- the `propertyFlags` members of `Y` includes `VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD` or `VK_MEMORY_PROPERTY_DEVICE_UNCACHED_BIT_AMD` and `X` does not

---

**Note**

There is no ordering requirement between `X` and `Y` elements for the case their `propertyFlags` members are not in a subset relation. That potentially allows more than one possible way to order the same set of memory types. Notice that the list of all allowed memory property flag combinations is written in a valid order. But if
instead `VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT` was before `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT`, the list would still be in a valid order.

There may be a performance penalty for using device coherent or uncached device memory types, and using these accidentally is undesirable. In order to avoid this, memory types with these properties always appear at the end of the list; but are subject to the same rules otherwise.

This ordering requirement enables applications to use a simple search loop to select the desired memory type along the lines of:

```c
int32_t findProperties(const VkPhysicalDeviceMemoryProperties* pMemoryProperties,
                        uint32_t memoryTypeBitsRequirement,
                        VkMemoryPropertyFlags requiredProperties) {
    const uint32_t memoryCount = pMemoryProperties->memoryTypeCount;
    for (uint32_t memoryIndex = 0; memoryIndex < memoryCount; ++memoryIndex) {
        const uint32_t memoryTypeBits = (1 << memoryIndex);
        const bool isRequiredMemoryType = memoryTypeBitsRequirement & memoryTypeBits;
        const VkMemoryPropertyFlags properties = pMemoryProperties->memoryTypes[memoryIndex].propertyFlags;
        const bool hasRequiredProperties = (properties & requiredProperties) == requiredProperties;
        if (isRequiredMemoryType && hasRequiredProperties)
            return static_cast<int32_t>(memoryIndex);
    }
    // failed to find memory type
    return -1;
}
```

// Try to find an optimal memory type, or if it does not exist try fallback memory type
// `device` is the VkDevice
// `image` is the VkImage that requires memory to be bound
// `memoryProperties` properties as returned by vkGetPhysicalDeviceMemoryProperties
// `requiredProperties` are the property flags that must be present
// `optimalProperties` are the property flags that are preferred by the application

VkMemoryRequirements memoryRequirements;
vkGetImageMemoryRequirements(device, image, &memoryRequirements);
int32_t memoryType = findProperties(&memoryProperties, memoryRequirements.memoryTypeBits, optimalProperties);
if (memoryType == -1) // not found; try fallback properties
    memoryType = findProperties(&memoryProperties, memoryRequirements.memoryTypeBits, optimalProperties);
VK_MAX_MEMORY_TYPES is the length of an array of VkMemoryType structures describing memory types, as returned in VkPhysicalDeviceMemoryProperties::memoryTypes.

#define VK_MAX_MEMORY_TYPES 32U

VK_MAX_MEMORY_HEAPS is the length of an array of VkMemoryHeap structures describing memory heaps, as returned in VkPhysicalDeviceMemoryProperties::memoryHeaps.

#define VK_MAX_MEMORY_HEAPS 16U

To query memory properties, call:

// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceMemoryProperties2(
  VkPhysicalDevice physicalDevice,
  VkPhysicalDeviceMemoryProperties2* pMemoryProperties);

or the equivalent command

// Provided by VK_KHR_get_physical_device_properties2
void vkGetPhysicalDeviceMemoryProperties2KHR(
  VkPhysicalDevice physicalDevice,
  VkPhysicalDeviceMemoryProperties2* pMemoryProperties);

• physicalDevice is the handle to the device to query.
• pMemoryProperties is a pointer to a VkPhysicalDeviceMemoryProperties2 structure in which the properties are returned.

vkGetPhysicalDeviceMemoryProperties2 behaves similarly to vkGetPhysicalDeviceMemoryProperties, with the ability to return extended information in a pNext chain of output structures.

Valid Usage (Implicit)

• VUID-vkGetPhysicalDeviceMemoryProperties2-physicalDevice-parameter physicalDevice must be a valid VkPhysicalDevice handle
• VUID-vkGetPhysicalDeviceMemoryProperties2-pMemoryProperties-parameter pMemoryProperties must be a valid pointer to a VkPhysicalDeviceMemoryProperties2 structure

The VkPhysicalDeviceMemoryProperties2 structure is defined as:
typedef struct VkPhysicalDeviceMemoryProperties2 {
    VkStructureType sType;
    void* pNext;
    VkPhysicalDeviceMemoryProperties memoryProperties;
} VkPhysicalDeviceMemoryProperties2;

or the equivalent

typedef VkPhysicalDeviceMemoryProperties2 VkPhysicalDeviceMemoryProperties2KHR;

• **sType** is a VkStructureType value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **memoryProperties** is a VkPhysicalDeviceMemoryProperties structure which is populated with the same values as in vkGetPhysicalDeviceMemoryProperties.

**Valid Usage (Implicit)**

• VUID-VkPhysicalDeviceMemoryProperties2-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MEMORY_PROPERTIES_2

• VUID-VkPhysicalDeviceMemoryProperties2-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkPhysicalDeviceMemoryBudgetPropertiesEXT

• VUID-VkPhysicalDeviceMemoryProperties2-sType-unique
  The sType value of each struct in the pNext chain must be unique

The **VkMemoryHeap** structure is defined as:

typedef struct VkMemoryHeap {
    VkDeviceSize size;
    VkMemoryHeapFlags flags;
} VkMemoryHeap;

• **size** is the total memory size in bytes in the heap.
• **flags** is a bitmask of VkMemoryHeapFlagBits specifying attribute flags for the heap.

Bits which may be set in VkMemoryHeap::flags, indicating attribute flags for the heap, are:

typedef enum VkMemoryHeapFlagBits {
    VK_MEMORY_HEAP_DEVICE_LOCAL_BIT = 0x00000001,
} VkMemoryHeapFlagBits;
• **VK_MEMORY_HEAP_DEVICE_LOCAL_BIT** specifies that the heap corresponds to device-local memory. Device-local memory may have different performance characteristics than host-local memory, and may support different memory property flags.

• **VK_MEMORY_HEAP_MULTI_INSTANCE_BIT** specifies that in a logical device representing more than one physical device, there is a per-physical device instance of the heap memory. By default, an allocation from such a heap will be replicated to each physical device's instance of the heap.

`VkMemoryHeapFlags` is a bitmask type for setting a mask of zero or more `VkMemoryHeapFlagBits`.

The `VkMemoryType` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkMemoryHeapFlags;
```

```
// Provided by VK_VERSION_1_0
typedef struct VkMemoryType {
    VkMemoryPropertyFlags propertyFlags;
    uint32_t heapIndex;
} VkMemoryType;
```

- **heapIndex** describes which memory heap this memory type corresponds to, and must be less than `memoryHeapCount` from the `VkPhysicalDeviceMemoryProperties` structure.
- **propertyFlags** is a bitmask of `VkMemoryPropertyFlagBits` of properties for this memory type.

Bits which may be set in `VkMemoryType::propertyFlags`, indicating properties of a memory type, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkMemoryPropertyFlagBits {
    VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT = 0x00000001,
    VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT = 0x00000002,
    VK_MEMORY_PROPERTY_HOST_COHERENT_BIT = 0x00000004,
    VK_MEMORY_PROPERTY_HOST_CACHED_BIT = 0x00000008,
    VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT = 0x00000010,
    // Provided by VK_VERSION_1_1
    VK_MEMORY_PROPERTY_PROTECTED_BIT = 0x00000020,
    // Provided by VK_AMD_device_coherent_memory
    VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD = 0x000000040,
    // Provided by VK_AMD_device_coherent_memory
    VK_MEMORY_PROPERTY_DEVICE_UNCACHED_BIT_AMD = 0x000000080,
```

884
• **VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT** bit specifies that memory allocated with this type is the most efficient for device access. This property will be set if and only if the memory type belongs to a heap with the **VK_MEMORY_HEAP_DEVICE_LOCAL_BIT** set.

• **VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT** bit specifies that memory allocated with this type can be mapped for host access using `vkMapMemory`.

• **VK_MEMORY_PROPERTY_HOST_COHERENT_BIT** bit specifies that the host cache management commands `vkFlushMappedMemoryRanges` and `vkInvalidateMappedMemoryRanges` are not needed to flush host writes to the device or make device writes visible to the host, respectively.

• **VK_MEMORY_PROPERTY_HOST_CACHED_BIT** bit specifies that memory allocated with this type is cached on the host. Host memory accesses to uncached memory are slower than to cached memory, however uncached memory is always host coherent.

• **VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT** bit specifies that the memory type only allows device access to the memory. Memory types must not have both **VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT** and **VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT** set. Additionally, the object’s backing memory may be provided by the implementation lazily as specified in Lazily Allocated Memory.

• **VK_MEMORY_PROPERTY_PROTECTED_BIT** bit specifies that the memory type only allows device access to the memory, and allows protected queue operations to access the memory. Memory types must not have **VK_MEMORY_PROPERTY_PROTECTED_BIT** set and any of **VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT** set, or **VK_MEMORY_PROPERTY_HOST_COHERENT_BIT** set, or **VK_MEMORY_PROPERTY_HOST_CACHED_BIT** set.

• **VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD** bit specifies that device accesses to allocations of this memory type are automatically made available and visible.

• **VK_MEMORY_PROPERTYDEVICE_UNCACHED_BIT_AMD** bit specifies that memory allocated with this type is not cached on the device. Uncached device memory is always device coherent.

• **VK_MEMORY_PROPERTY_RDMA_CAPABLE_BIT_NV** bit specifies that external devices can access this memory directly.

For any memory allocated with both the **VK_MEMORY_PROPERTY_HOST_COHERENT_BIT** and the **VK_MEMORY_PROPERTYDEVICE_COHERENT_BIT_AMD**, host or device accesses also perform automatic memory domain transfer operations, such that writes are always automatically available and visible to both host and device memory domains.

---

**Note**

Device coherence is a useful property for certain debugging use cases (e.g. crash analysis, where performing separate coherence actions could mean values are not reported correctly). However, device coherent accesses may be slower than equivalent accesses without device coherence, particularly if they are also device uncached. For device uncached memory in particular, repeated accesses to the same or neighbouring memory locations over a short time period (e.g. within a
frame) may be slower than it would be for the equivalent cached memory type. As such, it is generally inadvisable to use device coherent or device uncached memory except when really needed.

```c
// Provided by VK_VERSION_1_0
typedef VkFlagsVkMemoryPropertyFlags;
```

`VkMemoryPropertyFlags` is a bitmask type for setting a mask of zero or more `VkMemoryPropertyFlagBits`.

If the `VkPhysicalDeviceMemoryBudgetPropertiesEXT` structure is included in the `pNext` chain of `VkPhysicalDeviceMemoryProperties2`, it is filled with the current memory budgets and usages.

The `VkPhysicalDeviceMemoryBudgetPropertiesEXT` structure is defined as:

```c
// Provided by VK_EXT_memory_budget
typedef struct VkPhysicalDeviceMemoryBudgetPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    VkDeviceSize heapBudget[VK_MAX_MEMORY_HEAPS];
    VkDeviceSize heapUsage[VK_MAX_MEMORY_HEAPS];
} VkPhysicalDeviceMemoryBudgetPropertiesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `heapBudget` is an array of `VK_MAXMEMORYHEAPS` `VkDeviceSize` values in which memory budgets are returned, with one element for each memory heap. A heap’s budget is a rough estimate of how much memory the process can allocate from that heap before allocations may fail or cause performance degradation. The budget includes any currently allocated device memory.
- `heapUsage` is an array of `VK_MAXMEMORYHEAPS` `VkDeviceSize` values in which memory usages are returned, with one element for each memory heap. A heap’s usage is an estimate of how much memory the process is currently using in that heap.

The values returned in this structure are not invariant. The `heapBudget` and `heapUsage` values must be zero for array elements greater than or equal to `VkPhysicalDeviceMemoryProperties::memoryHeapCount`. The `heapBudget` value must be non-zero for array elements less than `VkPhysicalDeviceMemoryProperties::memoryHeapCount`. The `heapBudget` value must be less than or equal to `VkMemoryHeap::size` for each heap.

**Valid Usage (Implicit)**

- `VUID-VkPhysicalDeviceMemoryBudgetPropertiesEXT-sType-sType` `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MEMORY_BUDGET_PROPERTIES_EXT`
11.2.2. Device Memory Objects

A Vulkan device operates on data in device memory via memory objects that are represented in the API by a `VkDeviceMemory` handle:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDeviceMemory)
```

11.2.3. Device Memory Allocation

To allocate memory objects, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkAllocateMemory(VkDevice device, const VkMemoryAllocateInfo* pAllocateInfo, const VkAllocationCallbacks* pAllocator, VkDeviceMemory* pMemory);
```

- `device` is the logical device that owns the memory.
- `pAllocateInfo` is a pointer to a `VkMemoryAllocateInfo` structure describing parameters of the allocation. A successfully returned allocation must use the requested parameters—no substitution is permitted by the implementation.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pMemory` is a pointer to a `VkDeviceMemory` handle in which information about the allocated memory is returned.

Allocations returned by `vkAllocateMemory` are guaranteed to meet any alignment requirement of the implementation. For example, if an implementation requires 128 byte alignment for images and 64 byte alignment for buffers, the device memory returned through this mechanism would be 128-byte aligned. This ensures that applications can correctly suballocate objects of different types (with potentially different alignment requirements) in the same memory object.

When memory is allocated, its contents are undefined with the following constraint:

- The contents of unprotected memory must not be a function of the contents of data protected memory objects, even if those memory objects were previously freed.

```
Note
The contents of memory allocated by one application should not be a function of data from protected memory objects of another application, even if those memory objects were previously freed.
```

The maximum number of valid memory allocations that can exist simultaneously within a `VkDevice` may be restricted by implementation- or platform-dependent limits. The `maxMemoryAllocationCount` feature describes the number of allocations that can exist simultaneously.
before encountering these internal limits.

**Note**

For historical reasons, if `maxMemoryAllocationCount` is exceeded, some implementations may return `VK_ERROR_TOO_MANY_OBJECTS`. Exceeding this limit will result in undefined behavior, and an application should not rely on the use of the returned error code in order to identify when the limit is reached.

**Note**

Many protected memory implementations involve complex hardware and system software support, and often have additional and much lower limits on the number of simultaneous protected memory allocations (from memory types with the `VK_MEMORY_PROPERTY_PROTECTED_BIT` property) than for non-protected memory allocations. These limits can be system-wide, and depend on a variety of factors outside of the Vulkan implementation, so they cannot be queried in Vulkan. Applications should use as few allocations as possible from such memory types by suballocating aggressively, and be prepared for allocation failure even when there is apparently plenty of capacity remaining in the memory heap. As a guideline, the Vulkan conformance test suite requires that at least 80 minimum-size allocations can exist concurrently when no other uses of protected memory are active in the system.

Some platforms may have a limit on the maximum size of a single allocation. For example, certain systems may fail to create allocations with a size greater than or equal to 4GB. Such a limit is implementation-dependent, and if such a failure occurs then the error `VK_ERROR_OUT_OF_DEVICE_MEMORY` must be returned. This limit is advertised in `VkPhysicalDeviceMaintenance3Properties::maxMemoryAllocationSize`.

The cumulative memory size allocated to a heap can be limited by the size of the specified heap. In such cases, allocated memory is tracked on a per-device and per-heap basis. Some platforms allow overallocation into other heaps. The overallocation behavior can be specified through the `VK_AMD_memory_overallocation_behavior` extension.

If the `VkPhysicalDevicePageableDeviceLocalMemoryFeaturesEXT:: pageableDeviceLocalMemory` feature is enabled, memory allocations made from a heap that includes `VK_MEMORY_HEAP_DEVICE_LOCAL_BIT` in `VkMemoryHeap::flags` may be transparently moved to host-local memory allowing multiple applications to share device-local memory. If there is no space left in device-local memory when this new allocation is made, other allocations may be moved out transparently to make room. The operating system will determine which allocations to move to device-local memory or host-local memory based on platform-specific criteria. To help the operating system make good choices, the application should set the appropriate memory priority with `VkMemoryPriorityAllocateInfoEXT` and adjust it as necessary with `vkSetDeviceMemoryPriorityEXT`. Higher priority allocations will moved to device-local memory first.

Memory allocations made on heaps without the `VK_MEMORY_HEAP_DEVICE_LOCAL_BIT` property will not be transparently promoted to device-local memory by the operating system.
Valid Usage

- VUID-vkAllocateMemory-pAllocateInfo-01713
  \[ p\text{AllocateInfo}\rightarrow\text{allocationSize} \text{ must be less than or equal to } \text{VkPhysicalDeviceMemoryProperties::memoryHeaps[memindex].size} \text{ where } \text{memindex = VkPhysicalDeviceMemoryProperties::memoryTypes[p\text{AllocateInfo}\rightarrow\text{memoryTypeIndex}.heapIndex] as returned by } \text{vkGetPhysicalDeviceMemoryProperties} \text{ for the } \text{VkPhysicalDevice} \text{ that device was created from} \]

- VUID-vkAllocateMemory-pAllocateInfo-01714
  \[ p\text{AllocateInfo}\rightarrow\text{memoryTypeIndex} \text{ must be less than } \text{VkPhysicalDeviceMemoryProperties::memoryTypeCount} \text{ as returned by } \text{vkGetPhysicalDeviceMemoryProperties} \text{ for the } \text{VkPhysicalDevice} \text{ that device was created from} \]

- VUID-vkAllocateMemory-deviceCoherentMemory-02790
  If the deviceCoherentMemory feature is not enabled, pAllocateInfo\rightarrow\text{memoryTypeIndex} must not identify a memory type supporting VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD

- VUID-vkAllocateMemory-maxMemoryAllocationCount-04101
  There must be less than VkPhysicalDeviceLimits::maxMemoryAllocationCount device memory allocations currently allocated on the device

Valid Usage (Implicit)

- VUID-vkAllocateMemory-device-parameter
  device must be a valid VkDevice handle

- VUID-vkAllocateMemory-pAllocateInfo-parameter
  pAllocateInfo must be a valid pointer to a valid VkMemoryAllocateInfo structure

- VUID-vkAllocateMemory-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkAllocateMemory-pMemory-parameter
  pMemory must be a valid pointer to a VkDeviceMemory handle

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INVALID_EXTERNAL_HANDLE
- VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR
The `VkMemoryAllocateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkMemoryAllocateInfo {
    VkStructureType sType;
    const void* pNext;
    VkDeviceSize allocationSize;
    uint32_t memoryTypeIndex;
} VkMemoryAllocateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `allocationSize` is the size of the allocation in bytes.
- `memoryTypeIndex` is an index identifying a memory type from the `memoryTypes` array of the `VkPhysicalDeviceMemoryProperties` structure.

The internal data of an allocated device memory object must include a reference to implementation-specific resources, referred to as the memory object's *payload*. Applications can also import and export that internal data to and from device memory objects to share data between Vulkan instances and other compatible APIs. A `VkMemoryAllocateInfo` structure defines a memory import operation if its `pNext` chain includes one of the following structures:

- `VkImportMemoryWin32HandleInfoKHR` with a non-zero `handleType` value
- `VkImportMemoryFdInfoKHR` with a non-zero `handleType` value
- `VkImportMemoryHostPointerInfoEXT` with a non-zero `handleType` value
- `VkImportAndroidHardwareBufferInfoANDROID` with a non-`NULL` `buffer` value
- `VkImportZirconHandleInfoFUCHSIA` with a non-zero `handleType` value
- `VkImportScreenBufferInfoQNX` with a non-`NULL` `buffer` value

If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT`, or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT`, `allocationSize` is ignored. The implementation must query the size of these allocations from the OS.

Whether device memory objects constructed via a memory import operation hold a reference to their payload depends on the properties of the handle type used to perform the import, as defined below for each valid handle type. Importing memory must not modify the content of the memory. Implementations must ensure that importing memory does not enable the importing Vulkan instance to access any memory or resources in other Vulkan instances other than that corresponding to the memory object imported. Implementations must also ensure accessing imported memory which has not been initialized does not allow the importing Vulkan instance to obtain data from the exporting Vulkan instance or vice-versa.
How exported and imported memory is isolated is left to the implementation, but applications should be aware that such isolation may prevent implementations from placing multiple exportable memory objects in the same physical or virtual page. Hence, applications should avoid creating many small external memory objects whenever possible.

Importing memory must not increase overall heap usage within a system. However, it must affect the following per-process values:

- VkPhysicalDeviceMaintenance3Properties::maxMemoryAllocationCount
- VkPhysicalDeviceMemoryBudgetPropertiesEXT::heapUsage

When performing a memory import operation, it is the responsibility of the application to ensure the external handles and their associated payloads meet all valid usage requirements. However, implementations must perform sufficient validation of external handles and payloads to ensure that the operation results in a valid memory object which will not cause program termination, device loss, queue stalls, or corruption of other resources when used as allowed according to its allocation parameters. If the external handle provided does not meet these requirements, the implementation must fail the memory import operation with the error code VK_ERROR_INVALID_EXTERNAL_HANDLE. If the parameters define an export operation and the external handle type is VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID, implementations should not strictly follow memoryTypeIndex. Instead, they should modify the allocation internally to use the required memory type for the application’s given usage. This is because for an export operation, there is currently no way for the client to know the memory type index before allocating.

**Valid Usage**

- VUID-VkMemoryAllocateInfo-allocationSize-07897
  If the parameters do not define an import or export operation, allocationSize must be greater than 0

- VUID-VkMemoryAllocateInfo-None-06657
  The parameters must not define more than one import operation

- VUID-VkMemoryAllocateInfo-allocationSize-07899
  If the parameters define an export operation and the handle type is not VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID, allocationSize must be greater than 0

- VUID-VkMemoryAllocateInfo-buffer-06380
  If the parameters define an import operation from an VkBufferCollectionFUCHSIA, and VkMemoryDedicatedAllocateInfo::buffer is present and non-NULL, VkImportMemoryBufferCollectionFUCHSIA::collection and VkImportMemoryBufferCollectionFUCHSIA::index must match VkBufferCollectionBufferCreateInfoFUCHSIA::collection and VkBufferCollectionBufferCreateInfoFUCHSIA::index, respectively, of the VkBufferCollectionBufferCreateInfoFUCHSIA structure used to create the
VkMemoryDedicatedAllocateInfo::buffer

- VUID-VkMemoryDedicatedAllocateInfo-image-06381
  If the parameters define an import operation from an VkBufferCollectionFUCHSIA, and VkMemoryDedicatedAllocateInfo::image is present and non-NULL, VkImportMemoryBufferCollectionFUCHSIA::collection and VkImportMemoryBufferCollectionFUCHSIA::index must match VkBufferCollectionImageCreateInfoFUCHSIA::collection and VkBufferCollectionImageCreateInfoFUCHSIA::index, respectively, of the VkBufferCollectionImageCreateInfoFUCHSIA structure used to create the VkMemoryDedicatedAllocateInfo::image

- VUID-VkMemoryAllocateInfo-allocationSize-06382
  If the parameters define an import operation from an VkBufferCollectionFUCHSIA, allocationSize must match VkMemoryRequirements::size value retrieved by vkGetImageMemoryRequirements or vkGetBufferMemoryRequirements for image-based or buffer-based collections respectively

- VUID-VkMemoryAllocateInfo-pNext-06383
  If the parameters define an import operation from an VkBufferCollectionFUCHSIA, the pNext chain must include a VkMemoryDedicatedAllocateInfo structure with either its image or buffer field set to a value other than VK_NULL_HANDLE

- VUID-VkMemoryAllocateInfo-image-06384
  If the parameters define an import operation from an VkBufferCollectionFUCHSIA and VkMemoryDedicatedAllocateInfo::image is not VK_NULL_HANDLE, the image must be created with a VkBufferCollectionImageCreateInfoFUCHSIA structure chained to its VkImageCreateInfo::pNext pointer

- VUID-VkMemoryAllocateInfo-buffer-06385
  If the parameters define an import operation from an VkBufferCollectionFUCHSIA and VkMemoryDedicatedAllocateInfo::buffer is not VK_NULL_HANDLE, the buffer must be created with a VkBufferCollectionBufferCreateInfoFUCHSIA structure chained to its VkBufferCreateInfo::pNext pointer

- VUID-VkMemoryAllocateInfo-memoryTypeIndex-06386
  If the parameters define an import operation from an VkBufferCollectionFUCHSIA, memoryTypeIndex must be from VkBufferCollectionPropertiesFUCHSIA as retrieved by vkGetBufferCollectionPropertiesFUCHSIA

- VUID-VkMemoryAllocateInfo-pNext-00639
  If the pNext chain includes a VkExportMemoryAllocateInfo structure, and any of the handle types specified in VkExportMemoryAllocateInfo::handleTypes require a dedicated allocation, as reported by vkGetPhysicalDeviceImageFormatProperties2 in VkExternalImageFormatProperties::externalMemoryProperties.externalMemoryFeatures, or by vkGetPhysicalDeviceExternalBufferProperties in VkExternalBufferProperties::externalMemoryProperties.externalMemoryFeatures, the pNext chain must include a VkMemoryDedicatedAllocateInfo or VkDedicatedAllocationMemoryAllocateInfoNV structure with either its image or buffer member set to a value other than VK_NULL_HANDLE

- VUID-VkMemoryAllocateInfo-pNext-00640
  If the pNext chain includes a VkExportMemoryAllocateInfo structure, it must not include a VkExportMemoryAllocateInfoNV or VkExportMemoryWin32HandleInfoNV structure
If the `pNext` chain includes a `VkImportMemoryWin32HandleInfoKHR` structure, it must not include a `VkImportMemoryWin32HandleInfoNV` structure.

If the parameters define an import operation, the external handle specified was created by the Vulkan API, and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT`, then the values of `allocationSize` and `memoryTypeIndex` must match those specified when the payload being imported was created.

If the parameters define an import operation and the external handle specified was created by the Vulkan API, the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT` or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT`, then the values of `allocationSize` and `memoryTypeIndex` must match those specified when the payload being imported was created.

If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT`, `allocationSize` must match the size specified when creating the Direct3D 12 heap from which the payload was extracted.

If the parameters define an import operation and the external handle is an NT handle or a global share handle created outside of the Vulkan API, the value of `memoryTypeIndex` must be one of those returned by `vkGetMemoryWin32HandlePropertiesKHR`.

If the parameters define an import operation and the external handle is a host pointer, the value of `memoryTypeIndex` must be one of those returned by `vkGetMemoryHostPointerPropertiesEXT`.

If the `protectedMemory` feature is not enabled, the `VkMemoryAllocateInfo::memoryTypeIndex` must not indicate a memory type that reports `VK_MEMORY_PROPERTY_PROTECTED_BIT`.

If the parameters define an import operation and the external handle passed to `vkAllocateMemory` matches the list of physical devices that comprise the logical device on which the payload was originally allocated.

If the parameters define an import operation and the external handle is a POSIX file descriptor created outside of the Vulkan API, the value of `memoryTypeIndex` must be one of those returned by `vkGetMemoryFdPropertiesKHR`.
If the parameters define an import operation and the external handle is a host pointer, `allocationSize` must be an integer multiple of `VkPhysicalDeviceExternalMemoryHostPropertiesEXT::minImportedHostPointerAlignment`.

If the parameters define an import operation and the external handle is a host pointer, the `pNext` chain must not include a `VkDedicatedAllocationMemoryAllocateInfoNV` structure with either its `image` or `buffer` field set to a value other than `VK_NULL_HANDLE`.

If the parameters define an import operation and the external handle is a host pointer, the `pNext` chain must not include a `VkMemoryDedicatedAllocateInfo` structure with either its `image` or `buffer` field set to a value other than `VK_NULL_HANDLE`.

If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID`, `allocationSize` must be the size returned by `vkGetAndroidHardwareBufferPropertiesANDROID` for the Android hardware buffer.

If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID`, and the `pNext` chain does not include a `VkMemoryDedicatedAllocateInfo` structure or `VkMemoryDedicatedAllocateInfo::image` is `VK_NULL_HANDLE`, the Android hardware buffer must have a `AHardwareBuffer_Desc::format` of `AHARDWAREBUFFER_FORMAT_BLOB` and a `AHardwareBuffer_Desc::usage` that includes `AHARDWAREBUFFER_USAGE_GPU_DATA_BUFFER`.

If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID`, `memoryTypeIndex` must be one of those returned by `vkGetAndroidHardwareBufferPropertiesANDROID` for the Android hardware buffer.

If the parameters do not define an import operation, and the `pNext` chain includes a `VkExportMemoryAllocateInfo` structure with `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID` included in its `handleTypes` member, and the `pNext` chain includes a `VkMemoryDedicatedAllocateInfo` structure with `image` not equal to `VK_NULL_HANDLE`, then `allocationSize` must be 0.

If the parameters define an export operation, the handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID`, and the `pNext` does not include a `VkMemoryDedicatedAllocateInfo` structure, `allocationSize` must be greater than 0.

If the parameters define an export operation, the handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID`, and the `pNext` chain includes a `VkMemoryDedicatedAllocateInfo` structure with `buffer` set to a valid `VkBuffer` object, `allocationSize` must be greater than 0.
If the parameters define an import operation, the external handle is an Android hardware buffer, and the \textit{pNext} chain includes a \texttt{VkMemoryDedicatedAllocateInfo} with \texttt{image} that is not \texttt{VK_NULL_HANDLE}, the Android hardware buffer's \texttt{AHardwareBuffer::usage} must include at least one of \texttt{AHARDWAREBUFFER_USAGE_GPU_FRAMEBUFFER}, \texttt{AHARDWAREBUFFER_USAGE_GPU_SAMPLED_IMAGE} or \texttt{AHARDWAREBUFFER_USAGE_GPU_DATA_BUFFER}.

If the parameters define an import operation, the external handle is an Android hardware buffer, and the \textit{pNext} chain includes a \texttt{VkMemoryDedicatedAllocateInfo} with \texttt{image} that is not \texttt{VK_NULL_HANDLE}, the format of \texttt{image} must be \texttt{VK_FORMAT_UNDEFINED} or the format returned by \texttt{vkGetAndroidHardwareBufferPropertiesANDROID} in \texttt{VkAndroidHardwareBufferFormatPropertiesANDROID::format} for the Android hardware buffer.

If the parameters define an import operation, the external handle is an Android hardware buffer, and the \textit{pNext} chain includes a \texttt{VkMemoryDedicatedAllocateInfo} structure with \texttt{image} that is not \texttt{VK_NULL_HANDLE}, the width, height, and array layer dimensions of \texttt{image} and the Android hardware buffer's \texttt{AHardwareBuffer::usage} must be identical.

If the parameters define an import operation, the external handle is an Android hardware buffer, and the \textit{pNext} chain includes a \texttt{VkMemoryDedicatedAllocateInfo} structure with \texttt{image} that is not \texttt{VK_NULL_HANDLE}, and the Android hardware buffer's \texttt{AHardwareBuffer::usage} includes \texttt{AHARDWAREBUFFER_USAGE_GPU_MIPMAP_COMPLETE}, the \texttt{image} must have a complete mipmap chain.

If the parameters define an import operation, the external handle is an Android hardware buffer, and the \textit{pNext} chain includes a \texttt{VkMemoryDedicatedAllocateInfo} structure with \texttt{image} that is not \texttt{VK_NULL_HANDLE}, and the Android hardware buffer's \texttt{AHardwareBuffer::usage} does not include \texttt{AHARDWAREBUFFER_USAGE_GPU_MIPMAP_COMPLETE}, the \texttt{image} must have exactly one mipmap level.

If the parameters define an import operation, the external handle is an Android hardware buffer, and the \textit{pNext} chain includes a \texttt{VkMemoryDedicatedAllocateInfo} structure with \texttt{image} that is not \texttt{VK_NULL_HANDLE}, each bit set in the usage of \texttt{image} must be listed in \texttt{AHardwareBuffer Usage Equivalence}, and if there is a corresponding \texttt{AHARDWAREBUFFER_USAGE} bit listed that bit must be included in the Android hardware buffer's \texttt{AHardwareBuffer_Desc::usage}.

If the parameters define an import operation and the external handle type is \texttt{VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX}, \texttt{VkPhysicalDeviceExternalMemoryScreenBufferFeaturesQNX::screenBufferImport} must be enabled.

If the parameters define an import operation and the external handle type is \texttt{VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX}, \texttt{allocationSize} must be the size...
• VUID-VkMemoryAllocateInfo-memoryTypeIndex-08943
  If the parameters define an import operation and the external handle type is
  `VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX`, `memoryTypeIndex` must be one of
  those returned by `vkGetScreenBufferPropertiesQNX` for the QNX Screen buffer

• VUID-VkMemoryAllocateInfo-pNext-08944
  If the parameters define an import operation, the external handle is a QNX Screen buffer,
  and the `pNext` chain includes a `VkMemoryDedicatedAllocateInfo` with `image` that is not
  `VK_NULL_HANDLE`, the QNX Screen’s buffer must be a valid QNX Screen buffer

• VUID-VkMemoryAllocateInfo-pNext-08945
  If the parameters define an import operation, the external handle is a QNX Screen buffer,
  and the `pNext` chain includes a `VkMemoryDedicatedAllocateInfo` with `image` that is
  not `VK_NULL_HANDLE`, the format of `image` must be `VK_FORMAT_UNDEFINED` or the format
  returned by `vkGetScreenBufferPropertiesQNX` in `VkScreenBufferFormatPropertiesQNX` ::`format`
  for the QNX Screen buffer

• VUID-VkMemoryAllocateInfo-pNext-08946
  If the parameters define an import operation, the external handle is a QNX Screen buffer,
  and the `pNext` chain includes a `VkMemoryDedicatedAllocateInfo` structure with `image`
  that is not `VK_NULL_HANDLE`, the width, height, and array layer dimensions of `image` and the
  QNX Screen buffer’s `_screen_buffer` must be identical

• VUID-VkMemoryAllocateInfo-opaqueCaptureAddress-03329
  If `VkMemoryOpaqueCaptureAddressAllocateInfo` ::`opaqueCaptureAddress` is not zero,
  `VkMemoryAllocateFlagsInfo` ::`flags` must include `VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT`

• VUID-VkMemoryAllocateInfo-flags-03330
  If `VkMemoryAllocateFlagsInfo` ::`flags` includes `VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT`, the
  `bufferDeviceAddressCaptureReplay` feature must be enabled

• VUID-VkMemoryAllocateInfo-flags-03331
  If `VkMemoryAllocateFlagsInfo` ::`flags` includes `VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT`, the
  `bufferDeviceAddress` feature must be enabled

• VUID-VkMemoryAllocateInfo-pNext-03332
  If the `pNext` chain includes a `VkImportMemoryHostPointerInfoEXT` structure,
  `VkMemoryOpaqueCaptureAddressAllocateInfo` ::`opaqueCaptureAddress` must be zero

• VUID-VkMemoryAllocateInfo-opaqueCaptureAddress-03333
  If the parameters define an import operation,
  `VkMemoryOpaqueCaptureAddressAllocateInfo` ::`opaqueCaptureAddress` must be zero

• VUID-VkMemoryAllocateInfo-None-04749
  If the parameters define an import operation and the external handle type is
  `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA`, the value of `memoryTypeIndex`
  must be an index identifying a memory type from the `memoryTypeBits` field of the
  `VkMemoryZirconHandlePropertiesFUCHSIA` structure populated by a call to
  `vkGetMemoryZirconHandlePropertiesFUCHSIA`
If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA`, the value of `allocationSize` must be greater than 0.

If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA`, the value of `allocationSize` must be less than or equal to the size of the VMO as determined by `zx_vmo_get_size(handle)` where `handle` is the VMO handle to the imported external memory.

If the `pNext` chain includes a `VkExportMetalObjectCreateInfoEXT` structure, its `exportObjectType` member must be `VK_EXPORT_METAL_OBJECT_TYPE_METAL_BUFFER_BIT_EXT`.

Valid Usage (Implicit)

- **VUID-VkMemoryAllocateInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_MEMORY_ALLOCATE_INFO`.

- **VUID-VkMemoryAllocateInfo-pNext-pNext**
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkDedicatedAllocationMemoryAllocateInfoNV`, `VkExportMemoryAllocateInfo`, `VkExportMemoryWin32HandleInfoKHR`, `VkExportMetalObjectCreateInfoEXT`, `VkImportAndroidHardwareBufferInfoANDROID`, `VkImportMemoryBufferCollectionFUCHSIA`, `VkImportMemoryFdInfoKHR`, `VkImportMemoryHostPointerInfoEXT`, `VkImportMemoryWin32HandleInfoKHR`, `VkImportMemoryWin32HandleInfoNV`, `VkImportMemoryZirconHandleInfoFUCHSIA`, `VkImportMetalBufferInfoEXT`, `VkImportScreenBufferInfoQNX`, `VkMemoryAllocateFlagsInfo`, `VkMemoryDedicatedAllocateInfo`, `VkMemoryOpaqueCaptureAddressAllocateInfo`, or `VkMemoryPriorityAllocateInfoEXT`.

- **VUID-VkMemoryAllocateInfo-sType-unique**
  The `sType` value of each struct in the `pNext` chain must be unique, with the exception of structures of type `VkExportMetalObjectCreateInfoEXT`.

If the `pNext` chain includes a `VkMemoryDedicatedAllocateInfo` structure, then that structure includes a handle of the sole buffer or image resource that the memory can be bound to.

The `VkMemoryDedicatedAllocateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkMemoryDedicatedAllocateInfo {
    VkStructureType sType;
    const void* pNext;
    VkImage image;
    VkBuffer buffer;
} VkMemoryDedicatedAllocateInfo;
```
or the equivalent

```c
// Provided by VK_KHR_dedicated_allocation
typedef VkMemoryDedicatedAllocateInfo VkMemoryDedicatedAllocateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `image` is `VK_NULL_HANDLE` or a handle of an image which this memory will be bound to.
- `buffer` is `VK_NULL_HANDLE` or a handle of a buffer which this memory will be bound to.

### Valid Usage

- **VUID-VkMemoryDedicatedAllocateInfo-image-01432**
  At least one of `image` and `buffer` must be `VK_NULL_HANDLE`

- **VUID-VkMemoryDedicatedAllocateInfo-image-02964**
  If `image` is not `VK_NULL_HANDLE` and the memory is not an imported Android Hardware Buffer or an imported QNX Screen buffer, `VkMemoryAllocateInfo::allocationSize` must equal the `VkMemoryRequirements::size` of the image

- **VUID-VkMemoryDedicatedAllocateInfo-image-01434**
  If `image` is not `VK_NULL_HANDLE`, `image` must have been created without `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` set in `VkImageCreateInfo::flags`

- **VUID-VkMemoryDedicatedAllocateInfo-buffer-02965**
  If `buffer` is not `VK_NULL_HANDLE` and the memory is not an imported Android Hardware Buffer or an imported QNX Screen buffer, `VkMemoryAllocateInfo::allocationSize` must equal the `VkMemoryRequirements::size` of the buffer

- **VUID-VkMemoryDedicatedAllocateInfo-buffer-01436**
  If `buffer` is not `VK_NULL_HANDLE`, `buffer` must have been created without `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` set in `VkBufferCreateInfo::flags`

- **VUID-VkMemoryDedicatedAllocateInfo-image-01876**
  If `image` is not `VK_NULL_HANDLE` and `VkMemoryAllocateInfo` defines a memory import operation with handle type `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT`, or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT`, and the external handle was created by the Vulkan API, then the memory being imported must also be a dedicated image allocation and `image` must be identical to the image associated with the imported memory

- **VUID-VkMemoryDedicatedAllocateInfo-buffer-01877**
  If `buffer` is not `VK_NULL_HANDLE` and `VkMemoryAllocateInfo` defines a memory import operation with handle type `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT`,
VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT,
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT,
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT,
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT, or
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT, and the external handle was created by the Vulkan API, then the memory being imported must also be a dedicated buffer allocation and buffer must be identical to the buffer associated with the imported memory.

- VUID-VkMemoryDedicatedAllocateInfo-image-01878
  If image is not VK_NULL_HANDLE and VkMemoryAllocateInfo defines a memory import operation with handle type VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT, the memory being imported must also be a dedicated image allocation and image must be identical to the image associated with the imported memory.

- VUID-VkMemoryDedicatedAllocateInfo-image-01797
  If image is not VK_NULL_HANDLE, image must not have been created with VK_IMAGE_CREATE_DISJOINT_BIT set in VkImageCreateInfo::flags.

- VUID-VkMemoryDedicatedAllocateInfo-image-04751
  If image is not VK_NULL_HANDLE and VkMemoryAllocateInfo defines a memory import operation with handle type VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA, the memory being imported must also be a dedicated image allocation and image must be identical to the image associated with the imported memory.

- VUID-VkMemoryDedicatedAllocateInfo-buffer-04752
  If buffer is not VK_NULL_HANDLE and VkMemoryAllocateInfo defines a memory import operation with handle type VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA, the memory being imported must also be a dedicated buffer allocation and buffer must be identical to the buffer associated with the imported memory.

Valid Usage (Implicit)

- VUID-VkMemoryDedicatedAllocateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_MEMORY_DEDICATED_ALLOCATE_INFO.

- VUID-VkMemoryDedicatedAllocateInfo-image-parameter
  If image is not VK_NULL_HANDLE, image must be a valid VkImage handle.

- VUID-VkMemoryDedicatedAllocateInfo-buffer-parameter
  If buffer is not VK_NULL_HANDLE, buffer must be a valid VkBuffer handle.

- VUID-VkMemoryDedicatedAllocateInfo-commonparent
  Both of buffer, and image that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice.
If the `pNext` chain includes a `VkDedicatedAllocationMemoryAllocateInfoNV` structure, then that structure includes a handle of the sole buffer or image resource that the memory can be bound to.

The `VkDedicatedAllocationMemoryAllocateInfoNV` structure is defined as:

```c
// Provided by VK_NV_dedicated_allocation
typedef struct VkDedicatedAllocationMemoryAllocateInfoNV {
    VkStructureType sType;
    const void*pNext;
    VkImage image;
    VkBuffer buffer;
} VkDedicatedAllocationMemoryAllocateInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `image` is `VK_NULL_HANDLE` or a handle of an image which this memory will be bound to.
- `buffer` is `VK_NULL_HANDLE` or a handle of a buffer which this memory will be bound to.

### Valid Usage

- **VUID-VkDedicatedAllocationMemoryAllocateInfoNV-image-00649**
  At least one of `image` and `buffer` must be `VK_NULL_HANDLE`

- **VUID-VkDedicatedAllocationMemoryAllocateInfoNV-image-00650**
  If `image` is not `VK_NULL_HANDLE`, the image must have been created with `VkDedicatedAllocationImageCreateInfoNV::dedicatedAllocation` equal to `VK_TRUE`

- **VUID-VkDedicatedAllocationMemoryAllocateInfoNV-buffer-00651**
  If `buffer` is not `VK_NULL_HANDLE`, the buffer must have been created with `VkDedicatedAllocationBufferCreateInfoNV::dedicatedAllocation` equal to `VK_TRUE`

- **VUID-VkDedicatedAllocationMemoryAllocateInfoNV-image-00652**
  If `image` is not `VK_NULL_HANDLE`, `VkMemoryAllocateInfo::allocationSize` must equal the `VkMemoryRequirements::size` of the image

- **VUID-VkDedicatedAllocationMemoryAllocateInfoNV-buffer-00653**
  If `buffer` is not `VK_NULL_HANDLE`, `VkMemoryAllocateInfo::allocationSize` must equal the `VkMemoryRequirements::size` of the buffer

- **VUID-VkDedicatedAllocationMemoryAllocateInfoNV-image-00654**
  If `image` is not `VK_NULL_HANDLE` and `VkMemoryAllocateInfo` defines a memory import operation, the memory being imported must also be a dedicated image allocation and `image` must be identical to the image associated with the imported memory

- **VUID-VkDedicatedAllocationMemoryAllocateInfoNV-buffer-00655**
  If `buffer` is not `VK_NULL_HANDLE` and `VkMemoryAllocateInfo` defines a memory import operation, the memory being imported must also be a dedicated buffer allocation and `buffer` must be identical to the buffer associated with the imported memory
Valid Usage (Implicit)

- VUID-VkDedicatedAllocationMemoryAllocateInfoNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEDICATED_ALLOCATION_MEMORY_ALLOCATE_INFO_NV

- VUID-VkDedicatedAllocationMemoryAllocateInfoNV-image-parameter
  If image is not VK_NULL_HANDLE, image must be a valid VkImage handle

- VUID-VkDedicatedAllocationMemoryAllocateInfoNV-buffer-parameter
  If buffer is not VK_NULL_HANDLE, buffer must be a valid VkBuffer handle

- VUID-VkDedicatedAllocationMemoryAllocateInfoNV-commonparent
  Both of buffer, and image that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

If the pNext chain includes a VkMemoryPriorityAllocateInfoEXT structure, then that structure includes a priority for the memory.

The VkMemoryPriorityAllocateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_memory_priority
typedef struct VkMemoryPriorityAllocateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    float priority;
} VkMemoryPriorityAllocateInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- priority is a floating-point value between 0 and 1, indicating the priority of the allocation relative to other memory allocations. Larger values are higher priority. The granularity of the priorities is implementation-dependent.

Memory allocations with higher priority may be more likely to stay in device-local memory when the system is under memory pressure.

If this structure is not included, it is as if the priority value were 0.5.

Valid Usage

- VUID-VkMemoryPriorityAllocateInfoEXT-priority-02602
  priority must be between 0 and 1, inclusive

Valid Usage (Implicit)

- VUID-VkMemoryPriorityAllocateInfoEXT-sType-sType
To modify the priority of an existing memory allocation, call:

```c
void vkSetDeviceMemoryPriorityEXT(
    VkDevice device,
    VkDeviceMemory memory,
    float priority);
```

- `device` is the logical device that owns the memory.
- `memory` is the `VkDeviceMemory` object to which the new priority will be applied.
- `priority` is a floating-point value between 0 and 1, indicating the priority of the allocation relative to other memory allocations. Larger values are higher priority. The granularity of the priorities is implementation-dependent.

Memory allocations with higher priority may be more likely to stay in device-local memory when the system is under memory pressure.

### Valid Usage

- VUID-vkSetDeviceMemoryPriorityEXT-priority-06258
  
  `priority` must be between 0 and 1, inclusive

### Valid Usage (Implicit)

- VUID-vkSetDeviceMemoryPriorityEXT-device-parameter
  
  `device` must be a valid `VkDevice` handle

- VUID-vkSetDeviceMemoryPriorityEXT-memory-parameter
  
  `memory` must be a valid `VkDeviceMemory` handle

- VUID-vkSetDeviceMemoryPriorityEXT-memory-parent
  
  `memory` must have been created, allocated, or retrieved from `device`

When allocating memory whose payload may be exported to another process or Vulkan instance, add a `VkExportMemoryAllocateInfo` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure, specifying the handle types that may be exported.

The `VkExportMemoryAllocateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkExportMemoryAllocateInfo {
    VkStructureType sType;
    const void* pNext;
} VkExportMemoryAllocateInfo;
```
VkExternalMemoryHandleTypeFlags handleTypes;

{ VkExportMemoryAllocateInfo

or the equivalent

// Provided by VK_KHR_external_memory
typedef VkExportMemoryAllocateInfo VkExportMemoryAllocateInfoKHR;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• handleTypes is zero or a bitmask of VkExternalMemoryHandleTypeFlagBits specifying one or more memory handle types the application can export from the resulting allocation. The application can request multiple handle types for the same allocation.

Valid Usage

• VUID-VkExportMemoryAllocateInfo-handleTypes-00656
  The bits in handleTypes must be supported and compatible, as reported by VkExternalImageFormatProperties or VkExternalBufferProperties

Valid Usage (Implicit)

• VUID-VkExportMemoryAllocateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_EXPORT_MEMORY_ALLOCATE_INFO
• VUID-VkExportMemoryAllocateInfo-handleTypes-parameter
  handleTypes must be a valid combination of VkExternalMemoryHandleTypeFlagBits values

When allocating memory that may be exported to another process or Vulkan instance, add a VkExportMemoryAllocateInfoNV structure to the pNext chain of the VkMemoryAllocateInfo structure, specifying the handle types that may be exported.

The VkExportMemoryAllocateInfoNV structure is defined as:

// Provided by VK_NV_external_memory
typedef struct VkExportMemoryAllocateInfoNV {
  VkStructureType sType;
  const void* pNext;
  VkExternalMemoryHandleTypeFlagsNV handleTypes;
} VkExportMemoryAllocateInfoNV;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• **handleTypes** is a bitmask of **VkExternalMemoryHandleTypeFlagBitsNV** specifying one or more memory handle types that *may* be exported. Multiple handle types *may* be requested for the same allocation as long as they are compatible, as reported by **vkGetPhysicalDeviceExternalImageFormatPropertiesNV**.

---

**Valid Usage (Implicit)**

- **VUID-VkExportMemoryAllocateInfoNV-sType-sType**
  - *sType* must be **VK_STRUCTURE_TYPE_EXPORT_MEMORY_ALLOCATE_INFO_NV**
- **VUID-VkExportMemoryAllocateInfoNV-handleTypes-parameter handleTypes** must be a valid combination of **VkExternalMemoryHandleTypeFlagBitsNV** values

11.2.4. Win32 External Memory

To specify additional attributes of NT handles exported from a memory object, add a **VkExportMemoryWin32HandleInfoKHR** structure to the *pNext* chain of the **VkMemoryAllocateInfo** structure. The **VkExportMemoryWin32HandleInfoKHR** structure is defined as:

```c
// Provided by VK_KHR_external_memory_win32
typedef struct VkExportMemoryWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const SECURITY_ATTRIBUTES* pAttributes;
    DWORD dwAccess;
    LPCWSTR name;
} VkExportMemoryWin32HandleInfoKHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **pAttributes** is a pointer to a Windows **SECURITY_ATTRIBUTES** structure specifying security attributes of the handle.
- **dwAccess** is a **DWORD** specifying access rights of the handle.
- **name** is a null-terminated UTF-16 string to associate with the payload referenced by NT handles exported from the created memory.

If **VkExportMemoryAllocateInfo** is not included in the same *pNext* chain, this structure is ignored.

If **VkExportMemoryAllocateInfo** is included in the *pNext* chain of **VkMemoryAllocateInfo** with a Windows **handleType**, but either **VkExportMemoryWin32HandleInfoKHR** is not included in the *pNext* chain, or it is included but **pAttributes** is set to **NULL**, default security descriptor values will be used, and child processes created by the application will not inherit the handle, as described in the MSDN documentation for “Synchronization Object Security and Access Rights”. Further, if the structure is not present, the access rights used depend on the handle type.
For handles of the following types:

- **VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT**

The implementation **must** ensure the access rights allow read and write access to the memory.

1

---

### Valid Usage

- **VUID-VkExportMemoryWin32HandleInfoKHR-handleTypes-00657**
  
  If `VkExportMemoryAllocateInfo::handleTypes` does not include `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT`, a `VkExportMemoryWin32HandleInfoKHR` structure **must** not be included in the `pNext` chain of `VkMemoryAllocateInfo`.

---

### Valid Usage (Implicit)

- **VUID-VkExportMemoryWin32HandleInfoKHR-sType-sType**
  
  `sType` **must** be `VK_STRUCTURE_TYPE_EXPORT_MEMORY_WIN32_HANDLE_INFO_KHR`.

- **VUID-VkExportMemoryWin32HandleInfoKHR-pAttributes-parameter**
  
  If `pAttributes` is not `NULL`, `pAttributes` **must** be a valid pointer to a valid `SECURITY_ATTRIBUTES` value.

---

To import memory from a Windows handle, add a `VkImportMemoryWin32HandleInfoKHR` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure.

The `VkImportMemoryWin32HandleInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_memory_win32
typedef struct VkImportMemoryWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkExternalMemoryHandleTypeFlagBits handleType;
    HANDLE handle;
    LPCWSTR name;
} VkImportMemoryWin32HandleInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **handleType** is a `VkExternalMemoryHandleTypeFlagBits` value specifying the type of `handle` or `name`.
- **handle** is `NULL` or the external handle to import.
• name is NULL or a null-terminated UTF-16 string naming the payload to import.

Importing memory object payloads from Windows handles does not transfer ownership of the handle to the Vulkan implementation. For handle types defined as NT handles, the application must release handle ownership using the CloseHandle system call when the handle is no longer needed. For handle types defined as NT handles, the imported memory object holds a reference to its payload.

Note
Non-NT handle import operations do not add a reference to their associated payload. If the original object owning the payload is destroyed, all resources and handles sharing that payload will become invalid.

Applications can import the same payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance. In all cases, each import operation must create a distinct VkDeviceMemory object.

Valid Usage

• VUID-VkImportMemoryWin32HandleInfoKHR-handleType-00658
  If handleType is not 0, it must be supported for import, as reported by VkExternalImageFormatProperties or VkExternalBufferProperties

• VUID-VkImportMemoryWin32HandleInfoKHR-handle-00659
  The memory from which handle was exported, or the memory named by name must have been created on the same underlying physical device as device

• VUID-VkImportMemoryWin32HandleInfoKHR-handleType-00660
  If handleType is not 0, it must be defined as an NT handle or a global share handle

• VUID-VkImportMemoryWin32HandleInfoKHR-handleType-01439
  If handleType is not VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT,
  VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT,
  VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT,
  VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT, name must be NULL

• VUID-VkImportMemoryWin32HandleInfoKHR-handleType-01440
  If handleType is not 0 and handle is NULL, name must name a valid memory resource of the type specified by handleType

• VUID-VkImportMemoryWin32HandleInfoKHR-handleType-00661
  If handleType is not 0 and name is NULL, handle must be a valid handle of the type specified by handleType

• VUID-VkImportMemoryWin32HandleInfoKHR-handleType-01441
  If handle is not NULL, name must be NULL

• VUID-VkImportMemoryWin32HandleInfoKHR-handleType-01518
  If handle is not NULL, it must obey any requirements listed for handleType in external memory handle types compatibility

• VUID-VkImportMemoryWin32HandleInfoKHR-name-01519
If `name` is not `NULL`, it **must** obey any requirements listed for `handleType` in external memory handle types compatibility.

### Valid Usage (Implicit)

- VUID-VkImportMemoryWin32HandleInfoKHR-sType-sType `sType` **must** be `VK_STRUCTURE_TYPE_IMPORT_MEMORY_WIN32_HANDLE_INFO_KHR`
- VUID-VkImportMemoryWin32HandleInfoKHR-handleType-parameter If `handleType` is not `0`, `handleType` **must** be a valid `VkExternalMemoryHandleTypeFlagBits` value

To export a Windows handle representing the payload of a Vulkan device memory object, call:

```c
// Provided by VK_KHR_external_memory_win32
VkResult vkGetMemoryWin32HandleKHR(
    VkDevice device,
    const VkMemoryGetWin32HandleInfoKHR* pGetWin32HandleInfo,
    HANDLE* pHandle);
```

- `device` is the logical device that created the device memory being exported.
- `pGetWin32HandleInfo` is a pointer to a `VkMemoryGetWin32HandleInfoKHR` structure containing parameters of the export operation.
- `pHandle` will return the Windows handle representing the payload of the device memory object.

For handle types defined as NT handles, the handles returned by `vkGetMemoryWin32HandleKHR` are owned by the application and hold a reference to their payload. To avoid leaking resources, the application **must** release ownership of them using the `CloseHandle` system call when they are no longer needed.

**Note**

Non-NT handle types do not add a reference to their associated payload. If the original object owning the payload is destroyed, all resources and handles sharing that payload will become invalid.

### Valid Usage (Implicit)

- VUID-vkGetMemoryWin32HandleKHR-device-parameter `device` **must** be a valid `VkDevice` handle
- VUID-vkGetMemoryWin32HandleKHR-pGetWin32HandleInfo-parameter `pGetWin32HandleInfo` **must** be a valid pointer to a valid `VkMemoryGetWin32HandleInfoKHR` structure
- VUID-vkGetMemoryWin32HandleKHR-pHandle-parameter `pHandle` **must** be a valid pointer to a `HANDLE` value
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_TOO_MANY_OBJECTS
• VK_ERROR_OUT_OF_HOST_MEMORY

The VkMemoryGetWin32HandleInfoKHR structure is defined as:

```c
// Provided by VK_KHR_external_memory_win32
typedef struct VkMemoryGetWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceMemory memory;
    VkExternalMemoryHandleTypeFlagBits handleType;
} VkMemoryGetWin32HandleInfoKHR;
```

• `sType` is a VkStructureType value identifying this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.
• `memory` is the memory object from which the handle will be exported.
• `handleType` is a VkExternalMemoryHandleTypeFlagBits value specifying the type of handle requested.

The properties of the handle returned depend on the value of `handleType`. See VkExternalMemoryHandleTypeFlagBits for a description of the properties of the defined external memory handle types.

Valid Usage

• VUID-VkMemoryGetWin32HandleInfoKHR-handleType-00662
  `handleType` must have been included in VkExportMemoryAllocateInfo::`handleTypes` when `memory` was created

• VUID-VkMemoryGetWin32HandleInfoKHR-handleType-00663
  If `handleType` is defined as an NT handle, VkGetMemoryWin32HandleKHR must be called no more than once for each valid unique combination of `memory` and `handleType`

• VUID-VkMemoryGetWin32HandleInfoKHR-handleType-00664
  `handleType` must be defined as an NT handle or a global share handle

Valid Usage (Implicit)

• VUID-VkMemoryGetWin32HandleInfoKHR-sType-sType
sType must be VK_STRUCTURE_TYPE_MEMORY_GET_WIN32_HANDLE_INFO_KHR

- VUID-VkMemoryGetWin32HandleInfoKHR-pNext-pNext
  pNext must be NULL

- VUID-VkMemoryGetWin32HandleInfoKHR-memory-parameter
  memory must be a valid VkDeviceMemory handle

- VUID-VkMemoryGetWin32HandleInfoKHR-handleType-parameter
  handleType must be a valid VkExternalMemoryHandleTypeFlagBits value

Windows memory handles compatible with Vulkan may also be created by non-Vulkan APIs using methods beyond the scope of this specification. To determine the correct parameters to use when importing such handles, call:

```c
// Provided by VK_KHR_external_memory_win32
VkResult vkGetMemoryWin32HandlePropertiesKHR(
    VkDevice device,
    VkExternalMemoryHandleTypeFlagBits handleType,
    HANDLE handle,
    VkMemoryWin32HandlePropertiesKHR* pMemoryWin32HandleProperties);
```

- device is the logical device that will be importing handle.
- handleType is a VkExternalMemoryHandleTypeFlagBits value specifying the type of the handle handle.
- handle is the handle which will be imported.
- pMemoryWin32HandleProperties is a pointer to a VkMemoryWin32HandlePropertiesKHR structure in which properties of handle are returned.

**Valid Usage**

- VUID-vkGetMemoryWin32HandlePropertiesKHR-handle-00665
  handle must point to a valid Windows memory handle

- VUID-vkGetMemoryWin32HandlePropertiesKHR-handleType-00666
  handleType must not be one of the handle types defined as opaque

**Valid Usage (Implicit)**

- VUID-vkGetMemoryWin32HandlePropertiesKHR-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetMemoryWin32HandlePropertiesKHR-handleType-parameter
  handleType must be a valid VkExternalMemoryHandleTypeFlagBits value

- VUID-vkGetMemoryWin32HandlePropertiesKHR-pMemoryWin32HandleProperties-parameter
  pMemoryWin32HandleProperties must be a valid pointer to a
 VkMemoryWin32HandlePropertiesKHR structure

Return Codes

Success
  • VK_SUCCESS

Failure
  • VK_ERROR_OUT_OF_HOST_MEMORY
  • VK_ERROR_INVALID_EXTERNAL_HANDLE

The VkMemoryWin32HandlePropertiesKHR structure returned is defined as:

```c
// Provided by VK_KHR_external_memory_win32
typedef struct VkMemoryWin32HandlePropertiesKHR {
    VkStructureType sType;
    void* pNext;
    uint32_t memoryTypeBits;
} VkMemoryWin32HandlePropertiesKHR;
```

• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `memoryTypeBits` is a bitmask containing one bit set for every memory type which the specified windows handle can be imported as.

Valid Usage (Implicit)

• VUID-VkMemoryWin32HandlePropertiesKHR-sType-sType `sType` must be `VK_STRUCTURE_TYPE_MEMORY_WIN32_HANDLE_PROPERTIES_KHR`
• VUID-VkMemoryWin32HandlePropertiesKHR-pNext-pNext `pNext` must be `NULL`

When `VkExportMemoryAllocateInfoNV::handleTypes` includes `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT_NV`, add a `VkExportMemoryWin32HandleInfoNV` structure to the `pNext` chain of the `VkExportMemoryAllocateInfoNV` structure to specify security attributes and access rights for the memory object's external handle.

The `VkExportMemoryWin32HandleInfoNV` structure is defined as:

```c
// Provided by VK_NV_external_memory_win32
typedef struct VkExportMemoryWin32HandleInfoNV {
    VkStructureType sType;
    const void* pNext;
} VkExportMemoryWin32HandleInfoNV;
```
const SECURITY_ATTRIBUTES* pAttributes;
DWORD dwAccess;
} VkExportMemoryWin32HandleInfoNV;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **pAttributes** is a pointer to a Windows `SECURITY_ATTRIBUTES` structure specifying security attributes of the handle.
- **dwAccess** is a `DWORD` specifying access rights of the handle.

If this structure is not present, or if `pAttributes` is set to `NULL`, default security descriptor values will be used, and child processes created by the application will not inherit the handle, as described in the MSDN documentation for “Synchronization Object Security and Access Rights”. Further, if the structure is not present, the access rights will be

\[
\text{DXGI\_SHARED\_RESOURCE\_READ} \mid \text{DXGI\_SHARED\_RESOURCE\_WRITE}
\]

1

Valid Usage (Implicit)

- VUID-VkExportMemoryWin32HandleInfoNV-sType-sType
  - **sType** must be `VK\_STRUCTURE\_TYPE\_EXPORT\_MEMORY\_WIN32\_HANDLE\_INFO\_NV`

- VUID-VkExportMemoryWin32HandleInfoNV-pAttributes-parameter
  - If `pAttributes` is not `NULL`, `pAttributes` must be a valid pointer to a valid `SECURITY\_ATTRIBUTES` value

To import memory created on the same physical device but outside of the current Vulkan instance, add a `VkImportMemoryWin32HandleInfoNV` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure, specifying a handle to and the type of the memory.

The `VkImportMemoryWin32HandleInfoNV` structure is defined as:

```c
// Provided by VK\_NV\_external\_memory\_win32
typedef struct VkImportMemoryWin32HandleInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkExternalMemoryHandleTypeFlagsNV handleType;
    HANDLE handle;
} VkImportMemoryWin32HandleInfoNV;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
• `handleType` is 0 or a `VkExternalMemoryHandleTypeFlagBitsNV` value specifying the type of memory handle in `handle`.

• `handle` is a Windows `HANDLE` referring to the memory.

If `handleType` is 0, this structure is ignored by consumers of the `VkMemoryAllocateInfo` structure it is chained from.

### Valid Usage

- VUID-VkImportMemoryWin32HandleInfoNV-handleType-01327
  - `handleType` must not have more than one bit set

- VUID-VkImportMemoryWin32HandleInfoNV-handle-01328
  - `handle` must be a valid handle to memory, obtained as specified by `handleType`.

### Valid Usage (Implicit)

- VUID-VkImportMemoryWin32HandleInfoNV-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_IMPORT_MEMORY_WIN32_HANDLE_INFO_NV`

- VUID-VkImportMemoryWin32HandleInfoNV-handleType-parameter
  - `handleType` must be a valid combination of `VkExternalMemoryHandleTypeFlagBitsNV` values.

Bits which can be set in `handleType` are:

Possible values of `VkImportMemoryWin32HandleInfoNV::handleType`, specifying the type of an external memory handle, are:

```c
// Provided by VK_NV_external_memory_capabilities
typedef enum VkExternalMemoryHandleTypeFlagBitsNV {
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT_NV = 0x00000001,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT_NV = 0x00000002,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_IMAGE_BIT_NV = 0x00000004,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_IMAGE_KMT_BIT_NV = 0x00000008,
} VkExternalMemoryHandleTypeFlagBitsNV;
```

- `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT_NV` specifies a handle to memory returned by `vkGetMemoryWin32HandleNV`.

- `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT_NV` specifies a handle to memory returned by `vkGetMemoryWin32HandleNV`, or one duplicated from such a handle using `DuplicateHandle()`.

- `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_IMAGE_BIT_NV` specifies a valid NT handle to memory returned by `IDXGIResource1::CreateSharedHandle`, or a handle duplicated from such a handle using `DuplicateHandle()`.

- `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_IMAGE_KMT_BIT_NV` specifies a handle to memory returned
by IDXGIResource::GetSharedHandle().

// Provided by VK_NV_external_memory_capabilities
typedef VkFlags VkExternalMemoryHandleTypeFlagsNV;

VkExternalMemoryHandleTypeFlagsNV is a bitmask type for setting a mask of zero or more
VkExternalMemoryHandleTypeFlagBitsNV.

To retrieve the handle corresponding to a device memory object created with
VkExportMemoryAllocateInfoNV::handleTypes set to include
VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT_NV
or
VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT_NV, call:

// Provided by VK_NV_external_memory_win32
VkResult vkGetMemoryWin32HandleNV(
    VkDevice device,
    VkDeviceMemory memory,
    VkExternalMemoryHandleTypeFlagsNV handleType,
    HANDLE* pHandle);

• device is the logical device that owns the memory.
• memory is the VkDeviceMemory object.
• handleType is a bitmask of VkExternalMemoryHandleTypeFlagBitsNV containing a single bit
  specifying the type of handle requested.
• handle is a pointer to a Windows HANDLE in which the handle is returned.

Valid Usage

• VUID-vkGetMemoryWin32HandleNV-handleType-01326
  handleType must be a flag specified in VkExportMemoryAllocateInfoNV::handleTypes when
  allocating memory

Valid Usage (Implicit)

• VUID-vkGetMemoryWin32HandleNV-device-parameter
device must be a valid VkDevice handle
• VUID-vkGetMemoryWin32HandleNV-memory-parameter
  memory must be a valid VkDeviceMemory handle
• VUID-vkGetMemoryWin32HandleNV-handleType-parameter
  handleType must be a valid combination of VkExternalMemoryHandleTypeFlagBitsNV values
• VUID-vkGetMemoryWin32HandleNV-handleType-requiredbitmask
  handleType must not be 0
11.2.5. File Descriptor External Memory

To import memory from a POSIX file descriptor handle, add a `VkImportMemoryFdInfoKHR` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure. The `VkImportMemoryFdInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_memory_fd
typedef struct VkImportMemoryFdInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkExternalMemoryHandleTypeFlagBits handleType;
    int fd;
} VkImportMemoryFdInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleType` is a `VkExternalMemoryHandleTypeFlagBits` value specifying the handle type of `fd`.
- `fd` is the external handle to import.

Importing memory from a file descriptor transfers ownership of the file descriptor from the application to the Vulkan implementation. The application must not perform any operations on the file descriptor after a successful import. The imported memory object holds a reference to its payload.

Applications can import the same payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance. In all cases, each import operation must create a distinct `VkDeviceMemory` object.
Valid Usage

- **VUID-VkImportMemoryFdInfoKHR-handleType-00667**
  If `handleType` is not 0, it must be supported for import, as reported by `VkExternalImageFormatProperties` or `VkExternalBufferProperties`.

- **VUID-VkImportMemoryFdInfoKHR-fd-00668**
  The memory from which `fd` was exported must have been created on the same underlying physical device as `device`.

- **VUID-VkImportMemoryFdInfoKHR-handleType-00669**
  If `handleType` is not 0, it must be `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT` or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT`.

- **VUID-VkImportMemoryFdInfoKHR-handleType-00669**
  If `handleType` is not 0, `fd` must be a valid handle of the type specified by `handleType`.

- **VUID-VkImportMemoryFdInfoKHR-fd-01746**
  The memory represented by `fd` must have been created from a physical device and driver that is compatible with `device` and `handleType`, as described in External memory handle types compatibility.

- **VUID-VkImportMemoryFdInfoKHR-fd-01520**
  `fd` must obey any requirements listed for `handleType` in external memory handle types compatibility.

Valid Usage (Implicit)

- **VUID-VkImportMemoryFdInfoKHR-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_IMPORT_MEMORY_FD_INFO_KHR`.

- **VUID-VkImportMemoryFdInfoKHR-handleType-parameter**
  If `handleType` is not 0, `handleType` must be a valid `VkExternalMemoryHandleTypeFlagBits` value.

To export a POSIX file descriptor referencing the payload of a Vulkan device memory object, call:

```c
// Provided by VK_KHR_external_memory_fd
VkResult vkGetMemoryFdKHR(
    VkDevice device,
    const VkMemoryGetFdInfoKHR* pGetFdInfo,
    int* pf
);
```

- **device** is the logical device that created the device memory being exported.

- **pGetFdInfo** is a pointer to a `VkMemoryGetFdInfoKHR` structure containing parameters of the export operation.

- **pf** will return a file descriptor referencing the payload of the device memory object.
Each call to `vkGetMemoryFdKHR` must create a new file descriptor holding a reference to the memory object's payload and transfer ownership of the file descriptor to the application. To avoid leaking resources, the application must release ownership of the file descriptor using the `close` system call when it is no longer needed, or by importing a Vulkan memory object from it. Where supported by the operating system, the implementation must set the file descriptor to be closed automatically when an `execve` system call is made.

### Valid Usage (Implicit)

- **VUID-vkGetMemoryFdKHR-device-parameter**
  
  `device` must be a valid `VkDevice` handle

- **VUID-vkGetMemoryFdKHR-pGetFdInfo-parameter**
  
  `pGetFdInfo` must be a valid pointer to a valid `VkMemoryGetFdInfoKHR` structure

- **VUID-vkGetMemoryFdKHR-pFd-parameter**
  
  `pFd` must be a valid pointer to an `int` value

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkMemoryGetFdInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_memory_fd
typedef struct VkMemoryGetFdInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceMemory memory;
    VkExternalMemoryHandleTypeFlagBits handleType;
} VkMemoryGetFdInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **memory** is the memory object from which the handle will be exported.
- **handleType** is a `VkExternalMemoryHandleTypeFlagBits` value specifying the type of handle requested.

The properties of the file descriptor exported depend on the value of `handleType`. See `VkExternalMemoryHandleTypeFlagBits` for a description of the properties of the defined external
memory handle types.

**Note**
The size of the exported file may be larger than the size requested by `VkMemoryAllocateInfo::allocationSize`. If `handleType` is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT`, then the application can query the file’s actual size with `lseek`.

---

### Valid Usage

- VUID-VkMemoryGetFdInfoKHR-handleType-00671
  
  `handleType` must have been included in `VkExportMemoryAllocateInfo::handleTypes` when `memory` was created.

- VUID-VkMemoryGetFdInfoKHR-handleType-00672
  
  `handleType` must be `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT` or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT`.

---

### Valid Usage (Implicit)

- VUID-VkMemoryGetFdInfoKHR-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_MEMORY_GET_FD_INFO_KHR`.

- VUID-VkMemoryGetFdInfoKHR-pNext-pNext
  
  `pNext` must be `NULL`.

- VUID-VkMemoryGetFdInfoKHR-memory-parameter
  
  `memory` must be a valid `VkDeviceMemory` handle.

- VUID-VkMemoryGetFdInfoKHR-handleType-parameter
  
  `handleType` must be a valid `VkExternalMemoryHandleTypeFlagBits` value.

---

POSIX file descriptor memory handles compatible with Vulkan may also be created by non-Vulkan APIs using methods beyond the scope of this specification. To determine the correct parameters to use when importing such handles, call:

```c
// Provided by VK_KHR_external_memory_fd
VkResult vkGetMemoryFdPropertiesKHR(
  VkDevice device,
  VkExternalMemoryHandleTypeFlagBits handleType,
  int fd,
  VkMemoryFdPropertiesKHR* pMemoryFdProperties);
```

- `device` is the logical device that will be importing `fd`.

- `handleType` is a `VkExternalMemoryHandleTypeFlagBits` value specifying the type of the handle `fd`. 
• `fd` is the handle which will be imported.
• `pMemoryFdProperties` is a pointer to a `VkMemoryFdPropertiesKHR` structure in which the properties of the handle `fd` are returned.

## Valid Usage

- VUID-vkGetMemoryFdPropertiesKHR-fd-00673
  `fd` must point to a valid POSIX file descriptor memory handle
- VUID-vkGetMemoryFdPropertiesKHR-handleType-00674
  `handleType` must not be `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT`

## Valid Usage (Implicit)

- VUID-vkGetMemoryFdPropertiesKHR-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkGetMemoryFdPropertiesKHR-handleType-parameter
  `handleType` must be a valid `VkExternalMemoryHandleTypeFlagBits` value
- VUID-vkGetMemoryFdPropertiesKHR-pMemoryFdProperties-parameter
  `pMemoryFdProperties` must be a valid pointer to a `VkMemoryFdPropertiesKHR` structure

## Return Codes

### Success
- `VK_SUCCESS`

### Failure
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_INVALID_EXTERNAL_HANDLE`

The `VkMemoryFdPropertiesKHR` structure returned is defined as:

```c
// Provided by VK_KHR_external_memory_fd
typedef struct VkMemoryFdPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    uint32_t memoryTypeBits;
} VkMemoryFdPropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memoryTypeBits` is a bitmask containing one bit set for every memory type which the specified file descriptor can be imported as.
11.2.6. Host External Memory

To import memory from a host pointer, add a `VkImportMemoryHostPointerInfoEXT` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure. The `VkImportMemoryHostPointerInfoEXT` structure is defined as:

```c
typedef struct VkImportMemoryHostPointerInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkExternalMemoryHandleTypeFlagBits handleType;
    void* pHostPointer;
} VkImportMemoryHostPointerInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleType` is a `VkExternalMemoryHandleTypeFlagBits` value specifying the handle type.
- `pHostPointer` is the host pointer to import from.

Importing memory from a host pointer shares ownership of the memory between the host and the Vulkan implementation. The application can continue to access the memory through the host pointer but it is the application's responsibility to synchronize device and non-device access to the payload as defined in Host Access to Device Memory Objects.

Applications can import the same payload into multiple instances of Vulkan and multiple times into a given Vulkan instance. However, implementations may fail to import the same payload multiple times into a given physical device due to platform constraints.

Importing memory from a particular host pointer may not be possible due to additional platform-specific restrictions beyond the scope of this specification in which case the implementation must fail the memory import operation with the error code `VK_ERROR_INVALID_EXTERNAL_HANDLE_KHR`.

Whether device memory objects imported from a host pointer hold a reference to their payload is undefined. As such, the application must ensure that the imported memory range remains valid and accessible for the lifetime of the imported memory object.
Valid Usage

- VUID-VkImportMemoryHostPointerInfoEXT-handleType-01747
  If `handleType` is not 0, it **must** be supported for import, as reported in `VkExternalMemoryProperties`

- VUID-VkImportMemoryHostPointerInfoEXT-handleType-01748
  If `handleType` is not 0, it **must** be `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT` or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT`

- VUID-VkImportMemoryHostPointerInfoEXT-pHostPointer-01749
  `pHostPointer` **must** be a pointer aligned to an integer multiple of `VkPhysicalDeviceExternalMemoryHostPropertiesEXT::minImportedHostPointerAlignment`

- VUID-VkImportMemoryHostPointerInfoEXT-handleType-01750
  If `handleType` is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT`, `pHostPointer` **must** be a pointer to `allocationSize` number of bytes of host memory, where `allocationSize` is the member of the `VkMemoryAllocateInfo` structure this structure is chained to

- VUID-VkImportMemoryHostPointerInfoEXT-handleType-01751
  If `handleType` is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT`, `pHostPointer` **must** be a pointer to `allocationSize` number of bytes of host mapped foreign memory, where `allocationSize` is the member of the `VkMemoryAllocateInfo` structure this structure is chained to

Valid Usage (Implicit)

- VUID-VkImportMemoryHostPointerInfoEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_IMPORT_MEMORY_HOST_POINTER_INFO_EXT`

- VUID-VkImportMemoryHostPointerInfoEXT-handleType-parameter
  `handleType` **must** be a valid `VkExternalMemoryHandleTypeFlagBits` value

- VUID-VkImportMemoryHostPointerInfoEXT-pHostPointer-parameter
  `pHostPointer` **must** be a pointer value

To determine the correct parameters to use when importing host pointers, call:

```c
// Provided by VK_EXT_external_memory_host
VkResult vkGetMemoryHostPointerPropertiesEXT(
    VkDevice device,
    VkExternalMemoryHandleTypeFlagBits handleType,
    const void* pHostPointer,
    VkMemoryHostPointerPropertiesEXT* pMemoryHostPointerProperties);
```

- `device` is the logical device that will be importing `pHostPointer`.
- `handleType` is a `VkExternalMemoryHandleTypeFlagBits` value specifying the type of the handle
pHostPointer.

- **pHostPointer** is the host pointer to import from.
- **pMemoryHostPointerProperties** is a pointer to a `VkMemoryHostPointerPropertiesEXT` structure in which the host pointer properties are returned.

### Valid Usage

- **VUID-vkGetMemoryHostPointerPropertiesEXT-handleType-01752**
  
  `handleType` must be `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT` or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT`

- **VUID-vkGetMemoryHostPointerPropertiesEXT-pHostPointer-01753**
  
  `pHostPointer` must be a pointer aligned to an integer multiple of `VkPhysicalDeviceExternalMemoryHostPropertiesEXT::minImportedHostPointerAlignment`

- **VUID-vkGetMemoryHostPointerPropertiesEXT-handleType-01754**
  
  If `handleType` is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT`, `pHostPointer` must be a pointer to host memory

- **VUID-vkGetMemoryHostPointerPropertiesEXT-handleType-01755**
  
  If `handleType` is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT`, `pHostPointer` must be a pointer to host mapped foreign memory

### Valid Usage (Implicit)

- **VUID-vkGetMemoryHostPointerPropertiesEXT-device-parameter**
  
  `device` must be a valid `VkDevice` handle

- **VUID-vkGetMemoryHostPointerPropertiesEXT-handleType-parameter**
  
  `handleType` must be a valid `VkExternalMemoryHandleTypeFlagBits` value

- **VUID-vkGetMemoryHostPointerPropertiesEXT-pHostPointer-parameter**
  
  `pHostPointer` must be a pointer value

- **VUID-vkGetMemoryHostPointerPropertiesEXT-pMemoryHostPointerProperties-parameter**
  
  `pMemoryHostPointerProperties` must be a valid pointer to a `VkMemoryHostPointerPropertiesEXT` structure

### Return Codes

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_INVALID_EXTERNAL_HANDLE**
The `VkMemoryHostPointerPropertiesEXT` structure is defined as:

```c
// Provided by VK_EXT_external_memory_host
typedef struct VkMemoryHostPointerPropertiesEXT {
    VkStructureType      sType;
    void*                pNext;
    uint32_t             memoryTypeBits;
} VkMemoryHostPointerPropertiesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memoryTypeBits` is a bitmask containing one bit set for every memory type which the specified host pointer can be imported as.

The value returned by `memoryTypeBits` must only include bits that identify memory types which are host visible.

### Valid Usage (Implicit)

- `VUID-VkMemoryHostPointerPropertiesEXT-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_MEMORY_HOST_POINTER_PROPERTIES_EXT`

- `VUID-VkMemoryHostPointerPropertiesEXT-pNext-pNext`  
  `pNext` must be `NULL`

#### 11.2.7. Android Hardware Buffer External Memory

To import memory created outside of the current Vulkan instance from an Android hardware buffer, add a `VkImportAndroidHardwareBufferInfoANDROID` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure. The `VkImportAndroidHardwareBufferInfoANDROID` structure is defined as:

```c
// Provided by VK_ANDROID_external_memory_android_hardware_buffer
typedef struct VkImportAndroidHardwareBufferInfoANDROID {
    VkStructureType      sType;
    const void*          pNext;
    struct AHardwareBuffer* buffer;
} VkImportAndroidHardwareBufferInfoANDROID;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `buffer` is the Android hardware buffer to import.

If the `vkAllocateMemory` command succeeds, the implementation must acquire a reference to the imported hardware buffer, which it must release when the device memory object is freed. If the
command fails, the implementation must not retain a reference.

Valid Usage

- VUID-VkImportAndroidHardwareBufferInfoANDROID-buffer-01880
  If buffer is not NULL, Android hardware buffers must be supported for import, as reported by VkExternalImageFormatProperties or VkExternalBufferProperties

- VUID-VkImportAndroidHardwareBufferInfoANDROID-buffer-01881
  If buffer is not NULL, it must be a valid Android hardware buffer object with AHardwareBuffer_Desc::usage compatible with Vulkan as described in Android Hardware Buffers

Valid Usage (Implicit)

- VUID-VkImportAndroidHardwareBufferInfoANDROID-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMPORT_ANDROID_HARDWARE_BUFFER_INFO_ANDROID

- VUID-VkImportAndroidHardwareBufferInfoANDROID-buffer-parameter
  buffer must be a valid pointer to an AHardwareBuffer value

To export an Android hardware buffer referencing the payload of a Vulkan device memory object, call:

```c
// Provided by VK_ANDROID_external_memory_android_hardware_buffer
VkResult vkGetMemoryAndroidHardwareBufferANDROID(
    VkDevice device,
    const VkMemoryGetAndroidHardwareBufferInfoANDROID* pInfo,
    struct AHardwareBuffer** pBuffer);
```

- device is the logical device that created the device memory being exported.
- pInfo is a pointer to a VkMemoryGetAndroidHardwareBufferInfoANDROID structure containing parameters of the export operation.
- pBuffer will return an Android hardware buffer referencing the payload of the device memory object.

Each call to vkGetMemoryAndroidHardwareBufferANDROID must return an Android hardware buffer with a new reference acquired in addition to the reference held by the VkDeviceMemory. To avoid leaking resources, the application must release the reference by calling AHardwareBuffer_release when it is no longer needed. When called with the same handle in VkMemoryGetAndroidHardwareBufferInfoANDROID::memory, vkGetMemoryAndroidHardwareBufferInfoANDROID must return the same Android hardware buffer object. If the device memory was created by importing an Android hardware buffer, vkGetMemoryAndroidHardwareBufferInfoANDROID must return that same Android hardware buffer object.
Valid Usage (Implicit)

- VUID-vkGetMemoryAndroidHardwareBufferANDROID-device-parameter  
  device must be a valid VkDevice handle

- VUID-vkGetMemoryAndroidHardwareBufferANDROID-pInfo-parameter  
  pInfo must be a valid pointer to a valid VkMemoryGetAndroidHardwareBufferInfoANDROID structure

- VUID-vkGetMemoryAndroidHardwareBufferANDROID-pBuffer-parameter  
  pBuffer must be a valid pointer to a valid pointer to an AHardwareBuffer value

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_OUT_OF_HOST_MEMORY

The VkMemoryGetAndroidHardwareBufferInfoANDROID structure is defined as:

```c
// Provided by VK_ANDROID_external_memory_android_hardware_buffer
typedef struct VkMemoryGetAndroidHardwareBufferInfoANDROID {
    VkStructureType sType;
    const void* pNext;
    VkDeviceMemory memory;
} VkMemoryGetAndroidHardwareBufferInfoANDROID;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- memory is the memory object from which the Android hardware buffer will be exported.

Valid Usage

- VUID-VkMemoryGetAndroidHardwareBufferInfoANDROID-handleTypes-01882
  VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BITANDROID must have been included in VkExportMemoryAllocateInfo::handleTypes when memory was created

- VUID-VkMemoryGetAndroidHardwareBufferInfoANDROID-pNext-01883
  If the pNext chain of the VkMemoryAllocateInfo used to allocate memory included a VkMemoryDedicatedAllocateInfo with non-NULL image member, then that image must already be bound to memory
Valid Usage (Implicit)

- VUID-VkMemoryGetAndroidHardwareBufferInfoANDROID-sType-sType
  sType must be VK_STRUCTURE_TYPE_MEMORY_GET_ANDROID_HARDWARE_BUFFER_INFO_ANDROID

- VUID-VkMemoryGetAndroidHardwareBufferInfoANDROID-pNext-pNext
  pNext must be NULL

- VUID-VkMemoryGetAndroidHardwareBufferInfoANDROID-memory-parameter
  memory must be a valid VkDeviceMemory handle

To determine the memory parameters to use when importing an Android hardware buffer, call:

```c
// Provided by VK_ANDROID_external_memory_android_hardware_buffer
VkResult vkGetAndroidHardwareBufferPropertiesANDROID(
    VkDevice device,
    const struct AHardwareBuffer* buffer,
    VkAndroidHardwareBufferPropertiesANDROID* pProperties);
```

- `device` is the logical device that will be importing `buffer`.
- `buffer` is the Android hardware buffer which will be imported.
- `pProperties` is a pointer to a VkAndroidHardwareBufferPropertiesANDROID structure in which the properties of `buffer` are returned.

Valid Usage

- VUID-vkGetAndroidHardwareBufferPropertiesANDROID-buffer-01884
  buffer must be a valid Android hardware buffer object with at least one of the AHWAREBUFFER_USAGE_GPU_* flags in its AHardwareBuffer_Desc::usage

Valid Usage (Implicit)

- VUID-vkGetAndroidHardwareBufferPropertiesANDROID-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetAndroidHardwareBufferPropertiesANDROID-buffer-parameter
  buffer must be a valid pointer to a valid AHardwareBuffer value

- VUID-vkGetAndroidHardwareBufferPropertiesANDROID-pProperties-parameter
  pProperties must be a valid pointer to a VkAndroidHardwareBufferPropertiesANDROID structure
Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_INVALID_EXTERNAL_HANDLE_KHR

The `VkAndroidHardwareBufferPropertiesANDROID` structure returned is defined as:

```c
// Provided by VK_ANDROID_external_memory_android_hardware_buffer
typedef struct VkAndroidHardwareBufferPropertiesANDROID {
    VkStructureType sType;
    void* pNext;
    VkDeviceSize allocationSize;
    uint32_t memoryTypeBits;
} VkAndroidHardwareBufferPropertiesANDROID;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `allocationSize` is the size of the external memory
- `memoryTypeBits` is a bitmask containing one bit set for every memory type which the specified Android hardware buffer can be imported as.

**Valid Usage (Implicit)**

- VUID-VkAndroidHardwareBufferPropertiesANDROID-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_ANDROID_HARDWARE_BUFFER_PROPERTIES_ANDROID`

- VUID-VkAndroidHardwareBufferPropertiesANDROID-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of
  - `VkAndroidHardwareBufferFormatProperties2ANDROID`
  - `VkAndroidHardwareBufferFormatPropertiesANDROID`
  - `VkAndroidHardwareBufferFormatResolvePropertiesANDROID`

- VUID-VkAndroidHardwareBufferPropertiesANDROID-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique

To obtain format properties of an Android hardware buffer, include a `VkAndroidHardwareBufferFormatPropertiesANDROID` structure in the `pNext` chain of the `VkAndroidHardwareBufferPropertiesANDROID` structure passed to `vkGetAndroidHardwareBufferPropertiesANDROID`. This structure is defined as:
// Provided by VK_ANDROID_external_memory_androidHardwareBuffer

typedef struct VkAndroidHardwareBufferFormatPropertiesANDROID {
    VkStructureType sType;
    void* pNext;
    VkFormat format;
    uint64_t externalFormat;
    VkFormatFeatureFlags formatFeatures;
    VkComponentMapping samplerYcbcrConversionComponents;
    VkSamplerYcbcrModelConversion suggestedYcbcrModel;
    VkSamplerYcbcrRange suggestedYcbcrRange;
    VkChromaLocation suggestedXChromaOffset;
    VkChromaLocation suggestedYChromaOffset;
} VkAndroidHardwareBufferFormatPropertiesANDROID;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **format** is the Vulkan format corresponding to the Android hardware buffer’s format, or `VK_FORMAT_UNDEFINED` if there is not an equivalent Vulkan format.
- **externalFormat** is an implementation-defined external format identifier for use with `VkExternalFormatANDROID`. It must not be zero.
- **formatFeatures** describes the capabilities of this external format when used with an image bound to memory imported from buffer.
- **samplerYcbcrConversionComponents** is the component swizzle that should be used in `VkSamplerYcbcrConversionCreateInfo`.
- **suggestedYcbcrModel** is a suggested color model to use in the `VkSamplerYcbcrConversionCreateInfo`.
- **suggestedYcbcrRange** is a suggested numerical value range to use in `VkSamplerYcbcrConversionCreateInfo`.
- **suggestedXChromaOffset** is a suggested X chroma offset to use in `VkSamplerYcbcrConversionCreateInfo`.
- **suggestedYChromaOffset** is a suggested Y chroma offset to use in `VkSamplerYcbcrConversionCreateInfo`.

If the Android hardware buffer has one of the formats listed in the Format Equivalence table, then **format** must have the equivalent Vulkan format listed in the table. Otherwise, **format** may be `VK_FORMAT_UNDEFINED`, indicating the Android hardware buffer can only be used with an external format.

The **formatFeatures** member must include `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT` and at least one of `VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT` or `VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT`, and should include `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT` and `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_LINEAR_FILTER_BIT`.

Note
The `formatFeatures` member only indicates the features available when using an external-format image created from the Android hardware buffer. Images from Android hardware buffers with a format other than `VK_FORMAT_UNDEFINED` are subject to the format capabilities obtained from `vkGetPhysicalDeviceFormatProperties2`, and `vkGetPhysicalDeviceImageFormatProperties2` with appropriate parameters. These sets of features are independent of each other, e.g. the external format will support sampler Y’CbCr conversion even if the non-external format does not, and rendering directly to the external format will not be supported even if the non-external format does support this.

Android hardware buffers with the same external format must have the same support for `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`, `VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT`, `VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT`, `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_LINEAR_FILTER_BIT`, `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_SEPARATE_RECONSTRUCTION_FILTER_BIT`, and `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_FORCEABLE_BIT` in `formatFeatures`. Other format features may differ between Android hardware buffers that have the same external format. This allows applications to use the same `VkSamplerYcbcrConversion` object (and samplers and pipelines created from them) for any Android hardware buffers that have the same external format.

If `format` is not `VK_FORMAT_UNDEFINED`, then the value of `samplerYcbcrConversionComponents` must be valid when used as the `components` member of `VkSamplerYcbcrConversionCreateInfo` with that format. If `format` is `VK_FORMAT_UNDEFINED`, all members of `samplerYcbcrConversionComponents` must be the identity swizzle.

Implementations may not always be able to determine the color model, numerical range, or chroma offsets of the image contents, so the values in `VkAndroidHardwareBufferFormatPropertiesANDROID` are only suggestions. Applications should treat these values as sensible defaults to use in the absence of more reliable information obtained through some other means. If the underlying physical device is also usable via OpenGL ES with the `GL_OES_EGL_image_external` extension, the implementation should suggest values that will produce similar sampled values as would be obtained by sampling the same external image via `samplerExternalOES` in OpenGL ES using equivalent sampler parameters.

**Valid Usage (Implicit)**

- VUID-VkAndroidHardwareBufferFormatPropertiesANDROID-sType-sType
  
sType **must** be `VK_STRUCTURE_TYPE_ANDROID_HARDWARE_BUFFER_FORMAT_PROPERTIES_ANDROID`

The format properties of an Android hardware buffer can be obtained by including a

---

928
VkAndroidHardwareBufferFormatProperties2ANDROID structure in the pNext chain of the VkAndroidHardwareBufferPropertiesANDROID structure passed to vkGetAndroidHardwareBufferPropertiesANDROID. This structure is defined as:

```c
// Provided by VK_KHR_format_feature_flags2 with
VK_ANDROID_external_memory_android_hardware_buffer
typedef struct VkAndroidHardwareBufferFormatProperties2ANDROID {
  VkStructureType sType;
  void* pNext;
  VkFormat format;
  uint64_t externalFormat;
  VkFormatFeatureFlags2 formatFeatures;
  VkComponentMapping samplerYcbcrConversionComponents;
  VkSamplerYcbcrModelConversion suggestedYcbcrModel;
  VkSamplerYcbcrRange suggestedYcbcrRange;
  VkChromaLocation suggestedXChromaOffset;
  VkChromaLocation suggestedYChromaOffset;
} VkAndroidHardwareBufferFormatProperties2ANDROID;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **format** is the Vulkan format corresponding to the Android hardware buffer’s format, or VK_FORMAT_UNDEFINED if there is not an equivalent Vulkan format.
- **externalFormat** is an implementation-defined external format identifier for use with VkExternalFormatANDROID. It must not be zero.
- **formatFeatures** describes the capabilities of this external format when used with an image bound to memory imported from buffer.
- **samplerYcbcrConversionComponents** is the component swizzle that should be used in VkSamplerYcbcrConversionCreateInfo.
- **suggestedYcbcrModel** is a suggested color model to use in the VkSamplerYcbcrConversionCreateInfo.
- **suggestedYcbcrRange** is a suggested numerical value range to use in VkSamplerYcbcrConversionCreateInfo.
- **suggestedXChromaOffset** is a suggested X chroma offset to use in VkSamplerYcbcrConversionCreateInfo.
- **suggestedYChromaOffset** is a suggested Y chroma offset to use in VkSamplerYcbcrConversionCreateInfo.

The bits reported in formatFeatures must include the bits reported in the corresponding fields of VkAndroidHardwareBufferFormatPropertiesANDROID::formatFeatures.

**Valid Usage (Implicit)**

- VUID-VkAndroidHardwareBufferFormatProperties2ANDROID-sType-sType
sType must be VK_STRUCTURE_TYPE_ANDROID_HARDWARE_BUFFER_FORMAT_PROPERTIES_2_ANDROID

The VkAndroidHardwareBufferFormatResolvePropertiesANDROID structure is defined as:

```c
typedef struct VkAndroidHardwareBufferFormatResolvePropertiesANDROID {
    VkStructureType sType;
    void* pNext;
    VkFormat colorAttachmentFormat;
} VkAndroidHardwareBufferFormatResolvePropertiesANDROID;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- colorAttachmentFormat is a VkFormat specifying the format of color attachment images that must be used for color attachments when resolving to the specified external format. If the implementation supports external format resolves for the specified external format, this value will be set to a color format supporting the VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT in VkFormatProperties::optimalTilingFeatures as returned by vkGetPhysicalDeviceFormatProperties with format equal to colorAttachmentFormat. If external format resolves are not supported, this value will be set to VK_FORMAT_UNDEFINED.

Any Android hardware buffer created with the GRALLOC_USAGE_HW_RENDER flag must be renderable in some way in Vulkan, either:

- VkAndroidHardwareBufferFormatPropertiesANDROID::format must be a format that supports VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT or VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT in VkFormatProperties::optimalTilingFeatures; or
- colorAttachmentFormat must be a format that supports VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT in VkFormatProperties::optimalTilingFeatures.

Valid Usage (Implicit)

- VUID-VkAndroidHardwareBufferFormatResolvePropertiesANDROID-sType-sType
  sType must be VK_STRUCTURE_TYPE_ANDROID_HARDWARE_BUFFER_FORMAT_RESOLVE_PROPERTIES_2_ANDROID

11.2.8. Remote Device External Memory

To export an address representing the payload of a Vulkan device memory object accessible by remote devices, call:

```c
// Provided by VK_NV_external_memory_rdma
VkResult vkGetMemoryRemoteAddressNV(
    VkDevice device,
    const VkMemoryGetRemoteAddressInfoNV* pMemoryGetRemoteAddressInfo,
```
• **device** is the logical device that created the device memory being exported.

• **pMemoryGetRemoteAddressInfo** is a pointer to a `VkMemoryGetRemoteAddressInfoNV` structure containing parameters of the export operation.

• **pAddress** is a pointer to a `VkRemoteAddressNV` value in which an address representing the payload of the device memory object is returned.

More communication may be required between the kernel-mode drivers of the devices involved. This information is out of scope of this documentation and should be requested from the vendors of the devices.

### Valid Usage (Implicit)

- **VUID-vkGetMemoryRemoteAddressNV-device-parameter**  
  *device* must be a valid `VkDevice` handle

- **VUID-vkGetMemoryRemoteAddressNV-pMemoryGetRemoteAddressInfo-parameter**  
  *pMemoryGetRemoteAddressInfo* must be a valid pointer to a valid `VkMemoryGetRemoteAddressInfoNV` structure

- **VUID-vkGetMemoryRemoteAddressNV-pAddress-parameter**  
  *pAddress* must be a valid pointer to a `VkRemoteAddressNV` value

### Return Codes

#### Success
- **VK_SUCCESS**

#### Failure
- **VK_ERROR_INVALID_EXTERNAL_HANDLE**

The `VkMemoryGetRemoteAddressInfoNV` structure is defined as:

```c
// Provided by VK_NV_external_memory_rdma
typedef struct _VkMemoryGetRemoteAddressInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkDeviceMemory memory;
    VkExternalMemoryHandleTypeFlagBits handleType;
} VkMemoryGetRemoteAddressInfoNV;
```

- **sType** is a `VkStructureType` value identifying this structure.

- **pNext** is `NULL` or a pointer to a structure extending this structure.

- **memory** is the memory object from which the remote accessible address will be exported.
• **handleType** is the type of handle requested.

### Valid Usage

- VUID-VkMemoryGetRemoteAddressInfoNV-handleType-04966
  handleType **must** have been included in `VkExportMemoryAllocateInfo::handleTypes` when memory was created

### Valid Usage (Implicit)

- VUID-VkMemoryGetRemoteAddressInfoNV-sType-sType
  sType **must** be `VK_STRUCTURE_TYPE_MEMORY_GET_REMOTE_ADDRESS_INFO_NV`

- VUID-VkMemoryGetRemoteAddressInfoNV-pNext-pNext
  pNext **must** be `NULL`

- VUID-VkMemoryGetRemoteAddressInfoNV-memory-parameter
  memory **must** be a valid `VkDeviceMemory` handle

- VUID-VkMemoryGetRemoteAddressInfoNV-handleType-parameter
  handleType **must** be a valid `VkExternalMemoryHandleTypeFlagBits` value

**VkRemoteAddressNV** represents an address of a memory object accessible by remote devices, as returned in `vkGetMemoryRemoteAddressNV::pAddress`.

```c
// Provided by VK_NV_external_memory_rdma
typedef void* VkRemoteAddressNV;
```

### 11.2.9. Fuchsia External Memory

On Fuchsia, when allocating memory that **may** be imported from another device, process or Vulkan instance, add a `VkImportMemoryZirconHandleInfoFUCHSIA` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure.

External memory on Fuchsia is imported and exported using VMO handles of type `zx_handle_t`. VMO handles to external memory are canonically obtained from Fuchsia's Sysmem service or from syscalls such as `zx_vmo_create()`. VMO handles for import can also be obtained by exporting them from another Vulkan instance as described in exporting fuchsia device memory.

Importing VMO handles to the Vulkan instance transfers ownership of the handle to the instance from the application. The application **must** not perform any operations on the handle after successful import.

Applications **can** import the same underlying memory into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance. In all cases, each import operation **must** create a distinct `VkDeviceMemory` object.
Importing Fuchsia External Memory

The `VkImportMemoryZirconHandleInfoFUCHSIA` structure is defined as:

```c
// Provided by VK_FUCHSIA_external_memory
typedef struct VkImportMemoryZirconHandleInfoFUCHSIA {
    VkStructureType sType;
    const void* pNext;
    VkExternalMemoryHandleTypeFlagBits handleType;
    zx_handle_t handle;
} VkImportMemoryZirconHandleInfoFUCHSIA;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleType` is a `VkExternalMemoryHandleTypeFlagBits` value specifying the type of `handle`.
- `handle` is a `zx_handle_t` (Zircon) handle to the external memory.

**Valid Usage**

- VUID-VkImportMemoryZirconHandleInfoFUCHSIA-handleType-04771 `handleType` must be `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA`
- VUID-VkImportMemoryZirconHandleInfoFUCHSIA-handle-04772 `handle` must be a valid VMO handle

**Valid Usage (Implicit)**

- VUID-VkImportMemoryZirconHandleInfoFUCHSIA-sType-sType `sType` must be `VK_STRUCTURE_TYPE_IMPORT_MEMORY_ZIRCON_HANDLE_INFO_FUCHSIA`
- VUID-VkImportMemoryZirconHandleInfoFUCHSIA-handleType-parameter If `handleType` is not 0, `handleType` must be a valid `VkExternalMemoryHandleTypeFlagBits` value

To obtain the memoryTypeIndex for the `VkMemoryAllocateInfo` structure, call `vkGetMemoryZirconHandlePropertiesFUCHSIA`:

```c
// Provided by VK_FUCHSIA_external_memory
VkResult vkGetMemoryZirconHandlePropertiesFUCHSIA(
    VkDevice device,                        // device,             
    VkExternalMemoryHandleTypeFlagBits handleType,       // handleType,        
    zx_handle_t zirconHandle,                 // zirconHandle,      
    VkMemoryZirconHandlePropertiesFUCHSIA* pMemoryZirconHandleProperties);  // pMemoryZirconHandleProperties)
```

- `device` is the `VkDevice`.
• **handleType** is a `VkExternalMemoryHandleTypeFlagBits` value specifying the type of `zirconHandle`.
• **zirconHandle** is a `zx_handle_t` (Zircon) handle to the external resource.
• **pMemoryZirconHandleProperties** is a pointer to a `VkMemoryZirconHandlePropertiesFUCHSIA` structure in which the result will be stored.

### Valid Usage

- VUID-vkGetMemoryZirconHandlePropertiesFUCHSIA-handleType-04773
  - `handleType` must be `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA`
- VUID-vkGetMemoryZirconHandlePropertiesFUCHSIA-zirconHandle-04774
  - `zirconHandle` must reference a valid VMO

### Valid Usage (Implicit)

- VUID-vkGetMemoryZirconHandlePropertiesFUCHSIA-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkGetMemoryZirconHandlePropertiesFUCHSIA-handleType-parameter
  - `handleType` must be a valid `VkExternalMemoryHandleTypeFlagBits` value
- VUID-vkGetMemoryZirconHandlePropertiesFUCHSIA-pMemoryZirconHandleProperties-parameter
  - `pMemoryZirconHandleProperties` must be a valid pointer to a `VkMemoryZirconHandlePropertiesFUCHSIA` structure

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_INVALID_EXTERNAL_HANDLE`

The `VkMemoryZirconHandlePropertiesFUCHSIA` structure is defined as:

```c
// Provided by VK_FUCHSIA_external_memory
typedef struct VkMemoryZirconHandlePropertiesFUCHSIA {
    VkStructureType sType;
    void* pNext;
    uint32_t memoryTypeBits;
} VkMemoryZirconHandlePropertiesFUCHSIA;
```

• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is `NULL` or a pointer to a structure extending this structure.
• memoryTypeBits a bitmask containing one bit set for every memory type which the specified handle can be imported as.

**Valid Usage (Implicit)**

- VUID-VkMemoryZirconHandlePropertiesFUCHSIA-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_MEMORY_ZIRCON_HANDLE_PROPERTIES_FUCHSIA
- VUID-VkMemoryZirconHandlePropertiesFUCHSIA-pNext-pNext
  pNext **must** be NULL

With pMemoryZirconHandleProperties now successfully populated by `vkGetMemoryZirconHandlePropertiesFUCHSIA`, assign the `VkMemoryAllocateInfo` memoryTypeIndex field to a memory type which has a bit set in the `VkMemoryZirconHandlePropertiesFUCHSIA` memoryTypeBits field.

**Exporting Fuchsia Device Memory**

Similar to importing, exporting a VMO handle from Vulkan transfers ownership of the handle from the Vulkan instance to the application. The application is responsible for closing the handle with `zx_handle_close()` when it is no longer in use.

To export device memory as a Zircon handle that can be used by another instance, device, or process, the handle to the `VkDeviceMemory` must be retrieved using `vkGetMemoryZirconHandleFUCHSIA`:

```c
// Provided by VK_FUCHSIA_external_memory
VkResult vkGetMemoryZirconHandleFUCHSIA(
    VkDevice device,
    const VkMemoryGetZirconHandleInfoFUCHSIA* pGetZirconHandleInfo,
    zx_handle_t* pZirconHandle
);
```

- **device** is the `VkDevice`.
- **pGetZirconHandleInfo** is a pointer to a `VkMemoryGetZirconHandleInfoFUCHSIA` structure.
- **pZirconHandle** is a pointer to a `zx_handle_t` which holds the resulting Zircon handle.

**Valid Usage (Implicit)**

- VUID-vkGetMemoryZirconHandleFUCHSIA-device-parameter
  device **must** be a valid `VkDevice` handle
- VUID-vkGetMemoryZirconHandleFUCHSIA-pGetZirconHandleInfo-parameter
  pGetZirconHandleInfo **must** be a valid pointer to a valid `VkMemoryGetZirconHandleInfoFUCHSIA` structure
- VUID-vkGetMemoryZirconHandleFUCHSIA-pZirconHandle-parameter
  pZirconHandle **must** be a valid pointer to a `zx_handle_t` value
Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

`VkMemoryGetZirconHandleInfoFUCHSIA` is defined as:

```c
// Provided by VK_FUCHSIA_external_memory
typedef struct VkMemoryGetZirconHandleInfoFUCHSIA {
    VkStructureType sType;
    const void* pNext;
    VkDeviceMemory memory;
    VkExternalMemoryHandleTypeFlagBits handleType;
} VkMemoryGetZirconHandleInfoFUCHSIA;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memory` the `VkDeviceMemory` being exported.
- `handleType` is a `VkExternalMemoryHandleTypeFlagBits` value specifying the type of the handle pointed to by `vkGetMemoryZirconHandleFUCHSIA::pZirconHandle`.

**Valid Usage**

- VUID-VkMemoryGetZirconHandleInfoFUCHSIA-handleType-04775
  `handleType` must be `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA`

- VUID-VkMemoryGetZirconHandleInfoFUCHSIA-handleType-04776
  `handleType` must have been included in the `handleTypes` field of the `VkExportMemoryAllocateInfo` structure when the external memory was allocated.

**Valid Usage (Implicit)**

- VUID-VkMemoryGetZirconHandleInfoFUCHSIA-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_MEMORY_GET_ZIRCON_HANDLE_INFO_FUCHSIA`

- VUID-VkMemoryGetZirconHandleInfoFUCHSIA-pNext-pNext
  `pNext` must be `NULL`

- VUID-VkMemoryGetZirconHandleInfoFUCHSIA-memory-parameter
  `memory` must be a valid `VkDeviceMemory` handle

- VUID-VkMemoryGetZirconHandleInfoFUCHSIA-handleType-parameter
handleType must be a valid VkExternalMemoryHandleTypeFlagBits value

With the result pZirconHandle now obtained, the memory properties for the handle can be retrieved using vkGetMemoryZirconHandlePropertiesFUCHSIA as documented above substituting the dereferenced, retrieved pZirconHandle in for the zirconHandle argument.

11.2.10. Metal Objects

A Vulkan implementation that is layered on top of Metal on Apple device platform, and implements the VK_EXT_metal_objects extension, supports the ability to import and export the underlying Metal objects associated with specific Vulkan objects.

The underlying Metal objects associated with certain Vulkan objects can be exported from those Vulkan objects using the pNext chain of the VkExportMetalObjectsInfoEXT parameter of the vkExportMetalObjectsEXT command.

An VkDeviceMemory object can be allocated on an existing MTLBuffer object, by including the MTLBuffer object in a VkImportMetalBufferInfoEXT structure in the pNext chain of the VkMemoryAllocateInfo structure in the vkAllocateMemory command.

A new VkImage object can be created on an existing IOSurface object, or one or more existing Metal MTLTexture objects, by including those Metal objects in either VkImportMetalIOSurfaceInfoEXT or VkImportMetalTextureInfoEXT structures in the pNext chain of the VkImageCreateInfo structure in the vkCreateImage command.

To export Metal objects from Vulkan objects, the app must first indicate the intention to do so during the creation of the Vulkan object, by including one or more VkExportMetalObjectCreateInfoEXT structures in the pNext chain of the VkInstanceCreateInfo, VkMemoryAllocateInfo, VkImageCreateInfo, VkImageViewCreateInfo, VkBufferViewCreateInfo, VkSemaphoreCreateInfo, or VkEventCreateInfo, in the corresponding Vulkan object creation command.

The VkExportMetalObjectCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_metal_objects
typedef struct VkExportMetalObjectCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkExportMetalObjectTypeFlagBitsEXT exportObjectType;
} VkExportMetalObjectCreateInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- exportObjectType is a VkExportMetalObjectTypeFlagBitsEXT indicating the type of Metal object that the application may request to be exported from the Vulkan object.
Valid Usage (Implicit)

- VUID-VkExportMetalObjectCreateInfoEXT-sType-sType
  sType must be `VK_STRUCTURE_TYPE_EXPORT_METAL_OBJECT_CREATE_INFO_EXT`

- VUID-VkExportMetalObjectCreateInfoEXT-exportObjectType-parameter
  If `exportObjectType` is not 0, `exportObjectType` must be a valid `VkExportMetalObjectFlagBitsEXT` value

Bits which indicate the types of Metal objects that may be exported from a corresponding Vulkan object are:

```c
// Provided by VK_EXT_metal_objects
typedef enum VkExportMetalObjectFlagBitsEXT {
    VK_EXPORT_METAL_OBJECT_TYPE_METAL_DEVICE_BIT_EXT = 0x00000001,
    VK_EXPORT_METAL_OBJECT_TYPE_METAL_COMMAND_QUEUE_BIT_EXT = 0x00000002,
    VK_EXPORT_METAL_OBJECT_TYPE_METAL_BUFFER_BIT_EXT = 0x00000004,
    VK_EXPORT_METAL_OBJECT_TYPE_METAL_TEXTURE_BIT_EXT = 0x00000008,
    VK_EXPORT_METAL_OBJECT_TYPE_METAL_IOSURFACE_BIT_EXT = 0x00000010,
    VK_EXPORT_METAL_OBJECT_TYPE_METAL_SHARED_EVENT_BIT_EXT = 0x00000020,
} VkExportMetalObjectFlagBitsEXT;
```

- `VK_EXPORT_METAL_OBJECT_TYPE_METAL_DEVICE_BIT_EXT` indicates a Metal `MTLDevice` may be exported.
- `VK_EXPORT_METAL_OBJECT_TYPE_METAL_COMMAND_QUEUE_BIT_EXT` indicates a Metal `MTLCommandQueue` may be exported.
- `VK_EXPORT_METAL_OBJECT_TYPE_METAL_BUFFER_BIT_EXT` indicates a Metal `MTLBuffer` may be exported.
- `VK_EXPORT_METAL_OBJECT_TYPE_METAL_TEXTURE_BIT_EXT` indicates a Metal `MTLTexture` may be exported.
- `VK_EXPORT_METAL_OBJECT_TYPE_METAL_IOSURFACE_BIT_EXT` indicates a Metal `IOSurface` may be exported.
- `VK_EXPORT_METAL_OBJECT_TYPE_METAL_SHARED_EVENT_BIT_EXT` indicates a Metal `MTLSharedEvent` may be exported.

