deferredOperation is a valid handle, it must have been created, allocated, or retrieved from device
Return Codes

Success
• VK_SUCCESS
• VK_OPERATION_DEFERRED_KHR
• VK_OPERATION_NOT_DEFERRED_KHR

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

To copy host accessible memory to an acceleration structure, call:

```c
// Provided by VK_KHR_acceleration_structure
VkResult vkCopyMemoryToAccelerationStructureKHR(
    VkDevice device,
    VkDeferredOperationKHR deferredOperation,
    const VkCopyMemoryToAccelerationStructureInfoKHR* pInfo);
```

- `device` is the device which owns `pInfo->dst`.
- `deferredOperation` is an optional `VkDeferredOperationKHR` to request deferral for this command.
- `pInfo` is a pointer to a `VkCopyMemoryToAccelerationStructureInfoKHR` structure defining the copy operation.

This command fulfills the same task as `vkCmdCopyMemoryToAccelerationStructureKHR` but is executed by the host.

This command can accept acceleration structures produced by either `vkCmdCopyAccelerationStructureToMemoryKHR` or `vkCopyAccelerationStructureToMemoryKHR`.

Valid Usage

- VUID-vkCopyMemoryToAccelerationStructureKHR-accelerationStructureHostCommands-03583
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR`::`accelerationStructureHostCommands` feature must be enabled

- VUID-vkCopyMemoryToAccelerationStructureKHR-deferredOperation-03677
  If `deferredOperation` is not `VK_NULL_HANDLE`, it must be a valid `VkDeferredOperationKHR` object

- VUID-vkCopyMemoryToAccelerationStructureKHR-deferredOperation-03678
  Any previous deferred operation that was associated with `deferredOperation` must be complete
Valid Usage (Implicit)

- VUID-vkCopyMemoryToAccelerationStructureKHR-device-parameter
device must be a valid VkDevice handle

- VUID-vkCopyMemoryToAccelerationStructureKHR-deferredOperation-parameter
If deferredOperation is not VK_NULL_HANDLE, deferredOperation must be a valid VkDeferredOperationKHR handle

- VUID-vkCopyMemoryToAccelerationStructureKHR-pInfo-parameter
pInfo must be a valid pointer to a valid VkCopyMemoryToAccelerationStructureInfoKHR structure

- VUID-vkCopyMemoryToAccelerationStructureKHR-deferredOperation-parent
If deferredOperation is a valid handle, it must have been created, allocated, or retrieved from device

Return Codes

Success

- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To copy an acceleration structure to host accessible memory, call:

```c
// Provided by VK_KHR_acceleration_structure
VkResult vkCopyAccelerationStructureToMemoryKHR(  
    VkDevice device,  
    VkDeferredOperationKHR deferredOperation,
);```
```c
const VkCopyAccelerationStructureToMemoryInfoKHR* pInfo);
```

- **device** is the device which owns `pInfo->src`.
- **deferredOperation** is an optional `VkDeferredOperationKHR` to request deferral for this command.
- **pInfo** is a pointer to a `VkCopyAccelerationStructureToMemoryInfoKHR` structure defining the copy operation.

This command fulfills the same task as `vkCmdCopyAccelerationStructureToMemoryKHR` but is executed by the host.

This command produces the same results as `vkCmdCopyAccelerationStructureToMemoryKHR`, but writes its result directly to a host pointer, and is executed on the host rather than the device. The output may not necessarily be bit-for-bit identical, but it can be equally used by either `vkCmdCopyMemoryToAccelerationStructureKHR` or `vkCopyMemoryToAccelerationStructureKHR`.

### Valid Usage

- **VUID-vkCopyAccelerationStructureToMemoryKHR-accelerationStructureHostCommands-03584**
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR`::`accelerationStructureHostCommands` feature must be enabled.

- **VUID-vkCopyAccelerationStructureToMemoryKHR-deferredOperation-03677**
  If `deferredOperation` is not `VK_NULL_HANDLE`, it must be a valid `VkDeferredOperationKHR` object.

- **VUID-vkCopyAccelerationStructureToMemoryKHR-deferredOperation-03678**
  Any previous deferred operation that was associated with `deferredOperation` must be complete.

- **VUID-vkCopyAccelerationStructureToMemoryKHR-buffer-03731**
  The buffer used to create `pInfo->src` must be bound to host-visible device memory.

- **VUID-vkCopyAccelerationStructureToMemoryKHR-pInfo-03732**
  `pInfo->dst.hostAddress` must be a valid host pointer.

- **VUID-vkCopyAccelerationStructureToMemoryKHR-pInfo-03751**
  `pInfo->dst.hostAddress` must be aligned to 16 bytes.

- **VUID-vkCopyAccelerationStructureToMemoryKHR-buffer-03783**
  The buffer used to create `pInfo->src` must be bound to memory that was not allocated with multiple instances.

### Valid Usage (Implicit)

- **VUID-vkCopyAccelerationStructureToMemoryKHR-device-parameter**
  `device` must be a valid `VkDevice` handle.

3091
If `deferredOperation` is not `VK_NULL_HANDLE`, `deferredOperation` must be a valid `VkDeferredOperationKHR` handle.

`pInfo` must be a valid pointer to a valid `VkCopyAccelerationStructureToMemoryInfoKHR` structure.

If `deferredOperation` is a valid handle, it must have been created, allocated, or retrieved from `device`.

**Return Codes**

**Success**
- `VK_SUCCESS`
- `VK_OPERATION_DEFERRED_KHR`
- `VK_OPERATION_NOT_DEFERRED_KHR`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

To query acceleration structure size parameters on the host, call:

```c
// Provided by VK_KHR_acceleration_structure
VkResult vkWriteAccelerationStructuresPropertiesKHR(
    VkDevice device,
    uint32_t accelerationStructureCount,
    const VkAccelerationStructureKHR* pAccelerationStructures,
    VkQueryType queryType,
    size_t dataSize,
    void* pData,
    size_t stride);
```

- `device` is the device which owns the acceleration structures in `pAccelerationStructures`.
- `accelerationStructureCount` is the count of acceleration structures for which to query the property.
- `pAccelerationStructures` is a pointer to an array of existing previously built acceleration structures.
- `queryType` is a `VkQueryType` value specifying the property to be queried.
- `dataSize` is the size in bytes of the buffer pointed to by `pData`.
- `pData` is a pointer to a user-allocated buffer where the results will be written.
- `stride` is the stride in bytes between results for individual queries within `pData`.

3092
This command fulfills the same task as \texttt{vkCmdWriteAccelerationStructuresPropertiesKHR} but is executed by the host.

### Valid Usage

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-accelerationStructureHostCommands-03585**
  The \texttt{VkPhysicalDeviceAccelerationStructureFeaturesKHR} ::\texttt{accelerationStructureHostCommands} feature must be enabled.

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-pAccelerationStructures-04964**
  All acceleration structures in \texttt{pAccelerationStructures} must have been built prior to the execution of this command.

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-accelerationStructures-03431**
  All acceleration structures in \texttt{pAccelerationStructures} must have been built with \texttt{VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR} if \texttt{queryType} is \texttt{VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR}.

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-03448**
  If \texttt{queryType} is \texttt{VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR}, then \texttt{stride} must be a multiple of the size of \texttt{VkDeviceSize}.

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-03449**
  If \texttt{queryType} is \texttt{VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR}, then \texttt{pData} must point to a \texttt{VkDeviceSize}.

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-03450**
  If \texttt{queryType} is \texttt{VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR}, then \texttt{stride} must be a multiple of the size of \texttt{VkDeviceSize}.

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-03451**
  If \texttt{queryType} is \texttt{VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR}, then \texttt{pData} must point to a \texttt{VkDeviceSize}.

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-06731**
  If \texttt{queryType} is \texttt{VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR}, then \texttt{stride} must be a multiple of the size of \texttt{VkDeviceSize}.

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-06732**
  If \texttt{queryType} is \texttt{VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR}, then \texttt{pData} must point to a \texttt{VkDeviceSize}.

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-06733**
  If \texttt{queryType} is \texttt{VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR}, then \texttt{stride} must be a multiple of the size of \texttt{VkDeviceSize}.
If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR`, then `pData` must point to a `VkDeviceSize`

`dataSize` must be greater than or equal to `accelerationStructureCount * stride`

The buffer used to create each acceleration structure in `pAccelerationStructures` must be bound to host-visible device memory

The buffer used to create each acceleration structure in `pAccelerationStructures` must be bound to memory that was not allocated with multiple instances

### Valid Usage (Implicit)

- `device` must be a valid `VkDevice` handle
- `pAccelerationStructures` must be a valid pointer to an array of `accelerationStructureCount` valid `VkAccelerationStructureKHR` handles
- `queryType` must be a valid `VkQueryType` value
- `pData` must be a valid pointer to an array of `dataSize` bytes
- `accelerationStructureCount` must be greater than 0
- `dataSize` must be greater than 0
- Each element of `pAccelerationStructures` must have been created, allocated, or retrieved from `device`

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
Chapter 38. Micromap

38.1. Micromaps

Acceleration structures store and organize geometry for ray tracing, but in some cases it is beneficial to include some information within the geometry, particularly for triangles. A micromap organizes this data around a map of values corresponding to subdivided microtriangles which can be added to a triangle geometry when building a bottom level acceleration structure.

An opacity micromap is a type of micromap which stores information to control intersection opacity as described in Ray Opacity Micromap.

A displacement micromap is a type of micromap which stores information to displace sub-triangle vertices as described in Displacement Micromap.

A micromap is considered to be constructed if a micromap build command or copy command has been executed with the given acceleration structure as the destination.

38.1.1. Building Micromaps

To build micromaps call:

```
// Provided by VK_EXT_opacity_micromap
void vkCmdBuildMicromapsEXT(
    VkCommandBuffer commandBuffer,
    uint32_t infoCount,
    const VkMicromapBuildInfoEXT* pInfos);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `infoCount` is the number of micromaps to build. It specifies the number of the `pInfos` structures that must be provided.
- `pInfos` is a pointer to an array of `infoCount` `VkMicromapBuildInfoEXT` structures defining the data used to build each micromap.

The `vkCmdBuildMicromapsEXT` command provides the ability to initiate multiple micromaps builds, however there is no ordering or synchronization implied between any of the individual micromap builds.

**Note**

This means that there cannot be any memory aliasing between any micromap memories or scratch memories being used by any of the builds.

Accesses to the micromap scratch buffers as identified by the `VkMicromapBuildInfoEXT::scratchData` buffer device addresses must be synchronized with the `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` pipeline stage and an access type of `(VK_ACCESS_2_MICROMAP_READ_BIT_EXT | VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT)`. Accesses to
VkMicromapBuildInfoEXT::dstMicromap must be synchronized with the VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT pipeline stage and an access type of VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT.

Accesses to other input buffers as identified by any used values of VkMicromapBuildInfoEXT::data or VkMicromapBuildInfoEXT::triangleArray must be synchronized with the VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT pipeline stage and an access type of VK_ACCESS_SHADER_READ_BIT.

Valid Usage

• VUID-vkCmdBuild MicromapsEXT-pInfos-07461
  For each pInfos[i], dstMicromap must have been created with a value of VkMicromapCreateInfoEXT::size greater than or equal to the memory size required by the build operation, as returned by vkGetMicromapBuildSizesEXT with pBuildInfo = pInfos[i]

• VUID-vkCmdBuild MicromapsEXT-mode-07462
  The mode member of each element of pInfos must be a valid VkBuildMicromapModeEXT value

• VUID-vkCmdBuild MicromapsEXT-dstMicromap-07463
  The dstMicromap member of any element of pInfos must be a valid VkMicromapEXT handle

• VUID-vkCmdBuild MicromapsEXT-pInfos-07464
  For each element of pInfos its type member must match the value of VkMicromapCreateInfoEXT::type when its dstMicromap was created

• VUID-vkCmdBuild MicromapsEXT-dstMicromap-07465
  The range of memory backing the dstMicromap member of any element of pInfos that is accessed by this command must not overlap the memory backing the dstMicromap member of any other element of pInfos, which is accessed by this command

• VUID-vkCmdBuild MicromapsEXT-dstMicromap-07466
  The range of memory backing the dstMicromap member of any element of pInfos that is accessed by this command must not overlap the memory backing the scratchData member of any element of pInfos (including the same element), which is accessed by this command

• VUID-vkCmdBuild MicromapsEXT-scratchData-07467
  The range of memory backing the scratchData member of any element of pInfos that is accessed by this command must not overlap the memory backing the scratchData member of any other element of pInfos, which is accessed by this command

• VUID-vkCmdBuild MicromapsEXT-pInfos-07508
  For each element of pInfos, the buffer used to create its dstMicromap member must be bound to device memory

• VUID-vkCmdBuild MicromapsEXT-pInfos-07509
  If pInfos[i].mode is VK_BUILD_MICROMAP_MODE_BUILD_EXT, all addresses between pInfos[i].scratchData.deviceAddress and pInfos[i].scratchData.deviceAddress + N - 1 must be in
the buffer device address range of the same buffer, where \( N \) is given by the `buildScratchSize` member of the `VkMicromapBuildSizesInfoEXT` structure returned from a call to `vkGetMicromapBuildSizesEXT` with an identical `VkMicromapBuildInfoEXT` structure and primitive count.

- **VUID-vkCmdBuildMicromapsEXT-data-07510**
  The buffers from which the buffer device addresses for all of the data and `triangleArray` members of all `pInfos[i]` are queried must have been created with the `VK_BUFFER_USAGE_MICROMAP_BUILD_INPUT_READ_ONLY_BIT_EXT` usage flag.

- **VUID-vkCmdBuildMicromapsEXT-pInfos-07511**
  For each element of `pInfos[i]` the buffer from which the buffer device address `pInfos[i].scratchData.deviceAddress` is queried must have been created with `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT` usage flag.

- **VUID-vkCmdBuildMicromapsEXT-pInfos-07512**
  For each element of `pInfos`, its `scratchData.deviceAddress`, `data.deviceAddress`, and `triangleArray.deviceAddress` members must be valid device addresses obtained from `vkGetBufferDeviceAddress`.

- **VUID-vkCmdBuildMicromapsEXT-pInfos-07513**
  For each element of `pInfos`, if `scratchData.deviceAddress`, `data.deviceAddress`, or `triangleArray.deviceAddress` is the address of a non-sparse buffer then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdBuildMicromapsEXT-pInfos-07514**
  For each element of `pInfos`, its `scratchData.deviceAddress` member must be a multiple of `VkPhysicalDeviceAccelerationStructurePropertiesKHR::minAccelerationStructureScratchOffsetAlignment`.

- **VUID-vkCmdBuildMicromapsEXT-pInfos-07515**
  For each element of `pInfos`, its `triangleArray.deviceAddress` and `data.deviceAddress` members must be a multiple of `256`.

---

**Valid Usage (Implicit)**

- **VUID-vkCmdBuildMicromapsEXT-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdBuildMicromapsEXT-pInfos-parameter**
  `pInfos` must be a valid pointer to an array of `infoCount` valid `VkMicromapBuildInfoEXT` structures.

- **VUID-vkCmdBuildMicromapsEXT-commandBuffer-recording**
  `commandBuffer` must be in the recording state.

- **VUID-vkCmdBuildMicromapsEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support compute operations.

- **VUID-vkCmdBuildMicromapsEXT-renderpass**
  This command must only be called outside of a render pass instance.
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Compute</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Formats which can be set in `VkMicromapUsageEXT::format` and `VkMicromapTriangleEXT::format` for micromap builds, are:

```c
// Provided by VK_EXT_opacity_micromap
typedef enum VkOpacityMicromapFormatEXT {
    VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT = 1,
    VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT = 2,
} VkOpacityMicromapFormatEXT;
```

- `VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT` indicates that the given micromap format has one bit per subtriangle encoding either fully opaque or fully transparent.
- `VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT` indicates that the given micromap format has two bits per subtriangle encoding four modes which can be interpreted as described in ray traversal.

Note

For compactness, these values are stored as 16-bit in some structures.

Formats which can be set in `VkMicromapUsageEXT::format` and `VkMicromapTriangleEXT::format` for micromap builds, are:

```c
// Provided by VK_NV_displacement_micromap
typedef enum VkDisplacementMicromapFormatNV {
    VK_DISPLACEMENT_MICROMAP_FORMAT_64_TRIANGLES_64_BYTES_NV = 1,
    VK_DISPLACEMENT_MICROMAP_FORMAT_256_TRIANGLES_128_BYTES_NV = 2,
```

\*\* \* VK_DISPLACEMENT_MICROMAP_FORMAT_1024_TRIANGLES_128_BYTES_NV = 3, \* \*

- **VK_DISPLACEMENT_MICROMAP_FORMAT_64_TRIANGLES_64_BYTES_NV** indicates that the given micromap format encodes 64 micro-triangles worth of displacements in 64 bytes as described in Displacement Micromap Encoding.

- **VK_DISPLACEMENT_MICROMAP_FORMAT_256_TRIANGLES_128_BYTES_NV** indicates that the given micromap format encodes 256 micro-triangles worth of displacements in 128 bytes as described in Displacement Micromap Encoding.

- **VK_DISPLACEMENT_MICROMAP_FORMAT_1024_TRIANGLES_128_BYTES_NV** indicates that the given micromap format encodes 1024 micro-triangles worth of displacements in 128 bytes as described in Displacement Micromap Encoding.

\begin{itemize}
  \item For compactness, these values are stored as 16-bit in some structures.
\end{itemize}

The **VkMicromapBuildInfoEXT** structure is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkMicromapBuildInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkMicromapTypeEXT type;
    VkBuildMicromapFlagsEXT flags;
    VkBuildMicromapModeEXT mode;
    VkMicromapEXT dstMicromap;
    uint32_t usageCountsCount;
    const VkMicromapUsageEXT* pUsageCounts;
    const VkMicromapUsageEXT* const* ppUsageCounts;
    VkDeviceOrHostAddressConstKHR data;
    VkDeviceOrHostAddressKHR scratchData;
    VkDeviceOrHostAddressConstKHR triangleArray;
    VkDeviceSize triangleArrayStride;
} VkMicromapBuildInfoEXT;
```

\begin{itemize}
  \item **sType** is a **VkStructureType** value identifying this structure.
  \item **pNext** is **NULL** or a pointer to a structure extending this structure.
  \item **type** is a **VkMicromapTypeEXT** value specifying the type of micromap being built.
  \item **flags** is a bitmask of **VkBuildMicromapFlagBitsEXT** specifying additional parameters of the micromap.
  \item **mode** is a **VkBuildMicromapModeEXT** value specifying the type of operation to perform.
  \item **dstMicromap** is a pointer to the target micromap for the build.
  \item **usageCountsCount** specifies the number of usage counts structures that will be used to determine the size of this micromap.
\end{itemize}
• **pUsageCounts** is a pointer to an array of `VkMicromapUsageEXT` structures.
• **ppUsageCounts** is a pointer to an array of pointers to `VkMicromapUsageEXT` structures.
• **data** is the device or host address to memory which contains the data for the micromap.
• **scratchData** is the device or host address to memory that will be used as scratch memory for the build.
• **triangleArray** is the device or host address to memory containing the `VkMicromapTriangleEXT` data
• **triangleArrayStride** is the stride in bytes between each element of `triangleArray`

Only one of **pUsageCounts** or **ppUsageCounts** can be a valid pointer, the other must be **NULL**. The elements of the non-NULL array describe the total counts used to build each micromap. Each element contains a **count** which is the number of micromap triangles of that **format** and **subdivisionLevel** contained in the micromap. Multiple elements with the same **format** and **subdivisionLevel** are allowed and the total count for that **format** and **subdivisionLevel** is the sum of the **count** for each element.

Each micromap triangle refers to one element in `triangleArray` which contains the **format** and **subdivisionLevel** for that particular triangle as well as a **dataOffset** in bytes which is the location relative to `data` where that triangle’s micromap data begins. The data at `triangleArray` is laid out as a 4 byte unsigned integer for the **dataOffset** followed by a 2 byte unsigned integer for the subdivision level then a 2 byte unsigned integer for the format. In practice, compilers compile `VkMicromapTriangleEXT` to match this pattern.

For opacity micromaps, the data at `data` is packed as either one bit per element for `VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT` or two bits per element for `VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT` and is packed from LSB to MSB in each byte. The data at each index in those bytes is interpreted as discussed in [Ray Opacity Micromap](#).

For displacement micromaps, the data at `data` is interpreted as discussed in [Displacement Micromap Encoding](#).

---

### Valid Usage

- VUID-VkMicromapBuildInfoEXT-pUsageCounts-07516
  
  Only one of **pUsageCounts** or **ppUsageCounts** can be a valid pointer, the other must be **NULL**

- VUID-VkMicromapBuildInfoEXT-type-07517
  
  If **type** is **VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT** the **format** member of `VkMicromapUsageEXT` must be a valid value from `VkOpacityMicromapFormatEXT`

- VUID-VkMicromapBuildInfoEXT-type-07518
  
  If **type** is **VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT** the **format** member of `VkMicromapTriangleEXT` must be a valid value from `VkOpacityMicromapFormatEXT`

- VUID-VkMicromapBuildInfoEXT-type-08704
  
  If **type** is **VK_MICROMAP_TYPE_DISPLACEMENT_MICROMAP_NV** the **format** member of `VkMicromapUsageEXT` must be a valid value from `VkDisplacementMicromapFormatNV`

- VUID-VkMicromapBuildInfoEXT-type-08705
If `type` is `VK_MICROMAP_TYPE_DISPLACEMENT_MICROMAP_NV` the `format` member of `VkMicromapTriangleEXT` must be a valid value from `VkDisplacementMicromapFormatNV`.

### Valid Usage (Implicit)

- **VUID-VkMicromapBuildInfoEXT-sType-sType**
  * `sType` must be `VK_STRUCTURE_TYPE_MICROMAP_BUILD_INFO_EXT`

- **VUID-VkMicromapBuildInfoEXT-pNext-pNext**
  * `pNext` must be `NULL`

- **VUID-VkMicromapBuildInfoEXT-type-parameter**
  * `type` must be a valid `VkMicromapTypeEXT` value

- **VUID-VkMicromapBuildInfoEXT-flags-parameter**
  * `flags` must be a valid combination of `VkBuildMicromapFlagBitsEXT` values

- **VUID-VkMicromapBuildInfoEXT-pUsageCounts-parameter**
  * If `usageCountsCount` is not 0, and `pUsageCounts` is not NULL, `pUsageCounts` must be a valid pointer to an array of `usageCountsCount` `VkMicromapUsageEXT` structures

- **VUID-VkMicromapBuildInfoEXT-ppUsageCounts-parameter**
  * If `usageCountsCount` is not 0, and `ppUsageCounts` is not NULL, `ppUsageCounts` must be a valid pointer to an array of `usageCountsCount` valid pointers to `VkMicromapUsageEXT` structures

The `VkBuildMicromapModeEXT` enumeration is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef enum VkBuildMicromapModeEXT {
  VK_BUILD_MICROMAP_MODE_BUILD_EXT = 0,
} VkBuildMicromapModeEXT;
```

- `VK_BUILD_MICROMAP_MODE_BUILD_EXT` specifies that the destination micromap will be built using the specified data.

The `VkMicromapUsageEXT` structure is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkMicromapUsageEXT {
  uint32_t count;
  uint32_t subdivisionLevel;
  uint32_t format;
} VkMicromapUsageEXT;
```

- `count` is the number of triangles in the usage format defined by the `subdivisionLevel` and `format` below in the micromap
- `subdivisionLevel` is the subdivision level of this usage format
Valid Usage

- **VUID-VkMicromapUsageEXT-format-07519**
  If the `VkMicromapTypeEXT` of the micromap is `VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT` then `format` must be `VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT` or `VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT`

- **VUID-VkMicromapUsageEXT-format-07520**
  If the `VkMicromapTypeEXT` of the micromap is `VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT` and `format` is `VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT` then `subdivisionLevel` must be less than or equal to `VkPhysicalDeviceOpacityMicromapPropertiesEXT::maxOpacity2StateSubdivisionLevel`

- **VUID-VkMicromapUsageEXT-format-07521**
  If the `VkMicromapTypeEXT` of the micromap is `VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT` and `format` is `VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT` then `subdivisionLevel` must be less than or equal to `VkPhysicalDeviceOpacityMicromapPropertiesEXT::maxOpacity4StateSubdivisionLevel`

- **VUID-VkMicromapUsageEXT-format-08706**
  If the `VkMicromapTypeEXT` of the micromap is `VK_MICROMAP_TYPE_DISPLACEMENT_MICROMAP_NV` then `format` must be `VK_DISPLACEMENT_MICROMAP_FORMAT_64_TRIANGLES_64_BYTES_NV`, `VK_DISPLACEMENT_MICROMAP_FORMAT_256_TRIANGLES_128_BYTES_NV` or `VK_DISPLACEMENT_MICROMAP_FORMAT_1024_TRIANGLES_128_BYTES_NV`

- **VUID-VkMicromapUsageEXT-subdivisionLevel-08707**
  If the `VkMicromapTypeEXT` of the micromap is `VK_MICROMAP_TYPE_DISPLACEMENT_MICROMAP_NV` then `subdivisionLevel` must be less than or equal to `VkPhysicalDeviceDisplacementMicromapPropertiesNV::maxDisplacementMicromapSubdivisionLevel`

The `format` is interpreted based on the `type` of the micromap using it.

The `VkMicromapTriangleEXT` structure is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkMicromapTriangleEXT {
    uint32_t dataOffset;
    uint16_t subdivisionLevel;
    uint16_t format;
} VkMicromapTriangleEXT;
```

- `dataOffset` is the offset in bytes of the start of the data for this triangle. This is a byte aligned value.
- `subdivisionLevel` is the subdivision level of this triangle
Valid Usage

- VUID-VkMicromapTriangleEXT-format-07522
  If the `VkMicromapTypeEXT` of the micromap is `VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT` then `format` must be `VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT` or `VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT`.

- VUID-VkMicromapTriangleEXT-format-07523
  If the `VkMicromapTypeEXT` of the micromap is `VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT` and `format` is `VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT` then `subdivisionLevel` must be less than or equal to `VkPhysicalDeviceOpacityMicromapPropertiesEXT::maxOpacity2StateSubdivisionLevel`.

- VUID-VkMicromapTriangleEXT-format-07524
  If the `VkMicromapTypeEXT` of the micromap is `VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT` and `format` is `VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT` then `subdivisionLevel` must be less than or equal to `VkPhysicalDeviceOpacityMicromapPropertiesEXT::maxOpacity4StateSubdivisionLevel`.

- VUID-VkMicromapTriangleEXT-format-08708
  If the `VkMicromapTypeEXT` of the micromap is `VK_MICROMAP_TYPE_DISPLACEMENT_MICROMAP_NV` then `format` must be `VK_DISPLACEMENT_MICROMAP_FORMAT_64_TRIANGLES_64_BYTES_NV`, `VK_DISPLACEMENT_MICROMAP_FORMAT_256_TRIANGLES_128_BYTES_NV` or `VK_DISPLACEMENT_MICROMAP_FORMAT_1024_TRIANGLES_128_BYTES_NV`.

- VUID-VkMicromapTriangleEXT-subdivisionLevel-08709
  If the `VkMicromapTypeEXT` of the micromap is `VK_MICROMAP_TYPE_DISPLACEMENT_MICROMAP_NV` then `subdivisionLevel` must be less than or equal to `VkPhysicalDeviceDisplacementMicromapPropertiesNV::maxDisplacementMicromapSubdivisionLevel`.

The `format` is interpreted based on the `type` of the micromap using it.

38.1.2. Copying Micromaps

An additional command exists for copying micromaps without updating their contents. Before copying, an application must query the size of the resulting micromap.

To query micromap size parameters call:

```c
// Provided by VK_EXT_opacity_micromap
void vkCmdWriteMicromapsPropertiesEXT(
    VkCommandBuffer commandBuffer,    
    uint32_t micromapCount,           
    const VkMicromapEXT* pmicromaps,  
    VkQueryType queryType,            
    VkQueryPool queryPool,            
)
```
uint32_t firstQuery);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `micromapCount` is the count of micromaps for which to query the property.
- `pMicromaps` is a pointer to an array of existing previously built micromaps.
- `queryType` is a `VkQueryType` value specifying the type of queries managed by the pool.
- `queryPool` is the query pool that will manage the results of the query.
- `firstQuery` is the first query index within the query pool that will contain the `micromapCount` number of results.

Accesses to any of the micromaps listed in `pMicromaps` must be synchronized with the `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` pipeline stage and an access type of `VK_ACCESS_2_MICROMAP_READ_BIT_EXT`.

- If `queryType` is `VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT`, then the value written out is the number of bytes required by a serialized micromap.
- If `queryType` is `VK_QUERY_TYPE_MICROMAP_COMPACTED_SIZE_EXT`, then the value written out is the number of bytes required by a compacted micromap.

## Valid Usage

- **VUID-vkCmdWriteMicromapsPropertiesEXT-queryPool-07525**
  - `queryPool` must have been created with a `queryType` matching `queryType`.

- **VUID-vkCmdWriteMicromapsPropertiesEXT-queryPool-07526**
  - The queries identified by `queryPool` and `firstQuery` must be unavailable.

- **VUID-vkCmdWriteMicromapsPropertiesEXT-buffer-07527**
  - The buffer used to create each micromap in `pMicromaps` must be bound to device memory.

- **VUID-vkCmdWriteMicromapsPropertiesEXT-query-07528**
  - The sum of `query` plus `micromapCount` must be less than or equal to the number of queries in `queryPool`.

- **VUID-vkCmdWriteMicromapsPropertiesEXT-pMicromaps-07501**
  - All micromaps in `pMicromaps` must have been constructed prior to the execution of this command.

- **VUID-vkCmdWriteMicromapsPropertiesEXT-pMicromaps-07502**
  - All micromaps in `pMicromaps` must have been constructed with `VK_BUILD_MICROMAP_ALLOW_COMPACTION_BIT_EXT` if `queryType` is `VK_QUERY_TYPE_MICROMAP_COMPACTED_SIZE_EXT`.

- **VUID-vkCmdWriteMicromapsPropertiesEXT-queryType-07503**
  - `queryType` must be `VK_QUERY_TYPE_MICROMAP_COMPACTED_SIZE_EXT` or `VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT`. 
Valid Usage (Implicit)

- VUID-vkCmdWriteMicromapsPropertiesEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdWriteMicromapsPropertiesEXT-pMicromaps-parameter
  `pMicromaps` must be a valid pointer to an array of `micromapCount` valid `VkMicromapEXT` handles

- VUID-vkCmdWriteMicromapsPropertiesEXT-queryType-parameter
  `queryType` must be a valid `VkQueryType` value

- VUID-vkCmdWriteMicromapsPropertiesEXT-queryPool-parameter
  `queryPool` must be a valid `VkQueryPool` handle

- VUID-vkCmdWriteMicromapsPropertiesEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdWriteMicromapsPropertiesEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support compute operations

- VUID-vkCmdWriteMicromapsPropertiesEXT-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdWriteMicromapsPropertiesEXT-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdWriteMicromapsPropertiesEXT-micromapCount-arraylength
  `micromapCount` must be greater than 0

- VUID-vkCmdWriteMicromapsPropertiesEXT-commonparent
  Each of `commandBuffer`, `queryPool`, and the elements of `pMicromaps` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>

<td></td>
<td></td>
</tr>
</tbody>
</table>

To copy a micromap call:
// Provided by VK_EXT_opacity_micromap
void vkCmdCopyMicromapEXT(
    VkCommandBuffer commandBuffer,
    const VkCopyMicromapInfoEXT* pInfo);

• commandBuffer is the command buffer into which the command will be recorded.
• pInfo is a pointer to a VkCopyMicromapInfoEXT structure defining the copy operation.

This command copies the pInfo->src micromap to the pInfo->dst micromap in the manner specified by pInfo->mode.

Accesses to pInfo->src and pInfo->dst must be synchronized with the
VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT pipeline stage and an access type of
VK_ACCESS_2_MICROMAP_READ_BIT_EXT or VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT as appropriate.

Valid Usage

• VUID-vkCmdCopyMicromapEXT-buffer-07529
  The buffer used to create pInfo->src must be bound to device memory

• VUID-vkCmdCopyMicromapEXT-buffer-07530
  The buffer used to create pInfo->dst must be bound to device memory

Valid Usage (Implicit)

• VUID-vkCmdCopyMicromapEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdCopyMicromapEXT-pInfo-parameter
  pInfo must be a valid pointer to a valid VkCopyMicromapInfoEXT structure

• VUID-vkCmdCopyMicromapEXT-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdCopyMicromapEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

• VUID-vkCmdCopyMicromapEXT-renderpass
  This command must only be called outside of a render pass instance

• VUID-vkCmdCopyMicromapEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

• Host access to commandBuffer must be externally synchronized
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally
The `VkCopyMicromapInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkCopyMicromapInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkMicromapEXT src;
    VkMicromapEXT dst;
    VkCopyMicromapModeEXT mode;
} VkCopyMicromapInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `src` is the source micromap for the copy.
- `dst` is the target micromap for the copy.
- `mode` is a `VkCopyMicromapModeEXT` value specifying additional operations to perform during the copy.

### Valid Usage

- VUID-VkCopyMicromapInfoEXT-mode-07531
  mode must be `VK_COPY_MICROMAP_MODE_COMPACT_EXT` or `VK_COPY_MICROMAP_MODE_CLONE_EXT`

- VUID-VkCopyMicromapInfoEXT-src-07532
  The source acceleration structure `src` must have been constructed prior to the execution of this command.

- VUID-VkCopyMicromapInfoEXT-mode-07533
  If `mode` is `VK_COPY_MICROMAP_MODE_COMPACT_EXT`, `src` must have been constructed with `VK_BUILD_MICROMAP_ALLOW_COMPACTION_BIT_EXT` in the build.

- VUID-VkCopyMicromapInfoEXT-buffer-07534
  The `buffer` used to create `src` must be bound to device memory.

- VUID-VkCopyMicromapInfoEXT-buffer-07535
  The `buffer` used to create `dst` must be bound to device memory.
Valid Usage (Implicit)

- **VUID-VkCopyMicromapInfoEXT-sType**: `sType` must be `VK_STRUCTURE_TYPE_COPY_MICROMAP_INFO_EXT`
- **VUID-VkCopyMicromapInfoEXT-pNext**: `pNext` must be `NULL`
- **VUID-VkCopyMicromapInfoEXT-src-parameter**: `src` must be a valid `VkMicromapEXT` handle
- **VUID-VkCopyMicromapInfoEXT-dst-parameter**: `dst` must be a valid `VkMicromapEXT` handle
- **VUID-VkCopyMicromapInfoEXT-mode-parameter**: `mode` must be a valid `VkCopyMicromapModeEXT` value
- **VUID-VkCopyMicromapInfoEXT-commonparent**: Both of `dst` and `src` must have been created, allocated, or retrieved from the same `VkDevice`

Possible values of `mode` specifying additional operations to perform during the copy, are:

```c
// Provided by VK_EXT_opacity_micromap
typedef enum VkCopyMicromapModeEXT {
    VK_COPY_MICROMAP_MODE_CLONE_EXT = 0,
    VK_COPY_MICROMAP_MODE_SERIALIZE_EXT = 1,
    VK_COPY_MICROMAP_MODE_DESERIALIZE_EXT = 2,
    VK_COPY_MICROMAP_MODE_COMPACT_EXT = 3,
} VkCopyMicromapModeEXT;
```

- **VK_COPY_MICROMAP_MODE_CLONE_EXT** creates a direct copy of the micromap specified in `src` into the one specified by `dst`. The `dst` micromap must have been created with the same parameters as `src`.
- **VK_COPY_MICROMAP_MODE_SERIALIZE_EXT** serializes the micromap to a semi-opaque format which can be reloaded on a compatible implementation.
- **VK_COPY_MICROMAP_MODE_DESERIALIZE_EXT** deserializes the semi-opaque serialization format in the buffer to the micromap.
- **VK_COPY_MICROMAP_MODE_COMPACT_EXT** creates a more compact version of a micromap `src` into `dst`. The micromap `dst` must have been created with a size at least as large as that returned by `vkCmdWriteMicromapsPropertiesEXT` after the build of the micromap specified by `src`.

To copy a micromap to device memory call:

```c
// Provided by VK_EXT_opacity_micromap
void vkCmdCopyMicromapToMemoryEXT(
    VkCommandBuffer commandBuffer,
```

3108
const VkCopyMicromapToMemoryInfoEXT* pInfo);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pInfo` is an a pointer to a `VkCopyMicromapToMemoryInfoEXT` structure defining the copy operation.

Accesses to `pInfo->src` must be synchronized with the `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` pipeline stage and an access type of `VK_ACCESS_2_MICROMAP_READ_BIT_EXT`. Accesses to the buffer indicated by `pInfo->dst.deviceAddress` must be synchronized with the `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` pipeline stage and an access type of `VK_ACCESS_TRANSFER_WRITE_BIT`.

This command produces the same results as `vkCopyMicromapToMemoryEXT`, but writes its result to a device address, and is executed on the device rather than the host. The output may not necessarily be bit-for-bit identical, but it can be equally used by either `vkCmdCopyMemoryToMicromapEXT` or `vkCopyMemoryToMicromapEXT`.

The defined header structure for the serialized data consists of:

- `VK_UUID_SIZE` bytes of data matching `VkPhysicalDeviceIDProperties::driverUUID`
- `VK_UUID_SIZE` bytes of data identifying the compatibility for comparison using `vkGetDeviceMicromapCompatibilityEXT` The serialized data is written to the buffer (or read from the buffer) according to the host endianness.

### Valid Usage

- VUID-vkCmdCopyMicromapToMemoryEXT-pInfo-07536
  `pInfo->dst.deviceAddress` must be a valid device address for a buffer bound to device memory
- VUID-vkCmdCopyMicromapToMemoryEXT-pInfo-07537
  `pInfo->dst.deviceAddress` must be aligned to 256 bytes
- VUID-vkCmdCopyMicromapToMemoryEXT-pInfo-07538
  If the buffer pointed to by `pInfo->dst.deviceAddress` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-vkCmdCopyMicromapToMemoryEXT-buffer-07539
  The buffer used to create `pInfo->src` must be bound to device memory

### Valid Usage (Implicit)

- VUID-vkCmdCopyMicromapToMemoryEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdCopyMicromapToMemoryEXT-pInfo-parameter
  `pInfo` must be a valid pointer to a valid `VkCopyMicromapToMemoryInfoEXT` structure
- VUID-vkCmdCopyMicromapToMemoryEXT-commandBuffer-recording
The commandBuffer must be in the recording state

- VUID-vkCmdCopyMicromapToMemoryEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations
- VUID-vkCmdCopyMicromapToMemoryEXT-renderpass
  This command must only be called outside of a render pass instance
- VUID-vkCmdCopyMicromapToMemoryEXT-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>

// Provided by VK_EXT_opacity_micromap
typedef struct VkCopyMicromapToMemoryInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkMicromapEXT src;
    VkDeviceOrHostAddressKHR dst;
    VkCopyMicromapModeEXT mode;
} VkCopyMicromapToMemoryInfoEXT;

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- src is the source micromap for the copy
- dst is the device or host address to memory which is the target for the copy
- mode is a VkCopyMicromapModeEXT value specifying additional operations to perform during the copy.
Valid Usage

• VUID-VkCopyMicromapToMemoryInfoEXT-src-07540
  The source micromap \textit{src} must have been constructed prior to the execution of this command.

• VUID-VkCopyMicromapToMemoryInfoEXT-dst-07541
  The memory pointed to by \textit{dst} must be at least as large as the serialization size of \textit{src}, as reported by \texttt{vkWriteMicromapsPropertiesEXT} or \texttt{vkCmdWriteMicromapsPropertiesEXT} with a query type of \texttt{VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT}

• VUID-VkCopyMicromapToMemoryInfoEXT-mode-07542
  \textit{mode} must be \texttt{VK_COPY_MICROMAP_MODE_SERIALIZE_EXT}

Valid Usage (Implicit)

• VUID-VkCopyMicromapToMemoryInfoEXT-sType-sType
  \textit{sType} must be \texttt{VK_STRUCTURE_TYPE_COPY_MICROMAP_TO_MEMORY_INFO_EXT}

• VUID-VkCopyMicromapToMemoryInfoEXT-pNext-pNext
  \textit{pNext} must be \texttt{NULL}

• VUID-VkCopyMicromapToMemoryInfoEXT-src-parameter
  \textit{src} must be a valid \texttt{VkMicromapEXT} handle

• VUID-VkCopyMicromapToMemoryInfoEXT-mode-parameter
  \textit{mode} must be a valid \texttt{VkCopyMicromapModeEXT} value

To copy device memory to a micromap call:

```c
// Provided by VK_EXT_opacity_micromap
void vkCmdCopyMemoryToMicromapEXT(
  VkCommandBuffer commandBuffer,
  const VkCopyMicromapToMemoryInfoEXT* pInfo);
```

- \texttt{commandBuffer} is the command buffer into which the command will be recorded.
- \texttt{pInfo} is a pointer to a \texttt{VkCopyMicromapToMemoryInfoEXT} structure defining the copy operation.

Accesses to \texttt{pInfo->dst} must be synchronized with the \texttt{VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT} pipeline stage and an access type of \texttt{VK_ACCESS_2_MICROMAP_READ_BIT_EXT}. Accesses to the buffer indicated by \texttt{pInfo->src.deviceAddress} must be synchronized with the \texttt{VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT} pipeline stage and an access type of \texttt{VK_ACCESS_TRANSFER_READ_BIT}.

This command can accept micromaps produced by either \texttt{vkCmdCopyMicromapToMemoryEXT} or \texttt{vkCopyMicromapToMemoryEXT}. 

Valid Usage

- VUID-vkCmdCopyMemoryToMicromapEXT-pInfo-07543
  pInfo->src.deviceAddress must be a valid device address for a buffer bound to device memory
- VUID-vkCmdCopyMemoryToMicromapEXT-pInfo-07544
  pInfo->src.deviceAddress must be aligned to 256 bytes
- VUID-vkCmdCopyMemoryToMicromapEXT-pInfo-07545
  If the buffer pointed to by pInfo->src.deviceAddress is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object
- VUID-vkCmdCopyMemoryToMicromapEXT-buffer-07546
  The buffer used to create pInfo->dst must be bound to device memory

Valid Usage (Implicit)

- VUID-vkCmdCopyMemoryToMicromapEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdCopyMemoryToMicromapEXT-pInfo-parameter
  pInfo must be a valid pointer to a valid VkCopyMemoryToMicromapInfoEXT structure
- VUID-vkCmdCopyMemoryToMicromapEXT-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdCopyMemoryToMicromapEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations
- VUID-vkCmdCopyMemoryToMicromapEXT-renderpass
  This command must only be called outside of a render pass instance
- VUID-vkCmdCopyMemoryToMicromapEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
The `VkCopyMemoryToMicromapInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkCopyMemoryToMicromapInfoEXT {
VkStructureType                   sType;
const void*                       pNext;
VkDeviceOrHostAddressConstKHR    src;
VkMicromapEXT                     dst;
VkCopyMicromapModeEXT             mode;
} VkCopyMemoryToMicromapInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `src` is the device or host address to memory containing the source data for the copy.
- `dst` is the target micromap for the copy.
- `mode` is a `VkCopyMicromapModeEXT` value specifying additional operations to perform during the copy.

**Valid Usage**

- `VUID-VkCopyMemoryToMicromapInfoEXT-src-07547` The source memory pointed to by `src` must contain data previously serialized using `vkCmdCopyMicromapToMemoryEXT`
- `VUID-VkCopyMemoryToMicromapInfoEXT-mode-07548` `mode` must be `VK_COPY_MICROMAP_MODE_DESERIALIZE_EXT`
- `VUID-VkCopyMemoryToMicromapInfoEXT-src-07549` The data in `src` must have a format compatible with the destination physical device as returned by `vkGetDeviceMicromapCompatibilityEXT`
- `VUID-VkCopyMemoryToMicromapInfoEXT-dst-07550` `dst` must have been created with a size greater than or equal to that used to serialize the data in `src`
Valid Usage (Implicit)

- VUID-VkCopyMemoryToMicromapInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_COPY_MEMORY_TO_MICROMAP_INFO_EXT

- VUID-VkCopyMemoryToMicromapInfoEXT-pNext-pNext
  pNext must be NULL

- VUID-VkCopyMemoryToMicromapInfoEXT-dst-parameter
  dst must be a valid VkMicromapEXT handle

- VUID-VkCopyMemoryToMicromapInfoEXT-mode-parameter
  mode must be a valid VkCopyMicromapModeEXT value

To check if a serialized micromap is compatible with the current device call:

```c
// Provided by VK_EXT_opacity_micromap
void vkGetDeviceMicromapCompatibilityEXT(
    VkDevice device,
    const VkMicromapVersionInfoEXT* pVersionInfo,
    VkAccelerationStructureCompatibilityKHR* pCompatibility);
```

- `device` is the device to check the version against.
- `pVersionInfo` is a pointer to a VkMicromapVersionInfoEXT structure specifying version information to check against the device.
- `pCompatibility` is a pointer to a VkAccelerationStructureCompatibilityKHR value in which compatibility information is returned.

Valid Usage

- VUID-vkGetDeviceMicromapCompatibilityEXT-micromap-07551
  The micromap feature must be enabled

Valid Usage (Implicit)

- VUID-vkGetDeviceMicromapCompatibilityEXT-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetDeviceMicromapCompatibilityEXT-pVersionInfo-parameter
  pVersionInfo must be a valid pointer to a valid VkMicromapVersionInfoEXT structure

- VUID-vkGetDeviceMicromapCompatibilityEXT-pCompatibility-parameter
  pCompatibility must be a valid pointer to a VkAccelerationStructureCompatibilityKHR value

The VkMicromapVersionInfoEXT structure is defined as:
typedef struct VkMicromapVersionInfoEXT {
  VkStructureType sType;
  const void* pNext;
  const uint8_t* pVersionData;
} VkMicromapVersionInfoEXT;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• pVersionData is a pointer to the version header of a micromap as defined in vkCmdCopyMicromapToMemoryEXT

Note
pVersionData is a pointer to an array of 2×VK_UUID_SIZE uint8_t values instead of two VK_UUID_SIZE arrays as the expected use case for this member is to be pointed at the header of a previously serialized micromap (via vkCmdCopyMicromapToMemoryEXT or vkCopyMicromapToMemoryEXT) that is loaded in memory. Using arrays would necessitate extra memory copies of the UUIDs.

Valid Usage (Implicit)

• VUID-VkMicromapVersionInfoEXT-sType-sType sType must be VK_STRUCTURE_TYPE_MICROMAP_VERSION_INFO_EXT
• VUID-VkMicromapVersionInfoEXT-pNext-pNext pNext must be NULL
• VUID-VkMicromapVersionInfoEXT-pVersionData-parameter pVersionData must be a valid pointer to an array of 2×VK_UUID_SIZE uint8_t values

38.2. Host Micromap Operations

Implementations are also required to provide host implementations of the micromap operations if the micromapHostCommands feature is enabled:

• vkBuildMicromapsEXT corresponding to vkCmdBuildMicromapsEXT
• vkCopyMicromapEXT corresponding to vkCmdCopyMicromapEXT
• vkCopyMicromapToMemoryEXT corresponding to vkCmdCopyMicromapToMemoryEXT
• vkCopyMemoryToMicromapEXT corresponding to vkCmdCopyMemoryToMicromapEXT
• vkWriteMicromapsPropertiesEXT corresponding to vkCmdWriteMicromapsPropertiesEXT

These commands are functionally equivalent to their device counterparts, except that they are executed on the host timeline, rather than being enqueued into command buffers.
All micromaps used by the host commands must be bound to host-visible memory, and all input data for micromap builds must be referenced using host addresses instead of device addresses. Applications are not required to map micromap memory when using the host commands.

Note
The `vkBuildMicromapsEXT` and `vkCmdBuildMicromapsEXT` may use different algorithms, and thus are not required to produce identical structures.

Apart from these details, the host and device operations are interchangeable.

Note
For efficient execution, micromaps manipulated using these commands should always be bound to host cached memory, as the implementation may need to repeatedly read and write this memory during the execution of the command.

To build micromaps on the host, call:

```c
// Provided by VK_EXT_opacity_micromap
VkResult vkBuildMicromapsEXT(
    VkDevice device,
    VkDeferredOperationKHR deferredOperation,
    uint32_t infoCount,
    const VkMicromapBuildInfoEXT* pInfos);
```

- `device` is the `VkDevice` for which the micromaps are being built.
- `deferredOperation` is an optional `VkDeferredOperationKHR` to request deferral for this command.
- `infoCount` is the number of micromaps to build. It specifies the number of the `pInfos` that must be provided.
- `pInfos` is a pointer to an array of `infoCount` `VkMicromapBuildInfoEXT` structures defining the geometry used to build each micromap.

This command fulfills the same task as `vkCmdBuildMicromapsEXT` but is executed by the host.

The `vkBuildMicromapsEXT` command provides the ability to initiate multiple micromaps builds, however there is no ordering or synchronization implied between any of the individual micromap builds.

Note
This means that there cannot be any memory aliasing between any micromap memories or scratch memories being used by any of the builds.

Valid Usage

- VUID-vkBuildMicromapsEXT-pInfos-07461
For each `pInfos[i]`, `dstMicromap` must have been created with a value of `VkMicromapCreateInfoEXT::size` greater than or equal to the memory size required by the build operation, as returned by `vkGetMicromapBuildSizesEXT` with `pBuildInfo = pInfos[i]`.

- **VUID-vkBuildMicromapsEXT-mode-07462**
  The `mode` member of each element of `pInfos` must be a valid `VkBuildMicromapModeEXT` value.

- **VUID-vkBuildMicromapsEXT-dstMicromap-07463**
  The `dstMicromap` member of any element of `pInfos` must be a valid `VkMicromapEXT` handle.

- **VUID-vkBuildMicromapsEXT-pInfos-07464**
  For each element of `pInfos` its `type` member must match the value of `VkMicromapCreateInfoEXT::type` when its `dstMicromap` was created.

- **VUID-vkBuildMicromapsEXT-dstMicromap-07465**
  The range of memory backing the `dstMicromap` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `dstMicromap` member of any other element of `pInfos`, which is accessed by this command.

- **VUID-vkBuildMicromapsEXT-dstMicromap-07466**
  The range of memory backing the `scratchData` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `scratchData` member of any element of `pInfos` (including the same element), which is accessed by this command.

- **VUID-vkBuildMicromapsEXT-scratchData-07467**
  The range of memory backing the `scratchData` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `scratchData` member of any other element of `pInfos`, which is accessed by this command.

- **VUID-vkBuildMicromapsEXT-pInfos-07552**
  For each element of `pInfos`, the buffer used to create its `dstMicromap` member must be bound to host-visible device memory.

- **VUID-vkBuildMicromapsEXT-pInfos-07553**
  For each element of `pInfos`, all referenced addresses of `pInfos[i].data.hostAddress` must be valid host memory.

- **VUID-vkBuildMicromapsEXT-pInfos-07554**
  For each element of `pInfos`, all referenced addresses of `pInfos[i].triangleArray.hostAddress` must be valid host memory.

- **VUID-vkBuildMicromapsEXT-micromapHostCommands-07555**
  The `VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromapHostCommands` feature must be enabled.

- **VUID-vkBuildMicromapsEXT-pInfos-07556**
  If `pInfos[i].mode` is `VK_BUILD_MICROMAP_MODE_BUILD_EXT`, all addresses between `pInfos[i].scratchData.hostAddress` and `pInfos[i].scratchData.hostAddress + N - 1` must be valid host memory, where `N` is given by the `buildScratchSize` member of the `VkMicromapBuildSizesInfoEXT` structure returned from a call to...
vkGetMicromapBuildSizesEXT with an identical VkMicromapBuildInfoEXT structure and primitive count

- VUID-vkBuildMicromapsEXT-pInfos-07557
  For each element of pInfos, the buffer used to create its dstMicromap member must be bound to memory that was not allocated with multiple instances

### Valid Usage (Implicit)

- VUID-vkBuildMicromapsEXT-device-parameter
device must be a valid VkDevice handle

- VUID-vkBuildMicromapsEXT-deferredOperation-parameter
  If deferredOperation is not VK_NULL_HANDLE, deferredOperation must be a valid VkDeferredOperationKHR handle

- VUID-vkBuildMicromapsEXT-pInfos-parameter
  pInfos must be a valid pointer to an array of infoCount valid VkMicromapBuildInfoEXT structures

- VUID-vkBuildMicromapsEXT-infoCount-arraylength
  infoCount must be greater than 0

- VUID-vkBuildMicromapsEXT-deferredOperation-parent
  If deferredOperation is a valid handle, it must have been created, allocated, or retrieved from device

### Return Codes

**Success**

- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To copy or compact a micromap on the host, call:

```c
// Provided by VK_EXT_opacity_micromap
VkResult vkCopyMicromapEXT(
    VkDevice device,
    VkDeferredOperationKHR deferredOperation,
    const VkCopyMicromapInfoEXT* pInfo);
```
• **device** is the device which owns the micromaps.

• **deferredOperation** is an optional `VkDeferredOperationKHR` to request deferral for this command.

• **pInfo** is a pointer to a `VkCopyMicromapInfoEXT` structure defining the copy operation.

This command fulfills the same task as `vkCmdCopyMicromapEXT` but is executed by the host.

### Valid Usage

- **VUID-vkCopyMicromapEXT-deferredOperation-03677**
  If `deferredOperation` is not `VK_NULL_HANDLE`, it **must** be a valid `VkDeferredOperationKHR` object.

- **VUID-vkCopyMicromapEXT-deferredOperation-03678**
  Any previous deferred operation that was associated with `deferredOperation` **must** be complete.

- **VUID-vkCopyMicromapEXT-buffer-07558**
  The **buffer** used to create `pInfo->src` **must** be bound to host-visible device memory.

- **VUID-vkCopyMicromapEXT-buffer-07559**
  The **buffer** used to create `pInfo->dst` **must** be bound to host-visible device memory.

- **VUID-vkCopyMicromapEXT-micromapHostCommands-07560**
  The `VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromapHostCommands` feature **must** be enabled.

- **VUID-vkCopyMicromapEXT-buffer-07561**
  The **buffer** used to create `pInfo->src` **must** be bound to memory that was not allocated with multiple instances.

- **VUID-vkCopyMicromapEXT-buffer-07562**
  The **buffer** used to create `pInfo->dst` **must** be bound to memory that was not allocated with multiple instances.

### Valid Usage (Implicit)

- **VUID-vkCopyMicromapEXT-device-parameter**
  `device` **must** be a valid `VkDevice` handle.

- **VUID-vkCopyMicromapEXT-deferredOperation-parameter**
  If `deferredOperation` is not `VK_NULL_HANDLE`, `deferredOperation` **must** be a valid `VkDeferredOperationKHR` handle.

- **VUID-vkCopyMicromapEXT-pInfo-parameter**
  `pInfo` **must** be a valid pointer to a valid `VkCopyMicromapInfoEXT` structure.

- **VUID-vkCopyMicromapEXT-deferredOperation-parent**
  If `deferredOperation` is a valid handle, it **must** have been created, allocated, or retrieved from `device`.
Return Codes

Success
- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To copy host accessible memory to a micromap, call:

```c
// Provided by VK_EXT_opacity_micromap
VkResult vkCopyMemoryToMicromapEXT(
    VkDevice device,
    VkDeferredOperationKHR deferredOperation,
    const VkCopyMemoryToMicromapInfoEXT* pInfo);
```

- `device` is the device which owns `pInfo->dst`.
- `deferredOperation` is an optional `VkDeferredOperationKHR` to request deferral for this command.
- `pInfo` is a pointer to a `VkCopyMemoryToMicromapInfoEXT` structure defining the copy operation.

This command fulfills the same task as `vkCmdCopyMemoryToMicromapEXT` but is executed by the host.

This command can accept micromaps produced by either `vkCmdCopyMicromapToMemoryEXT` or `vkCopyMicromapToMemoryEXT`.

Valid Usage

- VUID-vkCopyMemoryToMicromapEXT-deferredOperation-03677
  If `deferredOperation` is not `VK_NULL_HANDLE`, it must be a valid `VkDeferredOperationKHR` object
- VUID-vkCopyMemoryToMicromapEXT-deferredOperation-03678
  Any previous deferred operation that was associated with `deferredOperation` must be complete
- VUID-vkCopyMemoryToMicromapEXT-pInfo-07563
  `pInfo->src.hostAddress` must be a valid host pointer
- VUID-vkCopyMemoryToMicromapEXT-pInfo-07564
  `pInfo->src.hostAddress` must be aligned to 16 bytes
The buffer used to create pInfo->dst must be bound to host-visible device memory.

The VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromapHostCommands feature must be enabled.

The buffer used to create pInfo->dst must be bound to memory that was not allocated with multiple instances.

Valid Usage (Implicit)

- VUID-vkCopyMemoryToMicromapEXT-device-parameter
  device must be a valid VkDevice handle

- VUID-vkCopyMemoryToMicromapEXT-deferredOperation-parameter
  If deferredOperation is not VK_NULL_HANDLE, deferredOperation must be a valid VkDeferredOperationKHR handle

- VUID-vkCopyMemoryToMicromapEXT-pInfo-parameter
  pInfo must be a valid pointer to a valid VkCopyMemoryToMicromapInfoEXT structure

- VUID-vkCopyMemoryToMicromapEXT-deferredOperation-parent
  If deferredOperation is a valid handle, it must have been created, allocated, or retrieved from device

Return Codes

Success
- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To copy a micromap to host accessible memory, call:

```c
// Provided by VK_EXT_opacity_micromap
VkResult vkCopyMicromapToMemoryEXT(
  VkDevice device,
  VkDeferredOperationKHR deferredOperation,
  const VkCopyMicromapToMemoryInfoEXT* pInfo);
```
• **device** is the device which owns pInfo->src.

• **deferredOperation** is an optional VkDeferredOperationKHR to request deferral for this command.

• **pInfo** is a pointer to a VkCopyMicromapToMemoryInfoEXT structure defining the copy operation.

This command fulfills the same task as vkCmdCopyMicromapToMemoryEXT but is executed by the host.

This command produces the same results as vkCmdCopyMicromapToMemoryEXT, but writes its result directly to a host pointer, and is executed on the host rather than the device. The output may not necessarily be bit-for-bit identical, but it can be equally used by either vkCmdCopyMemoryToMicromapEXT or vkCopyMemoryToMicromapEXT.

### Valid Usage

- VUID-vkCopyMicromapToMemoryEXT-deferredOperation-03677
  If deferredOperation is not VK_NULL_HANDLE, it must be a valid VkDeferredOperationKHR object

- VUID-vkCopyMicromapToMemoryEXT-deferredOperation-03678
  Any previous deferred operation that was associated with deferredOperation must be complete

- VUID-vkCopyMicromapToMemoryEXT-buffer-07568
  The buffer used to create pInfo->src must be bound to host-visible device memory

- VUID-vkCopyMicromapToMemoryEXT-pInfo-07569
  pInfo->dst.hostAddress must be a valid host pointer

- VUID-vkCopyMicromapToMemoryEXT-pInfo-07570
  pInfo->dst.hostAddress must be aligned to 16 bytes

- VUID-vkCopyMicromapToMemoryEXT-micromapHostCommands-07571
  The VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromapHostCommands feature must be enabled

- VUID-vkCopyMicromapToMemoryEXT-buffer-07572
  The buffer used to create pInfo->src must be bound to memory that was not allocated with multiple instances

### Valid Usage (Implicit)

- VUID-vkCopyMicromapToMemoryEXT-device-parameter
  device must be a valid VkDevice handle

- VUID-vkCopyMicromapToMemoryEXT-deferredOperation-parameter
  If deferredOperation is not VK_NULL_HANDLE, deferredOperation must be a valid VkDeferredOperationKHR handle

- VUID-vkCopyMicromapToMemoryEXT-pInfo-parameter
**pInfo** must be a valid pointer to a valid `VkCopyMicromapToMemoryInfoEXT` structure.

- VUID-vkCopyMicromapToMemoryEXT-deferredOperation-parent
  
  If **deferredOperation** is a valid handle, it must have been created, allocated, or retrieved from **device**.

### Return Codes

**Success**

- **VK_SUCCESS**
- **VK_OPERATION_DEFERRED_KHR**
- **VK_OPERATION_NOT_DEFERRED_KHR**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

To query micromap size parameters on the host, call:

```c
// Provided by VK_EXT_opacity_micromap
VkResult vkWriteMicromapsPropertiesEXT(
    VkDevice device,           // device,                      
    uint32_t micromapCount,    // micromapCount,               
    const VkMicromapEXT* pMicromaps, // pMicromaps,               
    VkQueryType queryType,     // queryType,                  
    size_t dataSize,           // dataSize,                   
    void* pData,               // pData,                      
    size_t stride);            // stride);
```

- **device** is the device which owns the micromaps in **pMicromaps**.
- **micromapCount** is the count of micromaps for which to query the property.
- **pMicromaps** is a pointer to an array of existing previously built micromaps.
- **queryType** is a **VkQueryType** value specifying the property to be queried.
- **dataSize** is the size in bytes of the buffer pointed to by **pData**.
- **pData** is a pointer to a user-allocated buffer where the results will be written.
- **stride** is the stride in bytes between results for individual queries within **pData**.

This command fulfills the same task as `vkCmdWriteMicromapsPropertiesEXT` but is executed by the host.

### Valid Usage

- VUID-vkWriteMicromapsPropertiesEXT-pMicromaps-07501
All micromaps in \texttt{pMicromaps} must have been constructed prior to the execution of this command.

- VUID-vkWriteMicromapsPropertiesEXT-pMicromaps-07502
  All micromaps in \texttt{pMicromaps} must have been constructed with \texttt{VK_BUILD_MICROMAP_ALLOW_COMPACTION_BIT_EXT} if \texttt{queryType} is \texttt{VK_QUERY_TYPE_MICROMAP_COMPACTED_SIZE_EXT}.

- VUID-vkWriteMicromapsPropertiesEXT-queryType-07503
  \texttt{queryType} must be \texttt{VK_QUERY_TYPE_MICROMAP_COMPACTED_SIZE_EXT} or \texttt{VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT}.

- VUID-vkWriteMicromapsPropertiesEXT-queryType-07573
  If \texttt{queryType} is \texttt{VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT}, then \texttt{stride} must be a multiple of the size of \texttt{VkDeviceSize}.

- VUID-vkWriteMicromapsPropertiesEXT-queryType-07574
  If \texttt{queryType} is \texttt{VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT}, then \texttt{pData} must point to a \texttt{VkDeviceSize}.

- VUID-vkWriteMicromapsPropertiesEXT-queryType-07575
  If \texttt{queryType} is \texttt{VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT}, then \texttt{pData} must point to a \texttt{VkDeviceSize}.

- VUID-vkWriteMicromapsPropertiesEXT-dataSize-07576
  \texttt{dataSize} must be greater than or equal to \texttt{micromapCount*stride}.

- VUID-vkWriteMicromapsPropertiesEXT-buffer-07577
  The buffer used to create each micromap in \texttt{pMicromaps} must be bound to host-visible device memory.

- VUID-vkWriteMicromapsPropertiesEXT-micromapHostCommands-07578
  The \texttt{VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromapHostCommands} feature must be enabled.

- VUID-vkWriteMicromapsPropertiesEXT-buffer-07579
  The buffer used to create each micromap in \texttt{pMicromaps} must be bound to memory that was not allocated with multiple instances.

### Valid Usage (Implicit)

- VUID-vkWriteMicromapsPropertiesEXT-device-parameter
  \texttt{device} must be a valid \texttt{VkDevice} handle.

- VUID-vkWriteMicromapsPropertiesEXT-pMicromaps-parameter
  \texttt{pMicromaps} must be a valid pointer to an array of \texttt{micromapCount} valid \texttt{VkMicromapEXT} handles.

- VUID-vkWriteMicromapsPropertiesEXT-queryType-parameter
  \texttt{queryType} must be a valid \texttt{VkQueryType} value.

- VUID-vkWriteMicromapsPropertiesEXT-pData-parameter
  \texttt{pData} must be a valid pointer to an array of \texttt{dataSize} bytes.

- VUID-vkWriteMicromapsPropertiesEXT-micromapCount-arraylength
  \texttt{micromapCount} must be greater than 0.
38.2.1. Displacement Micromap

A displacement micromap in an acceleration structure includes information in the `VkAccelerationStructureTrianglesDisplacementMicromapNV` to define a base triangle and displacement directions then uses displacement information encoded in the micromap to apply to those values to generate the final position.

**Displacement Base Triangle**

If `displacementBiasAndScaleBuffer` is provided the bias and scale are fetched from that buffer. If `displacementBiasAndScaleBuffer` is zero the bias and scale are assumed to be 0.0 and 1.0, respectively.

Given an input position from the geometry, the base position and displacement vector used by the displacement are computed by:

\[
\text{basePosition} = \text{inputPosition} + \text{displacementVector} \times \text{bias}
\]

\[
\text{baseDisplacementVector} = \text{displacementVector} \times \text{scale}
\]

The parameters of each micro-vertex are derived from a combination of the base triangle parameters extracted from the bottom-level acceleration structure, the barycentrics of that micro-vertex, and the displacement value fetched from the displacement micromap corresponding to that micro-vertex.

\[
\text{microVertexBasePosition} = \text{lerp(basePositions, microVertexBarycentrics)}
\]

\[
\text{microVertexDisplacementVector} = \text{lerp(displacementVectors, microVertexBarycentrics)}
\]

\[
\text{microVertexDisplacedPosition} = \text{microVertexBasePosition} + \text{microVertexDisplacementVector} \times \text{micromapDisplacementValue}
\]
Displacement micromap encoding

Displacement amounts are stored in displacement blocks, each covering a triangular region of microvertices. Depending on the subdivision level and encoding format, one or more displacement blocks combine to store all displacement values for a given displacement micromap.

Displacement blocks are organized along a space filling curve within a displacement micromap if more than one block is required, then micro-vertices are organized along the same space filling curve within a displacement micromap.

The space-filling curve is purely hierarchical with recursive splitting, similar to that for opacity micromaps but operating on vertices instead of triangles. To maintain that the hierarchical ordering is contiguous while keeping continuous winding, some triangles are flipped and wound differently.

The VK_DISPLACEMENT_MICROMAP_FORMAT_64_TRIANGLES_64_BYTES_NV format is an uncompressed, packed format which covers 64 microtriangles (subdivision level 3) in a block. The block contains 45 displacement values encoded as 11 bit unorm values and stored tightly packed in the vertex order described above, occupying 495 bits. This is followed by 15 unused bits then 2 reserved bits which must be 0. If this block is used to store displacement for a subdivision level below 3 the later unused values are ignored.

The VK_DISPLACEMENT_MICROMAP_FORMAT_256_TRIANGLES_128_BYTES_NV and VK_DISPLACEMENT_MICROMAP_FORMAT_1024_TRIANGLES_128_BYTES_NV formats store displacements in a compressed form to save space. Both formats use the same compression algorithm, differing in the number of bits used in the different fields.

The compression algorithm works by starting with fully specified anchor vertices, then for each level, predicting the value for the displacement and encoding the correction for that value, using fewer bits for each level of subdivision.

When adding a vertex in the recursive subdivision process between two adjacent displacement values, the predicted value is given by the rounded average of the two adjacent values as integers:

\[
\text{prediction} = \frac{A + B + 1}{2}
\]

The decoded value after applying the correction is given by:

\[
\text{decoded} = \text{prediction} + (\text{SignExtend(correction)} \ll \text{shift})
\]

where correction is given by the corrections field for a given level and micro vertex and shift is given by the shifts field indexed from the level then by 4 values, selected from interior or the 3 edges in vertex order in that order.

Chapter 39. Ray Traversal

The ray traversal process identifies and handles intersections between a ray and geometries in an acceleration structure.

Ray traversal cannot be started by a Vulkan API command directly - a shader must execute OpRayQueryProceedKHR or OpTraceRayKHR. When the rayTracingPipeline feature is enabled, OpTraceRayKHR can be used for ray tracing in a ray tracing pipeline. When the rayQuery feature is enabled, OpRayQueryProceedKHR can be used in any shader stage.

39.1. Ray Intersection Candidate Determination

Once tracing begins, rays are first tested against instances in a top-level acceleration structure. A ray that intersects an instance will be transformed into the space of the instance to continue traversal within that instance; therefore the transform matrix stored in the instance must be invertible.

In case multiple instances are intersected by a ray, the ray transformation into the space of the instance is invariant under the order in which these instances are encountered in the top-level acceleration structure.

Note
Applying multiple forward and reverse transforms to a ray to transition from one instance to another could result in accumulated errors. Thus an implementation should behave as if the ray is transformed from the origin for each instance independently.

Next, rays are tested against geometries in an bottom-level acceleration structure to determine if a hit occurred between them, initially based only on their geometric properties (i.e. their vertices). The implementation performs similar operations to that of rasterization, but with the effective viewport determined by the parameters of the ray, and the geometry transformed into a space determined by that viewport.

The vertices of each primitive are transformed from acceleration structure space to ray space according to the ray origin and direction as follows:

\[
\begin{pmatrix}
  x_r \\
  y_r \\
  z_r
\end{pmatrix} = \begin{pmatrix}
  a_x^2(1 - c) + c & a_x a_y (1 - c) - sa_z & a_x a_z (1 - c) + sa_y \\
  a_x a_y (1 - c) + sa_z & a_y^2(1 - c) + c & a_y a_z (1 - c) - sa_x \\
  a_x a_z (1 - c) - sa_y & a_y a_z (1 - c) + sa_x & a_z^2(1 - c) + c
\end{pmatrix} \begin{pmatrix}
  x_{as} - o_x \\
  y_{as} - o_y \\
  z_{as} - o_z
\end{pmatrix}
\]

\(a\) is the axis of rotation from the unnormalized ray direction vector \(d\) to the axis vector \(k\):
\[
\mathbf{a} = \begin{cases} 
\frac{\mathbf{d} \times \mathbf{k}}{\| \mathbf{d} \times \mathbf{k} \|} & \text{if } \| \mathbf{d} \times \mathbf{k} \| \neq 0 \\
(0, 1, 0) & \text{if } \| \mathbf{d} \times \mathbf{k} \| = 0
\end{cases}
\]

$s$ and $c$ are the sine and cosine of the angle of rotation about $\mathbf{a}$ from $\mathbf{d}$ to $\mathbf{k}$:

\[
c = \frac{\mathbf{d} \cdot \mathbf{k}}{\| \mathbf{d} \|} \\
s = \sqrt{1 - c^2}
\]

$k$ is the unit vector:

\[
k = \begin{pmatrix} 0 \\ 0 \\ -1 \end{pmatrix}
\]

$o$ and $d$ are the ray origin and unnormalized direction, respectively; the vector described by $x_{as}$, $y_{as}$, and $z_{as}$ is any position in acceleration structure space; and the vector described by $x_r$, $y_r$, and $z_r$ is the same position in ray space.

An intersection candidate is a unique point of intersection between a ray and a geometric primitive. For any primitive that has within its bounds a position $\mathbf{x y z}_{as}$ such that

\[
x_r = 0 \\
y_r = 0 \\
t_{min} \leq -\frac{z_r}{\| \mathbf{d} \|} < t_{max} \quad \text{if the primitive is a triangle,}
\]

\[
t_{min} \leq -\frac{z_r}{\| \mathbf{d} \|} \leq t_{max} \quad \text{otherwise}
\]

(where $t = -\frac{z_r}{\| \mathbf{d} \|}$), an intersection candidate exists.

Triangle primitive bounds consist of all points on the plane formed by the three vertices and within the bounds of the edges between the vertices, subject to the watertightness constraints below. AABB primitive bounds consist of all points within an implementation-defined bound which includes the specified box.

\[\text{Note}\]

The bounds of the AABB including all points internal to the bound implies that a ray started within the AABB will hit that AABB.
The determination of this condition is performed in an implementation specific manner, and may be performed with floating point operations. Due to the complexity and number of operations involved, inaccuracies are expected, particularly as the scale of values involved begins to diverge. Implementations should take efforts to maintain as much precision as possible.

Note

One very common case is when geometries are close to each other at some distance from the origin in acceleration structure space, where an effect similar to “z-fighting” is likely to be observed. Applications can mitigate this by ensuring their detailed geometries remain close to the origin.

Another likely case is when the origin of a ray is set to a position on a previously intersected surface, and its $t_{\text{min}}$ is zero or near zero; an intersection may be detected on the emitting surface. This case can usually be mitigated by offsetting $t_{\text{min}}$ slightly.

For a motion primitive or a motion instance, the positions for intersection are evaluated at the time specified in the `time` parameter to `OpTraceRayMotionNV` by interpolating between the two endpoints as specified for the given motion type. If a motion acceleration structure is traced with `OpTraceRayKHR`, it behaves as a `OpTraceRayMotionNV` with `time` of 0.0.

In the case of AABB geometries, implementations may increase their size in an acceleration structure in order to mitigate precision issues. This may result in false positive intersections being reported to the application.

For triangle intersection candidates, the $b$ and $c$ barycentric coordinates on the triangle where the above condition is met are made available to future shading. If the ray was traced with `OpTraceRayKHR`, these values are available as a vector of 2 32-bit floating point values in the `HitAttributeKHR` storage class.

Once an intersection candidate is determined, it proceeds through the following operations, in order:

1. Ray Intersection Culling
2. Ray Intersection Confirmation
3. Ray Closest Hit Determination
4. Ray Result Determination

The sections below describe the exact details of these tests. There is no ordering guarantee between
operations performed on different intersection candidates.

### 39.1.1. Watertightness

For a set of triangles with identical transforms, within a single instance:

- Any set of two or more triangles where all triangles have one vertex with an identical position value, that vertex is a *shared vertex*.
- Any set of two triangles with two shared vertices that were specified in the same *winding order* in each triangle have a *shared edge* defined by those vertices.

A *closed fan* is a set of three or more triangles where:

- All triangles in the set have the same shared vertex as one of their vertices.
- All edges that include the above vertex are shared edges.
- All above shared edges are shared by exactly two triangles from the set.
- No two triangles in the set intersect, except at shared edges.
- Every triangle in the set is joined to every other triangle in the set by a series of the above shared edges.

Implementations should not double-hit or miss when a ray intersects a shared edge, or a shared vertex of a closed fan.

### 39.2. Ray Intersection Culling

Candidate intersections go through several phases of culling before confirmation as an actual hit. There is no particular ordering dependency between the different culling operations.

#### 39.2.1. Ray Primitive Culling

If the *rayTraversalPrimitiveCulling* or *rayQuery* features are enabled, the *SkipTrianglesKHR* and *SkipAABBsKHR* ray flags can be specified when tracing a ray. *SkipTrianglesKHR* and *SkipAABBsKHR* are mutually exclusive. *SkipTrianglesKHR* is also mutually exclusive with *CullBackFacingTrianglesKHR* and *CullFrontFacingTrianglesKHR*.

If *SkipTrianglesKHR* was included in the Ray Flags operand of the ray trace instruction, and the intersection is with a triangle primitive, the intersection is dropped, and no further processing of this intersection occurs. If *VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR* was included in the pipeline, traversal with *OpTraceRayKHR* calls will all behave as if *SkipTrianglesKHR* was included in its Ray Flags operand.

If *SkipAABBsKHR* was included in the Ray Flags operand of the ray trace instruction, and the intersection is with an AABB primitive, the intersection is dropped, and no further processing of this intersection occurs. If *VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR* was included in the pipeline, traversal with *OpTraceRayKHR* calls will all behave as if *SkipAABBsKHR* was included in its Ray Flags operand.
39.2.2. Ray Mask Culling

Instances can be made invisible to particular rays based on the value of `VkAccelerationStructureInstanceKHR::mask` used to add that instance to a top-level acceleration structure, and the Cull Mask parameter used to trace the ray.

For the instance which is intersected, if `mask & Cull Mask == 0`, the intersection is dropped, and no further processing occurs.

39.2.3. Ray Face Culling

As in polygon rasterization, one of the stages of ray traversal is to determine if a triangle primitive is back- or front-facing, and primitives can be culled based on that facing.

If the intersection candidate is with an AABB primitive, this operation is skipped.

**Determination**

When a ray intersects a triangle primitive, the order that vertices are specified for the polygon affects whether the ray intersects the front or back face. Front or back facing is determined in the same way as they are for rasterization, based on the sign of the polygon's area but using the ray space coordinates instead of framebuffer coordinates. One way to compute this area is:

\[ a = -\frac{1}{2} \sum_{i=0}^{n-1} x_i y_{i+1} - x_{i+1} y_i \]

where \(x_i\) and \(y_i\) are the x and y ray space coordinates of the ith vertex of the n-vertex polygon (vertices are numbered starting at zero for the purposes of this computation) and \(i \oplus 1\) is \((i + 1) \text{ mod n}\).

By default, if \(a\) is negative then the intersection is with the front face of the triangle, otherwise it is with the back face. If `VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR` is included in `VkAccelerationStructureInstanceKHR::flags` for the instance containing the intersected triangle, this determination is reversed. Additionally, if \(a\) is 0, the intersection candidate is treated as not intersecting with any face, irrespective of the sign.

**Note**

In a left-handed coordinate system, an intersection will be with the front face of a triangle if the vertices of the triangle, as defined in index order, appear from the ray’s perspective in a clockwise rotation order. `VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR` was previously annotated as `VK_GEOMETRY_INSTANCE_TRIANGLE_FRONT_COUNTERCLOCKWISE_BIT_KHR` because of this.

If the ray was traced with `OpTraceRayKHR`, the `HitKindKHR` built-in is set to `HitKindFrontFacingTriangleKHR` if the intersection is with front-facing geometry, and `HitKindBackFacingTriangleKHR` if the intersection is with back-facing geometry, for shader stages considering this intersection.

If the ray was traced with `OpRayQueryProceedKHR`, `OpRayQueryGetIntersectionFrontFaceKHR` will return true for intersection candidates with front faces, or false for back faces.
**Culling**

If `CullBackFacingTrianglesKHR` was included in the Ray Flags parameter of the ray trace instruction, and the intersection is determined as with the back face of a triangle primitive, the intersection is dropped, and no further processing of this intersection occurs.

If `CullFrontFacingTrianglesKHR` was included in the Ray Flags parameter of the ray trace instruction, and the intersection is determined as with the front face of a triangle primitive, the intersection is dropped, and no further processing of this intersection occurs.

This culling is disabled if `VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR` was included in `VkAccelerationStructureInstanceKHR::flags` for the instance which the intersected geometry belongs to.

Intersection candidates that have not intersected with any face (a == 0) are unconditionally culled, irrespective of ray flags and geometry instance flags.

The `CullBackFacingTrianglesKHR` and `CullFrontFacingTrianglesKHR` Ray Flags are mutually exclusive.

### 39.2.4. Ray Opacity Culling

Each geometry in the acceleration structure may be considered either opaque or not. Opaque geometries continue through traversal as normal, whereas non-opaque geometries need to be either confirmed or discarded by shader code. Intersection candidates can also be culled based on their opacity.

**Determination**

Each individual intersection candidate is initially determined as opaque if `VK_GEOMETRY_OPAQUE_BIT_KHR` was included in the `VkAccelerationStructureGeometryKHR::flags` when the geometry it intersected with was built, otherwise it is considered non-opaque.

If the geometry includes an opacity micromap, the opacity of the intersection at this point is instead derived as described in Ray Opacity Micromap.

If the intersection candidate was generated by an intersection shader, the intersection is initially considered to have opacity matching the AABB candidate that it was generated from.

However, this opacity can be overridden when it is built into an instance. Setting `VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR` in `VkAccelerationStructureInstanceKHR::flags` will force all geometries in the instance to be considered opaque. Similarly, setting `VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR` will force all geometries in the instance to be considered non-opaque.

This can again be overridden by including `OpaqueKHR` or `NoOpaqueKHR` in the Ray Flags parameter when tracing a ray. `OpaqueKHR` forces all geometries to behave as if they are opaque, regardless of their build parameters. Similarly, `NoOpaqueKHR` forces all geometries to behave as if they are non-opaque.

If the ray was traced with `OpRayQueryProceedKHR`, to determine the opacity of AABB intersection candidates, `OpRayQueryGetIntersectionCandidateAABBOpaqueKHR` can be used. This instruction will return `true` for opaque intersection candidates, and `false` for non-opaque intersection candidates.
Culling

If `CullOpaqueKHR` is included in the Ray Flags parameter when tracing a ray, an intersection with a geometry that is considered opaque is dropped, and no further processing occurs.

If `CullNoOpaqueKHR` is included in the Ray Flags parameter when tracing a ray, an intersection with a geometry that is considered non-opaque is dropped, and no further processing occurs.

The `OpaqueKHR`, `NoOpaqueKHR`, `CullOpaqueKHR`, and `CullNoOpaqueKHR` Ray Flags are mutually exclusive.

39.2.5. Ray Opacity Micromap

A `VK_GEOMETRY_TYPE_TRIANGLES_KHR` geometry in the acceleration structure may have an opacity micromap associated with it to give finer-grained opacity information.

If the intersection candidate is with a geometry with an associated opacity micromap and `VK_GEOMETRY_INSTANCE_DISABLE_OPACITY_MICROMAPS_EXT` is not set in its instance then the micromap is used to determine geometry opacity instead of the `VK_GEOMETRY_OPAQUE_BIT_KHR` flag in the geometry.

The opacity information in the micromap object is accessed using the candidate intersection u and v coordinates. The integer u and v are computed from $\lfloor u \rfloor + \lfloor v \rfloor$, clamping $\lfloor u \rfloor$ as needed to keep the sum less than or equal to $1 << \text{subdivision level}$. These values are mapped into a linear index with a space filling curve which is defined recursively by traversing into the sub-triangle nearest vertex 0, then the middle triangle with ordering flipped, then nearest vertex 1 then nearest vertex 2.

![Figure 29. Example ordering for micromap data](image)

**Note**

This encoding is spatially coherent, purely hierarchical, and allows a bit-parallel conversion between barycentric address and index values.

See the appendix for reference code implementing this mapping.

The result of the opacity micromap lookup and operations is to treat the intersection as opaque, non-opaque, or ignored. The interpretation of the values depends on
**39.3. Ray Intersection Confirmation**

Depending on the opacity of intersected geometry and whether it is a triangle or an AABB, candidate intersections are further processed to determine the eventual hit result. Candidates generated from AABB intersections run through the same confirmation process as triangle hits.
39.3.1. AABB Intersection Candidates

For an intersection candidate with an AABB geometry generated by Ray Intersection Candidate Determination, shader code is executed to determine whether any hits should be reported to the traversal infrastructure; no further processing of this intersection candidate occurs. The occurrence of an AABB intersection candidate does not guarantee the ray intersects the primitive bounds. To avoid propagating false intersections the application should verify the intersection candidate before reporting any hits.

If the ray was traced with OpTraceRayKHR, an intersection shader is invoked from the Shader Binding Table according to the specified indexing for the intersected geometry. If this shader calls OpReportIntersectionKHR, a new intersection candidate is generated as described below. If the intersection shader is VK_SHADER_UNUSED_KHR (which is only allowed for a zero shader group) then no further processing of the intersection candidate occurs.

Each new candidate generated as a result of this processing is a generated intersection candidate that intersects the AABB geometry, with a t value equal to the Hit parameter of the OpReportIntersectionKHR instruction. The new generated candidate is then independently run through Ray Intersection Confirmation as a generated intersection.

If the ray was traced with OpRayQueryProceedKHR, control is returned to the shader which executed OpRayQueryProceedKHR, returning true. The resulting ray query has a candidate intersection type of RayQueryCandidateIntersectionAABBKHR. OpRayQueryGenerateIntersectionKHR can be called to commit a new intersection candidate with committed intersection type of RayQueryCommittedIntersectionGeneratedKHR. Further ray query processing can be continued by executing OpRayQueryProceedKHR with the same ray query, or intersection can be terminated with OpRayQueryTerminateKHR. Unlike rays traced with OpTraceRayKHR, candidates generated in this way skip generated intersection candidate confirmation; applications should make this determination before generating the intersection.

This operation may be executed multiple times for the same intersection candidate.

39.3.2. Triangle and Generated Intersection Candidates

For triangle and generated intersection candidates, additional shader code may be executed based on the intersection’s opacity.

If the intersection is opaque, the candidate is immediately confirmed as a valid hit and passes to the next stage of processing.

For non-opaque intersection candidates, shader code is executed to determine whether a hit occurred or not.

If the ray was traced with OpTraceRayKHR, an any-hit shader is invoked from the Shader Binding Table according to the specified indexing. If this shader calls OpIgnoreIntersectionKHR, the candidate is dropped and no further processing of the candidate occurs. If the any-hit shader identified is VK_SHADER_UNUSED_KHR, the candidate is immediately confirmed as a valid hit and passes to the next stage of processing.

If the ray was traced with OpRayQueryProceedKHR, control is returned to the shader which executed
OpRayQueryProceedKHR, returning true. As only triangle candidates participate in this operation with ray queries, the resulting candidate intersection type is always RayQueryCandidateIntersectionTriangleKHR. OpRayQueryConfirmIntersectionKHR can be called on the ray query to confirm the candidate as a hit with committed intersection type of RayQueryCommittedIntersectionTriangleKHR. Further ray query processing can be continued by executing OpRayQueryProceedKHR with the same ray query, or intersection can be terminated with OpRayQueryTerminateKHR. If OpRayQueryConfirmIntersectionKHR has not been executed, the candidate is dropped and no further processing of the candidate occurs.

This operation may be executed multiple times for the same intersection candidate unless VK_GEOMETRY_NO_DUPLICATE_ANY_HIT_INVOCATION_BIT_KHR was specified for the intersected geometry.

### 39.4. Ray Closest Hit Determination

Unless the ray was traced with the TerminateOnFirstHitKHR ray flag, the implementation must track the closest confirmed hit until all geometries have been tested and either confirmed or dropped.

After an intersection candidate is confirmed, its t value is compared to \( t_{\text{max}} \) to determine which intersection is closer, where \( t \) is the parametric distance along the ray at which the intersection occurred.

- If \( t < t_{\text{max}} \), \( t_{\text{max}} \) is set to \( t \) and the candidate is set as the current closest hit.
- If \( t > t_{\text{max}} \), the candidate is dropped and no further processing of that candidate occurs.
- If \( t = t_{\text{max}} \), the candidate may be set as the current closest hit or dropped.

If TerminateOnFirstHitKHR was included in the Ray Flags used to trace the ray, once the first hit is confirmed, the ray trace is terminated.

### 39.5. Ray Result Determination

Once all candidates have finished processing the prior stages, or if the ray is forcibly terminated, the final result of the ray trace is determined.

If a closest hit result was identified by Ray Closest Hit Determination, a closest hit has occurred, otherwise the final result is a miss.

For rays traced with OpTraceRayKHR, if a closest hit result was identified, a closest hit shader is invoked from the Shader Binding Table according to the specified indexing for the intersected geometry. Control returns to the shader that executed OpTraceRayKHR once this shader returns. This shader is skipped if either the ray flags included SkipClosestHitShaderKHR, or if the closest hit shader identified is VK_SHADER_UNUSED_KHR.

For rays traced with OpTraceRayKHR where no hit result was identified, the miss shader identified by the Miss Index parameter of OpTraceRayKHR is invoked. Control returns to the shader that executed OpTraceRayKHR once this shader returns. This shader is skipped if the miss shader identified is VK_SHADER_UNUSED_KHR.

If the ray was traced with OpRayQueryProceedKHR, control is returned to the shader which executed
OpRayQueryProceedKHR, returning false. If a closest hit was identified by Ray Closest Hit Determination, the ray query will now have a committed intersection type of RayQueryCommittedIntersectionGeneratedKHR or RayQueryCommittedIntersectionTriangleKHR. If no closest hit was identified, the committed intersection type will be RayQueryCommittedIntersectionNoneKHR.

No further processing of a ray query occurs after this result is determined.
Chapter 40. Ray Tracing

Ray tracing uses a separate rendering pipeline from both the graphics and compute pipelines (see Ray Tracing Pipeline).

![Ray tracing pipeline execution](image)

**Caption**

Interaction between the different shader stages in the ray tracing pipeline

Within the ray tracing pipeline, `OpTraceRayKHR` or `OpTraceRayMotionNV` can be called to perform a ray traversal that invokes the various ray tracing shader stages during its execution. The relationship between the ray tracing pipeline object and the geometries present in the acceleration structure traversed is passed into the ray tracing command in a `VkBuffer` object known as a shader binding table. `OpExecuteCallableKHR` can also be used in ray tracing pipelines to invoke a callable shader.

During execution, control alternates between scheduling and other operations. The scheduling functionality is implementation-specific and is responsible for workload execution. The shader stages are programmable. *Traversal*, which refers to the process of traversing acceleration structures to find potential intersections of rays with geometry, is fixed function.

The programmable portions of the pipeline are exposed in a single-ray programming model, with each invocation handling one ray at a time. Memory operations can be synchronized using standard memory barriers. The Workgroup scope and variables with a storage class of Workgroup must not be used in the ray tracing pipeline.

### 40.1. Shader Call Instructions

A *shader call* is an instruction which may cause execution to continue elsewhere by creating one or more invocations that execute a different shader stage.

The shader call instructions are:

- `OpTraceRayKHR` which may invoke intersection, any-hit, closest hit, or miss shaders,
• OpTraceRayMotionNV which may invoke intersection, any-hit, closest hit, or miss shaders,
• OpReportIntersectionKHR which may invoke any-hit shaders, and
• OpExecuteCallableKHR which will invoke a callable shader.
• OpHitObjectTraceRayNV, OpHitObjectTraceRayMotionNV, and OpHitObjectExecuteShaderNV which may invoke intersection, any-hit, closest hit, miss, or callable shaders.

The invocations created by shader call instructions are grouped into subgroups by the implementation. Those subgroups may be unrelated to the subgroup of the parent invocation.

*Pipeline trace ray instructions can* be used recursively; invoked shaders can themselves execute pipeline trace ray instructions, to a maximum depth defined by the maxRecursionDepth or maxRayRecursionDepth limit.

Shaders directly invoked from the API always have a recursion depth of 0; each shader executed by a pipeline trace ray instruction has a recursion depth one higher than the recursion depth of the shader which invoked it. Applications must not invoke a shader with a recursion depth greater than the value of maxRecursionDepth or maxPipelineRayRecursionDepth specified in the pipeline.

There is no explicit recursion limit for other shader call instructions which may recurse (e.g. OpExecuteCallableKHR) but there is an upper bound determined by the stack size.

An *invocation repack instruction* is a ray tracing shader call instruction where the implementation may change the set of invocations that are executing. When a repack instruction is encountered, the invocation is suspended and a new invocation begins and executes the instruction. After executing the repack instruction (which may result in other ray tracing shader stages executing) the new invocation ends and the original invocation is resumed, but it may be resumed in a different subgroup or at a different SubgroupLocalInvocationId within the same subgroup. When a subset of invocations in a subgroup execute the invocation repack instruction, those that do not execute it remain in the same subgroup at the same SubgroupLocalInvocationId.

The invocations that are executing before an invocation repack instruction, after the instruction, or are created by the instruction, are shader-call-related.

If the implementation changes the composition of subgroups, the values of SubgroupSize, SubgroupLocalInvocationId, SMIDNV, WarpIDNV, and builtin variables that are derived from them (SubgroupEqMask, SubgroupGeMask, SubgroupGtMask, SubgroupLeMask, SubgroupLtMask) must be changed accordingly by the invocation repack instruction. The application must use Volatile semantics on these BuiltIn variables when used in the ray generation, closest hit, miss, intersection, and callable shaders. Similarly, the application must use Volatile semantics on any RayTmaxKHR decorated BuiltIn used in an intersection shader.

*Note*

Subgroup operations are permitted in the programmable ray tracing shader stages. However, shader call instructions place a bound on where results of subgroup instructions or subgroup-scoped instructions that execute the dynamic
instance of that instruction are potentially valid. For example, care **must** be taken when using the result of a ballot operation that was computed before an invocation repack instruction, after that repack instruction. The ballot **may** be incorrect as the set of invocations could have changed.

While the `SubgroupSize` built-in is required to be declared `Volatile`, its value will never change unless `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` is set on pipeline creation, as without that bit set, its value is required to match that of `VkPhysicalDeviceSubgroupProperties::subgroupSize`.

For clock operations, the value of a `Subgroup` scoped `OpReadClockKHR` read before the dynamic instance of a repack instruction **should** not be compared to the result of that clock instruction after the repack instruction.

When a ray tracing shader executes a dynamic instance of an invocation repack instruction which results in another ray tracing shader being invoked, their instructions are related by `shader-call-order`.

For ray tracing invocations that are `shader-call-related`:

- **memory operations** on `StorageBuffer`, `Image`, and `ShaderRecordBufferKHR` storage classes **can** be synchronized using the `ShaderCallKHR` scope.
- the `CallableDataKHR`, `IncomingCallableDataKHR`, `RayPayloadKHR`, `HitAttributeKHR`, and `IncomingRayPayloadKHR` storage classes are **system-synchronized** and no application availability and visibility operations are required.
- **memory operations** within a single invocation before and after the invocation repack instruction are ordered by `program-order` and do not require explicit synchronization.

### 40.2. Ray Tracing Commands

`Ray tracing commands` provoke work in the ray tracing pipeline. Ray tracing commands are recorded into a command buffer and when executed by a queue will produce work that executes according to the currently bound ray tracing pipeline. A ray tracing pipeline **must** be bound to a command buffer before any ray tracing commands are recorded in that command buffer.

To dispatch ray tracing use:

```c
// Provided by VK_NV_ray_tracing
void vkCmdTraceRaysNV(
    VkCommandBuffer commandBuffer,
    VkBuffer raygenShaderBindingTableBuffer,
    VkDeviceSize raygenShaderBindingOffset,
    VkBuffer missShaderBindingTableBuffer,
    VkDeviceSize missShaderBindingOffset,
    VkDeviceSize missShaderBindingStride,
    VkBuffer hitShaderBindingTableBuffer,
    VkDeviceSize hitShaderBindingOffset,
);
```
VkDeviceSize hitShaderBindingStride,
VkBuffer callableShaderBindingTableBuffer,
VkDeviceSize callableShaderBindingOffset,
callableShaderBindingStride,
uint32_t width,
uint32_t height,
uint32_t depth);

- commandBuffer is the command buffer into which the command will be recorded.
- raygenShaderBindingTableBuffer is the buffer object that holds the shader binding table data for the ray generation shader stage.
- raygenShaderBindingOffset is the offset in bytes (relative to raygenShaderBindingTableBuffer) of the ray generation shader being used for the trace.
- missShaderBindingTableBuffer is the buffer object that holds the shader binding table data for the miss shader stage.
- missShaderBindingOffset is the offset in bytes (relative to missShaderBindingTableBuffer) of the miss shader being used for the trace.
- missShaderBindingStride is the size in bytes of each shader binding table record in missShaderBindingTableBuffer.
- hitShaderBindingTableBuffer is the buffer object that holds the shader binding table data for the hit shader stages.
- hitShaderBindingOffset is the offset in bytes (relative to hitShaderBindingTableBuffer) of the hit shader group being used for the trace.
- hitShaderBindingStride is the size in bytes of each shader binding table record in hitShaderBindingTableBuffer.
- callableShaderBindingTableBuffer is the buffer object that holds the shader binding table data for the callable shader stage.
- callableShaderBindingOffset is the offset in bytes (relative to callableShaderBindingTableBuffer) of the callable shader being used for the trace.
- callableShaderBindingStride is the size in bytes of each shader binding table record in callableShaderBindingTableBuffer.
- width is the width of the ray trace query dimensions.
- height is height of the ray trace query dimensions.
- depth is depth of the ray trace query dimensions.

When the command is executed, a ray generation group of \( \text{width} \times \text{height} \times \text{depth} \) rays is assembled.

**Valid Usage**

- VUID-vkCmdTraceRaysNV-magFilter-04553

  If a VkSampler created with magFilter or minFilter equal to VK_FILTER_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this
command, then the image view’s format features must contain
VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

• VUID-vkCmdTraceRaysNV-mipmapMode-04770
If a VkSampler created with mipmapMode equal to VK_SAMPLER_MIPMAP_MODE_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

• VUID-vkCmdTraceRaysNV-None-06479
If a VkImageView is sampled with depth comparison, the image view’s format features must contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT

• VUID-vkCmdTraceRaysNV-None-02691
If a VkImageView is accessed using atomic operations as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT

• VUID-vkCmdTraceRaysNV-None-07888
If a VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer’s format features must contain VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT

• VUID-vkCmdTraceRaysNV-None-02692
If a VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT

• VUID-vkCmdTraceRaysNV-None-02693
If the VK_EXT_filter_cubic extension is not enabled and any VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, it must not have a VkImageViewType of VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY

• VUID-vkCmdTraceRaysNV-filterCubic-02694
Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2

• VUID-vkCmdTraceRaysNV-filterCubicMinmax-02695
Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2

• VUID-vkCmdTraceRaysNV-cubicRangeClamp-09212
If the cubicRangeClamp feature is not enabled, then any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must not have a VkSamplerReductionModeCreateInfo reductionMode equal to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM
Any `VkImageView` being sampled with a `VkSamplerReductionModeCreateInfo`::`reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM` as a result of this command must sample with `VK_FILTER_CUBIC_EXT`.

If the `selectableCubicWeights` feature is not enabled, then any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have `VkSamplerCubicWeightsCreateInfoQCOM`:cubicWeights equal to `VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM`.

Any `VkImage` created with a `VkImageCreateInfo`::`flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

For any `VkImageView` being read as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

For any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

For any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, then the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

For each set `n` that is statically used by a bound shader, a descriptor set must have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` or `VkDescriptorSetLayout` array that was used to create the current `VkPipeline` or `VkShaderEXT`, as described in Pipeline Layout Compatibility.

For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` or `VkDescriptorSetLayout` and `VkPushConstantRange` arrays used to create the current `VkPipeline` or `VkShaderEXT`, as described in Pipeline Layout Compatibility.

If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the
VkPipelineLayout or VkDescriptorsetLayout and VkPushConstantRange arrays used to create the current VkPipeline or VkShaderEXT, as described in Pipeline Layout Compatibility

- VUID-vkCmdTraceRaysNV-None-08114
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid if they are statically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was not created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdTraceRaysNV-None-08115
  If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdBindDescriptorSets, the bound VkPipeline must have been created without VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdTraceRaysNV-None-08116
  Descriptors in bound descriptor buffers, specified via vkCmdSetDescriptorBufferOffsetsEXT, must be valid if they are dynamically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdTraceRaysNV-None-08604
  Descriptors in bound descriptor buffers, specified via vkCmdSetDescriptorBufferOffsetsEXT, must be valid if they are dynamically used by any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command

- VUID-vkCmdTraceRaysNV-None-08117
  If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdSetDescriptorBufferOffsetsEXT, the bound VkPipeline must have been created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdTraceRaysNV-None-08119
  If a descriptor is dynamically used with a VkPipeline created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory must be resident

- VUID-vkCmdTraceRaysNV-None-08605
  If a descriptor is dynamically used with a VkShaderEXT created with a VkDescriptorsetLayout that was created with VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory must be resident

- VUID-vkCmdTraceRaysNV-None-08606
  If the shaderObject feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command

- VUID-vkCmdTraceRaysNV-None-08607
  If the shaderObject is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command

- VUID-vkCmdTraceRaysNV-None-08608
  If a pipeline is bound to the pipeline bind point used by this command, there must not
have been any calls to dynamic state setting commands for any state not specified as dynamic in the \texttt{VkPipeline} object bound to the pipeline bind point used by this command, since that pipeline was bound

- \textbf{VUID-vkCmdTraceRaysNV-None-08609}

  If the \texttt{VkPipeline} object bound to the pipeline bind point used by this command or any \texttt{VkShaderEXT} bound to a stage corresponding to the pipeline bind point used by this command accesses a \texttt{VkSampler} object that uses unnormalized coordinates, that sampler \textbf{must} not be used to sample from any \texttt{VkImage} with a \texttt{VkImageView} of the type \texttt{VK_IMAGE_VIEW_TYPE_3D}, \texttt{VK_IMAGE_VIEW_TYPE_CUBE}, \texttt{VK_IMAGE_VIEW_TYPE_1D_ARRAY}, \texttt{VK_IMAGE_VIEW_TYPE_2D_ARRAY} or \texttt{VK_IMAGE_VIEW_TYPE_CUBE_ARRAY}, in any shader stage

- \textbf{VUID-vkCmdTraceRaysNV-None-08610}

  If the \texttt{VkPipeline} object bound to the pipeline bind point used by this command or any \texttt{VkShaderEXT} bound to a stage corresponding to the pipeline bind point used by this command accesses a \texttt{VkSampler} object that uses unnormalized coordinates, that sampler \textbf{must} not be used with any of the SPIR-V \texttt{OpImageSample*} or \texttt{OpImageSparseSample*} instructions with \texttt{ImplicitLod}, \texttt{Dref} or \texttt{Proj} in their name, in any shader stage

- \textbf{VUID-vkCmdTraceRaysNV-None-08611}

  If the \texttt{VkPipeline} object bound to the pipeline bind point used by this command or any \texttt{VkShaderEXT} bound to a stage corresponding to the pipeline bind point used by this command accesses a \texttt{VkSampler} object that uses unnormalized coordinates, that sampler \textbf{must} not be used with any of the SPIR-V \texttt{OpImageSample*} or \texttt{OpImageSparseSample*} instructions that includes a LOD bias or any offset values, in any shader stage

- \textbf{VUID-vkCmdTraceRaysNV-uniformBuffers-06935}

  If any stage of the \texttt{VkPipeline} object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either \texttt{VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT} or \texttt{VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT} for \texttt{uniformBuffers}, and the \texttt{robustBufferAccess} feature is not enabled, that stage \textbf{must} not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- \textbf{VUID-vkCmdTraceRaysNV-None-08612}

  If the \texttt{robustBufferAccess} feature is not enabled, and any \texttt{VkShaderEXT} bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it \textbf{must} not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- \textbf{VUID-vkCmdTraceRaysNV-storageBuffers-06936}

  If any stage of the \texttt{VkPipeline} object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either \texttt{VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT} or \texttt{VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT} for \texttt{storageBuffers}, and the \texttt{robustBufferAccess} feature is not enabled, that stage \textbf{must} not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- \textbf{VUID-vkCmdTraceRaysNV-None-08613}

  If the \texttt{robustBufferAccess} feature is not enabled, and any \texttt{VkShaderEXT} bound to a stage
corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdTraceRaysNV-commandBuffer-02707**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by bound shaders **must** not be a protected resource.

- **VUID-vkCmdTraceRaysNV-None-06550**
  If a bound shader accesses a `VkSampler` or `VkImageView` object that enables `sampler Y'CbCr conversion`, that object **must** only be used with `OpImageSample*` or `OpImageSparseSample*` instructions.

- **VUID-vkCmdTraceRaysNV-ConstOffset-06551**
  If a bound shader accesses a `VkSampler` or `VkImageView` object that enables `sampler Y'CbCr conversion`, that object **must** not use the `ConstOffset` and `Offset` operands.

- **VUID-vkCmdTraceRaysNV-viewType-07752**
  If a `VkImageView` is accessed as a result of this command, then the image view’s `viewType` **must** match the `Dim` operand of the `OpTypeImage` as described in Instruction/Sampler/Image View Validation.

- **VUID-vkCmdTraceRaysNV-format-07753**
  If a `VkImageView` is accessed as a result of this command, then the numeric type of the image view’s `format` and the `Sampled Type` operand of the `OpTypeImage` **must** match.

- **VUID-vkCmdTraceRaysNV-OpImageWrite-08795**
  If a `VkImageView` created with a format other than `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the image view’s `format`.

- **VUID-vkCmdTraceRaysNV-OpImageWrite-08796**
  If a `VkImageView` created with the format `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have four components.

- **VUID-vkCmdTraceRaysNV-OpImageWrite-04469**
  If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the buffer view’s `format`.

- **VUID-vkCmdTraceRaysNV-SampledType-04470**
  If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64.

- **VUID-vkCmdTraceRaysNV-SampledType-04471**
  If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32.

- **VUID-vkCmdTraceRaysNV-SampledType-04472**
  If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64.
must have a Width of 64

- VUID-vkCmdTraceRaysNV-SampledType-04473
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- VUID-vkCmdTraceRaysNV-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdTraceRaysNV-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdTraceRaysNV-OpImageWeightedSampleQCOM-06971
  If OpImageWeightedSampleQCOM is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM

- VUID-vkCmdTraceRaysNV-OpImageWeightedSampleSampleQCOM-06972
  If OpImageWeightedSampleSampleQCOM uses a VkImageView as a sample weight image as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM

- VUID-vkCmdTraceRaysNV-OpImageBoxFilterQCOM-06973
  If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM

- VUID-vkCmdTraceRaysNV-OpImageBlockMatchWindowSSDQCOM-06974
  If OpImageBlockMatchWindowSSDQCOM is used to read from an VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_WINDOW_BIT_QCOM

- VUID-vkCmdTraceRaysNV-OpImageBlockMatchWindowSADQCOM-06975
  If OpImageBlockMatchWindowSADQCOM is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation

- VUID-vkCmdTraceRaysNV-OpImageWeightedSampleQCOM-06977
  If OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchWindowSSDQCOM, OpImageBlockMatchWindowSADQCOM, OpImageBlockMatchGatherSSDQCOM, or OpImageBlockMatchGatherSADQCOM uses a VkSampler as a result of this command, then the sampler must have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM
• VUID-vkCmdTraceRaysNV-OpImageWeightedSampleQCOM-06978
  If any command other than OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchWindowSSDQCOM, OpImageBlockMatchWindowSADQCOM, OpImageBlockMatchGatherSSDQCOM, or OpImageBlockMatchGatherSADQCOM uses a VkSampler as a result of this command, then the sampler must not have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM

• VUID-vkCmdTraceRaysNV-OpImageBlockMatchWindow-09215
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM instruction is used to read from an VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

• VUID-vkCmdTraceRaysNV-OpImageBlockMatchWindow-09216
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM instruction is used to read from an VkImageView as a result of this command, then the image view's format must be a single-component format.

• VUID-vkCmdTraceRaysNV-OpImageBlockMatchWindow-09217
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation

• VUID-vkCmdTraceRaysNV-None-07288
  Any shader invocation executed by this command must terminate

• VUID-vkCmdTraceRaysNV-None-03429
  Any shader group handle referenced by this call must have been queried from the currently bound ray tracing pipeline

• VUID-vkCmdTraceRaysNV-commandBuffer-04624
  commandBuffer must not be a protected command buffer

• VUID-vkCmdTraceRaysNV-maxRecursionDepth-03625
  This command must not cause a pipeline trace ray instruction to be executed from a shader invocation with a recursion depth greater than the value of maxRecursionDepth used to create the bound ray tracing pipeline

• VUID-vkCmdTraceRaysNV-raygenShaderBindingTableBuffer-04042
  If raygenShaderBindingTableBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-vkCmdTraceRaysNV-raygenShaderBindingOffset-02455
  raygenShaderBindingOffset must be less than the size of raygenShaderBindingTableBuffer

• VUID-vkCmdTraceRaysNV-raygenShaderBindingOffset-02456
  raygenShaderBindingOffset must be a multiple of VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupBaseAlignment

• VUID-vkCmdTraceRaysNV-missShaderBindingTableBuffer-04043
  If missShaderBindingTableBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-vkCmdTraceRaysNV-missShaderBindingOffset-02457
  missShaderBindingOffset must be less than the size of missShaderBindingTableBuffer
- VUID-vkCmdTraceRaysNV-missShaderBindingOffset-02458
  missShaderBindingOffset must be a multiple of VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupBaseAlignment

- VUID-vkCmdTraceRaysNV-hitShaderBindingTableBuffer-04044
  If hitShaderBindingTableBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdTraceRaysNV-hitShaderBindingOffset-02459
  hitShaderBindingOffset must be less than the size of hitShaderBindingTableBuffer

- VUID-vkCmdTraceRaysNV-hitShaderBindingOffset-02460
  hitShaderBindingOffset must be a multiple of VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupBaseAlignment

- VUID-vkCmdTraceRaysNV-callableShaderBindingTableBuffer-04045
  If callableShaderBindingTableBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdTraceRaysNV-callableShaderBindingOffset-02461
  callableShaderBindingOffset must be less than the size of callableShaderBindingTableBuffer

- VUID-vkCmdTraceRaysNV-callableShaderBindingOffset-02462
  callableShaderBindingOffset must be a multiple of VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupBaseAlignment

- VUID-vkCmdTraceRaysNV-missShaderBindingStride-02463
  missShaderBindingStride must be a multiple of VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupHandleSize

- VUID-vkCmdTraceRaysNV-hitShaderBindingStride-02464
  hitShaderBindingStride must be a multiple of VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupHandleSize

- VUID-vkCmdTraceRaysNV-callableShaderBindingStride-02465
  callableShaderBindingStride must be a multiple of VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupHandleSize

- VUID-vkCmdTraceRaysNV-missShaderBindingStride-02466
  missShaderBindingStride must be less than or equal to VkPhysicalDeviceRayTracingPropertiesNV::maxShaderGroupStride

- VUID-vkCmdTraceRaysNV-hitShaderBindingStride-02467
  hitShaderBindingStride must be less than or equal to VkPhysicalDeviceRayTracingPropertiesNV::maxShaderGroupStride

- VUID-vkCmdTraceRaysNV-callableShaderBindingStride-02468
  callableShaderBindingStride must be less than or equal to VkPhysicalDeviceRayTracingPropertiesNV::maxShaderGroupStride

- VUID-vkCmdTraceRaysNV-width-02469
  width must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]

- VUID-vkCmdTraceRaysNV-height-02470
  height must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]
• VUID-vkCmdTraceRaysNV-depth-02471
  depth must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]

Valid Usage (Implicit)

• VUID-vkCmdTraceRaysNV-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdTraceRaysNV-raygenShaderBindingTableBuffer-parameter
  raygenShaderBindingTableBuffer must be a valid VkBuffer handle

• VUID-vkCmdTraceRaysNV-missShaderBindingTableBuffer-parameter
  If missShaderBindingTableBuffer is not VK_NULL_HANDLE, missShaderBindingTableBuffer must be a valid VkBuffer handle

• VUID-vkCmdTraceRaysNV-hitShaderBindingTableBuffer-parameter
  If hitShaderBindingTableBuffer is not VK_NULL_HANDLE, hitShaderBindingTableBuffer must be a valid VkBuffer handle

• VUID-vkCmdTraceRaysNV-callableShaderBindingTableBuffer-parameter
  If callableShaderBindingTableBuffer is not VK_NULL_HANDLE, callableShaderBindingTableBuffer must be a valid VkBuffer handle

• VUID-vkCmdTraceRaysNV-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdTraceRaysNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

• VUID-vkCmdTraceRaysNV-renderpass
  This command must only be called outside of a render pass instance

• VUID-vkCmdTraceRaysNV-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdTraceRaysNV-commonparent
  Each of callableShaderBindingTableBuffer, commandBuffer, hitShaderBindingTableBuffer, missShaderBindingTableBuffer, and raygenShaderBindingTableBuffer that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
To dispatch ray tracing use:

```c
void vkCmdTraceRaysKHR(
    VkCommandBuffer commandBuffer,
    const VkStridedDeviceAddressRegionKHR* pRaygenShaderBindingTable,
    const VkStridedDeviceAddressRegionKHR* pMissShaderBindingTable,
    const VkStridedDeviceAddressRegionKHR* pHitShaderBindingTable,
    const VkStridedDeviceAddressRegionKHR* pCallableShaderBindingTable,
    uint32_t width,
    uint32_t height,
    uint32_t depth);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pRaygenShaderBindingTable` is a `VkStridedDeviceAddressRegionKHR` that holds the shader binding table data for the ray generation shader stage.
- `pMissShaderBindingTable` is a `VkStridedDeviceAddressRegionKHR` that holds the shader binding table data for the miss shader stage.
- `pHitShaderBindingTable` is a `VkStridedDeviceAddressRegionKHR` that holds the shader binding table data for the hit shader stage.
- `pCallableShaderBindingTable` is a `VkStridedDeviceAddressRegionKHR` that holds the shader binding table data for the callable shader stage.
- `width` is the width of the ray trace query dimensions.
- `height` is height of the ray trace query dimensions.
- `depth` is depth of the ray trace query dimensions.

When the command is executed, a ray generation group of `width × height × depth` rays is assembled.

**Valid Usage**

- **VUID-vkCmdTraceRaysKHR-magFilter-04553**

  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

If a `VkImageView` is sampled with depth comparison, the image view's format features must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`.

If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`.

If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

Any `VkImageView` being sampled with a `VkSamplerReductionModeCreateInfo` as a result of this command must have a `VkImageFormatProperties2::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

If the `cubicRangeClamp` feature is not enabled, then any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must not have a `VkSamplerReductionModeCreateInfo::reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGE_CLAMP_QCOM`.

Any `VkImageView` being sampled with a `VkSamplerReductionModeCreateInfo` as a result of this command must not have a `VkImageFormatProperties2::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

Any `VkImageView` being sampled with `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`. 
::reductionMode equal to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM as a result of this command must sample with VK_FILTER_CUBIC_EXT

- VUID-vkCmdTraceRaysKHR-selectableCubicWeights-09214
  If the selectableCubicWeights feature is not enabled, then any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have VkSamplerCubicWeightsCreateInfoQCOM::cubicWeights equal to VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM

- VUID-vkCmdTraceRaysKHR-flags-02696
  Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE

- VUID-vkCmdTraceRaysKHR-OpTypeImage-07027
  For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- VUID-vkCmdTraceRaysKHR-OpTypeImage-07028
  For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- VUID-vkCmdTraceRaysKHR-OpTypeImage-07029
  For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view's buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- VUID-vkCmdTraceRaysKHR-OpTypeImage-07030
  Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view's buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- VUID-vkCmdTraceRaysKHR-None-08600
  For each set n that is statically used by a bound shader, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout or VkDescriptorSetLayout array that was used to create the current VkPipeline or VkShaderEXT, as described in Pipeline Layout Compatibility

- VUID-vkCmdTraceRaysKHR-None-08601
  For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout or VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkPipeline or VkShaderEXT, as described in Pipeline Layout Compatibility

- VUID-vkCmdTraceRaysKHR-maintenance4-08602
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout or VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkPipeline or VkShaderEXT, as described in Pipeline Layout Compatibility
Compatibility

• VUID-vkCmdTraceRaysKHR-None-08114
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, **must be** valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command and the bound `VkPipeline` was not created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

• VUID-vkCmdTraceRaysKHR-None-08115
  If the descriptors used by the `VkPipeline` bound to the pipeline bind point were specified via `vkCmdBindDescriptorSets`, the bound `VkPipeline` **must have** been created without `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

• VUID-vkCmdTraceRaysKHR-None-08116
  Descriptors in bound descriptor buffers, specified via `vkCmdSetDescriptorBufferOffsetsEXT`, **must be** valid if they are dynamically used by the `VkPipeline` bound to the pipeline bind point used by this command and the bound `VkPipeline` was created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

• VUID-vkCmdTraceRaysKHR-None-08604
  Descriptors in bound descriptor buffers, specified via `vkCmdSetDescriptorBufferOffsetsEXT`, **must be** valid if they are dynamically used by any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command

• VUID-vkCmdTraceRaysKHR-None-08117
  If the descriptors used by the `VkPipeline` bound to the pipeline bind point were specified via `vkCmdSetDescriptorBufferOffsetsEXT`, the bound `VkPipeline` **must have** been created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

• VUID-vkCmdTraceRaysKHR-None-08119
  If a descriptor is dynamically used with a `VkPipeline` created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, the descriptor memory **must be** resident

• VUID-vkCmdTraceRaysKHR-None-08605
  If a descriptor is dynamically used with a `VkShaderEXT` created with a `VkDescriptorSetLayout` that was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, the descriptor memory **must be** resident

• VUID-vkCmdTraceRaysKHR-None-08606
  If the `shaderObject` feature is not enabled, a valid pipeline **must be** bound to the pipeline bind point used by this command

• VUID-vkCmdTraceRaysKHR-None-08607
  If the `shaderObject` is enabled, either a valid pipeline **must be** bound to the pipeline bind point used by this command, or a valid combination of valid and `VK_NULL_HANDLE` shader objects **must be** bound to every supported shader stage corresponding to the pipeline bind point used by this command

• VUID-vkCmdTraceRaysKHR-None-08608
  If a pipeline is bound to the pipeline bind point used by this command, there **must not** have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command,
since that pipeline was bound

- **VUID-vkCmdTraceRaysKHR-None-08609**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

- **VUID-vkCmdTraceRaysKHR-None-08610**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

- **VUID-vkCmdTraceRaysKHR-None-08611**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

- **VUID-vkCmdTraceRaysKHR-uniformBuffers-06935**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `uniformBuffers`, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdTraceRaysKHR-None-08612**
  If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdTraceRaysKHR-storageBuffers-06936**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `storageBuffers`, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdTraceRaysKHR-None-08613**
  If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.
set bound to the same pipeline bind point

• VUID-vkCmdTraceRaysKHR-commandBuffer-02707
If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by bound shaders must not be a protected resource

• VUID-vkCmdTraceRaysKHR-None-06550
If a bound shader accesses a VkSampler or VkImageView object that enables sampler YC_aC conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions

• VUID-vkCmdTraceRaysKHR-ConstOffset-06551
If a bound shader accesses a VkSampler or VkImageView object that enables sampler YC_aC conversion, that object must not use the ConstOffset and Offset operands

• VUID-vkCmdTraceRaysKHR-viewType-07752
If a VkImageView is accessed as a result of this command, then the image view’s viewType must match the Dim operand of the OpTypeImage as described in Instruction/Sampler/Image View Validation

• VUID-vkCmdTraceRaysKHR-format-07753
If a VkImageView is accessed as a result of this command, then the numeric type of the image view’s format and the Sampled Type operand of the OpTypeImage must match

• VUID-vkCmdTraceRaysKHR-OpImageWrite-08795
If a VkImageView created with a format other than VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view’s format

• VUID-vkCmdTraceRaysKHR-OpImageWrite-08796
If a VkImageView created with the format VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have four components

• VUID-vkCmdTraceRaysKHR-SampledType-04470
If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

• VUID-vkCmdTraceRaysKHR-SampledType-04471
If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

• VUID-vkCmdTraceRaysKHR-SampledType-04472
If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

• VUID-vkCmdTraceRaysKHR-SampledType-04473
If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a Width of 32.

- VUID-vkCmdTraceRaysKHR-sparseImageInt64Atomics-04474
  If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a Width of 64 by this command.

- VUID-vkCmdTraceRaysKHR-sparseImageInt64Atomics-04475
  If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a Width of 64 by this command.

- VUID-vkCmdTraceRaysKHR-OpImageWeightedSampleQCOM-06971
  If `OpImageWeightedSampleQCOM` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM`.

- VUID-vkCmdTraceRaysKHR-OpImageWeightedSampleQCOM-06972
  If `OpImageWeightedSampleQCOM` uses a `VkImageView` as a sample weight image as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM`.

- VUID-vkCmdTraceRaysKHR-OpImageBoxFilterQCOM-06973
  If `OpImageBoxFilterQCOM` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM`.

- VUID-vkCmdTraceRaysKHR-OpImageBlockMatchSSDQCOM-06974
  If `OpImageBlockMatchSSDQCOM` is used to read from an `VkImageView` as a result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

- VUID-vkCmdTraceRaysKHR-OpImageBlockMatchSADQCOM-06975
  If `OpImageBlockMatchSSDQCOM` or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

- VUID-vkCmdTraceRaysKHR-OpImageBlockMatchSADQCOM-06976
  If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchWindowSSDQCOM`, `OpImageBlockMatchWindowSADQCOM`, `OpImageBlockMatchGatherSSDQCOM`, `OpImageBlockMatchGatherSADQCOM`, or `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.
OpImageBlockMatchGatherSSDQCOM, OpImageBlockMatchGatherSADQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must not have been created with

\begin{verbatim}
VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM
\end{verbatim}

- VUID-vkCmdTraceRaysKHR-OpImageBlockMatchWindow-09215
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM instruction is used to read from an VkImageView as a result of this command, then the image view's format features must contain \code{VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM}

- VUID-vkCmdTraceRaysKHR-OpImageBlockMatchWindow-09216
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM instruction is used to read from an VkImageView as a result of this command, then the image view's format must be a single-component format.

- VUID-vkCmdTraceRaysKHR-OpImageBlockMatchWindow-09217
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation

- VUID-vkCmdTraceRaysKHR-None-07288
  Any shader invocation executed by this command must terminate

- VUID-vkCmdTraceRaysKHR-None-03429
  Any shader group handle referenced by this call must have been queried from the currently bound ray tracing pipeline

- VUID-vkCmdTraceRaysKHR-maxPipelineRayRecursionDepth-03679
  This command must not cause a shader call instruction to be executed from a shader invocation with a recursion depth greater than the value of \code{maxPipelineRayRecursionDepth} used to create the bound ray tracing pipeline

- VUID-vkCmdTraceRaysKHR-commandBuffer-03635
  commandBuffer must not be a protected command buffer

- VUID-vkCmdTraceRaysKHR-size-04023
  The size member of \code{pRayGenShaderBindingTable} must be equal to its stride member

- VUID-vkCmdTraceRaysKHR-pRayGenShaderBindingTable-03680
  If the buffer from which \code{pRayGenShaderBindingTable->deviceAddress} was queried is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdTraceRaysKHR-pRayGenShaderBindingTable-03681
  The buffer from which the \code{pRayGenShaderBindingTable->deviceAddress} is queried must have been created with the \code{VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR} usage flag

- VUID-vkCmdTraceRaysKHR-pRayGenShaderBindingTable-03682
  \code{pRayGenShaderBindingTable->deviceAddress} must be a multiple of \code{VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment}

- VUID-vkCmdTraceRaysKHR-pMissShaderBindingTable-03683
  If the buffer from which \code{pMissShaderBindingTable->deviceAddress} was queried is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object
object

- VUID-vkCmdTraceRaysKHR-pMissShaderBindingTable-03684
  The buffer from which the pMissShaderBindingTable->deviceAddress is queried must have been created with the VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR usage flag

- VUID-vkCmdTraceRaysKHR-pMissShaderBindingTable-03685
  pMissShaderBindingTable->deviceAddress must be a multiple of VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment

- VUID-vkCmdTraceRaysKHR-stride-03686
  pMissShaderBindingTable->stride must be a multiple of VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment

- VUID-vkCmdTraceRaysKHR-stride-03687
  If the buffer from which pMissShaderBindingTable->deviceAddress was queried is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdTraceRaysKHR-pHitShaderBindingTable-03688
  The buffer from which the pHitShaderBindingTable->deviceAddress is queried must have been created with the VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR usage flag

- VUID-vkCmdTraceRaysKHR-pHitShaderBindingTable-03689
  pHitShaderBindingTable->deviceAddress must be a multiple of VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment

- VUID-vkCmdTraceRaysKHR-stride-03690
  pHitShaderBindingTable->stride must be a multiple of VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment

- VUID-vkCmdTraceRaysKHR-stride-03691
  If the buffer from which pHitShaderBindingTable->deviceAddress was queried is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdTraceRaysKHR-pCallableShaderBindingTable-03692
  The buffer from which the pCallableShaderBindingTable->deviceAddress is queried must have been created with the VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR usage flag

- VUID-vkCmdTraceRaysKHR-pCallableShaderBindingTable-03693
  pCallableShaderBindingTable->deviceAddress must be a multiple of VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment

- VUID-vkCmdTraceRaysKHR-stride-03694
  pCallableShaderBindingTable->stride must be a multiple of VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment
- **VUID-vkCmdTraceRaysKHR-stride-04041**
  pCallableShaderBindingTable->stride must be less than or equal to VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride

- **VUID-vkCmdTraceRaysKHR-flags-03696**
  If the currently bound ray tracing pipeline was created with flags that included VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR, pHitShaderBindingTable->deviceAddress must not be zero

- **VUID-vkCmdTraceRaysKHR-flags-03697**
  If the currently bound ray tracing pipeline was created with flags that included VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR, pHitShaderBindingTable->deviceAddress must not be zero

- **VUID-vkCmdTraceRaysKHR-flags-03511**
  If the currently bound ray tracing pipeline was created with flags that included VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR, the shader group handle identified by pMissShaderBindingTable->deviceAddress must not be set to zero

- **VUID-vkCmdTraceRaysKHR-flags-03512**
  If the currently bound ray tracing pipeline was created with flags that included VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR, entries in the table identified by pHitShaderBindingTable->deviceAddress accessed as a result of this command in order to execute an any-hit shader must not be set to zero

- **VUID-vkCmdTraceRaysKHR-flags-03513**
  If the currently bound ray tracing pipeline was created with flags that included VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR, entries in the table identified by pHitShaderBindingTable->deviceAddress accessed as a result of this command in order to execute a closest hit shader must not be set to zero

- **VUID-vkCmdTraceRaysKHR-flags-03514**
  If the currently bound ray tracing pipeline was created with flags that included VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR, entries in the table identified by pHitShaderBindingTable->deviceAddress accessed as a result of this command in order to execute an intersection shader must not be set to zero

- **VUID-vkCmdTraceRaysKHR-pHitShaderBindingTable-04735**
  Any non-zero hit shader group entries in the table identified by pHitShaderBindingTable->deviceAddress accessed by this call from a geometry with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR must have been created with VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR

- **VUID-vkCmdTraceRaysKHR-pHitShaderBindingTable-04736**
  Any non-zero hit shader group entries in the table identified by pHitShaderBindingTable->deviceAddress accessed by this call from a geometry with a geometryType of VK_GEOMETRY_TYPE_AABBS_KHR must have been created with VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR

- **VUID-vkCmdTraceRaysKHR-width-03638**
  width must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0] × VkPhysicalDeviceLimits::maxComputeWorkGroupSize[0]
- VUID-vkCmdTraceRaysKHR-height-03639
  height must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1] × VkPhysicalDeviceLimits::maxComputeWorkGroupSize[1]

- VUID-vkCmdTraceRaysKHR-depth-03640
  depth must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2] × VkPhysicalDeviceLimits::maxComputeWorkGroupSize[2]

- VUID-vkCmdTraceRaysKHR-width-03641
  width × height × depth must be less than or equal to VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxRayDispatchInvocationCount

Valid Usage (Implicit)

- VUID-vkCmdTraceRaysKHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdTraceRaysKHR-pRaygenShaderBindingTable-parameter
  pRaygenShaderBindingTable must be a valid pointer to a valid VkStridedDeviceAddressRegionKHR structure

- VUID-vkCmdTraceRaysKHR-pMissShaderBindingTable-parameter
  pMissShaderBindingTable must be a valid pointer to a valid VkStridedDeviceAddressRegionKHR structure

- VUID-vkCmdTraceRaysKHR-pHitShaderBindingTable-parameter
  pHitShaderBindingTable must be a valid pointer to a valid VkStridedDeviceAddressRegionKHR structure

- VUID-vkCmdTraceRaysKHR-pCallableShaderBindingTable-parameter
  pCallableShaderBindingTable must be a valid pointer to a valid VkStridedDeviceAddressRegionKHR structure

- VUID-vkCmdTraceRaysKHR-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdTraceRaysKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdTraceRaysKHR-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdTraceRaysKHR-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
The `VkStridedDeviceAddressRegionKHR` structure is defined as:

```c
typedef struct VkStridedDeviceAddressRegionKHR {
    VkDeviceAddress deviceAddress;
    VkDeviceSize stride;
    VkDeviceSize size;
} VkStridedDeviceAddressRegionKHR;
```

- `deviceAddress` is the device address (as returned by the `vkGetBufferDeviceAddress` command) at which the region starts, or zero if the region is unused.
- `stride` is the byte stride between consecutive elements.
- `size` is the size in bytes of the region starting at `deviceAddress`.

### Valid Usage

- **VUID-VkStridedDeviceAddressRegionKHR-size-04631**
  If `size` is not zero, all addresses between `deviceAddress` and `deviceAddress + size - 1` must be in the buffer device address range of the same buffer.

- **VUID-VkStridedDeviceAddressRegionKHR-size-04632**
  If `size` is not zero, `stride` must be less than or equal to the size of the buffer from which `deviceAddress` was queried.

When invocation mask image usage is enabled in the bound ray tracing pipeline, the pipeline uses an invocation mask image specified by the command:

```c
// Provided by VK_HUAWEI_invocation_mask
void vkCmdBindInvocationMaskHUAWEI(
    VkCommandBuffer commandBuffer,  
    VkImageView imageView,        
    VkImageLayout imageLayout);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `imageView` is an image view handle specifying the invocation mask image. `imageView` may be set to `VK_NULL_HANDLE`, which is equivalent to specifying a view of an image filled with ones value.
• **imageLayout** is the layout that the image subresources accessible from **imageView** will be in when the invocation mask image is accessed

### Valid Usage

- VUID-vkCmdBindInvocationMaskHUAWEI-None-04976
  The **invocationMask** feature must be enabled
- VUID-vkCmdBindInvocationMaskHUAWEI-imageView-04977
  If **imageView** is not **VK_NULL_HANDLE**, it must be a valid **VkImageView** handle of type **VK_IMAGE_VIEW_TYPE_2D**
- VUID-vkCmdBindInvocationMaskHUAWEI-imageView-04978
  If **imageView** is not **VK_NULL_HANDLE**, it must have a format of **VK_FORMAT_R8_UINT**
- VUID-vkCmdBindInvocationMaskHUAWEI-imageView-04979
  If **imageView** is not **VK_NULL_HANDLE**, it must have been created with **VK_IMAGE_USAGE_INVOCATION_MASK_BIT_HUAWEI** set
- VUID-vkCmdBindInvocationMaskHUAWEI-imageView-04980
  If **imageView** is not **VK_NULL_HANDLE**, **imageLayout** must be **VK_IMAGE_LAYOUT_GENERAL**
- VUID-vkCmdBindInvocationMaskHUAWEI-width-04981
  Thread mask image resolution must match the width and height in **vkCmdTraceRaysKHR**
- VUID-vkCmdBindInvocationMaskHUAWEI-None-04982
  Each element in the invocation mask image must have the value 0 or 1. The value 1 means the invocation is active
- VUID-vkCmdBindInvocationMaskHUAWEI-depth-04983
  **depth** in **vkCmdTraceRaysKHR** must be 1

### Valid Usage (Implicit)

- VUID-vkCmdBindInvocationMaskHUAWEI-commandBuffer-parameter
  commandBuffer must be a valid **VkCommandBuffer** handle
- VUID-vkCmdBindInvocationMaskHUAWEI-imageView-parameter
  If **imageView** is not **VK_NULL_HANDLE**, **imageView** must be a valid **VkImageView** handle
- VUID-vkCmdBindInvocationMaskHUAWEI-imageLayout-parameter
  **imageLayout** must be a valid **VkImageLayout** value
- VUID-vkCmdBindInvocationMaskHUAWEI-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdBindInvocationMaskHUAWEI-commandBuffer-cmdpool
  The **VkCommandPool** that commandBuffer was allocated from must support compute operations
- VUID-vkCmdBindInvocationMaskHUAWEI-renderpass
  This command must only be called outside of a render pass instance
- VUID-vkCmdBindInvocationMaskHUAWEI-videocoding
This command **must** only be called outside of a video coding scope

- VUID-vkCmdBindInvocationMaskHUAWEI-commonparent
  Both of `commandBuffer`, and `imageView` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

### Command Properties

<table>
<thead>

To dispatch ray tracing, with some parameters sourced on the device, use:

```c
// Provided by VK_KHR_ray_tracing_pipeline
void vkCmdTraceRaysIndirectKHR(
    VkCommandBuffer commandBuffer,
    const VkStridedDeviceAddressRegionKHR* pRaygenShaderBindingTable,
    const VkStridedDeviceAddressRegionKHR* pMissShaderBindingTable,
    const VkStridedDeviceAddressRegionKHR* pHitShaderBindingTable,
    const VkStridedDeviceAddressRegionKHR* pCallableShaderBindingTable,
    VkDeviceAddress indirectDeviceAddress);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pRaygenShaderBindingTable` is a `VkStridedDeviceAddressRegionKHR` that holds the shader binding table data for the ray generation shader stage.
- `pMissShaderBindingTable` is a `VkStridedDeviceAddressRegionKHR` that holds the shader binding table data for the miss shader stage.
- `pHitShaderBindingTable` is a `VkStridedDeviceAddressRegionKHR` that holds the shader binding table data for the hit shader stage.
- `pCallableShaderBindingTable` is a `VkStridedDeviceAddressRegionKHR` that holds the shader binding table data for the callable shader stage.
- `indirectDeviceAddress` is a buffer device address which is a pointer to a `VkTraceRaysIndirectCommandKHR` structure containing the trace ray parameters.
vkCmdTraceRaysIndirectKHR behaves similarly to vkCmdTraceRaysKHR except that the ray trace query dimensions are read by the device from indirectDeviceAddress during execution.

Valid Usage

- **VUID-vkCmdTraceRaysIndirectKHR-magFilter-04553**
  If a VkSampler created with magFilter or minFilter equal to VK_FILTER_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

- **VUID-vkCmdTraceRaysIndirectKHR-mipmapMode-04770**
  If a VkSampler created with mipmapMode equal to VK_SAMPLER_MIPMAP_MODE_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

- **VUID-vkCmdTraceRaysIndirectKHR-None-06479**
  If a VkImageView is sampled with depth comparison, the image view's format features must contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT

- **VUID-vkCmdTraceRaysIndirectKHR-None-02691**
  If a VkImageView is accessed using atomic operations as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT

- **VUID-vkCmdTraceRaysIndirectKHR-None-02692**
  If a VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features must contain VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT

- **VUID-vkCmdTraceRaysIndirectKHR-None-02693**
  If the VK_EXT_filter_cubic extension is not enabled and any VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, it must not have a VkImageViewType of VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY

- **VUID-vkCmdTraceRaysIndirectKHR-filterCubic-02694**
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2

- **VUID-vkCmdTraceRaysIndirectKHR-filterCubicMinmax-02695**
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by...
VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2

- **VUID-vkCmdTraceRaysIndirectKHR-cubicRangeClamp-09212**
  If the cubicRangeClamp feature is not enabled, then any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command **must not have a** VkSamplerReductionModeCreateInfo
  
  reductionMode equal to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM

- **VUID-vkCmdTraceRaysIndirectKHR-reductionMode-09213**
  Any VkImageView being sampled with a VkSamplerReductionModeCreateInfo
  
  ::reductionMode equal to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM as a result of this command **must** sample with VK_FILTER_CUBIC_EXT

- **VUID-vkCmdTraceRaysIndirectKHR-selectableCubicWeights-09214**
  If the selectableCubicWeights feature is not enabled, then any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command **must** have VkSamplerCubicWeightsCreateInfoQCOM::cubicWeights equal to VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM

- **VUID-vkCmdTraceRaysIndirectKHR-flags-02696**
  Any VkImage created with a VkImageCreateInfo
  
  ::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command **must** only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE

- **VUID-vkCmdTraceRaysIndirectKHR-OpTypeImage-07027**
  For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view’s format features **must** contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- **VUID-vkCmdTraceRaysIndirectKHR-OpTypeImage-07028**
  For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view’s format features **must** contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- **VUID-vkCmdTraceRaysIndirectKHR-OpTypeImage-07029**
  For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view’s buffer features **must** contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- **VUID-vkCmdTraceRaysIndirectKHR-OpTypeImage-07030**
  Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view’s buffer features **must** contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- **VUID-vkCmdTraceRaysIndirectKHR-None-08600**
  For each set n that is statically used by a bound shader, a descriptor set **must** have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout or VkDescriptorsetLayout array that was used to create the current VkPipeline or VkShaderEXT, as described in Pipeline Layout Compatibility

- **VUID-vkCmdTraceRaysIndirectKHR-None-08601**
For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout or VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkPipeline or VkShaderEXT, as described in Pipeline Layout Compatibility

- VUID-vkCmdTraceRaysIndirectKHR-maintenance4-08602
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout or VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkPipeline or VkShaderEXT, as described in Pipeline Layout EXT

- VUID-vkCmdTraceRaysIndirectKHR-None-08114
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid if they are statically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was not created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdTraceRaysIndirectKHR-None-08115
  If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdBindDescriptorSets, the bound VkPipeline must have been created without VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdTraceRaysIndirectKHR-None-08116
  Descriptors in bound descriptor buffers, specified via vkCmdSetDescriptorBufferOffsetsEXT, must be valid if they are dynamically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdTraceRaysIndirectKHR-None-08604
  Descriptors in bound descriptor buffers, specified via vkCmdSetDescriptorBufferOffsetsEXT, must be valid if they are dynamically used by any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command

- VUID-vkCmdTraceRaysIndirectKHR-None-08117
  If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdSetDescriptorBufferOffsetsEXT, the bound VkPipeline must have been created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdTraceRaysIndirectKHR-None-08119
  If a descriptor is dynamically used with a VkPipeline created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory must be resident

- VUID-vkCmdTraceRaysIndirectKHR-None-08605
  If a descriptor is dynamically used with a VkShaderEXT created with a VkDescriptorSetLayout that was created with VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory must be resident

- VUID-vkCmdTraceRaysIndirectKHR-None-08606
If the shaderObject feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command

- **VUID-vkCmdTraceRaysIndirectKHR-None-08607**
  If the shaderObject is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command.

- **VUID-vkCmdTraceRaysIndirectKHR-None-08608**
  If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound.

- **VUID-vkCmdTraceRaysIndirectKHR-None-08609**
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage.

- **VUID-vkCmdTraceRaysIndirectKHR-None-08610**
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage.

- **VUID-vkCmdTraceRaysIndirectKHR-None-08611**
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage.

- **VUID-vkCmdTraceRaysIndirectKHR-uniformBuffers-06935**
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdTraceRaysIndirectKHR-None-08612**
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdTraceRaysIndirectKHR-storageBuffers-06936**
If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdTraceRaysIndirectKHR-None-08613
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdTraceRaysIndirectKHR-commandBuffer-02707
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by bound shaders must not be a protected resource

- VUID-vkCmdTraceRaysIndirectKHR-None-06550
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y’C_bC_r conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions

- VUID-vkCmdTraceRaysIndirectKHR-ConstOffset-06551
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y’C_bC_r conversion, that object must not use the ConstOffset and Offset operands

- VUID-vkCmdTraceRaysIndirectKHR-viewType-07752
  If a VkImageView is accessed as a result of this command, then the image view’s viewType must match the Dim operand of the OpTypeImage as described in Instruction/Sampler/Image View Validation

- VUID-vkCmdTraceRaysIndirectKHR-format-07753
  If a VkImageView is accessed as a result of this command, then the numeric type of the image view’s format and the Sampled Type operand of the OpTypeImage must match

- VUID-vkCmdTraceRaysIndirectKHR-OpImageWrite-08795
  If a VkImageView created with a format other than VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view’s format

- VUID-vkCmdTraceRaysIndirectKHR-OpImageWrite-08796
  If a VkImageView created with the format VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have four components

- VUID-vkCmdTraceRaysIndirectKHR-OpImageWrite-04469
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format

- VUID-vkCmdTraceRaysIndirectKHR-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction...
must have a Width of 64

- VUID-vkCmdTraceRaysIndirectKHR-SampledType-04471
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- VUID-vkCmdTraceRaysIndirectKHR-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- VUID-vkCmdTraceRaysIndirectKHR-SampledType-04473
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- VUID-vkCmdTraceRaysIndirectKHR-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_Residency_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdTraceRaysIndirectKHR-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_Residency_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdTraceRaysIndirectKHR-OpImageWeightedSampleQCOM-06971
  If OpImageWeightedSampleQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM

- VUID-vkCmdTraceRaysIndirectKHR-OpImageWeightedSampleQCOM-06972
  If OpImageWeightedSampleQCOM uses a VkImageView as a sample weight image as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM

- VUID-vkCmdTraceRaysIndirectKHR-OpImageBoxFilterQCOM-06973
  If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM

- VUID-vkCmdTraceRaysIndirectKHR-OpImageBlockMatchSSDQCOM-06974
  If OpImageBlockMatchSSDQCOM is used to read from an VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

- VUID-vkCmdTraceRaysIndirectKHR-OpImageBlockMatchSADQCOM-06975
  If OpImageBlockMatchSADQCOM or OpImageBlockMatchSSDQCOM is used to read from a
reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation

- **VUID-vkCmdTraceRaysIndirectKHR-OpImageWeightedSampleQCOM-06977**
  If `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchWindowSSDQCOM`, `OpImageBlockMatchWindowSADQCOM`, `OpImageBlockMatchGatherSSDQCOM`, `OpImageBlockMatchGatherSADQCOM`, or `OpImageBlockMatchSSDQCOM` or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`

- **VUID-vkCmdTraceRaysIndirectKHR-OpImageWeightedSampleQCOM-06978**
  If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchWindowSSDQCOM`, `OpImageBlockMatchWindowSADQCOM`, `OpImageBlockMatchGatherSSDQCOM`, `OpImageBlockMatchGatherSADQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`

- **VUID-vkCmdTraceRaysIndirectKHR-OpImageBlockMatchWindow-09215**
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`

- **VUID-vkCmdTraceRaysIndirectKHR-OpImageBlockMatchWindow-09216**
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view's format must be a single-component format.

- **VUID-vkCmdTraceRaysIndirectKHR-OpImageBlockMatchWindow-09217**
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation

- **VUID-vkCmdTraceRaysIndirectKHR-None-07288**
  Any shader invocation executed by this command must terminate

- **VUID-vkCmdTraceRaysIndirectKHR-None-03429**
  Any shader group handle referenced by this call must have been queried from the currently bound ray tracing pipeline

- **VUID-vkCmdTraceRaysIndirectKHR-maxPipelineRayRecursionDepth-03679**
  This command must not cause a shader call instruction to be executed from a shader invocation with a recursion depth greater than the value of `maxPipelineRayRecursionDepth` used to create the bound ray tracing pipeline

- **VUID-vkCmdTraceRaysIndirectKHR-commandBuffer-03635**
  `commandBuffer` must not be a protected command buffer

- **VUID-vkCmdTraceRaysIndirectKHR-size-04023**
  The size member of `pRayGenShaderBindingTable` must be equal to its stride member

- **VUID-vkCmdTraceRaysIndirectKHR-pRayGenShaderBindingTable-03680**
  If the buffer from which `pRayGenShaderBindingTable->deviceAddress` was queried is non-
sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdTraceRaysIndirectKHR-pRayGenShaderBindingTable-03681**
  The buffer from which the `pRayGenShaderBindingTable->deviceAddress` is queried **must** have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag

- **VUID-vkCmdTraceRaysIndirectKHR-pRayGenShaderBindingTable-03682**
  `pRayGenShaderBindingTable->deviceAddress` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`

- **VUID-vkCmdTraceRaysIndirectKHR-pMissShaderBindingTable-03683**
  If the buffer from which `pMissShaderBindingTable->deviceAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdTraceRaysIndirectKHR-pMissShaderBindingTable-03684**
  The buffer from which the `pMissShaderBindingTable->deviceAddress` is queried **must** have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag

- **VUID-vkCmdTraceRaysIndirectKHR-pMissShaderBindingTable-03685**
  `pMissShaderBindingTable->deviceAddress` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`

- **VUID-vkCmdTraceRaysIndirectKHR-stride-03686**
  `pMissShaderBindingTable->stride` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment`

- **VUID-vkCmdTraceRaysIndirectKHR-stride-04029**
  `pMissShaderBindingTable->stride` **must** be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride`

- **VUID-vkCmdTraceRaysIndirectKHR-pHitShaderBindingTable-03687**
  If the buffer from which `pHitShaderBindingTable->deviceAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdTraceRaysIndirectKHR-pHitShaderBindingTable-03688**
  The buffer from which the `pHitShaderBindingTable->deviceAddress` is queried **must** have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag

- **VUID-vkCmdTraceRaysIndirectKHR-pHitShaderBindingTable-03689**
  `pHitShaderBindingTable->deviceAddress` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`

- **VUID-vkCmdTraceRaysIndirectKHR-stride-03690**
  `pHitShaderBindingTable->stride` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment`

- **VUID-vkCmdTraceRaysIndirectKHR-stride-04035**
  `pHitShaderBindingTable->stride` **must** be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride`

- **VUID-vkCmdTraceRaysIndirectKHR-pCallableShaderBindingTable-03691**
  If the buffer from which `pCallableShaderBindingTable->deviceAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
The buffer from which the `pCallableShaderBindingTable->deviceAddress` is queried must have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag.

`pCallableShaderBindingTable->deviceAddress` must be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`.

`pCallableShaderBindingTable->stride` must be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment`.

`pCallableShaderBindingTable->stride` must be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride`.

If the currently bound ray tracing pipeline was created with flags that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`, `pHitShaderBindingTable->deviceAddress` must not be zero.

If the currently bound ray tracing pipeline was created with flags that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`, `pHitShaderBindingTable->deviceAddress` must not be zero.

If the currently bound ray tracing pipeline was created with flags that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR`, the shader group handle identified by `pMissShaderBindingTable->deviceAddress` must not be set to zero.

If the currently bound ray tracing pipeline was created with flags that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR`, entries in the table identified by `pHitShaderBindingTable->deviceAddress` accessed as a result of this command in order to execute an any-hit shader must not be set to zero.

If the currently bound ray tracing pipeline was created with flags that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`, entries in the table identified by `pHitShaderBindingTable->deviceAddress` accessed as a result of this command in order to execute a closest hit shader must not be set to zero.

If the currently bound ray tracing pipeline was created with flags that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`, entries in the table identified by `pHitShaderBindingTable->deviceAddress` accessed as a result of this command in order to execute an intersection shader must not be set to zero.

Any non-zero hit shader group entries in the table identified by `pHitShaderBindingTable->deviceAddress` accessed by this call from a geometry with a `geometryType` of
VK_GEOMETRY_TYPE_TRIANGLES_KHR must have been created with VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR

- VUID-vkCmdTraceRaysIndirectKHR-pHitShaderBindingTable-04736
  Any non-zero hit shader group entries in the table identified by pHitShaderBindingTable->deviceAddress accessed by this call from a geometry with a geometryType of VK_GEOMETRY_TYPE_AABBS_KHR must have been created with VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR

- VUID-vkCmdTraceRaysIndirectKHR-indirectDeviceAddress-03632
  If the buffer from which indirectDeviceAddress was queried is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdTraceRaysIndirectKHR-indirectDeviceAddress-03633
  The buffer from which indirectDeviceAddress was queried must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

- VUID-vkCmdTraceRaysIndirectKHR-indirectDeviceAddress-03634
  indirectDeviceAddress must be a multiple of 4

- VUID-vkCmdTraceRaysIndirectKHR-indirectDeviceAddress-03636
  All device addresses between indirectDeviceAddress and indirectDeviceAddress + sizeof (VkTraceRaysIndirectCommandKHR) - 1 must be in the buffer device address range of the same buffer

- VUID-vkCmdTraceRaysIndirectKHR-rayTracingPipelineTraceRaysIndirect-03637
  The rayTracingPipelineTraceRaysIndirect feature must be enabled

- VUID-vkCmdTraceRaysIndirectKHR-rayTracingMotionBlurPipelineTraceRaysIndirect-04951
  If the bound ray tracing pipeline was created with VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV VkPhysicalDeviceRayTracingMotionBlurFeaturesNV::rayTracingMotionBlurPipelineTraceRaysIndirect feature must be enabled

**Valid Usage (Implicit)**

- VUID-vkCmdTraceRaysIndirectKHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdTraceRaysIndirectKHR-pRaygenShaderBindingTable-parameter
  pRaygenShaderBindingTable must be a valid pointer to a valid VkStridedDeviceAddressRegionKHR structure

- VUID-vkCmdTraceRaysIndirectKHR-pMissShaderBindingTable-parameter
  pMissShaderBindingTable must be a valid pointer to a valid VkStridedDeviceAddressRegionKHR structure

- VUID-vkCmdTraceRaysIndirectKHR-pHitShaderBindingTable-parameter
  pHitShaderBindingTable must be a valid pointer to a valid VkStridedDeviceAddressRegionKHR structure

- VUID-vkCmdTraceRaysIndirectKHR-pCallableShaderBindingTable-parameter
pCallableShaderBindingTable must be a valid pointer to a valid VkStridedDeviceAddressRegionKHR structure

- VUID-vkCmdTraceRaysIndirectKHR-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdTraceRaysIndirectKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdTraceRaysIndirectKHR-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdTraceRaysIndirectKHR-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

The VkTraceRaysIndirectCommandKHR structure is defined as:

```c
// Provided by VK_KHR_ray_tracing_pipeline
typedef struct VkTraceRaysIndirectCommandKHR {
    uint32_t width;
    uint32_t height;
    uint32_t depth;
} VkTraceRaysIndirectCommandKHR;
```

- width is the width of the ray trace query dimensions.
- height is height of the ray trace query dimensions.
- depth is depth of the ray trace query dimensions.

The members of VkTraceRaysIndirectCommandKHR have the same meaning as the similarly named parameters of vkCmdTraceRaysKHR.
Valid Usage

- VUID-VkTraceRaysIndirectCommandKHR-width-03638
  
  width must be less than or equal to \( \text{VkPhysicalDeviceLimits::maxComputeWorkGroupCount}[0] \times \text{VkPhysicalDeviceLimits::maxComputeWorkGroupSize}[0] \)

- VUID-VkTraceRaysIndirectCommandKHR-height-03639
  
  height must be less than or equal to \( \text{VkPhysicalDeviceLimits::maxComputeWorkGroupCount}[1] \times \text{VkPhysicalDeviceLimits::maxComputeWorkGroupSize}[1] \)

- VUID-VkTraceRaysIndirectCommandKHR-depth-03640
  
  depth must be less than or equal to \( \text{VkPhysicalDeviceLimits::maxComputeWorkGroupCount}[2] \times \text{VkPhysicalDeviceLimits::maxComputeWorkGroupSize}[2] \)

- VUID-VkTraceRaysIndirectCommandKHR-width-03641
  
  \( \text{width} \times \text{height} \times \text{depth} \) must be less than or equal to \( \text{VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxRayDispatchInvocationCount} \)

To dispatch ray tracing, with some parameters sourced on the device, use:

```c
// Provided by VK_KHR_ray_tracing_maintenance1 with VK_KHR_ray_tracing_pipeline
void vkCmdTraceRaysIndirect2KHR(
    VkCommandBuffer commandBuffer,
    VkDeviceAddress indirectDeviceAddress);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `indirectDeviceAddress` is a buffer device address which is a pointer to a `VkTraceRaysIndirectCommand2KHR` structure containing the trace ray parameters.

`vkCmdTraceRaysIndirect2KHR` behaves similarly to `vkCmdTraceRaysIndirectKHR` except that shader binding table parameters as well as dispatch dimensions are read by the device from `indirectDeviceAddress` during execution.

Valid Usage

- VUID-vkCmdTraceRaysIndirect2KHR-magFilter-04553
  
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdTraceRaysIndirect2KHR-mipmapMode-04770
  
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdTraceRaysIndirect2KHR-None-06479
If a `VkImageView` is sampled with depth comparison, the image view's format features must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`.

- VUID-vkCmdTraceRaysIndirect2KHR-None-02691
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`.

- VUID-vkCmdTraceRaysIndirect2KHR-None-07888
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the storage texel buffer's format features must contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`.

- VUID-vkCmdTraceRaysIndirect2KHR-None-02692
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

- VUID-vkCmdTraceRaysIndirect2KHR-None-02693
  If the `VK_EXT_filter_cubic` extension is not enabled and any `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, it must not have a `VkImageViewType` of `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`.

- VUID-vkCmdTraceRaysIndirect2KHR-filterCubic-02694
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- VUID-vkCmdTraceRaysIndirect2KHR-filterCubicMinmax-02695
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- VUID-vkCmdTraceRaysIndirect2KHR-cubicRangeClamp-09212
  If the cubicRangeClamp feature is not enabled, then any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must not have a `VkSamplerReductionModeCreateInfo::reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM`.