```c
// Provided by VK_EXT_metal_objects
typedef VkFlags VkExportMetalObjectFlagsEXT;
```

`VkExportMetalObjectFlagsEXT` is a bitmask type for setting a mask of zero or more `VkExportMetalObjectFlagBitsEXT`.

To export Metal objects that underlie Vulkan objects, call:

```c
// Provided by VK_EXT_metal_objects
void vkExportMetalObjectsEXT(
    VkDevice device,
    ...)
```
VkExportMetalObjectsInfoEXT* pMetalObjectsInfo);  

- `device` is the device that created the Vulkan objects.
- `pMetalObjectsInfo` is a pointer to a `VkExportMetalObjectsInfoEXT` structure whose `pNext` chain contains structures, each identifying a Vulkan object and providing a pointer through which the Metal object will be returned.

### Valid Usage (Implicit)

- VUID-vkExportMetalObjectsEXT-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkExportMetalObjectsEXT-pMetalObjectsInfo-parameter
  - `pMetalObjectsInfo` must be a valid pointer to a `VkExportMetalObjectsInfoEXT` structure

The `VkExportMetalObjectsInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_metal_objects
typedef struct VkExportMetalObjectsInfoEXT {
    VkStructureType sType;
    const void* pNext;
} VkExportMetalObjectsInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

### Valid Usage

- VUID-VkExportMetalObjectsInfoEXT-pNext-06791
  If the `pNext` chain includes a `VkExportMetalDeviceCreateInfoEXT` structure, the `VkInstance` must have been created with `VK_EXPORT_METAL_OBJECT_TYPE_METAL_DEVICE_BIT_EXT` in the `exportObjectType` member of a `VkExportMetalObjectCreateInfoEXT` structure in the `pNext` chain of the `VkInstanceCreateInfo` structure in the `vkCreateInstance` command
- VUID-VkExportMetalObjectsInfoEXT-pNext-06792
  If the `pNext` chain includes a `VkExportMetalCommandQueueInfoEXT` structure, the `VkInstance` must have been created with `VK_EXPORT_METAL_OBJECT_TYPE_METAL_COMMAND_QUEUE_BIT_EXT` in the `exportObjectType` member of a `VkExportMetalObjectCreateInfoEXT` structure in the `pNext` chain of the `VkInstanceCreateInfo` structure in the `vkCreateInstance` command
- VUID-VkExportMetalObjectsInfoEXT-pNext-06793
  If the `pNext` chain includes a `VkExportMetalBufferInfoEXT` structure, the `VkDeviceMemory` in its `memory` member must have been allocated with `VK_EXPORT_METAL_OBJECT_TYPE_METAL_BUFFER_BIT_EXT` in the `exportObjectType` member of a `VkExportMetalObjectCreateInfoEXT` structure in the `pNext` chain of the `VkMemoryAllocateInfo` structure in the `vkAllocateMemory` command
If the `pNext` chain includes a `VkExportMetalTextureInfoEXT` structure, exactly one of its `image`, `imageView`, or `bufferView` members must not be `VK_NULL_HANDLE`.

If the `pNext` chain includes a `VkExportMetalTextureInfoEXT` structure, and its `image` member is not `VK_NULL_HANDLE`, the `VkImage` in its `image` member must have been created with `VK_EXPORT_METAL_OBJECT_TYPE_METAL_TEXTURE_BIT_EXT` in the `exportObjectType` member of a `VkExportMetalObjectCreateInfoEXT` structure in the `pNext` chain of the `VkImageCreateInfo` structure in the `vkCreateImage` command.

If the `pNext` chain includes a `VkExportMetalTextureInfoEXT` structure, and its `imageView` member is not `VK_NULL_HANDLE`, the `VkImageView` in its `imageView` member must have been created with `VK_EXPORT_METAL_OBJECT_TYPE_METAL_TEXTURE_BIT_EXT` in the `exportObjectType` member of a `VkExportMetalObjectCreateInfoEXT` structure in the `pNext` chain of the `VkImageViewCreateInfo` structure in the `vkCreateImageView` command.

If the `pNext` chain includes a `VkExportMetalTextureInfoEXT` structure, and its `bufferView` member is not `VK_NULL_HANDLE`, the `VkBufferView` in its `bufferView` member must have been created with `VK_EXPORT_METAL_OBJECT_TYPE_METAL_TEXTURE_BIT_EXT` in the `exportObjectType` member of a `VkExportMetalObjectCreateInfoEXT` structure in the `pNext` chain of the `VkBufferViewCreateInfo` structure in the `vkCreateBufferView` command.

If the `pNext` chain includes a `VkExportMetalTextureInfoEXT` structure, and if either its `image` or `imageView` member is not `VK_NULL_HANDLE`, then `plane` must be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, or `VK_IMAGE_ASPECT_PLANE_2_BIT`.

If the `pNext` chain includes a `VkExportMetalTextureInfoEXT` structure, and if the `VkImage` in its `image` member does not have a multi-planar format, then its `plane` member must be `VK_IMAGE_ASPECT_PLANE_0_BIT`.

If the `pNext` chain includes a `VkExportMetalTextureInfoEXT` structure, and if the `VkImage` in its `image` member has a multi-planar format with only two planes, then its `plane` member must not be `VK_IMAGE_ASPECT_PLANE_2_BIT`.

If the `pNext` chain includes a `VkExportMetalTextureInfoEXT` structure, and if the `VkImageView` in its `imageView` member does not have a multi-planar format, then its `plane` member must be `VK_IMAGE_ASPECT_PLANE_0_BIT`.

If the `pNext` chain includes a `VkExportMetalTextureInfoEXT` structure, and if the `VkImageView` in its `imageView` member has a multi-planar format with only two planes, then its `plane` member must not be `VK_IMAGE_ASPECT_PLANE_2_BIT`.

If the `pNext` chain includes a `VkExportMetalTextureInfoEXT` structure, and if the `VkImage` in its `image` member must have been created with
VK_EXPORT_METAL_OBJECT_TYPE_METAL_IOSURFACE_BIT_EXT in the exportObject_Type member of a VkExportMetalObjectCreateInfoEXT structure in the pNext chain of the VkImageCreateInfo structure in the vkCreateImage command

• VUID-VkExportMetalObjectsInfoEXT-pNext-06804
If the pNext chain includes a VkExportMetalSharedEventInfoEXT structure, exactly one of its semaphore or event members must not be VK_NULL_HANDLE

• VUID-VkExportMetalObjectsInfoEXT-pNext-06805
If the pNext chain includes a VkExportMetalSharedEventInfoEXT structure, and its semaphore member is not VK_NULL_HANDLE, the VkSemaphore in its semaphore member must have been created with VK_EXPORT_METAL_OBJECT_TYPE_METAL_SHARED_EVENT_BIT_EXT in the exportObject_Type member of a VkExportMetalObjectCreateInfoEXT structure in the pNext chain of the VkSemaphoreCreateInfo structure in the vkCreateSemaphore command

• VUID-VkExportMetalObjectsInfoEXT-pNext-06806
If the pNext chain includes a VkExportMetalSharedEventInfoEXT structure, and its event member is not VK_NULL_HANDLE, the VkEvent in its event member must have been created with VK_EXPORT_METAL_OBJECT_TYPE_METAL_SHARED_EVENT_BIT_EXT in the exportObject_Type member of a VkExportMetalObjectCreateInfoEXT structure in the pNext chain of the VkEventCreateInfo structure in the vkCreateEvent command

Valid Usage (Implicit)

• VUID-VkExportMetalObjectsInfoEXT-sType-sType
sType must be VK_STRUCTURE_TYPE_EXPORT_METAL_OBJECTS_INFO_EXT

• VUID-VkExportMetalObjectsInfoEXT-pNext-pNext
Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkExportMetalBufferInfoEXT, VkExportMetalCommandQueueInfoEXT, VkExportMetalDeviceInfoEXT, VkExportMetalIOSurfaceInfoEXT, VkExportMetalSharedEventInfoEXT, or VkExportMetalTextureInfoEXT

• VUID-VkExportMetalObjectsInfoEXT-sType-unique
The sType value of each struct in the pNext chain must be unique, with the exception of structures of type VkExportMetalBufferInfoEXT, VkExportMetalCommandQueueInfoEXT, VkExportMetalIOSurfaceInfoEXT, VkExportMetalSharedEventInfoEXT, or VkExportMetalTextureInfoEXT

To export the Metal MTLDevice object underlying the VkPhysicalDevice associated with a VkDevice object, include a VkExportMetalDeviceInfoEXT structure in the pNext chain of the pMetalObjectsInfo parameter of a vkExportMetalObjectsEXT call.

The VkExportMetalDeviceInfoEXT structure is defined as:

```c
// Provided by VK_EXT_metal_objects
typedef struct VkExportMetalDeviceInfoEXT {
```
- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **mtlDevice** is the Metal `id<MTLDevice>` object underlying the `VkPhysicalDevice` associated with the `VkDevice` object identified in the call. The implementation will return the `MTLDevice` in this member, or it will return `NULL` if no `MTLDevice` could be found underlying the `VkPhysicalDevice` object.

### Valid Usage (Implicit)

- VUID-VkExportMetalDeviceInfoEXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_EXPORT_METAL_DEVICE_INFO_EXT`

The type `id<MTLDevice>` is defined in Apple's Metal framework, but to remove an unnecessary compile time dependency, an incomplete type definition of `MTLDevice_id` is provided in the Vulkan headers:

```c
// Provided by VK_EXT_metal_objects
#ifdef __OBJC__
@protocol MTLDevice;
typedef id<MTLDevice> MTLDevice_id;
#else
typedef void* MTLDevice_id;
#endif
```

To export the Metal `MTLCommandQueue` object underlying a `VkQueue` object, include a `VkExportMetalCommandQueueInfoEXT` structure in the `pNext` chain of the `pMetalObjectsInfo` parameter of a `vkExportMetalObjectsEXT` call.

The `VkExportMetalCommandQueueInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_metal_objects
typedef struct VkExportMetalCommandQueueInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkQueue queue;
    MTLCommandQueue_id mtlCommandQueue;
} VkExportMetalCommandQueueInfoEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
• queue is a VkQueue.

• mtlCommandQueue is the Metal id<MTLCommandQueue> object underlying the VkQueue object in queue. The implementation will return the MTLCommandQueue in this member, or it will return NULL if no MTLCommandQueue could be found underlying the VkQueue object.

### Valid Usage (Implicit)

- VUID-VkExportMetalCommandQueueInfoEXT-sType-sType
  
  _sType must be VK_STRUCTURE_TYPE_EXPORT_METAL_COMMAND_QUEUE_INFO_EXT_

- VUID-VkExportMetalCommandQueueInfoEXT-queue-parameter
  
  _queue must be a valid VkQueue handle_

The type id<MTLCommandQueue> is defined in Apple’s Metal framework, but to remove an unnecessary compile time dependency, an incomplete type definition of MTLCommandQueue_id is provided in the Vulkan headers:

```c
// Provided by VK_EXT_metal_objects
#ifdef __OBJC__
@protocol MTLCommandQueue;
typedef id<MTLCommandQueue> MTLCommandQueue_id;
#else
typedef void* MTLCommandQueue_id;
#endif
```

To export the Metal MTLBuffer object underlying a VkDeviceMemory object, include a VkExportMetalBufferInfoEXT structure in the pNext chain of the pMetalObjectsInfo parameter of a vkExportMetalObjectsEXT call.

The VkExportMetalBufferInfoEXT structure is defined as:

```c
// Provided by VK_EXT_metal_objects
typedef struct VkExportMetalBufferInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDeviceMemory memory;
    MTLBuffer_id mtlBuffer;
} VkExportMetalBufferInfoEXT;
```

- _sType_ is a VkStructureType value identifying this structure.
- _pNext_ is NULL or a pointer to a structure extending this structure.
- _memory_ is a VkDeviceMemory.
- _mtlBuffer_ is the Metal id<MTLBuffer> object underlying the VkDeviceMemory object in memory. The implementation will return the MTLBuffer in this member, or it will return NULL if no MTLBuffer could be found underlying the VkDeviceMemory object.
Valid Usage (Implicit)

- VUID-VkExportMetalBufferInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_EXPORT_METAL_BUFFER_INFO_EXT`

- VUID-VkExportMetalBufferInfoEXT-memory-parameter
  `memory` must be a valid `VkDeviceMemory` handle

To import a Metal `MTLBuffer` object to underlie a `VkDeviceMemory` object, include a `VkImportMetalBufferInfoEXT` structure in the `pNext` chain of the `VkMemoryAllocateInfo` structure in a `vkAllocateMemory` command.

The `VkImportMetalBufferInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_metal_objects
typedef struct VkImportMetalBufferInfoEXT {
    VkStructureType sType;
    const void* pNext;
    MTLBuffer_id mtlBuffer;
} VkImportMetalBufferInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `mtlBuffer` is the Metal `id<MTLBuffer>` object that is to underlie the `VkDeviceMemory`.

The app must ensure that the configuration of the `id<MTLBuffer>` object is compatible with the configuration of the `VkDeviceMemory`. Failure to do so results in undefined behavior.

Valid Usage (Implicit)

- VUID-VkImportMetalBufferInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_IMPORT_METAL_BUFFER_INFO_EXT`

The type `id<MTLBuffer>` is defined in Apple’s Metal framework, but to remove an unnecessary compile time dependency, an incomplete type definition of `MTLBuffer_id` is provided in the Vulkan headers:

```c
// Provided by VK_EXT_metal_objects
#ifdef __OBJC__
@protocol MTLBuffer;
typedef id<MTLBuffer> MTLBuffer_id;
#else
typedef void* MTLBuffer_id;
#endif
```
To export a Metal MTLTexture object underlying a VkImage, VkImageView, or VkBufferView object, include a VkExportMetalTextureInfoEXT structure in the pNext chain of the pMetalObjectsInfo parameter of a vkExportMetalObjectsEXT call.

The VkExportMetalTextureInfoEXT structure is defined as:

```c
// Provided by VK_EXT_metal_objects
typedef struct VkExportMetalTextureInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkImage image;
    VkImageView imageView;
    VkBufferView bufferView;
    VkImageAspectFlagBits plane;
    MTLTexture_id mtlTexture;
} VkExportMetalTextureInfoEXT;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **image** is VK_NULL_HANDLE or a VkImage.
- **imageView** is VK_NULL_HANDLE or a VkImageView.
- **bufferView** is VK_NULL_HANDLE or a VkBufferView.
- **plane** indicates the plane of a multi-planar VkImage or VkImageView.
- **mtlTexture** is the Metal id<MTLTexture> object underlying the VkImage, VkImageView, or VkBufferView object in image, imageView, or bufferView, respectively, at the plane indicated in aspectMask. The implementation will return the MTLTexture in this member, or it will return NULL if no MTLTexture could be found underlying the VkImage, VkImageView, or VkBufferView object, at the plane indicated in aspectMask.

### Valid Usage (Implicit)

- **VUID-VkExportMetalTextureInfoEXT-sType-sType**
  
  **sType must be VK_STRUCTURE_TYPE_EXPORT_METAL_TEXTURE_INFO_EXT**

- **VUID-VkExportMetalTextureInfoEXT-image-parameter**
  
  If **image** is not VK_NULL_HANDLE, **image must be a valid VkImage handle**

- **VUID-VkExportMetalTextureInfoEXT-imageView-parameter**
  
  If **imageView** is not VK_NULL_HANDLE, **imageView must be a valid VkImageView handle**

- **VUID-VkExportMetalTextureInfoEXT-bufferView-parameter**
  
  If **bufferView** is not VK_NULL_HANDLE, **bufferView must be a valid VkBufferView handle**

- **VUID-VkExportMetalTextureInfoEXT-plane-parameter**
  
  **plane must be a valid VkImageAspectFlagBits value**

- **VUID-VkExportMetalTextureInfoEXT-commonparent**
  
  Each of bufferView, image, and imageView that are valid handles of non-ignored parameters
must have been created, allocated, or retrieved from the same VkDevice

To import one or more existing Metal MTLTexture objects to underlie a VkImage object, include one or more VkImportMetalTextureInfoEXT structures in the pNext chain of the VkImageCreateInfo structure in a vkCreateImage command.

The VkImportMetalTextureInfoEXT structure is defined as:

```c
// Provided by VK_EXT_metal_objects
typedef struct VkImportMetalTextureInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkImageAspectFlagBits plane;
    MTLTexture_id mtlTexture;
} VkImportMetalTextureInfoEXT;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **plane** indicates the plane of the VkImage that the id<MTLTexture> object should be attached to.
- **mtlTexture** is a the Metal id<MTLTexture> object that is to underlie the VkImage plane.

The pNext chain must include one VkImportMetalTextureInfoEXT structure for each plane in the VkImage. The app must ensure that the configuration of the Metal id<MTLTexture> objects are compatible with the configuration of the VkImage. Failure to do so results in undefined behavior.

**Valid Usage (Implicit)**

- VUID-VkImportMetalTextureInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMPORT_METAL_TEXTURE_INFO_EXT
- VUID-VkImportMetalTextureInfoEXT-plane-parameter
  plane must be a valid VkImageAspectFlagBits value

The type id<MTLTexture> is defined in Apple’s Metal framework, but to remove an unnecessary compile time dependency, an incomplete type definition of MTLTexture_id is provided in the Vulkan headers:

```c
// Provided by VK_EXT_metal_objects
#ifdef __OBJC__
@protocol MTLTexture;
typedef id<MTLTexture> MTLTexture_id;
#else
typedef void* MTLTexture_id;
#endif
```
To export the Metal \texttt{IOSurfaceRef} object underlying a \texttt{VkImage} object, include a \texttt{VkExportMetalIOSurfaceInfoEXT} structure in the \texttt{pNext} chain of the \texttt{pMetalObjectsInfo} parameter of a \texttt{vkExportMetalObjectsEXT} call.

The \texttt{VkExportMetalIOSurfaceInfoEXT} structure is defined as:

```c
// Provided by VK_EXT_metal_objects
typedef struct VkExportMetalIOSurfaceInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkImage image;
    IOSurfaceRef ioSurface;
} VkExportMetalIOSurfaceInfoEXT;
```

- \texttt{sType} is a \texttt{VkStructureType} value identifying this structure.
- \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
- \texttt{image} is a \texttt{VkImage}.
- \texttt{ioSurface} is the Metal \texttt{IOSurfaceRef} object underlying the \texttt{VkImage} object in \texttt{image}. The implementation will return the \texttt{IOSurfaceRef} in this member, or it will return \texttt{NULL} if no \texttt{IOSurfaceRef} could be found underlying the \texttt{VkImage} object.

**Valid Usage (Implicit)**

- \texttt{VUID-VkExportMetalIOSurfaceInfoEXT-sType-sType} \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_EXPORT_Metal_IO_SURFACE_INFO_EXT}
- \texttt{VUID-VkExportMetalIOSurfaceInfoEXT-image-parameter} \texttt{image} must be a valid \texttt{VkImage} handle

To import, or create, a Metal \texttt{IOSurfaceRef} object to underlie a \texttt{VkImage} object, include a \texttt{VkImportMetalIOSurfaceInfoEXT} structure in the \texttt{pNext} chain of the \texttt{VkImageCreateInfo} structure in a \texttt{vkCreateImage} command.

The \texttt{VkImportMetalIOSurfaceInfoEXT} structure is defined as:

```c
// Provided by VK_EXT_metal_objects
typedef struct VkImportMetalIOSurfaceInfoEXT {
    VkStructureType sType;
    const void* pNext;
    IOSurfaceRef ioSurface;
} VkImportMetalIOSurfaceInfoEXT;
```

- \texttt{sType} is a \texttt{VkStructureType} value identifying this structure.
- \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
- \texttt{ioSurface} is \texttt{VK_NULL_HANDLE} or the Metal \texttt{IOSurfaceRef} object that is to underlie the
If `ioSurface` is not `VK_NULL_HANDLE`, it will be used to underlie the `VkImage`. If `ioSurface` is `VK_NULL_HANDLE`, the implementation will create a new `IOSurface` to underlie the `VkImage`.

If provided, the app **must** ensure that the configuration of the `IOSurfaceRef` object is compatible with the configuration of the `VkImage`. Failure to do so results in undefined behavior.

### Valid Usage (Implicit)

- VUID-VkImportMetalIOSurfaceInfoEXT-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_IMPORT_Metal_IO_SURFACE_INFO_EXT`

The type `IOSurfaceRef` is defined in Apple's CoreGraphics framework, but to remove an unnecessary compile time dependency, an incomplete type definition of `IOSurfaceRef` is provided in the Vulkan headers:

```c
// Provided by VK_EXT_metal_objects
typedef struct __IOSurface* IOSurfaceRef;
```

To export the Metal `MTLSharedEvent` object underlying a `VkSemaphore` or `VkEvent` object, include a `VkExportMetalSharedEventInfoEXT` structure in the `pNext` chain of the `pMetalObjectsInfo` parameter of a `vkExportMetalObjectsEXT` call.

The `VkExportMetalSharedEventInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_metal_objects
typedef struct VkExportMetalSharedEventInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    VkEvent event;
    MTLSharedEvent_id mtlSharedEvent;
} VkExportMetalSharedEventInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `semaphore` is `VK_NULL_HANDLE` or a `VkSemaphore`.
- `event` is `VK_NULL_HANDLE` or a `VkEvent`.
- `mtlSharedEvent` is the Metal `id<MTLSharedEvent>` object underlying the `VkSemaphore` or `VkEvent` object in `semaphore` or `event`, respectively. The implementation will return the `MTLSharedEvent` in this member, or it will return `NULL` if no `MTLSharedEvent` could be found underlying the `VkSemaphore` or `VkEvent` object.
Valid Usage (Implicit)

- VUID-VkExportMetalSharedEventInfoEXT-sType-sType
  
  *sType* must be `VK_STRUCTURE_TYPE_EXPORT_METAL_SHARED_EVENT_INFO_EXT`

- VUID-VkExportMetalSharedEventInfoEXT-semaphore-parameter
  
  If *semaphore* is not `VK_NULL_HANDLE`, *semaphore* must be a valid `VkSemaphore` handle

- VUID-VkExportMetalSharedEventInfoEXT-event-parameter
  
  If *event* is not `VK_NULL_HANDLE`, *event* must be a valid `VkEvent` handle

- VUID-VkExportMetalSharedEventInfoEXT-commonparent
  
  Both of *event*, and *semaphore* that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

To import a Metal `id<MTLSharedEvent>` object to underlie a `VkSemaphore` or `VkEvent` object, include a `VkImportMetalSharedEventInfoEXT` structure in the `pNext` chain of the `VkSemaphoreCreateInfo` or `VkEventCreateInfo` structure in a `vkCreateSemaphore` or `vkCreateEvent` command, respectively.

The `VkImportMetalSharedEventInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_metal_objects
typedef struct VkImportMetalSharedEventInfoEXT {
    VkStructureType sType;
    const void* pNext;
    MTLSharedEvent_id mtlSharedEvent;
} VkImportMetalSharedEventInfoEXT;
```

- *sType* is a `VkStructureType` value identifying this structure.
- *pNext* is `NULL` or a pointer to a structure extending this structure.
- *mtlSharedEvent* is the Metal `id<MTLSharedEvent>` object that is to underlie the `VkSemaphore` or `VkEvent`.

If the `pNext` chain of the `VkSemaphoreCreateInfo` structure includes both `VkImportMetalSharedEventInfoEXT` and `VkSemaphoreTypeCreateInfo`, the `signaledValue` property of the imported `id<MTLSharedEvent>` object will be set to `initialValue` of `VkSemaphoreTypeCreateInfo`.

Valid Usage (Implicit)

- VUID-VkImportMetalSharedEventInfoEXT-sType-sType
  
  *sType* must be `VK_STRUCTURE_TYPE_IMPORT_METAL_SHARED_EVENT_INFO_EXT`

The type `id<MTLSharedEvent>` is defined in Apple’s Metal framework, but to remove an unnecessary compile time dependency, an incomplete type definition of `MTLSharedEvent_id` is provided in the Vulkan headers:
11.2.11. QNX Screen Buffer External Memory

To import memory created outside of the current Vulkan instance from a QNX Screen buffer, add a `VkImportScreenBufferInfoQNX` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure. The `VkImportScreenBufferInfoQNX` structure is defined as:

```c
typedef struct VkImportScreenBufferInfoQNX {
    VkStructureType sType;
    const void*pNext;
    struct _screen_buffer* buffer;
} VkImportScreenBufferInfoQNX;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `buffer` is a pointer to a `struct _screen_buffer`, the QNX Screen buffer to import.

The implementation may not acquire a reference to the imported Screen buffer. Therefore, the application must ensure that the object referred to by `buffer` stays valid as long as the device memory to which it is imported is being used.

Valid Usage

- VUID-VkImportScreenBufferInfoQNX-buffer-08966
  If `buffer` is not `NULL`, QNX Screen Buffers must be supported for import, as reported by `VkExternalImageFormatProperties` or `VkExternalBufferProperties`.

- VUID-VkImportScreenBufferInfoQNX-buffer-08967
  `buffer` is not `NULL`, it must be a pointer to valid QNX Screen buffer.

Valid Usage (Implicit)

- VUID-VkImportScreenBufferInfoQNX-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_IMPORT_SCREEN_BUFFER_INFO_QNX`.

To determine the memory parameters to use when importing a QNX Screen buffer, call:
VkResult vkGetScreenBufferPropertiesQNX(
    VkDevice device,
    const struct _screen_buffer* buffer,
    VkScreenBufferPropertiesQNX* pProperties);

- `device` is the logical device that will be importing `buffer`.
- `buffer` is the QNX Screen buffer which will be imported.
- `pProperties` is a pointer to a `VkScreenBufferPropertiesQNX` structure in which the properties of `buffer` are returned.

### Valid Usage

- VUID-vkGetScreenBufferPropertiesQNX-buffer-08968
  `buffer` must be a valid QNX Screen buffer

### Valid Usage (Implicit)

- VUID-vkGetScreenBufferPropertiesQNX-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkGetScreenBufferPropertiesQNX-buffer-parameter
  `buffer` must be a valid pointer to a valid `_screen_buffer` value
- VUID-vkGetScreenBufferPropertiesQNX-pProperties-parameter
  `pProperties` must be a valid pointer to a `VkScreenBufferPropertiesQNX` structure

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_INVALID_EXTERNAL_HANDLE_KHR`

The `VkScreenBufferPropertiesQNX` structure returned is defined as:

```c
typedef struct VkScreenBufferPropertiesQNX {
    VkStructureType sType;
    void* pNext;
    VkDeviceSize allocationSize;
    uint32_t memoryTypeBits;
} VkScreenBufferPropertiesQNX;
```
sType is a VkStructureType value identifying this structure.

pNext is NULL or a pointer to a structure extending this structure.

allocationSize is the size of the external memory.

memoryTypeBits is a bitmask containing one bit set for every memory type which the specified Screen buffer can be imported as.

Valid Usage (Implicit)

- VUID-VkScreenBufferPropertiesQNX-sType-sType
  sType must be VK_STRUCTURE_TYPE_SCREEN_BUFFER_PROPERTIES_QNX

- VUID-VkScreenBufferPropertiesQNX-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkScreenBufferFormatPropertiesQNX

- VUID-VkScreenBufferPropertiesQNX-sType-unique
  The sType value of each struct in the pNext chain must be unique

To obtain format properties of a QNX Screen buffer, include a VkScreenBufferFormatPropertiesQNX structure in the pNext chain of the VkScreenBufferPropertiesQNX structure passed to vkGetScreenBufferPropertiesQNX. This structure is defined as:

```c
// Provided by VK_QNX_external_memory_screen_buffer
typedef struct VkScreenBufferFormatPropertiesQNX {
    VkStructureType sType;
    void* pNext;
    VkFormat format;
    uint64_t externalFormat;
    uint64_t screenUsage;
    VkFormatFeatureFlags formatFeatures;
    VkComponentMapping samplerYcbcrConversionComponents;
    VkSamplerYcbcrModelConversion suggestedYcbcrModel;
    VkSamplerYcbcrRange suggestedYcbcrRange;
    VkChromaLocation suggestedXChromaOffset;
    VkChromaLocation suggestedYChromaOffset;
} VkScreenBufferFormatPropertiesQNX;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- format is the Vulkan format corresponding to the Screen buffer’s format or VK_FORMAT_UNDEFINED if there is not an equivalent Vulkan format.
- externalFormat is an implementation-defined external format identifier for use with VkExternalFormatQNX. It must not be zero.
• **screenUsage** is an implementation-defined external usage identifier for the QNX Screen buffer.

• **formatFeatures** describes the capabilities of this external format when used with an image bound to memory imported from buffer.

• **samplerYcbcrConversionComponents** is the component swizzle that should be used in VkSamplerYcbcrConversionCreateInfo.

• **suggestedYcbcrModel** is a suggested color model to use in VkSamplerYcbcrConversionCreateInfo.

• **suggestedYcbcrRange** is a suggested numerical value range to use in VkSamplerYcbcrConversionCreateInfo.

• **suggestedXChromaOffset** is a suggested X chroma offset to use in VkSamplerYcbcrConversionCreateInfo.

• **suggestedYChromaOffset** is a suggested Y chroma offset to use in VkSamplerYcbcrConversionCreateInfo.

If the QNX Screen buffer has one of the formats listed in the QNX Screen Format Equivalence table, then format must have the equivalent Vulkan format listed in the table. Otherwise, format may be VK_FORMAT_UNDEFINED, indicating the QNX Screen buffer can only be used with an external format. The formatFeatures member must include VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT and should include VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT and VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_LINEAR_FILTER_BIT.

### Valid Usage (Implicit)

- VUID-VkScreenBufferFormatPropertiesQNX-sType-sType
  
sType must be VK_STRUCTURE_TYPE_SCREEN_BUFFER_FORMAT_PROPERTIES_QNX

### 11.2.12. Device Group Memory Allocations

If the pNext chain of VkMemoryAllocateInfo includes a VkMemoryAllocateFlagsInfo structure, then that structure includes flags and a device mask controlling how many instances of the memory will be allocated.

The VkMemoryAllocateFlagsInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkMemoryAllocateFlagsInfo {
    VkStructureType sType;
    const void* pNext;
    VkMemoryAllocateFlags flags;
    uint32_t deviceMask;
} VkMemoryAllocateFlagsInfo;
```

or the equivalent
typedef VkMemoryAllocateFlagsInfoVkMemoryAllocateFlagsInfoKHR;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is a bitmask of VkMemoryAllocateFlagBits controlling the allocation.
- **deviceMask** is a mask of physical devices in the logical device, indicating that memory **must** be allocated on each device in the mask, if VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT is set in **flags**.

If VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT is not set, the number of instances allocated depends on whether VK_MEMORY_HEAP_MULTI_INSTANCE_BIT is set in the memory heap. If VK_MEMORY_HEAP_MULTI_INSTANCE_BIT is set, then memory is allocated for every physical device in the logical device (as if deviceMask has bits set for all device indices). If VK_MEMORY_HEAP_MULTI_INSTANCE_BIT is not set, then a single instance of memory is allocated (as if deviceMask is set to one).

On some implementations, allocations from a multi-instance heap **may** consume memory on all physical devices even if the deviceMask excludes some devices. If VkPhysicalDeviceGroupProperties::subsetAllocation is VK_TRUE, then memory is only consumed for the devices in the device mask.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>In practice, most allocations on a multi-instance heap will be allocated across all physical devices. Unicast allocation support is an optional optimization for a minority of allocations.</td>
</tr>
</tbody>
</table>

### Valid Usage

- VUID-VkMemoryAllocateFlagsInfo-deviceMask-00675
  If VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT is set, deviceMask **must** be a valid device mask

- VUID-VkMemoryAllocateFlagsInfo-deviceMask-00676
  If VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT is set, deviceMask **must** not be zero

### Valid Usage (Implicit)

- VUID-VkMemoryAllocateFlagsInfo-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_MEMORY_ALLOCATE_FLAGS_INFO

- VUID-VkMemoryAllocateFlagsInfo-flags-parameter
  flags **must** be a valid combination of VkMemoryAllocateFlagBits values

Bits which **can** be set in VkMemoryAllocateFlagsInfo::flags, controlling device memory allocation, are:
// Provided by VK_VERSION_1_1
typedef enum VkMemoryAllocateFlagBits {
    VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT = 0x00000001,
// Provided by VK_VERSION_1_2
    VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT = 0x00000002,
// Provided by VK_VERSION_1_2
    VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT = 0x00000004,
// Provided by VK_KHR_device_group
    VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT_KHR = VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT,
// Provided by VK_KHR_buffer_device_address
    VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT_KHR = VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT,
    VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR = VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT,
} VkMemoryAllocateFlagBits;

or the equivalent

// Provided by VK_KHR_device_group
typedef VkMemoryAllocateFlagBits VkMemoryAllocateFlagBitsKHR;

• **VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT** specifies that memory will be allocated for the devices in `VkMemoryAllocateFlagsInfo::deviceMask`.

• **VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT** specifies that the memory can be attached to a buffer object created with the `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT` bit set in `usage`, and that the memory handle can be used to retrieve an opaque address via `vkGetDeviceMemoryOpaqueCaptureAddress`.

• **VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT** specifies that the memory's address can be saved and reused on a subsequent run (e.g. for trace capture and replay), see `VkBufferOpaqueCaptureAddressCreateInfo` for more detail.

// Provided by VK_VERSION_1_1
typedef VkFlags VkMemoryAllocateFlags;

or the equivalent

// Provided by VK_KHR_device_group
typedef VkMemoryAllocateFlags VkMemoryAllocateFlagsKHR;

`VkMemoryAllocateFlags` is a bitmask type for setting a mask of zero or more `VkMemoryAllocateFlagBits`. 
11.2.13. Opaque Capture Address Allocation

To request a specific device address for a memory allocation, add a `VkMemoryOpaqueCaptureAddressAllocateInfo` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure. The `VkMemoryOpaqueCaptureAddressAllocateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkMemoryOpaqueCaptureAddressAllocateInfo {
    VkStructureType sType;
    const void* pNext;
    uint64_t opaqueCaptureAddress;
} VkMemoryOpaqueCaptureAddressAllocateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_buffer_device_address
typedef VkMemoryOpaqueCaptureAddressAllocateInfo
VkMemoryOpaqueCaptureAddressAllocateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `opaqueCaptureAddress` is the opaque capture address requested for the memory allocation.

If `opaqueCaptureAddress` is zero, no specific address is requested.

If `opaqueCaptureAddress` is not zero, it **should** be an address retrieved from `vkGetDeviceMemoryOpaqueCaptureAddress` on an identically created memory allocation on the same implementation.

**Note**
In most cases, it is expected that a non-zero `opaqueAddress` is an address retrieved from `vkGetDeviceMemoryOpaqueCaptureAddress` on an identically created memory allocation. If this is not the case, it is likely that `VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS` errors will occur.

This is, however, not a strict requirement because trace capture/replay tools may need to adjust memory allocation parameters for imported memory.

If this structure is not present, it is as if `opaqueCaptureAddress` is zero.

**Valid Usage (Implicit)**

- `VUID-VkMemoryOpaqueCaptureAddressAllocateInfo-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_MEMORY_OPAQUE_CAPTURE_ADDRESS_ALLOCATE_INFO`
11.2.14. Freeing Device Memory

To free a memory object, call:

```c
// Provided by VK_VERSION_1_0
void vkFreeMemory(
    VkDevice device,
    VkDeviceMemory memory,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that owns the memory.
- `memory` is the `VkDeviceMemory` object to be freed.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

Before freeing a memory object, an application **must** ensure the memory object is no longer in use by the device — for example by command buffers in the pending state. Memory **can** be freed whilst still bound to resources, but those resources **must** not be used afterwards. Freeing a memory object releases the reference it held, if any, to its payload. If there are still any bound images or buffers, the memory object's payload **may** not be immediately released by the implementation, but **must** be released by the time all bound images and buffers have been destroyed. Once all references to a payload are released, it is returned to the heap from which it was allocated.

How memory objects are bound to Images and Buffers is described in detail in the Resource Memory Association section.

If a memory object is mapped at the time it is freed, it is implicitly unmapped.

---

**Note**

As described below, host writes are not implicitly flushed when the memory object is unmapped, but the implementation **must** guarantee that writes that have not been flushed do not affect any other memory.

---

**Valid Usage**

- VUID-vkFreeMemory-memory-00677
  All submitted commands that refer to `memory` (via images or buffers) **must** have completed execution

---

**Valid Usage (Implicit)**

- VUID-vkFreeMemory-device-parameter
  `device` **must** be a valid `VkDevice` handle

- VUID-vkFreeMemory-memory-parameter
  If `memory` is not `VK_NULL_HANDLE`, `memory` **must** be a valid `VkDeviceMemory` handle
11.2.15. Host Access to Device Memory Objects

Memory objects created with `vkAllocateMemory` are not directly host accessible.

Memory objects created with the memory property `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT` are considered *mappable*. Memory objects must be mappable in order to be successfully mapped on the host.

To retrieve a host virtual address pointer to a region of a mappable memory object, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkMapMemory(
    VkDevice device,            // Provided by VK_VERSION_1_0
    VkDeviceMemory memory,     // Provided by VK_VERSION_1_0
    VkDeviceSize offset,       // Provided by VK_VERSION_1_0
    VkDeviceSize size,         // Provided by VK_VERSION_1_0
    VkMemoryMapFlags flags,    // Provided by VK_VERSION_1_0
    void** ppData);            // Provided by VK_VERSION_1_0
```

- **device** is the logical device that owns the memory.
- **memory** is the `VkDeviceMemory` object to be mapped.
- **offset** is a zero-based byte offset from the beginning of the memory object.
- **size** is the size of the memory range to map, or `VK_WHOLE_SIZE` to map from **offset** to the end of the allocation.
- **flags** is a bitmask of `VkMemoryMapFlagBits` specifying additional parameters of the memory map operation.
- **ppData** is a pointer to a `void*` variable in which a host-accessible pointer to the beginning of the mapped range is returned. This pointer minus **offset** must be aligned to at least `VkPhysicalDeviceLimits::minMemoryMapAlignment`.

After a successful call to `vkMapMemory` the memory object **memory** is considered to be currently *host mapped*.

**Note**
It is an application error to call `vkMapMemory` on a memory object that is already *host mapped*.

**Note**
`vkMapMemory` will fail if the implementation is unable to allocate an appropriately sized contiguous virtual address range, e.g. due to virtual address space fragmentation or platform limits. In such cases, `vkMapMemory` must return `VK_ERROR_MEMORY_MAP_FAILED`. The application can improve the likelihood of success by reducing the size of the mapped range and/or removing unneeded mappings using `vkUnmapMemory`.

`vkMapMemory` does not check whether the device memory is currently in use before returning the host-accessible pointer. The application must guarantee that any previously submitted command that writes to this range has completed before the host reads from or writes to that range, and that any previously submitted command that reads from that range has completed before the host writes to that region (see [here](#) for details on fulfilling such a guarantee). If the device memory was allocated without the `VK_MEMORY_PROPERTY_HOST_COHERENT_BIT` set, these guarantees must be made for an extended range: the application must round down the start of the range to the nearest multiple of `VkPhysicalDeviceLimits::nonCoherentAtomSize`, and round the end of the range up to the nearest multiple of `VkPhysicalDeviceLimits::nonCoherentAtomSize`.

While a range of device memory is host mapped, the application is responsible for synchronizing both device and host access to that memory range.

**Note**
It is important for the application developer to become meticulously familiar with all of the mechanisms described in the chapter on Synchronization and Cache Control as they are crucial to maintaining memory access ordering.

Calling `vkMapMemory` is equivalent to calling `vkMapMemory2KHR` with an empty `pNext` chain.

### Valid Usage

- **VUID-vkMapMemory-memory-00678**
  `memory` must not be currently host mapped

- **VUID-vkMapMemory-offset-00679**
  `offset` must be less than the size of `memory`

- **VUID-vkMapMemory-size-00680**
  If `size` is not equal to `VK_WHOLE_SIZE`, `size` must be greater than 0

- **VUID-vkMapMemory-size-00681**
  If `size` is not equal to `VK_WHOLE_SIZE`, `size` must be less than or equal to the size of the `memory` minus `offset`

- **VUID-vkMapMemory-memory-00682**
  `memory` must have been created with a memory type that reports `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT`
• VUID-vkMapMemory-memory-00683
  memory must not have been allocated with multiple instances

• VUID-vkMapMemory-flags-09568
  VK_MEMORY_MAP_PLACED_BIT_EXT must not be set in flags

Valid Usage (Implicit)

• VUID-vkMapMemory-device-parameter
  device must be a valid VkDevice handle

• VUID-vkMapMemory-memory-parameter
  memory must be a valid VkDeviceMemory handle

• VUID-vkMapMemory-flags-parameter
  flags must be a valid combination of VkMemoryMapFlagBits values

• VUID-vkMapMemory-ppData-parameter
  ppData must be a valid pointer to a pointer value

• VUID-vkMapMemory-memory-parent
  memory must have been created, allocated, or retrieved from device

Host Synchronization

• Host access to memory must be externally synchronized

Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_MEMORY_MAP_FAILED

Bits which can be set in vkMapMemory::flags and VkMemoryMapInfoKHR::flags, specifying additional properties of a memory map, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkMemoryMapFlagBits {
  // Provided by VK_EXT_map_memory_placed
  VK_MEMORY_MAP_PLACED_BIT_EXT = 0x00000001,
} VkMemoryMapFlagBits;
```
VK_MEMORY_MAP_PLACED_BIT_EXT requests that the implementation place the memory map at the virtual address specified by the client via VkMemoryMapPlacedInfoEXT::pPlacedAddress, replacing any existing mapping at that address. This flag must not be used with vkMapMemory as there is no way to specify the placement address.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkMemoryMapFlags;
```

VkMemoryMapFlags is a bitmask type for setting a mask of zero or more VkMemoryMapFlagBits.

Alternatively, to retrieve a host virtual address pointer to a region of a mappable memory object, call:

```c
// Provided by VK_KHR_map_memory2
VkResult vkMapMemory2KHR(
    VkDevice device,  
    const VkMemoryMapInfoKHR* pMemoryMapInfo,  
    void** ppData);
```

- `device` is the logical device that owns the memory.
- `pMemoryMapInfo` is a pointer to a VkMemoryMapInfoKHR structure describing parameters of the map.
- `ppData` is a pointer to a void * variable in which is returned a host-accessible pointer to the beginning of the mapped range. This pointer minus VkMemoryMapInfoKHR::offset must be aligned to at least VkPhysicalDeviceLimits::minMemoryMapAlignment.

This function behaves identically to vkMapMemory except that it gets its parameters via an extensible structure pointer rather than directly as function arguments.

**Valid Usage (Implicit)**

- VUID-vkMapMemory2KHR-device-parameter
  device must be a valid VkDevice handle

- VUID-vkMapMemory2KHR-pMemoryMapInfo-parameter
  pMemoryMapInfo must be a valid pointer to a valid VkMemoryMapInfoKHR structure

- VUID-vkMapMemory2KHR-ppData-parameter
  ppData must be a valid pointer to a pointer value

**Return Codes**

**Success**

- VK_SUCCESS
The `VkMemoryMapInfoKHR` structure is defined as:

```
// Provided by VK_KHR_map_memory2
typedef struct VkMemoryMapInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkMemoryMapFlags flags;
    VkDeviceMemory memory;
    VkDeviceSize offset;
    VkDeviceSize size;
} VkMemoryMapInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is a bitmask of `VkMemoryMapFlagBits` specifying additional parameters of the memory map operation.
- **memory** is the `VkDeviceMemory` object to be mapped.
- **offset** is a zero-based byte offset from the beginning of the memory object.
- **size** is the size of the memory range to map, or `VK_WHOLE_SIZE` to map from `offset` to the end of the allocation.

### Valid Usage

- **VUID-VkMemoryMapInfoKHR-memory-07958**
  - `memory` **must** not be currently host mapped

- **VUID-VkMemoryMapInfoKHR-offset-07959**
  - `offset` **must** be less than the size of `memory`

- **VUID-VkMemoryMapInfoKHR-size-07960**
  - If `size` is not equal to `VK_WHOLE_SIZE`, `size` **must** be greater than 0

- **VUID-VkMemoryMapInfoKHR-size-07961**
  - If `size` is not equal to `VK_WHOLE_SIZE`, `size` **must** be less than or equal to the size of the `memory` minus `offset`

- **VUID-VkMemoryMapInfoKHR-memory-07962**
  - `memory` **must** have been created with a memory type that reports `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT`

- **VUID-VkMemoryMapInfoKHR-memory-07963**
  - `memory` **must** not have been allocated with multiple instances
If `VK_MEMORY_MAP_PLACED_BIT_EXT` is set in `flags`, the `memoryMapPlaced` feature must be enabled.

If `VK_MEMORY_MAP_PLACED_BIT_EXT` is set in `flags`, the `pNext` chain must include a `VkMemoryMapPlacedInfoEXT` structure and `VkMemoryMapPlacedInfoEXT::pPlacedAddress` must not be `NULL`.

If `VK_MEMORY_MAP_PLACED_BIT_EXT` is set in `flags` and the `memoryMapRangePlaced` feature is not enabled, `offset` must be zero.

If `VK_MEMORY_MAP_PLACED_BIT_EXT` is set in `flags` and the `memoryMapRangePlaced` feature is not enabled, `size` must be `VK_WHOLE_SIZE`.

If `VK_MEMORY_MAP_PLACED_BIT_EXT` is set in `flags` and the `memoryMapRangePlaced` feature is enabled, `offset` must be aligned to an integer multiple of `VkPhysicalDeviceMapMemoryPlacedPropertiesEXT::minPlacedMemoryMapAlignment`.

If `VK_MEMORY_MAP_PLACED_BIT_EXT` is set in `flags` and the `memoryMapRangePlaced` feature is enabled, `size` must be `VK_WHOLE_SIZE` or be aligned to an integer multiple of `VkPhysicalDeviceMapMemoryPlacedPropertiesEXT::minPlacedMemoryMapAlignment`.

If `VK_MEMORY_MAP_PLACED_BIT_EXT` is set in `flags`, the memory object must not have been imported from a handle type of `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT` or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT`.

**Valid Usage (Implicit)**

- `sType` must be `VK_STRUCTURE_TYPE_MEMORY_MAP_INFO_KHR`.
- `pNext` must be `NULL` or a pointer to a valid instance of `VkMemoryMapPlacedInfoEXT`.
- The `sType` value of each struct in the `pNext` chain must be unique.
- `flags` must be a valid combination of `VkMemoryMapFlagBits` values.
- `memory` must be a valid `VkDeviceMemory` handle.

**Host Synchronization**

- Host access to `memory` must be externally synchronized.
If `VK_MEMORY_MAP_PLACED_BIT_EXT` is set in `VkMemoryMapInfoKHR::flags` and the `pNext` chain of `VkMemoryMapInfoKHR` includes a `VkMemoryMapPlacedInfoEXT` structure, then that structure specifies the placement address of the memory map. The implementation will place the memory map at the specified address, replacing any existing maps in the specified memory range. Replacing memory maps in this way does not implicitly unmap Vulkan memory objects. Instead, the client must ensure no other Vulkan memory objects are mapped anywhere in the specified virtual address range. If successful, `ppData` will be set to the same value as `VkMemoryMapPlacedInfoEXT::pPlacedAddress` and `vkMapMemory2KHR` will return `VK_SUCCESS`. If it cannot place the map at the requested address for any reason, the memory object is left unmapped and `vkMapMemory2KHR` will return `VK_ERROR_MEMORY_MAP_FAILED`.

The `VkMemoryMapPlacedInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_map_memory_placed
typedef struct VkMemoryMapPlacedInfoEXT {
    VkStructureType sType;
    const void* pNext;
    void* pPlacedAddress;
} VkMemoryMapPlacedInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pPlacedAddress` is the virtual address at which to place the address. If `VkMemoryMapInfoKHR::flags` does not contain `VK_MEMORY_MAP_PLACED_BIT_EXT`, this value is ignored.

### Valid Usage

- **VUID-VkMemoryMapPlacedInfoEXT-flags-09576**
  If `VkMemoryMapInfoKHR::flags` contains `VK_MEMORY_MAP_PLACED_BIT_EXT`, `pPlacedAddress` must not be `NULL`.

- **VUID-VkMemoryMapPlacedInfoEXT-pPlacedAddress-09577**
  `pPlacedAddress` must be aligned to an integer multiple of `VkPhysicalDeviceMapMemoryPlacedPropertiesEXT::minPlacedMemoryMapAlignment`.

- **VUID-VkMemoryMapPlacedInfoEXT-pPlacedAddress-09578**
  The address range specified by `pPlacedAddress` and `VkMemoryMapInfoKHR::size` must not overlap any existing Vulkan memory object mapping.

### Valid Usage (Implicit)

- **VUID-VkMemoryMapPlacedInfoEXT-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_MEMORY_MAP_PLACED_INFO_EXT`.

Two commands are provided to enable applications to work with non-coherent memory allocations: `vkFlushMappedMemoryRanges` and `vkInvalidateMappedMemoryRanges`. 
If the memory object was created with the `VK_MEMORY_PROPERTY_HOST_COHERENT_BIT` set, `vkFlushMappedMemoryRanges` and `vkInvalidateMappedMemoryRanges` are unnecessary and may have a performance cost. However, availability and visibility operations still need to be managed on the device. See the description of host access types for more information.

While memory objects imported from a handle type of `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT` or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT` are inherently mapped to host address space, they are not considered to be host mapped device memory unless they are explicitly host mapped using `vkMapMemory`. That means flushing or invalidating host caches with respect to host accesses performed on such memory through the original host pointer specified at import time is the responsibility of the application and must be performed with appropriate synchronization primitives provided by the platform which are outside the scope of Vulkan. `vkFlushMappedMemoryRanges` and `vkInvalidateMappedMemoryRanges`, however, can still be used on such memory objects to synchronize host accesses performed through the host pointer of the host mapped device memory range returned by `vkMapMemory`.

After a successful call to `vkMapMemory` or `vkMapMemory2KHR` the memory object memory is considered to be currently host mapped.

To flush ranges of non-coherent memory from the host caches, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkFlushMappedMemoryRanges(
    VkDevice device,
    uint32_t memoryRangeCount,
    const VkMappedMemoryRange* pMemoryRanges);
```

- `device` is the logical device that owns the memory ranges.
- `memoryRangeCount` is the length of the `pMemoryRanges` array.
- `pMemoryRanges` is a pointer to an array of `VkMappedMemoryRange` structures describing the memory ranges to flush.

`vkFlushMappedMemoryRanges` guarantees that host writes to the memory ranges described by `pMemoryRanges` are made available to the host memory domain, such that they can be made available to the device memory domain via memory domain operations using the `VK_ACCESS_HOST_WRITE_BIT` access type.

Within each range described by `pMemoryRanges`, each set of `nonCoherentAtomSize` bytes in that range is flushed if any byte in that set has been written by the host since it was first host mapped, or the last time it was flushed. If `pMemoryRanges` includes sets of `nonCoherentAtomSize` bytes where no bytes have
been written by the host, those bytes **must** not be flushed.

Unmapping non-coherent memory does not implicitly flush the host mapped memory, and host writes that have not been flushed **may** not ever be visible to the device. However, implementations **must** ensure that writes that have not been flushed do not become visible to any other memory.

**Note**

The above guarantee avoids a potential memory corruption in scenarios where host writes to a mapped memory object have not been flushed before the memory is unmapped (or freed), and the virtual address range is subsequently reused for a different mapping (or memory allocation).

### Valid Usage (Implicit)

- VUID-vkFlushMappedMemoryRanges-device-parameter
  - `device` **must** be a valid `VkDevice` handle

- VUID-vkFlushMappedMemoryRanges-pMemoryRanges-parameter
  - `pMemoryRanges` **must** be a valid pointer to an array of `memoryRangeCount` valid `VkMappedMemoryRange` structures

- VUID-vkFlushMappedMemoryRanges-memoryRangeCount-arraylength
  - `memoryRangeCount` **must** be greater than `0`

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

To invalidate ranges of non-coherent memory from the host caches, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkInvalidateMappedMemoryRanges(
    VkDevice device,
    uint32_t memoryRangeCount,
    const VkMappedMemoryRange* pMemoryRanges);
```

- `device` is the logical device that owns the memory ranges.
- `memoryRangeCount` is the length of the `pMemoryRanges` array.
- `pMemoryRanges` is a pointer to an array of `VkMappedMemoryRange` structures describing the memory ranges to invalidate.
vkInvalidateMappedMemoryRanges guarantees that device writes to the memory ranges described by pMemoryRanges, which have been made available to the host memory domain using the VK_ACCESS_HOST_WRITE_BIT and VK_ACCESS_HOST_READ_BIT access types, are made visible to the host. If a range of non-coherent memory is written by the host and then invalidated without first being flushed, its contents are undefined.

Within each range described by pMemoryRanges, each set of nonCoherentAtomSize bytes in that range is invalidated if any byte in that set has been written by the device since it was first host mapped, or the last time it was invalidated.

Note
Mapping non-coherent memory does not implicitly invalidate that memory.

Valid Usage (Implicit)

- VUID-vkInvalidateMappedMemoryRanges-device-parameter
device must be a valid VkDevice handle
- VUID-vkInvalidateMappedMemoryRanges-pMemoryRanges-parameter
pMemoryRanges must be a valid pointer to an array of memoryRangeCount valid VkMappedMemoryRange structures
- VUID-vkInvalidateMappedMemoryRanges-memoryRangeCount-arraylength
memoryRangeCount must be greater than 0

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkMappedMemoryRange structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkMappedMemoryRange {
    VkStructureType sType;
    const void* pNext;
    VkDeviceMemory memory;
    VkDeviceSize offset;
    VkDeviceSize size;
} VkMappedMemoryRange;
```

- sType is a VkStructureType value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `memory` is the memory object to which this range belongs.
• `offset` is the zero-based byte offset from the beginning of the memory object.
• `size` is either the size of range, or `VK_WHOLE_SIZE` to affect the range from `offset` to the end of the current mapping of the allocation.

### Valid Usage

- VUID-VkMappedMemoryRange-memory-00684
  `memory` must be currently host mapped

- VUID-VkMappedMemoryRange-size-00685
  If `size` is not equal to `VK_WHOLE_SIZE`, `offset` and `size` must specify a range contained within the currently mapped range of `memory`

- VUID-VkMappedMemoryRange-size-00686
  If `size` is equal to `VK_WHOLE_SIZE`, `offset` must be within the currently mapped range of `memory`

- VUID-VkMappedMemoryRange-size-00687
  `offset` must be a multiple of `VkPhysicalDeviceLimits::nonCoherentAtomSize`

- VUID-VkMappedMemoryRange-size-01389
  If `size` is equal to `VK_WHOLE_SIZE`, the end of the current mapping of `memory` must either be a multiple of `VkPhysicalDeviceLimits::nonCoherentAtomSize` bytes from the beginning of the memory object, or be equal to the end of the memory object

- VUID-VkMappedMemoryRange-size-01390
  If `size` is not equal to `VK_WHOLE_SIZE`, `size` must either be a multiple of `VkPhysicalDeviceLimits::nonCoherentAtomSize`, or `offset` plus `size` must equal the size of `memory`

### Valid Usage (Implicit)

- VUID-VkMappedMemoryRange-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_MAPPED_MEMORY_RANGE`

- VUID-VkMappedMemoryRange-pNext-pNext
  `pNext` must be `NULL`

- VUID-VkMappedMemoryRange-memory-parameter
  `memory` must be a valid `VkDeviceMemory` handle

To unmap a memory object once host access to it is no longer needed by the application, call:

```c
// Provided by VK_VERSION_1_0
void vkUnmapMemory(
    VkDevice device,
```
- `device` is the logical device that owns the memory.
- `memory` is the memory object to be unmapped.

Calling `vkUnmapMemory` is equivalent to calling `vkUnmapMemory2KHR` with an empty `pNext` chain and the flags parameter set to zero.

### Valid Usage

- VUID-vkUnmapMemory-memory-00689
  
  `memory` must be currently host mapped

### Valid Usage (Implicit)

- VUID-vkUnmapMemory-device-parameter
  
  `device` must be a valid `VkDevice` handle

- VUID-vkUnmapMemory-memory-parameter
  
  `memory` must be a valid `VkDeviceMemory` handle

- VUID-vkUnmapMemory-memory-parent
  
  `memory` must have been created, allocated, or retrieved from `device`

### Host Synchronization

- Host access to `memory` must be externally synchronized

Alternatively, to unmap a memory object once host access to it is no longer needed by the application, call:

```c
// Provided by VK_KHR_map_memory2
VkResult vkUnmapMemory2KHR(
    VkDevice device,
    const VkMemoryUnmapInfoKHR* pMemoryUnmapInfo);
```

- `device` is the logical device that owns the memory.

- `pMemoryUnmapInfo` is a pointer to a `VkMemoryUnmapInfoKHR` structure describing parameters of the unmap.

This function behaves identically to `vkUnmapMemory` except that it gets its parameters via an extensible structure pointer rather than directly as function arguments.
Valid Usage (Implicit)

- VUID-vkUnmapMemory2KHR-device-parameter
device must be a valid VkDevice handle

- VUID-vkUnmapMemory2KHR-pMemoryUnmapInfo-parameter
pMemoryUnmapInfo must be a valid pointer to a valid VkMemoryUnmapInfoKHR structure

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_MEMORY_MAP_FAILED

The VkMemoryUnmapInfoKHR structure is defined as:

```c
// Provided by VK_KHR_map_memory2
typedef struct VkMemoryUnmapInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkMemoryUnmapFlagsKHR flags;
    VkDeviceMemory memory;
} VkMemoryUnmapInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkMemoryUnmapFlagBitsKHR specifying additional parameters of the memory map operation.
- `memory` is the VkDeviceMemory object to be unmapped.

Valid Usage

- VUID-VkMemoryUnmapInfoKHR-memory-07964
memory must be currently host mapped

- VUID-VkMemoryUnmapInfoKHR-flags-09579
If VK_MEMORY_UNMAP_RESERVE_BIT_EXT is set in flags, the memoryUnmapReserve must be enabled

- VUID-VkMemoryUnmapInfoKHR-flags-09580
If VK_MEMORY_UNMAP_RESERVE_BIT_EXT is set in flags, the memory object must not have been imported from a handle type of VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT or VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT
Valid Usage (Implicit)

- VUID-VkMemoryUnmapInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_MEMORY_UNMAP_INFO_KHR
- VUID-VkMemoryUnmapInfoKHR-pNext-pNext
  pNext must be NULL
- VUID-VkMemoryUnmapInfoKHR-flags-parameter
  flags must be a valid combination of VkMemoryUnmapFlagBitsKHR values
- VUID-VkMemoryUnmapInfoKHR-memory-parameter
  memory must be a valid VkDeviceMemory handle

Host Synchronization

- Host access to memory must be externally synchronized

Bits which can be set in VkMemoryUnmapInfoKHR::flags, specifying additional properties of a memory unmap, are:

```c
// Provided by VK_KHR_map_memory2
typedef enum VkMemoryUnmapFlagBitsKHR {
  // Provided by VK_EXT_map_memory_placed
  VK_MEMORY_UNMAP_RESERVE_BIT_EXT = 0x00000001,
} VkMemoryUnmapFlagBitsKHR;
```

- VK_MEMORY_UNMAP_RESERVE_BIT_EXT requests that virtual address range currently occupied by the memory map remain reserved after the vkUnmapMemory2KHR call completes. Future system memory map operations or calls to vkMapMemory or vkMapMemory2KHR will not return addresses in that range unless the range has since been unreserved by the client or the mapping is explicitly placed in that range by calling vkMapMemory2KHR with VK_MEMORY_MAP_PLACED_BIT_EXT, or doing the system memory map equivalent. When VK_MEMORY_UNMAP_RESERVE_BIT_EXT is set, the memory unmap operation may fail, in which case the memory object will remain host mapped and vkUnmapMemory2KHR will return VK_ERROR_MEMORY_MAP_FAILED.

```c
// Provided by VK_KHR_map_memory2
typedef VkFlags VkMemoryUnmapFlagsKHR;
```

VkMemoryUnmapFlagsKHR is a bitmask type for setting a mask of zero or more VkMemoryUnmapFlagBitsKHR.

11.2.16. Lazily Allocated Memory

If the memory object is allocated from a heap with the VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT bit
set, that object’s backing memory may be provided by the implementation lazily. The actual committed size of the memory may initially be as small as zero (or as large as the requested size), and monotonically increases as additional memory is needed.

A memory type with this flag set is only allowed to be bound to a VkImage whose usage flags include VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT.

Note
Using lazily allocated memory objects for framebuffer attachments that are not needed once a render pass instance has completed may allow some implementations to never allocate memory for such attachments.

To determine the amount of lazily-allocated memory that is currently committed for a memory object, call:

```c
// Provided by VK_VERSION_1_0
void vkGetDeviceMemoryCommitment(
  VkDevice device,
  VkDeviceMemory memory,
  VkDeviceSize* pCommittedMemoryInBytes);
```

- device is the logical device that owns the memory.
- memory is the memory object being queried.
- pCommittedMemoryInBytes is a pointer to a VkDeviceSize value in which the number of bytes currently committed is returned, on success.

The implementation may update the commitment at any time, and the value returned by this query may be out of date.

The implementation guarantees to allocate any committed memory from the heapIndex indicated by the memory type that the memory object was created with.

**Valid Usage**

- VUID-vkGetDeviceMemoryCommitment-memory-00690
  memory must have been created with a memory type that reports VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT

**Valid Usage (Implicit)**

- VUID-vkGetDeviceMemoryCommitment-device-parameter
device must be a valid VkDevice handle

- VUID-vkGetDeviceMemoryCommitment-memory-parameter
  memory must be a valid VkDeviceMemory handle

- VUID-vkGetDeviceMemoryCommitment-pCommittedMemoryInBytes-parameter
11.2.17. Protected Memory

Protected memory divides device memory into protected device memory and unprotected device memory.

Protected memory adds the following concepts:

- **Memory**:
  - Unprotected device memory, which **can** be visible to the device and **can** be visible to the host
  - Protected device memory, which **can** be visible to the device but **must** not be visible to the host

- **Resources**:
  - Unprotected images and unprotected buffers, to which unprotected memory **can** be bound
  - Protected images and protected buffers, to which protected memory **can** be bound

- **Command buffers**:
  - Unprotected command buffers, which **can** be submitted to a device queue to execute unprotected queue operations
  - Protected command buffers, which **can** be submitted to a protected-capable device queue to execute protected queue operations

- **Device queues**:
  - Unprotected device queues, to which unprotected command buffers **can** be submitted
  - Protected-capable device queues, to which unprotected command buffers or protected command buffers **can** be submitted

- **Queue submissions**:
  - Unprotected queue submissions, through which unprotected command buffers **can** be submitted
  - Protected queue submissions, through which protected command buffers **can** be submitted

- **Queue operations**:
  - Unprotected queue operations
  - Protected queue operations

*Note*

When the `protectedMemory` feature is enabled, all pipelines **may** be recorded in either protected or unprotected command buffers (or both), which may incur an extra cost on some implementations. This **can** be mitigated by enabling the
pipelineProtectedAccess feature, in which case pipelines created with `VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT_EXT` may only be recorded in protected command buffers, and pipelines created with `VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT_EXT` may only be recorded in unprotected command buffers.

### Protected Memory Access Rules

If `VkPhysicalDeviceProtectedMemoryProperties::protectedNoFault` is `VK_FALSE`, applications **must** not perform any of the following operations:

- Write to unprotected memory within protected queue operations.
- Access protected memory within protected queue operations other than in framebuffer-space pipeline stages, the compute shader stage, or the transfer stage.
- Perform a query within protected queue operations.

If `VkPhysicalDeviceProtectedMemoryProperties::protectedNoFault` is `VK_TRUE`, these operations are valid, but reads will return undefined values, and writes will either be dropped or store undefined values.

Additionally, indirect operations **must** not be performed within protected queue operations.

Whether these operations are valid or not, or if any other invalid usage is performed, the implementation **must** guarantee that:

- Protected device memory **must** never be visible to the host.
- Values written to unprotected device memory **must** not be a function of values from protected memory.

### 11.2.18. External Memory Handle Types

#### Android Hardware Buffer

Android's NDK defines `AHardwareBuffer` objects, which represent device memory that is shareable across processes and that **can** be accessed by a variety of media APIs and the hardware used to implement them. These Android hardware buffer objects **may** be imported into `VkDeviceMemory` objects for access via Vulkan, or exported from Vulkan. An `VkImage` or `VkBuffer` **can** be bound to the imported or exported `VkDeviceMemory` object if it is created with `VK_EXTERNAL_MEMORY_HANDLE_TYPEANDROID_HARDWARE_BUFFER_BIT_ANDROID`.

To remove an unnecessary compile time dependency, an incomplete type definition of `AHardwareBuffer` is provided in the Vulkan headers:

```c
// Provided by VK_ANDROID_external_memory_android_hardware_buffer
struct AHardwareBuffer;
```

The actual `AHardwareBuffer` type is defined in Android NDK headers.
The NDK format, usage, and size/dimensions of an AHardwareBuffer object can be obtained with the AHardwareBuffer_describe function. While Android hardware buffers can be imported to or exported from Vulkan without using that function, valid usage and implementation behavior is defined in terms of the AHardwareBuffer_Desc properties it returns.

Android hardware buffer objects are reference-counted using Android NDK functions outside of the scope of this specification. A VkDeviceMemory imported from an Android hardware buffer or that can be exported to an Android hardware buffer must acquire a reference to its AHardwareBuffer object, and must release this reference when the device memory is freed. During the host execution of a Vulkan command that has an Android hardware buffer as a parameter (including indirect parameters via pNext chains), the application must not decrement the Android hardware buffer's reference count to zero.

Android hardware buffers can be mapped and unmapped for CPU access using the NDK functions. These lock and unlock APIs are considered to acquire and release ownership of the Android hardware buffer, and applications must follow the rules described in External Resource Sharing to transfer ownership between the Vulkan instance and these native APIs.

Android hardware buffers can be shared with external APIs and Vulkan instances on the same device, and also with foreign devices. When transferring ownership of the Android hardware buffer, the external and foreign special queue families described in Queue Family Ownership Transfer are not identical. All APIs which produce or consume Android hardware buffers are considered to use foreign devices, except OpenGL ES contexts and Vulkan logical devices that have matching device and driver UUIDs. Implementations may treat a transfer to or from the foreign queue family as if it were a transfer to or from the external queue family when the Android hardware buffer's usage only permits it to be used on the same physical device.

Android Hardware Buffer Optimal Usages

Vulkan buffer and image usage flags do not correspond exactly to Android hardware buffer usage flags. When allocating Android hardware buffers with non-Vulkan APIs, if any AHARDWAREBUFFER_USAGE_GPU_* usage bits are included, by default the allocator must allocate the memory in such a way that it supports Vulkan usages and creation flags in the usage equivalence table which do not have Android hardware buffer equivalents.

An VkAndroidHardwareBufferUsageANDROID structure can be included in the pNext chain of a VkImageFormatProperties2 structure passed to vkGetPhysicalDeviceImageFormatProperties2 to obtain optimal Android hardware buffer usage flags for specific Vulkan resource creation parameters. Some usage flags returned by these commands are required based on the input parameters, but additional vendor-specific usage flags (AHARDWAREBUFFER_USAGE_VENDOR_*) may also be returned. Any Android hardware buffer allocated with these vendor-specific usage flags and imported to Vulkan must only be bound to resources created with parameters that are a subset of the parameters used to obtain the Android hardware buffer usage, since the memory may have been allocated in a way incompatible with other parameters. If an Android hardware buffer is successfully allocated with additional non-vendor-specific usage flags in addition to the recommended usage, it must support being used in the same ways as an Android hardware buffer.
allocated with only the recommended usage, and also in ways indicated by the additional usage.

**Android Hardware Buffer External Formats**

Android hardware buffers may represent images using implementation-specific formats, layouts, color models, etc., which do not have Vulkan equivalents. Such external formats are commonly used by external image sources such as video decoders or cameras. Vulkan can import Android hardware buffers that have external formats, but since the image contents are in an undiscoverable and possibly proprietary representation, images with external formats must only be used as resolve images or sampled images, and must have optimal tiling. Images with external formats must only be sampled with a sampler that has \(Y'C'B'R\) conversion enabled.

Images that will be backed by an Android hardware buffer can use an external format by setting `VkImageCreateInfo::format` to `VK_FORMAT_UNDEFINED` and including a `VkExternalFormatANDROID` structure in the `pNext` chain. Images can be created with an external format even if the Android hardware buffer has a format which has an equivalent Vulkan format to enable consistent handling of images from sources that might use either category of format. However, all images created with an external format are subject to the valid usage requirements associated with external formats, even if the Android hardware buffer's format has a Vulkan equivalent. The external format of an Android hardware buffer can be obtained by passing a `VkAndroidHardwareBufferFormatPropertiesANDROID` structure to `vkGetAndroidHardwareBufferPropertiesANDROID`.

**Android Hardware Buffer Image Resources**

Android hardware buffers have intrinsic width, height, format, and usage properties, so Vulkan images bound to memory imported from an Android hardware buffer must use dedicated allocations: `VkMemoryDedicatedRequirements::requiresDedicatedAllocation` must be `VK_TRUE` for images created with `VkExternalMemoryImageCreateInfo::handleTypes` that includes `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID`. When creating an image that will be bound to an imported Android hardware buffer, the image creation parameters must be equivalent to the `AHardwareBuffer` properties as described by the valid usage of `VkMemoryAllocateInfo`. Similarly, device memory allocated for a dedicated image must not be exported to an Android hardware buffer until it has been bound to that image, and the implementation must return an Android hardware buffer with properties derived from the image:

- The `width` and `height` members of `AHardwareBuffer_Desc` must be the same as the `width` and `height` members of `VkImageCreateInfo::extent`, respectively.
- The `layers` member of `AHardwareBuffer_Desc` must be the same as the `arrayLayers` member of `VkImageCreateInfo`.
- The `format` member of `AHardwareBuffer_Desc` must be equivalent to `VkImageCreateInfo::format` as defined by `AHardwareBuffer Format Equivalence`.
- The `usage` member of `AHardwareBuffer_Desc` must include bits corresponding to bits included in `VkImageCreateInfo::usage` and `VkImageCreateInfo::flags` where such a correspondence exists according to `AHardwareBuffer Usage Equivalence`. It may also include additional usage bits, including vendor-specific usages. Presence of vendor usage bits may make the Android hardware buffer only usable in ways indicated by the image creation parameters, even when used outside Vulkan, in a similar way that allocating the Android hardware buffer with usage
Implementations **may** support fewer combinations of image creation parameters for images with Android hardware buffer external handle type than for non-external images. Support for a given set of parameters **can** be determined by passing `VkExternalImageFormatProperties` to `vkGetPhysicalDeviceImageFormatProperties2` with `handleType` set to `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID`. Any Android hardware buffer successfully allocated outside Vulkan with usage that includes `AHARDWAREBUFFER_USAGE_GPU_*` **must** be supported when using equivalent Vulkan image parameters. If a given choice of image parameters are supported for import, they **can** also be used to create an image and memory that will be exported to an Android hardware buffer.

</tbody>
</table>
Vulkan does not differentiate between `AHARDWAREBUFFER_FORMAT_R8G8B8A8_UNORM` and `AHARDWAREBUFFER_FORMAT_R8G8B8X8_UNORM`; they both behave as `VK_FORMAT_R8G8B8A8_UNORM`. After an external entity writes to a `AHARDWAREBUFFER_FORMAT_R8G8B8X8_UNORM` Android hardware buffer, the values read by Vulkan from the X/A component are undefined. To emulate the traditional behavior of the X component during sampling or blending, applications should use `VK_COMPONENT_SWIZZLE_ONE` in image view component mappings and `VK_BLEND_FACTOR_ONE` in color blend factors. There is no way to avoid copying these undefined values when copying from such an image to another image or buffer.

The `AHARDWAREBUFFER_USAGE_GPU_MIPMAP_COMPLETE` flag does not correspond to a Vulkan image usage or creation flag. Instead, its presence indicates that the Android hardware buffer contains a complete mipmap chain, and its absence indicates that the Android hardware buffer contains only a single mip level.

Only image usages valid for the format are valid. It would be invalid to take a Android Hardware Buffer with a format of `AHARDWAREBUFFER_FORMAT_R8G8B8A8_UNORM` that has a `AHARDWAREBUFFER_USAGE_GPU_FRAMEBUFFER` usage and try to create an image with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

In combination with a hardware buffer format other than `BLOB`.

Note

When using `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT` with Android hardware buffer images, applications should use `VkImageFormatListCreateInfo` to inform the implementation which view formats will be used with the image. For some common sets of format, this allows some implementations to provide significantly better performance when accessing the image via Vulkan.

Android Hardware Buffer Buffer Resources

Android hardware buffers with a format of `AHARDWAREBUFFER_FORMAT_BLOB` and usage that includes `AHARDWAREBUFFER_USAGE_GPU_DATA_BUFFER` can be used as the backing store for `VkBuffer` objects. Such Android hardware buffers have a size in bytes specified by their `width`; `height` and `layers` are both 1.

Unlike images, buffer resources backed by Android hardware buffers do not require dedicated allocations.

Exported `AHardwareBuffer` objects that do not have dedicated images must have a format of `AHARDWAREBUFFER_FORMAT_BLOB`, usage must include `AHARDWAREBUFFER_USAGE_GPU_DATA_BUFFER`, width must equal the device memory allocation size, and `height` and `layers` must be 1.

QNX Screen Buffer

The QNX SDP defines `_screen_buffer` objects, which represent a buffer that the QNX Screen graphics
subsystem can use directly in its windowing system APIs. More specifically, a Screen buffer is an area of memory that stores pixel data. It can be attached to Screen windows, streams, or pixmaps. These QNX Screen buffer objects may be imported into VkDeviceMemory objects for access via Vulkan. An VkImage or VkBuffer can be bound to the imported VkDeviceMemory object if it is created with VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX.

struct _screen_buffer is strongly typed, so naming the handle type is redundant. The internal layout and therefore size of a struct _screen_buffer image may depend on native usage flags that do not have corresponding Vulkan counterparts.

QNX Screen Buffer Validity

The design of Screen in the QNX SDP makes it difficult to determine the validity of objects from outside of Screen. Therefore, applications must ensure that QNX Screen buffer objects provided used in various Vulkan interfaces are ones created explicitly with QNX Screen APIs. See QNX SDP documentation for more information.

A VkDeviceMemory imported from a QNX Screen buffer has no way to acquire a reference to its _screen_buffer object. Therefore, during the host execution of a Vulkan command that has a QNX Screen buffer as a parameter (including indirect parameters via pNext chains), the application must ensure that the QNX Screen buffer resource remains valid.

Generally, for a _screen_buffer object to be valid for use within a Vulkan implementation, the buffer object should have a _screen_buffer::SCREEN_PROPERTY_USAGE that includes at least one of: SCREEN_USAGE_VULKAN, SCREEN_USAGE_OPENGL_ES2, SCREEN_USAGE_OPENGL_ES3, or SCREEN_USAGE_NATIVE. The exact Screen-native usage flags required depends on the Vulkan implementation, and QNX Screen itself will not necessarily enforce these requirements. Note that Screen-native usage flags are in no way related to usage flags in the Vulkan specification.

QNX Screen Buffer External Formats

QNX Screen buffers may represent images using implementation-specific formats, layouts, color models, etc., which do not have Vulkan equivalents. Such external formats are commonly used by external image sources such as video decoders or cameras. Vulkan can import QNX Screen buffers that have external formats, but since the image contents are in an undiscoverable and possibly proprietary representation, images with external formats must only be used as sampled images, must only be sampled with a sampler that has Y′CbCr conversion enabled, and must have optimal tiling.

Images that will be backed by a QNX Screen buffer can use an external format by setting VkImageCreateInfo::format to VK_FORMAT_UNDEFINED and including a VkExternalFormatQNX structure in the pNext chain. Images can be created with an external format even if the QNX Screen buffer has a format which has an equivalent Vulkan format to enable consistent handling of images from sources that might use either category of format. The external format of a QNX Screen buffer can be obtained by passing a VkScreenBufferFormatPropertiesQNX structure to vkGetScreenBufferPropertiesQNX.

QNX Screen Buffer Image Resources

QNX Screen buffers have intrinsic width, height, format, and usage properties, so Vulkan images
bound to memory imported from a QNX Screen buffer must use dedicated allocations: `VkMemoryDedicatedRequirements::requiresDedicatedAllocation` must be `VK_TRUE` for images created with `VkExternalMemoryImageCreateInfo::handleTypes` that includes `VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX`. When creating an image that will be bound to an imported QNX Screen buffer, the image creation parameters must be equivalent to the `_screen_buffer` properties as described by the valid usage of `VkMemoryAllocateInfo`.

1. Vulkan does not differentiate between `SCREEN_FORMAT_R8B8A888` and `SCREEN_FORMAT_RGBX888`: they both behave as `VK_FORMAT_R8G8B8A8_UNORM`. After an external entity writes to a `SCREEN_FORMAT_RGBX888` QNX Screen buffer, the values read by Vulkan from the X/A component are undefined. To emulate the traditional behavior of the X component during sampling or blending, applications should use `VK_COMPONENT_SWIZZLE_ONE` in image view component mappings and `VK_BLEND_FACTOR_ONE` in color blend factors. There is no way to avoid copying these undefined values when copying from such an image to another image or buffer. The same behavior applies to the following pairs: `SCREEN_FORMAT_BGR8A888` and `SCREEN_FORMAT_BGRX888`, `SCREEN_FORMAT_R8A1010102` and `SCREEN_FORMAT_RGBX1010102`, `SCREEN_FORMAT_BGRX1010102` and `SCREEN_FORMAT_RGBX1010102`, `SCREEN_FORMAT_RGBX1010102` and `SCREEN_FORMAT_RGBX5551` and `SCREEN_FORMAT_RGBX5551`.

### 11.2.19. Peer Memory Features

Peer memory is memory that is allocated for a given physical device and then bound to a resource and accessed by a different physical device, in a logical device that represents multiple physical devices. Some ways of reading and writing peer memory may not be supported by a device.

To determine how peer memory can be accessed, call:

```c
// Provided by VK_VERSION_1_1
void vkGetDeviceGroupPeerMemoryFeatures(
```

980
VkDevice device,
uint32_t heapIndex,
uint32_t localDeviceIndex,
uint32_t remoteDeviceIndex,
VkPeerMemoryFeatureFlags* pPeerMemoryFeatures);

or the equivalent command

// Provided by VK_KHR_device_group
void vkGetDeviceGroupPeerMemoryFeaturesKHR(
    VkDevice device,
    uint32_t heapIndex,
    uint32_t localDeviceIndex,
    uint32_t remoteDeviceIndex,
    VkPeerMemoryFeatureFlags* pPeerMemoryFeatures);

• device is the logical device that owns the memory.
• heapIndex is the index of the memory heap from which the memory is allocated.
• localDeviceIndex is the device index of the physical device that performs the memory access.
• remoteDeviceIndex is the device index of the physical device that the memory is allocated for.
• pPeerMemoryFeatures is a pointer to a VkPeerMemoryFeatureFlags bitmask indicating which types of memory accesses are supported for the combination of heap, local, and remote devices.

Valid Usage

• VUID-vkGetDeviceGroupPeerMemoryFeatures-heapIndex-00691
  heapIndex must be less than memoryHeapCount

• VUID-vkGetDeviceGroupPeerMemoryFeatures-localDeviceIndex-00692
  localDeviceIndex must be a valid device index

• VUID-vkGetDeviceGroupPeerMemoryFeatures-remoteDeviceIndex-00693
  remoteDeviceIndex must be a valid device index

• VUID-vkGetDeviceGroupPeerMemoryFeatures-localDeviceIndex-00694
  localDeviceIndex must not equal remoteDeviceIndex

Valid Usage (Implicit)

• VUID-vkGetDeviceGroupPeerMemoryFeatures-device-parameter
  device must be a valid VkDevice handle

• VUID-vkGetDeviceGroupPeerMemoryFeatures-pPeerMemoryFeatures-parameter
  pPeerMemoryFeatures must be a valid pointer to a VkPeerMemoryFeatureFlags value

Bits which may be set in vkGetDeviceGroupPeerMemoryFeatures::pPeerMemoryFeatures, indicating
supported peer memory features, are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkPeerMemoryFeatureFlagBits {
    VK_PEER_MEMORY_FEATURE_COPY_SRC_BIT = 0x00000001,
    VK_PEER_MEMORY_FEATURE_COPY_DST_BIT = 0x00000002,
    VK_PEER_MEMORY_FEATURE_GENERIC_SRC_BIT = 0x00000004,
    VK_PEER_MEMORY_FEATURE_GENERIC_DST_BIT = 0x00000008,
} VkPeerMemoryFeatureFlagBits;
```

or the equivalent

```c
// Provided by VK_KHR_device_group
typedef VkPeerMemoryFeatureFlagBits VkPeerMemoryFeatureFlagBitsKHR;
```

- **VK_PEER_MEMORY_FEATURE_COPY_SRC_BIT** specifies that the memory can be accessed as the source of any `vkCmdCopy*` command.
- **VK_PEER_MEMORY_FEATURE_COPY_DST_BIT** specifies that the memory can be accessed as the destination of any `vkCmdCopy*` command.
- **VK_PEER_MEMORY_FEATURE_GENERIC_SRC_BIT** specifies that the memory can be read as any memory access type.
- **VK_PEER_MEMORY_FEATURE_GENERIC_DST_BIT** specifies that the memory can be written as any memory access type. Shader atomics are considered to be writes.

**Note**
The peer memory features of a memory heap also apply to any accesses that may be performed during image layout transitions.

**VK_PEER_MEMORY_FEATURE_COPY_DST_BIT** must be supported for all host local heaps and for at least one device-local memory heap.

If a device does not support a peer memory feature, it is still valid to use a resource that includes both local and peer memory bindings with the corresponding access type as long as only the local bindings are actually accessed. For example, an application doing split-frame rendering would use framebuffer attachments that include both local and peer memory bindings, but would scissor the rendering to only update local memory.
VkPeerMemoryFeatureFlags is a bitmask type for setting a mask of zero or more VkPeerMemoryFeatureFlagBits.

### 11.2.20. Opaque Capture Address Query

To query a 64-bit opaque capture address value from a memory object, call:

```c
// Provided by VK_VERSION_1_2
uint64_t vkGetDeviceMemoryOpaqueCaptureAddress(
    VkDevice device,
    const VkDeviceMemoryOpaqueCaptureAddressInfo* pInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_buffer_device_address
uint64_t vkGetDeviceMemoryOpaqueCaptureAddressKHR(
    VkDevice device,
    const VkDeviceMemoryOpaqueCaptureAddressInfo* pInfo);
```

- `device` is the logical device that the memory object was allocated on.
- `pInfo` is a pointer to a `VkDeviceMemoryOpaqueCaptureAddressInfo` structure specifying the memory object to retrieve an address for.

The 64-bit return value is an opaque address representing the start of `pInfo->memory`.

If the memory object was allocated with a non-zero value of `VkMemoryOpaqueCaptureAddressAllocateInfo::opaqueCaptureAddress`, the return value must be the same address.

**Note**

The expected usage for these opaque addresses is only for trace capture/replay tools to store these addresses in a trace and subsequently specify them during replay.
Valid Usage

• VUID-vkGetDeviceMemoryOpaqueCaptureAddress-None-03334
  The bufferDeviceAddress feature must be enabled

• VUID-vkGetDeviceMemoryOpaqueCaptureAddress-device-03335
  If device was created with multiple physical devices, then the bufferDeviceAddressMultiDevice feature must be enabled

Valid Usage (Implicit)

• VUID-vkGetDeviceMemoryOpaqueCaptureAddress-device-parameter
device must be a valid VkDevice handle

• VUID-vkGetDeviceMemoryOpaqueCaptureAddress-pInfo-parameter
  pInfo must be a valid pointer to a valid VkDeviceMemoryOpaqueCaptureAddressInfo structure

The VkDeviceMemoryOpaqueCaptureAddressInfo structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkDeviceMemoryOpaqueCaptureAddressInfo {
  VkStructureType sType;
  const void* pNext;
  VkDeviceMemory memory;
} VkDeviceMemoryOpaqueCaptureAddressInfo;
```

or the equivalent

```c
// Provided by VK_KHR_buffer_device_address
typedef VkDeviceMemoryOpaqueCaptureAddressInfo
VkDeviceMemoryOpaqueCaptureAddressInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- memory specifies the memory whose address is being queried.

Valid Usage

• VUID-VkDeviceMemoryOpaqueCaptureAddressInfo-memory-03336
  memory must have been allocated with VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT
Valid Usage (Implicit)

- **VUID-VkDeviceMemoryOpaqueCaptureAddressInfo-sType-sType**
  
  `sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_MEMORY_OPAQUE_CAPTURE_ADDRESS_INFO`

- **VUID-VkDeviceMemoryOpaqueCaptureAddressInfo-pNext-pNext**
  
  `pNext` **must** be `NULL`

- **VUID-VkDeviceMemoryOpaqueCaptureAddressInfo-memory-parameter**
  
  `memory` **must** be a valid `VkDeviceMemory` handle
Chapter 12. Resource Creation

Vulkan supports two primary resource types: buffers and images. Resources are views of memory with associated formatting and dimensionality. Buffers provide access to raw arrays of bytes, whereas images can be multidimensional and may have associated metadata.

Other resource types, such as acceleration structures and micromaps use buffers as the backing store for opaque data structures.

12.1. Buffers

Buffers represent linear arrays of data which are used for various purposes by binding them to a graphics or compute pipeline via descriptor sets or certain commands, or by directly specifying them as parameters to certain commands.

Buffers are represented by VkBuffer handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkBuffer)
```

To create buffers, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateBuffer( 
    VkDevice device, 
    const VkBufferCreateInfo* pCreateInfo, 
    const VkAllocationCallbacks* pAllocator, 
    VkBuffer* pBuffer);
```

- `device` is the logical device that creates the buffer object.
- `pCreateInfo` is a pointer to a VkBufferCreateInfo structure containing parameters affecting creation of the buffer.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pBuffer` is a pointer to a VkBuffer handle in which the resulting buffer object is returned.

Valid Usage

- VUID-vkCreateBuffer-flags-00911
  If the flags member of pCreateInfo includes VK_BUFFER_CREATE_SPARSE_BINDING_BIT, and the extendedSparseAddressSpace feature is not enabled, creating this VkBuffer must not cause the total required sparse memory for all currently valid sparse resources on the device to exceed VkPhysicalDeviceLimits::sparseAddressSpaceSize

- VUID-vkCreateBuffer-flags-09383
  If the flags member of pCreateInfo includes VK_BUFFER_CREATE_SPARSE_BINDING_BIT, the
extendedSparseAddressSpace feature is enabled, and the usage member of pCreateInfo contains bits not in `VkPhysicalDeviceExtendedSparseAddressSpacePropertiesNV::extendedSparseBufferUsageFlags`, creating this `VkBuffer` must not cause the total required sparse memory for all currently valid sparse resources on the device, excluding `VkBuffer` created with usage member of pCreateInfo containing bits in `VkPhysicalDeviceExtendedSparseAddressSpacePropertiesNV::extendedSparseBufferUsageFlags` and `VkImage` created with usage member of pCreateInfo containing bits in `VkPhysicalDeviceExtendedSparseAddressSpacePropertiesNV::extendedSparseImageUsageFlags`, to exceed `VkPhysicalDeviceLimits::sparseAddressSpaceSize`.

- **VUID-vkCreateBuffer-flags-09384**
  If the flags member of pCreateInfo includes `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` and the extendedSparseAddressSpace feature is enabled, creating this `VkBuffer` must not cause the total required sparse memory for all currently valid sparse resources on the device to exceed `VkPhysicalDeviceExtendedSparseAddressSpacePropertiesNV::extendedSparseAddressSpaceSize`.

- **VUID-vkCreateBuffer-pNext-06387**
  If using the `VkBuffer` for an import operation from a `VkBufferCollectionFUCHSIA` where a `VkBufferCollectionBufferCreateInfoFUCHSIA` has been chained to pNext, pCreateInfo must match the `VkBufferConstraintsInfoFUCHSIA::createInfo` used when setting the constraints on the buffer collection with `vkSetBufferCollectionBufferConstraintsFUCHSIA`.

**Valid Usage (Implicit)**

- **VUID-vkCreateBuffer-device-parameter**
  device must be a valid `VkDevice` handle

- **VUID-vkCreateBuffer-pCreateInfo-parameter**
  pCreateInfo must be a valid pointer to a valid `VkBufferCreateInfo` structure

- **VUID-vkCreateBuffer-pAllocator-parameter**
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkCreateBuffer-pBuffer-parameter**
  pBuffer must be a valid pointer to a `VkBuffer` handle

**Return Codes**

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR**
The **VkBufferCreateInfo** structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBufferCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkBufferCreateFlags flags;
    VkDeviceSize size;
    VkBufferUsageFlags usage;
    VkSharingMode sharingMode;
    uint32_t queueFamilyIndexCount;
    const uint32_t* pQueueFamilyIndices;
} VkBufferCreateInfo;
```

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is a bitmask of *VkBufferCreateFlagBits* specifying additional parameters of the buffer.
- **size** is the size in bytes of the buffer to be created.
- **usage** is a bitmask of *VkBufferUsageFlagBits* specifying allowed usages of the buffer.
- **sharingMode** is a *VkSharingMode* value specifying the sharing mode of the buffer when it will be accessed by multiple queue families.
- **queueFamilyIndexCount** is the number of entries in the *pQueueFamilyIndices* array.
- **pQueueFamilyIndices** is a pointer to an array of queue families that will access this buffer. It is ignored if **sharingMode** is not **VK_SHARING_MODE_CONCURRENT**.

If a **VkBufferUsageFlags2CreateInfoKHR** structure is present in the **pNext** chain, **VkBufferUsageFlags2CreateInfoKHR::usage** from that structure is used instead of **usage** from this structure.

### Valid Usage

- **VUID-VkBufferCreateInfo-None-09499**
  If the **pNext** chain does not include a **VkBufferUsageFlags2CreateInfoKHR** structure, **usage** must be a valid combination of **VkBufferUsageFlagBits** values.

- **VUID-VkBufferCreateInfo-None-09500**
  If the **pNext** chain does not include a **VkBufferUsageFlags2CreateInfoKHR** structure, **usage** must not be 0.

- **VUID-VkBufferCreateInfo-size-00912**
  **size** must be greater than 0.

- **VUID-VkBufferCreateInfo-sharingMode-00913**
  If **sharingMode** is **VK_SHARING_MODE_CONCURRENT**, **pQueueFamilyIndices** must be a valid pointer to an array of **queueFamilyIndexCount uint32_t** values.

- **VUID-VkBufferCreateInfo-sharingMode-00914**
If `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, `queueFamilyIndexCount` must be greater than 1

- **VUID-VkBufferCreateInfo-sharingMode-01419**
  If `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, each element of `pQueueFamilyIndices` must be unique and must be less than `pQueueFamilyPropertyCount` returned by either `vkGetPhysicalDeviceQueueFamilyProperties2` or `vkGetPhysicalDeviceQueueFamilyProperties` for the `physicalDevice` that was used to create device.

- **VUID-VkBufferCreateInfo-flags-00915**
  If the `sparseBinding` feature is not enabled, `flags` must not contain `VK_BUFFER_CREATE_SPARSE_BINDING_BIT`

- **VUID-VkBufferCreateInfo-flags-00916**
  If the `sparseResidencyBuffer` feature is not enabled, `flags` must not contain `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT`

- **VUID-VkBufferCreateInfo-flags-00917**
  If the `sparseResidencyAliased` feature is not enabled, `flags` must not contain `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT`

- **VUID-VkBufferCreateInfo-flags-00918**
  If `flags` contains `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` or `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT`, it must also contain `VK_BUFFER_CREATE_SPARSE_BINDING_BIT`

- **VUID-VkBufferCreateInfo-pNext-00920**
  If the `pNext` chain includes a `VkExternalMemoryBufferCreateInfo` structure, its `handleTypes` member must only contain bits that are also in `VkExternalBufferProperties::externalMemoryProperties.compatibleHandleTypes`, as returned by `vkGetPhysicalDeviceExternalBufferProperties` with `pExternalBufferInfo->handleType` equal to any one of the handle types specified in `VkExternalMemoryBufferCreateInfo::handleTypes`

- **VUID-VkBufferCreateInfo-flags-01887**
  If the `protectedMemory` feature is not enabled, `flags` must not contain `VK_BUFFER_CREATE_PROTECTED_BIT`

- **VUID-VkBufferCreateInfo-None-01888**
  If any of the bits `VK_BUFFER_CREATE_SPARSE_BINDING_BIT`, `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT`, or `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT` are set, `VK_BUFFER_CREATE_PROTECTED_BIT` must not also be set.

- **VUID-VkBufferCreateInfo-pNext-01571**
  If the `pNext` chain includes a `VkDedicatedAllocationBufferCreateInfoNV` structure, and the `dedicatedAllocation` member of the chained structure is `VK_TRUE`, then `flags` must not include `VK_BUFFER_CREATE_SPARSE_BINDING_BIT`, `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT`, or `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT`

- **VUID-VkBufferCreateInfo-deviceAddress-02604**
  If `VkBufferDeviceAddressCreateInfoEXT::deviceAddress` is not zero, `flags` must include `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT`
• VUID-VkBufferCreateInfo-opaqueCaptureAddress-03337
  If `VkBufferOpaqueCaptureAddressCreateInfo::opaqueCaptureAddress` is not zero, flags must include `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT`.

• VUID-VkBufferCreateInfo-flags-03338
  If flags includes `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT`, the `bufferDeviceAddressCaptureReplay` feature must be enabled.

• VUID-VkBufferCreateInfo-usage-04813
  If usage includes `VK_BUFFER_USAGE_VIDEO_DECODE_SRC_BIT_KHR` or `VK_BUFFER_USAGE_VIDEO_DECODE_DST_BIT_KHR`, and flags does not include `VK_BUFFER_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR`, then the `pNext` chain must include a `VkVideoProfileListInfoKHR` structure with `profileCount` greater than 0 and `pProfiles` including at least one `VkVideoProfileInfoKHR` structure with a `videoCodecOperation` member specifying a decode operation.

• VUID-VkBufferCreateInfo-usage-04814
  If usage includes `VK_BUFFER_USAGE_VIDEO_ENCODE_SRC_BIT_KHR` or `VK_BUFFER_USAGE_VIDEO_ENCODE_DST_BIT_KHR`, and flags does not include `VK_BUFFER_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR`, then the `pNext` chain must include a `VkVideoProfileListInfoKHR` structure with `profileCount` greater than 0 and `pProfiles` including at least one `VkVideoProfileInfoKHR` structure with a `videoCodecOperation` member specifying an encode operation.

• VUID-VkBufferCreateInfo-flags-08325
  If flags includes `VK_BUFFER_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR`, then `videoMaintenance1` must be enabled.

• VUID-VkBufferCreateInfo-size-06409
  `size` must be less than or equal to `VkPhysicalDeviceMaintenance4Properties::maxBufferSize`.

• VUID-VkBufferCreateInfo-usage-08097
  If usage includes `VK_BUFFER_USAGE_SAMPLER_DESCRIPTOR_BUFFER_BIT_EXT`, creating this `VkBuffer` must not cause the total required space for all currently valid buffers using this flag on the device to exceed `VkPhysicalDeviceDescriptorBufferPropertiesEXT::samplerDescriptorBufferAddressSpaceSize` or `VkPhysicalDeviceDescriptorBufferPropertiesEXT::descriptorBufferAddressSpaceSize`.

• VUID-VkBufferCreateInfo-usage-08098
  If usage includes `VK_BUFFER_USAGE_RESOURCE_DESCRIPTOR_BUFFER_BIT_EXT`, creating this `VkBuffer` must not cause the total required space for all currently valid buffers using this flag on the device to exceed `VkPhysicalDeviceDescriptorBufferPropertiesEXT::resourceDescriptorBufferAddressSpaceSize` or `VkPhysicalDeviceDescriptorBufferPropertiesEXT::descriptorBufferAddressSpaceSize`.

• VUID-VkBufferCreateInfo-flags-08099
  If flags includes `VK_BUFFER_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT`, the `descriptorBufferCaptureReplay` feature must be enabled.

• VUID-VkBufferCreateInfo-pNext-08100
  If the `pNext` chain includes a `VkOpaqueCaptureDescriptorDataCreateInfoEXT` structure, flags must contain `VK_BUFFER_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT`.  

• VUID-VkBufferCreateInfo-usage-08101
  If `usage` includes `VK_BUFFER_USAGE_PUSH_DESCRIPTORS_DESCRIPTOR_BUFFER_BIT_EXT`, the `descriptorBufferPushDescriptors` feature must be enabled.

• VUID-VkBufferCreateInfo-usage-08102
  If `usage` includes `VK_BUFFER_USAGE_PUSH_DESCRIPTORS_DESCRIPTOR_BUFFER_BIT_EXT`, `VkPhysicalDeviceDescriptorBufferPropertiesEXT::bufferlessPushDescriptors` must be `VK_FALSE`.

• VUID-VkBufferCreateInfo-usage-08103
  If `usage` includes `VK_BUFFER_USAGE_PUSH_DESCRIPTORS_DESCRIPTOR_BUFFER_BIT_EXT`, `usage` must contain at least one of `VK_BUFFER_USAGE_Resource_DESCRIPTOR_BUFFER_BIT_EXT` or `VK_BUFFER_USAGE_SAMPLER_DESCRIPTOR_BUFFER_BIT_EXT`.

### Valid Usage (Implicit)

• VUID-VkBufferCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_BUFFER_CREATE_INFO`.

• VUID-VkBufferCreateInfo-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkBufferCollectionBufferCreateInfoFUCHSIA`, `VkBufferDeviceAddressCreateInfoEXT`, `VkBufferOpaqueCaptureAddressCreateInfo`, `VkBufferUsageFlags2CreateInfoKHR`, `VkDedicatedAllocationBufferCreateInfoNV`, `VkExternalMemoryBufferCreateInfo`, `VkOpaqueCaptureDescriptorDataCreateInfoEXT`, or `VkVideoProfileListInfoKHR`.

• VUID-VkBufferCreateInfo-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique.

• VUID-VkBufferCreateInfo-flags-parameter
  `flags` must be a valid combination of `VkBufferCreateFlagBits` values.

• VUID-VkBufferCreateInfo-sharingMode-parameter
  `sharingMode` must be a valid `VkSharingMode` value.

The `VkBufferUsageFlags2CreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_maintenance5
typedef struct VkBufferUsageFlags2CreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkBufferUsageFlags2KHR usage;
} VkBufferUsageFlags2CreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `usage` is a bitmask of `VkBufferUsageFlagBits2KHR` specifying allowed usages of the buffer.
If this structure is included in the `pNext` chain of a buffer creation structure, `usage` is used instead of the corresponding `usage` value passed in that creation structure, allowing additional usage flags to be specified. If this structure is included in the `pNext` chain of a buffer query structure, the usage flags of the buffer are returned in `usage` of this structure, and the usage flags representable in `usage` of the buffer query structure are also returned in that field.

### Valid Usage (Implicit)

- VUID-VkBufferUsageFlags2CreateInfoKHR-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_BUFFER_USAGE_FLAGS_2_CREATE_INFO_KHR`

- VUID-VkBufferUsageFlags2CreateInfoKHR-usage-parameter
  
  `usage` must be a valid combination of `VkBufferUsageFlagBits2KHR` values

- VUID-VkBufferUsageFlags2CreateInfoKHR-usage-requiredbitmask
  
  `usage` must not be 0

Bits which can be set in `VkBufferUsageFlags2CreateInfoKHR::usage`, specifying usage behavior of a buffer, are:

```c
// Provided by VK_KHR_maintenance5
// Flag bits for VkBufferUsageFlagBits2KHR
typedef VkFlags64 VkBufferUsageFlagBits2KHR;
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_TRANSFER_SRC_BIT_KHR = 0x00000001ULL;
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_TRANSFER_DST_BIT_KHR = 0x00000002ULL;
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_UNIFORM_TEXEL_BUFFER_BIT_KHR = 0x00000004ULL;
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_STORAGE_TEXEL_BUFFER_BIT_KHR = 0x00000008ULL;
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_UNIFORM_BUFFER_BIT_KHR = 0x00000010ULL;
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_STORAGE_BUFFER_BIT_KHR = 0x00000020ULL;
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_INDEX_BUFFER_BIT_KHR = 0x00000040ULL;
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_VERTEX_BUFFER_BIT_KHR = 0x00000080ULL;
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_INDIRECT_BUFFER_BIT_KHR = 0x00000100ULL;
// Provided by VK_KHR_maintenance5 with VK_AMDX_shader_enqueue
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_EXECUTION_GRAPH_SCRATCH_BIT_AMDUX = 0x02000000ULL;
// Provided by VK_KHR_maintenance5 with VK_EXT_conditional_rendering
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_CONDITIONAL_RENDERING_BIT_EXT = 0x00000200ULL;
// Provided by VK_KHR_maintenance5 with VK_KHR_ray_tracing_pipeline
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_SHADER_BINDING_TABLE_BIT_KHR = 0x00000400ULL;
```
• **VK_BUFFER_USAGE_2_TRANSFER_SRC_BIT_KHR** specifies that the buffer can be used as the source of a transfer command (see the definition of **VK_PIPELINE_STAGE_TRANSFER_BIT**).
• **VK_BUFFER_USAGE_2_TRANSFER_DST_BIT_KHR** specifies that the buffer can be used as the destination of a transfer command.

• **VK_BUFFER_USAGE_2_UNIFORM_TEXEL_BUFFER_BIT_KHR** specifies that the buffer can be used to create a VkBufferView suitable for occupying a VkDescriptorSet slot of type VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER.

• **VK_BUFFER_USAGE_2_STORAGE_TEXEL_BUFFER_BIT_KHR** specifies that the buffer can be used to create a VkBufferView suitable for occupying a VkDescriptorSet slot of type VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER.

• **VK_BUFFER_USAGE_2_UNIFORM_BUFFER_BIT_KHR** specifies that the buffer can be used in a VkDescriptorBufferInfo suitable for occupying a VkDescriptorSet slot either of type VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER or VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC.

• **VK_BUFFER_USAGE_2_STORAGE_BUFFER_BIT_KHR** specifies that the buffer can be used in a VkDescriptorBufferInfo suitable for occupying a VkDescriptorSet slot either of type VK_DESCRIPTOR_TYPE_STORAGE_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC.

• **VK_BUFFER_USAGE_2_INDEX_BUFFER_BIT_KHR** specifies that the buffer is suitable for passing as the buffer parameter to vkCmdBindIndexBuffer2KHR and vkCmdBindIndexBuffer.

• **VK_BUFFER_USAGE_2_VERTEX_BUFFER_BIT_KHR** specifies that the buffer is suitable for passing as an element of the pBuffers array to vkCmdBindVertexBuffers.

• **VK_BUFFER_USAGE_2_INDIRECT_BUFFER_BIT_KHR** specifies that the buffer is suitable for passing as the buffer parameter to vkCmdDrawIndirect, vkCmdDrawIndexedIndirect, vkCmdDrawMeshTasksIndirectNV, vkCmdDrawMeshTasksIndirectCountNV, vkCmdDrawMeshTasksIndirectEXT, vkCmdDrawMeshTasksIndirectCountEXT, vkCmdDrawClusterIndirectHUAWEI, or vkCmdDispatchIndirect. It is also suitable for passing as the buffer member of VkIndirectCommandsStreamNV, or sequencesCountBuffer or sequencesIndexBuffer or preprocessedBuffer member of VkGeneratedCommandsInfoNV.

• **VK_BUFFER_USAGE_2_CONDITIONAL_RENDERING_BIT_EXT** specifies that the buffer is suitable for passing as the buffer parameter to vkCmdBeginConditionalRenderingEXT.

• **VK_BUFFER_USAGE_2_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT** specifies that the buffer is suitable for using for binding as a transform feedback buffer with vkCmdBindTransformFeedbackBuffersEXT.

• **VK_BUFFER_USAGE_2_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT** specifies that the buffer is suitable for using as a counter buffer with vkCmdBeginTransformFeedbackEXT and vkCmdEndTransformFeedbackEXT.

• **VK_BUFFER_USAGE_2_SAMPLER_DESCRIPTOR_BUFFER_BIT_EXT** specifies that the buffer is suitable to contain sampler and combined image sampler descriptors when bound as a descriptor buffer. Buffers containing combined image sampler descriptors must also specify VK_BUFFER_USAGE_2_RESOURCE_DESCRIPTOR_BUFFER_BIT_EXT.

• **VK_BUFFER_USAGE_2_RESOURCE_DESCRIPTOR_BUFFER_BIT_EXT** specifies that the buffer is suitable to contain resource descriptors when bound as a descriptor buffer.

• **VK_BUFFER_USAGE_2_PUSH_DESCRIPTORS_DESCRIPTOR_BUFFER_BIT_EXT** specifies that the buffer, when bound, can be used by the implementation to support push descriptors when using descriptor buffers.
• **VK_BUFFER_USAGE_2_RAY_TRACING_BIT_NV** specifies that the buffer is suitable for use in 
  `vkCmdTraceRaysNV`.

• **VK_BUFFER_USAGE_2_SHADER_BINDING_TABLE_BIT_KHR** specifies that the buffer is suitable for use as a 
  Shader Binding Table.

• **VK_BUFFER_USAGE_2_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR** specifies that the 
  buffer is suitable for use as a read-only input to an acceleration structure build.

• **VK_BUFFER_USAGE_2_ACCELERATION_STRUCTURE_STORAGE_BIT_KHR** specifies that the buffer is suitable 
  for storage space for a `VkAccelerationStructureKHR`.

• **VK_BUFFER_USAGE_2_SHADER_DEVICE_ADDRESS_BIT_KHR** specifies that the buffer can be used to 
  retrieve a buffer device address via `vkGetBufferDeviceAddress` and use that address to access 
  the buffer’s memory from a shader.

• **VK_BUFFER_USAGE_2_VIDEO_DECODE_SRC_BIT_KHR** specifies that the buffer can be used as the source 
  video bitstream buffer in a video decode operation.

• **VK_BUFFER_USAGE_2_VIDEO_DECODE_DST_BIT_KHR** is reserved for future use.

• **VK_BUFFER_USAGE_2_VIDEO_ENCODE_DST_BIT_KHR** specifies that the buffer can be used as the 
  destination video bitstream buffer in a video encode operation.

• **VK_BUFFER_USAGE_2_VIDEO_ENCODE_SRC_BIT_KHR** is reserved for future use.

• **VK_BUFFER_USAGE_2_EXECUTION_GRAPH_SCRATCH_BIT_AMDX** specifies that the buffer can be used for as 
  scratch memory for execution graph dispatch.

---

```c
// Provided by VK_KHR_maintenance5
typedef VkFlags64 VkBufferUsageFlags2KHR;
```

`VkBufferUsageFlags2KHR` is a bitmask type for setting a mask of zero or more 
`VkBufferUsageFlagBits2KHR`.

Bits which can be set in `VkBufferCreateInfo::usage`, specifying usage behavior of a buffer, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkBufferUsageFlagBits {
    VK_BUFFER_USAGE_TRANSFER_SRC_BIT = 0x00000001,
    VK_BUFFER_USAGE_TRANSFER_DST_BIT = 0x00000002,
    VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT = 0x00000004,
    VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT = 0x00000008,
    VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT = 0x00000010,
    VK_BUFFER_USAGE_STORAGE_BUFFER_BIT = 0x00000020,
    VK_BUFFER_USAGE_INDEX_BUFFER_BIT = 0x00000040,
    VK_BUFFER_USAGE_VERTEX_BUFFER_BIT = 0x00000080,
    VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT = 0x00000100,
// Provided by VK_VERSION_1_2
    VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT = 0x00020000,
// Provided by VK_KHR_video_decode_queue
    VK_BUFFER_USAGE_VIDEO_DECODE_SRC_BIT_KHR = 0x00002000,
// Provided by VK_KHR_video_decode_queue
```

---
VK_BUFFER_USAGE_VIDEO_DECODE_DST_BIT_KHR = 0x00004000,
// Provided by VK_EXT_transform_feedback
VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT = 0x00000800,
// Provided by VK_EXT_transform_feedback

// Provided by VK_KHR_video_encode_queue
VK_BUFFER_USAGE_VIDEO_ENCODE_SRC_BIT_KHR = 0x00010000,
// Provided by VK_EXT_descriptor_buffer
VK_BUFFER_USAGE_SAMPLER_DESCRIPTOR_BUFFER_BIT_EXT = 0x00200000,
// Provided by VK_EXT_descriptor_buffer
VK_BUFFER_USAGE_RESOURCE_DESCRIPTOR_BUFFER_BIT_EXT = 0x00400000,
// Provided by VK_EXT_descriptor_buffer
VK_BUFFER_USAGE_PUSH_DESCRIPTORS_DESCRIPTOR_BUFFER_BIT_EXT = 0x04000000,
// Provided by VK_EXT_opacity_micromap
VK_BUFFER_USAGE_MICROMAP_BUILD_INPUT_READ_ONLY_BIT_EXT = 0x00800000,
// Provided by VK_KHR_buffer_device_address
VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT_KHR = 0x00000000,
// Provided by VK_KHR_buffer_device_address
VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT = 0x00000000,
VK_BUFFER_USAGE_RAY_TRACING_BIT_NV = VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR,
// Provided by VK_KHR_acceleration_structure
VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR = 0x00080000,
// Provided by VK_KHR_acceleration_structure
VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_STORAGE_BIT_KHR = 0x00100000,
// Provided by VK_KHR_buffer_device_address
VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT_KHR = 0x00000000

• VK_BUFFER_USAGE_TRANSFER_SRC_BIT specifies that the buffer can be used as the source of a transfer command (see the definition of VK_PIPELINE_STAGE_TRANSFER_BIT).

• VK_BUFFER_USAGE_TRANSFER_DST_BIT specifies that the buffer can be used as the destination of a transfer command.

• VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT specifies that the buffer can be used to create a VkBufferView suitable for occupying a VkDescriptorSet slot of type VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER.

• VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT specifies that the buffer can be used to create a
VkBufferView suitable for occupying a VkDescriptorSet slot of type VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER.

- VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT specifies that the buffer can be used in a VkDescriptorBufferInfo suitable for occupying a VkDescriptorSet slot either of type VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER or VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC.

- VK_BUFFER_USAGE_STORAGE_BUFFER_BIT specifies that the buffer can be used in a VkDescriptorBufferInfo suitable for occupying a VkDescriptorSet slot either of type VK_DESCRIPTOR_TYPE_STORAGE_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC.

- VK_BUFFER_USAGE_INDEX_BUFFER_BIT specifies that the buffer is suitable for passing as the buffer parameter to vkCmdBindIndexBuffer2KHR and vkCmdBindIndexBuffer.

- VK_BUFFER_USAGE_VERTEX_BUFFER_BIT specifies that the buffer is suitable for passing as an element of the pBuffers array to vkCmdBindVertexBuffers.

- VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT specifies that the buffer is suitable for passing as the buffer parameter to vkCmdBindIndirect, vkCmdDrawIndirect, vkCmdDrawMeshTasksIndirectNV, vkCmdDrawMeshTasksIndirectEXT, vkCmdDrawClusterIndirectHUAWEI, or vkCmdDispatchIndirect. It is also suitable for passing as the buffer member of VkIndirectCommandsStreamNV, or sequencesCountBuffer or sequencesIndexBuffer or preprocessedBuffer member of VkGeneratedCommandsInfoNV.

- VK_BUFFER_USAGE_CONDITIONAL_RENDERING_BIT_EXT specifies that the buffer is suitable for passing as the buffer parameter to vkCmdBeginConditionalRenderingEXT.

- VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT specifies that the buffer is suitable for using for binding as a transform feedback buffer with vkCmdBindTransformFeedbackBuffersEXT.

- VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT specifies that the buffer is suitable for using as a counter buffer with vkCmdBeginTransformFeedbackEXT and vkCmdEndTransformFeedbackEXT.

- VK_BUFFER_USAGE_SAMPLER_DESCRIPTOR_BUFFER_BIT_EXT specifies that the buffer is suitable to contain sampler and combined image sampler descriptors when bound as a descriptor buffer. Buffers containing combined image sampler descriptors must also specify VK_BUFFER_USAGE_RESOURCE_DESCRIPTOR_BUFFER_BIT_EXT.

- VK_BUFFER_USAGE_RESOURCE_DESCRIPTOR_BUFFER_BIT_EXT specifies that the buffer is suitable to contain resource descriptors when bound as a descriptor buffer.

- VK_BUFFER_USAGE_PUSH_DESCRIPTOR_BUFFER_BIT_KHR specifies that the buffer, when bound, can be used by the implementation to support push descriptors when using descriptor buffers.

- VK_BUFFER_USAGE_RAY_TRACING_BIT_NV specifies that the buffer is suitable for use in vkCmdTraceRaysNV.

- VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR specifies that the buffer is suitable for use as a Shader Binding Table.

- VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR specifies that the buffer is suitable for use as a read-only input to an acceleration structure build.

- VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_STORAGE_BIT_KHR specifies that the buffer is suitable for use in
storage space for a `VkAccelerationStructureKHR`.

- `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT` specifies that the buffer can be used to retrieve a buffer device address via `vkGetBufferDeviceAddress` and use that address to access the buffer’s memory from a shader.
- `VK_BUFFER_USAGE_VIDEO_DECODE_SRC_BIT_KHR` specifies that the buffer can be used as the source video bitstream buffer in a video decode operation.
- `VK_BUFFER_USAGE_VIDEO_DECODE_DST_BIT_KHR` is reserved for future use.
- `VK_BUFFER_USAGE_VIDEO_ENCODE_DST_BIT_KHR` specifies that the buffer can be used as the destination video bitstream buffer in a video encode operation.
- `VK_BUFFER_USAGE_VIDEO_ENCODE_SRC_BIT_KHR` is reserved for future use.
- `VK_BUFFER_USAGE_EXECUTION_GRAPH_SCRATCH_BIT_AMD` specifies that the buffer can be used for scratch memory for execution graph dispatch.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkBufferUsageFlags;

VkBufferUsageFlags` is a bitmask type for setting a mask of zero or more `VkBufferUsageFlagBits`.

Bits which can be set in `VkBufferCreateInfo::flags`, specifying additional parameters of a buffer, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkBufferCreateFlagBits {
    VK_BUFFER_CREATE_SPARSE_BINDING_BIT = 0x00000001,
    VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT = 0x00000002,
    VK_BUFFER_CREATE_SPARSE_ALIASED_BIT = 0x00000004,
    // Provided by VK_VERSION_1_1
    VK_BUFFER_CREATE_PROTECTED_BIT = 0x00000008,
    // Provided by VK_VERSION_1_2
    VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT = 0x00000010,
    // Provided by VK_EXT_descriptor_buffer
    VK_BUFFER_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT = 0x00000020,
    // Provided by VK_KHR_video_maintenance1
    VK_BUFFER_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR = 0x00000040,
    // Provided by VK_EXT_buffer_device_address
    VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR = VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT
} VkBufferCreateFlagBits;
```

- `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` specifies that the buffer will be backed using sparse memory binding.
- `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` specifies that the buffer can be partially backed using
sparse memory binding. Buffers created with this flag must also be created with the 
VK_BUFFER_CREATE_SPARSE_BINDING_BIT flag.

• VK_BUFFER_CREATE_SPARSE_ALIASED_BIT specifies that the buffer will be backed using sparse memory binding with memory ranges that might also simultaneously be backing another buffer (or another portion of the same buffer). Buffers created with this flag must also be created with the VK_BUFFER_CREATE_SPARSE_BINDING_BIT flag.

• VK_BUFFER_CREATE_PROTECTED_BIT specifies that the buffer is a protected buffer.

• VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT specifies that the buffer’s address can be saved and reused on a subsequent run (e.g. for trace capture and replay), see VkBufferOpaqueCaptureAddressCreateInfo for more detail.

• VK_BUFFER_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT specifies that the buffer can be used with descriptor buffers when capturing and replaying (e.g. for trace capture and replay), see VkOpaqueCaptureDescriptorDataCreateInfoEXT for more detail.

• VK_BUFFER_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR specifies that the buffer can be used in video coding operations without having to specify at buffer creation time the set of video profiles the buffer will be used with.

See Sparse Resource Features and Physical Device Features for details of the sparse memory features supported on a device.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkBufferCreateFlags;
```

VkBufferCreateFlags is a bitmask type for setting a mask of zero or more VkBufferCreateFlagBits.

If the pNext chain includes a VkDedicatedAllocationBufferCreateInfoNV structure, then that structure includes an enable controlling whether the buffer will have a dedicated memory allocation bound to it.

The VkDedicatedAllocationBufferCreateInfoNV structure is defined as:

```
// Provided by VK_NV_dedicated_allocation
typedef struct VkDedicatedAllocationBufferCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkBool32 dedicatedAllocation;
} VkDedicatedAllocationBufferCreateInfoNV;
```

• sType is a VkStructureType value identifying this structure.

• pNext is NULL or a pointer to a structure extending this structure.

• dedicatedAllocation specifies whether the buffer will have a dedicated allocation bound to it.
Valid Usage (Implicit)

- VUID-VkDedicatedAllocationBufferCreateInfoNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEDICATED_ALLOCATION_BUFFER_CREATE_INFO_NV

To define a set of external memory handle types that may be used as backing store for a buffer, add a VkExternalMemoryBufferCreateInfo structure to the pNext chain of the VkBufferCreateInfo structure. The VkExternalMemoryBufferCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkExternalMemoryBufferCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkExternalMemoryHandleTypeFlags handleTypes;
} VkExternalMemoryBufferCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_external_memory
typedef VkExternalMemoryBufferCreateInfo VkExternalMemoryBufferCreateInfoKHR;
```

**Note**
A VkExternalMemoryBufferCreateInfo structure with a non-zero handleTypes field must be included in the creation parameters for a buffer that will be bound to memory that is either exported or imported.

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- handleTypes is zero or a bitmask of VkExternalMemoryHandleTypeFlagBits specifying one or more external memory handle types.

Valid Usage (Implicit)

- VUID-VkExternalMemoryBufferCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_EXTERNAL_MEMORY_BUFFER_CREATE_INFO

- VUID-VkExternalMemoryBufferCreateInfo-handleTypes-parameter
  handleTypes must be a valid combination of VkExternalMemoryHandleTypeFlagBits values

To request a specific device address for a buffer, add a VkBufferOpaqueCaptureAddressCreateInfo structure to the pNext chain of the VkBufferCreateInfo structure. TheVkBufferOpaqueCaptureAddressCreateInfo structure is defined as:
typedef struct VkBufferOpaqueCaptureAddressCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint64_t opaqueCaptureAddress;
} VkBufferOpaqueCaptureAddressCreateInfo;

or the equivalent

typedef VkBufferOpaqueCaptureAddressCreateInfo VkBufferOpaqueCaptureAddressCreateInfoKHR;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **opaqueCaptureAddress** is the opaque capture address requested for the buffer.

If **opaqueCaptureAddress** is zero, no specific address is requested.