- VUID-vkCmdTraceRaysIndirect2KHR-reductionMode-09213
  Any `VkImageView` being sampled with `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM` as a result of this command must sample with `VK_FILTER_CUBIC_EXT`.

- VUID-vkCmdTraceRaysIndirect2KHR-selectableCubicWeights-09214
  If the selectableCubicWeights feature is not enabled, then any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have `VkSamplerCubicWeightsCreateInfoQCOM::cubicWeights` equal to
• VUID-vkCmdTraceRaysIndirect2KHR-flags-02696
  Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE

• VUID-vkCmdTraceRaysIndirect2KHR-OpTypeImage-07027
  For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view’s format features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

• VUID-vkCmdTraceRaysIndirect2KHR-OpTypeImage-07028
  For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view’s format features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

• VUID-vkCmdTraceRaysIndirect2KHR-OpTypeImage-07029
  For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

• VUID-vkCmdTraceRaysIndirect2KHR-OpTypeImage-07030
  Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

• VUID-vkCmdTraceRaysIndirect2KHR-None-08600
  For each set n that is statically used by a bound shader, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout or VkDescriptorSetLayout array that was used to create the current VkPipeline or VkShaderEXT, as described in Pipeline Layout Compatibility

• VUID-vkCmdTraceRaysIndirect2KHR-None-08601
  For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout or VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkPipeline or VkShaderEXT, as described in Pipeline Layout Compatibility

• VUID-vkCmdTraceRaysIndirect2KHR-maintenance4-08602
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout or VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkPipeline or VkShaderEXT, as described in Pipeline Layout Compatibility

• VUID-vkCmdTraceRaysIndirect2KHR-None-08114
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid if they are statically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was not created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT
If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdBindDescriptorSets, the bound VkPipeline must have been created without VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT.

Descriptors in bound descriptor buffers, specified via vkCmdSetDescriptorBufferOffsetsEXT, must be valid if they are dynamically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT.

Descriptors in bound descriptor buffers, specified via vkCmdSetDescriptorBufferOffsetsEXT, must be valid if they are dynamically used by any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command.

If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdSetDescriptorBufferOffsetsEXT, the bound VkPipeline must have been created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT.

If a descriptor is dynamically used with a VkPipeline created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory must be resident.

If a descriptor is dynamically used with a VkShaderEXT created with a VkDescriptorSetLayout that was created with VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory must be resident.

If the shaderObject feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command.

If the shaderObject is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command.

If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound.

If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type.
VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage

- VUID-vkCmdTraceRaysIndirect2KHR-None-08610
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage

- VUID-vkCmdTraceRaysIndirect2KHR-None-08611
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage

- VUID-vkCmdTraceRaysIndirect2KHR-uniformBuffers-06935
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdTraceRaysIndirect2KHR-None-08612
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdTraceRaysIndirect2KHR-storageBuffers-06936
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdTraceRaysIndirect2KHR-None-08613
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdTraceRaysIndirect2KHR-commandBuffer-02707
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by bound shaders must not be a protected resource

- VUID-vkCmdTraceRaysIndirect2KHR-None-06550
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y'C
That object must only be used with \texttt{OpImageSample*} or \texttt{OpImageSparseSample*} instructions.

- **VUID-vkCmdTraceRaysIndirect2KHR-ConstOffset-06551**
  If a bound shader accesses a \texttt{VkSampler} or \texttt{VkImageView} object that enables sampler \texttt{Y'CbCr conversion}, that object must not use the \texttt{ConstOffset} and \texttt{Offset} operands.

- **VUID-vkCmdTraceRaysIndirect2KHR-viewType-07752**
  If a \texttt{VkImageView} is accessed as a result of this command, then the image view's \texttt{viewType} must match the \texttt{Dim} operand of the \texttt{OpTypeImage} as described in Instruction/Sampler/Image View Validation.

- **VUID-vkCmdTraceRaysIndirect2KHR-format-07753**
  If a \texttt{VkImageView} is accessed as a result of this command, then the numeric type of the image view's \texttt{format} and the \texttt{Sampled Type} operand of the \texttt{OpTypeImage} must match.

- **VUID-vkCmdTraceRaysIndirect2KHR-OpImageWrite-08795**
  If a \texttt{VkImageView} created with a format other than \texttt{VK_FORMAT_A8_UNORM_KHR} is accessed using \texttt{OpImageWrite} as a result of this command, then the \texttt{Type} of the \texttt{Texel} operand of that instruction must have at least as many components as the image view's \texttt{format}.

- **VUID-vkCmdTraceRaysIndirect2KHR-OpImageWrite-08796**
  If a \texttt{VkImageView} created with the format \texttt{VK_FORMAT_A8_UNORM_KHR} is accessed using \texttt{OpImageWrite} as a result of this command, then the \texttt{Type} of the \texttt{Texel} operand of that instruction must have four components.

- **VUID-vkCmdTraceRaysIndirect2KHR-SampledType-04470**
  If a \texttt{VkImageView} with a \texttt{VkFormat} that has a 64-bit component width is accessed as a result of this command, the \texttt{SampledType} of the \texttt{OpTypeImage} operand of that instruction must have a \texttt{Width} of 64.

- **VUID-vkCmdTraceRaysIndirect2KHR-SampledType-04471**
  If a \texttt{VkImageView} with a \texttt{VkFormat} that has a component width less than 64-bit is accessed as a result of this command, the \texttt{SampledType} of the \texttt{OpTypeImage} operand of that instruction must have a \texttt{Width} of 32.

- **VUID-vkCmdTraceRaysIndirect2KHR-SampledType-04472**
  If a \texttt{VkBufferView} with a \texttt{VkFormat} that has a 64-bit component width is accessed as a result of this command, the \texttt{SampledType} of the \texttt{OpTypeImage} operand of that instruction must have a \texttt{Width} of 64.

- **VUID-vkCmdTraceRaysIndirect2KHR-SampledType-04473**
  If a \texttt{VkBufferView} with a \texttt{VkFormat} that has a component width less than 64-bit is accessed as a result of this command, the \texttt{SampledType} of the \texttt{OpTypeImage} operand of that instruction must have a \texttt{Width} of 32.

- **VUID-vkCmdTraceRaysIndirect2KHR-sparseImageInt64Atomics-04474**
  If the \texttt{sparseImageInt64Atomics} feature is not enabled, \texttt{VkImage} objects created with the \texttt{VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT} flag must not be accessed by atomic instructions.
through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- **VUID-vkCmdTraceRaysIndirect2KHR-sparseImageInt64Atomics-04475**
  If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- **VUID-vkCmdTraceRaysIndirect2KHR-OpImageWeightedSampleQCOM-06971**
  If `OpImageWeightedSampleQCOM` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` must contain `VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM`

- **VUID-vkCmdTraceRaysIndirect2KHR-OpImageWeightedSampleQCOM-06972**
  If `OpImageWeightedSampleQCOM` uses a `VkImageView` as a sample weight image as a result of this command, then the image view's `format features` must contain `VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM`

- **VUID-vkCmdTraceRaysIndirect2KHR-OpImageBoxFilterQCOM-06973**
  If `OpImageBoxFilterQCOM` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` must contain `VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM`

- **VUID-vkCmdTraceRaysIndirect2KHR-OpImageBlockMatchSSDQCOM-06974**
  If `OpImageBlockMatchSSDQCOM` is used to read from a `VkImageView` as a result of this command, then the image view's `format features` must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`

- **VUID-vkCmdTraceRaysIndirect2KHR-OpImageBlockMatchSADQCOM-06975**
  If `OpImageBlockMatchSADQCOM` is used to read from a `reference image` as result of this command, then the specified reference coordinates must not fail `integer texel coordinate validation`

- **VUID-vkCmdTraceRaysIndirect2KHR-OpImageWeightedSampleQCOM-06977**
  If `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchWindowSSDQCOM`, `OpImageBlockMatchWindowSADQCOM`, `OpImageBlockMatchGatherSSDQCOM`, `OpImageBlockMatchGatherSADQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`

- **VUID-vkCmdTraceRaysIndirect2KHR-OpImageWeightedSampleQCOM-06978**
  If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchWindowSSDQCOM`, `OpImageBlockMatchWindowSADQCOM`, `OpImageBlockMatchGatherSSDQCOM`, `OpImageBlockMatchGatherSADQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`

- **VUID-vkCmdTraceRaysIndirect2KHR-OpImageBlockMatchWindow-09215**
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to
read from an VkImageView as a result of this command, then the image view's format features **must** contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

- **VUID-vkCmdTraceRaysIndirect2KHR-OpImageBlockMatchWindow-09216**
  If a *OpImageBlockMatchWindow*QCOM or *OpImageBlockMatchGather*QCOM instruction is used to read from an VkImageView as a result of this command, then the image view's format **must** be a single-component format.

- **VUID-vkCmdTraceRaysIndirect2KHR-OpImageBlockMatchWindow-09217**
  If a *OpImageBlockMatchWindow*QCOM or *OpImageBlockMatchGather*QCOM read from a reference image as result of this command, then the specified reference coordinates **must** not fail integer texel coordinate validation

- **VUID-vkCmdTraceRaysIndirect2KHR-None-07288**
  Any shader invocation executed by this command **must** terminate

- **VUID-vkCmdTraceRaysIndirect2KHR-None-03429**
  Any shader group handle referenced by this call **must** have been queried from the currently bound ray tracing pipeline

- **VUID-vkCmdTraceRaysIndirect2KHR-maxPipelineRayRecursionDepth-03679**
  This command **must** not cause a shader call instruction to be executed from a shader invocation with a recursion depth greater than the value of maxPipelineRayRecursionDepth used to create the bound ray tracing pipeline

- **VUID-vkCmdTraceRaysIndirect2KHR-commandBuffer-03635**
  commandBuffer **must** not be a protected command buffer

- **VUID-vkCmdTraceRaysIndirect2KHR-indirectDeviceAddress-03632**
  If the buffer from which indirectDeviceAddress was queried is non-sparse then it **must** be bound completely and contiguously to a single VkDeviceMemory object

- **VUID-vkCmdTraceRaysIndirect2KHR-indirectDeviceAddress-03633**
  The buffer from which indirectDeviceAddress was queried **must** have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

- **VUID-vkCmdTraceRaysIndirect2KHR-indirectDeviceAddress-03634**
  indirectDeviceAddress **must** be a multiple of 4

- **VUID-vkCmdTraceRaysIndirect2KHR-indirectDeviceAddress-03636**
  All device addresses between indirectDeviceAddress and indirectDeviceAddress + sizeof (VkTraceRaysIndirectCommand2KHR) - 1 **must** be in the buffer device address range of the same buffer

- **VUID-vkCmdTraceRaysIndirect2KHR-rayTracingPipelineTraceRaysIndirect2-03637**
  The rayTracingPipelineTraceRaysIndirect2 feature **must** be enabled

- **VUID-vkCmdTraceRaysIndirect2KHR-rayTracingMotionBlurPipelineTraceRaysIndirect-04951**
  If the bound ray tracing pipeline was created with VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV VkPhysicalDeviceRayTracingMotionBlurFeaturesNV::rayTracingMotionBlurPipelineTraceRaysIndirect feature **must** be enabled
Valid Usage (Implicit)

- VUID-vkCmdTraceRaysIndirect2KHR-commandBuffer-parameter
  
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdTraceRaysIndirect2KHR-commandBuffer-recording
  
  commandBuffer must be in the recording state

- VUID-vkCmdTraceRaysIndirect2KHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdTraceRaysIndirect2KHR-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdTraceRaysIndirect2KHR-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

The VkTraceRaysIndirectCommand2KHR structure is defined as:

```c
// Provided by VK_KHR_ray_tracing_maintenance1 with VK_KHR_ray_tracing_pipeline
typedef struct VkTraceRaysIndirectCommand2KHR {
    VkDeviceAddress raygenShaderRecordAddress;
    VkDeviceSize raygenShaderRecordSize;
    VkDeviceAddress missShaderBindingTableAddress;
    VkDeviceSize missShaderBindingTableSize;
    VkDeviceSize missShaderBindingTableStride;
    VkDeviceAddress callableShaderBindingTableAddress;
    VkDeviceSize callableShaderBindingTableSize;
    VkDeviceSize callableShaderBindingTableStride;
} VkTraceRaysIndirectCommand2KHR;
```
• `raygenShaderRecordAddress` is a `VkDeviceAddress` of the ray generation shader binding table record used by this command.

• `raygenShaderRecordSize` is a `VkDeviceSize` number of bytes corresponding to the ray generation shader binding table record at base address `raygenShaderRecordAddress`.

• `missShaderBindingTableAddress` is a `VkDeviceAddress` of the first record in the miss shader binding table used by this command.

• `missShaderBindingTableSize` is a `VkDeviceSize` number of bytes corresponding to the total size of the miss shader binding table at `missShaderBindingTableAddress` that may be accessed by this command.

• `missShaderBindingTableStride` is a `VkDeviceSize` number of bytes between records of the miss shader binding table.

• `hitShaderBindingTableAddress` is a `VkDeviceAddress` of the first record in the hit shader binding table used by this command.

• `hitShaderBindingTableSize` is a `VkDeviceSize` number of bytes corresponding to the total size of the hit shader binding table at `hitShaderBindingTableAddress` that may be accessed by this command.

• `hitShaderBindingTableStride` is a `VkDeviceSize` number of bytes between records of the hit shader binding table.

• `callableShaderBindingTableAddress` is a `VkDeviceAddress` of the first record in the callable shader binding table used by this command.

• `callableShaderBindingTableSize` is a `VkDeviceSize` number of bytes corresponding to the total size of the callable shader binding table at `callableShaderBindingTableAddress` that may be accessed by this command.

• `callableShaderBindingTableStride` is a `VkDeviceSize` number of bytes between records of the callable shader binding table.

• `width` is the width of the ray trace query dimensions.

• `height` is height of the ray trace query dimensions.

• `depth` is depth of the ray trace query dimensions.

The members of `VkTraceRaysIndirectCommand2KHR` have the same meaning as the similarly named parameters of `vkCmdTraceRaysKHR`.

Indirect shader binding table buffer parameters must satisfy the same memory alignment and binding requirements as their counterparts in `vkCmdTraceRaysIndirectKHR` and `vkCmdTraceRaysKHR`.
Valid Usage

- VUID-VkTraceRaysIndirectCommand2KHR-pRayGenShaderBindingTable-03680
  If the buffer from which raygenShaderRecordAddress was queried is non-sparse then it **must** be bound completely and contiguously to a single VkDeviceMemory object

- VUID-VkTraceRaysIndirectCommand2KHR-pRayGenShaderBindingTable-03681
  The buffer from which the raygenShaderRecordAddress is queried **must** have been created with the VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR usage flag

- VUID-VkTraceRaysIndirectCommand2KHR-pRayGenShaderBindingTable-03682
  raygenShaderRecordAddress **must** be a multiple of VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment

- VUID-VkTraceRaysIndirectCommand2KHR-pMissShaderBindingTable-03683
  If the buffer from which missShaderBindingTableAddress was queried is non-sparse then it **must** be bound completely and contiguously to a single VkDeviceMemory object

- VUID-VkTraceRaysIndirectCommand2KHR-pMissShaderBindingTable-03684
  The buffer from which the missShaderBindingTableAddress is queried **must** have been created with the VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR usage flag

- VUID-VkTraceRaysIndirectCommand2KHR-pMissShaderBindingTable-03685
  missShaderBindingTableAddress **must** be a multiple of VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment

- VUID-VkTraceRaysIndirectCommand2KHR-stride-03686
  missShaderBindingTableStride **must** be a multiple of VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment

- VUID-VkTraceRaysIndirectCommand2KHR-stride-04029
  missShaderBindingTableStride **must** be less than or equal to VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride

- VUID-VkTraceRaysIndirectCommand2KHR-pHitShaderBindingTable-03687
  If the buffer from which hitShaderBindingTableAddress was queried is non-sparse then it **must** be bound completely and contiguously to a single VkDeviceMemory object

- VUID-VkTraceRaysIndirectCommand2KHR-pHitShaderBindingTable-03688
  The buffer from which the hitShaderBindingTableAddress is queried **must** have been created with the VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR usage flag

- VUID-VkTraceRaysIndirectCommand2KHR-pHitShaderBindingTable-03689
  hitShaderBindingTableAddress **must** be a multiple of VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment

- VUID-VkTraceRaysIndirectCommand2KHR-stride-03690
  hitShaderBindingTableStride **must** be a multiple of VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment

- VUID-VkTraceRaysIndirectCommand2KHR-stride-04035
  hitShaderBindingTableStride **must** be less than or equal to VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride

- VUID-VkTraceRaysIndirectCommand2KHR-pCallableShaderBindingTable-03691
If the buffer from which `callableShaderBindingTableAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-VkTraceRaysIndirectCommand2KHR-pCallableShaderBindingTable-03692**
  The buffer from which the `callableShaderBindingTableAddress` is queried **must** have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag.

- **VUID-VkTraceRaysIndirectCommand2KHR-pCallableShaderBindingTable-03693**
  `callableShaderBindingTableAddress` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`.

- **VUID-VkTraceRaysIndirectCommand2KHR-stride-03694**
  `callableShaderBindingTableStride` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment`.

- **VUID-VkTraceRaysIndirectCommand2KHR-stride-04041**
  `callableShaderBindingTableStride` **must** be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride`.

- **VUID-VkTraceRaysIndirectCommand2KHR-flags-03696**
  If the currently bound ray tracing pipeline was created with flags that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`, `hitShaderBindingTableAddress` **must** not be zero.

- **VUID-VkTraceRaysIndirectCommand2KHR-flags-03697**
  If the currently bound ray tracing pipeline was created with flags that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`, `hitShaderBindingTableAddress` **must** not be zero.

- **VUID-VkTraceRaysIndirectCommand2KHR-flags-03511**
  If the currently bound ray tracing pipeline was created with flags that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR`, the shader group handle identified by `missShaderBindingTableAddress` **must** not be set to zero.

- **VUID-VkTraceRaysIndirectCommand2KHR-flags-03512**
  If the currently bound ray tracing pipeline was created with flags that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR`, entries in the table identified by `hitShaderBindingTableAddress` accessed as a result of this command in order to execute an any-hit shader **must** not be set to zero.

- **VUID-VkTraceRaysIndirectCommand2KHR-flags-03513**
  If the currently bound ray tracing pipeline was created with flags that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`, entries in the table identified by `hitShaderBindingTableAddress` accessed as a result of this command in order to execute a closest hit shader **must** not be set to zero.

- **VUID-VkTraceRaysIndirectCommand2KHR-flags-03514**
  If the currently bound ray tracing pipeline was created with flags that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`, entries in the table identified by `hitShaderBindingTableAddress` accessed as a result of this command in order to execute an intersection shader **must** not be set to zero.

- **VUID-VkTraceRaysIndirectCommand2KHR-pHitShaderBindingTable-04735**
  Any non-zero hit shader group entries in the table identified by...
40.3. Shader Binding Table

A shader binding table is a resource which establishes the relationship between the ray tracing pipeline and the acceleration structures that were built for the ray tracing pipeline. It indicates the shaders that operate on each geometry in an acceleration structure. In addition, it contains the resources accessed by each shader, including indices of textures, buffer device addresses, and constants. The application allocates and manages shader binding tables as VkBuffer objects.

Each entry in the shader binding table consists of shaderGroupHandleSize bytes of data, either as queried by vkGetRayTracingShaderGroupHandlesKHR to refer to those specified shaders, or all zeros to refer to a zero shader group. A zero shader group behaves as though it is a shader group consisting entirely of VK_SHADER_UNUSED_KHR. The remainder of the data specified by the stride is application-visible data that can be referenced by a ShaderRecordBufferKHR block in the shader.

The shader binding tables to use in a ray tracing pipeline are passed to the vkCmdTraceRaysNV, vkCmdTraceRaysKHR, or vkCmdTraceRaysIndirectKHR commands. Shader binding tables are readonly in shaders that are executing on the ray tracing pipeline.

Shader variables identified with the ShaderRecordBufferKHR storage class are used to access the provided shader binding table. Such variables must be:

- typed as OpTypeStruct, or an array of this type,
- identified with a Block decoration, and

hitShaderBindingTableAddress accessed by this call from a geometry with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR must have been created with VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR

- VUID-VkTraceRaysIndirectCommand2KHR-pHitShaderBindingTable-04736
  Any non-zero hit shader group entries in the table identified by hitShaderBindingTableAddress accessed by this call from a geometry with a geometryType of VK_GEOMETRY_TYPE_AABBS_KHR must have been created with VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR

- VUID-VkTraceRaysIndirectCommand2KHR-width-03638
  width must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0] × VkPhysicalDeviceLimits::maxComputeWorkGroupSize[0]

- VUID-VkTraceRaysIndirectCommand2KHR-height-03639
  height must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1] × VkPhysicalDeviceLimits::maxComputeWorkGroupSize[1]

- VUID-VkTraceRaysIndirectCommand2KHR-depth-03640
  depth must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2] × VkPhysicalDeviceLimits::maxComputeWorkGroupSize[2]

- VUID-VkTraceRaysIndirectCommand2KHR-width-03641
  width × height × depth must be less than or equal to VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxRayDispatchInvocationCount
• laid out explicitly using the Offset, ArrayStride, and MatrixStride decorations as specified in Offset and Stride Assignment.

The Offset decoration for any member of a Block-decorated variable in the ShaderRecordBufferKHR storage class must not cause the space required for that variable to extend outside the range [0, maxStorageBufferRange).

Accesses to the shader binding table from ray tracing pipelines must be synchronized with the VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR pipeline stage and an access type of VK_ACCESS_SHADER_READ_BIT.

Note
Because different shader record buffers can be associated with the same shader, a shader variable with ShaderRecordBufferKHR storage class will not be dynamically uniform if different invocations of the same shader can reference different data in the shader record buffer, such as if the same shader occurs twice in the shader binding table with a different shader record buffer. In this case, indexing resources based on values in the ShaderRecordBufferKHR storage class, the index should be decorated as NonUniform.

40.3.1. Indexing Rules

In order to execute the correct shaders and access the correct resources during a ray tracing dispatch, the implementation must be able to locate shader binding table entries at various stages of execution. This is accomplished by defining a set of indexing rules that compute shader binding table record positions relative to the buffer's base address in memory. The application must organize the contents of the shader binding table's memory in a way that application of the indexing rules will lead to correct records.

Ray Generation Shaders

Only one ray generation shader is executed per ray tracing dispatch.

For vkCmdTraceRaysKHR, the location of the ray generation shader is specified by the pRaygenShaderBindingTable->deviceAddress parameter—there is no indexing. All data accessed must be less than pRaygenShaderBindingTable->size bytes from deviceAddress. pRaygenShaderBindingTable->stride is unused, and must be equal to pRaygenShaderBindingTable->size.

For vkCmdTraceRaysNV, the location of the ray generation shader is specified by the raygenShaderBindingTableBuffer and raygenShaderBindingOffset parameters—there is no indexing.

Hit Shaders

The base for the computation of intersection, any-hit, and closest hit shader locations is the instanceShaderBindingTableRecordOffset value stored with each instance of a top-level acceleration structure (VkAccelerationStructureInstanceKHR). This value determines the beginning of the shader binding table records for a given instance.
In the following rule, `geometryIndex` refers to the `geometry index` of the intersected geometry within the instance.

The `sbtRecordOffset` and `sbtRecordStride` values are passed in as parameters to `traceNV()` or `traceRayEXT()` calls made in the shaders. See Section 8.19 (Ray Tracing Functions) of the OpenGL Shading Language Specification for more details. In SPIR-V, these correspond to the `SBTOffset` and `SBTStride` parameters to the `OpTraceRayNV` or `OpTraceRayKHR` or `OpTraceRayMotionNV` instruction.

The result of this computation is then added to `pHitShaderBindingTable->deviceAddress`, a device address passed to `vkCmdTraceRaysKHR`, or `hitShaderBindingOffset`, a base offset passed to `vkCmdTraceRaysNV`.

For `vkCmdTraceRaysKHR`, the complete rule to compute a hit shader binding table record address in the `pHitShaderBindingTable` is:

\[
\text{pHitShaderBindingTable->deviceAddress} + \text{pHitShaderBindingTable->stride} \times (\text{instanceShaderBindingTableRecordOffset} + \text{geometryIndex} \times \text{sbtRecordStride} + \text{sbtRecordOffset})
\]

All data accessed must be less than `pHitShaderBindingTable->size` bytes from the base address.

For `vkCmdTraceRaysNV`, the offset and stride come from direct parameters, so the full rule to compute a hit shader binding table record address in the `hitShaderBindingTableBuffer` is:

\[
\text{hitShaderBindingOffset} + \text{hitShaderBindingStride} \times (\text{instanceShaderBindingTableRecordOffset} + \text{geometryIndex} \times \text{sbtRecordStride} + \text{sbtRecordOffset})
\]

**Miss Shaders**

A miss shader is executed whenever a ray query fails to find an intersection for the given scene geometry. Multiple miss shaders may be executed throughout a ray tracing dispatch.

The base for the computation of miss shader locations is `pMissShaderBindingTable->deviceAddress`, a device address passed into `vkCmdTraceRaysKHR`, or `missShaderBindingOffset`, a base offset passed into `vkCmdTraceRaysNV`.

The `missIndex` value is passed in as a parameter to `traceNV()` or `traceRayEXT()` calls made in the shaders. See Section 8.19 (Ray Tracing Functions) of the OpenGL Shading Language Specification for more details. In SPIR-V, this corresponds to the `MissIndex` parameter to the `OpTraceRayNV` or `OpTraceRayKHR` or `OpTraceRayMotionNV` instruction.

For `vkCmdTraceRaysKHR`, the complete rule to compute a miss shader binding table record address in the `pMissShaderBindingTable` is:

\[
\text{pMissShaderBindingTable->deviceAddress} + \text{pMissShaderBindingTable->stride} \times \text{missIndex}
\]

All data accessed must be less than `pMissShaderBindingTable->size` bytes from the base address.
For \texttt{vkCmdTraceRaysNV}, the offset and stride come from direct parameters, so the full rule to compute a miss shader binding table record address in the \texttt{missShaderBindingTableBuffer} is:

\[
\text{missShaderBindingOffset} + \text{missShaderBindingStride} \times \text{missIndex}
\]

Callable Shaders

A callable shader is executed when requested by a ray tracing shader. Multiple callable shaders may be executed throughout a ray tracing dispatch.

The base for the computation of callable shader locations is \texttt{pCallableShaderBindingTable->deviceAddress}, a device address passed into \texttt{vkCmdTraceRaysKHR}, or \texttt{callableShaderBindingOffset}, a base offset passed into \texttt{vkCmdTraceRaysNV}.

The \texttt{sbtRecordIndex} value is passed in as a parameter to \texttt{executeCallableNV()} or \texttt{executeCallableEXT()} calls made in the shaders. See Section 8.19 (Ray Tracing Functions) of the OpenGL Shading Language Specification for more details. In SPIR-V, this corresponds to the \texttt{SBTIndex} parameter to the \texttt{OpExecuteCallableNV} or \texttt{OpExecuteCallableKHR} instruction.

For \texttt{vkCmdTraceRaysKHR}, the complete rule to compute a callable shader binding table record address in the \texttt{pCallableShaderBindingTable} is:

\[
\text{pCallableShaderBindingTable->deviceAddress} + \text{pCallableShaderBindingTable->stride} \times \text{sbtRecordIndex}
\]

All data accessed must be less than \texttt{pCallableShaderBindingTable->size} bytes from the base address.

For \texttt{vkCmdTraceRaysNV}, the offset and stride come from direct parameters, so the full rule to compute a callable shader binding table record address in the \texttt{callableShaderBindingTableBuffer} is:

\[
\text{callableShaderBindingOffset} + \text{callableShaderBindingStride} \times \text{sbtRecordIndex}
\]

40.4. Ray Tracing Pipeline Stack

Ray tracing pipelines have a potentially large set of shaders which may be invoked in various call chain combinations to perform ray tracing. To store parameters for a given shader execution, an implementation may use a stack of data in memory. This stack must be sized to the sum of the stack sizes of all shaders in any call chain executed by the application.

If the stack size is not set explicitly, the stack size for a pipeline is:

\[
\text{rayGenStackMax} + \min(1, \text{maxPipelineRayRecursionDepth}) \times \max(\text{closestHitStackMax}, \text{missStackMax}, \text{intersectionStackMax} + \text{anyHitStackMax}) + \max(0, \text{maxPipelineRayRecursionDepth} - 1) \times \max(\text{closestHitStackMax}, \text{missStackMax}) + 2 \times \text{callableStackMax}
\]
where `rayGenStackMax`, `closestHitStackMax`, `missStackMax`, `anyHitStackMax`, `intersectionStackMax`, and `callableStackMax` are the maximum stack values queried by the respective shader stages for any shaders in any shader groups defined by the pipeline.

This stack size is potentially significant, so an application may want to provide a more accurate stack size after pipeline compilation. The value that the application provides is the maximum value of the sum of all shaders in a call chain across all possible call chains, taking into account any application specific knowledge about the properties of the call chains.

**Note**

For example, if an application has two types of closest hit and miss shaders that it can use but the first level of rays will only use the first kind (possibly reflection) and the second level will only use the second kind (occlusion or shadow ray, for example) then the application can compute the stack size by something similar to:

\[
\text{rayGenStack} + \max(\text{closestHit1Stack, miss1Stack}) + \max(\text{closestHit2Stack, miss2Stack})
\]

This is guaranteed to be no larger than the default stack size computation which assumes that both call levels may be the larger of the two.

### 40.5. Ray Tracing Capture Replay

In a similar way to `bufferDeviceAddressCaptureReplay`, the `rayTracingPipelineShaderGroupHandleCaptureReplay` feature allows the querying of opaque data which can be used in a future replay.

During the capture phase, capture/replay tools are expected to query opaque data for shader group handle replay using `vkGetRayTracingCaptureReplayShaderGroupHandlesKHR`.

Providing the opaque data during replay, using `VkRayTracingShaderGroupCreateInfoKHR.pShaderGroupCaptureReplayHandle` at pipeline creation time, causes the implementation to generate identical shader group handles to those in the capture phase, allowing capture/replay tools to reuse previously recorded shader binding table buffer contents or to obtain the same handles by calling `vkGetRayTracingCaptureReplayShaderGroupHandlesKHR` again.
Chapter 41. Memory Decompression

To decompress data between one or more memory regions call:

```c
// Provided by VK_NV_memory_decompression
void vkCmdDecompressMemoryNV(
    VkCommandBuffer commandBuffer,
    uint32_t decompressRegionCount,
    const VkDecompressMemoryRegionNV* pDecompressMemoryRegions);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `decompressRegionCount` is the number of memory regions to decompress.
- `pDecompressMemoryRegions` is a pointer to an array of `decompressRegionCount` `VkDecompressMemoryRegionNV` structures specifying decompression parameters.

Each region specified in `pDecompressMemoryRegions` is decompressed from the source to destination region based on the specified decompression method.

Valid Usage

- VUID-vkCmdDecompressMemoryNV-None-07684
  The `memoryDecompression` feature must be enabled

Valid Usage (Implicit)

- VUID-vkCmdDecompressMemoryNV-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdDecompressMemoryNV-pDecompressMemoryRegions-parameter
  `pDecompressMemoryRegions` must be a valid pointer to an array of `decompressRegionCount` valid `VkDecompressMemoryRegionNV` structures

- VUID-vkCmdDecompressMemoryNV-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdDecompressMemoryNV-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

- VUID-vkCmdDecompressMemoryNV-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdDecompressMemoryNV-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdDecompressMemoryNV-decompressRegionCount-arraylength
  `decompressRegionCount` must be greater than 0
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

</tbody>
</table>

The `VkDecompressMemoryRegionNV` structure is defined as:

```c
// Provided by VK_NV_memory_decompression
typedef struct VkDecompressMemoryRegionNV {
    VkDeviceAddress srcAddress;
    VkDeviceAddress dstAddress;
    VkDeviceSize compressedSize;
    VkDeviceSize decompressedSize;
    VkMemoryDecompressionMethodFlagsNV decompressionMethod;
} VkDecompressMemoryRegionNV;
```

- `srcAddress` is the address where compressed data is stored.
- `dstAddress` is the destination address where decompressed data will be written.
- `compressedSize` is the size of compressed data in bytes.
- `decompressedSize` is the size of decompressed data in bytes.
- `decompressionMethod` is a bitmask of `VkMemoryDecompressionMethodFlagBitsNV` with a single bit set specifying the method used to decompress data.

Valid Usage

- VUID-VkDecompressMemoryRegionNV-srcAddress-07685
  The `srcAddress` must be 4 byte aligned.
- VUID-VkDecompressMemoryRegionNV-srcAddress-07686
  The memory in range `srcAddress` and `srcAddress + compressedSize` must be valid and bound to a `VkDeviceMemory` object.
- VUID-VkDecompressMemoryRegionNV-dstAddress-07687
  The `dstAddress` must be 4 byte aligned.
- VUID-VkDecompressMemoryRegionNV-dstAddress-07688
The memory in range `dstAddress` and `dstAddress + decompressedSize` must be valid and bound to a `VkDeviceMemory` object.

- VUID-VkDecompressMemoryRegionNV-decompressedSize-07689
  The `decompressedSize` must be large enough to hold the decompressed data based on the `decompressionMethod`.

- VUID-VkDecompressMemoryRegionNV-decompressionMethod-07690
  The `decompressionMethod` must have a single bit set.

- VUID-VkDecompressMemoryRegionNV-srcAddress-07691
  The `srcAddress` to `srcAddress + compressedSize` region must not overlap with the `dstAddress` and `dstAddress + decompressedSize` region.

**Valid Usage (Implicit)**

- VUID-VkDecompressMemoryRegionNV-decompressionMethod-parameter
  `decompressionMethod` must be a valid combination of `VkMemoryDecompressionMethodFlagBitsNV` values.

- VUID-VkDecompressMemoryRegionNV-decompressionMethod-requiredbitmask
  `decompressionMethod` must not be 0.

To decompress data between one or more memory regions by specifying decompression parameters indirectly in a buffer, call:

```c
// Provided by VK_NV_memory_decompression
void vkCmdDecompressMemoryIndirectCountNV(
    VkCommandBuffer commandBuffer,
    VkDeviceAddress indirectCommandsAddress,
    VkDeviceAddress indirectCommandsCountAddress,
    uint32_t stride);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `indirectCommandsAddress` is the device address containing decompression parameters laid out as an array of `VkDecompressMemoryRegionNV` structures.
- `indirectCommandsCountAddress` is the device address containing the decompression count.
- `stride` is the byte stride between successive sets of decompression parameters located starting from `indirectCommandsAddress`.

Each region specified in `indirectCommandsAddress` is decompressed from the source to destination region based on the specified decompression method.

**Valid Usage**

- VUID-vkCmdDecompressMemoryIndirectCountNV-None-07692
  The `memoryDecompression` feature must be enabled.
If \textit{indirectCommandsAddress} comes from a non-sparse buffer then it \textbf{must} be bound completely and contiguously to a single \texttt{VkDeviceMemory} object.

The \texttt{VkBuffer} that \textit{indirect CommandsAddress} comes from \textbf{must} have been created with the \texttt{VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT} bit set.

\textit{offset} \textbf{must} be a multiple of 4.

If \textit{indirectCommandsCountAddress} comes from a non-sparse buffer then it \textbf{must} be bound completely and contiguously to a single \texttt{VkDeviceMemory} object.

The \texttt{VkBuffer} that \textit{indirectCommandsCountAddress} comes from \textbf{must} have been created with the \texttt{VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT} bit set.

\textit{indirectCommandsCountAddress} \textbf{must} be a multiple of 4.

\textit{indirectCommandsCountAddress} \textbf{must} be a multiple of 4 and \textbf{must} be greater than or equal to \texttt{sizeof(VkDecompressMemoryRegionNV)}.

\textbf{must} be less than or equal to \texttt{sizeof(VkDecompressMemoryRegionNV)}.

\textbf{must} be less than or equal to the size of the \texttt{VkBuffer} that \textit{indirectCommandsAddress} comes from.

\textbf{must} be less than or equal to the last valid address in the \texttt{VkBuffer} that \textit{indirectCommandsAddress} was created from.

\textbf{Valid Usage (Implicit)}

\textbf{commandBuffer} \textbf{must} be a valid \texttt{VkCommandBuffer} handle.

\textbf{commandBuffer-recording}
**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Bits which can be set in `VkDecompressMemoryRegionNV::decompressionMethod` specifying the decompression method to select, or returned in `VkPhysicalDeviceMemoryDecompressionPropertiesNV::decompressionMethods` specifying the available decompression methods are:

```cpp
// Provided by VK_NV_memory_decompression
// Flag bits for VkMemoryDecompressionMethodFlagBitsNV
typedef VkFlags64 VkMemoryDecompressionMethodFlagBitsNV;
static const VkMemoryDecompressionMethodFlagBitsNV VK_MEMORY_DECOMPRESSION_METHOD_GDEFLATE_1_0_BIT_NV = 0x00000001ULL;
```

- `VK_MEMORY_DECOMPRESSION_METHOD_GDEFLATE_1_0_BIT_NV` specifies that the GDeflate 1.0 algorithm is used to decompress data.

```cpp
// Provided by VK_NV_memory_decompression
typedef VkFlags64 VkMemoryDecompressionMethodFlagsNV;
```

`VkMemoryDecompressionMethodFlagsNV` is a bitmask type for specifying a mask of one or more `VkMemoryDecompressionMethodFlagBitsNV`.
Chapter 42. Video Coding

Vulkan implementations may expose one or more queue families supporting video coding operations. These operations are performed by recording them into a command buffer within a video coding scope, and submitting them to queues with compatible video coding capabilities.

The Vulkan video functionalities are designed to be made available through a set of APIs built on top of each other, consisting of:

- A core API providing common video coding functionalities,
- APIs providing codec-independent video decode and video encode related functionalities, respectively,
- Additional codec-specific APIs built on top of those.

This chapter details the fundamental components and operations of these.

42.1. Video Picture Resources

In the context of video coding, multidimensional arrays of image data that can be used as the source or target of video coding operations are referred to as video picture resources. They may store additional metadata that includes implementation-private information used during the execution of video coding operations, as discussed later.

Video picture resources are backed by VkImage objects. Individual subregions of VkImageView objects created from such resources can be used as decode output pictures, encode input pictures, reconstructed pictures, and/or reference pictures.

The parameters of a video picture resource are specified using a VkVideoPictureResourceInfoKHR structure.

The VkVideoPictureResourceInfoKHR structure is defined as:

```c
typedef struct VkVideoPictureResourceInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkOffset2D codedOffset;
    VkExtent2D codedExtent;
    uint32_t baseArrayLayer;
    VkImageView imageViewBinding;
} VkVideoPictureResourceInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- codedOffset is the offset in texels of the image subregion to use.
- codedExtent is the size in pixels of the coded image data.
• **baseArrayLayer** is the array layer of the image view specified in **imageViewBinding** to use as the video picture resource.

• **imageViewBinding** is an image view representing the video picture resource.

The image subresource referred to by such a structure is defined as the image array layer index specified in **baseArrayLayer** relative to the image subresource range the image view specified in **imageViewBinding** was created with.

The meaning of the **codedOffset** and **codedExtent** depends on the command and context the video picture resource is used in, as well as on the used video profile and corresponding codec-specific semantics, as described later.

A video picture resource is uniquely defined by the image subresource referred to by an instance of this structure, together with the **codedOffset** and **codedExtent** members that identify the image subregion within the image subresource referenced corresponding to the video picture resource according to the particular codec-specific semantics.

Accesses to image data within a video picture resource happen at the granularity indicated by **VkVideoCapabilitiesKHR::pictureAccessGranularity**, as returned by **vkGetPhysicalDeviceVideoCapabilitiesKHR** for the used video profile. As a result, given an effective image subregion corresponding to a video picture resource, the actual image subregion accessed may be larger than that as it may include additional padding texels due to the picture access granularity. Any writes performed by video coding operations to such padding texels will result in undefined texel values.

Two video picture resources match if they refer to the same image subresource and they specify identical **codedOffset** and **codedExtent** values.

---

**Valid Usage**

- VUID-VkVideoPictureResourceInfoKHR-baseArrayLayer-07175
  - **baseArrayLayer** must be less than the **VkImageViewCreateInfo::subresourceRange.layerCount** specified when the image view **imageViewBinding** was created

---

**Valid Usage (Implicit)**

- VUID-VkVideoPictureResourceInfoKHR-sType-sType
  - **sType** must be **VK_STRUCTURE_TYPE_VIDEO_PICTURE_RESOURCE_INFO_KHR**

- VUID-VkVideoPictureResourceInfoKHR-pNext-pNext
  - **pNext** must be **NULL**

- VUID-VkVideoPictureResourceInfoKHR-imageViewBinding-parameter
  - **imageViewBinding** must be a valid **VkImageView** handle
42.2. Decoded Picture Buffer

An integral part of video coding pipelines is the reconstruction of pictures from a compressed video bitstream. A reconstructed picture is a video picture resource resulting from this process.

Such reconstructed pictures can be used as reference pictures in subsequent video coding operations to provide predictions of the values of samples of subsequently decoded or encoded pictures. The correct use of such reconstructed pictures as reference pictures is driven by the video compression standard, the implementation, and the application-specific use cases.

The list of reference pictures used to provide such predictions within a single video coding operation is referred to as the list of active reference pictures.

The decoded picture buffer (DPB) is an indexed data structure that maintains the set of reference pictures available to be used in video coding operations. Individual indexed entries of the DPB are referred to as the decoded picture buffer (DPB) slots. The range of valid DPB slot indices is between zero and $N-1$, where $N$ is the capacity of the DPB. Each DPB slot can refer to a reference picture containing a video frame or can refer to up to two reference pictures containing the top and/or bottom fields that, when both present, together represent a full video frame.

In Vulkan, the state and the backing store of the DPB is separated as follows:

- The state of individual DPB slots is maintained by video session objects.
- The backing store of DPB slots is provided by subregions of VkImage objects used as video picture resources.

In addition, the implementation may also maintain opaque metadata associated with DPB slots, including:

- Reference picture metadata corresponding to the video picture resource associated with the DPB slot.

Such metadata may be stored by the implementation as part of the DPB slot state maintained by the video session, or as part of the video picture resource backing the DPB slot.

Any metadata stored in the video picture resources backing DPB slots are independent of the video session used to store it, hence such video picture resources can be shared with other video sessions. Correspondingly, any metadata that is dependent on the video session will always be stored as part of the DPB slot state maintained by that video session.

The responsibility of managing the DPB is split between the application and the implementation as follows:

- The application maintains the association between DPB slot indices and corresponding video picture resources.
- The implementation maintains global and per-slot opaque reference picture metadata.

In addition, the application is also responsible for managing the mapping between the codec-specific picture IDs and DPB slots, and any other codec-specific states unless otherwise specified.
42.2.1. DPB Slot States

At a given time, each DPB slot is either in active or inactive state. Initially, all DPB slots managed by a video session are in inactive state.

A DPB slot can be activated by using it as the target of picture reconstruction within a video coding operation, changing its state to active.

As part of the picture reconstruction, the implementation may also generate reference picture metadata.

If such a video coding operation completes successfully, the activated DPB slot will have a valid picture reference and the reconstructed picture is associated with the DPB slot. This is true even if the DPB slot is used as the target of a picture reconstruction that only sets up a top field or bottom field reference picture and thus does not yet refer to a complete frame. However, if any data provided as input to such a video coding operation is not compliant to the video compression standard used, that video coding operation may complete unsuccessfully, in which case the activated DPB slot will have an invalid picture reference. This is true even if the DPB slot previously had a valid picture reference to a top field or bottom field reference picture, but the reconstruction of the other field corresponding to the DPB slot failed.

The application can use queries to get feedback about the outcome of video coding operations and use the resulting VkQueryResultStatusKHR value to determine whether the video coding operation completed successfully (result status is positive) or unsuccessfully (result status is negative).

Using a reference picture associated with a DPB slot that has an invalid picture reference as an active reference picture in subsequent video coding operations is legal, however, the contents of the outputs of such operations are undefined, and any DPB slots activated by such video coding operations will also have an invalid picture reference. This is true even if such video coding operations may otherwise complete successfully.

A DPB slot can also be deactivated by the application, changing its state to inactive and invalidating any picture references and reference picture metadata associated with the DPB slot.

A DPB slot can be activated with a new frame even if it is already active. In this case all previous associations of the DPB slots with reference pictures are replaced with an association with the reconstructed picture used to activate it. If an already active DPB slot is activated with a reconstructed field picture, then the behavior is as follows:

- If the DPB slot is currently associated with a frame, then that association is replaced with an association with the reconstructed field picture used to activate it.
- If the DPB slot is not currently associated with a top field picture and the DPB slot is activated with a top field picture, or if the DPB slot is not currently associated with a bottom field picture and the DPB slot is activated with a bottom field picture, then the DPB slot is associated with the reconstructed field picture used to activate it, without disturbing the other field picture association, if any.
- If the DPB slot is currently associated with a top field picture and the DPB slot is activated with a new top field picture, or if the DPB slot is currently associated with a bottom field picture and the DPB slot is activated with a new bottom field picture, then that association is replaced with
an association with the reconstructed field picture used to activate it, without disturbing the other field picture association, if any.

42.3. Video Profiles

The VkVideoProfileInfoKHR structure is defined as follows:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoProfileInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoCodecOperationFlagBitsKHR videoCodecOperation;
    VkVideoChromaSubsamplingFlagsKHR chromaSubsampling;
    VkVideoComponentBitDepthFlagsKHR lumaBitDepth;
    VkVideoComponentBitDepthFlagsKHR chromaBitDepth;
} VkVideoProfileInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `videoCodecOperation` is a VkVideoCodecOperationFlagBitsKHR value specifying a video codec operation.
- `chromaSubsampling` is a bitmask of VkVideoChromaSubsamplingFlagBitsKHR specifying video chroma subsampling information.
- `lumaBitDepth` is a bitmask of VkVideoComponentBitDepthFlagBitsKHR specifying video luma bit depth information.
- `chromaBitDepth` is a bitmask of VkVideoComponentBitDepthFlagBitsKHR specifying video chroma bit depth information.

Video profiles are provided as input to video capability queries such as vkGetPhysicalDeviceVideoCapabilitiesKHR or vkGetPhysicalDeviceVideoFormatPropertiesKHR, as well as when creating resources to be used by video coding operations such as images, buffers, query pools, and video sessions.

The full description of a video profile is specified by an instance of this structure, and the codec-specific and auxiliary structures provided in its `pNext` chain.

When this structure is specified as an input parameter to vkGetPhysicalDeviceVideoCapabilitiesKHR, or through the `pProfiles` member of an VkVideoProfileListInfoKHR structure in the `pNext` chain of the input parameter of a query command such as vkGetPhysicalDeviceVideoFormatPropertiesKHR or vkGetPhysicalDeviceImageFormatProperties2, the following error codes indicate specific causes of the failure of the query operation:

- VK_ERROR_VIDEO_PICTURE_LAYOUT_NOT_SUPPORTED_KHR indicates that the requested video picture layout (e.g. through the `pictureLayout` member of a VkVideoDecodeH264ProfileInfoKHR structure included in the `pNext` chain of VkVideoProfileInfoKHR) is not supported.
• **VK_ERROR_VIDEO_PROFILE_OPERATION_NOT_SUPPORTED_KHR** indicates that a video profile operation specified by `videoCodecOperation` is not supported.

• **VK_ERROR_VIDEO_PROFILE_FORMAT_NOT_SUPPORTED_KHR** indicates that video format parameters specified by `chromaSubsampling`, `lumaBitDepth`, or `chromaBitDepth` are not supported.

• **VK_ERROR_VIDEO_PROFILE_CODEC_NOT_SUPPORTED_KHR** indicates that the codec-specific parameters corresponding to the video codec operation are not supported.

### Valid Usage

- **VUID-VkVideoProfileInfoKHR-chromaSubsampling-07013**
  
  `chromaSubsampling` must have a single bit set

- **VUID-VkVideoProfileInfoKHR-lumaBitDepth-07014**
  
  `lumaBitDepth` must have a single bit set

- **VUID-VkVideoProfileInfoKHR-chromaSubsampling-07015**
  
  If `chromaSubsampling` is not **VK_VIDEO_CHROMA_SUBSAMPLING_MONOCHROME_BIT_KHR**, then `chromaBitDepth` must have a single bit set

- **VUID-VkVideoProfileInfoKHR-videoCodecOperation-07179**
  
  If `videoCodecOperation` is **VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR**, then the `pNext` chain must include a `VkVideoDecodeH264ProfileInfoKHR` structure

- **VUID-VkVideoProfileInfoKHR-videoCodecOperation-07180**
  
  If `videoCodecOperation` is **VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR**, then the `pNext` chain must include a `VkVideoDecodeH265ProfileInfoKHR` structure

- **VUID-VkVideoProfileInfoKHR-videoCodecOperation-07181**
  
  If `videoCodecOperation` is **VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT**, then the `pNext` chain must include a `VkVideoEncodeH264ProfileInfoEXT` structure

- **VUID-VkVideoProfileInfoKHR-videoCodecOperation-07182**
  
  If `videoCodecOperation` is **VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_EXT**, then the `pNext` chain must include a `VkVideoEncodeH265ProfileInfoEXT` structure

### Valid Usage (Implicit)

- **VUID-VkVideoProfileInfoKHR-sType-sType**
  
  `sType` must be **VK_STRUCTURE_TYPE_VIDEO_PROFILE_INFO_KHR**

- **VUID-VkVideoProfileInfoKHR-videoCodecOperation-parameter**
  
  `videoCodecOperation` must be a valid `VkVideoCodecOperationFlagBitsKHR` value

- **VUID-VkVideoProfileInfoKHR-chromaSubsampling-parameter**
  
  `chromaSubsampling` must be a valid combination of `VkVideoChromaSubsamplingFlagBitsKHR` values

- **VUID-VkVideoProfileInfoKHR-chromaSubsampling-required bitmask**
  
  `chromaSubsampling` must not be 0

- **VUID-VkVideoProfileInfoKHR-lumaBitDepth-parameter**
  
  `lumaBitDepth` must be a valid combination of `VkVideoComponentBitDepthFlagBitsKHR` values
values

• VUID-VkVideoProfileInfoKHR-lumaBitDepth-required bitmask
  lumaBitDepth must not be 0

• VUID-VkVideoProfileInfoKHR-chromaBitDepth-parameter
  chromaBitDepth must be a valid combination of VkVideoComponentBitDepthFlagBitsKHR values

Possible values of VkVideoProfileInfoKHR::videoCodecOperation, specifying the type of video coding operation and video compression standard used by a video profile, are:

```c
// Provided by VK_KHR_video_queue
typedef enum VkVideoCodecOperationFlagBitsKHR {
    VK_VIDEO_CODEC_OPERATION_NONE_KHR = 0,
    #ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_EXT_video_encode_h264
    VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT = 0x00010000,
    #endif
    #ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_EXT_video_encode_h265
    VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_EXT = 0x00020000,
    #endif
    // Provided by VK_KHR_video_decode_h264
    VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR = 0x00000001,
    // Provided by VK_KHR_video_decode_h265
    VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR = 0x00000002,
} VkVideoCodecOperationFlagBitsKHR;
```

• VK_VIDEO_CODEC_OPERATION_NONE_KHR indicates no support for any video codec operations.
• VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR specifies support for H.264 video decode operations.
• VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR specifies support for H.265 video decode operations.
• VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT specifies support for H.264 video encode operations.
• VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_EXT specifies support for H.265 video encode operations.

```c
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoCodecOperationFlagsKHR;
```

VkVideoCodecOperationFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoCodecOperationFlagBitsKHR.

The video format chroma subsampling is defined with the following enums:
**Provided by VK_KHR_video_queue**

```c
typedef enum VkVideoChromaSubsamplingFlagBitsKHR {
    VK_VIDEO_CHROMA_SUBSAMPLING_INVALID_KHR = 0,
    VK_VIDEO_CHROMA_SUBSAMPLING_MONOCHROME_BIT_KHR = 0x00000001,
    VK_VIDEO_CHROMA_SUBSAMPLING_420_BIT_KHR = 0x00000002,
    VK_VIDEO_CHROMA_SUBSAMPLING_422_BIT_KHR = 0x00000004,
    VK_VIDEO_CHROMA_SUBSAMPLING_444_BIT_KHR = 0x00000008,
} VkVideoChromaSubsamplingFlagBitsKHR;
```

- **VK_VIDEO_CHROMA_SUBSAMPLING_MONOCHROME_BIT_KHR** specifies that the format is monochrome.
- **VK_VIDEO_CHROMA_SUBSAMPLING_420_BIT_KHR** specifies that the format is 4:2:0 chroma subsampled, i.e. the two chroma components are sampled horizontally and vertically at half the sample rate of the luma component.
- **VK_VIDEO_CHROMA_SUBSAMPLING_422_BIT_KHR** - the format is 4:2:2 chroma subsampled, i.e. the two chroma components are sampled horizontally at half the sample rate of the luma component.
- **VK_VIDEO_CHROMA_SUBSAMPLING_444_BIT_KHR** - the format is 4:4:4 chroma sampled, i.e. all three components of the \( Y'C_bC_r \) format are sampled at the same rate, thus there is no chroma subsampling.

Chroma subsampling is described in more detail in the Chroma Reconstruction section.

**Provided by VK_KHR_video_queue**

```c
typedef VkFlags VkVideoChromaSubsamplingFlagsKHR;
```

**VkVideoChromaSubsamplingFlagsKHR** is a bitmask type for setting a mask of zero or more **VkVideoChromaSubsamplingFlagBitsKHR**.

Possible values for the video format component bit depth are:

**Provided by VK_KHR_video_queue**

```c
typedef enum VkVideoComponentBitDepthFlagBitsKHR {
    VK_VIDEO_COMPONENT_BIT_DEPTH_INVALID_KHR = 0,
    VK_VIDEO_COMPONENT_BIT_DEPTH_8_BIT_KHR = 0x00000001,
    VK_VIDEO_COMPONENT_BIT_DEPTH_10_BIT_KHR = 0x00000004,
    VK_VIDEO_COMPONENT_BIT_DEPTH_12_BIT_KHR = 0x00000010,
} VkVideoComponentBitDepthFlagBitsKHR;
```

- **VK_VIDEO_COMPONENT_BIT_DEPTH_8_BIT_KHR** specifies a component bit depth of 8 bits.
- **VK_VIDEO_COMPONENT_BIT_DEPTH_10_BIT_KHR** specifies a component bit depth of 10 bits.
- **VK_VIDEO_COMPONENT_BIT_DEPTH_12_BIT_KHR** specifies a component bit depth of 12 bits.

**Provided by VK_KHR_video_queue**

```c
typedef VkFlags VkVideoComponentBitDepthFlagsKHR;
```
VkVideoComponentBitDepthFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoComponentBitDepthFlagBitsKHR.

Additional information about the video decode use case can be provided by adding a VkVideoDecodeUsageInfoKHR structure to the pNext chain of VkVideoProfileInfoKHR.

The VkVideoDecodeUsageInfoKHR structure is defined as:

```c
typedef struct VkVideoDecodeUsageInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoDecodeUsageFlagsKHR videoUsageHints;
} VkVideoDecodeUsageInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `videoUsageHints` is a bitmask of VkVideoDecodeUsageFlagBitsKHR specifying hints about the intended use of the video decode profile.

**Valid Usage (Implicit)**

- VUID-VkVideoDecodeUsageInfoKHR-sType-sType
  - `sType` must be VK_STRUCTURE_TYPE_VIDEO_DECODE_USAGE_INFO_KHR
- VUID-VkVideoDecodeUsageInfoKHR-videoUsageHints-parameter
  - `videoUsageHints` must be a valid combination of VkVideoDecodeUsageFlagBitsKHR values

The following bits can be specified in VkVideoDecodeUsageInfoKHR::videoUsageHints as a hint about the video decode use case:

```c
typedef enum VkVideoDecodeUsageFlagBitsKHR {
    Vk_VIDEO_DECODE_USAGE_DEFAULT_KHR = 0,
    VK_VIDEO_DECODE_USAGE_TRANSCODING_BIT_KHR = 0x00000001,
    VK_VIDEO_DECODE_USAGE_OFFLINE_BIT_KHR = 0x00000002,
    VK_VIDEO_DECODE_USAGE_STREAMING_BIT_KHR = 0x00000004,
} VkVideoDecodeUsageFlagBitsKHR;
```

- `VK_VIDEO_DECODE_USAGE_TRANSCODING_BIT_KHR` specifies that video decoding is intended to be used in conjunction with video encoding to transcode a video bitstream with the same and/or different codecs.
- `VK_VIDEO_DECODE_USAGE_OFFLINE_BIT_KHR` specifies that video decoding is intended to be used to consume a local video bitstream.
- `VK_VIDEO_DECODE_USAGE_STREAMING_BIT_KHR` specifies that video decoding is intended to be used to
consume a video bitstream received as a continuous flow over network.

**Note**

There are no restrictions on the combination of bits that **can** be specified by the application. However, applications **should** use reasonable combinations in order for the implementation to be able to select the most appropriate mode of operation for the particular use case.

```c
// Provided by VK_KHR_video_decode_queue
typedef VkFlags VkVideoDecodeUsageFlagsKHR;
```

**VkVideoDecodeUsageFlagsKHR** is a bitmask type for setting a mask of zero or more **VkVideoDecodeUsageFlagBitsKHR**.

Additional information about the video encode use case **can** be provided by adding a **VkVideoEncodeUsageInfoKHR** structure to the **pNext** chain of **VkVideoProfileInfoKHR**.

The **VkVideoEncodeUsageInfoKHR** structure is defined as:

```c
// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeUsageInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoEncodeUsageFlagsKHR videoUsageHints;
    VkVideoEncodeContentFlagsKHR videoContentHints;
    VkVideoEncodeTuningModeKHR tuningMode;
} VkVideoEncodeUsageInfoKHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **videoUsageHints** is a bitmask of **VkVideoEncodeUsageFlagBitsKHR** specifying hints about the intended use of the video encode profile.
- **videoContentHints** is a bitmask of **VkVideoEncodeContentFlagBitsKHR** specifying hints about the content to be encoded using the video encode profile.
- **tuningMode** is a **VkVideoEncodeTuningModeKHR** value specifying the tuning mode to use when encoding with the video profile.

**Valid Usage (Implicit)**

- **VUID-VkVideoEncodeUsageInfoKHR-sType-sType**
  - **sType** must be **VK_STRUCTURE_TYPE_VIDEO_ENCODE_USAGE_INFO_KHR**

- **VUID-VkVideoEncodeUsageInfoKHR-videoUsageHints-parameter**
  - **videoUsageHints** must be a valid combination of **VkVideoEncodeUsageFlagBitsKHR** values

- **VUID-VkVideoEncodeUsageInfoKHR-videoContentHints-parameter**
videoContentHints must be a valid combination of VkVideoEncodeContentFlagBitsKHR values

• VUID-VkVideoEncodeUsageInfoKHR-tuningMode-parameter
  If tuningMode is not 0, tuningMode must be a valid VkVideoEncodeTuningModeKHR value

The following bits can be specified in VkVideoEncodeUsageInfoKHR::videoUsageHints as a hint about the video encode use case:

```c
// Provided by VK_KHR_video_encode_queue
typedef enum VkVideoEncodeUsageFlagBitsKHR {
    VK_VIDEO_ENCODE_USAGE_DEFAULT_KHR = 0,
    VK_VIDEO_ENCODE_USAGE_TRANSCODING_BIT_KHR = 0x00000001,
    VK_VIDEO_ENCODE_USAGE_STREAMING_BIT_KHR = 0x00000002,
    VK_VIDEO_ENCODE_USAGE_RECORDING_BIT_KHR = 0x00000004,
    VK_VIDEO_ENCODE_USAGE_CONFERENCING_BIT_KHR = 0x00000008,
} VkVideoEncodeUsageFlagBitsKHR;
```

• VK_VIDEO_ENCODE_USAGE_TRANSCODING_BIT_KHR specifies that video encoding is intended to be used in conjunction with video decoding to transcode a video bitstream with the same and/or different codecs.

• VK_VIDEO_ENCODE_USAGE_STREAMING_BIT_KHR specifies that video encoding is intended to be used to produce a video bitstream that is expected to be sent as a continuous flow over network.

• VK_VIDEO_ENCODE_USAGE_RECORDING_BIT_KHR specifies that video encoding is intended to be used for real-time recording for offline consumption.

• VK_VIDEO_ENCODE_USAGE_CONFERENCING_BIT_KHR specifies that video encoding is intended to be used in a video conferencing scenario.

\[\text{Note}\]

There are no restrictions on the combination of bits that can be specified by the application. However, applications should use reasonable combinations in order for the implementation to be able to select the most appropriate mode of operation for the particular use case.

```c
// Provided by VK_KHR_video_encode_queue
typedef VkFlags VkVideoEncodeUsageFlagsKHR;
```

VkVideoEncodeUsageFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoEncodeUsageFlagBitsKHR.

The following bits can be specified in VkVideoEncodeUsageInfoKHR::videoContentHints as a hint about the encoded video content:

```c
// Provided by VK_KHR_video_encode_queue
typedef enum VkVideoEncodeContentFlagBitsKHR {
```
VK_VIDEO_ENCODE_CONTENT_DEFAULT_KHR = 0,
VK_VIDEO_ENCODE_CONTENT_CAMERA_BIT_KHR = 0x00000001,
VK_VIDEO_ENCODE_CONTENT_DESKTOP_BIT_KHR = 0x00000002,
VK_VIDEO_ENCODE_CONTENT_RENDERED_BIT_KHR = 0x00000004,
} VkVideoEncodeContentFlagBitsKHR;

- **VK_VIDEO_ENCODE_CONTENT_CAMERA_BIT_KHR** specifies that video encoding is intended to be used to encode camera content.
- **VK_VIDEO_ENCODE_CONTENT_DESKTOP_BIT_KHR** specifies that video encoding is intended to be used to encode desktop content.
- **VK_VIDEO_ENCODE_CONTENT_RENDERED_BIT_KHR** specified that video encoding is intended to be used to encode rendered (e.g. game) content.

Note

There are no restrictions on the combination of bits that can be specified by the application. However, applications should use reasonable combinations in order for the implementation to be able to select the most appropriate mode of operation for the particular content type.

// Provided by VK_KHR_video_encode_queue
typedef VkFlags VkVideoEncodeContentFlagsKHR;

VkVideoEncodeContentFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoEncodeContentFlagBitsKHR.

Possible video encode tuning mode values are as follows:

// Provided by VK_KHR_video_encode_queue
typedef enum VkVideoEncodeTuningModeKHR {
    VK_VIDEO_ENCODE_TUNING_MODE_DEFAULT_KHR = 0,
    VK_VIDEO_ENCODE_TUNING_MODE_HIGH_QUALITY_KHR = 1,
    VK_VIDEO_ENCODE_TUNING_MODE_LOW_LATENCY_KHR = 2,
    VK_VIDEO_ENCODE_TUNING_MODE_ULTRA_LOW_LATENCY_KHR = 3,
    VK_VIDEO_ENCODE_TUNING_MODE_LOSSLESS_KHR = 4,
} VkVideoEncodeTuningModeKHR;

- **VK_VIDEO_ENCODE_TUNING_MODE_DEFAULT_KHR** specifies the default tuning mode.
- **VK_VIDEO_ENCODE_TUNING_MODE_HIGH_QUALITY_KHR** specifies that video encoding is tuned for high quality. When using this tuning mode, the implementation may compromise the latency of video encoding operations to improve quality.
- **VK_VIDEO_ENCODE_TUNING_MODE_LOW_LATENCY_KHR** specifies that video encoding is tuned for low latency. When using this tuning mode, the implementation may compromise quality to increase the performance and lower the latency of video encode operations.
- **VK_VIDEO_ENCODE_TUNING_MODE_ULTRA_LOW_LATENCY_KHR** specifies that video encoding is tuned for
ultra-low latency. When using this tuning mode, the implementation may compromise quality to maximize the performance and minimize the latency of video encoding operations.

- **VK_VIDEO_ENCODE_TUNING_MODE_LOSSLESS_KHR** specifies that video encoding is tuned for lossless encoding. When using this tuning mode, video encode operations produce lossless output.

The **VkVideoProfileListInfoKHR** structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoProfileListInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t profileCount;
    const VkVideoProfileInfoKHR* pProfiles;
} VkVideoProfileListInfoKHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **profileCount** is the number of elements in the **pProfiles** array.
- **pProfiles** is a pointer to an array of **VkVideoProfileInfoKHR** structures.

**Note:**
Video transcoding is an example of a use case that necessitates the specification of multiple profiles in various contexts.

When the application provides a video decode profile and one or more video encode profiles in the profile list, the implementation ensures that any capabilities returned or resources created are suitable for the video transcoding use cases without the need for manual data transformations.

**Valid Usage**

- **VUID-VkVideoProfileListInfoKHR-pProfiles-06813**
  pProfiles must not contain more than one element whose **videoCodecOperation** member specifies a decode operation

**Valid Usage (Implicit)**

- **VUID-VkVideoProfileListInfoKHR-sType-sType**
  sType must be **VK_STRUCTURE_TYPE_VIDEO_PROFILE_LIST_INFO_KHR**

- **VUID-VkVideoProfileListInfoKHR-pProfiles-parameter**
  If **profileCount** is not 0, pProfiles must be a valid pointer to an array of **profileCount** valid **VkVideoProfileInfoKHR** structures
42.4. Video Capabilities

42.4.1. Video Coding Capabilities

To query video coding capabilities for a specific video profile, call:

```c
// Provided by VK_KHR_video_queue
VkResult vkGetPhysicalDeviceVideoCapabilitiesKHR(
    VkPhysicalDevice physicalDevice,
    const VkVideoProfileInfoKHR* pVideoProfile,
    VkVideoCapabilitiesKHR* pCapabilities);
```

- `physicalDevice` is the physical device from which to query the video decode or encode capabilities.
- `pVideoProfile` is a pointer to a `VkVideoProfileInfoKHR` structure.
- `pCapabilities` is a pointer to a `VkVideoCapabilitiesKHR` structure in which the capabilities are returned.

If the video profile described by `pVideoProfile` is supported by the implementation, then this command returns `VK_SUCCESS` and `pCapabilities` is filled with the capabilities supported with the specified video profile. Otherwise, one of the video-profile-specific error codes are returned.

**Valid Usage**

- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07183
  If `pVideoProfile->videoCodecOperation` specifies a decode operation, then the `pNext` chain of `pCapabilities` must include a `VkVideoDecodeCapabilitiesKHR` structure

- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07184
  If `pVideoProfile->videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then the `pNext` chain of `pCapabilities` must include a `VkVideoDecodeH264CapabilitiesKHR` structure

- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07185
  If `pVideoProfile->videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then the `pNext` chain of `pCapabilities` must include a `VkVideoDecodeH265CapabilitiesKHR` structure

- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07186
  If `pVideoProfile->videoCodecOperation` specifies an encode operation, then the `pNext` chain of `pCapabilities` must include a `VkVideoEncodeCapabilitiesKHR` structure

- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07187
  If `pVideoProfile->videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT`, then the `pNext` chain of `pCapabilities` must include a `VkVideoEncodeH264CapabilitiesEXT` structure

- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07188
  If `pVideoProfile->videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_EXT`,
then the `pNext` chain of `pCapabilities` must include a `VkVideoEncodeH265CapabilitiesEXT` structure

### Valid Usage (Implicit)

- `VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-physicalDevice-parameter` physicalDevice must be a valid `VkPhysicalDevice` handle
- `VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-parameter` pVideoProfile must be a valid pointer to a valid `VkVideoProfileInfoKHR` structure
- `VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pCapabilities-parameter` pCapabilities must be a valid pointer to a `VkVideoCapabilitiesKHR` structure

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_VIDEO_PROFILE_OPERATION_NOT_SUPPORTED_KHR`
- `VK_ERROR_VIDEO_PROFILE_FORMAT_NOT_SUPPORTED_KHR`
- `VK_ERROR_VIDEO_PICTURE_LAYOUT_NOT_SUPPORTED_KHR`
- `VK_ERROR_VIDEO_PROFILE_CODEC_NOT_SUPPORTED_KHR`

The `VkVideoCapabilitiesKHR` structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoCapabilitiesKHR {
    VkStructureType sType;
    void* pNext;
    VkVideoCapabilityFlagsKHR flags;
    VkDeviceSize minBitstreamBufferOffsetAlignment;
    VkDeviceSize minBitstreamBufferSizeAlignment;
    VkExtent2D pictureAccessGranularity;
    VkExtent2D minCodedExtent;
    VkExtent2D maxCodedExtent;
    uint32_t maxDpbSlots;
    uint32_t maxActiveReferencePictures;
    VkExtensionProperties stdHeaderVersion;
} VkVideoCapabilitiesKHR;
```
- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is a bitmask of `VkVideoCapabilityFlagBitsKHR` specifying capability flags.
- **minBitstreamBufferOffsetAlignment** is the minimum alignment for bitstream buffer offsets.
- **minBitstreamBufferSizeAlignment** is the minimum alignment for bitstream buffer range sizes.
- **pictureAccessGranularity** is the granularity at which image access to video picture resources happen.
- **minCodedExtent** is the minimum width and height of the coded frames.
- **maxCodedExtent** is the maximum width and height of the coded frames.
- **maxDpbSlots** is the maximum number of DPB slots supported by a single video session.
- **maxActiveReferencePictures** is the maximum number of active reference pictures a single video coding operation can use.
- **stdHeaderVersion** is a `VkExtensionProperties` structure reporting the Video Std header name and version supported for the video profile.

**Note:**
It is common for video compression standards to allow using all reference pictures associated with active DPB slots as active reference pictures, hence for video decode profiles the values returned in `maxDpbSlots` and `maxActiveReferencePictures` are often equal. Similarly, in case of video decode profiles supporting field pictures the value of `maxActiveReferencePictures` often equals `maxDpbSlots × 2`.

**Valid Usage (Implicit)**

- **VUID-VkVideoCapabilitiesKHR-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_CAPABILITIES_KHR`

- **VUID-VkVideoCapabilitiesKHR-pNext-pNext**
  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkVideoDecodeCapabilitiesKHR`, `VkVideoDecodeH264CapabilitiesKHR`, `VkVideoDecodeH265CapabilitiesKHR`, `VkVideoEncodeCapabilitiesKHR`, `VkVideoEncodeH264CapabilitiesEXT`, or `VkVideoEncodeH265CapabilitiesEXT`

- **VUID-VkVideoCapabilitiesKHR-sType-unique**
  
  The `sType` value of each struct in the `pNext` chain must be unique

Bits which can be set in `VkVideoCapabilitiesKHR::flags` are:

```cpp
// Provided by VK_KHR_video_queue
typedef enum VkVideoCapabilityFlagBitsKHR {
  VK_VIDEO_CAPABILITY_PROTECTED_CONTENT_BIT_KHR = 0x00000001,
  VK_VIDEO_CAPABILITY_SEPARATE_REFERENCE_IMAGES_BIT_KHR = 0x00000002,
};
```
• **VK_VIDEO_CAPABILITY_PROTECTED_CONTENT_BIT_KHR** specifies that video sessions support producing and consuming protected content.

• **VK_VIDEO_CAPABILITY_SEPARATE_REFERENCE_IMAGES_BIT_KHR** specifies that the video picture resources associated with the DPB slots of a video session **can** be backed by separate VkImage objects. If this capability flag is not present, then all DPB slots of a video session **must** be associated with video picture resources backed by the same VkImage object (e.g. using different layers of the same image).

```cpp
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoCapabilityFlagsKHR;
```

**VkVideoCapabilityFlagsKHR** is a bitmask type for setting a mask of zero or more VkVideoCapabilityFlagBitsKHR.

### 42.4.2. Video Format Capabilities

To enumerate the supported output, input and DPB image formats and corresponding capabilities for a specific video profile, call:

```cpp
// Provided by VK_KHR_video_queue
VkResult vkGetPhysicalDeviceVideoFormatPropertiesKHR(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceVideoFormatInfoKHR* pVideoFormatInfo,
    uint32_t* pVideoFormatPropertyCount,
    VkVideoFormatPropertiesKHR* pVideoFormatProperties);
```

• **physicalDevice** is the physical device from which to query the video format properties.

• **pVideoFormatInfo** is a pointer to a VkPhysicalDeviceVideoFormatInfoKHR structure specifying the usage and video profiles for which supported image formats and capabilities are returned.

• **pVideoFormatPropertyCount** is a pointer to an integer related to the number of video format properties available or queried, as described below.

• **pVideoFormatProperties** is a pointer to an array of VkVideoFormatPropertiesKHR structures in which supported image formats and capabilities are returned.

If **pVideoFormatProperties** is NULL, then the number of video format properties supported for the given **physicalDevice** is returned in **pVideoFormatPropertyCount**. Otherwise, **pVideoFormatPropertyCount** must point to a variable set by the user to the number of elements in the **pVideoFormatProperties** array, and on return the variable is overwritten with the number of values actually written to **pVideoFormatProperties**. If the value of **pVideoFormatPropertyCount** is less than the number of video format properties supported, at most **pVideoFormatPropertyCount** values will be written to **pVideoFormatProperties**, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available values were returned.
Video format properties are always queried with respect to a specific set of video profiles. These are specified by chaining the 
\texttt{VkVideoProfileListInfoKHR} structure to \texttt{pVideoFormatInfo}.

For most use cases, the images are used by a single video session and a single video profile is provided. For a use case such as video transcoding, where a decode session output image \textit{can} be used as encode input in one or more encode sessions, multiple video profiles corresponding to the video sessions that will share the image \textbf{must} be provided.

If any of the \textit{video profiles} specified via \texttt{VkVideoProfileListInfoKHR::pProfiles} are not supported, then this command returns one of the \textit{video-profile-specific error codes}. Furthermore, if \texttt{VkPhysicalDeviceVideoFormatInfoKHR::imageUsage} includes any image usage flags not supported by the specified video profiles, then this command returns \texttt{VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR}.

This command also returns \texttt{VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR} if \texttt{VkPhysicalDeviceVideoFormatInfoKHR::imageUsage} does not include the appropriate flags as dictated by the decode capability flags returned in \texttt{VkVideoDecodeCapabilitiesKHR::flags} for any of the profiles specified in the \texttt{VkVideoProfileListInfoKHR} structure provided in the \texttt{pNext} chain of \texttt{pVideoFormatInfo}.

If the decode capability flags include \texttt{VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR} but not \texttt{VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR}, then in order to query video format properties for decode DPB and output usage, \texttt{VkPhysicalDeviceVideoFormatInfoKHR::imageUsage} \textbf{must} include both \texttt{VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR} and \texttt{VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR}. Otherwise, the call will fail with \texttt{VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR}.

If the decode capability flags include \texttt{VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR} but not \texttt{VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR}, then in order to query video format properties for decode DPB usage, \texttt{VkPhysicalDeviceVideoFormatInfoKHR::imageUsage} \textbf{must} include \texttt{VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR}, but not \texttt{VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR}. Otherwise, the call will fail with \texttt{VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR}. Similarly, to query video format properties for decode output usage, \texttt{VkPhysicalDeviceVideoFormatInfoKHR::imageUsage} \textbf{must} include \texttt{VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR}, but not \texttt{VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR}. Otherwise, the call will fail with \texttt{VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR}.

The \textit{imageUsage} member of the \texttt{VkPhysicalDeviceVideoFormatInfoKHR} structure specifies the expected video usage flags that the returned video formats \textbf{must} support. Correspondingly, the \textit{imageUsageFlags} member of each \texttt{VkVideoFormatPropertiesKHR} structure returned will contain at least the same set of image usage flags.

If the implementation supports using video input, output, or DPB images of a particular format in operations other than video decode/encode then the \textit{imageUsageFlags} member of the corresponding \texttt{VkVideoFormatPropertiesKHR} structure returned will include additional image usage flags indicating that.

\begin{itemize}
  \item \textbf{Note:}\n  
  For most use cases, only decode or encode related usage flags are going to be specified. For a use case such as transcoding, if the image were to be shared between
decode and encode session(s), then both decode and encode related usage flags can be set.

Multiple VkVideoFormatPropertiesKHR entries may be returned with the same format member with different componentMapping, imageType, or imageTiling values, as described later.

In addition, a different set of VkVideoFormatPropertiesKHR entries may be returned depending on the imageUsage member of the VkPhysicalDeviceVideoFormatInfoKHR structure, even for the same set of video profiles, for example, based on whether encode input, encode DPB, decode output, and/or decode DPB usage is requested.

The application can select the parameters returned in the VkVideoFormatPropertiesKHR entries and use compatible parameters when creating the input, output, and DPB images. The implementation will report all image creation and usage flags that are valid for images used with the requested video profiles but applications should create images only with those that are necessary for the particular use case.

Before creating an image, the application can obtain the complete set of supported image format features by calling vkGetPhysicalDeviceImageFormatProperties2 using parameters derived from the members of one of the reported VkVideoFormatPropertiesKHR entries and adding the same VkVideoProfileListInfoKHR structure to the pNext chain of VkPhysicalDeviceImageFormatInfo2.

The following applies to all VkVideoFormatPropertiesKHR entries returned by vkGetPhysicalDeviceVideoFormatPropertiesKHR:

- vkGetPhysicalDeviceFormatProperties2 must succeed when called with VkVideoFormatPropertiesKHR::format.
- If VkVideoFormatPropertiesKHR::imageTiling is VK_IMAGE_TILING_OPTIMAL, then the optimalTilingFeatures returned by vkGetPhysicalDeviceFormatProperties2 must include all format features required by the image usage flags reported in VkVideoFormatPropertiesKHR::imageUsageFlags for the format, as indicated in the Format Feature Dependent Usage Flags section.
- If VkVideoFormatPropertiesKHR::imageTiling is VK_IMAGE_TILING_LINEAR, then the linearTilingFeatures returned by vkGetPhysicalDeviceFormatProperties2 must include all format features required by the image usage flags reported in VkVideoFormatPropertiesKHR::imageUsageFlags for the format, as indicated in the Format Feature Dependent Usage Flags section.
- vkGetPhysicalDeviceImageFormatProperties2 must succeed when called with a VkPhysicalDeviceImageFormatInfo2 structure containing the following information:
  - The pNext chain including the same VkVideoProfileListInfoKHR structure used to call vkGetPhysicalDeviceVideoFormatPropertiesKHR.
  - format set to the value of VkVideoFormatPropertiesKHR::format.
  - type set to the value of VkVideoFormatPropertiesKHR::imageType.
  - tiling set to the value of VkVideoFormatPropertiesKHR::imageTiling.
  - usage set to the value of VkVideoFormatPropertiesKHR::imageUsageFlags.
flags set to the value of VkVideoFormatPropertiesKHR::imageCreateFlags.

The componentMapping member of VkVideoFormatPropertiesKHR defines the ordering of the Y′CbCr color channels from the perspective of the video codec operations specified in VkVideoProfileListInfoKHR. For example, if the implementation produces video decode output with the format VK_FORMAT_G8_B8R8_2PLANE_420_UNORM where the blue and red chrominance channels are swapped then the componentMapping member of the corresponding VkVideoFormatPropertiesKHR structure will have the following member values:

```
components.r = VK_COMPONENT_SWIZZLE_B;  // Cb component
components.g = VK_COMPONENT_SWIZZLE_IDENTITY;  // Y component
components.b = VK_COMPONENT_SWIZZLE_R;  // Cr component
components.a = VK_COMPONENT_SWIZZLE_IDENTITY;  // unused, defaults to 1.0
```

Valid Usage

- VUID-vkGetPhysicalDeviceVideoFormatPropertiesKHR-pNext-06812
  The pNext chain of pVideoFormatInfo must include a VkVideoProfileListInfoKHR structure with profileCount greater than 0

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceVideoFormatPropertiesKHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

- VUID-vkGetPhysicalDeviceVideoFormatPropertiesKHR-pVideoFormatInfo-parameter
  pVideoFormatInfo must be a valid pointer to a valid VkPhysicalDeviceVideoFormatInfoKHR structure

- VUID-vkGetPhysicalDeviceVideoFormatPropertiesKHR-pVideoFormatPropertyCount-parameter
  pVideoFormatPropertyCount must be a valid pointer to a uint32_t value

- VUID-vkGetPhysicalDeviceVideoFormatPropertiesKHR-pVideoFormatProperties-parameter
  If the value referenced by pVideoFormatPropertyCount is not 0, and pVideoFormatProperties is not NULL, pVideoFormatProperties must be a valid pointer to an array of pVideoFormatPropertyCount VkVideoFormatPropertiesKHR structures

Return Codes

Success

- VK_SUCCESS
- VK_INCOMPLETE
The `VkPhysicalDeviceVideoFormatInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkPhysicalDeviceVideoFormatInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkImageUsageFlags imageUsage;
} VkPhysicalDeviceVideoFormatInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `imageUsage` is a bitmask of `VkImageUsageFlagBits` specifying the intended usage of the video images.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVideoFormatInfoKHR-sType-sType `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VIDEO_FORMAT_INFO_KHR`
- VUID-VkPhysicalDeviceVideoFormatInfoKHR-pNext-pNext `pNext` must be `NULL` or a pointer to a valid instance of `VkVideoProfileListInfoKHR`
- VUID-VkPhysicalDeviceVideoFormatInfoKHR-sType-unique The `sType` value of each struct in the `pNext` chain must be unique
- VUID-VkPhysicalDeviceVideoFormatInfoKHR-imageUsage-parameter `imageUsage` must be a valid combination of `VkImageUsageFlagBits` values
- VUID-VkPhysicalDeviceVideoFormatInfoKHR-imageUsage-requiredbitmask `imageUsage` must not be 0

The `VkVideoFormatPropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoFormatPropertiesKHR {
    VkStructureType sType;
    VkVideoQueueFlags queueFlags;
} VkVideoFormatPropertiesKHR;
```
`void*` *pNext;
VkFormat format;
VkComponentMapping componentMapping;
VkImageCreateFlags imageCreateFlags;
VkImageType imageType;
VkImageTiling imageTiling;
VkImageUsageFlags imageUsageFlags;
} VkVideoFormatPropertiesKHR;

• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.
• `format` is a `VkFormat` that specifies the format that can be used with the specified video profiles and image usages.
• `componentMapping` defines the color channel order used for the format. `format` along with `componentMapping` describe how the color channels are ordered when producing video decoder output or are expected to be ordered in video encoder input, when applicable. If the `format` reported does not require component swizzling then all members of `componentMapping` will be set to `VK_COMPONENT_SWIZZLE_IDENTITY`.
• `imageCreateFlags` is a bitmask of `VkImageCreateFlagBits` specifying the supported image creation flags for the format.
• `imageType` is a `VkImageType` that specifies the image type the format can be used with.
• `imageTiling` is a `VkImageTiling` that specifies the image tiling the format can be used with.
• `imageUsageFlags` is a bitmask of `VkImageUsageFlagBits` specifying the supported image usage flags for the format.

### Valid Usage (Implicit)

- VUID-VkVideoFormatPropertiesKHR-sType-sType `sType` must be `VK_STRUCTURE_TYPE_VIDEO_FORMAT_PROPERTIES_KHR`  
- VUID-VkVideoFormatPropertiesKHR-pNext-pNext `pNext` must be NULL

### 42.5. Video Sessions

Video sessions are objects that represent and maintain the state needed to perform video decode or encode operations using a specific video profile.

Video sessions are represented by `VkVideoSessionKHR` handles:

```c
// Provided by VK_KHR_video_queue
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkVideoSessionKHR)
```
42.5.1. Creating a Video Session

To create a video session object, call:

```c
// Provided by VK_KHR_video_queue
VkResult vkCreateVideoSessionKHR(
    VkDevice device,
    const VkVideoSessionCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkVideoSessionKHR* pVideoSession);
```

- **device** is the logical device that creates the video session.
- **pCreateInfo** is a pointer to a `VkVideoSessionCreateInfoKHR` structure containing parameters to be used to create the video session.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pVideoSession** is a pointer to a `VkVideoSessionKHR` handle in which the resulting video session object is returned.

The resulting video session object is said to be created with the video codec operation specified in `pCreateInfo->pVideoProfile->videoCodecOperation`.

The name and version of the codec-specific Video Std header to be used with the video session is specified by the `VkExtensionProperties` structure pointed to by `pCreateInfo->pStdHeaderVersion`. If a non-existent or unsupported Video Std header version is specified in `pCreateInfo->pStdHeaderVersion->specVersion`, then this command returns `VK_ERROR_VIDEO_STD_VERSION_NOT_SUPPORTED_KHR`.

Video session objects are created in uninitialized state. In order to transition the video session into initial state, the application must issue a `vkCmdControlVideoCodingKHR` command with `VkVideoCodingControlInfoKHR::flags` including `VK_VIDEO_CODING_CONTROL_RESET_BIT_KHR`.

Video session objects also maintain the state of the DPB. The number of DPB slots usable with the created video session is specified in `pCreateInfo->maxDpbSlots`, and each slot is initially in the inactive state.

Each DPB slot maintained by the created video session can refer to a reference picture representing a video frame.

In addition, if the `videoCodecOperation` member of the `VkVideoProfileInfoKHR` structure pointed to by `pCreateInfo->pVideoProfile` is `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR` and the `pictureLayout` member of the `VkVideoDecodeH264ProfileInfoKHR` structure provided in the `VkVideoProfileInfoKHR::pNext` chain is not `VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_PROGRESSIVE_KHR`, then the created video session supports interlaced frames and each DPB slot maintained by the created video session can instead refer to separate top field and bottom field reference pictures that together can represent a full video frame. In this case, it is up to the application, driven by the video content, whether it associates any individual DPB slot with separate top and/or bottom field pictures or a single picture representing a full frame.
The created video session can be used to perform video coding operations using video frames up to the maximum size specified in `pCreateInfo->maxCodedExtent`. The minimum frame size allowed is implicitly derived from `VkVideoCapabilitiesKHR::minCodedExtent`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile specified by `pCreateInfo->pVideoProfile`. Accordingly, the created video session is said to be created with a `minCodedExtent` equal to that.

In case of video session objects created with a video encode operation, implementations may return the `VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR` error if any of the specified Video Std parameters do not adhere to the syntactic or semantic requirements of the used video compression standard, or if values derived from parameters according to the rules defined by the used video compression standard do not adhere to the capabilities of the video compression standard or the implementation.

**Note**

Applications should not rely on the `VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR` error being returned by any command as a means to verify Video Std parameters, as implementations are not required to report the error in any specific set of cases.

### Valid Usage (Implicit)

- VUID-vkCreateVideoSessionKHR-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkCreateVideoSessionKHR-pCreateInfo-parameter
  - `pCreateInfo` must be a valid pointer to a valid `VkVideoSessionCreateInfoKHR` structure
- VUID-vkCreateVideoSessionKHR-pAllocator-parameter
  - If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateVideoSessionKHR-pVideoSession-parameter
  - `pVideoSession` must be a valid pointer to a `VkVideoSessionKHR` handle

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_VIDEO_STD_VERSION_NOT_SUPPORTED_KHR`
- `VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR`
The `VkVideoSessionCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoSessionCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoSessionCreateFlagsKHR queueFamilyIndex;
    const VkVideoProfileInfoKHR* pVideoProfile;
    VkFormat pictureFormat;
    VkFormat referencePictureFormat;
    uint32_t maxDpbSlots;
    uint32_t maxActiveReferencePictures;
    const VkExtensionProperties* pStdHeaderVersion;
} VkVideoSessionCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `queueFamilyIndex` is the index of the queue family the created video session will be used with.
- `flags` is a bitmask of `VkVideoSessionCreateFlagBitsKHR` specifying creation flags.
- `pVideoProfile` is a pointer to a `VkVideoProfileInfoKHR` structure specifying the video profile the created video session will be used with.
- `pictureFormat` is the image format the created video session will be used with. If `pVideoProfile->videoCodecOperation` specifies a decode operation, then `pictureFormat` is the image format of decode output pictures usable with the created video session. If `pVideoProfile->videoCodecOperation` specifies an encode operation, then `pictureFormat` is the image format of encode input pictures usable with the created video session.
- `maxCodedExtent` is the maximum width and height of the coded frames the created video session will be used with.
- `referencePictureFormat` is the image format of reference pictures stored in the DPB the created video session will be used with.
- `maxDpbSlots` is the maximum number of DPB Slots that can be used with the created video session.
- `maxActiveReferencePictures` is the maximum number of active reference pictures that can be used in a single video coding operation using the created video session.
- `pStdHeaderVersion` is a pointer to a `VkExtensionProperties` structure requesting the Video Std header version to use for the `videoCodecOperation` specified in `pVideoProfile`.

**Valid Usage**

- `VUID-VkVideoSessionCreateInfoKHR-protectedMemory-07189
If the protectedMemory feature is not enabled or if `VkVideoCapabilitiesKHR::flags` does not
include VK_VIDEO_CAPABILITY_PROTECTED_CONTENT_BIT_KHR, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile specified by pVideoProfile, then flags must not include VK_VIDEO_SESSION_CREATE_PROTECTED_CONTENT_BIT_KHR

- VUID-VkVideoSessionCreateInfoKHR-pVideoProfile-04845
  pVideoProfile must be a supported video profile

- VUID-VkVideoSessionCreateInfoKHR-maxDpbSlots-04847
  maxDpbSlots must be less than or equal to VkVideoCapabilitiesKHR::maxDpbSlots, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile specified by pVideoProfile

- VUID-VkVideoSessionCreateInfoKHR-maxActiveReferencePictures-04849
  maxActiveReferencePictures must be less than or equal to VkVideoCapabilitiesKHR::maxActiveReferencePictures, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile specified by pVideoProfile

- VUID-VkVideoSessionCreateInfoKHR-maxDpbSlots-04850
  If either maxDpbSlots or maxActiveReferencePictures is 0, then both must be 0

- VUID-VkVideoSessionCreateInfoKHR-maxCodedExtent-04851
  maxCodedExtent must be between VkVideoCapabilitiesKHR::minCodedExtent and VkVideoCapabilitiesKHR::maxCodedExtent, inclusive, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile specified by pVideoProfile

- VUID-VkVideoSessionCreateInfoKHR-referencePictureFormat-04852
  If pVideoProfile->videoCodecOperation specifies a decode operation and maxActiveReferencePictures is greater than 0, then referencePictureFormat must be one of the supported decode DPB formats, as returned by vkGetPhysicalDeviceVideoFormatPropertiesKHR in VkVideoFormatPropertiesKHR::format when called with the imageUsage member of its pVideoFormatInfo parameter containing VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR, and with a VkVideoProfileListInfoKHR structure specified in the pNext chain of its pVideoFormatInfo parameter whose pProfiles member contains an element matching pVideoProfile

- VUID-VkVideoSessionCreateInfoKHR-referencePictureFormat-06814
  If pVideoProfile->videoCodecOperation specifies an encode operation and maxActiveReferencePictures is greater than 0, then referencePictureFormat must be one of the supported encode DPB formats, as returned by vkGetPhysicalDeviceVideoFormatPropertiesKHR in VkVideoFormatPropertiesKHR::format when called with the imageUsage member of its pVideoFormatInfo parameter containing VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR, and with a VkVideoProfileListInfoKHR structure specified in the pNext chain of its pVideoFormatInfo parameter whose pProfiles member contains an element matching pVideoProfile

- VUID-VkVideoSessionCreateInfoKHR-pictureFormat-04853
  If pVideoProfile->videoCodecOperation specifies a decode operation, then pictureFormat must be one of the supported decode output formats, as returned by vkGetPhysicalDeviceVideoFormatPropertiesKHR in VkVideoFormatPropertiesKHR::format when called with the imageUsage member of its pVideoFormatInfo parameter containing VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR, and with a VkVideoProfileListInfoKHR
structure specified in the pNext chain of its pVideoFormatInfo parameter whose pProfiles member contains an element matching pVideoProfile

- VUID-VkVideoSessionCreateInfoKHR-pictureFormat-04854
  If pVideoProfile->videoCodecOperation specifies an encode operation, then pictureFormat must be one of the supported encode input formats, as returned by vkGetPhysicalDeviceVideoFormatPropertiesKHR in VkVideoFormatPropertiesKHR::format when called with the imageUsage member of its pVideoFormatInfo parameter containing VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR, and with a VkVideoProfileListInfoKHR structure specified in the pNext chain of its pVideoFormatInfo parameter whose pProfiles member contains an element matching pVideoProfile

- VUID-VkVideoSessionCreateInfoKHR-pStdHeaderVersion-07190
  pStdHeaderVersion->extensionName must match VkVideoCapabilitiesKHR::stdHeaderVersion.extensionName, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile specified by pVideoProfile

- VUID-VkVideoSessionCreateInfoKHR-pStdHeaderVersion-07191
  pStdHeaderVersion->specVersion must be less than or equal to VkVideoCapabilitiesKHR::stdHeaderVersion.specVersion, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile specified by pVideoProfile

Valid Usage (Implicit)

- VUID-VkVideoSessionCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_SESSION_CREATE_INFO_KHR

- VUID-VkVideoSessionCreateInfoKHR-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkVideoEncodeH264SessionCreateInfoEXT or VkVideoEncodeH265SessionCreateInfoEXT

- VUID-VkVideoSessionCreateInfoKHR-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkVideoSessionCreateInfoKHR-flags-parameter
  flags must be a valid combination of VkVideoSessionCreateFlagBitsKHR values

- VUID-VkVideoSessionCreateInfoKHR-pVideoProfile-parameter
  pVideoProfile must be a valid pointer to a valid VkVideoProfileInfoKHR structure

- VUID-VkVideoSessionCreateInfoKHR-pictureFormat-parameter
  pictureFormat must be a valid VkFormat value

- VUID-VkVideoSessionCreateInfoKHR-referencePictureFormat-parameter
  referencePictureFormat must be a valid VkFormat value

- VUID-VkVideoSessionCreateInfoKHR-pStdHeaderVersion-parameter
  pStdHeaderVersion must be a valid pointer to a valid VkExtensionProperties structure

Bits which can be set in VkVideoSessionCreateInfoKHR::flags are:
• **VK_VIDEO_SESSION_CREATE_PROTECTED_CONTENT_BIT_KHR** specifies that the video session uses protected video content.

• **VK_VIDEO_SESSION_CREATE_ALLOW_ENCODE_PARAMETER_OPTIMIZATIONS_BIT_KHR** specifies that the implementation is allowed to override video session parameters and other codec-specific encoding parameters to optimize video encode operations based on the specific use case defined by the video profile and the used video encode quality level.

42.5.2. Destroying a Video Session

To destroy a video session, call:

```c
void vkDestroyVideoSessionKHR(
    VkDevice device,
    VkVideoSessionKHR videoSession,
    const VkAllocationCallbacks* pAllocator);
```

• **device** is the logical device that destroys the video session.

• **videoSession** is the video session to destroy.

• **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

**Valid Usage**

• VUID-vkDestroyVideoSessionKHR-videoSession-07192
  All submitted commands that refer to **videoSession** must have completed execution

• VUID-vkDestroyVideoSessionKHR-videoSession-07193
  If **VkAllocationCallbacks** were provided when **videoSession** was created, a compatible set of callbacks **must** be provided here
42.5.3. Video Session Memory Association

After creating a video session object, and before the object can be used to record video coding operations into command buffers using it, the application must allocate and bind device memory to the video session. Device memory is allocated separately (see Device Memory) and then associated with the video session.

Video sessions may have multiple memory bindings identified by unique unsigned integer values. Appropriate device memory must be bound to each such memory binding before using the video session to record command buffer commands with it.

To determine the memory requirements for a video session object, call:

```c
// Provided by VK_KHR_video_queue
VkResult vkGetVideoSessionMemoryRequirementsKHR(
    VkDevice device,  // Logical device that owns the video session.
    VkVideoSessionKHR videoSession,  // Video session handle.
    uint32_t* pMemoryRequirementsCount,  // Output: Count of memory requirements.
    VkVideoSessionMemoryRequirementsKHR* pMemoryRequirements) {  // Memory requirements for the video session.
```

- `device` is the logical device that owns the video session.
• `videoSession` is the video session to query.

• `pMemoryRequirementsCount` is a pointer to an integer related to the number of memory binding requirements available or queried, as described below.

• `pMemoryRequirements` is `NULL` or a pointer to an array of `VkVideoSessionMemoryRequirementsKHR` structures in which the memory binding requirements of the video session are returned.

If `pMemoryRequirements` is `NULL`, then the number of memory bindings required for the video session is returned in `pMemoryRequirementsCount`. Otherwise, `pMemoryRequirementsCount` must point to a variable set by the user with the number of elements in the `pMemoryRequirements` array, and on return the variable is overwritten with the number of memory binding requirements actually written to `pMemoryRequirements`. If `pMemoryRequirementsCount` is less than the number of memory bindings required for the video session, then at most `pMemoryRequirementsCount` elements will be written to `pMemoryRequirements`, and `VK_INCOMPLETE` will be returned, instead of `VK_SUCCESS`, to indicate that not all required memory binding requirements were returned.

Valid Usage (Implicit)

- VUID-vkGetVideoSessionMemoryRequirementsKHR-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkGetVideoSessionMemoryRequirementsKHR-videoSession-parameter
  `videoSession` must be a valid `VkVideoSessionKHR` handle

- VUID-vkGetVideoSessionMemoryRequirementsKHR-pMemoryRequirementsCount-parameter
  `pMemoryRequirementsCount` must be a valid pointer to a `uint32_t` value

- VUID-vkGetVideoSessionMemoryRequirementsKHR-pMemoryRequirements-parameter
  If the value referenced by `pMemoryRequirementsCount` is not 0, and `pMemoryRequirements` is not `NULL`, `pMemoryRequirements` must be a valid pointer to an array of `pMemoryRequirementsCount` `VkVideoSessionMemoryRequirementsKHR` structures

- VUID-vkGetVideoSessionMemoryRequirementsKHR-videoSession-parent
  `videoSession` must have been created, allocated, or retrieved from `device`

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

The `VkVideoSessionMemoryRequirementsKHR` structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoSessionMemoryRequirementsKHR {
    VkStructureType sType;
    // Other fields...}
```
```c
void* pNext;
uint32_t memoryBindIndex;
VkMemoryRequirements memoryRequirements;
} VkVideoSessionMemoryRequirementsKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **memoryBindIndex** is the index of the memory binding.
- **memoryRequirements** is a `VkMemoryRequirements` structure in which the requested memory binding requirements for the binding index specified by `memoryBindIndex` are returned.

### Valid Usage (Implicit)

- **VUID-VkVideoSessionMemoryRequirementsKHR-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_SESSION_MEMORY_REQUIREMENTS_KHR`

- **VUID-VkVideoSessionMemoryRequirementsKHR-pNext-pNext**
  
  `pNext` must be `NULL`

To attach memory to a video session object, call:

```c
// Provided by VK_KHR_video_queue
VkResult vkBindVideoSessionMemoryKHR(
    VkDevice device,
    VkVideoSessionKHR videoSession,
    uint32_t bindSessionMemoryInfoCount,
    const VkBindVideoSessionMemoryInfoKHR* pBindSessionMemoryInfos);
```

- **device** is the logical device that owns the video session.
- **videoSession** is the video session to be bound with device memory.
- **bindSessionMemoryInfoCount** is the number of elements in `pBindSessionMemoryInfos`.
- **pBindSessionMemoryInfos** is a pointer to an array of `bindSessionMemoryInfoCount` `VkBindVideoSessionMemoryInfoKHR` structures specifying memory regions to be bound to specific memory bindings of the video session.

The valid usage statements below refer to the `VkMemoryRequirements` structure corresponding to a specific element of `pBindSessionMemoryInfos`, which is defined as follows:

- If the `memoryBindIndex` member of the element of `pBindSessionMemoryInfos` in question matches the `memoryBindIndex` member of one of the elements returned in `pMemoryRequirements` when `vkGetVideoSessionMemoryRequirementsKHR` is called with the same `videoSession` and with `pMemoryRequirementsCount` equal to `bindSessionMemoryInfoCount`, then the `memoryRequirements` member of that element of `pMemoryRequirements` is the `VkMemoryRequirements` structure corresponding to the element of `pBindSessionMemoryInfos` in question.
Otherwise the element of `pBindSessionMemoryInfos` in question is said to not have a corresponding `VkMemoryRequirements` structure.

**Valid Usage**

- **VUID-vkBindVideoSessionMemoryKHR-videoSession-07195**
  The memory binding of `videoSession` identified by the `memoryBindIndex` member of any element of `pBindSessionMemoryInfos` must not already be backed by a memory object.

- **VUID-vkBindVideoSessionMemoryKHR-memoryBindIndex-07196**
  The `memoryBindIndex` member of each element of `pBindSessionMemoryInfos` must be unique within `pBindSessionMemoryInfos`.

- **VUID-vkBindVideoSessionMemoryKHR-pBindSessionMemoryInfos-07197**
  Each element of `pBindSessionMemoryInfos` must have a corresponding `VkMemoryRequirements` structure.

- **VUID-vkBindVideoSessionMemoryKHR-pBindSessionMemoryInfos-07198**
  If an element of `pBindSessionMemoryInfos` has a corresponding `VkMemoryRequirements` structure, then the `memory` member of that element of `pBindSessionMemoryInfos` must have been allocated using one of the memory types allowed in the `memoryTypeBits` member of the corresponding `VkMemoryRequirements` structure.

- **VUID-vkBindVideoSessionMemoryKHR-pBindSessionMemoryInfos-07199**
  If an element of `pBindSessionMemoryInfos` has a corresponding `VkMemoryRequirements` structure, then the `memoryOffset` member of that element of `pBindSessionMemoryInfos` must be an integer multiple of the `alignment` member of the corresponding `VkMemoryRequirements` structure.

- **VUID-vkBindVideoSessionMemoryKHR-pBindSessionMemoryInfos-07200**
  If an element of `pBindSessionMemoryInfos` has a corresponding `VkMemoryRequirements` structure, then the `memorySize` member of that element of `pBindSessionMemoryInfos` must equal the `size` member of the corresponding `VkMemoryRequirements` structure.

**Valid Usage (Implicit)**

- **VUID-vkBindVideoSessionMemoryKHR-device-parameter**
  `device` must be a valid `VkDevice` handle.

- **VUID-vkBindVideoSessionMemoryKHR-videoSession-parameter**
  `videoSession` must be a valid `VkVideoSessionKHR` handle.

- **VUID-vkBindVideoSessionMemoryKHR-pBindSessionMemoryInfos-parameter**
  `pBindSessionMemoryInfos` must be a valid pointer to an array of `bindSessionMemoryInfoCount` valid `VkBindVideoSessionMemoryInfoKHR` structures.

- **VUID-vkBindVideoSessionMemoryKHR-bindSessionMemoryInfoCount-arraylength**
  `bindSessionMemoryInfoCount` must be greater than 0.

- **VUID-vkBindVideoSessionMemoryKHR-videoSession-parent**
  `videoSession` must have been created, allocated, or retrieved from `device`. 
Host Synchronization

- Host access to videoSession must be externally synchronized

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkBindVideoSessionMemoryInfoKHR structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkBindVideoSessionMemoryInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t memoryBindIndex;
    VkDeviceMemory memory;
    VkDeviceSize memoryOffset;
    VkDeviceSize memorySize;
} VkBindVideoSessionMemoryInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `memoryBindIndex` is the memory binding index to bind memory to.
- `memory` is the allocated device memory to be bound to the video session's memory binding with index `memoryBindIndex`.
- `memoryOffset` is the start offset of the region of `memory` which is to be bound.
- `memorySize` is the size in bytes of the region of `memory`, starting from `memoryOffset` bytes, to be bound.

Valid Usage

- VUID-VkBindVideoSessionMemoryInfoKHR-memoryOffset-07201
  memoryOffset must be less than the size of `memory`

- VUID-VkBindVideoSessionMemoryInfoKHR-memorySize-07202
  memorySize must be less than or equal to the size of `memory` minus `memoryOffset`
42.6. Video Profile Compatibility

Resources and query pools used with a particular video session must be compatible with the video profile the video session was created with.

A VkBuffer is compatible with a video profile if it was created with the VkBufferCreateInfo::pNext chain including a VkVideoProfileListInfoKHR structure with its pProfiles member containing an element matching the VkVideoProfileInfoKHR structure chain describing the video profile, and VkBufferCreateInfo::usage including at least one bit specific to video coding usage.

- VK_BUFFER_USAGE_VIDEO_DECODE_SRC_BIT_KHR
- VK_BUFFER_USAGE_VIDEO_DECODE_DST_BIT_KHR
- VK_BUFFER_USAGE_VIDEO_ENCODE_SRC_BIT_KHR
- VK_BUFFER_USAGE_VIDEO_ENCODE_DST_BIT_KHR

A VkImage is compatible with a video profile if it was created with the VkImageCreateInfo::pNext chain including a VkVideoProfileListInfoKHR structure with its pProfiles member containing an element matching the VkVideoProfileInfoKHR structure chain describing the video profile, and VkImageCreateInfo::usage including at least one bit specific to video coding usage.

- VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR
- VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR
- VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR
- VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR

A VkImageView is compatible with a video profile if the VkImage it was created from is also compatible with that video profile.

A VkQueryPool is compatible with a video profile if it was created with the VkQueryPoolCreateInfo::pNext chain including a VkVideoProfileInfoKHR structure chain describing the same video profile, and VkQueryPoolCreateInfo::queryType having one of the following values:

- VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR
42.7. Video Session Parameters

Video session parameters objects can store preprocessed codec-specific parameters used with a compatible video session, and enable reducing the number of parameters needed to be provided and processed by the implementation while recording video coding operations into command buffers.

Parameters stored in such objects are immutable to facilitate the concurrent use of the stored parameters in multiple threads. At the same time, new parameters can be added to existing objects using the `vkUpdateVideoSessionParametersKHR` command.

In order to support concurrent use of the stored immutable parameters while also allowing the video session parameters object to be extended with new parameters, each video session parameters object maintains an update sequence counter that is set to 0 at object creation time and must be incremented by each subsequent update operation.

Certain video sequences that adhere to particular video compression standards permit updating previously supplied parameters. If a parameter update is necessary, the application has the following options:

- Cache the set of parameters on the application side and create a new video session parameters object adding all the parameters with appropriate changes, as necessary; or
- Create a new video session parameters object providing only the updated parameters and the previously used object as the template, which ensures that parameters not specified at creation time will be copied unmodified from the template object.

The actual types of parameters that can be stored and the capacity for individual parameter types, and the methods of initializing, updating, and referring to individual parameters are specific to the video codec operation the video session parameters object was created with.

- For `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR` these are defined in the H.264 Decode Parameter Sets section.
- For `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR` these are defined in the H.265 Decode Parameter Sets section.

Video session parameters are represented by `VkVideoSessionParametersKHR` handles:

```c
// Provided by VK_KHR_video_queue
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkVideoSessionParametersKHR)
```

42.7.1. Creating Video Session Parameters

To create a video session parameters object, call:

```c
// Provided by VK_KHR_video_queue
```
VkResult vkCreateVideoSessionParametersKHR(VkDevice device, const VkVideoSessionParametersCreateInfoKHR* pCreateInfo, const VkAllocationCallbacks* pAllocator, VkVideoSessionParametersKHR* pVideoSessionParameters);

- **device** is the logical device that creates the video session parameters object.
- **pCreateInfo** is a pointer to `VkVideoSessionParametersCreateInfoKHR` structure containing parameters to be used to create the video session parameters object.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pVideoSessionParameters** is a pointer to a `VkVideoSessionParametersKHR` handle in which the resulting video session parameters object is returned.

The resulting video session parameters object is said to be created with the video codec operation `pCreateInfo->videoSession` was created with.

If `pCreateInfo->videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then it will be used as a template for constructing the new video session parameters object. This happens by first adding any parameters according to the additional creation parameters provided in the `pCreateInfo->pNext` chain, followed by adding any parameters from the template object that have a key that does not match the key of any of the already added parameters.

If `pCreateInfo->videoSession` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODER_H264_BIT_KHR`, then the created video session parameters object will initially contain the following sets of parameter entries:

- **StdVideoH264SequenceParameterSet** structures representing H.264 SPS entries, as follows:
  - If the `pParametersAddInfo` member of the `VkVideoDecodeH264SessionParametersCreateInfoKHR` structure provided in the `pCreateInfo->pNext` chain is not `NULL`, then the set of `StdVideoH264SequenceParameterSet` entries specified in `pParametersAddInfo->pStdSPSs` are added first;
  - If `pCreateInfo->videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH264SequenceParameterSet` entry stored in it is copied to the created video session parameters object if the created object does not already contain such an entry with the same `seq_parameter_set_id`.

- **StdVideoH264PictureParameterSet** structures representing H.264 PPS entries, as follows:
  - If the `pParametersAddInfo` member of the `VkVideoDecodeH264SessionParametersCreateInfoKHR` structure provided in the `pCreateInfo->pNext` chain is not `NULL`, then the set of `StdVideoH264PictureParameterSet` entries specified in `pParametersAddInfo->pStdPPSs` are added first;
  - If `pCreateInfo->videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH264PictureParameterSet` entry stored in it is copied to the created video session parameters object if the created object does not already contain such an entry with the same `seq_parameter_set_id` and `pic_parameter_set_id`.

If `pCreateInfo->videoSession` was created with the video codec operation
VK_VIDEO_CODEC_OPERATION_DECOD_H265_BIT_KHR, then the created video session parameters object will initially contain the following sets of parameter entries:

- **StdVideoH265VideoParameterSet** structures representing **H.265 VPS** entries, as follows:
  - If the `pParametersAddInfo` member of the `VkVideoDecodeH265SessionParametersCreateInfoKHR` structure provided in the `pCreateInfo->pNext` chain is not NULL, then the set of `StdVideoH265VideoParameterSet` entries specified in `pParametersAddInfo->pStdVPSs` are added first;
  - If `pCreateInfo->videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH265VideoParameterSet` entry stored in it is copied to the created video session parameters object if the created object does not already contain such an entry with the same `vps_video_parameter_set_id`.

- **StdVideoH265SequenceParameterSet** structures representing **H.265 SPS** entries, as follows:
  - If the `pParametersAddInfo` member of the `VkVideoDecodeH265SessionParametersCreateInfoKHR` structure provided in the `pCreateInfo->pNext` chain is not NULL, then the set of `StdVideoH265SequenceParameterSet` entries specified in `pParametersAddInfo->pStdSPSs` are added first;
  - If `pCreateInfo->videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH265SequenceParameterSet` entry stored in it is copied to the created video session parameters object if the created object does not already contain such an entry with the same `sps_video_parameter_set_id` and `sps_seq_parameter_set_id`.

- **StdVideoH265PictureParameterSet** structures representing **H.265 PPS** entries, as follows:
  - If the `pParametersAddInfo` member of the `VkVideoDecodeH265SessionParametersCreateInfoKHR` structure provided in the `pCreateInfo->pNext` chain is not NULL, then the set of `StdVideoH265PictureParameterSet` entries specified in `pParametersAddInfo->pStdPPSs` are added first;
  - If `pCreateInfo->videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH265PictureParameterSet` entry stored in it is copied to the created video session parameters object if the created object does not already contain such an entry with the same `sps_video_parameter_set_id`, `pps_seq_parameter_set_id`, and `pps_pic_parameter_set_id`.

In case of video session parameters objects created with a video encode operation, implementations **may** return the `VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR` error if any of the specified Video Std parameters do not adhere to the syntactic or semantic requirements of the used video compression standard, or if values derived from parameters according to the rules defined by the used video compression standard do not adhere to the capabilities of the video compression standard or the implementation.

**Note**

Applications **should** not rely on the `VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR` error being returned by any command as a means to verify Video Std parameters, as implementations are not required to report the error in any specific set of cases.
### Valid Usage (Implicit)

- **VUID-vkCreateVideoSessionParametersKHR-device-parameter**
  
  `device` must be a valid `VkDevice` handle

- **VUID-vkCreateVideoSessionParametersKHR-pCreateInfo-parameter**
  
  `pCreateInfo` must be a valid pointer to a valid `VkVideoSessionParametersCreateInfoKHR` structure

- **VUID-vkCreateVideoSessionParametersKHR-pAllocator-parameter**
  
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkCreateVideoSessionParametersKHR-pVideoSessionParameters-parameter**
  
  `pVideoSessionParameters` must be a valid pointer to a `VkVideoSessionParametersKHR` handle

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR`

The `VkVideoSessionParametersCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoSessionParametersCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoSessionParametersCreateFlagsKHR flags;
    VkVideoSessionParametersKHR videoSessionParametersTemplate;
    VkVideoSessionKHR videoSession;
} VkVideoSessionParametersCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `videoSessionParametersTemplate` is `VK_NULL_HANDLE` or a valid handle to a `VkVideoSessionParametersKHR` object used as a template for constructing the new video session parameters object.
- **videoSession** is the video session object against which the video session parameters object is going to be created.

Limiting values are defined below that are referenced by the relevant valid usage statements of this structure.

- If `videoSession` was created with the codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then let `StdVideoH264SequenceParameterSet spsAddList[]` be the list of H.264 SPS entries to add to the created video session parameters object, defined as follows:
  - If the `pParametersAddInfo` member of the `VkVideoDecodeH264SessionParametersCreateInfoKHR` structure provided in the `pNext` chain is not `NULL`, then the set of `StdVideoH264SequenceParameterSet` entries specified in `pParametersAddInfo->pStdSPSs` are added to `spsAddList`;
  - If `videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH264SequenceParameterSet` entry stored in it with `seq_parameter_set_id` not matching any of the entries already in `spsAddList` is added to `spsAddList`.

- If `videoSession` was created with the codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then let `StdVideoH264PictureParameterSet ppsAddList[]` be the list of H.264 PPS entries to add to the created video session parameters object, defined as follows:
  - If the `pParametersAddInfo` member of the `VkVideoDecodeH264SessionParametersCreateInfoKHR` structure provided in the `pNext` chain is not `NULL`, then the set of `StdVideoH264PictureParameterSet` entries specified in `pParametersAddInfo->pStdPPSs` are added to `ppsAddList`;
  - If `videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH264PictureParameterSet` entry stored in it with `seq_parameter_set_id` or `pic_parameter_set_id` not matching any of the entries already in `ppsAddList` is added to `ppsAddList`.

- If `videoSession` was created with the codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then let `StdVideoH265VideoParameterSet vpsAddList[]` be the list of H.265 VPS entries to add to the created video session parameters object, defined as follows:
  - If the `pParametersAddInfo` member of the `VkVideoDecodeH265SessionParametersCreateInfoKHR` structure provided in the `pNext` chain is not `NULL`, then the set of `StdVideoH265VideoParameterSet` entries specified in `pParametersAddInfo->pStdVPSs` are added to `vpsAddList`;
  - If `videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH265VideoParameterSet` entry stored in it with `vps_video_parameter_set_id` not matching any of the entries already in `vpsAddList` is added to `vpsAddList`.

- If `videoSession` was created with the codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then let `StdVideoH265SequenceParameterSet spsAddList[]` be the list of H.265 SPS entries to add to the created video session parameters object, defined as follows:
If the `pParametersAddInfo` member of the `VkVideoDecodeH265SessionParametersCreateInfoKHR` structure provided in the `pNext` chain is not `NULL`, then the set of `StdVideoH265SequenceParameterSet` entries specified in `pParametersAddInfo->pStdSPSs` are added to `spsAddList`;

If `videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH265SequenceParameterSet` entry stored in it with `sps_video_parameter_set_id` or `sps_seq_parameter_set_id` not matching any of the entries already in `spsAddList` is added to `spsAddList`.

If `videoSession` was created with the codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then let `StdVideoH265PictureParameterSet` `ppsAddList[]` be the list of H.265 PPS entries to add to the created video session parameters object, defined as follows:

- If the `pParametersAddInfo` member of the `VkVideoDecodeH265SessionParametersCreateInfoKHR` structure provided in the `pNext` chain is not `NULL`, then the set of `StdVideoH265PictureParameterSet` entries specified in `pParametersAddInfo->pStdPPSs` are added to `ppsAddList`;
- If `videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH265PictureParameterSet` entry stored in it with `sps_video_parameter_set_id`, `pps_seq_parameter_set_id`, or `pps_pic_parameter_set_id` not matching any of the entries already in `ppsAddList` is added to `ppsAddList`.

### Valid Usage

- **VUID-VkVideoSessionParametersCreateInfoKHR-videoSessionParametersTemplate-04855**
  If `videoSessionParametersTemplate` represents a valid handle, it must have been created against `videoSession`.

- **VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-07203**
  If `videoSession` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then the `pNext` chain must include a `VkVideoDecodeH264SessionParametersCreateInfoKHR` structure.

- **VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-07204**
  If `videoSession` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then the number of elements of `spsAddList` must be less than or equal to the `maxStdSPSCount` specified in the `VkVideoDecodeH264SessionParametersCreateInfoKHR` structure included in the `pNext` chain.

- **VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-07205**
  If `videoSession` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then the number of elements of `ppsAddList` must be less than or equal to the `maxStdPPSCount` specified in the `VkVideoDecodeH264SessionParametersCreateInfoKHR` structure included in the `pNext` chain.

- **VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-07206**
  If `videoSession` was created with the video codec operation
VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, then the pNext chain must include a
VkVideoDecodeH265SessionParametersCreateInfoKHR structure

- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-07207
  If videoSession was created with the video codec operation
  VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, then the number of elements of vpsAddList
  must be less than or equal to the maxStdVPSCount specified in the
  VkVideoDecodeH265SessionParametersCreateInfoKHR structure included in the pNext
  chain

- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-07208
  If videoSession was created with the video codec operation
  VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, then the number of elements of spsAddList
  must be less than or equal to the maxStdSPSCount specified in the
  VkVideoDecodeH265SessionParametersCreateInfoKHR structure included in the pNext
  chain

- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-07209
  If videoSession was created with the video codec operation
  VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, then the number of elements of ppsAddList
  must be less than or equal to the maxStdPPSCount specified in the
  VkVideoDecodeH265SessionParametersCreateInfoKHR structure included in the pNext
  chain

- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-07210
  If videoSession was created with the video codec operation
  VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT, then the pNext chain must include a
  VkVideoEncodeH264SessionParametersCreateInfoEXT structure

- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-07211
  If videoSession was created with the video codec operation
  VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_EXT, then the pNext chain must include a
  VkVideoEncodeH265SessionParametersCreateInfoEXT structure

Valid Usage (Implicit)

- VUID-VkVideoSessionParametersCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_SESSION_PARAMETERS_CREATE_INFO_KHR

- VUID-VkVideoSessionParametersCreateInfoKHR-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either
  NULL or a pointer to a valid instance of
  VkVideoDecodeH264SessionParametersCreateInfoKHR,
  VkVideoDecodeH265SessionParametersCreateInfoKHR,
  VkVideoEncodeH264SessionParametersCreateInfoEXT,
  VkVideoEncodeH265SessionParametersCreateInfoEXT,
  or
  VkVideoEncodeQualityLevelInfoKHR

- VUID-VkVideoSessionParametersCreateInfoKHR-sType-unique
  The sType value of each struct in the pNext chain must be unique
• VUID-VkVideoSessionParametersCreateInfoKHR-flags-zerobitmask
  flags must be 0

• VUID-VkVideoSessionParametersCreateInfoKHR-videoSessionParametersTemplate-parameter
  If videoSessionParametersTemplate is not VK_NULL_HANDLE, videoSessionParametersTemplate must be a valid VkVideoSessionParametersKHR handle

• VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-parameter
  videoSession must be a valid VkVideoSessionKHR handle

• VUID-VkVideoSessionParametersCreateInfoKHR-videoSessionParametersTemplate-parent
  If videoSessionParametersTemplate is a valid handle, it must have been created, allocated, or retrieved from videoSession

• VUID-VkVideoSessionParametersCreateInfoKHR-commonparent
  Both of videoSession, and videoSessionParametersTemplate that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoSessionParametersCreateFlagsKHR;

VkVideoSessionParametersCreateFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.

42.7.2. Destroying Video Session Parameters

To destroy a video session parameters object, call:

// Provided by VK_KHR_video_queue
void vkDestroyVideoSessionParametersKHR(
    VkDevice device,
    VkVideoSessionParametersKHR videoSessionParameters,
    const VkAllocationCallbacks* pAllocator);

• device is the logical device that destroys the video session parameters object.
• videoSessionParameters is the video session parameters object to destroy.
• pAllocator controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

• VUID-vkDestroyVideoSessionParametersKHR-videoSessionParameters-07212
  All submitted commands that refer to videoSessionParameters must have completed execution

• VUID-vkDestroyVideoSessionParametersKHR-videoSessionParameters-07213
  If VkAllocationCallbacks were provided when videoSessionParameters was created, a
compatible set of callbacks must be provided here

- VUID-vkDestroyVideoSessionParametersKHR-videoSessionParameters-07214
  If no VkAllocationCallbacks were provided when videoSessionParameters was created, pAllocator must be NULL

Valid Usage (Implicit)

- VUID-vkDestroyVideoSessionParametersKHR-device-parameter
device must be a valid VkDevice handle

- VUID-vkDestroyVideoSessionParametersKHR-videoSessionParameters-parameter
If videoSessionParameters is not VK_NULL_HANDLE, videoSessionParameters must be a valid VkVideoSessionParametersKHR handle

- VUID-vkDestroyVideoSessionParametersKHR-pAllocator-parameter
If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroyVideoSessionParametersKHR-videoSessionParameters-parent
If videoSessionParameters is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to videoSessionParameters must be externally synchronized

42.7.3. Updating Video Session Parameters

To update video session parameters object with new parameters, call:

```c
// Provided by VK_KHR_video_queue
VkResult vkUpdateVideoSessionParametersKHR(
    VkDevice device,       // Provided by VK_KHR_video_queue
    VkVideoSessionParametersKHR videoSessionParameters, // Provided by VK_KHR_video_queue
    const VkVideoSessionParametersUpdateInfoKHR* pUpdateInfo);
```

- device is the logical device that updates the video session parameters.
- videoSessionParameters is the video session parameters object to update.
- pUpdateInfo is a pointer to a VkVideoSessionParametersUpdateInfoKHR structure specifying the parameter update information.

After a successful call to this command, the update sequence counter of videoSessionParameters is changed to the value specified in pUpdateInfo->updateSequenceCount.

Note:
As each update issued to a video session parameters object needs to specify the next available update sequence count value, concurrent updates of the same video session parameters object are inherently disallowed. However, recording video coding operations to command buffers referring to parameters previously added to the video session parameters object is allowed, even if there is a concurrent update in progress adding some new entries to the object.

If \texttt{videoSessionParameters} was created with the video codec operation \texttt{VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR} and the \texttt{pUpdateInfo->pNext} chain includes a \texttt{VkVideoDecodeH264SessionParametersAddInfoKHR} structure, then this command adds the following parameter entries to \texttt{videoSessionParameters}:

- The \texttt{H.264 SPS} entries specified in \texttt{VkVideoDecodeH264SessionParametersAddInfoKHR::pStdSPSs}.
- The \texttt{H.264 PPS} entries specified in \texttt{VkVideoDecodeH264SessionParametersAddInfoKHR::pStdPPSs}.

If \texttt{videoSessionParameters} was created with the video codec operation \texttt{VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR} and the \texttt{pUpdateInfo->pNext} chain includes a \texttt{VkVideoDecodeH265SessionParametersAddInfoKHR} structure, then this command adds the following parameter entries to \texttt{videoSessionParameters}:

- The \texttt{H.265 VPS} entries specified in \texttt{VkVideoDecodeH265SessionParametersAddInfoKHR::pStdVPSs}.
- The \texttt{H.265 SPS} entries specified in \texttt{VkVideoDecodeH265SessionParametersAddInfoKHR::pStdSPSs}.
- The \texttt{H.265 PPS} entries specified in \texttt{VkVideoDecodeH265SessionParametersAddInfoKHR::pStdPPSs}.

In case of video session parameters objects created with a video encode operation, implementations \textbf{may} return the \texttt{VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR} error if any of the specified Video Std parameters do not adhere to the syntactic or semantic requirements of the used video compression standard, or if values derived from parameters according to the rules defined by the used video compression standard do not adhere to the capabilities of the video compression standard or the implementation.

\textbf{Note}

Applications \textbf{should} not rely on the \texttt{VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR} error being returned by any command as a means to verify Video Std parameters, as implementations are not required to report the error in any specific set of cases.

\textbf{Valid Usage}

- \texttt{VUID-vkUpdateVideoSessionParametersKHR-pUpdateInfo-07215}
  \texttt{pUpdateInfo->updateSequenceCount} \textbf{must} equal the current \texttt{update sequence counter} of \texttt{videoSessionParameters} plus one
If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR` and the `pNext` chain of `pUpdateInfo` includes a `VkVideoDecodeH264SessionParametersAddInfoKHR` structure, then `videoSessionParameters` must not already contain a `StdVideoH264SequenceParameterSet` entry with `seq_parameter_set_id` matching any of the elements of `VkVideoDecodeH264SessionParametersAddInfoKHR::pStdSPSs`.

If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then the number of `StdVideoH264SequenceParameterSet` entries already stored in it plus the value of the `stdSPSCount` member of the `VkVideoDecodeH264SessionParametersAddInfoKHR` structure included in the `pUpdateInfo->pNext` chain must be less than or equal to the `VkVideoDecodeH264SessionParametersCreateInfoKHR::maxStdSPSCount`.

If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR` and the `pNext` chain of `pUpdateInfo` includes a `VkVideoDecodeH265SessionParametersAddInfoKHR` structure, then `videoSessionParameters` must not already contain a `StdVideoH265VideoParameterSet` entry with `vps_video_parameter_set_id` matching any of the elements of `VkVideoDecodeH265SessionParametersAddInfoKHR::pStdVPSs`.

If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then the number of `StdVideoH265VideoParameterSet` entries already stored in it plus the value of the `stdVPSCount` member of the `VkVideoDecodeH265SessionParametersAddInfoKHR` structure included in the `pUpdateInfo->pNext` chain must be less than or equal to the `VkVideoDecodeH265SessionParametersCreateInfoKHR::maxStdVPSCount`.

If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR` and the `pNext` chain of `pUpdateInfo` includes a `VkVideoDecodeH265SessionParametersAddInfoKHR` structure, then `videoSessionParameters` must not already contain a `StdVideoH265PictureParameterSet` entry with `seq_parameter_set_id` and `pic_parameter_set_id` matching any of the elements of `VkVideoDecodeH265SessionParametersAddInfoKHR::pStdPPSs`.

If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then the number of `StdVideoH265PictureParameterSet` entries already stored in it plus the value of the `stdPPSCount` member of the `VkVideoDecodeH265SessionParametersAddInfoKHR` structure included in the `pUpdateInfo->pNext` chain must be less than or equal to the `VkVideoDecodeH265SessionParametersCreateInfoKHR::maxStdPPSCount`. 
If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR` and the `pNext` chain of `pUpdateInfo` includes a `VkVideoDecodeH265SessionParametersAddInfoKHR` structure, then `videoSessionParameters` must not already contain a `StdVideoH265SequenceParameterSet` entry with both `sps_video_parameter_set_id` and `sps_seq_parameter_set_id` matching any of the elements of `VkVideoDecodeH265SessionParametersAddInfoKHR::pStdSPSs`.

If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then the number of `StdVideoH265SequenceParameterSet` entries already stored in it plus the value of the `stdSPSCount` member of the `VkVideoDecodeH265SessionParametersAddInfoKHR` structure included in the `pUpdateInfo->pNext` chain must be less than or equal to the `VkVideoDecodeH265SessionParametersCreateInfoKHR::maxStdSPSCount`.

If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT` and the `pNext` chain of `pUpdateInfo` includes a `VkVideoEncodeH264SessionParametersAddInfoEXT` structure, then `videoSessionParameters` must not already contain a `StdVideoH264SequenceParameterSet` entry with `seq_parameter_set_id` matching any of the elements of `VkVideoEncodeH264SessionParametersAddInfoEXT::pStdSPSs`.

If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT` and the `pNext` chain of `pUpdateInfo` includes a `VkVideoEncodeH264SessionParametersAddInfoEXT` structure, then `videoSessionParameters` must not already contain a `StdVideoH264PictureParameterSet` entry with both `seq_parameter_set_id` and `pic_parameter_set_id` matching any of the elements of `VkVideoEncodeH264SessionParametersAddInfoEXT::pStdPPSs`.

If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT`, then the number of `StdVideoH264PictureParameterSet` entries already stored in it plus the value of the `stdPPSCount` member of the `VkVideoEncodeH264SessionParametersAddInfoEXT` structure included in the `pUpdateInfo->pNext` chain must be less than or equal to the `VkVideoEncodeH264SessionParametersCreateInfoEXT::maxStdPPSCount`.

If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT`, then the number of `StdVideoH264PictureParameterSet` entries already stored in it plus the value of the `stdPPSCount` member of the `VkVideoEncodeH264SessionParametersAddInfoEXT` structure included in the `pUpdateInfo->pNext` chain must be less than or equal to the `VkVideoEncodeH264SessionParametersCreateInfoEXT::maxStdPPSCount`.

If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT` and the `pNext` chain of `pUpdateInfo` includes a `VkVideoEncodeH264SessionParametersAddInfoEXT` structure, then `videoSessionParameters` must not already contain a `StdVideoH264SequenceParameterSet` entry with `seq_parameter_set_id` matching any of the elements of `VkVideoEncodeH264SessionParametersAddInfoEXT::pStdSPSs`.

If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT` and the `pNext` chain of `pUpdateInfo` includes a `VkVideoEncodeH264SessionParametersAddInfoEXT` structure, then `videoSessionParameters` must not already contain a `StdVideoH264PictureParameterSet` entry with both `seq_parameter_set_id` and `pic_parameter_set_id` matching any of the elements of `VkVideoEncodeH264SessionParametersAddInfoEXT::pStdPPSs`.
If videoSessionParameters was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_EXT and the pNext chain of pUpdateInfo includes a VkVideoEncodeH265SessionParametersAddInfoEXT structure, then videoSessionParameters must not already contain a StdVideoH265VideoParameterSet entry with vps_video_parameter_set_id matching any of the elements of VkVideoEncodeH265SessionParametersAddInfoEXT::pStdVPSs.

If videoSessionParameters was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_EXT and the pNext chain of pUpdateInfo includes a VkVideoEncodeH265SessionParametersAddInfoEXT structure, then videoSessionParameters must not already contain a StdVideoH265SequenceParameterSet entry with both sps_video_parameter_set_id and sps_seq_parameter_set_id matching any of the elements of VkVideoEncodeH265SessionParametersAddInfoEXT::pStdSPSs.

If videoSessionParameters was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_EXT and the pNext chain of pUpdateInfo includes a VkVideoEncodeH265SessionParametersAddInfoEXT structure, then videoSessionParameters must not already contain a StdVideoH265PictureParameterSet entry with sps_video_parameter_set_id, pps_seq_parameter_set_id, and pps_pic_parameter_set_id all matching any of the elements of VkVideoEncodeH265SessionParametersAddInfoEXT::pStdPPSs.

Valid Usage (Implicit)

- VUID-vkUpdateVideoSessionParametersKHR-device-parameter: device must be a valid VkDevice handle
- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-parameter: videoSessionParameters must be a valid VkVideoSessionParametersKHR handle
- VUID-vkUpdateVideoSessionParametersKHR-pUpdateInfo-parameter: pUpdateInfo must be a valid pointer to a valid VkVideoSessionParametersUpdateInfoKHR structure
- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-parent: videoSessionParameters must have been created, allocated, or retrieved from device

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
The `VkVideoSessionParametersUpdateInfoKHR` structure is defined as:

```c
typedef struct VkVideoSessionParametersUpdateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t updateSequenceCount;
} VkVideoSessionParametersUpdateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `updateSequenceCount` is the new update sequence count to set for the video session parameters object.

### Valid Usage (Implicit)

- VUID-VkVideoSessionParametersUpdateInfoKHR-sType-sType
  * `sType` must be `VK_STRUCTURE_TYPE_VIDEO_SESSION_PARAMETERS_UPDATE_INFO_KHR`

- VUID-VkVideoSessionParametersUpdateInfoKHR-pNext-pNext
  * Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkVideoDecodeH264SessionParametersAddInfoKHR`, `VkVideoDecodeH265SessionParametersAddInfoKHR`, `VkVideoEncodeH264SessionParametersAddInfoEXT`, or `VkVideoEncodeH265SessionParametersAddInfoEXT`

- VUID-VkVideoSessionParametersUpdateInfoKHR-sType-unique
  * The `sType` value of each struct in the `pNext` chain must be unique

### 42.8. Video Coding Scope

Applications can record video coding commands for a video session only within a video coding scope.

To begin a video coding scope, call:

```c
void vkCmdBeginVideoCodingKHR(
    VkCommandBuffer commandBuffer,
    const VkVideoBeginCodingInfoKHR* pBeginInfo);
```

- `commandBuffer` is the command buffer in which to record the command.
• `pBeginInfo` is a pointer to a `VkVideoBeginCodingInfoKHR` structure specifying the parameters of the video coding scope, including the video session and video session parameters object to use.

After beginning a video coding scope, the video session object specified in `pBeginInfo->videoSession` is `bound` to the command buffer, and the command buffer is ready to record video coding operations. Similarly, if `pBeginInfo->videoSessionParameters` is not `VK_NULL_HANDLE`, it is also `bound` to the command buffer, and video coding operations can refer to the codec-specific parameters stored in it.

This command also establishes the set of `bound reference picture resources` that can be used as `reconstructed pictures` or `reference pictures` within the video coding scope. Each element of this set consists of a `video picture resource` and the DPB slot index associated with it, if there is one.

The set of bound reference picture resources is immutable within a video coding scope, however, the DPB slot index associated with any of the bound reference picture resources can change during the video coding scope in response to video coding operations.

The `VkVideoReferenceSlotInfoKHR` structures provided as the elements of `pBeginInfo->pReferenceSlots` are interpreted by this command as follows:

- If `slotIndex` is non-negative and `pPictureResource` is not `NULL`, then the `video picture resource` defined by the `VkVideoPictureResourceInfoKHR` structure pointed to by `pPictureResource` is added to the set of bound reference picture resources and is associated with the DPB slot index specified in `slotIndex`.
- If `slotIndex` is non-negative and `pPictureResource` is `NULL`, then the DPB slot with index `slotIndex` is `deactivated` by this command.
- If `slotIndex` is negative and `pPictureResource` is not `NULL`, then the `video picture resource` defined by the `VkVideoPictureResourceInfoKHR` structure pointed to by `pPictureResource` is added to the set of bound reference picture resources without an associated DPB slot. Such a picture resource can be subsequently used as a `reconstructed picture` to associate it with a DPB slot.
- If `slotIndex` is negative and `pPictureResource` is `NULL`, then the element is ignored.

**Note:**

It is possible for multiple bound reference picture resources to be associated with the same DPB slot index, or for a single bound reference picture to refer to multiple separate reference pictures. For example, in case of an H.264 decode profile with interlaced frame support a single DPB slot can refer to two separate pictures for the top and bottom fields. Depending on the picture layout used by the H.264 decode profile, the following special cases may arise:

- If the picture layout is `VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_INTERLEAVED_LINES_BIT_KHR`, then the top and bottom field pictures are physically co-located in the same video picture resource with even scanlines corresponding to the top field and odd scanlines corresponding to the bottom field, respectively.
- If the picture layout is `VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR`, then...
the top and bottom field pictures are stored in separate video picture resources (in separate subregions of the same image layer, in separate layers of the same image, or in entirely separate images), hence two elements of 

\texttt{VkVideoBeginCodingInfoKHR::pReferenceSlots} can contain the same \texttt{slotIndex} but specify different video picture resources in their \texttt{pPictureResource} members.

All non-negative \texttt{slotIndex} values specified in the elements of \texttt{pBeginInfo->pReferenceSlots} must identify DPB slots of the video session that are in the \textit{active state} at the time this command is executed on the device.

\textit{Note:}

The application does not have to specify an entry in \texttt{pBeginInfo->pReferenceSlots} corresponding to all active DPB slots of the video session, but only for those which are intended to be used in the video coding scope. This way the application can avoid any potential runtime cost associated with binding the corresponding picture resources to the command buffer.

\textbf{Valid Usage}

- **VUID-vkCmdBeginVideoCodingKHR-commandBuffer-07231**
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must support the video codec operation \texttt{pBeginInfo->videoSession} was created with, as returned by \texttt{vkGetPhysicalDeviceQueueFamilyProperties2} in \texttt{VkQueueFamilyVideoPropertiesKHR::videoCodecOperations}

- **VUID-vkCmdBeginVideoCodingKHR-None-07232**
  There must be no active queries.

- **VUID-vkCmdBeginVideoCodingKHR-commandBuffer-07233**
  If \texttt{commandBuffer} is an unprotected command buffer and \texttt{protectedNoFault} is not supported, then \texttt{pBeginInfo->videoSession} must not have been created with \texttt{VK_VIDEO_SESSION_CREATE_PROTECTED_CONTENT_BIT_KHR}

- **VUID-vkCmdBeginVideoCodingKHR-commandBuffer-07234**
  If \texttt{commandBuffer} is a protected command buffer and \texttt{protectedNoFault} is not supported, then \texttt{pBeginInfo->videoSession} must have been created with \texttt{VK_VIDEO_SESSION_CREATE_PROTECTED_CONTENT_BIT_KHR}

- **VUID-vkCmdBeginVideoCodingKHR-commandBuffer-07235**
  If \texttt{commandBuffer} is an unprotected command buffer, \texttt{protectedNoFault} is not supported, and the \texttt{pPictureResource} member of any element of \texttt{pBeginInfo->pReferenceSlots} is not NULL, then \texttt{pPictureResource->imageViewBinding} for that element must not specify an image view created from a protected image.

- **VUID-vkCmdBeginVideoCodingKHR-commandBuffer-07236**
  If \texttt{commandBuffer} is a protected command buffer \texttt{protectedNoFault} is not supported, and the \texttt{pPictureResource} member of any element of \texttt{pBeginInfo->pReferenceSlots} is not NULL, then \texttt{pPictureResource->imageViewBinding} for that element must specify an image view created from a protected image.
• VUID-vkCmdBeginVideoCodingKHR-slotIndex-07239
  If the slotIndex member of any element of pBeginInfo->pReferenceSlots is not negative, then it must specify the index of a DPB slot that is in the active state in pBeginInfo->videoSession at the time the command is executed on the device.

• VUID-vkCmdBeginVideoCodingKHR-pPictureResource-07265
  Each video picture resource specified by any non-NULL pPictureResource member specified in the elements of pBeginInfo->pReferenceSlots for which slotIndex is not negative must match one of the video picture resources currently associated with the DPB slot index of pBeginInfo->videoSession specified by slotIndex at the time the command is executed on the device.

---

**Valid Usage (Implicit)**

• VUID-vkCmdBeginVideoCodingKHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdBeginVideoCodingKHR-pBeginInfo-parameter
  pBeginInfo must be a valid pointer to a valid VkVideoBeginCodingInfoKHR structure

• VUID-vkCmdBeginVideoCodingKHR-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdBeginVideoCodingKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support decode, or encode operations

• VUID-vkCmdBeginVideoCodingKHR-renderpass
  This command must only be called outside of a render pass instance

• VUID-vkCmdBeginVideoCodingKHR-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdBeginVideoCodingKHR-bufferlevel
  commandBuffer must be a primary VkCommandBuffer

---

**Host Synchronization**

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
The `VkVideoBeginCodingInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoBeginCodingInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoBeginCodingFlagsKHR flags;
    VkVideoSessionKHR videoSession;
    VkVideoSessionParametersKHR videoSessionParameters;
    uint32_t referenceSlotCount;
    const VkVideoReferenceSlotInfoKHR* pReferenceSlots;
} VkVideoBeginCodingInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **videoSession** is the video session object to be bound for the processing of the video commands.
- **videoSessionParameters** is `VK_NULL_HANDLE` or a handle of a `VkVideoSessionParametersKHR` object to be used for the processing of the video commands. If `VK_NULL_HANDLE`, then no video session parameters object is bound for the duration of the video coding scope.
- **referenceSlotCount** is the number of elements in the `pReferenceSlots` array.
- **pReferenceSlots** is a pointer to an array of `VkVideoReferenceSlotInfoKHR` structures specifying the information used to determine the set of bound reference picture resources for the video coding scope and their initial association with DPB slot indices.

Limiting values are defined below that are referenced by the relevant valid usage statements of this structure.

- Let `VkOffset2D codedOffsetGranularity` be the minimum alignment requirement for the coded offset of video picture resources. Unless otherwise defined, the value of the `x` and `y` members of `codedOffsetGranularity` are 0.
  - If `videoSession` was created with an H.264 decode profile with a `VkVideoDecodeH264ProfileInfoKHR::pictureLayout` of `VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR`, then `codedOffsetGranularity` is equal to `VkVideoDecodeH264CapabilitiesKHR::fieldOffsetGranularity`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for that
Valid Usage

- VUID-VkVideoBeginCodingInfoKHR-videoSession-07237
  
  `videoSession` must have memory bound to all of its memory bindings returned by `vkGetVideoSessionMemoryRequirementsKHR` for `videoSession`.

- VUID-VkVideoBeginCodingInfoKHR-slotIndex-04856
  
  Each non-negative `VkVideoReferenceSlotInfoKHR::slotIndex` specified in the elements of `pReferenceSlots` must be less than the `VkVideoSessionCreateInfoKHR::maxDpbSlots` specified when `videoSession` was created.

- VUID-VkVideoBeginCodingInfoKHR-pPictureResource-07238
  
  Each video picture resource corresponding to any non-NULL `pPictureResource` member specified in the elements of `pReferenceSlots` must be unique within `pReferenceSlots`.

- VUID-VkVideoBeginCodingInfoKHR-pPictureResource-07240
  
  If the `pPictureResource` member of any element of `pReferenceSlots` is not NULL, then the image view specified in `pPictureResource->imageViewBinding` for that element must be compatible with the video profile `videoSession` was created with.

- VUID-VkVideoBeginCodingInfoKHR-pPictureResource-07241
  
  If the `pPictureResource` member of any element of `pReferenceSlots` is not NULL, then the format of the image view specified in `pPictureResource->imageViewBinding` for that element must match the `VkVideoSessionCreateInfoKHR::referencePictureFormat` `videoSession` was created with.

- VUID-VkVideoBeginCodingInfoKHR-pPictureResource-07242
  
  If the `pPictureResource` member of any element of `pReferenceSlots` is not NULL, then its `codedOffset` member must be an integer multiple of `codedOffsetGranularity`.

- VUID-VkVideoBeginCodingInfoKHR-pPictureResource-07243
  
  If the `pPictureResource` member of any element of `pReferenceSlots` is not NULL, then its `codedExtent` member must be between `minCodedExtent` and `maxCodedExtent`, inclusive, `videoSession` was created with.

- VUID-VkVideoBeginCodingInfoKHR-flags-07244
  
  If `VkVideoCapabilitiesKHR::flags` does not include `VK_VIDEO_CAPABILITY_SEPARATE_REFERENCE_IMAGES_BIT_KHR`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile `videoSession` was created with, then `pPictureResource->imageViewBinding` of all elements of `pReferenceSlots` with a non-NULL `pPictureResource` member must specify image views created from the same image.

- VUID-VkVideoBeginCodingInfoKHR-slotIndex-07245
  
  If `videoSession` was created with a decode operation and the `slotIndex` member of any element of `pReferenceSlots` is not negative, then the image view specified in `pPictureResource->imageViewBinding` for that element must have been created with `VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR`.

- VUID-VkVideoBeginCodingInfoKHR-slotIndex-07246
  
  If `videoSession` was created with an encode operation and the `slotIndex` member of any
element of `pReferenceSlots` is not negative, then the image view specified in `pPictureResource->imageViewBinding` for that element must have been created with `VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR`.

- **VUID-VkVideoBeginCodingInfoKHR-videoSession-07247**
  If `videoSession` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then `videoSessionParameters` must not be `VK_NULL_HANDLE`.

- **VUID-VkVideoBeginCodingInfoKHR-videoSession-07248**
  If `videoSession` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then `videoSessionParameters` must not be `VK_NULL_HANDLE`.

- **VUID-VkVideoBeginCodingInfoKHR-videoSession-07249**
  If `videoSession` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT`, then `videoSessionParameters` must not be `VK_NULL_HANDLE`.

- **VUID-VkVideoBeginCodingInfoKHR-videoSession-07250**
  If `videoSession` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_EXT`, then `videoSessionParameters` must not be `VK_NULL_HANDLE`.

- **VUID-VkVideoBeginCodingInfoKHR-videoSessionParameters-04857**
  If `videoSessionParameters` is not `VK_NULL_HANDLE`, it must have been created with `videoSession` specified in `VkVideoSessionParametersCreateInfoKHR::videoSession`.

### Valid Usage (Implicit)

- **VUID-VkVideoBeginCodingInfoKHR-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_BEGIN_CODING_INFO_KHR`.

- **VUID-VkVideoBeginCodingInfoKHR-pNext-pNext**
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkVideoEncodeH264GopRemainingFrameInfoEXT`, `VkVideoEncodeH264RateControlInfoEXT`, `VkVideoEncodeH265GopRemainingFrameInfoEXT`, `VkVideoEncodeH265RateControlInfoEXT`, or `VkVideoEncodeRateControlInfoKHR`.

- **VUID-VkVideoBeginCodingInfoKHR-sType-unique**
  The `sType` value of each struct in the `pNext` chain must be unique.

- **VUID-VkVideoBeginCodingInfoKHR-flags-zerobitmask**
  `flags` must be 0.

- **VUID-VkVideoBeginCodingInfoKHR-videoSession-parameter**
  `videoSession` must be a valid `VkVideoSessionKHR` handle.

- **VUID-VkVideoBeginCodingInfoKHR-videoSessionParameters-parameter**
  If `videoSessionParameters` is not `VK_NULL_HANDLE`, `videoSessionParameters` must be a valid `VkVideoSessionParametersKHR` handle.
If `referenceSlotCount` is not 0, `pReferenceSlots` must be a valid pointer to an array of `referenceSlotCount` valid `VkVideoReferenceSlotInfoKHR` structures.

If `videoSessionParameters` is a valid handle, it must have been created, allocated, or retrieved from `videoSession`.

Both of `videoSession`, and `videoSessionParameters` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.

---

```c
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoBeginCodingFlagsKHR;
```

`VkVideoBeginCodingFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

The `VkVideoReferenceSlotInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoReferenceSlotInfoKHR {
    VkStructureType sType;
    const void* pNext;
    int32_t slotIndex;
    const VkVideoPictureResourceInfoKHR* pPictureResource;
} VkVideoReferenceSlotInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `slotIndex` is the index of the DPB slot or a negative integer value.
- `pPictureResource` is `NULL` or a pointer to a `VkVideoPictureResourceInfoKHR` structure describing the video picture resource associated with the DPB slot index specified by `slotIndex`.

---

**Valid Usage (Implicit)**

- VUID-VkVideoReferenceSlotInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_REFERENCE_SLOT_INFO_KHR`

- VUID-VkVideoReferenceSlotInfoKHR-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkVideoDecodeH264DpbSlotInfoKHR`, `VkVideoDecodeH265DpbSlotInfoKHR`, `VkVideoEncodeH264DpbSlotInfoEXT`, or `VkVideoEncodeH265DpbSlotInfoEXT`

- VUID-VkVideoReferenceSlotInfoKHR-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique
To end a video coding scope, call:

```c
// Provided by VK_KHR_video_queue
void vkCmdEndVideoCodingKHR(
    VkCommandBuffer commandBuffer,      // Provided by VK_KHR_video_queue
    const VkVideoEndCodingInfoKHR* pEndCodingInfo);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pEndCodingInfo` is a pointer to a `VkVideoEndCodingInfoKHR` structure specifying the parameters for ending the video coding scope.

After ending a video coding scope, the video session object, the optional video session parameters object, and all reference picture resources previously bound by the corresponding `vkCmdBeginVideoCodingKHR` command are unbound.

**Valid Usage**

- VUID-vkCmdEndVideoCodingKHR-None-07251
  There must be no active queries

**Valid Usage (Implicit)**

- VUID-vkCmdEndVideoCodingKHR-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdEndVideoCodingKHR-pEndCodingInfo-parameter
  `pEndCodingInfo` must be a valid pointer to a valid `VkVideoEndCodingInfoKHR` structure
- VUID-vkCmdEndVideoCodingKHR-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdEndVideoCodingKHR-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support decode, or encode operations
- VUID-vkCmdEndVideoCodingKHR-renderpass
  This command must only be called outside of a render pass instance
- VUID-vkCmdEndVideoCodingKHR-videocoding
  This command must only be called inside of a video coding scope
- VUID-vkCmdEndVideoCodingKHR-bufferlevel
  `commandBuffer` must be a primary `VkCommandBuffer`
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>

<td>Inside</td>
<td>Decode Encode</td>
<td>Action State</td>
</tr>
</tbody>
</table>

The `VkVideoEndCodingInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoEndCodingInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoEndCodingFlagsKHR flags;
} VkVideoEndCodingInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.

Valid Usage (Implicit)

- VUID-VkVideoEndCodingInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_END_CODING_INFO_KHR`
- VUID-VkVideoEndCodingInfoKHR-pNext-pNext
  `pNext` must be `NULL`
- VUID-VkVideoEndCodingInfoKHR-flags-zerobitmask
  `flags` must be `0`

```c
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoEndCodingFlagsKHR;
```

`VkVideoEndCodingFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.
42.9. Video Coding Control

To apply dynamic controls to the currently bound video session object, call:

```
// Provided by VK_KHR_video_queue
void vkCmdControlVideoCodingKHR(
    VkCommandBuffer commandBuffer,
    const VkVideoCodingControlInfoKHR* pCodingControlInfo);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pCodingControlInfo` is a pointer to a `VkVideoCodingControlInfoKHR` structure specifying the control parameters.

The control parameters provided in this call are applied to the video session at the time the command executes on the device and are in effect until a subsequent call to this command with the same video session bound changes the corresponding control parameters.

A newly created video session **must** be reset before performing video coding operations using it by including `VK_VIDEO_CODING_CONTROL_RESET_BIT_KHR` in `pCodingControlInfo->flags`. The reset operation also returns all DPB slots of the video session to the inactive state. Correspondingly, any DPB slot index associated with the bound reference picture resources is removed.

For encode sessions, the reset operation returns rate control configuration to implementation default settings and sets the video encode quality level to zero.

After video coding operations are performed using a video session, the reset operation **can** be used to return the video session to the same initial state as after the reset of a newly created video session. This **can** be used, for example, when different video sequences are needed to be processed with the same video session object.

### Valid Usage

- **VUID-vkCmdControlVideoCodingKHR-flags-07017**
  If `pCodingControlInfo->flags` does not include `VK_VIDEO_CODING_CONTROL_RESET_BIT_KHR`, then the bound video session **must** not be in uninitialized state at the time the command is executed on the device

### Valid Usage (Implicit)

- **VUID-vkCmdControlVideoCodingKHR-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdControlVideoCodingKHR-pCodingControlInfo-parameter**
  `pCodingControlInfo` **must** be a valid pointer to a valid `VkVideoCodingControlInfoKHR` structure

- **VUID-vkCmdControlVideoCodingKHR-commandBuffer-recording**
**commandBuffer** must be in the recording state

- VUID-vkCmdControlVideoCodingKHR-commandBuffer-cmdpool
  The **VkCommandPool** that **commandBuffer** was allocated from **must** support decode, or encode operations

- VUID-vkCmdControlVideoCodingKHR-renderpass
  This command **must** only be called outside of a render pass instance

- VUID-vkCmdControlVideoCodingKHR-videocoding
  This command **must** only be called inside of a video coding scope

- VUID-vkCmdControlVideoCodingKHR-bufferlevel
  **commandBuffer** must be a primary **VkCommandBuffer**

**Host Synchronization**

- Host access to **commandBuffer** **must** be externally synchronized

- Host access to the **VkCommandPool** that **commandBuffer** was allocated from **must** be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Inside</td>
<td>Decode</td>
<td>Action</td>
</tr>
</tbody>
</table>

The **VkVideoCodingControlInfoKHR** structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoCodingControlInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoCodingControlFlagsKHR flags;
} VkVideoCodingControlInfoKHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is a bitmask of **VkVideoCodingControlFlagsKHR** specifying control flags.