If **opaqueCaptureAddress** is not zero, then it should be an address retrieved from vkGetBufferOpaqueCaptureAddress for an identically created buffer on the same implementation.

If this structure is not present, it is as if **opaqueCaptureAddress** is zero.

Apps should avoid creating buffers with app-provided addresses and implementation-provided addresses in the same process, to reduce the likelihood of VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS errors.

**Note**

The expected usage for this is that a trace capture/replay tool will add the VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT flag to all buffers that use VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT, and during capture will save the queried opaque device addresses in the trace. During replay, the buffers will be created specifying the original address so any address values stored in the trace data will remain valid.

Implementations are expected to separate such buffers in the GPU address space so normal allocations will avoid using these addresses. Apps/tools should avoid mixing app-provided and implementation-provided addresses for buffers created with VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT, to avoid address space allocation conflicts.

**Valid Usage (Implicit)**

- VUID-VkBufferOpaqueCaptureAddressCreateInfo-sType-sType
  - **sType** must be VK_STRUCTURE_TYPE_BUFFER_OPAQUE_CAPTURE_ADDRESS_CREATE_INFO
Alternatively, to request a specific device address for a buffer, add a `VkBufferDeviceAddressCreateInfoEXT` structure to the `pNext` chain of the `VkBufferCreateInfo` structure. The `VkBufferDeviceAddressCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_buffer_device_address
ttypedef struct VkBufferDeviceAddressCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDeviceAddress deviceAddress;
} VkBufferDeviceAddressCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `deviceAddress` is the device address requested for the buffer.

If `deviceAddress` is zero, no specific address is requested.

If `deviceAddress` is not zero, then it must be an address retrieved from an identically created buffer on the same implementation. The buffer must also be bound to an identically created `VkDeviceMemory` object.

If this structure is not present, it is as if `deviceAddress` is zero.

Apps should avoid creating buffers with app-provided addresses and implementation-provided addresses in the same process, to reduce the likelihood of `VK_ERROR_INVALID_DEVICE_ADDRESS_EXT` errors.

---

**Valid Usage (Implicit)**

- `VUID-VkBufferDeviceAddressCreateInfoEXT-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_BUFFER_DEVICE_ADDRESS_CREATE_INFO_EXT`

---

The `VkBufferCollectionBufferCreateInfoFUCHSIA` structure is defined as:

```c
// Provided by VK_FUCHSIA_buffer_collection
ttypedef struct VkBufferCollectionBufferCreateInfoFUCHSIA {
    VkStructureType sType;
    const void* pNext;
    VkBufferCollectionFUCHSIA collection;
    uint32_t index;
} VkBufferCollectionBufferCreateInfoFUCHSIA;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `collection` is the `VkBufferCollectionFUCHSIA` handle.
• index is the index of the buffer in the buffer collection from which the memory will be imported.

Valid Usage

• VUID-VkBufferCollectionBufferCreateInfoFUCHSIA-index-06388
  index must be less than VkBufferCollectionPropertiesFUCHSIA::bufferCount

Valid Usage (Implicit)

• VUID-VkBufferCollectionBufferCreateInfoFUCHSIA-sType-sType
  sType must be VK_STRUCTURE_TYPE_BUFFER_COLLECTION_BUFFER_CREATE_INFO_FUCHSIA

• VUID-VkBufferCollectionBufferCreateInfoFUCHSIA-collection-parameter
  collection must be a valid VkBufferCollectionFUCHSIA handle

To destroy a buffer, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyBuffer(
    VkDevice device,
    VkBuffer buffer,
    const VkAllocationCallbacks* pAllocator);
```

• device is the logical device that destroys the buffer.
• buffer is the buffer to destroy.
• pAllocator controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

• VUID-vkDestroyBuffer-buffer-00922
  All submitted commands that refer to buffer, either directly or via a VkBufferView, must have completed execution

• VUID-vkdestroyBuffer-buffer-00923
  If VkAllocationCallbacks were provided when buffer was created, a compatible set of callbacks must be provided here

• VUID-vkdestroyBuffer-buffer-00924
  If no VkAllocationCallbacks were provided when buffer was created, pAllocator must be NULL

Valid Usage (Implicit)

• VUID-vkDestroyBuffer-device-parameter
  device must be a valid VkDevice handle
12.2. Buffer Views

A buffer view represents a contiguous range of a buffer and a specific format to be used to interpret the data. Buffer views are used to enable shaders to access buffer contents using image operations. In order to create a valid buffer view, the buffer must have been created with at least one of the following usage flags:

- VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT
- VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT

Buffer views are represented by VkBufferView handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkBufferView)
```

To create a buffer view, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateBufferView(
    VkDevice device,                     // device
    const VkBufferViewCreateInfo* pCreateInfo, // pCreateInfo
    const VkAllocationCallbacks* pAllocator,  // pAllocator
    VkBufferView* pView);                 // pView
```

- `device` is the logical device that creates the buffer view.
- `pCreateInfo` is a pointer to a VkBufferViewCreateInfo structure containing parameters to be used to create the buffer view.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pView` is a pointer to a VkBufferView handle in which the resulting buffer view object is returned.
Valid Usage (Implicit)

- VUID-vkCreateBufferView-device-parameter
  device must be a valid VkDevice handle

- VUID-vkCreateBufferView-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkBufferViewCreateInfo structure

- VUID-vkCreateBufferView-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateBufferView-pView-parameter
  pView must be a valid pointer to a VkBufferView handle

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkBufferViewCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBufferViewCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkBufferViewCreateFlags flags;
    VkBuffer buffer;
    VkFormat format;
    VkDeviceSize offset;
    VkDeviceSize range;
} VkBufferViewCreateInfo;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is reserved for future use.
- buffer is a VkBuffer on which the view will be created.
- format is a VkFormat describing the format of the data elements in the buffer.
- offset is an offset in bytes from the base address of the buffer. Accesses to the buffer view from shaders use addressing that is relative to this starting offset.
- range is a size in bytes of the buffer view. If range is equal to VK_WHOLE_SIZE, the range from
offset to the end of the buffer is used. If VK_WHOLE_SIZE is used and the remaining size of the buffer is not a multiple of the texel block size of format, the nearest smaller multiple is used.

The buffer view has a buffer view usage identifying which descriptor types can be created from it. This usage can be defined by including the VkBufferUsageFlags2CreateInfoKHR structure in the pNext chain, and specifying the usage value there. If this structure is not included, it is equal to the VkBufferCreateInfo::usage value used to create buffer.

Valid Usage

- VUID-VkBufferViewCreateInfo-offset-00925
  offset must be less than the size of buffer

- VUID-VkBufferViewCreateInfo-range-00928
  If range is not equal to VK_WHOLE_SIZE, range must be greater than 0

- VUID-VkBufferViewCreateInfo-range-00929
  If range is not equal to VK_WHOLE_SIZE, range must be an integer multiple of the texel block size of format

- VUID-VkBufferViewCreateInfo-range-00930
  If range is not equal to VK_WHOLE_SIZE, the number of texel buffer elements given by \( \left\lfloor \frac{\text{range}}{\text{texel block size}} \right\rfloor \times (\text{texels per block}) \) where texel block size and texels per block are as defined in the Compatible Formats table for format, must be less than or equal to VkPhysicalDeviceLimits::maxTexelBufferElements

- VUID-VkBufferViewCreateInfo-offset-00931
  If range is not equal to VK_WHOLE_SIZE, the sum of offset and range must be less than or equal to the size of buffer

- VUID-VkBufferViewCreateInfo-range-04059
  If range is equal to VK_WHOLE_SIZE, the number of texel buffer elements given by \( \left\lfloor \frac{\text{size} - \text{offset}}{\text{texel block size}} \right\rfloor \times (\text{texels per block}) \) where size is the size of buffer, and texel block size and texels per block are as defined in the Compatible Formats table for format, must be less than or equal to VkPhysicalDeviceLimits::maxTexelBufferElements

- VUID-VkBufferViewCreateInfo-buffer-00932
  buffer must have been created with a usage value containing at least one of VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT or VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT

- VUID-VkBufferViewCreateInfo-format-08778
  If the buffer view usage contains VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT, then format features of format must contain VK_FORMAT_FEATURE_UNIFORM_TEXEL_BUFFER_BIT

- VUID-VkBufferViewCreateInfo-format-08779
  If the buffer view usage contains VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT, then format features of format must contain VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_BIT

- VUID-VkBufferViewCreateInfo-buffer-00935
  If buffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-VkBufferViewCreateInfo-offset-02749
  If the texelBufferAlignment feature is not enabled, offset must be a multiple of
If the `texelBufferAlignment` feature is enabled and if `buffer` was created with `usage` containing `VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT`, offset must be a multiple of the lesser of `VkPhysicalDeviceTexelBufferAlignmentProperties::storageTexelBufferOffsetAlignmentBytes` or, if `VkPhysicalDeviceTexelBufferAlignmentProperties::storageTexelBufferOffsetSingleTexelAlignment` is `VK_TRUE`, the size of a texel of the requested `format`. If the size of a texel is a multiple of three bytes, then the size of a single component of `format` is used instead.

If the `texelBufferAlignment` feature is enabled and if `buffer` was created with `usage` containing `VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT`, offset must be a multiple of the lesser of `VkPhysicalDeviceTexelBufferAlignmentProperties::uniformTexelBufferOffsetAlignmentBytes` or, if `VkPhysicalDeviceTexelBufferAlignmentProperties::uniformTexelBufferOffsetSingleTexelAlignment` is `VK_TRUE`, the size of a texel of the requested `format`. If the size of a texel is a multiple of three bytes, then the size of a single component of `format` is used instead.

If the `pNext` chain includes a `VkExportMetalObjectCreateInfoEXT` structure, its `exportObjectType` member must be `VK_EXPORT_METAL_OBJECT_TYPE_METAL_TEXTURE_BIT_EXT`.

If the `pNext` chain includes a `VkBufferUsageFlags2CreateInfoKHR`, its `usage` must not contain any other bit than `VK_BUFFER_USAGE_2_UNIFORM_TEXEL_BUFFER_BIT_KHR` or `VK_BUFFER_USAGE_2_STORAGE_TEXEL_BUFFER_BIT_KHR`.

If the `pNext` chain includes a `VkBufferUsageFlags2CreateInfoKHR`, its `usage` must be a subset of the `VkBufferCreateInfo::usage` specified or `VkBufferUsageFlags2CreateInfoKHR::usage` from `VkBufferCreateInfo::pNext` when creating `buffer`.

### Valid Usage (Implicit)

- **sType** must be `VK_STRUCTURE_TYPE_BUFFER_VIEW_CREATE_INFO`
- **pNext** must be either `NULL` or a pointer to a valid instance of `VkBufferUsageFlags2CreateInfoKHR` or `VkExportMetalObjectCreateInfoEXT`.
- **sType** value of each struct in the `pNext` chain must be unique, with the exception of structures of type `VkExportMetalObjectCreateInfoEXT`.
- **flags** must be `0`.
- **buffer** parameter.
buffer must be a valid VkBuffer handle

- VUID-VkBufferViewCreateInfo-format-parameter
  format must be a valid VkFormat value

// Provided by VK_VERSION_1_0
typedef VkFlags VkBufferViewCreateInfo;

VkBufferViewCreateInfo is a bitmask type for setting a mask, but is currently reserved for future use.

To destroy a buffer view, call:

// Provided by VK_VERSION_1_0
void vkDestroyBufferView(
  VkDevice device, 
  VkBufferView bufferView, 
  const VkAllocationCallbacks* pAllocator);

- device is the logical device that destroys the buffer view.
- bufferView is the buffer view to destroy.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyBufferView-bufferView-00936
  All submitted commands that refer to bufferView must have completed execution

- VUID-vkDestroyBufferView-bufferView-00937
  If VkAllocationCallbacks were provided when bufferView was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyBufferView-bufferView-00938
  If no VkAllocationCallbacks were provided when bufferView was created, pAllocator must be NULL

Valid Usage (Implicit)

- VUID-vkDestroyBufferView-device-parameter
  device must be a valid VkDevice handle

- VUID-vkDestroyBufferView-bufferView-parameter
  If bufferView is not VK_NULL_HANDLE, bufferView must be a valid VkBufferView handle

- VUID-vkDestroyBufferView-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure
If `bufferView` is a valid handle, it must have been created, allocated, or retrieved from `device`.

**Host Synchronization**

- Host access to `bufferView` must be externally synchronized.

### 12.2.1. Buffer View Format Features

Valid uses of a `VkBufferView` may depend on the buffer view's format features, defined below. Such constraints are documented in the affected valid usage statement.

- If Vulkan 1.3 is supported or the `VK_KHR_format_feature_flags2` extension is supported, then the buffer view's set of format features is the value of `VkFormatProperties3::bufferFeatures` found by calling `vkGetPhysicalDeviceFormatProperties2` on the same `format` as `VkBufferViewCreateInfo::format`.

### 12.3. Images

Images represent multidimensional - up to 3 - arrays of data which can be used for various purposes (e.g. attachments, textures), by binding them to a graphics or compute pipeline via descriptor sets, or by directly specifying them as parameters to certain commands.

Images are represented by `VkImage` handles:

```plaintext
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkImage)
```

To create images, call:

```plaintext
// Provided by VK_VERSION_1_0
VkResult vkCreateImage(  
    VkDevice device,  
    const VkImageCreateInfo* pCreateInfo,  
    const VkAllocationCallbacks* pAllocator,  
    VkImage* pImage);
```

- `device` is the logical device that creates the image.
- `pCreateInfo` is a pointer to a `VkImageCreateInfo` structure containing parameters to be used to create the image.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pImage` is a pointer to a `VkImage` handle in which the resulting image object is returned.
Valid Usage

- **VUID-vkCreateImage-flags-00939**
  If the flags member of pCreateInfo includes `VK_IMAGE_CREATE_SPARSE_BINDING_BIT`, and the extendedSparseAddressSpace feature is not enabled, creating this VkImage must not cause the total required sparse memory for all currently valid sparse resources on the device to exceed `VkPhysicalDeviceLimits::sparseAddressSpaceSize`

- **VUID-vkCreateImage-flags-09385**
  If the flags member of pCreateInfo includes `VK_IMAGE_CREATE_SPARSE_BINDING_BIT`, the extendedSparseAddressSpace feature is enabled, and the usage member of pCreateInfo contains bits not in `VkPhysicalDeviceExtendedSparseAddressSpacePropertiesNV::extendedSparseImageUsageFlags`, creating this VkImage must not cause the total required sparse memory for all currently valid sparse resources on the device, excluding VkBuffer created with usage member of pCreateInfo containing bits in `VkPhysicalDeviceExtendedSparseAddressSpacePropertiesNV::extendedSparseBufferUsageFlags` and VkImage created with usage member of pCreateInfo containing bits in `VkPhysicalDeviceExtendedSparseAddressSpacePropertiesNV::extendedSparseImageUsageFlags`, to exceed `VkPhysicalDeviceLimits::sparseAddressSpaceSize`

- **VUID-vkCreateImage-flags-09386**
  If the flags member of pCreateInfo includes `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` and the extendedSparseAddressSpace feature is enabled, creating this VkImage must not cause the total required sparse memory for all currently valid sparse resources on the device to exceed `VkPhysicalDeviceExtendedSparseAddressSpacePropertiesNV::extendedSparseAddressSpaceSize`

- **VUID-vkCreateImage-pNext-06389**
  If a `VkBufferCollectionImageCreateInfoFUCHSIA` has been chained to pNext, pCreateInfo must match the Sysmem chosen VkImageCreateInfo excepting members `VkImageCreateInfo::extent` and `VkImageCreateInfo::usage` in the match criteria

Valid Usage (Implicit)

- **VUID-vkCreateImage-device-parameter**
  device must be a valid VkDevice handle

- **VUID-vkCreateImage-pCreateInfo-parameter**
  pCreateInfo must be a valid pointer to a valid VkImageCreateInfo structure

- **VUID-vkCreateImage-pAllocator-parameter**
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- **VUID-vkCreateImage-pImage-parameter**
  pImage must be a valid pointer to a VkImage handle
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_COMPRESSION_EXHAUSTED_EXT
• VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR

The VkImageCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkImageCreateFlags flags;
    VkImageType imageType;
    VkFormat format;
    VkExtent3D extent;
    uint32_t mipLevels;
    uint32_t arrayLayers;
    VkSampleCountFlagBits samples;
    VkImageTiling tiling;
    VkImageUsageFlags usage;
    VkSharingMode sharingMode;
    uint32_t queueFamilyIndexCount;
    const uint32_t* pQueueFamilyIndices;
    VkImageLayout initialLayout;
} VkImageCreateInfo;
```

• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `flags` is a bitmask of `VkImageCreateFlagBits` describing additional parameters of the image.
• `imageType` is a `VkImageType` value specifying the basic dimensionality of the image. Layers in array textures do not count as a dimension for the purposes of the image type.
• `format` is a `VkFormat` describing the format and type of the texel blocks that will be contained in the image.
• `extent` is a `VkExtent3D` describing the number of data elements in each dimension of the base level.
• `mipLevels` describes the number of levels of detail available for minified sampling of the image.
• `arrayLayers` is the number of layers in the image.
• **samples** is a VkSampleCountFlagBits value specifying the number of samples per texel.
• **tiling** is a VkImageTiling value specifying the tiling arrangement of the texel blocks in memory.
• **usage** is a bitmask of VkImageUsageFlagBits describing the intended usage of the image.
• **sharingMode** is a VkSharingMode value specifying the sharing mode of the image when it will be accessed by multiple queue families.
• **queueFamilyIndexCount** is the number of entries in the pQueueFamilyIndices array.
• **pQueueFamilyIndices** is a pointer to an array of queue families that will access this image. It is ignored if sharingMode is not VK_SHARING_MODE_CONCURRENT.
• **initialLayout** is a VkImageLayout value specifying the initial VkImageLayout of all image subresources of the image. See Image Layouts.

Images created with **tiling** equal to VK_IMAGE_TILING_LINEAR have further restrictions on their limits and capabilities compared to images created with **tiling** equal to VK_IMAGE_TILING_OPTIMAL. Creation of images with tiling VK_IMAGE_TILING_LINEAR may not be supported unless other parameters meet all of the constraints:

• **imageType** is VK_IMAGE_TYPE_2D
• **format** is not a depth/stencil format
• **mipLevels** is 1
• **arrayLayers** is 1
• **samples** is VK_SAMPLE_COUNT_1_BIT
• **usage** only includes VK_IMAGE_USAGE_TRANSFER_SRC_BIT and/or VK_IMAGE_USAGE_TRANSFER_DST_BIT

Images created with one of the formats that require a sampler Y’C₈C₆ conversion, have further restrictions on their limits and capabilities compared to images created with other formats. Creation of images with a format requiring Y’C₈C₆ conversion may not be supported unless other parameters meet all of the constraints:

• **imageType** is VK_IMAGE_TYPE_2D
• **mipLevels** is 1
• **arrayLayers** is 1, unless the ycbcrImageArrays feature is enabled, or otherwise indicated by VkImageFormatProperties::maxArrayLayers, as returned by vkGetPhysicalDeviceImageFormatProperties
• **samples** is VK_SAMPLE_COUNT_1_BIT

Implementations may support additional limits and capabilities beyond those listed above.

To determine the set of valid usage bits for a given format, call vkGetPhysicalDeviceFormatProperties.

If the size of the resultant image would exceed maxResourceSize, then vkCreateImage must fail and return VK_ERROR_OUT_OF_DEVICE_MEMORY. This failure may occur even when all image creation parameters satisfy their valid usage requirements.
If the implementation reports `VK_TRUE` in `VkPhysicalDeviceHostImageCopyPropertiesEXT::identicalMemoryTypeRequirements`, usage of `VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT` must not affect the memory type requirements of the image as described in Sparse Resource Memory Requirements and Resource Memory Association.

**Note**

For images created without `VK_IMAGE_CREATE_EXTENDED_USAGE_BIT` a usage bit is valid if it is supported for the format the image is created with.

For images created with `VK_IMAGE_CREATE_EXTENDED_USAGE_BIT` a usage bit is valid if it is supported for at least one of the formats a `VkImageView` created from the image can have (see Image Views for more detail).

### Image Creation Limits

Valid values for some image creation parameters are limited by a numerical upper bound or by inclusion in a bitset. For example, `VkImageCreateInfo::arrayLayers` is limited by `imageCreateMaxArrayLayers`, defined below; and `VkImageCreateInfo::samples` is limited by `imageCreateSampleCounts`, also defined below.

Several limiting values are defined below, as well as assisting values from which the limiting values are derived. The limiting values are referenced by the relevant valid usage statements of `VkImageCreateInfo`.

- Let `uint64_t imageCreateDrmFormatModifiers[]` be the set of Linux DRM format modifiers that the resultant image may have.
  - If tiling is not `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then `imageCreateDrmFormatModifiers` is empty.
  - If `VkImageCreateInfo::pNext` contains `VkImageDrmFormatModifierExplicitCreateInfoEXT`, then `imageCreateDrmFormatModifiers` contains exactly one modifier, `VkImageDrmFormatModifierExplicitCreateInfoEXT::drmFormatModifier`.
  - If `VkImageCreateInfo::pNext` contains `VkImageDrmFormatModifierListCreateInfoEXT`, then `imageCreateDrmFormatModifiers` contains the entire array `VkImageDrmFormatModifierListCreateInfoEXT::pDrmFormatModifiers`.

- Let `VkBool32 imageCreateMaybeLinear` indicate if the resultant image may be linear.
  - If tiling is `VK_IMAGE_TILING_LINEAR`, then `imageCreateMaybeLinear` is `VK_TRUE`.
  - If tiling is `VK_IMAGE_TILING_OPTIMAL`, then `imageCreateMaybeLinear` is `VK_FALSE`.
  - If tiling is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then `imageCreateMaybeLinear` is `VK_TRUE` if and only if `imageCreateDrmFormatModifiers` contains `DRM_FORMAT_MOD_LINEAR`.

- Let `VkFormatFeatureFlags imageCreateFormatFeatures` be the set of valid format features available during image creation.
  - If tiling is `VK_IMAGE_TILING_LINEAR`, then `imageCreateFormatFeatures` is the value of `VkFormatProperties::linearTilingFeatures` found by calling
vkGetPhysicalDeviceFormatProperties with parameter format equal to VkImageCreateInfo::format.

- If tiling is VK_IMAGE_TILING_OPTIMAL, and if the pNext chain includes no VkExternalFormatANDROID or VkExternalFormatQNX structure with non-zero externalFormat, then imageCreateFormatFeatures is the value of VkFormatProperties::optimalTilingFeatures found by calling vkGetPhysicalDeviceFormatProperties with parameter format equal to VkImageCreateInfo::format.

- If tiling is VK_IMAGE_TILING_OPTIMAL, and if the pNext chain includes a VkExternalFormatANDROID structure with non-zero externalFormat, then imageCreateFormatFeatures is the value of VkAndroidHardwareBufferFormatPropertiesANDROID::formatFeatures obtained by vkGetAndroidHardwareBufferPropertiesANDROID with a matching externalFormat value.

- If tiling is VK_IMAGE_TILING_OPTIMAL, and if the pNext chain includes a VkExternalFormatQNX structure with non-zero externalFormat, then imageCreateFormatFeatures is the value of VkScreenBufferFormatPropertiesQNX::formatFeatures obtained by vkGetScreenBufferPropertiesQNX with a matching externalFormat value.

- If the pNext chain includes a VkBufferCollectionImageCreateInfoFUCHSIA structure, then imageCreateFormatFeatures is the value of VkBufferCollectionPropertiesFUCHSIA::formatFeatures found by calling vkGetBufferCollectionPropertiesFUCHSIA with a parameter collection equal to VkBufferCollectionImageCreateInfoFUCHSIA::collection.

- If tiling is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then the value of imageCreateFormatFeatures is found by calling vkGetPhysicalDeviceFormatProperties2 with VkImageFormatProperties::format equal to VkImageCreateInfo::format and with VkDrmFormatModifierPropertiesListEXT chained into VkFormatProperties2; by collecting all members of the returned array VkDrmFormatModifierPropertiesListEXT::pDrmFormatModifierProperties whose drmFormatModifier belongs to imageCreateDrmFormatModifiers; and by taking the bitwise intersection, over the collected array members, of drmFormatModifierTilingFeatures. (The resultant imageCreateFormatFeatures may be empty).

- Let VkImageFormatProperties2 imageCreateImageFormatPropertiesList[] be defined as follows.

  - If VkImageCreateInfo::pNext contains no VkExternalFormatANDROID or VkExternalFormatQNX structure with non-zero externalFormat, then imageCreateImageFormatPropertiesList is the list of structures obtained by calling vkGetPhysicalDeviceImageFormatProperties2, possibly multiple times, as follows:
    - The parameters VkPhysicalDeviceImageFormatCreateInfo2::format, imageType, tiling, usage, and flags must be equal to those in VkImageCreateInfo.
    - If VkImageCreateInfo::pNext contains a VkExternalMemoryImageCreateInfo structure whose handleTypes is not 0, then VkPhysicalDeviceImageFormatCreateInfo2::pNext must contain a VkPhysicalDeviceExternalImageFormatCreateInfo structure whose handleType is not 0; and vkGetPhysicalDeviceImageFormatProperties2 must
be called for each handle type in `VkExternalMemoryImageCreateInfo::handleTypes`, successively setting `VkPhysicalDeviceExternalImageFormatInfo::handleType` on each call.

- If `VkImageCreateInfo::pNext` contains no `VkExternalMemoryImageCreateInfo` structure, or contains a structure whose `handleTypes` is 0, then `VkPhysicalDeviceImageFormatInfo2::pNext` must either contain no `VkPhysicalDeviceExternalImageFormatInfo` structure, or contain a structure whose `handleType` is 0.

- If `VkImageCreateInfo::pNext` contains a `VkVideoProfileListInfoKHR` structure then `VkPhysicalDeviceImageFormatInfo2::pNext` must also contain the same `VkVideoProfileListInfoKHR` structure on each call.

- If `tiling` is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then:
  - `VkPhysicalDeviceImageFormatInfo2::pNext` must contain a `VkPhysicalDeviceImageDrmFormatModifierInfoEXT` structure where `sharingMode` is equal to `VkImageCreateInfo::sharingMode`;
  - if `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, then `queueFamilyIndexCount` and `pQueueFamilyIndices` must be equal to those in `VkImageCreateInfo`;
  - if `flags` contains `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT`, then the `VkImageFormatListCreateInfo` structure included in the `pNext` chain of `VkPhysicalDeviceImageFormatInfo2` must be equivalent to the one included in the `pNext` chain of `VkImageCreateInfo`;
  - if `VkImageCreateInfo::pNext` contains a `VkImageCompressionControlEXT` structure, then the `VkPhysicalDeviceImageFormatInfo2::pNext` chain must contain an equivalent structure;
  - `vkGetPhysicalDeviceImageFormatProperties2` must be called for each modifier in `imageCreateDrmFormatModifiers`, successively setting `VkPhysicalDeviceImageDrmFormatModifierInfoEXT::drmFormatModifier` on each call.

- If `tiling` is not `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then `VkPhysicalDeviceImageFormatInfo2::pNext` must contain no `VkPhysicalDeviceImageDrmFormatModifierInfoEXT` structure.

- If any call to `vkGetPhysicalDeviceImageFormatProperties2` returns an error, then `imageCreateImageFormatPropertiesList` is defined to be the empty list.

- If `VkImageCreateInfo::pNext` contains a `VkExternalFormatANDROID` structure with non-zero `externalFormat`, then `imageCreateImageFormatPropertiesList` contains a single element where:
  - `VkImageFormatProperties::maxMipLevels` is `\(\lceil \log_2(\max(\text{extent.width, extent.height, extent.depth})) \rceil + 1 \)`.
  - `VkImageFormatProperties::maxArrayLayers` is `VkPhysicalDeviceLimits::maxImageArrayLayers`.
  - Each component of `VkImageFormatProperties::maxExtent` is `VkPhysicalDeviceLimits::maxImageDimension2D`. 
### VkImageFormatProperties

- **sampleCounts** contains exactly **VK_SAMPLE_COUNT_1_BIT**.

- Let `uint32_t` `imageCreateMaxMipLevels` be the minimum value of `VkImageFormatProperties::maxMipLevels` in `imageCreateImageFormatPropertiesList`. The value is undefined if `imageCreateImageFormatPropertiesList` is empty.

- Let `uint32_t` `imageCreateMaxArrayLayers` be the minimum value of `VkImageFormatProperties::maxArrayLayers` in `imageCreateImageFormatPropertiesList`. The value is undefined if `imageCreateImageFormatPropertiesList` is empty.

- Let `VkExtent3D` `imageCreateMaxExtent` be the component-wise minimum over all `VkImageFormatProperties::maxExtent` values in `imageCreateImageFormatPropertiesList`. The value is undefined if `imageCreateImageFormatPropertiesList` is empty.

- Let `VkSampleCountFlags` `imageCreateSampleCounts` be the intersection of each `VkImageFormatProperties::sampleCounts` in `imageCreateImageFormatPropertiesList`. The value is undefined if `imageCreateImageFormatPropertiesList` is empty.

- Let `VkVideoFormatPropertiesKHR` `videoFormatProperties[]` be defined as follows.

  - If `VkImageCreateInfo::pNext` contains a `VkVideoProfileListInfoKHR` structure, then `videoFormatProperties` is the list of structures obtained by calling `vkGetPhysicalDeviceVideoFormatPropertiesKHR` with `VkPhysicalDeviceVideoFormatInfoKHR::imageUsage` equal to the `usage` member of `VkImageCreateInfo` and `VkPhysicalDeviceVideoFormatInfoKHR::pNext` containing the same `VkVideoProfileListInfoKHR` structure chained to `VkImageCreateInfo`.

  - If `VkImageCreateInfo::pNext` contains no `VkVideoProfileListInfoKHR` structure, then `videoFormatProperties` is an empty list.

- Let `VkBool32` `supportedVideoFormat` indicate if the image parameters are supported by the specified video profiles.

  - `supportedVideoFormat` is **VK_TRUE** if there exists an element in the `videoFormatProperties` list for which all of the following conditions are true:
    - `VkImageCreateInfo::format` equals `VkVideoFormatPropertiesKHR::format`.
    - `VkImageCreateInfo::flags` only contains bits also set in `VkVideoFormatPropertiesKHR::imageCreateFlags`.
    - `VkImageCreateInfo::imageType` equals `VkVideoFormatPropertiesKHR::imageType`.
    - `VkImageCreateInfo::tiling` equals `VkVideoFormatPropertiesKHR::imageTiling`.
    - `VkImageCreateInfo::usage` only contains bits also set in `VkVideoFormatPropertiesKHR::imageUsageFlags`.

  - Otherwise `supportedVideoFormat` is **VK_FALSE**.

### Valid Usage

- **VUID-VkImageCreateInfo-imageCreateMaxMipLevels-02251**

  Each of the following values (as described in Image Creation Limits) must not be undefined: `imageCreateMaxMipLevels`, `imageCreateMaxArrayLayers`, `imageCreateMaxExtent`, and `imageCreateSampleCounts`
If `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, `pQueueFamilyIndices` must be a valid pointer to an array of `queueFamilyIndexCount uint32_t` values.

If `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, `queueFamilyIndexCount` must be greater than 1.

If `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, each element of `pQueueFamilyIndices` must be unique and must be less than `pQueueFamilyPropertyCount` returned by either `vkGetPhysicalDeviceQueueFamilyProperties` or `vkGetPhysicalDeviceQueueFamilyProperties2` for the `physicalDevice` that was used to create `device`.

If the `pNext` chain includes a `VkExternalFormatANDROID` structure, and its `externalFormat` member is non-zero the `format` must be `VK_FORMAT_UNDEFINED`.

If the `pNext` chain does not include a `VkExternalFormatANDROID` structure, or does and its `externalFormat` member is 0, the `format` must not be `VK_FORMAT_UNDEFINED`.

`extent.width` must be greater than 0.

`extent.height` must be greater than 0.

`extent.depth` must be greater than 0.

`mipLevels` must be greater than 0.

`arrayLayers` must be greater than 0.

If `flags` contains `VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT`, `imageType` must be `VK_IMAGE_TYPE_2D`.

If `flags` contains `VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT`, `extent.width` and `extent.height` must be equal.

If `flags` contains `VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT`, `arrayLayers` must be greater than or equal to 6.

If `flags` contains `VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT`, `imageType` must be `VK_IMAGE_TYPE_2D`.

If `flags` contains `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT`, `imageType` must be `VK_IMAGE_TYPE_2D`.
• VUID-VkImageCreateInfo-flags-09403
  If flags contains VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT, flags must not include VK_IMAGE_CREATE_SPARSE_ALIASED_BIT, VK_IMAGE_CREATE_SPARSE_BINDING_BIT, or VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT

• VUID-VkImageCreateInfo-flags-07755
  If flags contains VK_IMAGE_CREATE_2D_VIEW_COMPATIBLE_BIT_EXT, imageType must be VK_IMAGE_TYPE_3D

• VUID-VkImageCreateInfo-extent-02252
  extent.width must be less than or equal to imageCreateMaxExtent.width (as defined in Image Creation Limits)

• VUID-VkImageCreateInfo-extent-02253
  extent.height must be less than or equal to imageCreateMaxExtent.height (as defined in Image Creation Limits)

• VUID-VkImageCreateInfo-extent-02254
  extent.depth must be less than or equal to imageCreateMaxExtent.depth (as defined in Image Creation Limits)

• VUID-VkImageCreateInfo-imageType-00956
  If imageType is VK_IMAGE_TYPE_1D, both extent.height and extent.depth must be 1

• VUID-VkImageCreateInfo-imageType-00957
  If imageType is VK_IMAGE_TYPE_2D, extent.depth must be 1

• VUID-VkImageCreateInfo-mipLevels-00958
  mipLevels must be less than or equal to the number of levels in the complete mipmap chain based on extent.width, extent.height, and extent.depth

• VUID-VkImageCreateInfo-mipLevels-02255
  mipLevels must be less than or equal to imageCreateMaxMipLevels (as defined in Image Creation Limits)

• VUID-VkImageCreateInfo-arrayLayers-02256
  arrayLayers must be less than or equal to imageCreateMaxArrayLayers (as defined in Image Creation Limits)

• VUID-VkImageCreateInfo-imageType-00961
  If imageType is VK_IMAGE_TYPE_3D, arrayLayers must be 1

• VUID-VkImageCreateInfo-samples-02257
  If samples is not VK_SAMPLE_COUNT_1_BIT, then imageType must be VK_IMAGE_TYPE_2D, flags must not contain VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT, mipLevels must be equal to 1, and imageCreateMaybeLinear (as defined in Image Creation Limits) must be VK_FALSE,

• VUID-VkImageCreateInfo-samples-02558
  If samples is not VK_SAMPLE_COUNT_1_BIT, usage must not contain VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT

• VUID-VkImageCreateInfo-usage-00963
  If usage includes VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT, then bits other than VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT, VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, and...
**VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT** must not be set

- **VUID-VkImageCreateInfo-usage-00964**
  If `usage` includes `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`, `extent.width` must be less than or equal to `VkPhysicalDeviceLimits::maxFramebufferWidth`

- **VUID-VkImageCreateInfo-usage-00965**
  If `usage` includes `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`, `extent.height` must be less than or equal to `VkPhysicalDeviceLimits::maxFramebufferHeight`

- **VUID-VkImageCreateInfo-fragmentDensityMapOffset-06514**
  If the `fragmentDensityMapOffset` feature is not enabled and `usage` includes `VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT`, `extent.width` must be less than or equal to
  \[
  \frac{\text{maxFramebufferWidth}}{\text{minFragmentDensityTexelSize.width}}
  \]

- **VUID-VkImageCreateInfo-fragmentDensityMapOffset-06515**
  If the `fragmentDensityMapOffset` feature is not enabled and `usage` includes `VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT`, `extent.height` must be less than or equal to
  \[
  \frac{\text{maxFramebufferHeight}}{\text{minFragmentDensityTexelSize.height}}
  \]

- **VUID-VkImageCreateInfo-usage-00966**
  If `usage` includes `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT`, `usage` must also contain at least one of `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`

- **VUID-VkImageCreateInfo-samples-02258**
  `samples` must be a valid `VkSampleCountFlagBits` value that is set in `imageCreateSampleCounts` (as defined in **Image Creation Limits**)

- **VUID-VkImageCreateInfo-usage-00968**
  If the `shaderStorageImageMultisample` feature is not enabled, and `usage` contains `VK_IMAGE_USAGE_STORAGE_BIT`, `samples` must be `VK_SAMPLE_COUNT_1_BIT`

- **VUID-VkImageCreateInfo-flags-00969**
  If the `sparseBinding` feature is not enabled, `flags` must not contain `VK_IMAGE_CREATE_SPARSE_BINDING_BIT`

- **VUID-VkImageCreateInfo-flags-01924**
  If the `sparseResidencyAliased` feature is not enabled, `flags` must not contain `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT`

- **VUID-VkImageCreateInfo-tiling-04121**
  If `tiling` is `VK_IMAGE_TILING_LINEAR`, `flags` must not contain `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`

- **VUID-VkImageCreateInfo-imageType-00970**
  If `imageType` is `VK_IMAGE_TYPE_1D`, `flags` must not contain `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`

- **VUID-VkImageCreateInfo-imageType-00971**
  If the `sparseResidencyImage2D` feature is not enabled, and `imageType` is `VK_IMAGE_TYPE_2D`,
flags **must** not contain `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`

- **VUID-VkImageCreateInfo-imageType-00972**
  If the `sparseResidencyImage3D` feature is not enabled, and `imageType` is `VK_IMAGE_TYPE_3D`, flags **must** not contain `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`

- **VUID-VkImageCreateInfo-imageType-00973**
  If the `sparseResidency2Samples` feature is not enabled, `imageType` is `VK_IMAGE_TYPE_2D`, and `samples` is `VK_SAMPLE_COUNT_2_BIT`, flags **must** not contain `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`

- **VUID-VkImageCreateInfo-imageType-00974**
  If the `sparseResidency4Samples` feature is not enabled, `imageType` is `VK_IMAGE_TYPE_2D`, and `samples` is `VK_SAMPLE_COUNT_4_BIT`, flags **must** not contain `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`

- **VUID-VkImageCreateInfo-imageType-00975**
  If the `sparseResidency8Samples` feature is not enabled, `imageType` is `VK_IMAGE_TYPE_2D`, and `samples` is `VK_SAMPLE_COUNT_8_BIT`, flags **must** not contain `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`

- **VUID-VkImageCreateInfo-imageType-00976**
  If the `sparseResidency16Samples` feature is not enabled, `imageType` is `VK_IMAGE_TYPE_2D`, and `samples` is `VK_SAMPLE_COUNT_16_BIT`, flags **must** not contain `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`

- **VUID-VkImageCreateInfo-flags-00987**
  If flags contains `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` or `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT`, it **must** also contain `VK_IMAGE_CREATE_SPARSE_BINDING_BIT`

- **VUID-VkImageCreateInfo-None-01925**
  If any of the bits `VK_IMAGE_CREATE_SPARSE_BINDING_BIT`, `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`, or `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT` are set, `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT` **must** not also be set

- **VUID-VkImageCreateInfo-flags-01890**
  If the `protectedMemory` feature is not enabled, flags **must** not contain `VK_IMAGE_CREATE_PROTECTED_BIT`

- **VUID-VkImageCreateInfo-None-01891**
  If any of the bits `VK_IMAGE_CREATE_SPARSE_BINDING_BIT`, `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`, or `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT` are set, `VK_IMAGE_CREATE_PROTECTED_BIT` **must** not also be set

- **VUID-VkImageCreateInfo-pNext-00988**
  If the `pNext` chain includes a `VkExternalMemoryImageCreateInfoNV` structure, it **must** not contain a `VkExternalMemoryImageCreateInfo` structure

- **VUID-VkImageCreateInfo-pNext-00990**
  If the `pNext` chain includes a `VkExternalMemoryImageCreateInfo` structure, its `handleTypes` member **must** only contain bits that are also in `VkExternalImageFormatProperties::externalMemoryProperties.compatibleHandleTypes`, as returned by `vkGetPhysicalDeviceImageFormatProperties2` with `format`, `imageType`, `tiling`, `usage`, and
flags equal to those in this structure, and with a VkPhysicalDeviceExternalImageFormatInfo structure included in the pNext chain, with a
handleType equal to any one of the handle types specified in VkExternalMemoryImageCreateInfo::handleTypes

• VUID-VkImageCreateInfo-pNext-00991
If the pNext chain includes a VkExternalMemoryImageCreateInfoNV structure, its handleTypes member must only contain bits that are also in VkExternalImageFormatPropertiesNV::externalMemoryProperties.compatibleHandleTypes, as returned by vkGetPhysicalDeviceExternalImageFormatPropertiesNV with format, imageType, tiling, usage, and flags equal to those in this structure, and with externalHandleType equal to any one of the handle types specified in VkExternalMemoryImageCreateInfoNV::handleTypes

• VUID-VkImageCreateInfo-physicalDeviceCount-01421
If the logical device was created with VkDeviceGroupDeviceCreateInfo::physicalDeviceCount equal to 1, flags must not contain VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT

• VUID-VkImageCreateInfo-flags-02259
If flags contains VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT, then mipLevels must be one, arrayLayers must be one, imageType must be VK_IMAGE_TYPE_2D, and imageCreateMaybeLinear (as defined in Image Creation Limits) must be VK_FALSE

• VUID-VkImageCreateInfo-flags-01572
If flags contains VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT, then format must be a compressed image format

• VUID-VkImageCreateInfo-flags-01573
If flags contains VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT, then flags must also contain VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT

• VUID-VkImageCreateInfo-initialLayout-00993
initialLayout must be VK_IMAGE_LAYOUT_UNDEFINED or VK_IMAGE_LAYOUT_PREINITIALIZED

• VUID-VkImageCreateInfo-pNext-01443
If the pNext chain includes a VkExternalMemoryImageCreateInfo or VkExternalMemoryImageCreateInfoNV structure whose handleTypes member is not 0, initialLayout must be VK_IMAGE_LAYOUT_UNDEFINED

• VUID-VkImageCreateInfo-format-06410
If the image format is one of the formats that require a sampler Y'C_B_C_R conversion, mipLevels must be 1

• VUID-VkImageCreateInfo-format-06411
If the image format is one of the formats that require a sampler Y'C_B_C_R conversion, samples must be VK_SAMPLE_COUNT_1_BIT

• VUID-VkImageCreateInfo-format-06412
If the image format is one of the formats that require a sampler Y'C_B_C_R conversion, imageType must be VK_IMAGE_TYPE_2D

• VUID-VkImageCreateInfo-imageCreateFormatFeatures-02260
If format is a multi-planar format, and if imageCreateFormatFeatures (as defined in Image
Creation Limits) does not contain VK_FORMAT_FEATURE_DISJOINT_BIT, then flags must not contain VK_IMAGE_CREATE_DISJOINT_BIT

- VUID-VkImageCreateInfo-format-01577
  If format is not a multi-planar format, and flags does not include VK_IMAGE_CREATE_ALIAS_BIT, flags must not contain VK_IMAGE_CREATE_DISJOINT_BIT

- VUID-VkImageCreateInfo-format-04712
  If format has a _422 or _420 suffix, extent.width must be a multiple of 2

- VUID-VkImageCreateInfo-format-04713
  If format has a _420 suffix, extent.height must be a multiple of 2

- VUID-VkImageCreateInfo-format-09583
  If format is one of the VK_FORMAT_PVTRC1_*_IMG formats, extent.width must be a power of 2

- VUID-VkImageCreateInfo-format-09584
  If format is one of the VK_FORMAT_PVTRC1_*_IMG formats, extent.height must be a power of 2

- VUID-VkImageCreateInfo-tiling-02261
  If tiling is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then the pNext chain must include exactly one of VkImageDrmFormatModifierListCreateInfoEXT or VkImageDrmFormatModifierExplicitCreateInfoEXT structures

- VUID-VkImageCreateInfo-pNext-02262
  If the pNext chain includes a VkImageDrmFormatModifierListCreateInfoEXT or VkImageDrmFormatModifierExplicitCreateInfoEXT structure, then tiling must be VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT

- VUID-VkImageCreateInfo-tiling-02353
  If tiling is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT and flags contains VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT, then the pNext chain must include a VkImageFormatListCreateInfo structure with non-zero viewFormatCount

- VUID-VkImageCreateInfo-pNext-02393
  If the pNext chain includes a VkExternalMemoryImageCreateInfo structure whose handleTypes member includes VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID, imageType must be VK_IMAGE_TYPE_2D

- VUID-VkImageCreateInfo-pNext-02394
  If the pNext chain includes a VkExternalMemoryImageCreateInfo structure whose handleTypes member includes VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID, mipLevels must either be 1 or equal to the number of levels in the complete mipmap chain based on extent.width, extent.height, and extent.depth

- VUID-VkImageCreateInfo-pNext-02396
  If the pNext chain includes a VkExternalFormatANDROID structure whose externalFormat member is not 0, flags must not include VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT

- VUID-VkImageCreateInfo-pNext-02397
If the `pNext` chain includes a `VkExternalFormatANDROID` structure whose `externalFormat` member is not 0, usage must not include any usages except `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`, or `VK_IMAGE_USAGE_SAMPLED_BIT`

- **VUID-VkImageCreateInfo-pNext-09457**
  If the `pNext` chain includes a `VkExternalFormatANDROID` structure whose `externalFormat` member is not 0, and `externalFormatResolve` feature is not enabled, usage must not include `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`

- **VUID-VkImageCreateInfo-pNext-02398**
  If the `pNext` chain includes a `VkExternalFormatANDROID` structure whose `externalFormat` member is not 0, and `externalFormatResolve` feature is not enabled, usage must not include `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`

- **VUID-VkImageCreateInfo-pNext-08951**
  If the `pNext` chain includes a `VkImageCreateInfo` where `imageType` is `VK_IMAGE_TYPE_2D` and the `handleTypes` member includes `VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX`, `imageType` must be `VK_IMAGE_TYPE_2D`

- **VUID-VkImageCreateInfo-pNext-08952**
  If the `pNext` chain includes a `VkImageCreateInfo` where `imageType` is `VK_IMAGE_TYPE_2D` and the `handleTypes` member includes `VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX`, `mipLevels` must either be 1 or equal to the number of levels in the complete mipmap chain based on `extent.width`, `extent.height`, and `extent.depth`

- **VUID-VkImageCreateInfo-pNext-08953**
  If the `pNext` chain includes a `VkExternalFormatQNX` structure whose `externalFormat` member is not 0, `flags` must not include `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT`

- **VUID-VkImageCreateInfo-pNext-08954**
  If the `pNext` chain includes a `VkExternalFormatQNX` structure whose `externalFormat` member is not 0, usage must not include any usages except `VK_IMAGE_USAGE_SAMPLED_BIT`

- **VUID-VkImageCreateInfo-pNext-08955**
  If the `pNext` chain includes a `VkExternalFormatQNX` structure whose `externalFormat` member is not 0, tiling must be `VK_IMAGE_TILING_OPTIMAL`

- **VUID-VkImageCreateInfo-format-02795**
  If `format` is a depth-stencil format, usage includes `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, and the `pNext` chain includes a `VkImageStencilUsageCreateInfo` structure, then its `VkImageStencilUsageCreateInfo::stencilUsage` member must also include `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- **VUID-VkImageCreateInfo-format-02796**
  If `format` is a depth-stencil format, usage does not include `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, and the `pNext` chain includes a `VkImageStencilUsageCreateInfo` structure, then its `VkImageStencilUsageCreateInfo::stencilUsage` member must also not include `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- **VUID-VkImageCreateInfo-format-02797**
  If `format` is a depth-stencil format, usage includes `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT`, and the `pNext` chain includes a `VkImageStencilUsageCreateInfo` structure, then its `VkImageStencilUsageCreateInfo::stencilUsage` member must also include `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`
::stencilUsage member must also include VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT

- VUID-VkImageCreateInfo-format-02798
  If format is a depth-stencil format, usage does not include VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT, and the pNext chain includes a VkImageStencilUsageCreateInfo structure, then its VkImageStencilUsageCreateInfo ::stencilUsage member must also include VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT

- VUID-VkImageCreateInfo-Format-02536
  If format is a depth-stencil format and the pNext chain includes a VkImageStencilUsageCreateInfo structure with its stencilUsage member including VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT, extent.width must be less than or equal to VkPhysicalDeviceLimits::maxFramebufferWidth

- VUID-VkImageCreateInfo-format-02537
  If format is a depth-stencil format and the pNext chain includes a VkImageStencilUsageCreateInfo structure with its stencilUsage member including VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT, extent.height must be less than or equal to VkPhysicalDeviceLimits::maxFramebufferHeight

- VUID-VkImageCreateInfo-format-02538
  If the shaderStorageImageMultisample feature is not enabled, format is a depth-stencil format and the pNext chain includes a VkImageStencilUsageCreateInfo structure with its stencilUsage including VK_IMAGE_USAGE_STORAGE_BIT, samples must be VK_SAMPLE_COUNT_1_BIT

- VUID-VkImageCreateInfo-flags-02050
  If flags contains VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV, imageType must be VK_IMAGE_TYPE_2D or VK_IMAGE_TYPE_3D

- VUID-VkImageCreateInfo-flags-02051
  If flags contains VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV, it must not contain VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT and the format must not be a depth/stencil format

- VUID-VkImageCreateInfo-flags-02052
  If flags contains VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV and imageType is VK_IMAGE_TYPE_2D, extent.width and extent.height must be greater than 1

- VUID-VkImageCreateInfo-flags-02053
  If flags contains VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV and imageType is VK_IMAGE_TYPE_3D, extent.width, extent.height, and extent.depth must be greater than 1

- VUID-VkImageCreateInfo-imageType-02082
  If usage includes VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR, imageType must be VK_IMAGE_TYPE_2D

- VUID-VkImageCreateInfo-samples-02083
  If usage includes VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR, samples must be VK_SAMPLE_COUNT_1_BIT

- VUID-VkImageCreateInfo-shadingRateImage-07727
  If the shadingRateImage feature is enabled and usage includes VK_IMAGE_USAGE_SHADING_RATE_IMAGE_BIT_NV, tiling must be VK_IMAGE_TILING_OPTIMAL

- VUID-VkImageCreateInfo-flags-02565
If `flags` contains `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`, tiling must be `VK_IMAGE_TILING_OPTIMAL`

- **VUID-VkImageCreateInfo-flags-02566**
  If `flags` contains `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`, `imageType` must be `VK_IMAGE_TYPE_2D`

- **VUID-VkImageCreateInfo-flags-02567**
  If `flags` contains `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`, `flags` must not contain `VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT`

- **VUID-VkImageCreateInfo-flags-02568**
  If `flags` contains `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`, `mipLevels` must be 1

- **VUID-VkImageCreateInfo-usage-04992**
  If `usage` includes `VK_IMAGE_USAGE_INVOCATION_MASK_BIT_HUAWEI`, tiling must be `VK_IMAGE_TILING_LINEAR`

- **VUID-VkImageCreateInfo-imageView2DOn3DImage-04459**
  If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::imageView2DOn3DImage` is `VK_FALSE`, `flags` must not contain `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT`

- **VUID-VkImageCreateInfo-multisampleArrayImage-04460**
  If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::multisampleArrayImage` is `VK_FALSE`, and `samples` is not `VK_SAMPLE_COUNT_1_BIT`, then `arrayLayers` must be 1

- **VUID-VkImageCreateInfo-pNext-06722**
  If a `VkImageFormatListCreateInfo` structure was included in the `pNext` chain and `VkImageFormatListCreateInfo::viewFormatCount` is not zero, then each format in `VkImageFormatListCreateInfo::pViewFormats` must either be compatible with the `format` as described in the compatibility table or, if `flags` contains `VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT`, be an uncompressed format that is size-compatible with `format`

- **VUID-VkImageCreateInfo-flags-04738**
  If `flags` does not contain `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT` and the `pNext` chain includes a `VkImageFormatListCreateInfo` structure, then `VkImageFormatListCreateInfo::viewFormatCount` must be 0 or 1

- **VUID-VkImageCreateInfo-usage-04815**
  If `usage` includes `VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR`, `VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR`, or `VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR`, and `flags` does not include `VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR`, then the `pNext` chain must include a `VkVideoProfileListInfoKHR` structure with `profileCount` greater than 0 and `pProfiles` including at least one `VkVideoProfileInfoKHR` structure with a `videoCodecOperation` member specifying a decode operation

- **VUID-VkImageCreateInfo-usage-04816**
  If `usage` includes `VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR`, `VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR`, or `VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR`, and `flags` does not include `VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR`, then the `pNext` chain must include a `VkVideoProfileListInfoKHR` structure with `profileCount` greater than 0 and `pProfiles` including at least one `VkVideoProfileInfoKHR` structure with
a videoCodecOperation member specifying an encode operation

- **VUID-VkImageCreateInfo-flags-08328**
  If flags includes VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR, then videoMaintenance1 must be enabled

- **VUID-VkImageCreateInfo-flags-08329**
  If flags includes VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR and usage does not include VK_IMAGE_USAGE_VIDEO_DECODER_DST_BIT_KHR, then usage must not include VK_IMAGE_USAGE_VIDEO_DECODER_DPB_BIT_KHR

- **VUID-VkImageCreateInfo-flags-08331**
  If flags includes VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR, then usage must not include VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR

- **VUID-VkImageCreateInfo-pNext-06811**
  If the pNext chain includes a VkVideoProfileListInfoKHR structure with profileCount greater than 0, then supportedVideoFormat must be VK_TRUE

- **VUID-VkImageCreateInfo-pNext-06390**
  If the VkImage is to be used to import memory from a VkBufferCollectionFUCHSIA, a VkBufferCollectionImageCreateInfoFUCHSIA structure must be chained to pNext

- **VUID-VkImageCreateInfo-multisampledRenderToSingleSampled-06882**
  If the multisampledRenderToSingleSampled feature is not enabled, flags must not contain VK_IMAGE_CREATE_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_BIT_EXT

- **VUID-VkImageCreateInfo-flags-08104**
  If flags includes VK_IMAGE_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT, the descriptorBufferCaptureReplay feature must be enabled

- **VUID-VkImageCreateInfo-pNext-08105**
  If the pNext chain includes a VkOpaqueCaptureDescriptorDataCreateInfoEXT structure, flags must contain VK_IMAGE_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT

- **VUID-VkImageCreateInfo-pNext-06744**
  If the pNext chain includes a VkImageCompressionControlEXT structure, format is a multi-planar format, and VkImageCompressionControlEXT::flags includes VK_IMAGE_COMPRESSION_FIXED_RATE_EXPLICIT_EXT, then VkImageCompressionControlEXT::compressionControlPlaneCount must be equal to the number of planes in format

- **VUID-VkImageCreateInfo-pNext-06746**
  If the pNext chain includes a VkImageCompressionControlEXT structure, format is not a multi-planar format, and VkImageCompressionControlEXT::flags includes VK_IMAGE_COMPRESSION_FIXED_RATE_EXPLICIT_EXT, then VkImageCompressionControlEXT::compressionControlPlaneCount must be 1

- **VUID-VkImageCreateInfo-pNext-06746**
  If the pNext chain includes a VkImageCompressionControlEXT structure, it must not contain a VkImageDrmFormatModifierExplicitCreateInfoEXT structure

- **VUID-VkImageCreateInfo-flags-08104**
  If flags includes VK_IMAGE_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT, the descriptorBufferCaptureReplay feature must be enabled

- **VUID-VkImageCreateInfo-pNext-08105**
  If the pNext chain includes a VkOpaqueCaptureDescriptorDataCreateInfoEXT structure, flags must contain VK_IMAGE_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT

- **VUID-VkImageCreateInfo-pNext-06783**
If the `pNext` chain includes a `VkExportMetalObjectCreateInfoEXT` structure, its `exportObjectType` member must be either `VK_EXPORT_METAL_OBJECT_TYPE_METAL_TEXTURE_BIT_EXT` or `VK_EXPORT_METAL_OBJECT_TYPE_METAL_IOSURFACE_BIT_EXT`.

- **VUID-VkImageCreateInfo-pNext-06784**
  If the `pNext` chain includes a `VkImportMetalTextureInfoEXT` structure its `plane` member must be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, or `VK_IMAGE_ASPECT_PLANE_2_BIT`.

- **VUID-VkImageCreateInfo-pNext-06785**
  If the `pNext` chain includes a `VkImportMetalTextureInfoEXT` structure and the image does not have a multi-planar format, then `VkImportMetalTextureInfoEXT::plane` must be `VK_IMAGE_ASPECT_PLANE_0_BIT`.

- **VUID-VkImageCreateInfo-pNext-06786**
  If the `pNext` chain includes a `VkImportMetalTextureInfoEXT` structure and the image has a multi-planar format with only two planes, then `VkImportMetalTextureInfoEXT::plane` must not be `VK_IMAGE_ASPECT_PLANE_2_BIT`.

- **VUID-VkImageCreateInfo-imageCreateFormatFeatures-09048**
  If `imageCreateFormatFeatures` (as defined in Image Creation Limits) does not contain `VK_FORMAT_FEATURE_2_HOST_IMAGE_TRANSFER_BIT_EXT`, then `usage` must not contain `VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT`.

### Valid Usage (Implicit)

- **VUID-VkImageCreateInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_IMAGE_CREATE_INFO`.

- **VUID-VkImageCreateInfo-pNext-pNext**
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkBufferCollectionImageCreateInfoFUCHSIA`, `VkDedicatedAllocationImageCreateInfoNV`, `VkExportMetalObjectCreateInfoEXT`, `VkExternalFormatANDROID`, `VkExternalFormatQNX`, `VkExternalMemoryImageCreateInfo`, `VkExternalMemoryImageCreateInfoNV`, `VkImageCompressionControlEXT`, `VkImageDrmFormatModifierExplicitCreateInfoEXT`, `VkImageDrmFormatModifierListCreateInfoEXT`, `VkImageFormatListCreateInfo`, `VkImageStencilUsageCreateInfo`, `VkImageSwapchainCreateInfoKHR`, `VkImportMetalIOSurfaceInfoEXT`, `VkImportMetalTextureInfoEXT`, `VkOpaqueCaptureDescriptorDataCreateInfoEXT`, `VkOpticalFlowImageFormatInfoNV`, or `VkVideoProfileListInfoKHR`.

- **VUID-VkImageCreateInfo-sType-unique**
  The `sType` value of each struct in the `pNext` chain must be unique, with the exception of structures of type `VkExportMetalObjectCreateInfoEXT` or `VkImportMetalTextureInfoEXT`.

- **VUID-VkImageCreateInfo-flags-parameter**
  `flags` must be a valid combination of `VkImageCreateFlagBits` values.

- **VUID-VkImageCreateInfo-imageType-parameter**
**imageType must** be a valid *VkImageType* value

- **VUID-VkImageCreateInfo-format-parameter**
  *format must* be a valid *VkFormat* value

- **VUID-VkImageCreateInfo-samples-parameter**
  *samples must* be a valid *VkSampleCountFlagBits* value

- **VUID-VkImageCreateInfo-tiling-parameter**
  *tiling must* be a valid *VkImageTiling* value

- **VUID-VkImageCreateInfo-usage-parameter**
  *usage must* be a valid combination of *VkImageUsageFlagBits* values

- **VUID-VkImageCreateInfo-usage-requiredbitmask**
  *usage must* not be 0

- **VUID-VkImageCreateInfo-sharingMode-parameter**
  *sharingMode must* be a valid *VkSharingMode* value

- **VUID-VkImageCreateInfo-initialLayout-parameter**
  *initialLayout must* be a valid *VkImageLayout* value

The *VkBufferCollectionImageCreateInfoFUCHSIA* structure is defined as:

```c
// Provided by VK_FUCHSIA_buffer_collection
typedef struct VkBufferCollectionImageCreateInfoFUCHSIA {
    VkStructureType sType;
    const void* pNext;
    VkBufferCollectionFUCHSIA collection;
    uint32_t index;
} VkBufferCollectionImageCreateInfoFUCHSIA;
```

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure
- **collection** is the *VkBufferCollectionFUCHSIA* handle
- **index** is the index of the buffer in the buffer collection from which the memory will be imported

**Valid Usage**

- **VUID-VkBufferCollectionImageCreateInfoFUCHSIA-index-06391**
  *index must* be less than *VkBufferCollectionPropertiesFUCHSIA::bufferCount*

**Valid Usage (Implicit)**

- **VUID-VkBufferCollectionImageCreateInfoFUCHSIA-sType-sType**
  *sType must* be *VK_STRUCTURE_TYPE_BUFFER_COLLECTION_IMAGE_CREATE_INFO_FUCHSIA*

- **VUID-VkBufferCollectionImageCreateInfoFUCHSIA-collection-parameter**
collection must be a valid VkBufferCollectionFUCHSIA handle

The VkImageStencilUsageCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkImageStencilUsageCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkImageUsageFlags stencilUsage;
} VkImageStencilUsageCreateInfo;
```

or the equivalent

```c
// Provided by VK_EXT_separate_stencil_usage
typedef VkImageStencilUsageCreateInfo VkImageStencilUsageCreateInfoEXT;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **stencilUsage** is a bitmask of VkImageUsageFlagBits describing the intended usage of the stencil aspect of the image.

If the **pNext** chain of VkImageCreateInfo includes a VkImageStencilUsageCreateInfo structure, then that structure includes the usage flags specific to the stencil aspect of the image for an image with a depth-stencil format.

This structure specifies image usages which only apply to the stencil aspect of a depth/stencil format image. When this structure is included in the **pNext** chain of VkImageCreateInfo, the stencil aspect of the image **must** only be used as specified by **stencilUsage**. When this structure is not included in the **pNext** chain of VkImageCreateInfo, the stencil aspect of an image **must** only be used as specified by VkImageCreateInfo::usage. Use of other aspects of an image are unaffected by this structure.

This structure can also be included in the **pNext** chain of VkPhysicalDeviceImageFormatInfo2 to query additional capabilities specific to image creation parameter combinations including a separate set of usage flags for the stencil aspect of the image using vkGetPhysicalDeviceImageFormatProperties2. When this structure is not included in the **pNext** chain of VkPhysicalDeviceImageFormatInfo2 then the implicit value of stencilUsage matches that of VkPhysicalDeviceImageFormatInfo2::usage.

**Valid Usage**

- **VUID-VkImageStencilUsageCreateInfo-stencilUsage-02539**
  If **stencilUsage** includes VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT, it **must** not include bits other than VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT.
Valid Usage (Implicit)

- VUID-VkImageStencilUsageCreateInfo-sType-sType
  
  **sType** must be **VK_STRUCTURE_TYPE_IMAGE_STENCIL_USAGE_CREATE_INFO**

- VUID-VkImageStencilUsageCreateInfo-stencilUsage-parameter
  
  **stencilUsage** must be a valid combination of **VkImageUsageFlagBits** values

- VUID-VkImageStencilUsageCreateInfo-stencilUsage-requiredbitsetmask
  
  **stencilUsage** must not be 0

If the **pNext** chain includes a **VkDedicatedAllocationImageCreateInfoNV** structure, then that structure includes an enable controlling whether the image will have a dedicated memory allocation bound to it.

The **VkDedicatedAllocationImageCreateInfoNV** structure is defined as:

```c
// Provided by VK_NV_dedicated_allocation
typedef struct VkDedicatedAllocationImageCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkBool32 dedicatedAllocation;
} VkDedicatedAllocationImageCreateInfoNV;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **dedicatedAllocation** specifies whether the image will have a dedicated allocation bound to it.

**Note**

Using a dedicated allocation for color and depth/stencil attachments or other large images may improve performance on some devices.

Valid Usage

- VUID-VkDedicatedAllocationImageCreateInfoNV-dedicatedAllocation-00994
  
  If **dedicatedAllocation** is **VK_TRUE**, **VkImageCreateInfo::flags** must not include **VK_IMAGE_CREATE_SPARSE_BINDING_BIT**, **VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT**, or **VK_IMAGE_CREATE_SPARSE_ALIASED_BIT**

Valid Usage (Implicit)

- VUID-VkDedicatedAllocationImageCreateInfoNV-sType-sType
  
  **sType** must be **VK_STRUCTURE_TYPE_DEDICATED_ALLOCATION_IMAGE_CREATE_INFO_NV**
To define a set of external memory handle types that may be used as backing store for an image, add a `VkExternalMemoryImageCreateInfo` structure to the `pNext` chain of the `VkImageCreateInfo` structure. The `VkExternalMemoryImageCreateInfo` structure is defined as:

// Provided by VK_VERSION_1_1
typedef struct VkExternalMemoryImageCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkExternalMemoryHandleTypeFlags handleTypes;
} VkExternalMemoryImageCreateInfo;

or the equivalent

// Provided by VK_KHR_external_memory
typedef VkExternalMemoryImageCreateInfo VkExternalMemoryImageCreateInfoKHR;

Note

A `VkExternalMemoryImageCreateInfo` structure with a non-zero `handleTypes` field must be included in the creation parameters for an image that will be bound to memory that is either exported or imported.

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleTypes` is zero or a bitmask of `VkExternalMemoryHandleTypeFlagBits` specifying one or more external memory handle types.

Valid Usage (Implicit)

- VUID-VkExternalMemoryImageCreateInfo-sType-sType `sType` must be `VK_STRUCTURE_TYPE_EXTERNAL_MEMORY_IMAGE_CREATE_INFO`
- VUID-VkExternalMemoryImageCreateInfo-handleTypes-parameter `handleTypes` must be a valid combination of `VkExternalMemoryHandleTypeFlagBits` values

If the `pNext` chain includes a `VkExternalMemoryImageCreateInfoNV` structure, then that structure defines a set of external memory handle types that may be used as backing store for the image.

The `VkExternalMemoryImageCreateInfoNV` structure is defined as:

// Provided by VK_NV_external_memory
typedef struct VkExternalMemoryImageCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkExternalMemoryHandleTypeFlagsNV handleTypes;
} VkExternalMemoryImageCreateInfoNV;
• **sType** is a **VkStructureType** value identifying this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **handleTypes** is zero or a bitmask of **VkExternalMemoryHandleTypeFlagBitsNV** specifying one or more external memory handle types.

### Valid Usage (Implicit)

• **VUID-VkExternalMemoryImageCreateInfoNV-sType-sType**  
  sType **must** be **VK_STRUCTURE_TYPE_EXTERNAL_MEMORY_IMAGE_CREATE_INFO_NV**

• **VUID-VkExternalMemoryImageCreateInfoNV-handleTypes-parameter**  
  handleTypes **must** be a valid combination of **VkExternalMemoryHandleTypeFlagBitsNV** values

---

**VkExternalFormatANDROID** is defined as:

```c
typedef struct VkExternalFormatANDROID {
    VkStructureType sType;
    void* pNext;
    uint64_t externalFormat;
} VkExternalFormatANDROID;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **externalFormat** is an implementation-defined identifier for the external format

When included in the **pNext** chain of another structure, it indicates additional format information beyond what is provided by **VkFormat** values for an Android hardware buffer. If **externalFormat** is zero, it indicates that no external format is used, and implementations should rely only on other format information. If this structure is not present, it is equivalent to setting **externalFormat** to zero.

### Valid Usage

• **VUID-VkExternalFormatANDROID-externalFormat-01894**  
  externalFormat **must** be 0 or a value returned in the externalFormat member of **VkAndroidHardwareBufferFormatPropertiesANDROID** by an earlier call to **vkGetAndroidHardwareBufferPropertiesANDROID**

### Valid Usage (Implicit)

• **VUID-VkExternalFormatANDROID-sType-sType**
To create an image with a QNX Screen external format, add a `VkExternalFormatQNX` structure in the `pNext` chain of `VkImageCreateInfo`. `VkExternalFormatQNX` is defined as:

```c
// Provided by VK_QNX_external_memory_screen_buffer
typedef struct VkExternalFormatQNX {
    VkStructureType sType;
    void* pNext;
    uint64_t externalFormat;
} VkExternalFormatQNX;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `externalFormat` is an implementation-defined identifier for the external format

If `externalFormat` is zero, the effect is as if the `VkExternalFormatQNX` structure was not present. Otherwise, the image will have the specified external format.

### Valid Usage

- `VUID-VkExternalFormatQNX-externalFormat-08956`
  
  `externalFormat` must be 0 or a value returned in the `externalFormat` member of `VkScreenBufferFormatPropertiesQNX` by an earlier call to `vkGetScreenBufferPropertiesQNX`

### Valid Usage (Implicit)

- `VUID-VkExternalFormatQNX-sType-sType`
  
  `sType` must be `VK_STRUCTURE_TYPE_EXTERNAL_FORMAT_QNX`

If the `pNext` chain of `VkImageCreateInfo` includes a `VkImageSwapchainCreateInfoKHR` structure, then that structure includes a swapchain handle indicating that the image will be bound to memory from that swapchain.

The `VkImageSwapchainCreateInfoKHR` structure is defined as:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_swapchain
typedef struct VkImageSwapchainCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSwapchainKHR swapchain;
} VkImageSwapchainCreateInfoKHR;
```
• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is `NULL` or a pointer to a structure extending this structure.
• **swapchain** is `VK_NULL_HANDLE` or a handle of a swapchain that the image will be bound to.

### Valid Usage

- VUID-VkImageSwapchainCreateInfoKHR-swapchain-00995
  If **swapchain** is not `VK_NULL_HANDLE`, the fields of `VkImageCreateInfo` must match the implied image creation parameters of the swapchain

### Valid Usage (Implicit)

- VUID-VkImageSwapchainCreateInfoKHR-sType-sType
  **sType** must be `VK_STRUCTURE_TYPE_IMAGE_SWAPCHAIN_CREATE_INFO_KHR`
- VUID-VkImageSwapchainCreateInfoKHR-swapchain-parameter
  If **swapchain** is not `VK_NULL_HANDLE`, **swapchain** must be a valid `VkSwapchainKHR` handle

If the **pNext** chain of `VkImageCreateInfo` includes a `VkImageFormatListCreateInfo` structure, then that structure contains a list of all formats that can be used when creating views of this image.

The `VkImageFormatListCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkImageFormatListCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t viewFormatCount;
    const VkFormat* pViewFormats;
} VkImageFormatListCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_image_format_list
typedef VkImageFormatListCreateInfo VkImageFormatListCreateInfoKHR;
```

• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is `NULL` or a pointer to a structure extending this structure.
• **viewFormatCount** is the number of entries in the **pViewFormats** array.
• **pViewFormats** is a pointer to an array of `VkFormat` values specifying all formats which can be used when creating views of this image.

If **viewFormatCount** is zero, **pViewFormats** is ignored and the image is created as if the
VkImageFormatListCreateInfo structure were not included in the pNext chain of VkImageCreateInfo.

Valid Usage

- VUID-VkImageFormatListCreateInfo-viewFormatCount-09540
  If viewFormatCount is not 0, each element of pViewFormats must not be VK_FORMAT_UNDEFINED

Valid Usage (Implicit)

- VUID-VkImageFormatListCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMAGE_FORMAT_LIST_CREATE_INFO

- VUID-VkImageFormatListCreateInfo-pViewFormats-parameter
  If viewFormatCount is not 0, pViewFormats must be a valid pointer to an array of viewFormatCount valid VkFormat values

If the pNext chain of VkImageCreateInfo includes a VkImageDrmFormatModifierListCreateInfoEXT structure, then the image will be created with one of the Linux DRM format modifiers listed in the structure. The choice of modifier is implementation-dependent.

The VkImageDrmFormatModifierListCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_image_drm_format_modifier
typedef struct VkImageDrmFormatModifierListCreateInfoEXT {
  VkStructureType  sType;
  const void*      pNext;
  uint32_t         drmFormatModifierCount;
  const uint64_t*  pDrmFormatModifiers;
} VkImageDrmFormatModifierListCreateInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- drmFormatModifierCount is the length of the pDrmFormatModifiers array.
- pDrmFormatModifiers is a pointer to an array of Linux DRM format modifiers.

Valid Usage

- VUID-VkImageDrmFormatModifierListCreateInfoEXT-pDrmFormatModifiers-02263
  Each modifier in pDrmFormatModifiers must be compatible with the parameters in VkImageCreateInfo and its pNext chain, as determined by querying VkPhysicalDeviceImageFormatInfo2 extended with VkPhysicalDeviceImageDrmFormatModifierInfoEXT.
Valid Usage (Implicit)

- **VUID-VkImageDrmFormatModifierListCreateInfoEXT-sType-sType**
  
  *sType* must be **VK_STRUCTURE_TYPE_IMAGE_DRM_FORMAT_MODIFIER_LIST_CREATE_INFO_EXT**

- **VUID-VkImageDrmFormatModifierListCreateInfoEXT-pDrmFormatModifiers-parameter**
  
  *pDrmFormatModifiers* must be a valid pointer to an array of *drmFormatModifierCount* uint64_t values

- **VUID-VkImageDrmFormatModifierListCreateInfoEXT-drmFormatModifierCount-arraylength**
  
  *drmFormatModifierCount* must be greater than 0

If the *pNext* chain of **VkImageCreateInfo** includes a **VkImageDrmFormatModifierExplicitCreateInfoEXT** structure, then the image will be created with the Linux DRM format modifier and memory layout defined by the structure.

The **VkImageDrmFormatModifierExplicitCreateInfoEXT** structure is defined as:

```c
// Provided by VK_EXT_image_drm_format_modifier
typedef struct VkImageDrmFormatModifierExplicitCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint64_t drmFormatModifier;
    uint32_t drmFormatModifierPlaneCount;
    const VkSubresourceLayout* pPlaneLayouts;
} VkImageDrmFormatModifierExplicitCreateInfoEXT;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **drmFormatModifier** is the Linux DRM format modifier with which the image will be created.
- **drmFormatModifierPlaneCount** is the number of memory planes in the image (as reported by **VkDrmFormatModifierPropertiesEXT**) as well as the length of the *pPlaneLayouts* array.
- **pPlaneLayouts** is a pointer to an array of **VkSubresourceLayout** structures describing the image’s memory planes.

The *i*\textsuperscript{th} member of *pPlaneLayouts* describes the layout of the image’s *i*\textsuperscript{th} memory plane (that is, **VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT**). In each element of *pPlaneLayouts*, the implementation must ignore size. The implementation calculates the size of each plane, which the application can query with **vkGetImageSubresourceLayout**.

When creating an image with **VkImageDrmFormatModifierExplicitCreateInfoEXT**, it is the application’s responsibility to satisfy all valid usage requirements. However, the implementation must validate that the provided *pPlaneLayouts*, when combined with the provided *drmFormatModifier* and other creation parameters in **VkImageCreateInfo** and its *pNext* chain, produce a valid image. (This validation is necessarily implementation-dependent and outside the scope of Vulkan, and therefore not described by valid usage requirements). If this validation fails,
then `vkCreateImage` returns `VK_ERROR_INVALID_DRM_FORMAT_MODIFIER_PLANE_LAYOUT_EXT`.

### Valid Usage

- **VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-drmFormatModifier-02264**
  - `drmFormatModifier` must be compatible with the parameters in `VkImageCreateInfo` and its `pNext` chain, as determined by querying `VkPhysicalDeviceImageFormatInfo2` extended with `VkPhysicalDeviceImageDrmFormatModifierInfoEXT`.

- **VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-drmFormatModifierPlaneCount-02265**
  - `drmFormatModifierPlaneCount` must be equal to the `VkDrmFormatModifierPropertiesEXT::drmFormatModifierPlaneCount` associated with `VkImageCreateInfo::format` and `drmFormatModifier`, as found by querying `VkDrmFormatModifierPropertiesListEXT`.

- **VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-size-02267**
  - For each element of `pPlaneLayouts`, `size` must be 0.

- **VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-arrayPitch-02268**
  - For each element of `pPlaneLayouts`, `arrayPitch` must be 0 if `VkImageCreateInfo::arrayLayers` is 1.

- **VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-depthPitch-02269**
  - For each element of `pPlaneLayouts`, `depthPitch` must be 0 if `VkImageCreateInfo::extent.depth` is 1.

### Valid Usage (Implicit)

- **VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_IMAGE_DRM_FORMAT_MODIFIER_EXPLICIT_CREATE_INFO_EXT`.

- **VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-pPlaneLayouts-parameter**
  - `pPlaneLayouts` must be a valid pointer to an array of `drmFormatModifierPlaneCount` `VkSubresourceLayout` structures.

- **VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-drmFormatModifierPlaneCount-arraylength**
  - `drmFormatModifierPlaneCount` must be greater than 0.

If the `pNext` list of `VkImageCreateInfo` includes a `VkImageCompressionControlEXT` structure, then that structure describes compression controls for this image.

The `VkImageCompressionControlEXT` structure is defined as:

```c
// Provided by VK_EXT_image_compression_control
typedef struct VkImageCompressionControlEXT {
    VkStructureType sType;
    const void* pNext;
    VkImageCompressionFlagsEXT flags;
    uint32_t compressionControlPlaneCount;
} VkImageCompressionControlEXT;
```
VkImageCompressionControlEXT* pFixedRateFlags;
}

• **sType** is a *VkStructureType* value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **flags** is a bitmask of *VkImageCompressionFlagBitsEXT* describing compression controls for the image.
• **compressionControlPlaneCount** is the number of entries in the **pFixedRateFlags** array.
• **pFixedRateFlags** is NULL or a pointer to an array of *VkImageCompressionFixedRateFlagsEXT* bitfields describing allowed fixed-rate compression rates of each image plane. It is ignored if **flags** does not include *VK_IMAGE_COMPRESSION_FIXED_RATE_EXPLICIT_EXT*.

If enabled, fixed-rate compression is done in an implementation-defined manner and may be applied at block granularity. In that case, a write to an individual texel may modify the value of other texels in the same block.

---

### Valid Usage

- **VUID-VkImageCompressionControlEXT-flags-06747**
  - **flags** must be one of
    - *VK_IMAGE_COMPRESSION_DEFAULT_EXT*,
    - *VK_IMAGE_COMPRESSION_FIXED_RATE_DEFAULT_EXT*,
    - *VK_IMAGE_COMPRESSION_FIXED_RATE_EXPLICIT_EXT*, or
    - *VK_IMAGE_COMPRESSION_DISABLED_EXT*

- **VUID-VkImageCompressionControlEXT-flags-06748**
  - If **flags** includes *VK_IMAGE_COMPRESSION_FIXED_RATE_EXPLICIT_EXT*, **pFixedRateFlags** must not be NULL

---

### Valid Usage (Implicit)

- **VUID-VkImageCompressionControlEXT-sType-sType**
  - **sType** must be *VK_STRUCTURE_TYPE_IMAGE_COMPRESSION_CONTROL_EXT*

---

**Note**

Some combinations of compression properties may not be supported. For example, some implementations may not support different fixed-rate compression rates per plane of a multi-planar format and will not be able to enable fixed-rate compression for any plane if the requested rates differ.

Possible values of *VkImageCompressionControlEXT::flags*, specifying compression controls for an image, are:

```c
// Provided by VK_EXT_image_compression_control
typedef enum VkImageCompressionFlagBitsEXT {
    VK_IMAGE_COMPRESSION_DEFAULT_EXT = 0,
```
VK_IMAGE_COMPRESSION_DEFAULT_EXT = 0x00000001,
VK_IMAGE_COMPRESSION_FIXED_RATE_DEFAULT_EXT = 0x00000002,
VK_IMAGE_COMPRESSION_DISABLED_EXT = 0x00000004,
} VkImageCompressionFlagBitsEXT;

- **VK_IMAGE_COMPRESSION_DEFAULT_EXT** specifies that the default image compression setting is used. Implementations **must** not apply fixed-rate compression.
- **VK_IMAGE_COMPRESSION_FIXED_RATE_DEFAULT_EXT** specifies that the implementation **may** choose any supported fixed-rate compression setting in an implementation-defined manner based on the properties of the image.
- **VK_IMAGE_COMPRESSION_FIXED_RATE_EXPLICIT_EXT** specifies that fixed-rate compression **may** be used and that the allowed compression rates are specified by `VkImageCompressionControlEXT::pFixedRateFlags`.
- **VK_IMAGE_COMPRESSION_DISABLED_EXT** specifies that all lossless and fixed-rate compression **should** be disabled.

If `VkImageCompressionControlEXT::flags` is **VK_IMAGE_COMPRESSION_FIXED_RATE_EXPLICIT_EXT**, then the i\(^{th}\) member of the `pFixedRateFlags` array specifies the allowed compression rates for the image’s i\(^{th}\) plane.

**Note**

If **VK_IMAGE_COMPRESSION_DISABLED_EXT** is included in `VkImageCompressionControlEXT::flags`, both lossless and fixed-rate compression will be disabled. This is likely to have a negative impact on performance and is only intended to be used for debugging purposes.

```
// Provided by VK_EXT_image_compression_control
typedef VkFlags VkImageCompressionFlagsEXT;

VkImageCompressionFlagsEXT is a bitmask type for setting a mask of zero or more `VkImageCompressionFlagBitsEXT`.
```

```
// Provided by VK_EXT_image_compression_control
typedef VkFlags VkImageCompressionFixedRateFlagsEXT;

VkImageCompressionFixedRateFlagsEXT is a bitmask type for setting a mask of zero or more `VkImageCompressionFixedRateFlagBitsEXT`.
```

Bits which **can** be set in `VkImageCompressionControlEXT::pFixedRateFlags`, specifying allowed compression rates for an image plane, are:

```
// Provided by VK_EXT_image_compression_control
typedef enum VkImageCompressionFixedRateFlagBitsEXT {
    VK_IMAGE_COMPRESSION_FIXED_RATE_NONE_EXT = 0,
    VK_IMAGE_COMPRESSION_FIXED_RATE_1BPC_BIT_EXT = 0x00000001,
```
VK_IMAGE_COMPRESSION_FIXED_RATE_1BPC_BIT_EXT = 0x00000002,
VK_IMAGE_COMPRESSION_FIXED_RATE_2BPC_BIT_EXT = 0x00000004,
VK_IMAGE_COMPRESSION_FIXED_RATE_3BPC_BIT_EXT = 0x00000008,
VK_IMAGE_COMPRESSION_FIXED_RATE_4BPC_BIT_EXT = 0x00000010,
VK_IMAGE_COMPRESSION_FIXED_RATE_5BPC_BIT_EXT = 0x00000020,
VK_IMAGE_COMPRESSION_FIXED_RATE_6BPC_BIT_EXT = 0x00000040,
VK_IMAGE_COMPRESSION_FIXED_RATE_7BPC_BIT_EXT = 0x00000080,
VK_IMAGE_COMPRESSION_FIXED_RATE_8BPC_BIT_EXT = 0x00000100,
VK_IMAGE_COMPRESSION_FIXED_RATE_9BPC_BIT_EXT = 0x00000200,
VK_IMAGE_COMPRESSION_FIXED_RATE_10BPC_BIT_EXT = 0x00000400,
VK_IMAGE_COMPRESSION_FIXED_RATE_11BPC_BIT_EXT = 0x00000800,
VK_IMAGE_COMPRESSION_FIXED_RATE_12BPC_BIT_EXT = 0x00001000,
VK_IMAGE_COMPRESSION_FIXED_RATE_13BPC_BIT_EXT = 0x00002000,
VK_IMAGE_COMPRESSION_FIXED_RATE_14BPC_BIT_EXT = 0x00004000,
VK_IMAGE_COMPRESSION_FIXED_RATE_15BPC_BIT_EXT = 0x00008000,
VK_IMAGE_COMPRESSION_FIXED_RATE_16BPC_BIT_EXT = 0x00010000,
VK_IMAGE_COMPRESSION_FIXED_RATE_17BPC_BIT_EXT = 0x00020000,
VK_IMAGE_COMPRESSION_FIXED_RATE_18BPC_BIT_EXT = 0x00040000,
VK_IMAGE_COMPRESSION_FIXED_RATE_19BPC_BIT_EXT = 0x00080000,
VK_IMAGE_COMPRESSION_FIXED_RATE_20BPC_BIT_EXT = 0x00100000,
VK_IMAGE_COMPRESSION_FIXED_RATE_21BPC_BIT_EXT = 0x00200000,
VK_IMAGE_COMPRESSION_FIXED_RATE_22BPC_BIT_EXT = 0x00400000,
VK_IMAGE_COMPRESSION_FIXED_RATE_24BPC_BIT_EXT = 0x00800000,
}

VkImageCompressionFixedRateFlagBitsEXT;

- **VK_IMAGE_COMPRESSION_FIXED_RATE_NONE_EXT** specifies that fixed-rate compression must not be used.
- **VK_IMAGE_COMPRESSION_FIXED_RATE_1BPC_BIT_EXT** specifies that fixed-rate compression with a bitrate of [1,2) bits per component may be used.
- **VK_IMAGE_COMPRESSION_FIXED_RATE_2BPC_BIT_EXT** specifies that fixed-rate compression with a bitrate of [2,3) bits per component may be used.
- **VK_IMAGE_COMPRESSION_FIXED_RATE_3BPC_BIT_EXT** specifies that fixed-rate compression with a bitrate of [3,4) bits per component may be used.
- **VK_IMAGE_COMPRESSION_FIXED_RATE_4BPC_BIT_EXT** specifies that fixed-rate compression with a bitrate of [4,5) bits per component may be used.
- **VK_IMAGE_COMPRESSION_FIXED_RATE_5BPC_BIT_EXT** specifies that fixed-rate compression with a bitrate of [5,6) bits per component may be used.
- **VK_IMAGE_COMPRESSION_FIXED_RATE_6BPC_BIT_EXT** specifies that fixed-rate compression with a bitrate of [6,7) bits per component may be used.
- **VK_IMAGE_COMPRESSION_FIXED_RATE_7BPC_BIT_EXT** specifies that fixed-rate compression with a bitrate of [7,8) bits per component may be used.
- **VK_IMAGE_COMPRESSION_FIXED_RATE_8BPC_BIT_EXT** specifies that fixed-rate compression with a bitrate of [8,9) bits per component may be used.
- **VK_IMAGE_COMPRESSION_FIXED_RATE_9BPC_BIT_EXT** specifies that fixed-rate compression with a bitrate of [9,10) bits per component may be used.
• **VK_IMAGE_COMPRESSION_FIXED_RATE_10BPC_BIT_EXT** specifies that fixed-rate compression with a bitrate of \([10,11)\) bits per component may be used.

• **VK_IMAGE_COMPRESSION_FIXED_RATE_11BPC_BIT_EXT** specifies that fixed-rate compression with a bitrate of \([11,12)\) bits per component may be used.

• **VK_IMAGE_COMPRESSION_FIXED_RATE_12BPC_BIT_EXT** specifies that fixed-rate compression with a bitrate of at least 12 bits per component may be used.

If the format has a different bit rate for different components, `VkImageCompressionControlEXT::pFixedRateFlags` describes the rate of the component with the largest number of bits assigned to it, scaled pro rata. For example, to request that a `VK_FORMAT_A2R10G10B10_UNORM_PACK32` format be stored at a rate of 8 bits per pixel, use `VK_IMAGE_COMPRESSION_FIXED_RATE_2BPC_BIT_EXT` (10 bits for the largest component, stored at quarter the original size, 2.5 bits, rounded down).

If flags includes `VK_IMAGE_COMPRESSION_FIXED_RATE_EXPLICIT_EXT`, and multiple bits are set in `VkImageCompressionControlEXT::pFixedRateFlags` for a plane, implementations should apply the lowest allowed bitrate that is supported.

**Note**
The choice of “bits per component” terminology was chosen so that the same compression rate describes the same degree of compression applied to formats that differ only in the number of components. For example, `VK_FORMAT_R8G8_UNORM` compressed to half its original size is a rate of 4 bits per component, 8 bits per pixel. `VK_FORMAT_R8G8B8A8_UNORM` compressed to half its original size is 4 bits per component, 16 bits per pixel. Both of these cases can be requested with `VK_IMAGE_COMPRESSION_FIXED_RATE_4BPC_BIT_EXT`.

To query the compression properties of an image, add a `VkImageCompressionPropertiesEXT` structure to the `pNext` chain of the `VkSubresourceLayout2EXT` structure in a call to `vkGetImageSubresourceLayout2KHR` or `vkGetImageSubresourceLayout2EXT`.

To determine the compression rates that are supported for a given image format, add a `VkImageCompressionPropertiesEXT` structure to the `pNext` chain of the `VkImageFormatProperties2` structure in a call to `vkGetPhysicalDeviceImageFormatProperties2`.

**Note**
Since fixed-rate compression is disabled by default, the `VkImageCompressionPropertiesEXT` structure passed to `vkGetPhysicalDeviceImageFormatProperties2` will not indicate any fixed-rate compression support unless a `VkImageCompressionControlEXT` structure is also included in the `pNext` chain of the `VkPhysicalDeviceImageFormatInfo2` structure passed to the same command.

The `VkImageCompressionPropertiesEXT` structure is defined as:

```c
// Provided by VK_EXT_image_compression_control
typedef struct VkImageCompressionPropertiesEXT {
    VkStructureType           sType;
```
void* pNext;
VkImageCompressionFlagsEXT imageCompressionFlags;
VkImageCompressionFixedRateFlagsEXT imageCompressionFixedRateFlags;
} VkImageCompressionPropertiesEXT;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **imageCompressionFlags** returns a value describing the compression controls that apply to the image. The value will be either VK_IMAGE_COMPRESSION_DEFAULT_EXT to indicate no fixed-rate compression, VK_IMAGE_COMPRESSION_FIXED_RATE_EXPLICIT_EXT to indicate fixed-rate compression, or VK_IMAGE_COMPRESSION_DISABLED_EXT to indicate no compression.
- **imageCompressionFixedRateFlags** returns a VkImageCompressionFixedRateFlagsEXT value describing the compression rates that apply to the specified aspect of the image.

## Valid Usage (Implicit)

- VUID-VkImageCompressionPropertiesEXT-sType-sType
  
  *sType must be VK_STRUCTURE_TYPE_IMAGE_COMPRESSION_PROPERTIES_EXT*

### Bits which can be set in

- VkImageViewUsageCreateInfo::usage
- VkImageStencilUsageCreateInfo::stencilUsage
- VkImageCreateInfo::usage

specify intended usage of an image, and are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkImageUsageFlagBits {
    VK_IMAGE_USAGE_TRANSFER_SRC_BIT = 0x00000001,
    VK_IMAGE_USAGE_TRANSFER_DST_BIT = 0x00000002,
    VK_IMAGE_USAGE_SAMPLED_BIT = 0x00000004,
    VK_IMAGE_USAGE_STORAGE_BIT = 0x00000008,
    VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT = 0x00000010,
    VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT = 0x00000020,
    VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT = 0x00000040,
    VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT = 0x00000080,
    // Provided by VK_KHR_video_decode_queue
    VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR = 0x00000400,
    // Provided by VK_KHR_video_decode_queue
    VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR = 0x00000800,
    // Provided by VK_KHR_video_decode_queue
    VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR = 0x00001000,
    // Provided by VK_EXT_fragment_density_map
    VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT = 0x00002000,
    // Provided by VK_KHR_fragment_shading_rate
```
- `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` specifies that the image can be used as the source of a transfer command.

- `VK_IMAGE_USAGE_TRANSFER_DST_BIT` specifies that the image can be used as the destination of a transfer command.

- `VK_IMAGE_USAGE_SAMPLED_BIT` specifies that the image can be used to create a `VkImageView` suitable for occupying a `VkDescriptorSet` slot either of type `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE` or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, and be sampled by a shader.

- `VK_IMAGE_USAGE_STORAGE_BIT` specifies that the image can be used to create a `VkImageView` suitable for occupying a `VkDescriptorSet` slot of type `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`.

- `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` specifies that the image can be used to create a `VkImageView` suitable for use as a color or resolve attachment in a `VkFramebuffer`.

- `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` specifies that the image can be used to create a `VkImageView` suitable for use as a depth/stencil or depth/stencil resolve attachment in a `VkFramebuffer`.

- `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT` specifies that implementations may support using memory allocations with the `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT` to back an image with this usage. This bit can be set for any image that can be used to create a `VkImageView` suitable for use as a color, resolve, depth/stencil, or input attachment.

- `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` specifies that the image can be used to create a `VkImageView` suitable for occupying `VkDescriptorSet` slot of type `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`; be read from a shader as an input attachment; and be used as an input attachment in a framebuffer.

- `VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT` specifies that the image can be used to create a `VkImageView` for use as a fragment density map attachment in a `VkFramebuffer`.
 VkImageView suitable for use as a fragment density map image.

• `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` specifies that the image can be used to create a VkImageView suitable for use as a fragment shading rate attachment or shading rate image.

• `VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR` specifies that the image can be used as a decode output picture in a video decode operation.

• `VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR` is reserved for future use.

• `VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR` specifies that the image can be used as an output reconstructed picture or an input reference picture in a video decode operation.

• `VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR` is reserved for future use.

• `VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR` specifies that the image can be used as an encode input picture in a video encode operation.

• `VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR` specifies that the image can be used as an output reconstructed picture or an input reference picture in a video encode operation.

• `VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` specifies that the image can be transitioned to the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` layout to be used as a color or depth/stencil attachment in a VkFramebuffer and/or as a read-only input resource in a shader (sampled image, combined image sampler or input attachment) in the same render pass.

• `VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT` specifies that the image can be used with host copy commands and host layout transitions.

// Provided by VK_VERSION_1_0
typedef VkFlags VkImageUsageFlags;

VkImageUsageFlags is a bitmask type for setting a mask of zero or more VkImageUsageFlagBits.

When creating a VkImageView one of the following VkImageUsageFlagBits must be set:

• `VK_IMAGE_USAGE_SAMPLED_BIT`
• `VK_IMAGE_USAGE_STORAGE_BIT`
• `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`

- **VK_IMAGE_USAGE_SAMPLE_WEIGHT_BIT_QCOM**
- **VK_IMAGE_USAGE_SAMPLE_BLOCK_MATCH_BIT_QCOM**

Bits which can be set in `VkImageCreateInfo::flags`, specifying additional parameters of an image, are:

```c
typedef enum VkImageCreateFlagBits {
    VK_IMAGE_CREATE_SPARSE_BINDING_BIT = 0x00000001,
    VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT = 0x00000002,
    VK_IMAGE_CREATE_SPARSE_ALIASED_BIT = 0x00000004,
    VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT = 0x00000008,
    VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT = 0x00000010,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_CREATE_ALIAS_BIT = 0x00000400,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT = 0x00000040,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT = 0x00000020,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT = 0x00000080,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_CREATE_EXTENDED_USAGE_BIT = 0x00000100,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_CREATE_PROTECTED_BIT = 0x00000800,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_CREATE_DISJOINT_BIT = 0x00000200,
    // Provided by VK_NV_corner_sampled_image
    VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV = 0x00002000,
    // Provided by VK_EXT_sample_locations
    VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT = 0x00001000,
    // Provided by VK_EXT_fragment_density_map
    VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT = 0x00004000,
    // Provided by VK_EXT_descriptor_buffer
    VK_IMAGE_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT = 0x00010000,
    // Provided by VK_EXT_multisampled_render_to_single_sampled
    VK_IMAGE_CREATE_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_BIT_EXT = 0x00040000,
    // Provided by VK_KHR_video_maintenance1
    VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR = 0x00100000,
    // Provided by VK_KHR_bind_memory2 with VK_KHR_device_group
    VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR = VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT,
    // Provided by VK_KHR_maintenance1
    VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT_KHR = VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT
}
```
VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT_KHR = 
VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT,
// Provided by VK_KHR_maintenance2
VK_IMAGE_CREATE_EXTENDED_USAGE_BIT_KHR = VK_IMAGE_CREATE_EXTENDED_USAGE_BIT,
// Provided by VK_KHR_sampler_yccbcr_conversion
VK_IMAGE_CREATE_DISJOINT_BIT_KHR = VK_IMAGE_CREATE_DISJOINT_BIT,
// Provided by VK_KHR_bind_memory2
VK_IMAGE_CREATE_ALIAS_BIT_KHR = VK_IMAGE_CREATE_ALIAS_BIT,
} VkImageCreateFlagBits;

- **VK_IMAGE_CREATE_SPARSE_BINDING_BIT** specifies that the image will be backed using sparse memory binding.

- **VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT** specifies that the image can be partially backed using sparse memory binding. Images created with this flag must also be created with the **VK_IMAGE_CREATE_SPARSE_BINDING_BIT** flag.

- **VK_IMAGE_CREATE_SPARSE_ALIASED_BIT** specifies that the image will be backed using sparse memory binding with memory ranges that might also simultaneously be backing another image (or another portion of the same image). Images created with this flag must also be created with the **VK_IMAGE_CREATE_SPARSE_BINDING_BIT** flag.

- **VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT** specifies that the image can be used to create a VkImageView with a different format from the image. For multi-planar formats, **VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT** specifies that a VkImageView can be created of a plane of the image.

- **VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT** specifies that the image can be used to create a VkImageView of type **VK_IMAGE_VIEW_TYPE_CUBE** or **VK_IMAGE_VIEW_TYPE_CUBE_ARRAY**.

- **VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT** specifies that the image can be used to create a VkImageView of type **VK_IMAGE_VIEW_TYPE_2D** or **VK_IMAGE_VIEW_TYPE_2D_ARRAY**.

- **VK_IMAGE_CREATE_2D_VIEW_COMPATIBLE_BIT_EXT** specifies that the image can be used to create a VkImageView of type **VK_IMAGE_VIEW_TYPE_2D**.

- **VK_IMAGE_CREATE_PROTECTED_BIT** specifies that the image is a protected image.

- **VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT** specifies that the image can be used with a non-zero value of the **splitInstanceBindRegionCount** member of a VkBindImageMemoryDeviceGroupInfo structure passed into vkBindImageMemory2. This flag also has the effect of making the image use the standard sparse image block dimensions.

- **VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT** specifies that the image having a compressed format can be used to create a VkImageView with an uncompressed format where each texel in the image view corresponds to a compressed texel block of the image.

- **VK_IMAGE_CREATE_EXTENDED_USAGE_BIT** specifies that the image can be created with usage flags that are not supported for the format the image is created with but are supported for at least one format a VkImageView created from the image can have.

- **VK_IMAGE_CREATE_DISJOINT_BIT** specifies that an image with a multi-planar format must have each plane separately bound to memory, rather than having a single memory binding for the whole image; the presence of this bit distinguishes a disjoint image from an image without this bit set.
• **VK_IMAGE_CREATE_ALIAS_BIT** specifies that two images created with the same creation parameters and aliased to the same memory can interpret the contents of the memory consistently with each other, subject to the rules described in the Memory Aliasing section. This flag further specifies that each plane of a disjoint image can share an in-memory non-linear representation with single-plane images, and that a single-plane image can share an in-memory non-linear representation with a plane of a multi-planar disjoint image, according to the rules in Compatible Formats of Planes of Multi-Planar Formats. If the pNext chain includes a VkExternalMemoryImageCreateInfo or VkExternalMemoryImageCreateInfoNV structure whose handleTypes member is not 0, it is as if **VK_IMAGE_CREATE_ALIAS_BIT** is set.

• **VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT** specifies that an image with a depth or depth/stencil format can be used with custom sample locations when used as a depth/stencil attachment.

• **VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV** specifies that the image is a corner-sampled image.

• **VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT** specifies that an image can be in a subsampled format which may be more optimal when written as an attachment by a render pass that has a fragment density map attachment. Accessing a subsampled image has additional considerations:

  ◦ Image data read as an image sampler will have undefined values if the sampler was not created with flags containing **VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT** or was not sampled through the use of a combined image sampler with an immutable sampler in VkDescriptorSetLayoutBinding.

  ◦ Image data read with an input attachment will have undefined values if the contents were not written as an attachment in an earlier subpass of the same render pass.

  ◦ Image data read as an image sampler in the fragment shader will be additionally be read by the device during **VK_PIPELINE_STAGE_VERTEX_SHADER_BIT** if VkPhysicalDeviceFragmentDensityMap2PropertiesEXT::subsampledCoarseReconstructionEarlyAccess is **VK_TRUE** and the sampler was created with flags containing **VK_SAMPLER_CREATE_SUBSAMPLED_COARSE_RECONSTRUCTION_BIT_EXT**.

  ◦ Image data read with load operations are resampled to the fragment density of the render pass if VkPhysicalDeviceFragmentDensityMap2PropertiesEXT::subsampledLoads is **VK_TRUE**. Otherwise, values of image data are undefined.

  ◦ Image contents outside of the render area take on undefined values if the image is stored as a render pass attachment.

• **VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_QCOM** specifies that an image can be used in a render pass with non-zero fragment density map offsets. In a render pass with non-zero offsets, fragment density map attachments, input attachments, color attachments, depth/stencil attachment, resolve attachments, and preserve attachments must be created with **VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_QCOM**.

• **VK_IMAGE_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT** specifies that the image can be used with descriptor buffers when capturing and replaying (e.g. for trace capture and replay), see VkOpaqueCaptureDescriptorDataCreateInfoEXT for more detail.

• **VK_IMAGE_CREATE_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_BIT_EXT** specifies that an image can be used with multisampled rendering as a single-sampled framebuffer attachment.
VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR specifies that the image can be used in video coding operations without having to specify at image creation time the set of video profiles the image will be used with, except for images used only as DPB pictures, as long as the image is otherwise compatible with the video profile in question.

Note
This enables exchanging video picture data without additional copies or conversions when used as:

- **Decode output pictures**, indifferent of the video profile used to produce them.
- **Encode input pictures**, indifferent of the video profile used to consume them.

This includes images created with both VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR and VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR, which is necessary to use the same video picture as the reconstructed picture and decode output picture in a video decode operation on implementations supporting VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR.

However, images with only DPB usage remain tied to the video profiles the image was created with, as the data layout of such DPB-only images may be implementation- and codec-dependent.

If an application would like to share or reuse the device memory backing such images (e.g. for the purposes of temporal aliasing), then it should create separate image objects for each video profile and bind them to the same underlying device memory range, similar to how memory resources can be shared across separate video sessions or any other memory-backed resource.

See Sparse Resource Features and Sparse Physical Device Features for more details.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkImageCreateFlags;
```

`VkImageCreateFlags` is a bitmask type for setting a mask of zero or more `VkImageCreateFlagBits`.

Possible values of `VkImageCreateInfo::imageType`, specifying the basic dimensionality of an image, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkImageType {
    VK_IMAGE_TYPE_1D = 0,
    VK_IMAGE_TYPE_2D = 1,
    VK_IMAGE_TYPE_3D = 2,
} VkImageType;
```
• **VK_IMAGE_TYPE_1D** specifies a one-dimensional image.

• **VK_IMAGE_TYPE_2D** specifies a two-dimensional image.

• **VK_IMAGE_TYPE_3D** specifies a three-dimensional image.

Possible values of `VkImageCreateInfo::tiling`, specifying the tiling arrangement of texel blocks in an image, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkImageTiling {
    VK_IMAGE_TILING_OPTIMAL = 0,
    VK_IMAGE_TILING_LINEAR = 1,
    // Provided by VK_EXT_image_drm_format_modifier
    VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT = 1000158000,
} VkImageTiling;
```

• **VK_IMAGE_TILING_OPTIMAL** specifies optimal tiling (texels are laid out in an implementation-dependent arrangement, for more efficient memory access).

• **VK_IMAGE_TILING_LINEAR** specifies linear tiling (texels are laid out in memory in row-major order, possibly with some padding on each row).

• **VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT** indicates that the image's tiling is defined by a Linux DRM format modifier. The modifier is specified at image creation with `VkImageDrmFormatModifierListCreateInfoEXT` or `VkImageDrmFormatModifierExplicitCreateInfoEXT`, and can be queried with `vkGetImageDrmFormatModifierPropertiesEXT`.

To query the memory layout of an image subresource, call:

```
// Provided by VK_VERSION_1_0
void vkGetImageSubresourceLayout(
    VkDevice device,
    VkImage image,
    const VkImageSubresource* pSubresource,
    VkSubresourceLayout* pLayout);
```

• **device** is the logical device that owns the image.

• **image** is the image whose layout is being queried.

• **pSubresource** is a pointer to a `VkImageSubresource` structure selecting a specific image subresource from the image.

• **pLayout** is a pointer to a `VkSubresourceLayout` structure in which the layout is returned.

If the image is linear, then the returned layout is valid for host access.

If the image's tiling is **VK_IMAGE_TILING_LINEAR** and its format is a multi-planar format, then `vkGetImageSubresourceLayout` describes one format plane of the image. If the image's tiling is **VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT**, then `vkGetImageSubresourceLayout` describes one memory...
plane of the image. If the image's tiling is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT and the image is non-linear, then the returned layout has an implementation-dependent meaning; the vendor of the image’s DRM format modifier may provide documentation that explains how to interpret the returned layout.

vkGetImageSubresourceLayout is invariant for the lifetime of a single image. However, the subresource layout of images in Android hardware buffer or QNX Screen buffer external memory is not known until the image has been bound to memory, so applications must not call vkGetImageSubresourceLayout for such an image before it has been bound.

Valid Usage

- VUID-vkGetImageSubresourceLayout-image-07790
  image must have been created with tiling equal to VK_IMAGE_TILING_LINEAR or VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT

- VUID-vkGetImageSubresourceLayout-aspectMask-00997
  The aspectMask member of pSubresource must only have a single bit set

- VUID-vkGetImageSubresourceLayout-mipLevel-01716
  The mipLevel member of pSubresource must be less than the mipLevels specified in image

- VUID-vkGetImageSubresourceLayout-arrayLayer-01717
  The arrayLayer member of pSubresource must be less than the arrayLayers specified in image

- VUID-vkGetImageSubresourceLayout-format-08886
  If format of the image is a color format that is not a multi-planar image format, and tiling of the image is VK_IMAGE_TILING_LINEAR or VK_IMAGE_TILING_OPTIMAL, the aspectMask member of pSubresource must be VK_IMAGE_ASPECT_COLOR_BIT

- VUID-vkGetImageSubresourceLayout-format-04462
  If format of the image has a depth component, the aspectMask member of pSubresource must contain VK_IMAGE_ASPECT_DEPTH_BIT

- VUID-vkGetImageSubresourceLayout-format-04463
  If format of the image has a stencil component, the aspectMask member of pSubresource must contain VK_IMAGE_ASPECT_STENCIL_BIT

- VUID-vkGetImageSubresourceLayout-format-04464
  If format of the image does not contain a stencil or depth component, the aspectMask member of pSubresource must not contain VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT

- VUID-vkGetImageSubresourceLayout-tiling-08717
  If the tiling of the image is VK_IMAGE_TILING_LINEAR and has a multi-planar image format, then the aspectMask member of pSubresource must be a single valid multi-planar aspect mask bit

- VUID-vkGetImageSubresourceLayout-image-09432
  If image was created with the VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID external memory handle type, then image must be bound to memory
If the tiling of the image is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then the aspectMask member of pSubresource must be VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT and the index i must be less than the VkDrmFormatModifierPropertiesEXT::drmFormatModifierPlaneCount associated with the image's format and VkImageDrmFormatModifierPropertiesEXT::drmFormatModifier.

Valid Usage (Implicit)

• VUID-vkGetImageSubresourceLayout-device-parameter
device must be a valid VkDevice handle

• VUID-vkGetImageSubresourceLayout-image-parameter
image must be a valid VkImage handle

• VUID-vkGetImageSubresourceLayout-pSubresource-parameter
pSubresource must be a valid pointer to a valid VkImageSubresource structure

• VUID-vkGetImageSubresourceLayout-pLayout-parameter
pLayout must be a valid pointer to a VkSubresourceLayout structure

• VUID-vkGetImageSubresourceLayout-image-parent
image must have been created, allocated, or retrieved from device

The VkImageSubresource structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkImageSubresource {
    VkImageAspectFlags aspectMask;
    uint32_t mipLevel;
    uint32_t arrayLayer;
} VkImageSubresource;
```

• aspectMask is a VkImageAspectFlags value selecting the image aspect.

• mipLevel selects the mipmap level.

• arrayLayer selects the array layer.

Valid Usage (Implicit)

• VUID-VkImageSubresource-aspectMask-parameter
aspectMask must be a valid combination of VkImageAspectFlagBits values

• VUID-VkImageSubresource-aspectMask-requiredbitmask
aspectMask must not be 0

Information about the layout of the image subresource is returned in a VkSubresourceLayout structure:
// Provided by VK_VERSION_1_0

typedef struct VkSubresourceLayout {
    VkDeviceSize offset;
    VkDeviceSize size;
    VkDeviceSize rowPitch;
    VkDeviceSize arrayPitch;
    VkDeviceSize depthPitch;
} VkSubresourceLayout;

• **offset** is the byte offset from the start of the image or the plane where the image subresource begins.

• **size** is the size in bytes of the image subresource. **size** includes any extra memory that is required based on **rowPitch**.

• **rowPitch** describes the number of bytes between each row of texels in an image.

• **arrayPitch** describes the number of bytes between each array layer of an image.

• **depthPitch** describes the number of bytes between each slice of 3D image.

If the image is **linear**, then **rowPitch**, **arrayPitch** and **depthPitch** describe the layout of the image subresource in linear memory. For uncompressed formats, **rowPitch** is the number of bytes between texels with the same x coordinate in adjacent rows (y coordinates differ by one). **arrayPitch** is the number of bytes between texels with the same x and y coordinate in adjacent array layers of the image (array layer values differ by one). **depthPitch** is the number of bytes between texels with the same x and y coordinate in adjacent slices of a 3D image (z coordinates differ by one). Expressed as an addressing formula, the starting byte of a texel in the image subresource has address:

// (x,y,z,layer) are in texel coordinates
address(x,y,z,layer) = layer*arrayPitch + z*depthPitch + y*rowPitch + x*elementSize + offset

For compressed formats, the **rowPitch** is the number of bytes between compressed texel blocks in adjacent rows. **arrayPitch** is the number of bytes between compressed texel blocks in adjacent array layers. **depthPitch** is the number of bytes between compressed texel blocks in adjacent slices of a 3D image.

// (x,y,z,layer) are in compressed texel block coordinates
address(x,y,z,layer) = layer*arrayPitch + z*depthPitch + y*rowPitch + x
*compressedTexelBlockByteSize + offset;

The value of **arrayPitch** is undefined for images that were not created as arrays. **depthPitch** is defined only for 3D images.

If the image has a **single-plane** color format and its tiling is **VK_IMAGE_TILING_LINEAR**, then the **aspectMask** member of **VkImageSubresource** must be **VK_IMAGE_ASPECT_COLOR_BIT**.

If the image has a depth/stencil format and its tiling is **VK_IMAGE_TILING_LINEAR**, then **aspectMask**
must be either `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT`. On implementations that store depth and stencil aspects separately, querying each of these image subresource layouts will return a different offset and size representing the region of memory used for that aspect. On implementations that store depth and stencil aspects interleaved, the same offset and size are returned and represent the interleaved memory allocation.

If the image has a multi-planar format and its tiling is `VK_IMAGE_TILING_LINEAR`, then the `aspectMask` member of `VkImageSubresource` must be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, or (for 3-plane formats only) `VK_IMAGE_ASPECT_PLANE_2_BIT`. Querying each of these image subresource layouts will return a different offset and size representing the region of memory used for that plane. If the image is disjoint, then the offset is relative to the base address of the plane. If the image is non-disjoint, then the offset is relative to the base address of the image.

If the image's tiling is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then the `aspectMask` member of `VkImageSubresource` must be one of `VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT`, where the maximum allowed plane index i is defined by the `VkDrmFormatModifierPropertiesEXT::drmFormatModifierPlaneCount` associated with the image's `VkImageCreateInfo::format` and modifier. The memory range used by the subresource is described by offset and size. If the image is disjoint, then the offset is relative to the base address of the memory plane. If the image is non-disjoint, then the offset is relative to the base address of the image. If the image is non-linear, then `rowPitch`, `arrayPitch`, and `depthPitch` have an implementation-dependent meaning.

To query the memory layout of an image subresource, call:

```c
// Provided by VK_KHR_maintenance5
void vkGetImageSubresourceLayout2KHR(
    VkDevice device,
    VkImage image,
    const VkImageSubresource2KHR* pSubresource,
    VkSubresourceLayout2KHR* pLayout);
```

or the equivalent command

```c
// Provided by VK_EXT_host_image_copy, VK_EXT_image_compression_control
void vkGetImageSubresourceLayout2EXT(
    VkDevice device,
    VkImage image,
    const VkImageSubresource2KHR* pSubresource,
    VkSubresourceLayout2KHR* pLayout);
```

- `device` is the logical device that owns the image.
- `image` is the image whose layout is being queried.
- `pSubresource` is a pointer to a `VkImageSubresource2KHR` structure selecting a specific image for the image subresource.
- `pLayout` is a pointer to a `VkSubresourceLayout2KHR` structure in which the layout is returned.
vkGetImageSubresourceLayout2KHR behaves similarly to vkGetImageSubresourceLayout, with the ability to specify extended inputs via chained input structures, and to return extended information via chained output structures.

It is legal to call vkGetImageSubresourceLayout2KHR with an image created with tiling equal to VK_IMAGE_TILING_OPTIMAL, but the members of VkSubresourceLayout2KHR::subresourceLayout will have undefined values in this case.

**Note**
Structures chained from VkImageSubresource2KHR::pNext will also be updated when tiling is equal to VK_IMAGE_TILING_OPTIMAL.

## Valid Usage

- **VUID-vkGetImageSubresourceLayout2KHR-aspectMask-00997**
  The aspectMask member of pSubresource must only have a single bit set

- **VUID-vkGetImageSubresourceLayout2KHR-mipLevel-01716**
  The mipLevel member of pSubresource must be less than the mipLevels specified in image

- **VUID-vkGetImageSubresourceLayout2KHR-arrayLayer-01717**
  The arrayLayer member of pSubresource must be less than the arrayLayers specified in image

- **VUID-vkGetImageSubresourceLayout2KHR-format-08886**
  If format of the image is a color format that is not a multi-planar image format, and tiling of the image is VK_IMAGE_TILING_LINEAR or VK_IMAGE_TILING_OPTIMAL, the aspectMask member of pSubresource must be VK_IMAGE_ASPECT_COLOR_BIT

- **VUID-vkGetImageSubresourceLayout2KHR-format-04462**
  If format of the image has a depth component, the aspectMask member of pSubresource must contain VK_IMAGE_ASPECT_DEPTH_BIT

- **VUID-vkGetImageSubresourceLayout2KHR-format-04463**
  If format of the image has a stencil component, the aspectMask member of pSubresource must contain VK_IMAGE_ASPECT_STENCIL_BIT

- **VUID-vkGetImageSubresourceLayout2KHR-format-04464**
  If format of the image does not contain a stencil or depth component, the aspectMask member of pSubresource must not contain VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT

- **VUID-vkGetImageSubresourceLayout2KHR-tiling-08717**
  If the tiling of the image is VK_IMAGE_TILING_LINEAR and has a multi-planar image format, then the aspectMask member of pSubresource must be a single valid multi-planar aspect mask bit

- **VUID-vkGetImageSubresourceLayout2KHR-image-09434**
  If image was created with the VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID external memory handle type, then image must be bound to memory

- **VUID-vkGetImageSubresourceLayout2KHR-tiling-09435**
If the tiling of the image is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then the aspectMask member of pSubresource must be VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT and the index i must be less than the VkDrmFormatModifierPropertiesEXT::drmFormatModifierPlaneCount associated with the image’s format and VkImageDrmFormatModifierPropertiesEXT::drmFormatModifier.

Valid Usage (Implicit)

• VUID-vkGetImageSubresourceLayout2KHR-device-parameter
  device must be a valid VkDevice handle

• VUID-vkGetImageSubresourceLayout2KHR-image-parameter
  image must be a valid VkImage handle

• VUID-vkGetImageSubresourceLayout2KHR-pSubresource-parameter
  pSubresource must be a valid pointer to a valid VkImageSubresource2KHR structure

• VUID-vkGetImageSubresourceLayout2KHR-pLayout-parameter
  pLayout must be a valid pointer to a VkSubresourceLayout2KHR structure

• VUID-vkGetImageSubresourceLayout2KHR-image-parent
  image must have been created, allocated, or retrieved from device

The VkImageSubresource2KHR structure is defined as:

```
// Provided by VK_KHR_maintenance5
typedef struct VkImageSubresource2KHR {
    VkStructureType sType;
    void*pNext;
    VkImageSubresource imageSubresource;
} VkImageSubresource2KHR;
```

or the equivalent

```
// Provided by VK_EXT_host_image_copy, VK_EXT_image_compression_control
typedef VkImageSubresource2KHR VkImageSubresource2EXT;
```

• sType is a VkStructureType value identifying this structure.

• pParent is NULL or a pointer to a structure extending this structure.

• imageSubresource is a VkImageSubresource structure.

Valid Usage (Implicit)

• VUID-VkImageSubresource2KHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMAGE_SUBRESOURCE_2_KHR

• VUID-VkImageSubresource2KHR-pNext-pNext
pNext must be NULL

- VUID-VkImageSubresource2KHR-imageSubresource-parameter
  imageSubresource must be a valid VkImageSubresource structure

Information about the layout of the image subresource is returned in a VkSubresourceLayout2KHR structure:

```c
// Provided by VK_KHR_maintenance5
typedef struct VkSubresourceLayout2KHR {
    VkStructureType sType;
    void* pNext;
    VkSubresourceLayout subresourceLayout;
} VkSubresourceLayout2KHR;
```

or the equivalent

```c
// Provided by VK_EXT_host_image_copy, VK_EXT_image_compression_control
typedef VkSubresourceLayout2KHR VkSubresourceLayout2EXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `subresourceLayout` is a VkSubresourceLayout structure.

**Valid Usage (Implicit)**

- VUID-VkSubresourceLayout2KHR-sType-sType
  `sType` must be VK_STRUCTURE_TYPE_SUBRESOURCE_LAYOUT_2_KHR

- VUID-VkSubresourceLayout2KHR-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either NULL or a pointer to a valid instance of VkImageCompressionPropertiesEXT or VkSubresourceHostMemcpySizeEXT

- VUID-VkSubresourceLayout2KHR-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique

To query the memory size needed to copy to or from an image using `vkCopyMemoryToImageEXT` or `vkCopyImageToMemoryEXT` when the VK_HOST_IMAGE_COPY_MEMCPY_EXT flag is specified, add a VkSubresourceHostMemcpySizeEXT structure to the `pNext` chain of the VkSubresourceLayout2EXT structure in a call to `vkGetImageSubresourceLayout2EXT`.

The VkSubresourceHostMemcpySizeEXT structure is defined as:

```c
// Provided by VK_EXT_host_image_copy
typedef struct VkSubresourceHostMemcpySizeEXT {
```
```c
typedef struct VkDeviceImageSubresourceInfoKHR {
    VkDevice device,
    const VkDeviceImageSubresourceInfoKHR* pInfo,
    VkSubresourceLayout2KHR* pLayout);
```

Valid Usage (Implicit)

- `device` must be a valid `VkDevice` handle
- `pInfo` must be a valid pointer to a valid `VkDeviceImageSubresourceInfoKHR` structure
- `pLayout` must be a valid pointer to a `VkSubresourceLayout2KHR` structure

The `VkDeviceImageSubresourceInfoKHR` structure is defined as:

```c
typedef struct VkDeviceImageSubresourceInfoKHR {
    VkDevice device,
    const VkDeviceImageSubresourceInfoKHR* pInfo,
    VkSubresourceLayout2KHR* pLayout);
```
VkDeviceImageSubresourceInfoKHR

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **pCreateInfo** is a pointer to a `VkImageCreateInfo` structure containing parameters affecting creation of the image to query.
- **pSubresource** is a pointer to a `VkImageSubresource2KHR` structure selecting a specific image subresource for the query.

### Valid Usage

- **VUID-VkDeviceImageSubresourceInfoKHR-aspectMask-00997**
  The `aspectMask` member of `pSubresource` must only have a single bit set.

- **VUID-VkDeviceImageSubresourceInfoKHR-mipLevel-01716**
  The `mipLevel` member of `pSubresource` must be less than the `mipLevels` specified in `pCreateInfo`.

- **VUID-VkDeviceImageSubresourceInfoKHR-arrayLayer-01717**
  The `arrayLayer` member of `pSubresource` must be less than the `arrayLayers` specified in `pCreateInfo`.

- **VUID-VkDeviceImageSubresourceInfoKHR-format-08886**
  If format of the image is a color format that is not a multi-planar image format, and tiling of the `pCreateInfo` is `VK_IMAGE_TILING_LINEAR` or `VK_IMAGE_TILING_OPTIMAL`, the `aspectMask` member of `pSubresource` must be `VK_IMAGE_ASPECT_COLOR_BIT`.

- **VUID-VkDeviceImageSubresourceInfoKHR-format-04462**
  If format of the `pCreateInfo` has a depth component, the `aspectMask` member of `pSubresource` must contain `VK_IMAGE_ASPECT_DEPTH_BIT`.

- **VUID-VkDeviceImageSubresourceInfoKHR-format-04463**
  If format of the `pCreateInfo` has a stencil component, the `aspectMask` member of `pSubresource` must contain `VK_IMAGE_ASPECT_STENCIL_BIT`.

- **VUID-VkDeviceImageSubresourceInfoKHR-format-04464**
  If format of the `pCreateInfo` does not contain a stencil or depth component, the `aspectMask` member of `pSubresource` must not contain `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT`.

- **VUID-VkDeviceImageSubresourceInfoKHR-tiling-08717**
  If the tiling of the `pCreateInfo` is `VK_IMAGE_TILING_LINEAR` and has a multi-planar image format, then the `aspectMask` member of `pSubresource` must be a single valid multi-planar aspect mask bit.
Valid Usage (Implicit)

• VUID-VkDeviceImageSubresourceInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEVICE_IMAGE_SUBRESOURCE_INFO_KHR

• VUID-VkDeviceImageSubresourceInfoKHR-pNext-pNext
  pNext must be NULL

• VUID-VkDeviceImageSubresourceInfoKHR-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkImageCreateInfo

• VUID-VkDeviceImageSubresourceInfoKHR-pSubresource-parameter
  pSubresource must be a valid pointer to a valid VkImageSubresource2KHR structure

If an image was created with VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then the image has a Linux DRM format modifier. To query the modifier, call:

```c
// Provided by VK_EXT_image_drm_format_modifier
VkResult vkGetImageDrmFormatModifierPropertiesEXT(
    VkDevice device,
    VkImage image,
    VkImageDrmFormatModifierPropertiesEXT* pProperties);
```

- **device** is the logical device that owns the image.
- **image** is the queried image.
- **pProperties** is a pointer to a VkImageDrmFormatModifierPropertiesEXT structure in which properties of the image's DRM format modifier are returned.

Valid Usage

• VUID-vkGetImageDrmFormatModifierPropertiesEXT-image-02272
  image must have been created with tiling equal to VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT

Valid Usage (Implicit)

• VUID-vkGetImageDrmFormatModifierPropertiesEXT-device-parameter
  device must be a valid VkDevice handle

• VUID-vkGetImageDrmFormatModifierPropertiesEXT-image-parameter
  image must be a valid VkImage handle

• VUID-vkGetImageDrmFormatModifierPropertiesEXT-pProperties-parameter
  pProperties must be a valid pointer to a VkImageDrmFormatModifierPropertiesEXT structure

• VUID-vkGetImageDrmFormatModifierPropertiesEXT-image-parent
Return Codes

Success

• VK_SUCCESS

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY

The `VkImageDrmFormatModifierPropertiesEXT` structure is defined as:

```c
typedef struct VkImageDrmFormatModifierPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    uint64_t drmFormatModifier;
} VkImageDrmFormatModifierPropertiesEXT;
```

• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.
• `drmFormatModifier` returns the image’s Linux DRM format modifier.

If the image was created with `VkImageDrmFormatModifierListCreateInfoEXT`, then the returned `drmFormatModifier` must belong to the list of modifiers provided at time of image creation in `VkImageDrmFormatModifierListCreateInfoEXT::pDrmFormatModifiers`. If the image was created with `VkImageDrmFormatModifierExplicitCreateInfoEXT`, then the returned `drmFormatModifier` must be the modifier provided at time of image creation in `VkImageDrmFormatModifierExplicitCreateInfoEXT::drmFormatModifier`.

Valid Usage (Implicit)

• VUID-VkImageDrmFormatModifierPropertiesEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_IMAGE_DRM_FORMAT_MODIFIER_PROPERTIES_EXT`

• VUID-VkImageDrmFormatModifierPropertiesEXT-pNext-pNext
  `pNext` must be NULL

To destroy an image, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyImage(
    VkDevice device,
    VkImage image,
```
```c
const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the image.
- **image** is the image to destroy.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.

### Valid Usage

- **VUID-vkDestroyImage-image-01000**
  All submitted commands that refer to `image`, either directly or via a `VkImageView`, **must** have completed execution.

- **VUID-vkDestroyImage-image-01001**
  If `VkAllocationCallbacks` were provided when `image` was created, a compatible set of callbacks **must** be provided here.

- **VUID-vkDestroyImage-image-01002**
  If no `VkAllocationCallbacks` were provided when `image` was created, `pAllocator` **must** be `NULL`.

- **VUID-vkDestroyImage-image-04882**
  `image` **must** not have been acquired from `vkGetSwapchainImagesKHR`.

### Valid Usage (Implicit)

- **VUID-vkDestroyImage-device-parameter**
  `device` **must** be a valid `VkDevice` handle.

- **VUID-vkDestroyImage-image-parameter**
  If `image` is not `VK_NULL_HANDLE`, `image` **must** be a valid `VkImage` handle.

- **VUID-vkDestroyImage-pAllocator-parameter**
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure.

- **VUID-vkDestroyImage-image-parent**
  If `image` is a valid handle, it **must** have been created, allocated, or retrieved from `device`.

### Host Synchronization

- Host access to `image` **must** be externally synchronized.

### 12.3.1. Image Format Features

Valid uses of a `VkImage` **may** depend on the image's *format features*, defined below. Such constraints are documented in the affected valid usage statement.
• If the image was created with \texttt{VK\_IMAGE\_TILING\_LINEAR}, then its set of \textit{format features} is the value of \texttt{VkFormatProperties::linearTilingFeatures} found by calling \texttt{vkGetPhysicalDeviceFormatProperties} on the same \texttt{format} as \texttt{VkImageCreateInfo::format}.

• If the image was created with \texttt{VK\_IMAGE\_TILING\_OPTIMAL}, but without an Android hardware buffer external format, or a QNX Screen Buffer external format or an \texttt{VkBufferCollectionImageCreateInfoFUCHSIA}, then its set of \textit{format features} is the value of \texttt{VkFormatProperties::optimalTilingFeatures} found by calling \texttt{vkGetPhysicalDeviceFormatProperties} on the same \texttt{format} as \texttt{VkImageCreateInfo::format}.

• If the image was created with an Android hardware buffer external format, then its set of \textit{format features} is the value of \texttt{VkAndroidHardwareBufferFormatPropertiesANDROID::formatFeatures} found by calling \texttt{vkGetAndroidHardwareBufferPropertiesANDROID} on the Android hardware buffer that was imported to the \texttt{VkDeviceMemory} to which the image is bound.

• If the image was created with an QNX Screen buffer external format, then its set of \textit{format features} is the value of \texttt{VkScreenBufferFormatPropertiesQNX::formatFeatures} found by calling \texttt{vkGetScreenBufferPropertiesQNX} on the QNX Screen buffer that was imported to the \texttt{VkDeviceMemory} to which the image is bound.

• If the image was created with \texttt{VK\_IMAGE\_TILING\_DRM\_FORMAT\_MODIFIER\_EXT}, then:
  
  ◦ The image's DRM format modifier is the value of \texttt{VkImageDrmFormatModifierPropertiesEXT::drmFormatModifier} found by calling \texttt{vkGetImageDrmFormatModifierPropertiesEXT}.
  
  ◦ Let \texttt{VkDrmFormatModifierPropertiesListEXT::pDrmFormatModifierProperties} be the array found by calling \texttt{vkGetPhysicalDeviceFormatProperties2} on the same \texttt{format} as \texttt{VkImageCreateInfo::format}.
  
  ◦ Let \texttt{VkDrmFormatModifierPropertiesEXT prop} be the array element whose \texttt{drmFormatModifier} member is the value of the image's DRM format modifier.
  
  ◦ Then the image's set of \textit{format features} is the value of \texttt{prop::drmFormatModifierTilingFeatures}.

### 12.3.2. Corner-Sampled Images

A \textit{corner-sampled image} is an image where unnormalized texel coordinates are centered on integer values rather than half-integer values.

A corner-sampled image has a number of differences compared to conventional texture image:

- Texels are centered on integer coordinates. See \texttt{Unnormalized Texel Coordinate Operations}.
- Normalized coordinates are scaled using \texttt{coord \times (dim - 1)} rather than \texttt{coord \times dim}, where \texttt{dim} is the size of one dimension of the image. See \texttt{normalized texel coordinate transform}.
- Partial derivatives are scaled using \texttt{coord \times (dim - 1)} rather than \texttt{coord \times dim}. See \texttt{Scale Factor Operation}.
- Calculation of the next higher LOD size goes according to $\lceil \frac{\text{dim}}{2} \rceil$ rather than $\lfloor \frac{\text{dim}}{2} \rfloor$. See \texttt{Image Mip Level Sizing}.
- The minimum level size is 2x2 for 2D images and 2x2x2 for 3D images. See \texttt{Image Mip Level Sizing}.
Corner-sampling is only supported for 2D and 3D images. When sampling a corner-sampled image, the sampler addressing mode must be `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`. Corner-sampled images are not supported as cube maps or depth/stencil images.

12.3.3. Image Mip Level Sizing

A complete mipmap chain is the full set of mip levels, from the largest mip level provided, down to the minimum mip level size.

Conventional Images

For conventional images, the dimensions of each successive mip level, n+1, are:

\[
\text{width}_{n+1} = \max(\left\lceil \text{width}_n/2 \right\rceil, 1)
\]

\[
\text{height}_{n+1} = \max(\left\lceil \text{height}_n/2 \right\rceil, 1)
\]

\[
\text{depth}_{n+1} = \max(\left\lceil \text{depth}_n/2 \right\rceil, 1)
\]

where width_n, height_n, and depth_n are the dimensions of the next larger mip level, n.

The minimum mip level size is:

- 1 for one-dimensional images,
- 1x1 for two-dimensional images, and
- 1x1x1 for three-dimensional images.

The number of levels in a complete mipmap chain is:

\[
\left\lceil \log_2(\max(\text{width}_0, \text{height}_0, \text{depth}_0)) \right\rceil + 1
\]

where width_0, height_0, and depth_0 are the dimensions of the largest (most detailed) mip level, 0.

Corner-Sampled Images

For corner-sampled images, the dimensions of each successive mip level, n+1, are:

\[
\text{width}_{n+1} = \max(\left\lceil \text{width}_n/2 \right\rceil, 2)
\]

\[
\text{height}_{n+1} = \max(\left\lceil \text{height}_n/2 \right\rceil, 2)
\]

\[
\text{depth}_{n+1} = \max(\left\lceil \text{depth}_n/2 \right\rceil, 2)
\]
where \( \text{width}_n, \text{height}_n, \text{and depth}_n \) are the dimensions of the next larger mip level, \( n \).

The minimum mip level size is:

- 2x2 for two-dimensional images, and
- 2x2x2 for three-dimensional images.

The number of levels in a complete mipmap chain is:

\[
\lceil \log_2(\max(\text{width}_0, \text{height}_0, \text{depth}_0)) \rceil
\]

where \( \text{width}_0, \text{height}_0, \text{and depth}_0 \) are the dimensions of the largest (most detailed) mip level, \( 0 \).

### 12.4. Image Layouts

Images are stored in implementation-dependent opaque layouts in memory. Each layout has limitations on what kinds of operations are supported for image subresources using the layout. At any given time, the data representing an image subresource in memory exists in a particular layout which is determined by the most recent layout transition that was performed on that image subresource. Applications have control over which layout each image subresource uses, and can transition an image subresource from one layout to another. Transitions can happen with an image memory barrier, included as part of a `vkCmdPipelineBarrier` or a `vkCmdWaitEvents` command buffer command (see Image Memory Barriers), or as part of a subpass dependency within a render pass (see `VkSubpassDependency`).

Image layout is per-image subresource. Separate image subresources of the same image can be in different layouts at the same time, with the exception that depth and stencil aspects of a given image subresource can only be in different layouts if the `separateDepthStencilLayouts` feature is enabled.

**Note**
Each layout may offer optimal performance for a specific usage of image memory. For example, an image with a layout of `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` may provide optimal performance for use as a color attachment, but be unsupported for use in transfer commands. Applications can transition an image subresource from one layout to another in order to achieve optimal performance when the image subresource is used for multiple kinds of operations. After initialization, applications need not use any layout other than the general layout, though this may produce suboptimal performance on some implementations.

Upon creation, all image subresources of an image are initially in the same layout, where that layout is selected by the `VkImageCreateInfo`::`initialLayout` member. The `initialLayout` must be either `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`. If it is `VK_IMAGE_LAYOUT_PREINITIALIZED`, then the image data can be preinitialized by the host while using this layout, and the transition away from this layout will preserve that data. If it is `VK_IMAGE_LAYOUT_UNDEFINED`, then the contents of the data are considered to be undefined, and the transition away from this layout is not guaranteed to preserve that data. For either of these initial
layouts, any image subresources must be transitioned to another layout before they are accessed by the device.

Host access to image memory is only well-defined for linear images and for image subresources of those images which are currently in either the VK_IMAGE_LAYOUT_PREINITIALIZED or VK_IMAGE_LAYOUT_GENERAL layout. Calling vkGetImageSubresourceLayout for a linear image returns a subresource layout mapping that is valid for either of those image layouts.

The set of image layouts consists of:

```c
// Provided by VK_VERSION_1_0
typedef enum VkImageLayout {

    VK_IMAGE_LAYOUT_UNDEFINED = 0,
    VK_IMAGE_LAYOUT_GENERAL = 1,
    VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL = 2,
    VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL = 3,
    VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL = 4,
    VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL = 5,
    VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL = 6,
    VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL = 7,
    VK_IMAGE_LAYOUT_PREINITIALIZED = 8,

    // Provided by VK_VERSION_1_1
    VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL = 1000117000,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL = 1000117001,
    // Provided by VK_VERSION_1_2
    VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL = 1000241000,
    // Provided by VK_VERSION_1_2
    VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL = 1000241001,
    // Provided by VK_VERSION_1_2
    VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL = 1000241002,
    // Provided by VK_VERSION_1_2
    VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL = 1000241003,
    // Provided by VK_VERSION_1_3
    VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL = 1000314000,
    // Provided by VK_VERSION_1_3
    VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL = 1000314001,
    // Provided by VK_KHR_swapchain
    VK_IMAGE_LAYOUT_PRESENT_SRC_KHR = 1000001002,
    // Provided by VK_KHR_video_decode_queue
    VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR = 1000024000,
    // Provided by VK_KHR_video_decode_queue
    VK_IMAGE_LAYOUT_VIDEO_DECODE_SRC_KHR = 1000024001,
    // Provided by VK_KHR_video_decode_queue
    VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR = 1000024002,
    // Provided by VK_KHR_shared_presentable_image
    VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR = 1000111000,
    // Provided by VK_EXT_fragment_density_map
    VK_IMAGE_LAYOUT_FRAGMENT_DENSITY_MAP_OPTIMAL_EXT = 1000218000,
    // Provided by VK_KHR_fragment_shading_rate
}
```
The type(s) of device access supported by each layout are:

- **VK_IMAGE_LAYOUT_UNDEFINED** specifies that the layout is unknown. Image memory **cannot** be transitioned into this layout. This layout **can** be used as the `initialLayout` member of `VkImageCreateInfo`. This layout **can** be used in place of the current image layout in a layout transition, but doing so will cause the contents of the image's memory to be undefined.

- **VK_IMAGE_LAYOUT_PREINITIALIZED** specifies that an image's memory is in a defined layout and **can** be populated by data, but that it has not yet been initialized by the driver. Image memory **cannot** be transitioned into this layout. This layout **can** be used as the `initialLayout` member of `VkImageCreateInfo`. This layout is intended to be used as the initial layout for an image whose contents are written by the host, and hence the data **can** be written to memory immediately,
without first executing a layout transition. Currently, `VK_IMAGE_LAYOUT_PREINITIALIZED` is only useful with linear images because there is not a standard layout defined for `VK_IMAGE_TILING_OPTIMAL` images.

- **VK_IMAGE_LAYOUT_GENERAL** supports all types of device access.
- **VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL** specifies a layout that must only be used with attachment accesses in the graphics pipeline.
- **VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL** specifies a layout allowing read only access as an attachment, or in shaders as a sampled image, combined image/sampler, or input attachment.
- **VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL** must only be used as a color or resolve attachment in a `VkFramebuffer`. This layout is valid only for image subresources of images created with the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` usage bit enabled.
- **VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL** specifies a layout for both the depth and stencil aspects of a depth/stencil format image allowing read and write access as a depth/stencil attachment. It is equivalent to `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` and `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`.
- **VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL** specifies a layout for both the depth and stencil aspects of a depth/stencil format image allowing read only access as a depth/stencil attachment or in shaders as a sampled image, combined image/sampler, or input attachment. It is equivalent to `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL` and `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`.
- **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL** specifies a layout for depth/stencil format images allowing read and write access to the stencil aspect as a stencil attachment, and read only access to the depth aspect as a depth attachment or in shaders as a sampled image, combined image/sampler, or input attachment. It is equivalent to `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`.
- **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL** specifies a layout for depth/stencil format images allowing read and write access to the depth aspect as a depth attachment, and read only access to the stencil aspect as a stencil attachment or in shaders as a sampled image, combined image/sampler, or input attachment. It is equivalent to `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`.
- **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL** specifies a layout for the depth aspect of a depth/stencil format image allowing read and write access as a depth attachment.
- **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL** specifies a layout for the depth aspect of a depth/stencil format image allowing read-only access as a depth attachment or in shaders as a sampled image, combined image/sampler, or input attachment.
- **VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL** specifies a layout for the stencil aspect of a depth/stencil format image allowing read and write access as a stencil attachment.
- **VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL** specifies a layout for the stencil aspect of a depth/stencil format image allowing read-only access as a stencil attachment or in shaders as a sampled image, combined image/sampler, or input attachment.
- **VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL** specifies a layout allowing read-only access in a shader as a sampled image, combined image/sampler, or input attachment. This layout is valid only for image subresources of images created with the `VK_IMAGE_USAGE_SAMPLED_BIT` or...
VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT usage bits enabled.

- **VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL** must only be used as a source image of a transfer command (see the definition of VK_PIPELINE_STAGE_TRANSFER_BIT). This layout is valid only for image subresources of images created with the VK_IMAGE_USAGE_TRANSFER_SRC_BIT usage bit enabled.

- **VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL** must only be used as a destination image of a transfer command. This layout is valid only for image subresources of images created with the VK_IMAGE_USAGE_TRANSFER_DST_BIT usage bit enabled.

- **VK_IMAGE_LAYOUT_PRESENT_SRC_KHR** must only be used for presenting a presentable image for display.

- **VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR** is valid only for shared presentable images, and must be used for any usage the image supports.

- **VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR** must only be used as a fragment shading rate attachment or shading rate image. This layout is valid only for image subresources of images created with the VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR usage bit enabled.

- **VK_IMAGE_LAYOUT_FRAGMENT_DENSITY_MAP_OPTIMAL_EXT** must only be used as a fragment density map attachment in a VkRenderPass. This layout is valid only for image subresources of images created with the VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT usage bit enabled.

- **VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR** must only be used as a decode output picture in a video decode operation. This layout is valid only for image subresources of images created with the VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR usage bit enabled.

- **VK_IMAGE_LAYOUT_VIDEO_DECODE_SRC_KHR** is reserved for future use.

- **VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR** must only be used as an output reconstructed picture or an input reference picture in a video decode operation. This layout is valid only for image subresources of images created with the VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR usage bit enabled.

- **VK_IMAGE_LAYOUT_VIDEO_ENCODE_DST_KHR** is reserved for future use.

- **VK_IMAGE_LAYOUT_VIDEO_ENCODE_SRC_KHR** must only be used as an encode input picture in a video encode operation. This layout is valid only for image subresources of images created with the VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR usage bit enabled.

- **VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR** must only be used as an output reconstructed picture or an input reference picture in a video encode operation. This layout is valid only for image subresources of images created with the VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR usage bit enabled.

- **VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT** must only be used as either a color attachment or depth/stencil attachment in a VkFramebuffer and/or read-only access in a shader as a sampled image, combined image/sampler, or input attachment. This layout is valid only for image subresources of images created with the VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT usage bit enabled and either the VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT or VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT and either the VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT or VK_IMAGE_USAGE_SAMPLED_BIT usage bits enabled.
• VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR must only be used as either a storage image, or a color or depth/stencil attachment and an input attachment. This layout is valid only for image subresources of images created with either VK_IMAGE_USAGE_STORAGE_BIT, or both VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT and either of VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT or VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT.

The layout of each image subresource is not a state of the image subresource itself, but is rather a property of how the data in memory is organized, and thus for each mechanism of accessing an image in the API the application must specify a parameter or structure member that indicates which image layout the image subresource(s) are considered to be in when the image will be accessed. For transfer commands, this is a parameter to the command (see Clear Commands and Copy Commands). For use as a framebuffer attachment, this is a member in the substructures of the VkRenderPassCreateInfo (see Render Pass). For use in a descriptor set, this is a member in the VkDescriptorImageInfo structure (see Descriptor Set Updates).

12.4.1. Image Layout Matching Rules

At the time that any command buffer command accessing an image executes on any queue, the layouts of the image subresources that are accessed must all match exactly the layout specified via the API controlling those accesses, except in case of accesses to an image with a depth/stencil format performed through descriptors referring to only a single aspect of the image, where the following relaxed matching rules apply:

• Descriptors referring just to the depth aspect of a depth/stencil image only need to match in the image layout of the depth aspect, thus VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL and VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL are considered to match.

• Descriptors referring just to the stencil aspect of a depth/stencil image only need to match in the image layout of the stencil aspect, thus VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL and VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL are considered to match.

When performing a layout transition on an image subresource, the old layout value must either equal the current layout of the image subresource (at the time the transition executes), or else be VK_IMAGE_LAYOUT_UNDEFINED (implying that the contents of the image subresource need not be preserved). The new layout used in a transition must not be VK_IMAGE_LAYOUT_UNDEFINED or VK_IMAGE_LAYOUT_PREINITIALIZED.

The image layout of each image subresource of a depth/stencil image created with VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT is dependent on the last sample locations used to render to the image subresource as a depth/stencil attachment, thus applications must provide the same sample locations that were last used to perform depth writes to the image subresource whenever a layout transition of the image subresource happens, otherwise the contents of the depth aspect of the image subresource become undefined.

In addition, depth reads from a depth/stencil attachment referring to an image subresource range of a depth/stencil image created with VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT using different sample locations than what have been last used to perform depth writes to the image subresources of the same image subresource range return undefined values.

Similarly, depth writes to a depth/stencil attachment referring to an image subresource range of a
depth/stencil image created with VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT using different sample locations than what have been last used to perform depth writes to the image subresources of the same image subresource range make the contents of the depth aspect of those image subresources undefined.

12.5. Image Views

Image objects are not directly accessed by pipeline shaders for reading or writing image data. Instead, image views representing contiguous ranges of the image subresources and containing additional metadata are used for that purpose. Views must be created on images of compatible types, and must represent a valid subset of image subresources.

Image views are represented by VkImageView handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkImageView)
```

VK_REMAINING_ARRAY_LAYERS is a special constant value used for image views to indicate that all remaining array layers in an image after the base layer should be included in the view.

```c
#define VK_REMAINING_ARRAY_LAYERS (-0U)
```

VK_REMAINING_MIP_LEVELS is a special constant value used for image views to indicate that all remaining mipmap levels in an image after the base level should be included in the view.

```c
#define VK_REMAINING_MIP_LEVELS (-0U)
```

The types of image views that can be created are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkImageViewType {
    VK_IMAGE_VIEW_TYPE_1D = 0,
    VK_IMAGE_VIEW_TYPE_2D = 1,
    VK_IMAGE_VIEW_TYPE_3D = 2,
    VK_IMAGE_VIEW_TYPE_CUBE = 3,
    VK_IMAGE_VIEW_TYPE_1D_ARRAY = 4,
    VK_IMAGE_VIEW_TYPE_2D_ARRAY = 5,
    VK_IMAGE_VIEW_TYPE_CUBE_ARRAY = 6,
} VkImageViewType;
```

To create an image view, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateImageView(
    VkDevice device,
```
```c
const VkImageViewCreateInfo* pCreateInfo,
const VkAllocationCallbacks* pAllocator,
VkImageView* pView);
```

- **device** is the logical device that creates the image view.
- **pCreateInfo** is a pointer to a `VkImageViewCreateInfo` structure containing parameters to be used to create the image view.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pView** is a pointer to a `VkImageView` handle in which the resulting image view object is returned.

### Valid Usage

- VUID-vkCreateImageView-image-09179
  `VkImageViewCreateInfo::image` must have been created from `device`

### Valid Usage (Implicit)

- VUID-vkCreateImageView-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkCreateImageView-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid `VkImageViewCreateInfo` structure
- VUID-vkCreateImageView-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateImageView-pView-parameter
  `pView` must be a valid pointer to a `VkImageView` handle

### Return Codes

#### Success

- `VK_SUCCESS`

#### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR`

The `VkImageViewCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
```
typedef struct VkImageViewCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkImageViewCreateFlags flags;
    VkImage image;
    VkImageViewType viewType;
    VkFormat format;
    VkComponentMapping components;
    VkImageSubresourceRange subresourceRange;
} VkImageViewCreateInfo;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• flags is a bitmask of VkImageViewCreateFlagBits specifying additional parameters of the image view.
• image is a VkImage on which the view will be created.
• viewType is a VkImageViewType value specifying the type of the image view.
• format is a VkFormat specifying the format and type used to interpret texel blocks of the image.
• components is a VkComponentMapping structure specifying a remapping of color components (or of depth or stencil components after they have been converted into color components).
• subresourceRange is a VkImageSubresourceRange structure selecting the set of mipmap levels and array layers to be accessible to the view.

Some of the image creation parameters are inherited by the view. In particular, image view creation inherits the implicit parameter usage specifying the allowed usages of the image view that, by default, takes the value of the corresponding usage parameter specified in VkImageCreateInfo at image creation time. The implicit usage can be overridden by adding a VkImageViewUsageCreateInfo structure to the pNext chain, but the view usage must be a subset of the image usage. If image has a depth-stencil format and was created with a VkImageStencilUsageCreateInfo structure included in the pNext chain of VkImageCreateInfo, the usage is calculated based on the subresource.aspectMask provided:

• If aspectMask includes only VK_IMAGE_ASPECT_STENCIL_BIT, the implicit usage is equal to VkImageStencilUsageCreateInfo::stencilUsage.
• If aspectMask includes only VK_IMAGE_ASPECT_DEPTH_BIT, the implicit usage is equal to VkImageCreateInfo::usage.
• If both aspects are included in aspectMask, the implicit usage is equal to the intersection of VkImageCreateInfo::usage and VkImageStencilUsageCreateInfo::stencilUsage.

If image is a 3D image, its Z range can be restricted to a subset by adding a VkImageViewSlicedCreateInfoEXT to the pNext chain.

If image was created with the VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT flag, and if the format of the image is not multi-planar, format can be different from the image’s format, but if image was created without the VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT flag and they are not equal they must
be compatible. Image format compatibility is defined in the Format Compatibility Classes section. Views of compatible formats will have the same mapping between texel coordinates and memory locations irrespective of the format, with only the interpretation of the bit pattern changing.

If image was created with a multi-planar format, and the image view's aspectMask is one of VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT or VK_IMAGE_ASPECT_PLANE_2_BIT, the view's aspect mask is considered to be equivalent to VK_IMAGE_ASPECT_COLOR_BIT when used as a framebuffer attachment.

Note

Values intended to be used with one view format may not be exactly preserved when written or read through a different format. For example, an integer value that happens to have the bit pattern of a floating point denorm or NaN may be flushed or canonicalized when written or read through a view with a floating point format. Similarly, a value written through a signed normalized format that has a bit pattern exactly equal to \(-2^b\) may be changed to \(-2^b + 1\) as described in Conversion from Normalized Fixed-Point to Floating-Point.

If image was created with the VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT flag, format must be compatible with the image's format as described above; or must be an uncompressed format, in which case it must be size-compatible with the image's format. In this case, the resulting image view's texel dimensions equal the dimensions of the selected mip level divided by the compressed texel block size and rounded up.

The VkComponentMapping components member describes a remapping from components of the image to components of the vector returned by shader image instructions. This remapping must be the identity swizzle for storage image descriptors, input attachment descriptors, framebuffer attachments, and any VkImageView used with a combined image sampler that enables sampler Y'CbCr conversion.

If the image view is to be used with a sampler which supports sampler Y'CbCr conversion, an identically defined object of type VkSamplerYcbcrConversion to that used to create the sampler must be passed to vkCreateImageView in a VkSamplerYcbcrConversionInfo included in the pNext chain of VkImageViewCreateInfo. Conversely, if a VkSamplerYcbcrConversion object is passed to vkCreateImageView, an identically defined VkSamplerYcbcrConversion object must be used when sampling the image.

If the image has a multi-planar format, subresourceRange.aspectMask is VK_IMAGE_ASPECT_COLOR_BIT, and usage includes VK_IMAGE_USAGE_SAMPLED_BIT, then the format must be identical to the image format and the sampler to be used with the image view must enable sampler Y'CbCr conversion.

When such an image is used in a video coding operation, the sampler Y'CbCr conversion has no effect.

If image was created with the VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT and the image has a multi-planar format, and if subresourceRange.aspectMask is VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANEB_1_BIT, or VK_IMAGE_ASPECT_PLANEB_2_BIT, format must be compatible with the corresponding plane of the image, and the sampler to be used with the image view must not enable sampler Y'CbCr conversion. The width and height of the single-plane image view must be derived
from the multi-planar image’s dimensions in the manner listed for plane compatibility for the plane.

Any view of an image plane will have the same mapping between texel coordinates and memory locations as used by the components of the color aspect, subject to the formulae relating texel coordinates to lower-resolution planes as described in Chroma Reconstruction. That is, if an R or B plane has a reduced resolution relative to the G plane of the multi-planar image, the image view operates using the \((u_{\text{plane}}, v_{\text{plane}})\) unnormalized coordinates of the reduced-resolution plane, and these coordinates access the same memory locations as the \((u_{\text{color}}, v_{\text{color}})\) unnormalized coordinates of the color aspect for which chroma reconstruction operations operate on the same \((u_{\text{plane}}, v_{\text{plane}})\) or \((i_{\text{plane}}, j_{\text{plane}})\) coordinates.

Table 16. Image type and image view type compatibility requirements

Valid Usage

- **VUID-VkImageViewCreateInfo-image-01003**
  If image was not created with VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT then viewType must not be VK_IMAGE_VIEW_TYPE_CUBE or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY

- **VUID-VkImageViewCreateInfo-viewType-01004**
  If the imageCubeArray feature is not enabled, viewType must not be VK_IMAGE_VIEW_TYPE_CUBE_ARRAY

- **VUID-VkImageViewCreateInfo-image-06723**
  If image was created with VK_IMAGE_TYPE_3D but without VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT set then viewType must not be VK_IMAGE_VIEW_TYPE_2D_ARRAY

- **VUID-VkImageViewCreateInfo-image-06728**
  If image was created with VK_IMAGE_TYPE_3D but without VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT or VK_IMAGE_CREATE_2D_VIEW_COMPATIBLE_BIT_EXT set, then viewType must not be VK_IMAGE_VIEW_TYPE_2D

- **VUID-VkImageViewCreateInfo-image-04970**
  If image was created with VK_IMAGE_TYPE_3D and viewType is VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY then subresourceRange.levelCount must be 1

- **VUID-VkImageViewCreateInfo-image-04971**
  If image was created with VK_IMAGE_TYPE_3D and viewType is VK_IMAGE_VIEW_TYPE_2D or
then `VkImageCreateInfo::flags` must not contain any of `VK_IMAGE_CREATE_SPARSE_BINDING_BIT`, `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`, and `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT`

- **VUID-VkImageViewCreateInfo-image-04972**
  If `image` was created with a `samples` value not equal to `VK_SAMPLE_COUNT_1_BIT` then `viewType` must be either `VK_IMAGE_VIEW_TYPE_2D` or `VK_IMAGE_VIEW_TYPE_2D_ARRAY`

- **VUID-VkImageViewCreateInfo-image-04441**
  `image` must have been created with a `usage` value containing at least one of the usages defined in the valid image usage list for image views

- **VUID-VkImageViewCreateInfo-None-02273**
  The format features of the resultant image view must contain at least one bit

- **VUID-VkImageViewCreateInfo-usage-02274**
  If `usage` contains `VK_IMAGE_USAGE_SAMPLED_BIT`, then the format features of the resultant image view must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`

- **VUID-VkImageViewCreateInfo-usage-02275**
  If `usage` contains `VK_IMAGE_USAGE_STORAGE_BIT`, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT`

- **VUID-VkImageViewCreateInfo-usage-02276**
  If `usage` contains `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`, then the image view's format features must contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT` or `VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV`

- **VUID-VkImageViewCreateInfo-usage-02277**
  If `usage` contains `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, then the image view's format features must contain `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`

- **VUID-VkImageViewCreateInfo-image-08333**
  If `image` was created with `VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR` and `usage` contains `VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR`, then the image view's format features must contain `VK_FORMAT_FEATURE_VIDEO_DECODE_OUTPUT_BIT_KHR`

- **VUID-VkImageViewCreateInfo-image-08334**
  If `image` was created with `VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR` and `usage` contains `VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR`, then the image view's format features must contain `VK_FORMAT_FEATURE_VIDEO_DECODE_DPB_BIT_KHR`

- **VUID-VkImageViewCreateInfo-image-08335**
  If `image` was created with `VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR`, then `usage` must not include `VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR`

- **VUID-VkImageViewCreateInfo-image-08336**
  If `image` was created with `VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR` and `usage` contains `VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR`, then the image view's format features must contain `VK_FORMAT_FEATURE_VIDEO_ENCODE_INPUT_BIT_KHR`

- **VUID-VkImageViewCreateInfo-image-08337**
  If `image` was created with `VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR` and `usage` contains `VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR`, then the image view's format features must contain `VK_FORMAT_FEATURE_VIDEO_ENCODE_DPB_BIT_KHR`
If image was created with VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR, then usage must not include VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR.

If usage contains VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT, and any of the following is true:

- the externalFormatResolve feature is not enabled
- the nullColorAttachmentWithExternalFormatResolve property is VK_FALSE
- image was created with an VkExternalFormatANDROID::externalFormat value of 0

then the image view's format features must contain at least one of VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT or VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT or VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV.

subresourceRange.baseMipLevel must be less than the mipLevels specified in VkImageCreateInfo when image was created.

If subresourceRange.levelCount is not VK_REMAINING_MIP_LEVELS, subresourceRange.baseMipLevel + subresourceRange.levelCount must be less than or equal to the mipLevels specified in VkImageCreateInfo when image was created.

If image was created with usage containing VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT, subresourceRange.levelCount must be 1.

If image is not a 3D image created with VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT or VK_IMAGE_CREATE_2D_VIEW_COMPATIBLE_BIT_EXT set, or viewType is not VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY, subresourceRange.baseArrayLayer must be less than the arrayLayers specified in VkImageCreateInfo when image was created.

If subresourceRange.layerCount is not VK_REMAINING_ARRAY_LAYERS, image is not a 3D image created with VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT or VK_IMAGE_CREATE_2D_VIEW_COMPATIBLE_BIT_EXT set, or viewType is not VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY, subresourceRange.layerCount must be non-zero and subresourceRange.baseArrayLayer + subresourceRange.layerCount must be less than or equal to the arrayLayers specified in VkImageCreateInfo when image was created.

If image is a 3D image created with VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT set, and viewType is VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY, subresourceRange.baseArrayLayer must be less than the depth computed from baseMipLevel and extent.depth specified in VkImageCreateInfo when image was created, according to the formula defined in Image Mip Level Sizing.

If subresourceRange.layerCount is not VK_REMAINING_ARRAY_LAYERS, image is a 3D image created with VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT set, and viewType is...
VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY, subresourceRange.layerCount must be non-zero and subresourceRange.baseArrayLayer + subresourceRange.layerCount must be less than or equal to the depth computed from baseMipLevel and extent.depth specified in VkImageCreateInfo when image was created, according to the formula defined in Image Mip Level Sizing

- **VUID-VkImageViewCreateInfo-image-01761**
  If image was created with the VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT flag, but without the VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT flag, and if the format of the image is not a multi-planar format, format must be compatible with the format used to create image, as defined in Format Compatibility Classes

- **VUID-VkImageViewCreateInfo-image-01583**
  If image was created with the VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT flag, format must be compatible with, or must be an uncompressed format that is size-compatible with, the format used to create image

- **VUID-VkImageViewCreateInfo-image-07072**
  If image was created with the VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT flag and format is a non-compressed format, the levelCount member of subresourceRange must be 1

- **VUID-VkImageViewCreateInfo-image-09487**
  If image was created with the VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT flag, the VkPhysicalDeviceMaintenance6PropertiesKHR::blockTexelViewCompatibleMultipleLayers property is not set to VK_TRUE, and format is a non-compressed format, then the layerCount member of subresourceRange must be 1

- **VUID-VkImageViewCreateInfo-pNext-01585**
  If a VkImageFormatListCreateInfo structure was included in the pNext chain of the VkImageCreateInfo structure used when creating image and VkImageFormatListCreateInfo::viewFormatCount is not zero then format must be one of the formats in VkImageFormatListCreateInfo::pViewFormats

- **VUID-VkImageViewCreateInfo-image-01586**
  If image was created with the VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT flag, if the format of the image is a multi-planar format, and if subresourceRange.aspectMask is one of the multi-planar aspect mask bits, then format must be compatible with the VkFormat for the plane of the image format indicated by subresourceRange.aspectMask, as defined in Compatible Formats of Planes of Multi-Planar Formats

- **VUID-VkImageViewCreateInfo-subresourceRange-07818**
  subresourceRange.aspectMask must only have at most 1 valid multi-planar aspect mask bit

- **VUID-VkImageViewCreateInfo-image-01762**
  If image was not created with the VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT flag, or if the format of the image is a multi-planar format and if subresourceRange.aspectMask is VK_IMAGE_ASPECT_COLOR_BIT, format must be identical to the format used to create image

- **VUID-VkImageViewCreateInfo-format-06415**
  If the image view requires a sampler Y’C₆C₆R conversion and usage contains VK_IMAGE_USAGE_SAMPLED_BIT, then the pNext chain must include a VkSamplerYcbcrConversionInfo structure with a conversion value other than VK_NULL_HANDLE
If `format` has a `_422` or `_420` suffix then `image` must have been created with a width that is a multiple of 2

If `format` has a `_420` suffix then `image` must have been created with a height that is a multiple of 2

If the `pNext` chain includes a `VkSamplerYcbcrConversionInfo` structure with a conversion value other than `VK_NULL_HANDLE`, all members of `components` must have the identity swizzle

If the `pNext` chain includes a `VkSamplerYcbcrConversionInfo` structure with a conversion value other than `VK_NULL_HANDLE`, `format` must be the same used in `VkSamplerYcbcrConversionCreateInfo::format`

If `image` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

`viewType` must be compatible with the type of `image` as shown in the view type compatibility table

If `image` has an Android external format, `format` must be `VK_FORMAT_UNDEFINED`

If `image` has an Android external format, the `pNext` chain must include a `VkSamplerYcbcrConversionInfo` structure with a conversion object created with the same external format as `image`

If `image` has an Android external format, all members of `components` must be the identity swizzle

If `image` has an QNX Screen external format, `format` must be `VK_FORMAT_UNDEFINED`

If `image` has an QNX Screen external format, the `pNext` chain must include a `VkSamplerYcbcrConversionInfo` structure with a conversion object created with the same external format as `image`

If `image` has an QNX Screen external format, all members of `components` must be the identity swizzle

If `image` was created with usage containing `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`, `viewType` must be `VK_IMAGE_VIEW_TYPE_2D` or `VK_IMAGE_VIEW_TYPE_2D_ARRAY`
If the shadingRateImage feature is enabled, and if image was created with usage containing VK_IMAGE_USAGE_SHADING_RATE_IMAGE_BIT_NV, format must be VK_FORMAT_R8_UINT

- VUID-VkImageViewCreateInfo-usage-04550
  If the attachmentFragmentShadingRate feature is enabled, and the usage for the image view includes VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR, then the image view's format features must contain VK_FORMAT_FEATURE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-VkImageViewCreateInfo-usage-04551
  If the attachmentFragmentShadingRate feature is enabled, the usage for the image view includes VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR, and layeredShadingRateAttachments is VK_FALSE, subresourceRange.layerCount must be 1

- VUID-VkImageViewCreateInfo-flags-02572
  If the fragmentDensityMapDynamic feature is not enabled, flags must not contain VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT

- VUID-VkImageViewCreateInfo-flags-03567
  If the fragmentDensityMapDeferred feature is not enabled, flags must not contain VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DEFERRED_BIT_EXT

- VUID-VkImageViewCreateInfo-flags-03568
  If flags contains VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DEFERRED_BIT_EXT, flags must not contain VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT

- VUID-VkImageViewCreateInfo-image-03569
  If image was created with flags containing VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT and usage containing VK_IMAGE_USAGE_SAMPLED_BIT, subresourceRange.layerCount must be less than or equal to VkPhysicalDeviceFragmentDensityMap2PropertiesEXT::maxSubsampledArrayLayers

- VUID-VkImageViewCreateInfo-invocationMask-04993
  If the invocationMask feature is enabled, and if image was created with usage containing VK_IMAGE_USAGE_INVOCATION_MASK_BIT_HUAWEI, format must be VK_FORMAT_R8_UINT

- VUID-VkImageViewCreateInfo-flags-04116
  If flags does not contain VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT and image was created with usage containing VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT, its flags must not contain any of VK_IMAGE_CREATE_PROTECTED_BIT, VK_IMAGE_CREATE_SPARSE_BINDING_BIT, VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT, or VK_IMAGE_CREATE_SPARSE_ALIASED_BIT

- VUID-VkImageViewCreateInfo-pNext-02662
  If the pNext chain includes a VkImageViewUsageCreateInfo structure, and image was not created with a VkImageStencilUsageCreateInfo structure included in the pNext chain of VkImageCreateInfo, its usage member must not include any bits that were not set in the usage member of the VkImageCreateInfo structure used to create image

- VUID-VkImageViewCreateInfo-pNext-02663
  If the pNext chain includes a VkImageViewUsageCreateInfo structure, image was created with a VkImageStencilUsageCreateInfo structure included in the pNext chain of VkImageCreateInfo, and subresourceRange.aspectMask includes VK_IMAGE_ASPECT_STENCIL_BIT, the usage member of the VkImageViewUsageCreateInfo structure must not include any bits that were not set in the usage member of the
VkImageStencilUsageCreateInfo structure used to create image

- **VUID-VkImageViewCreateInfo-pNext-02664**
  If the pNext chain includes a VkImageViewUsageCreateInfo structure, image was created with a VkImageStencilUsageCreateInfo structure included in the pNext chain of VkImageCreateInfo, and subresourceRange.aspectMask includes bits other than VK_IMAGE_ASPECT_STENCIL_BIT, the usage member of the VkImageViewUsageCreateInfo structure must not include any bits that were not set in the usage member of the VkImageCreateInfo structure used to create image.

- **VUID-VkImageViewCreateInfo-imageViewType-04973**
  If viewType is VK_IMAGE_VIEW_TYPE_1D, VK_IMAGE_VIEW_TYPE_2D, or VK_IMAGE_VIEW_TYPE_3D; and subresourceRange.layerCount is not VK_REMAINING_ARRAY_LAYERS, then subresourceRange.layerCount must be 1.

- **VUID-VkImageViewCreateInfo-imageViewType-04974**
  If viewType is VK_IMAGE_VIEW_TYPE_1D, VK_IMAGE_VIEW_TYPE_2D, or VK_IMAGE_VIEW_TYPE_3D; and subresourceRange.layerCount is VK_REMAINING_ARRAY_LAYERS, then the remaining number of layers must be 1.

- **VUID-VkImageViewCreateInfo-viewType-02960**
  If viewType is VK_IMAGE_VIEW_TYPE_CUBE and subresourceRange.layerCount is not VK_REMAINING_ARRAY_LAYERS, subresourceRange.layerCount must be 6.

- **VUID-VkImageViewCreateInfo-viewType-02961**
  If viewType is VK_IMAGE_VIEW_TYPE_CUBE_ARRAY and subresourceRange.layerCount is not VK_REMAINING_ARRAY_LAYERS, subresourceRange.layerCount must be a multiple of 6.

- **VUID-VkImageViewCreateInfo-viewType-02962**
  If viewType is VK_IMAGE_VIEW_TYPE_CUBE and subresourceRange.layerCount is VK_REMAINING_ARRAY_LAYERS, the remaining number of layers must be 6.

- **VUID-VkImageViewCreateInfo-viewType-02963**
  If viewType is VK_IMAGE_VIEW_TYPE_CUBE_ARRAY and subresourceRange.layerCount is VK_REMAINING_ARRAY_LAYERS, the remaining number of layers must be a multiple of 6.

- **VUID-VkImageViewCreateInfo-imageViewFormatSwizzle-04465**
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::imageViewFormatSwizzle is VK_FALSE, all elements of components must have the identity swizzle.

- **VUID-VkImageViewCreateInfo-imageViewFormatReinterpretation-04466**
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::imageViewFormatReinterpretation is VK_FALSE, the VkFormat in format must not contain a different number of components, or a different number of bits in each component, than the format of the VkImage in image.

- **VUID-VkImageViewCreateInfo-image-04817**
  If image was created with usage containing VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR, VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR, or VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR, then the viewType must be VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY.

- **VUID-VkImageViewCreateInfo-image-04818**
  If image was created with usage containing VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR,
If `flags` includes `VK_IMAGE_VIEW_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT`, the `descriptorBufferCaptureReplay` feature must be enabled.

If the `pNext` chain includes a `VkOpaqueCaptureDescriptorDataCreateInfoEXT` structure, `flags` must contain `VK_IMAGE_VIEW_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT`.

If the `pNext` chain includes a `VkExportMetalObjectCreateInfoEXT` structure, its `exportObjectType` member must be `VK_EXPORT_METAL_OBJECT_TYPE_METAL_TEXTURE_BIT_EXT`.

If the `pNext` chain includes a `VkImageViewSampleWeightCreateInfoQCOM` structure, then the `textureSampleWeighted` feature must be enabled.

If the `pNext` chain includes a `VkImageViewSampleWeightCreateInfoQCOM` structure, then the `image` must have been created with usage containing `VK_IMAGE_USAGE_SAMPLE_WEIGHT_BIT_QCOM`.

If the `pNext` chain includes a `VkImageViewSampleWeightCreateInfoQCOM` structure, then all components must be `VK_COMPONENT_SWIZZLE_IDENTITY`.

If the `pNext` chain includes a `VkImageViewSampleWeightCreateInfoQCOM` structure, then `subresourceRange.aspectMask` must be `VK_IMAGE_ASPECT_COLOR_BIT`.

If the `pNext` chain includes a `VkImageViewSampleWeightCreateInfoQCOM` structure, then `subresourceRange.levelCount` must be `1`.

If the `pNext` chain includes a `VkImageViewSampleWeightCreateInfoQCOM` structure and if `viewType` is `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, then the `image` must have been created with `imageType` `VK_IMAGE_TYPE_1D`.

If the `pNext` chain includes a `VkImageViewSampleWeightCreateInfoQCOM` structure and `viewType` is `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, then `subresourceRange.layerCount` must be equal to `2`.

If the `pNext` chain includes a `VkImageViewSampleWeightCreateInfoQCOM` structure and `viewType` is `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, then `image` must have been created with `width` equal to or greater than \(\text{numPhases} \times \max(\text{align}(\text{filterSize.width}, 4), \text{filterSize.height})\).

If the `pNext` chain includes a `VkImageViewSampleWeightCreateInfoQCOM` structure and `viewType` is `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, then `image` must have been created with `width` equal to or greater than \(\text{numPhases} \times \max(\text{align}(\text{filterSize.width}, 4), \text{filterSize.height})\).
If the `pNext` chain includes `VkImageViewSampleWeightCreateInfoQCOM` structure and if `viewType` is `VK_IMAGE_VIEW_TYPE_2D_ARRAY`, then `image` must have been created with `imageType` `VK_IMAGE_TYPE_2D`.

- **VUID-VkImageViewCreateInfo-pNext-06954**
  If the `pNext` chain includes `VkImageViewSampleWeightCreateInfoQCOM` structure and `viewType` is `VK_IMAGE_VIEW_TYPE_2D_ARRAY`, then `subresourceRange.layerCount` must be equal or greater than `numPhases`.

- **VUID-VkImageViewCreateInfo-pNext-06955**
  If the `pNext` chain includes `VkImageViewSampleWeightCreateInfoQCOM` structure and `viewType` is `VK_IMAGE_VIEW_TYPE_2D_ARRAY`, then `image` must have been created with `width` equal to or greater than `filterSize.width`.

- **VUID-VkImageViewCreateInfo-pNext-06956**
  If the `pNext` chain includes `VkImageViewSampleWeightCreateInfoQCOM` structure and `viewType` is `VK_IMAGE_VIEW_TYPE_2D_ARRAY`, then `image` must have been created with `height` equal to or greater than `filterSize.height`.

- **VUID-VkImageViewCreateInfo-pNext-06957**
  If the `pNext` chain includes `VkImageViewSampleWeightCreateInfoQCOM` structure then `VkImageViewSampleWeightCreateInfoQCOM::filterSize.height` must be less than or equal to `VkPhysicalDeviceImageProcessingPropertiesQCOM::maxWeightFilterDimension.height`.

### Valid Usage (Implicit)

- **VUID-VkImageViewCreateInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_IMAGE_VIEW_CREATE_INFO`.

- **VUID-VkImageViewCreateInfo-pNext-pNext**
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkExportMetalObjectCreateInfoEXT`, `VkImageViewASTCDecodeModeEXT`, `VkImageViewMinLodCreateInfoEXT`, `VkImageViewSampleWeightCreateInfoQCOM`, `VkImageViewSlicedCreateInfoEXT`, `VkImageViewUsageCreateInfo`, `VkOpaqueCaptureDescriptorDataCreateInfoEXT`, or `VkSamplerYcbcrConversionInfo`.

- **VUID-VkImageViewCreateInfo-sType-unique**
  The `sType` value of each struct in the `pNext` chain must be unique, with the exception of structures of type `VkExportMetalObjectCreateInfoEXT`.

- **VUID-VkImageViewCreateInfo-flags-parameter**
  `flags` must be a valid combination of `VkImageViewCreateFlagBits` values.

- **VUID-VkImageViewCreateInfo-image-parameter**
  `image` must be a valid `VkImage` handle.

- **VUID-VkImageViewCreateInfo-viewType-parameter**
  `viewType` must be a valid `VkImageViewType` value.

- **VUID-VkImageViewCreateInfo-format-parameter**
  `format` must be a valid `VkFormat` value.
Bits which can be set in `VkImageViewCreateInfo::flags`, specifying additional parameters of an image view, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkImageViewCreateFlagBits {
    // Provided by VK_EXT_fragment_density_map
    VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT = 0x00000001,
    // Provided by VK_EXT_descriptor_buffer
    VK_IMAGE_VIEW_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT = 0x00000004,
    // Provided by VK_EXT_fragment_density_map2
    VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DEFERRED_BIT_EXT = 0x00000002,
} VkImageViewCreateFlagBits;
```

- `VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT` specifies that the fragment density map will be read by device during `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`
- `VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DEFERRED_BIT_EXT` specifies that the fragment density map will be read by the host during `vkEndCommandBuffer` for the primary command buffer that the render pass is recorded into
- `VK_IMAGE_VIEW_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT` specifies that the image view can be used with descriptor buffers when capturing and replaying (e.g. for trace capture and replay), see `VkOpaqueCaptureDescriptorDataCreateInfoEXT` for more detail.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkImageViewCreateFlags;
```

`VkImageViewCreateFlags` is a bitmask type for setting a mask of zero or more `VkImageViewCreateFlagBits`.

The set of usages for the created image view can be restricted compared to the parent image's usage flags by adding a `VkImageViewUsageCreateInfo` structure to the `pNext` chain of `VkImageViewCreateInfo`.

The `VkImageViewUsageCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkImageViewUsageCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkImageUsageFlags usage;
} VkImageViewUsageCreateInfo;
```
or the equivalent

```c
// Provided by VK_KHR_maintenance2
typedef VkImageViewUsageCreateInfo VkImageViewUsageCreateInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **usage** is a bitmask of `VkImageUsageFlagBits` specifying allowed usages of the image view.

When this structure is chained to `VkImageViewCreateInfo` the `usage` field overrides the implicit `usage` parameter inherited from image creation time and its value is used instead for the purposes of determining the valid usage conditions of `VkImageViewCreateInfo`.

### Valid Usage (Implicit)

- `VUID-VkImageViewUsageCreateInfo-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_IMAGE_VIEW_USAGE_CREATE_INFO`  
- `VUID-VkImageViewUsageCreateInfo-usage-parameter`  
  `usage` must be a valid combination of `VkImageUsageFlagBits` values  
- `VUID-VkImageViewUsageCreateInfo-usage-requiredmask`  
  `usage` must not be `0`

The range of 3D slices for the created image view can be restricted to a subset of the parent image’s Z range by adding a `VkImageViewSlicedCreateInfoEXT` structure to the `pNext` chain of `VkImageViewCreateInfo`.

The `VkImageViewSlicedCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_image_sliced_view_of_3d
typedef struct VkImageViewSlicedCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t sliceOffset;
    uint32_t sliceCount;
} VkImageViewSlicedCreateInfoEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **sliceOffset** is the Z-offset for the first 3D slice accessible to the image view.
- **sliceCount** is the number of 3D slices accessible to the image view.

When this structure is chained to `VkImageViewCreateInfo` the `sliceOffset` field is treated as a Z-offset for the sliced view and `sliceCount` specifies the range. Shader accesses using a Z coordinate of 0 will access the depth slice corresponding to `sliceOffset` in the image, and in a shader, the
maximum in-bounds Z coordinate for the view is sliceCount - 1.

A sliced 3D view **must** only be used with a single mip level. The slice coordinates are integer coordinates within the subresourceRange.baseMipLevel used to create the image view.

The effective view depth is equal to extent.depth used to create the image for this view adjusted by subresourceRange.baseMipLevel as specified in Image Mip Level Sizing.

Shader access to this image view is only affected by VkImageViewSlicedCreateInfoEXT if it uses a descriptor of type VK_DESCRIPTOR_TYPE_STORAGE_IMAGE. For access using any other descriptor type, the contents of VkImageViewSlicedCreateInfoEXT are ignored; instead, sliceOffset is treated as being equal to 0, and sliceCount is treated as being equal to VK_REMAINING_3D_SLICES_EXT.

---

**Valid Usage**

- VUID-VkImageViewSlicedCreateInfoEXT-sliceOffset-07867
  sliceOffset **must** be less than the effective view depth as specified in Image Mip Level Sizing

- VUID-VkImageViewSlicedCreateInfoEXT-sliceCount-07868
  If sliceCount is not VK_REMAINING_3D_SLICES_EXT, it **must** be non-zero and sliceOffset + sliceCount **must** be less than or equal to the effective view depth as specified in Image Mip Level Sizing

- VUID-VkImageViewSlicedCreateInfoEXT-image-07869
  image **must** have been created with imageType equal to VK_IMAGE_TYPE_3D

- VUID-VkImageViewSlicedCreateInfoEXT-viewType-07909
  viewType **must** be VK_IMAGE_VIEW_TYPE_3D

- VUID-VkImageViewSlicedCreateInfoEXT-None-07870
  The image view **must** reference exactly 1 mip level

- VUID-VkImageViewSlicedCreateInfoEXT-None-07871
  The imageSlicedViewOf3D feature **must** be enabled on the device

---

**Valid Usage (Implicit)**

- VUID-VkImageViewSlicedCreateInfoEXT-sType-07866
  sType **must** be VK_STRUCTURE_TYPE_IMAGE_VIEW_SLICED_CREATE_INFO_EXT

---

VK_REMAINING_3D_SLICES_EXT is a special constant value used for VkImageViewSlicedCreateInfoEXT::sliceCount to indicate that all remaining 3D slices in an image after the first slice offset specified should be included in the view.

```c
#define VK_REMAINING_3D_SLICES_EXT (~0U)
```

The VkImageSubresourceRange structure is defined as:
typedef struct VkImageSubresourceRange {
  VkImageAspectFlags aspectMask;
  uint32_t baseMipLevel;
  uint32_t levelCount;
  uint32_t baseArrayLayer;
  uint32_t layerCount;
} VkImageSubresourceRange;

- `aspectMask` is a bitmask of `VkImageAspectFlagBits` specifying which aspect(s) of the image are included in the view.
- `baseMipLevel` is the first mipmap level accessible to the view.
- `levelCount` is the number of mipmap levels (starting from `baseMipLevel`) accessible to the view.
- `baseArrayLayer` is the first array layer accessible to the view.
- `layerCount` is the number of array layers (starting from `baseArrayLayer`) accessible to the view.

The number of mipmap levels and array layers must be a subset of the image subresources in the image. If an application wants to use all mip levels or layers in an image after the `baseMipLevel` or `baseArrayLayer`, it can set `levelCount` and `layerCount` to the special values `VK_REMAINING_MIP_LEVELS` and `VK_REMAINING_ARRAY_LAYERS` without knowing the exact number of mip levels or layers.

For cube and cube array image views, the layers of the image view starting at `baseArrayLayer` correspond to faces in the order +X, -X, +Y, -Y, +Z, -Z. For cube arrays, each set of six sequential layers is a single cube, so the number of cube maps in a cube map array view is `layerCount / 6`, and image array layer `(baseArrayLayer + i)` is face index `(i mod 6)` of cube `i / 6`. If the number of layers in the view, whether set explicitly in `layerCount` or implied by `VK_REMAINING_ARRAY_LAYERS`, is not a multiple of 6, the last cube map in the array must not be accessed.

`aspectMask` must be only `VK_IMAGE_ASPECT_COLOR_BIT`, `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT` if `format` is a color, depth-only or stencil-only format, respectively, except if `format` is a multi-planar format. If using a depth/stencil format with both depth and stencil components, `aspectMask` must include at least one of `VK_IMAGE_ASPECT_DEPTH_BIT` and `VK_IMAGE_ASPECT_STENCIL_BIT`, and can include both.

When the `VkImageSubresourceRange` structure is used to select a subset of the slices of a 3D image’s mip level in order to create a 2D or 2D array image view of a 3D image created with `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT`, `baseArrayLayer` and `layerCount` specify the first slice index and the number of slices to include in the created image view. Such an image view can be used as a framebuffer attachment that refers only to the specified range of slices of the selected mip level. However, any layout transitions performed on such an attachment view during a render pass instance still apply to the entire subresource referenced which includes all the slices of the selected mip level.

When using an image view of a depth/stencil image to populate a descriptor set (e.g. for sampling in the shader, or for use as an input attachment), the `aspectMask` must only include one bit, which selects whether the image view is used for depth reads (i.e. using a floating-point sampler or input attachment in the shader) or stencil reads (i.e. using an unsigned integer sampler or input attachment in the shader).
attachment in the shader). When an image view of a depth/stencil image is used as a depth/stencil framebuffer attachment, the aspectMask is ignored and both depth and stencil image subresources are used.

When creating a VKImageview, if sampler Y’C_bC_r conversion is enabled in the sampler, the aspectMask of a subresourceRange used by the VKImageview must be VK_IMAGE_ASPECT_COLOR_BIT.

When creating a VKImageview, if sampler Y’C_bC_r conversion is not enabled in the sampler and the image format is multi-planar, the image must have been created with VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT, and the aspectMask of the VKImageview’s subresourceRange must be VK_IMAGE_ASPECT_PLANES_0_BIT, VK_IMAGE_ASPECT_PLANES_1_BIT or VK_IMAGE_ASPECT_PLANES_2_BIT.

Valid Usage

• VUID-VkImageSubresourceRange-levelCount-01720
  If levelCount is not VK_REMAINING_MIP_LEVELS, it must be greater than 0

• VUID-VkImageSubresourceRange-layerCount-01721
  If layerCount is not VK_REMAINING_ARRAY_LAYERS, it must be greater than 0

• VUID-VkImageSubresourceRange-aspectMask-01670
  If aspectMask includes VK_IMAGE_ASPECT_COLOR_BIT, then it must not include any of VK_IMAGE_ASPECT_PLANES_0_BIT, VK_IMAGE_ASPECT_PLANES_1_BIT, or VK_IMAGE_ASPECT_PLANES_2_BIT

• VUID-VkImageSubresourceRange-aspectMask-02278
  aspectMask must not include VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT for any index i

Valid Usage (Implicit)

• VUID-VkImageSubresourceRange-aspectMask-parameter
  aspectMask must be a valid combination of VkImageAspectFlagBits values

• VUID-VkImageSubresourceRange-aspectMask-required bitmask
  aspectMask must not be 0

Bits which can be set in an aspect mask to specify aspects of an image for purposes such as identifying a subresource, are:

// Provided by VK_VERSION_1_0
typedef enum VkImageAspectFlagBits {
    VK_IMAGE_ASPECT_COLOR_BIT = 0x00000001,
    VK_IMAGE_ASPECT_DEPTH_BIT = 0x00000002,
    VK_IMAGE_ASPECT_STENCIL_BIT = 0x00000004,
    VK_IMAGE_ASPECT_METADATA_BIT = 0x00000008,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_MANUAL_BIT = 0x00000009,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANES_0_BIT = 0x00000010,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANES_1_BIT = 0x00000020,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANES_2_BIT = 0x00000030,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANES_3_BIT = 0x00000040,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANES_4_BIT = 0x00000080,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANES_5_BIT = 0x00000100,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANES_6_BIT = 0x00000200,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANES_7_BIT = 0x00000400,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANES_8_BIT = 0x00000800,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANES_9_BIT = 0x00001000,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANES_10_BIT = 0x00002000,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANES_11_BIT = 0x00004000,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANES_12_BIT = 0x00008000,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANES_13_BIT = 0x00010000,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANES_14_BIT = 0x00020000,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANES_15_BIT = 0x00040000,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANES_16_BIT = 0x00080000,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANES_17_BIT = 0x00100000,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANES_18_BIT = 0x00200000,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANES_19_BIT = 0x00400000,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANES_20_BIT = 0x00800000,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANES_21_BIT = 0x01000000,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANES_22_BIT = 0x02000000,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANES_23_BIT = 0x04000000,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANES_24_BIT = 0x08000000,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANES_25_BIT = 0x10000000,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANES_26_BIT = 0x20000000,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANES_27_BIT = 0x40000000,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANES_28_BIT = 0x80000000,
VK_IMAGE_ASPECT_PLANE_2_BIT = 0x00000040,
// Provided by VK_VERSION_1_3
VK_IMAGE_ASPECT_NONE = 0,
// Provided by VK_EXT_image_drm_format_modifier
VK_IMAGE_ASPECT_MEMORY_PLANE_0_BIT_EXT = 0x00000080,
// Provided by VK_EXT_image_drm_format_modifier
VK_IMAGE_ASPECT_MEMORY_PLANE_1_BIT_EXT = 0x00000100,
// Provided by VK_EXT_image_drm_format_modifier
VK_IMAGE_ASPECT_MEMORY_PLANE_2_BIT_EXT = 0x00000200,
// Provided by VK_EXT_image_drm_format_modifier
VK_IMAGE_ASPECT_MEMORY_PLANE_3_BIT_EXT = 0x00000400,
// Provided by VK_KHR_sampler_ycbcr_conversion
VK_IMAGE_ASPECT_PLANE_0_BIT_KHR = VK_IMAGE_ASPECT_PLANE_0_BIT,
// Provided by VK_KHR_sampler_ycbcr_conversion
VK_IMAGE_ASPECT_PLANE_1_BIT_KHR = VK_IMAGE_ASPECT_PLANE_1_BIT,
// Provided by VK_KHR_sampler_ycbcr_conversion
VK_IMAGE_ASPECT_PLANE_2_BIT_KHR = VK_IMAGE_ASPECT_PLANE_2_BIT,
// Provided by VK_KHR_maintenance4
VK_IMAGE_ASPECT_NONE_KHR = VK_IMAGE_ASPECT_NONE,
} VkImageAspectFlagBits;

- VK_IMAGE_ASPECT_NONE specifies no image aspect, or the image aspect is not applicable.
- VK_IMAGE_ASPECT_COLOR_BIT specifies the color aspect.
- VK_IMAGE_ASPECT_DEPTH_BIT specifies the depth aspect.
- VK_IMAGE_ASPECT_STENCIL_BIT specifies the stencil aspect.
- VK_IMAGE_ASPECT_METADATA_BIT specifies the metadata aspect used for sparse resource operations.
- VK_IMAGE_ASPECT_PLANE_0_BIT specifies plane 0 of a multi-planar image format.
- VK_IMAGE_ASPECT_PLANE_1_BIT specifies plane 1 of a multi-planar image format.
- VK_IMAGE_ASPECT_PLANE_2_BIT specifies plane 2 of a multi-planar image format.
- VK_IMAGE_ASPECT_MEMORY_PLANE_0_BIT_EXT specifies memory plane 0.
- VK_IMAGE_ASPECT_MEMORY_PLANE_1_BIT_EXT specifies memory plane 1.
- VK_IMAGE_ASPECT_MEMORY_PLANE_2_BIT_EXT specifies memory plane 2.
- VK_IMAGE_ASPECT_MEMORY_PLANE_3_BIT_EXT specifies memory plane 3.

typedef VkFlags VkImageAspectFlags;

VkImageAspectFlags is a bitmask type for setting a mask of zero or more VkImageAspectFlagBits.

The VkComponentMapping structure is defined as:

typedef struct VkComponentMapping {

// Provided by VK_VERSION_1_0
typedef VkFlags VkImageAspectFlags;

VkImageAspectFlags is a bitmask type for setting a mask of zero or more VkImageAspectFlagBits.

The VkComponentMapping structure is defined as:
VKComponentSwizzle r;
VKComponentSwizzle g;
VKComponentSwizzle b;
VKComponentSwizzle a;
} VkComponentMapping;

- r is a `VkComponentSwizzle` specifying the component value placed in the R component of the output vector.
- g is a `VkComponentSwizzle` specifying the component value placed in the G component of the output vector.
- b is a `VkComponentSwizzle` specifying the component value placed in the B component of the output vector.
- a is a `VkComponentSwizzle` specifying the component value placed in the A component of the output vector.

**Valid Usage (Implicit)**

- VUID-VkComponentMapping-r-parameter  
  *r* must be a valid `VkComponentSwizzle` value
- VUID-VkComponentMapping-g-parameter  
  *g* must be a valid `VkComponentSwizzle` value
- VUID-VkComponentMapping-b-parameter  
  *b* must be a valid `VkComponentSwizzle` value
- VUID-VkComponentMapping-a-parameter  
  *a* must be a valid `VkComponentSwizzle` value

Possible values of the members of `VkComponentMapping`, specifying the component values placed in each component of the output vector, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkComponentSwizzle {
    VK_COMPONENT_SWIZZLE_IDENTITY = 0,
    VK_COMPONENT_SWIZZLE_ZERO = 1,
    VK_COMPONENT_SWIZZLE_ONE = 2,
    VK_COMPONENT_SWIZZLE_R = 3,
    VK_COMPONENT_SWIZZLE_G = 4,
    VK_COMPONENT_SWIZZLE_B = 5,
    VK_COMPONENT_SWIZZLE_A = 6,
} VkComponentSwizzle;
```

- `VK_COMPONENT_SWIZZLE_IDENTITY` specifies that the component is set to the identity swizzle.
- `VK_COMPONENT_SWIZZLE_ZERO` specifies that the component is set to zero.
- `VK_COMPONENT_SWIZZLE_ONE` specifies that the component is set to either 1 or 1.0, depending on
whether the type of the image view format is integer or floating-point respectively, as determined by the Format Definition section for each VkFormat.

- **VK_COMPONENT_SWIZZLE_R** specifies that the component is set to the value of the R component of the image.
- **VK_COMPONENT_SWIZZLE_G** specifies that the component is set to the value of the G component of the image.
- **VK_COMPONENT_SWIZZLE_B** specifies that the component is set to the value of the B component of the image.
- **VK_COMPONENT_SWIZZLE_A** specifies that the component is set to the value of the A component of the image.

Setting the identity swizzle on a component is equivalent to setting the identity mapping on that component. That is:

<table>
<thead>
<tr>
<th>Component</th>
<th>Identity Mapping</th>
</tr>
</thead>
<tbody>
<tr>
<td>components.r</td>
<td>VK_COMPONENT_SWIZZLE_R</td>
</tr>
<tr>
<td>components.g</td>
<td>VK_COMPONENT_SWIZZLE_G</td>
</tr>
<tr>
<td>components.b</td>
<td>VK_COMPONENT_SWIZZLE_B</td>
</tr>
<tr>
<td>components.a</td>
<td>VK_COMPONENT_SWIZZLE_A</td>
</tr>
</tbody>
</table>

If the pNext chain includes a VkImageViewASTCDecodeModeEXT structure, then that structure includes a parameter specifying the decode mode for image views using ASTC compressed formats.

The VkImageViewASTCDecodeModeEXT structure is defined as:

```c
// Provided by VK_EXT_astc_decode_mode
typedef struct VkImageViewASTCDecodeModeEXT {
  VkStructureType sType;
  const void* pNext;
  VkFormat decodeMode;
} VkImageViewASTCDecodeModeEXT;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **decodeMode** is the intermediate format used to decode ASTC compressed formats.

**Valid Usage**

- VUID-VkImageViewASTCDecodeModeEXT-decodeMode-02230 decodeMode must be one of VK_FORMAT_R16G16B16A16_SFLOAT, VK_FORMAT_R8G8B8A8_UNORM, or VK_FORMAT_E5B9G9R9_UFLOAT_PACK32
- VUID-VkImageViewASTCDecodeModeEXT-decodeMode-02231 If the decodeModeSharedExponent feature is not enabled, decodeMode must not be
If `format` uses sRGB encoding then the `decodeMode` has no effect.

### Valid Usage (Implicit)

- VUID-VkImageViewASTCDecodeModeEXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_IMAGE_VIEW_ASTC_DECODE_MODE_EXT`

- VUID-VkImageViewASTCDecodeModeEXT-decodeMode-parameter
  
  `decodeMode` must be a valid `VkFormat` value

If the `pNext` chain includes a `VkImageViewSampleWeightCreateInfoQCOM` structure, then that structure includes a parameter specifying the parameters for weight image views used in weight image sampling.

The `VkImageViewSampleWeightCreateInfoQCOM` structure is defined as:

```c
// Provided by VK_QCOM_image_processing
typedef struct VkImageViewSampleWeightCreateInfoQCOM {
    VkStructureType sType;
    const void* pNext;
    VkOffset2D filterCenter;
    VkExtent2D filterSize;
    uint32_t numPhases;
} VkImageViewSampleWeightCreateInfoQCOM;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `filterCenter` is a `VkOffset2D` describing the location of the weight filter origin.
- `filterSize` is a `VkExtent2D` specifying weight filter dimensions.
- `numPhases` is number of sub-pixel filter phases.

The `filterCenter` specifies the origin or center of the filter kernel, as described in Weight Sampling Operation. The `numPhases` describes the number of sub-pixel filter phases as described in Weight Sampling Phases.
Valid Usage

• VUID-VkImageViewSampleWeightCreateInfoQCOM-filterSize-06958
  `filterSize.width` must be less than or equal to
  `VkPhysicalDeviceImageProcessingPropertiesQCOM::maxWeightFilterDimension.width`

• VUID-VkImageViewSampleWeightCreateInfoQCOM-filterSize-06959
  `filterSize.height` must be less than or equal to
  `VkPhysicalDeviceImageProcessingPropertiesQCOM::maxWeightFilterDimension.height`

• VUID-VkImageViewSampleWeightCreateInfoQCOM-filterCenter-06960
  `filterCenter.x` must be less than or equal to (`filterSize.width - 1`)

• VUID-VkImageViewSampleWeightCreateInfoQCOM-filterCenter-06961
  `filterCenter.y` must be less than or equal to (`filterSize.height - 1`)

• VUID-VkImageViewSampleWeightCreateInfoQCOM-numPhases-06962
  `numPhases` must be a power of two squared value (i.e., 1, 4, 16, 64, 256, etc.)

• VUID-VkImageViewSampleWeightCreateInfoQCOM-numPhases-06963
  `numPhases` must be less than or equal to `VkPhysicalDeviceImageProcessingPropertiesQCOM::maxWeightFilterPhases`

Valid Usage (Implicit)

• VUID-VkImageViewSampleWeightCreateInfoQCOM-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_IMAGE_VIEW_SAMPLE_WEIGHT_CREATE_INFO_QCOM`

To destroy an image view, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyImageView(
    VkDevice device,
    VkImageView imageView,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the image view.
- `imageView` is the image view to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

• VUID-vkDestroyImageView-imageView-01026
  All submitted commands that refer to `imageView` must have completed execution

• VUID-vkDestroyImageView-imageView-01027
  If `VkAllocationCallbacks` were provided when `imageView` was created, a compatible set of
callbacks **must** be provided here

- VUID-vkDestroyImageView-imageView-01028
  If no `VkAllocationCallbacks` were provided when `imageView` was created, **pAllocator must** be `NULL`

## Valid Usage (Implicit)

- VUID-vkDestroyImageView-device-parameter
  `device must` be a valid `VkDevice` handle

- VUID-vkDestroyImageView-imageView-parameter
  If `imageView` is not `VK_NULL_HANDLE`, `imageView must be` a valid `VkImageView` handle

- VUID-vkDestroyImageView-pAllocator-parameter
  If `pAllocator` is not `NULL`, **pAllocator must be** a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkDestroyImageView-imageView-parent
  If `imageView` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

## Host Synchronization

- Host access to `imageView must` be externally synchronized

To get the handle for an image view, call:

```
// Provided by VK_NVX_image_view_handle
uint32_t vkGetImageViewHandleNVX(
    VkDevice device,                        // logical device that owns the image view.
    const VkImageViewHandleInfoNVX* pInfo); // describes the image view to query and type of handle.
```

- `device` is the logical device that owns the image view.
- `pInfo` describes the image view to query and type of handle.

## Valid Usage (Implicit)

- VUID-vkGetImageViewHandleNVX-device-parameter
  `device must be` a valid `VkDevice` handle

- VUID-vkGetImageViewHandleNVX-pInfo-parameter
  `pInfo must be` a valid pointer to a valid `VkImageViewHandleInfoNVX` structure

The `VkImageViewHandleInfoNVX` structure is defined as:

---

1093
// Provided by VK_NVX_image_view_handle
typedef struct VkImageViewHandleInfoNVX {
    VkStructureType sType;
    const void* pNext;
    VkImageView imageView;
    VkDescriptorType descriptorType;
    VkSampler sampler;
} VkImageViewHandleInfoNVX;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• imageView is the image view to query.
• descriptorType is the type of descriptor for which to query a handle.
• sampler is the sampler to combine with the image view when generating the handle.

Valid Usage

• VUID-VkImageViewHandleInfoNVX-descriptorType-02654
  descriptorType must be VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE,
  VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER

• VUID-VkImageViewHandleInfoNVX-sampler-02655
  sampler must be a valid VkSampler if descriptorType is
  VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER

• VUID-VkImageViewHandleInfoNVX-imageView-02656
  If descriptorType is VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE or
  VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, the image that imageView was created from
  must have been created with the VK_IMAGE_USAGE_SAMPLED_BIT usage bit set

• VUID-VkImageViewHandleInfoNVX-imageView-02657
  If descriptorType is VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, the image that imageView was
  created from must have been created with the VK_IMAGE_USAGE_STORAGE_BIT usage bit set

Valid Usage (Implicit)

• VUID-VkImageViewHandleInfoNVX-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMAGE_VIEW_HANDLE_INFO_NVX

• VUID-VkImageViewHandleInfoNVX-pNext-pNext
  pNext must be NULL

• VUID-VkImageViewHandleInfoNVX-imageView-parameter
  imageView must be a valid VkImageView handle

• VUID-VkImageViewHandleInfoNVX-descriptorType-parameter
  descriptorType must be a valid VkDescriptorType value
If `imageView` and `sampler` are valid handles of non-ignored parameters, both must have been created, allocated, or retrieved from the same `VkDevice`.

To get the device address for an image view, call:

```c
VkResult vkGetImageViewAddressNVX(
    VkDevice device,      // device is the logical device that owns the image view.
    VkImageView imageView, // imageView is a handle to the image view.
    VkImageViewAddressPropertiesNVX* pProperties); // pProperties contains the device address and size when the call returns.
```

Valid Usage (Implicit)

- `device` must be a valid `VkDevice` handle
- `imageView` must be a valid `VkImageView` handle
- `pProperties` must be a valid pointer to a `VkImageViewAddressPropertiesNVX` structure
- `imageView` must have been created, allocated, or retrieved from `device` handle

Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`

The `VkImageViewAddressPropertiesNVX` structure is defined as:

```c
typedef struct VkImageViewAddressPropertiesNVX {
    // Fields...
} VkImageViewAddressPropertiesNVX;
```
VkStructureType sType;
void* pNext;
VkDeviceAddress deviceAddress;
VkDeviceSize size;
} VkImageViewAddressPropertiesNVX;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **deviceAddress** is the device address of the image view.
- **size** is the size in bytes of the image view device memory.

**Valid Usage (Implicit)**

- VUID-VkImageViewAddressPropertiesNVX-sType-sType
  sType **must** be `VK_STRUCTURE_TYPE_IMAGE_VIEW_ADDRESS_PROPERTIES_NVX`
- VUID-VkImageViewAddressPropertiesNVX-pNext-pNext
  pNext **must** be `NULL`

### 12.5.1. Image View Format Features

Valid uses of a `VkImageView` may depend on the image view's *format features*, defined below. Such constraints are documented in the affected valid usage statement.

- If Vulkan 1.3 is supported or the `VK_KHR_format_feature_flags2` extension is supported, and `VkImageViewCreateInfo::image` was created with `VK_IMAGE_TILING_LINEAR`, then the image view's set of *format features* is the value of `VkFormatProperties3::linearTilingFeatures` found by calling `vkGetPhysicalDeviceFormatProperties2` on the same format as `VkImageViewCreateInfo::format`.

- If Vulkan 1.3 is not supported and the `VK_KHR_format_feature_flags2` extension is not supported, and `VkImageViewCreateInfo::image` was created with `VK_IMAGE_TILING_LINEAR`, then the image view's set of *format features* is the union of the value of `VkFormatProperties::linearTilingFeatures` found by calling `vkGetPhysicalDeviceFormatProperties` on the same format as `VkImageViewCreateInfo::format`, with:
  - `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT` if the format is a depth/stencil format and the image view features also contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_BIT`.
  - `VK_FORMAT_FEATURE_2_STORAGE_READWITHOUT_FORMAT_BIT` if the format is one of the extended storage formats and shaderStorageImageReadWithoutFormat is enabled on the device.
  - `VK_FORMAT_FEATURE_2_STORAGE_WRITEWITHOUT_FORMAT_BIT` if the format is one of the extended storage formats and shaderStorageImageWriteWithoutFormat is enabled on the device.

- If Vulkan 1.3 is supported or the `VK_KHR_format_feature_flags2` extension is supported, and `VkImageViewCreateInfo::image` was created with `VK_IMAGE_TILING_OPTIMAL`, but without an Android hardware buffer external format, or a QNX Screen buffer external format, then the image view's set of *format features* is the value of `VkFormatProperties::optimalTilingFeatures` or
VkFormatProperties::optimalTilingFeatures found by calling 
vkGetPhysicalDeviceFormatProperties or vkGetPhysicalDeviceImageFormatProperties2 on the same format as VkImageViewCreateInfo::format.

• If Vulkan 1.3 is not supported and the VK_KHR_format_feature_flags2 extension is not supported, and VkImageViewCreateInfo::image was created with VK_IMAGE_TILING_OPTIMAL, but without an Android hardware buffer external format, or a QNX Screen buffer external format, then the image view's set of format features is the union of the value of VkFormatProperties::optimalTilingFeatures found by calling vkGetPhysicalDeviceFormatProperties on the same format as VkImageViewCreateInfo::format, with:
  ◦ VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT if the format is a depth/stencil format and the image view features also contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_BIT.
  ◦ VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT if the format is one of the extended storage formats and shaderStorageImageReadWithoutFormat is enabled on the device.
  ◦ VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT if the format is one of the extended storage formats and shaderStorageImageWriteWithoutFormat is enabled on the device.

• If VkImageViewCreateInfo::image was created with an Android hardware buffer external format, then the image views's set of format features is the value of VkAndroidHardwareBufferFormatPropertiesANDROID::formatFeatures found by calling vkGetAndroidHardwareBufferPropertiesANDROID on the Android hardware buffer that was imported to the VkDeviceMemory to which the VkImageViewCreateInfo::image is bound.

• If VkImageViewCreateInfo::image was created with a QNX Screen buffer external format, then the image view's set of format features is the value of VkScreenBufferFormatPropertiesQNX::formatFeatures found by calling vkGetScreenBufferPropertiesQNX on the QNX Screen buffer that was imported to the VkDeviceMemory to which the VkImageViewCreateInfo::image is bound.

• If VkImageViewCreateInfo::image was created with a chained VkBufferCollectionImageCreateInfoFUCHSIA, then the image view's set of format features is the value of VkBufferCollectionPropertiesFUCHSIA::formatFeatures found by calling vkGetBufferCollectionPropertiesFUCHSIA on the buffer collection passed as VkBufferCollectionImageCreateInfoFUCHSIA::collection when the image was created.

• If VkImageViewCreateInfo::image was created with VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then:
  ◦ The image's DRM format modifier is the value of VkImageDrmFormatModifierPropertiesEXT::drmFormatModifier found by calling vkGetImageDrmFormatModifierPropertiesEXT.
  ◦ Let VkDrmFormatModifierPropertiesListEXT::pDrmFormatModifierProperties be the array found by calling vkGetPhysicalDeviceFormatProperties2 on the same format as VkImageViewCreateInfo::format.
  ◦ Let VkDrmFormatModifierPropertiesEXT prop be the array element whose drmFormatModifier member is the value of the image's DRM format modifier.
  ◦ Then the image view's set of format features is prop::drmFormatModifierTilingFeatures.

The VkImageViewMinLodCreateInfoEXT structure is defined as:
// Provided by VK_EXT_image_view_min_lod
typedef struct VkImageViewMinLodCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    float minLod;
} VkImageViewMinLodCreateInfoEXT;

• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is `NULL` or a pointer to a structure extending this structure.
• **minLod** is the value to clamp the minimum LOD accessible by this `VkImageView`.

If the `pNext` chain includes a `VkImageViewMinLodCreateInfoEXT` structure, then that structure includes a parameter specifying a value to clamp the minimum LOD value during **Image Level(s) Selection, Texel Gathering** and **Integer Texel Coordinate Operations**.

If the image view contains `VkImageViewMinLodCreateInfoEXT` and it is used as part of a sampling operation:

\[
\text{minLodFloat}_{\text{imageView}} = \text{minLod}
\]

otherwise:

\[
\text{minLodFloat}_{\text{imageView}} = 0.0
\]

An integer variant of this parameter is also defined for sampling operations which access integer mipmap levels:

\[
\text{minLodInteger}_{\text{imageView}} = \lfloor \text{minLodFloat}_{\text{imageView}} \rfloor
\]

### Valid Usage

- **VUID-VkImageViewMinLodCreateInfoEXT-minLod-06455**
  If the `minLod` feature is not enabled, `minLod` **must** be 0.0

- **VUID-VkImageViewMinLodCreateInfoEXT-minLod-06456**
  `minLod` **must** be less or equal to the index of the last mipmap level accessible to the view

### Valid Usage (Implicit)

- **VUID-VkImageViewMinLodCreateInfoEXT-sType-sType**
  `sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_VIEW_MIN_LOD_CREATE_INFO_EXT`

### 12.6. Acceleration Structures

Acceleration structures are opaque data structures that are built by the implementation to more efficiently perform spatial queries on the provided geometric data. For this extension, an
acceleration structure is either a top-level acceleration structure containing a set of bottom-level acceleration structures or a bottom-level acceleration structure containing either a set of axis-aligned bounding boxes for custom geometry or a set of triangles.

Each instance in the top-level acceleration structure contains a reference to a bottom-level acceleration structure as well as an instance transform plus information required to index into the shader bindings. The top-level acceleration structure is what is bound to the acceleration descriptor, for example to trace inside the shader in the ray tracing pipeline.

Acceleration structures are represented by `VkAccelerationStructureKHR` handles:

```c
// Provided by VK_KHR_acceleration_structure
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkAccelerationStructureKHR)
```

Acceleration structures for the `VK_NV_ray_tracing` extension are represented by the similar `VkAccelerationStructureNV` handles:

```c
// Provided by VK_NV_ray_tracing
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkAccelerationStructureNV)
```

To create acceleration structures, call:

```c
// Provided by VK_NV_ray_tracing
VkResult vkCreateAccelerationStructureNV(
    VkDevice device,
    const VkAccelerationStructureCreateInfoNV* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkAccelerationStructureNV* pAccelerationStructure);
```

- `device` is the logical device that creates the buffer object.
- `pCreateInfo` is a pointer to a `VkAccelerationStructureCreateInfoNV` structure containing parameters affecting creation of the acceleration structure.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pAccelerationStructure` is a pointer to a `VkAccelerationStructureNV` handle in which the resulting acceleration structure object is returned.

Similarly to other objects in Vulkan, the acceleration structure creation merely creates an object with a specific "shape" as specified by the information in `VkAccelerationStructureInfoNV` and `compactedSize` in `pCreateInfo`.

Once memory has been bound to the acceleration structure using `vkBindAccelerationStructureMemoryNV`, that memory is populated by calls to `vkCmdBuildAccelerationStructureNV` and `vkCmdCopyAccelerationStructureNV`.

Acceleration structure creation uses the count and type information from the geometries, but does not use the data references in the structures.
Valid Usage (Implicit)

- VUID-vkCreateAccelerationStructureNV-device-parameter
  *device must* be a valid *VkDevice* handle

- VUID-vkCreateAccelerationStructureNV-pCreateInfo-parameter
  *pCreateInfo must* be a valid pointer to a valid *VkAccelerationStructureCreateInfoNV* structure

- VUID-vkCreateAccelerationStructureNV-pAllocator-parameter
  If *pAllocator* is not *NULL*, *pAllocator must* be a valid pointer to a valid *VkAllocationCallbacks* structure

- VUID-vkCreateAccelerationStructureNV-pAccelerationStructure-parameter
  *pAccelerationStructure must* be a valid pointer to a *VkAccelerationStructureNV* handle

Return Codes

Success
- *VK_SUCCESS*

Failure
- *VK_ERROR_OUT_OF_HOST_MEMORY*

The *VkAccelerationStructureCreateInfoNV* structure is defined as:

```c
// Provided by VK_NV_ray_tracing
typedef struct VkAccelerationStructureCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkDeviceSize compactedSize;
    VkAccelerationStructureInfoNV info;
} VkAccelerationStructureCreateInfoNV;
```

- *sType* is a *VkStructureType* value identifying this structure.
- *pNext* is *NULL* or a pointer to a structure extending this structure.
- *compactedSize* is the size from the result of *vkCmdWriteAccelerationStructuresPropertiesNV* if this acceleration structure is going to be the target of a compacting copy.
- *info* is the *VkAccelerationStructureInfoNV* structure specifying further parameters of the created acceleration structure.

Valid Usage

- VUID-vkAccelerationStructureCreateInfoNV-compactedSize-02421
  If *compactedSize* is not 0 then both *info.geometryCount* and *info.instanceCount* must be 0
Valid Usage (Implicit)

- **VUID-VkAccelerationStructureCreateInfoNV-sType-sType**
  
  *sType* must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_CREATE_INFO_NV`.

- **VUID-VkAccelerationStructureCreateInfoNV-pNext-pNext**
  
  *pNext* must be `NULL` or a pointer to a valid instance of `VkOpaqueCaptureDescriptorDataCreateInfoEXT`.

- **VUID-VkAccelerationStructureCreateInfoNV-sType-unique**
  
  The *sType* value of each struct in the *pNext* chain must be unique.

- **VUID-VkAccelerationStructureCreateInfoNV-info-parameter**
  
  *info* must be a valid `VkAccelerationStructureInfoNV` structure.

The `VkAccelerationStructureInfoNV` structure is defined as:

```c
// Provided by VK_NV_ray_tracing
typdef struct VkAccelerationStructureInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkAccelerationStructureTypeNV type;
    VkBuildAccelerationStructureFlagsNV flags;
    uint32_t instanceCount;
    uint32_t geometryCount;
    const VkGeometryNV* pGeometries;
} VkAccelerationStructureInfoNV;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **type** is a `VkAccelerationStructureTypeNV` value specifying the type of acceleration structure that will be created.
- **flags** is a bitmask of `VkBuildAccelerationStructureFlagBitsNV` specifying additional parameters of the acceleration structure.
- **instanceCount** specifies the number of instances that will be in the new acceleration structure.
- **geometryCount** specifies the number of geometries that will be in the new acceleration structure.
- **pGeometries** is a pointer to an array of `geometryCount` `VkGeometryNV` structures containing the scene data being passed into the acceleration structure.

`VkAccelerationStructureInfoNV` contains information that is used both for acceleration structure creation with `vkCreateAccelerationStructureNV` and in combination with the actual geometric data to build the acceleration structure with `vkCmdBuildAccelerationStructureNV`.

Valid Usage

- **VUID-VkAccelerationStructureInfoNV-geometryCount-02422**

"Valid Usage (Implicit)"
geometryCount must be less than or equal to `VkPhysicalDeviceRayTracingPropertiesNV::maxGeometryCount`

- **VUID-VkAccelerationStructureInfoNV-instanceCount-02423**
  instanceCount must be less than or equal to `VkPhysicalDeviceRayTracingPropertiesNV::maxInstanceCount`

- **VUID-VkAccelerationStructureInfoNV-maxTriangleCount-02424**
The total number of triangles in all geometries must be less than or equal to `VkPhysicalDeviceRayTracingPropertiesNV::maxTriangleCount`

- **VUID-VkAccelerationStructureInfoNV-type-02425**
  If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_NV` then `geometryCount` must be 0

- **VUID-VkAccelerationStructureInfoNV-type-02426**
  If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_NV` then `instanceCount` must be 0

- **VUID-VkAccelerationStructureInfoNV-type-02786**
  If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_NV` then the `geometryType` member of each geometry in `pGeometries` must be the same

- **VUID-VkAccelerationStructureInfoNV-type-parameter**
  `type` must not be `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`

- **VUID-VkAccelerationStructureInfoNV-flags-parameter**
  `flags` must be a valid combination of `VkBuildAccelerationStructureFlagBitsNV` values

- **VUID-VkAccelerationStructureInfoNV-pGeometries-parameter**
  If `geometryCount` is not 0, `pGeometries` must be a valid pointer to an array of `VkGeometryNV` structures

---

**Valid Usage (Implicit)**

- **VUID-VkAccelerationStructureInfoNV-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_INFO_NV`

- **VUID-VkAccelerationStructureInfoNV-pNext-pNext**
  `pNext` must be `NULL`

- **VUID-VkAccelerationStructureInfoNV-type-parameter**
  `type` must be a valid `VkAccelerationStructureTypeNV` value

- **VUID-VkAccelerationStructureInfoNV-flags-parameter**
  `flags` must be a valid combination of `VkBuildAccelerationStructureFlagBitsNV` values

- **VUID-VkAccelerationStructureInfoNV-pGeometries-parameter**
  If `geometryCount` is not 0, `pGeometries` must be a valid pointer to an array of `VkGeometryNV` structures

To create an acceleration structure, call:
// Provided by VK_KHR_acceleration_structure

VkResult vkCreateAccelerationStructureKHR(
    VkDevice device, 
    const VkAccelerationStructureCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkAccelerationStructureKHR* pAccelerationStructure);

- **device** is the logical device that creates the acceleration structure object.
- **pCreateInfo** is a pointer to a `VkAccelerationStructureCreateInfoKHR` structure containing parameters affecting creation of the acceleration structure.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pAccelerationStructure** is a pointer to a `VkAccelerationStructureKHR` handle in which the resulting acceleration structure object is returned.

Similar to other objects in Vulkan, the acceleration structure creation merely creates an object with a specific “shape”. The type and quantity of geometry that can be built into an acceleration structure is determined by the parameters of `VkAccelerationStructureCreateInfoKHR`.

The acceleration structure data is stored in the object referred to by `VkAccelerationStructureCreateInfoKHR::buffer`. Once memory has been bound to that buffer, it **must** be populated by acceleration structure build or acceleration structure copy commands such as `vkCmdBuildAccelerationStructuresKHR`, `vkBuildAccelerationStructuresKHR`, `vkCmdCopyAccelerationStructureKHR`, and `vkCopyAccelerationStructureKHR`.

**Note**

The expected usage for a trace capture/replay tool is that it will serialize and later deserialize the acceleration structure data using acceleration structure copy commands. During capture the tool will use `vkCopyAccelerationStructureToMemoryKHR` or `vkCmdCopyAccelerationStructureToMemoryKHR` with a **mode** of `VK_COPY_ACCELERATION_STRUCTURE_MODE_SERIALIZE_KHR`, and `vkCopyMemoryToAccelerationStructureKHR` or `vkCmdCopyMemoryToAccelerationStructureKHR` with a **mode** of `VK_COPY_ACCELERATION_STRUCTURE_MODE_DESERIALIZE_KHR` during replay.

**Note**

Memory does not need to be bound to the underlying buffer when `vkCreateAccelerationStructureKHR` is called.

The input buffers passed to acceleration structure build commands will be referenced by the implementation for the duration of the command. After the command completes, the acceleration structure **may** hold a reference to any acceleration structure specified by an active instance contained therein. Apart from this referencing, acceleration structures **must** be fully self-contained. The application **can** reuse or free any memory which was used by the command as an input or as scratch without affecting the results of ray traversal.
Valid Usage

- VUID-vkCreateAccelerationStructureKHR-accelerationStructure-03611
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure` feature must be enabled

- VUID-vkCreateAccelerationStructureKHR-deviceAddress-03488
  If `VkAccelerationStructureCreateInfoKHR::deviceAddress` is not zero, the `accelerationStructureCaptureReplay` feature must be enabled

- VUID-vkCreateAccelerationStructureKHR-device-03489
  If `device` was created with multiple physical devices, then the `bufferDeviceAddressMultiDevice` feature must be enabled

Valid Usage (Implicit)

- VUID-vkCreateAccelerationStructureKHR-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkCreateAccelerationStructureKHR-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid `VkAccelerationStructureCreateInfoKHR` structure

- VUID-vkCreateAccelerationStructureKHR-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateAccelerationStructureKHR-pAccelerationStructure-parameter
  `pAccelerationStructure` must be a valid pointer to a `VkAccelerationStructureKHR` handle

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR

The `VkAccelerationStructureCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkAccelerationStructureCreateFlagsKHR createFlags;
    VkBuffer buffer;
} VkAccelerationStructureCreateInfoKHR;
```
VkDeviceSize offset;
VkDeviceSize size;
VkAccelerationStructureTypeKHR type;
VkDeviceAddress deviceAddress;
} VkAccelerationStructureCreateInfoKHR;

• **sType** is a VkStructureType value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **createFlags** is a bitmask of VkAccelerationStructureCreateFlagBitsKHR specifying additional creation parameters of the acceleration structure.
• **buffer** is the buffer on which the acceleration structure will be stored.
• **offset** is an offset in bytes from the base address of the buffer at which the acceleration structure will be stored, and **must** be a multiple of 256.
• **size** is the size required for the acceleration structure.
• **type** is a VkAccelerationStructureTypeKHR value specifying the type of acceleration structure that will be created.
• **deviceAddress** is the device address requested for the acceleration structure if the accelerationStructureCaptureReplay feature is being used. If deviceAddress is zero, no specific address is requested.

Applications **should** avoid creating acceleration structures with application-provided addresses and implementation-provided addresses in the same process, to reduce the likelihood of VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR errors.

**Note**

The expected usage for this is that a trace capture/replay tool will add the VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT flag to all buffers that use VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT, and will add VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT to all buffers used as storage for an acceleration structure where deviceAddress is not zero. This also means that the tool will need to add VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT to memory allocations to allow the flag to be set where the application may not have otherwise required it. During capture the tool will save the queried opaque device addresses in the trace. During replay, the buffers will be created specifying the original address so any address values stored in the trace data will remain valid.

Implementations are expected to separate such buffers in the GPU address space so normal allocations will avoid using these addresses. Apps/tools should avoid mixing app-provided and implementation-provided addresses for buffers created with VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT, to avoid address space allocation conflicts.

Applications **should** create an acceleration structure with a specific VkAccelerationStructureTypeKHR other than VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR.
**Note**

`VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR` is intended to be used by API translation layers. This can be used at acceleration structure creation time in cases where the actual acceleration structure type (top or bottom) is not yet known. The actual acceleration structure type must be specified as `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR` or `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` when the build is performed.

If the acceleration structure will be the target of a build operation, the required size for an acceleration structure can be queried with `vkGetAccelerationStructureBuildSizesKHR`. If the acceleration structure is going to be the target of a compacting copy, `vkCmdWriteAccelerationStructuresPropertiesKHR` or `vkWriteAccelerationStructuresPropertiesKHR` can be used to obtain the compacted size required.

If the acceleration structure will be the target of a build operation with `VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV` it must include `VK_ACCELERATION_STRUCTURE_CREATE_MOTION_BIT_NV` in `createFlags` and include `VkAccelerationStructureMotionInfoNV` as an extension structure in `pNext` with the number of instances as metadata for the object.

### Valid Usage

- VUID-VkAccelerationStructureCreateInfoKHR-deviceAddress-03612
  If `deviceAddress` is not zero, `createFlags` must include `VK_ACCELERATION_STRUCTURE_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR`

- VUID-VkAccelerationStructureCreateInfoKHR-deviceAddress-09488
  If `deviceAddress` is not zero, it must have been retrieved from an identically created acceleration structure, except for `buffer` and `deviceAddress`

- VUID-VkAccelerationStructureCreateInfoKHR-deviceAddress-09489
  If `deviceAddress` is not zero, `buffer` must have been created identically to the `buffer` used to create the acceleration structure from which `deviceAddress` was retrieved, except for `VkBufferOpaqueCaptureAddressCreateInfo::opaqueCaptureAddress`

- VUID-VkAccelerationStructureCreateInfoKHR-deviceAddress-09490
  If `deviceAddress` is not zero, `buffer` must have been created with a `VkBufferOpaqueCaptureAddressCreateInfo::opaqueCaptureAddress` that was retrieved from `vkGetBufferOpaqueCaptureAddress` for the `buffer` that was used to create the acceleration structure from which `deviceAddress` was retrieved

- VUID-VkAccelerationStructureCreateInfoKHR-createFlags-03613
  If `createFlags` includes `VK_ACCELERATION_STRUCTURE_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR`, `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureCaptureReplay must be VK_TRUE`

- VUID-VkAccelerationStructureCreateInfoKHR-buffer-03614
  `buffer` must have been created with a usage value containing `VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_STORAGE_BIT_KHR`
• VUID-VkAccelerationStructureCreateInfoKHR-buffer-03615
  buffer must not have been created with VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT

• VUID-VkAccelerationStructureCreateInfoKHR-offset-03616
  The sum of offset and size must be less than the size of buffer

• VUID-VkAccelerationStructureCreateInfoKHR-offset-03734
  offset must be a multiple of 256 bytes

• VUID-VkAccelerationStructureCreateInfoKHR-createFlags-04954
  If VK_ACCELERATION_STRUCTURE_CREATE_MOTION_BIT_NV is set in createFlags and type is
  VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR, one member of the pNext chain must be a
  pointer to a valid instance of VkAccelerationStructureMotionInfoNV

• VUID-VkAccelerationStructureCreateInfoKHR-createFlags-04955
  If any geometry includes VkAccelerationStructureGeometryMotionTrianglesDataNV then
  createFlags must contain VK_ACCELERATION_STRUCTURE_CREATE_MOTION_BIT_NV

• VUID-VkAccelerationStructureCreateInfoKHR-createFlags-08108
  If createFlags includes
  VK_ACCELERATION_STRUCTURE_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT, the
  descriptorBufferCaptureReplay feature must be enabled

• VUID-VkAccelerationStructureCreateInfoKHR-pNext-08109
  If the pNext chain includes a VkOpaqueCaptureDescriptorDataCreateInfoEXT structure,
  createFlags must contain
  VK_ACCELERATION_STRUCTURE_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT

Valid Usage (Implicit)

• VUID-VkAccelerationStructureCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_CREATE_INFO_KHR

• VUID-VkAccelerationStructureCreateInfoKHR-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either
  NULL or a pointer to a valid instance of VkAccelerationStructureMotionInfoNV or
  VkOpaqueCaptureDescriptorDataCreateInfoEXT

• VUID-VkAccelerationStructureCreateInfoKHR-sType-unique
  The sType value of each struct in the pNext chain must be unique

• VUID-VkAccelerationStructureCreateInfoKHR-createFlags-parameter
  createFlags must be a valid combination of VkAccelerationStructureCreateFlagBitsKHR
  values

• VUID-VkAccelerationStructureCreateInfoKHR-buffer-parameter
  buffer must be a valid VkBuffer handle

• VUID-VkAccelerationStructureCreateInfoKHR-type-parameter
  type must be a valid VkAccelerationStructureTypeKHR value

The VkAccelerationStructureMotionInfoNV structure is defined as:
typedef struct VkAccelerationStructureMotionInfoNV {
    VkStructureType sType;
    const void* pNext;
    uint32_t maxInstances;
    VkAccelerationStructureMotionInfoFlagsNV flags;
} VkAccelerationStructureMotionInfoNV;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxInstances` is the maximum number of instances that may be used in the motion top-level acceleration structure.
- `flags` is 0 and reserved for future use.

Valid Usage (Implicit)

- VUID-VkAccelerationStructureMotionInfoNV-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_MOTION_INFO_NV`
- VUID-VkAccelerationStructureMotionInfoNV-flags-zerobitmask
  `flags` must be 0

typedef VkFlags VkAccelerationStructureMotionInfoFlagsNV;

`VkAccelerationStructureMotionInfoFlagsNV` is a bitmask type for setting a mask, but is currently reserved for future use.

To get the build sizes for an acceleration structure, call:

```c
void vkGetAccelerationStructureBuildSizesKHR(
    VkDevice device,
    VkAccelerationStructureBuildTypeKHR buildType,
    const VkAccelerationStructureBuildGeometryInfoKHR* pBuildInfo,
    const uint32_t* pMaxPrimitiveCounts,
    VkAccelerationStructureBuildSizesInfoKHR* pSizeInfo);
```

- `device` is the logical device that will be used for creating the acceleration structure.
- `buildType` defines whether host or device operations (or both) are being queried for.
- `pBuildInfo` is a pointer to a `VkAccelerationStructureBuildGeometryInfoKHR` structure describing parameters of a build operation.
- `pMaxPrimitiveCounts` is a pointer to an array of `pBuildInfo->geometryCount` `uint32_t` values
defining the number of primitives built into each geometry.

- `pSizeInfo` is a pointer to a `VkAccelerationStructureBuildSizesInfoKHR` structure which returns the size required for an acceleration structure and the sizes required for the scratch buffers, given the build parameters.

The `srcAccelerationStructure`, `dstAccelerationStructure`, and `mode` members of `pBuildInfo` are ignored. Any `VkDeviceOrHostAddressKHR` or `VkDeviceOrHostAddressConstKHR` members of `pBuildInfo` are ignored by this command, except that the `hostAddress` member of `VkAccelerationStructureGeometryTrianglesDataKHR::transformData` will be examined to check if it is NULL.

An acceleration structure created with the `accelerationStructureSize` returned by this command supports any build or update with a `VkAccelerationStructureBuildGeometryInfoKHR` structure and array of `VkAccelerationStructureBuildRangeInfoKHR` structures subject to the following properties:

- The build command is a host build command, and `buildType` is `VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_KHR` or `VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR`.
- The build command is a device build command, and `buildType` is `VK_ACCELERATION_STRUCTURE_BUILD_TYPE_DEVICE_KHR` or `VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR`.
- For `VkAccelerationStructureBuildGeometryInfoKHR`:
  - Its `type`, and `flags` members are equal to `pBuildInfo->type` and `pBuildInfo->flags`, respectively.
  - `geometryCount` is less than or equal to `pBuildInfo->geometryCount`.
  - For each element of either `pGeometries` or `ppGeometries` at a given index, its `geometryType` member is equal to the corresponding member of the same element in `pBuildInfo`.
  - For each element of either `pGeometries` or `ppGeometries` at a given index, its `flags` member is equal to the corresponding member of the same element in `pBuildInfo`.
  - For each element of either `pGeometries` or `ppGeometries` at a given index, with a `geometryType` member equal to `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, the `vertexFormat` and `indexType` members of `geometry.triangles` are equal to the corresponding members of the same element in `pBuildInfo`.
  - For each element of either `pGeometries` or `ppGeometries` at a given index, with a `geometryType` member equal to `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, the `maxVertex` member of `geometry.triangles` is less than or equal to the corresponding member of the same element in `pBuildInfo`.
  - For each element of either `pGeometries` or `ppGeometries` at a given index, with a `geometryType` member equal to `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if the applicable address in the `transformData` member of `geometry.triangles` is not NULL, the corresponding `transformData.hostAddress` parameter in `pBuildInfo` is not NULL.
- For each `VkAccelerationStructureBuildRangeInfoKHR` corresponding to the `VkAccelerationStructureBuildGeometryInfoKHR`:
  - Its `primitiveCount` member is less than or equal to the corresponding element of
For each element of either pGeometries or ppGeometries at a given index, with a geometryType
member equal to VK_GEOMETRY_TYPE_TRIANGLES_KHR, if the pNext chain contains
VkAccelerationStructureTrianglesOpacityMicromapEXT the corresponding member of
pBuildInfo also contains VkAccelerationStructureTrianglesOpacityMicromapEXT and with
an equivalent micromap.

For each element of either pGeometries or ppGeometries at a given index, with a geometryType
member equal to VK_GEOMETRY_TYPE_TRIANGLES_KHR, if the pNext chain contains
VkAccelerationStructureTrianglesDisplacementMicromapNV the corresponding member of
pBuildInfo also contains VkAccelerationStructureTrianglesDisplacementMicromapNV and
with an equivalent micromap.

Similarly, the updateScratchSize value will support any build command specifying the
VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR mode under the above conditions, and the
buildScratchSize value will support any build command specifying the
VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR mode under the above conditions.

Valid Usage

- VUID-vkGetAccelerationStructureBuildSizesKHR-accelerationStructure-08933
  The VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure feature
  must be enabled

- VUID-vkGetAccelerationStructureBuildSizesKHR-device-03618
  If device was created with multiple physical devices, then the
  bufferDeviceAddressMultiDevice feature must be enabled

- VUID-vkGetAccelerationStructureBuildSizesKHR-pBuildInfo-03619
  If pBuildInfo->geometryCount is not 0, pMaxPrimitiveCounts must be a valid pointer to an
  array of pBuildInfo->geometryCount uint32_t values

- VUID-vkGetAccelerationStructureBuildSizesKHR-pBuildInfo-03785
  If pBuildInfo->pGeometries or pBuildInfo->ppGeometries has a geometryType of
  VK_GEOMETRY_TYPE_INSTANCES_KHR, each pMaxPrimitiveCounts[i] must be less than or equal to
  VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxInstanceCount

Valid Usage (Implicit)

- VUID-vkGetAccelerationStructureBuildSizesKHR-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetAccelerationStructureBuildSizesKHR-buildType-parameter
  buildType must be a valid VkAccelerationStructureBuildTypeKHR value

- VUID-vkGetAccelerationStructureBuildSizesKHR-pBuildInfo-parameter
  pBuildInfo must be a valid pointer to a valid
  VkAccelerationStructureBuildGeometryInfoKHR structure

- VUID-vkGetAccelerationStructureBuildSizesKHR-pMaxPrimitiveCounts-parameter
If `pMaxPrimitiveCounts` is not NULL, `pMaxPrimitiveCounts` must be a valid pointer to an array of `pBuildInfo->geometryCount` uint32_t values.

- VUID-vkGetAccelerationStructureBuildSizesKHR-pSizeInfo-parameter `pSizeInfo` must be a valid pointer to a `VkAccelerationStructureBuildSizesInfoKHR` structure.

The `VkAccelerationStructureBuildSizesInfoKHR` structure describes the required build sizes for an acceleration structure and scratch buffers and is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureBuildSizesInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceSize accelerationStructureSize;
    VkDeviceSize updateScratchSize;
    VkDeviceSize buildScratchSize;
} VkAccelerationStructureBuildSizesInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `accelerationStructureSize` is the size in bytes required in a `VkAccelerationStructureKHR` for a build or update operation.
- `updateScratchSize` is the size in bytes required in a scratch buffer for an update operation.
- `buildScratchSize` is the size in bytes required in a scratch buffer for a build operation.

### Valid Usage (Implicit)

- VUID-VkAccelerationStructureBuildSizesInfoKHR-sType-sType `sType` must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_BUILD_SIZES_INFO_KHR`.
- VUID-VkAccelerationStructureBuildSizesInfoKHR-pNext-pNext `pNext` must be NULL.