**Valid Usage**

- VUID-VkVideoCodingControlInfoKHR-flags-07018
  If **flags** includes **VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR**, then the **pNext**
chain must include a VkVideoEncodeRateControlInfoKHR structure

- VUID-VkVideoCodingControlInfoKHR-flags-07021
  If flags includes VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR, the rateControlMode member of VkVideoEncodeRateControlInfoKHR included in the pNext chain is not VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DEFAULT_KHR or VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR, and the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT, then the pNext chain must include a VkVideoEncodeH264RateControlInfoEXT structure

- VUID-VkVideoCodingControlInfoKHR-pNext-07022
  If the pNext chain includes a VkVideoEncodeRateControlInfoKHR, and VkVideoEncodeRateControlInfoKHR::layerCount is greater than 1, then VkVideoEncodeH264RateControlInfoEXT::temporalLayerCount must be equal to layerCount

- VUID-VkVideoCodingControlInfoKHR-flags-07024
  If flags includes VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR, the rateControlMode member of VkVideoEncodeRateControlInfoKHR included in the pNext chain is not VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DEFAULT_KHR or VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR, and the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_EXT, then the pNext chain must include a VkVideoEncodeH265RateControlInfoEXT structure

- VUID-VkVideoCodingControlInfoKHR-pNext-07025
  If the pNext chain includes a VkVideoEncodeRateControlInfoKHR, and VkVideoEncodeRateControlInfoKHR::layerCount is greater than 1, then VkVideoEncodeH265RateControlInfoEXT::subLayerCount must be equal to layerCount

Valid Usage (Implicit)

- VUID-VkVideoCodingControlInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_CODING_CONTROL_INFO_KHR

- VUID-VkVideoCodingControlInfoKHR-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkVideoEncodeH264RateControlInfoEXT, VkVideoEncodeH265RateControlInfoEXT, VkVideoEncodeQualityLevelInfoKHR, or VkVideoEncodeRateControlInfoKHR

- VUID-VkVideoCodingControlInfoKHR-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkVideoCodingControlInfoKHR-flags-parameter
  flags must be a valid combination of VkVideoCodingControlFlagBitsKHR values

- VUID-VkVideoCodingControlInfoKHR-flags-requiredbitmask
  flags must not be 0

Bits which can be set in VkVideoCodingControlInfoKHR::flags, specifying the video coding control parameters to be modified, are:
typedef enum VkVideoCodingControlFlagBitsKHR {
    VK_VIDEO_CODING_CONTROL_RESET_BIT_KHR = 0x00000001,
} VkVideoCodingControlFlagBitsKHR;

• VK_VIDEO_CODING_CONTROL_RESET_BIT_KHR indicates a request for the bound video session to be reset before other coding control parameters are applied.

• VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR indicates that the coding control parameters include video encode rate control parameters (see VkVideoEncodeRateControlInfoKHR).

• VK_VIDEO_CODING_CONTROL_ENCODE_QUALITY_LEVEL_BIT_KHR indicates that the coding control parameters include video encode quality level parameters (see VkVideoEncodeQualityLevelInfoKHR).

typedef VkFlags VkVideoCodingControlFlagsKHR;

VkVideoCodingControlFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoCodingControlFlagBitsKHR.

42.10. Video Decode Operations

Video decode operations consume compressed video data from a video bitstream buffer and zero or more reference pictures, and produce a decode output picture and an optional reconstructed picture.

Note:

Such decode output pictures can be shared with the Decoded Picture Buffer, and can also be used as the input of video encode operations, with graphics or compute operations, or with Window System Integration APIs, depending on the capabilities of the implementation.

Video decode operations may access the following resources in the VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR stage:

• The source video bitstream buffer range and the image subregions corresponding to the list of active reference pictures with access VK_ACCESS_2_VIDEO_DECODE_READ_BIT_KHR.
• The image subregions corresponding to the target decode output picture and reconstructed picture with access VK_ACCESS_2_VIDEO_DECODE_WRITE_BIT_KHR.

The image subresource of each video picture resource accessed by the video coding operation is specified using a corresponding VkVideoPictureResourceInfoKHR structure. Each such image subresource must be in the appropriate image layout as follows:

• If the image subresource is used in the video decode operation only as decode output picture, then it must be in the VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR layout.

• If the image subresource is used in the video decode operation both as decode output picture and reconstructed picture, then it must be in the VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR layout.

• If the image subresource is used in the video decode operation only as reconstructed picture, then it must be in the VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR layout.

• If the image subresource is used in the video decode operation as a reference picture, then it must be in the VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR layout.

A video decode operation may complete unsuccessfully. In this case the decode output picture will have undefined contents. Similarly, if a reconstructed picture is specified, it will also have undefined contents, and the activated DPB slot will have an invalid picture reference.

42.10.1. Codec-Specific Semantics

The following aspects of video decode operations are codec-specific:

• The interpretation of the contents of the source video bitstream buffer range.

• The construction and interpretation of the list of active reference pictures and the interpretation of the picture data referred to by the corresponding image subregions.

• The construction and interpretation of information related to the decode output picture and the generation of picture data to the corresponding image subregion.

• The construction and interpretation of information related to the optional reconstructed picture and the generation of picture data to the corresponding image subregion.

These codec-specific behaviors are defined for each video codec operation separately.

• If the used video codec operation is VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR, then the codec-specific aspects of the video decoding process are performed as defined in the H.264 Decode Operations section.

• If the used video codec operation is VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, then the codec-specific aspects of the video decoding process are performed as defined in the H.265 Decode Operations section.

42.10.2. Video Decode Operation Steps

Each video decode operation performs the following steps in the VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR stage:

1. Reads the encoded video data from the source video bitstream buffer range.
2. Performs picture reconstruction of the encoded video data according to the **codec-specific semantics**, applying any prediction data read from the **active reference pictures** in the process;

3. Writes the decoded picture data to the **decode output picture**, and to the **reconstructed picture**, if one is specified and is different from the decode output picture, according to the **codec-specific semantics**;

4. When **reconstructed picture information** is provided, the requested **DPB slot** is **activated** with the specified picture and the DPB slot index is associated with the corresponding **bound reference picture resource**.

### 42.10.3. Capabilities

When calling `vkGetPhysicalDeviceVideoCapabilitiesKHR` with `pVideoProfile->videoCodecOperation` specifying a decode operation, the `VkVideoDecodeCapabilitiesKHR` structure **must** be included in the `pNext` chain of the `VkVideoCapabilitiesKHR` structure to retrieve capabilities specific to video decoding.

The `VkVideoDecodeCapabilitiesKHR` structure is defined as:

```c
// Provided by VK_KHR_video_decode_queue
typedef struct VkVideoDecodeCapabilitiesKHR {
    VkStructureType sType;
    void* pNext;
    VkVideoDecodeCapabilityFlagsKHR flags;
} VkVideoDecodeCapabilitiesKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is a bitmask of `VkVideoDecodeCapabilityFlagBitsKHR` describing the supported video decoding capabilities.

### Valid Usage (Implicit)

- VUID-VkVideoDecodeCapabilitiesKHR-sType-sType
  - **sType** must be `VK_STRUCTURE_TYPE_VIDEO_DECODE_CAPABILITIES_KHR`

Bits which **may** be set in `VkVideoDecodeCapabilitiesKHR::flags`, indicating the decoding capabilities supported, are:

```c
// Provided by VK_KHR_video_decode_queue
typedef enum VkVideoDecodeCapabilityFlagBitsKHR {
    VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR = 0x00000001,
    VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR = 0x00000002,
} VkVideoDecodeCapabilityFlagBitsKHR;
```
• **VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR** indicates support for using the same video picture resource as the reconstructed picture and decode output picture in a video decode operation.

• **VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR** indicates support for using distinct video picture resources as the reconstructed picture and decode output picture in a video decode operation.

Implementations are only required to support one of **VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR** and **VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR**. Accordingly, applications should handle both cases to maximize portability.

**Note:**

If both **VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR** and **VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR** are supported, an application can choose to create separate images for decode DPB and decode output. E.g. in cases when linear tiling is preferred (and supported) for the decode output picture and the DPB requires optimal tiling, this avoids the need for a separate copy at the expense of additional memory bandwidth requirements during decoding.

```c
// Provided by VK_KHR_video_decode_queue
typedef VkFlags VkVideoDecodeCapabilityFlagsKHR;
```

**VkVideoDecodeCapabilityFlagsKHR** is a bitmask type for setting a mask of zero or more **VkVideoDecodeCapabilityFlagBitsKHR**.

## 42.10.4. Video Decode Commands

To launch video decode operations, call:

```c
// Provided by VK_KHR_video_decode_queue
void vkCmdDecodeVideoKHR(
    VkCommandBuffer commandBuffer,
    const VkVideoDecodeInfoKHR* pDecodeInfo);
```

• **commandBuffer** is the command buffer in which to record the command.

• **pDecodeInfo** is a pointer to a **VkVideoDecodeInfoKHR** structure specifying the parameters of the video decode operations.

Each call issues one or more video decode operations. The implicit parameter **opCount** corresponds to the number of video decode operations issued by the command. After calling this command, the active query index of each active query is incremented by **opCount**.

Currently each call to this command results in the issue of a single video decode operation.
Active Reference Picture Information

The list of active reference pictures used by a video decode operation is a list of image subregions used as the source of reference picture data and related parameters, and is derived from the VkVideoReferenceSlotInfoKHR structures provided as the elements of the pDecodeInfo->pReferenceSlots array. For each element of pDecodeInfo->pReferenceSlots, one or more elements are added to the active reference picture list, as defined by the codec-specific semantics. Each element of this list contains the following information:

- The image subregion within the image subresource referred to by the video picture resource used as the reference picture.
- The DPB slot index the reference picture is associated with.
- The codec-specific reference information related to the reference picture.

Reconstructed Picture Information

Information related to the optional reconstructed picture used by a video decode operation is derived from the VkVideoReferenceSlotInfoKHR structure pointed to by pDecodeInfo->pSetupReferenceSlot, if not NULL, as defined by the codec-specific semantics, and consists of the following:

- The image subregion within the image subresource referred to by the video picture resource used as the reconstructed picture.
- The DPB slot index to activate with the reconstructed picture.
- The codec-specific reference information related to the reconstructed picture.

Decode Output Picture Information

Information related to the decode output picture used by a video decode operation is derived from pDecodeInfo->dstPictureResource and any codec-specific parameters provided in the pDecodeInfo->pNext chain, as defined by the codec-specific semantics, and consists of the following:

- The image subregion within the image subresource referred to by the video picture resource used as the decode output picture.
- The codec-specific picture information related to the decode output picture.

Several limiting values are defined below that are referenced by the relevant valid usage statements of this command.

- Let uint32_t activeReferencePictureCount be the size of the list of active reference pictures used by the video decode operation. Unless otherwise defined, activeReferencePictureCount is set to the value of pDecodeInfo->referenceSlotCount.

  - If the bound video session was created with an H.264 decode profile, then let activeReferencePictureCount be the value of pDecodeInfo->referenceSlotCount plus the number of elements of the pDecodeInfo->pReferenceSlots array that have a VkVideoDecodeH264DpbSlotInfoKHR structure included in their pNext chain with both pStdReferenceInfo->flags.top_field_flag and pStdReferenceInfo->flags.bottom_field_flag set.
Note

This means that the elements of pDecodeInfo->pReferenceSlots that include both a top and bottom field reference are counted as two separate active reference pictures, as described in the active reference picture list construction rules for H.264 decode operations.

• Let VkOffset2D codedOffsetGranularity be the minimum alignment requirement for the coded offset of video picture resources. Unless otherwise defined, the value of the x and y members of codedOffsetGranularity are 0.
  ◦ If the bound video session was created with an H.264 decode profile with a VkVideoDecodeH264ProfileInfoKHR::pictureLayout of VK_VIDEO_CODEC_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR, then codedOffsetGranularity is equal to VkVideoDecodeH264CapabilitiesKHR::fieldOffsetGranularity, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for that video profile.

• Let uint32_t dpbFrameUseCount[] be an array of size maxDpbSlots, where maxDpbSlots is the VkVideoSessionCreateInfoKHR::maxDpbSlots the bound video session was created with, with each element indicating the number of times a frame associated with the corresponding DPB slot index is referred to by the video coding operation. Let the initial value of each element of the array be 0.
  ◦ If pDecodeInfo->pSetupReferenceSlot is not NULL, then dpbFrameUseCount[i] is incremented by one, where i equals pDecodeInfo->pSetupReferenceSlot->slotIndex. If the bound video session object was created with an H.264 decode profile, then dpbFrameUseCount[i] is decremented by one if either pStdReferenceInfo->flags.top_field_flag or pStdReferenceInfo->flags.bottom_field_flag is set in the VkVideoDecodeH264DpbSlotInfoKHR structure in the pDecodeInfo->pSetupReferenceSlot->pNext chain.
  ◦ For each element of pDecodeInfo->pReferenceSlots, dpbFrameUseCount[i] is incremented by one, where i equals the slotIndex member of the corresponding element. If the bound video session object was created with an H.264 decode profile, then dpbFrameUseCount[i] is decremented by one if either pStdReferenceInfo->flags.top_field_flag or pStdReferenceInfo->flags.bottom_field_flag is set in the VkVideoDecodeH264DpbSlotInfoKHR structure in the pNext chain of the corresponding element of pDecodeInfo->pReferenceSlots.

• Let uint32_t dpbTopFieldUseCount[] and uint32_t dpbBottomFieldUseCount[] be arrays of size maxDpbSlots, where maxDpbSlots is the VkVideoSessionCreateInfoKHR::maxDpbSlots the bound video session was created with, with each element indicating the number of times the top field or the bottom field, respectively, associated with the corresponding DPB slot index is referred to by the video coding operation. Let the initial value of each element of the arrays be 0.
  ◦ If the bound video session object was created with an H.264 decode profile and pDecodeInfo->pSetupReferenceSlot is not NULL, then perform the following:
    • If pStdReferenceInfo->flags.top_field_flag is set in the VkVideoDecodeH264DpbSlotInfoKHR structure in the pDecodeInfo->pSetupReferenceSlot->pNext chain, then dpbTopFieldUseCount[i] is incremented by one, where i equals
pDecodeInfo->pSetupReferenceSlot->slotIndex.

- If pStdReferenceInfo->flags.bottom_field_flag is set in the VkVideoDecodeH264DpbSlotInfoKHR structure in the pDecodeInfo->pSetupReferenceSlot->pNext chain, then dpbBottomFieldUseCount[i] is incremented by one, where i equals pDecodeInfo->pSetupReferenceSlot->slotIndex.

- If the bound video session object was created with an H.264 decode profile, then perform the following for each element of pDecodeInfo->pReferenceSlots:
  - If pStdReferenceInfo->flags.top_field_flag is set in the VkVideoDecodeH264DpbSlotInfoKHR structure in the pNext chain of the element, then dpbTopFieldUseCount[i] is incremented by one, where i equals the slotIndex member of the element.
  - If pStdReferenceInfo->flags.bottom_field_flag is set in the VkVideoDecodeH264DpbSlotInfoKHR structure in the pNext chain of the element, then dpbBottomFieldUseCount[i] is incremented by one, where i equals the slotIndex member of the element.

Valid Usage

- VUID-vkCmdDecodeVideoKHR-None-07011
  The bound video session must not be in uninitialized state at the time the command is executed on the device.

- VUID-vkCmdDecodeVideoKHR-opCount-07134
  For each active query, the active query index corresponding to the query type of that query plus opCount must be less than or equal to the last activatable query index corresponding to the query type of that query plus one.

- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07135
  pDecodeInfo->srcBuffer must be compatible with the video profile the bound video session was created with.

- VUID-vkCmdDecodeVideoKHR-commandBuffer-07136
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, then pDecodeInfo->srcBuffer must not be a protected buffer.

- VUID-vkCmdDecodeVideoKHR-commandBuffer-07137
  If commandBuffer is a protected command buffer and protectedNoFault is not supported, then pDecodeInfo->srcBuffer must be a protected buffer.

- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07138
  pDecodeInfo->srcBufferOffset must be an integer multiple of VkVideoCapabilitiesKHR::minBitstreamBufferOffsetAlignment, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with.

- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07139
  pDecodeInfo->srcBufferRange must be an integer multiple of VkVideoCapabilitiesKHR::minBitstreamBufferSizeAlignment, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with.
If pDecodeInfo->pSetupReferenceSlot is not NULL and VkVideoDecodeCapabilitiesKHR::flags does not include VK_VIDEO_DECODER_CODEC_DHBCAND_OUTPUT_COINCIDE_BIT_KHR, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with, then the video picture resources specified by pDecodeInfo->dstPictureResource and pDecodeInfo->pSetupReferenceSlot->pPictureResource must not match.

If pDecodeInfo->pSetupReferenceSlot is not NULL and VkVideoDecodeCapabilitiesKHR::flags does not include VK_VIDEO_DECODER_CODEC_DHBCAND_OUTPUT_DISTINCT_BIT_KHR, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with, then the video picture resources specified by pDecodeInfo->dstPictureResource and pDecodeInfo->pSetupReferenceSlot->pPictureResource must match.

pDecodeInfo->dstPictureResource.imageViewBinding must be compatible with the video profile the bound video session was created with.

The format of pDecodeInfo->dstPictureResource.imageViewBinding must match the VkVideoSessionCreateInfoKHR::pictureFormat the bound video session was created with.

pDecodeInfo->dstPictureResource.codedOffset must be an integer multiple of codedOffsetGranularity.

pDecodeInfo->dstPictureResource.codedExtent must be between minCodedExtent and maxCodedExtent, inclusive, the bound video session was created with.

pDecodeInfo->dstPictureResource.imageViewBinding must have been created with VK_IMAGE_USAGE_VIDEO_DECODER_DST_BIT_KHR.

If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, then pDecodeInfo->dstPictureResource.imageViewBinding must not have been created from a protected image.

If commandBuffer is a protected command buffer and protectedNoFault is not supported, then pDecodeInfo->dstPictureResource.imageViewBinding must have been created from a protected image.

If pDecodeInfo->pSetupReferenceSlot is not NULL, then pDecodeInfo->pSetupReferenceSlot->slotIndex must be less than the VkVideoSessionCreateInfoKHR::maxDpbSlots specified when the bound video session was created.

If pDecodeInfo->pSetupReferenceSlot is not NULL, then pDecodeInfo->pSetupReferenceSlot-
>pPictureResource->codedOffset must be an integer multiple of codedOffsetGranularity

- **VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07149**
  If pDecodeInfo->pSetupReferenceSlot is not NULL, then pDecodeInfo->pSetupReferenceSlot->pPictureResource must match one of the bound reference picture resource

- **VUID-vkCmdDecodeVideoKHR-activeReferencePictureCount-07150**
  activeReferencePictureCount must be less than or equal to the VkVideoSessionCreateInfoKHR::maxActiveReferencePictures specified when the bound video session was created

- **VUID-vkCmdDecodeVideoKHR-slotIndex-07256**
  The slotIndex member of each element of pDecodeInfo->pReferenceSlots must be less than or equal to the VkVideoSessionCreateInfoKHR::maxDpbSlots specified when the bound video session was created

- **VUID-vkCmdDecodeVideoKHR-codedOffset-07257**
  The codedOffset member of the VkVideoPictureResourceInfoKHR structure pointed to by the pPictureResource member of each element of pDecodeInfo->pReferenceSlots must be an integer multiple of codedOffsetGranularity

- **VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07151**
  The pPictureResource member of each element of pDecodeInfo->pReferenceSlots must match one of the bound reference picture resource associated with the DPB slot index specified in the slotIndex member of that element

- **VUID-vkCmdDecodeVideoKHR-dpbFrameUseCount-07176**
  All elements of dpbFrameUseCount must be less than or equal to 1

- **VUID-vkCmdDecodeVideoKHR-dpbTopFieldUseCount-07177**
  All elements of dpbTopFieldUseCount must be less than or equal to 1

- **VUID-vkCmdDecodeVideoKHR-dpbBottomFieldUseCount-07178**
  All elements of dpbBottomFieldUseCount must be less than or equal to 1

- **VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07252**
  If pDecodeInfo->pSetupReferenceSlot is not NULL or pDecodeInfo->pSetupReferenceSlot->pPictureResource does not refer to the same image subresource as pDecodeInfo->dstPictureResource, then the image subresource referred to by pDecodeInfo->dstPictureResource must be in the VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR layout at the time the video decode operation is executed on the device

- **VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07253**
  If pDecodeInfo->pSetupReferenceSlot is not NULL and pDecodeInfo->pSetupReferenceSlot->pPictureResource refers to the same image subresource as pDecodeInfo->dstPictureResource, then the image subresource referred to by pDecodeInfo->dstPictureResource must be in the VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR layout at the time the video decode operation is executed on the device

- **VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07254**
If `pDecodeInfo->pSetupReferenceSlot` is not `NULL`, then the image subresource referred to by `pDecodeInfo->pSetupReferenceSlot->pPictureResource` must be in the `VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR` layout at the time the video decode operation is executed on the device.

- **VUID-vkCmdDecodeVideoKHR-pPictureResource-07255**  
The image subresource referred to by the `pPictureResource` member of each element of `pDecodeInfo->pReferenceSlots` must be in the `VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR` layout at the time the video decode operation is executed on the device.

- **VUID-vkCmdDecodeVideoKHR-pNext-07152**  
If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then the `pNext` chain of `pDecodeInfo` must include a `VkVideoDecodeH264PictureInfoKHR` structure.

- **VUID-vkCmdDecodeVideoKHR-None-07258**  
If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR` but was not created with interlaced frame support, then the decode output picture must represent a frame.

- **VUID-vkCmdDecodeVideoKHR-pSliceOffsets-07153**  
If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then all elements of the `pSliceOffsets` member of the `VkVideoDecodeH264PictureInfoKHR` structure included in the `pNext` chain of `pDecodeInfo` must be less than `pDecodeInfo->srcBufferRange`.

- **VUID-vkCmdDecodeVideoKHR-StdVideoH264SequenceParameterSet-07154**  
If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then the bound video session parameters object must contain a `StdVideoH264SequenceParameterSet` entry with `seq_parameter_set_id` matching `StdVideoDecodeH264PictureInfo::seq_parameter_set_id` that is provided in the `pStdPictureInfo` member of the `VkVideoDecodeH264PictureInfoKHR` structure included in the `pNext` chain of `pDecodeInfo`.

- **VUID-vkCmdDecodeVideoKHR-StdVideoH264PictureParameterSet-07155**  
If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then the bound video session parameters object must contain a `StdVideoH264PictureParameterSet` entry with `seq_parameter_set_id` and `pic_parameter_set_id` matching `StdVideoDecodeH264PictureInfo::seq_parameter_set_id` and `StdVideoDecodeH264PictureInfo::pic_parameter_set_id`, respectively, that are provided in the `pStdPictureInfo` member of the `VkVideoDecodeH264PictureInfoKHR` structure included in the `pNext` chain of `pDecodeInfo`.

- **VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07156**  
If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR` and `pDecodeInfo->pSetupReferenceSlot` is not `NULL`, then the `pNext` chain of `pDecodeInfo->pSetupReferenceSlot` must include a `VkVideoDecodeH264DpbSlotInfoKHR` structure.

- **VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07259**  
If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR` but was not created with interlaced frame support, and `pDecodeInfo->pSetupReferenceSlot` is not `NULL`, then the reconstructed picture...
must represent a frame

• VUID-vkCmdDecodeVideoKHR-pNext-07157
If the bound video session was created with the video codec operation
VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR, then the pNext chain of each element of
pDecodeInfo->pReferenceSlots must include a VkVideoDecodeH264DpbSlotInfoKHR
structure

• VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07260
If the bound video session was created with the video codec operation
VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR but was not created with interlaced frame
support, then each active reference picture corresponding to the elements of pDecodeInfo-
> pReferenceSlots must represent a frame

• VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07261
If the bound video session was created with the video codec operation
VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR, pDecodeInfo->pSetupReferenceSlot is not
NULL, and the decode output picture represents a frame, then the reconstructed picture
must also represent a frame

• VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07262
If the bound video session was created with the video codec operation
VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR, pDecodeInfo->pSetupReferenceSlot is not
NULL, and the decode output picture represents a top field, then the reconstructed picture
must also represent a top field

• VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07263
If the bound video session was created with the video codec operation
VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR, pDecodeInfo->pSetupReferenceSlot is not
NULL, and the decode output picture represents a bottom field, then the reconstructed picture
must also represent a bottom field

• VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07266
If the bound video session was created with the video codec operation
VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR and an active reference picture
corresponding to any element of pDecodeInfo->pReferenceSlots represents a frame, then
the DPB slot index of the bound video session specified by the slotIndex member of that
element must be currently associated with a frame picture matching the video picture
resource specified by the pPictureResource member of the same element at the time the
command is executed on the device

• VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07267
If the bound video session was created with the video codec operation
VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR and an active reference picture
corresponding to any element of pDecodeInfo->pReferenceSlots represents a top field, then
the DPB slot index of the bound video session specified by the slotIndex member of that
element must be currently associated with a top field picture matching the video picture
resource specified by the pPictureResource member of the same element at the time the
command is executed on the device

• VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07268
If the bound video session was created with the video codec operation
VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR and an active reference picture
corresponding to any element of `pDecodeInfo->pReferenceSlots` represents a bottom field, then the DPB slot index of the bound video session specified by the `slotIndex` member of that element **must** be currently associated with a bottom field picture matching the video picture resource specified by the `pPictureResource` member of the same element at the time the command is executed on the device

- **VUID-vkCmdDecodeVideoKHR-pNext-07158**
  If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then the `pNext` chain of `pDecodeInfo` **must** include a `VkVideoDecodeH265PictureInfoKHR` structure

- **VUID-vkCmdDecodeVideoKHR-pSliceSegmentOffsets-07159**
  If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then all elements of the `pSliceSegmentOffsets` member of the `VkVideoDecodeH265PictureInfoKHR` structure included in the `pNext` chain of `pDecodeInfo` **must** be less than `pDecodeInfo->srcBufferRange`

- **VUID-vkCmdDecodeVideoKHR-StdVideoH265VideoParameterSet-07160**
  If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then the bound video session parameters object **must** contain a `StdVideoH265VideoParameterSet` entry with `vps_video_parameter_set_id` matching `StdVideoDecodeH265PictureInfo::sps_video_parameter_set_id` that is provided in the `pStdPictureInfo` member of the `VkVideoDecodeH265PictureInfoKHR` structure included in the `pNext` chain of `pDecodeInfo`

- **VUID-vkCmdDecodeVideoKHR-StdVideoH265SequenceParameterSet-07161**
  If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then the bound video session parameters object **must** contain a `StdVideoH265SequenceParameterSet` entry with `sps_video_parameter_set_id` and `sps_seq_parameter_set_id` matching `StdVideoDecodeH265PictureInfo::sps_video_parameter_set_id` and `StdVideoDecodeH265PictureInfo::pps_seq_parameter_set_id`, respectively, that are provided in the `pStdPictureInfo` member of the `VkVideoDecodeH265PictureInfoKHR` structure included in the `pNext` chain of `pDecodeInfo`

- **VUID-vkCmdDecodeVideoKHR-StdVideoH265PictureParameterSet-07162**
  If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then the bound video session parameters object **must** contain a `StdVideoH265PictureParameterSet` entry with `sps_video_parameter_set_id`, `pps_seq_parameter_set_id`, and `pps_pic_parameter_set_id` matching `StdVideoDecodeH265PictureInfo::sps_video_parameter_set_id`, `StdVideoDecodeH265PictureInfo::pps_seq_parameter_set_id`, and `StdVideoDecodeH265PictureInfo::pps_pic_parameter_set_id`, respectively, that are provided in the `pStdPictureInfo` member of the `VkVideoDecodeH265PictureInfoKHR` structure included in the `pNext` chain of `pDecodeInfo`

- **VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07163**
  If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR` and `pDecodeInfo->pSetupReferenceSlot` is not `NULL`, then the `pNext` chain of `pDecodeInfo->pSetupReferenceSlot` **must** include a `VkVideoDecodeH265DpbSlotInfoKHR` structure
If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then the `pNext` chain of each element of `pDecodeInfo->pReferenceSlots` must include a `VkVideoDecodeH265DpbSlotInfoKHR` structure.

---

**Valid Usage (Implicit)**

- VUID-vkCmdDecodeVideoKHR-pCommandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-parameter
  
  `pDecodeInfo` must be a valid pointer to a valid `VkVideoDecodeInfoKHR` structure.

- VUID-vkCmdDecodeVideoKHR-pCommandBuffer-recording
  
  `commandBuffer` must be in the recording state.

- VUID-vkCmdDecodeVideoKHR-pCommandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support decode operations.

- VUID-vkCmdDecodeVideoKHR-pRenderPass
  
  This command must only be called outside of a render pass instance.

- VUID-vkCmdDecodeVideoKHR-pVideoCoding
  
  This command must only be called inside of a video coding scope.

- VUID-vkCmdDecodeVideoKHR-pBufferLevel
  
  `commandBuffer` must be a primary `VkCommandBuffer`.

---

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

---

**Command Properties**

<table>
<thead>

The `VkVideoDecodeInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_decode_queue
typedef struct VkVideoDecodeInfoKHR {
    VkStructureType sType;
```
const void* pNext;
VkVideoDecodeFlagsKHR flags;
VkBuffer srcBuffer;
VkDeviceSize srcBufferOffset;
VkDeviceSize srcBufferRange;
VkVideoPictureResourceInfoKHR dstPictureResource;
const VkVideoReferenceSlotInfoKHR* pSetupReferenceSlot;
uint32_t referenceSlotCount;
const VkVideoReferenceSlotInfoKHR* pReferenceSlots;
}

VkVideoDecodeInfoKHR;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **srcBuffer** is the source video bitstream buffer to read the encoded bitstream from.
- **srcBufferOffset** is the starting offset in bytes from the start of **srcBuffer** to read the encoded bitstream from.
- **srcBufferRange** is the size in bytes of the encoded bitstream to decode from **srcBuffer**, starting from **srcBufferOffset**.
- **dstPictureResource** is the video picture resource to use as the decode output picture.
- **pSetupReferenceSlot** is NULL or a pointer to a VkVideoReferenceSlotInfoKHR structure describing the DPB slot to activate and the video picture resource to use as the reconstructed picture to activate the DPB slot with.
- **referenceSlotCount** is the number of elements in the **pReferenceSlots** array.
- **pReferenceSlots** is NULL or a pointer to an array of VkVideoReferenceSlotInfoKHR structures describing the DPB slots and corresponding reference picture resources to use in this video decode operation (the set of active reference pictures).

### Valid Usage

- **VUID-VkVideoDecodeInfoKHR-srcBuffer-07165**
  
  **srcBuffer** must have been created with VK_BUFFER_USAGE_VIDEO_DECODE_SRC_BIT_KHR set

- **VUID-VkVideoDecodeInfoKHR-srcBufferOffset-07166**
  
  **srcBufferOffset** must be less than the size of **srcBuffer**

- **VUID-VkVideoDecodeInfoKHR-srcBufferRange-07167**
  
  **srcBufferRange** must be less than or equal to the size of **srcBuffer** minus **srcBufferOffset**

- **VUID-VkVideoDecodeInfoKHR-pSetupReferenceSlot-07168**
  
  If **pSetupReferenceSlot** is not NULL, then its **slotIndex** member must not be negative

- **VUID-VkVideoDecodeInfoKHR-pSetupReferenceSlot-07169**
  
  If **pSetupReferenceSlot** is not NULL, then its **pPictureResource** must not be NULL

- **VUID-VkVideoDecodeInfoKHR-slotIndex-07171**
  
  The **slotIndex** member of each element of **pReferenceSlots** must not be negative
Valid Usage (Implicit)

- **VUID-VkVideoDecodeInfoKHR-sType-sType**
  sType must be VK_STRUCTURE_TYPE_VIDEO_DECODE_INFO_KHR

- **VUID-VkVideoDecodeInfoKHR-pNext-pNext**
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkVideoDecodeH264PictureInfoKHR or VkVideoDecodeH265PictureInfoKHR

- **VUID-VkVideoDecodeInfoKHR-sType-unique**
  The sType value of each struct in the pNext chain must be unique

- **VUID-VkVideoDecodeInfoKHR-flags-zerobitmask**
  flags must be 0

- **VUID-VkVideoDecodeInfoKHR-srcBuffer-parameter**
  srcBuffer must be a valid VkBuffer handle

- **VUID-VkVideoDecodeInfoKHR-dstPictureResource-parameter**
  dstPictureResource must be a valid VkVideoPictureResourceInfoKHR structure

- **VUID-VkVideoDecodeInfoKHR-pSetupReferenceSlot-parameter**
  If pSetupReferenceSlot is not NULL, pSetupReferenceSlot must be a valid pointer to a valid VkVideoReferenceSlotInfoKHR structure

- **VUID-VkVideoDecodeInfoKHR-pReferenceSlots-parameter**
  If referenceSlotCount is not 0, pReferenceSlots must be a valid pointer to an array of referenceSlotCount valid VkVideoReferenceSlotInfoKHR structures

---

```c
// Provided by VK_KHR_video_decode_queue
typedef VkFlags VkVideoDecodeFlagsKHR;
```

VkVideoDecodeFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.

## 42.11. H.264 Decode Operations

Video decode operations using an H.264 decode profile can be used to decode elementary video stream sequences compliant to the ITU-T H.264 Specification.

**Note**
Refer to the Preamble for information on how the Khronos Intellectual Property Rights Policy relates to normative references to external materials not created by Khronos.

This process is performed according to the video decode operation steps with the codec-specific
semantics defined in section 8 of the ITU-T H.264 Specification as follows:

- Syntax elements, derived values, and other parameters are applied from the following structures:
  - The `StdVideoH264SequenceParameterSet` structure corresponding to the active SPS specifying the H.264 sequence parameter set.
  - The `StdVideoH264PictureParameterSet` structure corresponding to the active PPS specifying the H.264 picture parameter set.
  - The `StdVideoDecodeH264PictureInfo` structure specifying the H.264 picture information.
  - The `StdVideoDecodeH264ReferenceInfo` structures specifying the H.264 reference information corresponding to the optional reconstructed picture and any active reference pictures.
- The contents of the provided video bitstream buffer range are interpreted as defined in the H.264 Decode Bitstream Data Access section.
- Picture data in the video picture resources corresponding to the used active reference pictures, decode output picture, and optional reconstructed picture is accessed as defined in the H.264 Decode Picture Data Access section.

If the parameters and the bitstream adhere to the syntactic and semantic requirements defined in the corresponding sections of the ITU-T H.264 Specification, as described above, and the DPB slots associated with the active reference pictures all refer to valid picture references, then the video decode operation will complete successfully. Otherwise, the video decode operation may complete unsuccessfully.

### 42.11.1. H.264 Decode Bitstream Data Access

If the target decode output picture is a frame, then the video bitstream buffer range should contain a VCL NAL unit comprised of the slice headers and data of a picture representing an entire frame, as defined in sections 7.3.3 and 7.3.4, and this data is interpreted as defined in sections 7.4.3 and 7.4.4 of the ITU-T H.264 Specification, respectively.

If the target decode output picture is a field, then the video bitstream buffer range should contain a VCL NAL unit comprised of the slice headers and data of a picture representing a field, as defined in sections 7.3.3 and 7.3.4, and this data is interpreted as defined in sections 7.4.3 and 7.4.4 of the ITU-T H.264 Specification, respectively.

The offsets provided in VkVideoDecodeH264PictureInfoKHR::pSliceOffsets should specify the starting offsets corresponding to each slice header within the video bitstream buffer range.

### 42.11.2. H.264 Decode Picture Data Access

The effective imageOffset and imageExtent corresponding to a decode output picture, reference picture, or reconstructed picture used in video decode operations with an H.264 decode profile are defined as follows:

- imageOffset is `(codedOffset.x, codedOffset.y)` and imageExtent is `(codedExtent.width, codedExtent.height)`, if the picture represents a frame.
• imageOffset is \((\text{codedOffset.x}, \text{codedOffset.y})\) and imageExtent is \((\text{codedExtent.width}, \\text{codedExtent.height})\), if the picture represents a field and the picture layout of the used H.264 decode profile is \text{VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_INTERLEAVED_LINES_BIT_KHR}.

• imageOffset is \((\text{codedOffset.x}, \text{codedOffset.y})\) and imageExtent is \((\text{codedExtent.width}, \text{codedExtent.height} / 2)\), if the picture represents a field and the picture layout of the used H.264 decode profile is \text{VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR}.

Where \text{codedOffset} and \text{codedExtent} are the members of the \text{VkVideoPictureResourceInfoKHR} structure corresponding to the picture.

However, accesses to image data within a video picture resource happen at the granularity indicated by \text{VkVideoCapabilitiesKHR::pictureAccessGranularity}, as returned by \text{vkGetPhysicalDeviceVideoCapabilitiesKHR} for the used video profile. This means that the complete image subregion accessed by video coding operations using an H.264 decode profile for the video picture resource is defined as the set of texels within the coordinate range:

\[
((\text{startX}, \text{endX}), (\text{startY}, \text{endY}))
\]

Where:

• startX equals \(\text{imageOffset.x}\) rounded down to the nearest integer multiple of \text{pictureAccessGranularity.width};

• endX equals \(\text{imageOffset.x} + \text{imageExtent.width}\) rounded up to the nearest integer multiple of \text{pictureAccessGranularity.width} and clamped to the width of the image subresource referred to by the corresponding \text{VkVideoPictureResourceInfoKHR} structure;

• startY equals \(\text{imageOffset.y}\) rounded down to the nearest integer multiple of \text{pictureAccessGranularity.height};

• endY equals \(\text{imageOffset.y} + \text{imageExtent.height}\) rounded up to the nearest integer multiple of \text{pictureAccessGranularity.height} and clamped to the height of the image subresource referred to by the corresponding \text{VkVideoPictureResourceInfoKHR} structure.

In case of video decode operations using an H.264 decode profile, any access to a picture at the coordinates \((x,y)\), as defined by the ITU-T H.264 Specification, is an access to the image subresource referred to by the corresponding \text{VkVideoPictureResourceInfoKHR} structure at the texel coordinates specified below:

• \((x,y)\), if the accessed picture represents a frame.

• \((x,y \times 2)\), if the accessed picture represents a top field and the picture layout of the used H.264 decode profile is \text{VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_INTERLEAVED_LINES_BIT_KHR}.

• \((x,y \times 2 + 1)\), if the accessed picture represents a bottom field and the picture layout of the used H.264 decode profile is \text{VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_INTERLEAVED_LINES_BIT_KHR}.

• \((x,y)\), if the accessed picture represents a top field and the picture layout of the used H.264 decode profile is \text{VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR}.

• \((\text{codedOffset.x} + x, \text{codedOffset.y} + y)\), if the accessed picture represents a bottom field and the
picture layout of the used H.264 decode profile is VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR.

Where codedOffset is the member of the corresponding VkVideoPictureResourceInfoKHR structure.

42.11.3. H.264 Decode Profile

A video profile supporting H.264 video decode operations is specified by setting VkVideoProfileInfoKHR::videoCodecOperation to VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR and adding a VkVideoDecodeH264ProfileInfoKHR structure to the VkVideoProfileInfoKHR::pNext chain.

The VkVideoDecodeH264ProfileInfoKHR structure is defined as:

```c
// Provided by VK_KHR_video_decode_h264
typedef struct VkVideoDecodeH264ProfileInfoKHR {
    VkStructureType sType;
    const void* pNext;
    StdVideoH264ProfileIdc stdProfileIdc;
    VkVideoDecodeH264PictureLayoutFlagBitsKHR pictureLayout;
} VkVideoDecodeH264ProfileInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **stdProfileIdc** is a StdVideoH264ProfileIdc value specifying the H.264 codec profile IDC, as defined in section A.2 of the ITU-T H.264 Specification.
- **pictureLayout** is a VkVideoDecodeH264PictureLayoutFlagBitsKHR value specifying the picture layout used by the H.264 video sequence to be decoded.

### Valid Usage (Implicit)

- VUID-VkVideoDecodeH264ProfileInfoKHR-sType-sType
  - **sType** must be VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_PROFILE_INFO_KHR
- VUID-VkVideoDecodeH264ProfileInfoKHR-pictureLayout-parameter
  - If **pictureLayout** is not 0, **pictureLayout** must be a valid VkVideoDecodeH264PictureLayoutFlagBitsKHR value

The H.264 video decode picture layout flags are defined as follows:

```c
// Provided by VK_KHR_video_decode_h264
typedef enum VkVideoDecodeH264PictureLayoutFlagBitsKHR {
    VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_PROGRESSIVE_KHR = 0,
    VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_INTERLEAVED_LINES_BIT_KHR = 0x00000001,
    VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR = 0x00000002,
};
```
- **VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_PROGRESSIVE_KHR** specifies support for progressive content. This flag has the value 0.

- **VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_INTERLEAVED_LINES_BIT_KHR** specifies support for or use of a picture layout for interlaced content where all lines belonging to the top field are decoded to the even-numbered lines within the picture resource, and all lines belonging to the bottom field are decoded to the odd-numbered lines within the picture resource.

- **VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR** specifies support for or use of a picture layout for interlaced content where all lines belonging to a field are grouped together in a single image subregion, and the two fields comprising the frame can be stored in separate image subregions of the same image subresource or in separate image subresources.

```c
// Provided by VK_KHR_video_decode_h264
typedef VkFlags VkVideoDecodeH264PictureLayoutFlagsKHR;
```

**VkVideoDecodeH264PictureLayoutFlagsKHR** is a bitmask type for setting a mask of zero or more **VkVideoDecodeH264PictureLayoutFlagBitsKHR**.

### 42.11.4. H.264 Decode Capabilities

When calling **vkGetPhysicalDeviceVideoCapabilitiesKHR** to query the capabilities for an H.264 decode profile, the **VkVideoCapabilitiesKHR::pNext** chain must include a **VkVideoDecodeH264CapabilitiesKHR** structure that will be filled with the profile-specific capabilities.

The **VkVideoDecodeH264CapabilitiesKHR** structure is defined as:

```c
// Provided by VK_KHR_video_decode_h264
typedef struct VkVideoDecodeH264CapabilitiesKHR {
    VkStructureType sType;
    void* pNext;
    StdVideoH264LevelIdc maxLevelIdc;
    VkOffset2D fieldOffsetGranularity;
} VkVideoDecodeH264CapabilitiesKHR;
```

- **sType** is a **VkStructureType** value identifying this structure.

- **pNext** is NULL or a pointer to a structure extending this structure.

- **maxLevelIdc** is a **StdVideoH264LevelIdc** value specifying the maximum H.264 level supported by the profile, where enum constant **STD_VIDEO_H264_LEVEL_IDC_<major>_<minor>** identifies H.264 level <major>.<minor> as defined in section A.3 of the ITU-T H.264 Specification.

- **fieldOffsetGranularity** is the minimum alignment for **VkVideoPictureResourceInfoKHR::codedOffset** specified for a video picture resource when using the picture layout **VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR**.
Valid Usage (Implicit)

- VUID-VkVideoDecodeH264CapabilitiesKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_CAPABILITIES_KHR

42.11.5. H.264 Decode Parameter Sets

Video session parameters objects created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR can contain the following types of parameters:

H.264 Sequence Parameter Sets (SPS)

Represented by StdVideoH264SequenceParameterSet structures and interpreted as follows:

- reserved1 and reserved2 are used only for padding purposes and are otherwise ignored;
- seq_parameter_set_id is used as the key of the SPS entry;
- level_idc is one of the enum constants STD_VIDEO_H264_LEVEL_IDC_<major>_<minor> identifying the H.264 level <major>.<minor> as defined in section A.3 of the ITU-T H.264 Specification;
- if flags.seq_scaling_matrix_present_flag is set, then the StdVideoH264ScalingLists structure pointed to by pScalingLists is interpreted as follows:
  - scaling_list_present_mask is a bitmask where bit index i corresponds to seq_scaling_list_present_flag[i] as defined in section 7.4.2.1 of the ITU-T H.264 Specification;
  - use_default_scaling_matrix_mask is a bitmask where bit index i corresponds to UseDefaultScalingMatrix4x4Flag[i], when i < 6, or corresponds to UseDefaultScalingMatrix8x8Flag[i-6], otherwise, as defined in section 7.3.2.1 of the ITU-T H.264 Specification;
  - ScalingList4x4 and ScalingList8x8 correspond to the identically named syntax elements defined in section 7.3.2.1 of the ITU-T H.264 Specification;
- if flags.vui_parameters_present_flag is set, then pSequenceParameterSetVui is a pointer to a StdVideoH264SequenceParameterSetVui structure that is interpreted as follows:
  - reserved1 is used only for padding purposes and is otherwise ignored;
  - if flags.nal_hrd_parameters_present_flag or flags.vcl_hrd_parameters_present_flag is set, then the StdVideoH264HrdParameters structure pointed to by pHrdParameters is interpreted as follows:
    - reserved1 is used only for padding purposes and is otherwise ignored;
    - all other members of StdVideoH264HrdParameters are interpreted as defined in section E.2.2 of the ITU-T H.264 Specification;
    - all other members of StdVideoH264SequenceParameterSetVui are interpreted as defined in section E.2.1 of the ITU-T H.264 Specification;
- all other members of StdVideoH264SequenceParameterSet are interpreted as defined in section 7.4.2.1 of the ITU-T H.264 Specification.
H.264 Picture Parameter Sets (PPS)

Represented by StdVideoH264PictureParameterSet structures and interpreted as follows:

- the pair constructed from seq_parameter_set_id and pic_parameter_set_id is used as the key of the PPS entry;
- if flags.pic_scaling_matrix_present_flag is set, then the StdVideoH264ScalingLists structure pointed to by pScalingLists is interpreted as follows:
  - scaling_list_present_mask is a bitmask where bit index i corresponds to pic_scaling_list_present_flag[i] as defined in section 7.4.2.2 of the ITU-T H.264 Specification;
  - use_default_scaling_matrix_mask is a bitmask where bit index i corresponds to UseDefaultScalingMatrix4x4Flag[i], when i < 6, or corresponds to UseDefaultScalingMatrix8x8Flag[i-6], otherwise, as defined in section 7.3.2.2 of the ITU-T H.264 Specification;
  - ScalingList4x4 and ScalingList8x8 correspond to the identically named syntax elements defined in section 7.3.2.2 of the ITU-T H.264 Specification;
- all other members of StdVideoH264PictureParameterSet are interpreted as defined in section 7.4.2.2 of the ITU-T H.264 Specification.

When a video session parameters object is created with the codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR, the VkVideoSessionParametersCreateInfoKHR::pNext chain must include a VkVideoDecodeH264SessionParametersCreateInfoKHR structure specifying the capacity and initial contents of the object.

The VkVideoDecodeH264SessionParametersCreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_video_decode_h264
typedef struct VkVideoDecodeH264SessionParametersCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t maxStdSPSCount;
    uint32_t maxStdPPSCount;
    const VkVideoDecodeH264SessionParametersAddInfoKHR* pParametersAddInfo;
} VkVideoDecodeH264SessionParametersCreateInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **maxStdSPSCount** is the maximum number of H.264 SPS entries the created VkVideoSessionParametersKHR can contain.
- **maxStdPPSCount** is the maximum number of H.264 PPS entries the created VkVideoSessionParametersKHR can contain.
- **pParametersAddInfo** is NULL or a pointer to a VkVideoDecodeH264SessionParametersAddInfoKHR structure specifying H.264 parameters to add upon object creation.
Valid Usage (Implicit)

- VUID-VkVideoDecodeH264SessionParametersCreateInfoKHR-sType-sType
  \textbf{sType must} be VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_SESSION_PARAMETERS_CREATE_INFO_KHR

- VUID-VkVideoDecodeH264SessionParametersCreateInfoKHR-pParametersAddInfo-parameter
  If \texttt{pParametersAddInfo} is not \texttt{NULL}, \texttt{pParametersAddInfo} \textbf{must} be a valid pointer to a valid
  \texttt{VkVideoDecodeH264SessionParametersAddInfoKHR} structure

The \texttt{VkVideoDecodeH264SessionParametersAddInfoKHR} structure is defined as:

```c
// Provided by VK_KHR_video_decode_h264
typedef struct VkVideoDecodeH264SessionParametersAddInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t stdSPSCount;
    const StdVideoH264SequenceParameterSet* pStdSPSSs;
    uint32_t stdPPSCount;
    const StdVideoH264PictureParameterSet* pStdPPSSs;
} VkVideoDecodeH264SessionParametersAddInfoKHR;
```

- \texttt{sType} is a \texttt{VkStructureType} value identifying this structure.
- \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
- \texttt{stdSPSCount} is the number of elements in the \texttt{pStdSPSSs} array.
- \texttt{pStdSPSSs} is a pointer to an array of \texttt{StdVideoH264SequenceParameterSet} structures describing the
  H.264 \texttt{SPS} entries to add.
- \texttt{stdPPSCount} is the number of elements in the \texttt{pStdPPSSs} array.
- \texttt{pStdPPSSs} is a pointer to an array of \texttt{StdVideoH264PictureParameterSet} structures describing the
  H.264 \texttt{PPS} entries to add.

This structure \textbf{can} be specified in the following places:

- In the \texttt{pParametersAddInfo} member of the \texttt{VkVideoDecodeH264SessionParametersCreateInfoKHR}
  structure specified in the \texttt{pNext} chain of \texttt{VkVideoSessionParametersCreateInfoKHR} used to
  create a video session parameters object. In this case, if the video codec operation the video
  session parameters object is created with \texttt{VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR}, then
  it defines the set of initial parameters to add to the created object (see Creating Video Session
  Parameters).

- In the \texttt{pNext} chain of \texttt{VkVideoSessionParametersUpdateInfoKHR}. In this case, if the video codec
  operation the video session parameters object to be updated was created with is \texttt{VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR},
  then it defines the set of parameters to add to it (see Updating Video Session Parameters).
Valid Usage

• VUID-VkVideoDecodeH264SessionParametersAddInfoKHR-None-04825
  The seq_parameter_set_id member of each StdVideoH264SequenceParameterSet structure specified in the elements of pStdSPSs must be unique within pStdSPSs.

• VUID-VkVideoDecodeH264SessionParametersAddInfoKHR-None-04826
  The pair constructed from the seq_parameter_set_id and pic_parameter_set_id members of each StdVideoH264PictureParameterSet structure specified in the elements of pStdPPSs must be unique within pStdPPSs.

Valid Usage (Implicit)

• VUID-VkVideoDecodeH264SessionParametersAddInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_SESSION_PARAMETERS_ADD_INFO_KHR.

• VUID-VkVideoDecodeH264SessionParametersAddInfoKHR-pStdSPSs-parameter
  If stdSPSCount is not 0, pStdSPSs must be a valid pointer to an array of stdSPSCount StdVideoH264SequenceParameterSet values.

• VUID-VkVideoDecodeH264SessionParametersAddInfoKHR-pStdPPSs-parameter
  If stdPPSCount is not 0, pStdPPSs must be a valid pointer to an array of stdPPSCount StdVideoH264PictureParameterSet values.

42.11.6. H.264 Decoding Parameters

The VkVideoDecodeH264PictureInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_decode_h264
typedef struct VkVideoDecodeH264PictureInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const StdVideoDecodeH264PictureInfo* pStdPictureInfo;
    uint32_t sliceCount;
    pSliceOffsets;
} VkVideoDecodeH264PictureInfoKHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• pStdPictureInfo is a pointer to a StdVideoDecodeH264PictureInfo structure specifying H.264 picture information.
• sliceCount is the number of elements in pSliceOffsets.
• pSliceOffsets is a pointer to an array of sliceCount offsets specifying the start offset of the slices of the picture within the video bitstream buffer range specified in VkVideoDecodeInfoKHR.
This structure is specified in the `pNext` chain of the `VkVideoDecodeInfoKHR` structure passed to `vkCmdDecodeVideoKHR` to specify the codec-specific picture information for an H.264 decode operation.

**Decode Output Picture Information**

When this structure is specified in the `pNext` chain of the `VkVideoDecodeInfoKHR` structure passed to `vkCmdDecodeVideoKHR`, the information related to the decode output picture is defined as follows:

- If `pStdPictureInfo->flags.field_pic_flag` is not set, then the picture represents a frame.
- If `pStdPictureInfo->flags.field_pic_flag` is set, then the picture represents a field. Specifically:
  - If `pStdPictureInfo->flags.bottom_field_flag` is not set, then the picture represents the top field of the frame.
  - If `pStdPictureInfo->flags.bottom_field_flag` is set, then the picture represents the bottom field of the frame.
- The image subregion used is determined according to the H.264 Decode Picture Data Access section.
- The decode output picture is associated with the H.264 picture information provided in `pStdPictureInfo`.

**Std Picture Information**

The members of the `StdVideoDecodeH264PictureInfo` structure pointed to by `pStdPictureInfo` are interpreted as follows:

- `reserved1` and `reserved2` are used only for padding purposes and are otherwise ignored;
- `flags.is_intra` as defined in section 3.73 of the ITU-T H.264 Specification;
- `flags.is_reference` as defined in section 3.136 of the ITU-T H.264 Specification;
- `flags.complementary_field_pair` as defined in section 3.35 of the ITU-T H.264 Specification;
- `seq_parameter_set_id` and `pic_parameter_set_id` are used to identify the active parameter sets, as described below;
- all other members are interpreted as defined in section 7.4.3 of the ITU-T H.264 Specification.

**Active Parameter Sets**

The members of the `StdVideoDecodeH264PictureInfo` structure pointed to by `pStdPictureInfo` are used to select the active parameter sets to use from the bound video session parameters object, as follows:

- The active SPS is the SPS identified by the key specified in `StdVideoDecodeH264PictureInfo::seq_parameter_set_id`.
- The active PPS is the PPS identified by the key specified by the pair constructed from `StdVideoDecodeH264PictureInfo::seq_parameter_set_id` and `StdVideoDecodeH264PictureInfo::pic_parameter_set_id`.
Valid Usage (Implicit)

- **VUID-VkVideoDecodeH264PictureInfoKHR-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_PICTURE_INFO_KHR`

- **VUID-VkVideoDecodeH264PictureInfoKHR-pStdPictureInfo-parameter**
  - `pStdPictureInfo` must be a valid pointer to a valid `StdVideoDecodeH264PictureInfo` value

- **VUID-VkVideoDecodeH264PictureInfoKHR-pSliceOffsets-parameter**
  - `pSliceOffsets` must be a valid pointer to an array of `sliceCount` `uint32_t` values

- **VUID-VkVideoDecodeH264PictureInfoKHR-sliceCount-arraylength**
  - `sliceCount` must be greater than 0

The `VkVideoDecodeH264DpbSlotInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_decode_h264
typedef struct VkVideoDecodeH264DpbSlotInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const StdVideoDecodeH264ReferenceInfo* pStdReferenceInfo;
} VkVideoDecodeH264DpbSlotInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pStdReferenceInfo` is a pointer to a `StdVideoDecodeH264ReferenceInfo` structure specifying H.264 reference information.

This structure is specified in the `pNext` chain of `VkVideoDecodeInfoKHR::pSetupReferenceSlot`, if not `NULL`, and the `pNext` chain of the elements of `VkVideoDecodeInfoKHR::pReferenceSlots` to specify the codec-specific reference picture information for an H.264 decode operation.

Active Reference Picture Information

When this structure is specified in the `pNext` chain of the elements of `VkVideoDecodeInfoKHR::pReferenceSlots`, one or two elements are added to the list of active reference pictures used by the video decode operation for each element of `VkVideoDecodeInfoKHR::pReferenceSlots` as follows:

- If neither `pStdReferenceInfo->flags.top_field_flag` nor `pStdReferenceInfo->flags.bottom_field_flag` is set, then the picture is added as a frame reference to the list of active reference pictures.

- If `pStdReferenceInfo->flags.top_field_flag` is set, then the picture is added as a top field reference to the list of active reference pictures.

- If `pStdReferenceInfo->flags.bottom_field_flag` is set, then the picture is added as a bottom field reference to the list of active reference pictures.

- For each added reference picture, the corresponding image subregion used is determined
according to the H.264 Decode Picture Data Access section.

- Each added reference picture is associated with the DPB slot index specified in the slotIndex member of the corresponding element of VkVideoDecodeInfoKHR::pReferenceSlots.
- Each added reference picture is associated with the H.264 reference information provided in pStdReferenceInfo.

**Note**
When both the top and bottom field of an interlaced frame currently associated with a DPB slot is intended to be used as an active reference picture and both fields are stored in the same image subregion (which is the case when using VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_INTERLEAVED_LINES_BIT_KHR which stores the two fields at even and odd scanlines of the same image subregion), both references have to be provided through a single VkVideoReferenceSlotInfoKHR structure that has both flags.top_field_flag and flags.bottom_field_flag set in the StdVideoDecodeH264ReferenceInfo structure pointed to by the pStdReferenceInfo member of the VkVideoDecodeH264DpbSlotInfoKHR structure included in the corresponding VkVideoReferenceSlotInfoKHR structure's pNext chain. However, this approach can only be used when both fields are stored in the same image subregion. If that is not the case (e.g. when using VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR which requires separate codedOffset values for the two fields and also allows storing the two fields of a frame in separate image layers or entirely separate images), then a separate VkVideoReferenceSlotInfoKHR structure needs to be provided for referencing the two fields, each only setting one of flags.top_field_flag or flags.bottom_field_flag, and providing the appropriate video picture resource information in VkVideoReferenceSlotInfoKHR::pPictureResource.

**Reconstructed Picture Information**
When this structure is specified in the pNext chain of VkVideoDecodeInfoKHR::pSetupReferenceSlot, the information related to the reconstructed picture is defined as follows:

- If neither pStdReferenceInfo->flags.top_field_flag nor pStdReferenceInfo->flags.bottom_field_flag is set, then the picture represents a frame.
- If pStdReferenceInfo->flags.top_field_flag is set, then the picture represents a field, specifically, the top field of the frame.
- If pStdReferenceInfo->flags.bottom_field_flag is set, then the picture represents a field, specifically, the bottom field of the frame.
- The image subregion used is determined according to the H.264 Decode Picture Data Access section.
- The reconstructed picture is used to activate the DPB slot with the index specified in VkVideoDecodeInfoKHR::pSetupReferenceSlot->slotIndex.
- The reconstructed picture is associated with the H.264 reference information provided in pStdReferenceInfo.
Std Reference Information

The members of the StdVideoDecodeH264ReferenceInfo structure pointed to by pStdReferenceInfo are interpreted as follows:

- **flags.top_field_flag** is used to indicate whether the reference is used as top field reference;
- **flags.bottom_field_flag** is used to indicate whether the reference is used as bottom field reference;
- **flags.used_for_long_term_reference** is used to indicate whether the picture is marked as “used for long-term reference” as defined in section 8.2.5.1 of the ITU-T H.264 Specification;
- **flags.is_non_existing** is used to indicate whether the picture is marked as “non-existing” as defined in section 8.2.5.2 of the ITU-T H.264 Specification;
- all other members are interpreted as defined in section 8.2 of the ITU-T H.264 Specification.

Valid Usage (Implicit)

- VUID-VkVideoDecodeH264DpbSlotInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_DPB_SLOT_INFO_KHR
- VUID-VkVideoDecodeH264DpbSlotInfoKHR-pStdReferenceInfo-parameter
  pStdReferenceInfo **must** be a valid pointer to a valid StdVideoDecodeH264ReferenceInfo value

42.11.7. H.264 Decode Requirements

This section describes the **required** H.264 decoding capabilities for physical devices that have at least one queue family that supports the video codec operation **VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR**, as returned by **vkGetPhysicalDeviceQueueFamilyProperties2** in **VkQueueFamilyVideoPropertiesKHR::videoCodecOperations**.

42.12. H.265 Decode Operations

Video decode operations using an **H.265 decode profile can** be used to decode elementary video stream sequences compliant to the **ITU-T H.265 Specification**.

*Note*

Refer to the **Preamble** for information on how the Khronos Intellectual Property Rights Policy relates to normative references to external materials not created by Khronos.
This process is performed according to the video decode operation steps with the codec-specific semantics defined in section 8 of ITU-T H.265 Specification:

- Syntax elements, derived values, and other parameters are applied from the following structures:
  - The StdVideoH265VideoParameterSet structure corresponding to the active VPS specifying the H.265 video parameter set.
  - The StdVideoH265SequenceParameterSet structure corresponding to the active SPS specifying the H.265 sequence parameter set.
  - The StdVideoH265PictureParameterSet structure corresponding to the active PPS specifying the H.265 picture parameter set.
  - The StdVideoDecodeH265PictureInfo structure specifying the H.265 picture information.
  - The StdVideoDecodeH265ReferenceInfo structures specifying the H.265 reference information corresponding to the optional reconstructed picture and any active reference pictures.

- The contents of the provided video bitstream buffer range are interpreted as defined in the H.265 Decode Bitstream Data Access section.

- Picture data in the video picture resources corresponding to the used active reference pictures, decode output picture, and optional reconstructed picture is accessed as defined in the H.265 Decode Picture Data Access section.

If the parameters and the bitstream adhere to the syntactic and semantic requirements defined in the corresponding sections of the ITU-T H.265 Specification, as described above, and the DPB slots associated with the active reference pictures all refer to valid picture references, then the video decode operation will complete successfully. Otherwise, the video decode operation may complete unsuccessfully.

### 42.12.1. H.265 Decode Bitstream Data Access

The video bitstream buffer range should contain a VCL NAL unit comprised of the slice segment headers and data of a picture representing a frame, as defined in sections 7.3.6 and 7.3.8, and this data is interpreted as defined in sections 7.4.7 and 7.4.9 of the ITU-T H.265 Specification, respectively.

The offsets provided in VkVideoDecodeH265PictureInfoKHR::pSliceSegmentOffsets should specify the starting offsets corresponding to each slice segment header within the video bitstream buffer range.

### 42.12.2. H.265 Decode Picture Data Access

Accesses to image data within a video picture resource happen at the granularity indicated by VkVideoCapabilitiesKHR::pictureAccessGranularity, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile. Accordingly, the complete image subregion of a decode output picture, reference picture, or reconstructed picture accessed by video coding operations using an H.265 decode profile is defined as the set of texels within the coordinate range:
(0,endX),(0,endY))

Where:

- endX equals codedExtent.width rounded up to the nearest integer multiple of pictureAccessGranularity.width and clamped to the width of the image subresource referred to by the corresponding VkVideoPictureResourceInfoKHR structure;
- endY equals codedExtent.height rounded up to the nearest integer multiple of pictureAccessGranularity.height and clamped to the height of the image subresource referred to by the corresponding VkVideoPictureResourceInfoKHR structure;

Where codedExtent is the member of the VkVideoPictureResourceInfoKHR structure corresponding to the picture.

In case of video decode operations using an H.265 decode profile, any access to a picture at the coordinates (x,y), as defined by the ITU-T H.265 Specification, is an access to the image subresource referred to by the corresponding VkVideoPictureResourceInfoKHR structure at the texel coordinates (x,y).

42.12.3. H.265 Decode Profile

A video profile supporting H.265 video decode operations is specified by setting VkVideoProfileInfoKHR::videoCodecOperation to VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR and adding a VkVideoDecodeH265ProfileInfoKHR structure to the VkVideoProfileInfoKHR::pNext chain.

The VkVideoDecodeH265ProfileInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_decode_h265
typedef struct VkVideoDecodeH265ProfileInfoKHR {
    VkStructureType sType;
    const void* pNext;
    StdVideoH265ProfileIdc stdProfileIdc;
} VkVideoDecodeH265ProfileInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- stdProfileIdc is a StdVideoH265ProfileIdc value specifying the H.265 codec profile IDC, as defined in section A3 of the ITU-T H.265 Specification.

Valid Usage (Implicit)

- VUID-VkVideoDecodeH265ProfileInfoKHR-sType-sType sType must be VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_PROFILE_INFO_KHR
42.12.4. H.265 Decode Capabilities

When calling `vkGetPhysicalDeviceVideoCapabilitiesKHR` to query the capabilities for an H.265 decode profile, the `VkVideoCapabilitiesKHR::pNext` chain must include a `VkVideoDecodeH265CapabilitiesKHR` structure that will be filled with the profile-specific capabilities.

The `VkVideoDecodeH265CapabilitiesKHR` structure is defined as:

```
// Provided by VK_KHR_video_decode_h265
typedef struct VkVideoDecodeH265CapabilitiesKHR {
    VkStructureType sType;
    void* pNext;
    StdVideoH265LevelIdc maxLevelIdc;
} VkVideoDecodeH265CapabilitiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxLevelIdc` is a `StdVideoH265LevelIdc` value specifying the maximum H.265 level supported by the profile, where enum constant `STD_VIDEO_H265_LEVEL_IDC_<major>_<minor>` identifies H.265 level `<major>.<minor>` as defined in section A.4 of the ITU-T H.265 Specification.

Valid Usage ( Implicit )

- VUID-VkVideoDecodeH265CapabilitiesKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_CAPABILITIES_KHR`

42.12.5. H.265 Decode Parameter Sets

Video session parameters objects created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR` can contain the following types of parameters:

H.265 Video Parameter Sets ( VPS )

Represented by `StdVideoH265VideoParameterSet` structures and interpreted as follows:

- `reserved1`, `reserved2`, and `reserved3` are used only for padding purposes and are otherwise ignored;
- `vps_video_parameter_set_id` is used as the key of the VPS entry;
- the `max_latency_increase_plus1`, `max_dec_pic_buffering_minus1`, and `max_num_reorder_pics` members of the `StdVideoH265DecPicBufMgr` structure pointed to by `pDecPicBufMgr` correspond to `vps_max_latency_increase_plus1`, `vps_max_dec_pic_buffering_minus1`, and `vps_max_num_reorder_pics`, respectively, as defined in section 7.4.3.1 of the ITU-T H.265 Specification;
- the `StdVideoH265HrdParameters` structure pointed to by `pHrdParameters` is interpreted as follows:
  - `reserved` is used only for padding purposes and is otherwise ignored;
• flags.fixed_pic_rate_general_flag is a bitmask where bit index i corresponds to fixed_pic_rate_general_flag[i] as defined in section E.3.2 of the ITU-T H.265 Specification;

• flags.fixed_pic_rate_within_cvs_flag is a bitmask where bit index i corresponds to fixed_pic_rate_within_cvs_flag[i] as defined in section E.3.2 of the ITU-T H.265 Specification;

• flags.low_delay_hrd_flag is a bitmask where bit index i corresponds to low_delay_hrd_flag[i] as defined in section E.3.2 of the ITU-T H.265 Specification;

• if flags.nal_hrd_parameters_present_flag is set, then pSubLayerHrdParametersNal is a pointer to an array of vps_max_sub_layers_minus1 + 1 number of StdVideoH265SubLayerHrdParameters structures where vps_max_sub_layers_minus1 is the corresponding member of the encompassing StdVideoH265VideoParameterSet structure and each element is interpreted as follows:
  ▪ cbr_flag is a bitmask where bit index i corresponds to cbr_flag[i] as defined in section E.3.3 of the ITU-T H.265 Specification;
  ▪ all other members of the StdVideoH265SubLayerHrdParameters structure are interpreted as defined in section E.3.3 of the ITU-T H.265 Specification;

• if flags.vcl_hrd_parameters_present_flag is set, then pSubLayerHrdParametersVcl is a pointer to an array of vps_max_sub_layers_minus1 + 1 number of StdVideoH265SubLayerHrdParameters structures where vps_max_sub_layers_minus1 is the corresponding member of the encompassing StdVideoH265VideoParameterSet structure and each element is interpreted as follows:
  ▪ cbr_flag is a bitmask where bit index i corresponds to cbr_flag[i] as defined in section E.3.3 of the ITU-T H.265 Specification;
  ▪ all other members of the StdVideoH265SubLayerHrdParameters structure are interpreted as defined in section E.3.3 of the ITU-T H.265 Specification;

• all other members of StdVideoH265HrdParameters are interpreted as defined in section E.3.2 of the ITU-T H.265 Specification;

• the StdVideoH265ProfileTierLevel structure pointed to by pProfileTierLevel are interpreted as follows:
  ▪ general_level_idc is one of the enum constants STD_VIDEO_H265_LEVEL_IDC_<major>_<minor> identifying the H.265 level <major>.<minor> as defined in section A.4 of the ITU-T H.265 Specification;
  ▪ all other members of StdVideoH265ProfileTierLevel are interpreted as defined in section 7.4.4 of the ITU-T H.265 Specification;

• all other members of StdVideoH265VideoParameterSet are interpreted as defined in section 7.4.3.1 of the ITU-T H.265 Specification.

H.265 Sequence Parameter Sets (SPS)

Represented by StdVideoH265SequenceParameterSet structures and interpreted as follows:

• reserved1 and reserved2 are used only for padding purposes and are otherwise ignored;
• the pair constructed from sps_video_parameter_set_id and sps_seq_parameter_set_id is used
as the key of the SPS entry;

• the StdVideoH265ProfileTierLevel structure pointed to by pProfileTierLevel are interpreted as follows:
  
  ◦ general_level_idc is one of the enum constants STD_VIDEO_H265_LEVEL_IDC_<major>_<minor> identifying the H.265 level <major>.<minor> as defined in section A.4 of the ITU-T H.265 Specification;
  
  ◦ all other members of StdVideoH265ProfileTierLevel are interpreted as defined in section 7.4.4 of the ITU-T H.265 Specification;

• the max_latency_increase_plus1, max_dec_pic_buffering_minus1, and max_num_reorder_pics members of the StdVideoH265DecPicBufMgr structure pointed to by pDecPicBufMgr correspond to sps_max_latency_increase_plus1, sps_max_dec_pic_buffering_minus1, and sps_max_num_reorder_pics, respectively, as defined in section 7.4.3.2 of the ITU-T H.265 Specification;

• if flags.sps_scaling_list_data_present_flag is set, then the StdVideoH265ScalingLists structure pointed to by pScalingLists is interpreted as follows:
  
  ◦ ScalingList4x4, ScalingList8x8, ScalingList16x16, and ScalingList32x32 correspond to ScalingList[0], ScalingList[1], ScalingList[2], and ScalingList[3], respectively, as defined in section 7.3.4 of the ITU-T H.265 Specification;
  
  ◦ ScalingListDCCoef16x16 and ScalingListDCCoef32x32 correspond to scaling_list_dc_coef_minus8[0] and scaling_list_dc_coef_minus8[1], respectively, as defined in section 7.3.4 of the ITU-T H.265 Specification;

• pShortTermRefPicSet is a pointer to an array of num_short_term_ref_pic_sets number of StdVideoH265ShortTermRefPicSet structures where each element is interpreted as follows:
  
  ◦ reserved1, reserved2, and reserved3 are used only for padding purposes and are otherwise ignored;
  
  ◦ used_by_curr_pic_flag is a bitmask where bit index i corresponds to used_by_curr_pic_flag[i] as defined in section 7.4.8 of the ITU-T H.265 Specification;
  
  ◦ use_delta_flag is a bitmask where bit index i corresponds to use_delta_flag[i] as defined in section 7.4.8 of the ITU-T H.265 Specification;
  
  ◦ used_by_curr_pic_s0_flag is a bitmask where bit index i corresponds to used_by_curr_pic_s0_flag[i] as defined in section 7.4.8 of the ITU-T H.265 Specification;
  
  ◦ used_by_curr_pic_s1_flag is a bitmask where bit index i corresponds to used_by_curr_pic_s1_flag[i] as defined in section 7.4.8 of the ITU-T H.265 Specification;
  
  ◦ all other members of StdVideoH265ShortTermRefPicSet are interpreted as defined in section 7.4.8 of the ITU-T H.265 Specification;

• if flags.long_term_ref_pics_present_flag is set then the StdVideoH265LongTermRefPicsSps structure pointed to by pLongTermRefPicsSps is interpreted as follows:
  
  ◦ used_by_curr_pic_lt_sps_flag is a bitmask where bit index i corresponds to used_by_curr_pic_lt_sps_flag[i] as defined in section 7.4.3.2 of the ITU-T H.265 Specification;
  
  ◦ all other members of StdVideoH265LongTermRefPicsSps are interpreted as defined in
if flags.vui_parameters_present_flag is set, then the StdVideoH265SequenceParameterSetVui structure pointed to by pSequenceParameterSetVui is interpreted as follows:

- reserved1, reserved2, and reserved3 are used only for padding purposes and are otherwise ignored;
- the StdVideoH265HrdParameters structure pointed to by pHrdParameters is interpreted as follows:
  - flags.fixed_pic_rate_general_flag is a bitmask where bit index i corresponds to fixed_pic_rate_general_flag[i] as defined in section E.3.2 of the ITU-T H.265 Specification;
  - flags.fixed_pic_rate_within_cvs_flag is a bitmask where bit index i corresponds to fixed_pic_rate_within_cvs_flag[i] as defined in section E.3.2 of the ITU-T H.265 Specification;
  - flags.low_delay_hrd_flag is a bitmask where bit index i corresponds to low_delay_hrd_flag[i] as defined in section E.3.2 of the ITU-T H.265 Specification;
  - if flags.nal_hrd_parameters_present_flag is set, then pSubLayerHrdParametersNal is a pointer to an array of sps_max_sub_layers_minus1 + 1 number of StdVideoH265SubLayerHrdParameters structures where sps_max_sub_layers_minus1 is the corresponding member of the encompassing StdVideoH265SequenceParameterSet structure and each element is interpreted as follows:
    - cbr_flag is a bitmask where bit index i corresponds to cbr_flag[i] as defined in section E.3.3 of the ITU-T H.265 Specification;
    - all other members of the StdVideoH265SubLayerHrdParameters structure are interpreted as defined in section E.3.3 of the ITU-T H.265 Specification;
  - if flags.vcl_hrd_parameters_present_flag is set, then pSubLayerHrdParametersVcl is a pointer to an array of sps_max_sub_layers_minus1 + 1 number of StdVideoH265SubLayerHrdParameters structures where sps_max_sub_layers_minus1 is the corresponding member of the encompassing StdVideoH265SequenceParameterSet structure and each element is interpreted as follows:
    - cbr_flag is a bitmask where bit index i corresponds to cbr_flag[i] as defined in section E.3.3 of the ITU-T H.265 Specification;
    - all other members of the StdVideoH265SubLayerHrdParameters structure are interpreted as defined in section E.3.3 of the ITU-T H.265 Specification;
    - all other members of StdVideoH265HrdParameters are interpreted as defined in section E.3.2 of the ITU-T H.265 Specification;
    - all other members of pSequenceParameterSetVui are interpreted as defined in section E.3.1 of the ITU-T H.265 Specification;
  - if flags.sps_palette_predictor_initializer_present_flag is set, then the PredictorPaletteEntries member of the StdVideoH265PredictorPaletteEntries structure pointed to by pPredictorPaletteEntries is interpreted as defined in section 7.4.9.13 of the ITU-T H.265 Specification;
• all other members of StdVideoH265SequenceParameterSet are interpreted as defined in section 7.4.3.1 of the ITU-T H.265 Specification.

H.265 Picture Parameter Sets (PPS)
Represented by StdVideoH265PictureParameterSet structures and interpreted as follows:

• reserved1, reserved2, and reserved3 are used only for padding purposes and are otherwise ignored;
• the triplet constructed from sps_video_parameter_set_id, pps_seq_parameter_set_id, and pps_pic_parameter_set_id is used as the key of the PPS entry;
• if flags.pps_scaling_list_data_present_flag is set, then the StdVideoH265ScalingLists structure pointed to by pScalingLists is interpreted as follows:
  ◦ ScalingList4x4, ScalingList8x8, ScalingList16x16, and ScalingList32x32 correspond to ScalingList[0], ScalingList[1], ScalingList[2], and ScalingList[3], respectively, as defined in section 7.3.4 of the ITU-T H.265 Specification;
  ◦ ScalingListDCCoeff16x16 and ScalingListDCCoeff32x32 correspond to scaling_list_dc_coef_minus8[0] and scaling_list_dc_coef_minus8[1], respectively, as defined in section 7.3.4 of the ITU-T H.265 Specification;
• if flags.pps_palette_predictor_initializer_present_flag is set, then the PredictorPaletteEntries member of the StdVideoH265PredictorPaletteEntries structure pointed to by pPredictorPaletteEntries is interpreted as defined in section 7.4.9.13 of the ITU-T H.265 Specification;
• all other members of StdVideoH265PictureParameterSet are interpreted as defined in section 7.4.3.3 of the ITU-T H.265 Specification.

When a video session parameters object is created with the codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, the VkVideoSessionParametersCreateInfoKHR::pNext chain must include a VkVideoDecodeH265SessionParametersCreateInfoKHR structure specifying the capacity and initial contents of the object.

The VkVideoDecodeH265SessionParametersCreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_video_decode_h265
typedef struct VkVideoDecodeH265SessionParametersCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t maxStdVPSCount;
    uint32_t maxStdSPSCount;
    uint32_t maxStdPPSCount;
    const VkVideoDecodeH265SessionParametersAddInfoKHR* pParametersAddInfo;
} VkVideoDecodeH265SessionParametersCreateInfoKHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• maxStdVPSCount is the maximum number of H.265 VPS entries the created
 VkVideoSessionParametersKHR can contain.

- maxStdSPSCount is the maximum number of H.265 SPS entries the created VkVideoSessionParametersKHR can contain.
- maxStdPPSCount is the maximum number of H.265 PPS entries the created VkVideoSessionParametersKHR can contain.
- pParametersAddInfo is NULL or a pointer to a VkVideoDecodeH265SessionParametersAddInfoKHR structure specifying H.265 parameters to add upon object creation.

**Valid Usage (Implicit)**

- VUID-VkVideoDecodeH265SessionParametersCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_SESSION_PARAMETERS_CREATE_INFO_KHR
- VUID-VkVideoDecodeH265SessionParametersCreateInfoKHR-pParametersAddInfo-parameter
  If pParametersAddInfo is not NULL, pParametersAddInfo must be a valid pointer to a valid VkVideoDecodeH265SessionParametersAddInfoKHR structure

The VkVideoDecodeH265SessionParametersAddInfoKHR structure is defined as:

```c
// Provided by VK_KHR_video_decode_h265
typedef struct VkVideoDecodeH265SessionParametersAddInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t stdVPSCount;
    const StdVideoH265VideoParameterSet* pStdVPSs;
    uint32_t stdSPSCount;
    const StdVideoH265SequenceParameterSet* pStdSPSs;
    uint32_t stdPPSCount;
    const StdVideoH265PictureParameterSet* pStdPPSs;
} VkVideoDecodeH265SessionParametersAddInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- stdVPSCount is the number of elements in the pStdVPSs array.
- pStdVPSs is a pointer to an array of StdVideoH265VideoParameterSet structures describing the H.265 VPS entries to add.
- stdSPSCount is the number of elements in the pStdSPSs array.
- pStdSPSs is a pointer to an array of StdVideoH265SequenceParameterSet structures describing the H.265 SPS entries to add.
- stdPPSCount is the number of elements in the pStdPPSs array.
- pStdPPSs is a pointer to an array of StdVideoH265PictureParameterSet structures describing the H.265 PPS entries to add.
This structure can be specified in the following places:

- In the pParametersAddInfo member of the VkVideoDecodeH265SessionParametersCreateInfoKHR structure specified in the pNext chain of VkVideoSessionParametersCreateInfoKHR used to create a video session parameters object. In this case, if the video codec operation the video session parameters object is created with is VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, then it defines the set of initial parameters to add to the created object (see Creating Video Session Parameters).

- In the pNext chain of VkVideoSessionParametersUpdateInfoKHR. In this case, if the video codec operation the video session parameters object to be updated was created with is VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, then it defines the set of parameters to add to it (see Updating Video Session Parameters).

### Valid Usage

- VUID-VkVideoDecodeH265SessionParametersAddInfoKHR-None-04833
  The vps_video_parameter_set_id member of each StdVideoH265VideoParameterSet structure specified in the elements of pStdVPSs must be unique within pStdVPSs.

- VUID-VkVideoDecodeH265SessionParametersAddInfoKHR-None-04834
  The pair constructed from the sps_video_parameter_set_id and sps_seq_parameter_set_id members of each StdVideoH265SequenceParameterSet structure specified in the elements of pStdSPSs must be unique within pStdSPSs.

- VUID-VkVideoDecodeH265SessionParametersAddInfoKHR-None-04835
  The triplet constructed from the sps_video_parameter_set_id, pps_seq_parameter_set_id, and pps_pic_parameter_set_id members of each StdVideoH265PictureParameterSet structure specified in the elements of pStdPPSs must be unique within pStdPPSs.

### Valid Usage (Implicit)

- VUID-VkVideoDecodeH265SessionParametersAddInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_DECODER_H265_SESSION_PARAMETERS_ADD_INFO_KHR.

- VUID-VkVideoDecodeH265SessionParametersAddInfoKHR-pStdVPSs-parameter
  If stdVPCount is not 0, pStdVPSs must be a valid pointer to an array of stdVPCount StdVideoH265VideoParameterSet values.

- VUID-VkVideoDecodeH265SessionParametersAddInfoKHR-pStdSPSs-parameter
  If stdSPSCount is not 0, pStdSPSs must be a valid pointer to an array of stdSPSCount StdVideoH265SequenceParameterSet values.

- VUID-VkVideoDecodeH265SessionParametersAddInfoKHR-pStdPPSs-parameter
  If stdPPSCount is not 0, pStdPPSs must be a valid pointer to an array of stdPPSCount StdVideoH265PictureParameterSet values.
42.12.6. H.265 Decoding Parameters

The VkVideoDecodeH265PictureInfoKHR structure is defined as:

```c
// Provided by VK_KHR_video_decode_h265
typedef struct VkVideoDecodeH265PictureInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const StdVideoDecodeH265PictureInfo* pStdPictureInfo;
    uint32_t sliceSegmentCount;
    const uint32_t* pSliceSegmentOffsets;
} VkVideoDecodeH265PictureInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `pStdPictureInfo` is a pointer to a StdVideoDecodeH265PictureInfo structure specifying H.265 picture information.
- `sliceSegmentCount` is the number of elements in `pSliceSegmentOffsets`.
- `pSliceSegmentOffsets` is a pointer to an array of `sliceSegmentCount` offsets specifying the start offset of the slice segments of the picture within the video bitstream buffer range specified in VkVideoDecodeInfoKHR.

This structure is specified in the `pNext` chain of the VkVideoDecodeInfoKHR structure passed to vkCmdDecodeVideoKHR to specify the codec-specific picture information for an H.265 decode operation.

**Decode Output Picture Information**

When this structure is specified in the `pNext` chain of the VkVideoDecodeInfoKHR structure passed to vkCmdDecodeVideoKHR, the information related to the decode output picture is defined as follows:

- The image subregion used is determined according to the H.265 Decode Picture Data Access section.
- The decode output picture is associated with the H.265 picture information provided in `pStdPictureInfo`.

**Std Picture Information**

The members of the StdVideoDecodeH265PictureInfo structure pointed to by `pStdPictureInfo` are interpreted as follows:

- `reserved` is used only for padding purposes and is otherwise ignored;
- `flags.IrapPicFlag` as defined in section 3.73 of the ITU-T H.265 Specification;
- `flags.IdrPicFlag` as defined in section 3.67 of the ITU-T H.265 Specification;
- `flags.IsReference` as defined in section 3.132 of the ITU-T H.265 Specification;
- `sps_video_parameter_set_id`, `pps_seq_parameter_set_id`, and `pps_pic_parameter_set_id` are
used to identify the active parameter sets, as described below;

- **PicOrderCntVal** as defined in section 8.3.1 of the [ITU-T H.265 Specification](https://www.itu.int/rec/T-REC-H.265-201304-I/en);
- **NumBitsForSTRefPicSetInSlice** is the number of bits used in `st_ref_pic_set` when `short_term_ref_pic_set_sps_flag` is 0, or 0 otherwise, as defined in sections 7.4.7 and 7.4.8 of the [ITU-T H.265 Specification](https://www.itu.int/rec/T-REC-H.265-201304-I/en);
- **NumDeltaPocsOfRefRpsIdx** is the value of `NumDeltaPocs[RefRpsIdx]` when `short_term_ref_pic_set_sps_flag` is 1, or 0 otherwise, as defined in sections 7.4.7 and 7.4.8 of the [ITU-T H.265 Specification](https://www.itu.int/rec/T-REC-H.265-201304-I/en);
- **RefPicSetStCurrBefore**, **RefPicSetStCurrAfter**, and **RefPicSetLtCurr** are interpreted as defined in section 8.3.2 of the [ITU-T H.265 Specification](https://www.itu.int/rec/T-REC-H.265-201304-I/en) where each element of these arrays either identifies an active reference picture using its DPB slot index or contains the value 0xFF to indicate "no reference picture";
- all other members are interpreted as defined in section 8.3.2 of the [ITU-T H.265 Specification](https://www.itu.int/rec/T-REC-H.265-201304-I/en).

**Active Parameter Sets**

The members of the `StdVideoDecodeH265PictureInfo` structure pointed to by `pStdPictureInfo` are used to select the active parameter sets to use from the bound video session parameters object, as follows:

- The **active VPS** is the VPS identified by the key specified in `StdVideoDecodeH265PictureInfo::sps_video_parameter_set_id`.
- The **active SPS** is the SPS identified by the key specified by the pair constructed from `StdVideoDecodeH265PictureInfo::sps_video_parameter_set_id` and `StdVideoDecodeH265PictureInfo::pps_seq_parameter_set_id`.
- The **active PPS** is the PPS identified by the key specified by the triplet constructed from `StdVideoDecodeH265PictureInfo::sps_video_parameter_set_id`, `StdVideoDecodeH265PictureInfo::pps_seq_parameter_set_id`, and `StdVideoDecodeH265PictureInfo::pps_pic_parameter_set_id`.

### Valid Usage (Implicit)

- **VUID-VkVideoDecodeH265PictureInfoKHR-sType-sType**
  - `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_PICTURE_INFO_KHR`
- **VUID-VkVideoDecodeH265PictureInfoKHR-pStdPictureInfo-parameter**
  - `pStdPictureInfo` **must** be a valid pointer to a valid `StdVideoDecodeH265PictureInfo` value
- **VUID-VkVideoDecodeH265PictureInfoKHR-pSliceSegmentOffsets-parameter**
  - `pSliceSegmentOffsets` **must** be a valid pointer to an array of `sliceSegmentCount` `uint32_t` values
- **VUID-VkVideoDecodeH265PictureInfoKHR-sliceSegmentCount-arraylength**
  - `sliceSegmentCount` **must** be greater than 0

The `VkVideoDecodeH265DpbSlotInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_decode_h265
```
typedef struct VkVideoDecodeH265DpbSlotInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const StdVideoDecodeH265ReferenceInfo* pStdReferenceInfo;
} VkVideoDecodeH265DpbSlotInfoKHR;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pStdReferenceInfo` is a pointer to a `StdVideoDecodeH265ReferenceInfo` structure specifying reference picture information described in section 8.3 of the ITU-T H.265 Specification.

This structure is specified in the `pNext` chain of `VkVideoDecodeInfoKHR::pSetupReferenceSlot`, if not `NULL`, and the `pNext` chain of the elements of `VkVideoDecodeInfoKHR::pReferenceSlots` to specify the codec-specific reference picture information for an H.265 decode operation.

**Active Reference Picture Information**

When this structure is specified in the `pNext` chain of the elements of `VkVideoDecodeInfoKHR::pReferenceSlots`, one element is added to the list of active reference pictures used by the video decode operation for each element of `VkVideoDecodeInfoKHR::pReferenceSlots` as follows:

- The image subregion used is determined according to the H.265 Decode Picture Data Access section.
- The reference picture is associated with the DPB slot index specified in the `slotIndex` member of the corresponding element of `VkVideoDecodeInfoKHR::pReferenceSlots`.
- The reference picture is associated with the H.265 reference information provided in `pStdReferenceInfo`.

**Reconstructed Picture Information**

When this structure is specified in the `pNext` chain of `VkVideoDecodeInfoKHR::pSetupReferenceSlot`, the information related to the reconstructed picture is defined as follows:

- The image subregion used is determined according to the H.265 Decode Picture Data Access section.
- The reconstructed picture is used to activate the DPB slot with the index specified in `VkVideoDecodeInfoKHR::pSetupReferenceSlot->slotIndex`.
- The reconstructed picture is associated with the H.265 reference information provided in `pStdReferenceInfo`.

**Std Reference Information**

The members of the `StdVideoDecodeH265ReferenceInfo` structure pointed to by `pStdReferenceInfo` are interpreted as follows:

- `flags.used_for_long_term_reference` is used to indicate whether the picture is marked as “used for long-term reference” as defined in section 8.3.2 of the ITU-T H.265 Specification;
- `flags.unused_for_reference` is used to indicate whether the picture is marked as “unused for reference” as defined in section 8.3.2 of the ITU-T H.265 Specification;
42.12.7. H.265 Decode Requirements

This section describes the **required** H.265 decoding capabilities for physical devices that have at least one queue family that supports the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, as returned by `vkGetPhysicalDeviceQueueFamilyProperties2` in `VkQueueFamilyVideoPropertiesKHR::videoCodecOperations`.

<table>

</table>

42.13. Video Encode Operations

Before the application can start recording Vulkan command buffers for the Video Encode Operations, it **must** do the following, beforehand:

1. Ensure that the implementation can encode the Video Content by querying the supported codec operations and profiles using `vkGetPhysicalDeviceQueueFamilyProperties2`.

2. By using `vkGetPhysicalDeviceVideoFormatPropertiesKHR` and providing one or more video profiles, choose the Vulkan formats supported by the implementation. The formats for **input** and **reference** pictures **must** be queried and chosen separately. Refer to the section on Video Format Capabilities.

3. Before creating an image to be used as a video picture resource, obtain the supported image creation parameters by querying with `vkGetPhysicalDeviceFormatProperties2` and `vkGetPhysicalDeviceImageFormatProperties2` using one of the reported formats and adding `VkVideoProfileListInfoKHR` to the `pNext` chain of `VkFormatProperties2`. When querying the parameters with `vkGetPhysicalDeviceImageFormatProperties2` for images targeting **input** and **reference (DPB)** pictures, the `VkPhysicalDeviceImageFormatInfo2::usage` field should contain `VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR` and `VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR`, respectively.

4. Create none, some, or all of the required **images** for the **input** and **reference** pictures. More Video Picture Resources **can** be created at some later point if needed while processing the content to be encoded. Also, if the size of the picture to be encoded is expected to change, the
5. Create the **video session** to be used for video encode operations. Before creating the Encode Video Session, the encode capabilities **should** be queried with `vkGetPhysicalDeviceVideoCapabilitiesKHR` to obtain the limits of the parameters allowed by the implementation for a particular codec profile.

6. Bind memory resources with the encode video session by calling `vkBindVideoSessionMemoryKHR`. The video session **cannot** be used until memory resources are allocated and bound to it. In order to determine the required memory sizes and heap types of the device memory allocations, `vkGetVideoSessionMemoryRequirementsKHR` **should** be called.

7. Create one or more **Video Session Parameter objects** for use across command buffer recording operations, if required by the codec extension in use. These objects **must** be created against a video session with the parameters required by the codec. Each Video Session Parameter object created is a child object of the associated **Session object** and **cannot** be bound in the command buffer with any other Session Object.

The recording of Video Encode Commands against a Vulkan Command Buffer consists of the following sequence:

1. `vkCmdBeginVideoCodingKHR` starts the recording of one or more Video Encode operations in the command buffer. For each Video Encode Command operation, a Video Session **must** be bound to the command buffer within this command. This command establishes a Vulkan Video Encode Context that consists of the bound Video Session Object, Session Parameters Object, and the required Video Picture Resources. The established Video Encode Context is in effect until the `vkCmdEndVideoCodingKHR` command is recorded. If more Video Encode operations are to be required after the `vkCmdEndVideoCodingKHR` command, another Video Encode Context **can** be started with the `vkCmdBeginVideoCodingKHR` command.

2. `vkCmdEncodeVideoKHR` specifies one or more frames to be encoded. The `VkVideoEncodeInfoKHR` parameters, and the codec extension structures chained to this, specify the details of the encode operation.

3. `vkCmdControlVideoCodingKHR` records operations against the encoded data, encoding device, or the Video Session state.

4. `vkCmdEndVideoCodingKHR` signals the end of the recording of the Vulkan Video Encode Context, as established by `vkCmdBeginVideoCodingKHR`.

In addition to the above, the following commands **can** be recorded between `vkCmdBeginVideoCodingKHR` and `vkCmdEndVideoCodingKHR`:

- Query operations
- Global Memory Barriers
- Buffer Memory Barriers
- Image Memory Barriers (these **must** be used to transition the Video Picture Resources to the proper `VK_IMAGE_LAYOUT_VIDEO_ENCODE_SRC_KHR` and `VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR` layouts).
- Pipeline Barriers
• Events
• Timestamps
• Device Groups (device mask)

The following Video Encode related commands must be recorded outside the Vulkan Video Encode Context established with the `vkCmdBeginVideoCodingKHR` and `vkCmdEndVideoCodingKHR` commands:

• Sparse Memory Binding
• Copy Commands
• Clear Commands

42.13.1. Encode Input Picture

The primary source of input pixels for the video encoding process is the Encode Input Picture, represented by a `VkImageView`. It may also be a direct target of video decode, graphics, or compute operations, or with Window System Integration APIs.

42.13.2. Capabilities

When calling `vkGetPhysicalDeviceVideoCapabilitiesKHR` with `pVideoProfile->videoCodecOperation` specified as one of the encode operation bits, the `VkVideoEncodeCapabilitiesKHR` structure must be included in the `pNext` chain of the `VkVideoCapabilitiesKHR` structure to retrieve capabilities specific to video encoding.

The `VkVideoEncodeCapabilitiesKHR` structure is defined as:

```c
// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeCapabilitiesKHR {
    VkStructureType sType;
    void* pNext;
    VkVideoEncodeCapabilityFlagsKHR flags;
    VkVideoEncodeRateControlModeFlagsKHR rateControlModes;
    uint32_t maxRateControlLayers;
    uint32_t maxBitrate;
    uint32_t maxQualityLevels;
    VkExtent2D encodeInputPictureGranularity;
    VkVideoEncodeFeedbackFlagsKHR supportedEncodeFeedbackFlags;
} VkVideoEncodeCapabilitiesKHR;
```

• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `flags` is a bitmask of `VkVideoEncodeCapabilityFlagBitsKHR` describing supported encoding features.
• `rateControlModes` is a bitmask of `VkVideoEncodeRateControlModeFlagBitsKHR` indicating supported rate control modes.
• `maxRateControlLayers` indicates the maximum number of rate control layers supported.

• `maxBitrate` indicates the maximum supported bitrate.

• `maxQualityLevels` indicates the number of discrete video encode quality levels supported. Implementations must report at least 1.

• `encodeInputPictureGranularity` indicates the granularity at which encode input picture data is encoded.

• `supportedEncodeFeedbackFlags` is a bitmask of `VkVideoEncodeFeedbackFlagBitsKHR` values specifying the supported flags for video encode feedback queries.

Implementations must include support for at least `VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_BUFFER_OFFSET_BIT_KHR` and `VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_BYTES_WRITTEN_BIT_KHR` in `supportedEncodeFeedbackFlags`.

The input content and encode resolution (specified in `VkVideoEncodeInfoKHR::codedExtent`) may not be aligned with the codec-specific coding block size. For example, the input content may be 1920x1080 and the coding block size may be 16x16 pixel blocks. In this example, the content is horizontally aligned with the coding block size, but not vertically aligned with the coding block size. Encoding of the last row of blocks may be impacted by contents of the input image in pixel rows 1081 to 1088 (the next vertical alignment with the coding block size). In general, to ensure efficient encoding for the last row/column of blocks, and/or to ensure consistent encoding results between repeated encoding of the same input content, these extra pixel rows/columns should be filled to known values up to the coding block size alignment before encoding operations are performed. Some implementations support performing auto-fill of unaligned pixels beyond a specific alignment for the purposes of encoding, which is reported in `encodeInputPictureGranularity`. For example, if an implementation reports 1x1 in `encodeInputPictureGranularity`, then the implementation will perform auto-fill for any unaligned pixels beyond the encode resolution up to the next coding block size. For a coding block size of 16x16, if the implementation reports 16x16 in `encodeInputPictureGranularity`, then it is the application's responsibility to fill any unaligned pixels, if desired. When the application does not fill these unaligned pixels, there may be an impact on the encoding efficiency but there will be no effect on the validity of the generated bitstream. If the implementation reports 8x8 in `encodeInputPictureGranularity`, then for the 1920x1080 example, since the content is aligned to 8 pixels vertically, the implementation will auto-fill pixel rows 1081 to 1088 (up to the 16x16 coding block size in the example). The auto-fill value(s) are implementation-specific. The auto-fill value(s) are not written to the input image memory, but are used as part of the encoding operation on the input image.

---

**Valid Usage (Implicit)**

- `VUID-VkVideoEncodeCapabilitiesKHR-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_CAPABILITIES_KHR`

---

```c
// Provided by VK_KHR_video_encode_queue
typedef VkFlags VkVideoEncodeCapabilityFlagsKHR;
```

`VkVideoEncodeCapabilityFlagsKHR` is a bitmask type for setting a mask of zero or more
Bits which may be set in `VkVideoEncodeCapabilitiesKHR::flags`, indicating the encoding tools supported, are:

```c
// Provided by VK_KHR_video_encode_queue
typedef enum VkVideoEncodeCapabilityFlagBitsKHR {
    VK_VIDEO_ENCODE_CAPABILITY_PRECEDING_EXTERNALLY_ENCODED_BYTES_BIT_KHR = 0x00000001,
    VK_VIDEO_ENCODE_CAPABILITY_INSUFFICIENT_BITSTREAM_BUFFER_RANGE_DETECTION_BIT_KHR = 0x00000002,
} VkVideoEncodeCapabilityFlagBitsKHR;
```

- `VK_VIDEO_ENCODE_CAPABILITY_PRECEDING_EXTERNALLY_ENCODED_BYTES_BIT_KHR` indicates that the implementation supports the use of `VkVideoEncodeInfoKHR::precedingExternallyEncodedBytes`.
- `VK_VIDEO_ENCODE_CAPABILITY_INSUFFICIENT_BITSTREAM_BUFFER_RANGE_DETECTION_BIT_KHR` indicates that the implementation is able to detect and report when the destination video bitstream buffer range provided by the application is not sufficiently large to fit the encoded bitstream data produced by a video encode operation by reporting the `VK_QUERY_RESULT_STATUS_INSUFFICIENT_BITSTREAM_BUFFER_RANGE_KHR` query result status code.

**Note**

Some implementations may not be able to reliably detect insufficient bitstream buffer range conditions in all situations. Such implementations will not report support for the `VK_VIDEO_ENCODE_CAPABILITY_INSUFFICIENT_BITSTREAM_BUFFER_RANGE_DETECTION_BIT_KHR` encode capability flag for the video profile, but may still report the `VK_QUERY_RESULT_STATUS_INSUFFICIENT_BITSTREAM_BUFFER_RANGE_KHR` query result status code in certain cases. Applications should always check for the specific query result status code even when this encode capability flag is not supported by the implementation for the video profile in question. However, applications must not assume that a different negative query result status code indicating an unsuccessful completion of a video encode operation is not the result of an insufficient bitstream buffer condition unless this encode capability flag is supported.

### 42.13.3. Video Encode Quality Levels

To query properties for a specific video encode quality level supported by a video encode profile, call:

```c
// Provided by VK_KHR_video_encode_queue
VkResult vkGetPhysicalDeviceVideoEncodeQualityLevelPropertiesKHR(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR* pQualityLevelInfo,
);```
• `physicalDevice` is the physical device to query the video encode quality level properties for.
• `pQualityLevelInfo` is a pointer to a `VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR` structure specifying the video encode profile and quality level to query properties for.
• `pQualityLevelProperties` is a pointer to a `VkVideoEncodeQualityLevelPropertiesKHR` structure in which the properties are returned.

Valid Usage (Implicit)

• VUID-vkGetPhysicalDeviceVideoEncodeQualityLevelPropertiesKHR-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle
• VUID-vkGetPhysicalDeviceVideoEncodeQualityLevelPropertiesKHR-pQualityLevelInfo-parameter
  `pQualityLevelInfo` must be a valid pointer to a valid `VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR` structure
• VUID-vkGetPhysicalDeviceVideoEncodeQualityLevelPropertiesKHR-pQualityLevelProperties-parameter
  `pQualityLevelProperties` must be a valid pointer to a `VkVideoEncodeQualityLevelPropertiesKHR` structure

Return Codes

Success
  • `VK_SUCCESS`

Failure
  • `VK_ERROR_OUT_OF_HOST_MEMORY`
  • `VK_ERROR_OUT_OF_DEVICE_MEMORY`
  • `VK_ERROR_VIDEO_PROFILE_OPERATION_NOT_SUPPORTED_KHR`
  • `VK_ERROR_VIDEO_PROFILE_FORMAT_NOT_SUPPORTED_KHR`
  • `VK_ERROR_VIDEO_PICTURE_LAYOUT_NOT_SUPPORTED_KHR`
  • `VK_ERROR_VIDEO_PROFILE_CODEC_NOT_SUPPORTED_KHR`

The `VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_encode_queue
typedef struct VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const VkVideoProfileInfoKHR* pVideoProfile;
} VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR;
```
uint32_t qualityLevel;
} VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **pVideoProfile** is a pointer to a `VkVideoProfileInfoKHR` structure specifying the video profile to query the video encode quality level properties for.
- **qualityLevel** is the video encode quality level to query properties for.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VIDEO_ENCODE_QUALITY_LEVEL_INFO_KHR`

- VUID-VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR-pNext-pNext
  
  `pNext` must be `NULL`

- VUID-VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR-pVideoProfile-parameter
  
  `pVideoProfile` must be a valid pointer to a valid `VkVideoProfileInfoKHR` structure

The `VkVideoEncodeQualityLevelPropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeQualityLevelPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    VkVideoEncodeRateControlModeFlagBitsKHR preferredRateControlMode;
    uint32_t preferredRateControlLayerCount;
} VkVideoEncodeQualityLevelPropertiesKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **preferredRateControlMode** is a `VkVideoEncodeRateControlModeFlagBitsKHR` value indicating the preferred rate control mode to use with the video encode quality level.
- **preferredRateControlLayerCount** indicates the preferred number of rate control layers to use with the quality level.

### Valid Usage (Implicit)

- VUID-VkVideoEncodeQualityLevelPropertiesKHR-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_QUALITY_LEVEL_PROPERTIES_KHR`

- VUID-VkVideoEncodeQualityLevelPropertiesKHR-pNext-pNext
  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkVideoEncodeH264QualityLevelPropertiesEXT` or
The `VkVideoEncodeQualityLevelInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeQualityLevelInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t qualityLevel;
} VkVideoEncodeQualityLevelInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **qualityLevel** is the used video encode quality level.

This structure **can** be specified in the following places:

- In the **pNext** chain of `VkVideoSessionParametersCreateInfoKHR` to specify the video encode quality level to use for a video session parameters object created for a video encode session. If no instance of this structure is included in the **pNext** chain of `VkVideoSessionParametersCreateInfoKHR`, then the video session parameters object is created with a video encode quality level of zero.
- In the **pNext** chain of `VkVideoCodingControlInfoKHR` to change the video encode quality level state of the bound video session.

**Valid Usage (Implicit)**

- VUID-VkVideoEncodeQualityLevelInfoKHR-sType-sType
  
  **sType** must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_QUALITY_LEVEL_INFO_KHR`

### 42.13.4. Retrieving Encoded Session Parameters

Any codec-specific parameters stored in video session parameters objects **may** need to be separately encoded and included in the final video bitstream data, depending on the used video compression standard. In such cases the application **must** call the `vkGetEncodedVideoSessionParametersKHR` command to retrieve the encoded parameter data from the used video session parameters object in order to be able to produce a compliant video bitstream.

Encoded parameter data **can** be retrieved from a video session parameters object created with a video encode operation using the command:
VkResult vkGetEncodedVideoSessionParametersKHR(
    VkDevice device,
    const VkVideoEncodeSessionParametersGetInfoKHR* pVideoSessionParametersInfo,
    VkVideoEncodeSessionParametersFeedbackInfoKHR* pFeedbackInfo,
    size_t* pDataSize, 
    void* pData);

- **device** is the logical device that owns the video session parameters object.
- **pVideoSessionParametersInfo** is a pointer to a VkVideoEncodeSessionParametersGetInfoKHR structure specifying the parameters of the encoded parameter data to retrieve.
- **pFeedbackInfo** is either NULL or a pointer to a VkVideoEncodeSessionParametersFeedbackInfoKHR structure in which feedback about the requested parameter data is returned.
- **pDataSize** is a pointer to a size_t value related to the amount of encode parameter data returned, as described below.
- **pData** is either NULL or a pointer to a buffer to write the encoded parameter data to.

If **pData** is NULL, then the size of the encoded parameter data, in bytes, that can be retrieved is returned in **pDataSize**. Otherwise, **pDataSize** must point to a variable set by the application to the size of the buffer, in bytes, pointed to by **pData**, and on return the variable is overwritten with the number of bytes actually written to **pData**. If **pDataSize** is less than the size of the encoded parameter data that can be retrieved, then no data will be written to **pData**, zero will be written to **pDataSize**, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that no encoded parameter data was returned.

If **pFeedbackInfo** is not NULL then the members of the VkVideoEncodeSessionParametersFeedbackInfoKHR structure and any additional structures included in its pNext chain that are applicable to the video session parameters object specified in **pVideoSessionParametersInfo::videoSessionParameters** will be filled with feedback about the requested parameter data on all successful calls to this command.

**Note:**
This includes the cases when **pData** is NULL or when **VK_INCOMPLETE** is returned by the command, and enables the application to determine whether the implementation overrode any of the requested video session parameters without actually needing to retrieve the encoded parameter data itself.

**Valid Usage (Implicit)**

- VUID-vkGetEncodedVideoSessionParametersKHR-device-parameter
  - **device** must be a valid VkDevice handle
- VUID-vkGetEncodedVideoSessionParametersKHR-pVideoSessionParametersInfo-parameter
  - **pVideoSessionParametersInfo** must be a valid pointer to a valid
The ** VkVideoEncodeSessionParametersGetInfoKHR ** structure

- **VUID-vkGetEncodedVideoSessionParametersKHR-pFeedbackInfo-parameter**
  If **pFeedbackInfo** is not **NULL**, **pFeedbackInfo** must be a valid pointer to a ** VkVideoEncodeSessionParametersFeedbackInfoKHR ** structure

- **VUID-vkGetEncodedVideoSessionParametersKHR-pDataSize-parameter**
  **pDataSize** must be a valid pointer to a **size_t** value

- **VUID-vkGetEncodedVideoSessionParametersKHR-pData-parameter**
  If the value referenced by **pDataSize** is not 0, and **pData** is not **NULL**, **pData** must be a valid pointer to an array of **pDataSize** bytes

**Return Codes**

**Success**
- VK_SUCCESS
- VK_INCOMPLETE

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The ** VkVideoEncodeSessionParametersGetInfoKHR ** structure is defined as:

```c
// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeSessionParametersGetInfoKHR {
  VkStructureType sType;
  const void* pNext;
  VkVideoSessionParametersKHR videoSessionParameters;
} VkVideoEncodeSessionParametersGetInfoKHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **videoSessionParameters** is the **VkVideoSessionParametersKHR** object to retrieve encoded parameter data from.

Depending on the used video encode operation, additional codec-specific structures may need to be included in the **pNext** chain of this structure to identify the specific video session parameters to retrieve encoded parameter data for, as described in the corresponding sections.

**Valid Usage (Implicit)**

- **VUID-VkVideoEncodeSessionParametersGetInfoKHR-sType-sType**
  **sType** must be **VK_STRUCTURE_TYPE_VIDEO_ENCODE_SESSION_PARAMETERS_GET_INFO_KHR**

- **VUID-VkVideoEncodeSessionParametersGetInfoKHR-pNext-pNext**
Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkVideoEncodeH264SessionParametersGetInfoEXT` or `VkVideoEncodeH265SessionParametersGetInfoEXT`

- VUID-VkVideoEncodeSessionParametersGetInfoKHR-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique

- VUID-VkVideoEncodeSessionParametersGetInfoKHR-videoSessionParameters-parameter
  `videoSessionParameters` must be a valid `VkVideoSessionParametersKHR` handle

The `VkVideoEncodeSessionParametersFeedbackInfoKHR` structure is defined as:

```
// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeSessionParametersFeedbackInfoKHR {
    VkStructureType      sType;
    void*                pNext;
    VkBool32             hasOverrides;
} VkVideoEncodeSessionParametersFeedbackInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `hasOverrides` indicates whether any of the requested parameter data were overridden by the implementation.

Depending on the used video encode operation, additional codec-specific structures may need to be included in the `pNext` chain of this structure to capture feedback information about the requested parameter data, as described in the corresponding sections.

**Valid Usage (Implicit)**

- VUID-VkVideoEncodeSessionParametersFeedbackInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_SESSION_PARAMETERS_FEEDBACK_INFO_KHR`

- VUID-VkVideoEncodeSessionParametersFeedbackInfoKHR-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkVideoEncodeH264SessionParametersFeedbackInfoEXT` or `VkVideoEncodeH265SessionParametersFeedbackInfoEXT`

- VUID-VkVideoEncodeSessionParametersFeedbackInfoKHR-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique

### 42.13.5. Video Encode Commands

To launch video encode operations, call:

```
// Provided by VK_KHR_video_encode_queue
```
void vkCmdEncodeVideoKHR(
    VkCommandBuffer       commandBuffer,
    const VkVideoEncodeInfoKHR* pEncodeInfo);

- **commandBuffer** is the command buffer to be filled with this function for encoding to generate a bitstream.
- **pEncodeInfo** is a pointer to a *VkVideoEncodeInfoKHR* structure.

Each call issues one or more video encode operations. The implicit parameter **opCount** corresponds to the number of video encode operations issued by the command. After calling this command, the *active query index* of each *active* query is incremented by **opCount**.

Currently each call to this command results in the issue of a single video encode operation.

### Valid Usage

- **VUID-vkCmdEncodeVideoKHR-opCount-07174**
  For each *active* query, the *active query index* corresponding to the query type of that query plus **opCount** must be less than or equal to the last activatable query index corresponding to the query type of that query plus one

### Valid Usage (Implicit)

- **VUID-vkCmdEncodeVideoKHR-commandBuffer-parameter**
  *commandBuffer* must be a valid *VkCommandBuffer* handle

- **VUID-vkCmdEncodeVideoKHR-pEncodeInfo-parameter**
  *pEncodeInfo* must be a valid pointer to a valid *VkVideoEncodeInfoKHR* structure

- **VUID-vkCmdEncodeVideoKHR-commandBuffer-recording**
  *commandBuffer* must be in the *recording state*

- **VUID-vkCmdEncodeVideoKHR-commandBuffer-cmdpool**
  The *VkCommandPool* that *commandBuffer* was allocated from must support encode operations

- **VUID-vkCmdEncodeVideoKHR-renderpass**
  This command must only be called outside of a render pass instance

- **VUID-vkCmdEncodeVideoKHR-videocoding**
  This command must only be called inside of a video coding scope

- **VUID-vkCmdEncodeVideoKHR-bufferlevel**
  *commandBuffer* must be a primary *VkCommandBuffer*

### Host Synchronization

- Host access to *commandBuffer* must be externally synchronized
- Host access to the *VkCommandPool* that *commandBuffer* was allocated from must be externally
The `VkVideoEncodeInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoEncodeFlagsKHR flags;
    VkBuffer dstBuffer;
    VkDeviceSize dstBufferOffset;
    VkDeviceSize dstBufferRange;
    VkVideoPictureResourceInfoKHR srcPictureResource;
    const VkVideoReferenceSlotInfoKHR* pSetupReferenceSlot;
    uint32_t referenceSlotCount;
    const VkVideoReferenceSlotInfoKHR* pReferenceSlots;
    uint32_t precedingExternallyEncodedBytes;
} VkVideoEncodeInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is a pointer to a structure extending this structure. A codec-specific extension structure must be chained to specify what bitstream unit to generate with this encode operation.
- `flags` is reserved for future use.
- `dstBuffer` is the destination video bitstream buffer to write the encoded bitstream to.
- `dstBufferOffset` is the starting offset in bytes from the start of `dstBuffer` to write the encoded bitstream to. `dstBufferOffset`'s value must be aligned to `VkVideoCapabilitiesKHR::minBitstreamBufferOffsetAlignment`, as reported by the implementation.
- `dstBufferRange` is the maximum size in bytes of the encoded bitstream written to `dstBuffer`, starting from `dstBufferOffset`. `dstBufferRange`'s value must be aligned to `VkVideoCapabilitiesKHR::minBitstreamBufferSizeAlignment`, as reported by the implementation.
- `srcPictureResource` is the Picture Resource of the Input Picture to be encoded by the operation.
- `pSetupReferenceSlot` is a pointer to a `VkVideoReferenceSlotInfoKHR` structure used for generating a reconstructed reference slot and Picture Resource. `pSetupReferenceSlot->slotIndex` specifies the slot index number to use as a target for producing the Reconstructed (DPB) data. `pSetupReferenceSlot` must be one of the entries provided in `VkVideoBeginCodingInfoKHR` via the `pReferenceSlots` within the `vkCmdBeginVideoCodingKHR` command that established the Vulkan Video Encode Context for this command.
• **referenceSlotCount** is the number of Reconstructed Reference Pictures that will be used when this encoding operation is executing.

• **pReferenceSlots** is **NULL** or a pointer to an array of `VkVideoReferenceSlotInfoKHR` structures that will be used when this encoding operation is executing. Each entry in **pReferenceSlots** **must** be one of the entries provided in `VkVideoBeginCodingInfoKHR` via the **pReferenceSlots** within the `vkCmdBeginVideoCodingKHR` command that established the Vulkan Video Encode Context for this command.

• **precedingExternallyEncodedBytes** is the number of bytes externally encoded for insertion in the active video encode session overall bitstream prior to the bitstream that will be generated by the implementation for this instance of `VkVideoEncodeInfoKHR`. The value provided is used to update the implementation’s rate control algorithm for the rate control layer this instance of `VkVideoEncodeInfoKHR` belongs to, by accounting for the bitrate budget consumed by these externally encoded bytes. See `VkVideoEncodeRateControlInfoKHR` for additional information about encode rate control.

The coded size of the encode operation is specified in **codedExtent** of `srcPictureResource`.

Multiple `vkCmdEncodeVideoKHR` commands **may** be recorded within a Vulkan Video Encode Context. The execution of each `vkCmdEncodeVideoKHR` command will result in generating codec-specific bitstream units. These bitstream units are generated consecutively into the bitstream buffer specified in **dstBuffer** of a `VkVideoEncodeInfoKHR` structure within the `vkCmdBeginVideoCodingKHR` command. The produced bitstream is the sum of all these bitstream units, including any padding between the bitstream units. Any bitstream padding **must** be filled with data compliant to the codec standard so as not to cause any syntax errors during decoding of the bitstream units with the padding included. The range of the bitstream buffer written **can** be queried via video encode feedback queries.

---

**Valid Usage**

- **VUID-VkVideoEncodeInfoKHR-None-07012**
  The bound video session **must** not be in **uninitialized** state at the time the command is executed on the device

---

**Valid Usage (Implicit)**

- **VUID-VkVideoEncodeInfoKHR-sType-sType**
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_INFO_KHR`

- **VUID-VkVideoEncodeInfoKHR-pNext-pNext**
  Each **pNext** member of any structure (including this one) in the **pNext** chain **must** be either **NULL** or a pointer to a valid instance of `VkVideoEncodeH264PictureInfoEXT` or `VkVideoEncodeH265PictureInfoEXT`

- **VUID-VkVideoEncodeInfoKHR-sType-unique**
  The `sType` value of each struct in the **pNext** chain **must** be unique

- **VUID-VkVideoEncodeInfoKHR-flags-zerobitmask**
  `flags` **must** be `0`
**VUID-VkVideoEncodeInfoKHR-dstBuffer-parameter**

*dstBuffer* must be a valid `VkBuffer` handle.

**VUID-VkVideoEncodeInfoKHR-srcPictureResource-parameter**

*srcPictureResource* must be a valid `VkVideoPictureResourceInfoKHR` structure.

**VUID-VkVideoEncodeInfoKHR-pSetupReferenceSlot-parameter**

If `pSetupReferenceSlot` is not `NULL`, `pSetupReferenceSlot` must be a valid pointer to a valid `VkVideoReferenceSlotInfoKHR` structure.

**VUID-VkVideoEncodeInfoKHR-pReferenceSlots-parameter**

If `referenceSlotCount` is not 0, `pReferenceSlots` must be a valid pointer to an array of `referenceSlotCount` valid `VkVideoReferenceSlotInfoKHR` structures.

// Provided by VK_KHR_video_encode_queue
typedef VkFlags VkVideoEncodeFlagsKHR;

`VkVideoEncodeFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

The `VkVideoEncodeRateControlInfoKHR` structure is defined as:

// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeRateControlInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoEncodeRateControlFlagsKHR flags;
    VkVideoEncodeRateControlModeFlagBitsKHR rateControlMode;
    uint32_t layerCount;
    const VkVideoEncodeRateControlLayerInfoKHR* pLayers;
    uint32_t virtualBufferSizeInMs;
    uint32_t initialVirtualBufferSizeInMs;
} VkVideoEncodeRateControlInfoKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **rateControlMode** is a `VkVideoEncodeRateControlModeFlagBitsKHR` value specifying the encode stream rate control mode.
- **layerCount** specifies the number of rate control layers in the video encode stream.
- **pLayers** is a pointer to an array of `VkVideoEncodeRateControlLayerInfoKHR` structures specifying the rate control configurations of `layerCount` rate control layers.
- **virtualBufferSizeInMs** is the leaky bucket model virtual buffer size in milliseconds, with respect to peak bitrate. Valid when rate control mode is `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_CBR_BIT_KHR` or `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_VBR_BIT_KHR`. For example, virtual buffer size is `(virtualBufferSizeInMs × maxBitrate / 1000).`
• initialVirtualBufferSizeInMs is the initial occupancy in milliseconds of the virtual buffer in the leaky bucket model. Valid when rate control mode is VK_VIDEO_ENCODE_RATE_CONTROL_MODE_CBR_BIT_KHR or VK_VIDEO_ENCODE_RATE_CONTROL_MODE_VBR_BIT_KHR.

Including this structure in the pNext chain of VkVideoCodingControlInfoKHR and including VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR in VkVideoCodingControlInfoKHR::flags will define stream rate control settings for video encoding.

Additional structures providing codec-specific rate control parameters may need to be included in the pNext chain of VkVideoCodingControlInfoKHR depending on the codec profile the bound video session was created with and the parameters specified in VkVideoEncodeRateControlInfoKHRK (see Video Coding Control).

To ensure that the video session is properly initialized with stream-level rate control settings, the application must call vkCmdControlVideoCodingKHR with stream-level rate control settings at least once in execution order before the first vkCmdEncodeVideoKHR command that is executed after video session reset. If not provided, default implementation-specific stream rate control settings will be used.

Stream rate control settings can also be re-initialized during an active video encoding session. The re-initialization takes effect whenever the VkVideoEncodeRateControlInfoKHR structure is included in the pNext chain of the VkVideoCodingControlInfoKHR structure in the call to vkCmdControlVideoCodingKHR, and only impacts vkCmdEncodeVideoKHR operations that follow in execution order.

Valid Usage (Implicit)

- VUID-VkVideoEncodeRateControlInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_RATE_CONTROL_INFO_KHR

- VUID-VkVideoEncodeRateControlInfoKHR-flags-zerobitmask
  flags must be 0

- VUID-VkVideoEncodeRateControlInfoKHR-rateControlMode-parameter
  If rateControlMode is not 0, rateControlMode must be a valid VkVideoEncodeRateControlModeFlagBitsKHR value

- VUID-VkVideoEncodeRateControlInfoKHR-pLayers-parameter
  If layerCount is not 0, pLayers must be a valid pointer to an array of layerCount valid VkVideoEncodeRateControlLayerInfoKHR structures

// Provided by VK_KHR_video_encode_queue
typedef VkFlags VkVideoEncodeRateControlFlagsKHR;

VkVideoEncodeRateControlFlagsKHR is a bitmask type for setting a mask, but currently reserved for future use.

The rate control modes are defined with the following enums:
typedef enum VkVideoEncodeRateControlModeFlagBitsKHR {
    VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DEFAULT_KHR = 0,
    VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR = 0x00000001,
    VK_VIDEO_ENCODE_RATE_CONTROL_MODE_CBR_BIT_KHR = 0x00000002,
    VK_VIDEO_ENCODE_RATE_CONTROL_MODE_VBR_BIT_KHR = 0x00000004,
} VkVideoEncodeRateControlModeFlagBitsKHR;

- **VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DEFAULT_KHR** specifies the use of implementation-specific rate control.
- **VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR** specifies that rate control is disabled and any quality control parameters for the encoding are provided on a per-picture basis. In this mode implementations will encode pictures independently of the output bitrate of prior video encode operations. When using an H.264 encode profile, implementations will use the QP values specified in the VkVideoEncodeH264RateControlInfoEXT structure for the encoded picture. When using an H.265 encode profile, implementations will use the QP values specified in the VkVideoEncodeH265RateControlInfoEXT structure for the encoded picture.
- **VK_VIDEO_ENCODE_RATE_CONTROL_MODE_CBR_BIT_KHR** specifies the use of constant bitrate rate control mode.
- **VK_VIDEO_ENCODE_RATE_CONTROL_MODE_VBR_BIT_KHR** specifies the use of variable bitrate rate control mode.

typedef VkFlags VkVideoEncodeRateControlModeFlagsKHR;

VkVideoEncodeRateControlModeFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoEncodeRateControlModeFlagBitsKHR.

The VkVideoEncodeRateControlLayerInfoKHR structure is defined as:

typedef struct VkVideoEncodeRateControlLayerInfoKHR {
    VkStructureType      sType;
    const void*           pNext;
    uint64_t              averageBitrate;
    uint64_t              maxBitrate;
    uint32_t              frameRateNumerator;
    uint32_t              frameRateDenominator;
} VkVideoEncodeRateControlLayerInfoKHR;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is a pointer to a structure extending this structure.
- **averageBitrate** is the average bitrate in bits/second. Valid when rate control mode is **VK_VIDEO_ENCODE_RATE_CONTROL_MODE_CBR_BIT_KHR** or **VK_VIDEO_ENCODE_RATE_CONTROL_MODE_VBR_BIT_KHR**.
maxBitrate is the peak bitrate in bits/second. Valid when rate control mode is \texttt{VK_VIDEO_ENCODE_RATE_CONTROL_MODE_VBR_BIT_KHR}.

frameRateNumerator is the numerator of the frame rate. Valid when rate control mode is \texttt{VK_VIDEO_ENCODE_RATE_CONTROL_MODE_CBR_BIT_KHR} or \texttt{VK_VIDEO_ENCODE_RATE_CONTROL_MODE_VBR_BIT_KHR}.

frameRateDenominator is the denominator of the frame rate. Valid when rate control mode is \texttt{VK_VIDEO_ENCODE_RATE_CONTROL_MODE_CBR_BIT_KHR} or \texttt{VK_VIDEO_ENCODE_RATE_CONTROL_MODE_VBR_BIT_KHR}.

A codec-specific structure specifying additional per-layer rate control settings \textbf{must} be chained to \texttt{VkVideoEncodeRateControlLayerInfoKHR}. If multiple rate control layers are enabled (\texttt{VkVideoEncodeRateControlInfoKHR::layerCount} is greater than 1), then the chained codec-specific extension structure also identifies the specific video coding layer its parent \texttt{VkVideoEncodeRateControlLayerInfoKHR} applies to. If multiple rate control layers are enabled, the number of rate control layers \textbf{must} match the number of video coding layers. The specification for an encode codec-specific extension would describe how multiple video coding layers are enabled for the corresponding codec.

Per-layer rate control settings for all enabled rate control layers \textbf{must} be initialized or re-initialized whenever stream rate control settings are provided via \texttt{VkVideoEncodeRateControlInfoKHR}. This is done by specifying settings for all enabled rate control layers in \texttt{VkVideoEncodeRateControlInfoKHR::pLayers}.

It is possible for an application to enable multiple video coding layers (via codec-specific extensions to encoding operations) while only enabling a single layer of rate control for the entire video stream. To achieve this, \texttt{layerCount} in \texttt{VkVideoEncodeRateControlInfoKHR} \textbf{must} be set to 1, and the single \texttt{VkVideoEncodeRateControlLayerInfoKHR} provided in \texttt{pLayers} would apply to all encoded segments of the video stream, regardless of which codec-defined video coding layer they belong to. In this case, the implementation decides bitrate distribution across video coding layers (if applicable to the specified stream rate control mode).

### Valid Usage (Implicit)

- VUID-VkVideoEncodeRateControlLayerInfoKHR-sType-sType \r
  \textbf{sType} \textbf{must} be \texttt{VK_STRUCTURE_TYPE_VIDEO_ENCODE_RATE_CONTROL_LAYER_INFO_KHR}

- VUID-VkVideoEncodeRateControlLayerInfoKHR-pNext-pNext
  Each \texttt{pNext} member of any structure (including this one) in the \texttt{pNext} chain \textbf{must} be either \texttt{NULL} or a pointer to a valid instance of \texttt{VkVideoEncodeH264RateControlLayerInfoEXT} or \texttt{VkVideoEncodeH265RateControlLayerInfoEXT}

- VUID-VkVideoEncodeRateControlLayerInfoKHR-sType-unique
  The \texttt{sType} value of each struct in the \texttt{pNext} chain \textbf{must} be unique
42.14. Encode H.264

The VK_EXT_video_encode_h264 extension adds H.264 codec specific structures/types needed to support H.264 encoding. Unless otherwise noted, all references to the H.264 specification are to the 2010 edition published by the ITU-T, dated March 2010. This specification is available at https://www.itu.int/rec/T-REC-H.264.

Note
Refer to the Preamble for information on how the Khronos Intellectual Property Rights Policy relates to normative references to external materials not created by Khronos.

42.14.1. H.264 encode profile

The VkVideoEncodeH264ProfileInfoEXT structure is defined as:

```c
typedef struct VkVideoEncodeH264ProfileInfoEXT {
    VkStructureType sType;
    const void* pNext;
    StdVideoH264ProfileIdc stdProfileIdc;
} VkVideoEncodeH264ProfileInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `stdProfileIdc` is a StdVideoH264ProfileIdc value specifying the H.264 codec profile IDC.

An H.264 encode profile is specified by including a VkVideoEncodeH264ProfileInfoEXT structure in the `pNext` chain of the VkVideoProfileInfoKHR structure when VkVideoProfileInfoKHR::videoCodecOperation is VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH264ProfileInfoEXT-sType-sType
  `sType` must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_PROFILE_INFO_EXT

42.14.2. Capabilities

When calling vkGetPhysicalDeviceVideoCapabilitiesKHR with `pVideoProfile->videoCodecOperation` specified as VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT, the VkVideoEncodeH264CapabilitiesEXT structure must be included in the `pNext` chain of the VkVideoCapabilitiesKHR structure to retrieve more capabilities specific to H.264 video encoding.

The VkVideoEncodeH264CapabilitiesEXT structure is defined as:
typedef struct VkVideoEncodeH264CapabilitiesEXT {
    VkStructureType sType;
    void* pNext;
    VkVideoEncodeH264CapabilityFlagsEXT flags;
    StdVideoH264LevelIdc maxLevelIdc;
    uint32_t maxSliceCount;
    uint32_t maxPPictureL0ReferenceCount;
    uint32_t maxBPictureL0ReferenceCount;
    uint32_t maxL1ReferenceCount;
    uint32_t maxTemporalLayerCount;
    VkBool32 expectDyadicTemporalLayerPattern;
    int32_t minQp;
    int32_t maxQp;
    VkBool32 prefersGopRemainingFrames;
    VkBool32 requiresGopRemainingFrames;
    VkVideoEncodeH264StdFlagsEXT stdSyntaxFlags;
} VkVideoEncodeH264CapabilitiesEXT;

• **sType** is a VkStructureType value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **flags** is a bitmask of VkVideoEncodeH264CapabilityFlagBitsEXT indicating supported H.264 encoding capabilities.
• **maxLevelIdc** is a StdVideoH264LevelIdc value indicating the maximum H.264 level supported.
• **maxSliceCount** indicates the maximum number of slices that can be encoded for a single picture. Further restrictions may apply to the number of slices that can be encoded for a single picture depending on other capabilities and codec-specific rules.
• **maxPPictureL0ReferenceCount** indicates the maximum number of reference pictures the implementation supports in the reference list L0 for P pictures.
• **maxBPictureL0ReferenceCount** indicates the maximum number of reference pictures the implementation supports in the reference list L0 for B pictures. The reported value is 0 if encoding of B pictures is not supported.
• **maxL1ReferenceCount** reports the maximum number of reference pictures the implementation supports in the reference list L1 if encoding of B pictures is supported. The reported value is 0 if encoding of B pictures is not supported.
• **maxTemporalLayerCount** indicates the maximum number of H.264 temporal layers supported by the implementation.
• **expectDyadicTemporalLayerPattern** indicates that the implementation’s rate control algorithms expect the application to use a dyadic temporal layer pattern when encoding multiple temporal layers.
• **minQp** indicates the minimum QP value supported.
• **maxQp** indicates the maximum QP value supported.
• **prefersGopRemainingFrames** indicates that the implementation’s rate control algorithm prefers
the application to specify the number of frames of each type remaining in the current group of pictures.

- requiresGopRemainingFrames indicates that the implementation's rate control algorithm requires the application to specify the number of frames of each type remaining in the current group of pictures.

- stdSyntaxflags is a bitmask of VkVideoEncodeH264StdFlagBitsEXT indicating capabilities related to H.264 syntax elements.

When vkGetPhysicalDeviceVideoCapabilitiesKHR is called to query the capabilities with parameter videoCodecOperation specified as VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT, a VkVideoEncodeH264CapabilitiesEXT structure can be chained to VkVideoCapabilitiesKHR to retrieve H.264 extension specific capabilities.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH264CapabilitiesEXT-sType-sType

  sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_CAPABILITIES_EXT

Bits which may be set in VkVideoEncodeH264CapabilitiesEXT::flags, indicating the supported H.264 encoding capabilities, are:

```c
// Provided by VK_EXT_video_encode_h264
typedef enum VkVideoEncodeH264CapabilityFlagBitsEXT {
    VK_VIDEO_ENCODE_H264_CAPABILITY_HRD_COMPLIANCE_BIT_EXT = 0x00000001,
    VK_VIDEO_ENCODE_H264_CAPABILITY_PREDICTION_WEIGHT_TABLE_GENERATED_BIT_EXT = 0x00000002,
    VK_VIDEO_ENCODE_H264_CAPABILITY_ROW_UNALIGNED_SLICE_BIT_EXT = 0x00000004,
    VK_VIDEO_ENCODE_H264_CAPABILITY_DIFFERENT_SLICE_TYPE_BIT_EXT = 0x00000008,
    VK_VIDEO_ENCODE_H264_CAPABILITY_B_FRAME_IN_L0_LIST_BIT_EXT = 0x00000010,
    VK_VIDEO_ENCODE_H264_CAPABILITY_B_FRAME_IN_L1_LIST_BIT_EXT = 0x00000020,
    VK_VIDEO_ENCODE_H264_CAPABILITY_PER_PICTURE_TYPE_MIN_MAX_QP_BIT_EXT = 0x00000040,
    VK_VIDEO_ENCODE_H264_CAPABILITY_PER_SLICE_CONSTANT_QP_BIT_EXT = 0x00000080,
    VK_VIDEO_ENCODE_H264_CAPABILITY_GENERATE_PREFIX_NALU_BIT_EXT = 0x00000100,
} VkVideoEncodeH264CapabilityFlagBitsEXT;
```

- VK_VIDEO_ENCODE_H264_CAPABILITY_HRD_COMPLIANCE_BIT_EXT indicates if the implementation guarantees generating a HRD compliant bitstream if nal_hrd_parameters_present_flag or vcl_hrd_parameters_present_flag are enabled in StdVideoH264SpsVuiflags.

- VK_VIDEO_ENCODE_H264_CAPABILITY_PREDICTION_WEIGHT_TABLE_GENERATED_BIT_EXT indicates that when weighted_pred_flag is enabled or STD_VIDEO_H264_WEIGHTED_BIPRED_IDC_EXPLICIT from StdVideoH264WeightedBipredIdc is used, the implementation is able to internally decide syntax for pred_weight_table.

- VK_VIDEO_ENCODE_H264_CAPABILITY_ROW_UNALIGNED_SLICE_BIT_EXT indicates that each slice in a frame with multiple slices may begin or finish at any offset in a macroblock row. If not supported, all slices in the frame must begin at the start of a macroblock row (and hence each
slice must finish at the end of a macroblock row).

- **VK_VIDEO_ENCODE_H264_CAPABILITY_DIFFERENT_SLICE_TYPE_BIT_EXT** indicates that when a frame is encoded with multiple slices, the implementation allows encoding each slice with a different `StdVideoEncodeH264SliceHeader::slice_type`. If not supported, all slices of the frame must be encoded with the same `slice_type` which corresponds to the picture type of the frame. For example, all slices of a P-frame would be encoded as P-slices.

- **VK_VIDEO_ENCODE_H264_CAPABILITY_B_FRAME_IN_L0_LIST_BIT_EXT** indicates support for using a B frame as L0 reference.

- **VK_VIDEO_ENCODE_H264_CAPABILITY_B_FRAME_IN_L1_LIST_BIT_EXT** indicates support for using a B frame as L1 reference.

- **VK_VIDEO_ENCODE_H264_CAPABILITY_PER_PICTURE_TYPE_MIN_MAX_QP_BIT_EXT** indicates support for specifying different QP values in the members of `VkVideoEncodeH264QpEXT`.

- **VK_VIDEO_ENCODE_H264_CAPABILITY_PER_SLICE_CONSTANT_QP_BIT_EXT** indicates support for specifying different constant QP values for each slice.

- **VK_VIDEO_ENCODE_H264_CAPABILITY_GENERATE_PREFIX_NALU_BIT_EXT** indicates support for generating prefix NALUs by setting `VkVideoEncodeH264PictureInfoEXT::generatePrefixNalu` to `VK_TRUE`.

```cpp
// Provided by VK_EXT_video_encode_h264
typedef VkFlags VkVideoEncodeH264CapabilityFlagsEXT;
```

`VkVideoEncodeH264CapabilityFlagsEXT` is a bitmask type for setting a mask of zero or more `VkVideoEncodeH264CapabilityFlagBitsEXT`.

Bits which may be set in `VkVideoEncodeH264CapabilitiesEXT::stdSyntaxFlags`, indicating the capabilities related to the H.264 syntax elements, are:

```cpp
// Provided by VK_EXT_video_encode_h264
typedef enum VkVideoEncodeH264StdFlagBitsEXT {
    VK_VIDEO_ENCODE_H264_STD_SEPARATE_COLOR_PLANE_FLAG_SET_BIT_EXT = 0x00000001,
    VK_VIDEO_ENCODE_H264_STD_QPPRIME_Y_ZERO_TRANSFORM_BYPASS_FLAG_SET_BIT_EXT = 0x00000002,
    VK_VIDEO_ENCODE_H264_STD_SCALING_MATRIX_PRESENT_FLAG_SET_BIT_EXT = 0x00000004,
    VK_VIDEO_ENCODE_H264_STD_SECOND_CHROMA_QP_INDEX_OFFSET_BIT_EXT = 0x00000008,
    VK_VIDEO_ENCODE_H264_STD_PIC_INIT_QP_MINUS26_BIT_EXT = 0x00000020,
    VK_VIDEO_ENCODE_H264_STD_WEIGHTED_PRED_FLAG_SET_BIT_EXT = 0x00000040,
    VK_VIDEO_ENCODE_H264_STD_WEIGHTED_BIPRED_IDC_EXPLICIT_BIT_EXT = 0x00000080,
    VK_VIDEO_ENCODE_H264_STD_WEIGHTED_BIPRED_IDC_IMPLICIT_BIT_EXT = 0x00000100,
    VK_VIDEO_ENCODE_H264_STD_TRANSFORM_8X8_MODE_FLAG_SET_BIT_EXT = 0x00000200,
    VK_VIDEO_ENCODE_H264_STD_DIRECT_SPATIAL_MV_PRED_FLAG_UNSET_BIT_EXT = 0x00000400,
    VK_VIDEO_ENCODE_H264_STD_ENTROPY_CODING_MODE_FLAG_UNSET_BIT_EXT = 0x00000800,
    VK_VIDEO_ENCODE_H264_STD_ENTROPY_CODING_MODE_FLAG_SET_BIT_EXT = 0x00001000,
    VK_VIDEO_ENCODE_H264_STD_DIRECT_8X8_INFERENCE_FLAG_UNSET_BIT_EXT = 0x00002000,
    VK_VIDEO_ENCODE_H264_STD_CONSTRAINED_INTRA_PRED_FLAG_SET_BIT_EXT = 0x00004000,
    VK_VIDEO_ENCODE_H264_STD_DEBLOCKING_FILTER_DISABLED_BIT_EXT = 0x00008000,
    VK_VIDEO_ENCODE_H264_STD_DEBLOCKING_FILTER_ENABLED_BIT_EXT = 0x00010000,
};
```
• VK_VIDEO_ENCODE_H264_STD_SEPARATE_COLOR_PLANE_FLAG_SET_BIT_EXT indicates if enabling separate_colour_plane_flag in StdVideoH264SpsFlags is supported.

• VK_VIDEO_ENCODE_H264_STD_QPPRIME_Y_ZERO_TRANSFORM_BYPASS_FLAG_SET_BIT_EXT indicates if enabling qpprime_y_zero_transform_bypass_flag in StdVideoH264SpsFlags is supported.

• VK_VIDEO_ENCODE_H264_STD_SCALING_MATRIX_PRESENT_FLAG_SET_BIT_EXT indicates if enabling seq_scaling_matrix_present_flag in StdVideoH264SpsFlags or pic_scaling_matrix_present_flag in StdVideoH264PpsFlags are supported.

• VK_VIDEO_ENCODE_H264_STD_CHROMA_QP_INDEX_OFFSET_BIT_EXT indicates if setting non-zero chroma_qp_index_offset in StdVideoH264PictureParameterSet is supported.

• VK_VIDEO_ENCODE_H264_STD_SECOND_CHROMA_QP_INDEX_OFFSET_BIT_EXT indicates if setting non-zero second_chroma_qp_index_offset in StdVideoH264PictureParameterSet is supported.

• VK_VIDEO_ENCODE_H264_STD_PIC_INIT_QP_MINUS26_BIT_EXT indicates if setting non-zero pic_init_qp_minus26 in StdVideoH264PictureParameterSet is supported.

• VK_VIDEO_ENCODE_H264_STD_WEIGHTED_PRED_FLAG_SET_BIT_EXT indicates if enabling weighted_pred_flag in StdVideoH264PpsFlags is supported.

• VK_VIDEO_ENCODE_H264_STD_WEIGHTED_BIPRED_IDC_EXPLICIT_BIT_EXT indicates if using STD_VIDEO_H264_WEIGHTED_BIPRED_IDC_EXPLICIT from StdVideoH264WeightedBipredIdc is supported.

• VK_VIDEO_ENCODE_H264_STD_WEIGHTED_BIPRED_IDC_IMPLICIT_BIT_EXT indicates if using STD_VIDEO_H264_WEIGHTED_BIPRED_IDC_IMPLICIT from StdVideoH264WeightedBipredIdc is supported.

• VK_VIDEO_ENCODE_H264_STD_TRANSFORM_8X8_MODE_FLAG_SET_BIT_EXT indicates if enabling transform_8x8_mode_flag in StdVideoH264PpsFlags is supported.

• VK_VIDEO_ENCODE_H264_STD_DIRECT_SPATIAL_MV_PRED_FLAG_UNSET_BIT_EXT indicates if disabling StdVideoEncodeH264SliceHeaderFlags::direct_spatial_mv_pred_flag is supported when it is present in the slice header.

• VK_VIDEO_ENCODE_H264_STD_DIRECT_8X8_INFERENCE_FLAG_UNSET_BIT_EXT indicates if disabling direct_8x8_inference_flag in StdVideoH264SpsFlags is supported.

• VK_VIDEO_ENCODE_H264_STD_CONSTRAINED_INTRA_PRED_FLAG_SET_BIT_EXT indicates if enabling constrained_intra_pred_flag in StdVideoH264PpsFlags is supported.

• VK_VIDEO_ENCODE_H264_STD_DEBLOCKING_FILTER_DISABLED_BIT_EXT indicates if using STD_VIDEO_H264_DISABLE_DEBLOCKING_FILTER_IDC_DISABLED from StdVideoH264DisableDeblockingFilterIdc is supported.

• VK_VIDEO_ENCODE_H264_STD_DEBLOCKING_FILTER_ENABLED_BIT_EXT indicates if using
from StdVideoH264DisableDeblockingFilterIdc is supported.

• VK_VIDEO_ENCODE_H264_STD_DEBLOCKING_FILTER_PARTIAL_BIT_EXT indicates if using
  STD_VIDEO_H264_DISABLE_DEBLOCKING_FILTER_IDC_PARTIAL from
  StdVideoH264DisableDeblockingFilterIdc is supported. An implementation must support at
  least one deblocking filter mode.

• VK_VIDEO_ENCODE_H264_STD_SLICE_QP_DELTA_BIT_EXT indicates whether the implementation
  supports using the application-provided value for StdVideoEncodeH264SliceHeader
  ::slice_qp_delta when that value is identical across the slices of the encoded frame.

• VK_VIDEO_ENCODE_H264_STD_DIFFERENT_SLICE_QP_DELTA_BIT_EXT indicates whether the
  implementation supports using the application-provided value for
  StdVideoEncodeH264SliceHeader::slice_qp_delta when that value is different across the slices of
  the encoded frame.

// Provided by VK_EXT_video_encode_h264
typedef VkFlags VkVideoEncodeH264StdFlagsEXT;

VkVideoEncodeH264StdFlagsEXT is a bitmask type for setting a mask of zero or more
VkVideoEncodeH264StdFlagBitsEXT.

42.14.3. H.264 Encode Quality Level Properties

When calling vkGetPhysicalDeviceVideoEncodeQualityLevelPropertiesKHR with pVideoProfile-
>videoCodecOperation specified as VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT, the
VkVideoEncodeH264QualityLevelPropertiesEXT structure can be included in the pNext chain of the
VkVideoEncodeQualityLevelPropertiesKHR structure to retrieve additional video encode quality
level properties specific to H.264 encoding.

The VkVideoEncodeH264QualityLevelPropertiesEXT structure is defined as:

// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264QualityLevelPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    VkVideoEncodeH264RateControlFlagsEXT preferredRateControlFlags;
    uint32_t preferredGopFrameCount;
    uint32_t preferredIdrPeriod;
    uint32_t preferredConsecutiveBFrameCount;
    uint32_t preferredTemporalLayerCount;
    VkVideoEncodeH264QpEXT preferredConstantQp;
    preferredMaxL0ReferenceCount;
    preferredMaxL1ReferenceCount;
    preferredStdEntropyCodingModeFlag;
} VkVideoEncodeH264QualityLevelPropertiesEXT;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.

• preferredRateControlFlags is a bitmask of VkVideoEncodeH264RateControlFlagBitsEXT values indicating the preferred flags to use for VkVideoEncodeH264RateControlInfoEXT::flags.

• preferredGopFrameCount indicates the preferred value to use for VkVideoEncodeH264RateControlInfoEXT::gopFrameCount.

• preferredIdrPeriod indicates the preferred value to use for VkVideoEncodeH264RateControlInfoEXT::idrPeriod.

• preferredConsecutiveBFrameCount indicates the preferred value to use for VkVideoEncodeH264RateControlInfoEXT::consecutiveBFrameCount.

• preferredTemporalLayerCount indicates the preferred value to use for VkVideoEncodeH264RateControlInfoEXT::temporalLayerCount.

• preferredConstantQp indicates the preferred values to use for VkVideoEncodeH264NaluSliceInfoEXT::constantQp for each picture type when using rate control mode VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR.

• preferredMaxL0ReferenceCount indicates the preferred maximum number of reference pictures to use in the reference list L0.

• preferredMaxL1ReferenceCount indicates the preferred maximum number of reference pictures to use in the reference list L1.

• preferredStdEntropyCodingModeFlag indicates the preferred value to use for entropy_coding_mode_flag in StdVideoH264PpsFlags.

**Valid Usage (Implicit)**

- VUID-VkVideoEncodeH264QualityLevelPropertiesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_QUALITY_LEVEL_PROPERTIES_EXT

### 42.14.4. H.264 Encode Session

Additional parameters can be specified when creating a video session with an H.264 encode profile by including an instance of the VkVideoEncodeH264SessionCreateInfoEXT structure in the pNext chain of VkVideoSessionCreateInfoKHR.

The VkVideoEncodeH264SessionCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264SessionCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 useMaxLevelIdc;
    StdVideoH264LevelIdc maxLevelIdc;
} VkVideoEncodeH264SessionCreateInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `useMaxLevelIdc` indicates whether the value of `maxLevelIdc` should be used by the implementation. When it is set to `VK_FALSE`, the implementation ignores the value of `maxLevelIdc` and uses the value of `VkVideoEncodeH264CapabilitiesEXT:maxLevelIdc`, as reported by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile.

• `maxLevelIdc` provides the upper bound on the H.264 level for the video bitstreams produced by the created video session.

### Valid Usage (Implicit)

- VUID-VkVideoEncodeH264SessionCreateInfoEXT-sType-sType
  sType must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_SESSION_CREATE_INFO_EXT`

---

### 42.14.5. Encoder Parameter Sets

To reduce parameter traffic during encoding, the encoder parameter set object supports storing H.264 SPS/PPS parameter sets that may be later referenced during encoding.

The `VkVideoEncodeH264SessionParametersCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264SessionParametersCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t maxStdSPSCount;
    uint32_t maxStdPPSCount;
    const VkVideoEncodeH264SessionParametersAddInfoEXT* pParametersAddInfo;
} VkVideoEncodeH264SessionParametersCreateInfoEXT;
```

• `sType` is a `VkStructureType` value identifying this structure.

• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `maxStdSPSCount` is the maximum number of SPS parameters that the `VkVideoSessionParametersKHR` can contain.

• `maxStdPPSCount` is the maximum number of PPS parameters that the `VkVideoSessionParametersKHR` can contain.

• `pParametersAddInfo` is `NULL` or a pointer to a `VkVideoEncodeH264SessionParametersAddInfoEXT` structure specifying H.264 parameters to add upon object creation.

### Valid Usage (Implicit)

- VUID-VkVideoEncodeH264SessionParametersCreateInfoEXT-sType-sType
  sType must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_SESSION_PARAMETERS_CREATE_INFO_EXT`

- VUID-VkVideoEncodeH264SessionParametersCreateInfoEXT-pParametersAddInfo-
If `pParametersAddInfo` is not NULL, `pParametersAddInfo` must be a valid pointer to a valid `VkVideoEncodeH264SessionParametersAddInfoEXT` structure.

The `VkVideoEncodeH264SessionParametersAddInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264SessionParametersAddInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t stdSPSCount;
    const StdVideoH264SequenceParameterSet* pStdSPSs;
    uint32_t stdPPSCount;
    const StdVideoH264PictureParameterSet* pStdPPSs;
} VkVideoEncodeH264SessionParametersAddInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `stdSPSCount` is the number of SPS elements in the `pStdSPSs`. Its value must be less than or equal to the value of `maxStdSPSCount`.
- `pStdSPSs` is a pointer to an array of `StdVideoH264SequenceParameterSet` structures representing H.264 sequence parameter sets. Each element of the array must have a unique H.264 SPS ID.
- `stdPPSCount` is the number of PPS provided in `pStdPPSs`. Its value must be less than or equal to the value of `maxStdPPSCount`.
- `pStdPPSs` is a pointer to an array of `StdVideoH264PictureParameterSet` structures representing H.264 picture parameter sets. Each element of the array must have a unique H.264 SPS-PPS ID pair.

### Valid Usage

- **VUID-VkVideoEncodeH264SessionParametersAddInfoEXT-stdSPSCount-04837**
  The values of `stdSPSCount` and `stdPPSCount` must be less than or equal to the values of `maxStdSPSCount` and `maxStdPPSCount`, respectively.

- **VUID-VkVideoEncodeH264SessionParametersAddInfoEXT-maxStdSPSCount-04838**
  When the `maxStdSPSCount` number of parameters of type `StdVideoH264SequenceParameterSet` in the Video Session Parameters object is reached, no additional parameters of that type can be added to the object. `VK_ERROR_TOO_MANY_OBJECTS` will be returned if an attempt is made to add additional data to this object at this point.

- **VUID-VkVideoEncodeH264SessionParametersAddInfoEXT-maxStdPPSCount-04839**
  When the `maxStdPPSCount` number of parameters of type `StdVideoH264PictureParameterSet` in the Video Session Parameters object is reached, no additional parameters of that type can be added to the object. `VK_ERROR_TOO_MANY_OBJECTS` will be returned if an attempt is made to add additional data to this object at this point.
Each entry to be added must have a unique, to the rest of the parameter array entries and the existing parameters in the Video Session Parameters Object that is being updated, SPS-PPS IDs.

Parameter entries that already exist in Video Session Parameters object with a particular SPS-PPS IDs cannot be replaced nor updated.

When creating a new object using a Video Session Parameters as a template, the array's parameters with the same SPS-PPS IDs as the ones from the template take precedence.

SPS/PPS parameters must comply with the limits specified in VkVideoSessionCreateInfoKHR during Video Session creation.

Valid Usage (Implicit)

- **sType** must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_SESSION_PARAMETERS_ADD_INFO_EXT

If stdSPSCount is not 0, and pStdSPSs is not NULL, pStdSPSs must be a valid pointer to an array of stdSPSCount StdVideoH264SequenceParameterSet values.

If stdPPSCount is not 0, and pStdPPSs is not NULL, pStdPPSs must be a valid pointer to an array of stdPPSCount StdVideoH264PictureParameterSet values.

The VkVideoEncodeH264SessionParametersGetInfoEXT structure is defined as:

```c
typedef struct VkVideoEncodeH264SessionParametersGetInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 writeStdSPS;
    VkBool32 writeStdPPS;
    uint32_t stdSPSId;
    uint32_t stdPPSId;
} VkVideoEncodeH264SessionParametersGetInfoEXT;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **writeStdSPS** indicates whether the encoded H.264 sequence parameter set identified by stdSPSId is requested to be retrieved.
- **writeStdPPS** indicates whether the encoded H.264 picture parameter set identified by the pair constructed from stdSPSId and stdPPSId is requested to be retrieved.
• stdSPSId specifies the H.264 sequence parameter set ID used to identify the retrieved H.264 sequence and/or picture parameter set(s).

• stdPPSId specifies the H.264 picture parameter set ID used to identify the retrieved H.264 picture parameter set when writeStdPPS is set to VK_TRUE.