Values which can be set in `VkAccelerationStructureCreateInfoKHR::type` or `VkAccelerationStructureInfoNV::type` specifying the type of acceleration structure, are:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkAccelerationStructureTypeKHR {
    VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR = 0,
    VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR = 1,
    VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR = 2,
    // Provided by VK_NV_ray_tracing
    VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_NV =
    VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR,
    // Provided by VK_NV_ray_tracing
```
or the equivalent

```c
// Provided by VK_NV_ray_tracing
typedef VkAccelerationStructureTypeKHR VkAccelerationStructureTypeNV;
```

- **VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR** is a top-level acceleration structure containing instance data referring to bottom-level acceleration structures.
- **VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR** is a bottom-level acceleration structure containing the AABBs or geometry to be intersected.
- **VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR** is an acceleration structure whose type is determined at build time used for special circumstances. In these cases, the acceleration structure type is not known at creation time, but **must** be specified at build time as either top or bottom.

Bits which **can** be set in `VkAccelerationStructureCreateInfoKHR::createFlags`, specifying additional creation parameters for acceleration structures, are:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkAccelerationStructureCreateFlagBitsKHR {
   VK_ACCELERATION_STRUCTURE_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR = 0x00000001,
   // Provided by VK_EXT_descriptor_buffer
   VK_ACCELERATION_STRUCTURE_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT = 0x00000008,
   // Provided by VK_NV_ray_tracing_motion_blur
   VK_ACCELERATION_STRUCTURE_CREATE_MOTION_BIT_NV = 0x00000004,
} VkAccelerationStructureCreateFlagBitsKHR;
```

- **VK_ACCELERATION_STRUCTURE_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR** specifies that the acceleration structure's address **can** be saved and reused on a subsequent run.
- **VK_ACCELERATION_STRUCTURE_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT** specifies that the acceleration structure **can** be used with descriptor buffers when capturing and replaying (e.g. for trace capture and replay), see `VkOpaqueCaptureDescriptorDataCreateInfoEXT` for more detail.

```c
// Provided by VK_KHR_acceleration_structure
typedef VkFlags VkAccelerationStructureCreateFlagsKHR;
```

`VkAccelerationStructureCreateFlagsKHR` is a bitmask type for setting a mask of zero or more `VkAccelerationStructureCreateFlagBitsKHR`.

```c
VkAccelerationStructureCreateFlagsKHR
```
Bits which can be set in `VkAccelerationStructureBuildGeometryInfoKHR::flags` or `VkAccelerationStructureInfoNV::flags` specifying additional parameters for acceleration structure builds, are:

```cpp
// Provided by VK_KHR_acceleration_structure
typedef enum VkBuildAccelerationStructureFlagBitsKHR {
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR = 0x00000001,
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR = 0x00000002,
    VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_TRACE_BIT_KHR = 0x00000004,
    VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_BUILD_BIT_KHR = 0x00000008,
    VK_BUILD_ACCELERATION_STRUCTURE_LOW_MEMORY_BIT_KHR = 0x00000010,
    // Provided by VK_NV_ray_tracing_motion_blur
    VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV = 0x00000020,
    // Provided by VK_NV_displacement_micromap
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DISPLACEMENT_MICROMAP_UPDATE_NV = 0x00000200,
    // Provided by VK_KHR_ray_tracing_position_fetch
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DATA_ACCESS_KHR = 0x00000800,
} VkBuildAccelerationStructureFlagBitsKHR;
```

or the equivalent

```cpp
// Provided by VK_NV_ray_tracing
typedef VkBuildAccelerationStructureFlagBitsKHR
```

1113
• **VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR** indicates that the specified acceleration structure **can** be updated with a **mode** of **VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR** in **VkAccelerationStructureBuildGeometryInfoKHR** or an **update** of **VK_TRUE** in **vkCmdBuildAccelerationStructureNV**.

• **VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR** indicates that the specified acceleration structure **can** act as the source for a copy acceleration structure command with **mode** of **VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR** to produce a compacted acceleration structure.

• **VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_TRACE_BIT_KHR** indicates that the given acceleration structure build **should** prioritize trace performance over build time.

• **VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_BUILD_BIT_KHR** indicates that the given acceleration structure build **should** prioritize build time over trace performance.

• **VK_BUILD_ACCELERATION_STRUCTURE_LOW_MEMORY_BIT_KHR** indicates that this acceleration structure **should** minimize the size of the scratch memory and the final result acceleration structure, potentially at the expense of build time or trace performance.

• **VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_UPDATE_EXT** indicates that the opacity micromaps associated with the specified acceleration structure **may** change with an acceleration structure update.

• **VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_DATA_UPDATE_EXT** indicates that the data of the opacity micromaps associated with the specified acceleration structure **may** change with an acceleration structure update.

• **VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DISABLE_OPACITY_MICROMAPS_EXT** indicates that the specified acceleration structure **may** be referenced in an instance with **VK_GEOMETRY_INSTANCE_DISABLE_OPACITY_MICROMAPS_EXT** set.

• **VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DATA_ACCESS_KHR** indicates that the specified acceleration structure **can** be used when fetching the vertex positions of a hit triangle.

• **VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DISPLACEMENT_MICROMAP_UPDATE_NV** indicates that the displacement micromaps associated with the specified acceleration structure **may** change with an acceleration structure update.

**Note**

**VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR** and **VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR** **may** take more time and memory than a normal build, and so **should** only be used when those features are needed.

// Provided by VK_KHR_acceleration_structure
typedef VkFlags VkBuildAccelerationStructureFlagsKHR;

or the equivalent
typedef VkBuildAccelerationStructureFlagsKHR VkBuildAccelerationStructureFlagsNV;

VkBuildAccelerationStructureFlagsKHR is a bitmask type for setting a mask of zero or more VkBuildAccelerationStructureFlagBitsKHR.

The VkGeometryNV structure describes geometry in a bottom-level acceleration structure and is defined as:

```c
typedef struct VkGeometryNV {
    VkStructureType sType;
    const void* pNext;
    VkGeometryTypeKHR geometryType;
    VkGeometryDataNV geometry;
    VkGeometryFlagsKHR flags;
} VkGeometryNV;
```

- ```sType``` is a VkStructureType value identifying this structure.
- ```pNext``` is NULL or a pointer to a structure extending this structure.
- ```geometryType``` specifies the VkGeometryTypeKHR which this geometry refers to.
- ```geometry``` contains the geometry data as described in VkGeometryDataNV.
- ```flags``` has VkGeometryFlagBitsKHR describing options for this geometry.

Valid Usage

- VUID-VkGeometryNV-geometryType-03503
  geometryType must be VK_GEOMETRY_TYPE_TRIANGLES_NV or VK_GEOMETRY_TYPE_AABBS_NV

Valid Usage (Implicit)

- VUID-VkGeometryNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_GEOMETRY_NV
- VUID-VkGeometryNV-pNext-pNext
  pNext must be NULL
- VUID-VkGeometryNV-geometryType-parameter
  geometryType must be a valid VkGeometryTypeKHR value
- VUID-VkGeometryNV-geometry-parameter
  geometry must be a valid VkGeometryDataNV structure
- VUID-VkGeometryNV-flags-parameter
  flags must be a valid combination of VkGeometryFlagBitsKHR values
Geometry types are specified by `VkGeometryTypeKHR`, which takes values:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkGeometryTypeKHR {
    VK_GEOMETRY_TYPE_TRIANGLES_KHR = 0,
    VK_GEOMETRY_TYPE_AABBS_KHR = 1,
    VK_GEOMETRY_TYPE_INSTANCES_KHR = 2,
    // Provided by VK_NV_ray_tracing
    VK_GEOMETRY_TYPE_TRIANGLES_NV = VK_GEOMETRY_TYPE_TRIANGLES_KHR,
    // Provided by VK_NV_ray_tracing
    VK_GEOMETRY_TYPE_AABBS_NV = VK_GEOMETRY_TYPE_AABBS_KHR,
} VkGeometryTypeKHR;
```
or the equivalent

```c
// Provided by VK_NV_ray_tracing
typedef VkGeometryTypeKHR VkGeometryTypeNV;
```

- `VK_GEOMETRY_TYPE_TRIANGLES_KHR` specifies a geometry type consisting of triangles.
- `VK_GEOMETRY_TYPE_AABBS_KHR` specifies a geometry type consisting of axis-aligned bounding boxes.
- `VK_GEOMETRY_TYPE_INSTANCES_KHR` specifies a geometry type consisting of acceleration structure instances.

Bits specifying additional parameters for geometries in acceleration structure builds, are:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkGeometryFlagBitsKHR {
    VK_GEOMETRY_OPAQUE_BIT_KHR = 0x00000001,
    VK_GEOMETRY_NO_DUPLICATE_ANY_HIT_INVOCATION_BIT_KHR = 0x00000002,
    // Provided by VK_NV_ray_tracing
    VK_GEOMETRY_OPAQUE_BIT_NV = VK_GEOMETRY_OPAQUE_BIT_KHR,
    // Provided by VK_NV_ray_tracing
    VK_GEOMETRY_NO_DUPLICATE_ANY_HIT_INVOCATION_BIT_NV = VK_GEOMETRY_NO_DUPLICATE_ANY_HIT_INVOCATION_BIT_KHR,
} VkGeometryFlagBitsKHR;
```
or the equivalent

```c
// Provided by VK_NV_ray_tracing
typedef VkGeometryFlagBitsKHR VkGeometryFlagBitsNV;
```

- `VK_GEOMETRY_OPAQUE_BIT_KHR` indicates that this geometry does not invoke the any-hit shaders even if present in a hit group.
- `VK_GEOMETRY_NO_DUPLICATE_ANY_HIT_INVOCATION_BIT_KHR` indicates that the implementation must only call the any-hit shader a single time for each primitive in this geometry. If this bit is absent
an implementation may invoke the any-hit shader more than once for this geometry.

```c
// Provided by VK_KHR_acceleration_structure
typedef VkFlags VkGeometryFlagsKHR;
```

or the equivalent

```c
// Provided by VK_NV_ray_tracing
typedef VkGeometryFlagsKHR VkGeometryFlagsNV;
```

VkGeometryFlagsKHR is a bitmask type for setting a mask of zero or more VkGeometryFlagBitsKHR.

The VkGeometryDataNV structure specifies geometry in a bottom-level acceleration structure and is defined as:

```c
// Provided by VK_NV_ray_tracing
typedef struct VkGeometryDataNV {
    VkGeometryTrianglesNV triangles;
    VkGeometryAABBNV aabbs;
} VkGeometryDataNV;
```

- `triangles` contains triangle data if VkGeometryNV::geometryType is VK_GEOMETRY_TYPE_TRIANGLES_NV.
- `aabbs` contains axis-aligned bounding box data if VkGeometryNV::geometryType is VK_GEOMETRY_TYPE_AABBS_NV.

Valid Usage (Implicit)

- VUID-VkGeometryDataNV-triangles-parameter `triangles` must be a valid VkGeometryTrianglesNV structure
- VUID-VkGeometryDataNV-aabbs-parameter `aabbs` must be a valid VkGeometryAABBNV structure

The VkGeometryTrianglesNV structure specifies triangle geometry in a bottom-level acceleration structure and is defined as:

```c
// Provided by VK_NV_ray_tracing
typedef struct VkGeometryTrianglesNV {
    VkStructureType sType;
    const void* pNext;
    VkBuffer vertexData;
    VkDeviceSize vertexOffset;
    uint32_t vertexCount;
    VkDeviceSize vertexStride;
} VkGeometryTrianglesNV;
```
VkFormat vertexFormat;
VkBuffer indexData;
VkDeviceSize indexOffset;
uint32_t indexCount;
VkIndexType indexType;
VkBuffer transformData;
VkDeviceSize transformOffset;
} VkGeometryTrianglesNV;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• vertexData is the buffer containing vertex data for this geometry.
• vertexOffset is the offset in bytes within vertexData containing vertex data for this geometry.
• vertexCount is the number of valid vertices.
• vertexStride is the stride in bytes between each vertex.
• vertexFormat is a VkFormat describing the format of each vertex element.
• indexData is the buffer containing index data for this geometry.
• indexOffset is the offset in bytes within indexData containing index data for this geometry.
• indexCount is the number of indices to include in this geometry.
• indexType is a VkIndexType describing the format of each index.
• transformData is an optional buffer containing an VkTransformMatrixNV structure defining a transformation to be applied to this geometry.
• transformOffset is the offset in bytes in transformData of the transform information described above.

If indexType is VK_INDEX_TYPE_NONE_NV, then this structure describes a set of triangles determined by vertexCount. Otherwise, this structure describes a set of indexed triangles determined by indexCount.

Valid Usage

• VUID-VkGeometryTrianglesNV-vertexOffset-02428 vertexOffset must be less than the size of vertexData
• VUID-VkGeometryTrianglesNV-vertexOffset-02429 vertexOffset must be a multiple of the component size of vertexFormat
• VUID-VkGeometryTrianglesNV-vertexFormat-02430 vertexFormat must be one of VK_FORMAT_R32G32B32_SFLOAT, VK_FORMAT_R32G32_SFLOAT, VK_FORMAT_R16G16B16_SFLOAT, VK_FORMAT_R16G16_SFLOAT, VK_FORMAT_R16G16_SNORM, or VK_FORMAT_R16G16B16_SNORM
• VUID-VkGeometryTrianglesNV-vertexStride-03818 vertexStride must be less than or equal to \(2^{32}-1\)
• VUID-VkGeometryTrianglesNV-indexOffset-02431
**indexOffset** must be less than the size of **indexData**

- VUID-VkGeometryTrianglesNV-indexOffset-02432
  **indexOffset** must be a multiple of the element size of **indexType**

- VUID-VkGeometryTrianglesNV-indexType-02433
  **indexType** must be **VK_INDEX_TYPE_UINT16**, **VK_INDEX_TYPE_UINT32**, or **VK_INDEX_TYPE_NONE_NV**

- VUID-VkGeometryTrianglesNV-indexData-02434
  **indexData** must be **VK_NULL_HANDLE** if **indexType** is **VK_INDEX_TYPE_NONE_NV**

- VUID-VkGeometryTrianglesNV-indexData-02435
  **indexData** must be a valid **VkBuffer** handle if **indexType** is not **VK_INDEX_TYPE_NONE_NV**

- VUID-VkGeometryTrianglesNV-indexCount-02436
  **indexCount** must be 0 if **indexType** is **VK_INDEX_TYPE_NONE_NV**

- VUID-VkGeometryTrianglesNV-transformOffset-02437
  **transformOffset** must be less than the size of **transformData**

- VUID-VkGeometryTrianglesNV-transformOffset-02438
  **transformOffset** must be a multiple of 16

---

**Valid Usage (Implicit)**

- VUID-VkGeometryTrianglesNV-sType-sType
  **sType** must be **VK_STRUCTURE_TYPE_GEOMETRY_TRIANGLES_NV**

- VUID-VkGeometryTrianglesNV-pNext-pNext
  **pNext** must be **NULL**

- VUID-VkGeometryTrianglesNV-vertexData-parameter
  If **vertexData** is not **VK_NULL_HANDLE**, **vertexData** must be a valid **VkBuffer** handle

- VUID-VkGeometryTrianglesNV-vertexFormat-parameter
  **vertexFormat** must be a valid **VkFormat** value

- VUID-VkGeometryTrianglesNV-indexData-parameter
  If **indexData** is not **VK_NULL_HANDLE**, **indexData** must be a valid **VkBuffer** handle

- VUID-VkGeometryTrianglesNV-indexType-parameter
  **indexType** must be a valid **VkIndexType** value

- VUID-VkGeometryTrianglesNV-transformData-parameter
  If **transformData** is not **VK_NULL_HANDLE**, **transformData** must be a valid **VkBuffer** handle

- VUID-VkGeometryTrianglesNV-commonparent
  Each of **indexData**, **transformData**, and **vertexData** that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same **VkDevice**

---

The **VkGeometryAABBNV** structure specifies axis-aligned bounding box geometry in a bottom-level acceleration structure, and is defined as:

```
// Provided by VK_NV_ray_tracing
```
typedef struct VkGeometryAABBNV {
    VkStructureType sType;
    const void* pNext;
    VkBuffer aabbData;
    uint32_t numAABBs;
    uint32_t stride;
    VkDeviceSize offset;
} VkGeometryAABBNV;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **aabbData** is the buffer containing axis-aligned bounding box data.
- **numAABBs** is the number of AABBs in this geometry.
- **stride** is the stride in bytes between AABBs in aabbData.
- **offset** is the offset in bytes of the first AABB in aabbData.

The AABB data in memory is six 32-bit floats consisting of the minimum x, y, and z values followed by the maximum x, y, and z values.

### Valid Usage

- VUID-VkGeometryAABBNV-offset-02439
  offset must be less than the size of aabbData
- VUID-VkGeometryAABBNV-offset-02440
  offset must be a multiple of 8
- VUID-VkGeometryAABBNV-stride-02441
  stride must be a multiple of 8

### Valid Usage (Implicit)

- VUID-VkGeometryAABBNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_GEOMETRY_AABB_NV
- VUID-VkGeometryAABBNV-pNext-pNext
  pNext must be NULL
- VUID-VkGeometryAABBNV-aabbData-parameter
  If aabbData is not VK_NULL_HANDLE, aabbData must be a valid VkBuffer handle

To destroy an acceleration structure, call:

```c
// Provided by VK_KHR_acceleration_structure
void vkDestroyAccelerationStructureKHR(
    VkDevice device,
```
 VkAccelerationStructureKHR accelerationStructure,
const VkAllocationCallbacks* pAllocator);

- **device** is the logical device that destroys the acceleration structure.
- **accelerationStructure** is the acceleration structure to destroy.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- **VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-08934**
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure` feature must be enabled

- **VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-02442**
  All submitted commands that refer to `accelerationStructure` must have completed execution

- **VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-02443**
  If `VkAllocationCallbacks` were provided when `accelerationStructure` was created, a compatible set of callbacks must be provided here

- **VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-02444**
  If no `VkAllocationCallbacks` were provided when `accelerationStructure` was created, `pAllocator` must be NULL

### Valid Usage (Implicit)

- **VUID-vkDestroyAccelerationStructureKHR-device-parameter**
  `device` must be a valid `VkDevice` handle

- **VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-parameter**
  If `accelerationStructure` is not `VK_NULL_HANDLE`, `accelerationStructure` must be a valid `VkAccelerationStructureKHR` handle

- **VUID-vkDestroyAccelerationStructureKHR-pAllocator-parameter**
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-parent**
  If `accelerationStructure` is a valid handle, it must have been created, allocated, or retrieved from `device`

### Host Synchronization

- Host access to `accelerationStructure` must be externally synchronized

To destroy an acceleration structure, call:
// Provided by VK_NV_ray_tracing

```c
void vkDestroyAccelerationStructureNV(
    VkDevice device,
    VkAccelerationStructureNV accelerationStructure,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the buffer.
- `accelerationStructure` is the acceleration structure to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- **VUID-vkDestroyAccelerationStructureNV-accelerationStructure-03752**
  All submitted commands that refer to `accelerationStructure` **must** have completed execution.

- **VUID-vkDestroyAccelerationStructureNV-accelerationStructure-03753**
  If `VkAllocationCallbacks` were provided when `accelerationStructure` was created, a compatible set of callbacks **must** be provided here.

- **VUID-vkDestroyAccelerationStructureNV-accelerationStructure-03754**
  If no `VkAllocationCallbacks` were provided when `accelerationStructure` was created, `pAllocator` **must** be `NULL`.

### Valid Usage (Implicit)

- **VUID-vkDestroyAccelerationStructureNV-device-parameter**
  `device` **must** be a valid `VkDevice` handle.

- **VUID-vkDestroyAccelerationStructureNV-accelerationStructure-parameter**
  If `accelerationStructure` is not `VK_NULL_HANDLE`, `accelerationStructure` **must** be a valid `VkAccelerationStructureNV` handle.

- **VUID-vkDestroyAccelerationStructureNV-pAllocator-parameter**
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure.

- **VUID-vkDestroyAccelerationStructureNV-accelerationStructure-parent**
  If `accelerationStructure` is a valid handle, it **must** have been created, allocated, or retrieved from `device`.

### Host Synchronization

- Host access to `accelerationStructure` **must** be externally synchronized.

An acceleration structure has memory requirements for the structure object itself, scratch space for
the build, and scratch space for the update.

Scratch space is allocated as a VkBuffer, so for VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_BUILD_SCRATCH_NV and VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_UPDATE_SCRATCH_NV the pMemoryRequirements->alignment and pMemoryRequirements->memoryTypeBits values returned by this call must be filled with zero, and should be ignored by the application.

To query the memory requirements, call:

```c
// Provided by VK_NV_ray_tracing
void vkGetAccelerationStructureMemoryRequirementsNV(
    VkDevice device, 
    const VkAccelerationStructureMemoryRequirementsInfoNV* pInfo, 
    VkMemoryRequirements2KHR* pMemoryRequirements);
```

- `device` is the logical device on which the acceleration structure was created.
- `pInfo` is a pointer to a VkAccelerationStructureMemoryRequirementsInfoNV structure specifying the acceleration structure to get memory requirements for.
- `pMemoryRequirements` is a pointer to a VkMemoryRequirements2KHR structure in which the requested acceleration structure memory requirements are returned.

**Valid Usage (Implicit)**

- VUID-vkGetAccelerationStructureMemoryRequirementsNV-device-parameter device must be a valid VkDevice handle
- VUID-vkGetAccelerationStructureMemoryRequirementsNV-pInfo-parameter pInfo must be a valid pointer to a valid VkAccelerationStructureMemoryRequirementsInfoNV structure
- VUID-vkGetAccelerationStructureMemoryRequirementsNV-pMemoryRequirements-parameter pMemoryRequirements must be a valid pointer to a VkMemoryRequirements2KHR structure

The VkAccelerationStructureMemoryRequirementsInfoNV structure is defined as:

```c
// Provided by VK_NV_ray_tracing
typedef struct VkAccelerationStructureMemoryRequirementsInfoNV {
    VkStructureType sType; 
    const void* pNext; 
    VkAccelerationStructureMemoryRequirementsTypeNV type; 
    VkAccelerationStructureNV accelerationStructure;
} VkAccelerationStructureMemoryRequirementsInfoNV;
```

- `sType` is a VkStructureType value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `type` selects the type of memory requirement being queried.
  - `VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_OBJECT_NV` returns the memory requirements for the object itself.
  - `VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_BUILD_SCRATCH_NV` returns the memory requirements for the scratch memory when doing a build.
  - `VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_UPDATE_SCRATCH_NV` returns the memory requirements for the scratch memory when doing an update.

• `accelerationStructure` is the acceleration structure to be queried for memory requirements.

### Valid Usage (Implicit)

- VUID-VkAccelerationStructureMemoryRequirementsInfoNV-sType-sType `sType` must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_INFO_NV`
- VUID-VkAccelerationStructureMemoryRequirementsInfoNV-pNext-pNext `pNext` must be `NULL`
- VUID-VkAccelerationStructureMemoryRequirementsInfoNV-type-parameter `type` must be a valid `VkAccelerationStructureMemoryRequirementsTypeNV` value
- VUID-VkAccelerationStructureMemoryRequirementsInfoNV-accelerationStructure-parameter `accelerationStructure` must be a valid `VkAccelerationStructureNV` handle

Possible values of `type` in `VkAccelerationStructureMemoryRequirementsInfoNV` are:

```c
// Provided by VK_NV_ray_tracing
typedef enum VkAccelerationStructureMemoryRequirementsTypeNV {
    VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_OBJECT_NV = 0,
    VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_BUILD_SCRATCH_NV = 1,
    VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_UPDATE_SCRATCH_NV = 2,
} VkAccelerationStructureMemoryRequirementsTypeNV;
```

- `VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_OBJECT_NV` requests the memory requirement for the `VkAccelerationStructureNV` backing store.
- `VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_BUILD_SCRATCH_NV` requests the memory requirement for scratch space during the initial build.
- `VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_UPDATE_SCRATCH_NV` requests the memory requirement for scratch space during an update.

Possible values of `buildType` in `vkGetAccelerationStructureBuildSizesKHR` are:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkAccelerationStructureBuildTypeKHR {
    VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_KHR = 0,
    VK_ACCELERATION_STRUCTURE_BUILD_TYPE_DEVICE_KHR = 1,
};
```
VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR = 2,
} VkAccelerationStructureBuildTypeKHR;

• VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_KHR requests the memory requirement for operations performed by the host.
• VK_ACCELERATION_STRUCTURE_BUILD_TYPE_DEVICE_KHR requests the memory requirement for operations performed by the device.
• VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR requests the memory requirement for operations performed by either the host, or the device.

To attach memory to one or more acceleration structures at a time, call:

```c
// Provided by VK_NV_ray_tracing
VkResult vkBindAccelerationStructureMemoryNV(
    VkDevice device,
    uint32_t bindInfoCount,
    const VkBindAccelerationStructureMemoryInfoNV* pBindInfos);
```

• `device` is the logical device that owns the acceleration structures and memory.
• `bindInfoCount` is the number of elements in `pBindInfos`.
• `pBindInfos` is a pointer to an array of `VkBindAccelerationStructureMemoryInfoNV` structures describing acceleration structures and memory to bind.

Valid Usage (Implicit)

- VUID-vkBindAccelerationStructureMemoryNV-device-parameter `device` must be a valid `VkDevice` handle
- VUID-vkBindAccelerationStructureMemoryNV-pBindInfos-parameter `pBindInfos` must be a valid pointer to an array of `bindInfoCount` valid `VkBindAccelerationStructureMemoryInfoNV` structures
- VUID-vkBindAccelerationStructureMemoryNV-bindInfoCount-arraylength `bindInfoCount` must be greater than 0

Return Codes

Success
  • VK_SUCCESS

Failure
  • VK_ERROR_OUT_OF_HOST_MEMORY
  • VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkBindAccelerationStructureMemoryInfoNV` structure is defined as:
// Provided by VK_NV_ray_tracing

typedef struct VkBindAccelerationStructureMemoryInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkAccelerationStructureNV accelerationStructure;
    VkDeviceMemory memory;
    VkDeviceSize memoryOffset;
    uint32_t deviceIndexCount;
    const uint32_t* pDeviceIndices;
} VkBindAccelerationStructureMemoryInfoNV;

• **sType** is a VkStructureType value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **accelerationStructure** is the acceleration structure to be attached to memory.
• **memory** is a VkDeviceMemory object describing the device memory to attach.
• **memoryOffset** is the start offset of the region of memory that is to be bound to the acceleration structure. The number of bytes returned in the VkMemoryRequirements::size member in memory, starting from memoryOffset bytes, will be bound to the specified acceleration structure.
• **deviceIndexCount** is the number of elements in pDeviceIndices.
• **pDeviceIndices** is a pointer to an array of device indices.

## Valid Usage

• VUID-VkBindAccelerationStructureMemoryInfoNV-accelerationStructure-03620
  accelerationStructure must not already be backed by a memory object

• VUID-VkBindAccelerationStructureMemoryInfoNV-memoryOffset-03621
  memoryOffset must be less than the size of memory

• VUID-VkBindAccelerationStructureMemoryInfoNV-memory-03622
  memory must have been allocated using one of the memory types allowed in the memoryTypeBits member of the VkMemoryRequirements structure returned from a call to vkGetAccelerationStructureMemoryRequirementsNV with accelerationStructure and type of VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_OBJECT_NV

• VUID-VkBindAccelerationStructureMemoryInfoNV-memoryOffset-03623
  memoryOffset must be an integer multiple of the alignment member of the VkMemoryRequirements structure returned from a call to vkGetAccelerationStructureMemoryRequirementsNV with accelerationStructure and type of VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_OBJECT_NV

• VUID-VkBindAccelerationStructureMemoryInfoNV-size-03624
  The size member of the VkMemoryRequirements structure returned from a call to vkGetAccelerationStructureMemoryRequirementsNV with accelerationStructure and type of VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_OBJECT_NV must be less than or equal to the size of memory minus memoryOffset
Valid Usage (Implicit)

- VUID-VkBindAccelerationStructureMemoryInfoNV-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_BIND_ACCELERATION_STRUCTURE_MEMORY_INFO_NV`

- VUID-VkBindAccelerationStructureMemoryInfoNV-pNext-pNext
  `pNext` must be `NULL`

- VUID-VkBindAccelerationStructureMemoryInfoNV-accelerationStructure-parameter
  `accelerationStructure` must be a valid `VkAccelerationStructureNV` handle

- VUID-VkBindAccelerationStructureMemoryInfoNV-memory-parameter
  `memory` must be a valid `VkDeviceMemory` handle

- VUID-VkBindAccelerationStructureMemoryInfoNV-pDeviceIndices-parameter
  If `deviceIndexCount` is not `0`, `pDeviceIndices` must be a valid pointer to an array of
  `deviceIndexCount uint32_t` values

- VUID-VkBindAccelerationStructureMemoryInfoNV-commonparent
  Both of `accelerationStructure`, and `memory` must have been created, allocated, or retrieved
  from the same `VkDevice`

To allow constructing geometry instances with device code if desired, we need to be able to query a
opaque handle for an acceleration structure. This handle is a value of 8 bytes. To get this handle, call:

```c
// Provided by VK_NV_ray_tracing
VkResult vkGetAccelerationStructureHandleNV(
    VkDevice device,
    VkAccelerationStructureNV accelerationStructure,
    size_t dataSize,
    void* pData);
```

- `device` is the logical device that owns the acceleration structures.
- `accelerationStructure` is the acceleration structure.
- `dataSize` is the size in bytes of the buffer pointed to by `pData`.
- `pData` is a pointer to a user-allocated buffer where the results will be written.

Valid Usage

- VUID-vkGetAccelerationStructureHandleNV-dataSize-02240
  `dataSize` must be large enough to contain the result of the query, as described above

- VUID-vkGetAccelerationStructureHandleNV-accelerationStructure-02787
  `accelerationStructure` must be bound completely and contiguously to a single
  `VkDeviceMemory` object via `vkBindAccelerationStructureMemoryNV`
Valid Usage (Implicit)

- VUID-vkGetAccelerationStructureHandleNV-device-parameter  
  device must be a valid VkDevice handle
- VUID-vkGetAccelerationStructureHandleNV-accelerationStructure-parameter  
  accelerationStructure must be a valid VkAccelerationStructureNV handle
- VUID-vkGetAccelerationStructureHandleNV-pData-parameter  
  pData must be a valid pointer to an array of dataSize bytes
- VUID-vkGetAccelerationStructureHandleNV-dataSize-arraylength  
  dataSize must be greater than 0
- VUID-vkGetAccelerationStructureHandleNV-accelerationStructure-parent  
  accelerationStructure must have been created, allocated, or retrieved from device

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To query the 64-bit device address for an acceleration structure, call:

```c
// Provided by VK_KHR_acceleration_structure
VkDeviceAddress vkGetAccelerationStructureDeviceAddressKHR(
    VkDevice device,
    const VkAccelerationStructureDeviceAddressInfoKHR* pInfo);
```

- device is the logical device that the acceleration structure was created on.
- pInfo is a pointer to a VkAccelerationStructureDeviceAddressInfoKHR structure specifying the acceleration structure to retrieve an address for.

The 64-bit return value is an address of the acceleration structure, which can be used for device and shader operations that involve acceleration structures, such as ray traversal and acceleration structure building.

If the acceleration structure was created with a non-zero value of VkAccelerationStructureCreateInfoKHR::deviceAddress, the return value will be the same address.

If the acceleration structure was created with a type of VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR, the returned address must be consistent with the relative offset to other acceleration structures with type VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR allocated with the same VkBuffer. That is, the
difference in returned addresses between the two must be the same as the difference in offsets provided at acceleration structure creation.

The returned address must be aligned to 256 bytes.

**Note**
The acceleration structure device address may be different from the buffer device address corresponding to the acceleration structure's start offset in its storage buffer for acceleration structure types other than VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR.

### Valid Usage

- **VUID-vkGetAccelerationStructureDeviceAddressKHR-accelerationStructure-08935**
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure` feature must be enabled

- **VUID-vkGetAccelerationStructureDeviceAddressKHR-device-03504**
  If `device` was created with multiple physical devices, then the `bufferDeviceAddressMultiDevice` feature must be enabled

- **VUID-vkGetAccelerationStructureDeviceAddressKHR-pInfo-09541**
  If the buffer on which `pInfo->accelerationStructure` was placed is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkGetAccelerationStructureDeviceAddressKHR-pInfo-09542**
  The buffer on which `pInfo->accelerationStructure` was placed must have been created with the `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT` usage flag

### Valid Usage (Implicit)

- **VUID-vkGetAccelerationStructureDeviceAddressKHR-device-parameter**
  `device` must be a valid `VkDevice` handle

- **VUID-vkGetAccelerationStructureDeviceAddressKHR-pInfo-parameter**
  `pInfo` must be a valid pointer to a valid `VkAccelerationStructureDeviceAddressInfoKHR` structure

The `VkAccelerationStructureDeviceAddressInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureDeviceAddressInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkAccelerationStructureKHR accelerationStructure;
} VkAccelerationStructureDeviceAddressInfoKHR;
```
sType is a VkStructureType value identifying this structure.

pNext is NULL or a pointer to a structure extending this structure.

accelerationStructure specifies the acceleration structure whose address is being queried.

Valid Usage (Implicit)

- VUID-VkAccelerationStructureDeviceAddressInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_DEVICE_ADDRESS_INFO_KHR

- VUID-VkAccelerationStructureDeviceAddressInfoKHR-pNext-pNext
  pNext must be NULL

- VUID-VkAccelerationStructureDeviceAddressInfoKHR-accelerationStructure-parameter
  accelerationStructure must be a valid VkAccelerationStructureKHR handle

12.7. Micromaps

Micromaps are opaque data structures that are built by the implementation to encode sub-triangle data to be included in an acceleration structure.

Micromaps are represented by VkMicromapEXT handles:

```c
// Provided by VK_EXT_opacity_micromap
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkMicromapEXT)
```

To create a micromap, call:

```c
// Provided by VK_EXT_opacity_micromap
VkResult vkCreateMicromapEXT(
    VkDevice device,
    const VkMicromapCreateInfoEXT* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkMicromapEXT* pMicromap);
```

- device is the logical device that creates the acceleration structure object.

- pCreateInfo is a pointer to a VkMicromapCreateInfoEXT structure containing parameters affecting creation of the micromap.

- pAllocator controls host memory allocation as described in the Memory Allocation chapter.

- pMicromap is a pointer to a VkMicromapEXT handle in which the resulting micromap object is returned.

Similar to other objects in Vulkan, the micromap creation merely creates an object with a specific “shape”. The type and quantity of geometry that can be built into a micromap is determined by the parameters of VkMicromapCreateInfoEXT.
The micromap data is stored in the object referred to by \texttt{VkMicromapCreateInfoEXT::buffer}. Once memory has been bound to that buffer, it \textbf{must} be populated by micromap build or micromap copy commands such as \texttt{vkCmdBuildMicromapsEXT}, \texttt{vkBuildMicromapsEXT}, \texttt{vkCmdCopyMicromapEXT}, and \texttt{vkCopyMicromapEXT}.

\begin{quote}
\textbf{Note}

The expected usage for a trace capture/replay tool is that it will serialize and later deserialize the micromap data using micromap copy commands. During capture the tool will use \texttt{vkCopyMicromapToMemoryEXT} or \texttt{vkCmdCopyMicromapToMemoryEXT} with a mode of \texttt{VK_COPY_MICROMAP_MODE_SERIALIZE_EXT}, and \texttt{vkCopyMemoryToMicromapEXT} or \texttt{vkCmdCopyMemoryToMicromapEXT} with a mode of \texttt{VK_COPY_MICROMAP_MODE_DESERIALIZE_EXT} during replay.
\end{quote}

The input buffers passed to micromap build commands will be referenced by the implementation for the duration of the command. Micromaps \textbf{must} be fully self-contained. The application \textbf{can} reuse or free any memory which was used by the command as an input or as scratch without affecting the results of a subsequent acceleration structure build using the micromap or traversal of that acceleration structure.

\begin{table}[h]
\centering
\begin{tabular}{|c|}
\hline
\textbf{Valid Usage} \\
\hline
- VUID-vkCreateMicromapEXT-micromap-07430 \\
  The micromap feature \textbf{must} be enabled \\
- VUID-vkCreateMicromapEXT-deviceAddress-07431 \\
  If \texttt{VkMicromapCreateInfoEXT::deviceAddress} is not zero, the micromapCaptureReplay feature \textbf{must} be enabled \\
- VUID-vkCreateMicromapEXT-device-07432 \\
  If \texttt{device} was created with multiple physical devices, then the bufferDeviceAddressMultiDevice feature \textbf{must} be enabled \\
\hline
\end{tabular}
\end{table}

\begin{table}[h]
\centering
\begin{tabular}{|c|}
\hline
\textbf{Valid Usage (Implicit)} \\
\hline
- VUID-vkCreateMicromapEXT-device-parameter \\
  \texttt{device} \textbf{must} be a valid \texttt{VkDevice} handle \\
- VUID-vkCreateMicromapEXT-pCreateInfo-parameter \\
  \texttt{pCreateInfo} \textbf{must} be a valid pointer to a valid \texttt{VkMicromapCreateInfoEXT} structure \\
- VUID-vkCreateMicromapEXT-pAllocator-parameter \\
  If \texttt{pAllocator} is not \texttt{NULL}, \texttt{pAllocator} \textbf{must} be a valid pointer to a valid \texttt{VkAllocationCallbacks} structure \\
- VUID-vkCreateMicromapEXT-pMicromap-parameter \\
  \texttt{pMicromap} \textbf{must} be a valid pointer to a \texttt{VkMicromapEXT} handle \\
\hline
\end{tabular}
\end{table}
Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR

The `VkMicromapCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkMicromapCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkMicromapCreateFlagsEXT createFlags;
    VkBuffer buffer;
    VkDeviceSize offset;
    VkDeviceSize size;
    VkMicromapTypeEXT type;
    VkDeviceAddress deviceAddress;
} VkMicromapCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `createFlags` is a bitmask of `VkMicromapCreateFlagBitsEXT` specifying additional creation parameters of the micromap.
- `buffer` is the buffer on which the micromap will be stored.
- `offset` is an offset in bytes from the base address of the buffer at which the micromap will be stored, and must be a multiple of 256.
- `size` is the size required for the micromap.
- `type` is a `VkMicromapTypeEXT` value specifying the type of micromap that will be created.
- `deviceAddress` is the device address requested for the micromap if the `micromapCaptureReplay` feature is being used.

If `deviceAddress` is zero, no specific address is requested.

If `deviceAddress` is not zero, `deviceAddress` must be an address retrieved from an identically created micromap on the same implementation. The micromap must also be placed on an identically created `buffer` and at the same `offset`.

Applications should avoid creating micromaps with application-provided addresses and implementation-provided addresses in the same process, to reduce the likelihood of `VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR` errors.
**Note**

The expected usage for this is that a trace capture/replay tool will add the `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT` flag to all buffers that use `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT`, and will add `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT` to all buffers used as storage for a micromap where `deviceAddress` is not zero. This also means that the tool will need to add `VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT` to memory allocations to allow the flag to be set where the application may not have otherwise required it. During capture the tool will save the queried opaque device addresses in the trace. During replay, the buffers will be created specifying the original address so any address values stored in the trace data will remain valid.

Implementations are expected to separate such buffers in the GPU address space so normal allocations will avoid using these addresses. Apps/tools should avoid mixing app-provided and implementation-provided addresses for buffers created with `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT`, to avoid address space allocation conflicts.

If the micromap will be the target of a build operation, the required size for a micromap can be queried with `vkGetMicromapBuildSizesEXT`.

### Valid Usage

- **VUID-VkMicromapCreateInfoEXT-deviceAddress-07433**
  If `deviceAddress` is not zero, `createFlags` must include `VK_MICROMAP_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_EXT`

- **VUID-VkMicromapCreateInfoEXT-createFlags-07434**
  If `createFlags` includes `VK_MICROMAP_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_EXT`, `VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromapCaptureReplay` must be `VK_TRUE`

- **VUID-VkMicromapCreateInfoEXT-buffer-07435**
  `buffer` must have been created with a usage value containing `VK_BUFFER_USAGE_MICROMAP_STORAGE_BIT_EXT`

- **VUID-VkMicromapCreateInfoEXT-buffer-07436**
  `buffer` must not have been created with `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT`

- **VUID-VkMicromapCreateInfoEXT-offset-07437**
  The sum of `offset` and `size` must be less than the size of `buffer`

- **VUID-VkMicromapCreateInfoEXT-offset-07438**
  `offset` must be a multiple of 256 bytes

### Valid Usage (Implicit)

- **VUID-VkMicromapCreateInfoEXT-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_MICROMAP_CREATE_INFO_EXT`

- **VUID-VkMicromapCreateInfoEXT-pNext-pNext**
pNext must be NULL

- VUID-VkMicromapCreateInfoEXT-createFlags-parameter
  createFlags must be a valid combination of VkMicromapCreateFlagBitsEXT values

- VUID-VkMicromapCreateInfoEXT-buffer-parameter
  buffer must be a valid VkBuffer handle

- VUID-VkMicromapCreateInfoEXT-type-parameter
  type must be a valid VkMicromapTypeEXT value

To get the build sizes for a micromap, call:

```c
// Provided by VK_EXT_opacity_micromap
void vkGetMicromapBuildSizesEXT(
    VkDevice device,                
    VkAccelerationStructureBuildTypeKHR buildType, 
    const VkMicromapBuildInfoEXT* pBuildInfo, 
    VkMicromapBuildSizesInfoEXT* pSizeInfo);
```

- device is the logical device that will be used for creating the micromap.
- buildType defines whether host or device operations (or both) are being queried for.
- pBuildInfo is a pointer to a VkMicromapBuildInfoEXT structure describing parameters of a build operation.
- pSizeInfo is a pointer to a VkMicromapBuildSizesInfoEXT structure which returns the size required for a micromap and the sizes required for the scratch buffers, given the build parameters.

The dstMicromap and mode members of pBuildInfo are ignored. Any VkDeviceOrHostAddressKHR members of pBuildInfo are ignored by this command.

A micromap created with the micromapSize returned by this command supports any build with a VkMicromapBuildInfoEXT structure subject to the following properties:

- The build command is a host build command, and buildType is
  VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_KHR
  or
  VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR

- The build command is a device build command, and buildType is
  VK_ACCELERATION_STRUCTURE_BUILD_TYPE_DEVICE_KHR
  or
  VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR

- For VkMicromapBuildInfoEXT:
  - Its type, and flags members are equal to pBuildInfo->type and pBuildInfo->flags, respectively.
  - The sum of usage information in either pUsageCounts or ppUsageCounts is equal to the sum of usage information in either pBuildInfo->pUsageCounts or pBuildInfo->ppUsageCounts.

Similarly, the buildScratchSize value will support any build command specifying the
**VK_BUILD_MICROMAP_MODE_BUILD_EXT** mode under the above conditions.

### Valid Usage

- **VUID-vkGetMicromapBuildSizesEXT-dstMicromap-09180**
  
  `VkMicromapBuildInfoEXT::dstMicromap` must have been created from device

- **VUID-vkGetMicromapBuildSizesEXT-micromap-07439**
  
  The micromap feature must be enabled

- **VUID-vkGetMicromapBuildSizesEXT-device-07440**
  
  If device was created with multiple physical devices, then the `bufferDeviceAddressMultiDevice` feature must be enabled

### Valid Usage (Implicit)

- **VUID-vkGetMicromapBuildSizesEXT-device-parameter**
  
  device must be a valid `VkDevice` handle

- **VUID-vkGetMicromapBuildSizesEXT-buildType-parameter**
  
  buildType must be a valid `VkAccelerationStructureBuildTypeKHR` value

- **VUID-vkGetMicromapBuildSizesEXT-pBuildInfo-parameter**
  
  pBuildInfo must be a valid pointer to a valid `VkMicromapBuildInfoEXT` structure

- **VUID-vkGetMicromapBuildSizesEXT-pSizeInfo-parameter**
  
  pSizeInfo must be a valid pointer to a `VkMicromapBuildSizesInfoEXT` structure

The `VkMicromapBuildSizesInfoEXT` structure describes the required build sizes for a micromap and scratch buffers and is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkMicromapBuildSizesInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDeviceSize micromapSize;
    VkDeviceSize buildScratchSize;
    VkBool32 discardable;
} VkMicromapBuildSizesInfoEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **micromapSize** is the size in bytes required in a `VkMicromapEXT` for a build or update operation.
- **buildScratchSize** is the size in bytes required in a scratch buffer for a build operation.
- **discardable** indicates whether or not the micromap object may be destroyed after an acceleration structure build or update. A false value means that acceleration structures built with this micromap **may** contain references to the data contained therein, and the application
must not destroy the micromap until ray traversal has concluded. A true value means that the information in the micromap will be copied by value into the acceleration structure, and the micromap may be destroyed after the acceleration structure build concludes.

Valid Usage (Implicit)

- VUID-VkMicromapBuildSizesInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_MICROMAP_BUILD_SIZES_INFO_EXT
- VUID-VkMicromapBuildSizesInfoEXT-pNext-pNext
  pNext must be NULL

Values which can be set in VkMicromapCreateInfoEXT::type specifying the type of micromap, are:

```c
typedef enum VkMicromapTypeEXT {
    VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT = 0,
    #ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_NV_displacement_micromap
    VK_MICROMAP_TYPE_DISPLACEMENT_MICROMAP_NV = 1000397000,
    #endif
} VkMicromapTypeEXT;
```

- **VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT** is a micromap containing data to control the opacity of a triangle.
- **VK_MICROMAP_TYPE_DISPLACEMENT_MICROMAP_NV** is a micromap containing data to control the displacement of subtriangles within a triangle.

Bits which can be set in VkMicromapCreateInfoEXT::createFlags, specifying additional creation parameters for micromaps, are:

```c
// Provided by VK_EXT_opacity_micromap
typedef enum VkMicromapCreateFlagBitsEXT {
    VK_MICROMAP_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_EXT = 0x00000001,
} VkMicromapCreateFlagBitsEXT;
```

- **VK_MICROMAP_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_EXT** specifies that the micromap’s address can be saved and reused on a subsequent run.

```c
// Provided by VK_EXT_opacity_micromap
typedef VkFlags VkMicromapCreateFlagsEXT;
```

VkMicromapCreateFlagsEXT is a bitmask type for setting a mask of zero or more VkMicromapCreateFlagBitsEXT.

Bits which can be set in VkMicromapBuildInfoEXT::flags specifying additional parameters for
micromap builds, are:

```c
// Provided by VK_EXT_opacity_micromap
typedef enum VkBuildMicromapFlagBitsEXT {
    VK_BUILD_MICROMAP_PREFER_FAST_TRACE_BIT_EXT = 0x00000001,
    VK_BUILD_MICROMAP_PREFER_FAST_BUILD_BIT_EXT = 0x00000002,
    VK_BUILD_MICROMAP_ALLOW_COMPACTION_BIT_EXT = 0x00000004,
} VkBuildMicromapFlagBitsEXT;
```

- **VK_BUILD_MICROMAP_PREFER_FAST_TRACE_BIT_EXT** indicates that the given micromap build should prioritize trace performance over build time.
- **VK_BUILD_MICROMAP_PREFER_FAST_BUILD_BIT_EXT** indicates that the given micromap build should prioritize build time over trace performance.

```c
// Provided by VK_EXT_opacity_micromap
typedef VkFlags VkBuildMicromapFlagsEXT;
```

`VkBuildMicromapFlagsEXT` is a bitmask type for setting a mask of zero or more `VkBuildMicromapFlagBitsEXT`.

To destroy a micromap, call:

```c
// Provided by VK_EXT_opacity_micromap
void vkDestroyMicromapEXT(
    VkDevice device,  // device
    VkMicromapEXT micromap,  // micromap
    const VkAllocationCallbacks* pAllocator);  // pAllocator
```

- **device** is the logical device that destroys the micromap.
- **micromap** is the micromap to destroy.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

**Valid Usage**

- **VUID-vkDestroyMicromapEXT-micromap-07441**
  All submitted commands that refer to micromap must have completed execution

- **VUID-vkDestroyMicromapEXT-micromap-07442**
  If VkAllocationCallbacks were provided when micromap was created, a compatible set of callbacks must be provided here

- **VUID-vkDestroyMicromapEXT-micromap-07443**
  If no VkAllocationCallbacks were provided when micromap was created, pAllocator must be NULL
Valid Usage (Implicit)

- **VUID-vkDestroyMicromapEXT-device-parameter**
  - `device` must be a valid `VkDevice` handle

- **VUID-vkDestroyMicromapEXT-micromap-parameter**
  - If `micromap` is not `VK_NULL_HANDLE`, `micromap` must be a valid `VkMicromapEXT` handle

- **VUID-vkDestroyMicromapEXT-pAllocator-parameter**
  - If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkDestroyMicromapEXT-micromap-parent**
  - If `micromap` is a valid handle, it must have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `micromap` must be externally synchronized

12.8. Resource Memory Association

Resources are initially created as *virtual allocations* with no backing memory. Device memory is allocated separately (see Device Memory) and then associated with the resource. This association is done differently for sparse and non-sparse resources.

Resources created with any of the sparse creation flags are considered sparse resources. Resources created without these flags are non-sparse. The details on resource memory association for sparse resources is described in Sparse Resources.

Non-sparse resources must be bound completely and contiguously to a single `VkDeviceMemory` object before the resource is passed as a parameter to any of the following operations:

- creating image or buffer views
- updating descriptor sets
- recording commands in a command buffer

Once bound, the memory binding is immutable for the lifetime of the resource.

In a logical device representing more than one physical device, buffer and image resources exist on all physical devices but can be bound to memory differently on each. Each such replicated resource is an *instance* of the resource. For sparse resources, each instance can be bound to memory arbitrarily differently. For non-sparse resources, each instance can either be bound to the local or a peer instance of the memory, or for images can be bound to rectangular regions from the local and/or peer instances. When a resource is used in a descriptor set, each physical device interprets the descriptor according to its own instance’s binding to memory.
There are no new copy commands to transfer data between physical devices. Instead, an application can create a resource with a peer mapping and use it as the source or destination of a transfer command executed by a single physical device to copy the data from one physical device to another.

To determine the memory requirements for a buffer resource, call:

```c
// Provided by VK_VERSION_1_0
void vkGetBufferMemoryRequirements(
    VkDevice device,
    VkBuffer buffer,
    VkMemoryRequirements* pMemoryRequirements);
```

- `device` is the logical device that owns the buffer.
- `buffer` is the buffer to query.
- `pMemoryRequirements` is a pointer to a `VkMemoryRequirements` structure in which the memory requirements of the buffer object are returned.

### Valid Usage (Implicit)

- VUID-vkGetBufferMemoryRequirements-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkGetBufferMemoryRequirements-buffer-parameter
  - `buffer` must be a valid `VkBuffer` handle
- VUID-vkGetBufferMemoryRequirements-pMemoryRequirements-parameter
  - `pMemoryRequirements` must be a valid pointer to a `VkMemoryRequirements` structure
- VUID-vkGetBufferMemoryRequirements-buffer-parent
  - `buffer` must have been created, allocated, or retrieved from `device`

To determine the memory requirements for an image resource which is not created with the `VK_IMAGE_CREATE_DISJOINT_BIT` flag set, call:

```c
// Provided by VK_VERSION_1_0
void vkGetImageMemoryRequirements(
    VkDevice device,
    VkImage image,
    VkMemoryRequirements* pMemoryRequirements);
```

- `device` is the logical device that owns the image.
- `image` is the image to query.
- `pMemoryRequirements` is a pointer to a `VkMemoryRequirements` structure in which the memory requirements of the image object are returned.
Valid Usage

- VUID-vkGetImageMemoryRequirements-image-01588
  image must not have been created with the VK_IMAGE_CREATE_DISJOINT_BIT flag set

- VUID-vkGetImageMemoryRequirements-image-04004
  If image was created with the VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID external memory handle type, then image must be bound to memory

- VUID-vkGetImageMemoryRequirements-image-08960
  If image was created with the VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX external memory handle type, then image must be bound to memory

Valid Usage (Implicit)

- VUID-vkGetImageMemoryRequirements-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetImageMemoryRequirements-image-parameter
  image must be a valid VkImage handle

- VUID-vkGetImageMemoryRequirements-pMemoryRequirements-parameter
  pMemoryRequirements must be a valid pointer to a VkMemoryRequirements structure

- VUID-vkGetImageMemoryRequirements-image-parent
  image must have been created, allocated, or retrieved from device

The VkMemoryRequirements structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkMemoryRequirements {
    VkDeviceSize size;
    VkDeviceSize alignment;
    uint32_t memoryTypeBits;
} VkMemoryRequirements;
```

- size is the size, in bytes, of the memory allocation required for the resource.
- alignment is the alignment, in bytes, of the offset within the allocation required for the resource.
- memoryTypeBits is a bitmask and contains one bit set for every supported memory type for the resource. Bit i is set if and only if the memory type i in the VkPhysicalDeviceMemoryProperties structure for the physical device is supported for the resource.

The precise size of images that will be bound to external Android hardware buffer memory is unknown until the memory has been imported or allocated, so applications must not call vkGetImageMemoryRequirements or vkGetImageMemoryRequirements2 with such a VkImage
before it has been bound to memory. For this reason, applications also must not call `vkGetDeviceImageMemoryRequirements` with a `VkImageCreateInfo` describing an external Android hardware buffer. When importing Android hardware buffer memory, the allocationSize can be determined by calling `vkGetAndroidHardwareBufferPropertiesANDROID`. When allocating new memory for a `VkImage` that can be exported to an Android hardware buffer, the memory's allocationSize must be zero; the actual size will be determined by the dedicated image's parameters. After the memory has been allocated, the amount of space allocated from the memory's heap can be obtained by getting the image's memory requirements or by calling `vkGetAndroidHardwareBufferPropertiesANDROID` with the Android hardware buffer exported from the memory.

When allocating new memory for a `VkBuffer` that can be exported to an Android hardware buffer an application may still call `vkGetBufferMemoryRequirements` or `vkGetBufferMemoryRequirements2` with `VkBuffer` before it has been bound to memory.

If the resource being queried was created with the `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT`, or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT` external memory handle type, the value of size has no meaning and should be ignored.

The implementation guarantees certain properties about the memory requirements returned by `vkGetBufferMemoryRequirements2`, `vkGetImageMemoryRequirements2`, `vkGetDeviceBufferMemoryRequirements`, `vkGetDeviceImageMemoryRequirements`, `vkGetBufferMemoryRequirements` and `vkGetImageMemoryRequirements`:

- The `memoryTypeBits` member always contains at least one bit set.
- If `buffer` is a `VkBuffer` not created with the `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` or `VK_BUFFER_CREATE_PROTECTED_BIT` bits set, or if `image` is a linear image that was not created with the `VK_IMAGE_CREATE_PROTECTED_BIT` bit set, then the `memoryTypeBits` member always contains at least one bit set corresponding to a `VkMemoryType` with a `propertyFlags` that has both the `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT` bit and the `VK_MEMORY_PROPERTY_HOST_COHERENT_BIT` bit set. In other words, mappable coherent memory can always be attached to these objects.
- If `buffer` was created with `VkExternalMemoryBufferCreateInfo`::`handleTypes` set to 0 or `image` was created with `VkExternalMemoryImageCreateInfo`::`handleTypes` set to 0, the `memoryTypeBits` member always contains at least one bit set corresponding to a `VkMemoryType` with a `propertyFlags` that has the `VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT` bit set.
- The `memoryTypeBits` member is identical for all `VkBuffer` objects created with the same combination of values for the `flags` and `usage` members in the `VkBufferCreateInfo` structure and the `handleTypes` member of the `VkExternalMemoryBufferCreateInfo` structure passed to `vkCreateBuffer`. Further, if `usage1` and `usage2` of type `VkBufferUsageFlags` are such that the bits set in `usage2` are a subset of the bits set in `usage1`, and they have the same `flags` and `VkExternalMemoryBufferCreateInfo`::`handleTypes`, then the bits set in `memoryTypeBits` returned for `usage1` must be a subset of the bits set in `memoryTypeBits` returned for `usage2`, for all values of `flags`.
- The `alignment` member is a power of two.
- The `alignment` member is identical for all `VkBuffer` objects created with the same combination of values for the `usage` and `flags` members in the `VkBufferCreateInfo` structure passed to
If the maintenance4 feature is enabled, then the alignment member is identical for all VkImage objects created with the same combination of values for the flags, imageType, format, extent, mipLevels, arrayLayers, samples, tiling and usage members in the VkImageCreateInfo structure passed to vkCreateImage.

The alignment member satisfies the buffer descriptor offset alignment requirements associated with the VkBuffer’s usage:

- If usage included VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT or VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT, alignment must be an integer multiple of VkPhysicalDeviceLimits::minTexelBufferOffsetAlignment.
- If usage included VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT, alignment must be an integer multiple of VkPhysicalDeviceLimits::minUniformBufferOffsetAlignment.
- If usage included VK_BUFFER_USAGE_STORAGE_BUFFER_BIT, alignment must be an integer multiple of VkPhysicalDeviceLimits::minStorageBufferOffsetAlignment.

For images created with a color format, the memoryTypeBits member is identical for all VkImage objects created with the same combination of values for the tiling member, the VK_IMAGE_CREATE_SPARSE_BINDING_BIT bit of the flags member, the VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT bit of the flags member, the VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT bit of the usage member if the VkPhysicalDeviceHostImageCopyPropertiesEXT::identicalMemoryTypeRequirements property is VK_FALSE, handleTypes member of VkExternalMemoryImageCreateInfo, and the VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT of the usage member in the VkImageCreateInfo structure passed to vkCreateImage.

For images created with a depth/stencil format, the memoryTypeBits member is identical for all VkImage objects created with the same combination of values for the format member, the tiling member, the VK_IMAGE_CREATE_SPARSE_BINDING_BIT bit of the flags member, the VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT bit of the flags member, the VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT bit of the usage member if the VkPhysicalDeviceHostImageCopyPropertiesEXT::identicalMemoryTypeRequirements property is VK_FALSE, handleTypes member of VkExternalMemoryImageCreateInfo, and the VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT of the usage member in the VkImageCreateInfo structure passed to vkCreateImage.

If the memory requirements are for a VkImage, the memoryTypeBits member must not refer to a VkMemoryType with a propertyFlags that has the VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT bit set if the image did not have VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT bit set in the usage member of the VkImageCreateInfo structure passed to vkCreateImage.

If the memory requirements are for a VkBuffer, the memoryTypeBits member must not refer to a VkMemoryType with a propertyFlags that has the VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT bit set.

Note
The implication of this requirement is that lazily allocated memory is disallowed for buffers in all cases.

- The size member is identical for all VkBuffer objects created with the same combination of

1142
creation parameters specified in VkBufferCreateInfo and its pNext chain.

- The size member is identical for all VkImage objects created with the same combination of creation parameters specified in VkImageCreateInfo and its pNext chain.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>This, however, does not imply that they interpret the contents of the bound memory identically with each other. That additional guarantee, however, can be explicitly requested using VK_IMAGE_CREATE_ALIAS_BIT.</td>
</tr>
</tbody>
</table>

- If the maintenance4 feature is enabled, these additional guarantees apply:
  - For a VkBuffer, the size memory requirement is never greater than that of another VkBuffer created with a greater or equal size specified in VkBufferCreateInfo, all other creation parameters being identical.
  - For a VkBuffer, the size memory requirement is never greater than the result of aligning VkBufferCreateInfo::size with the alignment memory requirement.
  - For a VkImage, the size memory requirement is never greater than that of another VkImage created with a greater or equal value in each of extent.width, extent.height, and extent.depth; all other creation parameters being identical.
  - The memory requirements returned by vkGetDeviceBufferMemoryRequirements are identical to those that would be returned by vkGetBufferMemoryRequirements2 if it were called with a VkBuffer created with the same VkBufferCreateInfo values.
  - The memory requirements returned by vkGetDeviceImageMemoryRequirements are identical to those that would be returned by vkGetImageMemoryRequirements2 if it were called with a VkImage created with the same VkImageCreateInfo values.

To determine the memory requirements for a buffer resource, call:

```c
// Provided by VK_VERSION_1_1
void vkGetBufferMemoryRequirements2(VkDevice device, const VkBufferMemoryRequirementsInfo2* pInfo, VkMemoryRequirements2* pMemoryRequirements);
```

or the equivalent command

```c
// Provided by VK_KHR_get_memory_requirements2
void vkGetBufferMemoryRequirements2KHR(VkDevice device, const VkBufferMemoryRequirementsInfo2* pInfo, VkMemoryRequirements2* pMemoryRequirements);
```

- device is the logical device that owns the buffer.
- pInfo is a pointer to a VkBufferMemoryRequirementsInfo2 structure containing parameters required for the memory requirements query.
• `pMemoryRequirements` is a pointer to a `VkMemoryRequirements2` structure in which the memory requirements of the buffer object are returned.

---

**Valid Usage (Implicit)**

- VUID-vkGetBufferMemoryRequirements2-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkGetBufferMemoryRequirements2-pInfo-parameter
  `pInfo` must be a valid pointer to a valid `VkBufferMemoryRequirementsInfo2` structure

- VUID-vkGetBufferMemoryRequirements2-pMemoryRequirements-parameter
  `pMemoryRequirements` must be a valid pointer to a `VkMemoryRequirements2` structure

---

To determine the memory requirements for a buffer resource without creating an object, call:

```c
// Provided by VK_VERSION_1_3
void vkGetDeviceBufferMemoryRequirements(
    VkDevice device,
    const VkDeviceBufferMemoryRequirements* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

or the equivalent command

```c
// Provided by VK_KHR_maintenance4
void vkGetDeviceBufferMemoryRequirementsKHR(
    VkDevice device,
    const VkDeviceBufferMemoryRequirements* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

• `device` is the logical device intended to own the buffer.

• `pInfo` is a pointer to a `VkDeviceBufferMemoryRequirements` structure containing parameters required for the memory requirements query.

• `pMemoryRequirements` is a pointer to a `VkMemoryRequirements2` structure in which the memory requirements of the buffer object are returned.

---

**Valid Usage (Implicit)**

- VUID-vkGetDeviceBufferMemoryRequirements-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkGetDeviceBufferMemoryRequirements-pInfo-parameter
  `pInfo` must be a valid pointer to a valid `VkDeviceBufferMemoryRequirements` structure

- VUID-vkGetDeviceBufferMemoryRequirements-pMemoryRequirements-parameter
  `pMemoryRequirements` must be a valid pointer to a `VkMemoryRequirements2` structure
The `VkBufferMemoryRequirementsInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkBufferMemoryRequirementsInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkBuffer buffer;
} VkBufferMemoryRequirementsInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_get_memory_requirements2
typedef VkBufferMemoryRequirementsInfo2 VkBufferMemoryRequirementsInfo2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `buffer` is the buffer to query.

**Valid Usage (Implicit)**

- `VUID-VkBufferMemoryRequirementsInfo2-sType-sType
  sType` must be `VK_STRUCTURE_TYPE_BUFFER_MEMORY_REQUIREMENTS_INFO_2`
- `VUID-VkBufferMemoryRequirementsInfo2-pNext-pNext
  pNext` must be `NULL`
- `VUID-VkBufferMemoryRequirementsInfo2-buffer-parameter
  buffer` must be a valid `VkBuffer` handle

The `VkDeviceBufferMemoryRequirements` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkDeviceBufferMemoryRequirements {
    VkStructureType sType;
    const void* pNext;
    const VkBufferCreateInfo* pCreateInfo;
} VkDeviceBufferMemoryRequirements;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance4
typedef VkDeviceBufferMemoryRequirements VkDeviceBufferMemoryRequirementsKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `pCreateInfo` is a pointer to a `VkBufferCreateInfo` structure containing parameters affecting creation of the buffer to query.

---

**Valid Usage (Implicit)**

- VUID-VkDeviceBufferMemoryRequirements-sType-sType
  
  `sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_BUFFER_MEMORY_REQUIREMENTS`

- VUID-VkDeviceBufferMemoryRequirements-pNext-pNext
  
  `pNext` **must** be `NULL`

- VUID-VkDeviceBufferMemoryRequirements-pCreateInfo-parameter
  
  `pCreateInfo` **must** be a valid pointer to a valid `VkBufferCreateInfo` structure

---

To determine the memory requirements for an image resource, call:

```c
// Provided by VK_VERSION_1_1
void vkGetImageMemoryRequirements2(
    VkDevice device,
    const VkImageMemoryRequirementsInfo2* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

or the equivalent command

```c
// Provided by VK_KHR_get_memory_requirements2
void vkGetImageMemoryRequirements2KHR(
    VkDevice device,
    const VkImageMemoryRequirementsInfo2* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

• `device` is the logical device that owns the image.

• `pInfo` is a pointer to a `VkImageMemoryRequirementsInfo2` structure containing parameters required for the memory requirements query.

• `pMemoryRequirements` is a pointer to a `VkMemoryRequirements2` structure in which the memory requirements of the image object are returned.

---

**Valid Usage (Implicit)**

- VUID-vkGetImageMemoryRequirements2-device-parameter
  
  `device` **must** be a valid `VkDevice` handle

- VUID-vkGetImageMemoryRequirements2-pInfo-parameter
  
  `pInfo` **must** be a valid pointer to a valid `VkImageMemoryRequirementsInfo2` structure

- VUID-vkGetImageMemoryRequirements2-pMemoryRequirements-parameter
  
  `pMemoryRequirements` **must** be a valid pointer to a `VkMemoryRequirements2` structure
To determine the memory requirements for an image resource without creating an object, call:

```c
// Provided by VK_VERSION_1_3
void vkGetDeviceImageMemoryRequirements(
    VkDevice device,
    const VkDeviceImageMemoryRequirements* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

or the equivalent command

```c
// Provided by VK_KHR_maintenance4
void vkGetDeviceImageMemoryRequirementsKHR(
    VkDevice device,
    const VkDeviceImageMemoryRequirements* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

- `device` is the logical device intended to own the image.
- `pInfo` is a pointer to a `VkDeviceImageMemoryRequirements` structure containing parameters required for the memory requirements query.
- `pMemoryRequirements` is a pointer to a `VkMemoryRequirements2` structure in which the memory requirements of the image object are returned.

### Valid Usage (Implicit)

- VUID-vkGetDeviceImageMemoryRequirements-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkGetDeviceImageMemoryRequirements-pInfo-parameter
  `pInfo` must be a valid pointer to a valid `VkDeviceImageMemoryRequirements` structure
- VUID-vkGetDeviceImageMemoryRequirements-pMemoryRequirements-parameter
  `pMemoryRequirements` must be a valid pointer to a `VkMemoryRequirements2` structure

The `VkImageMemoryRequirementsInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkImageMemoryRequirementsInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkImage image;
} VkImageMemoryRequirementsInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_get_memory_requirements2
```
typedef VkImageMemoryRequirementsInfo2 VkImageMemoryRequirementsInfo2KHR;

- **sType** is a \texttt{VkStructureType} value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **image** is the image to query.

**Valid Usage**

- VUID-VkImageMemoryRequirementsInfo2-image-01589
  If \texttt{image} was created with a multi-planar format and the \texttt{VK_IMAGE_CREATE_DISJOINT_BIT} flag, there must be a \texttt{VkImagePlaneMemoryRequirementsInfo} included in the \texttt{pNext} chain of the \texttt{VkImageMemoryRequirementsInfo2} structure

- VUID-VkImageMemoryRequirementsInfo2-image-02279
  If \texttt{image} was created with \texttt{VK_IMAGE_CREATE_DISJOINT_BIT} and with \texttt{VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT}, then there must be a \texttt{VkImagePlaneMemoryRequirementsInfo} included in the \texttt{pNext} chain of the \texttt{VkImageMemoryRequirementsInfo2} structure

- VUID-VkImageMemoryRequirementsInfo2-image-01590
  If \texttt{image} was not created with the \texttt{VK_IMAGE_CREATE_DISJOINT_BIT} flag, there must not be a \texttt{VkImagePlaneMemoryRequirementsInfo} included in the \texttt{pNext} chain of the \texttt{VkImageMemoryRequirementsInfo2} structure

- VUID-VkImageMemoryRequirementsInfo2-image-02280
  If \texttt{image} was created with a single-plane format and with any tiling other than \texttt{VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT}, then there must not be a \texttt{VkImagePlaneMemoryRequirementsInfo} included in the \texttt{pNext} chain of the \texttt{VkImageMemoryRequirementsInfo2} structure

- VUID-VkImageMemoryRequirementsInfo2-image-01897
  If \texttt{image} was created with the \texttt{VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID} external memory handle type, then \texttt{image} must be bound to memory

- VUID-VkImageMemoryRequirementsInfo2-image-08961
  If \texttt{image} was created with the \texttt{VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX} external memory handle type, then \texttt{image} must be bound to memory

**Valid Usage (Implicit)**

- VUID-VkImageMemoryRequirementsInfo2-sType-sType
  \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_IMAGE_MEMORY_REQUIREMENTS_INFO_2}

- VUID-VkImageMemoryRequirementsInfo2-pNext-pNext
  \texttt{pNext} must be NULL or a pointer to a valid instance of \texttt{VkImagePlaneMemoryRequirementsInfo}

- VUID-VkImageMemoryRequirementsInfo2-sType-unique
The \texttt{sType} value of each struct in the \texttt{pNext} chain \textbf{must} be unique

- VUID-VkImageMemoryRequirementsInfo2-image-parameter
  \textbf{image \textbf{must} be a valid \texttt{VkImage} handle}

The \texttt{VkDeviceImageMemoryRequirements} structure is defined as:

\begin{verbatim}
// Provided by VK_VERSION_1_3
typedef struct VkDeviceImageMemoryRequirements {
    VkStructureType sType;
    const void* pNext;
    const VkImageCreateInfo* pCreateInfo;
    VkImageAspectFlagBits planeAspect;
} VkDeviceImageMemoryRequirements;
\end{verbatim}

or the equivalent

\begin{verbatim}
// Provided by VK_KHR_maintenance4
typedef VkDeviceImageMemoryRequirements VkDeviceImageMemoryRequirementsKHR;
\end{verbatim}

- \texttt{sType} is a \texttt{VkStructureType} value identifying this structure.
- \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
- \texttt{pCreateInfo} is a pointer to a \texttt{VkImageCreateInfo} structure containing parameters affecting creation of the image to query.
- \texttt{planeAspect} is a \texttt{VkImageAspectFlagBits} value specifying the aspect corresponding to the image plane to query. This parameter is ignored unless \texttt{pCreateInfo->tiling} is \texttt{VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT}, or \texttt{pCreateInfo->flags} has \texttt{VK_IMAGE_CREATE_DISJOINT_BIT} set.

**Valid Usage**

- VUID-VkDeviceImageMemoryRequirements-pCreateInfo-06416
  The \texttt{pCreateInfo->pNext} chain \textbf{must} not contain a \texttt{VkImageSwapchainCreateInfoKHR} structure.

- VUID-VkDeviceImageMemoryRequirements-pCreateInfo-06776
  The \texttt{pCreateInfo->pNext} chain \textbf{must} not contain a \texttt{VkImageDrmFormatModifierExplicitCreateInfoEXT} structure.

- VUID-VkDeviceImageMemoryRequirements-pNext-06996
  Applications also \textbf{must} not call \texttt{vkGetDeviceImageMemoryRequirements} with a \texttt{VkImageCreateInfo} whose \texttt{pNext} chain includes a \texttt{VkExternalFormatANDROID} structure with non-zero \texttt{externalFormat}.

- VUID-VkDeviceImageMemoryRequirements-pNext-08962
  Applications also \textbf{must} not call \texttt{vkGetDeviceImageMemoryRequirements} with a \texttt{VkImageCreateInfo} whose \texttt{pNext} chain includes a \texttt{VkExternalFormatQNX} structure with
To determine the memory requirements for a plane of a disjoint image, add a `VkImagePlaneMemoryRequirementsInfo` structure to the `pNext` chain of the `VkImageMemoryRequirementsInfo2` structure.

The `VkImagePlaneMemoryRequirementsInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkImagePlaneMemoryRequirementsInfo {
    VkStructureType sType;
    const void* pNext;
    VkImageAspectFlagBits planeAspect;
} VkImagePlaneMemoryRequirementsInfo;
```

or the equivalent

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
```
typedef VkImagePlaneMemoryRequirementsInfo VkImagePlaneMemoryRequirementsInfoKHR;

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- planeAspect is a VkImageAspectFlagBits value specifying the aspect corresponding to the image plane to query.

**Valid Usage**

- VUID-VkImagePlaneMemoryRequirementsInfo-planeAspect-02281
  If the image's tiling is VK_IMAGE_TILING_LINEAR or VK_IMAGE_TILING_OPTIMAL, then planeAspect must be a single valid multi-planar aspect mask bit

- VUID-VkImagePlaneMemoryRequirementsInfo-planeAspect-02282
  If the image's tiling is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then planeAspect must be a single valid memory plane for the image (that is, aspectMask must specify a plane index that is less than the VkDrmFormatModifierPropertiesEXT::drmFormatModifierPlaneCount associated with the image's format and VkImageDrmFormatModifierPropertiesEXT::drmFormatModifier)

**Valid Usage (Implicit)**

- VUID-VkImagePlaneMemoryRequirementsInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMAGE_PLANE_MEMORY_REQUIREMENTS_INFO

- VUID-VkImagePlaneMemoryRequirementsInfo-planeAspect-parameter
  planeAspect must be a valid VkImageAspectFlagBits value

The VkMemoryRequirements2 structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkMemoryRequirements2 {
    VkStructureType sType;
    void* pNext;
    VkMemoryRequirements memoryRequirements;
} VkMemoryRequirements2;
```

or the equivalent

```c
// Provided by VK_KHR_get_memory_requirements2, VK_KHR_get_memory_requirements2 with VK_NV_ray_tracing
typedef VkMemoryRequirements2 VkMemoryRequirements2KHR;
```

- sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• memoryRequirements is a VkMemoryRequirements structure describing the memory requirements of the resource.

Valid Usage (Implicit)

• VUID-VkMemoryRequirements2-sType-sType
  sType must be VK_STRUCTURE_TYPE_MEMORY_REQUIREMENTS_2

• VUID-VkMemoryRequirements2-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkMemoryDedicatedRequirements

• VUID-VkMemoryRequirements2-sType-unique
  The sType value of each struct in the pNext chain must be unique

The VkMemoryDedicatedRequirements structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkMemoryDedicatedRequirements {
  VkStructureType sType;
  void* pNext;
  VkBool32 prefersDedicatedAllocation;
  VkBool32 requiresDedicatedAllocation;
} VkMemoryDedicatedRequirements;
```
or the equivalent

```c
// Provided by VK_KHR_dedicated_allocation
typedef VkMemoryDedicatedRequirements VkMemoryDedicatedRequirementsKHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• prefersDedicatedAllocation specifies that the implementation would prefer a dedicated allocation for this resource. The application is still free to suballocate the resource but it may get better performance if a dedicated allocation is used.
• requiresDedicatedAllocation specifies that a dedicated allocation is required for this resource.

To determine the dedicated allocation requirements of a buffer or image resource, add a VkMemoryDedicatedRequirements structure to the pNext chain of the VkMemoryRequirements2 structure passed as the pMemoryRequirements parameter of vkGetBufferMemoryRequirements2 or vkGetImageMemoryRequirements2, respectively.

Constraints on the values returned for buffer resources are:

• requiresDedicatedAllocation may be VK_TRUE if the pNext chain of VkBufferCreateInfo for the call to vkCreateBuffer used to create the buffer being queried included a
When the implementation sets `requiresDedicatedAllocation` to `VK_TRUE`, it **must** also set `prefersDedicatedAllocation` to `VK_TRUE`.

If `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` was set in `VkBufferCreateInfo::flags` when `buffer` was created, then both `prefersDedicatedAllocation` and `requiresDedicatedAllocation` will be `VK_FALSE`.

Constraints on the values returned for image resources are:

- `requiresDedicatedAllocation` **may** be `VK_TRUE` if the `pNext` chain of `VkImageCreateInfo` for the call to `vkCreateImage` used to create the image being queried included a `VkExternalMemoryImageCreateInfo` structure, and any of the handle types specified in `VkExternalMemoryImageCreateInfo::handleTypes` requires dedicated allocation, as reported by `vkGetPhysicalDeviceImageFormatProperties2` in `VkExternalImageFormatProperties`.

- `requiresDedicatedAllocation` **may** be `VK_TRUE` if the image’s tiling is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`.

- `requiresDedicatedAllocation` will otherwise be `VK_FALSE`.

- If `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` was set in `VkImageCreateInfo::flags` when `image` was created, then both `prefersDedicatedAllocation` and `requiresDedicatedAllocation` will be `VK_FALSE`.

### Valid Usage (Implicit)

```
// Provided by VK_VERSION_1_0
VkResult vkBindBufferMemory(
    VkDevice device,               // Provided by VK_VERSION_1_0
    VkBuffer buffer,              // Provided by VK_VERSION_1_0
    VkDeviceMemory memory,        // Provided by VK_VERSION_1_0
    VkDeviceSize memoryOffset);  // Provided by VK_VERSION_1_0
```

- `device` is the logical device that owns the buffer and memory.
- `buffer` is the buffer to be attached to memory.
- `memory` is a `VkDeviceMemory` object describing the device memory to attach.
- `memoryOffset` is the start offset of the region of `memory` which is to be bound to the buffer. The number of bytes returned in the `VkMemoryRequirements::size` member in `memory`, starting from `memoryOffset` bytes, will be bound to the specified buffer.
vkBindBufferMemory is equivalent to passing the same parameters through VkBindBufferMemoryInfo to vkBindBufferMemory2.

### Valid Usage

- **VUID-vkBindBufferMemory-buffer-07459**
  buffer must not have been bound to a memory object

- **VUID-vkBindBufferMemory-buffer-01030**
  buffer must not have been created with any sparse memory binding flags

- **VUID-vkBindBufferMemory-memoryOffset-01031**
  memoryOffset must be less than the size of memory

- **VUID-vkBindBufferMemory-memory-01035**
  memory must have been allocated using one of the memory types allowed in the memoryTypeBits member of the VkMemoryRequirements structure returned from a call to vkGetBufferMemoryRequirements with buffer

- **VUID-vkBindBufferMemory-memoryOffset-01036**
  memoryOffset must be an integer multiple of the alignment member of the VkMemoryRequirements structure returned from a call to vkGetBufferMemoryRequirements with buffer

- **VUID-vkBindBufferMemory-size-01037**
  The size member of the VkMemoryRequirements structure returned from a call to vkGetBufferMemoryRequirements with buffer must be less than or equal to the size of memory minus memoryOffset

- **VUID-vkBindBufferMemory-buffer-01444**
  If buffer requires a dedicated allocation (as reported by vkGetBufferMemoryRequirements2 in VkMemoryDedicatedRequirements::requiresDedicatedAllocation for buffer), memory must have been allocated with VkMemoryDedicatedAllocateInfo::buffer equal to buffer

- **VUID-vkBindBufferMemory-memory-01508**
  If the VkMemoryAllocateInfo provided when memory was allocated included a VkMemoryDedicatedAllocateInfo structure in its pNext chain, and VkMemoryDedicatedAllocateInfo::buffer was not VK_NULL_HANDLE, then buffer must equal VkMemoryDedicatedAllocateInfo::buffer, and memoryOffset must be zero

- **VUID-vkBindBufferMemory-None-01898**
  If buffer was created with the VK_BUFFER_CREATE_PROTECTED_BIT bit set, the buffer must be bound to a memory object allocated with a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT

- **VUID-vkBindBufferMemory-None-01899**
  If buffer was created with the VK_BUFFER_CREATE_PROTECTED_BIT bit not set, the buffer must not be bound to a memory object allocated with a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT

- **VUID-vkBindBufferMemory-buffer-01038**
  If buffer was created with VkDedicatedAllocationBufferCreateInfoNV
dedicatedAllocation equal to VK_TRUE, memory must have been allocated with VkDedicatedAllocationMemoryAllocateInfoNV::buffer equal to a buffer handle created with identical creation parameters to buffer and memoryOffset must be zero

• VUID-vkBindBufferMemory-apiVersion-07920
   If the VK_KHR_dedicated_allocation extension is not enabled, VkPhysicalDeviceProperties::apiVersion is less than Vulkan 1.1, and buffer was not created with VkDedicatedAllocationBufferCreateInfoNV::dedicatedAllocation equal to VK_TRUE, memory must not have been allocated dedicated for a specific buffer or image

• VUID-vkBindBufferMemory-memory-02726
   If the value of VkExportMemoryAllocateInfo::handleTypes used to allocate memory is not 0, it must include at least one of the handles set in VkExternalMemoryBufferCreateInfo::handleTypes when buffer was created

• VUID-vkBindBufferMemory-memory-02985
   If memory was allocated by a memory import operation, that is not VkImportAndroidHardwareBufferInfoANDROID with a non-NULL buffer value, the external handle type of the imported memory must also have been set in VkExternalMemoryBufferCreateInfo::handleTypes when buffer was created

• VUID-vkBindBufferMemory-memory-02986
   If memory was allocated with the VkImportAndroidHardwareBufferInfoANDROID memory import operation with a non-NULL buffer value, VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID must also have been set in VkExternalMemoryBufferCreateInfo::handleTypes when buffer was created

• VUID-vkBindBufferMemory-bufferDeviceAddress-03339
   If the VkPhysicalDeviceBufferDeviceAddressFeatures::bufferDeviceAddress feature is enabled and buffer was created with the VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT bit set, memory must have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT bit set

• VUID-vkBindBufferMemory-bufferDeviceAddressCaptureReplay-09200
   If the VkPhysicalDeviceBufferDeviceAddressCaptureReplay feature is enabled and buffer was created with the VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT bit set, memory must have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT bit set

• VUID-vkBindBufferMemory-buffer-06408
   If the buffer was created with VkBufferCollectionBufferCreateInfoFUCHSIA chained to VkBufferCreateInfo::pNext, memory must be allocated with a VkImportMemoryBufferCollectionFUCHSIA chained to VkMemoryAllocateInfo::pNext

• VUID-vkBindBufferMemory-descriptorBufferCaptureReplay-08112
   If the buffer was created with the VK_BUFFER_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT bit set, memory must have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT bit set

• VUID-vkBindBufferMemory-buffer-09201
   If the buffer was created with the VK_BUFFER_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT bit set, memory must have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT bit set
Valid Usage (Implicit)

- VUID-vkBindBufferMemory-device-parameter
device must be a valid VkDevice handle

- VUID-vkBindBufferMemory-buffer-parameter
tbuffer must be a valid VkBuffer handle

- VUID-vkBindBufferMemory-memory-parameter
memory must be a valid VkDeviceMemory handle

- VUID-vkBindBufferMemory-buffer-parent
tbuffer must have been created, allocated, or retrieved from device

- VUID-vkBindBufferMemory-memory-parent
memory must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to buffer must be externally synchronized

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR

To attach memory to buffer objects for one or more buffers at a time, call:

```c
// Provided by VK_VERSION_1_1
VkResult vkBindBufferMemory2(
    VkDevice device,
    uint32_t bindInfoCount,
    const VkBindBufferMemoryInfo* pBindInfos);
```
or the equivalent command

```c
// Provided by VK_KHR_bind_memory2
VkResult vkBindBufferMemory2KHR(
    VkDevice device,
    uint32_t bindInfoCount,
```
• `device` is the logical device that owns the buffers and memory.
• `bindInfoCount` is the number of elements in `pBindInfos`.
• `pBindInfos` is a pointer to an array of `bindInfoCount` `VkBindBufferMemoryInfo` structures describing buffers and memory to bind.

On some implementations, it **may** be more efficient to batch memory bindings into a single command.

If the `maintenance6` feature is enabled, this command **must** attempt to perform all of the memory binding operations described by `pBindInfos`, and **must** not early exit on the first failure.

If any of the memory binding operations described by `pBindInfos` fail, the `VkResult` returned by this command **must** be the return value of any one of the memory binding operations which did not return `VK_SUCCESS`.

**Note**

If the `vkBindBufferMemory2` command failed, `VkBindMemoryStatusKHR` structures were not included in the `pNext` chains of each element of `pBindInfos`, and `bindInfoCount` was greater than one, then the buffers referenced by `pBindInfos` will be in an indeterminate state, and must not be used.

Applications should destroy these buffers.

---

**Valid Usage (Implicit)**

- **VUID-vkBindBufferMemory2-device-parameter**
  - `device` **must** be a valid `VkDevice` handle

- **VUID-vkBindBufferMemory2-pBindInfos-parameter**
  - `pBindInfos` **must** be a valid pointer to an array of `bindInfoCount` valid `VkBindBufferMemoryInfo` structures

- **VUID-vkBindBufferMemory2-bindInfoCount-arraylength**
  - `bindInfoCount` **must** be greater than 0

---

**Return Codes**

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR`
The `VkBindBufferMemoryInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkBindBufferMemoryInfo {
    VkStructureType sType;
    const void* pNext;
    VkBuffer buffer;
    VkDeviceMemory memory;
    VkDeviceSize memoryOffset;
} VkBindBufferMemoryInfo;
```

or the equivalent

```c
// Provided by VK_KHR_bind_memory2
typedef VkBindBufferMemoryInfo VkBindBufferMemoryInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `buffer` is the buffer to be attached to memory.
- `memory` is a `VkDeviceMemory` object describing the device memory to attach.
- `memoryOffset` is the start offset of the region of `memory` which is to be bound to the buffer. The number of bytes returned in the `VkMemoryRequirements::size` member in `memory`, starting from `memoryOffset` bytes, will be bound to the specified buffer.

### Valid Usage

- **VUID-VkBindBufferMemoryInfo-buffer-07459**
  - `buffer` must not have been bound to a memory object
- **VUID-VkBindBufferMemoryInfo-buffer-01030**
  - `buffer` must not have been created with any sparse memory binding flags
- **VUID-VkBindBufferMemoryInfo-memoryOffset-01031**
  - `memoryOffset` must be less than the size of `memory`
- **VUID-VkBindBufferMemoryInfo-memory-01035**
  - `memory` must have been allocated using one of the memory types allowed in the `memoryTypeBits` member of the `VkMemoryRequirements` structure returned from a call to `vkGetBufferMemoryRequirements` with `buffer`
- **VUID-VkBindBufferMemoryInfo-memoryOffset-01036**
  - `memoryOffset` must be an integer multiple of the `alignment` member of the `VkMemoryRequirements` structure returned from a call to `vkGetBufferMemoryRequirements` with `buffer`
The size member of the VkMemoryRequirements structure returned from a call to vkGetBufferMemoryRequirements with buffer must be less than or equal to the size of memory minus memoryOffset.

If buffer requires a dedicated allocation (as reported by vkGetBufferMemoryRequirements2 in VkMemoryDedicatedRequirements::requiresDedicatedAllocation for buffer), memory must have been allocated with VkMemoryDedicatedAllocateInfo::buffer equal to buffer.

If the VkMemoryAllocateInfo provided when memory was allocated included a VkMemoryDedicatedAllocateInfo structure in its pNext chain, and VkMemoryDedicatedAllocateInfo::buffer was not VK_NULL_HANDLE, then buffer must equal VkMemoryDedicatedAllocateInfo::buffer, and memoryOffset must be zero.

If buffer was created with the VK_BUFFER_CREATE_PROTECTED_BIT bit set, the buffer must be bound to a memory object allocated with a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT.

If buffer was created with the VK_BUFFER_CREATE_PROTECTED_BIT bit not set, the buffer must not be bound to a memory object allocated with a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT.

If buffer was created with VkDedicatedAllocationBufferCreateInfoNV::dedicatedAllocation equal to VK_TRUE, memory must have been allocated with VkDedicatedAllocationMemoryAllocateInfoNV::buffer equal to a buffer handle created with identical creation parameters to buffer and memoryOffset must be zero.

If the VK_KHR_dedicated_allocation extension is not enabled, VkPhysicalDeviceProperties::apiVersion is less than Vulkan 1.1, and buffer was not created with VkDedicatedAllocationBufferCreateInfoNV::dedicatedAllocation equal to VK_TRUE, memory must not have been allocated dedicated for a specific buffer or image.

If the value of VkExportMemoryAllocateInfo::handleTypes used to allocate memory is not 0, it must include at least one of the handles set in VkExternalMemoryBufferCreateInfo::handleTypes when buffer was created.

If memory was allocated by a memory import operation, that is not VkImportAndroidHardwareBufferInfoANDROID with a non-NULL buffer value, the external handle type of the imported memory must also have been set in VkExternalMemoryBufferCreateInfo::handleTypes when buffer was created.

If memory was allocated with the VkImportAndroidHardwareBufferInfoANDROID memory import operation with a non-NULL buffer value,
VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID must also have been set in VkExternalMemoryBufferCreateInfo::handleTypes when buffer was created.

- **VUID-VkBindBufferMemoryInfo-bufferDeviceAddress-03339**
  If the VkPhysicalDeviceBufferDeviceAddressFeatures::bufferDeviceAddress feature is enabled and buffer was created with the VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT bit set, memory must have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT bit set.

- **VUID-VkBindBufferMemoryInfo-bufferDeviceAddressCaptureReplay-09200**
  If the VkPhysicalDeviceBufferDeviceAddressFeatures::bufferDeviceAddressCaptureReplay feature is enabled and buffer was created with the VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT bit set, memory must have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT bit set.

- **VUID-VkBindBufferMemoryInfo-buffer-06408**
  If buffer was created with VkBufferCollectionBufferCreateInfoFUCHSIA chained to VkBufferCreateInfo::pNext, memory must be allocated with a VkImportMemoryBufferCollectionFUCHSIA chained to VkMemoryAllocateInfo::pNext.

- **VUID-VkBindBufferMemoryInfo-descriptorBufferCaptureReplay-08112**
  If the buffer was created with the VK_BUFFER_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT bit set, memory must have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT bit set.

- **VUID-VkBindBufferMemoryInfo-buffer-09201**
  If the buffer was created with the VK_BUFFER_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT bit set, memory must have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT bit set.

- **VUID-VkBindBufferMemoryInfo-pNext-01605**
  If the pNext chain includes a VkBindBufferMemoryDeviceGroupInfo structure, all instances of memory specified by VkBindBufferMemoryDeviceGroupInfo::pDeviceIndices must have been allocated.

---

**Valid Usage (Implicit)**

- **VUID-VkBindBufferMemoryInfo-sType-sType**
  sType must be VK_STRUCTURE_TYPE_BIND_BUFFER_MEMORY_INFO.

- **VUID-VkBindBufferMemoryInfo-pNext-pNext**
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkBindBufferMemoryDeviceGroupInfo or VkBindMemoryStatusKHR.

- **VUID-VkBindBufferMemoryInfo-sType-unique**
  The sType value of each struct in the pNext chain must be unique.

- **VUID-VkBindBufferMemoryInfo-buffer-parameter**
  buffer must be a valid VkBuffer handle.

- **VUID-VkBindBufferMemoryInfo-memory-parameter**
  memory must be a valid VkDeviceMemory handle.
Both of `buffer`, and `memory` must have been created, allocated, or retrieved from the same `VkDevice`.

The `VkBindBufferMemoryDeviceGroupInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkBindBufferMemoryDeviceGroupInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t deviceIndexCount;
    const uint32_t* pDeviceIndices;
} VkBindBufferMemoryDeviceGroupInfo;
```

or the equivalent

```c
// Provided by VK_KHR_bind_memory2 with VK_KHR_device_group
typedef VkBindBufferMemoryDeviceGroupInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `deviceIndexCount` is the number of elements in `pDeviceIndices`.
- `pDeviceIndices` is a pointer to an array of device indices.

If the `pNext` chain of `VkBindBufferMemoryInfo` includes a `VkBindBufferMemoryDeviceGroupInfo` structure, then that structure determines how memory is bound to buffers across multiple devices in a device group.

If `deviceIndexCount` is greater than zero, then on device index i the buffer is attached to the instance of `memory` on the physical device with device index `pDeviceIndices[i]`.

If `deviceIndexCount` is zero and `memory` comes from a memory heap with the `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` bit set, then it is as if `pDeviceIndices` contains consecutive indices from zero to the number of physical devices in the logical device, minus one. In other words, by default each physical device attaches to its own instance of `memory`.

If `deviceIndexCount` is zero and `memory` comes from a memory heap without the `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` bit set, then it is as if `pDeviceIndices` contains an array of zeros. In other words, by default each physical device attaches to instance zero.

**Valid Usage**

- `VUID-VkBindBufferMemoryDeviceGroupInfo-deviceIndexCount-01606` deviceIndexCount must either be zero or equal to the number of physical devices in the logical device.
All elements of `pDeviceIndices` must be valid device indices

**Valid Usage (Implicit)**

- VUID-VkBindBufferMemoryDeviceGroupInfo-pDeviceIndices-01607
  
  All elements of `pDeviceIndices` must be valid device indices

- VUID-VkBindBufferMemoryDeviceGroupInfo-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_BIND_BUFFER_MEMORY_DEVICE_GROUP_INFO`

- VUID-VkBindBufferMemoryDeviceGroupInfo-pDeviceIndices-parameter
  
  If `deviceIndexCount` is not 0, `pDeviceIndices` must be a valid pointer to an array of `deviceIndexCount uint32_t` values

The `VkBindMemoryStatusKHR` structure is defined as:

```c
// Provided by VK_KHR_maintenance6
typedef struct VkBindMemoryStatusKHR {
    VkStructureType sType;
    const void* pNext;
    VkResult* pResult;
} VkBindMemoryStatusKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pResult` is a pointer to a `VkResult` value.

If the `pNext` chain of `VkBindBufferMemoryInfo` or `VkBindImageMemoryInfo` includes a `VkBindMemoryStatusKHR` structure, then the `VkBindMemoryStatusKHR::pResult` will be populated with a value describing the result of the corresponding memory binding operation.

**Valid Usage (Implicit)**

- VUID-VkBindMemoryStatusKHR-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_BIND_MEMORY_STATUS_KHR`

- VUID-VkBindMemoryStatusKHR-pResult-parameter
  
  `pResult` must be a valid pointer to a `VkResult` value

To attach memory to a `VkImage` object created without the `VK_IMAGE_CREATE_DISJOINT_BIT` set, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkBindImageMemory(
    VkDevice device,
    VkImage image,
    VkDeviceMemory memory,
    VkDeviceSize memoryOffset);
```
• **device** is the logical device that owns the image and memory.

• **image** is the image.

• **memory** is the **VkDeviceMemory** object describing the device memory to attach.

• **memoryOffset** is the start offset of the region of **memory** which is to be bound to the image. The number of bytes returned in the **VkMemoryRequirements::size** member in **memory**, starting from **memoryOffset** bytes, will be bound to the specified image.

**vkBindImageMemory** is equivalent to passing the same parameters through **VkBindImageMemoryInfo** to **vkBindImageMemory2**.

### Valid Usage

- **VUID-vkBindImageMemory-image-07460**
  - **image** must not have been bound to a memory object

- **VUID-vkBindImageMemory-image-01045**
  - **image** must not have been created with any sparse memory binding flags

- **VUID-vkBindImageMemory-memoryOffset-01046**
  - **memoryOffset** must be less than the size of **memory**

- **VUID-vkBindImageMemory-image-01445**
  - If **image** requires a dedicated allocation (as reported by **vkGetImageMemoryRequirements2** in **VkMemoryDedicatedRequirements::requiresDedicatedAllocation** for **image**), **memory** must have been created with **VkMemoryDedicatedAllocateInfo::image** equal to **image**

- **VUID-vkBindImageMemory-memory-02628**
  - If the dedicatedAllocationImageAliasing feature is not enabled, and the **VkMemoryAllocateInfo** provided when **memory** was allocated included a **VkMemoryDedicatedAllocateInfo** structure in its **pNext** chain, and **VkMemoryDedicatedAllocateInfo::image** was not **VK_NULL_HANDLE**, then **image** must equal **VkMemoryDedicatedAllocateInfo::image** and **memoryOffset** must be zero

- **VUID-vkBindImageMemory-memory-02629**
  - If the dedicatedAllocationImageAliasing feature is enabled, and the **VkMemoryAllocateInfo** provided when **memory** was allocated included a **VkMemoryDedicatedAllocateInfo** structure in its **pNext** chain, and **VkMemoryDedicatedAllocateInfo::image** was not **VK_NULL_HANDLE**, then **memoryOffset** must be zero, and **image** must be either equal to **VkMemoryDedicatedAllocateInfo::image** or an image that was created using the same parameters in **VkImageCreateInfo**, with the exception that **extent** and **arrayLayers** may differ subject to the following restrictions: every dimension in the **extent** parameter of the image being bound must be equal to or smaller than the original image for which the allocation was created; and the **arrayLayers** parameter of the image being bound must be equal to or smaller than the original image for which the allocation was created

- **VUID-vkBindImageMemory-None-01901**
  - If **image** was created with the **VK_IMAGE_CREATE_PROTECTED_BIT** bit set, the image must be bound to a memory object allocated with a memory type that reports **VK_MEMORY_PROPERTY_PROTECTED_BIT**
If image was created with the \textit{VK\_IMAGE\_CREATE\_PROTECTED\_BIT} bit not set, the image \textbf{must} not be bound to a memory object created with a memory type that reports \textit{VK\_MEMORY\_PROPERTY\_PROTECTED\_BIT}.

If image was created with \texttt{VkDedicatedAllocationImageCreateInfoNV::dedicatedAllocation} equal to \texttt{VK\_TRUE}, memory \textbf{must} have been created with \texttt{VkDedicatedAllocationMemoryAllocateInfoNV::image} equal to an image handle created with identical creation parameters to image and memoryOffset \textbf{must} be zero.

If the \textit{VK\_KHR\_dedicated\_allocation} extension is not enabled, \texttt{VkPhysicalDeviceProperties::apiVersion} is less than Vulkan 1.1, and image was not created with \texttt{VkDedicatedAllocationImageCreateInfoNV::dedicatedAllocation} equal to \texttt{VK\_TRUE}, memory \textbf{must} not have been allocated dedicated for a specific buffer or image.

If the value of \texttt{VkExportMemoryAllocateInfo::handleTypes} used to allocate memory is not \texttt{0}, it \textbf{must} include at least one of the handles set in \texttt{VkExternalMemoryImageCreateInfo::handleTypes} when image was created.

If memory was created by a memory import operation, that is not \texttt{VkImportAndroidHardwareBufferInfoANDROID} with a non-NULL buffer value, the external handle type of the imported memory \textbf{must} also have been set in \texttt{VkExternalMemoryImageCreateInfo::handleTypes} when image was created.

If memory was created with the \texttt{VkImportAndroidHardwareBufferInfoANDROID} memory import operation with a non-NULL buffer value, \texttt{VK\_EXTERNAL\_MEMORY\_HANDLE\_TYPE\_ANDROID\_HARDWARE\_BUFFER\_BIT\_ANDROID} \textbf{must} also have been set in \texttt{VkExternalMemoryImageCreateInfo::handleTypes} when image was created.

If the image was created with the \texttt{VK\_IMAGE\_CREATE\_DESCRIPTOR\_BUFFER\_CAPTURE\_REPLAY\_BIT\_EXT} bit set, memory \textbf{must} have been allocated with the \texttt{VK\_MEMORY\_ALLOCATE\_DEVICE\_ADDRESS\_BIT} bit set.

If the image was created with the \texttt{VK\_IMAGE\_CREATE\_DESCRIPTOR\_BUFFER\_CAPTURE\_REPLAY\_BIT\_EXT} bit set, memory \textbf{must} have been allocated with the \texttt{VK\_MEMORY\_ALLOCATE\_DEVICE\_ADDRESS\_CAPTURE\_REPLAY\_BIT} bit set.

If image \textbf{must} not have been created with the \texttt{VK\_IMAGE\_CREATE\_DISJOINT\_BIT} set.

memory \textbf{must} have been allocated using one of the memory types allowed in the memoryTypeBits member of the \texttt{VkMemoryRequirements} structure returned from a call to \texttt{vkGetImageMemoryRequirements} with image.

memoryOffset \textbf{must} be an integer multiple of the alignment member of the
The difference of the size of `memory` and `memoryOffset` must be greater than or equal to the size member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements` with the same `image`.

If `image` was created with `VkBufferCollectionImageCreateInfoFUCHSIA` chained to `VkImageCreateInfo::pNext`, `memory` must be allocated with a `VkImportMemoryBufferCollectionFUCHSIA` chained to `VkMemoryAllocateInfo::pNext`.

Valid Usage (Implicit)

- VUID-vkBindImageMemory-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkBindImageMemory-image-parameter
  `image` must be a valid `VkImage` handle

- VUID-vkBindImageMemory-memory-parameter
  `memory` must be a valid `VkDeviceMemory` handle

- VUID-vkBindImageMemory-image-parent
  `image` must have been created, allocated, or retrieved from `device`

- VUID-vkBindImageMemory-memory-parent
  `memory` must have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `image` must be externally synchronized

Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To attach memory to image objects for one or more images at a time, call:

```c
// Provided by VK_VERSION_1_1
VkResult vkBindImageMemory2(
```
or the equivalent command

```c
// Provided by VK_KHR_bind_memory2
VkResult vkBindImageMemory2KHR(
    VkDevice device,
    uint32_t bindInfoCount,
    const VkBindImageMemoryInfo* pBindInfos);
```

- `device` is the logical device that owns the images and memory.
- `bindInfoCount` is the number of elements in `pBindInfos`.
- `pBindInfos` is a pointer to an array of `VkBindImageMemoryInfo` structures, describing images and memory to bind.

On some implementations, it may be more efficient to batch memory bindings into a single command.

If the `maintenance6` feature is enabled, this command must attempt to perform all of the memory binding operations described by `pBindInfos`, and must not early exit on the first failure.

If any of the memory binding operations described by `pBindInfos` fail, the `VkResult` returned by this command must be the return value of any one of the memory binding operations which did not return `VK_SUCCESS`.

**Note**

If the `vkBindImageMemory2` command failed, `VkBindMemoryStatusKHR` structures were not included in the `pNext` chains of each element of `pBindInfos`, and `bindInfoCount` was greater than one, then the images referenced by `pBindInfos` will be in an indeterminate state, and must not be used.

Applications should destroy these images.

**Valid Usage**

- **VUID-vkBindImageMemory2-pBindInfos-02858**
  If any `VkBindImageMemoryInfo::image` was created with `VK_IMAGE_CREATE_DISJOINT_BIT` then all planes of `VkBindImageMemoryInfo::image` must be bound individually in separate `pBindInfos`

- **VUID-vkBindImageMemory2-pBindInfos-04006**
  `pBindInfos` must not refer to the same image subresource more than once
Valid Usage (Implicit)

• VUID-vkBindImageMemory2-device-parameter
device must be a valid VkDevice handle

• VUID-vkBindImageMemory2-pBindInfos-parameter
pBindInfos must be a valid pointer to an array of bindInfoCount valid
VkBindImageMemoryInfo structures

• VUID-vkBindImageMemory2-bindInfoCount-arraylength
bindInfoCount must be greater than 0

Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

VkBindImageMemoryInfo contains members corresponding to the parameters of
vkBindImageMemory.

The VkBindImageMemoryInfo structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkBindImageMemoryInfo {
    VkStructureType sType;
    const void* pNext;
    VkImage image;
    VkDeviceMemory memory;
    VkDeviceSize memoryOffset;
} VkBindImageMemoryInfo;
```

or the equivalent

```
// Provided by VK_KHR_bind_memory2
typedef VkBindImageMemoryInfo VkBindImageMemoryInfoKHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• image is the image to be attached to memory.
• memory is a VkDeviceMemory object describing the device memory to attach.
• memoryOffset is the start offset of the region of memory which is to be bound to the image. The number of bytes returned in the VkMemoryRequirements::size member in memory, starting from memoryOffset bytes, will be bound to the specified image.

Valid Usage

• VUID-VkBindImageMemoryInfo-image-07460
  image must not have been bound to a memory object

• VUID-VkBindImageMemoryInfo-image-01045
  image must not have been created with any sparse memory binding flags

• VUID-VkBindImageMemoryInfo-memoryOffset-01046
  memoryOffset must be less than the size of memory

• VUID-VkBindImageMemoryInfo-image-01445
  If image requires a dedicated allocation (as reported by vkGetImageMemoryRequirements2 in VkMemoryDedicatedRequirements::requiresDedicatedAllocation for image), memory must have been created with VkMemoryDedicatedAllocateInfo::image equal to image

• VUID-VkBindImageMemoryInfo-memory-02628
  If the dedicatedAllocationImageAliasing feature is not enabled, and the VkMemoryAllocateInfo provided when memory was allocated included a VkMemoryDedicatedAllocateInfo structure in its pNext chain, and VkMemoryDedicatedAllocateInfo::image was not VK_NULL_HANDLE, then image must equal VkMemoryDedicatedAllocateInfo::image and memoryOffset must be zero

• VUID-VkBindImageMemoryInfo-memory-02629
  If the dedicatedAllocationImageAliasing feature is enabled, and the VkMemoryAllocateInfo provided when memory was allocated included a VkMemoryDedicatedAllocateInfo structure in its pNext chain, and VkMemoryDedicatedAllocateInfo::image was not VK_NULL_HANDLE, then memoryOffset must be zero, and image must be either equal to VkMemoryDedicatedAllocateInfo::image or an image that was created using the same parameters in VkImageCreateInfo, with the exception that extent and arrayLayers may differ subject to the following restrictions: every dimension in the extent parameter of the image being bound must be equal to or smaller than the original image for which the allocation was created; and the arrayLayers parameter of the image being bound must be equal to or smaller than the original image for which the allocation was created

• VUID-VkBindImageMemoryInfo-None-01901
  If image was created with the VK_IMAGE_CREATE_PROTECTED_BIT bit set, the image must be bound to a memory object allocated with a memory type that reports VK_MEMORYPROPERTY_PROTECTED_BIT

• VUID-VkBindImageMemoryInfo-None-01902
  If image was created with the VK_IMAGE_CREATE_PROTECTED_BIT bit not set, the image must not be bound to a memory object created with a memory type that reports VK_MEMORYPROPERTY_PROTECTED_BIT

• VUID-VkBindImageMemoryInfo-image-01050
  If image was created with VkDedicatedAllocationImageCreateInfoNV::dedicatedAllocation
equal to VK_TRUE, memory must have been created with VkDedicatedAllocationMemoryAllocateInfoNV::image equal to an image handle created with identical creation parameters to image and memoryOffset must be zero

- VUID-VkBindImageMemoryInfo-apiVersion-07921
  If the VK_KHR_dedicated_allocation extension is not enabled, VkPhysicalDeviceProperties::apiVersion is less than Vulkan 1.1, and image was not created with VkDedicatedAllocationImageCreateInfoNV::dedicatedAllocation equal to VK_TRUE, memory must not have been allocated dedicated for a specific buffer or image

- VUID-VkBindImageMemoryInfo-memory-02728
  If the value of VkExportMemoryAllocateInfo::handleTypes used to allocate memory is not 0, it must include at least one of the handles set in VkExternalMemoryImageCreateInfo::handleTypes when image was created

- VUID-VkBindImageMemoryInfo-memory-02989
  If memory was created by a memory import operation, that is not VkImportAndroidHardwareBufferInfoANDROID with a non-NULL buffer value, the external handle type of the imported memory must also have been set in VkExternalMemoryImageCreateInfo::handleTypes when image was created

- VUID-VkBindImageMemoryInfo-memory-02990
  If memory was created with the VkImportAndroidHardwareBufferInfoANDROID memory import operation with a non-NULL buffer value, VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID must also have been set in VkExternalMemoryImageCreateInfo::handleTypes when image was created

- VUID-VkBindImageMemoryInfo-descriptorBufferCaptureReplay-08113
  If the image was created with the VK_IMAGE_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT bit set, memory must have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT bit set

- VUID-VkBindImageMemoryInfo-image-09202
  If the image was created with the VK_IMAGE_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT bit set, memory must have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT bit set

- VUID-VkBindImageMemoryInfo-pNext-01615
  If the pNext chain does not include a VkBindImagePlaneMemoryInfo structure, memory must have been allocated using one of the memory types allowed in the memoryTypeBits member of the VkMemoryRequirements structure returned from a call to vkGetImageMemoryRequirements2 with image

- VUID-VkBindImageMemoryInfo-pNext-01616
  If the pNext chain does not include a VkBindImagePlaneMemoryInfo structure, memoryOffset must be an integer multiple of the alignment member of the VkMemoryRequirements structure returned from a call to vkGetImageMemoryRequirements2 with image

- VUID-VkBindImageMemoryInfo-pNext-01617
  If the pNext chain does not include a VkBindImagePlaneMemoryInfo structure, the difference of the size of memory and memoryOffset must be greater than or equal to the size member of the VkMemoryRequirements structure returned from a call to
If the `pNext` chain includes a `VkBindImagePlaneMemoryInfo` structure, memory must have been allocated using one of the memory types allowed in the `memoryTypeBits` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements2` with the same `image` and where `VkBindImagePlaneMemoryInfo::planeAspect` corresponds to the `VkImagePlaneMemoryRequirementsInfo::planeAspect` in the `VkImageMemoryRequirementsInfo2` structure's `pNext` chain.

If the `pNext` chain includes a `VkBindImagePlaneMemoryInfo` structure, memoryOffset must be an integer multiple of the `alignment` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements2` with the same `image` and where `VkBindImagePlaneMemoryInfo::planeAspect` corresponds to the `VkImagePlaneMemoryRequirementsInfo::planeAspect` in the `VkImageMemoryRequirementsInfo2` structure's `pNext` chain.

If the `pNext` chain includes a `VkBindImagePlaneMemoryInfo` structure, the difference of the size of memory and memoryOffset must be greater than or equal to the size member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements2` with the same `image` and where `VkBindImagePlaneMemoryInfo::planeAspect` corresponds to the `VkImagePlaneMemoryRequirementsInfo::planeAspect` in the `VkImageMemoryRequirementsInfo2` structure's `pNext` chain.

If the `pNext` chain includes a `VkBindImageMemoryDeviceGroupInfo` structure, all instances of memory specified by `VkBindImageMemoryDeviceGroupInfo::pDeviceIndices` must have been allocated.
If the `pNext` chain includes a `VkBindImageMemoryDeviceGroupInfo` structure, the union of the areas of all elements of `VkBindImageMemoryDeviceGroupInfo::pSplitInstanceBindRegions` that correspond to the same instance of `image` must cover the entire image.

- **VUID-VkBindImageMemoryInfo-image-01630**
  If `image` was created with a valid swapchain handle in `VkImageSwapchainCreateInfoKHR::swapchain`, then the `pNext` chain must include a `VkBindImageMemorySwapchainInfoKHR` structure containing the same swapchain handle.

- **VUID-VkBindImageMemoryInfo-pNext-01631**
  If the `pNext` chain includes a `VkBindImageMemorySwapchainInfoKHR` structure, `memory` must be `VK_NULL_HANDLE`.

- **VUID-VkBindImageMemoryInfo-pNext-01632**
  If the `pNext` chain does not include a `VkBindImageMemorySwapchainInfoKHR` structure, `memory` must be a valid `VkDeviceMemory` handle.

### Valid Usage (Implicit)

- **VUID-VkBindImageMemoryInfo-sType-sType**
  The `sType` value of each struct in the `pNext` chain must be unique.

- **VUID-VkBindImageMemoryInfo-pNext-pNext**
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkBindImageMemoryDeviceGroupInfo`, `VkBindImageMemorySwapchainInfoKHR`, `VkBindImagePlaneMemoryInfo`, or `VkBindMemoryStatusKHR`.

- **VUID-VkBindImageMemoryInfo-sType-unique**
  For each struct in the `pNext` chain, the `sType` value must be unique.

- **VUID-VkBindImageMemoryInfo-image-parameter**
  The `image` parameter must be a valid `VkImage` handle.

- **VUID-VkBindImageMemoryInfo-commonparent**
  Both of `image`, and `memory` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.

The `VkBindImageMemoryDeviceGroupInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkBindImageMemoryDeviceGroupInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t deviceIndexCount;
    const uint32_t* pDeviceIndices;
    uint32_t splitInstanceBindRegionCount;
    const VkRect2D* pSplitInstanceBindRegions;
} VkBindImageMemoryDeviceGroupInfo;
```
or the equivalent

```c
// Provided by VK_KHR_bind_memory2 with VK_KHR_device_group
typedef VkBindImageMemoryDeviceGroupInfo VkBindImageMemoryDeviceGroupInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `deviceIndexCount` is the number of elements in `pDeviceIndices`.
- `pDeviceIndices` is a pointer to an array of device indices.
- `splitInstanceBindRegionCount` is the number of elements in `pSplitInstanceBindRegions`.
- `pSplitInstanceBindRegions` is a pointer to an array of `VkRect2D` structures describing which regions of the image are attached to each instance of memory.

If the `pNext` chain of `VkBindImageMemoryInfo` includes a `VkBindImageMemoryDeviceGroupInfo` structure, then that structure determines how memory is bound to images across multiple devices in a device group.

If `deviceIndexCount` is greater than zero, then on device index `i` image is attached to the instance of the memory on the physical device with device index `pDeviceIndices[i]`.

Let `N` be the number of physical devices in the logical device. If `splitInstanceBindRegionCount` is greater than zero, then `pSplitInstanceBindRegions` is a pointer to an array of `N^2` rectangles, where the image region specified by the rectangle at element `i*N+j` in resource instance `i` is bound to the memory instance `j`. The blocks of the memory that are bound to each sparse image block region use an offset in memory, relative to `memoryOffset`, computed as if the whole image was being bound to a contiguous range of memory. In other words, horizontally adjacent image blocks are separated by the number of bytes per block multiplied by the width in blocks of `image`, and the block at `(0,0)` corresponds to memory starting at `memoryOffset`.

If `splitInstanceBindRegionCount` and `deviceIndexCount` are zero and the memory comes from a memory heap with the `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` bit set, then it is as if `pDeviceIndices` contains consecutive indices from zero to the number of physical devices in the logical device, minus one. In other words, by default each physical device attaches to its own instance of the memory.

If `splitInstanceBindRegionCount` and `deviceIndexCount` are zero and the memory comes from a memory heap without the `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` bit set, then it is as if `pDeviceIndices` contains an array of zeros. In other words, by default each physical device attaches to instance zero.

**Valid Usage**

- VUID-VkBindImageMemoryDeviceGroupInfo-deviceIndexCount-01633
At least one of `deviceIndexCount` and `splitInstanceBindRegionCount` must be zero

- VUID-VkBindImageMemoryDeviceGroupInfo-deviceIndexCount-01634
  `deviceIndexCount` must either be zero or equal to the number of physical devices in the logical device

- VUID-VkBindImageMemoryDeviceGroupInfo-pDeviceIndices-01635
  All elements of `pDeviceIndices` must be valid device indices

- VUID-VkBindImageMemoryDeviceGroupInfo-splitInstanceBindRegionCount-01636
  `splitInstanceBindRegionCount` must either be zero or equal to the number of physical devices in the logical device squared

- VUID-VkBindImageMemoryDeviceGroupInfo-pSplitInstanceBindRegions-01637
  Elements of `pSplitInstanceBindRegions` that correspond to the same instance of an image must not overlap

- VUID-VkBindImageMemoryDeviceGroupInfo-offset-01638
  The `offset.x` member of any element of `pSplitInstanceBindRegions` must be a multiple of the sparse image block width (`VkSparseImageFormatProperties:imageGranularity.width`) of all non-metadata aspects of the image

- VUID-VkBindImageMemoryDeviceGroupInfo-offset-01639
  The `offset.y` member of any element of `pSplitInstanceBindRegions` must be a multiple of the sparse image block height (`VkSparseImageFormatProperties:imageGranularity.height`) of all non-metadata aspects of the image

- VUID-VkBindImageMemoryDeviceGroupInfo-extent-01640
  The `extent.width` member of any element of `pSplitInstanceBindRegions` must either be a multiple of the sparse image block width of all non-metadata aspects of the image, or else `extent.width + offset.x` must equal the width of the image subresource

- VUID-VkBindImageMemoryDeviceGroupInfo-extent-01641
  The `extent.height` member of any element of `pSplitInstanceBindRegions` must either be a multiple of the sparse image block height of all non-metadata aspects of the image, or else `extent.height + offset.y` must equal the height of the image subresource

Valid Usage (Implicit)

- VUID-VkBindImageMemoryDeviceGroupInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_DEVICE_GROUP_INFO`

- VUID-VkBindImageMemoryDeviceGroupInfo-pDeviceIndices-parameter
  If `deviceIndexCount` is not 0, `pDeviceIndices` must be a valid pointer to an array of `deviceIndexCount` uint32_t values

- VUID-VkBindImageMemoryDeviceGroupInfo-pSplitInstanceBindRegions-parameter
  If `splitInstanceBindRegionCount` is not 0, `pSplitInstanceBindRegions` must be a valid pointer to an array of `splitInstanceBindRegionCount` `VkRect2D` structures

If the `pNext` chain of `VkBindImageMemoryInfo` includes a `VkBindImageMemorySwapchainInfoKHR` structure, then that structure includes a swapchain handle and image index indicating that the
image will be bound to memory from that swapchain.

The `VkBindImageMemorySwapchainInfoKHR` structure is defined as:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_swapchain
typedef struct VkBindImageMemorySwapchainInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSwapchainKHR swapchain;
    uint32_t imageIndex;
} VkBindImageMemorySwapchainInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `swapchain` is `VK_NULL_HANDLE` or a swapchain handle.
- `imageIndex` is an image index within `swapchain`.

If `swapchain` is not `NULL`, the `swapchain` and `imageIndex` are used to determine the memory that the image is bound to, instead of `memory` and `memoryOffset`.

Memory can be bound to a swapchain and use the `pDeviceIndices` or `pSplitInstanceBindRegions` members of `VkBindImageMemoryDeviceGroupInfo`.

### Valid Usage

- **VUID-VkBindImageMemorySwapchainInfoKHR-imageIndex-01644**
  - `imageIndex` must be less than the number of images in `swapchain`.
- **VUID-VkBindImageMemorySwapchainInfoKHR-swapchain-07756**
  - If the `swapchain` has been created with `VK_SWAPCHAIN_CREATE_DEFERRED_MEMORY_ALLOCATION_BIT_EXT`, `imageIndex` must be one that has previously been returned by `vkAcquireNextImageKHR` or `vkAcquireNextImage2KHR`.

### Valid Usage (Implicit)

- **VUID-VkBindImageMemorySwapchainInfoKHR-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_SWAPCHAIN_INFO_KHR`.
- **VUID-VkBindImageMemorySwapchainInfoKHR-swapchain-parameter**
  - `swapchain` must be a valid `VkSwapchainKHR` handle.

### Host Synchronization

- Host access to `swapchain` must be externally synchronized.
In order to bind planes of a disjoint image, add a VkBindImagePlaneMemoryInfo structure to the pNext chain of VkBindImageMemoryInfo.

The VkBindImagePlaneMemoryInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkBindImagePlaneMemoryInfo {
    VkStructureType sType;
    const void* pNext;
    VkImageAspectFlagBits planeAspect;
} VkBindImagePlaneMemoryInfo;
```

or the equivalent

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkBindImagePlaneMemoryInfo VkBindImagePlaneMemoryInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `planeAspect` is a VkImageAspectFlagBits value specifying the aspect of the disjoint image plane to bind.