When this structure is specified in the pNext chain of the VkVideoEncodeSessionParametersGetInfoKHR structure passed to vkGetEncodedVideoSessionParametersKHR, the command will write encoded parameter data to the output buffer in the following order:

1. The H.264 sequence parameter set identified by stdSPSId, if writeStdSPS is set to VK_TRUE.
2. The H.264 picture parameter set identified by the pair constructed from stdSPSId and stdPPSId, if writeStdPPS is set to VK_TRUE.

Valid Usage (Implicit)

• VUID-VkVideoEncodeH264SessionParametersGetInfoEXT-sType-sType sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_SESSION_PARAMETERS_GET_INFO_EXT

The VkVideoEncodeH264SessionParametersFeedbackInfoEXT structure is defined as:

```c
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264SessionParametersFeedbackInfoEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 hasStdSPSOversrides;
    VkBool32 hasStdPPSOversrides;
} VkVideoEncodeH264SessionParametersFeedbackInfoEXT;
```

• sType is a VkStructureType value identifying this structure.

• pNext is NULL or a pointer to a structure extending this structure.

• hasStdSPSOversrides indicates whether any of the parameters of the requested H.264 sequence parameter set, if one was requested via VkVideoEncodeH264SessionParametersGetInfoEXT ::writeStdSPS, were overridden by the implementation.

• hasStdPPSOversrides indicates whether any of the parameters of the requested H.264 picture parameter set, if one was requested via VkVideoEncodeH264SessionParametersGetInfoEXT ::writeStdPPS, were overridden by the implementation.

Valid Usage (Implicit)

• VUID-VkVideoEncodeH264SessionParametersFeedbackInfoEXT-sType-sType sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_SESSION_PARAMETERS_FEEDBACK_INFO_EXT
42.14.6. Frame Encoding

In order to encode a frame, add a `VkVideoEncodeH264PictureInfoEXT` structure to the `pNext` chain of the `VkVideoEncodeInfoKHR` structure passed to the `vkCmdEncodeVideoKHR` command.

The `VkVideoEncodeH264PictureInfoEXT` structure representing a frame encode operation is defined as:

```
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264PictureInfoEXT {
    VkStructureType sType; // Type of the structure
    const void*pNext; // Pointer to a structure extending this structure
    uint32_t naluSliceEntryCount; // Number of slice NALUs in the frame
    const VkVideoEncodeH264NaluSliceInfoEXT* pNaluSliceEntries; // Pointer to an array of NALUs
    const StdVideoEncodeH264PictureInfo* pStdPictureInfo; // Pointer to a structure specifying codec-specific information
    VkBool32 generatePrefixNalu; // Whether to generate prefix NALUs
} VkVideoEncodeH264PictureInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `naluSliceEntryCount` is the number of slice NALUs in the frame.
- `pNaluSliceEntries` is a pointer to an array of `VkVideoEncodeH264NaluSliceInfoEXT` structures specifying the division of the current picture into slices and the properties of these slices. This is an ordered sequence; the NALUs are generated consecutively in `VkVideoEncodeInfoKHR::dstBuffer` in the same order as in this array.
- `pStdPictureInfo` is a pointer to a `StdVideoEncodeH264PictureInfo` structure specifying the syntax and other codec-specific information from the H.264 specification associated with this picture. The information provided must reflect the decoded picture marking operations that are applicable to this frame.
- `generatePrefixNalu` controls whether prefix NALUs are generated before slice NALUs into the target bitstream.

**Valid Usage (Implicit)**

- `VUID-VkVideoEncodeH264PictureInfoEXT-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_PICTURE_INFO_EXT`

- `VUID-VkVideoEncodeH264PictureInfoEXT-pNaluSliceEntries-parameter`  
  `pNaluSliceEntries` must be a valid pointer to an array of valid `VkVideoEncodeH264NaluSliceInfoEXT` structures

- `VUID-VkVideoEncodeH264PictureInfoEXT-pStdPictureInfo-parameter`  
  `pStdPictureInfo` must be a valid pointer to a valid `StdVideoEncodeH264PictureInfo` value

- `VUID-VkVideoEncodeH264PictureInfoEXT-naluSliceEntryCount-arraylength`  
  `naluSliceEntryCount` must be greater than 0

3327
The **VkVideoEncodeH264NaluSliceInfoEXT** structure representing a slice is defined as:

```c
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264NaluSliceInfoEXT {
    VkStructureType sType;
    const void* pNext;
    int32_t constantQp;
    const StdVideoEncodeH264SliceHeader* pStdSliceHeader;
} VkVideoEncodeH264NaluSliceInfoEXT;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **constantQp** is the QP to use for the slice if the current rate control mode configured for the video session is **VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR**.
- **pStdSliceHeader** is a pointer to a **StdVideoEncodeH264SliceHeader** structure specifying the slice header for the current slice.

### Valid Usage (Implicit)

- VUID-VkVideoEncodeH264NaluSliceInfoEXT-sType-sType
  - **sType** must be **VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_NALU_SLICE_INFO_EXT**
- VUID-VkVideoEncodeH264NaluSliceInfoEXT-pNext-pNext
  - **pNext** must be **NULL**
- VUID-VkVideoEncodeH264NaluSliceInfoEXT-pStdSliceHeader-parameter
  - **pStdSliceHeader** must be a valid pointer to a valid **StdVideoEncodeH264SliceHeader** value

The **VkVideoEncodeH264DpbSlotInfoEXT** structure, representing a reconstructed picture that is being used as a reference picture, is defined as:

```c
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264DpbSlotInfoEXT {
    VkStructureType sType;
    const void* pNext;
    const StdVideoEncodeH264ReferenceInfo* pStdReferenceInfo;
} VkVideoEncodeH264DpbSlotInfoEXT;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **pStdReferenceInfo** is a pointer to a **StdVideoEncodeH264ReferenceInfo** structure specifying the syntax and other codec-specific information from the H.264 specification associated with this reference picture.
42.14.7. Rate control

The `VkVideoEncodeH264RateControlInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264RateControlInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkVideoEncodeH264RateControlFlagsEXT flags;
    uint32_t gopFrameCount;
    uint32_t idrPeriod;
    uint32_t consecutiveBFrameCount;
    uint32_t temporalLayerCount;
} VkVideoEncodeH264RateControlInfoEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is a bitmask of `VkVideoEncodeH264RateControlFlagBitsEXT` specifying H.264 rate control flags.
- **gopFrameCount** is the number of frames contained within the group of pictures (GOP), starting from an intra frame and until the next intra frame. If it is set to 0, the implementation chooses a suitable value. If it is set to `UINT32_MAX`, the GOP length is treated as infinite.
- **idrPeriod** is the interval, in terms of number of frames, between two IDR frames. If it is set to 0, the implementation chooses a suitable value. If it is set to `UINT32_MAX`, the IDR period is treated as infinite.
- **consecutiveBFrameCount** is the number of consecutive B-frames between I- and/or P-frames within the GOP.
- **temporalLayerCount** specifies the number of temporal layers enabled in the stream.

In order to provide H.264-specific stream rate control parameters, add a `VkVideoEncodeH264RateControlInfoEXT` structure to the `pNext` chain of the `VkVideoEncodeRateControlInfoKHR` structure in the `pNext` chain of the `VkVideoCodingControlInfoKHR` structure passed to the `vkCmdControlVideoCodingKHR` command.

The parameters from this structure act as a guidance for implementations to apply various rate control heuristics.
It is possible to infer the picture type to be used when encoding a frame, on the basis of the values provided for `consecutiveBFrameCount`, `idrPeriod`, and `gopFrameCount`, but this inferred picture type will not be used by implementations to override the picture type provided in `vkCmdEncodeVideoKHR`. Additionally, it is not required for the video session to be reset if the inferred picture type does not match the actual picture type.

**Valid Usage (Implicit)**

- VUID-VkVideoEncodeH264RateControlInfoEXT-sType-sType
  
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_RATE_CONTROL_INFO_EXT`

- VUID-VkVideoEncodeH264RateControlInfoEXT-flags-parameter
  
  `flags` **must** be a valid combination of `VkVideoEncodeH264RateControlFlagBitsEXT` values

Bits which **can** be set in `VkVideoEncodeH264RateControlInfoEXT::flags`, specifying H.264 rate control flags, are:

```c
// Provided by VK_EXT_video_encode_h264
typedef enum VkVideoEncodeH264RateControlFlagBitsEXT {
    VK_VIDEO_ENCODE_H264_RATE_CONTROL_ATTEMPT_HRD_COMPLIANCE_BIT_EXT = 0x00000001,
    VK_VIDEO_ENCODE_H264_RATE_CONTROL_REGULAR_GOP_BIT_EXT = 0x00000002,
    VK_VIDEO_ENCODE_H264_RATE_CONTROL_REFERENCE_PATTERN_FLAT_BIT_EXT = 0x00000004,
    VK_VIDEO_ENCODE_H264_RATE_CONTROL_REFERENCE_PATTERN_DYADIC_BIT_EXT = 0x00000008,
    VK_VIDEO_ENCODE_H264_RATE_CONTROL_TEMPORAL_LAYER_PATTERN_DYADIC_BIT_EXT = 0x00000010,
} VkVideoEncodeH264RateControlFlagBitsEXT;
```

- `VK_VIDEO_ENCODE_H264_RATE_CONTROL_ATTEMPT_HRD_COMPLIANCE_BIT_EXT` specifies that rate control **should** attempt to produce an HRD compliant bitstream.

- `VK_VIDEO_ENCODE_H264_RATE_CONTROL_REGULAR_GOP_BIT_EXT` specifies that the application intends to use a regular GOP structure according to the parameters specified in the `gopFrameCount`, `idrPeriod`, and `consecutiveBFrameCount` members of the `VkVideoEncodeH264RateControlInfoEXT` structure.

- `VK_VIDEO.Encode_H264_RATE_CONTROL_REFERENCE_PATTERN_FLAT_BIT_EXT` specifies that the application intends to follow a flat reference pattern.

- `VK_VIDEO.Encode_H264_RATE_CONTROL_REFERENCE_PATTERN_DYADIC_BIT_EXT` specifies that the application intends to follow a dyadic reference pattern.

- `VK_VIDEO.Encode_H264_RATE_CONTROL_TEMPORAL_LAYER_PATTERN_DYADIC_BIT_EXT` specifies that the application intends to follow a dyadic temporal layer pattern.

```c
// Provided by VK_EXT_video_encode_h264
typedef VkFlags VkVideoEncodeH264RateControlFlagsEXT;
```

`VkVideoEncodeH264RateControlFlagsEXT` is a bitmask type for setting a mask of zero or more `VkVideoEncodeH264RateControlFlagBitsEXT`. 
The `VkVideoEncodeH264RateControlLayerInfoEXT` structure is defined as:

```c
typedef struct VkVideoEncodeH264RateControlLayerInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 useMinQp;
    VkVideoEncodeH264QpEXT minQp;
    VkBool32 useMaxQp;
    VkVideoEncodeH264QpEXT maxQp;
    VkBool32 useMaxFrameSize;
    VkVideoEncodeH264FrameSizeEXT maxFrameSize;
} VkVideoEncodeH264RateControlLayerInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `useMinQp` indicates whether the values within `minQp` should be used by the implementation. When it is set to `VK_FALSE`, the implementation ignores the values in `minQp` and chooses suitable values.
- `minQp` provides the lower bound on the QP values for each picture type, to be used in rate control calculations.
- `useMaxQp` indicates whether the values within `maxQp` should be used by the implementation. When it is set to `VK_FALSE`, the implementation ignores the values in `maxQp` and chooses suitable values.
- `maxQp` provides the upper bound on the QP values for each picture type, to be used in rate control calculations.
- `useMaxFrameSize` indicates whether the values within `maxFrameSize` should be used by the implementation.
- `maxFrameSize` provides the upper bound on the encoded frame size for each picture type. The implementation does not guarantee the encoded frame sizes will be within the specified limits, however these limits may be used as a guide in rate control calculations. If enabled and not set properly, the `maxQp` limit may prevent the implementation from respecting the `maxFrameSize` limit.

H.264-specific per-layer rate control parameters must be specified by adding a `VkVideoEncodeH264RateControlLayerInfoEXT` structure to the `pNext` chain of each `VkVideoEncodeRateControlLayerInfoKHR` structure in a call to `vkCmdControlVideoCodingKHR` command, when the command buffer context has an active video encode H.264 session.

**Valid Usage (Implicit)**

- `VUID-VkVideoEncodeH264RateControlLayerInfoEXT-sType-sType` `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_RATE_CONTROL_LAYER_INFO_EXT`
- `VUID-VkVideoEncodeH264RateControlLayerInfoEXT-minQp-parameter`
\texttt{minQp} must be a valid \texttt{VkVideoEncodeH264QpEXT} structure

- VUID-VkVideoEncodeH264RateControlLayerInfoEXT-maxQp-parameter
  \texttt{maxQp} must be a valid \texttt{VkVideoEncodeH264QpEXT} structure
- VUID-VkVideoEncodeH264RateControlLayerInfoEXT-maxFrameSize-parameter
  \texttt{maxFrameSize} must be a valid \texttt{VkVideoEncodeH264FrameSizeEXT} structure

The \texttt{VkVideoEncodeH264QpEXT} structure is defined as:

\begin{verbatim}
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264QpEXT {
    int32_t qpI;
    int32_t qpP;
    int32_t qpB;
} VkVideoEncodeH264QpEXT;
\end{verbatim}

- \texttt{qpI} is the QP to be used for I-frames.
- \texttt{qpP} is the QP to be used for P-frames.
- \texttt{qpB} is the QP to be used for B-frames.

The \texttt{VkVideoEncodeH264FrameSizeEXT} structure is defined as:

\begin{verbatim}
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264FrameSizeEXT {
    uint32_t frameISize;
    uint32_t framePSize;
    uint32_t frameBSize;
} VkVideoEncodeH264FrameSizeEXT;
\end{verbatim}

- \texttt{frameISize} is the size in bytes to be used for I-frames.
- \texttt{framePSize} is the size in bytes to be used for P-frames.
- \texttt{frameBSize} is the size in bytes to be used for B-frames.

The \texttt{VkVideoEncodeH264GopRemainingFrameInfoEXT} structure is defined as:

\begin{verbatim}
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264GopRemainingFrameInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 useGopRemainingFrames;
    uint32_t gopRemainingI;
    uint32_t gopRemainingP;
    uint32_t gopRemainingB;
} VkVideoEncodeH264GopRemainingFrameInfoEXT;
\end{verbatim}
- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **useGopRemainingFrames** indicates whether the implementation's rate control algorithm should use the values specified in `gopRemainingI`, `gopRemainingP`, and `gopRemainingB`. If `useGopRemainingFrames` is `VK_FALSE`, then the values of `gopRemainingI`, `gopRemainingP`, and `gopRemainingB` are ignored.

  - **gopRemainingI** specifies the number of I-frames the implementation's rate control algorithm should assume to be remaining in the GOP prior to executing the video encode operation.
  - **gopRemainingP** specifies the number of P-frames the implementation's rate control algorithm should assume to be remaining in the GOP prior to executing the video encode operation.
  - **gopRemainingB** specifies the number of B-frames the implementation's rate control algorithm should assume to be remaining in the GOP prior to executing the video encode operation.

Setting `useGopRemainingFrames` to `VK_TRUE` and including this structure in the `pNext` chain of `VkVideoEncodeInfoKHR` is only mandatory if the `VkVideoEncodeH264CapabilitiesEXT::requiresGopRemainingFrames` reported for the used video profile is `VK_TRUE`. However, implementations may use these remaining frame counts, when specified, even when it is not required. In particular, when the application does not use a regular GOP structure, these values may provide additional guidance for the implementation's rate control algorithm.

The `VkVideoEncodeH264CapabilitiesEXT::prefersGopRemainingFrames` capability is also used to indicate that the implementation's rate control algorithm may operate more accurately if the application specifies the remaining frame counts using this structure.

As with other rate control guidance values, if the effective order and number of frames encoded by the application are not in line with the remaining frame counts specified in this structure at any given point, then the behavior of the implementation's rate control algorithm may deviate from the one expected by the application.

### Valid Usage (Implicit)

- VUID-VkVideoEncodeH264GopRemainingFrameInfoEXT-sType-sType  
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_GOP_REMAINING_FRAME_INFO_EXT`

### 42.15. Encode H.265

The `VK_EXT_video_encode_h265` extension adds H.265 codec-specific structures/types needed to support H.265 video encoding. Unless otherwise noted, all references to the H.265 specification are to the 2013 edition published by the ITU-T, dated April 2013. This specification is available at [https://www.itu.int/rec/T-REC-H.265](https://www.itu.int/rec/T-REC-H.265).

#### Note

Refer to the Preamble for information on how the Khronos Intellectual Property Rights Policy relates to normative references to external materials not created by Khronos.
42.15.1. H.265 encode profile

An H.265 encode profile is specified by including the VkVideoEncodeH265ProfileInfoEXT structure in the pNext chain of the VkVideoProfileInfoKHR structure when VkVideoProfileInfoKHR::videoCodecOperation is VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_EXT.

The VkVideoEncodeH265ProfileInfoEXT structure is defined as:

```c
typedef struct VkVideoEncodeH265ProfileInfoEXT {
    VkStructureType sType;
    const void* pNext;
    StdVideoH265ProfileIdc stdProfileIdc;
} VkVideoEncodeH265ProfileInfoEXT;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **stdProfileIdc** is a StdVideoH265ProfileIdc value specifying the H.265 codec profile IDC.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH265ProfileInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_PROFILE_INFO_EXT

42.15.2. Capabilities

When calling vkGetPhysicalDeviceVideoCapabilitiesKHR with pVideoProfile->videoCodecOperation specified as VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_EXT, the VkVideoEncodeH265CapabilitiesEXT structure must be included in the pNext chain of the VkVideoCapabilitiesKHR structure to retrieve more capabilities specific to H.265 video encoding.

The VkVideoEncodeH265CapabilitiesEXT structure is defined as:

```c
typedef struct VkVideoEncodeH265CapabilitiesEXT {
    VkStructureType sType;
    void* pNext;
    VkVideoEncodeH265CapabilityFlagsEXT flags;
    StdVideoH265LevelIdc maxLevelIdc;
    uint32_t maxSliceSegmentCount;
    VkExtent2D maxTiles;
    VkVideoEncodeH265CtbSizeFlagsEXT ctbSizes;
    VkVideoEncodeH265TransformBlockSizeFlagsEXT transformBlockSizes;
    uint32_t maxPPictureL0ReferenceCount;
    uint32_t maxBPictureL0ReferenceCount;
    uint32_t maxL1ReferenceCount;
    uint32_t maxSubLayerCount;
} VkVideoEncodeH265CapabilitiesEXT;
```
VkBool32
expectDyadicTemporalSubLayerPattern;

int32_t
minQp;

int32_t
maxQp;

VkBool32
prefersGopRemainingFrames;

VkBool32
requiresGopRemainingFrames;

VkVideoEncodeH265StdFlagsEXT
stdSyntaxFlags;

• **sType** is a *VkStructureType* value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **flags** is a bitmask of *VkVideoEncodeH265CapabilityFlagBitsEXT* indicating supported H.265 encoding capabilities.
• **maxLevelIdc** is a *StdVideoH265LevelIdc* value indicating the maximum H.265 level supported.
• **maxSliceSegmentCount** indicates the maximum number of slice segments that *can* be encoded for a single picture. Further restrictions *may* apply to the number of slice segments that *can* be encoded for a single picture depending on other capabilities and codec-specific rules.
• **maxTiles** indicates the maximum number of H.265 tile columns and rows that *can* be encoded for a single picture. Further restrictions *may* apply to the number of H.265 tiles that *can* be encoded for a single picture depending on other capabilities and codec-specific rules.
• **ctbSizes** is a bitmask of *VkVideoEncodeH265CtbSizeFlagBitsEXT* describing the supported CTB sizes.
• **transformBlockSizes** is a bitmask of *VkVideoEncodeH265TransformBlockSizeFlagBitsEXT* describing the supported transform block sizes.
• **maxPPictureL0ReferenceCount** indicates the maximum number of reference pictures the implementation supports in the reference list L0 for P pictures.
• **maxBPictureL0ReferenceCount** indicates the maximum number of reference pictures the implementation supports in the reference list L0 for B pictures. The reported value is 0 if encoding of B pictures is not supported.
• **maxL1ReferenceCount** indicates the maximum number of reference pictures the implementation supports in the reference list L1 if encoding of B pictures is supported. The reported value is 0 if encoding of B pictures is not supported.
• **maxSubLayerCount** indicates the maximum number of H.265 sub-layers supported by the implementation.
• **expectDyadicTemporalSubLayerPattern** indicates that the implementation’s rate control algorithms expect the application to use a dyadic temporal sub-layer pattern when encoding multiple temporal sub-layers.
• **minQp** indicates the minimum QP value supported.
• **maxQp** indicates the maximum QP value supported.
• **prefersGopRemainingFrames** indicates that the implementation’s rate control algorithm prefers the application to specify the number of frames of each type remaining in the current group of pictures.
• `requiresGopRemainingFrames` indicates that the implementation's rate control algorithm requires the application to specify the number of frames of each type remaining in the current group of pictures.

• `stdSyntaxFlags` is a bitmask of `VkVideoEncodeH265StdFlagBitsEXT` indicating capabilities related to H.265 syntax elements.

---

**Valid Usage (Implicit)**

- VUID-VkVideoEncodeH265CapabilitiesEXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_CAPABILITIES_EXT`

---

Bits which may be set in `VkVideoEncodeH265CapabilitiesEXT::flags` indicating the supported H.265 encoding capabilities, are:

```c
// Provided by VK_EXT_video_encode_h265
typedef enum VkVideoEncodeH265CapabilityFlagBitsEXT {
    VK_VIDEO_ENCODE_H265_CAPABILITY_HRD_COMPLIANCE_BIT_EXT = 0x00000001,
    VK_VIDEO_ENCODE_H265_CAPABILITY_PREDICTION_WEIGHT_TABLE_GENERATED_BIT_EXT = 0x00000002,
    VK_VIDEO_ENCODE_H265_CAPABILITY_ROW_UNALIGNED_SLICE_SEGMENT_BIT_EXT = 0x00000004,
    VK_VIDEO_ENCODE_H265_CAPABILITY_DIFFERENT_SLICE_SEGMENT_TYPE_BIT_EXT = 0x00000008,
    VK_VIDEO_ENCODE_H265_CAPABILITY_B_FRAME_IN_L0_LIST_BIT_EXT = 0x00000010,
    VK_VIDEO_ENCODE_H265_CAPABILITY_B_FRAME_IN_L1_LIST_BIT_EXT = 0x00000020,
    VK_VIDEO_ENCODE_H265_CAPABILITY_PER_PICTURE_TYPE_MIN_MAX_QP_BIT_EXT = 0x00000040,
    VK_VIDEO_ENCODE_H265_CAPABILITY_PER_SLICE_SEGMENT_CONSTANT_QP_BIT_EXT = 0x00000080,
    VK_VIDEO_ENCODE_H265_CAPABILITY_MULTIPLE_TILES_PER_SLICE_SEGMENT_BIT_EXT = 0x00000100,
    VK_VIDEO_ENCODE_H265_CAPABILITY_MULTIPLE_SLICE_SEGMENTS_PER_TILE_BIT_EXT = 0x00000200,
} VkVideoEncodeH265CapabilityFlagBitsEXT;
```

- `VK_VIDEO_ENCODE_H265_CAPABILITY_HRD_COMPLIANCE_BIT_EXT` indicates if the implementation guarantees generating a HRD compliant bitstream if `nal_hrd_parameters_present_flag`, `vcl_hrd_parameters_present_flag`, or `sub_pic_hrd_params_present_flag` are enabled in `StdVideoH265HrdFlags`, or `vui_hrd_parameters_present_flag` is enabled in `StdVideoH265SpsVuiFlags`.

- `VK_VIDEO_ENCODE_H265_CAPABILITY_PREDICTION_WEIGHT_TABLE_GENERATED_BIT_EXT` indicates that when `weighted_pred_flag` or `weighted_bipred_flag` in `StdVideoH265PpsFlags` are enabled, the implementation is able to internally decide syntax for `pred_weight_table`.

- `VK_VIDEO_ENCODE_H265_CAPABILITY_ROW_UNALIGNED_SLICE_SEGMENT_BIT_EXT` indicates that each slice segment in a frame with a single or multiple tiles per slice may begin or finish at any offset in a CTB row. If not supported, all slice segments in such a frame must begin at the start of a CTB row (and hence each slice segment must finish at the end of a CTB row). Also indicates that each slice segment in a frame with multiple slices per tile may begin or finish at any offset within the enclosing tile’s CTB row. If not supported, slice segments in such a frame must begin at the start of the enclosing tile’s CTB row (and hence each slice segment must finish at the end of the...
• **VK_VIDEO_ENCODE_H265_CAPABILITY_DIFFERENT_SLICE_SEGMENT_TYPE_BIT_EXT** indicates that when a frame is encoded with multiple slice segments, the implementation allows encoding each slice segment with a different `StdVideoEncodeH265SliceSegmentHeader::slice_type`. If not supported, all slice segments of the frame **must** be encoded with the same `slice_type` which corresponds to the picture type of the frame. For example, all slice segments of a P-frame would be encoded as P-slices.

• **VK_VIDEO_ENCODE_H265_CAPABILITY_B_FRAME_IN_L0_LIST_BIT_EXT** indicates support for using a B frame as L0 reference.

• **VK_VIDEO_ENCODE_H265_CAPABILITY_B_FRAME_IN_L1_LIST_BIT_EXT** indicates support for using a B frame as L1 reference.

• **VK_VIDEO_ENCODE_H265_CAPABILITY_PER_PICTURE_TYPE_MIN_MAX_QP_BIT_EXT** indicates support for specifying different QP values in the members of `VkVideoEncodeH265QpEXT`.

• **VK_VIDEO_ENCODE_H265_CAPABILITY_PER_SLICE_SEGMENT_CONSTANT_QP_BIT_EXT** indicates support for specifying different constant QP values for each slice segment.

• **VK_VIDEO_ENCODE_H265_CAPABILITY_MULTIPLE_TILES_PER_SLICE_SEGMENT_BIT_EXT** indicates if encoding multiple tiles per slice segment is supported. If not set, the implementation is only able to encode a single tile for each slice segment.

• **VK_VIDEO_ENCODE_H265_CAPABILITY_PER_SLICE_SEGMENT_CONSTANT_QP_BIT_EXT** indicates if encoding multiple slice segments per tile is supported. If not set, the implementation is only able to encode a single slice segment for each tile.

```c
// Provided by VK_EXT_video_encode_h265
typedef VkFlags VkVideoEncodeH265CapabilityFlagsEXT;
```

`VkVideoEncodeH265CapabilityFlagsEXT` is a bitmask type for setting a mask of zero or more `VkVideoEncodeH265CapabilityFlagBitsEXT`.

Bits which **may** be set in `VkVideoEncodeH265CapabilitiesEXT::stdSyntaxFlags`, indicating the capabilities related to the H.265 syntax elements, are:

```c
// Provided by VK_EXT_video_encode_h265
typedef enum VkVideoEncodeH265StdFlagBitsEXT {
    VK_VIDEO_ENCODE_H265_STD_SEPARATE_COLOR_PLANE_FLAG_SET_BIT_EXT = 0x00000001,
    VK_VIDEO_ENCODE_H265_STD_SAMPLE_ADAPTIVE_OFFSET_ENABLED_FLAG_SET_BIT_EXT = 0x00000002,
    VK_VIDEO_ENCODE_H265_STD_SCALING_LIST_DATA_PRESENT_FLAG_SET_BIT_EXT = 0x00000004,
    VK_VIDEO_ENCODE_H265_STD_PCM_ENABLED_FLAG_SET_BIT_EXT = 0x00000008,
    VK_VIDEO_ENCODE_H265_STD_SPS_TEMPORAL_MVP_ENABLED_FLAG_SET_BIT_EXT = 0x00000010,

VK_VIDEO_ENCODE_H265_STD_DIFFERENT_SLICE_QP_DELTA_BIT_EXT = 0x00100000,

VkVideoEncodeH265StdFlagBitsEXT;

- VK_VIDEO_ENCODE_H265_STD_SEPARATE_COLOR_PLANE_FLAG_SET_BIT_EXT indicates if enabling separate_colour_plane_flag in StdVideoH265SpsFlags is supported.
- VK_VIDEO_ENCODE_H265_STD_SAMPLE_ADAPTIVE_OFFSET_ENABLED_FLAG_SET_BIT_EXT indicates if enabling sample_adaptive_offset_enabled_flag in StdVideoH265SpsFlags is supported.
- VK_VIDEO_ENCODE_H265_STD_SCALING_LIST_DATA_PRESENT_FLAG_SET_BIT_EXT indicates if enabling scaling_list_enabled_flag and sps_scaling_list_data_present_flag in StdVideoH265SpsFlags, or enabling pps_scaling_list_data_present_flag in StdVideoH265PpsFlags are supported.
- VK_VIDEO_ENCODE_H265_STD_PCM_ENABLED_FLAG_SET_BIT_EXT indicates if enabling pcm_enable_flag in StdVideoH265SpsFlags is supported.
- VK_VIDEO_ENCODE_H265_STD_SPS_TEMPORAL_MVP_ENABLED_FLAG_SET_BIT_EXT indicates if enabling sps_temporal_mvp_enabled_flag in StdVideoH265SpsFlags is supported.
- VK_VIDEO_ENCODE_H265_STD_INIT_QP_MINUS26_BIT_EXT indicates if setting non-zero init_qp_minus26 in StdVideoH265PictureParameterSet is supported.
- VK_VIDEO_ENCODE_H265_STD_WEIGHTED_PRED_FLAG_SET_BIT_EXT indicates if enabling weighted_pred_flag in StdVideoH265PpsFlags is supported.
- VK_VIDEO_ENCODE_H265_STD_WEIGHTED_BIPRED_FLAG_SET_BIT_EXT indicates if enabling weighted_bipred_flag in StdVideoH265PpsFlags is supported.
- VK_VIDEO_ENCODE_H265_STD_LOG2_PARALLEL_MERGE_LEVEL_MINUS2_BIT_EXT indicates if setting non-zero value for log2_parallel_merge_level_minus2 in StdVideoH265PictureParameterSet is supported.
- VK_VIDEO_ENCODE_H265_STD_SIGN_DATA_HIDING_ENABLED_FLAG_SET_BIT_EXT indicates if enabling sign_data_hiding_enabled_flag in StdVideoH265PpsFlags is supported.
- VK_VIDEO_ENCODE_H265_STD_TRANSFORM_SKIP_ENABLED_FLAG_SET_BIT_EXT indicates if enabling transform_skip_enabled_flag in StdVideoH265PpsFlags is supported.
- VK_VIDEO_ENCODE_H265_STD_TRANSFORM_SKIP_ENABLED_FLAG_UNSET_BIT_EXT indicates if disabling transform_skip_enabled_flag in StdVideoH265PpsFlags is supported. Implementations must report at least one of VK_VIDEO_ENCODE_H265_STD_TRANSFORM_SKIP_ENABLED_FLAG_SET_BIT_EXT and VK_VIDEO_ENCODE_H265_STD_TRANSFORM_SKIP_ENABLED_FLAG_UNSET_BIT_EXT as supported.
• **VK_VIDEO_ENCODE_H265_STD_PPS_SLICE_CHROMA_QP_OFFSETS_PRESENT_FLAG_SET_BIT_EXT** indicates if enabling `pps_slice_chroma_qp_offsets_present_flag` in `StdVideoH265PpsFlags` is supported.

• **VK_VIDEO_ENCODE_H265_STD_TRANSQUANT_BYPASS_ENABLED_FLAG_SET_BIT_EXT** indicates if enabling `transquant_bypass_enabled_flag` in `StdVideoH265PpsFlags` is supported.

• **VK_VIDEO_ENCODE_H265_STD_CONstrained_INTRA_PRED_FLAG_SET_BIT_EXT** indicates if enabling `constrained_intra_pred_flag` in `StdVideoH265PpsFlags` is supported.

• **VK_VIDEO_ENCODE_H265_STD_ENTROPY_CODING_SYNC_ENABLED_FLAG_SET_BIT_EXT** indicates if enabling `entropy_coding_sync_enabled_flag` in `StdVideoH265PpsFlags` is supported.

• **VK_VIDEO_ENCODE_H265_STD_DEBLOCKING_FILTER_OVERRIDE_ENABLED_FLAG_SET_BIT_EXT** indicates if enabling `deblocking_filter_override_enabled_flag` in `StdVideoH265PpsFlags` is supported.

• **VK_VIDEO_ENCODE_H265_STD_DEPENDENT_SLICE_SEGMENTS_ENABLED_FLAG_SET_BIT_EXT** indicates if enabling `dependent_slice_segments_enabled_flag` in `StdVideoH265PpsFlags` is supported.

• **VK_VIDEO_ENCODE_H265_STD_DEPENDENT_SLICE_SEGMENT_FLAG_SET_BIT_EXT** indicates if enabling `dependent_slice_segment_flag` in `StdVideoEncodeH265SliceHeaderFlags` is supported.

• **VK_VIDEO_ENCODE_H265_STD_SLICE_QP_DELTA_BIT_EXT** indicates whether the implementation supports using the application-provided value for `StdVideoEncodeH265SliceSegmentHeader::slice_qp_delta` when that value is identical across the slice segments of the encoded frame.

• **VK_VIDEO_ENCODE_H265_STD_DIFFERENT_SLICE_QP_DELTA_BIT_EXT** indicates whether the implementation supports using the application-provided value for `StdVideoEncodeH265SliceSegmentHeader::slice_qp_delta` when that value is different across the slice segments of the encoded frame.

```c
// Provided by VK_EXT_video_encode_h265
typedef VkFlags VkVideoEncodeH265StdFlagsEXT;
```

`VkVideoEncodeH265StdFlagsEXT` is a bitmask type for setting a mask of zero or more `VkVideoEncodeH265StdFlagBitsEXT`.

```c
// Provided by VK_EXT_video_encode_h265
typedef VkFlags VkVideoEncodeH265CtbSizeFlagsEXT;
```

`VkVideoEncodeH265CtbSizeFlagsEXT` is a bitmask type for setting a mask of zero or more `VkVideoEncodeH265CtbSizeFlagBitsEXT`. Implementations **must** set at least one of `VkVideoEncodeH265CtbSizeFlagBitsEXT`.

Bits which **may** be set in `VkVideoEncodeH265CapabilitiesEXT::ctbSizes`, indicating the CTB sizes supported by the implementation, are:

```c
// Provided by VK_EXT_video_encode_h265
typedef enum VkVideoEncodeH265CtbSizeFlagBitsEXT {
    VK_VIDEO_ENCODE_H265_CTB_SIZE_16_BIT_EXT = 0x00000001,
    VK_VIDEO_ENCODE_H265_CTB_SIZE_32_BIT_EXT = 0x00000002,
    VK_VIDEO_ENCODE_H265_CTB_SIZE_64_BIT_EXT = 0x00000004,
};
```
VK_VIDEO_ENCODE_H265_CTB_SIZE_16_BIT_EXT specifies that a CTB size of 16x16 is supported.

VK_VIDEO_ENCODE_H265_CTB_SIZE_32_BIT_EXT specifies that a CTB size of 32x32 is supported.

VK_VIDEO_ENCODE_H265_CTB_SIZE_64_BIT_EXT specifies that a CTB size of 64x64 is supported.

// Provided by VK_EXT_video_encode_h265
typedef VkFlags VkVideoEncodeH265TransformBlockSizeFlagsEXT;

VkVideoEncodeH265TransformBlockSizeFlagsEXT is a bitmask type for setting a mask of zero or more VkVideoEncodeH265TransformBlockSizeFlagBitsEXT. Implementations must set at least one of VkVideoEncodeH265TransformBlockSizeFlagBitsEXT.

Bits which may be set in VkVideoEncodeH265CapabilitiesEXT::transformBlockSizes, indicating the transform block sizes supported by the implementation, are:

// Provided by VK_EXT_video_encode_h265
typedef enum VkVideoEncodeH265TransformBlockSizeFlagBitsEXT {
    VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_4_BIT_EXT = 0x00000001,
    VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_8_BIT_EXT = 0x00000002,
    VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_16_BIT_EXT = 0x00000004,
    VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_32_BIT_EXT = 0x00000008,
} VkVideoEncodeH265TransformBlockSizeFlagBitsEXT;

- VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_4_BIT_EXT specifies that a transform block size of 4x4 is supported.
- VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_8_BIT_EXT specifies that a transform block size of 8x8 is supported.
- VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_16_BIT_EXT specifies that a transform block size of 16x16 is supported.
- VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_32_BIT_EXT specifies that a transform block size of 32x32 is supported.

42.15.3. H.265 Encode Quality Level Properties

When calling vkGetPhysicalDeviceVideoEncodeQualityLevelPropertiesKHR with pVideoProfile->videoCodecOperation specified as VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_EXT, the VkVideoEncodeH265QualityLevelPropertiesEXT structure can be included in the pNext chain of the VkVideoEncodeQualityLevelPropertiesKHR structure to retrieve additional video encode quality level properties specific to H.265 encoding.

The VkVideoEncodeH265QualityLevelPropertiesEXT structure is defined as:

// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265QualityLevelPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    VkVideoEncodeH265RateControlFlagsEXT preferredRateControlFlags;
    uint32_t preferredGopFrameCount;
    uint32_t preferredIdrPeriod;
    uint32_t preferredConsecutiveBFrameCount;
    VkVideoEncodeH265QpEXT preferredSubLayerCount;
    uint32_t preferredConstantQp;
    uint32_t preferredMaxL0ReferenceCount;
    uint32_t preferredMaxL1ReferenceCount;
} VkVideoEncodeH265QualityLevelPropertiesEXT;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• preferredRateControlFlags is a bitmask of VkVideoEncodeH265RateControlFlagBitsEXT values indicating the preferred flags to use for VkVideoEncodeH265RateControlInfoEXT::flags.
• preferredGopFrameCount indicates the preferred value to use for VkVideoEncodeH265RateControlInfoEXT::gopFrameCount.
• preferredIdrPeriod indicates the preferred value to use for VkVideoEncodeH265RateControlInfoEXT::idrPeriod.
• preferredConsecutiveBFrameCount indicates the preferred value to use for VkVideoEncodeH265RateControlInfoEXT::consecutiveBFrameCount.
• preferredSubLayerCount indicates the preferred value to use for VkVideoEncodeH265RateControlInfoEXT::subLayerCount.
• preferredConstantQp indicates the preferred values to use for VkVideoEncodeH265NaluSliceSegmentInfoEXT::constantQp for each picture type when using rate control mode VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR.
• preferredMaxL0ReferenceCount indicates the preferred maximum number of reference pictures to use in the reference list L0.
• preferredMaxL1ReferenceCount indicates the preferred maximum number of reference pictures to use in the reference list L1.

Valid Usage (Implicit)

• VUID-VkVideoEncodeH265QualityLevelPropertiesEXT-sType-sType sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_QUALITY_LEVEL_PROPERTIES_EXT

42.15.4. H.265 Encode Session

Additional parameters can be specified when creating a video session with an H.265 encode profile by including an instance of the VkVideoEncodeH265SessionCreateInfoEXT structure in the pNext chain of VkVideoSessionCreateInfoKHR.
The `VkVideoEncodeH265SessionCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265SessionCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 useMaxLevelIdc;
    StdVideoH265LevelIdc maxLevelIdc;
} VkVideoEncodeH265SessionCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `useMaxLevelIdc` indicates whether the value of `maxLevelIdc` should be used by the implementation. When it is set to `VK_FALSE`, the implementation ignores the value of `maxLevelIdc` and uses the value of `VkVideoEncodeH265CapabilitiesEXT::maxLevelIdc`, as reported by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile.
- `maxLevelIdc` provides the upper bound on the H.265 level for the video bitstreams produced by the created video session.

### Valid Usage (Implicit)

- VUID-VkVideoEncodeH265SessionCreateInfoEXT-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_SESSION_CREATE_INFO_EXT`

#### 42.15.5. Encoder H.265 Video Session Parameters Object

When creating a Video Session Parameters object, add a `VkVideoEncodeH265SessionParametersCreateInfoEXT` structure to the `pNext` chain of the `VkVideoSessionParametersCreateInfoKHR` structure passed to `vkCreateVideoSessionParametersKHR` in order to specify the H.265-specific video encoder session parameters.

The `VkVideoEncodeH265SessionParametersCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265SessionParametersCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t maxStdVPSCount;
    uint32_t maxStdSPSCount;
    uint32_t maxStdPPSCount;
    const VkVideoEncodeH265SessionParametersAddInfoEXT* pParametersAddInfo;
} VkVideoEncodeH265SessionParametersCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
• \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.

• \texttt{maxStdVPSCount} is the maximum number of entries of type \texttt{StdVideoH265VideoParameterSet} within \texttt{VkVideoSessionParametersKHR}.

• \texttt{maxStdSPSCount} is the maximum number of entries of type \texttt{StdVideoH265SequenceParameterSet} within \texttt{VkVideoSessionParametersKHR}.

• \texttt{maxStdPPSCount} is the maximum number of entries of type \texttt{StdVideoH265PictureParameterSet} within \texttt{VkVideoSessionParametersKHR}.

• \texttt{pParametersAddInfo} is \texttt{NULL} or a pointer to a \texttt{VkVideoEncodeH265SessionParametersAddInfoEXT} structure specifying the video session parameters to add upon creation of this object.

When a \texttt{VkVideoSessionParametersKHR} object contains \texttt{maxStdVPSCount} \texttt{StdVideoH265VideoParameterSet} entries, no additional \texttt{StdVideoH265VideoParameterSet} entries can be added to it, and \texttt{VK_ERROR_TOO_MANY_OBJECTS} will be returned if an attempt is made to add these entries. When a \texttt{VkVideoSessionParametersKHR} object contains \texttt{maxStdSPSCount} \texttt{StdVideoH265SequenceParameterSet} entries, no additional \texttt{StdVideoH265SequenceParameterSet} entries can be added to it, and \texttt{VK_ERROR_TOO_MANY_OBJECTS} will be returned if an attempt is made to add these entries. When a \texttt{VkVideoSessionParametersKHR} object contains \texttt{maxStdPPSCount} \texttt{StdVideoH265PictureParameterSet} entries, no additional \texttt{StdVideoH265PictureParameterSet} entries can be added to it, and \texttt{VK_ERROR_TOO_MANY_OBJECTS} will be returned if an attempt is made to add these entries.

**Valid Usage (Implicit)**

• VUID-VkVideoEncodeH265SessionParametersCreateInfoEXT-sType-sType \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_SESSION_PARAMETERS_CREATE_INFO_EXT}

• VUID-VkVideoEncodeH265SessionParametersCreateInfoEXT-pParametersAddInfo-parameter If \texttt{pParametersAddInfo} is not \texttt{NULL}, \texttt{pParametersAddInfo} must be a valid pointer to a valid \texttt{VkVideoEncodeH265SessionParametersAddInfoEXT} structure

The \texttt{VkVideoEncodeH265SessionParametersAddInfoEXT} structure is defined as:

```c
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265SessionParametersAddInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t stdVPSCount;
    const StdVideoH265VideoParameterSet* pStdVPSs;
    uint32_t stdSPSCount;
    const StdVideoH265SequenceParameterSet* pStdSPSs;
    uint32_t stdPPSCount;
    const StdVideoH265PictureParameterSet* pStdPPSs;
} VkVideoEncodeH265SessionParametersAddInfoEXT;
```

• \texttt{sType} is a \texttt{VkStructureType} value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.

• stdVPSCount is the number of VPS elements in pStdVPSs.

• pStdVPSs is a pointer to an array of stdVPSCount StdVideoH265VideoParameterSet structures representing H.265 video parameter sets.

• stdSPSCount is the number of SPS elements in pStdSPSs.

• pStdSPSs is a pointer to an array of stdSPSCount StdVideoH265SequenceParameterSet structures representing H.265 sequence parameter sets.

• stdPPSCount is the number of PPS elements in pStdPPSs.

• pStdPPSs is a pointer to an array of stdPPSCount StdVideoH265PictureParameterSet structures representing H.265 picture parameter sets.

---

**Valid Usage (Implicit)**

- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_SESSION_PARAMETERS_ADD_INFO_EXT

- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-pStdVPSs-parameter
  If stdVPSCount is not 0, and pStdVPSs is not NULL, pStdVPSs must be a valid pointer to an array of stdVPSCount StdVideoH265VideoParameterSet values

- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-pStdSPSs-parameter
  If stdSPSCount is not 0, and pStdSPSs is not NULL, pStdSPSs must be a valid pointer to an array of stdSPSCount StdVideoH265SequenceParameterSet values

- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-pStdPPSs-parameter
  If stdPPSCount is not 0, and pStdPPSs is not NULL, pStdPPSs must be a valid pointer to an array of stdPPSCount StdVideoH265PictureParameterSet values

---

**Valid Usage**

- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-stdVPSCount-06438
  The values of stdVPSCount, stdSPSCount and stdPPSCount must be less than or equal to the values of VkVideoEncodeH265SessionParametersCreateInfoEXT::maxStdVPSCount, VkVideoEncodeH265SessionParametersCreateInfoEXT::maxStdSPSCount, and VkVideoEncodeH265SessionParametersCreateInfoEXT::maxStdPPSCount, respectively

- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-pStdVPSs-06439
  Each StdVideoH265VideoParameterSet entry in pStdVPSs must have a unique H.265 VPS ID

- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-pStdSPSs-06440
  Each StdVideoH265SequenceParameterSet entry in pStdSPSs must have a unique H.265 VPS-SPS ID pair

- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-pStdPPSs-06441
  Each StdVideoH265PictureParameterSet entry in pStdPPSs must have a unique H.265 VPS-SPS-PPS ID tuple

- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-None-06442
Each entry to be added must have a unique, to the rest of the parameter array entries and the existing parameters in the Video Session Parameters Object that is being updated, VPS-SPS-PPS IDs

- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-None-06443
  Parameter entries that already exist in Video Session Parameters object with a particular VPS-SPS-PPS IDs must not be replaced nor updated

- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-None-06444
  When creating a new object using a Video Session Parameters as a template, the array's parameters with the same VPS-SPS-PPS IDs as the ones from the template take precedence

- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-None-06445
  VPS/SPS/PPS parameters must comply with the limits specified in VkVideoSessionCreateInfoKHR during Video Session creation

The VkVideoEncodeH265SessionParametersGetInfoEXT structure is defined as:

```c
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265SessionParametersGetInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 writeStdVPS;
    VkBool32 writeStdSPS;
    VkBool32 writeStdPPS;
    uint32_t stdVPSId;
    uint32_t stdSPSId;
    uint32_t stdPPSId;
} VkVideoEncodeH265SessionParametersGetInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `writeStdVPS` indicates whether the encoded H.265 video parameter set identified by `stdVPSId` is requested to be retrieved.
- `writeStdSPS` indicates whether the encoded H.265 sequence parameter set identified by the pair constructed from `stdVPSId` and `stdSPSId` is requested to be retrieved.
- `writeStdPPS` indicates whether the encoded H.265 picture parameter set identified by the triplet constructed from `stdVPSId`, `stdSPSId`, and `stdPPSId` is requested to be retrieved.
- `stdVPSId` specifies the H.265 video parameter set ID used to identify the retrieved H.265 video, sequence, and/or picture parameter set(s).
- `stdSPSId` specifies the H.265 sequence parameter set ID used to identify the retrieved H.265 sequence and/or picture parameter set(s) when `writeStdSPS` and/or `writeStdPPS` is set to VK_TRUE.
- `stdPPSId` specifies the H.265 picture parameter set ID used to identify the retrieved H.265 picture parameter set when `writeStdPPS` is set to VK_TRUE.
The `VkVideoEncodeSessionParametersGetInfoKHR` structure passed to `vkGetEncodedVideoSessionParametersKHR`, the command will write encoded parameter data to the output buffer in the following order:

1. The H.265 video parameter set identified by `stdVPSId`, if `writeStdVPS` is set to `VK_TRUE`.
2. The H.265 sequence parameter set identified by the pair constructed from `stdVPSId` and `stdSPSId`, if `writeStdSPS` is set to `VK_TRUE`.
3. The H.265 picture parameter set identified by the triplet constructed from `stdVPSId`, `stdSPSId`, and `stdPPSId`, if `writeStdPPS` is set to `VK_TRUE`.

**Valid Usage (Implicit)**

- VUID-VkVideoEncodeH265SessionParametersGetInfoEXT-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_SESSION_PARAMETERS_GET_INFO_EXT`

The `VkVideoEncodeH265SessionParametersFeedbackInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265SessionParametersFeedbackInfoEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 hasStdVPSOverrides;
    VkBool32 hasStdSPSOverrides;
    VkBool32 hasStdPPSOverrides;
} VkVideoEncodeH265SessionParametersFeedbackInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `hasStdVPSOverrides` indicates whether any of the parameters of the requested H.265 video parameter set, if one was requested via `VkVideoEncodeH265SessionParametersGetInfoEXT::writeStdVPS`, were overridden by the implementation.
- `hasStdSPSOverrides` indicates whether any of the parameters of the requested H.265 sequence parameter set, if one was requested via `VkVideoEncodeH265SessionParametersGetInfoEXT::writeStdSPS`, were overridden by the implementation.
- `hasStdPPSOverrides` indicates whether any of the parameters of the requested H.265 picture parameter set, if one was requested via `VkVideoEncodeH265SessionParametersGetInfoEXT::writeStdPPS`, were overridden by the implementation.

**Valid Usage (Implicit)**

- VUID-VkVideoEncodeH265SessionParametersFeedbackInfoEXT-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_SESSION_PARAMETERS_FEEDBACK_INFO_EXT`
42.15.6. Frame Encoding

In order to encode a frame, add a `VkVideoEncodeH265PictureInfoEXT` structure to the `pNext` chain of the `VkVideoEncodeInfoKHR` structure passed to the `vkCmdEncodeVideoKHR` command.

The `VkVideoEncodeH265PictureInfoEXT` structure representing a frame encode operation is defined as:

```c
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265PictureInfoEXT {
  VkStructureType sType;
  const void* pNext;
  uint32_t naluSliceSegmentEntryCount;
  const VkVideoEncodeH265NaluSliceSegmentInfoEXT* pNaluSliceSegmentEntries;
  const StdVideoEncodeH265PictureInfo* pStdPictureInfo;
} VkVideoEncodeH265PictureInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `naluSliceSegmentEntryCount` is the number of slice segment NALUs in the frame.
- `pNaluSliceSegmentEntries` is a pointer to an array of `VkVideoEncodeH265NaluSliceSegmentInfoEXT` structures specifying the division of the current picture into slice segments and the properties of these slice segments.
- `pStdPictureInfo` is a pointer to a `StdVideoEncodeH265PictureInfo` structure specifying the syntax and other codec-specific information from the H.265 specification, associated with this picture.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH265PictureInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_PICTURE_INFO_EXT`

- VUID-VkVideoEncodeH265PictureInfoEXT-pNaluSliceSegmentEntries-parameter
  `pNaluSliceSegmentEntries` must be a valid pointer to an array of `naluSliceSegmentEntryCount` valid `VkVideoEncodeH265NaluSliceSegmentInfoEXT` structures

- VUID-VkVideoEncodeH265PictureInfoEXT-pStdPictureInfo-parameter
  `pStdPictureInfo` must be a valid pointer to a valid `StdVideoEncodeH265PictureInfo` value

- VUID-VkVideoEncodeH265PictureInfoEXT-naluSliceSegmentEntryCount-arraylength
  `naluSliceSegmentEntryCount` must be greater than 0

The `VkVideoEncodeH265NaluSliceSegmentInfoEXT` structure representing a slice segment is defined as:

```c
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265NaluSliceSegmentInfoEXT {
  ...
} VkVideoEncodeH265NaluSliceSegmentInfoEXT;
```
VkStructureType
  const void *
  int32_t
  const StdVideoEncodeH265SliceSegmentHeader *
} VkVideoEncodeH265NaluSliceSegmentInfoEXT;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **constantQp** is the QP to use for the slice segment if the current rate control mode configured for the video session is `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR`.
- **pStdSliceSegmentHeader** is a pointer to a `StdVideoEncodeH265SliceSegmentHeader` structure specifying the slice segment header for the current slice segment.

**Valid Usage (Implicit)**

- VUID-VkVideoEncodeH265NaluSliceSegmentInfoEXT-sType-sType
  **sType** must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_NALU_SLICE_SEGMENT_INFO_EXT`
- VUID-VkVideoEncodeH265NaluSliceSegmentInfoEXT-pNext-pNext
  **pNext** must be `NULL`
- VUID-VkVideoEncodeH265NaluSliceSegmentInfoEXT-pStdSliceSegmentHeader-parameter
  **pStdSliceSegmentHeader** must be a valid pointer to a valid `StdVideoEncodeH265SliceSegmentHeader` value

The `VkVideoEncodeH265DpbSlotInfoEXT` structure, representing a reconstructed picture that is being used as a reference picture, is defined as:

```c
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265DpbSlotInfoEXT {
    VkStructureType sType;
    const void *pNext;
    const StdVideoEncodeH265ReferenceInfo *pStdReferenceInfo;
} VkVideoEncodeH265DpbSlotInfoEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **pStdReferenceInfo** is a pointer to a `StdVideoEncodeH265ReferenceInfo` structure specifying the syntax and other codec-specific information from the H.265 specification, associated with this reference picture.

**Valid Usage (Implicit)**

- VUID-VkVideoEncodeH265DpbSlotInfoEXT-sType-sType
  **sType** must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_DPB_SLOT_INFO_EXT`
42.15.7. Rate control

The `VkVideoEncodeH265RateControlInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265RateControlInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkVideoEncodeH265RateControlFlagsEXT flags;
    uint32_t gopFrameCount;
    uint32_t idrPeriod;
    uint32_t consecutiveBFrameCount;
    uint32_t subLayerCount;
} VkVideoEncodeH265RateControlInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkVideoEncodeH265RateControlFlagBitsEXT` specifying H.265 rate control flags.
- `gopFrameCount` is the number of frames contained within the group of pictures (GOP), starting from an intra frame and until the next intra frame. If it is set to 0, the implementation chooses a suitable value. If it is set to `UINT32_MAX`, the GOP length is treated as infinite.
- `idrPeriod` is the interval, in terms of number of frames, between two IDR frames. If it is set to 0, the implementation chooses a suitable value. If it is set to `UINT32_MAX`, the IDR period is treated as infinite.
- `consecutiveBFrameCount` is the number of consecutive B-frames between I- and/or P-frames within the GOP.
- `subLayerCount` specifies the number of sub layers enabled in the stream.

In order to provide H.265-specific stream rate control parameters, add a `VkVideoEncodeH265RateControlInfoEXT` structure to the `pNext` chain of the `VkVideoEncodeRateControlInfoKHR` structure in the `pNext` chain of the `VkVideoCodingControlInfoKHR` structure passed to the `vkCmdControlVideoCodingKHR` command.

The parameters from this structure act as a guidance for implementations to apply various rate control heuristics.

It is possible to infer the picture type to be used when encoding a frame, on the basis of the values provided for `consecutiveBFrameCount`, `idrPeriod`, and `gopFrameCount`, but this inferred picture type will not be used by implementations to override the picture type provided in `vkCmdEncodeVideoKHR`. Additionally, it is not required for the video session to be reset if the
Valid Usage (Implicit)

- VUID-VkVideoEncodeH265RateControlInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_RATE_CONTROL_INFO_EXT

- VUID-VkVideoEncodeH265RateControlInfoEXT-flags-parameter
  flags must be a valid combination of VkVideoEncodeH265RateControlFlagBitsEXT values.

Bits which can be set in VkVideoEncodeH265RateControlInfoEXT::flags, specifying H.265 rate control flags, are:

```c
// Provided by VK_EXT_video_encode_h265
typedef enum VkVideoEncodeH265RateControlFlagBitsEXT {
    VK_VIDEO_ENCODE_H265_RATE_CONTROL_ATTEMPT_HRD_COMPLIANCE_BIT_EXT = 0x00000001,
    VK_VIDEO_ENCODE_H265_RATE_CONTROL_REGULAR_GOP_BIT_EXT = 0x00000002,
    VK_VIDEO_ENCODE_H265_RATE_CONTROL_REFERENCE_PATTERN_FLAT_BIT_EXT = 0x00000004,
    VK_VIDEO_ENCODE_H265_RATE_CONTROL_REFERENCE_PATTERN_DYADIC_BIT_EXT = 0x00000008,
    VK_VIDEO_ENCODE_H265_RATE_CONTROL_TEMPORAL_SUB_LAYER_PATTERN_DYADIC_BIT_EXT = 0x00000010,
} VkVideoEncodeH265RateControlFlagBitsEXT;
```

- VK_VIDEO_ENCODE_H265_RATE_CONTROL_ATTEMPT_HRD_COMPLIANCE_BIT_EXT specifies that rate control should attempt to produce an HRD compliant bitstream.
- VK_VIDEO_ENCODE_H265_RATE_CONTROL_REGULAR_GOP_BIT_EXT specifies that the application intends to use a regular GOP structure according to the parameters specified in the gopFrameCount, idrPeriod, and consecutiveBFrameCount members of the VkVideoEncodeH265RateControlInfoEXT structure.
- VK_VIDEO_ENCODE_H265_RATE_CONTROL_REFERENCE_PATTERN_FLAT_BIT_EXT specifies that the application intends to follow a flat reference pattern.
- VK_VIDEO_ENCODE_H265_RATE_CONTROL_REFERENCE_PATTERN_DYADIC_BIT_EXT specifies that the application intends to follow a dyadic reference pattern.
- VK_VIDEO_ENCODE_H265_RATE_CONTROL_TEMPORAL_SUB_LAYER_PATTERN_DYADIC_BIT_EXT specifies that the application intends to follow a dyadic temporal sub-layer pattern.

```c
// Provided by VK_EXT_video_encode_h265
typedef VkFlags VkVideoEncodeH265RateControlFlagsEXT;
```

VkVideoEncodeH265RateControlFlagsEXT is a bitmask type for setting a mask of zero or more VkVideoEncodeH265RateControlFlagBitsEXT.

The VkVideoEncodeH265RateControlLayerInfoEXT structure is defined as:

```c
// Provided by VK_EXT_video_encode_h265
```
typedef struct VkVideoEncodeH265RateControlLayerInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 useMinQp;
    VkVideoEncodeH265QpEXT minQp;
    VkVideoEncodeH265QpEXT useMaxQp;
    VkVideoEncodeH265QpEXT maxQp;
    VkBool32 useMaxFrameSize;
    VkVideoEncodeH265FrameSizeEXT maxFrameSize;
} VkVideoEncodeH265RateControlLayerInfoEXT;

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **useMinQp** indicates whether the values within **minQp** should be used by the implementation. When it is set to *VK_FALSE*, the implementation ignores the values in **minQp** and chooses suitable values.
- **minQp** provides the lower bound on the QP values for each picture type, to be used in rate control calculations.
- **useMaxQp** indicates whether the values within **maxQp** should be used by the implementation. When it is set to *VK_FALSE*, the implementation ignores the values in **maxQp** and chooses suitable values.
- **maxQp** provides the upper bound on the QP values for each picture type, to be used in rate control calculations.
- **useMaxFrameSize** indicates whether the values within **maxFrameSize** should be used by the implementation.
- **maxFrameSize** provides the upper bound on the encoded frame size for each picture type. The implementation does not guarantee the encoded frame sizes will be within the specified limits, however these limits may be used as a guide in rate control calculations. If enabled and not set properly, the **maxQp** limit may prevent the implementation from respecting the **maxFrameSize** limit.

H.265-specific per-layer rate control parameters must be specified by adding a *VkVideoEncodeH265RateControlLayerInfoEXT* structure to the **pNext** chain of each *VkVideoEncodeRateControlLayerInfoKHR* structure in a call to *vkCmdControlVideoCodingKHR* command, when the command buffer context has an active video encode H.265 session.

**Valid Usage (Implicit)**

- VUID-VkVideoEncodeH265RateControlLayerInfoEXT-sType-sType
  - **sType** must be *VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_RATE_CONTROL_LAYER_INFO_EXT*

- VUID-VkVideoEncodeH265RateControlLayerInfoEXT-minQp-parameter
  - **minQp** must be a valid *VkVideoEncodeH265QpEXT* structure

- VUID-VkVideoEncodeH265RateControlLayerInfoEXT-maxQp-parameter
  - **maxQp** must be a valid *VkVideoEncodeH265QpEXT* structure
The `VkVideoEncodeH265QpEXT` structure is defined as:

```c
typedef struct VkVideoEncodeH265QpEXT {
    int32_t qpI;
    int32_t qpP;
    int32_t qpB;
} VkVideoEncodeH265QpEXT;
```

- `qpI` is the QP to be used for I-frames.
- `qpP` is the QP to be used for P-frames.
- `qpB` is the QP to be used for B-frames.

The `VkVideoEncodeH265FrameSizeEXT` structure is defined as:

```c
typedef struct VkVideoEncodeH265FrameSizeEXT {
    uint32_t frameISize;
    uint32_t framePSize;
    uint32_t frameBSize;
} VkVideoEncodeH265FrameSizeEXT;
```

- `frameISize` is the size in bytes to be used for I-frames.
- `framePSize` is the size in bytes to be used for P-frames.
- `frameBSize` is the size in bytes to be used for B-frames.

The `VkVideoEncodeH265GopRemainingFrameInfoEXT` structure is defined as:

```c
typedef struct VkVideoEncodeH265GopRemainingFrameInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 useGopRemainingFrames;
    uint32_t gopRemainingI;
    uint32_t gopRemainingP;
    uint32_t gopRemainingB;
} VkVideoEncodeH265GopRemainingFrameInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `useGopRemainingFrames` indicates whether the implementation’s rate control algorithm should
use the values specified in \texttt{gopRemainingI}, \texttt{gopRemainingP}, and \texttt{gopRemainingB}. If \texttt{useGopRemainingFrames} is \texttt{VK_FALSE}, then the values of \texttt{gopRemainingI}, \texttt{gopRemainingP}, and \texttt{gopRemainingB} are ignored.

- \texttt{gopRemainingI} specifies the number of I-frames the implementation's rate control algorithm \textbf{should} assume to be remaining in the GOP prior to executing the video encode operation.
- \texttt{gopRemainingP} specifies the number of P-frames the implementation's rate control algorithm \textbf{should} assume to be remaining in the GOP prior to executing the video encode operation.
- \texttt{gopRemainingB} specifies the number of B-frames the implementation's rate control algorithm \textbf{should} assume to be remaining in the GOP prior to executing the video encode operation.

Setting \texttt{useGopRemainingFrames} to \texttt{VK_TRUE} and including this structure in the \texttt{pNext} chain of \texttt{VkVideoEncodeInfoKHR} is only mandatory if the \texttt{VkVideoEncodeH265CapabilitiesEXT::requiresGopRemainingFrames} reported for the used video profile is \texttt{VK_TRUE}. However, implementations \textbf{may} use these remaining frame counts, when specified, even when it is not required. In particular, when the application does not use a regular GOP structure, these values \textbf{may} provide additional guidance for the implementation's rate control algorithm.

The \texttt{VkVideoEncodeH265CapabilitiesEXT::prefersGopRemainingFrames} capability is also used to indicate that the implementation's rate control algorithm \textbf{may} operate more accurately if the application specifies the remaining frame counts using this structure.

As with other rate control guidance values, if the effective order and number of frames encoded by the application are not in line with the remaining frame counts specified in this structure at any given point, then the behavior of the implementation's rate control algorithm \textbf{may} deviate from the one expected by the application.

\end{table}
Chapter 43. Optical Flow

43.1. Optical Flow Queues

VK_NV_optical_flow adds a optical flow queue type bit VK_QUEUE_OPTICAL_FLOW_BIT_NV to VkQueueFlagBits. Optical flow operations are supported by queues with an advertised queue capability of VK_QUEUE_OPTICAL_FLOW_BIT_NV. As in the case of other queue types, an application must use vkGetPhysicalDeviceQueueFamilyProperties to query whether the physical device has support for the Optical Flow Queue. When the implementation reports the VK_QUEUE_OPTICAL_FLOW_BIT_NV bit for a queue family, it advertises general support for Vulkan queue operations described in Devices and Queues.

43.2. Optical Flow Image Formats

To enumerate the supported image formats for a specific optical flow usage, call:

```c
// Provided by VK_NV_optical_flow
VkResult vkGetPhysicalDeviceOpticalFlowImageFormatsNV(
    VkPhysicalDevice physicalDevice,
    const VkOpticalFlowImageFormatInfoNV* pOpticalFlowImageFormatInfo,
    uint32_t* pFormatCount,
    VkOpticalFlowImageFormatPropertiesNV* pImageFormatProperties);
```

- `physicalDevice` is the physical device being queried.
- `pOpticalFlowImageFormatInfo` is a pointer to a VkOpticalFlowImageFormatInfoNV structure specifying the optical flow usage for which information is returned.
- `pFormatCount` is a pointer to an integer related to the number of optical flow properties available or queried, as described below.
- `pImageFormatProperties` is a pointer to an array of VkOpticalFlowImageFormatPropertiesNV structures in which supported formats and image parameters are returned.

If `pImageFormatProperties` is NULL, then the number of optical flow properties supported for the given `physicalDevice` is returned in `pFormatCount`. Otherwise, `pFormatCount` must point to a variable set by the user to the number of elements in the `pImageFormatProperties` array, and on return the variable is overwritten with the number of values actually written to `pImageFormatProperties`. If the value of `pFormatCount` is less than the number of optical flow properties supported, at most `pFormatCount` values will be written to `pImageFormatProperties`, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available values were returned. Before creating an image to be used as a optical flow frame, obtain the supported image creation parameters by querying with `vkGetPhysicalDeviceFormatProperties2` and `vkGetPhysicalDeviceImageFormatProperties2` using one of the reported formats and adding VkOpticalFlowImageFormatInfoNV to the pNext chain of VkPhysicalDeviceImageFormatInfo2. When querying the parameters with `vkGetPhysicalDeviceImageFormatProperties2` for images used for optical flow operations, the VkOpticalFlowImageFormatInfoNV::usage field should contain one or more of the bits defined in VkOpticalFlowUsageFlagBitsNV.
Valid Usage (Implicit)

- **VUID-vkGetPhysicalDeviceOpticalFlowImageFormatsNV-physicalDevice-parameter**
  physicalDevice **must** be a valid VkPhysicalDevice handle

  pOpticalFlowImageFormatInfo **must** be a valid pointer to a valid VkOpticalFlowImageFormatInfoNV structure

- **VUID-vkGetPhysicalDeviceOpticalFlowImageFormatsNV-pFormatCount-parameter**
  pFormatCount **must** be a valid pointer to a uint32_t value

  If the value referenced by pFormatCount is not 0, and pImageFormatProperties is not NULL, pImageFormatProperties **must** be a valid pointer to an array of pFormatCount VkOpticalFlowImageFormatPropertiesNV structures

Return Codes

Success
- VK_SUCCESS
- VK_INCOMPLETE

Failure
- VK_ERROR_EXTENSION_NOT_PRESENT
- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_FORMAT_NOT_SUPPORTED

Note

**VK_FORMAT_B8G8R8A8_UNORM**, **VK_FORMAT_R8_UNORM** and **VK_FORMAT_G8_B8R8_2PLANE_420_UNORM** are initially supported for images with optical usage **VK_OPTICAL_FLOW_USAGE_INPUT_BIT_NV**.

**VK_FORMAT_R16G16_S10_5_NV** is initially supported for images with optical flow usage **VK_OPTICAL_FLOW_USAGE_OUTPUT_BIT_NV**, **VK_OPTICAL_FLOW_USAGE_HINT_BIT_NV** and **VK_OPTICAL_FLOW_USAGE_GLOBAL_FLOW_BIT_NV**.

**VK_FORMAT_R8_UINT** and **VK_FORMAT_R32_UINT** are initially supported for images with optical flow usage **VK_OPTICAL_FLOW_USAGE_COST_BIT_NV**. It is recommended to use **VK_FORMAT_R8_UINT** because of the lower bandwidth.

The **VkOpticalFlowImageFormatInfoNV** structure is defined as:

```c
// Provided by VK_NV_optical_flow
```
typedef struct VkOpticalFlowImageFormatInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkOpticalFlowUsageFlagsNV usage;
} VkOpticalFlowImageFormatInfoNV;

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- usage is a bitmask of VkOpticalFlowUsageFlagBitsNV describing the intended optical flow usage of the image.

**Valid Usage (Implicit)**

- VUID-VkOpticalFlowImageFormatInfoNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_OPTICAL_FLOW_IMAGE_FORMAT_INFO_NV

- VUID-VkOpticalFlowImageFormatInfoNV-usage-parameter
  usage must be a valid combination of VkOpticalFlowUsageFlagBitsNV values

- VUID-VkOpticalFlowImageFormatInfoNV-usage-requiredbitmask
  usage must not be 0

Bits which can be set in VkOpticalFlowImageFormatInfoNV::usage, controlling optical flow usage, are:

```c
// Provided by VK_NV_optical_flow
typedef enum VkOpticalFlowUsageFlagBitsNV {
    VK_OPTICAL_FLOW_USAGE_UNKNOWN_NV = 0,
    VK_OPTICAL_FLOW_USAGE_INPUT_BIT_NV = 0x00000001,
    VK_OPTICAL_FLOW_USAGE_OUTPUT_BIT_NV = 0x00000002,
    VK_OPTICAL_FLOW_USAGE_HINT_BIT_NV = 0x00000004,
    VK_OPTICAL_FLOW_USAGE_COST_BIT_NV = 0x00000008,
    VK_OPTICAL_FLOW_USAGE_GLOBAL_FLOW_BIT_NV = 0x00000010,
} VkOpticalFlowUsageFlagBitsNV;
```

- VK_OPTICAL_FLOW_USAGE_INPUT_BIT_NV specifies that the image can be used as input or reference frame for an optical flow operation.
- VK_OPTICAL_FLOW_USAGE_OUTPUT_BIT_NV specifies that the image can be used as output flow vector map for an optical flow operation.
- VK_OPTICAL_FLOW_USAGE_HINT_BIT_NV specifies that the image can be used as hint flow vector map for an optical flow operation.
- VK_OPTICAL_FLOW_USAGE_COST_BIT_NV specifies that the image can be used as output cost map for an optical flow operation.
- VK_OPTICAL_FLOW_USAGE_GLOBAL_FLOW_BIT_NV specifies that the image can be used as global flow vector for an optical flow operation.
VkOpticalFlowUsageFlagsNV is a bitmask type for setting a mask of zero or more VkOpticalFlowUsageFlagBitsNV.