**Valid Usage**

- **VUID-VkBindImagePlaneMemoryInfo-planeAspect-02283**
  If the image's tiling is VK_IMAGE_TILING_LINEAR or VK_IMAGE_TILING_OPTIMAL, then `planeAspect` must be a single valid multi-planar aspect mask bit

- **VUID-VkBindImagePlaneMemoryInfo-planeAspect-02284**
  If the image's tiling is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then `planeAspect` must be a single valid memory plane for the image (that is, `aspectMask` must specify a plane index that is less than the VkDrmFormatModifierPropertiesEXT::drmFormatModifierPlaneCount associated with the image's format and VkImageDrmFormatModifierPropertiesEXT::drmFormatModifier)

**Valid Usage (Implicit)**

- **VUID-VkBindImagePlaneMemoryInfo-sType-sType**
  `sType` must be VK_STRUCTURE_TYPE_BIND_IMAGE_PLANE_MEMORY_INFO

- **VUID-VkBindImagePlaneMemoryInfo-planeAspect-parameter**
  `planeAspect` must be a valid VkImageAspectFlagBits value

**Buffer-Image Granularity**

The implementation-dependent limit bufferImageGranularity specifies a page-like granularity at
which linear and non-linear resources **must** be placed in adjacent memory locations to avoid aliasing. Two resources which do not satisfy this granularity requirement are said to alias. **bufferImageGranularity** is specified in bytes, and **must** be a power of two. Implementations which do not impose a granularity restriction **may** report a **bufferImageGranularity** value of one.

**Note**
Despite its name, **bufferImageGranularity** is really a granularity between “linear” and “non-linear” resources.

Given resourceA at the lower memory offset and resourceB at the higher memory offset in the same **VkDeviceMemory** object, where one resource is linear and the other is non-linear (as defined in the **Glossary**), and the following:

```
resourceA.end = resourceA.memoryOffset + resourceA.size - 1
resourceA.endPage = resourceA.end & ~(bufferImageGranularity-1)
resourceB.start = resourceB.memoryOffset
resourceB.startPage = resourceB.start & ~(bufferImageGranularity-1)
```

The following property **must** hold:

```
resourceA.endPage < resourceB.startPage
```

That is, the end of the first resource (A) and the beginning of the second resource (B) **must** be on separate “pages” of size **bufferImageGranularity**. **bufferImageGranularity** **may** be different than the physical page size of the memory heap. This restriction is only needed when a linear resource and a non-linear resource are adjacent in memory and will be used simultaneously. The memory ranges of adjacent resources **can** be closer than **bufferImageGranularity**, provided they meet the alignment requirement for the objects in question.

Sparse block size in bytes and sparse image and buffer memory alignments **must** all be multiples of the **bufferImageGranularity**. Therefore, memory bound to sparse resources naturally satisfies the **bufferImageGranularity**.

### 12.9. Resource Sharing Mode

Buffer and image objects are created with a **sharing mode** controlling how they **can** be accessed from queues. The supported sharing modes are:

```
// Provided by VK_VERSION_1_0
typedef enum VkSharingMode {
    VK_SHARING_MODE_EXCLUSIVE = 0,
    VK_SHARING_MODE_CONCURRENT = 1,
} VkSharingMode;
```

- **VK_SHARING_MODE_EXCLUSIVE** specifies that access to any range or image subresource of the object
will be exclusive to a single queue family at a time.

- **VK_SHARING_MODE_CONCURRENT** specifies that concurrent access to any range or image subresource of the object from multiple queue families is supported.

```
Note
VK_SHARING_MODE_CONCURRENT may result in lower performance access to the buffer or image than VK_SHARING_MODE_EXCLUSIVE.
```

Ranges of buffers and image subresources of image objects created using **VK_SHARING_MODE_EXCLUSIVE** must only be accessed by queues in the queue family that has ownership of the resource. Upon creation, such resources are not owned by any queue family; ownership is implicitly acquired upon first use within a queue. Once a resource using **VK_SHARING_MODE_EXCLUSIVE** is owned by some queue family, the application must perform a queue family ownership transfer to make the memory contents of a range or image subresource accessible to a different queue family.

```
Note
Images still require a layout transition from VK_IMAGE_LAYOUT_UNDEFINED or VK_IMAGE_LAYOUT_PREINITIALIZED before being used on the first queue.
```

A queue family can take ownership of an image subresource or buffer range of a resource created with **VK_SHARING_MODE_EXCLUSIVE**, without an ownership transfer, in the same way as for a resource that was just created; however, taking ownership in this way has the effect that the contents of the image subresource or buffer range are undefined.

Ranges of buffers and image subresources of image objects created using **VK_SHARING_MODE_CONCURRENT** must only be accessed by queues from the queue families specified through the `queueFamilyIndexCount` and `pQueueFamilyIndices` members of the corresponding create info structures.

### 12.9.1. External Resource Sharing

Resources should only be accessed in the Vulkan instance that has exclusive ownership of their underlying memory. Only one Vulkan instance has exclusive ownership of a resource’s underlying memory at a given time, regardless of whether the resource was created using **VK_SHARING_MODE_EXCLUSIVE** or **VK_SHARING_MODE_CONCURRENT**. Applications can transfer ownership of a resource’s underlying memory only if the memory has been imported from or exported to another instance or external API using external memory handles. The semantics for transferring ownership outside of the instance are similar to those used for transferring ownership of **VK_SHARING_MODE_EXCLUSIVE** resources between queues, and is also accomplished using `VkBufferMemoryBarrier` or `VkImageMemoryBarrier` operations. To make the contents of the underlying memory accessible in the destination instance or API, applications must

1. Release exclusive ownership from the source instance or API.
2. Ensure the release operation has completed using semaphores or fences.
3. Acquire exclusive ownership in the destination instance or API.

Unlike queue ownership transfers, the destination instance or API is not specified explicitly when
releasing ownership, nor is the source instance or API specified when acquiring ownership. Instead, the image or memory barrier’s dstQueueFamilyIndex or srcQueueFamilyIndex parameters are set to the reserved queue family index VK_QUEUE_FAMILY_EXTERNAL or VK_QUEUE_FAMILY_FOREIGN_EXT to represent the external destination or source respectively.

Binding a resource to a memory object shared between multiple Vulkan instances or other APIs does not change the ownership of the underlying memory. The first entity to access the resource implicitly acquires ownership. An entity can also implicitly take ownership from another entity in the same way without an explicit ownership transfer. However, taking ownership in this way has the effect that the contents of the underlying memory are undefined.

Accessing a resource backed by memory that is owned by a particular instance or API has the same semantics as accessing a VK_SHARING_MODE_EXCLUSIVE resource, with one exception: Implementations must ensure layout transitions performed on one member of a set of identical subresources of identical images that alias the same range of an underlying memory object affect the layout of all the subresources in the set.

As a corollary, writes to any image subresources in such a set must not make the contents of memory used by other subresources in the set undefined. An application can define the content of a subresource of one image by performing device writes to an identical subresource of another image provided both images are bound to the same region of external memory. Applications may also add resources to such a set after the content of the existing set members has been defined without making the content undefined by creating a new image with the initial layout VK_IMAGE_LAYOUT_UNDEFINED and binding it to the same region of external memory as the existing images.

Note
Because layout transitions apply to all identical images aliasing the same region of external memory, the actual layout of the memory backing a new image as well as an existing image with defined content will not be undefined. Such an image is not usable until it acquires ownership of its memory from the existing owner. Therefore, the layout specified as part of this transition will be the true initial layout of the image. The undefined layout specified when creating it is a placeholder to simplify valid usage requirements.

12.10. Memory Aliasing
A range of a VkDeviceMemory allocation is aliased if it is bound to multiple resources simultaneously, as described below, via vkBindImageMemory, vkBindBufferMemory, vkBindAccelerationStructureMemoryNV, via sparse memory bindings, or by binding the memory to resources in multiple Vulkan instances or external APIs using external memory handle export and import mechanisms.

Consider two resources, resource\textsubscript{A} and resource\textsubscript{B}, bound respectively to memory range\textsubscript{A} and range\textsubscript{B}. Let paddedRange\textsubscript{A} and paddedRange\textsubscript{B} be, respectively, range\textsubscript{A} and range\textsubscript{B} aligned to bufferImageGranularity. If the resources are both linear or both non-linear (as defined in the Glossary), then the resources alias the memory in the intersection of range\textsubscript{A} and range\textsubscript{B}. If one resource is linear and the other is non-linear, then the resources alias the memory in the
intersection of paddedRange\(_ A \) and paddedRange\(_ B \).

Applications can alias memory, but use of multiple aliases is subject to several constraints.

**Note**

Memory aliasing can be useful to reduce the total device memory footprint of an application, if some large resources are used for disjoint periods of time.

When a non-linear, non-VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT image is bound to an aliased range, all image subresources of the image overlap the range. When a linear image is bound to an aliased range, the image subresources that (according to the image's advertised layout) include bytes from the aliased range overlap the range. When a VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT image has sparse image blocks bound to an aliased range, only image subresources including those sparse image blocks overlap the range, and when the memory bound to the image's mip tail overlaps an aliased range all image subresources in the mip tail overlap the range.

Buffers, and linear image subresources in either the VK_IMAGE_LAYOUT_PREINITIALIZED or VK_IMAGE_LAYOUT_GENERAL layouts, are host-accessible subresources. That is, the host has a well-defined addressing scheme to interpret the contents, and thus the layout of the data in memory can be consistently interpreted across aliases if each of those aliases is a host-accessible subresource. Non-linear images, and linear image subresources in other layouts, are not host-accessible.

If two aliases are both host-accessible, then they interpret the contents of the memory in consistent ways, and data written to one alias can be read by the other alias.

If two aliases are both images that were created with identical creation parameters, both were created with the VK_IMAGE_CREATE_ALIAS_BIT flag set, and both are bound identically to memory except for VkBindImageMemoryDeviceGroupInfo::pDeviceIndices and VkBindImageMemoryDeviceGroupInfo::pSplitInstanceBindRegions, then they interpret the contents of the memory in consistent ways, and data written to one alias can be read by the other alias.

Additionally, if an individual plane of a multi-planar image and a single-plane image alias the same memory, then they also interpret the contents of the memory in consistent ways under the same conditions, but with the following modifications:

- Both must have been created with the VK_IMAGE_CREATE_DISJOINT_BIT flag.
- The single-plane image must have a VkFormat that is equivalent to that of the multi-planar image's individual plane.
- The single-plane image and the individual plane of the multi-planar image must be bound identically to memory except for VkBindImageMemoryDeviceGroupInfo::pDeviceIndices and VkBindImageMemoryDeviceGroupInfo::pSplitInstanceBindRegions.
- The width and height of the single-plane image are derived from the multi-planar image's dimensions in the manner listed for plane compatibility for the aliased plane.
- If either image's tiling is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then both images must be linear.
- All other creation parameters must be identical.
Aliases created by binding the same memory to resources in multiple Vulkan instances or external APIs using external memory handle export and import mechanisms interpret the contents of the memory in consistent ways, and data written to one alias can be read by the other alias.

Otherwise, the aliases interpret the contents of the memory differently, and writes via one alias make the contents of memory partially or completely undefined to the other alias. If the first alias is a host-accessible subresource, then the bytes affected are those written by the memory operations according to its addressing scheme. If the first alias is not host-accessible, then the bytes affected are those overlapped by the image subresources that were written. If the second alias is a host-accessible subresource, the affected bytes become undefined. If the second alias is not host-accessible, all sparse image blocks (for sparse partially-resident images) or all image subresources (for non-sparse image and fully resident sparse images) that overlap the affected bytes become undefined.

If any image subresources are made undefined due to writes to an alias, then each of those image subresources must have its layout transitioned from VK_IMAGE_LAYOUT_UNDEFINED to a valid layout before it is used, or from VK_IMAGE_LAYOUT_PREINITIALIZED if the memory has been written by the host. If any sparse blocks of a sparse image have been made undefined, then only the image subresources containing them must be transitioned.

Use of an overlapping range by two aliases must be separated by a memory dependency using the appropriate access types if at least one of those uses performs writes, whether the aliases interpret memory consistently or not. If buffer or image memory barriers are used, the scope of the barrier must contain the entire range and/or set of image subresources that overlap.

If two aliasing image views are used in the same framebuffer, then the render pass must declare the attachments using the VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT, and follow the other rules listed in that section.

**Note**
Memory recycled via an application suballocator (i.e. without freeing and reallocating the memory objects) is not substantially different from memory aliasing. However, a suballocator usually waits on a fence before recycling a region of memory, and signaling a fence involves sufficient implicit dependencies to satisfy all the above requirements.

### 12.10.1. Resource Memory Overlap

Applications can safely access a resource concurrently as long as the memory locations do not overlap as defined in Memory Location. This includes aliased resources if such aliasing is well-defined. It also includes access from different queues and/or queue families if such concurrent access is supported by the resource. Transfer commands only access memory locations specified by the range of the transfer command.

**Note**
The intent is that buffers (or linear images) can be accessed concurrently, even when they share cache lines, but otherwise do not access the same memory range. The concept of a device cache line size is not exposed in the memory model.
12.11. Buffer Collections

Fuchsia's FIDL-based Sysmem service interoperates with Vulkan via the `VK_FUCHSIA_buffer_collection` extension.

A buffer collection is a set of one or more buffers which were allocated together as a group and which all have the same properties. These properties describe the buffers' internal representation, such as its dimensions and memory layout. This ensures that all of the buffers can be used interchangeably by tasks that require swapping among multiple buffers, such as double-buffered graphics rendering.

On Fuchsia, the Sysmem service uses buffer collections as a core construct in its design.

Buffer collections are represented by `VkBufferCollectionFUCHSIA` handles:

```c
// Provided by VK_FUCHSIA_buffer_collection
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkBufferCollectionFUCHSIA)
```

12.11.1. Definitions

- **FIDL** - Fuchsia Interface Definition Language. The declarative language used to define FIDL interprocess communication interfaces on Fuchsia. FIDL files use the `fidl` extension. FIDL is also used to refer to the services defined by interfaces declared in the FIDL language.
- **Sysmem** - The FIDL service that facilitates optimal buffer sharing and reuse on Fuchsia.
- **client** - Any participant of the buffer collection e.g. the Vulkan application.
- **token** - A `zx_handle_t` Zircon channel object that allows participation in the buffer collection.

12.11.2. Platform Initialization for Buffer Collections

To initialize a buffer collection on Fuchsia:

- Connect to the Sysmem service to initialize a Sysmem allocator.
- Create an initial buffer collection token using the Sysmem allocator.
- Duplicate the token for each participant beyond the initiator.
- See the Sysmem Overview and fuchsia.sysmem FIDL documentation on fuchsia.dev for more detailed information.

12.11.3. Create the Buffer Collection

To create a `VkBufferCollectionFUCHSIA` for Vulkan to participate in the buffer collection:

```c
// Provided by VK_FUCHSIA_buffer_collection
VkResult vkCreateBufferCollectionFUCHSIA(
    VkDevice device,
    const VkBufferCollectionCreateInfoFUCHSIA* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkBufferCollectionFUCHSIA* pCollection)
```
```c
const VkAllocationCallbacks* pAllocator,
VkBufferCollectionFUCHSIA* pCollection);
```

- **device** is the logical device that creates the `VkBufferCollectionFUCHSIA`.
- **pCreateInfo** is a pointer to a `VkBufferCollectionCreateInfoFUCHSIA` structure containing parameters affecting creation of the buffer collection.
- **pAllocator** is a pointer to a `VkAllocationCallbacks` structure controlling host memory allocation as described in the Memory Allocation chapter.
- **pBufferCollection** is a pointer to a `VkBufferCollectionFUCHSIA` handle in which the resulting buffer collection object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateBufferCollectionFUCHSIA-device-parameter
  - `device` must be a valid `VkDevice` handle.
- VUID-vkCreateBufferCollectionFUCHSIA-pCreateInfo-parameter
  - `pCreateInfo` must be a valid pointer to a valid `VkBufferCollectionCreateInfoFUCHSIA` structure.
- VUID-vkCreateBufferCollectionFUCHSIA-pAllocator-parameter
  - If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.
- VUID-vkCreateBufferCollectionFUCHSIA-pCollection-parameter
  - `pCollection` must be a valid pointer to a `VkBufferCollectionFUCHSIA` handle.

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_INVALID_EXTERNAL_HANDLE`
- `VK_ERROR_INITIALIZATION_FAILED`

### Host Access

All functions referencing a `VkBufferCollectionFUCHSIA` must be externally synchronized with the exception of `vkCreateBufferCollectionFUCHSIA`.

The `VkBufferCollectionCreateInfoFUCHSIA` structure is defined as:
typedef struct VkBufferCollectionCreateInfoFUCHSIA {
   VkStructureType sType;
    const void* pNext;
    zx_handle_t collectionToken;
} VkBufferCollectionCreateInfoFUCHSIA;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure
- **collectionToken** is a zx_handle_t containing the Sysmem client’s buffer collection token

### Valid Usage

- VUID-VkBufferCollectionCreateInfoFUCHSIA-collectionToken-06393
collectionToken must be a valid zx_handle_t to a Zircon channel allocated from Sysmem (fuchsia.sysmem.Allocator/AllocateSharedCollection) with ZX_DEFAULT_CHANNEL_RIGHTS rights

### Valid Usage (Implicit)

- VUID-VkBufferCollectionCreateInfoFUCHSIA-sType-sType
  sType must be VK_STRUCTURE>Type_BUFFER_COLLECTION_CREATE_INFO_FUCHSIA
- VUID-VkBufferCollectionCreateInfoFUCHSIA-pNext-pNext
  pNext must be NULL

### 12.11.4. Set the Constraints

Buffer collections can be established for VkImage allocations or VkBuffer allocations.

#### Set Image-based Buffer Collection Constraints

Setting the constraints on the buffer collection initiates the format negotiation and allocation of the buffer collection. To set the constraints on a VkImage buffer collection, call:

```
// Provided by VK_FUCHSIA_buffer_collection
VkResult vkSetBufferCollectionImageConstraintsFUCHSIA(
    VkDevice device, 
    VkBufferCollectionFUCHSIA collection, 
    const VkImageConstraintsInfoFUCHSIA* pImageConstraintsInfo);
```

- **device** is the logical device
- **collection** is the VkBufferCollectionFUCHSIA handle
- **pImageConstraintsInfo** is a pointer to a VkImageConstraintsInfoFUCHSIA structure
vkSetBufferCollectionImageConstraintsFUCHSIA may fail if `pImageConstraintsInfo->formatConstraintsCount` is larger than the implementation-defined limit. If that occurs, `vkSetBufferCollectionImageConstraintsFUCHSIA` will return `VK_ERROR_INITIALIZATION_FAILED`.

`vkSetBufferCollectionImageConstraintsFUCHSIA` may fail if the implementation does not support any of the formats described by the `pImageConstraintsInfo` structure. If that occurs, `vkSetBufferCollectionImageConstraintsFUCHSIA` will return `VK_ERROR_FORMAT_NOT_SUPPORTED`.

### Valid Usage

- VUID-vkSetBufferCollectionImageConstraintsFUCHSIA-collection-06394
  - `vkSetBufferCollectionImageConstraintsFUCHSIA` or `vkSetBufferCollectionBufferConstraintsFUCHSIA` must not have already been called on `collection`.

### Valid Usage (Implicit)

- VUID-vkSetBufferCollectionImageConstraintsFUCHSIA-device-parameter
  - `device` must be a valid `VkDevice` handle

- VUID-vkSetBufferCollectionImageConstraintsFUCHSIA-collection-parameter
  - `collection` must be a valid `VkBufferCollectionFUCHSIA` handle

- VUID-vkSetBufferCollectionImageConstraintsFUCHSIA-pImageConstraintsInfo-parameter
  - `pImageConstraintsInfo` must be a valid pointer to a valid `VkImageConstraintsInfoFUCHSIA` structure

- VUID-vkSetBufferCollectionImageConstraintsFUCHSIA-collection-parent
  - `collection` must have been created, allocated, or retrieved from `device`

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_FORMAT_NOT_SUPPORTED`

The `VkImageConstraintsInfoFUCHSIA` structure is defined as:

```c
// Provided by VK_FUCHSIA_buffer_collection
typedef struct VkImageConstraintsInfoFUCHSIA {
    VkStructureType sType;
    const void* pNext;
} VkImageConstraintsInfoFUCHSIA;
```
uint32_t formatConstraintsCount;
const VkImageFormatConstraintsInfoFUCHSIA* pFormatConstraints;
VkBufferCollectionConstraintsInfoFUCHSIA bufferCollectionConstraints;
VkImageConstraintsInfoFlagsFUCHSIA flags;
}
VkImageConstraintsInfoFUCHSIA;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• formatConstraintsCount is the number of elements in pFormatConstraints.
• pFormatConstraints is a pointer to an array of VkImageFormatConstraintsInfoFUCHSIA structures of size formatConstraintsCount that is used to further constrain buffer collection format selection for image-based buffer collections.
• bufferCollectionConstraints is a VkBufferCollectionConstraintsInfoFUCHSIA structure used to supply parameters for the negotiation and allocation for buffer-based buffer collections.
• flags is a VkImageConstraintsInfoFlagBitsFUCHSIA value specifying hints about the type of memory Sysmem should allocate for the buffer collection.

Valid Usage

• VUID-VkImageConstraintsInfoFUCHSIA-pFormatConstraints-06395
  All elements of pFormatConstraints must have at least one bit set in its VkImageFormatConstraintsInfoFUCHSIA::requiredFormatFeatures

• VUID-VkImageConstraintsInfoFUCHSIA-pFormatConstraints-06396
  If pFormatConstraints->imageCreateInfo->usage contains VK_IMAGE_USAGE_SAMPLED_BIT, then pFormatConstraints->requiredFormatFeatures must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT

• VUID-VkImageConstraintsInfoFUCHSIA-pFormatConstraints-06397
  If pFormatConstraints->imageCreateInfo->usage contains VK_IMAGE_USAGE_STORAGE_BIT, then pFormatConstraints->requiredFormatFeatures must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT

• VUID-VkImageConstraintsInfoFUCHSIA-pFormatConstraints-06398
  If pFormatConstraints->imageCreateInfo->usage contains VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT, then pFormatConstraints->requiredFormatFeatures must contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT

• VUID-VkImageConstraintsInfoFUCHSIA-pFormatConstraints-06399
  If pFormatConstraints->imageCreateInfo->usage contains VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, then pFormatConstraints->requiredFormatFeatures must contain VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT

• VUID-VkImageConstraintsInfoFUCHSIA-pFormatConstraints-06400
  If pFormatConstraints->imageCreateInfo->usage contains VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT, then pFormatConstraints->requiredFormatFeatures must contain at least one of VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT or VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT
If the `attachmentFragmentShadingRate` feature is enabled, and `pFormatConstraints->imageCreateInfo->usage` contains `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`, then `pFormatConstraints->requiredFormatFeatures` must contain `VK_FORMAT_FEATURE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

### Valid Usage (Implicit)

- **VUID-VkImageConstraintsInfoFUCHSIA-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_IMAGE_CONSTRAINTS_INFO_FUCHSIA`
- **VUID-VkImageConstraintsInfoFUCHSIA-pNext-pNext**
  - `pNext` must be `NULL`
- **VUID-VkImageConstraintsInfoFUCHSIA-pFormatConstraints-parameter**
  - `pFormatConstraints` must be a valid pointer to an array of `formatConstraintsCount` valid `VkImageFormatConstraintsInfoFUCHSIA` structures.
- **VUID-VkImageConstraintsInfoFUCHSIA-bufferCollectionConstraints-parameter**
  - `bufferCollectionConstraints` must be a valid `VkBufferCollectionConstraintsInfoFUCHSIA` structure.
- **VUID-VkImageConstraintsInfoFUCHSIA-flags-parameter**
  - `flags` must be a valid combination of `VkImageConstraintsInfoFlagBitsFUCHSIA` values.
- **VUID-VkImageConstraintsInfoFUCHSIA-formatConstraintsCount-arraylength**
  - `formatConstraintsCount` must be greater than `0`.

```c
// Provided by VK_FUCHSIA_buffer_collection
typedef VkFlags VkImageConstraintsInfoFlagsFUCHSIA;
```

`VkImageConstraintsInfoFlagsFUCHSIA` is a bitmask type for setting a mask of zero or more `VkImageConstraintsInfoFlagBitsFUCHSIA` bits.

Bits which can be set in `VkImageConstraintsInfoFlagBitsFUCHSIA::flags` include:

```c
// Provided by VK_FUCHSIA_buffer_collection
typedef enum VkImageConstraintsInfoFlagBitsFUCHSIA {
    VK_IMAGE_CONSTRAINTS_INFO_CPU_READ_RARELY_FUCHSIA = 0x00000001,
    VK_IMAGE_CONSTRAINTS_INFO_CPU_READ_OFTEN_FUCHSIA = 0x00000002,
    VK_IMAGE_CONSTRAINTS_INFO_CPU_WRITE_RARELY_FUCHSIA = 0x00000004,
    VK_IMAGE_CONSTRAINTS_INFO_CPU_WRITE_OFTEN_FUCHSIA = 0x00000008,
    VK_IMAGE_CONSTRAINTS_INFO_PROTECTED_OPTIONAL_FUCHSIA = 0x00000010,
} VkImageConstraintsInfoFlagBitsFUCHSIA;
```

General hints about the type of memory that should be allocated by Sysmem based on the expected usage of the images in the buffer collection include:
• VK_IMAGE_CONSTRAINTS_INFO_CPU_READ_RARELY_FUCHSIA
• VK_IMAGE_CONSTRAINTS_INFO_CPU_READ_OFTEN_FUCHSIA
• VK_IMAGE_CONSTRAINTS_INFO_CPU_WRITE_RARELY_FUCHSIA
• VK_IMAGE_CONSTRAINTS_INFO_CPU_WRITE_OFTEN_FUCHSIA

For protected memory:

• VK_IMAGE_CONSTRAINTS_INFO_PROTECTED_OPTIONAL_FUCHSIA specifies that protected memory is optional for the buffer collection.

Note that if all participants in the buffer collection (Vulkan or otherwise) specify that protected memory is optional, Sysmem will not allocate protected memory.

The VkImageFormatConstraintsInfoFUCHSIA structure is defined as:

```c
// Provided by VK_FUCHSIA_buffer_collection
typedef struct VkImageFormatConstraintsInfoFUCHSIA {
    VkStructureType sType;
    const void* pNext;
    VkImageCreateInfo imageCreateInfo;
    VkFormatFeatureFlags requiredFormatFeatures;
    VkImageFormatConstraintsFlagsFUCHSIA flags;
    uint64_t sysmemPixelFormat;
    uint32_t colorSpaceCount;
    const VkSysmemColorSpaceFUCHSIA* pColorSpaces;
} VkImageFormatConstraintsInfoFUCHSIA;
```

• `sType` is a VkStructureType value identifying this structure.
• `pNext` is NULL or a pointer to a structure extending this structure
• `imageCreateInfo` is the VkImageCreateInfo used to create a VkImage that is to use memory from the VkBufferCollectionFUCHSIA
• `requiredFormatFeatures` is a bitmask of VkFormatFeatureFlagBits specifying required features of the buffers in the buffer collection
• `flags` is reserved for future use
• `sysmemPixelFormat` is a PixelFormatType value from the fuchsia.sysmem/image_formats.fidl FIDL interface
• `colorSpaceCount` the element count of `pColorSpaces`
• `pColorSpaces` is a pointer to an array of VkSysmemColorSpaceFUCHSIA structs of size `colorSpaceCount`

Valid Usage (Implicit)

• VUID-VkImageFormatConstraintsInfoFUCHSIA-sType-sType
  `sType` must be VK_STRUCTURE_TYPE_IMAGE_FORMAT_CONSTRAINTS_INFO_FUCHSIA
• **VUID-VkImageFormatConstraintsInfoFUCHSIA-pNext-pNext**
  `pNext` must be `NULL`

• **VUID-VkImageFormatConstraintsInfoFUCHSIA-imageCreateInfo-parameter**
  `imageCreateInfo` must be a valid `VkImageCreateInfo` structure

• **VUID-VkImageFormatConstraintsInfoFUCHSIA-requiredFormatFeatures-parameter**
  `requiredFormatFeatures` must be a valid combination of `VkFormatFeatureFlagBits` values

• **VUID-VkImageFormatConstraintsInfoFUCHSIA-requiredFormatFeatures-requiredbitsetmask**
  `requiredFormatFeatures` must not be `0`

• **VUID-VkImageFormatConstraintsInfoFUCHSIA-flags-zerobitmask**
  `flags` must be `0`

• **VUID-VkImageFormatConstraintsInfoFUCHSIA-pColorSpaces-parameter**
  `pColorSpaces` must be a valid pointer to an array of `colorSpaceCount` valid `VkSysmemColorSpaceFUCHSIA` structures

• **VUID-VkImageFormatConstraintsInfoFUCHSIA-colorSpaceCount-arraylength**
  `colorSpaceCount` must be greater than `0`

```c
// Provided by VK_FUCHSIA_buffer_collection
typedef VkFlags VkImageFormatConstraintsFlagsFUCHSIA;
```

`VkImageFormatConstraintsFlagsFUCHSIA` is a bitmask type for setting a mask, but is currently reserved for future use.

The `VkBufferCollectionConstraintsInfoFUCHSIA` structure is defined as:

```c
// Provided by VK_FUCHSIA_buffer_collection
typedef struct VkBufferCollectionConstraintsInfoFUCHSIA {
    VkStructureType sType;
    const void* pNext;
    uint32_t minBufferCount;
    uint32_t maxBufferCount;
    uint32_t minBufferCountForCamping;
    uint32_t minBufferCountForDedicatedSlack;
    uint32_t minBufferCountForSharedSlack;
} VkBufferCollectionConstraintsInfoFUCHSIA;
```

• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure
• `minBufferCount` is the minimum number of buffers available in the collection
• `maxBufferCount` is the maximum number of buffers allowed in the collection
• `minBufferCountForCamping` is the per-participant minimum buffers for camping
• `minBufferCountForDedicatedSlack` is the per-participant minimum buffers for dedicated slack
• **minBufferCountForSharedSlack** is the per-participant minimum buffers for shared slack

Sysmem uses all buffer count parameters in combination to determine the number of buffers it will allocate. Sysmem defines buffer count constraints in `fuchsia.sysmem/constraints.fidl`.

*Camping* as referred to by **minBufferCountForCamping**, is the number of buffers that should be available for the participant that are not for transient use. This number of buffers is required for the participant to logically operate.

*Slack* as referred to by **minBufferCountForDedicatedSlack** and **minBufferCountForSharedSlack**, refers to the number of buffers desired by participants for optimal performance. **minBufferCountForDedicatedSlack** refers to the current participant. **minBufferCountForSharedSlack** refers to buffer slack for all participants in the collection.

### Valid Usage (Implicit)

- VUID-VkBufferCollectionConstraintsInfoFUCHSIA-sType-sType
  - `sType` **must** be `VK_STRUCTURE_TYPE_BUFFER_COLLECTION_CONSTRAINTS_INFO_FUCHSIA`
- VUID-VkBufferCollectionConstraintsInfoFUCHSIA-pNext-pNext
  - `pNext` **must** be `NULL`

The **VkSysmemColorSpaceFUCHSIA** structure is defined as:

```c
// Provided by VK_FUCHSIA_buffer_collection
typedef struct VkSysmemColorSpaceFUCHSIA {
    VkStructureType           sType;
    const void*               pNext;
    uint32_t                  colorSpace;
} VkSysmemColorSpaceFUCHSIA;
```

- `sType` is a **VkStructureType** value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure
- `colorSpace` value of the Sysmem **ColorSpaceType**

### Valid Usage

- VUID-VkSysmemColorSpaceFUCHSIA-colorSpace-06402
  - `colorSpace` **must** be a **ColorSpaceType** as defined in `fuchsia.sysmem/image_formats.fidl`

### Valid Usage (Implicit)

- VUID-VkSysmemColorSpaceFUCHSIA-sType-sType
  - `sType` **must** be `VK_STRUCTURE_TYPE_SYSMEM_COLOR_SPACE_FUCHSIA`
- VUID-VkSysmemColorSpaceFUCHSIA-pNext-pNext
Set Buffer-based Buffer Collection Constraints

To set the constraints on a VkBuffer buffer collection, call:

```c
// Provided by VK_FUCHSIA_buffer_collection
VkResult vkSetBufferCollectionBufferConstraintsFUCHSIA(
    VkDevice device,
    VkBufferCollectionFUCHSIA collection,
    const VkBufferConstraintsInfoFUCHSIA* pBufferConstraintsInfo);
```

- `device` is the logical device
- `collection` is the VkBufferCollectionFUCHSIA handle
- `pBufferConstraintsInfo` is a pointer to a VkBufferConstraintsInfoFUCHSIA structure

vkSetBufferCollectionBufferConstraintsFUCHSIA may fail if the implementation does not support the constraints specified in the bufferCollectionConstraints structure. If that occurs, vkSetBufferCollectionBufferConstraintsFUCHSIA will return VK_ERROR_FORMAT_NOT_SUPPORTED.

Valid Usage

- VUID-vkSetBufferCollectionBufferConstraintsFUCHSIA-collection-06403
  vkSetBufferCollectionImageConstraintsFUCHSIA or
  vkSetBufferCollectionBufferConstraintsFUCHSIA must not have already been called on collection

Valid Usage (Implicit)

- VUID-vkSetBufferCollectionBufferConstraintsFUCHSIA-device-parameter
  device must be a valid VkDevice handle

- VUID-vkSetBufferCollectionBufferConstraintsFUCHSIA-collection-parameter
  collection must be a valid VkBufferCollectionFUCHSIA handle

- VUID-vkSetBufferCollectionBufferConstraintsFUCHSIA-pBufferConstraintsInfo-parameter
  pBufferConstraintsInfo must be a valid pointer to a valid VkBufferConstraintsInfoFUCHSIA structure

- VUID-vkSetBufferCollectionBufferConstraintsFUCHSIA-collection-parent
  collection must have been created, allocated, or retrieved from device
Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_FORMAT_NOT_SUPPORTED

The `VkBufferConstraintsInfoFUCHSIA` structure is defined as:

```c
// Provided by VK_FUCHSIA_buffer_collection
typedef struct VkBufferConstraintsInfoFUCHSIA {
    VkStructureType sType;
    const void* pNext;
    VkBufferCreateInfo createInfo;
    VkFormatFeatureFlags requiredFormatFeatures;
    VkBufferCollectionConstraintsInfoFUCHSIA bufferCollectionConstraints;
} VkBufferConstraintsInfoFUCHSIA;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure
- **pBufferCreateInfo** a pointer to a `VkBufferCreateInfo` struct describing the buffer attributes for the buffer collection
- **requiredFormatFeatures** bitmask of `VkFormatFeatureFlagBits` required features of the buffers in the buffer collection
- **bufferCollectionConstraints** is used to supply parameters for the negotiation and allocation of the buffer collection

**Valid Usage**

- VUID-VkBufferConstraintsInfoFUCHSIA-requiredFormatFeatures-06404
  The `requiredFormatFeatures` bitmask of `VkFormatFeatureFlagBits` must be chosen from among the buffer compatible format features listed in `buffer compatible format features`

**Valid Usage (Implicit)**

- VUID-VkBufferConstraintsInfoFUCHSIA-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_BUFFER_CONSTRAINTS_INFO_FUCHSIA`
- VUID-VkBufferConstraintsInfoFUCHSIA-pNext-pNext
  `pNext` must be `NULL`
12.11.5. Retrieve Buffer Collection Properties

After constraints have been set on the buffer collection by calling `vkSetBufferCollectionImageConstraintsFUCHSIA` or `vkSetBufferCollectionBufferConstraintsFUCHSIA`, call `vkGetBufferCollectionPropertiesFUCHSIA` to retrieve the negotiated and finalized properties of the buffer collection.

The call to `vkGetBufferCollectionPropertiesFUCHSIA` is synchronous. It waits for the Sysmem format negotiation and buffer collection allocation to complete before returning.

```c
// Provided by VK_FUCHSIA_buffer_collection
VkResult vkGetBufferCollectionPropertiesFUCHSIA(
    VkDevice device,
    VkBufferCollectionFUCHSIA collection,
    VkBufferCollectionPropertiesFUCHSIA* pProperties);
```

- `device` is the logical device handle
- `collection` is the `VkBufferCollectionFUCHSIA` handle
- `pProperties` is a pointer to the retrieved `VkBufferCollectionPropertiesFUCHSIA` struct

For image-based buffer collections, upon calling `vkGetBufferCollectionPropertiesFUCHSIA`, Sysmem will choose an element of the `VkImageConstraintsInfoFUCHSIA::pImageCreateInfos` established by the preceding call to `vkSetBufferCollectionImageConstraintsFUCHSIA`. The index of the element chosen is stored in and can be retrieved from `VkBufferCollectionPropertiesFUCHSIA::createInfoIndex`.

For buffer-based buffer collections, a single `VkBufferCreateInfo` is specified as `VkBufferConstraintsInfoFUCHSIA::createInfo`. `VkBufferCollectionPropertiesFUCHSIA::createInfoIndex` will therefore always be zero.

`vkGetBufferCollectionPropertiesFUCHSIA` may fail if Sysmem is unable to resolve the constraints of all of the participants in the buffer collection. If that occurs, `vkGetBufferCollectionPropertiesFUCHSIA` will return `VK_ERROR_INITIALIZATION_FAILED`.

Valid Usage

- VUID-vkGetBufferCollectionPropertiesFUCHSIA-None-06405
Prior to calling `vkGetBufferCollectionPropertiesFUCHSIA`, the constraints on the buffer collection **must** have been set by either `vkSetBufferCollectionImageConstraintsFUCHSIA` or `vkSetBufferCollectionBufferConstraintsFUCHSIA`

**Valid Usage (Implicit)**

- **VUID-vkGetBufferCollectionPropertiesFUCHSIA-device-parameter**
  *device* **must** be a valid `VkDevice` handle

- **VUID-vkGetBufferCollectionPropertiesFUCHSIA-collection-parameter**
  *collection* **must** be a valid `VkBufferCollectionFUCHSIA` handle

- **VUID-vkGetBufferCollectionPropertiesFUCHSIA-pProperties-parameter**
  *pProperties* **must** be a valid pointer to a `VkBufferCollectionPropertiesFUCHSIA` structure

- **VUID-vkGetBufferCollectionPropertiesFUCHSIA-collection-parent**
  *collection* **must** have been created, allocated, or retrieved from *device*

**Return Codes**

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_INITIALIZATION_FAILED**

The `VkBufferCollectionPropertiesFUCHSIA` structure is defined as:

```c
// Provided by VK_FUCHSIA_buffer_collection
typedef struct VkBufferCollectionPropertiesFUCHSIA {
    VkStructureType sType;
    void* pNext;
    uint32_t memoryTypeBits;
    uint32_t bufferCount;
    uint32_t createInfoIndex;
    uint64_t sysmemPixelFormat;
    VkFormatFeatureFlags formatFeatures;
    VkSysmemColorSpaceFUCHSIA sysmemColorSpaceIndex;
    VkComponentMapping samplerYcbcrConversionComponents;
    VkSamplerYcbcrModelConversion suggestedYcbcrModel;
    VkSamplerYcbcrRange suggestedYcbcrRange;
    VkChromaLocation suggestedXChromaOffset;
    VkChromaLocation suggestedYChromaOffset;
} VkBufferCollectionPropertiesFUCHSIA;
```

- *sType* is a `VkStructureType` value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure

• **memoryTypeBits** is a bitmask containing one bit set for every memory type which the buffer collection can be imported as buffer collection

• **bufferCount** is the number of buffers in the collection

• **createInfoIndex** as described in [Sysmem chosen create infos](#)

• **sysmemPixelFormat** is the Sysmem PixelFormatType as defined in fuchsia.sysmem/image_formats.fidl

• **formatFeatures** is a bitmask of VkFormatFeatureFlagBits shared by the buffer collection

• **sysmemColorSpaceIndex** is a VkSysmemColorSpaceFUCHSIA struct specifying the color space

• **samplerYcbcrConversionComponents** is a VkComponentMapping struct specifying the component mapping

• **suggestedYcbcrModel** is a VkSamplerYcbcrModelConversion value specifying the suggested Y'C_{b}C_{r} model

• **suggestedYcbcrRange** is a VkSamplerYcbcrRange value specifying the suggested Y'C_{b}C_{r} range

• **suggestedXChromaOffset** is a VkChromaLocation value specifying the suggested X chroma offset

• **suggestedYChromaOffset** is a VkChromaLocation value specifying the suggested Y chroma offset

**sysmemColorSpace** is only set for image-based buffer collections where the constraints were specified using VkImageConstraintsInfoFUCHSIA in a call to vkSetBufferCollectionImageConstraintsFUCHSIA.

For image-based buffer collections, **createInfoIndex** will identify both the VkImageConstraintsInfoFUCHSIA::pImageCreateInfos element and the VkImageConstraintsInfoFUCHSIA::pFormatConstraints element chosen by Sysmem when vkSetBufferCollectionImageConstraintsFUCHSIA was called. The value of **sysmemColorSpaceIndex** will be an index to one of the color spaces provided in the VkImageFormatConstraintsInfoFUCHSIA::pColorSpaces array.

The implementation must have **formatFeatures** with all bits set that were set in VkImageFormatConstraintsInfoFUCHSIA::requiredFormatFeatures, by the call to vkSetBufferCollectionImageConstraintsFUCHSIA, at **createInfoIndex** (other bits could be set as well).

### Valid Usage (Implicit)

- VUID-VkBufferCollectionPropertiesFUCHSIA-sType-sType  
  *sType* must be VK_STRUCTURE_TYPE_BUFFER_COLLECTION_PROPERTIES_FUCHSIA

- VUID-VkBufferCollectionPropertiesFUCHSIA-pNext-pNext  
  *pNext* must be NULL

### 12.11.6. Memory Allocation

To import memory from a buffer collection into a VkImage or a VkBuffer, chain a VkImportMemoryBufferCollectionFUCHSIA structure to the **pNext** member of the VkMemoryAllocateInfo in the call to vkAllocateMemory.
The `VkImportMemoryBufferCollectionFUCHSIA` structure is defined as:

```c
// Provided by VK_FUCHSIA_buffer_collection
typedef struct VkImportMemoryBufferCollectionFUCHSIA {
    VkStructureType sType;
    const void* pNext;
    VkBufferCollectionFUCHSIA collection;
    uint32_t index;
} VkImportMemoryBufferCollectionFUCHSIA;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `collection` is the `VkBufferCollectionFUCHSIA` handle.
- `index` the index of the buffer to import from `collection`.

### Valid Usage

- `VUID-VkImportMemoryBufferCollectionFUCHSIA-index-06406` index must be less than the value retrieved as `VkBufferCollectionPropertiesFUCHSIA:bufferCount`.

### Valid Usage (Implicit)

- `VUID-VkImportMemoryBufferCollectionFUCHSIA-sType-sType` `sType` must be `VK_STRUCTURE_TYPE_IMPORT_MEMORY_BUFFER_COLLECTION_FUCHSIA`.
- `VUID-VkImportMemoryBufferCollectionFUCHSIA-collection-parameter` `collection` must be a valid `VkBufferCollectionFUCHSIA` handle.

To release a `VkBufferCollectionFUCHSIA`:

```c
// Provided by VK_FUCHSIA_buffer_collection
void vkDestroyBufferCollectionFUCHSIA(
    VkDevice device,
    VkBufferCollectionFUCHSIA collection,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that creates the `VkBufferCollectionFUCHSIA`
- `collection` is the `VkBufferCollectionFUCHSIA` handle.
- `pAllocator` is a pointer to a `VkAllocationCallbacks` structure controlling host memory allocation as described in the Memory Allocation chapter.
**Valid Usage**

- VUID-vkDestroyBufferCollectionFUCHSIA-collection-06407
  
  \textit{VkImage} and \textit{VkBuffer} objects that referenced \textit{collection} upon creation by inclusion of a \textit{VkBufferCollectionImageCreateInfoFUCHSIA} or \textit{VkBufferCollectionBufferCreateInfoFUCHSIA} chained to their \textit{VkImageCreateInfo} or \textit{VkBufferCreateInfo} structures respectively, may outlive \textit{collection}

**Valid Usage (Implicit)**

- VUID-vkDestroyBufferCollectionFUCHSIA-device-parameter
  
  \textit{device} must be a valid \textit{VkDevice} handle

- VUID-vkDestroyBufferCollectionFUCHSIA-collection-parameter
  
  \textit{collection} must be a valid \textit{VkBufferCollectionFUCHSIA} handle

- VUID-vkDestroyBufferCollectionFUCHSIA-pAllocator-parameter
  
  If \textit{pAllocator} is not \textit{NULL}, \textit{pAllocator} must be a valid pointer to a valid \textit{VkAllocationCallbacks} structure

- VUID-vkDestroyBufferCollectionFUCHSIA-collection-parent
  
  \textit{collection} must have been created, allocated, or retrieved from \textit{device}
Chapter 13. Samplers

*VkSampler* objects represent the state of an image sampler which is used by the implementation to read image data and apply filtering and other transformations for the shader.

Samplers are represented by *VkSampler* handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSampler)
```

To create a sampler object, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateSampler(
    VkDevice device,
    const VkSamplerCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSampler* pSampler);
```

- *device* is the logical device that creates the sampler.
- *pCreateInfo* is a pointer to a *VkSamplerCreateInfo* structure specifying the state of the sampler object.
- *pAllocator* controls host memory allocation as described in the Memory Allocation chapter.
- *pSampler* is a pointer to a *VkSampler* handle in which the resulting sampler object is returned.

**Valid Usage**

- VUID-vkCreateSampler-maxSamplerAllocationCount-04110
  There must be less than *VkPhysicalDeviceLimits::maxSamplerAllocationCount* *VkSampler* objects currently created on the device

**Valid Usage (Implicit)**

- VUID-vkCreateSampler-device-parameter
  *device* must be a valid *VkDevice* handle
- VUID-vkCreateSampler-pCreateInfo-parameter
  *pCreateInfo* must be a valid pointer to a valid *VkSamplerCreateInfo* structure
- VUID-vkCreateSampler-pAllocator-parameter
  If *pAllocator* is not NULL, *pAllocator* must be a valid pointer to a valid *VkAllocationCallbacks* structure
- VUID-vkCreateSampler-pSampler-parameter
  *pSampler* must be a valid pointer to a *VkSampler* handle
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR

The VkSamplerCreateInfo structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkSamplerCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkSamplerCreateFlags flags;
    VkFilter magFilter;
    VkFilter minFilter;
    VkSamplerMipmapMode.mipmapMode;
    VkSamplerAddressMode addressModeU;
    VkSamplerAddressMode addressModeV;
    VkSamplerAddressMode addressModeW;
    float mipLodBias;
    VkBool32 anisotropyEnable;
    float maxAnisotropy;
    VkBool32 compareEnable;
    VkCompareOp compareOp;
    float minLod;
    float maxLod;
    VkBorderColor borderColor;
    VkBool32 unnormalizedCoordinates;
} VkSamplerCreateInfo;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is a bitmask of VkSamplerCreateFlagBits describing additional parameters of the sampler.
- **magFilter** is a VkFilter value specifying the magnification filter to apply to lookups.
- **minFilter** is a VkFilter value specifying the minification filter to apply to lookups.
- **mipmapMode** is a VkSamplerMipmapMode value specifying the mipmap filter to apply to lookups.
- **addressModeU** is a VkSamplerAddressMode value specifying the addressing mode for U coordinates outside [0,1).
- **addressModeV** is a VkSamplerAddressMode value specifying the addressing mode for V coordinates outside [0,1).

1198
• **addressModeW** is a `VkSamplerAddressMode` value specifying the addressing mode for W coordinates outside [0,1).

• **mipLodBias** is the bias to be added to mipmap LOD calculation and bias provided by image sampling functions in SPIR-V, as described in the LOD Operation section.

• **anisotropyEnable** is `VK_TRUE` to enable anisotropic filtering, as described in the Texel Anisotropic Filtering section, or `VK_FALSE` otherwise.

• **maxAnisotropy** is the anisotropy value clamp used by the sampler when **anisotropyEnable** is `VK_TRUE`. If **anisotropyEnable** is `VK_FALSE`, **maxAnisotropy** is ignored.

• **compareEnable** is `VK_TRUE` to enable comparison against a reference value during lookups, or `VK_FALSE` otherwise.

  ◦ Note: Some implementations will default to shader state if this member does not match.

• **compareOp** is a `VkCompareOp` value specifying the comparison operator to apply to fetched data before filtering as described in the Depth Compare Operation section.

• **minLod** is used to clamp the minimum of the computed LOD value.

• **maxLod** is used to clamp the maximum of the computed LOD value. To avoid clamping the maximum value, set **maxLod** to the constant `VK_LOD_CLAMP_NONE`.

• **borderColor** is a `VkBorderColor` value specifying the predefined border color to use.

• **unnormalizedCoordinates** controls whether to use unnormalized or normalized texel coordinates to address texels of the image. When set to `VK_TRUE`, the range of the image coordinates used to lookup the texel is in the range of zero to the image size in each dimension. When set to `VK_FALSE` the range of image coordinates is zero to one.

When **unnormalizedCoordinates** is `VK_TRUE`, images the sampler is used with in the shader have the following requirements:

  ◦ The **viewType** must be either `VK_IMAGE_VIEW_TYPE_1D` or `VK_IMAGE_VIEW_TYPE_2D`.
  
  ◦ The image view must have a single layer and a single mip level.

When **unnormalizedCoordinates** is `VK_TRUE`, image built-in functions in the shader that use the sampler have the following requirements:

  ◦ The functions must not use projection.
  
  ◦ The functions must not use offsets.

---

**Mapping of OpenGL to Vulkan filter modes**

**magFilter** values of `VK_FILTER_NEAREST` and `VK_FILTER_LINEAR` directly correspond to **GL_NEAREST** and **GL_LINEAR** magnification filters. **minFilter** and **mipmapMode** combine to correspond to the similarly named OpenGL minification filter of **GL_minFilter_MIPMAP_mipmapMode** (e.g. **minFilter** of `VK_FILTER_LINEAR` and **mipmapMode** of `VK_SAMPLER_MIPMAP_MODE_NEAREST` correspond to **GL_LINEAR_MIPMAP_NEAREST**).

There are no Vulkan filter modes that directly correspond to OpenGL minification filters of **GL_LINEAR** or **GL_NEAREST**, but they can be emulated using `VK_SAMPLER_MIPMAP_MODE_NEAREST`, `minLod = 0`, and `maxLod = 0.25`, and using **minFilter** = `VK_FILTER_LINEAR` or **minFilter** = `VK_FILTER_NEAREST`, respectively.
Note that using a `maxLod` of zero would cause magnification to always be performed, and the `magFilter` to always be used. This is valid, just not an exact match for OpenGL behavior. Clamping the maximum LOD to 0.25 allows the $\lambda$ value to be non-zero and minification to be performed, while still always rounding down to the base level. If the `minFilter` and `magFilter` are equal, then using a `maxLod` of zero also works.

The maximum number of sampler objects which can be simultaneously created on a device is implementation-dependent and specified by the `maxSamplerAllocationCount` member of the `VkPhysicalDeviceLimits` structure.

Note
For historical reasons, if `maxSamplerAllocationCount` is exceeded, some implementations may return `VK_ERROR_TOO_MANY_OBJECTS`. Exceeding this limit will result in undefined behavior, and an application should not rely on the use of the returned error code in order to identify when the limit is reached.

Since `VkSampler` is a non-dispatchable handle type, implementations may return the same handle for sampler state vectors that are identical. In such cases, all such objects would only count once against the `maxSamplerAllocationCount` limit.

Valid Usage

- VUID-VkSamplerCreateInfo-mipLodBias-01069
  The absolute value of `mipLodBias` must be less than or equal to `VkPhysicalDeviceLimits::maxSamplerLodBias`

- VUID-VkSamplerCreateInfo-samplerMipLodBias-04467
  If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::samplerMipLodBias` is `VK_FALSE`, `mipLodBias` must be zero

- VUID-VkSamplerCreateInfo-maxLod-01973
  `maxLod` must be greater than or equal to `minLod`

- VUID-VkSamplerCreateInfo-anisotropyEnable-01070
  If the `samplerAnisotropy` feature is not enabled, `anisotropyEnable` must be `VK_FALSE`

- VUID-VkSamplerCreateInfo-anisotropyEnable-01071
  If `anisotropyEnable` is `VK_TRUE`, `maxAnisotropy` must be between 1.0 and `VkPhysicalDeviceLimits::maxSamplerAnisotropy`, inclusive

- VUID-VkSamplerCreateInfo-minFilter-01645
  If `sampler YC_bC_r` conversion is enabled and the potential format features of the sampler `YC_bC_r` conversion do not support `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_SEPARATE_RECONSTRUCTION_FILTER_BIT`, `minFilter` and `magFilter` must be equal to the sampler `YC_bC_r` conversion's `chromaFilter`

- VUID-VkSamplerCreateInfo-unnormalizedCoordinates-01072
  If `unnormalizedCoordinates` is `VK_TRUE`, `minFilter` and `magFilter` must be equal
If `unnormalizedCoordinates` is `VK_TRUE`, `mipmapMode` must be `VK_SAMPLER_MIPMAP_MODE_NEAREST`.

If `unnormalizedCoordinates` is `VK_TRUE`, `minLod` and `maxLod` must be zero.

If `unnormalizedCoordinates` is `VK_TRUE`, `addressModeU` and `addressModeV` must each be either `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE` or `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER`.

If `unnormalizedCoordinates` is `VK_TRUE`, `anisotropyEnable` must be `VK_FALSE`.

If `unnormalizedCoordinates` is `VK_TRUE`, `compareEnable` must be `VK_FALSE`.

If `samplerMirrorClampToEdge` is not enabled, and if the `VK_KHR_sampler_mirror_clamp_to_edge` extension is not enabled, `addressModeU`, `addressModeV` and `addressModeW` must not be `VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE`.

If `compareEnable` is `VK_TRUE`, `compareOp` must be a valid `VkCompareOp` value.

If either `magFilter` or `minFilter` is `VK_FILTER_CUBIC_EXT`, `anisotropyEnable` must be `VK_FALSE`.

If the `VK_KHR_sampler_mirror_clamp_to_edge` extension is not enabled and either `magFilter` or `minFilter` is `VK_FILTER_CUBIC_EXT`, the `reductionMode` member of `VkSamplerReductionModeCreateInfo` must be `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`.

If `compareEnable` is `VK_TRUE`, the `reductionMode` member of `VkSamplerReductionModeCreateInfo` must be `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`.
If flags includes `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT`, then `minFilter` and `magFilter` must be equal.

If flags includes `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT`, then `mipmapMode` must be `VK_SAMPLER_MIPMAP_MODE_NEAREST`.

If flags includes `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT`, then `minLod` and `maxLod` must be zero.

If flags includes `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT`, then `addressModeU` and `addressModeV` must each be either `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE` or `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER`.

If flags includes `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT`, then `anisotropyEnable` must be `VK_FALSE`.

If flags includes `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT`, then `compareEnable` must be `VK_FALSE`.

If flags includes `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT`, then `unnormalizedCoordinates` must be `VK_FALSE`.

If the `nonSeamlessCubeMap` feature is not enabled, flags must not include `VK_SAMPLER_CREATE_NON_SEAMLESS_CUBE_MAP_BIT_EXT`.

If `borderColor` is one of `VK_BORDER_COLOR_FLOAT_CUSTOM_EXT` or `VK_BORDER_COLOR_INT_CUSTOM_EXT`, then a `VkSamplerCustomBorderColorCreateInfoEXT` must be included in the `pNext` chain.

If the `customBorderColors` feature is not enabled, `borderColor` must not be `VK_BORDER_COLOR_FLOAT_CUSTOM_EXT` or `VK_BORDER_COLOR_INT_CUSTOM_EXT`.

If `borderColor` is one of `VK_BORDER_COLOR_FLOAT_CUSTOM_EXT` or `VK_BORDER_COLOR_INT_CUSTOM_EXT`, and `VkSamplerCustomBorderColorCreateInfoEXT::format` is not `VK_FORMAT_UNDEFINED`, `VkSamplerCustomBorderColorCreateInfoEXT::customBorderColor` must be within the range of values representable in `format`.

The maximum number of samplers with custom border colors which can be simultaneously created on a device is implementation-dependent and specified by the `maxCustomBorderColorSamplers` member of the `VkPhysicalDeviceCustomBorderColorPropertiesEXT` structure.
If flags includes VK_SAMPLER_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT, the descriptorBufferCaptureReplay feature must be enabled

• VUID-VkSamplerCreateInfo-pNext-08111
  If the pNext chain includes a VkOpaqueCaptureDescriptorDataCreateInfoEXT structure, flags must contain VK_SAMPLER_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT

• VUID-VkSamplerCreateInfo-flags-06964
  If flags includes VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM, then minFilter and magFilter must be VK_FILTER_NEAREST

• VUID-VkSamplerCreateInfo-flags-06965
  If flags includes VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM, then mipmapMode must be VK_SAMPLER_MIPMAP_MODE_NEAREST

• VUID-VkSamplerCreateInfo-flags-06966
  If flags includes VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM, then minLod and maxLod must be zero

• VUID-VkSamplerCreateInfo-flags-06967
  If flags includes VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM, and if addressModeU or addressModeV is VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER, then borderColor must be VK_BORDER_COLOR_FLOAT_TRANSPARENT_BLACK

• VUID-VkSamplerCreateInfo-flags-06969
  If flags includes VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM, then anisotropyEnable must be VK_FALSE

• VUID-VkSamplerCreateInfo-flags-06970
  If flags includes VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM, then compareEnable must be VK_FALSE

Valid Usage (Implicit)

• VUID-VkSamplerCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_SAMPLER_CREATE_INFO

• VUID-VkSamplerCreateInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkOpaqueCaptureDescriptorDataCreateInfoEXT, VkSamplerBlockMatchWindowCreateInfoQCOM, VkSamplerBorderColorComponentMappingCreateInfoEXT, VkSamplerCubicWeightsCreateInfoQCOM, VkSamplerCustomBorderColorCreateInfoEXT, VkSamplerReductionModeCreateInfo, or VkSamplerYcbcrConversionInfo

• VUID-VkSamplerCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique
• **VUID-VkSamplerCreateInfo-flags-parameter**
  `flags` **must** be a valid combination of `VkSamplerCreateFlagBits` values

• **VUID-VkSamplerCreateInfo-magFilter-parameter**
  `magFilter` **must** be a valid `VkFilter` value

• **VUID-VkSamplerCreateInfo-minFilter-parameter**
  `minFilter` **must** be a valid `VkFilter` value

• **VUID-VkSamplerCreateInfo-mipmapMode-parameter**
  `mipmapMode` **must** be a valid `VkSamplerMipmapMode` value

• **VUID-VkSamplerCreateInfo-addressModeU-parameter**
  `addressModeU` **must** be a valid `VkSamplerAddressMode` value

• **VUID-VkSamplerCreateInfo-addressModeV-parameter**
  `addressModeV` **must** be a valid `VkSamplerAddressMode` value

• **VUID-VkSamplerCreateInfo-addressModeW-parameter**
  `addressModeW` **must** be a valid `VkSamplerAddressMode` value

`VK_LOD_CLAMP_NONE` is a special constant value used for `VkSamplerCreateInfo::maxLod` to indicate that maximum LOD clamping should not be performed.

```c
#define VK_LOD_CLAMP_NONE 1000.0F
```

Bits which **can** be set in `VkSamplerCreateInfo::flags`, specifying additional parameters of a sampler, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSamplerCreateFlagBits {
    // Provided by VK_EXT_fragment_density_map
    VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT = 0x00000001,
    // Provided by VK_EXT_fragment_density_map
    VK_SAMPLER_CREATE_SUBSAMPLED_COARSE_RECONSTRUCTION_BIT_EXT = 0x00000002,
    // Provided by VK_EXT_descriptor_buffer
    VK_SAMPLER_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT = 0x00000008,
    // Provided by VK_EXT_non_seamless_cube_map
    VK_SAMPLER_CREATE_NON_SEAMLESS_CUBE_MAP_BIT_EXT = 0x00000004,
    // Provided by VK_QCOM_image_processing
    VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM = 0x00000010,
} VkSamplerCreateFlagBits;
```

• **VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT** specifies that the sampler will read from an image created with `flags` containing `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`.

• **VK_SAMPLER_CREATE_SUBSAMPLED_COARSE_RECONSTRUCTION_BIT_EXT** specifies that the implementation **may** use approximations when reconstructing a full color value for texture access from a subsampled image.

• **VK_SAMPLER_CREATE_NON_SEAMLESS_CUBE_MAP_BIT_EXT** specifies that **cube map edge handling** is not
• **VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM** specifies that the sampler will read from images using only `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchGatherSSDQCOM`, `OpImageBlockMatchGatherSADQCOM`, `OpImageBlockMatchWindowSSDQCOM`, `OpImageBlockMatchWindowSADQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM`.

**Note**
The approximations used when **VK_SAMPLER_CREATE_SUBSAMPLED_COARSE_RECONSTRUCTION_BIT_EXT** is specified are implementation defined. Some implementations may interpolate between fragment density levels in a subsampled image. In that case, this bit may be used to decide whether the interpolation factors are calculated per fragment or at a coarser granularity.

• **VK_SAMPLER_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT** specifies that the sampler can be used with descriptor buffers when capturing and replaying (e.g. for trace capture and replay), see **VkOpaqueCaptureDescriptorDataCreateInfoEXT** for more detail.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkSamplerCreateFlags;
```

**VkSamplerCreateFlags** is a bitmask type for setting a mask of zero or more **VkSamplerCreateFlagBits**. The **VkSamplerReductionModeCreateInfo** structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkSamplerReductionModeCreateInfo {   
  VkStructureType sType;
  const void*   pNext;
  VkSamplerReductionMode reductionMode;
} VkSamplerReductionModeCreateInfo;
```

or the equivalent

```c
// Provided by VK_EXT_sampler_filter_minmax
typedef VkSamplerReductionModeCreateInfo VkSamplerReductionModeCreateInfoEXT;
```

• **sType** is a **VkStructureType** value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **reductionMode** is a **VkSamplerReductionMode** value controlling how texture filtering combines texel values.

If the **pNext** chain of **VkSamplerCreateInfo** includes a **VkSamplerReductionModeCreateInfo** structure, then that structure includes a mode controlling how texture filtering combines texel values.
If this structure is not present, reductionMode is considered to be VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE.

Valid Usage (Implicit)

- VUID-VkSamplerReductionModeCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_SAMPLER_REDUCTION_MODE_CREATE_INFO
- VUID-VkSamplerReductionModeCreateInfo-reductionMode-parameter
  reductionMode must be a valid VkSamplerReductionMode value

Reduction modes are specified by VkSamplerReductionMode, which takes values:

```c
// Provided by VK_VERSION_1_2
typedef enum VkSamplerReductionMode {
    VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE = 0,
    VK_SAMPLER_REDUCTION_MODE_MIN = 1,
    VK_SAMPLER_REDUCTION_MODE_MAX = 2,
    // Provided by VK_QCOM_filter_cubic_clamp
    VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM = 1000521000,
    // Provided by VK_EXT_sampler_filter_minmax
    VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_EXT = VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE,
    // Provided by VK_EXT_sampler_filter_minmax
    VK_SAMPLER_REDUCTION_MODE_MIN_EXT = VK_SAMPLER_REDUCTION_MODE_MIN,
    // Provided by VK_EXT_sampler_filter_minmax
    VK_SAMPLER_REDUCTION_MODE_MAX_EXT = VK_SAMPLER_REDUCTION_MODE_MAX,
} VkSamplerReductionMode;
```

or the equivalent

```c
// Provided by VK_EXT_sampler_filter_minmax
typedef VkSamplerReductionMode VkSamplerReductionModeEXT;
```

- VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE specifies that texel values are combined by computing a weighted average of values in the footprint, using weights as specified in the image operations chapter.
- VK_SAMPLER_REDUCTION_MODE_MIN specifies that texel values are combined by taking the component-wise minimum of values in the footprint with non-zero weights.
- VK_SAMPLER_REDUCTION_MODE_MAX specifies that texel values are combined by taking the component-wise maximum of values in the footprint with non-zero weights.
- VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM specifies values are combined as described by VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE, followed by a texel range clamp.

The VkSamplerCubicWeightsCreateInfoQCOM structure is defined as:
typedef struct VkSamplerCubicWeightsCreateInfoQCOM {
    VkStructureType sType;
    const void* pNext;
    VkCubicFilterWeightsQCOM cubicWeights;
} VkSamplerCubicWeightsCreateInfoQCOM;

sType is a VkStructureType value identifying this structure.
pNext is NULL or a pointer to a structure extending this structure.
cubicWeights is a VkCubicFilterWeightsQCOM value controlling which cubic weights are used.

If the pNext chain of VkSamplerCreateInfo includes a VkSamplerCubicWeightsCreateInfoQCOM structure, then that structure specifies which cubic weights are used.

If that structure is not present, cubicWeights is considered to be VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM.

### Valid Usage (Implicit)

- VUID-VkSamplerCubicWeightsCreateInfoQCOM-sType-sType 
sType must be VK_STRUCTURE_TYPE_SAMPLER_CUBIC_WEIGHTS_CREATE_INFO_QCOM
- VUID-VkSamplerCubicWeightsCreateInfoQCOM-cubicWeights-parameter 
cubicWeights must be a valid VkCubicFilterWeightsQCOM value

Possible values of the VkSamplerCubicWeightsCreateInfoQCOM::cubicWeights, specifying cubic weights used in Texel Cubic Filtering are:

```c
typedef enum VkCubicFilterWeightsQCOM {
    VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM = 0,
    VK_CUBIC_FILTER_WEIGHTS_ZERO_TANGENT_CARDINAL_QCOM = 1,
    VK_CUBIC_FILTER_WEIGHTS_B_SPLINE_QCOM = 2,
    VK_CUBIC_FILTER_WEIGHTS_MITCHELL_NETRAVALI_QCOM = 3,
} VkCubicFilterWeightsQCOM;
```

- VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM specifies Catmull-Rom weights.
- VK_CUBIC_FILTER_WEIGHTS_ZERO_TANGENT_CARDINAL_QCOM specifies Zero Tangent Cardinal weights.
- VK_CUBIC_FILTER_WEIGHTS_B_SPLINE_QCOM specifies B-Spline weights.
- VK_CUBIC_FILTER_WEIGHTS_MITCHELL_NETRAVALI_QCOM specifies Mitchell-Netravali weights.

Possible values of the VkSamplerCreateInfo::magFilter and minFilter parameters, specifying filters used for texture lookups, are:

```c
// Provided by VK_VERSION_1_0
```
typedef enum VkFilter {
    VK_FILTER_NEAREST = 0,
    VK_FILTER_LINEAR = 1,
    // Provided by VK_EXT_filter_cubic
    VK_FILTER_CUBIC_EXT = 1000015000,
    // Provided by VK_IMG_filter_cubic
    VK_FILTER_CUBIC_IMG = VK_FILTER_CUBIC_EXT,
} VkFilter;

• **VK_FILTER_NEAREST** specifies nearest filtering.
• **VK_FILTER_LINEAR** specifies linear filtering.
• **VK_FILTER_CUBIC_EXT** specifies cubic filtering.

These filters are described in detail in [Texel Filtering](#).

Possible values of the `VkSamplerCreateInfo::mipmapMode`, specifying the mipmap mode used for texture lookups, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSamplerMipmapMode {
    VK_SAMPLER_MIPMAP_MODE_NEAREST = 0,
    VK_SAMPLER_MIPMAP_MODE_LINEAR = 1,
} VkSamplerMipmapMode;
```

• **VK_SAMPLER_MIPMAP_MODE_NEAREST** specifies nearest filtering.
• **VK_SAMPLER_MIPMAP_MODE_LINEAR** specifies linear filtering.

These modes are described in detail in [Texel Filtering](#).

Possible values of the `VkSamplerCreateInfo::addressMode*` parameters, specifying the behavior of sampling with coordinates outside the range [0,1] for the respective u, v, or w coordinate as defined in the [Wrapping Operation](#) section, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSamplerAddressMode {
    VK_SAMPLER_ADDRESS_MODE_REPEAT = 0,
    VK_SAMPLER_ADDRESS_MODE_MIRRORED_REPEAT = 1,
    VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE = 2,
    VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER = 3,
    // Provided by VK_VERSION_1_2, VK_KHR_samplerr_mirror_clamp_to_edge
    VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE_KHR = VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE,
} VkSamplerAddressMode;
```

• **VK_SAMPLER_ADDRESS_MODE_REPEAT** specifies that the repeat wrap mode will be used.
• VK_SAMPLER_ADDRESS_MODE_MIRRORED_REPEAT specifies that the mirrored repeat wrap mode will be used.

• VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE specifies that the clamp to edge wrap mode will be used.

• VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER specifies that the clamp to border wrap mode will be used.

• VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE specifies that the mirror clamp to edge wrap mode will be used. This is only valid if samplerMirrorClampToEdge is enabled, or if the VK_KHR_sampler_mirror_clamp_to_edge extension is enabled.

Comparison operators compare a reference and a test value, and return a true ("passed") or false ("failed") value depending on the comparison operator chosen. The supported operators are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCompareOp {
    VK_COMPARE_OP_NEVER = 0,
    VK_COMPARE_OP_LESS = 1,
    VK_COMPARE_OP_EQUAL = 2,
    VK_COMPARE_OP_LESS_OR_EQUAL = 3,
    VK_COMPARE_OP_GREATER = 4,
    VK_COMPARE_OP_NOT_EQUAL = 5,
    VK_COMPARE_OP_GREATER_OR_EQUAL = 6,
    VK_COMPARE_OP_ALWAYS = 7,
} VkCompareOp;
```

• VK_COMPARE_OP_NEVER specifies that the comparison always evaluates false.

• VK_COMPARE_OP_LESS specifies that the comparison evaluates reference < test.

• VK_COMPARE_OP_EQUAL specifies that the comparison evaluates reference = test.

• VK_COMPARE_OP_LESS_OR_EQUAL specifies that the comparison evaluates reference \leq test.

• VK_COMPARE_OP_GREATER specifies that the comparison evaluates reference > test.

• VK_COMPARE_OP_NOT_EQUAL specifies that the comparison evaluates reference \neq test.

• VK_COMPARE_OP_GREATER_OR_EQUAL specifies that the comparison evaluates reference \geq test.

• VK_COMPARE_OP_ALWAYS specifies that the comparison always evaluates true.

Comparison operators are used for:

• The Depth Compare Operation operator for a sampler, specified by VkSamplerCreateInfo::compareOp.

• The stencil comparison operator for the stencil test, specified by vkCmdSetStencilOp::compareOp or VkStencilOpState::compareOp.

• The Depth Comparison operator for the depth test, specified by vkCmdSetDepthCompareOp::depthCompareOp or VkPipelineDepthStencilStateCreateInfo::depthCompareOp.

Each such use describes how the reference and test values for that comparison are determined.
Possible values of `VkSamplerCreateInfo::borderColor`, specifying the border color used for texture lookups, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkBorderColor {
    VK_BORDER_COLOR_FLOAT_TRANSPARENT_BLACK = 0,
    VK_BORDER_COLOR_INT_TRANSPARENT_BLACK = 1,
    VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK = 2,
    VK_BORDER_COLOR_INT_OPAQUE_BLACK = 3,
    VK_BORDER_COLOR_FLOAT_OPAQUE_WHITE = 4,
    VK_BORDER_COLOR_INT_OPAQUE_WHITE = 5,
    // Provided by VK_EXT_custom_border_color
    VK_BORDER_COLOR_FLOAT_CUSTOM_EXT = 1000287003,
    // Provided by VK_EXT_custom_border_color
    VK_BORDER_COLOR_INT_CUSTOM_EXT = 1000287004,
} VkBorderColor;
```

- `VK_BORDER_COLOR_FLOAT_TRANSPARENT_BLACK` specifies a transparent, floating-point format, black color.
- `VK_BORDER_COLOR_INT_TRANSPARENT_BLACK` specifies a transparent, integer format, black color.
- `VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK` specifies an opaque, floating-point format, black color.
- `VK_BORDER_COLOR_INT_OPAQUE_BLACK` specifies an opaque, integer format, black color.
- `VK_BORDER_COLOR_FLOAT_OPAQUE_WHITE` specifies an opaque, floating-point format, white color.
- `VK_BORDER_COLOR_INT_OPAQUE_WHITE` specifies an opaque, integer format, white color.
- `VK_BORDER_COLOR_FLOAT_CUSTOM_EXT` indicates that a `VkSamplerCustomBorderColorCreateInfoEXT` structure is included in the `VkSamplerCreateInfo::pNext` chain containing the color data in floating-point format.
- `VK_BORDER_COLOR_INT_CUSTOM_EXT` indicates that a `VkSamplerCustomBorderColorCreateInfoEXT` structure is included in the `VkSamplerCreateInfo::pNext` chain containing the color data in integer format.

These colors are described in detail in [Texel Replacement](#).

To destroy a sampler, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroySampler(
    VkDevice device,
    VkSampler sampler,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the sampler.
- `sampler` is the sampler to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
Valid Usage

- VUID-vkDestroySampler-sampler-01082
  All submitted commands that refer to sampler must have completed execution

- VUID-vkDestroySampler-sampler-01083
  If VkAllocationCallbacks were provided when sampler was created, a compatible set of callbacks must be provided here

- VUID-vkDestroySampler-sampler-01084
  If no VkAllocationCallbacks were provided when sampler was created, pAllocator must be NULL

Valid Usage (Implicit)

- VUID-vkDestroySampler-device-parameter
  device must be a valid VkDevice handle

- VUID-vkDestroySampler-sampler-parameter
  If sampler is not VK_NULL_HANDLE, sampler must be a valid VkSampler handle

- VUID-vkDestroySampler-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroySampler-sampler-parent
  If sampler is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to sampler must be externally synchronized

13.1. Sampler Y'CbCr Conversion

To create a sampler with Y'CbCr conversion enabled, add a VkSamplerYcbcrConversionInfo structure to the pNext chain of the VkSamplerCreateInfo structure. To create a sampler Y'CbCr conversion, the samplerYcbcrConversion feature must be enabled. Conversion must be fixed at pipeline creation time, through use of a combined image sampler with an immutable sampler in VkDescriptorSetLayoutBinding.

A VkSamplerYcbcrConversionInfo must be provided for samplers to be used with image views that access VK_IMAGE_ASPECT_COLOR_BIT if the format is one of the formats that require a sampler Y'CbCr conversion, or if the image view has an external format.

The VkSamplerYcbcrConversionInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
```
typedef struct VkSamplerYcbcrConversionInfo {
    VkStructureType sType;
    const void* pNext;
    VkSamplerYcbcrConversion conversion;
} VkSamplerYcbcrConversionInfo;

or the equivalent

// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkSamplerYcbcrConversionInfo VkSamplerYcbcrConversionInfoKHR;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• conversion is a VkSamplerYcbcrConversion handle created with vkCreateSamplerYcbcrConversion.

Valid Usage (Implicit)

• VUID-VkSamplerYcbcrConversionInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_SAMPLER_YCBCR_CONVERSION_INFO
• VUID-VkSamplerYcbcrConversionInfo-conversion-parameter
  conversion must be a valid VkSamplerYcbcrConversion handle

A sampler Y’C_bC_r conversion is an opaque representation of a device-specific sampler Y’C_bC_r conversion description, represented as a VkSamplerYcbcrConversion handle:

// Provided by VK_VERSION_1_1
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSamplerYcbcrConversion)

or the equivalent

// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkSamplerYcbcrConversion VkSamplerYcbcrConversionKHR;

To create a VkSamplerYcbcrConversion, call:

// Provided by VK_VERSION_1_1
VkResult vkCreateSamplerYcbcrConversion(
    VkDevice device,
    const VkSamplerYcbcrConversionCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSamplerYcbcrConversion* pYcbcrConversion);
or the equivalent command

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
VkResult vkCreateSamplerYcbcrConversionKHR(
    VkDevice device,
    const VkSamplerYcbcrConversionCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSamplerYcbcrConversion* pYcbcrConversion);
```

- **device** is the logical device that creates the sampler \( Y' \)C\(_a\)C\(_b\)C\(_r\) conversion.
- **pCreateInfo** is a pointer to a `VkSamplerYcbcrConversionCreateInfo` structure specifying the requested sampler \( Y' \)C\(_a\)C\(_b\)C\(_r\) conversion.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pYcbcrConversion** is a pointer to a `VkSamplerYcbcrConversion` handle in which the resulting sampler \( Y' \)C\(_a\)C\(_b\)C\(_r\) conversion is returned.

The interpretation of the configured sampler \( Y' \)C\(_a\)C\(_b\)C\(_r\) conversion is described in more detail in the description of sampler \( Y' \)C\(_a\)C\(_b\)C\(_r\) conversion in the Image Operations chapter.

### Valid Usage

- **VUID-vkCreateSamplerYcbcrConversion-None-01648**
  The `samplerYcbcrConversion` feature **must** be enabled

### Valid Usage (Implicit)

- **VUID-vkCreateSamplerYcbcrConversion-device-parameter**
  `device` **must** be a valid `VkDevice` handle.

- **VUID-vkCreateSamplerYcbcrConversion-pCreateInfo-parameter**
  `pCreateInfo` **must** be a valid pointer to a valid `VkSamplerYcbcrConversionCreateInfo` structure.

- **VUID-vkCreateSamplerYcbcrConversion-pAllocator-parameter**
  If `pAllocator` is not NULL, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure.

- **VUID-vkCreateSamplerYcbcrConversion-pYcbcrConversion-parameter**
  `pYcbcrConversion` **must** be a valid pointer to a `VkSamplerYcbcrConversion` handle.

### Return Codes

**Success**

- **VK_SUCCESS**
The `VkSamplerYcbcrConversionCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkSamplerYcbcrConversionCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkFormat format;
    VkSamplerYcbcrModelConversion ycbcrModel;
    VkSamplerYcbcrRange ycbcrRange;
    VkComponentMapping components;
    VkChromaLocation xChromaOffset;
    VkChromaLocation yChromaOffset;
    VkFilter chromaFilter;
    VkBool32 forceExplicitReconstruction;
} VkSamplerYcbcrConversionCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkSamplerYcbcrConversionCreateInfo VkSamplerYcbcrConversionCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `format` is the format of the image from which color information will be retrieved.
- `ycbcrModel` describes the color matrix for conversion between color models.
- `ycbcrRange` describes whether the encoded values have headroom and foot room, or whether the encoding uses the full numerical range.
- `components` applies a *swizzle* based on `VkComponentSwizzle` enums prior to range expansion and color model conversion.
- `xChromaOffset` describes the sample location associated with downsampled chroma components in the x dimension. `xChromaOffset` has no effect for formats in which chroma components are not downsampled horizontally.
- `yChromaOffset` describes the sample location associated with downsampled chroma components in the y dimension. `yChromaOffset` has no effect for formats in which the chroma components are not downsampled vertically.
- `chromaFilter` is the filter for chroma reconstruction.
- `forceExplicitReconstruction` can be used to ensure that reconstruction is done explicitly, if supported.
Note

Setting `forceExplicitReconstruction` to `VK_TRUE` may have a performance penalty on implementations where explicit reconstruction is not the default mode of operation.

If the format supports `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT` the `forceExplicitReconstruction` value behaves as if it was set to `VK_TRUE`.

If the `pNext` chain includes a `VkExternalFormatANDROID` structure with non-zero `externalFormat` member, the sampler Y’C_bC_r conversion object represents an external format conversion, and `format` must be `VK_FORMAT_UNDEFINED`. Such conversions must only be used to sample image views with a matching external format. When creating an external format conversion, the value of `components` is ignored.

Valid Usage

• VUID-VkSamplerYcbcrConversionCreateInfo-format-01904
  If an external format conversion is being created, `format` must be `VK_FORMAT_UNDEFINED`

• VUID-VkSamplerYcbcrConversionCreateInfo-format-04061
  If an external format conversion is not being created, `format` must represent unsigned normalized values (i.e. the `format` must be a UNORM format)

• VUID-VkSamplerYcbcrConversionCreateInfo-format-01650
  The potential format features of the sampler Y’C_bC_r conversion must support `VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT` or `VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT`

• VUID-VkSamplerYcbcrConversionCreateInfo-xChromaOffset-01651
  If the potential format features of the sampler Y’C_bC_r conversion do not support `VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT`, `xChromaOffset` and `yChromaOffset` must not be `VK_CHROMA_LOCATION_COSITED_EVEN` if the corresponding components are downsampling

• VUID-VkSamplerYcbcrConversionCreateInfo-xChromaOffset-01652
  If the potential format features of the sampler Y’C_bC_r conversion do not support `VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT`, `xChromaOffset` and `yChromaOffset` must not be `VK_CHROMA_LOCATION_MIDPOINT` if the corresponding components are downsampling

• VUID-VkSamplerYcbcrConversionCreateInfo-components-02581
  If the format has a _422 or _420 suffix, then `components.g` must be the identity swizzle

• VUID-VkSamplerYcbcrConversionCreateInfo-components-02582
  If the format has a _422 or _420 suffix, then `components.a` must be the identity swizzle, `VK_COMPONENT_SWIZZLE_ONE`, or `VK_COMPONENT_SWIZZLE_ZERO`

• VUID-VkSamplerYcbcrConversionCreateInfo-components-02583
  If the format has a _422 or _420 suffix, then `components.r` must be the identity swizzle or `VK_COMPONENT_SWIZZLE_B`

• VUID-VkSamplerYcbcrConversionCreateInfo-components-02584
  If the format has a _422 or _420 suffix, then `components.b` must be the identity swizzle or...
VK_COMPONENT_SWIZZLE_R

• VUID-VkSamplerYcbcrConversionCreateInfo-components-02585
If the format has a _422 or _420 suffix, and if either components.r or components.b is the identity swizzle, both values must be the identity swizzle.

• VUID-VkSamplerYcbcrConversionCreateInfo-ycbcrModel-01655
If ycbcrModel is not VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY, then components.r, components.g, and components.b must correspond to components of the format; that is, components.r, components.g, and components.b must not be VK_COMPONENT_SWIZZLE_ZERO or VK_COMPONENT_SWIZZLE_ONE, and must not correspond to a component containing zero or one as a consequence of conversion to RGBA.

• VUID-VkSamplerYcbcrConversionCreateInfo-ycbcrRange-02748
If ycbcrRange is VK_SAMPLER_YCBCR_RANGE_ITU_NARROW then the R, G and B components obtained by applying the component swizzle to format must each have a bit-depth greater than or equal to 8.

• VUID-VkSamplerYcbcrConversionCreateInfo-forceExplicitReconstruction-01656
If the potential format features of the sampler Y’CbCr conversion do not support VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_FORCEABLE_BIT forceExplicitReconstruction must be VK_FALSE.

• VUID-VkSamplerYcbcrConversionCreateInfo-chromaFilter-01657
If the potential format features of the sampler Y’CbCr conversion do not support VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_LINEAR_FILTER_BIT, chromaFilter must not be VK_FILTER_LINEAR.

• VUID-VkSamplerYcbcrConversionCreateInfo-pNext-09207
If the pNext chain includes a VkSamplerYcbcrConversionYcbcrDegammaCreateInfoQCOM structure, and if the ycbcrDegamma feature is not enabled, then VkSamplerYcbcrConversionYcbcrDegammaCreateInfoQCOM::enableYDegamma must be VK_FALSE.

• VUID-VkSamplerYcbcrConversionCreateInfo-pNext-09208
If the pNext chain includes a VkSamplerYcbcrConversionYcbcrDegammaCreateInfoQCOM structure, and if the ycbcrDegamma feature is not enabled, then VkSamplerYcbcrConversionYcbcrDegammaCreateInfoQCOM::enableCbCrDegamma must be VK_FALSE.

• VUID-VkSamplerYcbcrConversionCreateInfo-pNext-09209
If the pNext chain includes a VkSamplerYcbcrConversionYcbcrDegammaCreateInfoQCOM structure, format must be a format with 8-bit R, G, and B components.

Valid Usage (Implicit)

• VUID-VkSamplerYcbcrConversionCreateInfo-sType-sType
sType must be VK_STRUCTURE_TYPE_SAMPLER_YCBCR_CONVERSION_CREATE_INFO.

• VUID-VkSamplerYcbcrConversionCreateInfo-pNext-pNext
Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkExternalFormatANDROID.
VkExternalFormatQNX, or VkSamplerYcbcrConversionYcbcrDegammaCreateInfoQCOM

• VUID-VkSamplerYcbcrConversionCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

• VUID-VkSamplerYcbcrConversionCreateInfo-format-parameter
  format must be a valid VkFormat value

• VUID-VkSamplerYcbcrConversionCreateInfo-ycbcrModel-parameter
  ycbcrModel must be a valid VkSamplerYcbcrModelConversion value

• VUID-VkSamplerYcbcrConversionCreateInfo-ycbcrRange-parameter
  ycbcrRange must be a valid VkSamplerYcbcrRange value

• VUID-VkSamplerYcbcrConversionCreateInfo-components-parameter
  components must be a valid VkComponentMapping structure

• VUID-VkSamplerYcbcrConversionCreateInfo-xChromaOffset-parameter
  xChromaOffset must be a valid VkChromaLocation value

• VUID-VkSamplerYcbcrConversionCreateInfo-yChromaOffset-parameter
  yChromaOffset must be a valid VkChromaLocation value

• VUID-VkSamplerYcbcrConversionCreateInfo-chromaFilter-parameter
  chromaFilter must be a valid VkFilter value

If chromaFilter is VK_FILTER_NEAREST, chroma samples are reconstructed to luma component resolution using nearest-neighbour sampling. Otherwise, chroma samples are reconstructed using interpolation. More details can be found in the description of sampler Y’C’B’C’r conversion in the Image Operations chapter.

VkSamplerYcbcrModelConversion defines the conversion from the source color model to the shader color model. Possible values are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkSamplerYcbcrModelConversion {
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY = 0,
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY = 1,
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_709 = 2,
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_601 = 3,
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_2020 = 4,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY_KHR =
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY_KHR =
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_709_KHR =
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_709,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_601_KHR =
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_601,
```
• VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY specifies that the input values to the conversion are unmodified.

• VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY specifies no model conversion but the inputs are range expanded as for Y'CbCr.

• VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_709 specifies the color model conversion from Y'CbCr to R'G'B' defined in BT.709 and described in the “BT.709 Y'CbCr conversion” section of the Khronos Data Format Specification.

• VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_601 specifies the color model conversion from Y'CbCr to R'G'B' defined in BT.601 and described in the “BT.601 Y'CbCr conversion” section of the Khronos Data Format Specification.

• VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_2020 specifies the color model conversion from Y'CbCr to R'G'B' defined in BT.2020 and described in the “BT.2020 Y'CbCr conversion” section of the Khronos Data Format Specification.

In the VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_* color models, for the input to the sampler Y'CbCr range expansion and model conversion:

• the Y (Y' luma) component corresponds to the G component of an RGB image.

• the CB (C_b or “U” blue color difference) component corresponds to the B component of an RGB image.

• the CR (C_r or “V” red color difference) component corresponds to the R component of an RGB image.

• the alpha component, if present, is not modified by color model conversion.

These rules reflect the mapping of components after the component swizzle operation (controlled by VkSamplerYcbcrConversionCreateInfo::components).

**Note**

For example, an “YUVA” 32-bit format comprising four 8-bit components can be implemented as VK_FORMAT_R8G8B8A8_UNORM with a component mapping:

• components.a = VK_COMPONENT_SWIZZLE_IDENTITY

• components.r = VK_COMPONENT_SWIZZLE_B

• components.g = VK_COMPONENT_SWIZZLE_R
The `VkSamplerYcbcrRange` enum describes whether color components are encoded using the full range of numerical values or whether values are reserved for headroom and foot room. `VkSamplerYcbcrRange` is defined as:

```c
typedef enum VkSamplerYcbcrRange {
    VK_SAMPLER_YCBCR_RANGE_ITU_FULL = 0,
    VK_SAMPLER_YCBCR_RANGE_ITU_NARROW = 1,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_SAMPLER_YCBCR_RANGE_ITU_FULL_KHR = VK_SAMPLER_YCBCR_RANGE_ITU_FULL,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_SAMPLER_YCBCR_RANGE_ITU_NARROW_KHR = VK_SAMPLER_YCBCR_RANGE_ITU_NARROW,
} VkSamplerYcbcrRange;
```

or the equivalent

```c
typedef VkSamplerYcbcrRange VKSamplerYcbcrRangeKHR;
```

- `VK_SAMPLER_YCBCR_RANGE_ITU_FULL` specifies that the full range of the encoded values are valid and interpreted according to the ITU “full range” quantization rules.
- `VK_SAMPLER_YCBCR_RANGE_ITU_NARROW` specifies that headroom and foot room are reserved in the numerical range of encoded values, and the remaining values are expanded according to the ITU “narrow range” quantization rules.

The formulae for these conversions is described in the `Sampler Y’C₆C₈ Range Expansion` section of the `Image Operations` chapter.

No range modification takes place if `ycbcrModel` is `VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY`; the `ycbcrRange` field of `VkSamplerYcbcrConversionCreateInfo` is ignored in this case.

The `VkChromaLocation` enum defines the location of downsampled chroma component samples relative to the luma samples, and is defined as:

```c
typedef enum VkChromaLocation {
    VK_CHROMA_LOCATION_COSITED_EVEN = 0,
    VK_CHROMA_LOCATION_MIDPOINT = 1,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_CHROMA_LOCATION_COSITED_EVEN_KHR = VK_CHROMA_LOCATION_COSITED_EVEN,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_CHROMA_LOCATION_MIDPOINT_KHR = VK_CHROMA_LOCATION_MIDPOINT,
} VkChromaLocation;
```
or the equivalent

```c
typedef VkChromaLocation VkChromaLocationKHR;
```

- `VK_CHroma_LOCATION_COSITED_EVEN` specifies that downsampled chroma samples are aligned with luma samples with even coordinates.
- `VK_CHroma_LOCATION_MIDPOINT` specifies that downsampled chroma samples are located halfway between each even luma sample and the nearest higher odd luma sample.

Applications can enable sRGB to linear conversion for the R, G, and B components of a Y'CbCr image during format conversion by including `VkSamplerYcbcrConversionYcbcrDegammaCreateInfoQCOM` structure in the `pNext` chain of `VkSamplerYcbcrConversionCreateInfo`.

The `VkSamplerYcbcrConversionYcbcrDegammaCreateInfoQCOM` structure is defined as:

```c
// Provided by VK_QCOM_ycbcr_degamma
typedef struct VkSamplerYcbcrConversionYcbcrDegammaCreateInfoQCOM {
    VkStructureType sType;
    void* pNext;
    VkBool32 enableYDegamma;
    VkBool32 enableCbCrDegamma;
} VkSamplerYcbcrConversionYcbcrDegammaCreateInfoQCOM;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `enableYDegamma` indicates sRGB to linear conversion is enabled for the G component.
- `enableCbCrDegamma` indicates sRGB to linear conversion is enabled for the R and B components.

### Valid Usage (Implicit)

- `VUID-VkSamplerYcbcrConversionYcbcrDegammaCreateInfoQCOM-sType-sType` must be

To destroy a sampler Y'CbCr conversion, call:

```c
// Provided by VK_VERSION_1_1
void vkDestroySamplerYcbcrConversion( VkDevice device, VkSamplerYcbcrConversion ycbcrConversion, const VkAllocationCallbacks* pAllocator);
```

or the equivalent command
// Provided by VK_KHR_sampler_ycbcr_conversion

```c
void vkDestroySamplerYcbcrConversionKHR(
    VkDevice device,
    VkSamplerYcbcrConversion ycbcrConversion,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the Y′C₈C₉ conversion.
- **ycbcrConversion** is the conversion to destroy.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage (Implicit)

- VUID-vkDestroySamplerYcbcrConversion-device-parameter
  
  device **must** be a valid VkDevice handle

- VUID-vkDestroySamplerYcbcrConversion-ycbcrConversion-parameter
  
  If ycbcrConversion is not VK_NULL_HANDLE, ycbcrConversion **must** be a valid VkSamplerYcbcrConversion handle

- VUID-vkDestroySamplerYcbcrConversion-pAllocator-parameter
  
  If pAllocator is not NULL, pAllocator **must** be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroySamplerYcbcrConversion-ycbcrConversion-parent
  
  If ycbcrConversion is a valid handle, it **must** have been created, allocated, or retrieved from device

### Host Synchronization

Host access to ycbcrConversion **must** be externally synchronized

In addition to the predefined border color values, applications can provide a custom border color value by including the VkSamplerCustomBorderColorCreateInfoEXT structure in the VkSamplerCreateInfo::pNext chain.

The **VkSamplerCustomBorderColorCreateInfoEXT** structure is defined as:

// Provided by VK_EXT_custom_border_color

typedef struct VkSamplerCustomBorderColorCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkClearColorValue customBorderColor;
    VkFormat format;
} VkSamplerCustomBorderColorCreateInfoEXT;

- **sType** is a VkStructureType value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `customBorderColor` is a `VkClearColorValue` representing the desired custom sampler border color.
• `format` is a `VkFormat` representing the format of the sampled image view(s). This field may be `VK_FORMAT_UNDEFINED` if the `customBorderColorWithoutFormat` feature is enabled.

**Note**

If `format` is a depth/stencil format, the aspect is determined by the value of `VkSamplerCreateInfo::borderColor`. If `VkSamplerCreateInfo::borderColor` is `VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK`, `VK_BORDER_COLOR_INT_OPAQUE_BLACK`, `VK_BORDER_COLOR_FLOAT_CUSTOM_EXT`, or `VK_BORDER_COLOR_INT_CUSTOM_EXT` border color, and that sampler will be combined with an image view

---

**Valid Usage**

- **VUID-VkSamplerCustomBorderColorCreateInfoEXT-format-07605**
  If `format` is not `VK_FORMAT_UNDEFINED` and `format` is not a depth/stencil format then the `VkSamplerCreateInfo::borderColor` type must match the sampled type of the provided `format`, as shown in the `SPIR-V Type` column of the Interpretation of Numeric Format table.

- **VUID-VkSamplerCustomBorderColorCreateInfoEXT-format-04014**
  If the `customBorderColorWithoutFormat` feature is not enabled then `format` must not be `VK_FORMAT_UNDEFINED`.

- **VUID-VkSamplerCustomBorderColorCreateInfoEXT-format-04015**
  If the sampler is used to sample an image view of `VK_FORMAT_B4G4R4A4_UNORM_PACK16`, `VK_FORMAT_B5G6R5_UNORM_PACK16`, `VK_FORMAT_A1B5G5R5_UNORM_PACK16_KHR`, or `VK_FORMAT_B5G5R5A1_UNORM_PACK16` format then `format` must not be `VK_FORMAT_UNDEFINED`.

---

**Valid Usage (Implicit)**

- **VUID-VkSamplerCustomBorderColorCreateInfoEXT-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_SAMPLER_CUSTOM_BORDER_COLOR_CREATE_INFO_EXT`.

- **VUID-VkSamplerCustomBorderColorCreateInfoEXT-format-parameter**
  `format` must be a valid `VkFormat` value.

If the sampler is created with `VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK`, `VK_BORDER_COLOR_INT_OPAQUE_BLACK`, `VK_BORDER_COLOR_FLOAT_CUSTOM_EXT`, or `VK_BORDER_COLOR_INT_CUSTOM_EXT` border color, and that sampler will be combined with an image view
that does not have an identity swizzle, and `VkPhysicalDeviceBorderColorSwizzleFeaturesEXT`:borderColorSwizzleFromImage is not enabled, then it is necessary to specify the component mapping of the border color, by including the `VkSamplerBorderColorComponentMappingCreateInfoEXT` structure in the `VkSamplerCreateInfo::pNext` chain, to get defined results.

The `VkSamplerBorderColorComponentMappingCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_border_color_swizzle
typedef struct VkSamplerBorderColorComponentMappingCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkComponentMapping components;
    VkBool32 srgb;
} VkSamplerBorderColorComponentMappingCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `components` is a `VkComponentMapping` structure specifying a remapping of the border color components.
- `srgb` indicates that the sampler will be combined with an image view that has an image format which is sRGB encoded.

The `VkComponentMapping` components member describes a remapping from components of the border color to components of the vector returned by shader image instructions when the border color is used.

### Valid Usage

- VUID-VkSamplerBorderColorComponentMappingCreateInfoEXT-borderColorSwizzle-06437
The `borderColorSwizzle` feature must be enabled

### Valid Usage (Implicit)

- VUID-VkSamplerBorderColorComponentMappingCreateInfoEXT-sType-sType must be `VK_STRUCTURE_TYPE_SAMPLER_BORDER_COLOR_COMPONENT_MAPPING_CREATE_INFO_EXT`
- VUID-VkSamplerBorderColorComponentMappingCreateInfoEXT-components-parameter components must be a valid `VkComponentMapping` structure

The `VkSamplerBlockMatchWindowCreateInfoQCOM` structure is defined as:

```c
// Provided by VK_QCOM_image_processing2
typedef struct VkSamplerBlockMatchWindowCreateInfoQCOM {
```

1223
VkStructureType
    sType;
    const void* pNext;
    VkExtent2D windowExtent;
    VkBlockMatchWindowCompareModeQCOM windowCompareMode;
} VkSamplerBlockMatchWindowCreateInfoQCOM;

- \textbf{sType} is a \texttt{VkStructureType} value identifying this structure.
- \textbf{pNext} is NULL or a pointer to a structure extending this structure.
- \textbf{windowExtent} is a \texttt{VkExtent2D} specifying the width and height of the block match window.
- \textbf{windowCompareMode} is a \texttt{VkBlockMatchWindowCompareModeQCOM} specifying the compare mode.

\textbf{Valid Usage}

- VUID-VkSamplerBlockMatchWindowCreateInfoQCOM-WindowExtent-09210 WindowExtent must not be larger than \texttt{VkPhysicalDeviceImageProcessing2PropertiesQCOM::maxBlockMatchWindow}.

\textbf{Valid Usage (Implicit)}

- VUID-VkSamplerBlockMatchWindowCreateInfoQCOM-sType-sType \textbf{sType} must be \texttt{VK_STRUCTURE_TYPE_SAMPLER_BLOCK_MATCH_WINDOW_CREATE_INFO_QCOM}.
- VUID-VkSamplerBlockMatchWindowCreateInfoQCOM-windowCompareMode-parameter \textbf{windowCompareMode} must be a valid \texttt{VkBlockMatchWindowCompareModeQCOM} value.

The \texttt{VkBlockMatchWindowCompareModeQCOM} enum describes how block match values within the window are compared. \texttt{VkBlockMatchWindowCompareModeQCOM} is defined as:

```c
// Provided by VK_QCOM_image_processing2
typedef enum VkBlockMatchWindowCompareModeQCOM {
    VK_BLOCK_MATCH_WINDOWCOMPARE_MODE_MIN_QCOM = 0,
    VK_BLOCK_MATCH_WINDOWCOMPARE_MODE_MAX_QCOM = 1,
} VkBlockMatchWindowCompareModeQCOM;
```

- \texttt{VK_BLOCK_MATCH_WINDOWCOMPARE_MODE_MIN_QCOM} specifies that windowed block match operations return the minimum error within the window.
- \texttt{VK_BLOCK_MATCH_WINDOWCOMPARE_MODE_MAX_QCOM} specifies that windowed block match operations return the maximum error within the window.
Chapter 14. Resource Descriptors

A descriptor is an opaque data structure representing a shader resource such as a buffer, buffer view, image view, sampler, or combined image sampler. Descriptors are organized into descriptor sets, which are bound during command recording for use in subsequent drawing commands. The arrangement of content in each descriptor set is determined by a descriptor set layout, which determines what descriptors can be stored within it. The sequence of descriptor set layouts that can be used by a pipeline is specified in a pipeline layout. Each pipeline object can use up to maxBoundDescriptorSets (see Limits) descriptor sets.

If the descriptorBuffer feature is enabled, the implementation supports placing descriptors into descriptor buffers which are bound during command recording in a similar way to descriptor sets.

Shaders access resources via variables decorated with a descriptor set and binding number that link them to a descriptor in a descriptor set. The shader interface mapping to bound descriptor sets is described in the Shader Resource Interface section.

Shaders can also access buffers without going through descriptors by using Physical Storage Buffer Access to access them through 64-bit addresses.

14.1. Descriptor Types

There are a number of different types of descriptor supported by Vulkan, corresponding to different resources or usage. The following sections describe the API definitions of each descriptor type. The mapping of each type to SPIR-V is listed in the Shader Resource and Descriptor Type Correspondence and Shader Resource and Storage Class Correspondence tables in the Shader Interfaces chapter.

14.1.1. Storage Image

A storage image (VK_DESCRIPTOR_TYPE_STORAGE_IMAGE) is a descriptor type associated with an image resource via an image view that load, store, and atomic operations can be performed on.

Storage image loads are supported in all shader stages for image views whose format features contain VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT.

Stores to storage images are supported in task, mesh and compute shaders for image views whose format features contain VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT.

Atomic operations on storage images are supported in task, mesh and compute shaders for image views whose format features contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT.

When the fragmentStoresAndAtomics feature is enabled, stores and atomic operations are also supported for storage images in fragment shaders with the same set of image formats as supported in compute shaders. When the vertexPipelineStoresAndAtomics feature is enabled, stores and atomic operations are also supported in vertex, tessellation, and geometry shaders with the same set of image formats as supported in compute shaders.

The image subresources for a storage image must be in the VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR or
14.1.2. Sampler

A sampler descriptor (VK_DESCRIPTOR_TYPE_SAMPLER) is a descriptor type associated with a sampler object, used to control the behavior of sampling operations performed on a sampled image.

14.1.3. Sampled Image

A sampled image (VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE) is a descriptor type associated with an image resource via an image view that sampling operations can be performed on.

Shaders combine a sampled image variable and a sampler variable to perform sampling operations.

Sampled images are supported in all shader stages for image views whose format features contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT.

An image subresources for a sampled image must be in one of the following layouts:

- VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_GENERAL
- VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR
- VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL
- VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL
- VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL
- VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR
- VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT

14.1.4. Combined Image Sampler

A combined image sampler (VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER) is a single descriptor type associated with both a sampler and an image resource, combining both a sampler and sampled image descriptor into a single descriptor.

If the descriptor refers to a sampler that performs YCbcCr conversion or samples a subsampled image, the sampler must only be used to sample the image in the same descriptor. Otherwise, the sampler and image in this type of descriptor can be used freely with any other samplers and images.

An image subresources for a combined image sampler must be in one of the following layouts:

- VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL
• VK_IMAGE_LAYOUT_GENERAL
• VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR
• VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL
• VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL
• VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL
• VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL
• VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR
• VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT

**Note**
On some implementations, it may be more efficient to sample from an image using a combination of sampler and sampled image that are stored together in the descriptor set in a combined descriptor.

### 14.1.5. Uniform Texel Buffer

A **uniform texel buffer** (VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER) is a descriptor type associated with a **buffer resource** via a **buffer view** that image sampling operations can be performed on.

Uniform texel buffers define a tightly-packed 1-dimensional linear array of texels, with texels going through format conversion when read in a shader in the same way as they are for an image.

Load operations from uniform texel buffers are supported in all shader stages for buffer view formats which report **format features** support for **VK_FORMAT_FEATURE_UNIFORM_TEXEL_BUFFER_BIT**

### 14.1.6. Storage Texel Buffer

A **storage texel buffer** (VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER) is a descriptor type associated with a **buffer resource** via a **buffer view** that image load, store, and atomic operations can be performed on.

Storage texel buffers define a tightly-packed 1-dimensional linear array of texels, with texels going through format conversion when read in a shader in the same way as they are for an image. Unlike uniform texel buffers, these buffers can also be written to in the same way as for storage images.

Storage texel buffer loads are supported in all shader stages for texel buffer view formats which report **format features** support for **VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_BIT**

Stores to storage texel buffers are supported in task, mesh and compute shaders for texel buffer formats which report **format features** support for **VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_BIT**

Atomic operations on storage texel buffers are supported in task, mesh and compute shaders for texel buffer formats which report **format features** support for **VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT**

When the **fragmentStoresAndAtomics** feature is enabled, stores and atomic operations are also supported for storage texel buffers in fragment shaders with the same set of texel buffer formats as
supported in compute shaders. When the `vertexPipelineStoresAndAtomics` feature is enabled, stores and atomic operations are also supported in vertex, tessellation, and geometry shaders with the same set of texel buffer formats as supported in compute shaders.

### 14.1.7. Storage Buffer

A *storage buffer* ([VK_DESCRIPTOR_TYPE_STORAGE_BUFFER]) is a descriptor type associated with a buffer resource directly, described in a shader as a structure with various members that load, store, and atomic operations can be performed on.

**Note**

Atomic operations can only be performed on members of certain types as defined in the SPIR-V environment appendix.

### 14.1.8. Uniform Buffer

A *uniform buffer* ([VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER]) is a descriptor type associated with a buffer resource directly, described in a shader as a structure with various members that load operations can be performed on.

### 14.1.9. Dynamic Uniform Buffer

A *dynamic uniform buffer* ([VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC]) is almost identical to a uniform buffer, and differs only in how the offset into the buffer is specified. The base offset calculated by the `VkDescriptorBufferInfo` when initially updating the descriptor set is added to a dynamic offset when binding the descriptor set.

### 14.1.10. Dynamic Storage Buffer

A *dynamic storage buffer* ([VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC]) is almost identical to a storage buffer, and differs only in how the offset into the buffer is specified. The base offset calculated by the `VkDescriptorBufferInfo` when initially updating the descriptor set is added to a dynamic offset when binding the descriptor set.

### 14.1.11. Inline Uniform Block

An *inline uniform block* ([VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK]) is almost identical to a uniform buffer, and differs only in taking its storage directly from the encompassing descriptor set instead of being backed by buffer memory. It is typically used to access a small set of constant data that does not require the additional flexibility provided by the indirection enabled when using a uniform buffer where the descriptor and the referenced buffer memory are decoupled. Compared to push constants, they allow reusing the same set of constant data across multiple disjoint sets of drawing and dispatching commands.

Inline uniform block descriptors cannot be aggregated into arrays. Instead, the array size specified for an inline uniform block descriptor binding specifies the binding’s capacity in bytes.
14.1.12. Sample Weight Image

A sample weight image (VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM) is a descriptor type associated with an image resource via an image view that can be used in weight image sampling. The image view must have been created with VkImageViewSampleWeightCreateInfoQCOM.

Shaders can combine a weight image variable, a sampled image variable, and a sampler variable to perform weight image sampling.

Weight image sampling is supported in all shader stages if the weight image view specifies a format that supports format feature VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM and the sampled image view specifies a format that supports format feature VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM.

The image subresources for the weight image must be in the VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL, or VK_IMAGE_LAYOUT_GENERAL layout in order to access its data in a shader.

14.1.13. Block Matching Image

A block matching image (VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM) is a descriptor type associated with an image resource via an image view that can be used in block matching.

Shaders can combine a target image variable, a reference image variable, and a sampler variable to perform block matching.

Block matching is supported in all shader stages for if both the target view and reference view specifies a format that supports format feature VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM.

The image subresources for block matching must be in the VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL, or VK_IMAGE_LAYOUT_GENERAL layout in order to access its data in a shader.

An input attachment (VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT) is a descriptor type associated with an image resource via an image view that can be used for framebuffer local load operations in fragment shaders.

All image formats that are supported for color attachments (VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT or VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV) or depth/stencil attachments (VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT) for a given image tiling mode are also supported for input attachments.

An image view used as an input attachment must be in one of the following layouts:

- VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_GENERAL
14.1.15. Acceleration Structure

An acceleration structure (VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR or VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV) is a descriptor type that is used to retrieve scene geometry from within shaders that are used for ray traversal. Shaders have read-only access to the memory.

14.1.16. Mutable

A descriptor of mutable (VK_DESCRIPTOR_TYPE_MUTABLE_EXT) type indicates that this descriptor can mutate to any of the descriptor types given in the VkMutableDescriptorTypeListEXT::pDescriptorTypes list of descriptor types in the pNext chain of VkDescriptorSetLayoutCreateInfo for this binding. At any point, each individual descriptor of mutable type has an active descriptor type. The active descriptor type can be any one of the declared types in pDescriptorTypes. Additionally, a mutable descriptor's active descriptor type can be of the VK_DESCRIPTOR_TYPE_MUTABLE_EXT type, which is the initial active descriptor type. The active descriptor type can change when the descriptor is updated. When a descriptor is consumed by binding a descriptor set, the active descriptor type is considered, not VK_DESCRIPTOR_TYPE_MUTABLE_EXT.

An active descriptor type of VK_DESCRIPTOR_TYPE_MUTABLE_EXT is considered an undefined descriptor. If a descriptor is consumed where the active descriptor type does not match what the shader expects, the descriptor is considered an undefined descriptor.

Note

To find which descriptor types are supported as VK_DESCRIPTOR_TYPE_MUTABLE_EXT, the application can use vkGetDescriptorSetLayoutSupport with an VK_DESCRIPTOR_TYPE_MUTABLE_EXT binding, with the list of descriptor types to query in the VkMutableDescriptorTypeCreateInfoEXT::pDescriptorTypes array for that binding.

Note

The intention of a mutable descriptor type is that implementations allocate N bytes per descriptor, where N is determined by the maximum descriptor size for a given descriptor binding. Implementations are not expected to keep track of the active descriptor type, and it should be considered a C-like union type.

A mutable descriptor type is not considered as efficient in terms of runtime performance as using a non-mutable descriptor type, and applications are not encouraged to use them outside API layering efforts. Mutable descriptor types can
be more efficient if the alternative is using many different descriptors to emulate mutable descriptor types.

## 14.2. Descriptor Sets

Descriptors are grouped together into descriptor set objects. A descriptor set object is an opaque object containing storage for a set of descriptors, where the types and number of descriptors is defined by a descriptor set layout. The layout object may be used to define the association of each descriptor binding with memory or other implementation resources. The layout is used both for determining the resources that need to be associated with the descriptor set, and determining the interface between shader stages and shader resources.

### 14.2.1. Descriptor Set Layout

A descriptor set layout object is defined by an array of zero or more descriptor bindings. Each individual descriptor binding is specified by a descriptor type, a count (array size) of the number of descriptors in the binding, a set of shader stages that can access the binding, and (if using immutable samplers) an array of sampler descriptors.

Descriptor set layout objects are represented by `VkDescriptorSetLayout` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDescriptorSetLayout)
```

To create descriptor set layout objects, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateDescriptorSetLayout(
    VkDevice device,
    const VkDescriptorSetLayoutCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkDescriptorSetLayout* pSetLayout);
```

- `device` is the logical device that creates the descriptor set layout.
- `pCreateInfo` is a pointer to a `VkDescriptorSetLayoutCreateInfo` structure specifying the state of the descriptor set layout object.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pSetLayout` is a pointer to a `VkDescriptorSetLayout` handle in which the resulting descriptor set layout object is returned.

### Valid Usage

- `VUID-vkCreateDescriptorSetLayout-support-09582`  
  If the descriptor layout does not meet the limits reported through the physical device limits, then `vkGetDescriptorSetLayoutSupport` must return...
Valid Usage (Implicit)

- VUID-vkCreateDescriptorSetLayout-device-parameter
  
  **device** must be a valid **VkDevice** handle

- VUID-vkCreateDescriptorSetLayout-pCreateInfo-parameter
  
  **pCreateInfo** must be a valid pointer to a valid **VkDescriptorSetLayoutCreateInfo** structure

- VUID-vkCreateDescriptorSetLayout-pAllocator-parameter
  
  If **pAllocator** is not **NULL**, **pAllocator** must be a valid pointer to a valid **VkAllocationCallbacks** structure

- VUID-vkCreateDescriptorSetLayout-pSetLayout-parameter
  
  **pSetLayout** must be a valid pointer to a **VkDescriptorSetLayout** handle

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

Information about the descriptor set layout is passed in a **VkDescriptorSetLayoutCreateInfo** structure:

```cpp
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorSetLayoutCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkDescriptorSetLayoutCreateFlags flags;
    uint32_t bindingCount;
    const VkDescriptorSetLayoutBinding* pBindings;
} VkDescriptorSetLayoutCreateInfo;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is a bitmask of **VkDescriptorSetLayoutCreateFlagBits** specifying options for descriptor set layout creation.
- **bindingCount** is the number of elements in **pBindings**.
- **pBindings** is a pointer to an array of **VkDescriptorSetLayoutBinding** structures.
Valid Usage

- VUID-VkDescriptorSetLayoutCreateInfo-binding-00279
  If the \textit{perStageDescriptorSet} feature is not enabled, or flags does not contain \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_PER_STAGE_BIT_NV}, then the \texttt{VkDeviceSetLayoutBinding::binding} members of the elements of the \texttt{pBindings} array must each have different values.

- VUID-VkDescriptorSetLayoutCreateInfo-flags-00280
  If flags contains \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR}, then all elements of \texttt{pBindings} must not have a descriptorType of \texttt{VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC} or \texttt{VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC}.

- VUID-VkDescriptorSetLayoutCreateInfo-flags-02208
  If flags contains \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR}, then all elements of \texttt{pBindings} must not have a descriptorType of \texttt{VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK}.

- VUID-VkDescriptorSetLayoutCreateInfo-flags-00281
  If flags contains \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR}, then the total number of elements of all bindings must be less than or equal to \texttt{VkPhysicalDevicePushDescriptorPropertiesKHR::maxPushDescriptors}.

- VUID-VkDescriptorSetLayoutCreateInfo-flags-04590
  If flags contains \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR}, flags must not contain \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_EXT}.

- VUID-VkDescriptorSetLayoutCreateInfo-flags-04591
  If flags contains \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR}, \texttt{pBindings} must not have a descriptorType of \texttt{VK_DESCRIPTOR_TYPE_MUTABLE_EXT}.

- VUID-VkDescriptorSetLayoutCreateInfo-flags-03000
  If any binding has the \texttt{VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT} bit set, flags must include \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT}.

- VUID-VkDescriptorSetLayoutCreateInfo-descriptorType-03001
  If any binding has the \texttt{VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT} bit set, then all bindings must not have descriptorType of \texttt{VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC} or \texttt{VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC}.

- VUID-VkDescriptorSetLayoutCreateInfo-flags-04592
  If flags contains \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT}, flags must not contain \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_EXT}.

- VUID-VkDescriptorSetLayoutCreateInfo-pBindings-07303
  If any element \texttt{pBindings[i]} has a descriptorType of \texttt{VK_DESCRIPTOR_TYPE_MUTABLE_EXT}, then a \texttt{VkMutableDescriptorTypeCreateInfoEXT} must be present in the \texttt{pNext} chain, and \texttt{mutableDescriptorTypeListCount} must be greater than \texttt{i}.

- VUID-VkDescriptorSetLayoutCreateInfo-descriptorType-04594
  If a binding has a descriptorType value of \texttt{VK_DESCRIPTOR_TYPE_MUTABLE_EXT}, then \texttt{pImmutableSamplers} must be \texttt{NULL}.

- VUID-VkDescriptorSetLayoutCreateInfo-mutableDescriptorType-04595
If `VkPhysicalDeviceMutableDescriptorTypeFeaturesEXT::mutableDescriptorType` is not enabled, `pBindings` must not contain a descriptorType of `VK_DESCRIPTOR_TYPE_MUTABLE_EXT`.

- **VUID-VkDescriptorSetLayoutCreateInfo-flags-04596**
  If `flags` contains `VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_EXT`, `VkPhysicalDeviceMutableDescriptorTypeFeaturesEXT::mutableDescriptorType` must be enabled.

- **VUID-VkDescriptorSetLayoutCreateInfo-flags-08000**
  If `flags` contains `VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, then all elements of `pBindings` must not have a descriptorType of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`.

- **VUID-VkDescriptorSetLayoutCreateInfo-flags-08001**
  If `flags` contains `VK_DESCRIPTOR_SET_LAYOUT_CREATE_EMBEDDED_IMMUTABLE_SAMPLERS_BIT_EXT`, `flags` must also contain `VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.

- **VUID-VkDescriptorSetLayoutCreateInfo-flags-08002**
  If `flags` contains `VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, then `flags` must not contain `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT`.

- **VUID-VkDescriptorSetLayoutCreateInfo-flags-08003**
  If `flags` contains `VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, then `flags` must not contain `VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_VALVE`.

- **VUID-VkDescriptorSetLayoutCreateInfo-flags-09463**
  If `flags` contains `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PER_STAGE_BIT_NV`, then `perStageDescriptorSet` must be enabled.

- **VUID-VkDescriptorSetLayoutCreateInfo-flags-09464**
  If `flags` contains `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PER_STAGE_BIT_NV`, then there must not be any two elements of the `pBindings` array with the same `VkDescriptorSetLayoutBinding::binding` value and their `VkDescriptorSetLayoutBinding::stageFlags` containing the same bit.

### Valid Usage (Implicit)

- **VUID-VkDescriptorSetLayoutCreateInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_CREATE_INFO`.

- **VUID-VkDescriptorSetLayoutCreateInfo-pNext-pNext**
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkDescriptorSetLayoutBindingFlagsCreateInfo` or `VkMutableDescriptorTypeCreateInfoEXT`.

- **VUID-VkDescriptorSetLayoutCreateInfo-sType-unique**
  The `sType` value of each struct in the `pNext` chain must be unique.

- **VUID-VkDescriptorSetLayoutCreateInfo-flags-parameter**
  `flags` must be a valid combination of `VkDescriptorSetLayoutCreateFlagBits` values.

- **VUID-VkDescriptorSetLayoutCreateInfo-pBindings-parameter**
  If `bindingCount` is not 0, `pBindings` must be a valid pointer to an array of `bindingCount` valid...
If the `pNext` chain of a `VkDescriptorSetLayoutCreateInfo` or `VkDescriptorPoolCreateInfo` structure includes a `VkMutableDescriptorTypeCreateInfoEXT` structure, then that structure specifies information about the possible descriptor types for mutable descriptor types.

The `VkMutableDescriptorTypeCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_mutable_descriptor_type
typedef struct VkMutableDescriptorTypeCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t mutableDescriptorTypeListCount;
    const VkMutableDescriptorTypeListEXT* pMutableDescriptorTypeLists;
} VkMutableDescriptorTypeCreateInfoEXT;
```

or the equivalent

```c
// Provided by VK_VALVE_mutable_descriptor_type
typedef VkMutableDescriptorTypeCreateInfoEXT VkMutableDescriptorTypeCreateInfoVALVE;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `mutableDescriptorTypeListCount` is the number of elements in `pMutableDescriptorTypeLists`.
- `pMutableDescriptorTypeLists` is a pointer to an array of `VkMutableDescriptorTypeListEXT` structures.

If `mutableDescriptorTypeListCount` is zero or if this structure is not included in the `pNext` chain, the `VkMutableDescriptorTypeListEXT` for each element is considered to be zero or `NULL` for each member. Otherwise, the descriptor set layout binding at `VkDescriptorSetLayoutCreateInfo::pBindings[i]` uses the descriptor type lists in `VkMutableDescriptorTypeCreateInfoEXT::pMutableDescriptorTypeLists[i]`.

### Valid Usage (Implicit)

- `VUID-VkMutableDescriptorTypeCreateInfoEXT-sType-sType` `sType` must be `VK_STRUCTURE_TYPE_MUTABLE_DESCRIPTOR_TYPE_CREATE_INFO_EXT`

- `VUID-VkMutableDescriptorTypeCreateInfoEXT-pMutableDescriptorTypeLists-parameter` If `mutableDescriptorTypeListCount` is not 0, `pMutableDescriptorTypeLists` must be a valid pointer to an array of `mutableDescriptorTypeListCount` valid `VkMutableDescriptorTypeListEXT` structures

The list of potential descriptor types a given mutable descriptor can mutate to is passed in a `VkMutableDescriptorTypeListEXT` structure.
The `VkMutableDescriptorTypeListEXT` structure is defined as:

```c
// Provided by VK_EXT_mutable_descriptor_type
typedef struct VkMutableDescriptorTypeListEXT {
    uint32_t descriptorTypeCount;
    const VkDescriptorType* pDescriptorTypes;
} VkMutableDescriptorTypeListEXT;
```

or the equivalent

```c
// Provided by VK_VALVE_mutable_descriptor_type
typedef VkMutableDescriptorTypeListEXT VkMutableDescriptorTypeListVALVE;
```

- `descriptorTypeCount` is the number of elements in `pDescriptorTypes`.
- `pDescriptorTypes` is NULL or a pointer to an array of `descriptorTypeCount` `VkDescriptorType` values defining which descriptor types a given binding may mutate to.

### Valid Usage

- **VUID-VkMutableDescriptorTypeListEXT-descriptorTypeCount-04597**
  `descriptorTypeCount` must not be 0 if the corresponding binding is of `VK_DESCRIPTOR_TYPE_MUTABLE_EXT`

- **VUID-VkMutableDescriptorTypeListEXT-pDescriptorTypes-04598**
  `pDescriptorTypes` must be a valid pointer to an array of `descriptorTypeCount` valid, unique `VkDescriptorType` values if the given binding is of `VK_DESCRIPTOR_TYPE_MUTABLE_EXT` type

- **VUID-VkMutableDescriptorTypeListEXT-descriptorTypeCount-04599**
  `descriptorTypeCount` must be 0 if the corresponding binding is not of `VK_DESCRIPTOR_TYPE_MUTABLE_EXT`

- **VUID-VkMutableDescriptorTypeListEXT-pDescriptorTypes-04600**
  `pDescriptorTypes` must not contain `VK_DESCRIPTOR_TYPE_MUTABLE_EXT`

- **VUID-VkMutableDescriptorTypeListEXT-pDescriptorTypes-04601**
  `pDescriptorTypes` must not contain `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`

- **VUID-VkMutableDescriptorTypeListEXT-pDescriptorTypes-04602**
  `pDescriptorTypes` must not contain `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`

- **VUID-VkMutableDescriptorTypeListEXT-pDescriptorTypes-04603**
  `pDescriptorTypes` must not contain `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`

### Valid Usage (Implicit)

- **VUID-VkMutableDescriptorTypeListEXT-pDescriptorTypes-parameter**
  If `descriptorTypeCount` is not 0, `pDescriptorTypes` must be a valid pointer to an array of `descriptorTypeCount` valid `VkDescriptorType` values.
Bits which **can** be set in `VkDescriptorSetLayoutCreateInfo::flags`, specifying options for descriptor set layout, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkDescriptorSetLayoutCreateFlagBits {
    // Provided by VK_VERSION_1_2
    VkDescriptorSetLayoutCreateUpdateAfterBindPoolBit = 0x00000002,
    // Provided by VK_KHR_push_descriptor
    VkDescriptorSetLayoutCreatePushDescriptorBitKHR = 0x00000001,
    // Provided by VK_EXT_descriptor_buffer
    VkDescriptorSetLayoutCreateDescriptorBufferBit_EXT = 0x00000010,
    // Provided by VK_EXT_descriptor_buffer
    VkDescriptorSetLayoutCreateEmbeddedImmutableSamplersBit_EXT = 0x00000020,
    // Provided by VK_NV_device_generated_commands_compute
    VkDescriptorSetLayoutCreateIndirectBindableBit_NV = 0x00000080,
    // Provided by VK_EXT_mutable_descriptor_type
    VkDescriptorSetLayoutCreateHostOnlyPoolBit_EXT = 0x00000004,
    // Provided by VK_NV_per_stage_descriptor_set
    VkDescriptorSetLayoutCreatePerStageBit_NV = 0x00000040,
    // Provided by VK_EXT_descriptor_indexing
    VkDescriptorSetLayoutCreateUpdateAfterBindPoolBit_EXT =
    VkDescriptorSetLayoutCreateUpdateAfterBindPoolBit,
    // Provided by VK_VALVE_mutable_descriptor_type
    VkDescriptorSetLayoutCreateHostOnlyPoolBit_VALVE =
    VkDescriptorSetLayoutCreateHostOnlyPoolBit_EXT,
} VkDescriptorSetLayoutCreateFlagBits;
```

- `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR` specifies that descriptor sets **must** not be allocated using this layout, and descriptors are instead pushed by `vkCmdPushDescriptorSetKHR`.

- `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` specifies that descriptor sets using this layout **must** be allocated from a descriptor pool created with the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` bit set. Descriptor set layouts created with this bit set have alternate limits for the maximum number of descriptors per-stage and per-pipeline layout. The non-UpdateAfterBind limits only count descriptors in sets created without this flag. The UpdateAfterBind limits count all descriptors, but the limits **may** be higher than the non-UpdateAfterBind limits.

- `VK_DESCRIPTOR_SET_LAYOUT_CREATE_INDIRECT_BINDABLE_BIT_NV` specifies that descriptor sets using this layout allows them to be bound with compute pipelines that are created with `VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV` flag set to be used in Device-Generated Commands.

- `VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT` specifies that this layout **must** only be used with descriptor buffers.

- `VK_DESCRIPTOR_SET_LAYOUT_CREATE_EMBEDDED_IMMUTABLE_SAMPLERS_BIT_EXT` specifies that this is a layout only containing immutable samplers that **can** be bound by `vkCmdBindDescriptorBufferEmbeddedSamplersEXT`. Unlike normal immutable samplers, embedded immutable samplers do not require the application to provide them in a descriptor
buffer.

- **VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_EXT** specifies that descriptor sets using this layout must be allocated from a descriptor pool created with the **VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_EXT** bit set. Descriptor set layouts created with this bit have no expressible limit for maximum number of descriptors per-stage. Host descriptor sets are limited only by available host memory, but may be limited for implementation specific reasons. Implementations may limit the number of supported descriptors to UpdateAfterBind limits or non-UpdateAfterBind limits, whichever is larger.

- **VK_DESCRIPTOR_SET_LAYOUT_CREATE_PER_STAGE_BIT_NV** specifies that binding numbers in descriptor sets using this layout may represent different resources and/or types of resources in each stage.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkDescriptorSetLayoutCreateFlags;
```

**VkDescriptorSetLayoutCreateFlags** is a bitmask type for setting a mask of zero or more **VkDescriptorSetLayoutCreateFlagBits**.

The **VkDescriptorSetLayoutBinding** structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorSetLayoutBinding {
    uint32_t binding;
    VkDescriptorType descriptorType;
    uint32_t descriptorCount;
    VkShaderStageFlags stageFlags;
    const VkSampler* pImmutableSamplers;
} VkDescriptorSetLayoutBinding;
```

- **binding** is the binding number of this entry and corresponds to a resource of the same binding number in the shader stages.

- **descriptorType** is a **VkDescriptorType** specifying which type of resource descriptors are used for this binding.

- **descriptorCount** is the number of descriptors contained in the binding, accessed in a shader as an array, except if **descriptorType** is **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK** in which case **descriptorCount** is the size in bytes of the inline uniform block. If **descriptorCount** is zero this binding entry is reserved and the resource must not be accessed from any stage via this binding within any pipeline using the set layout.

- **stageFlags** member is a bitmask of **VkShaderStageFlagBits** specifying which pipeline shader stages can access a resource for this binding. **VK_SHADER_STAGE_ALL** is a shorthand specifying that all defined shader stages, including any additional stages defined by extensions, can access the resource.

If a shader stage is not included in **stageFlags**, then a resource must not be accessed from that stage via this binding within any pipeline using the set layout. Other than input attachments which are limited to the fragment shader, there are no limitations on what combinations of
stages can use a descriptor binding, and in particular a binding can be used by both graphics stages and the compute stage.

- `pImmutableSamplers` affects initialization of samplers. If `descriptorType` specifies a `VK_DESCRIPTOR_TYPE_SAMPLER` or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` type descriptor, then `pImmutableSamplers` can be used to initialize a set of immutable samplers. Immutable samplers are permanently bound into the set layout and must not be changed; updating a `VK_DESCRIPTOR_TYPE_SAMPLER` descriptor with immutable samplers is not allowed and updates to a `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` descriptor with immutable samplers does not modify the samplers (the image views are updated, but the sampler updates are ignored). If `pImmutableSamplers` is not NULL, then it is a pointer to an array of sampler handles that will be copied into the set layout and used for the corresponding binding. Only the sampler handles are copied; the sampler objects must not be destroyed before the final use of the set layout and any descriptor pools and sets created using it. If `pImmutableSamplers` is NULL, then the sampler slots are dynamic and sampler handles must be bound into descriptor sets using this layout. If `descriptorType` is not one of these descriptor types, then `pImmutableSamplers` is ignored.

The above layout definition allows the descriptor bindings to be specified sparsely such that not all binding numbers between 0 and the maximum binding number need to be specified in the `pBindings` array. Bindings that are not specified have a `descriptorCount` and `stageFlags` of zero, and the value of `descriptorType` is undefined. However, all binding numbers between 0 and the maximum binding number in the `VkDescriptorSetLayoutCreateInfo::pBindings` array may consume memory in the descriptor set layout even if not all descriptor bindings are used, though it should not consume additional memory from the descriptor pool.

Note
The maximum binding number specified should be as compact as possible to avoid wasted memory.

Valid Usage

- VUID-VkDescriptorSetLayoutBinding-descriptorType-00282
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLER` or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, and `descriptorCount` is not 0 and `pImmutableSamplers` is not NULL, `pImmutableSamplers` must be a valid pointer to an array of `descriptorCount` valid `VkSampler` handles

- VUID-VkDescriptorSetLayoutBinding-descriptorType-04604
  If the `inlineUniformBlock` feature is not enabled, `descriptorType` must not be `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`

- VUID-VkDescriptorSetLayoutBinding-descriptorType-02209
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` then `descriptorCount` must be a multiple of 4

- VUID-VkDescriptorSetLayoutBinding-descriptorType-08004
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` and `VkDescriptorSetLayoutCreateInfo::flags` does not contain `VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT` then `descriptorCount` must be
less than or equal to VkPhysicalDeviceInlineUniformBlockProperties::maxInlineUniformBlockSize

- VUID-VkDescriptorSetLayoutBinding-flags-08005
  If VkDescriptorSetLayoutCreateInfo::flags contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_EMBEDDED_IMMUTABLE_SAMPLERS_BIT_EXT, descriptorType must be VK_DESCRIPTOR_TYPE_SAMPLER

- VUID-VkDescriptorSetLayoutBinding-flags-08006
  If VkDescriptorSetLayoutCreateInfo::flags contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_EMBEDDED_IMMUTABLE_SAMPLERS_BIT_EXT, descriptorCount must be less than or equal to 1

- VUID-VkDescriptorSetLayoutBinding-flags-08007
  If VkDescriptorSetLayoutCreateInfo::flags contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_EMBEDDED_IMMUTABLE_SAMPLERS_BIT_EXT, and descriptorCount is equal to 1, pImmutableSamplers must not be NULL

- VUID-VkDescriptorSetLayoutBinding-descriptorCount-09465
  If descriptorCount is not 0, stageFlags must be VK_SHADER_STAGE_ALL or a valid combination of other VkShaderStageFlagBits values

- VUID-VkDescriptorSetLayoutBinding-descriptorType-01510
  If descriptorType is VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT and descriptorCount is not 0, then stageFlags must be 0 or VK_SHADER_STAGE_FRAGMENT_BIT

- VUID-VkDescriptorSetLayoutBinding-pImmutableSamplers-04009
  The sampler objects indicated by pImmutableSamplers must not have a borderColor with one of the values VK_BORDER_COLOR_FLOAT_CUSTOM_EXT or VK_BORDER_COLOR_INT_CUSTOM_EXT

- VUID-VkDescriptorSetLayoutBinding-descriptorType-04605
  If descriptorType is VK_DESCRIPTOR_TYPE_MUTABLE_EXT, then pImmutableSamplers must be NULL

- VUID-VkDescriptorSetLayoutBinding-flags-09466
  If VkDescriptorSetLayoutCreateInfo::flags contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_PER_STAGE_NV, and descriptorCount is not 0, then stageFlags must be a valid combination of VK_SHADER_STAGE_VERTEX_BIT, VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT, VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, VK_SHADER_STAGE_GEOMETRY_BIT, VK_SHADER_STAGE_FRAGMENT_BIT, and VK_SHADER_STAGE_COMPUTE_BIT values

**Valid Usage (Implicit)**

- VUID-VkDescriptorSetLayoutBinding-descriptorType-parameter descriptorType must be a valid VkDescriptorType value

If the pNext chain of a VkDescriptorSetLayoutCreateInfo structure includes a VkDescriptorSetLayoutBindingFlagsCreateInfo structure, then that structure includes an array of flags, one for each descriptor set layout binding.

The VkDescriptorSetLayoutBindingFlagsCreateInfo structure is defined as:

---

1240
`typedef struct VkDescriptorSetLayoutBindingFlagsCreateInfo {
    VkStructureType sType;
    const void*pNext;
    uint32_t bindingCount;
    const VkDescriptorBindingFlags*pBindingFlags;
} VkDescriptorSetLayoutBindingFlagsCreateInfo;`

or the equivalent

`typedef VkDescriptorSetLayoutBindingFlagsCreateInfo VkDescriptorSetLayoutBindingFlagsCreateInfoEXT;`

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `bindingCount` is zero or the number of elements in `pBindingFlags`.
- `pBindingFlags` is a pointer to an array of `VkDescriptorBindingFlags` bitfields, one for each descriptor set layout binding.

If `bindingCount` is zero or if this structure is not included in the `pNext` chain, the `VkDescriptorBindingFlags` for each descriptor set layout binding is considered to be zero. Otherwise, the descriptor set layout binding at `VkDescriptorSetLayoutCreateInfo::pBindings[i]` uses the flags in `pBindingFlags[i].`

### Valid Usage

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-bindingCount-03002
  If `bindingCount` is not zero, `bindingCount` must equal `VkDescriptorSetLayoutCreateInfo::bindingCount`

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-flags-03003
  If `VkDescriptorSetLayoutCreateInfo::flags` includes `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR`, then all elements of `pBindingFlags` must not include `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`, `VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT`, or `VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT`

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-pBindingFlags-03004
  If an element of `pBindingFlags` includes `VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT`, then it must be the element with the highest `binding` number.

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-pDescriptorBindingUniformBufferUpdateAfterBind-03005
  If `VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingUniformBufferUpdateAfterBind` is not enabled, all bindings with
descriptor type VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER must not use VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT

• VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingSampledImageUpdateAfterBind-03006
  If VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingSampledImageUpdateAfterBind is not enabled, all bindings with descriptor type VK_DESCRIPTOR_TYPE_SAMPLER, VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, or VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE must not use VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT

• VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingStorageImageUpdateAfterBind-03007
  If VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingStorageImageUpdateAfterBind is not enabled, all bindings with descriptor type VK_DESCRIPTOR_TYPE_STORAGE_IMAGE must not use VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT

• VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingStorageBufferUpdateAfterBind-03008
  If VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingStorageBufferUpdateAfterBind is not enabled, all bindings with descriptor type VK_DESCRIPTOR_TYPE_STORAGE_BUFFER must not use VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT

• VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingUniformTexelBufferUpdateAfterBind-03009
  If VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingUniformTexelBufferUpdateAfterBind is not enabled, all bindings with descriptor type VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER must not use VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT

• VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingStorageTexelBufferUpdateAfterBind-03010
  If VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingStorageTexelBufferUpdateAfterBind is not enabled, all bindings with descriptor type VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER must not use VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT

• VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingInlineUniformBlockUpdateAfterBind-02211
  If VkPhysicalDeviceInlineUniformBlockFeatures::descriptorBindingInlineUniformBlockUpdateAfterBind is not enabled, all bindings with descriptor type VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK must not use VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT

• VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingAccelerationStructureUpdateAfterBind-03570
  If VkPhysicalDeviceAccelerationStructureFeaturesKHR::descriptorBindingAccelerationStructureUpdateAfterBind is not enabled, all bindings with descriptor type VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR or VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV must not use VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT
VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-None-03011
  All bindings with descriptor type VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC, or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC must not use VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingUpdateUnusedWhilePending-03012
  If VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingUpdateUnusedWhilePending is not enabled, all elements of pBindingFlags must not include VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingPartiallyBound-03013
  If VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingPartiallyBound is not enabled, all elements of pBindingFlags must not include VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingVariableDescriptorCount-03014
  If VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingVariableDescriptorCount is not enabled, all elements of pBindingFlags must not include VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-pBindingFlags-03015
  If an element of pBindingFlags includes VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT, that element's descriptorType must not be VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC

Valid Usage (Implicit)

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_BINDING_FLAGS_CREATE_INFO

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-pBindingFlags-parameter
  If bindingCount is not 0, pBindingFlags must be a valid pointer to an array of bindingCount valid combinations of VkDescriptorBindingFlagBits values

Bits which can be set in each element of VkDescriptorSetLayoutBindingFlagsCreateInfo::pBindingFlags, specifying options for the corresponding descriptor set layout binding, are:

```c
// Provided by VK_VERSION_1_2
typedef enum VkDescriptorBindingFlagBits {
    VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT = 0x00000001,
    VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT = 0x00000002,
    VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT = 0x00000004,
    VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT = 0x00000008,
};
// Provided by VK_EXT_descriptor_indexing
```
VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT_EXT =
VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT,
// Provided by VK_EXT_descriptor_indexing

VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT_EXT =
VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT,
// Provided by VK_EXT_descriptor_indexing

VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT_EXT =
VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT,
// Provided by VK_EXT_descriptor_indexing

VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT_EXT =
VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT,
} VkDescriptorBindingFlagBits;

or the equivalent

// Provided by VK_EXT_descriptor_indexing
typedef VkDescriptorBindingFlagBits VkDescriptorBindingFlagBitsEXT;

- **VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT** indicates that if descriptors in this binding are updated between when the descriptor set is bound in a command buffer and when that command buffer is submitted to a queue, then the submission will use the most recently set descriptors for this binding and the updates do not invalidate the command buffer. Descriptor bindings created with this flag are also partially exempt from the external synchronization requirement in `vkUpdateDescriptorSetWithTemplateKHR` and `vkUpdateDescriptorSets`. Multiple descriptors with this flag set can be updated concurrently in different threads, though the same descriptor must not be updated concurrently by two threads. Descriptors with this flag set can be updated concurrently with the set being bound to a command buffer in another thread, but not concurrently with the set being reset or freed.

- **VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT** indicates that descriptors in this binding that are not dynamically used need not contain valid descriptors at the time the descriptors are consumed. A descriptor is dynamically used if any shader invocation executes an instruction that performs any memory access using the descriptor. If a descriptor is not dynamically used, any resource referenced by the descriptor is not considered to be referenced during command execution.

- **VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT** indicates that descriptors in this binding can be updated after a command buffer has bound this descriptor set, or while a command buffer that uses this descriptor set is pending execution, as long as the descriptors that are updated are not used by those command buffers. Descriptor bindings created with this flag are also partially exempt from the external synchronization requirement in `vkUpdateDescriptorSetWithTemplateKHR` and `vkUpdateDescriptorSets` in the same way as for **VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT**. If **VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT** is also set, then descriptors can be updated as long as they are not dynamically used by any shader invocations. If **VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT** is not set, then descriptors can be updated as long as they are not statically used by any shader invocations.

- **VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT** indicates that this is a variable-sized descriptor binding whose size will be specified when a descriptor set is allocated using this
layout. The value of descriptorCount is treated as an upper bound on the size of the binding. This must only be used for the last binding in the descriptor set layout (i.e. the binding with the largest value of binding). For the purposes of counting against limits such as maxDescriptorSet* and maxPerStageDescriptor*, the full value of descriptorCount is counted, except for descriptor bindings with a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, when VkDescriptorSetLayoutCreateInfo::flags does not contain VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT. In this case, descriptorCount specifies the upper bound on the byte size of the binding; thus it counts against the maxInlineUniformBlockSize and maxInlineUniformTotalSize limits instead.

Note
Note that while VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT and VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT both involve updates to descriptor sets after they are bound, VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT is a weaker requirement since it is only about descriptors that are not used, whereas VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT requires the implementation to observe updates to descriptors that are used.

// Provided by VK_VERSION_1_2
typedef VkFlags VkDescriptorBindingFlags;

or the equivalent

// Provided by VK_EXT_descriptor_indexing
typedef VkDescriptorBindingFlags VkDescriptorBindingFlagsEXT;

VkDescriptorBindingFlags is a bitmask type for setting a mask of zero or more VkDescriptorBindingFlagBits.

To query information about whether a descriptor set layout can be created, call:

// Provided by VK_VERSION_1_1
void vkGetDescriptorSetLayoutSupport(
    VkDevice device,
    const VkDescriptorSetLayoutCreateInfo* pCreateInfo,
    VkDescriptorSetLayoutSupport* pSupport);

or the equivalent command

// Provided by VK_KHR_maintenance3
void vkGetDescriptorSetLayoutSupportKHR(
    VkDevice device,
    const VkDescriptorSetLayoutCreateInfo* pCreateInfo,
• `device` is the logical device that would create the descriptor set layout.

• `pCreateInfo` is a pointer to a `VkDescriptorSetLayoutCreateInfo` structure specifying the state of the descriptor set layout object.

• `pSupport` is a pointer to a `VkDescriptorSetLayoutSupport` structure, in which information about support for the descriptor set layout object is returned.

Some implementations have limitations on what fits in a descriptor set which are not easily expressible in terms of existing limits like `maxDescriptorSet`*, for example if all descriptor types share a limited space in memory but each descriptor is a different size or alignment. This command returns information about whether a descriptor set satisfies this limit. If the descriptor set layout satisfies the `VkPhysicalDeviceMaintenance3Properties::maxPerSetDescriptors` limit, this command is guaranteed to return `VK_TRUE` in `VkDescriptorSetLayoutSupport::supported`. If the descriptor set layout exceeds the `VkPhysicalDeviceMaintenance3Properties::maxPerSetDescriptors` limit, whether the descriptor set layout is supported is implementation-dependent and may depend on whether the descriptor sizes and alignments cause the layout to exceed an internal limit.

This command does not consider other limits such as `maxPerStageDescriptor`*, and so a descriptor set layout that is supported according to this command must still satisfy the pipeline layout limits such as `maxPerStageDescriptor`* in order to be used in a pipeline layout.

**Note**
This is a `VkDevice` query rather than `VkPhysicalDevice` because the answer may depend on enabled features.

### Valid Usage (Implicit)

- VUID-vkGetDescriptorSetLayoutSupport-device-parameter
  
  `device` **must** be a valid `VkDevice` handle

- VUID-vkGetDescriptorSetLayoutSupport-pCreateInfo-parameter
  
  `pCreateInfo` **must** be a valid pointer to a valid `VkDescriptorSetLayoutCreateInfo` structure

- VUID-vkGetDescriptorSetLayoutSupport-pSupport-parameter
  
  `pSupport` **must** be a valid pointer to a `VkDescriptorSetLayoutSupport` structure

Information about support for the descriptor set layout is returned in a `VkDescriptorSetLayoutSupport` structure:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDescriptorSetLayoutSupport {
    VkStructureType sType;
    void* pNext;
    VkBool32 supported;
} VkDescriptorSetLayoutSupport;
```
typedef VkDescriptorSetLayoutSupport VkDescriptorSetLayoutSupportKHR;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `supported` specifies whether the descriptor set layout can be created.

`supported` is set to `VK_TRUE` if the descriptor set can be created, or else is set to `VK_FALSE`.

### Valid Usage (Implicit)

- VUID-VkDescriptorSetLayoutSupport-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_SUPPORT`
- VUID-VkDescriptorSetLayoutSupport-pNext-pNext
  - `pNext` must be `NULL` or a pointer to a valid instance of `VkDescriptorSetVariableDescriptorCountLayoutSupport`
- VUID-VkDescriptorSetLayoutSupport-sType-unique
  - The `sType` value of each struct in the `pNext` chain must be unique

If the `pNext` chain of a `VkDescriptorSetLayoutSupport` structure includes a `VkDescriptorSetVariableDescriptorCountLayoutSupport` structure, then that structure returns additional information about whether the descriptor set layout is supported.

typedef struct VkDescriptorSetVariableDescriptorCountLayoutSupport {
    VkStructureType sType;
    void* pNext;
    uint32_t maxVariableDescriptorCount;
} VkDescriptorSetVariableDescriptorCountLayoutSupport;

or the equivalent

typedef VkDescriptorSetVariableDescriptorCountLayoutSupport EXT

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxVariableDescriptorCount` indicates the maximum number of descriptors supported in the highest numbered binding of the layout, if that binding is variable-sized. If the highest numbered binding of the layout has a descriptor type of
If the VkDescriptorSetLayoutCreateInfo structure specified in vkGetDescriptorSetLayoutSupport::pCreateInfo includes a variable-sized descriptor, then supported is determined assuming the requested size of the variable-sized descriptor, and maxVariableDescriptorCount is set to the maximum size of that descriptor that can be successfully created (which is greater than or equal to the requested size passed in). If the VkDescriptorSetLayoutCreateInfo structure does not include a variable-sized descriptor, or if the VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingVariableDescriptorCount feature is not enabled, then maxVariableDescriptorCount is set to zero. For the purposes of this command, a variable-sized descriptor binding with a descriptorCount of zero is treated as having a descriptorCount of four if descriptorType is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, or one otherwise, and thus the binding is not ignored and the maximum descriptor count will be returned. If the layout is not supported, then the value written to maxVariableDescriptorCount is undefined.

Valid Usage (Implicit)

- VUID-VkDescriptorSetVariableDescriptorCountLayoutSupport-sType-sType must be VK_STRUCTURE_TYPE_DESCRIPTOR_SET_VARIABLE_DESCRIPTOR_COUNT_LAYOUT_SUPPORT

The following examples show a shader snippet using two descriptor sets, and application code that creates corresponding descriptor set layouts.

**GLSL example**

```glsl
// binding to a single sampled image descriptor in set 0
// layout (set=0, binding=0) uniform texture2D mySampledImage;

// binding to an array of sampled image descriptors in set 0
// layout (set=0, binding=1) uniform texture2D myArrayOfSampledImages[12];

// binding to a single uniform buffer descriptor in set 1
// layout (set=1, binding=0) uniform myUniformBuffer
// {
//   vec4 myElement[32];
// };
```

**SPIR-V example**

```glsl
...```

1248
%1 = OpExtInstImport "GLSL.std.450"
...
OpName %9 "mySampledImage"
OpName %14 "myArrayOfSampledImages"
OpName %18 "myUniformBuffer"
OpMemberName %18 0 "myElement"
OpName %20 ""
OpDecorate %9 DescriptorSet 0
OpDecorate %9 Binding 0
OpDecorate %14 DescriptorSet 0
OpDecorate %14 Binding 1
OpDecorate %17 ArrayStride 16
OpMemberDecorate %18 0 Offset 0
OpDecorate %18 Block
OpDecorate %20 DescriptorSet 1
OpDecorate %20 Binding 0
%2 = OpTypeVoid
%3 = OpTypeFunction %2
%6 = OpTypeFloat 32
%7 = OpTypeImage %6 2D 0 0 0 1 Unknown
%8 = OpTypePointer UniformConstant %7
%9 = OpVariable %8 UniformConstant
%10 = OpTypeInt 32 0
%11 = OpConstant %10 12
%12 = OpTypeArray %7 %11
%13 = OpTypePointer UniformConstant %12
%14 = OpVariable %13 UniformConstant
%15 = OpTypeVector %6 4
%16 = OpConstant %10 32
%17 = OpTypeArray %15 %16
%18 = OpTypeStruct %17
%19 = OpTypePointer Uniform %18
%20 = OpVariable %19 Uniform
...

API example

VkResult myResult;

const VkDescriptorSetLayoutBinding myDescriptorSetLayoutBinding[] =
{
    // binding to a single image descriptor
    {
        .binding = 0,
        .descriptorType = VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE,
        .descriptorCount = 1,
        .stageFlags = VK_SHADER_STAGE_FRAGMENT_BIT,
        .pImmutableSamplers = NULL
    },
...
// binding to an array of image descriptors
{
    binding = 1,
    descriptorType = VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE,
    descriptorCount = 12,
    stageFlags = VK_SHADER_STAGE_FRAGMENT_BIT,
    pImmutableSamplers = NULL
},

// binding to a single uniform buffer descriptor
{
    binding = 0,
    descriptorType = VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER,
    descriptorCount = 1,
    stageFlags = VK_SHADER_STAGE_FRAGMENT_BIT,
    pImmutableSamplers = NULL
}

const VkDescriptorSetLayoutCreateInfo myDescriptorSetLayoutCreateInfo[] =
{
    // Information for first descriptor set with two descriptor bindings
    {
        sType = VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_CREATE_INFO,
       pNext = NULL,
        flags = 0,
        bindingCount = 2,
        pBindings = &myDescriptorSetLayoutBinding[0]
    },

    // Information for second descriptor set with one descriptor binding
    {
        sType = VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_CREATE_INFO,
        pNext = NULL,
        flags = 0,
        bindingCount = 1,
        pBindings = &myDescriptorSetLayoutBinding[2]
    }
};

VkDescriptorSetLayout myDescriptorSetLayout[2];

// Create first descriptor set layout
//
myResult = vkCreateDescriptorSetLayout(
    myDevice,
    &myDescriptorSetLayoutCreateInfo[0],
    NULL,
    &myDescriptorSetLayout[0]);
// Create second descriptor set layout
myResult = vkCreateDescriptorSetLayout(
    myDevice,
    &myDescriptorSetLayoutCreateInfo[1],
    NULL,
    &myDescriptorSetLayout[1]);

To destroy a descriptor set layout, call:

// Provided by VK_VERSION_1_0
void vkDestroyDescriptorSetLayout(
    VkDevice device,
    VkDescriptorSetLayout descriptorSetLayout,
    const VkAllocationCallbacks* pAllocator);

• device is the logical device that destroys the descriptor set layout.
• descriptorSetLayout is the descriptor set layout to destroy.
• pAllocator controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

• VUID-vkDestroyDescriptorSetLayout-descriptorSetLayout-00284
  If VkAllocationCallbacks were provided when descriptorSetLayout was created, a compatible set of callbacks must be provided here.

• VUID-vkDestroyDescriptorSetLayout-descriptorSetLayout-00285
  If no VkAllocationCallbacks were provided when descriptorSetLayout was created, pAllocator must be NULL.

Valid Usage (Implicit)

• VUID-vkDestroyDescriptorSetLayout-device-parameter
device must be a valid VkDevice handle.

• VUID-vkDestroyDescriptorSetLayout-descriptorSetLayout-parameter
  If descriptorSetLayout is not VK_NULL_HANDLE, descriptorSetLayout must be a valid VkDescriptorSetLayout handle.

• VUID-vkDestroyDescriptorSetLayout-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure.

• VUID-vkDestroyDescriptorSetLayout-descriptorSetLayout-parent
  If descriptorSetLayout is a valid handle, it must have been created, allocated, or retrieved from device.
14.2.2. Pipeline Layouts

Access to descriptor sets from a pipeline is accomplished through a pipeline layout. Zero or more descriptor set layouts and zero or more push constant ranges are combined to form a pipeline layout object describing the complete set of resources that can be accessed by a pipeline. The pipeline layout represents a sequence of descriptor sets with each having a specific layout. This sequence of layouts is used to determine the interface between shader stages and shader resources. Each pipeline is created using a pipeline layout.

Pipeline layout objects are represented by VkPipelineLayout handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPipelineLayout)
```

To create a pipeline layout, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreatePipelineLayout(
    VkDevice device,
    const VkPipelineLayoutCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkPipelineLayout* pPipelineLayout);
```

- `device` is the logical device that creates the pipeline layout.
- `pCreateInfo` is a pointer to a VkPipelineLayoutCreateInfo structure specifying the state of the pipeline layout object.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pPipelineLayout` is a pointer to a VkPipelineLayout handle in which the resulting pipeline layout object is returned.

**Valid Usage (Implicit)**

- VUID-vkCreatePipelineLayout-device-parameter
  device must be a valid VkDevice handle
- VUID-vkCreatePipelineLayout-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkPipelineLayoutCreateInfo structure
- VUID-vkCreatePipelineLayout-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure
pPipelineLayout must be a valid pointer to a VkPipelineLayout handle

Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkPipelineLayoutCreateInfo structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineLayoutCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineLayoutCreateFlags flags;
    uint32_t setLayoutCount;
    const VkDescriptorSetLayout* pSetLayouts;
    uint32_t pushConstantRangeCount;
    const VkPushConstantRange* pPushConstantRanges;
} VkPipelineLayoutCreateInfo;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• flags is a bitmask of VkPipelineLayoutCreateFlagBits specifying options for pipeline layout creation.
• setLayoutCount is the number of descriptor sets included in the pipeline layout.
• pSetLayouts is a pointer to an array of VkDescriptorSetLayout objects.
• pushConstantRangeCount is the number of push constant ranges included in the pipeline layout.
• pPushConstantRanges is a pointer to an array of VkPushConstantRange structures defining a set of push constant ranges for use in a single pipeline layout. In addition to descriptor set layouts, a pipeline layout also describes how many push constants can be accessed by each stage of the pipeline.

Note
Push constants represent a high speed path to modify constant data in pipelines that is expected to outperform memory-backed resource updates.
Valid Usage

- VUID-VkPipelineLayoutCreateInfo-setLayoutCount-00286
  
  `setLayoutCount` must be less than or equal to `VkPhysicalDeviceLimits::maxBoundDescriptorSets`

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03016
  
  The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a descriptorType of `VK_DESCRIPTOR_TYPE_SAMPLER` and `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageDescriptorSamplers`

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03017
  
  The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a descriptorType of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` and `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageDescriptorUniformBuffers`

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03018
  
  The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a descriptorType of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` and `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageDescriptorStorageBuffers`

- VUID-VkPipelineLayoutCreateInfo-descriptorType-06939
  
  The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a descriptorType of `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM`, `VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM`, and `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER`, accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageDescriptorSampledImages`

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03020
  
  The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a descriptorType of `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, and `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageDescriptorStorageImages`

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03021
  
  The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a descriptorType of `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageDescriptorInputAttachments`

- VUID-VkPipelineLayoutCreateInfo-descriptorType-02214
The total number of bindings in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set and with a `descriptorType` of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` accessible to any given shader stage across all elements of `pSetLayouts`, must be less than or equal to `VkPhysicalDeviceInlineUniformBlockProperties::maxPerStageDescriptorInlineUniformBlocks`.

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03022**
  The total number of descriptors with a `descriptorType` of `VK_DESCRIPTOR_TYPE_SAMPLER` and `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindSamplers`.

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03023**
  The total number of descriptors with a `descriptorType` of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` and `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindUniformBuffers`.

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03024**
  The total number of descriptors with a `descriptorType` of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` and `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindStorageBuffers`.

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03025**
  The total number of descriptors with a `descriptorType` of `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, and `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindSampledImages`.

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03026**
  The total number of descriptors with a `descriptorType` of `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, and `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindStorageImages`.

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03027**
  The total number of descriptors with a `descriptorType` of `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindInputAttachments`.

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-02215**
  The total number of bindings with a `descriptorType` of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` accessible to any given shader stage across all
elements of \texttt{pSetLayouts} must be less than or equal to \texttt{VkPhysicalDeviceInlineUniformBlockProperties::maxPerStageDescriptorUpdateAfterBindInlineUniformBlocks}

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03028**
The total number of descriptors in descriptor set layouts created without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set with a \texttt{descriptorType} of \texttt{VK_DESCRIPTOR_TYPE_SAMPLER} and \texttt{VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER} accessible across all shader stages and across all elements of \texttt{pSetLayouts} must be less than or equal to \texttt{VkPhysicalDeviceLimits::maxDescriptorSetSamplers}

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03029**
The total number of descriptors in descriptor set layouts created without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set with a \texttt{descriptorType} of \texttt{VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER} accessible across all shader stages and across all elements of \texttt{pSetLayouts} must be less than or equal to \texttt{VkPhysicalDeviceLimits::maxDescriptorSetUniformBuffers}

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03030**
The total number of descriptors in descriptor set layouts created without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set with a \texttt{descriptorType} of \texttt{VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC} accessible across all shader stages and across all elements of \texttt{pSetLayouts} must be less than or equal to \texttt{VkPhysicalDeviceLimits::maxDescriptorSetUniformBuffersDynamic}

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03031**
The total number of descriptors in descriptor set layouts created without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set with a \texttt{descriptorType} of \texttt{VK_DESCRIPTOR_TYPE_STORAGE_BUFFER} accessible across all shader stages and across all elements of \texttt{pSetLayouts} must be less than or equal to \texttt{VkPhysicalDeviceLimits::maxDescriptorSetStorageBuffers}

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03032**
The total number of descriptors in descriptor set layouts created without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set with a \texttt{descriptorType} of \texttt{VK_DESCRIPTOR_TYPE_STORAGE_IMAGE}, and \texttt{VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER} accessible across all shader stages and across all elements of \texttt{pSetLayouts} must be less than or equal to \texttt{VkPhysicalDeviceLimits::maxDescriptorSetStorageBuffersDynamic}

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03033**
The total number of descriptors in descriptor set layouts created without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set with a \texttt{descriptorType} of \texttt{VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER}, \texttt{VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE}, and \texttt{VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER} accessible across all shader stages and across all elements of \texttt{pSetLayouts} must be less than or equal to \texttt{VkPhysicalDeviceLimits::maxDescriptorSetSampledImages}

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03034**
The total number of descriptors in descriptor set layouts created without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set with a \texttt{descriptorType} of \texttt{VK_DESCRIPTOR_TYPE_STORAGE_IMAGE}, and \texttt{VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER} accessible across all shader stages and across all elements of \texttt{pSetLayouts} must be less than or equal to \texttt{VkPhysicalDeviceLimits::maxDescriptorSetSampledImages}
than or equal to `VkPhysicalDeviceLimits::maxDescriptorSetStorageImages`

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03035**
  The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceLimits::maxDescriptorSetInputAttachments`

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-02216**
  The total number of bindings in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceInlineUniformBlockProperties::maxDescriptorSetInlineUniformBlocks`

- **VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03036**
  The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_SAMPLER` and `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindSamplers`

- **VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03037**
  The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindUniformBuffers`

- **VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03038**
  The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindUniformBuffersDynamic`

- **VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03039**
  The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindStorageBuffers`

- **VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03040**
  The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindStorageBuffersDynamic`

- **VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03041**
  The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, and `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindSampledImages`
The total number of descriptors of the type \texttt{VK_DESCRIPTOR_TYPE_STORAGE_IMAGE} and \texttt{VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER} accessible across all shader stages and across all elements of \texttt{pSetLayouts} must be less than or equal to \texttt{VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindStorageImages}.

The total number of descriptors of the type \texttt{VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT} accessible across all shader stages and across all elements of \texttt{pSetLayouts} must be less than or equal to \texttt{VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindInputAttachments}.

The total number of bindings with a \texttt{descriptorType} of \texttt{VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK} accessible across all shader stages and across all elements of \texttt{pSetLayouts} must be less than or equal to \texttt{VkPhysicalDeviceInlineUniformBlockProperties::maxDescriptorSetUpdateAfterBindInlineUniformBlocks}.

Any two elements of \texttt{pPushConstantRanges} must not include the same stage in \texttt{stageFlags}.

\texttt{pSetLayouts} must not contain more than one descriptor set layout that was created with \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR} set.

The total number of bindings in descriptor set layouts created without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set with a \texttt{descriptorType} of \texttt{VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR} accessible to any given shader stage across all elements of \texttt{pSetLayouts} must be less than or equal to \texttt{VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxPerStageDescriptorAccelerationStructures}.

The total number of bindings with a \texttt{descriptorType} of \texttt{VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR} accessible to any given shader stage across all elements of \texttt{pSetLayouts} must be less than or equal to \texttt{VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxPerStageDescriptorUpdateAfterBindAccelerationStructures}.

The total number of bindings in descriptor set layouts created without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set with a \texttt{descriptorType} of \texttt{VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR} accessible across all shader stages and across all elements of \texttt{pSetLayouts} must be less than or equal to
VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxDescriptorSetAccelerationStructures

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03574
  The total number of bindings with a descriptorType of VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxDescriptorSetUpdateAfterBindAccelerationStructures

- VUID-VkPipelineLayoutCreateInfo-descriptorType-02381
  The total number of bindings with a descriptorType of VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceRayTracingPropertiesNV::maxDescriptorSetAccelerationStructures

- VUID-VkPipelineLayoutCreateInfo-pImmutableSamplers-03566
  The total number of pImmutableSamplers created with flags containing VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT or VK_SAMPLER_CREATE_SUBSAMPLED_COARSE_RECONSTRUCTION_BIT_EXT across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceFragmentDensityMap2PropertiesEXT::maxDescriptorSetSubsampledSamplers

- VUID-VkPipelineLayoutCreateInfo-pSetLayouts-04606
  Any element of pSetLayouts must not have been created with the VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_EXT bit set

- VUID-VkPipelineLayoutCreateInfo-graphicsPipelineLibrary-06753
  If graphicsPipelineLibrary is not enabled, elements of pSetLayouts must be valid VkDescriptorSetLayout objects

- VUID-VkPipelineLayoutCreateInfo-pSetLayouts-08008
  If any element of pSetLayouts was created with the VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT bit set, all elements of pSetLayouts must have been created with the VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT bit set

Valid Usage (Implicit)

- VUID-VkPipelineLayoutCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_LAYOUT_CREATE_INFO

- VUID-VkPipelineLayoutCreateInfo-flags-parameter
  flags must be a valid combination of VkPipelineLayoutCreateFlagBits values

- VUID-VkPipelineLayoutCreateInfo-pSetLayouts-parameter
  If setLayoutCount is not 0, pSetLayouts must be a valid pointer to an array of setLayoutCount valid or VK_NULL_HANDLE VkDescriptorSetLayout handles

- VUID-VkPipelineLayoutCreateInfo-pPushConstantRanges-parameter
  If pushConstantRangeCount is not 0, pPushConstantRanges must be a valid pointer to an array of pushConstantRangeCount valid VkPushConstantRange structures
• **VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT** specifies that implementations must ensure that the properties and/or absence of a particular descriptor set do not influence any other properties of the pipeline layout. This allows pipelines libraries linked without **VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT** to be created with a subset of the total descriptor sets.

**VkPipelineLayoutCreateFlags** is a bitmask type for setting a mask of **VkPipelineLayoutCreateFlagBits**.

The **VkPushConstantRange** structure is defined as:

• **stageFlags** is a set of stage flags describing the shader stages that will access a range of push constants. If a particular stage is not included in the range, then accessing members of that range of push constants from the corresponding shader stage will return undefined values.

• **offset** and **size** are the start offset and size, respectively, consumed by the range. Both **offset** and **size** are in units of bytes and must be a multiple of 4. The layout of the push constant variables is specified in the shader.

**Valid Usage**

• VUID-VkPushConstantRange-offset-00294
  offset must be less than VkPhysicalDeviceLimits::maxPushConstantsSize

• VUID-VkPushConstantRange-offset-00295
  offset must be a multiple of 4

• VUID-VkPushConstantRange-size-00296
  size must be greater than 0

• VUID-VkPushConstantRange-size-00297
  size must be a multiple of 4
Once created, pipeline layouts are used as part of pipeline creation (see Pipelines), as part of binding descriptor sets (see Descriptor Set Binding), and as part of setting push constants (see Push Constant Updates). Pipeline creation accepts a pipeline layout as input, and the layout may be used to map (set, binding, arrayElement) tuples to implementation resources or memory locations within a descriptor set. The assignment of implementation resources depends only on the bindings defined in the descriptor sets that comprise the pipeline layout, and not on any shader source.

All resource variables statically used in all shaders in a pipeline must be declared with a (set, binding, arrayElement) that exists in the corresponding descriptor set layout and is of an appropriate descriptor type and includes the set of shader stages it is used by in stageFlags. The pipeline layout can include entries that are not used by a particular pipeline. The pipeline layout allows the application to provide a consistent set of bindings across multiple pipeline compiles, which enables those pipelines to be compiled in a way that the implementation may cheaply switch pipelines without reprogramming the bindings.

Similarly, the push constant block declared in each shader (if present) must only place variables at offsets that are each included in a push constant range with stageFlags including the bit corresponding to the shader stage that uses it. The pipeline layout can include ranges or portions of ranges that are not used by a particular pipeline.

There is a limit on the total number of resources of each type that can be included in bindings in all descriptor set layouts in a pipeline layout as shown in Pipeline Layout Resource Limits. The “Total Resources Available” column gives the limit on the number of each type of resource that can be included in bindings in all descriptor sets in the pipeline layout. Some resource types count against multiple limits. Additionally, there are limits on the total number of each type of resource that can be used in any pipeline stage as described in Shader Resource Limits.

To destroy a pipeline layout, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyPipelineLayout(
    VkDevice device,
    VkPipelineLayout pipelineLayout,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the pipeline layout.
- `pipelineLayout` is the pipeline layout to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

## Valid Usage

- VUID-vkDestroyPipelineLayout-pipelineLayout-00299
  If `VkAllocationCallbacks` were provided when `pipelineLayout` was created, a compatible
set of callbacks **must** be provided here

- **VUID-vkDestroyPipelineLayout-pipelineLayout-00300**
  If no `VkAllocationCallbacks` were provided when `pipelineLayout` was created, `pAllocator` **must** be `NULL`

- **VUID-vkDestroyPipelineLayout-pipelineLayout-02004**
  `pipelineLayout` **must** not have been passed to any `vkCmd*` command for any command buffers that are still in the **recording state** when `vkDestroyPipelineLayout` is called

---

**Valid Usage (Implicit)**

- **VUID-vkDestroyPipelineLayout-device-parameter**
  `device` **must** be a valid `VkDevice` handle

- **VUID-vkDestroyPipelineLayout-pipelineLayout-parameter**
  If `pipelineLayout` is not `VK_NULL_HANDLE`, `pipelineLayout` **must** be a valid `VkPipelineLayout` handle

- **VUID-vkDestroyPipelineLayout-pAllocator-parameter**
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkDestroyPipelineLayout-pipelineLayout-parent**
  If `pipelineLayout` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

---

**Host Synchronization**

- Host access to `pipelineLayout` **must** be externally synchronized

---

**Pipeline Layout Compatibility**

Two pipeline layouts are defined to be “compatible for **push constants**” if they were created with identical push constant ranges. Two pipeline layouts are defined to be “compatible for set N” if they were created with *identically defined* descriptor set layouts for sets zero through N, if both of them either were or were not created with `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT`, and if they were created with identical push constant ranges.

When binding a descriptor set (see **Descriptor Set Binding**) to set number N, a previously bound descriptor set bound with lower index M than N is disturbed if the pipeline layouts for set M and N are not compatible for set M. Otherwise, the bound descriptor set in M is not disturbed.

If, additionally, the previously bound descriptor set for set N was bound using a pipeline layout not compatible for set N, then all bindings in sets numbered greater than N are disturbed.

When binding a pipeline, the pipeline **can** correctly access any previously bound descriptor set N if it was bound with compatible pipeline layout for set N, and it was not disturbed.
Layout compatibility means that descriptor sets can be bound to a command buffer for use by any pipeline created with a compatible pipeline layout, and without having bound a particular pipeline first. It also means that descriptor sets can remain valid across a pipeline change, and the same resources will be accessible to the newly bound pipeline.

When a descriptor set is disturbed by binding descriptor sets, the disturbed set is considered to contain undefined descriptors bound with the same pipeline layout as the disturbing descriptor set.

**Implementor’s Note**

A consequence of layout compatibility is that when the implementation compiles a pipeline layout and maps pipeline resources to implementation resources, the mechanism for set N should only be a function of sets [0..N].

**Note**

Place the least frequently changing descriptor sets near the start of the pipeline layout, and place the descriptor sets representing the most frequently changing resources near the end. When pipelines are switched, only the descriptor set bindings that have been invalidated will need to be updated and the remainder of the descriptor set bindings will remain in place.

The maximum number of descriptor sets that can be bound to a pipeline layout is queried from physical device properties (see `maxBoundDescriptorSets` in Limits).

**API example**

```c
const VkDescriptorSetLayout layouts[] = { layout1, layout2 };

const VkPushConstantRange ranges[] =
{
    {
        .stageFlags = VK_SHADER_STAGE_VERTEX_BIT,
        .offset = 0,
        .size = 4
    },
    {
        .stageFlags = VK_SHADER_STAGE_FRAGMENT_BIT,
        .offset = 4,
        .size = 4
    },
};

const VkPipelineLayoutCreateInfo createInfo =
{
    .sType = VK_STRUCTURE_TYPE_PIPELINE_LAYOUT_CREATE_INFO,
    .pNext = NULL,
    .flags = 0,
    .setLayoutCount = 2,
};
```
14.2.3. Allocation of Descriptor Sets

A descriptor pool maintains a pool of descriptors, from which descriptor sets are allocated. Descriptor pools are externally synchronized, meaning that the application must not allocate and/or free descriptor sets from the same pool in multiple threads simultaneously.

Descriptor pools are represented by VkDescriptorPool handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDescriptorPool)
```

To create a descriptor pool object, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateDescriptorPool(
    VkDevice device,
    const VkDescriptorPoolCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkDescriptorPool* pDescriptorPool);
```

- `device` is the logical device that creates the descriptor pool.
- `pCreateInfo` is a pointer to a VkDescriptorPoolCreateInfo structure specifying the state of the descriptor pool object.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pDescriptorPool` is a pointer to a VkDescriptorPool handle in which the resulting descriptor pool object is returned.

The created descriptor pool is returned in `pDescriptorPool`.

**Valid Usage (Implicit)**

- VUID-vkCreateDescriptorPool-device-parameter
  - `device` must be a valid VkDevice handle
Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_FRAGMENTATION_EXT

Additional information about the pool is passed in a `VkDescriptorPoolCreateInfo` structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorPoolCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkDescriptorPoolCreateFlags flags;
    uint32_t maxSets;
    uint32_t poolSizeCount;
    const VkDescriptorPoolSize* pPoolSizes;
} VkDescriptorPoolCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkDescriptorPoolCreateFlagBits` specifying certain supported operations on the pool.
- `maxSets` is the maximum number of descriptor sets that can be allocated from the pool.
- `poolSizeCount` is the number of elements in `pPoolSizes`.
- `pPoolSizes` is a pointer to an array of `VkDescriptorPoolSize` structures, each containing a descriptor type and number of descriptors of that type to be allocated in the pool.

If multiple `VkDescriptorPoolSize` structures containing the same descriptor type appear in the `pPoolSizes` array then the pool will be created with enough storage for the total number of descriptors of each type.
Fragmentation of a descriptor pool is possible and may lead to descriptor set allocation failures. A failure due to fragmentation is defined as failing a descriptor set allocation despite the sum of all outstanding descriptor set allocations from the pool plus the requested allocation requiring no more than the total number of descriptors requested at pool creation. Implementations provide certain guarantees of when fragmentation must not cause allocation failure, as described below.

If a descriptor pool has not had any descriptor sets freed since it was created or most recently reset then fragmentation must not cause an allocation failure (note that this is always the case for a pool created without the `VK_DESCRIPTOR_POOL_CREATE_FREE_DESCRIPTOR_SET_BIT` bit set). Additionally, if all sets allocated from the pool since it was created or most recently reset use the same number of descriptors (of each type) and the requested allocation also uses that same number of descriptors (of each type), then fragmentation must not cause an allocation failure.

If an allocation failure occurs due to fragmentation, an application can create an additional descriptor pool to perform further descriptor set allocations.

If `flags` has the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` bit set, descriptor pool creation may fail with the error `VK_ERROR_FRAGMENTATION` if the total number of descriptors across all pools (including this one) created with this bit set exceeds `maxUpdateAfterBindDescriptorsInAllPools`, or if fragmentation of the underlying hardware resources occurs.

If a `pPoolSizes[i]::type` is `VK_DESCRIPTOR_TYPE_MUTABLE_EXT`, a `VkMutableDescriptorTypeCreateInfoEXT` struct in the `pNext` chain can be used to specify which mutable descriptor types can be allocated from the pool. If included in the `pNext` chain, `VkMutableDescriptorTypeCreateInfoEXT`::{pMutableDescriptorTypeLists[i] specifies which kind of `VK_DESCRIPTOR_TYPE_MUTABLE_EXT` descriptors can be allocated from this pool entry. If `VkMutableDescriptorTypeCreateInfoEXT` does not exist in the `pNext` chain, or `VkMutableDescriptorTypeCreateInfoEXT`::{pMutableDescriptorTypeLists[i] is out of range, the descriptor pool allocates enough memory to be able to allocate a `VK_DESCRIPTOR_TYPE_MUTABLE_EXT` descriptor with any supported `VkDescriptorType` as a mutable descriptor. A mutable descriptor can be allocated from a pool entry if the type list in `VkDescriptorSetLayoutCreateInfo` is a subset of the type list declared in the descriptor pool, or if the pool entry is created without a descriptor type list. Multiple `pPoolSizes` entries with `VK_DESCRIPTOR_TYPE_MUTABLE_EXT` can be declared. When multiple such pool entries are present in `pPoolSizes`, they specify sets of supported descriptor types which either fully overlap, partially overlap, or are disjoint. Two sets fully overlap if the sets of supported descriptor types are equal. If the sets are not disjoint they partially overlap. A pool entry without a `VkMutableDescriptorTypeListEXT` assigned to it is considered to partially overlap any other pool entry which has a `VkMutableDescriptorTypeListEXT` assigned to it. The application must ensure that partial overlap does not exist in `pPoolSizes`.

---

**Valid Usage**

- VUID-VkDescriptorPoolCreateInfo-descriptorPoolOverallocation-09227

---

---

---

---
If the descriptorPoolOverallocation feature is not enabled, or flags does not have 
VK_DESCRIPTOR_POOL_CREATE_ALLOW_OVERALLOCATION_SETS_BIT_NV set, maxSets must be greater than 0

- VUID-VkDescriptorPoolCreateInfo-flags-09228
  If flags has the VK_DESCRIPTOR_POOL_CREATE_ALLOW_OVERALLOCATION_SETS_BIT_NV or 
  VK_DESCRIPTOR_POOL_CREATE_ALLOW_OVERALLOCATION_POOLS_BIT_NV bits set, then 
descriptorPoolOverallocation must be enabled

- VUID-VkDescriptorPoolCreateInfo-flags-04607
  If flags has the VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_EXT bit set, then the 
  VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT bit must not be set

- VUID-VkDescriptorPoolCreateInfo-mutableDescriptorType-04608
  If VkPhysicalDeviceMutableDescriptorTypeFeaturesEXT::mutableDescriptorType is not 
  enabled, pPoolSizes must not contain a descriptorType of VK_DESCRIPTOR_TYPE_MUTABLE_EXT

- VUID-VkDescriptorPoolCreateInfo-flags-04609
  If flags has the VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_EXT bit set, 
  VkPhysicalDeviceMutableDescriptorTypeFeaturesEXT::mutableDescriptorType must be 
  enabled

- VUID-VkDescriptorPoolCreateInfo-pPoolSizes-04787
  If pPoolSizes contains a descriptorType of VK_DESCRIPTOR_TYPE_MUTABLE_EXT, any other 
  VK_DESCRIPTOR_TYPE_MUTABLE_EXT element in pPoolSizes must not have sets of supported 
descriptor types which partially overlap

- VUID-VkDescriptorPoolCreateInfo-pPoolSizes-09424
  If pPoolSizes contains a descriptorType of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, the 
  pNext chain must include a VkDescriptorPoolInlineUniformBlockCreateInfo structure 
  whose maxInlineUniformBlockBindings member is not zero

**Valid Usage (Implicit)**

- VUID-VkDescriptorPoolCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_DESCRIPTOR_POOL_CREATE_INFO

- VUID-VkDescriptorPoolCreateInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either 
  NULL or a pointer to a valid instance of VkDescriptorPoolInlineUniformBlockCreateInfo or 
  VkMutableDescriptorTypeCreateInfoEXT

- VUID-VkDescriptorPoolCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkDescriptorPoolCreateInfo-flags-parameter
  flags must be a valid combination of VkDescriptorPoolCreateFlagBits values

- VUID-VkDescriptorPoolCreateInfo-pPoolSizes-parameter
  If poolSizeCount is not 0, pPoolSizes must be a valid pointer to an array of poolSizeCount 
  valid VkDescriptorPoolSize structures
In order to be able to allocate descriptor sets having *inline uniform block* bindings the descriptor pool **must** be created with specifying the inline uniform block binding capacity of the descriptor pool, in addition to the total inline uniform data capacity in bytes which is specified through a `VkDescriptorPoolSize` structure with a `descriptorType` value of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`. This can be done by adding a `VkDescriptorPoolInlineUniformBlockCreateInfo` structure to the `pNext` chain of `VkDescriptorPoolCreateInfo`.

The `VkDescriptorPoolInlineUniformBlockCreateInfo` structure is defined as:

```cpp
// Provided by VK_VERSION_1_3
typedef struct VkDescriptorPoolInlineUniformBlockCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t maxInlineUniformBlockBindings;
} VkDescriptorPoolInlineUniformBlockCreateInfo;
```

or the equivalent

```cpp
// Provided by VK_EXT_inline_uniform_block
typedef VkDescriptorPoolInlineUniformBlockCreateInfo VkDescriptorPoolInlineUniformBlockCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxInlineUniformBlockBindings` is the number of inline uniform block bindings to allocate.

**Valid Usage (Implicit)**

- `VUID-VkDescriptorPoolInlineUniformBlockCreateInfo-sType-sType` 
  `sType` must be `VK_STRUCTURE_TYPE_DESCRIPTOR_POOL_INLINE_UNIFORM_BLOCK_CREATE_INFO`

Bits which **can** be set in `VkDescriptorPoolCreateInfo::flags`, enabling operations on a descriptor pool, are:

```cpp
// Provided by VK_VERSION_1_0
typedef enum VkDescriptorPoolCreateFlagBits {
    VK_DESCRIPTOR_POOL_CREATE_FREE_DESCRIPTOR_SET_BIT = 0x00000001,
    // Provided by VK_VERSION_1_2
    VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT = 0x00000002,
    // Provided by VK_EXT_mutable_descriptor_type
    VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_EXT = 0x00000004,
    // Provided by VK_NV_descriptor_pool_overallocation
    VK_DESCRIPTOR_POOL_CREATE_ALLOW_OVERALLOCATION_SETS_BIT_NV = 0x00000008,
    // Provided by VK_NV_descriptor_pool_overallocation
}
```
VK_DESCRIPTOR_POOL_CREATE_ALLOW_OVERALLOCATION_SETS_BIT_NV = 0x00000010,
// Provided by VK_EXT_descriptor_indexing
VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT_EXT =
VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT,
// Provided by VK_VALVE_mutable_descriptor_type
VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_VALVE =
VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_EXT,
} VkDescriptorPoolCreateFlagBits;

- **VK_DESCRIPTOR_POOL_CREATE_FREE_DESCRIPTOR_SET_BIT** specifies that descriptor sets can return their individual allocations to the pool, i.e. all of `vkAllocateDescriptorSets`, `vkFreeDescriptorSets`, and `vkResetDescriptorPool` are allowed. Otherwise, descriptor sets allocated from the pool must not be individually freed back to the pool, i.e. only `vkAllocateDescriptorSets` and `vkResetDescriptorPool` are allowed.

- **VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT** specifies that descriptor sets allocated from this pool can include bindings with the **VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT** bit set. It is valid to allocate descriptor sets that have bindings that do not set the **VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT** bit from a pool that has **VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT** set.

- **VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_EXT** specifies that this descriptor pool and the descriptor sets allocated from it reside entirely in host memory and cannot be bound. Similar to descriptor sets allocated without this flag, applications can copy-from and copy-to descriptors sets allocated from this descriptor pool. Descriptor sets allocated from this pool are partially exempt from the external synchronization requirement in `vkUpdateDescriptorSetWithTemplateKHR` and `vkUpdateDescriptorSets`. Descriptor sets and their descriptors can be updated concurrently in different threads, though the same descriptor must not be updated concurrently by two threads.

- **VK_DESCRIPTOR_POOL_CREATE_ALLOW_OVERALLOCATION_SETS_BIT_NV** specifies that the implementation should allow the application to allocate more than `VkDescriptorPoolCreateInfo::maxSets` descriptor set objects from the descriptor pool as available resources allow. The implementation may use the `maxSets` value to allocate the initial available sets, but using zero is permitted.

- **VK_DESCRIPTOR_POOL_CREATE_ALLOW_OVERALLOCATION_POOLS_BIT_NV** specifies that the implementation should allow the application to allocate more descriptors from the pool than was specified by the `VkDescriptorPoolSize::descriptorCount` for any descriptor type as specified by `VkDescriptorPoolCreateInfo::poolSizeCount` and `VkDescriptorPoolCreateInfo::pPoolSizes`, as available resources allow. The implementation may use the `descriptorCount` for each descriptor type to allocate the initial pool, but the application is allowed to set the `poolSizeCount` to zero, or any of the `descriptorCount` values in the `pPoolSizes` array to zero.

// Provided by VK_VERSION_1_0
typedef VkFlags VkDescriptorPoolCreateFlags;

**VkDescriptorPoolCreateFlags** is a bitmask type for setting a mask of zero or more `VkDescriptorPoolCreateFlagBits`.

The **VkDescriptorPoolSize** structure is defined as:
typedef struct VkDescriptorPoolSize {
    VkDescriptorType type;
    uint32_t descriptorCount;
} VkDescriptorPoolSize;

- type is the type of descriptor.
- descriptorCount is the number of descriptors of that type to allocate. If type is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK then descriptorCount is the number of bytes to allocate for descriptors of this type.

Note
When creating a descriptor pool that will contain descriptors for combined image samplers of multi-planar formats, an application needs to account for non-trivial descriptor consumption when choosing the descriptorCount value, as indicated by VkSamplerYcbcrConversionImageFormatProperties::combinedImageSamplerDescriptorCount.

For simplicity the application can use the VkPhysicalDeviceMaintenance6PropertiesKHR::maxCombinedImageSamplerDescriptorCount property, which is sized to accommodate any and all formats that require a sampler Y’C_aC_b conversion supported by the implementation.

Valid Usage
- VUID-VkDescriptorPoolSize-descriptorCount-00302 descriptorCount must be greater than 0
- VUID-VkDescriptorPoolSize-type-02218 If type is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK then descriptorCount must be a multiple of 4

Valid Usage (Implicit)
- VUID-VkDescriptorPoolSize-type-parameter type must be a valid VkDescriptorType value

To destroy a descriptor pool, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyDescriptorPool(
    VkDevice device,
    VkDescriptorPool descriptorPool,
    const VkAllocationCallbacks* pAllocator);
```
• **device** is the logical device that destroys the descriptor pool.

• **descriptorPool** is the descriptor pool to destroy.

• **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

When a pool is destroyed, all descriptor sets allocated from the pool are implicitly freed and become invalid. Descriptor sets allocated from a given pool do not need to be freed before destroying that descriptor pool.

### Valid Usage

- **VUID-vkDestroyDescriptorPool-descriptorPool-00303**
  All submitted commands that refer to `descriptorPool` (via any allocated descriptor sets) must have completed execution

- **VUID-vkDestroyDescriptorPool-descriptorPool-00304**
  If `VkAllocationCallbacks` were provided when `descriptorPool` was created, a compatible set of callbacks must be provided here

- **VUID-vkDestroyDescriptorPool-descriptorPool-00305**
  If no `VkAllocationCallbacks` were provided when `descriptorPool` was created, `pAllocator` must be **NULL**

### Valid Usage (Implicit)

- **VUID-vkDestroyDescriptorPool-device-parameter**
  `device` must be a valid `VkDevice` handle

- **VUID-vkDestroyDescriptorPool-descriptorPool-parameter**
  If `descriptorPool` is not **VK_NULL_HANDLE**, `descriptorPool` must be a valid `VkDescriptorPool` handle

- **VUID-vkDestroyDescriptorPool-pAllocator-parameter**
  If `pAllocator` is not **NULL**, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkDestroyDescriptorPool-descriptorPool-parent**
  If `descriptorPool` is a valid handle, it must have been created, allocated, or retrieved from `device`

### Host Synchronization

- Host access to `descriptorPool` must be externally synchronized

Descriptor sets are allocated from descriptor pool objects, and are represented by `VkDescriptorSet` handles:

```c
// Provided by VK_VERSION_1_0
```

1272
To allocate descriptor sets from a descriptor pool, call:

```
// Provided by VK_VERSION_1_0
VkResult vkAllocateDescriptorSets(
    VkDevice device, 
    const VkDescriptorSetAllocateInfo* pAllocateInfo, 
    VkDescriptorSet* pDescriptorSets);
```

- `device` is the logical device that owns the descriptor pool.
- `pAllocateInfo` is a pointer to a `VkDescriptorSetAllocateInfo` structure describing parameters of the allocation.
- `pDescriptorSets` is a pointer to an array of `VkDescriptorSet` handles in which the resulting descriptor set objects are returned.

The allocated descriptor sets are returned in `pDescriptorSets`.

When a descriptor set is allocated, the initial state is largely uninitialized and all descriptors are undefined, with the exception that samplers with a non-null `pImmutableSamplers` are initialized on allocation. Descriptors also become undefined if the underlying resource or view object is destroyed. Descriptor sets containing undefined descriptors can still be bound and used, subject to the following conditions:

- For descriptor set bindings created with the `VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT` bit set, all descriptors in that binding that are dynamically used must have been populated before the descriptor set is consumed.
- For descriptor set bindings created without the `VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT` bit set, all descriptors in that binding that are statically used must have been populated before the descriptor set is consumed.
- Descriptor bindings with descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` can be undefined when the descriptor set is consumed; though values in that block will be undefined.
- Entries that are not used by a pipeline can have undefined descriptors.

If a call to `vkAllocateDescriptorSets` would cause the total number of descriptor sets allocated from the pool to exceed the value of `VkDescriptorPoolCreateInfo::maxSets` used to create `pAllocateInfo->descriptorPool`, then the allocation may fail due to lack of space in the descriptor pool. Similarly, the allocation may fail due to lack of space if the call to `vkAllocateDescriptorSets` would cause the number of any given descriptor type to exceed the sum of all the `descriptorCount` members of each element of `VkDescriptorPoolCreateInfo::pPoolSizes` with a type equal to that type.

Additionally, the allocation may also fail if a call to `vkAllocateDescriptorSets` would cause the total number of inline uniform block bindings allocated from the pool to exceed the value of `VkDescriptorPoolInlineUniformBlockCreateInfo::maxInlineUniformBlockBindings` used to create the descriptor pool.
If the allocation fails due to no more space in the descriptor pool, and not because of system or device memory exhaustion, then **VK_ERROR_OUT_OF_POOL_MEMORY** must be returned.

`vkAllocateDescriptorSets` can be used to create multiple descriptor sets. If the creation of any of those descriptor sets fails, then the implementation must destroy all successfully created descriptor set objects from this command, set all entries of the `pDescriptorSets` array to **VK_NULL_HANDLE** and return the error.

### Valid Usage (Implicit)

- VUID-vkAllocateDescriptorSets-device-parameter
  - `device` must be a valid `VkDevice` handle

- VUID-vkAllocateDescriptorSets-pAllocateInfo-parameter
  - `pAllocateInfo` must be a valid pointer to a valid `VkDescriptorSetAllocateInfo` structure

- VUID-vkAllocateDescriptorSets-pDescriptorSets-parameter
  - `pDescriptorSets` must be a valid pointer to an array of `pAllocateInfo->descriptorSetCount` `VkDescriptorSet` handles

- VUID-vkAllocateDescriptorSets-pAllocateInfo::descriptorSetCount-arraylength
  - `pAllocateInfo->descriptorSetCount` must be greater than 0

### Host Synchronization

- Host access to `pAllocateInfo->descriptorPool` must be externally synchronized

### Return Codes

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_FRAGMENTED_POOL**
- **VK_ERROR_OUT_OF_POOL_MEMORY**

The `VkDescriptorSetAllocateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorSetAllocateInfo {
    VkStructureType sType;
    const void* pNext;
    VkDescriptorPool descriptorPool;
    uint32_t descriptorSetCount;
} VkDescriptorSetAllocateInfo;
```
const VkDescriptorSetLayout* pSetLayouts;
} VkDescriptorSetAllocateInfo;

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **descriptorPool** is the pool which the sets will be allocated from.
- **descriptorSetCount** determines the number of descriptor sets to be allocated from the pool.
- **pSetLayouts** is a pointer to an array of descriptor set layouts, with each member specifying how the corresponding descriptor set is allocated.

### Valid Usage

- **VUID-VkDescriptorSetAllocateInfo-apiVersion-07895**
  If the *VK_KHR_maintenance1* extension is not enabled and *VkPhysicalDeviceProperties* ::apiVersion is less than Vulkan 1.1, **descriptorSetCount** must not be greater than the number of sets that are currently available for allocation in **descriptorPool**

- **VUID-VkDescriptorSetAllocateInfo-apiVersion-07896**
  If the *VK_KHR_maintenance1* extension is not enabled and *VkPhysicalDeviceProperties* ::apiVersion is less than Vulkan 1.1, **descriptorPool** must have enough free descriptor capacity remaining to allocate the descriptor sets of the specified layouts

- **VUID-VkDescriptorSetAllocateInfo-pSetLayouts-00308**
  Each element of **pSetLayouts** must not have been created with *VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR* set

- **VUID-VkDescriptorSetAllocateInfo-pSetLayouts-03044**
  If any element of **pSetLayouts** was created with the *VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT* bit set, **descriptorPool** must have been created with the *VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT* flag set

- **VUID-VkDescriptorSetAllocateInfo-pSetLayouts-09380**
  If **pSetLayouts[i]** was created with an element of **pBindingFlags** that includes *VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT*, and *VkDescriptorSetVariableDescriptorCountAllocateInfo* is included in the **pNext** chain, and *VkDescriptorSetVariableDescriptorCountAllocateInfo::descriptorSetCount* is not zero, then *VkDescriptorSetVariableDescriptorCountAllocateInfo::pDescriptorCounts[i] must be less than or equal to *VkDescriptorSetLayoutBinding::descriptorCount* for the corresponding binding used to create **pSetLayouts[i]**

- **VUID-VkDescriptorSetAllocateInfo-pSetLayouts-04610**
  If any element of **pSetLayouts** was created with the *VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_EXT* bit set, **descriptorPool** must have been created with the *VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_EXT* flag set

- **VUID-VkDescriptorSetAllocateInfo-pSetLayouts-08009**
  Each element of **pSetLayouts** must not have been created with the *VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT* bit set
Valid Usage (Implicit)

• **VUID-VkDescriptorSetAllocateInfo-sType-sType**  
  *sType* must be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_ALLOCATE_INFO`

• **VUID-VkDescriptorSetAllocateInfo-pNext-pNext**  
  *pNext* must be NULL or a pointer to a valid instance of  
  `VkDescriptorSetVariableDescriptorCountAllocateInfo`

• **VUID-VkDescriptorSetAllocateInfo-sType-unique**  
  The *sType* value of each struct in the *pNext* chain must be unique

• **VUID-VkDescriptorSetAllocateInfo-descriptorPool-parameter**  
  *descriptorPool* must be a valid `VkDescriptorPool` handle

• **VUID-VkDescriptorSetAllocateInfo-pSetLayouts-parameter**  
  *pSetLayouts* must be a valid pointer to an array of *descriptorSetCount* valid  
  `VkDescriptorSetLayout` handles

• **VUID-VkDescriptorSetAllocateInfo-descriptorSetCount-arraylength**  
  *descriptorSetCount* must be greater than 0

• **VUID-VkDescriptorSetAllocateInfo-commonparent**  
  Both of *descriptorPool*, and the elements of *pSetLayouts* must have been created,  
  allocated, or retrieved from the same `VkDevice`

If the *pNext* chain of a `VkDescriptorSetAllocateInfo` structure includes a  
`VkDescriptorSetVariableDescriptorCountAllocateInfo` structure, then that structure includes an  
array of descriptor counts for variable-sized descriptor bindings, one for each descriptor set being  
allocated.

The `VkDescriptorSetVariableDescriptorCountAllocateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2  
typedef struct VkDescriptorSetVariableDescriptorCountAllocateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t descriptorSetCount;
    const uint32_t* pDescriptorCounts;
} VkDescriptorSetVariableDescriptorCountAllocateInfo;
```

or the equivalent

```c
// Provided by VK_EXT_descriptor_indexing  
typedef VkDescriptorSetVariableDescriptorCountAllocateInfoEXT
VkDescriptorSetVariableDescriptorCountAllocateInfoEXT;
```

• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• descriptorSetCount is zero or the number of elements in pDescriptorCounts.
• pDescriptorCounts is a pointer to an array of descriptor counts, with each member specifying the number of descriptors in a variable-sized descriptor binding in the corresponding descriptor set being allocated.

If descriptorSetCount is zero or this structure is not included in the pNext chain, then the variable lengths are considered to be zero. Otherwise, pDescriptorCounts[i] is the number of descriptors in the variable-sized descriptor binding in the corresponding descriptor set layout. If the variable-sized descriptor binding in the corresponding descriptor set layout has a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK then pDescriptorCounts[i] specifies the binding’s capacity in bytes. If VkDescriptorSetAllocateInfo::pSetLayouts[i] does not include a variable-sized descriptor binding, then pDescriptorCounts[i] is ignored.

Valid Usage
• VUID-VkDescriptorSetVariableDescriptorCountAllocateInfo-descriptorSetCount-03045
  If descriptorSetCount is not zero, descriptorSetCount must equal VkDescriptorSetAllocateInfo::descriptorSetCount

Valid Usage (Implicit)
• VUID-VkDescriptorSetVariableDescriptorCountAllocateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_DESCRIPTOR_SET_VARIABLE_DESCRIPTOR_COUNT_ALLOCATE_INFO
• VUID-VkDescriptorSetVariableDescriptorCountAllocateInfo-pDescriptorCounts-parameter
  If descriptorSetCount is not 0, pDescriptorCounts must be a valid pointer to an array of descriptorSetCount uint32_t values

To free allocated descriptor sets, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkFreeDescriptorSets(
  VkDevice device,
  VkDescriptorPool descriptorPool,
  uint32_t descriptorSetCount,
  const VkDescriptorSet* pDescriptorSets);
```

• device is the logical device that owns the descriptor pool.
• descriptorPool is the descriptor pool from which the descriptor sets were allocated.
• descriptorSetCount is the number of elements in the pDescriptorSets array.
• pDescriptorSets is a pointer to an array of handles to VkDescriptorSet objects.

After calling vkFreeDescriptorSets, all descriptor sets in pDescriptorSets are invalid.
Valid Usage

- VUID-vkFreeDescriptorSets-pDescriptorSets-00309
  All submitted commands that refer to any element of `pDescriptorSets` must have completed execution.

- VUID-vkFreeDescriptorSets-pDescriptorSets-00310
  `pDescriptorSets` must be a valid pointer to an array of `descriptorSetCount` `VkDescriptorSet` handles, each element of which must either be a valid handle or `VK_NULL_HANDLE`.

- VUID-vkFreeDescriptorSets-descriptorPool-00312
  `descriptorPool` must have been created with the `VK_DESCRIPTOR_POOL_CREATE_FREE_DESCRIPTOR_SET_BIT` flag.

Valid Usage (Implicit)

- VUID-vkFreeDescriptorSets-device-parameter
  `device` must be a valid `VkDevice` handle.

- VUID-vkFreeDescriptorSets-descriptorPool-parameter
  `descriptorPool` must be a valid `VkDescriptorPool` handle.

- VUID-vkFreeDescriptorSets-descriptorSetCount-arraylength
  `descriptorSetCount` must be greater than 0.

- VUID-vkFreeDescriptorSets-descriptorPool-parent
  `descriptorPool` must have been created, allocated, or retrieved from `device`.

- VUID-vkFreeDescriptorSets-pDescriptorSets-parent
  Each element of `pDescriptorSets` that is a valid handle must have been created, allocated, or retrieved from `descriptorPool`.

Host Synchronization

- Host access to `descriptorPool` must be externally synchronized.
- Host access to each member of `pDescriptorSets` must be externally synchronized.

Return Codes

**Success**

- `VK_SUCCESS`
VkResult vkResetDescriptorPool(
    VkDevice device,
    VkDescriptorPool descriptorPool,
    VkDescriptorPoolResetFlags flags);

- **device** is the logical device that owns the descriptor pool.
- **descriptorPool** is the descriptor pool to be reset.
- **flags** is reserved for future use.

Resetting a descriptor pool recycles all of the resources from all of the descriptor sets allocated from the descriptor pool back to the descriptor pool, and the descriptor sets are implicitly freed.

### Valid Usage

- VUID-vkResetDescriptorPool-descriptorPool-00313
  All uses of **descriptorPool** (via any allocated descriptor sets) **must** have completed execution

### Valid Usage (Implicit)

- VUID-vkResetDescriptorPool-device-parameter
  **device** **must** be a valid **VkDevice** handle
- VUID-vkResetDescriptorPool-descriptorPool-parameter
  **descriptorPool** **must** be a valid **VkDescriptorPool** handle
- VUID-vkResetDescriptorPool-flags-zero-bitmask
  **flags** **must** be 0
- VUID-vkResetDescriptorPool-descriptorPool-parent
  **descriptorPool** **must** have been created, allocated, or retrieved from **device**

### Host Synchronization

- Host access to **descriptorPool** **must** be externally synchronized
- Host access to any **VkDescriptorSet** objects allocated from **descriptorPool** **must** be externally synchronized

### Return Codes

**Success**
- **VK_SUCCESS**
typedef VkFlags VkDescriptorPoolResetFlags;

VkDescriptorPoolResetFlags is a bitmask type for setting a mask, but is currently reserved for future use.

14.2.4. Descriptor Set Updates

Once allocated, descriptor sets can be updated with a combination of write and copy operations. To update descriptor sets, call:

```c
// Provided by VK_VERSION_1_0
void vkUpdateDescriptorSets(
    VkDevice device,
    uint32_t descriptorWriteCount,
    const VkWriteDescriptorSet* pDescriptorWrites,
    uint32_t descriptorCopyCount,
    const VkCopyDescriptorSet* pDescriptorCopies);
```

- device is the logical device that updates the descriptor sets.
- descriptorWriteCount is the number of elements in the pDescriptorWrites array.
- pDescriptorWrites is a pointer to an array of VkWriteDescriptorSet structures describing the descriptor sets to write to.
- descriptorCopyCount is the number of elements in the pDescriptorCopies array.
- pDescriptorCopies is a pointer to an array of VkCopyDescriptorSet structures describing the descriptor sets to copy between.

The operations described by pDescriptorWrites are performed first, followed by the operations described by pDescriptorCopies. Within each array, the operations are performed in the order they appear in the array.

Each element in the pDescriptorWrites array describes an operation updating the descriptor set using descriptors for resources specified in the structure.

Each element in the pDescriptorCopies array is a VkCopyDescriptorSet structure describing an operation copying descriptors between sets.

If the dstSet member of any element of pDescriptorWrites or pDescriptorCopies is bound, accessed, or modified by any command that was recorded to a command buffer which is currently in the recording or executable state, and any of the descriptor bindings that are updated were not created with the VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT or VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT bits set, that command buffer becomes invalid.
Valid Usage

- **VUID-vkUpdateDescriptorSets-pDescriptorWrites-06236**
  For each element i where pDescriptorWrites[i].descriptorType is VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER, elements of the pTexelBufferView member of pDescriptorWrites[i] must have been created on device.

- **VUID-vkUpdateDescriptorSets-pDescriptorWrites-06237**
  For each element i where pDescriptorWrites[i].descriptorType is VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER, VK_DESCRIPTOR_TYPE_STORAGE_BUFFER, VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC, or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC, the buffer member of any element of the pBufferInfo member of pDescriptorWrites[i] must have been created on device.

- **VUID-vkUpdateDescriptorSets-pDescriptorWrites-06238**
  For each element i where pDescriptorWrites[i].descriptorType is VK_DESCRIPTOR_TYPE_SAMPLER or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, and dstSet was not allocated with a layout that included immutable samplers for dstBinding with descriptorType, the sampler member of any element of the pImageInfo member of pDescriptorWrites[i] must have been created on device.

- **VUID-vkUpdateDescriptorSets-pDescriptorWrites-06239**
  For each element i where pDescriptorWrites[i].descriptorType is VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, the imageView member of any element of pDescriptorWrites[i] must have been created on device.

- **VUID-vkUpdateDescriptorSets-pDescriptorWrites-06240**
  For each element i where pDescriptorWrites[i].descriptorType is VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR, elements of the pAccelerationStructures member of a VkWriteDescriptorSetAccelerationStructureKHR structure in the pNext chain of pDescriptorWrites[i] must have been created on device.

- **VUID-vkUpdateDescriptorSets-pDescriptorWrites-06241**
  For each element i where pDescriptorWrites[i].descriptorType is VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV, elements of the pAccelerationStructures member of a VkWriteDescriptorSetAccelerationStructureNV structure in the pNext chain of pDescriptorWrites[i] must have been created on device.

- **VUID-vkUpdateDescriptorSets-pDescriptorWrites-06940**
  For each element i where pDescriptorWrites[i].descriptorType is VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM or VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM, the imageView member of any element of pDescriptorWrites[i] must have been created on device.
VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, pDescriptorWrites[i].pImageInfo must be a valid pointer to an array of pDescriptorWrites[i].descriptorCount valid VkDescriptorImageInfo structures

- VUID-vkUpdateDescriptorSets-pDescriptorWrites-06941
  For each element i where pDescriptorWrites[i].descriptorType is VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM or VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM, pDescriptorWrites[i].pImageInfo must be a valid pointer to an array of pDescriptorWrites[i].descriptorCount valid VkDescriptorImageInfo structures

- VUID-vkUpdateDescriptorSets-None-03047
  The dstSet member of each element of pDescriptorWrites or pDescriptorCopies for bindings which were created without the VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT or VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT bits set must not be used by any command that was recorded to a command buffer which is in the pending state

- VUID-vkUpdateDescriptorSets-pDescriptorWrites-06993
  Host access to pDescriptorWrites[i].dstSet and pDescriptorCopies[i].dstSet must be externally synchronized unless explicitly denoted otherwise for specific flags

Valid Usage (Implicit)

- VUID-vkUpdateDescriptorSets-device-parameter
  device must be a valid VkDevice handle

- VUID-vkUpdateDescriptorSets-pDescriptorWrites-parameter
  If descriptorWriteCount is not 0, pDescriptorWrites must be a valid pointer to an array of descriptorWriteCount valid VkWriteDescriptorSet structures

- VUID-vkUpdateDescriptorSets-pDescriptorCopies-parameter
  If descriptorCopyCount is not 0, pDescriptorCopies must be a valid pointer to an array of descriptorCopyCount valid VkCopyDescriptorSet structures

The VkWriteDescriptorSet structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkWriteDescriptorSet {
    VkStructureType sType;
    const void* pNext;
    VkDescriptorSet dstSet;
    uint32_t dstBinding;
    uint32_t dstArrayElement;
    uint32_t descriptorCount;
    VkDescriptorType descriptorType;
    const VkDescriptorImageInfo* pImageInfo;
    const VkDescriptorBufferInfo* pBufferInfo;
    const VkBufferView* pTexelBufferView;
} VkWriteDescriptorSet;
```
• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is `NULL` or a pointer to a structure extending this structure.

• **dstSet** is the destination descriptor set to update.

• **dstBinding** is the descriptor binding within that set.

• **dstArrayElement** is the starting element in that array. If the descriptor binding identified by `dstSet` and `dstBinding` has a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` then `dstArrayElement` specifies the starting byte offset within the binding.

• **descriptorCount** is the number of descriptors to update. If the descriptor binding identified by `dstSet` and `dstBinding` has a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`, then `descriptorCount` specifies the number of bytes to update. Otherwise, `descriptorCount` is one of:
  - the number of elements in `pImageInfo`
  - the number of elements in `pBufferInfo`
  - the number of elements in `pTexelBufferView`
  - a value matching the `dataSize` member of a `VkWriteDescriptorSetInlineUniformBlock` structure in the `pNext` chain
  - a value matching the `accelerationStructureCount` of a `VkWriteDescriptorSetAccelerationStructureKHR` structure in the `pNext` chain

• **descriptorType** is a `VkDescriptorType` specifying the type of each descriptor in `pImageInfo`, `pBufferInfo`, or `pTexelBufferView`, as described below. If `VkDescriptorSetLayoutBinding` for `dstSet` at `dstBinding` is not equal to `VK_DESCRIPTOR_TYPE_MUTABLE_EXT`, `descriptorType` must be the same type as the `descriptorType` specified in `VkDescriptorSetLayoutBinding` for `dstSet` at `dstBinding`. The type of the descriptor also controls which array the descriptors are taken from.

• **pImageInfo** is a pointer to an array of `VkDescriptorImageInfo` structures or is ignored, as described below.

• **pBufferInfo** is a pointer to an array of `VkDescriptorBufferInfo` structures or is ignored, as described below.

• **pTexelBufferView** is a pointer to an array of `VkBufferView` handles as described in the Buffer Views section or is ignored, as described below.

Only one of `pImageInfo`, `pBufferInfo`, or `pTexelBufferView` members is used according to the descriptor type specified in the `descriptorType` member of the containing `VkWriteDescriptorSet` structure, or none of them in case `descriptorType` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`, in which case the source data for the descriptor writes is taken from the `VkWriteDescriptorSetInlineUniformBlock` structure included in the `pNext` chain of `VkWriteDescriptorSet`, or if `descriptorType` is `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR`, in which case the source data for the descriptor writes is taken from the `VkWriteDescriptorSetAccelerationStructureKHR` structure in the `pNext` chain of `VkWriteDescriptorSet`, or if `descriptorType` is `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV`, in which case the source data for the descriptor writes is taken from the `VkWriteDescriptorSetAccelerationStructureNV` structure in the `pNext` chain of `VkWriteDescriptorSet`, as specified below.

If the nullDescriptor feature is enabled, the buffer, acceleration structure, imageView, or
bufferView can be VK_NULL_HANDLE. Loads from a null descriptor return zero values and stores and atomics to a null descriptor are discarded. A null acceleration structure descriptor results in the miss shader being invoked.

If the destination descriptor is a mutable descriptor, the active descriptor type for the destination descriptor becomes descriptorType.

If the dstBinding has fewer than descriptorCount array elements remaining starting from dstArrayElement, then the remainder will be used to update the subsequent binding - dstBinding+1 starting at array element zero. If a binding has a descriptorCount of zero, it is skipped. This behavior applies recursively, with the update affecting consecutive bindings as needed to update all descriptorCount descriptors. Consecutive bindings must have identical VkDescriptorType, VkShaderStageFlags, VkDescriptorBindingFlagBits, and immutable samplers references. In addition, if the VkDescriptorType is VK_DESCRIPTOR_TYPE_MUTABLE_EXT, the supported descriptor types in VkMutableDescriptorTypeCreateInfoEXT must be equally defined.

Note

The same behavior applies to bindings with a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK where descriptorCount specifies the number of bytes to update while dstArrayElement specifies the starting byte offset, thus in this case if the dstBinding has a smaller byte size than the sum of dstArrayElement and descriptorCount, then the remainder will be used to update the subsequent binding - dstBinding+1 starting at offset zero. This falls out as a special case of the above rule.

Valid Usage

- VUID-VkWriteDescriptorSet-dstBinding-00315
dstBinding must be less than or equal to the maximum value of binding of all VkDescriptorSetLayoutBinding structures specified when dstSet's descriptor set layout was created

- VUID-VkWriteDescriptorSet-dstBinding-00316
dstBinding must be a binding with a non-zero descriptorCount

- VUID-VkWriteDescriptorSet-descriptorCount-00317
All consecutive bindings updated via a single VkWriteDescriptorSet structure, except those with a descriptorCount of zero, must have identical descriptorType and stageFlags

- VUID-VkWriteDescriptorSet-descriptorCount-00318
All consecutive bindings updated via a single VkWriteDescriptorSet structure, except those with a descriptorCount of zero, must all either use immutable samplers or must all not use immutable samplers

- VUID-VkWriteDescriptorSet-descriptorType-00319
descriptorType must match the type of dstBinding within dstSet

- VUID-VkWriteDescriptorSet-dstSet-00320
dstSet must be a valid VkDescriptorSet handle

- VUID-VkWriteDescriptorSet-dstArrayElement-00321
The sum of \texttt{dstArrayElement} and \texttt{descriptorCount} must be less than or equal to the number of array elements in the descriptor set binding specified by \texttt{dstBinding}, and all applicable consecutive bindings, as described by \texttt{consecutive binding updates}

- \textbf{VUID-VkWriteDescriptorSet-descriptorType-02219}
  If \texttt{descriptorType} is \texttt{VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK}, \texttt{dstArrayElement} must be an integer multiple of 4

- \textbf{VUID-VkWriteDescriptorSet-descriptorType-02220}
  If \texttt{descriptorType} is \texttt{VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK}, \texttt{descriptorCount} must be an integer multiple of 4

- \textbf{VUID-VkWriteDescriptorSet-descriptorType-02994}
  If \texttt{descriptorType} is \texttt{VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER} or \texttt{VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER}, each element of \texttt{pTexelBufferView} must be either a valid \texttt{VkBufferView} handle or \texttt{VK_NULL_HANDLE}

- \textbf{VUID-VkWriteDescriptorSet-descriptorType-02995}
  If \texttt{descriptorType} is \texttt{VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER} or \texttt{VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER} and the \textit{nullDescriptor} feature is not enabled, each element of \texttt{pTexelBufferView} must not be \texttt{VK_NULL_HANDLE}

- \textbf{VUID-VkWriteDescriptorSet-descriptorType-00324}
  If \texttt{descriptorType} is \texttt{VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER}, \texttt{VK_DESCRIPTOR_TYPE_STORAGE_BUFFER}, \texttt{VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC}, or \texttt{VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC}, \texttt{pBufferInfo} must be a valid pointer to an array of \texttt{descriptorCount} valid \texttt{VkDescriptorBufferInfo} structures

- \textbf{VUID-VkWriteDescriptorSet-descriptorType-00325}
  If \texttt{descriptorType} is \texttt{VK_DESCRIPTOR_TYPE_SAMPLER} or \texttt{VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER}, and \texttt{dstSet} was not allocated with a layout that included immutable samplers for \texttt{dstBinding} with \texttt{descriptorType}, the \texttt{_sampler} member of each element of \texttt{pImageInfo} must be a valid \texttt{VkSampler} object

- \textbf{VUID-VkWriteDescriptorSet-descriptorType-02996}
  If \texttt{descriptorType} is \texttt{VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER}, \texttt{VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE}, or \texttt{VK_DESCRIPTOR_TYPE_STORAGE_IMAGE}, the \texttt{imageView} member of each element of \texttt{pImageInfo} must be either a valid \texttt{VkImageView} handle or \texttt{VK_NULL_HANDLE}

- \textbf{VUID-VkWriteDescriptorSet-descriptorType-02997}
  If \texttt{descriptorType} is \texttt{VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER}, \texttt{VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE}, or \texttt{VK_DESCRIPTOR_TYPE_STORAGE_IMAGE}, and the \textit{nullDescriptor} feature is not enabled, the \texttt{imageView} member of each element of \texttt{pImageInfo} must not be \texttt{VK_NULL_HANDLE}

- \textbf{VUID-VkWriteDescriptorSet-descriptorType-07683}
  If \texttt{descriptorType} is \texttt{VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT}, the \texttt{imageView} member of each element of \texttt{pImageInfo} must not be \texttt{VK_NULL_HANDLE}

- \textbf{VUID-VkWriteDescriptorSet-descriptorType-02221}
  If \texttt{descriptorType} is \texttt{VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK}, the \texttt{pNext} chain must include a \texttt{VkWriteDescriptorSetInlineUniformBlock} structure whose \texttt{dataSize} member equals \texttt{descriptorCount}
If `descriptorType` is `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR`, the `pNext` chain must include a `VkWriteDescriptorSetAccelerationStructureKHR` structure whose `accelerationStructureCount` member equals `descriptorCount`.

If `descriptorType` is `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV`, the `pNext` chain must include a `VkWriteDescriptorSetAccelerationStructureNV` structure whose `accelerationStructureCount` member equals `descriptorCount`.

If `descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, then the `imageView` member of each `pImageInfo` element must have been created without a `VkSamplerYcbcrConversionInfo` structure in its `pNext` chain.

If `descriptorType` is `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, and if any element of `pImageInfo` has an `imageView` member that was created with a `VkSamplerYcbcrConversionInfo` structure in its `pNext` chain, then `dstSet` must have been allocated with a layout that included immutable samplers for `dstBinding`, and the corresponding immutable sampler must have been created with an identically defined `VkSamplerYcbcrConversionInfo` object.

If `descriptorType` is `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, and `dstSet` was allocated with a layout that included immutable samplers for `dstBinding`, then the `imageView` member of each element of `pImageInfo` which corresponds to an immutable sampler that enables `Y'CbCr` conversion must have been created with a `VkSamplerYcbcrConversionInfo` structure in its `pNext` chain with an identically defined `VkSamplerYcbcrConversionInfo` to the corresponding immutable sampler.

If `descriptorType` is `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `dstSet` was allocated with a layout that included immutable samplers for `dstBinding`, and those samplers enable `Y'CbCr` conversion, then `imageView` must not be `VK_NULL_HANDLE`.

If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, the `offset` member of each element of `pBufferInfo` must be a multiple of `VkPhysicalDeviceLimits::minUniformBufferOffsetAlignment`.

If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`, the `offset` member of each element of `pBufferInfo` must be a multiple of `VkPhysicalDeviceLimits::minStorageBufferOffsetAlignment`.

If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER`, `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER`, or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`, and the `buffer` member of any element of `pBufferInfo` is the handle of a non-sparse buffer, then that buffer must be bound.
completely and contiguously to a single VkDeviceMemory object

- VUID-VkWriteDescriptorSet-descriptorType-00330
  If descriptorType is VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER or VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC, the buffer member of each element of pBufferInfo must have been created with VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT set

- VUID-VkWriteDescriptorSet-descriptorType-00331
  If descriptorType is VK_DESCRIPTOR_TYPE_STORAGE_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC, the buffer member of each element of pBufferInfo must have been created with VK_BUFFER_USAGE_STORAGE_BUFFER_BIT set

- VUID-VkWriteDescriptorSet-descriptorType-00332
  If descriptorType is VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER or VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC, the range member of each element of pBufferInfo, or the effective range if range is VK_WHOLE_SIZE, must be less than or equal to VkPhysicalDeviceLimits::maxUniformBufferRange

- VUID-VkWriteDescriptorSet-descriptorType-00333
  If descriptorType is VK_DESCRIPTOR_TYPE_STORAGE_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC, the range member of each element of pBufferInfo, or the effective range if range is VK_WHOLE_SIZE, must be less than or equal to VkPhysicalDeviceLimits::maxStorageBufferRange

- VUID-VkWriteDescriptorSet-descriptorType-08765
  If descriptorType is VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER, the pTexelBufferView buffer view usage must include VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT

- VUID-VkWriteDescriptorSet-descriptorType-08766
  If descriptorType is VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER, the pTexelBufferView buffer view usage must include VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT

- VUID-VkWriteDescriptorSet-descriptorType-00336
  If descriptorType is VK_DESCRIPTOR_TYPE_STORAGE_IMAGE or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, the imageView member of each element of pImageInfo must have been created with the identity swizzle

- VUID-VkWriteDescriptorSet-descriptorType-00337
  If descriptorType is VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, the imageView member of each element of pImageInfo must have been created with VK_IMAGE_USAGE_SAMPLED_BIT set

- VUID-VkWriteDescriptorSet-descriptorType-04149
  If descriptorType is VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE the imageLayout member of each element of pImageInfo must be a member of the list given in Sampled Image

- VUID-VkWriteDescriptorSet-descriptorType-04150
  If descriptorType is VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER the imageLayout member of each element of pImageInfo must be a member of the list given in Combined Image Sampler

- VUID-VkWriteDescriptorSet-descriptorType-04151
  If descriptorType is VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT the imageLayout member of each element of pImageInfo must be a member of the list given in Input Attachment
• VUID-VkWriteDescriptorSet-descriptorType-04152
  If descriptorType is VK_DESCRIPTOR_TYPE_STORAGE_IMAGE the imageLayout member of each element of pImageInfo must be a member of the list given in Storage Image

• VUID-VkWriteDescriptorSet-descriptorType-00338
  If descriptorType is VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, the imageView member of each element of pImageInfo must have been created with VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT set

• VUID-VkWriteDescriptorSet-descriptorType-00339
  If descriptorType is VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, the imageView member of each element of pImageInfo must have been created with VK_IMAGE_USAGE_STORAGE_BIT set

• VUID-VkWriteDescriptorSet-descriptorType-02752
  If descriptorType is VK_DESCRIPTOR_TYPE_SAMPLER, then dstSet must not have been allocated with a layout that included immutable samplers for dstBinding

• VUID-VkWriteDescriptorSet-dstSet-04611
  If the VkDescriptorSetLayoutBinding for dstSet at dstBinding is VK_DESCRIPTOR_TYPE_MUTABLE_EXT, the new active descriptor type descriptorType must exist in the corresponding pMutableDescriptorTypeLists list for dstBinding

• VUID-VkWriteDescriptorSet-descriptorType-06450
  If descriptorType is VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, the imageView member of each element of pImageInfo must have either been created without a VkImageViewMinLodCreateInfoEXT included in the pNext chain or with a VkImageViewMinLodCreateInfoEXT::minLod of 0.0

• VUID-VkWriteDescriptorSet-descriptorType-06942
  If descriptorType is VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM, the imageView member of each element of pImageInfo must have been created with a view created with an image created with VK_IMAGE_USAGE_SAMPLE_WEIGHT_BIT_QCOM

• VUID-VkWriteDescriptorSet-descriptorType-06943
  If descriptorType is VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM, the imageView member of each element of pImageInfo must have been created with a view created with an image created with VK_IMAGE_USAGE_SAMPLE_BLOCK_MATCH_BIT_QCOM

Valid Usage (Implicit)

• VUID-VkWriteDescriptorSet-sType-sType
  sType must be VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET

• VUID-VkWriteDescriptorSet-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkWriteDescriptorSetAccelerationStructureKHR, VkWriteDescriptorSetAccelerationStructureNV, or VkWriteDescriptorSetInlineUniformBlock

• VUID-VkWriteDescriptorSet-sType-unique
  The sType value of each struct in the pNext chain must be unique

• VUID-VkWriteDescriptorSet-descriptorType-parameter
**descriptorType** must be a valid *VkDescriptorType* value

- VUID-VkWriteDescriptorSet-descriptorCount-arraylength
  descriptorCount must be greater than 0
- VUID-VkWriteDescriptorSet-commonparent
  Both of *dstSet*, and the elements of *pTexelBufferView* that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same *VkDevice*

The type of descriptors in a descriptor set is specified by *VkWriteDescriptorSet::descriptorType*, which must be one of the values:

```c
// Provided by VK_VERSION_1_0
typedef enum VkDescriptorType {
    VK_DESCRIPTOR_TYPE_SAMPLER = 0,
    VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER = 1,
    VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE = 2,
    VK_DESCRIPTOR_TYPE_STORAGE_IMAGE = 3,
    VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER = 4,
    VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER = 5,
    VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER = 6,
    VK_DESCRIPTOR_TYPE_STORAGE_BUFFER = 7,
    VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC = 8,
    VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC = 9,
    VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT = 10,
    // Provided by VK_VERSION_1_3
    VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK = 1000138000,
    // Provided by VK_KHR_acceleration_structure
    VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR = 1000150000,
    // Provided by VK_NV_ray_tracing
    VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV = 1000165000,
    // Provided by VK_QCOM_image_processing
    VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM = 1000440000,
    // Provided by VK_QCOM_image_processing
    VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM = 1000440001,
    // Provided by VK_EXT_mutable_descriptor_type
    VK_DESCRIPTOR_TYPE_MUTABLE_EXT = 1000351000,
    // Provided by VK_EXT_inline_uniform_block
    VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT = VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK,
    // Provided by VK_VALVE_mutable_descriptor_type
    VK_DESCRIPTOR_TYPE_MUTABLE_VALVE = VK_DESCRIPTOR_TYPE_MUTABLE_EXT,
} VkDescriptorType;
```

- **VK_DESCRIPTOR_TYPE_SAMPLER** specifies a sampler descriptor.
- **VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER** specifies a combined image sampler descriptor.
- **VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE** specifies a sampled image descriptor.
- **VK_DESCRIPTOR_TYPE_STORAGE_IMAGE** specifies a storage image descriptor.
• **VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER** specifies a uniform texel buffer descriptor.

• **VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER** specifies a storage texel buffer descriptor.

• **VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER** specifies a uniform buffer descriptor.

• **VK_DESCRIPTOR_TYPE_STORAGE_BUFFER** specifies a storage buffer descriptor.

• **VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC** specifies a dynamic uniform buffer descriptor.

• **VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC** specifies a dynamic storage buffer descriptor.

• **VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT** specifies an input attachment descriptor.

• **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK** specifies an inline uniform block.

• **VK_DESCRIPTOR_TYPE_MUTABLE_EXT** specifies a descriptor of mutable type.

• **VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM** specifies a sampled weight image descriptor.

• **VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM** specifies a block matching image descriptor.

When a descriptor set is updated via elements of **VkWriteDescriptorSet**, members of **pImageInfo**, **pBufferInfo** and **pTexelBufferView** are only accessed by the implementation when they correspond to descriptor type being defined - otherwise they are ignored. The members accessed are as follows for each descriptor type:

• **For** **VK_DESCRIPTOR_TYPE_SAMPLER**, only the **sampler** member of each element of **VkWriteDescriptorSet::pImageInfo** is accessed.

• **For** **VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE**, **VK_DESCRIPTOR_TYPE_STORAGE_IMAGE**, or **VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT**, only the **imageView** and **imageLayout** members of each element of **VkWriteDescriptorSet::pImageInfo** are accessed.

• **For** **VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER**, all members of each element of **VkWriteDescriptorSet::pImageInfo** are accessed.

• **For** **VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER**, **VK_DESCRIPTOR_TYPE_STORAGE_BUFFER**, **VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC**, or **VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC**, all members of each element of **VkWriteDescriptorSet::pBufferInfo** are accessed.

• **For** **VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER** or **VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER**, each element of **VkWriteDescriptorSet::pTexelBufferView** is accessed.

When updating descriptors with a **descriptorType** of **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK**, none of the **pImageInfo**, **pBufferInfo**, or **pTexelBufferView** members are accessed, instead the source data of the descriptor update operation is taken from the **VkWriteDescriptorSetInlineUniformBlock** structure in the **pNext** chain of **VkWriteDescriptorSet**. When updating descriptors with a **descriptorType** of **VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR**, none of the **pImageInfo**, **pBufferInfo**, or **pTexelBufferView** members are accessed, instead the source data of the descriptor update operation is taken from the **VkWriteDescriptorSetAccelerationStructureKHR** structure in the **pNext** chain of **VkWriteDescriptorSet**. When updating descriptors with a **descriptorType** of **VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV**, none of the **pImageInfo**, **pBufferInfo**, or **pTexelBufferView** members are accessed, instead the source data of the descriptor update operation is taken from the **VkWriteDescriptorSetAccelerationStructureNV** structure in the **pNext** chain of **VkWriteDescriptorSet**.
The `VkDescriptorBufferInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorBufferInfo {
    VkBuffer buffer;
    VkDeviceSize offset;
    VkDeviceSize range;
} VkDescriptorBufferInfo;
```

- **buffer** is `VK_NULL_HANDLE` or the buffer resource.
- **offset** is the offset in bytes from the start of `buffer`. Access to buffer memory via this descriptor uses addressing that is relative to this starting offset.
- **range** is the size in bytes that is used for this descriptor update, or `VK_WHOLE_SIZE` to use the range from `offset` to the end of the buffer.

**Note**

When setting `range` to `VK_WHOLE_SIZE`, the effective range must not be larger than the maximum range for the descriptor type (`maxUniformBufferRange` or `maxStorageBufferRange`). This means that `VK_WHOLE_SIZE` is not typically useful in the common case where uniform buffer descriptors are suballocated from a buffer that is much larger than `maxUniformBufferRange`.

For `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` and `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` descriptor types, `offset` is the base offset from which the dynamic offset is applied and `range` is the static size used for all dynamic offsets.

When `range` is `VK_WHOLE_SIZE` the effective range is calculated at `vkUpdateDescriptorSets` is by taking the size of `buffer` minus the `offset`.