The VkOpticalFlowImageFormatPropertiesNV structure is defined as:

```c
typedef struct VkOpticalFlowImageFormatPropertiesNV {
    VkStructureType sType;
    const void* pNext;
    VkFormat format;
} VkOpticalFlowImageFormatPropertiesNV;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **format** is a VkFormat that specifies the format that can be used with the specified optical flow image usages.

**Valid Usage (Implicit)**

- VUID-VkOpticalFlowImageFormatPropertiesNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_OPTICAL_FLOW_IMAGE_FORMAT_PROPERTIES_NV
- VUID-VkOpticalFlowImageFormatPropertiesNV-pNext-pNext
  pNext must be NULL

### 43.3. Optical Flow Session

#### 43.3.1. Optical Flow Session Object

Optical flow session objects are abstracted and represented by VkOpticalFlowSessionNV handles:

```c
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkOpticalFlowSessionNV)
```

**Creating an Optical Flow Session**

To create an optical flow session object, call:

```c
VkResult vkCreateOpticalFlowSessionNV(VkDevice device, 
                                     const VkOpticalFlowSessionCreateInfoNV* createInfo, 
                                     VkAllocationCallbacks* pAllocator, 
                                     VkOpticalFlowSessionNV* pSession)
```
const VkOpticalFlowSessionCreateInfoNV* pCreateInfo,
const VkAllocationCallbacks* pAllocator,
VkOpticalFlowSessionNV* pSession);

- **device** is the logical device that creates the optical flow session object.
- **pCreateInfo** is a pointer to a `VkOpticalFlowSessionCreateInfoNV` structure containing parameters specifying the creation of the optical flow session.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pSession** is a pointer to a `VkOpticalFlowSessionNV` handle specifying the optical flow session object which will be created by this function when it returns **VK_SUCCESS**

### Valid Usage (Implicit)

- **VUID-vkCreateOpticalFlowSessionNV-device-parameter**
  - `device` **must** be a valid `VkDevice` handle
- **VUID-vkCreateOpticalFlowSessionNV-pCreateInfo-parameter**
  - `pCreateInfo` **must** be a valid pointer to a valid `VkOpticalFlowSessionCreateInfoNV` structure
- **VUID-vkCreateOpticalFlowSessionNV-pAllocator-parameter**
  - If `pAllocator` is not NULL, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- **VUID-vkCreateOpticalFlowSessionNV-pSession-parameter**
  - `pSession` **must** be a valid pointer to a `VkOpticalFlowSessionNV` handle

### Return Codes

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_INITIALIZATION_FAILED**

The `VkOpticalFlowSessionCreateInfoNV` structure is defined as:

```c
// Provided by VK_NV_optical_flow
typedef struct VkOpticalFlowSessionCreateInfoNV {
    VkStructureType sType;
    void* pNext;
    uint32_t width;
    uint32_t height;
    VkFormat imageFormat;
    VkFormat flowVectorFormat;
} VkOpticalFlowSessionCreateInfoNV;
```
VkFormat costFormat;
VkOpticalFlowGridSizeFlagsNV outputGridSize;
VkOpticalFlowGridSizeFlagsNV hintGridSize;
VkOpticalFlowPerformanceLevelNV performanceLevel;
VkOpticalFlowSessionCreateFlagsNV flags;
} VkOpticalFlowSessionCreateInfoNV;

• **sType** is a **VkStructureType** value identifying this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **width** is the width in pixels of the input or reference frame to be bound to this optical flow session.

• **height** is the height in pixels of the input or reference frame to be bound to this optical flow session.

• **imageFormat** is the **VkFormat** of the input and reference frame to be bound to this optical flow session.

• **flowVectorFormat** is the **VkFormat** of the flow vector maps (output or hint) to be bound to this optical flow session.

• **costFormat** is the **VkFormat** of the cost maps to be bound to this optical flow session.

• **outputGridSize** is exactly one bit of **VkOpticalFlowGridSizeFlagsNV** specifying the grid size of the output flow and cost maps to be bound to this optical flow session. The size of the output flow and cost maps is determined by **VkOpticalFlowSessionCreateInfoNV::width** and **VkOpticalFlowSessionCreateInfoNV::height** divided by **VkOpticalFlowSessionCreateInfoNV::outputGridSize**.

• **hintGridSize** is one exactly bit of **VkOpticalFlowGridSizeFlagsNV** specifying the grid size of the hint flow vector maps to be bound to this optical flow session. The size of the hint maps is determined by **VkOpticalFlowSessionCreateInfoNV::width** and **VkOpticalFlowSessionCreateInfoNV::height** divided by **VkOpticalFlowSessionCreateInfoNV::hintGridSize**.

• **performanceLevel** is the **VkOpticalFlowPerformanceLevelNV** used for this optical flow session.

• **flags** are the **VkOpticalFlowSessionCreateFlagsNV** used for this optical flow session.

---

**Valid Usage**

- **VUID-VkOpticalFlowSessionCreateInfoNV-width-07581**
  
  width must be greater than or equal to **VkPhysicalDeviceOpticalFlowPropertiesNV::minWidth** and less than or equal to **VkPhysicalDeviceOpticalFlowPropertiesNV::maxWidth**

- **VUID-VkOpticalFlowSessionCreateInfoNV-height-07582**
  
  height must be greater than or equal to **VkPhysicalDeviceOpticalFlowPropertiesNV::minHeight** and less than or equal to **VkPhysicalDeviceOpticalFlowPropertiesNV::maxHeight**

- **VUID-VkOpticalFlowSessionCreateInfoNV-imageFormat-07583**
  
  imageFormat must be one of the formats returned by **vkGetPhysicalDeviceOpticalFlowImageFormatsNV** for VK_OPTICAL_FLOWUSAGE_INPUT_BIT_NV

- **VUID-VkOpticalFlowSessionCreateInfoNV-flowVectorFormat-07584**
flowVectorFormat must be one of the formats returned by
vkGetPhysicalDeviceOpticalFlowImageFormatsNV
for
VK_OPTICAL_FLOW_USAGE_OUTPUT_BIT_NV

- VUID-VkOpticalFlowSessionCreateInfoNV-costFormat-07585
costFormat must be one of the formats returned by
vkGetPhysicalDeviceOpticalFlowImageFormatsNV for VK_OPTICAL_FLOW_USAGE_COST_BIT_NV
if VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_COST_BIT_NV is set in flags

- VUID-VkOpticalFlowSessionCreateInfoNV-outputGridSize-07586
outputGridSize must be exactly one of the bits reported in
VkPhysicalDeviceOpticalFlowPropertiesNV::supportedOutputGridSizes

- VUID-VkOpticalFlowSessionCreateInfoNV-hintGridSize-07587
hintGridSize must be exactly one of the bits reported in
VkPhysicalDeviceOpticalFlowPropertiesNV::supportedHintGridSizes if
VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_HINT_BIT_NV is set in flags

- VUID-VkOpticalFlowSessionCreateInfoNV-flags-07588
VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_HINT_BIT_NV must not be set in flags if
VkPhysicalDeviceOpticalFlowPropertiesNV::hintSupported is VK_FALSE

- VUID-VkOpticalFlowSessionCreateInfoNV-flags-07589
VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_COST_BIT_NV must not be set in flags if
VkPhysicalDeviceOpticalFlowPropertiesNV::costSupported is VK_FALSE

- VUID-VkOpticalFlowSessionCreateInfoNV-flags-07590
VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_GLOBAL_FLOW_BIT_NV must not be set in flags if
VkPhysicalDeviceOpticalFlowPropertiesNV::globalFlowSupported is VK_FALSE

- VUID-VkOpticalFlowSessionCreateInfoNV-flags-07591
VK_OPTICAL_FLOW_SESSION_CREATE_ALLOW_REGIONS_BIT_NV must not be set in flags if
VkPhysicalDeviceOpticalFlowPropertiesNV::maxNumRegionsOfInterest is 0

- VUID-VkOpticalFlowSessionCreateInfoNV-flags-07592
VK_OPTICAL_FLOW_SESSION_CREATE_BOTH_DIRECTIONS_BIT_NV must not be set in flags if
VkPhysicalDeviceOpticalFlowPropertiesNV::bidirectionalFlowSupported is VK_FALSE

Valid Usage (Implicit)

- VUID-VkOpticalFlowSessionCreateInfoNV-sType-sType
sType must be VK_STRUCTURE_TYPE_OPTICAL_FLOW_SESSION_CREATE_INFO_NV

- VUID-VkOpticalFlowSessionCreateInfoNV-pNext-pNext
pNext must be NULL or a pointer to a valid instance of
VkOpticalFlowSessionCreatePrivateDataInfoNV

- VUID-VkOpticalFlowSessionCreateInfoNV-sType-unique
The sType value of each struct in the pNext chain must be unique

- VUID-VkOpticalFlowSessionCreateInfoNV-imageFormat-parameter
imageFormat must be a valid VkFormat value

- VUID-VkOpticalFlowSessionCreateInfoNV-flowVectorFormat-parameter
**flowVectorFormat must** be a valid **VkFormat** value

- VUID-VkOpticalFlowSessionCreateInfoNV-costFormat-parameter
  
  If `costFormat` is not 0, `costFormat` **must** be a valid **VkFormat** value

- VUID-VkOpticalFlowSessionCreateInfoNV-outputGridSize-parameter
  
  `outputGridSize` **must** be a valid combination of **VkOpticalFlowGridSizeFlagBitsNV** values

- VUID-VkOpticalFlowSessionCreateInfoNV-outputGridSize-requiredbitmask
  
  `outputGridSize` **must not** be 0

- VUID-VkOpticalFlowSessionCreateInfoNV-hintGridSize-parameter
  
  `hintGridSize` **must** be a valid combination of **VkOpticalFlowGridSizeFlagBitsNV** values

- VUID-VkOpticalFlowSessionCreateInfoNV-performanceLevel-parameter
  
  If `performanceLevel` is not 0, `performanceLevel` **must** be a valid **VkOpticalFlowPerformanceLevelNV** value

- VUID-VkOpticalFlowSessionCreateInfoNV-flags-parameter
  
  `flags` **must** be a valid combination of **VkOpticalFlowSessionCreateFlagBitsNV** values

The **VkOpticalFlowSessionCreatePrivateDataInfoNV** structure is for NV internal use only and is defined as:

```c
// Provided by VK_NV_optical_flow
typedef struct VkOpticalFlowSessionCreatePrivateDataInfoNV {
    VkStructureType sType;
    void*pNext;
    uint32_t id;
    uint32_t size;
    const void* pPrivateData;
} VkOpticalFlowSessionCreatePrivateDataInfoNV;
```

- `sType` is a **VkStructureType** value identifying this structure.
- `pNext` is **NULL** or a pointer to a structure extending this structure.
- `id` is an identifier for data which is passed at a memory location specified in `VkOpticalFlowSessionCreatePrivateDataInfoNV::pPrivateData`.
- `size` is the size of data in bytes which is passed at a memory location specified in `VkOpticalFlowSessionCreatePrivateDataInfoNV::pPrivateData`.
- `pPrivateData` is a pointer to NV internal data.

### Valid Usage (Implicit)

- VUID-VkOpticalFlowSessionCreatePrivateDataInfoNV-sType-sType
  
  `sType` **must** be **VK_STRUCTURE_TYPE_OPTICAL_FLOW_SESSION_CREATE_PRIVATE_DATA_INFO_NV**

- VUID-VkOpticalFlowSessionCreatePrivateDataInfoNV-pPrivateData-parameter
  
  `pPrivateData` **must** be a pointer value
Optical flow vectors are generated block-wise, one vector for each block of \(NxN\) pixels (referred to as grid).

Bits which can be set in `VkOpticalFlowSessionCreateInfoNV::outputGridSize` and `VkOpticalFlowSessionCreateInfoNV::hintGridSize`, or which are returned in `VkPhysicalDeviceOpticalFlowPropertiesNV::supportedOutputGridSizes` and `VkPhysicalDeviceOpticalFlowPropertiesNV::supportedHintGridSizes` controlling optical flow grid sizes, are:

```c
// Provided by VK_NV_optical_flow
typedef enum VkOpticalFlowGridSizeFlagBitsNV {
    VK_OPTICAL_FLOW_GRID_SIZE_UNKNOWN_NV = 0,
    VK_OPTICAL_FLOW_GRID_SIZE_1X1_BIT_NV = 0x00000001,
    VK_OPTICAL_FLOW_GRID_SIZE_2X2_BIT_NV = 0x00000002,
    VK_OPTICAL_FLOW_GRID_SIZE_4X4_BIT_NV = 0x00000004,
    VK_OPTICAL_FLOW_GRID_SIZE_8X8_BIT_NV = 0x00000008,
} VkOpticalFlowGridSizeFlagBitsNV;
```

- `VK_OPTICAL_FLOW_GRID_SIZE_1X1_BIT_NV` specifies that grid is 1x1 pixel.
- `VK_OPTICAL_FLOW_GRID_SIZE_2X2_BIT_NV` specifies that grid is 2x2 pixel.
- `VK_OPTICAL_FLOW_GRID_SIZE_4X4_BIT_NV` specifies that grid is 4x4 pixel.
- `VK_OPTICAL_FLOW_GRID_SIZE_8X8_BIT_NV` specifies that grid is 8x8 pixel.

```c
// Provided by VK_NV_optical_flow
typedef VkFlags VkOpticalFlowGridSizeFlagsNV;
```

`VkOpticalFlowGridSizeFlagsNV` is a bitmask type for setting a mask of zero or more `VkOpticalFlowGridSizeFlagBitsNV`.

Optical flow exposes performance levels which the user can choose based on the desired performance and quality requirement.

The optical flow performance level types are defined with the following:

```c
// Provided by VK_NV_optical_flow
typedef enum VkOpticalFlowPerformanceLevelNV {
    VK_OPTICAL_FLOW_PERFORMANCE_LEVEL_UNKNOWN_NV = 0,
    VK_OPTICAL_FLOW_PERFORMANCE_LEVEL_SLOW_NV = 1,
    VK_OPTICAL_FLOW_PERFORMANCE_LEVEL_MEDIUM_NV = 2,
    VK_OPTICAL_FLOW_PERFORMANCE_LEVEL_FAST_NV = 3,
} VkOpticalFlowPerformanceLevelNV;
```

- `VK_OPTICAL_FLOW_PERFORMANCE_LEVEL_SLOW_NV` is a level with slower performance but higher quality.
- `VK_OPTICAL_FLOW_PERFORMANCE_LEVEL_MEDIUM_NV` is a level with medium performance and medium
quality.

- **VK_OPTICAL_FLOW_PERFORMANCE_LEVEL_FAST_NV** is a preset with higher performance but lower quality.

Bits which can be set in `VkOpticalFlowSessionCreateInfoNV::flags`, controlling optical flow session operations, are:

```c
// Provided by VK_NV_optical_flow
typedef enum VkOpticalFlowSessionCreateFlagBitsNV {
    VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_HINT_BIT_NV = 0x00000001,
    VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_COST_BIT_NV = 0x00000002,
    VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_GLOBAL_FLOW_BIT_NV = 0x00000004,
    VK_OPTICAL_FLOW_SESSION_CREATE_ALLOW_REGIONS_BIT_NV = 0x00000008,
    VK_OPTICAL_FLOW_SESSION_CREATE_BOTH_DIRECTIONS_BIT_NV = 0x00000010,
} VkOpticalFlowSessionCreateFlagBitsNV;
```

- **VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_HINT_BIT_NV** specifies that a `VkImageView` with external flow vectors will be used as hints in performing the motion search and must be bound to `VK_OPTICAL_FLOW_SESSION_BINDING_POINT_HINT_NV`.

- **VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_COST_BIT_NV** specifies that the cost for the forward flow is generated in a `VkImageView` which must be bound to `VK_OPTICAL_FLOW_SESSION_BINDING_POINT_COST_NV`. Additionally, if **VK_OPTICAL_FLOW_SESSION_CREATE_BOTH_DIRECTIONS_BIT_NV** is also set, the cost for backward flow is generated in a `VkImageView` which must be bound to `VK_OPTICAL_FLOW_SESSION_BINDING_POINT_BACKWARD_COST_NV`. The cost is the confidence level of the flow vector for each grid in the frame. The Cost implies how (in)accurate the flow vector is. Higher cost value implies the flow vector to be less accurate and vice-versa.

- **VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_GLOBAL_FLOW_BIT_NV** specifies that a global flow vector is estimated from forward flow in a single pixel `VkImageView` which must be bound to `VK_OPTICAL_FLOW_SESSION_BINDING_POINT_GLOBAL_FLOW_NV`.

- **VK_OPTICAL_FLOW_SESSION_CREATE_ALLOW_REGIONS_BIT_NV** specifies that regions of interest can be specified in `VkOpticalFlowExecuteInfoNV`.

- **VK_OPTICAL_FLOW_SESSION_CREATE_BOTH_DIRECTIONS_BIT_NV** specifies that backward flow is generated in addition to forward flow which is always generated.

`VkOpticalFlowSessionCreateFlagsNV` is a bitmask type for setting a mask of zero or more `VkOpticalFlowSessionCreateFlagBitsNV`.

```c
// Provided by VK_NV_optical_flow
typedef VkFlags VkOpticalFlowSessionCreateFlagsNV;
```

### Destroying an Optical Flow Session

To destroy a optical flow session object, call:
// Provided by VK_NV_optical_flow
void vkDestroyOpticalFlowSessionNV(
    VkDevice device,
    VkOpticalFlowSessionNV session,
    const VkAllocationCallbacks* pAllocator);

• **device** is the device that was used for the creation of the optical flow session.

• **session** is the optical flow session to be destroyed.

• **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

<table>
<thead>
<tr>

### 43.3.2. Binding vulkan image views to an optical flow session

To bind a vulkan image to an optical flow session object, call:

// Provided by VK_NV_optical_flow
VkResult vkBindOpticalFlowSessionImageNV(
    VkDevice device,
    VkOpticalFlowSessionNV session,
    VkOpticalFlowSessionBindingPointNV bindingPoint,
    VkImageView view,
    VkImageLayout layout);

• **device** is the device which owns the optical flow session object **session**.

• **session** is the optical flow session object to which the image view is to be bound.

• **bindingPoint** specifies the binding point VkOpticalFlowSessionBindingPointNV to which the image view is bound.

• **view** is a VkImageView to be bound.

• **layout** must specify the layout that the image subresources accessible from **view** will be in at the time the optical flow vectors are calculated with vkCmdOpticalFlowExecuteNV on a VkDevice.
Valid Usage (Implicit)

- **VUID-vkBindOpticalFlowSessionImageNV-device-parameter**
  device must be a valid VkDevice handle

- **VUID-vkBindOpticalFlowSessionImageNV-session-parameter**
  session must be a valid VkOpticalFlowSessionNV handle

- **VUID-vkBindOpticalFlowSessionImageNV-bindingPoint-parameter**
  bindingPoint must be a valid VkOpticalFlowSessionBindingPointNV value

- **VUID-vkBindOpticalFlowSessionImageNV-view-parameter**
  If view is not VK_NULL_HANDLE, view must be a valid VkImageView handle

- **VUID-vkBindOpticalFlowSessionImageNV-layout-parameter**
  layout must be a valid VkImageLayout value

- **VUID-vkBindOpticalFlowSessionImageNV-session-parent**
  session must have been created, allocated, or retrieved from device

- **VUID-vkBindOpticalFlowSessionImageNV-view-parent**
  If view is a valid handle, it must have been created, allocated, or retrieved from device

Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_INITIALIZATION_FAILED

The optical flow session binding points are defined with the following:

```c
// Provided by VK_NV_optical_flow
typedef enum VkOpticalFlowSessionBindingPointNV {
    VK_OPTICAL_FLOW_SESSION_BINDING_POINT_UNKNOWN_NV = 0,
    VK_OPTICAL_FLOW_SESSION_BINDING_POINT_INPUT_NV = 1,
    VK_OPTICAL_FLOW_SESSION_BINDING_POINT_REFERENCE_NV = 2,
    VK_OPTICAL_FLOW_SESSION_BINDING_POINT_HINT_NV = 3,
    VK_OPTICAL_FLOW_SESSION_BINDING_POINT_FLOW_VECTOR_NV = 4,
    VK_OPTICAL_FLOW_SESSION_BINDING_POINT_BACKWARD_FLOW_VECTOR_NV = 5,
    VK_OPTICAL_FLOW_SESSION_BINDING_POINT_COST_NV = 6,
    VK_OPTICAL_FLOW_SESSION_BINDING_POINT_BACKWARD_COST_NV = 7,
    VK_OPTICAL_FLOW_SESSION_BINDING_POINT_GLOBAL_FLOW_NV = 8,
} VkOpticalFlowSessionBindingPointNV;
```

- **VK_OPTICAL_FLOW_SESSION_BINDING_POINT_INPUT_NV** specifies the binding point for the input frame.
• **VK_OPTICAL_FLOW_SESSION_BINDING_POINT_REFERENCE_NV** specifies the binding point for the input reference frame.

• **VK_OPTICAL_FLOW_SESSION_BINDING_POINT_HINT_NV** specifies the binding point for the optional external hint flow vectors.

• **VK_OPTICAL_FLOW_SESSION_BINDING_POINT_FLOW_VECTOR_NV** specifies the binding point for output flow vectors of default forward flow calculation.

• **VK_OPTICAL_FLOW_SESSION_BINDING_POINT_BACKWARD_FLOW_VECTOR_NV** specifies the binding point for the optional output flow vector map of optional backward flow calculation.

• **VK_OPTICAL_FLOW_SESSION_BINDING_POINT_COST_NV** specifies the binding point for the optional output cost map of default forward flow calculation.

• **VK_OPTICAL_FLOW_SESSION_BINDING_POINT_BACKWARD_COST_NV** specifies the binding point for the optional output cost map of optional backward flow calculation.

• **VK_OPTICAL_FLOW_SESSION_BINDING_POINT_GLOBAL_FLOW_NV** specifies the binding point for the optional global flow value of default forward flow calculation.

### 43.3.3. Optical Flow Execution

Default direction of flow estimation is forward which calculates the optical flow from input frame to reference frame. Optionally backward flow estimation can be additionally calculated. An output flow vector \((V_x, V_y)\) means that current pixel \((x, y)\) of input frame can be found at location \((x+V_x, y+V_y)\) in reference frame. A backward flow vector \((V_x, V_y)\) means that current pixel \((x, y)\) of reference frame can be found at location \((x+V_x, y+V_y)\) in input frame.

To calculate optical flow vectors from two input frames, call:

```c
// Provided by VK_NV_optical_flow
void vkCmdOpticalFlowExecuteNV(
    VkCommandBuffer commandBuffer, 
    VkOpticalFlowSessionNV session, 
    const VkOpticalFlowExecuteInfoNV* pExecuteInfo);
```

• **commandBuffer** is the command buffer into which the command will be recorded.

• **session** is the optical flow session object on which this command is operating.

• **pExecuteInfo** Info is a pointer to a **VkOpticalFlowExecuteInfoNV**.

#### Valid Usage (Implicit)

- **VUID-vkCmdOpticalFlowExecuteNV-commandBuffer-parameter**
  **commandBuffer** must be a valid **VkCommandBuffer** handle

- **VUID-vkCmdOpticalFlowExecuteNV-session-parameter**
  **session** must be a valid **VkOpticalFlowSessionNV** handle

- **VUID-vkCmdOpticalFlowExecuteNV-pExecuteInfo-parameter**
  **pExecuteInfo** must be a valid pointer to a valid **VkOpticalFlowExecuteInfoNV** structure
• **VUID-vkCmdOpticalFlowExecuteNV-commandBuffer-recording**
  
  commandBuffer must be in the recording state

• **VUID-vkCmdOpticalFlowExecuteNV-commandBuffer-cmdpool**

  The VkCommandPool that commandBuffer was allocated from must support optical flow operations

• **VUID-vkCmdOpticalFlowExecuteNV-renderpass**

  This command must only be called outside of a render pass instance

• **VUID-vkCmdOpticalFlowExecuteNV-videocoding**

  This command must only be called outside of a video coding scope

• **VUID-vkCmdOpticalFlowExecuteNV-commonparent**

  Both of commandBuffer, and session must have been created, allocated, or retrieved from the same VkDevice

---

**Host Synchronization**

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

---

**Command Properties**

The VkOpticalFlowExecuteInfoNV structure is defined as:

```c
// Provided by VK_NV_optical_flow
typedef struct VkOpticalFlowExecuteInfoNV {
    VkStructureType sType;
    void* pNext;
    VkOpticalFlowExecuteFlagsNV flags;
    uint32_t regionCount;
    const VkRect2D* pRegions;
} VkOpticalFlowExecuteInfoNV;
```

• **sType** is a VkStructureType value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **flags** are the VkOpticalFlowExecuteFlagsNV used for this command.

• **regionCount** is the number of regions of interest specified in pRegions.

• **pRegions** is a pointer to regionCount VkRect2D regions of interest.
Valid Usage

- VUID-VkOpticalFlowExecuteInfoNV-regionCount-07593
  regionCount must be 0 if VK_OPTICAL_FLOW_SESSION_CREATE_ALLOW_REGIONS_BIT_NV was not set for VkOpticalFlowSessionNV on which this command is operating

Valid Usage (Implicit)

- VUID-VkOpticalFlowExecuteInfoNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_OPTICAL_FLOW_EXECUTE_INFO_NV

- VUID-VkOpticalFlowExecuteInfoNV-pNext-pNext
  pNext must be NULL

- VUID-VkOpticalFlowExecuteInfoNV-flags-parameter
  flags must be a valid combination of VkOpticalFlowExecuteFlagBitsNV values

- VUID-VkOpticalFlowExecuteInfoNV-pRegions-parameter
  If regionCount is not 0, pRegions must be a valid pointer to an array of regionCount VkRect2D structures

Bits which can be set in VkOpticalFlowExecuteInfoNV::flags, controlling optical flow execution, are:

```c
// Provided by VK_NV_optical_flow
typedef enum VkOpticalFlowExecuteFlagBitsNV {
    VK_OPTICAL_FLOW_EXECUTE_DISABLE_TEMPORAL_HINTS_BIT_NV = 0x00000001,
} VkOpticalFlowExecuteFlagBitsNV;
```

- VK_OPTICAL_FLOW_EXECUTE_DISABLE_TEMPORAL_HINTS_BIT_NV specifies that temporal hints from previously generated flow vectors are not used. If temporal hints are enabled, optical flow vectors from previous vkCmdOpticalFlowExecuteNV call are automatically used as hints for the current vkCmdOpticalFlowExecuteNV call, to take advantage of temporal correlation in a video sequence. Temporal hints should be disabled if there is a-priori knowledge of no temporal correlation (e.g. a scene change, independent successive frame pairs).

VkOpticalFlowExecuteFlagsNV is a bitmask type for setting a mask of zero or more VkOpticalFlowExecuteFlagBitsNV.

```c
// Provided by VK_NV_optical_flow
typedef VkFlags VkOpticalFlowExecuteFlagsNV;
```
Chapter 44. Execution Graphs

*Execution graphs* provide a way for applications to dispatch multiple operations dynamically from a single initial command on the host. To achieve this, a new execution graph pipeline is provided, that links together multiple shaders or pipelines which each describe one or more operations that can be dispatched within the execution graph. Each linked pipeline or shader describes an *execution node* within the graph, which *can* be dispatched dynamically from another shader within the same graph. This allows applications to describe much richer execution topologies at a finer granularity than would typically be possible with API commands alone.

### 44.1. Pipeline Creation

To create execution graph pipelines, call:

```c
// Provided by VK_AMDX_shader_enqueue
VkResult vkCreateExecutionGraphPipelinesAMDX(
    VkDevice device,
    VkPipelineCache pipelineCache,
    uint32_t createInfoCount,
    const VkExecutionGraphPipelineCreateInfoAMDX* pCreateInfos,
    const VkAllocationCallbacks* pAllocator,
    VkPipeline* pPipelines);
```

- `device` is the logical device that creates the execution graph pipelines.
- `pipelineCache` is either `VK_NULL_HANDLE`, indicating that pipeline caching is disabled; or the handle of a valid pipeline cache object, in which case use of that cache is enabled for the duration of the command.
- `createInfoCount` is the length of the `pCreateInfos` and `pPipelines` arrays.
- `pCreateInfos` is a pointer to an array of `VkExecutionGraphPipelineCreateInfoAMDX` structures.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pPipelines` is a pointer to an array of `VkPipeline` handles in which the resulting execution graph pipeline objects are returned.

The implementation will create a pipeline in each element of `pPipelines` from the corresponding element of `pCreateInfos`. If creation of any pipeline fails, that pipeline will be set to `VK_NULL_HANDLE`.

If creation fails for a pipeline create info with a `VkExecutionGraphPipelineCreateInfoAMDX::flags` value that included `VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT`, all pipelines at a greater index all automatically fail.

**Valid Usage**

- VUID-vkCreateExecutionGraphPipelinesAMDX-shaderEnqueue-09124
  The `shaderEnqueue` feature *must* be enabled
If the `flags` member of any element of `pCreateInfos` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and the `basePipelineIndex` member of that same element is not -1, `basePipelineIndex must be less than the index into pCreateInfos that corresponds to that element.

If the `flags` member of any element of `pCreateInfos` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, the base pipeline must have been created with the `VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT` flag set.

If `pipelineCache` was created with `VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT`, host access to `pipelineCache must be externally synchronized`.

**Valid Usage (Implicit)**

- `device` must be a valid `VkDevice` handle.
- If `pipelineCache` is not `VK_NULL_HANDLE`, `pipelineCache must be a valid `VkPipelineCache` handle.
- `pCreateInfos` must be a valid pointer to an array of `createInfoCount` valid `VkExecutionGraphPipelineCreateInfoAMDX` structures.
- If `pAllocator` is not `NULL`, `pAllocator must be a valid pointer to a valid `VkAllocationCallbacks` structure.
- `pPipelines` must be a valid pointer to an array of `createInfoCount` `VkPipeline` handles.
- `createInfoCount` must be greater than 0.
- If `pipelineCache` is a valid handle, it must have been created, allocated, or retrieved from `device`.

**Return Codes**

**Success**
- `VK_SUCCESS`
- `VK_PIPELINE_COMPILE_REQUIRED_EXT`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
The `VkExecutionGraphPipelineCreateInfoAMDX` structure is defined as:

```c
typedef struct VkExecutionGraphPipelineCreateInfoAMDX {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCreateFlags flags;
    uint32_t stageCount;
    const VkPipelineShaderStageCreateInfo* pStages;
    const VkPipelineLibraryCreateInfoKHR* pLibraryInfo;
    VkPipelineLayout layout;
    VkPipeline basePipelineHandle;
    int32_t basePipelineIndex;
} VkExecutionGraphPipelineCreateInfoAMDX;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkPipelineCreateFlagBits` specifying how the pipeline will be generated.
- `stageCount` is the number of entries in the `pStages` array.
- `pStages` is a pointer to an array of `stageCount` `VkPipelineShaderStageCreateInfo` structures describing the set of the shader stages to be included in the execution graph pipeline.
- `pLibraryInfo` is a pointer to a `VkPipelineLibraryCreateInfoKHR` structure defining pipeline libraries to include.
- `layout` is the description of binding locations used by both the pipeline and descriptor sets used with the pipeline.
- `basePipelineHandle` is a pipeline to derive from
- `basePipelineIndex` is an index into the `pCreateInfos` parameter to use as a pipeline to derive from

The parameters `basePipelineHandle` and `basePipelineIndex` are described in more detail in Pipeline Derivatives.

Each shader stage provided when creating an execution graph pipeline (including those in libraries) is associated with a name and an index, determined by the inclusion or omission of a `VkPipelineShaderStageNodeCreateInfoAMDX` structure in its `pNext` chain.

In addition to the shader name and index, an internal "node index" is also generated for each node, which can be queried with `vkGetExecutionGraphPipelineNodeIndexAMDX`, and is used exclusively for initial dispatch of an execution graph.
Valid Usage

- **VUID-VkExecutionGraphPipelineCreateInfoAMDX-flags-07984**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineIndex` is -1, `basePipelineHandle` must be a valid execution graph `VkPipeline` handle.

- **VUID-VkExecutionGraphPipelineCreateInfoAMDX-flags-07985**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineHandle` is `VK_NULL_HANDLE`, `basePipelineIndex` must be a valid index into the calling command's `pCreateInfos` parameter.

- **VUID-VkExecutionGraphPipelineCreateInfoAMDX-flags-07986**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineHandle` is `VK_NULL_HANDLE`, `basePipelineIndex` must be -1 or `basePipelineHandle` must be `VK_NULL_HANDLE`.

- **VUID-VkExecutionGraphPipelineCreateInfoAMDX-layout-07987**
  If a push constant block is declared in a shader, a push constant range in `layout` must match both the shader stage and range.

- **VUID-VkExecutionGraphPipelineCreateInfoAMDX-layout-07988**
  If a resource variables is declared in a shader, a descriptor slot in `layout` must match the shader stage.

- **VUID-VkExecutionGraphPipelineCreateInfoAMDX-layout-07990**
  If a resource variables is declared in a shader, and the descriptor type is not `VK_DESCRIPTOR_TYPE_MUTABLE_EXT`, a descriptor slot in `layout` must match the descriptor type.

- **VUID-VkExecutionGraphPipelineCreateInfoAMDX-layout-07991**
  If a resource variables is declared in a shader as an array, a descriptor slot in `layout` must match the descriptor count.

- **VUID-VkExecutionGraphPipelineCreateInfoAMDX-flags-03365**
  `flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR`.

- **VUID-VkExecutionGraphPipelineCreateInfoAMDX-flags-03366**
  `flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`.

- **VUID-VkExecutionGraphPipelineCreateInfoAMDX-flags-03367**
  `flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR`.

- **VUID-VkExecutionGraphPipelineCreateInfoAMDX-flags-03368**
  `flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`.

- **VUID-VkExecutionGraphPipelineCreateInfoAMDX-flags-03369**
  `flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR`.

- **VUID-VkExecutionGraphPipelineCreateInfoAMDX-flags-03370**
  `flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR`.

- **VUID-VkExecutionGraphPipelineCreateInfoAMDX-flags-03576**
  `flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR`.
• VUID-VkExecutionGraphPipelineCreateInfoAMDX-flags-09007
  If flags includes VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV, then the
  VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV::deviceGeneratedComputePipelines feature must be enabled

• VUID-VkExecutionGraphPipelineCreateInfoAMDX-flags-09008
  If flags includes VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV, then the pNext chain must include a pointer to a valid instance of VkComputePipelineIndirectBufferInfoNV specifying the address where the pipeline’s metadata will be saved

• VUID-VkExecutionGraphPipelineCreateInfoAMDX-pipelineCreationCacheControl-02875
  If the pipelineCreationCacheControl feature is not enabled, flags must not include
  VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT or
  VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT

• VUID-VkExecutionGraphPipelineCreateInfoAMDX-stage-09128
  The stage member of any element of pStages must be VK_SHADER_STAGE_COMPUTE_BIT

• VUID-VkExecutionGraphPipelineCreateInfoAMDX-pStages-09129
  The shader code for the entry point identified by each element of pStages and the rest of the state identified by this structure must adhere to the pipeline linking rules described in the Shader Interfaces chapter

• VUID-VkExecutionGraphPipelineCreateInfoAMDX-layout-09130
  layout must be consistent with the layout of the shaders specified in pStages

• VUID-VkExecutionGraphPipelineCreateInfoAMDX-pLibraryInfo-09131
  If pLibraryInfo is not NULL, each element of its pLibraries member must have been created with a layout that is compatible with the layout in this pipeline

• VUID-VkExecutionGraphPipelineCreateInfoAMDX-layout-09132
  The number of resources in layout accessible to each shader stage that is used by the pipeline must be less than or equal to VkPhysicalDeviceLimits::maxPerStageResources

• VUID-VkExecutionGraphPipelineCreateInfoAMDX-pLibraryInfo-09133
  If pLibraryInfo is not NULL, each element of pLibraryInfo->libraries must be either a compute pipeline or an execution graph pipeline

• VUID-VkExecutionGraphPipelineCreateInfoAMDX-None-09134
  There must be no two nodes in the pipeline that share both the same shader name and index, as specified by VkPipelineShaderStageNodeCreateInfoAMDX

• VUID-VkExecutionGraphPipelineCreateInfoAMDX-None-09135
  There must be no two nodes in the pipeline that share the same shader name and have input payload declarations with different sizes

• VUID-VkExecutionGraphPipelineCreateInfoAMDX-None-09136
  There must be no two nodes in the pipeline that share the same name but have different execution models

• VUID-VkExecutionGraphPipelineCreateInfoAMDX-CoalescedInputCountAMDX-09137
  There must be no two nodes in the pipeline that share the same name where one includes CoalescedInputCountAMDX and the other does not
There must be no two nodes in the pipeline that share the same name where one includes \texttt{StaticNumWorkgroupsAMDX} and the other does not.

If an output payload declared in any shader in the pipeline has a \texttt{PayloadNodeNameAMDX} decoration with a \texttt{Node Name} that matches the shader name of any other node in the graph, the size of the output payload must match the size of the input payload in the matching node.

### Valid Usage (Implicit)

- \texttt{VK_SHADER_INDEX_UNUSED_AMDX} is a special shader index used to indicate that the created node does not override the index. In this case, the shader index is determined through other means. It is defined as:

  ```
  #define VK_SHADER_INDEX_UNUSED_AMDX (~0U)
  ```

The \texttt{VkPipelineShaderStageNodeCreateInfoAMDX} structure is defined as:

```
typedef struct VkPipelineShaderStageNodeCreateInfoAMDX {
    VkStructureType sType;
    const void* pNext;
    const char* pName;
    uint32_t index;
} VkPipelineShaderStageNodeCreateInfoAMDX;

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- pName is the shader name to use when creating a node in an execution graph. If pName is NULL, the name of the entry point specified in SPIR-V is used as the shader name.
- index is the shader index to use when creating a node in an execution graph. If index is VK_SHADER_INDEX_UNUSED_AMDX then the original index is used, either as specified by the ShaderIndexAMDX execution mode, or 0 if that too is not specified.

When included in the pNext chain of a VkPipelineShaderStageCreateInfo structure, this structure specifies the shader name and shader index of a node when creating an execution graph pipeline. If this structure is omitted, the shader name is set to the name of the entry point in SPIR-V and the shader index is set to 0.

When dispatching a node from another shader, the name is fixed at pipeline creation, but the index can be set dynamically. By associating multiple shaders with the same name but different indexes, applications can dynamically select different nodes to execute. Applications must ensure each node has a unique name and index.

Valid Usage (Implicit)

- VUID-VkPipelineShaderStageNodeCreateInfoAMDX-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_NODE_CREATE_INFO_AMDX
- VUID-VkPipelineShaderStageNodeCreateInfoAMDX-pName-parameter
  If pName is not NULL, pName must be a null-terminated UTF-8 string

To query the internal node index for a particular node in an execution graph, call:

```c
// Provided by VK_AMDX_shader_enqueue
VkResult vkGetExecutionGraphPipelineNodeIndexAMDX(
    VkDevice device,                      // Provided by VK_AMDX_shader_enqueue
    VkPipeline executionGraph,            // Provided by VK_AMDX_shader_enqueue
    const VkPipelineShaderStageNodeCreateInfoAMDX* pNodeInfo,
    uint32_t* pNodeIndex);
```

- device is the that executionGraph was created on.
- executionGraph is the execution graph pipeline to query the internal node index for.
- pNodeInfo is a pointer to a VkPipelineShaderStageNodeCreateInfoAMDX structure identifying
the name and index of the node to query.

- **pNodeIndex** is the returned internal node index of the identified node.

Once this function returns, the contents of **pNodeIndex** contain the internal node index of the identified node.

### Valid Usage

- VUID-vkGetExecutionGraphPipelineNodeIndexAMDX-pNodeInfo-09140
  **pNodeInfo->pName** must not be NULL
- VUID-vkGetExecutionGraphPipelineNodeIndexAMDX-pNodeInfo-09141
  **pNodeInfo->index** must not be VK_SHADER_INDEX_UNUSED_AMDX
- VUID-vkGetExecutionGraphPipelineNodeIndexAMDX-executionGraph-09142
  There must be a node in **executionGraph** with a shader name and index equal to **pNodeInfo->pName** and **pNodeInfo->index**

### Valid Usage (Implicit)

- VUID-vkGetExecutionGraphPipelineNodeIndexAMDX-device-parameter
  **device** must be a valid **VkDevice** handle
- VUID-vkGetExecutionGraphPipelineNodeIndexAMDX-executionGraph-parameter
  **executionGraph** must be a valid **VkPipeline** handle
- VUID-vkGetExecutionGraphPipelineNodeIndexAMDX-pNodeInfo-parameter
  **pNodeInfo** must be a valid pointer to a valid **VkPipelineShaderStageNodeCreateInfoAMDX** structure
- VUID-vkGetExecutionGraphPipelineNodeIndexAMDX-pNodeIndex-parameter
  **pNodeIndex** must be a valid pointer to a **uint32_t** value
- VUID-vkGetExecutionGraphPipelineNodeIndexAMDX-executionGraph-parent
  **executionGraph** must have been created, allocated, or retrieved from **device**

### Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY

### 44.2. Initializing Scratch Memory

Implementations may need scratch memory to manage dispatch queues or similar when executing a pipeline graph, and this is explicitly managed by the application.
To query the scratch space required to dispatch an execution graph, call:

```c
// Provided by VK_AMDX_shader_enqueue
VkResult vkGetExecutionGraphPipelineScratchSizeAMDX(
    VkDevice device,
    VkPipeline executionGraph,
    VkExecutionGraphPipelineScratchSizeAMDX* pSizeInfo);
```

- `device` is the device that `executionGraph` was created on.
- `executionGraph` is the execution graph pipeline to query the scratch space for.
- `pSizeInfo` is a pointer to a `VkExecutionGraphPipelineScratchSizeAMDX` structure that will contain the required scratch size.

After this function returns, information about the scratch space required will be returned in `pSizeInfo`.

### Valid Usage (Implicit)

- VUID-vkGetExecutionGraphPipelineScratchSizeAMDX-device-parameter device **must** be a valid `VkDevice` handle
- VUID-vkGetExecutionGraphPipelineScratchSizeAMDX-executionGraph-parameter executionGraph **must** be a valid `VkPipeline` handle
- VUID-vkGetExecutionGraphPipelineScratchSizeAMDX-pSizeInfo-parameter pSizeInfo **must** be a valid pointer to a `VkExecutionGraphPipelineScratchSizeAMDX` structure
- VUID-vkGetExecutionGraphPipelineScratchSizeAMDX-executionGraph-parent executionGraph **must** have been created, allocated, or retrieved from `device`

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkExecutionGraphPipelineScratchSizeAMDX` structure is defined as:

```c
// Provided by VK_AMDX_shader_enqueue
typedef struct VkExecutionGraphPipelineScratchSizeAMDX {
    VkStructureType sType;
    void* pNext;
    VkDeviceSize size;
}...
```
### VkExecutionGraphPipelineScratchSizeAMDX

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **size** indicates the scratch space required for dispatch the queried execution graph.

### Valid Usage (Implicit)

- `VUID-VkExecutionGraphPipelineScratchSizeAMDX-sType-sType`
  
  **sType** must be `VK_STRUCTURE_TYPE_EXECUTION_GRAPH_PIPELINE_SCRATCH_SIZE_AMDX`

To initialize scratch memory for a particular execution graph, call:

```c
// Provided by VK_AMDX_shader_enqueue
void vkCmdInitializeGraphScratchMemoryAMDX(
    VkCommandBuffer commandBuffer,  // Provided by VK_AMDX_shader_enqueue
    VkDeviceAddress scratch);       // Provided by VK_AMDX_shader_enqueue
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **scratch** is a pointer to the scratch memory to be initialized.

This command **must** be called before using **scratch** to dispatch the currently bound execution graph pipeline.

Execution of this command may modify any memory locations in the range `[scratch, scratch + size)`, where **size** is the value returned in `VkExecutionGraphPipelineScratchSizeAMDX::size` by `VkExecutionGraphPipelineScratchSizeAMDX` for the currently bound execution graph pipeline. Accesses to this memory range are performed in the `VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT` pipeline stage with the `VK_ACCESS_2_SHADER_STORAGE_READ_BIT` and `VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT` access flags.

If any portion of **scratch** is modified by any command other than `vkCmdDispatchGraphAMDX`, `vkCmdDispatchGraphIndirectAMDX`, `vkCmdDispatchGraphIndirectCountAMDX`, or `vkCmdInitializeGraphScratchMemoryAMDX` with the same execution graph, it **must** be reinitialized for the execution graph again before dispatching against it.

### Valid Usage

- `VUID-vkCmdInitializeGraphScratchMemoryAMDX-scratch-09143`
  
  **scratch** must be the device address of an allocated memory range at least as large as the value of `VkExecutionGraphPipelineScratchSizeAMDX::size` returned by `VkExecutionGraphPipelineScratchSizeAMDX` for the currently bound execution graph pipeline.

- `VUID-vkCmdInitializeGraphScratchMemoryAMDX-scratch-09144`
  
  **scratch** must be a multiple of 64
### Valid Usage (Implicit)

- **VUID-vkCmdInitializeGraphScratchMemoryAMDX-commandBuffer-parameter**
  
  `commandBuffer must be a valid VkCommandBuffer handle`

- **VUID-vkCmdInitializeGraphScratchMemoryAMDX-commandBuffer-recording**
  
  `commandBuffer must be in the recording state`

- **VUID-vkCmdInitializeGraphScratchMemoryAMDX-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from *must* support graphics, or compute operations

- **VUID-vkCmdInitializeGraphScratchMemoryAMDX-renderpass**
  
  This command *must* only be called outside of a render pass instance

- **VUID-vkCmdInitializeGraphScratchMemoryAMDX-videocoding**
  
  This command *must* only be called outside of a video coding scope

- **VUID-vkCmdInitializeGraphScratchMemoryAMDX-bufferlevel**
  
  `commandBuffer must be a primary VkCommandBuffer`

### Host Synchronization

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from *must* be externally synchronized

### Command Properties

### 44.3. Dispatching a Graph

Initial dispatch of an execution graph is done from the host in the same way as any other command, and *can* be used in a similar way to compute dispatch commands, with indirect variants available.

To record an execution graph dispatch, call:

```c
// Provided by VK_AMDX_shader_enqueue
void vkCmdDispatchGraphAMDX(
    VkCommandBuffer commandBuffer,
    VkDeviceAddress scratch,
    const VkDispatchGraphCountInfoAMDX* pCountInfo);```
• **commandBuffer** is the command buffer into which the command will be recorded.
• **scratch** is a pointer to the scratch memory to be used.
• **pCountInfo** is a host pointer to a **VkDispatchGraphCountInfoAMDX** structure defining the nodes which will be initially executed.

When this command is executed, the nodes specified in **pCountInfo** are executed. Nodes executed as part of this command are not implicitly synchronized in any way against each other once they are dispatched.

For this command, all device/host pointers in substructures are treated as host pointers and read only during host execution of this command. Once this command returns, no reference to the original pointers is retained.

Execution of this command **may** modify any memory locations in the range \([\text{scratch}, \text{scratch} + \text{size})\), where **size** is the value returned in **VkExecutionGraphPipelineScratchSizeAMDX::size** by **VkExecutionGraphPipelineScratchSizeAMDX** for the currently bound execution graph pipeline. Accesses to this memory range are performed in the **VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT** pipeline stage with the **VK_ACCESS_2_SHADER_STORAGE_READ_BIT** and **VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT** access flags.

### Valid Usage

- **VUID-vkCmdDispatchGraphAMDX-magFilter-04553**
  If a **VkSampler** created with **magFilter** or **minFilter** equal to **VK_FILTER_LINEAR** and **compareEnable** equal to **VK_FALSE** is used to sample a **VkImageView** as a result of this command, then the image view's format features **must** contain **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT**

- **VUID-vkCmdDispatchGraphAMDX-mipmapMode-04770**
  If a **VkSampler** created with **mipmapMode** equal to **VK_SAMPLER_MIPMAP_MODE_LINEAR** and **compareEnable** equal to **VK_FALSE** is used to sample a **VkImageView** as a result of this command, then the image view's format features **must** contain **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT**

- **VUID-vkCmdDispatchGraphAMDX-None-06479**
  If a **VkImageView** is sampled with depth comparison, the image view's format features **must** contain **VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT**

- **VUID-vkCmdDispatchGraphAMDX-None-02691**
  If a **VkImageView** is accessed using atomic operations as a result of this command, then the image view's format features **must** contain **VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT**

- **VUID-vkCmdDispatchGraphAMDX-None-07888**
  If a **VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER** descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features **must** contain **VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT**

- **VUID-vkCmdDispatchGraphAMDX-None-02692**
  If a **VkImageView** is sampled with **VK_FILTER_CUBIC_EXT** as a result of this command, then...
the image view's format features must contain
VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT

- VUID-vkCmdDispatchGraphAMDX-None-02693
If the VK_EXT_filter_cubic extension is not enabled and any VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, it must not have a VkImageViewType of VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY

- VUID-vkCmdDispatchGraphAMDX-filterCubic-02694
Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2

- VUID-vkCmdDispatchGraphAMDX-filterCubicMinmax-02695
Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2

- VUID-vkCmdDispatchGraphAMDX-cubicRangeClamp-09212
If the cubicRangeClamp feature is not enabled, then any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command
must not have a VkSampler ReductionModeCreateInfo
reductionMode equal to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM

- VUID-vkCmdDispatchGraphAMDX-reductionMode-09213
Any VkImageView being sampled with a VkSamplerReductionModeCreateInfo::reductionMode equal to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM as a result of this command must sample with VK_FILTER_CUBIC_EXT

- VUID-vkCmdDispatchGraphAMDX-selectableCubicWeights-09214
If the selectableCubicWeights feature is not enabled, then any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have VkSamplerCubicWeightsCreateInfoQCOM::cubicWeights equal to VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM

- VUID-vkCmdDispatchGraphAMDX-flags-02696
Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE

- VUID-vkCmdDispatchGraphAMDX-OpTypeImage-07027
For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- VUID-vkCmdDispatchGraphAMDX-OpTypeImage-07028
For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain
• VUID-vkCmdDispatchGraphAMDX-OpTypeImage-07029
  For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

• VUID-vkCmdDispatchGraphAMDX-OpTypeImage-07030
  Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

• VUID-vkCmdDispatchGraphAMDX-None-08600
  For each set n that is statically used by a bound shader, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout or VkDescriptorsetLayout array that was used to create the current VkPipeline or VkShaderEXT, as described in Pipeline Layout Compatibility

• VUID-vkCmdDispatchGraphAMDX-None-08601
  For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout or VkDescriptorsetLayout and VkPushConstantRange arrays used to create the current VkPipeline or VkShaderEXT, as described in Pipeline Layout Compatibility

• VUID-vkCmdDispatchGraphAMDX-maintenance4-08602
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout or VkDescriptorsetLayout and VkPushConstantRange arrays used to create the current VkPipeline or VkShaderEXT, as described in Pipeline Layout Compatibility

• VUID-vkCmdDispatchGraphAMDX-None-08114
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid if they are statically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was not created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

• VUID-vkCmdDispatchGraphAMDX-None-08115
  If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdBindDescriptorSets, the bound VkPipeline must have been created without VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

• VUID-vkCmdDispatchGraphAMDX-None-08116
  Descriptors in bound descriptor buffers, specified via vkCmdSetDescriptorBufferOffsetsEXT, must be valid if they are dynamically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

• VUID-vkCmdDispatchGraphAMDX-None-08604
  Descriptors in bound descriptor buffers, specified via vkCmdSetDescriptorBufferOffsetsEXT, must be valid if they are dynamically used by any
VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command

- **VUID-vkCmdDispatchGraphAMDX-None-08117**
  If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdSetDescriptorBufferOffsetsEXT, the bound VkPipeline must have been created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- **VUID-vkCmdDispatchGraphAMDX-None-08119**
  If a descriptor is dynamically used with a VkPipeline created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory must be resident

- **VUID-vkCmdDispatchGraphAMDX-None-08605**
  If a descriptor is dynamically used with a VkShaderEXT created with a VkDescriptorSetLayout that was created with VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory must be resident

- **VUID-vkCmdDispatchGraphAMDX-None-08606**
  If the shaderObject feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command

- **VUID-vkCmdDispatchGraphAMDX-None-08607**
  If the shaderObject is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command

- **VUID-vkCmdDispatchGraphAMDX-None-08608**
  If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound

- **VUID-vkCmdDispatchGraphAMDX-None-08609**
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage

- **VUID-vkCmdDispatchGraphAMDX-None-08610**
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage

- **VUID-vkCmdDispatchGraphAMDX-None-08611**
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler
must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage

- VUID-vkCmdDispatchGraphAMDX-uniformBuffers-06935
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDispatchGraphAMDX-None-08612
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDispatchGraphAMDX-storageBuffers-06936
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDispatchGraphAMDX-None-08613
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDispatchGraphAMDX-commandBuffer-02707
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by bound shaders must not be a protected resource

- VUID-vkCmdDispatchGraphAMDX-None-06550
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y′C′B′C conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions

- VUID-vkCmdDispatchGraphAMDX-ConstOffset-06551
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y′C′B′C conversion, that object must not use the ConstOffset and Offset operands

- VUID-vkCmdDispatchGraphAMDX-viewType-07752
  If a VkImageView is accessed as a result of this command, then the image view’s viewType must match the Dim operand of the OpTypeImage as described in Instruction/Sampler/Image View Validation

- VUID-vkCmdDispatchGraphAMDX-format-07753
  If a VkImageView is accessed as a result of this command, then the numeric type of the
image view's format and the Sampled Type operand of the OpTypeImage must match

- **VUID-vkCmdDispatchGraphAMDX-OpImageWrite-08795**
  If a VkImageView created with a format other than VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view's format

- **VUID-vkCmdDispatchGraphAMDX-OpImageWrite-08796**
  If a VkImageView created with the format VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have four components

- **VUID-vkCmdDispatchGraphAMDX-OpImageWrite-04469**
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view's format

- **VUID-vkCmdDispatchGraphAMDX-SampledType-04470**
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- **VUID-vkCmdDispatchGraphAMDX-SampledType-04471**
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- **VUID-vkCmdDispatchGraphAMDX-SampledType-04472**
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- **VUID-vkCmdDispatchGraphAMDX-SampledType-04473**
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- **VUID-vkCmdDispatchGraphAMDX-sparseImageInt64Atomics-04474**
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- **VUID-vkCmdDispatchGraphAMDX-sparseImageInt64Atomics-04475**
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- **VUID-vkCmdDispatchGraphAMDX-OpImageWeightedSampleQCOM-06971**
  If OpImageWeightedSampleQCOM is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM

- **VUID-vkCmdDispatchGraphAMDX-OpImageWeightedSampleQCOM-06972**
  If OpImageWeightedSampleQCOM uses a VkImageView as a sample weight image as a result of
this command, then the image view's **format features** must contain `VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM`

- **VUID-vkCmdDispatchGraphAMDX-OpImageBoxFilterQCOM-06973**
  If `OpImageBoxFilterQCOM` is used to sample a `VkImageView` as a result of this command, then the image view's **format features** must contain `VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM`

- **VUID-vkCmdDispatchGraphAMDX-OpImageBlockMatchSSDQCOM-06974**
  If `OpImageBlockMatchSSDQCOM` is used to read from an `VkImageView` as a result of this command, then the image view's **format features** must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`

- **VUID-vkCmdDispatchGraphAMDX-OpImageBlockMatchSADQCOM-06975**
  If `OpImageBlockMatchSADQCOM` is used to read from an `VkImageView` as a result of this command, then the image view's **format features** must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`

- **VUID-vkCmdDispatchGraphAMDX-OpImageBlockMatchWindowSSDQCOM-06976**
  If `OpImageBlockMatchWindowSSDQCOM` or `OpImageBlockMatchSSDQCOM` is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation

- **VUID-vkCmdDispatchGraphAMDX-OpImageBlockMatchWindow-09215**
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view's **format features** must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`

- **VUID-vkCmdDispatchGraphAMDX-OpImageBlockMatchWindow-09216**
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view's **format** must be a single-component format.

- **VUID-vkCmdDispatchGraphAMDX-OpImageBlockMatchWindow-09217**
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` read from a reference image as result of this command, then the specified reference coordinates **must** not fail integer texel coordinate validation

- **VUID-vkCmdDispatchGraphAMDX-None-07288**
Any shader invocation executed by this command must terminate

- VUID-vkCmdDispatchGraphAMDX-commandBuffer-09181
  commandBuffer must not be a protected command buffer

- VUID-vkCmdDispatchGraphAMDX-commandBuffer-09182
  commandBuffer must be a primary command buffer

- VUID-vkCmdDispatchGraphAMDX-scratch-09183
  scratch must be the device address of an allocated memory range at least as large as the value of VkExecutionGraphPipelineScratchSizeAMDX::size returned by VkExecutionGraphPipelineScratchSizeAMDX for the currently bound execution graph pipeline

- VUID-vkCmdDispatchGraphAMDX-scratch-09184
  scratch must be a device address within a VkBuffer created with the VK_BUFFER_USAGE_EXECUTION_GRAPH_SCRATCH_BIT_AMDX or VK_BUFFER_USAGE_2_EXECUTION_GRAPH_SCRATCH_BIT_AMDX flag

- VUID-vkCmdDispatchGraphAMDX-scratch-09185
  Device memory in the range [scratch, scratch + VkExecutionGraphPipelineScratchSizeAMDX::size) must have been initialized with vkCmdInitializeGraphScratchMemoryAMDX using the currently bound execution graph pipeline, and not modified after that by anything other than another execution graph dispatch command

- VUID-vkCmdDispatchGraphAMDX-maxComputeWorkGroupCount-09186
  Execution of this command must not cause a node to be dispatched with a larger number of workgroups than that specified by either a MaxNumWorkgroupsAMDX decoration in the dispatched node or maxComputeWorkGroupCount

- VUID-vkCmdDispatchGraphAMDX-maxExecutionGraphShaderPayloadCount-09187
  Execution of this command must not cause any shader to initialize more than maxExecutionGraphShaderPayloadCount output payloads

- VUID-vkCmdDispatchGraphAMDX-NodeMaxPayloadsAMDX-09188
  Execution of this command must not cause any shader that declares NodeMaxPayloadsAMDX to initialize more output payloads than specified by the max number of payloads for that decoration. This requirement applies to each NodeMaxPayloadsAMDX decoration separately

- VUID-vkCmdDispatchGraphAMDX-pCountInfo-09145
  pCountInfo->infos must be a host pointer to a memory allocation at least as large as the product of count and stride

- VUID-vkCmdDispatchGraphAMDX-infos-09146
  Host memory locations at indexes in the range [infos, infos + (count*stride)), at a granularity of stride must contain valid VkDispatchGraphInfoAMDX structures in the first 24 bytes

- VUID-vkCmdDispatchGraphAMDX-pCountInfo-09147
  For each VkDispatchGraphInfoAMDX structure in pCountInfo->infos, payloads must be a host pointer to a memory allocation at least as large as the product of payloadCount and payloadStride

- VUID-vkCmdDispatchGraphAMDX-pCountInfo-09148
For each `VkDispatchGraphInfoAMDX` structure in `pCountInfo->infos`, `nodeIndex` must be a valid node index in the currently bound execution graph pipeline, as returned by `vkGetExecutionGraphPipelineNodeIndexAMDX`.

- VUID-vkCmdDispatchGraphAMDX-pCountInfo-09149
  For each `VkDispatchGraphInfoAMDX` structure in `pCountInfo->infos`, host memory locations at indexes in the range `[payloads, payloads + (payloadCount * payloadStride)]`, at a granularity of `payloadStride` must contain a payload matching the size of the input payload expected by the node in `nodeIndex` in the first bytes.

### Valid Usage (Implicit)

- VUID-vkCmdDispatchGraphAMDX-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- VUID-vkCmdDispatchGraphAMDX-pCountInfo-parameter
  `pCountInfo` must be a valid pointer to a valid `VkDispatchGraphCountInfoAMDX` structure.

- VUID-vkCmdDispatchGraphAMDX-commandBuffer-recording
  `commandBuffer` must be in the recording state.

- VUID-vkCmdDispatchGraphAMDX-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations.

- VUID-vkCmdDispatchGraphAMDX-renderpass
  This command must only be called outside of a render pass instance.

- VUID-vkCmdDispatchGraphAMDX-videocoding
  This command must only be called outside of a video coding scope.

- VUID-vkCmdDispatchGraphAMDX-bufferlevel
  `commandBuffer` must be a primary `VkCommandBuffer`.

### Host Synchronization

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

To record an execution graph dispatch with node and payload parameters read on device, call:
```c
void vkCmdDispatchGraphIndirectAMDX(
    VkCommandBuffer   commandBuffer,  
    VkDeviceAddress   scratch,  
    const VkDispatchGraphCountInfoAMDX* pCountInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `scratch` is a pointer to the scratch memory to be used.
- `pCountInfo` is a host pointer to a `VkDispatchGraphCountInfoAMDX` structure defining the nodes which will be initially executed.

When this command is executed, the nodes specified in `pCountInfo` are executed. Nodes executed as part of this command are not implicitly synchronized in any way against each other once they are dispatched.

For this command, all device/host pointers in substructures are treated as device pointers and read during device execution of this command. All of these addresses will be read in the `VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT` pipeline stage with the `VK_ACCESS_2_SHADER_STORAGE_READ_BIT` access flag.

Execution of this command may modify any memory locations in the range `scratch`, \( scratch + size \) where \( size \) is the value returned in `VkExecutionGraphPipelineScratchSizeAMDX::size` by `VkExecutionGraphPipelineScratchSizeAMDX` for the currently bound execution graph pipeline. Accesses to this memory range are performed in the `VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT` pipeline stage with the `VK_ACCESS_2_SHADER_STORAGE_READ_BIT` and `VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT` access flags.

### Valid Usage

- **VUID-vkCmdDispatchGraphIndirectAMDX-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDispatchGraphIndirectAMDX-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDispatchGraphIndirectAMDX-None-06479**
  If a `VkImageView` is sampled with depth comparison, the image view’s format features must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`

- **VUID-vkCmdDispatchGraphIndirectAMDX-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then
the image view's format features must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT

- VUID-vkCmdDispatchGraphIndirectAMDX-None-07888
  If a VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features must contain VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT

- VUID-vkCmdDispatchGraphIndirectAMDX-None-02692
  If a VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT

- VUID-vkCmdDispatchGraphIndirectAMDX-None-02693
  If the VK_EXT_filter_cubic extension is not enabled and any VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, it must not have a VkImageViewType of VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY

- VUID-vkCmdDispatchGraphIndirectAMDX-filterCubic-02694
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2

- VUID-vkCmdDispatchGraphIndirectAMDX-filterCubicMinmax-02695
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2

- VUID-vkCmdDispatchGraphIndirectAMDX-cubicRangeClamp-09212
  If the cubicRangeClamp feature is not enabled, then any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must not have a VkSamplerReductionModeCreateInfo reductionMode equal to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM

- VUID-vkCmdDispatchGraphIndirectAMDX-reductionMode-09213
  Any VkImageView being sampled with a VkSamplerReductionModeCreateInfo::reductionMode equal to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM as a result of this command must sample with VK_FILTER_CUBIC_EXT

- VUID-vkCmdDispatchGraphIndirectAMDX-selectableCubicWeights-09214
  If the selectableCubicWeights feature is not enabled, then any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have VkSamplerCubicWeightsCreateInfoQCOM::cubicWeights equal to VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM

- VUID-vkCmdDispatchGraphIndirectAMDX-flags-02696
  Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be...
sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE

- **VUID-vkCmdDispatchGraphIndirectAMDX-OpTypeImage-07027**
  For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view’s format features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- **VUID-vkCmdDispatchGraphIndirectAMDX-OpTypeImage-07028**
  For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view’s format features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- **VUID-vkCmdDispatchGraphIndirectAMDX-OpTypeImage-07029**
  For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- **VUID-vkCmdDispatchGraphIndirectAMDX-OpTypeImage-07030**
  Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- **VUID-vkCmdDispatchGraphIndirectAMDX-None-08600**
  For each set n that is statically used by a bound shader, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout or VkDescriptorSetLayout array that was used to create the current VkPipeline or VkShaderEXT, as described in Pipeline Layout Compatibility

- **VUID-vkCmdDispatchGraphIndirectAMDX-None-08601**
  For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout or VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkPipeline or VkShaderEXT, as described in Pipeline Layout Compatibility

- **VUID-vkCmdDispatchGraphIndirectAMDX-maintenance4-08602**
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout or VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkPipeline or VkShaderEXT, as described in Pipeline Layout Compatibility

- **VUID-vkCmdDispatchGraphIndirectAMDX-None-08114**
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid if they are statically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was not created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- **VUID-vkCmdDispatchGraphIndirectAMDX-None-08115**
  If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdBindDescriptorSets, the bound VkPipeline must have been created without VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT
Descriptors in bound descriptor buffers, specified via *vkCmdSetDescriptorBufferOffsetsEXT*, **must** be valid if they are dynamically used by the *VkPipeline* bound to the pipeline bind point used by this command and the bound *VkPipeline* was created with *VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT*

Descriptors in bound descriptor buffers, specified via *vkCmdSetDescriptorBufferOffsetsEXT*, **must** be valid if they are dynamically used by any *VkShaderEXT* bound to a stage corresponding to the pipeline bind point used by this command.

If the descriptors used by the *VkPipeline* bound to the pipeline bind point were specified via *vkCmdSetDescriptorBufferOffsetsEXT*, the bound *VkPipeline* **must** have been created with *VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT*

If a descriptor is dynamically used with a *VkPipeline* created with *VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT*, the descriptor memory **must** be resident.

If a descriptor is dynamically used with a *VkShaderEXT* created with a *VkDescriptorSetLayout* that was created with *VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT*, the descriptor memory **must** be resident.

If the *shaderObject* feature is not enabled, a valid pipeline **must** be bound to the pipeline bind point used by this command.

If the *shaderObject* is enabled, either a valid pipeline **must** be bound to the pipeline bind point used by this command, or a valid combination of valid and *VK_NULL_HANDLE* shader objects **must** be bound to every supported shader stage corresponding to the pipeline bind point used by this command.

If a pipeline is bound to the pipeline bind point used by this command, there **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the *VkPipeline* object bound to the pipeline bind point used by this command, since that pipeline was bound.

If the *VkPipeline* object bound to the pipeline bind point used by this command or any *VkShaderEXT* bound to a stage corresponding to the pipeline bind point used by this command accesses a *VkSampler* object that uses unnormalized coordinates, that sampler **must** not be used to sample from any *VkImage* with a *VkImageView* of the type *VK_IMAGE_VIEW_TYPE_3D*, *VK_IMAGE_VIEW_TYPE_CUBE*, *VK_IMAGE_VIEW_TYPE_1D_ARRAY*, *VK_IMAGE_VIEW_TYPE_2D_ARRAY* or *VK_IMAGE_VIEW_TYPE_CUBE_ARRAY*, in any shader stage.

If the *VkPipeline* object bound to the pipeline bind point used by this command or any
VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage

• VUID-vkCmdDispatchGraphIndirectAMDX-None-08611
If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage

• VUID-vkCmdDispatchGraphIndirectAMDX-uniformBuffers-06935
If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

• VUID-vkCmdDispatchGraphIndirectAMDX-None-08612
If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

• VUID-vkCmdDispatchGraphIndirectAMDX-storageBuffers-06936
If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

• VUID-vkCmdDispatchGraphIndirectAMDX-None-08613
If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

• VUID-vkCmdDispatchGraphIndirectAMDX-commandBuffer-02707
If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by bound shaders must not be a protected resource

• VUID-vkCmdDispatchGraphIndirectAMDX-None-06550
If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y'C aC conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions

• VUID-vkCmdDispatchGraphIndirectAMDX-ConstOffset-06551
If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y'C
a conversion, that object must not use the ConstOffset and Offset operands

- **VUID-vkCmdDispatchGraphIndirectAMDX-viewType-07752**
  If a VkImageView is accessed as a result of this command, then the image view’s viewType must match the Dim operand of the OpTypeImage as described in Instruction/Sampler/Image View Validation.

- **VUID-vkCmdDispatchGraphIndirectAMDX-format-07753**
  If a VkImageView is accessed as a result of this command, then the numeric type of the image view’s format and the Sampled Type operand of the OpTypeImage must match.

- **VUID-vkCmdDispatchGraphIndirectAMDX-OpImageWrite-08795**
  If a VkImageView created with a format other than VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view’s format.

- **VUID-vkCmdDispatchGraphIndirectAMDX-OpImageWrite-08796**
  If a VkImageView created with the format VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have four components.

- **VUID-vkCmdDispatchGraphIndirectAMDX-OpImageWrite-04469**
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format.

- **VUID-vkCmdDispatchGraphIndirectAMDX-SampledType-04470**
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- **VUID-vkCmdDispatchGraphIndirectAMDX-SampledType-04471**
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

- **VUID-vkCmdDispatchGraphIndirectAMDX-SampledType-04472**
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- **VUID-vkCmdDispatchGraphIndirectAMDX-SampledType-04473**
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

- **VUID-vkCmdDispatchGraphIndirectAMDX-sparseImageInt64Atomics-04474**
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

- **VUID-vkCmdDispatchGraphIndirectAMDX-sparseImageInt64Atomics-04475**
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions.
through an OpTypeImage with a SampledType with a Width of 64 by this command

• VUID-vkCmdDispatchGraphIndirectAMDX-OpImageWeightedSampleQCOM-06971
  If OpImageWeightedSampleQCOM is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_WEIGHT_SAMPED_IMAGE_BIT_QCOM

• VUID-vkCmdDispatchGraphIndirectAMDX-OpImageWeightedSampleQCOM-06972
  If OpImageWeightedSampleQCOM uses a VkImageView as a sample weight image as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM

• VUID-vkCmdDispatchGraphIndirectAMDX-OpImageBoxFilterQCOM-06973
  If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPED_BIT_QCOM

• VUID-vkCmdDispatchGraphIndirectAMDX-OpImageBlockMatchSSDQCOM-06974
  If OpImageBlockMatchSSDQCOM is used to read from a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

• VUID-vkCmdDispatchGraphIndirectAMDX-OpImageBlockMatchSSDQCOM-06975
  If OpImageBlockMatchSSDQCOM is used to read from a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

• VUID-vkCmdDispatchGraphIndirectAMDX-OpImageBlockMatchSSDQCOM-06976
  If OpImageBlockMatchSSDQCOM or OpImageBlockMatchSSDQCOM is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation

• VUID-vkCmdDispatchGraphIndirectAMDX-OpImageWeightedSampleQCOM-06977
  If OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchWindowSSDQCOM, OpImageBlockMatchWindowSADQCOM, OpImageBlockMatchGatherSSDQCOM, OpImageBlockMatchGatherSADQCOM, or OpImageBlockMatchSSDQCOM uses a VkSampler as a result of this command, then the sampler must have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM

• VUID-vkCmdDispatchGraphIndirectAMDX-OpImageWeightedSampleQCOM-06978
  If any command other than OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchWindowSSDQCOM, OpImageBlockMatchWindowSADQCOM, OpImageBlockMatchGatherSSDQCOM, OpImageBlockMatchGatherSADQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSSDQCOM uses a VkSampler as a result of this command, then the sampler must not have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM

• VUID-vkCmdDispatchGraphIndirectAMDX-OpImageBlockMatchWindow-09215
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM instruction is used to read from a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

• VUID-vkCmdDispatchGraphIndirectAMDX-OpImageBlockMatchWindow-09216
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM instruction is used to
read from an VkImageView as a result of this command, then the image view’s format must be a single-component format.

- VUID-vkCmdDispatchGraphIndirectAMDX-OpImageBlockMatchWindow-09217
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation

- VUID-vkCmdDispatchGraphIndirectAMDX-OpImageBlockMatchWindow-09217
  Any shader invocation executed by this command must terminate

- VUID-vkCmdDispatchGraphIndirectAMDX-commandBuffer-09181
  commandBuffer must not be a protected command buffer

- VUID-vkCmdDispatchGraphIndirectAMDX-commandBuffer-09182
  commandBuffer must be a primary command buffer

- VUID-vkCmdDispatchGraphIndirectAMDX-scratch-09183
  scratch must be the device address of an allocated memory range at least as large as the value of VkExecutionGraphPipelineScratchSizeAMDX::size returned by VkExecutionGraphPipelineScratchSizeAMDX for the currently bound execution graph pipeline

- VUID-vkCmdDispatchGraphIndirectAMDX-scratch-09184
  scratch must be a device address within a VkBuffer created with the VK_BUFFER_USAGE_EXECUTION_GRAPH_SCRATCH_BIT_AMDX or VK_BUFFER_USAGE_2_EXECUTION_GRAPH_SCRATCH_BIT_AMDX flag

- VUID-vkCmdDispatchGraphIndirectAMDX-scratch-09185
  Device memory in the range [scratch,scratch VkExecutionGraphPipelineScratchSizeAMDX::size) must have been initialized with vkCmdInitializeGraphScratchMemoryAMDX using the currently bound execution graph pipeline, and not modified after that by anything other than another execution graph dispatch command

- VUID-vkCmdDispatchGraphIndirectAMDX-maxComputeWorkGroupCount-09186
  Execution of this command must not cause a node to be dispatched with a larger number of workgroups than that specified by either a MaxNumWorkgroupsAMDX decoration in the dispatched node or maxComputeWorkGroupCount

- VUID-vkCmdDispatchGraphIndirectAMDX-maxExecutionGraphShaderPayloadCount-09187
  Execution of this command must not cause any shader to initialize more than maxExecutionGraphShaderPayloadCount output payloads

- VUID-vkCmdDispatchGraphIndirectAMDX-NodeMaxPayloadsAMDX-09188
  Execution of this command must not cause any shader that declares NodeMaxPayloadsAMDX to initialize more output payloads than specified by the max number of payloads for that decoration. This requirement applies to each NodeMaxPayloadsAMDX decoration separately

- VUID-vkCmdDispatchGraphIndirectAMDX-pCountInfo-09150
  pCountInfo->infos must be a device pointer to a memory allocation at least as large as the product of count and stride when this command is executed on the device

- VUID-vkCmdDispatchGraphIndirectAMDX-pCountInfo-09151
pCountInfo->infos must be a device address within a VkBuffer created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT flag

- VUID-vkCmdDispatchGraphIndirectAMDX-pCount-09152
  pCountInfo->infos must be a multiple of executionGraphDispatchAddressAlignment

- VUID-vkCmdDispatchGraphIndirectAMDX-infos-09153
  Device memory locations at indexes in the range [infos, infos + (count*stride)), at a granularity of stride must contain valid VkDispatchGraphInfoAMDX structures in the first 24 bytes when this command is executed on the device

- VUID-vkCmdDispatchGraphIndirectAMDX-pCountInfo-09154
  For each VkDispatchGraphInfoAMDX structure in pCountInfo->infos, payloads must be a device pointer to a memory allocation at least as large as the product of payloadCount and payloadStride when this command is executed on the device

- VUID-vkCmdDispatchGraphIndirectAMDX-pCountInfo-09155
  For each VkDispatchGraphInfoAMDX structure in pCountInfo->infos, payloads must be a device address within a VkBuffer created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT flag

- VUID-vkCmdDispatchGraphIndirectAMDX-pCountInfo-09156
  For each VkDispatchGraphInfoAMDX structure in pCountInfo->infos, payloads must be a multiple of executionGraphDispatchAddressAlignment

- VUID-vkCmdDispatchGraphIndirectAMDX-pCountInfo-09157
  For each VkDispatchGraphInfoAMDX structure in pCountInfo->infos, nodeIndex must be a valid node index in the currently bound execution graph pipeline, as returned by vkGetExecutionGraphPipelineNodeIndexAMDX when this command is executed on the device

- VUID-vkCmdDispatchGraphIndirectAMDX-pCountInfo-09158
  For each VkDispatchGraphInfoAMDX structure in pCountInfo->infos, device memory locations at indexes in the range [payloads, payloads + (payloadCount * payloadStride)), at a granularity of payloadStride must contain a payload matching the size of the input payload expected by the node in nodeIndex in the first bytes when this command is executed on the device

Valid Usage (Implicit)

- VUID-vkCmdDispatchGraphIndirectAMDX-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdDispatchGraphIndirectAMDX-pCountInfo-parameter
  pCountInfo must be a valid pointer to a valid VkDispatchGraphCountInfoAMDX structure

- VUID-vkCmdDispatchGraphIndirectAMDX-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdDispatchGraphIndirectAMDX-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations
• VUID-vkCmdDispatchGraphIndirectAMDX-renderpass
  This command must only be called outside of a render pass instance

• VUID-vkCmdDispatchGraphIndirectAMDX-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdDispatchGraphIndirectAMDX-bufferlevel
  commandBuffer must be a primary VkCommandBuffer

Host Synchronization

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

To record an execution graph dispatch with all parameters read on device, call:

```c
// Provided by VK_AMDX_shader_enqueue
def void vkCmdDispatchGraphIndirectCountAMDX(
    VkCommandBuffer commandBuffer,
    VkDeviceAddress scratch,
    VkDeviceAddress countInfo);
```

• commandBuffer is the command buffer into which the command will be recorded.

• scratch is a pointer to the scratch memory to be used.

• countInfo is a device address of a VkDispatchGraphCountInfoAMDX structure defining the nodes which will be initially executed.

When this command is executed, the nodes specified in countInfo are executed. Nodes executed as part of this command are not implicitly synchronized in any way against each other once they are dispatched.

For this command, all pointers in substructures are treated as device pointers and read during device execution of this command. The allocation and contents of these pointers only needs to be valid during device execution. All of these addresses will be read in the VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT pipeline stage with the VK_ACCESS_2_SHADER_STORAGE_READ_BIT access flag.

Execution of this command may modify any memory locations in the range [scratch, scratch + size),
where \( \text{size} \) is the value returned in `VkExecutionGraphPipelineScratchSizeAMDX::size` by `VkExecutionGraphPipelineScratchSizeAMDX` for the currently bound execution graph pipeline. Accesses to this memory range are performed in the `VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT` pipeline stage with the `VK_ACCESS_2_SHADER_STORAGE_READ_BIT` and `VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT` access flags.

### Valid Usage

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-None-06479**
  If a `VkImageView` is sampled with depth comparison, the image view's format features must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-None-02692**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-None-02693**
  If the `VK_EXT_filter_cubic` extension is not enabled and any `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, it must not have a `VkImageViewType` of `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-filterCubic-02694**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-filterCubicMinmax-02695**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of...
either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-cubicRangeClamp-09212**
  If the `cubicRangeClamp` feature is not enabled, then any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must not have a `VkSamplerReductionModeCreateInfo` reductionMode equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM`.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-reductionMode-09213**
  Any `VkImageView` being sampled with a `VkSamplerReductionModeCreateInfo::reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM` as a result of this command must sample with `VK_FILTER_CUBIC_EXT`.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-selectableCubicWeights-09214**
  If the `selectableCubicWeights` feature is not enabled, then any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have `VkSamplerCubicWeightsCreateInfoQCOM::cubicWeights` equal to `VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM`.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-flags-02696**
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-OpTypeImage-07027**
  For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is Unknown, the view’s format features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-OpTypeImage-07028**
  For any `VkImageView` being read as a storage image where the image format field of the `OpTypeImage` is Unknown, the view’s format features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-OpTypeImage-07029**
  For any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is Unknown, the view’s buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-OpTypeImage-07030**
  Any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is Unknown then the view’s buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-None-08600**
  For each set n that is statically used by a bound shader, a descriptor set must have been bound to n at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set n, with the `VkPipelineLayout` or `VkDescriptorSetLayout` array that was used to create...
the current VkPipeline or VkShaderEXT, as described in Pipeline Layout Compatibility

- VUID-vkCmdDispatchGraphIndirectCountAMDX-None-08601
  For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout or VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkPipeline or VkShaderEXT, as described in Pipeline Layout Compatibility

- VUID-vkCmdDispatchGraphIndirectCountAMDX-maintenance4-08602
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout or VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkPipeline or VkShaderEXT, as described in Pipeline Layout Compatibility

- VUID-vkCmdDispatchGraphIndirectCountAMDX-None-08114
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid if they are statically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was not created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdDispatchGraphIndirectCountAMDX-None-08115
  If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdBindDescriptorSets, the bound VkPipeline must have been created without VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdDispatchGraphIndirectCountAMDX-None-08116
  Descriptors in bound descriptor buffers, specified via vkCmdSetDescriptorBufferOffsetsEXT, must be valid if they are dynamically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdDispatchGraphIndirectCountAMDX-None-08604
  Descriptors in bound descriptor buffers, specified via vkCmdSetDescriptorBufferOffsetsEXT, must be valid if they are dynamically used by any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command

- VUID-vkCmdDispatchGraphIndirectCountAMDX-None-08117
  If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdSetDescriptorBufferOffsetsEXT, the bound VkPipeline must have been created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdDispatchGraphIndirectCountAMDX-None-08119
  If a descriptor is dynamically used with a VkPipeline created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory must be resident

- VUID-vkCmdDispatchGraphIndirectCountAMDX-None-08605
  If a descriptor is dynamically used with a VkShaderEXT created with VkDescriptorSetLayout that was created with VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory must
be resident

- VUID-vkCmdDispatchGraphIndirectCountAMDX-None-08606
  If the shaderObject feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command.

- VUID-vkCmdDispatchGraphIndirectCountAMDX-None-08607
  If the shaderObject is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command.

- VUID-vkCmdDispatchGraphIndirectCountAMDX-None-08608
  If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound.

- VUID-vkCmdDispatchGraphIndirectCountAMDX-None-08609