**Valid Usage**

- VUID-VkDescriptorBufferInfo-offset-00340
  offset must be less than the size of `buffer`

- VUID-VkDescriptorBufferInfo-range-00341
  If `range` is not equal to `VK_WHOLE_SIZE`, range must be greater than 0

- VUID-VkDescriptorBufferInfo-range-00342
  If `range` is not equal to `VK_WHOLE_SIZE`, range must be less than or equal to the size of `buffer
minus offset`

- VUID-VkDescriptorBufferInfo-buffer-02998
  If the nullDescriptor feature is not enabled, `buffer` must not be `VK_NULL_HANDLE`

- VUID-VkDescriptorBufferInfo-buffer-02999
  If `buffer` is `VK_NULL_HANDLE`, offset must be zero and range must be `VK_WHOLE_SIZE`
Valid Usage (Implicit)

- VUID-VkDescriptorBufferInfo-buffer-parameter
  If buffer is not VK_NULL_HANDLE, buffer must be a valid VkBuffer handle

The VkDescriptorImageInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorImageInfo {
    VkSampler sampler;
    VkImageView imageView;
    VkImageLayout imageLayout;
} VkDescriptorImageInfo;
```

- sampler is a sampler handle, and is used in descriptor updates for types VK_DESCRIPTOR_TYPE_SAMPLER and VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER if the binding being updated does not use immutable samplers.

- imageView is VK_NULL_HANDLE or an image view handle, and is used in descriptor updates for types VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, and VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT.

- imageLayout is the layout that the image subresources accessible from imageView will be in at the time this descriptor is accessed. imageLayout is used in descriptor updates for types VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, and VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT.

Members of VkDescriptorImageInfo that are not used in an update (as described above) are ignored.

Valid Usage

- VUID-VkDescriptorImageInfo-imageView-06712
  imageView must not be a 2D array image view created from a 3D image

- VUID-VkDescriptorImageInfo-imageView-07795
  If imageView is a 2D view created from a 3D image, then descriptorType must be VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER

- VUID-VkDescriptorImageInfo-imageView-07796
  If imageView is a 2D view created from a 3D image, then the image must have been created with VK_IMAGE_CREATE_2D_VIEW_COMPATIBLE_BIT_EXT set

- VUID-VkDescriptorImageInfo-descriptorType-06713
  If the image2DViewOf3D feature is not enabled or descriptorType is not VK_DESCRIPTOR_TYPE_STORAGE_IMAGE then imageView must not be a 2D view created from a 3D image

- VUID-VkDescriptorImageInfo-descriptorType-06714
  If the sampler2DViewOf3D feature is not enabled or descriptorType is not
VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER then imageView must not be a 2D view created from a 3D image

- VUID-VkDescriptorImageInfo-imageView-01976
  If imageView is created from a depth/stencil image, the aspectMask used to create the imageView must include either VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT but not both

- VUID-VkDescriptorImageInfo-imageView-00425
  If imageView is created from a depth/stencil image, the aspectMask used to create imageView must not be a 2D view created from a 3D image

- VUID-VkDescriptorImageInfo-imageLayout-09425
  If imageView is created from a depth/stencil image, the aspectMask used to create imageView must include either VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT but not both

- VUID-VkDescriptorImageInfo-imageLayout-09426
  If imageView is created from a depth/stencil image, the aspectMask used to create imageView must not include either VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT

- VUID-VkDescriptorImageInfo-imageLayout-00344
  If imageView is created from a depth/stencil image, the aspectMask used to create imageView must not include VK_IMAGE_ASPECT_COLOR_BIT

- VUID-VkDescriptorImageInfo-mutableComparisonSamplers-04450
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::mutableComparisonSamplers is VK_FALSE, then sampler must have been created with VkSamplerCreateInfo::compareEnable set to VK_FALSE

Valid Usage (Implicit)

- VUID-VkDescriptorImageInfo-commonparent
  Both of imageView, and sampler that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

If the descriptorType member of VkWriteDescriptorSet is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK then the data to write to the descriptor set is specified through a VkWriteDescriptorSetInlineUniformBlock structure included in the pNext chain of VkWriteDescriptorSet.

The VkWriteDescriptorSetInlineUniformBlock structure is defined as:
typedef struct VkWriteDescriptorSetInlineUniformBlock {
    VkStructureType sType;
    const void* pNext;
    uint32_t dataSize;
    const void* pData;
} VkWriteDescriptorSetInlineUniformBlock;

or the equivalent

typedef VkWriteDescriptorSetInlineUniformBlock VkWriteDescriptorSetInlineUniformBlockEXT;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **dataSize** is the number of bytes of inline uniform block data pointed to by **pData**.
- **pData** is a pointer to **dataSize** number of bytes of data to write to the inline uniform block.

**Valid Usage**

- VUID-VkWriteDescriptorSetInlineUniformBlock-dataSize-02222
  **dataSize** must be an integer multiple of 4

**Valid Usage (Implicit)**

- VUID-VkWriteDescriptorSetInlineUniformBlock-sType-sType
  **sType** must be VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET_INLINE_UNIFORM_BLOCK

- VUID-VkWriteDescriptorSetInlineUniformBlock-pData-parameter
  **pData** must be a valid pointer to an array of **dataSize** bytes

- VUID-VkWriteDescriptorSetInlineUniformBlock-dataSize-arraylength
  **dataSize** must be greater than 0

The **VkWriteDescriptorSetAccelerationStructureKHR** structure is defined as:

typedef struct VkWriteDescriptorSetAccelerationStructureKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t accelerationStructureCount;
    const VkAccelerationStructureKHR* pAccelerationStructures;
} VkWriteDescriptorSetAccelerationStructureKHR;
• **sType** is a *VkStructureType* value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **accelerationStructureCount** is the number of elements in **pAccelerationStructures**.
• **pAccelerationStructures** is a pointer to an array of *VkAccelerationStructureKHR* structures specifying the acceleration structures to update.

### Valid Usage

- VUID-VkWriteDescriptorSetAccelerationStructureKHR-accelerationStructureCount-02236: **accelerationStructureCount** must be equal to **descriptorCount** in the extended structure.
- VUID-VkWriteDescriptorSetAccelerationStructureKHR-pAccelerationStructures-03579: Each acceleration structure in **pAccelerationStructures** must have been created with a type of **VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR** or **VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR**.
- VUID-VkWriteDescriptorSetAccelerationStructureKHR-pAccelerationStructures-03580: If the nullDescriptor feature is not enabled, each element of **pAccelerationStructures** must not be **VK_NULL_HANDLE**.

### Valid Usage (Implicit)

- VUID-VkWriteDescriptorSetAccelerationStructureKHR-sType-sType: **sType** must be **VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET_ACCELERATION_STRUCTURE_KHR**.
- VUID-VkWriteDescriptorSetAccelerationStructureKHR-pAccelerationStructures-parameter: **pAccelerationStructures** must be a valid pointer to an array of **accelerationStructureCount** valid or **VK_NULL_HANDLE** *VkAccelerationStructureKHR* handles.
- VUID-VkWriteDescriptorSetAccelerationStructureKHR-accelerationStructureCount-arraylength: **accelerationStructureCount** must be greater than 0.

The *VkWriteDescriptorSetAccelerationStructureNV* structure is defined as:

```c
// Provided by VK_NV_ray_tracing
typedef struct VkWriteDescriptorSetAccelerationStructureNV {
    VkStructureType sType;
    const void* pNext;
    uint32_t accelerationStructureCount;
    const VkAccelerationStructureNV* pAccelerationStructures;
} VkWriteDescriptorSetAccelerationStructureNV;
```

• **sType** is a *VkStructureType* value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• accelerationStructureCount is the number of elements in pAccelerationStructures.

• pAccelerationStructures is a pointer to an array of VkAccelerationStructureNV structures specifying the acceleration structures to update.

Valid Usage

• VUID-VkWriteDescriptorSetAccelerationStructureNV-accelerationStructureCount-03747 accelerationStructureCount must be equal to descriptorCount in the extended structure

• VUID-VkWriteDescriptorSetAccelerationStructureNV-pAccelerationStructures-03748 Each acceleration structure in pAccelerationStructures must have been created with VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR

• VUID-VkWriteDescriptorSetAccelerationStructureNV-pAccelerationStructures-03749 If the nullDescriptor feature is not enabled, each member of pAccelerationStructures must not be VK_NULL_HANDLE

Valid Usage (Implicit)

• VUID-VkWriteDescriptorSetAccelerationStructureNV-sType-sType sType must be VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET_ACCELERATION_STRUCTURE_NV

• VUID-VkWriteDescriptorSetAccelerationStructureNV-pAccelerationStructures-parameter pAccelerationStructures must be a valid pointer to an array of accelerationStructureCount valid or VK_NULL_HANDLE VkAccelerationStructureNV handles

• VUID-VkWriteDescriptorSetAccelerationStructureNV-accelerationStructureCount-arraylength accelerationStructureCount must be greater than 0

The VkCopyDescriptorSet structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkCopyDescriptorSet {
    VkStructureType      sType;
    const void*          pNext;
    VkDescriptorSet      srcSet;
    uint32_t             srcBinding;
    uint32_t             srcArrayElement;
    VkDescriptorSet      dstSet;
    uint32_t             dstBinding;
    uint32_t             dstArrayElement;
    uint32_t             descriptorCount;
} VkCopyDescriptorSet;
```

• sType is a VkStructureType value identifying this structure.

• pNext is NULL or a pointer to a structure extending this structure.
• **srcSet**, **srcBinding**, and **srcArrayElement** are the source set, binding, and array element, respectively. If the descriptor binding identified by **srcSet** and **srcBinding** has a descriptor type of **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK** then **srcArrayElement** specifies the starting byte offset within the binding to copy from.

• **dstSet**, **dstBinding**, and **dstArrayElement** are the destination set, binding, and array element, respectively. If the descriptor binding identified by **dstSet** and **dstBinding** has a descriptor type of **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK** then **dstArrayElement** specifies the starting byte offset within the binding to copy to.

• **descriptorCount** is the number of descriptors to copy from the source to destination. If **descriptorCount** is greater than the number of remaining array elements in the source or destination binding, those affect consecutive bindings in a manner similar to **VkWriteDescriptorSet** above. If the descriptor binding identified by **srcSet** and **srcBinding** has a descriptor type of **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK** then **descriptorCount** specifies the number of bytes to copy and the remaining array elements in the source or destination binding refer to the remaining number of bytes in those.

If the **VkDescriptorSetLayoutBinding** for **dstBinding** is **VK_DESCRIPTOR_TYPE_MUTABLE_EXT** and **srcBinding** is not **VK_DESCRIPTOR_TYPE_MUTABLE_EXT**, the new active descriptor type becomes the descriptor type of **srcBinding**. If both **VkDescriptorSetLayoutBinding** for **srcBinding** and **dstBinding** are **VK_DESCRIPTOR_TYPE_MUTABLE_EXT**, the active descriptor type in each source descriptor is copied into the corresponding destination descriptor. The active descriptor type can be different for each source descriptor.

**Note**
The intention is that copies to and from mutable descriptors is a simple memcpy. Copies between non-mutable and mutable descriptors are expected to require one memcpy per descriptor to handle the difference in size, but this use case with more than one **descriptorCount** is considered rare.

### Valid Usage

- **VUID-VkCopyDescriptorSet-srcBinding-00345**
  **srcBinding** must be a valid binding within **srcSet**

- **VUID-VkCopyDescriptorSet-srcArrayElement-00346**
  The sum of **srcArrayElement** and **descriptorCount** must be less than or equal to the number of array elements in the descriptor set binding specified by **srcBinding**, and all applicable consecutive bindings, as described by consecutive binding updates

- **VUID-VkCopyDescriptorSet-dstBinding-00347**
  **dstBinding** must be a valid binding within **dstSet**

- **VUID-VkCopyDescriptorSet-dstArrayElement-00348**
  The sum of **dstArrayElement** and **descriptorCount** must be less than or equal to the number of array elements in the descriptor set binding specified by **dstBinding**, and all applicable consecutive bindings, as described by consecutive binding updates

- **VUID-VkCopyDescriptorSet-dstBinding-02632**
  The type of **dstBinding** within **dstSet** must be equal to the type of **srcBinding** within **srcSet**
If `srcSet` is equal to `dstSet`, then the source and destination ranges of descriptors **must** not overlap, where the ranges **may** include array elements from consecutive bindings as described by **consecutive binding updates**

If the descriptor type of the descriptor set binding specified by `srcBinding` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`, `srcArrayElement` **must** be an integer multiple of 4

If the descriptor type of the descriptor set binding specified by `dstBinding` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`, `dstArrayElement` **must** be an integer multiple of 4

If the descriptor type of the descriptor set binding specified by either `srcBinding` or `dstBinding` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`, `descriptorCount` **must** be an integer multiple of 4

If `srcSet`'s layout was created with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` flag set, then `dstSet`'s layout **must** also have been created with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` flag set

If `srcSet`'s layout was created without either the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_EXT` flag or the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` flag set, then `dstSet`'s layout **must** have been created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` flag set

If the descriptor pool from which `srcSet` was allocated was created with the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` flag set, then the descriptor pool from which `dstSet` was allocated **must** also have been created with the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` flag set

If the descriptor pool from which `srcSet` was allocated was created without either the `VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_EXT` flag or the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` flag set, then the descriptor pool from which `dstSet` was allocated **must** have been created without the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` flag set

If the descriptor type of the descriptor set binding specified by `dstBinding` is `VK_DESCRIPTOR_TYPE_SAMPLER`, then `dstSet` **must not** have been allocated with a layout that included immutable samplers for `dstBinding`

If `VkDescriptorSetLayoutBinding` for `dstSet` at `dstBinding` is `VK_DESCRIPTOR_TYPE_MUTABLE_EXT`,
the new active descriptor type must exist in the corresponding pMutableDescriptorTypeLists list for dstBinding if the new active descriptor type is not VK_DESCRIPTOR_TYPE_MUTABLE_EXT

- VUID-VkCopyDescriptorSet-srcSet-04613
  If VkDescriptorSetLayoutBinding for srcSet at srcBinding is VK_DESCRIPTOR_TYPE_MUTABLE_EXT and the VkDescriptorSetLayoutBinding for dstSet at dstBinding is not VK_DESCRIPTOR_TYPE_MUTABLE_EXT, the active descriptor type for the source descriptor must match the descriptor type of dstBinding

- VUID-VkCopyDescriptorSet-dstSet-04614
  If VkDescriptorSetLayoutBinding for dstSet at dstBinding is VK_DESCRIPTOR_TYPE_MUTABLE_EXT, and the new active descriptor type is VK_DESCRIPTOR_TYPE_MUTABLE_EXT, the pMutableDescriptorTypeLists for srcBinding and dstBinding must match exactly

### Valid Usage (Implicit)

- VUID-VkCopyDescriptorSet-sType-sType
  sType must be VK_STRUCTURE_TYPE_COPY_DESCRIPTOR_SET

- VUID-VkCopyDescriptorSet-pNext-pNext
  pNext must be NULL

- VUID-VkCopyDescriptorSet-srcSet-parameter
  srcSet must be a valid VkDescriptorSet handle

- VUID-VkCopyDescriptorSet-dstSet-parameter
  dstSet must be a valid VkDescriptorSet handle

- VUID-VkCopyDescriptorSet-commonparent
  Both of dstSet, and srcSet must have been created, allocated, or retrieved from the same VkDevice

### 14.2.5. Descriptor Update Templates

A descriptor update template specifies a mapping from descriptor update information in host memory to descriptors in a descriptor set. It is designed to avoid passing redundant information to the driver when frequently updating the same set of descriptors in descriptor sets.

Descriptor update template objects are represented by VkDescriptorUpdateTemplate handles:

```c
// Provided by VK_VERSION_1_1
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDescriptorUpdateTemplate)
```

or the equivalent

```c
// Provided by VK_KHR_descriptor_update_template
typedef VkDescriptorUpdateTemplate VkDescriptorUpdateTemplateKHR;
```
14.2.6. Descriptor Set Updates With Templates

Updating a large VkDescriptorSet array can be an expensive operation since an application must specify one VkWriteDescriptorSet structure for each descriptor or descriptor array to update, each of which re-specifies the same state when updating the same descriptor in multiple descriptor sets. For cases when an application wishes to update the same set of descriptors in multiple descriptor sets allocated using the same VkDescriptorSetLayout, vkUpdateDescriptorSetWithTemplate can be used as a replacement for vkUpdateDescriptorSets.

VkDescriptorUpdateTemplate allows implementations to convert a set of descriptor update operations on a single descriptor set to an internal format that, in conjunction with vkUpdateDescriptorSetWithTemplate or vkCmdPushDescriptorSetWithTemplateKHR, can be more efficient compared to calling vkUpdateDescriptorSets or vkCmdPushDescriptorSetKHR. The descriptors themselves are not specified in the VkDescriptorUpdateTemplate, rather, offsets into an application provided pointer to host memory are specified, which are combined with a pointer passed to vkUpdateDescriptorSetWithTemplate or vkCmdPushDescriptorSetWithTemplateKHR. This allows large batches of updates to be executed without having to convert application data structures into a strictly-defined Vulkan data structure.

To create a descriptor update template, call:

```c
// Provided by VK_VERSION_1_1
VkResult vkCreateDescriptorUpdateTemplate(
    VkDevice device,
    const VkDescriptorUpdateTemplateCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkDescriptorUpdateTemplate* pDescriptorUpdateTemplate);
```

or the equivalent command

```c
// Provided by VK_KHR_descriptor_update_template
VkResult vkCreateDescriptorUpdateTemplateKHR(
    VkDevice device,
    const VkDescriptorUpdateTemplateCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkDescriptorUpdateTemplate* pDescriptorUpdateTemplate);
```

- `device` is the logical device that creates the descriptor update template.
- `pCreateInfo` is a pointer to a VkDescriptorUpdateTemplateCreateInfo structure specifying the set of descriptors to update with a single call to vkCmdPushDescriptorSetWithTemplateKHR or vkUpdateDescriptorSetWithTemplate.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pDescriptorUpdateTemplate` is a pointer to a VkDescriptorUpdateTemplate handle in which the resulting descriptor update template object is returned.
Valid Usage (Implicit)

- VUID-vkCreateDescriptorUpdateTemplate-device-parameter
  *device* must be a valid *VkDevice* handle

- VUID-vkCreateDescriptorUpdateTemplate-pCreateInfo-parameter
  *pCreateInfo* must be a valid pointer to a valid *VkDescriptorUpdateTemplateCreateInfo* structure

- VUID-vkCreateDescriptorUpdateTemplate-pAllocator-parameter
  If *pAllocator* is not NULL, *pAllocator* must be a valid pointer to a valid *VkAllocationCallbacks* structure

- VUID-vkCreateDescriptorUpdateTemplate-pDescriptorUpdateTemplate-parameter
  *pDescriptorUpdateTemplate* must be a valid pointer to a *VkDescriptorUpdateTemplate* handle

Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The *VkDescriptorUpdateTemplateCreateInfo* structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDescriptorUpdateTemplateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkDescriptorUpdateTemplateCreateFlags flags;
    uint32_t descriptorUpdateEntryCount;
    const VkDescriptorUpdateTemplateEntry* pDescriptorUpdateEntries;
    VkDescriptorUpdateTemplateType templateType;
    VkDescriptorSetLayout descriptorSetLayout;
    VkPipelineBindPoint pipelineBindPoint;
    VkPipelineLayout pipelineLayout;
    uint32_t set;
} VkDescriptorUpdateTemplateCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_descriptor_update_template
typedef VkDescriptorUpdateTemplateCreateInfo VkDescriptorUpdateTemplateCreateInfoKHR;
```
• **sType** is a *VkStructureType* value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **flags** is reserved for future use.

• **descriptorUpdateEntryCount** is the number of elements in the *pDescriptorUpdateEntries* array.

• **pDescriptorUpdateEntries** is a pointer to an array of *VkDescriptorUpdateTemplateEntry* structures describing the descriptors to be updated by the descriptor update template.

• **templateType** specifies the type of the descriptor update template. If set to *VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET* it can only be used to update descriptor sets with a fixed *descriptorSetLayout*. If set to *VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR* it can only be used to push descriptor sets using the provided *pipelineBindPoint*, *pipelineLayout*, and *set* number.

• **descriptorSetLayout** is the descriptor set layout used to build the descriptor update template. All descriptor sets which are going to be updated through the newly created descriptor update template must be created with a layout that matches (is the same as, or defined identically to) this layout. This parameter is ignored if **templateType** is not *VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET*.

• **pipelineBindPoint** is a *VkPipelineBindPoint* indicating the type of the pipeline that will use the descriptors. This parameter is ignored if **templateType** is not *VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR*.

• **pipelineLayout** is a *VkPipelineLayout* object used to program the bindings. This parameter is ignored if **templateType** is not *VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR*.

• **set** is the set number of the descriptor set in the pipeline layout that will be updated. This parameter is ignored if **templateType** is not *VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR*.

### Valid Usage

- **VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-00350**
  If **templateType** is *VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET*, *descriptorSetLayout* must be a valid *VkDescriptorSetLayout* handle.

- **VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-00351**
  If **templateType** is *VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR*, *pipelineBindPoint* must be a valid *VkPipelineBindPoint* value.

- **VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-00352**
  If **templateType** is *VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR*, *pipelineLayout* must be a valid *VkPipelineLayout* handle.

- **VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-00353**
  If **templateType** is *VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR*, *set* must be the unique set number in the pipeline layout that uses a descriptor set layout that was created with *VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR*.

- **VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-04615**
  If **templateType** is *VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET*, *descriptorSetLayout* must be a valid *VkDescriptorSetLayout* handle.
**Valid Usage (Implicit)**

- **VUID-VkDescriptorUpdateTemplateCreateInfo-sType-sType**
  
  *sType must be* `VK_STRUCTURE_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_CREATE_INFO`.

- **VUID-VkDescriptorUpdateTemplateCreateInfo-pNext-pNext**
  
  *pNext must be* `NULL`.

- **VUID-VkDescriptorUpdateTemplateCreateInfo-flags-zerobitmask**
  
  *flags must be* `0`.

- **VUID-VkDescriptorUpdateTemplateCreateInfo-pDescriptorUpdateEntries-parameter**
  
  *pDescriptorUpdateEntries must be a valid pointer to an array of `descriptorUpdateEntryCount` valid `VkDescriptorUpdateTemplateEntry` structures.

- **VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-parameter**
  
  *templateType must be a valid `VkDescriptorUpdateTemplateType` value.

- **VUID-VkDescriptorUpdateTemplateCreateInfo-descriptorUpdateEntryCount-arraylength**
  
  *descriptorUpdateEntryCount must be greater than* `0`.

- **VUID-VkDescriptorUpdateTemplateCreateInfo-commonparent**
  
  Both of `descriptorSetLayout`, and `pipelineLayout` that are valid handles of non-ignored parameters *must* have been created, allocated, or retrieved from the same `VkDevice`.

---

```c
// Provided by VK_VERSION_1_1
typedef VkFlags VkDescriptorUpdateTemplateCreateFlags;
```

or the equivalent

```c
// Provided by VK_KHR_descriptor_update_template
typedef VkDescriptorUpdateTemplateCreateFlags VkDescriptorUpdateTemplateCreateFlagsKHR;
```

`VkDescriptorUpdateTemplateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

The descriptor update template type is determined by the `VkDescriptorUpdateTemplateCreateInfo::templateType` property, which takes the following values:

```c
// Provided by VK_VERSION_1_1
typedef enum VkDescriptorUpdateTemplateType {
    VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET = 0,
    // Provided by VK_VERSION_1_1 with VK_KHR_push_descriptor,
    VK_KHR_descriptor_update_template with VK_KHR_push_descriptor
    VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR = 1,
};
```
or the equivalent

```c
// Provided by VK_KHR_descriptor_update_template
typedef VkDescriptorUpdateTemplateTypeKHR VkDescriptorUpdateTemplateType;
```

- `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET_KHR` specifies that the descriptor update template will be used for descriptor set updates only.
- `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR` specifies that the descriptor update template will be used for push descriptor updates only.

The `VkDescriptorUpdateTemplateEntry` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDescriptorUpdateTemplateEntry {
    uint32_t dstBinding;
    uint32_t dstArrayElement;
    uint32_t descriptorCount;
    VkDescriptorType descriptorType;
    size_t offset;
    size_t stride;
} VkDescriptorUpdateTemplateEntry;
```

or the equivalent

```c
// Provided by VK_KHR_descriptor_update_template
typedef VkDescriptorUpdateTemplateEntryKHR VkDescriptorUpdateTemplateEntry;
```

- `dstBinding` is the descriptor binding to update when using this descriptor update template.
- `dstArrayElement` is the starting element in the array belonging to `dstBinding`. If the descriptor binding identified by `dstBinding` has a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` then `dstArrayElement` specifies the starting byte offset to update.
- `descriptorCount` is the number of descriptors to update. If `descriptorCount` is greater than the number of remaining array elements in the destination binding, those affect consecutive bindings in a manner similar to `VkWriteDescriptorSet` above. If the descriptor binding identified by `dstBinding` has a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` then `descriptorCount` specifies the number of bytes to update and the remaining array elements in the destination binding refer to the remaining number of bytes in it.
- `descriptorType` is a `VkDescriptorType` specifying the type of the descriptor.
- **offset** is the offset in bytes of the first binding in the raw data structure.
- **stride** is the stride in bytes between two consecutive array elements of the descriptor update information in the raw data structure. The actual pointer `ptr` for each array element `j` of update entry `i` is computed using the following formula:

\[
\text{const char *} \text{ptr} = (\text{const char *}) \text{pData} + \text{pDescriptorUpdateEntries}[i].\text{offset} + j * \text{pDescriptorUpdateEntries}[i].\text{stride}
\]

The stride is useful in case the bindings are stored in structs along with other data. If `descriptorType` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` then the value of `stride` is ignored and the stride is assumed to be 1, i.e. the descriptor update information for them is always specified as a contiguous range.

### Valid Usage
- **VUID-VkDescriptorUpdateTemplateEntry-dstBinding-00354**
  `dstBinding` **must** be a valid binding in the descriptor set layout implicitly specified when using a descriptor update template to update descriptors.

- **VUID-VkDescriptorUpdateTemplateEntry-dstArrayElement-00355**
  `dstArrayElement` and `descriptorCount` **must** be less than or equal to the number of array elements in the descriptor set binding implicitly specified when using a descriptor update template to update descriptors, and all applicable consecutive bindings, as described by consecutive binding updates.

- **VUID-VkDescriptorUpdateTemplateEntry-descriptor-02226**
  If `descriptor` type is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`, `dstArrayElement` **must** be an integer multiple of 4.

- **VUID-VkDescriptorUpdateTemplateEntry-descriptor-02227**
  If `descriptor` type is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`, `descriptorCount` **must** be an integer multiple of 4.

### Valid Usage (Implicit)
- **VUID-VkDescriptorUpdateTemplateEntry-descriptorType-parameter**
  `descriptorType` **must** be a valid `VkDescriptorType` value.

To destroy a descriptor update template, call:

```c
// Provided by VK_VERSION_1_1
void vkDestroyDescriptorUpdateTemplate(
    VkDevice device,
    VkDescriptorUpdateTemplate descriptorUpdateTemplate,
    const VkAllocationCallbacks* pAllocator);
```
or the equivalent command

```c
// Provided by VK_KHR_descriptor_update_template
void vkDestroyDescriptorUpdateTemplateKHR(
    VkDevice device,
    VkDescriptorUpdateTemplate descriptorUpdateTemplate,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that has been used to create the descriptor update template.
- `descriptorUpdateTemplate` is the descriptor update template to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- VUID-vkDestroyDescriptorUpdateTemplate-descriptorSetLayout-00356
  If `VkAllocationCallbacks` were provided when `descriptorUpdateTemplate` was created, a compatible set of callbacks **must** be provided here.

- VUID-vkDestroyDescriptorUpdateTemplate-descriptorSetLayout-00357
  If no `VkAllocationCallbacks` were provided when `descriptorUpdateTemplate` was created, `pAllocator` **must** be `NULL`.

### Valid Usage (Implicit)

- VUID-vkDestroyDescriptorUpdateTemplate-device-parameter
  `device` **must** be a valid `VkDevice` handle.

- VUID-vkDestroyDescriptorUpdateTemplate-descriptorUpdateTemplate-parameter
  If `descriptorUpdateTemplate` is not `VK_NULL_HANDLE`, `descriptorUpdateTemplate` **must** be a valid `VkDescriptorUpdateTemplate` handle.

- VUID-vkDestroyDescriptorUpdateTemplate-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure.

- VUID-vkDestroyDescriptorUpdateTemplate-descriptorUpdateTemplate-parent
  If `descriptorUpdateTemplate` is a valid handle, it **must** have been created, allocated, or retrieved from `device`.

### Host Synchronization

- Host access to `descriptorUpdateTemplate` **must** be externally synchronized.

Once a `VkDescriptorUpdateTemplate` has been created, descriptor sets **can** be updated by calling:
```c
// Provided by VK_VERSION_1_1
void vkUpdateDescriptorSetWithTemplate(
    VkDevice device,
    VkDescriptorSet descriptorSet,
    VkDescriptorUpdateTemplate descriptorUpdateTemplate,
    const void* pData);
```

or the equivalent command

```c
// Provided by VK_KHR_descriptor_update_template
void vkUpdateDescriptorSetWithTemplateKHR(
    VkDevice device,
    VkDescriptorSet descriptorSet,
    VkDescriptorUpdateTemplate descriptorUpdateTemplate,
    const void* pData);
```

- **device** is the logical device that updates the descriptor set.
- **descriptorSet** is the descriptor set to update
- **descriptorUpdateTemplate** is a `VkDescriptorUpdateTemplate` object specifying the update mapping between `pData` and the descriptor set to update.
- **pData** is a pointer to memory containing one or more `VkDescriptorImageInfo`, `VkDescriptorBufferInfo`, or `VkBufferView` structures or `VkAccelerationStructureKHR` or `VkAccelerationStructureNV` handles used to write the descriptors.

### Valid Usage

- **VUID-vkUpdateDescriptorSetWithTemplate-pData-01685**
  
  `pData` must be a valid pointer to a memory containing one or more valid instances of `VkDescriptorImageInfo`, `VkDescriptorBufferInfo`, or `VkBufferView` in a layout defined by `descriptorUpdateTemplate` when it was created with `vkCreateDescriptorUpdateTemplate`

- **VUID-vkUpdateDescriptorSetWithTemplate-descriptorSet-06995**
  
  Host access to `descriptorSet` must be externally synchronized unless explicitly denoted otherwise for specific flags

### Valid Usage (Implicit)

- **VUID-vkUpdateDescriptorSetWithTemplate-device-parameter**
  
  `device` must be a valid `VkDevice` handle

- **VUID-vkUpdateDescriptorSetWithTemplate-descriptorSet-parameter**
  
  `descriptorSet` must be a valid `VkDescriptorSet` handle

- **VUID-vkUpdateDescriptorSetWithTemplate-descriptorUpdateTemplate-parameter**
  
  `descriptorUpdateTemplate` must be a valid `VkDescriptorUpdateTemplate` handle
- VUID-vkUpdateDescriptorSetWithTemplate-descriptorSet-parent
descriptorSet must have been created, allocated, or retrieved from device
- VUID-vkUpdateDescriptorSetWithTemplate-descriptorUpdateTemplate-parent
descriptorUpdateTemplate must have been created, allocated, or retrieved from device

API example

```c
struct AppBufferView {
    VkBufferView bufferView;
    uint32_t applicationRelatedInformation;
};

struct AppDataStructure {
    VkDescriptorImageInfo imageInfo; // a single image info
    VkDescriptorBufferInfo bufferInfoArray[3]; // 3 buffer infos in an array
    AppBufferView bufferView[2]; // An application defined structure
    // An application defined structure
    // ... some more application related data
};

const VkDescriptorUpdateTemplateEntry descriptorUpdateTemplateEntries[] = {
    // binding to a single image descriptor
    {
        .binding = 0,
        .dstArrayElement = 0,
        .descriptorCount = 1,
        .descriptorType = VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER,
        .offset = offsetof(AppDataStructure, imageInfo),
        .stride = 0 // stride not required if descriptorCount is 1
    },

    // binding to an array of buffer descriptors
    {
        .binding = 1,
        .dstArrayElement = 0,
        .descriptorCount = 3,
        .descriptorType = VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER,
        .offset = offsetof(AppDataStructure, bufferInfoArray),
        .stride = sizeof(VkDescriptorBufferInfo) // descriptor buffer infos are compact
    },

    // binding to an array of buffer views
    {
        .binding = 2,
        .dstArrayElement = 0,
        .descriptorCount = 2,
        .descriptorType = VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER,
    }
};
```
.offset = offsetof(AppDataStructure, bufferView) +
    offsetof(AppBufferView, bufferView),
    .stride = sizeof(AppBufferView)       // bufferViews do not have to be compact
    },
};

// create a descriptor update template for descriptor set updates
const VkDescriptorUpdateTemplateCreateInfo createInfo = {
    .sType = VK_STRUCTURE_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_CREATE_INFO,
    .pNext = NULL,
    .flags = 0,
    .descriptorUpdateEntryCount = 3,
    .pDescriptorUpdateEntries = descriptorUpdateTemplateEntries,
    .templateType = VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET,
    .descriptorSetLayout = myLayout,
    .pipelineBindPoint = 0,     // ignored by given templateType
    .pipelineLayout = 0,       // ignored by given templateType
    .set = 0,                  // ignored by given templateType
};

VkDescriptorUpdateTemplate myDescriptorUpdateTemplate;
myResult = vkCreateDescriptorUpdateTemplate(
    myDevice,
    &createInfo,
    NULL,
    &myDescriptorUpdateTemplate);

AppDataStructure appData;

// fill appData here or cache it in your engine
vkUpdateDescriptorSetWithTemplate(myDevice, myDescriptorSet,
    myDescriptorUpdateTemplate, &appData);

14.2.7. Descriptor Set Binding

To bind one or more descriptor sets to a command buffer, call:

// Provided by VK_VERSION_1_0
void vkCmdBindDescriptorSets(
    VkCommandBuffer commandBuffer,
    VkPipelineBindPoint pipelineBindPoint,
    VkPipelineLayout layout,
    uint32_t firstSet,
    uint32_t descriptorSetCount,
    const VkDescriptorSet* pDescriptorSets,
    const uint32_t* pDynamicOffsets);
- **commandBuffer** is the command buffer that the descriptor sets will be bound to.
- **pipelineBindPoint** is a `VkPipelineBindPoint` indicating the type of the pipeline that will use the descriptors. There is a separate set of bind points for each pipeline type, so binding one does not disturb the others.
- **layout** is a `VkPipelineLayout` object used to program the bindings.
- **firstSet** is the set number of the first descriptor set to be bound.
- **descriptorSetCount** is the number of elements in the `pDescriptorSets` array.
- **pDescriptorSets** is a pointer to an array of handles to `VkDescriptorSet` objects describing the descriptor sets to bind to.
- **dynamicOffsetCount** is the number of dynamic offsets in the `pDynamicOffsets` array.
- **pDynamicOffsets** is a pointer to an array of `uint32_t` values specifying dynamic offsets.

`vkCmdBindDescriptorSets` binds descriptor sets `pDescriptorSets[0..descriptorSetCount-1]` to set numbers `[firstSet..firstSet+descriptorSetCount-1]` for subsequent bound pipeline commands set by `pipelineBindPoint`. Any bindings that were previously applied via these sets, or calls to `vkCmdSetDescriptorBufferOffsetsEXT` or `vkCmdBindDescriptorBufferEmbeddedSamplersEXT`, are no longer valid.

Once bound, a descriptor set affects rendering of subsequent commands that interact with the given pipeline type in the command buffer until either a different set is bound to the same set number, or the set is disturbed as described in Pipeline Layout Compatibility.

A compatible descriptor set **must** be bound for all set numbers that any shaders in a pipeline access, at the time that a drawing or dispatching command is recorded to execute using that pipeline. However, if none of the shaders in a pipeline statically use any bindings with a particular set number, then no descriptor set need be bound for that set number, even if the pipeline layout includes a non-trivial descriptor set layout for that set number.

When consuming a descriptor, a descriptor is considered valid if the descriptor is not undefined as described by descriptor set allocation. If the `nullDescriptor` feature is enabled, a null descriptor is also considered valid. A descriptor that was disturbed by Pipeline Layout Compatibility, or was never bound by `vkCmdBindDescriptorSets` is not considered valid. If a pipeline accesses a descriptor either statically or dynamically depending on the `VkDescriptorBindingFlagBits`, the consuming descriptor type in the pipeline **must** match the `VkDescriptorType` in `VkDescriptorSetLayoutCreateInfo` for the descriptor to be considered valid. If a descriptor is a mutable descriptor, the consuming descriptor type in the pipeline **must** match the active descriptor type for the descriptor to be considered valid.

**Note**
Further validation may be carried out beyond validation for descriptor types, e.g. Texel Input Validation.

If any of the sets being bound include dynamic uniform or storage buffers, then `pDynamicOffsets` includes one element for each array element in each dynamic descriptor type binding in each set. Values are taken from `pDynamicOffsets` in an order such that all entries for set N come before set N+1; within a set, entries are ordered by the binding numbers in the descriptor set layouts; and
within a binding array, elements are in order. *dynamicOffsetCount must* equal the total number of
dynamic descriptors in the sets being bound.

The effective offset used for dynamic uniform and storage buffer bindings is the sum of the relative
offset taken from *pDynamicOffsets*, and the base address of the buffer plus base offset in the
descriptor set. The range of the dynamic uniform and storage buffer bindings is the buffer range as
specified in the descriptor set.

Each of the *pDescriptorSets must* be compatible with the pipeline layout specified by *layout*. The
layout used to program the bindings *must* also be compatible with the pipeline used in subsequent
bound pipeline commands with that pipeline type, as defined in the Pipeline Layout Compatibility
section.

The descriptor set contents bound by a call to *vkCmdBindDescriptorSets may* be consumed at the
following times:

- For descriptor bindings created with the *VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT* bit set,
  the contents *may* be consumed when the command buffer is submitted to a queue, or during
  shader execution of the resulting draws and dispatches, or any time in between. Otherwise,
- during host execution of the command, or during shader execution of the resulting draws and
  dispatches, or any time in between.

Thus, the contents of a descriptor set binding *must* not be altered (overwritten by an update
command, or freed) between the first point in time that it *may* be consumed, and when the
command completes executing on the queue.

The contents of *pDynamicOffsets* are consumed immediately during execution of
*vkCmdBindDescriptorSets*. Once all pending uses have completed, it is legal to update and reuse a
descriptor set.

### Valid Usage

- **VUID-vkCmdBindDescriptorSets-pDescriptorSets-00358**
  Each element of *pDescriptorSets must* have been allocated with a *VkDescriptorSetLayout*
  that matches (is the same as, or identically defined as) the *VkDescriptorSetLayout* at set *n*
in *layout*, where *n* is the sum of *firstSet* and the index into *pDescriptorSets*

- **VUID-vkCmdBindDescriptorSets-dynamicOffsetCount-00359**
  *dynamicOffsetCount must* be equal to the total number of dynamic descriptors in
  *pDescriptorSets*

- **VUID-vkCmdBindDescriptorSets-firstSet-00360**
  The sum of *firstSet* and *descriptorSetCount must* be less than or equal to
  *VkPipelineLayoutCreateInfo::setLayoutCount* provided when *layout* was created

- **VUID-vkCmdBindDescriptorSets-pDynamicOffsets-01971**
  Each element of *pDynamicOffsets* which corresponds to a descriptor binding with type
  *VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC must* be a multiple of *VkPhysicalDeviceLimits::minUniformBufferOffsetAlignment*

- **VUID-vkCmdBindDescriptorSets-pDynamicOffsets-01972**
Each element of \( p_{\text{DynamicOffsets}} \) which corresponds to a descriptor binding with type \( \text{VK}_{\cdot}\text{DESCRIP}_{\cdot}\text{TOR}_{\cdot}\text{TYPE}_{\cdot}\text{STORAGE}_{\cdot}\text{BUFFER}_{\cdot}\text{DYNAMIC} \) must be a multiple of \( \text{VkPhysicalDeviceLimits}::\text{minStorageBufferOffsetAlignment} \)

- VUID-vkCmdBindDescriptorSets-pDescriptorSets-01979
  For each dynamic uniform or storage buffer binding in \( p_{\text{DescriptorSets}} \), the sum of the effective offset and the range of the binding must be less than or equal to the size of the buffer

- VUID-vkCmdBindDescriptorSets-pDescriptorSets-06715
  For each dynamic uniform or storage buffer binding in \( p_{\text{DescriptorSets}} \), if the range was set with \( \text{VK}_{\cdot}\text{WHOLE}_{\cdot}\text{SIZE} \) then \( p_{\text{DynamicOffsets}} \) which corresponds to the descriptor binding must be 0

- VUID-vkCmdBindDescriptorSets-pDescriptorSets-04616
  Each element of \( p_{\text{DescriptorSets}} \) must not have been allocated from a \( \text{VkDescriptorPool} \) with the \( \text{VK}_{\cdot}\text{DESCRIPTOR}_{\cdot}\text{POOL}_{\cdot}\text{CREATE}_{\cdot}\text{HOST}_{\cdot}\text{ONLY}_{\cdot}\text{BIT}_{\cdot}\text{EXT} \) flag set

- VUID-vkCmdBindDescriptorSets-pDescriptorSets-06563
  If \( \text{graphicsPipelineLibrary} \) is not enabled, each element of \( p_{\text{DescriptorSets}} \) must be a valid \( \text{VkDescriptorSet} \)

- VUID-vkCmdBindDescriptorSets-pDescriptorSets-08010
  Each element of \( p_{\text{DescriptorSets}} \) must have been allocated with a \( \text{VkDescriptorSetLayout} \) which was not created with \( \text{VK}_{\cdot}\text{DESCRIPTOR}_{\cdot}\text{SET}_{\cdot}\text{LAYOUT}_{\cdot}\text{CREATE}_{\cdot}\text{DESCRIPTOR}_{\cdot}\text{BUFFER}_{\cdot}\text{BIT}_{\cdot}\text{EXT} \)

- VUID-vkCmdBindDescriptorSets-pipelineBindPoint-00361
  \( \text{pipelineBindPoint} \) must be supported by the \( \text{commandBuffer} \)'s parent \( \text{VkCommandPool} \)'s queue family

### Valid Usage (Implicit)

- VUID-vkCmdBindDescriptorSets-commandBuffer-parameter
  \( \text{commandBuffer} \) must be a valid \( \text{VkCommandBuffer} \) handle

- VUID-vkCmdBindDescriptorSets-pipelineBindPoint-parameter
  \( \text{pipelineBindPoint} \) must be a valid \( \text{VkPipelineBindPoint} \) value

- VUID-vkCmdBindDescriptorSets-layout-parameter
  \( \text{layout} \) must be a valid \( \text{VkPipelineLayout} \) handle

- VUID-vkCmdBindDescriptorSets-pDescriptorSets-parameter
  \( p_{\text{DescriptorSets}} \) must be a valid pointer to an array of \( \text{descriptorSetCount} \) valid or \( \text{VK}_{\cdot}\text{NULL}_{\cdot}\text{HANDLE} \) \( \text{VkDescriptorSet} \) handles

- VUID-vkCmdBindDescriptorSets-pDynamicOffsets-parameter
  If \( \text{dynamicOffsetCount} \) is not 0, \( p_{\text{DynamicOffsets}} \) must be a valid pointer to an array of \( \text{dynamicOffsetCount} \) \text{uint32}_t \) values

- VUID-vkCmdBindDescriptorSets-commandBuffer-recording
  \( \text{commandBuffer} \) must be in the recording state

- VUID-vkCmdBindDescriptorSets-commandBuffer-cmdpool
  The \( \text{VkCommandPool} \) that \( \text{commandBuffer} \) was allocated from must support graphics, or
compute operations

- VUID-vkCmdBindDescriptorSets-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdBindDescriptorSets-descriptorSetCount-arraylength
  descriptorSetCount must be greater than 0

- VUID-vkCmdBindDescriptorSets-commonparent
  Each of commandBuffer, layout, and the elements of pDescriptorSets that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>

<td>Compute</td>
<td></td>
</tr>
</tbody>
</table>

Alternatively, to bind one or more descriptor sets to a command buffer, call:

```c
// Provided by VK_KHR_maintenance6
void vkCmdBindDescriptorSets2KHR(
    VkCommandBuffer commandBuffer,
    const VkBindDescriptorSetsInfoKHR* pBindDescriptorSetsInfo);
```

- commandBuffer is the command buffer that the descriptor sets will be bound to.
- pBindDescriptorSetsInfo is a pointer to a VkBindDescriptorSetsInfoKHR structure.

Valid Usage

- VUID-vkCmdBindDescriptorSets2KHR-pBindDescriptorSetsInfo-09467
  Each bit in pBindDescriptorSetsInfo->stageFlags must be a stage supported by the commandBuffer’s parent VkCommandPool’s queue family
Valid Usage (Implicit)

- VUID-vkCmdBindDescriptorSets2KHR-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdBindDescriptorSets2KHR-pBindDescriptorSetsInfo-parameter
  `pBindDescriptorSetsInfo` **must** be a valid pointer to a valid `VkBindDescriptorSetsInfoKHR` structure

- VUID-vkCmdBindDescriptorSets2KHR-commandBuffer-recording
  `commandBuffer` **must** be in the recording state

- VUID-vkCmdBindDescriptorSets2KHR-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, or compute operations

- VUID-vkCmdBindDescriptorSets2KHR-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td>Compute</td>
<td></td>
</tr>
</tbody>
</table>

The `VkBindDescriptorSetsInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_maintenance6
typedef struct VkBindDescriptorSetsInfoKHR {
    VkStructureType   sType;
    const void*       pNext;
    VkShaderStageFlags stageFlags;
    VkPipelineLayout   layout;
    uint32_t           firstSet;
    uint32_t           descriptorSetCount;
    const VkDescriptorSet* pDescriptorSets;
    uint32_t           dynamicOffsetCount;
    const uint32_t*    pDynamicOffsets;
} VkBindDescriptorSetsInfoKHR;
```
VkBindDescriptorSetsInfoKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **stageFlags** is a bitmask of `VkShaderStageFlagBits` specifying the shader stages the descriptor sets will be bound to.
- **layout** is a `VkPipelineLayout` object used to program the bindings. If the `dynamicPipelineLayout` feature is enabled, **layout** can be `VK_NULL_HANDLE` and the layout **must** be specified by chaining the `VkPipelineLayoutCreateInfo` structure off the **pNext**
- **firstSet** is the set number of the first descriptor set to be bound.
- **descriptorSetCount** is the number of elements in the **pDescriptorSets** array.
- **pDescriptorSets** is a pointer to an array of handles to `VkDescriptorSet` objects describing the descriptor sets to bind to.
- **dynamicOffsetCount** is the number of dynamic offsets in the **pDynamicOffsets** array.
- **pDynamicOffsets** is a pointer to an array of `uint32_t` values specifying dynamic offsets.

If **stageFlags** specifies a subset of all stages corresponding to one or more pipeline bind points, the binding operation still affects all stages corresponding to the given pipeline bind point(s) as if the equivalent original version of this command had been called with the same parameters. For example, specifying a **stageFlags** value of `VK_SHADER_STAGE_VERTEX_BIT | VK_SHADER_STAGE_FRAGMENT_BIT | VK_SHADER_STAGE_COMPUTE_BIT` is equivalent to calling the original version of this command once with `VK_PIPELINE_BIND_POINT_GRAPHICS` and once with `VK_PIPELINE_BIND_POINT_COMPUTE`.

### Valid Usage

- **VUID-VkBindDescriptorSetsInfoKHR-pDescriptorSets-00358**
  Each element of **pDescriptorSets** **must** have been allocated with a `VkDescriptorSetLayout` that matches (is the same as, or identically defined as) the `VkDescriptorSetLayout` at set `n` in **layout**, where `n` is the sum of **firstSet** and the index into **pDescriptorSets**
- **VUID-VkBindDescriptorSetsInfoKHR-dynamicOffsetCount-00359**
  **dynamicOffsetCount** **must** be equal to the total number of dynamic descriptors in **pDescriptorSets**
- **VUID-VkBindDescriptorSetsInfoKHR-firstSet-00360**
  The sum of **firstSet** and **descriptorSetCount** **must** be less than or equal to `VkPipelineLayoutCreateInfo::setLayoutCount` provided when **layout** was created
- **VUID-VkBindDescriptorSetsInfoKHR-pDynamicOffsets-01971**
  Each element of **pDynamicOffsets** which corresponds to a descriptor binding with type `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` **must** be a multiple of `VkPhysicalDeviceLimits::minUniformBufferOffsetAlignment`
- **VUID-VkBindDescriptorSetsInfoKHR-pDynamicOffsets-01972**
  Each element of **pDynamicOffsets** which corresponds to a descriptor binding with type `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` **must** be a multiple of `VkPhysicalDeviceLimits`
For each dynamic uniform or storage buffer binding in `pDescriptorSets`, the sum of the effective offset and the range of the binding must be less than or equal to the size of the buffer.

For each dynamic uniform or storage buffer binding in `pDescriptorSets`, if the range was set with `VK_WHOLE_SIZE` then `pDynamicOffsets` which corresponds to the descriptor binding must be 0.

Each element of `pDescriptorSets` must not have been allocated from a `VkDescriptorPool` with the `VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_EXT` flag set.

If `graphicsPipelineLibrary` is not enabled, each element of `pDescriptorSets` must be a valid `VkDescriptorSet`.

Each element of `pDescriptorSets` must have been allocated with a `VkDescriptorSetLayout` which was not created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.

If the `dynamicPipelineLayout` feature is not enabled, `layout` must be a valid `VkPipelineLayout` handle.

If `layout` is `VK_NULL_HANDLE`, the `pNext` chain must include a valid `VkPipelineLayoutCreateInfo` structure.

Valid Usage (Implicit)

`sType` must be `VK_STRUCTURE_TYPE_BIND_DESCRIPTOR_SETS_INFO_KHR`.

`pNext` must be `NULL` or a pointer to a valid instance of `VkPipelineLayoutCreateInfo`.

The `sType` value of each struct in the `pNext` chain must be unique.

`stageFlags` must be a valid combination of `VkShaderStageFlagBits` values.

`stageFlags` must not be 0.

If `layout` is not `VK_NULL_HANDLE`, `layout` must be a valid `VkPipelineLayout` handle.

`pDescriptorSets` must be a valid pointer to an array of `descriptorSetCount` valid
VkDescriptorSet handles

- VUID-VkBindDescriptorSetsInfoKHR-pDynamicOffsets-parameter
  If `dynamicOffsetCount` is not 0, and `pDynamicOffsets` is not NULL, `pDynamicOffsets` must be a valid pointer to an array of `dynamicOffsetCount` or `VK_NULL_HANDLE uint32_t` values

- VUID-VkBindDescriptorSetsInfoKHR-descriptorSetCount-arraylength
  `descriptorSetCount` must be greater than 0

- VUID-VkBindDescriptorSetsInfoKHR-commonparent
  Both of `layout`, and the elements of `pDescriptorSets` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

### 14.2.8. Push Descriptor Updates

In addition to allocating descriptor sets and binding them to a command buffer, an application can record descriptor updates into the command buffer.

To push descriptor updates into a command buffer, call:

```c
// Provided by VK_KHR_push_descriptor
void vkCmdPushDescriptorSetKHR(
  VkCommandBuffer commandBuffer,
  VkPipelineBindPoint pipelineBindPoint,
  VkPipelineLayout layout,
  uint32_t set,
  uint32_t descriptorWriteCount,
  const VkWriteDescriptorSet* pDescriptorWrites);
```

- `commandBuffer` is the command buffer that the descriptors will be recorded in.
- `pipelineBindPoint` is a `VkPipelineBindPoint` indicating the type of the pipeline that will use the descriptors. There is a separate set of push descriptor bindings for each pipeline type, so binding one does not disturb the others.
- `layout` is a `VkPipelineLayout` object used to program the bindings.
- `set` is the set number of the descriptor set in the pipeline layout that will be updated.
- `descriptorWriteCount` is the number of elements in the `pDescriptorWrites` array.
- `pDescriptorWrites` is a pointer to an array of `VkWriteDescriptorSet` structures describing the descriptors to be updated.

Push descriptors are a small bank of descriptors whose storage is internally managed by the command buffer rather than being written into a descriptor set and later bound to a command buffer. Push descriptors allow for incremental updates of descriptors without managing the lifetime of descriptor sets.

When a command buffer begins recording, all push descriptors are undefined. Push descriptors can be updated incrementally and cause shaders to use the updated descriptors for subsequent bound pipeline commands with the pipeline type set by `pipelineBindPoint` until the descriptor is
overwritten, or else until the set is disturbed as described in Pipeline Layout Compatibility. When the set is disturbed or push descriptors with a different descriptor set layout are set, all push descriptors are undefined.

Push descriptors that are **statically used** by a pipeline must not be undefined at the time that a drawing or dispatching command is recorded to execute using that pipeline. This includes immutable sampler descriptors, which must be pushed before they are accessed by a pipeline (the immutable samplers are pushed, rather than the samplers in `pDescriptorWrites`). Push descriptors that are not statically used can remain undefined.

Push descriptors do not use dynamic offsets. Instead, the corresponding non-dynamic descriptor types can be used and the offset member of `VkDescriptorBufferInfo` can be changed each time the descriptor is written.

Each element of `pDescriptorWrites` is interpreted as in `VkWriteDescriptorSet`, except the `dstSet` member is ignored.

To push an immutable sampler, use a `VkWriteDescriptorSet` with `dstBinding` and `dstArrayElement` selecting the immutable sampler's binding. If the descriptor type is `VK_DESCRIPTOR_TYPE_SAMPLER`, the `pImageInfo` parameter is ignored and the immutable sampler is taken from the push descriptor set layout in the pipeline layout. If the descriptor type is `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, the `sampler` member of the `pImageInfo` parameter is ignored and the immutable sampler is taken from the push descriptor set layout in the pipeline layout.

---

**Valid Usage**

- VUID-vkCmdPushDescriptorSetKHR-set-00364
  
  set must be less than `VkPipelineLayoutCreateInfo::setLayoutCount` provided when layout was created

- VUID-vkCmdPushDescriptorSetKHR-set-00365
  
  set must be the unique set number in the pipeline layout that uses a descriptor set layout that was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR`

- VUID-vkCmdPushDescriptorSetKHR-pDescriptorWrites-06494
  
  For each element `i` where `pDescriptorWrites[i].descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLER`, `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`, `pDescriptorWrites[i].pImageInfo` must be a valid pointer to an array of `pDescriptorWrites[i].descriptorCount` valid `VkDescriptorImageInfo` structures

- VUID-vkCmdPushDescriptorSetKHR-pipelineBindPoint-00363
  
  `pipelineBindPoint` must be supported by the commandBuffer's parent `VkCommandPool`'s queue family

---

**Valid Usage (Implicit)**

- VUID-vkCmdPushDescriptorSetKHR-commandBuffer-parameter
**commandBuffer** must be a valid `VkCommandBuffer` handle

- VUID-vkCmdPushDescriptorSetKHR-pipelineBindPoint-parameter
  `pipelineBindPoint` must be a valid `VkPipelineBindPoint` value

- VUID-vkCmdPushDescriptorSetKHR-layout-parameter
  `layout` must be a valid `VkPipelineLayout` handle

- VUID-vkCmdPushDescriptorSetKHR-pDescriptorWrites-parameter
  `pDescriptorWrites` must be a valid pointer to an array of `descriptorWriteCount` valid `VkWriteDescriptorSet` structures

- VUID-vkCmdPushDescriptorSetKHR-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdPushDescriptorSetKHR-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

- VUID-vkCmdPushDescriptorSetKHR-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdPushDescriptorSetKHR-descriptorWriteCount-arraylength
  `descriptorWriteCount` must be greater than 0

- VUID-vkCmdPushDescriptorSetKHR-commonparent
  Both of `commandBuffer`, and `layout` must have been created, allocated, or retrieved from the same `VkDevice`

---

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

---

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics Compute</td>
<td>State</td>
</tr>
</tbody>
</table>

Alternatively, to push descriptor updates into a command buffer, call:

```c
// Provided by VK_KHR_maintenance6 with VK_KHR_push_descriptor
void vkCmdPushDescriptorSet2KHR(
    VkCommandBuffer commandBuffer,  // Provided by VK_KHR_maintenance6 with VK_KHR_push_descriptor
    const VkPushDescriptorSetInfoKHR* pPushDescriptorSetInfo);
```
• commandBuffer is the command buffer that the descriptors will be recorded in.
• pPushDescriptorSetInfo is a pointer to a VkPushDescriptorSetInfoKHR structure.

**Valid Usage**

• VUID-vkCmdPushDescriptorSet2KHR-pPushDescriptorSetInfo-09468
  Each bit in pPushDescriptorSetInfo->stageFlags **must** be a stage supported by the commandBuffer’s parent VkCommandPool’s queue family

**Valid Usage (Implicit)**

• VUID-vkCmdPushDescriptorSet2KHR-commandBuffer-parameter
  commandBuffer **must** be a valid VkCommandBuffer handle

• VUID-vkCmdPushDescriptorSet2KHR-pPushDescriptorSetInfo-parameter
  pPushDescriptorSetInfo **must** be a valid pointer to a valid VkPushDescriptorSetInfoKHR structure

• VUID-vkCmdPushDescriptorSet2KHR-commandBuffer-recording
  commandBuffer **must** be in the recording state

• VUID-vkCmdPushDescriptorSet2KHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from **must** support graphics, or compute operations

• VUID-vkCmdPushDescriptorSet2KHR-videocoding
  This command **must** only be called outside of a video coding scope

**Host Synchronization**

• Host access to commandBuffer **must** be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from **must** be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics Compute</td>
<td>State</td>
</tr>
</tbody>
</table>

The VkPushDescriptorSetInfoKHR structure is defined as:

```c
// Provided by VK_KHR_maintenance6 with VK_KHR_push_descriptor
```
typedef struct VkPushDescriptorSetInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkShaderStageFlags stageFlags;
    VkPipelineLayout layout;
    uint32_t set;
    uint32_t descriptorWriteCount;
    const VkWriteDescriptorSet* pDescriptorWrites;
} VkPushDescriptorSetInfoKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **stageFlags** is a bitmask of `VkShaderStageFlagBits` specifying the shader stages that will use the descriptors.
- **layout** is a `VkPipelineLayout` object used to program the bindings. If the `dynamicPipelineLayout` feature is enabled, **layout** can be `VK_NULL_HANDLE` and the layout must be specified by chaining `VkPipelineLayoutCreateInfo` structure off the **pNext**
- **set** is the set number of the descriptor set in the pipeline layout that will be updated.
- **descriptorWriteCount** is the number of elements in the **pDescriptorWrites** array.
- **pDescriptorWrites** is a pointer to an array of `VkWriteDescriptorSet` structures describing the descriptors to be updated.

If **stageFlags** specifies a subset of all stages corresponding to one or more pipeline bind points, the binding operation still affects all stages corresponding to the given pipeline bind point(s) as if the equivalent original version of this command had been called with the same parameters. For example, specifying a **stageFlags** value of `VK_SHADER_STAGE_VERTEX_BIT | VK_SHADER_STAGE_FRAGMENT_BIT | VK_SHADER_STAGE_COMPUTE_BIT` is equivalent to calling the original version of this command once with `VK_PIPELINE_BIND_POINT_GRAPHICS` and once with `VK_PIPELINE_BIND_POINT_COMPUTE`.

### Valid Usage

- **VUID-VkPushDescriptorSetInfoKHR-set-00364**
  - **set** must be less than `VkPipelineLayoutCreateInfo::setLayoutCount` provided when **layout** was created.

- **VUID-VkPushDescriptorSetInfoKHR-set-00365**
  - **set** must be the unique set number in the pipeline layout that uses a descriptor set layout that was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR`.

- **VUID-VkPushDescriptorSetInfoKHR-pDescriptorWrites-06494**
  - For each element `i` where **pDescriptorWrites[i].descriptorType** is `VK_DESCRIPTOR_TYPE_SAMPLER`, `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`, **pDescriptorWrites[i].pImageInfo** must be a valid pointer to an array of `pDescriptorWrites[i].descriptorCount` valid `VkDescriptorImageInfo` structures.
• VUID-VkPushDescriptorSetInfoKHR-None-09495
  If the dynamicPipelineLayout feature is not enabled, layout must be a valid VkPipelineLayout handle

• VUID-VkPushDescriptorSetInfoKHR-layout-09496
  If layout is VK_NULL_HANDLE, the pNext chain must include a valid VkPipelineLayoutCreateInfo structure

Valid Usage (Implicit)

• VUID-VkPushDescriptorSetInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_PUSH_DESCRIPTOR_SET_INFO_KHR

• VUID-VkPushDescriptorSetInfoKHR-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkPipelineLayoutCreateInfo

• VUID-VkPushDescriptorSetInfoKHR-sType-unique
  The sType value of each struct in the pNext chain must be unique

• VUID-VkPushDescriptorSetInfoKHR-stageFlags-parameter
  stageFlags must be a valid combination of VkShaderStageFlagBits values

• VUID-VkPushDescriptorSetInfoKHR-stageFlags-requiredbitsetmask
  stageFlags must not be 0

• VUID-VkPushDescriptorSetInfoKHR-layout-parameter
  If layout is not VK_NULL_HANDLE, layout must be a valid VkPipelineLayout handle

• VUID-VkPushDescriptorSetInfoKHR-pDescriptorWrites-parameter
  pDescriptorWrites must be a valid pointer to an array of descriptorWriteCount valid VkWriteDescriptorSet structures

• VUID-VkPushDescriptorSetInfoKHR-descriptorWriteCount-arraylength
  descriptorWriteCount must be greater than 0

14.2.9. Push Descriptor Updates With Descriptor Update Templates

It is also possible to use a descriptor update template to specify the push descriptors to update. To do so, call:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_push_descriptor,
// VK_KHR_descriptor_update_template with VK_KHR_push_descriptor
void vkCmdPushDescriptorSetWithTemplateKHR(
    VkCommandBuffer commandBuffer,  // Provided by VK_VERSION_1_1 with VK_KHR_push_descriptor,
    VkDescriptorUpdateTemplate descriptorUpdateTemplate,  // Provided by VK_VERSION_1_1 with VK_KHR_push_descriptor,
    VkPipelineLayout layout,  // Provided by VK_VERSION_1_1 with VK_KHR_push_descriptor,
    uint32_t set,  // Provided by VK_VERSION_1_1 with VK_KHR_push_descriptor,
    const void* pData);  // Provided by VK_VERSION_1_1 with VK_KHR_push_descriptor,
```

• commandBuffer is the command buffer that the descriptors will be recorded in.
• descriptorUpdateTemplate is a descriptor update template defining how to interpret the descriptor information in pData.

• layout is a VkPipelineLayout object used to program the bindings. It must be compatible with the layout used to create the descriptorUpdateTemplate handle.

• set is the set number of the descriptor set in the pipeline layout that will be updated. This must be the same number used to create the descriptorUpdateTemplate handle.

• pData is a pointer to memory containing descriptors for the templated update.

Valid Usage

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-commandBuffer-00366
  The pipelineBindPoint specified during the creation of the descriptor update template must be supported by the commandBuffer’s parent VkCommandPool’s queue family

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-pData-01686
  pData must be a valid pointer to a memory containing one or more valid instances of VkDescriptorImageInfo, VkDescriptorBufferInfo, or VkBufferView in a layout defined by descriptorUpdateTemplate when it was created with vkCreateDescriptorUpdateTemplate

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-layout-07993
  layout must be compatible with the layout used to create descriptorUpdateTemplate

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-descriptorUpdateTemplate-07994
  descriptorUpdateTemplate must have been created with a templateType of VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-set-07995
  set must be the same value used to create descriptorUpdateTemplate

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-set-07304
  set must be less than VkPipelineLayoutCreateInfo::setLayoutCount provided when layout was created

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-set-07305
  set must be the unique set number in the pipeline layout that uses a descriptor set layout that was created with VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR

Valid Usage (Implicit)

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-descriptorUpdateTemplate-parameter
  descriptorUpdateTemplate must be a valid VkDescriptorUpdateTemplate handle

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-layout-parameter
  layout must be a valid VkPipelineLayout handle

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-commandBuffer-recording
  commandBuffer must be in the recording state
• VUID-vkCmdPushDescriptorSetWithTemplateKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations

• VUID-vkCmdPushDescriptorSetWithTemplateKHR-vidcoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdPushDescriptorSetWithTemplateKHR-commonparent
  Each of commandBuffer, descriptorUpdateTemplate, and layout must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>

<td></td>
</tr>
</tbody>
</table>

API example

```c
struct AppDataStructure
{
  VkDescriptorImageInfo imageInfo;  // a single image info
  // ... some more application related data
};

const VkDescriptorUpdateTemplateEntry descriptorUpdateTemplateEntries[] =
{
  // binding to a single image descriptor
  {
    .binding = 0,
    .dstArrayElement = 0,
    .descriptorCount = 1,
    .descriptorType = VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER,
    .offset = offsetof(AppDataStructure, imageInfo),
    .stride = 0  // not required if descriptorCount is 1
  }
};

// create a descriptor update template for push descriptor set updates
```
const VkDescriptorUpdateTemplateCreateInfo createInfo =
{
    .sType = VK_STRUCTURE_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_CREATE_INFO,
    .pNext = NULL,
    .flags = 0,
    .descriptorUpdateEntryCount = 1,
    .pDescriptorUpdateEntries = descriptorUpdateTemplateEntries,
    .templateType = VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR,
    .descriptorSetLayout = 0,  // ignored by given templateType
    .pipelineBindPoint = VK_PIPELINE_BIND_POINT_GRAPHICS,
    .pipelineLayout = myPipelineLayout,
    .set = 0,
};

VkDescriptorUpdateTemplate myDescriptorUpdateTemplate;
myResult = vkCreateDescriptorUpdateTemplate(  
    myDevice,  
    &createInfo,  
    NULL,  
    &myDescriptorUpdateTemplate);

AppDataStructure appData;
// fill appData here or cache it in your engine
vkCmdPushDescriptorSetWithTemplateKHR(myCmdBuffer, myDescriptorUpdateTemplate,  
    myPipelineLayout, 0,&appData);

Alternatively, to use a descriptor update template to specify the push descriptors to update, call:

// Provided by VK_KHR_maintenance6 with VK_KHR_push_descriptor
void vkCmdPushDescriptorSetWithTemplate2KHR(  
    VkCommandBuffer commandBuffer,  
    const VkPushDescriptorSetWithTemplateInfoKHR* pPushDescriptorSetWithTemplateInfo);

• commandBuffer is the command buffer that the descriptors will be recorded in.
• pPushDescriptorSetWithTemplateInfo is a pointer to a VkPushDescriptorSetWithTemplateInfoKHR structure.

Valid Usage (Implicit)

• VUID-vkCmdPushDescriptorSetWithTemplate2KHR-commandBuffer-parameter  
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdPushDescriptorSetWithTemplate2KHR-pPushDescriptorSetWithTemplateInfo-parameter  
  pPushDescriptorSetWithTemplateInfo must be a valid pointer to a valid  
  VkPushDescriptorSetWithTemplateInfoKHR structure

• VUID-vkCmdPushDescriptorSetWithTemplate2KHR-commandBuffer-recording  
  commandBuffer must be in the recording state
The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, or compute operations.

This command **must** only be called outside of a video coding scope.

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized.

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td>Compute</td>
<td></td>
</tr>
</tbody>
</table>

The `VkPushDescriptorSetWithTemplateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_maintenance6 with VK_KHR_push_descriptor
typedef struct VkPushDescriptorSetWithTemplateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDescriptorUpdateTemplate descriptorUpdateTemplate;
    VkPipelineLayout layout;
    uint32_t set;
    const void* pData;
} VkPushDescriptorSetWithTemplateInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **descriptorUpdateTemplate** is a descriptor update template defining how to interpret the descriptor information in `pData`.
- **layout** is a `VkPipelineLayout` object used to program the bindings. It **must** be compatible with the layout used to create the `descriptorUpdateTemplate` handle. If the `dynamicPipelineLayout` feature is enabled, `layout` can be `VK_NULL_HANDLE` and the layout **must** be specified by chaining `VkPipelineLayoutCreateInfo` structure off the `pNext`.
- **set** is the set number of the descriptor set in the pipeline layout that will be updated. This **must** be the same number used to create the `descriptorUpdateTemplate` handle.
• pData is a pointer to memory containing descriptors for the templated update.

Valid Usage

• VUID-VkPushDescriptorSetWithTemplateInfoKHR-commandBuffer-00366
  The pipelineBindPoint specified during the creation of the descriptor update template must be supported by the commandBuffer's parent VkCommandPool's queue family.

• VUID-VkPushDescriptorSetWithTemplateInfoKHR-pData-01686
  pData must be a valid pointer to a memory containing one or more valid instances of VkDescriptorImageInfo, VkDescriptorBufferInfo, or VkBufferView in a layout defined by descriptorUpdateTemplate when it was created with vkCreateDescriptorUpdateTemplate.

• VUID-VkPushDescriptorSetWithTemplateInfoKHR-layout-07993
  layout must be compatible with the layout used to create descriptorUpdateTemplate.

• VUID-VkPushDescriptorSetWithTemplateInfoKHR-descriptorUpdateTemplate-07994
  descriptorUpdateTemplate must have been created with a templateType of VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTOR_KHR.

• VUID-VkPushDescriptorSetWithTemplateInfoKHR-set-07995
  set must be the same value used to create descriptorUpdateTemplate.

• VUID-VkPushDescriptorSetWithTemplateInfoKHR-set-07304
  set must be less than VkPipelineLayoutCreateInfo::setLayoutCount provided when layout was created.

• VUID-VkPushDescriptorSetWithTemplateInfoKHR-set-07305
  set must be the unique set number in the pipeline layout that uses a descriptor set layout that was created with VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR.

• VUID-VkPushDescriptorSetWithTemplateInfoKHR-None-09495
  If the dynamicPipelineLayout feature is not enabled, layout must be a valid VkPipelineLayout handle.

• VUID-VkPushDescriptorSetWithTemplateInfoKHR-layout-09496
  If layout is VK_NULL_HANDLE, the pNext chain must include a valid VkPipelineLayoutCreateInfo structure.

Valid Usage (Implicit)

• VUID-VkPushDescriptorSetWithTemplateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_PUSH_DESCRIPTOR_SET_WITH_TEMPLATE_INFO_KHR.

• VUID-VkPushDescriptorSetWithTemplateInfoKHR-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkPipelineLayoutCreateInfo.

• VUID-VkPushDescriptorSetWithTemplateInfoKHR-sType-unique
  The sType value of each struct in the pNext chain must be unique.

• VUID-VkPushDescriptorSetWithTemplateInfoKHR-descriptorUpdateTemplate-parameter
descriptorUpdateTemplate must be a valid VkDescriptorUpdateTemplate handle.
14.2.10. Push Constant Updates

As described above in section Pipeline Layouts, the pipeline layout defines shader push constants which are updated via Vulkan commands rather than via writes to memory or copy commands.

![Note]

Push constants represent a high speed path to modify constant data in pipelines that is expected to outperform memory-backed resource updates.

To update push constants, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdPushConstants(
    VkCommandBuffer commandBuffer,
    VkPipelineLayout layout,
    VkShaderStageFlags stageFlags,
    uint32_t offset,
    uint32_t size,
    const void* pValues);
```

- `commandBuffer` is the command buffer in which the push constant update will be recorded.
- `layout` is the pipeline layout used to program the push constant updates.
- `stageFlags` is a bitmask of `VkShaderStageFlagBits` specifying the shader stages that will use the push constants in the updated range.
- `offset` is the start offset of the push constant range to update, in units of bytes.
- `size` is the size of the push constant range to update, in units of bytes.
- `pValues` is a pointer to an array of `size` bytes containing the new push constant values.

When a command buffer begins recording, all push constant values are undefined. Reads of undefined push constant values by the executing shader return undefined values.

Push constant values can be updated incrementally, causing shader stages in `stageFlags` to read the new data from `pValues` for push constants modified by this command, while still reading the previous data for push constants not modified by this command. When a bound pipeline command is issued, the bound pipeline’s layout must be compatible with the layouts used to set the values of all push constants in the pipeline layout’s push constant ranges, as described in Pipeline Layout
Compatibility. Binding a pipeline with a layout that is not compatible with the push constant layout does not disturb the push constant values.

Note
As stageFlags needs to include all flags the relevant push constant ranges were created with, any flags that are not supported by the queue family that the VkCommandPool used to allocate commandBuffer was created on are ignored.

Valid Usage

- VUID-vkCmdPushConstants-offset-01795
  For each byte in the range specified by offset and size and for each shader stage in stageFlags, there must be a push constant range in layout that includes that byte and that stage

- VUID-vkCmdPushConstants-offset-01796
  For each byte in the range specified by offset and size and for each push constant range that overlaps that byte, stageFlags must include all stages in that push constant range’s VkPushConstantRange::stageFlags

- VUID-vkCmdPushConstants-offset-00368
  offset must be a multiple of 4

- VUID-vkCmdPushConstants-size-00369
  size must be a multiple of 4

- VUID-vkCmdPushConstants-offset-00370
  offset must be less than VkPhysicalDeviceLimits::maxPushConstantsSize

- VUID-vkCmdPushConstants-size-00371
  size must be less than or equal to VkPhysicalDeviceLimits::maxPushConstantsSize minus offset

Valid Usage (Implicit)

- VUID-vkCmdPushConstants-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdPushConstants-layout-parameter
  layout must be a valid VkPipelineLayout handle

- VUID-vkCmdPushConstants-stageFlags-parameter
  stageFlags must be a valid combination of VkShaderStageFlagBits values

- VUID-vkCmdPushConstants-stageFlags-required bitmask
  stageFlags must not be 0

- VUID-vkCmdPushConstants-pValues-parameter
  pValues must be a valid pointer to an array of size bytes

- VUID-vkCmdPushConstants-commandBuffer-recording
  commandBuffer must be in the recording state
• VUID-vkCmdPushConstants-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations

• VUID-vkCmdPushConstants-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdPushConstants-size-arraylength
  size must be greater than 0

• VUID-vkCmdPushConstants-commonparent
  Both of commandBuffer, and layout must have been created, allocated, or retrieved from the same VkDevice

---

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

---

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td>Compute</td>
<td></td>
</tr>
</tbody>
</table>

Alternatively, to update push constants, call:

```c
// Provided by VK_KHR_maintenance6
void vkCmdPushConstants2KHR(
  VkCommandBuffer commandBuffer,
  const VkPushConstantsInfoKHR* pPushConstantsInfo);
```

- commandBuffer is the command buffer in which the push constant update will be recorded.
- pPushConstantsInfo is a pointer to a VkPushConstantsInfoKHR structure.

---

**Valid Usage (Implicit)**

- VUID-vkCmdPushConstants2KHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdPushConstants2KHR-pPushConstantsInfo-parameter
  pPushConstantsInfo must be a valid pointer to a valid VkPushConstantsInfoKHR structure
- VUID-vkCmdPushConstants2KHR-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdPushConstants2KHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations

- VUID-vkCmdPushConstants2KHR-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td>Compute</td>
<td></td>
</tr>
</tbody>
</table>

The VkPushConstantsInfoKHR structure is defined as:

```c
// Provided by VK_KHR_maintenance6
typedef struct VkPushConstantsInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkPipelineLayout layout;
    VkShaderStageFlags stageFlags;
    uint32_t offset;
    uint32_t size;
    const void* pValues;
} VkPushConstantsInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **layout** is the pipeline layout used to program the push constant updates. If the dynamicPipelineLayout feature is enabled, layout can be VK_NULL_HANDLE and the layout must be specified by chaining VkPipelineLayoutCreateInfo structure off the pNext
- **stageFlags** is a bitmask of VkShaderStageFlagBits specifying the shader stages that will use the push constants in the updated range.
- **offset** is the start offset of the push constant range to update, in units of bytes.
- **size** is the size of the push constant range to update, in units of bytes.
- **pValues** is a pointer to an array of **size** bytes containing the new push constant values.

### Valid Usage

- **VUID-VkPushConstantsInfoKHR-offset-01795**
  For each byte in the range specified by **offset** and **size** and for each shader stage in **stageFlags**, there **must** be a push constant range in **layout** that includes that byte and that stage.

- **VUID-VkPushConstantsInfoKHR-offset-01796**
  For each byte in the range specified by **offset** and **size** and for each push constant range that overlaps that byte, **stageFlags** **must** include all stages in that push constant range’s **VkPushConstantRange::stageFlags**.

- **VUID-VkPushConstantsInfoKHR-offset-00368**
  **offset** **must** be a multiple of 4.

- **VUID-VkPushConstantsInfoKHR-size-00369**
  **size** **must** be a multiple of 4.

- **VUID-VkPushConstantsInfoKHR-offset-00370**
  **offset** **must** be less than **VkPhysicalDeviceLimits::maxPushConstantsSize**.

- **VUID-VkPushConstantsInfoKHR-size-00371**
  **size** **must** be less than or equal to **VkPhysicalDeviceLimits::maxPushConstantsSize** minus **offset**.

- **VUID-VkPushConstantsInfoKHR-None-09495**
  If the **dynamicPipelineLayout** feature is not enabled, **layout** **must** be a valid **VkPipelineLayout** handle.

- **VUID-VkPushConstantsInfoKHR-layout-09496**
  If **layout** is **VK_NULL_HANDLE**, the **pNext** chain **must** include a valid **VkPipelineLayoutCreateInfo** structure.

### Valid Usage (Implicit)

- **VUID-VkPushConstantsInfoKHR-sType-sType**
  **sType** **must** be **VK_STRUCTURE_TYPE_PUSH_CONSTANTS_INFO_KHR**.

- **VUID-VkPushConstantsInfoKHR-pNext-pNext**
  **pNext** **must** be **NULL** or a pointer to a valid instance of **VkPipelineLayoutCreateInfo**.

- **VUID-VkPushConstantsInfoKHR-sType-unique**
  The **sType** value of each struct in the **pNext** chain **must** be unique.

- **VUID-VkPushConstantsInfoKHR-layout-parameter**
  If **layout** is not **VK_NULL_HANDLE**, **layout** **must** be a valid **VkPipelineLayout** handle.

- **VUID-VkPushConstantsInfoKHR-stageFlags-parameter**
stageFlags must be a valid combination of VkShaderStageFlagBits values

- VUID-VkPushConstantsInfoKHR-stageFlags-required bitmask
  stageFlags must not be 0
- VUID-VkPushConstantsInfoKHR-pValues-parameter
  pValues must be a valid pointer to an array of size bytes
- VUID-VkPushConstantsInfoKHR-size-arraylength
  size must be greater than 0

### 14.3. Physical Storage Buffer Access

To query a 64-bit buffer device address value through which buffer memory can be accessed in a shader, call:

```c
// Provided by VK_VERSION_1_2
VkDeviceAddress vkGetBufferDeviceAddress(
    VkDevice device,
    const VkBufferDeviceAddressInfo* pInfo);
```
or the equivalent command

```c
// Provided by VK_KHR_buffer_device_address
VkDeviceAddress vkGetBufferDeviceAddressKHR(
    VkDevice device,
    const VkBufferDeviceAddressInfo* pInfo);
```
or the equivalent command

```c
// Provided by VK_EXT_buffer_device_address
VkDeviceAddress vkGetBufferDeviceAddressEXT(
    VkDevice device,
    const VkBufferDeviceAddressInfo* pInfo);
```

- **device** is the logical device that the buffer was created on.
- **pInfo** is a pointer to a VkBufferDeviceAddressInfo structure specifying the buffer to retrieve an address for.

The 64-bit return value is an address of the start of pInfo->buffer. The address range starting at this value and whose size is the size of the buffer can be used in a shader to access the memory bound to that buffer, using the SPV_KHRPhysicalStorageBuffer extension or the equivalent SPV_EXT_physical_storage_buffer extension and the PhysicalStorageBuffer storage class. For example, this value can be stored in a uniform buffer, and the shader can read the value from the uniform buffer and use it to do a dependent read/write to this buffer. A value of zero is reserved as a “null” pointer and must not be returned as a valid buffer device address. All loads, stores, and
atomics in a shader through PhysicalStorageBuffer pointers must access addresses in the address range of some buffer.

If the buffer was created with a non-zero value of VkBufferOpaqueCaptureAddressCreateInfo::opaqueCaptureAddress or VkBufferDeviceAddressCreateInfoEXT::deviceAddress, the return value will be the same address that was returned at capture time.

The returned address must satisfy the alignment requirement specified by VkMemoryRequirements::alignment for the buffer in VkBufferDeviceAddressInfo::buffer.

If multiple VkBuffer objects are bound to overlapping ranges of VkDeviceMemory, implementations may return address ranges which overlap. In this case, it is ambiguous which VkBuffer is associated with any given device address. For purposes of valid usage, if multiple VkBuffer objects can be attributed to a device address, a VkBuffer is selected such that valid usage passes, if it exists.

Valid Usage

- VUID-vkGetBufferDeviceAddress-bufferDeviceAddress-03324
  The bufferDeviceAddress or VkPhysicalDeviceBufferDeviceAddressFeaturesEXT::bufferDeviceAddress feature must be enabled

- VUID-vkGetBufferDeviceAddress-device-03325
  If device was created with multiple physical devices, then the bufferDeviceAddressMultiDevice or VkPhysicalDeviceBufferDeviceAddressFeaturesEXT::bufferDeviceAddressMultiDevice feature must be enabled

Valid Usage (Implicit)

- VUID-vkGetBufferDeviceAddress-device-parameter
device must be a valid VkDevice handle

- VUID-vkGetBufferDeviceAddress-pInfo-parameter
  pInfo must be a valid pointer to a valid VkBufferDeviceAddressInfo structure

The VkBufferDeviceAddressInfo structure is defined as:

```c
typedef struct VkBufferDeviceAddressInfo {
    VkStructureType sType;
    const void* pNext;
    VkBuffer buffer;
} VkBufferDeviceAddressInfo;
```

or the equivalent

```c
// Provided by VK_KHR_buffer_device_address
```
typedef VkBufferDeviceAddressInfo VkBufferDeviceAddressInfoKHR;

or the equivalent

// Provided by VK_EXT_buffer_device_address
typedef VkBufferDeviceAddressInfo VkBufferDeviceAddressInfoEXT;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **buffer** specifies the buffer whose address is being queried.

### Valid Usage

- VUID-VkBufferDeviceAddressInfo-buffer-02600
  If **buffer** is non-sparse and was not created with the VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT flag, then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-VkBufferDeviceAddressInfo-buffer-02601
  **buffer** must have been created with VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT

### Valid Usage (Implicit)

- VUID-VkBufferDeviceAddressInfo-sType-sType
  **sType** must be VK_STRUCTURE_TYPE_BUFFER_DEVICE_ADDRESS_INFO

- VUID-VkBufferDeviceAddressInfo-pNext-pNext
  **pNext** must be NULL

- VUID-VkBufferDeviceAddressInfo-buffer-parameter
  **buffer** must be a valid VkBuffer handle

To query a 64-bit buffer opaque capture address, call:

// Provided by VK_VERSION_1_2

```c
uint64_t vkGetBufferOpaqueCaptureAddress(
    VkDevice device,
    const VkBufferDeviceAddressInfo* pInfo);
```

or the equivalent command

// Provided by VK_KHR_buffer_device_address

```c
uint64_t vkGetBufferOpaqueCaptureAddressKHR(
    VkDevice device,
```
const VkBufferDeviceAddressInfo* pInfo);

- `device` is the logical device that the buffer was created on.
- `pInfo` is a pointer to a `VkBufferDeviceAddressInfo` structure specifying the buffer to retrieve an address for.

The 64-bit return value is an opaque capture address of the start of `pInfo->buffer`.

If the buffer was created with a non-zero value of `VkBufferOpaqueCaptureAddressCreateInfo::opaqueCaptureAddress` the return value **must** be the same address.

### Valid Usage

- VUID-vkGetBufferOpaqueCaptureAddress-None-03326
  The bufferDeviceAddress feature **must** be enabled
- VUID-vkGetBufferOpaqueCaptureAddress-device-03327
  If `device` was created with multiple physical devices, then the bufferDeviceAddressMultiDevice feature **must** be enabled

### Valid Usage (Implicit)

- VUID-vkGetBufferOpaqueCaptureAddress-device-parameter
  `device` **must** be a valid `VkDevice` handle
- VUID-vkGetBufferOpaqueCaptureAddress-pInfo-parameter
  `pInfo` **must** be a valid pointer to a valid `VkBufferDeviceAddressInfo` structure

## 14.4. Descriptor Buffers

If the `descriptorBuffer` feature is enabled, an alternative way to specify descriptor sets is via buffers, rather than descriptor set objects.

### 14.4.1. Putting Descriptors in Memory

Commands are provided to retrieve descriptor data, and also to locate where in memory that data **must** be written to match the given descriptor set layout.

To determine the amount of memory needed to store all descriptors with a given layout, call:

```c
// Provided by VK_EXT_descriptor_buffer
void vkGetDescriptorSetLayoutSizeEXT(
  VkDevice device,
  VkDescriptorSetLayout layout,
  VkDeviceSize* pLayoutSizeInBytes);
```
• **device** is the logical device that gets the size.
• **layout** is the descriptor set layout being queried.
• **pLayoutSizeInBytes** is a pointer to **VkDeviceSize** where the size in bytes will be written.

The size of a descriptor set layout will be at least as large as the sum total of the size of all descriptors in the layout, and **may** be larger. This size represents the amount of memory that will be required to store all of the descriptors for this layout in memory, when placed according to the layout's offsets as obtained by `vkGetDescriptorSetLayoutBindingOffsetEXT`.

If any binding in `layout` is **VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT**, the returned size includes space for the maximum `descriptorCount` descriptors as declared for that binding. To compute the required size of a descriptor set with a **VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT**:

\[
\text{size} = \text{offset} + \text{descriptorSize} \times \text{variableDescriptorCount}
\]

where `offset` is obtained by `vkGetDescriptorSetLayoutBindingOffsetEXT` and `descriptorSize` is the size of the relevant descriptor as obtained from `VkPhysicalDeviceDescriptorBufferPropertiesEXT`, and `variableDescriptorCount` is the equivalent of `VkDescriptorSetVariableDescriptorCountAllocateInfo::pDescriptorCounts`. For **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK**, `variableDescriptorCount` is the size in bytes for the inline uniform block, and `descriptorSize` is 1.

If `VkPhysicalDeviceDescriptorBufferPropertiesEXT::combinedImageSamplerDescriptorSingleArray` is **VK_FALSE** and the variable descriptor type is **VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER**, `variableDescriptorCount` is always considered to be the upper bound.

### Valid Usage

- **VUID-vkGetDescriptorSetLayoutSizeEXT-None-08011**
  The descriptorBuffer feature **must** be enabled

- **VUID-vkGetDescriptorSetLayoutSizeEXT-layout-08012**
  `layout` **must** have been created with the **VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT** flag set

### Valid Usage (Implicit)

- **VUID-vkGetDescriptorSetLayoutSizeEXT-device-parameter**
  `device` **must** be a valid **VkDevice** handle

- **VUID-vkGetDescriptorSetLayoutSizeEXT-layout-parameter**
  `layout` **must** be a valid **VkDescriptorSetLayout** handle

- **VUID-vkGetDescriptorSetLayoutSizeEXT-pLayoutSizeInBytes-parameter**
  `pLayoutSizeInBytes` **must** be a valid pointer to a **VkDeviceSize** value

- **VUID-vkGetDescriptorSetLayoutSizeEXT-layout-parent**
To get the offset of a binding within a descriptor set layout in memory, call:

```c
// Provided by VK_EXT_descriptor_buffer
void vkGetDescriptorSetLayoutBindingOffsetEXT(
    VkDevice                        device,
    VkDescriptorSetLayout         layout,
    uint32_t                        binding,
    VkDeviceSize*                  pOffset);
```

- `device` is the logical device that gets the offset.
- `layout` is the descriptor set layout being queried.
- `binding` is the binding number being queried.
- `pOffset` is a pointer to `VkDeviceSize` where the byte offset of the binding will be written.

Each binding in a descriptor set layout is assigned an offset in memory by the implementation. When a shader accesses a resource with that binding, it will access the bound descriptor buffer from that offset to look for its descriptor. This command provides an application with that offset, so that descriptors can be placed in the correct locations. The precise location accessed by a shader for a given descriptor is as follows:

\[
\text{location} = \text{bufferAddress} + \text{setOffset} + \text{descriptorOffset} + (\text{arrayElement} \times \text{descriptorSize})
\]

where `bufferAddress` and `setOffset` are the base address and offset for the identified descriptor set as specified by `vkCmdBindDescriptorBuffersEXT` and `vkCmdSetDescriptorBufferOffsetsEXT`, `descriptorOffset` is the offset for the binding returned by this command, `arrayElement` is the index into the array specified in the shader, and `descriptorSize` is the size of the relevant descriptor as obtained from `VkPhysicalDeviceDescriptorBufferPropertiesEXT`. Applications are responsible for placing valid descriptors at the expected location in order for a shader to access it. The overall offset added to `bufferAddress` to calculate `location` must be less than `VkPhysicalDeviceDescriptorBufferPropertiesEXT::maxSamplerDescriptorBufferRange` for samplers and `VkPhysicalDeviceDescriptorBufferPropertiesEXT::maxResourceDescriptorBufferRange` for resources.

If any binding in `layout` is `VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT`, that binding must have the largest offset of any binding.

A descriptor binding with type `VK_DESCRIPTOR_TYPE_MUTABLE_VALVE` can be used. Any potential types in `VkMutableDescriptorTypeCreateInfoVALVE::pDescriptorTypes` for `binding` share the same offset. If the size of the mutable descriptor is larger than the size of a concrete descriptor type being accessed, the padding area is ignored by the implementation.
Valid Usage

- VUID-vkGetDescriptorSetLayoutBindingOffsetEXT-None-08013
  The descriptorBuffer feature must be enabled

- VUID-vkGetDescriptorSetLayoutBindingOffsetEXT-layout-08014
  layout must have been created with the
  VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT flag set

Valid Usage (Implicit)

- VUID-vkGetDescriptorSetLayoutBindingOffsetEXT-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetDescriptorSetLayoutBindingOffsetEXT-layout-parameter
  layout must be a valid VkDescriptorSetLayout handle

- VUID-vkGetDescriptorSetLayoutBindingOffsetEXT-pOffset-parameter
  pOffset must be a valid pointer to a VkDeviceSize value

- VUID-vkGetDescriptorSetLayoutBindingOffsetEXT-layout-parent
  layout must have been created, allocated, or retrieved from device

To get descriptor data to place in a buffer, call:

```c
// Provided by VK_EXT_descriptor_buffer
void vkGetDescriptorEXT(
    VkDevice device,
    const VkDescriptorGetInfoEXT* pDescriptorInfo,
    size_t dataSize,
    void* pDescriptor);
```

- device is the logical device that gets the descriptor.
- pDescriptorInfo is a pointer to a VkDescriptorGetInfoEXT structure specifying the parameters of the descriptor to get.
- dataSize is the amount of the descriptor data to get in bytes.
- pDescriptor is a pointer to a user-allocated buffer where the descriptor will be written.

The size of the data for each descriptor type is determined by the value in VkPhysicalDeviceDescriptorBufferPropertiesEXT. This value also defines the stride in bytes for arrays of that descriptor type.

If the VkPhysicalDeviceDescriptorBufferPropertiesEXT::combinedImageSamplerDescriptorSingleArray property is VK_FALSE the implementation requires an array of VkDescriptorTypeCombinedImageSampler descriptors to be written into a descriptor buffer as an array of image descriptors, immediately followed by an array of sampler descriptors. Applications must write the first VkPhysicalDeviceDescriptorBufferPropertiesEXT::sampledImageDescriptorSize
bytes of the data returned through pDescriptor to the first array, and the remaining VkPhysicalDeviceDescriptorBufferPropertiesEXT::samplerDescriptorSize bytes of the data to the second array. For variable-sized descriptor bindings of VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER descriptors, the two arrays each have a size equal to the upper bound descriptorCount of that binding.

A descriptor obtained by this command references the underlying VkImageView or VkSampler, and these objects must not be destroyed before the last time a descriptor is dynamically accessed. For descriptor types which consume an address instead of an object, the underlying VkBuffer is referenced instead.

Valid Usage

- VUID-vkGetDescriptorEXT-None-08015
  The descriptorBuffer feature must be enabled

- VUID-vkGetDescriptorEXT-dataSize-08125
  If pDescriptorInfo->type is not VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER or pDescriptorInfo->data.pCombinedImageSampler has an imageView member that was not created with a VkSamplerYcbcrConversionInfo structure in its pNext chain, dataSize must equal the size of a descriptor of type VkDescriptorGetInfoEXT::type determined by the value in VkPhysicalDeviceDescriptorBufferPropertiesEXT, or determined by VkPhysicalDeviceDescriptorBufferDensityMapPropertiesEXT::combinedImageSamplerDensityMapDescriptorSize if pDescriptorInfo specifies a VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER whose VkSampler was created with VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT set

- VUID-vkGetDescriptorEXT-descriptorType-09469
  If pDescriptorInfo->type is VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER and pDescriptorInfo->data.pCombinedImageSampler has an imageView member that was created with a VkSamplerYcbcrConversionInfo structure in its pNext chain, dataSize must equal the size of VkPhysicalDeviceDescriptorBufferPropertiesEXT::combinedImageSamplerDescriptorSize times VkSamplerYcbcrConversionImageFormatProperties::combinedImageSamplerDescriptorCount

- VUID-vkGetDescriptorEXT-pDescriptorInfo-09507
  If pDescriptorInfo->type is VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER and it has a imageView that is VK_NULL_HANDLE then dataSize must be equal to the size of VkPhysicalDeviceDescriptorBufferPropertiesEXT::combinedImageSamplerDescriptorSize

Valid Usage (Implicit)

- VUID-vkGetDescriptorEXT-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetDescriptorEXT-pDescriptorInfo-parameter
  pDescriptorInfo must be a valid pointer to a valid VkDescriptorGetInfoEXT structure

- VUID-vkGetDescriptorEXT-pDescriptor-parameter
**pDescriptor** must be a valid pointer to an array of **dataSize** bytes

- VUID-vkGetDescriptorEXT-dataSize-arraylength
  **dataSize** must be greater than 0

Information about the descriptor to get is passed in a **VkDescriptorGetInfoEXT** structure:

```c
// Provided by VK_EXT_descriptor_buffer
typedef struct VkDescriptorGetInfoEXT {
    VkStructureType       sType;
    const void*           pNext;
    VkDescriptorType      type;
    VkDescriptorDataEXT   data;
} VkDescriptorGetInfoEXT;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **type** is the type of descriptor to get.
- **data** is a structure containing the information needed to get the descriptor.

**Valid Usage**

- VUID-VkDescriptorGetInfoEXT-type-08018
  type must not be **VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC**, **VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC** or **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK**

- VUID-VkDescriptorGetInfoEXT-type-08019
  If **type** is **VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER**, the **pCombinedImageSampler->sampler** member of **data** must be a **VkSampler** created on **device**

- VUID-VkDescriptorGetInfoEXT-type-08020
  If **type** is **VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER**, the **pCombinedImageSampler->imageView** member of **data** must be a **VkImageView** created on **device**, or **VK_NULL_HANDLE**

- VUID-VkDescriptorGetInfoEXT-type-08021
  If **type** is **VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT**, the **pInputAttachmentImage->imageView** member of **data** must be a **VkImageView** created on **device**

- VUID-VkDescriptorGetInfoEXT-type-08022
  If **type** is **VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE**, and if **pSampledImage** is not **NULL**, the **pSampledImage->imageView** member of **data** must be a **VkImageView** created on **device**, or **VK_NULL_HANDLE**

- VUID-VkDescriptorGetInfoEXT-type-08023
  If **type** is **VK_DESCRIPTOR_TYPE_STORAGE_IMAGE**, and if **pStorageImage** is not **NULL**, the **pStorageImage->imageView** member of **data** must be a **VkImageView** created on **device**, or **VK_NULL_HANDLE**
• **VUID-VkDescriptorGetInfoEXT-type-08024**
  If `type` is `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER`, `pUniformTexelBuffer` is not `NULL` and `pUniformTexelBuffer->address` is not zero, `pUniformTexelBuffer->address` must be an address within a `VkBuffer` created on device.

• **VUID-VkDescriptorGetInfoEXT-type-08025**
  If `type` is `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER`, `pStorageTexelBuffer` is not `NULL` and `pStorageTexelBuffer->address` is not zero, `pStorageTexelBuffer->address` must be an address within a `VkBuffer` created on device.

• **VUID-VkDescriptorGetInfoEXT-type-08026**
  If `type` is `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER`, `pUniformBuffer` is not `NULL` and `pUniformBuffer->address` is not zero, `pUniformBuffer->address` must be an address within a `VkBuffer` created on device.

• **VUID-VkDescriptorGetInfoEXT-type-08027**
  If `type` is `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER`, `pStorageBuffer` is not `NULL` and `pStorageBuffer->address` is not zero, `pStorageBuffer->address` must be an address within a `VkBuffer` created on device.

• **VUID-VkDescriptorGetInfoEXT-type-09427**
  If `type` is `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER`, `pUniformBuffer` is not `NULL`, the number of texel buffer elements given by $(\lfloor pUniformBuffer->range / (texel block size) \rfloor \times (texels per block))$ where texel block size and texels per block are as defined in the Compatible Formats table for `pUniformBuffer->format`, must be less than or equal to `VkPhysicalDeviceLimits::maxTexelBufferElements`.

• **VUID-VkDescriptorGetInfoEXT-type-09428**
  If `type` is `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER`, `pStorageBuffer` is not `NULL`, the number of texel buffer elements given by $(\lfloor pStorageBuffer->range / (texel block size) \rfloor \times (texels per block))$ where texel block size and texels per block are as defined in the Compatible Formats table for `pStorageBuffer->format`, must be less than or equal to `VkPhysicalDeviceLimits::maxTexelBufferElements`.

• **VUID-VkDescriptorGetInfoEXT-type-08028**
  If `type` is `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR` and `accelerationStructure` is not `0`, `accelerationStructure` must contain the address of a `VkAccelerationStructureKHR` created on device.

• **VUID-VkDescriptorGetInfoEXT-type-08029**
  If `type` is `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV` and `accelerationStructure` is not `0`, `accelerationStructure` must contain the handle of a `VkAccelerationStructureNV` created on device, returned by `vkGetAccelerationStructureHandleNV`.

---

**Valid Usage (Implicit)**

- **VUID-VkDescriptorGetInfoEXT-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_DESCRIPTOR_GET_INFO_EXT`.

- **VUID-VkDescriptorGetInfoEXT-pNext-pNext**
  `pNext` must be `NULL`. 

1342
• VUID-VkDescriptorGetInfoEXT-type-parameter
  type must be a valid VkDescriptorType value

• VUID-VkDescriptorGetInfoEXT-pSampler-parameter
  If type is VK_DESCRIPTOR_TYPE_SAMPLER, the pSampler member of data must be a valid pointer to a valid VkSampler handle

• VUID-VkDescriptorGetInfoEXT-pCombinedImageSampler-parameter
  If type is VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, the pCombinedImageSampler member of data must be a valid pointer to a valid VkDescriptorImageInfo structure

• VUID-VkDescriptorGetInfoEXT-pInputAttachmentImage-parameter
  If type is VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, the pInputAttachmentImage member of data must be a valid pointer to a valid VkDescriptorImageInfo structure

• VUID-VkDescriptorGetInfoEXT-pSampledImage-parameter
  If type is VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, and if pSampledImage is not NULL, the pSampledImage member of data must be a valid pointer to a valid VkDescriptorImageInfo structure

• VUID-VkDescriptorGetInfoEXT-pStorageImage-parameter
  If type is VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, and if pStorageImage is not NULL, the pStorageImage member of data must be a valid pointer to a valid VkDescriptorImageInfo structure

• VUID-VkDescriptorGetInfoEXT-pUniformTexelBuffer-parameter
  If type is VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER, and if pUniformTexelBuffer is not NULL, the pUniformTexelBuffer member of data must be a valid pointer to a valid VkDescriptorAddressInfoEXT structure

• VUID-VkDescriptorGetInfoEXT-pStorageTexelBuffer-parameter
  If type is VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER, and if pStorageTexelBuffer is not NULL, the pStorageTexelBuffer member of data must be a valid pointer to a valid VkDescriptorAddressInfoEXT structure

• VUID-VkDescriptorGetInfoEXT-pUniformBuffer-parameter
  If type is VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER, and if pUniformBuffer is not NULL, the pUniformBuffer member of data must be a valid pointer to a valid VkDescriptorAddressInfoEXT structure

• VUID-VkDescriptorGetInfoEXT-pStorageBuffer-parameter
  If type is VK_DESCRIPTOR_TYPE_STORAGE_BUFFER, and if pStorageBuffer is not NULL, the pStorageBuffer member of data must be a valid pointer to a valid VkDescriptorAddressInfoEXT structure

Data describing the descriptor is passed in a VkDescriptorDataEXT structure:

// Provided by VK_EXT_descriptor_buffer
typedef union VkDescriptorDataEXT {
  const VkSampler* pSampler;
  const VkDescriptorImageInfo* pCombinedImageSampler;
  const VkDescriptorImageInfo* pInputAttachmentImage;
  const VkDescriptorImageInfo* pSampledImage;
  const VkDescriptorImageInfo* pStorageImage;
  const VkDescriptorAddressInfoEXT* pUniformTexelBuffer;
  const VkDescriptorAddressInfoEXT* pStorageTexelBuffer;
  const VkDescriptorAddressInfoEXT* pUniformBuffer;
  const VkDescriptorAddressInfoEXT* pStorageBuffer;
}
• **pSampler** is a pointer to a `VkSampler` handle specifying the parameters of a `VK_DESCRIPTOR_TYPE_SAMPLER` descriptor.

• **pCombinedImageSampler** is a pointer to a `VkDescriptorImageInfo` structure specifying the parameters of a `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` descriptor.

• **pInputAttachmentImage** is a pointer to a `VkDescriptorImageInfo` structure specifying the parameters of a `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` descriptor.

• **pSampledImage** is a pointer to a `VkDescriptorImageInfo` structure specifying the parameters of a `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE` descriptor.

• **pStorageImage** is a pointer to a `VkDescriptorImageInfo` structure specifying the parameters of a `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE` descriptor.

• **pUniformTexelBuffer** is a pointer to a `VkDescriptorAddressInfoEXT` structure specifying the parameters of a `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` descriptor.

• **pStorageTexelBuffer** is a pointer to a `VkDescriptorAddressInfoEXT` structure specifying the parameters of a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor.

• **pUniformBuffer** is a pointer to a `VkDescriptorAddressInfoEXT` structure specifying the parameters of a `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` descriptor.

• **pStorageBuffer** is a pointer to a `VkDescriptorAddressInfoEXT` structure specifying the parameters of a `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` descriptor.

• **accelerationStructure** is the address of a `VkAccelerationStructureKHR` specifying the parameters of a `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR` descriptor, or a `VkAccelerationStructureNV` handle specifying the parameters of a `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV` descriptor.

If the `nullDescriptor` feature is enabled, `pSampledImage`, `pStorageImage`, `pUniformTexelBuffer`, `pStorageTexelBuffer`, `pUniformBuffer`, and `pStorageBuffer` can each be `NULL`. Loads from a null descriptor return zero values and stores and atomics to a null descriptor are discarded.

If the `nullDescriptor` feature is enabled, `accelerationStructure` can be `0`. A null acceleration structure descriptor results in the miss shader being invoked.

### Valid Usage

- **VUID-VkDescriptorDataEXT-type-08030**
  - If `VkDescriptorGetInfoEXT::type` is `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER`, and `pUniformBuffer->address` is the address of a non-sparse buffer, then that buffer must be bound completely and contiguously to a single `VkDeviceMemory` object.
If `VkDescriptorGetInfoEXT::type` is `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER`, and `pStorageBuffer->address` is the address of a non-sparse buffer, then that buffer must be bound completely and contiguously to a single `VkDeviceMemory` object.

If `VkDescriptorGetInfoEXT::type` is `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER`, and `pUniformTexelBuffer->address` is the address of a non-sparse buffer, then that buffer must be bound completely and contiguously to a single `VkDeviceMemory` object.

If `VkDescriptorGetInfoEXT::type` is `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER`, and `pStorageTexelBuffer->address` is the address of a non-sparse buffer, then that buffer must be bound completely and contiguously to a single `VkDeviceMemory` object.

If `VkDescriptorGetInfoEXT::type` is `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, and the `nullDescriptor` feature is not enabled, `pCombinedImageSampler->imageView` must not be `VK_NULL_HANDLE`.

If `VkDescriptorGetInfoEXT::type` is `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, and the `nullDescriptor` feature is not enabled, `pSampledImage` must not be `NULL` and `pSampledImage->imageView` must not be `VK_NULL_HANDLE`.

If `VkDescriptorGetInfoEXT::type` is `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, and the `nullDescriptor` feature is not enabled, `pStorageImage` must not be `NULL` and `pStorageImage->imageView` must not be `VK_NULL_HANDLE`.

If `VkDescriptorGetInfoEXT::type` is `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER`, and the `nullDescriptor` feature is not enabled, `pUniformTexelBuffer` must not be `NULL`.

If `VkDescriptorGetInfoEXT::type` is `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER`, and the `nullDescriptor` feature is not enabled, `pStorageTexelBuffer` must not be `NULL`.

If `VkDescriptorGetInfoEXT::type` is `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER`, and the `nullDescriptor` feature is not enabled, `pUniformBuffer` must not be `NULL`.

If `VkDescriptorGetInfoEXT::type` is `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER`, and the `nullDescriptor` feature is not enabled, `pStorageBuffer` must not be `NULL`.

If `VkDescriptorGetInfoEXT::type` is `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR`, and the `nullDescriptor` feature is not enabled, `accelerationStructure` must not be `0`.

If `VkDescriptorGetInfoEXT::type` is `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV`, and the `nullDescriptor` feature is not enabled, `accelerationStructure` must not be `0`. 
Data describing a VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER, VK_DESCRIPTOR_TYPE_STORAGE_BUFFER, VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER, or VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER descriptor is passed in a VkDescriptorAddressInfoEXT structure:

```
// Provided by VK_EXT_descriptor_buffer
typedef struct VkDescriptorAddressInfoEXT {
    VkStructureType sType;
    void* pNext;
    VkDeviceAddress address;
    VkDeviceSize range;
    VkFormat format;
} VkDescriptorAddressInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `address` is either 0 or a device address at an offset in a buffer, where the base address can be queried from vkGetBufferDeviceAddress.
- `range` is the size in bytes of the buffer or buffer view used by the descriptor.
- `format` is the format of the data elements in the buffer view and is ignored for buffers.

### Valid Usage

- VUID-VkDescriptorAddressInfoEXT-None-09508
  If `address` is not zero, and the descriptor is of type VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER, then `format` must not be VK_FORMAT_UNDEFINED.

- VUID-VkDescriptorAddressInfoEXT-address-08043
  If the nullDescriptor feature is not enabled, `address` must not be zero.

- VUID-VkDescriptorAddressInfoEXT-nullDescriptor-08938
  If `address` is zero, `range` must be VK_WHOLE_SIZE.

- VUID-VkDescriptorAddressInfoEXT-nullDescriptor-08939
  If `address` is not zero, `range` must not be VK_WHOLE_SIZE.

- VUID-VkDescriptorAddressInfoEXT-None-08044
  If `address` is not zero, `address` must be a valid device address at an offset within a VkBuffer.

- VUID-VkDescriptorAddressInfoEXT-range-08045
  `range` must be less than or equal to the size of the buffer containing `address` minus the offset of `address` from the base address of the buffer.

- VUID-VkDescriptorAddressInfoEXT-range-08940
  `range` must not be zero.
Valid Usage (Implicit)

- **VUID-VkDescriptorAddressInfoEXT-sType-sType**
  - `sType` **must** be `VK_STRUCTURE_TYPE_DESCRIPTOR_ADDRESS_INFO_EXT`

- **VUID-VkDescriptorAddressInfoEXT-pNext-pNext**
  - `pNext` **must** be `NULL`

- **VUID-VkDescriptorAddressInfoEXT-format-parameter**
  - `format` **must** be a valid `VkFormat` value

If the `nullDescriptor` feature is enabled, `address can be zero`. Loads from a null descriptor return zero values and stores and atomics to a null descriptor are discarded.

Immutable samplers specified in a descriptor set layout through `pImmutableSamplers` **must** be provided by applications when obtaining descriptor data. Immutable samplers written in a descriptor buffer **must** have identical parameters to the immutable samplers in the descriptor set layout that consumes the sampler.

**Note**
If the descriptor set layout was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_EMBEDDED_IMMUTABLE_SAMPLERS_BIT_EXT`, there is no buffer backing for the immutable sampler, so this requirement does not exist. The implementation handles allocation of these descriptors internally.

**Note**
As descriptors are now in regular memory, drivers cannot hide copies of immutable samplers that end up in descriptor sets from the application. As such, applications are required to provide these samplers as if they were not provided immutably.

### 14.4.2. Binding Descriptor Buffers

Descriptor buffers have their own separate binding point on the command buffer, with buffers bound using `vkCmdBindDescriptorBuffersEXT`. `vkCmdSetDescriptorBufferOffsetsEXT` assigns pairs of buffer binding indices and buffer offsets to the same binding point on the command buffer as `vkCmdBindDescriptorSets`, allowing subsequent bound pipeline commands to use the specified descriptor buffers. Bindings applied via `vkCmdBindDescriptorSets` cannot exist simultaneously with those applied via calls to `vkCmdSetDescriptorBufferOffsetsEXT` or `vkCmdBindDescriptorBufferEmbeddedSamplersEXT`, as calls to `vkCmdSetDescriptorBufferOffsetsEXT` or `vkCmdBindDescriptorBufferEmbeddedSamplersEXT` invalidate any bindings by previous calls to `vkCmdBindDescriptorSets` and vice-versa.

To bind descriptor buffers to a command buffer, call:

```c
// Provided by VK_EXT_descriptor_buffer
void vkCmdBindDescriptorBuffersEXT(
```
VkCommandBuffer commandBuffer, uint32_t bufferCount, const VkDescriptorBufferBindingInfoEXT* pBindingInfos);

- **commandBuffer** is the command buffer that the descriptor buffers will be bound to.
- **bufferCount** is the number of elements in the pBindingInfos array.
- **pBindingInfos** is a pointer to an array of VkDescriptorBufferBindingInfoEXT structures.

vkCmdBindDescriptorBuffersEXT causes any offsets previously set by vkCmdSetDescriptorBufferOffsetsEXT that use the bindings numbered [0..bufferCount-1] to be no longer valid for subsequent bound pipeline commands. Any previously bound buffers at binding points greater than or equal to bufferCount are unbound.

### Valid Usage

- **VUID-vkCmdBindDescriptorBuffersEXT-None-08047**
The descriptorBuffer feature must be enabled

- **VUID-vkCmdBindDescriptorBuffersEXT-maxSamplerDescriptorBufferBindings-08048**
There must be no more than VkPhysicalDeviceDescriptorBufferPropertiesEXT::maxSamplerDescriptorBufferBindings descriptor buffers containing sampler descriptor data bound

- **VUID-vkCmdBindDescriptorBuffersEXT-maxResourceDescriptorBufferBindings-08049**
There must be no more than VkPhysicalDeviceDescriptorBufferPropertiesEXT::maxResourceDescriptorBufferBindings descriptor buffers containing resource descriptor data bound

- **VUID-vkCmdBindDescriptorBuffersEXT-None-08050**
There must be no more than 1 descriptor buffer bound that was created with the VK_BUFFER_USAGE_PUSH_DESCRIPTORs_DESCRIPTOR_BUFFER_BIT_EXT bit set

- **VUID-vkCmdBindDescriptorBuffersEXT-bufferCount-08051**
bufferCount must be less than or equal to VkPhysicalDeviceDescriptorBufferPropertiesEXT::maxDescriptorBufferBindings

- **VUID-vkCmdBindDescriptorBuffersEXT-pBindingInfos-08052**
For any element of pBindingInfos, if the buffer from which address was queried is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- **VUID-vkCmdBindDescriptorBuffersEXT-pBindingInfos-08053**
For any element of pBindingInfos, the buffer from which address was queried must have been created with the VK_BUFFER_USAGE_SAMPLER_DESCRIPTOR_BUFFER_BIT_EXT bit set if it contains sampler descriptor data

- **VUID-vkCmdBindDescriptorBuffersEXT-pBindingInfos-08054**
For any element of pBindingInfos, the buffer from which address was queried must have been created with the VK_BUFFER_USAGE_RESOURCE_DESCRIPTOR_BUFFER_BIT_EXT bit set if it contains resource descriptor data
For any element of `pBindingInfos`, usage must match the buffer from which address was queried.

**Valid Usage (Implicit)**

- **VUID-vkCmdBindDescriptorBuffersEXT-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdBindDescriptorBuffersEXT-pBindingInfos-parameter**
  `pBindingInfos` must be a valid pointer to an array of `bufferCount` valid `VkDescriptorBufferBindingInfoEXT` structures.

- **VUID-vkCmdBindDescriptorBuffersEXT-commandBuffer-recording**
  `commandBuffer` must be in the recording state.

- **VUID-vkCmdBindDescriptorBuffersEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations.

- **VUID-vkCmdBindDescriptorBuffersEXT-videocoding**
  This command must only be called outside of a video coding scope.

- **VUID-vkCmdBindDescriptorBuffersEXT-bufferCount-arraylength**
  `bufferCount` must be greater than 0.

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>

Data describing a descriptor buffer binding is passed in a `VkDescriptorBufferBindingInfoEXT` structure:

```c
// Provided by VK_EXT_descriptor_buffer
typedef struct VkDescriptorBufferBindingInfoEXT {
    VkStructureType sType;
    void* pNext;
} VkDescriptorBufferBindingInfoEXT;
```
VkDeviceAddress address;
VkBufferUsageFlags usage;
} VkDescriptorBufferBindingInfoEXT;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `address` is a `VkDeviceAddress` specifying the device address defining the descriptor buffer to be bound.
- `usage` is a bitmask of `VkBufferUsageFlagBits` specifying the `VkBufferCreateInfo::usage` for the buffer from which `address` was queried.

If a `VkBufferUsageFlags2CreateInfoKHR` structure is present in the `pNext` chain, `VkBufferUsageFlags2CreateInfoKHR::usage` from that structure is used instead of `usage` from this structure.

### Valid Usage

- **VUID-VkDescriptorBufferBindingInfoEXT-None-09499**
  If the `pNext` chain does not include a `VkBufferUsageFlags2CreateInfoKHR` structure, `usage` must be a valid combination of `VkBufferUsageFlagBits` values.

- **VUID-VkDescriptorBufferBindingInfoEXT-None-09500**
  If the `pNext` chain does not include a `VkBufferUsageFlags2CreateInfoKHR` structure, `usage` must not be 0.

- **VUID-VkDescriptorBufferBindingInfoEXT-bufferlessPushDescriptors-08056**
  If `VkPhysicalDeviceDescriptorBufferPropertiesEXT::bufferlessPushDescriptors` is `VK_FALSE`, and `usage` contains `VK_BUFFER_USAGE.PushDescriptors_DESCRIPTOR_BUFFER_BIT_EXT`, then the `pNext` chain **must** include a `VkDescriptorBufferBindingPushDescriptorBufferHandleEXT` structure.

- **VUID-VkDescriptorBufferBindingInfoEXT-address-08057**
  `address` **must** be aligned to `VkPhysicalDeviceDescriptorBufferPropertiesEXT::descriptorBufferOffsetAlignment`.

- **VUID-VkDescriptorBufferBindingInfoEXT-usage-08122**
  If `usage` includes `VK_BUFFER_USAGE_SAMPLER_DESCRIPTOR_BUFFER_BIT_EXT`, `address` **must** be an address within a valid buffer that was created with `VK_BUFFER_USAGE_SAMPLER_DESCRIPTOR_BUFFER_BIT_EXT`.

- **VUID-VkDescriptorBufferBindingInfoEXT-usage-08123**
  If `usage` includes `VK_BUFFER_USAGE_RESOURCE_DESCRIPTOR_BUFFER_BIT_EXT`, `address` **must** be an address within a valid buffer that was created with `VK_BUFFER_USAGE_RESOURCE_DESCRIPTOR_BUFFER_BIT_EXT`.

- **VUID-VkDescriptorBufferBindingInfoEXT-usage-08124**
  If `usage` includes `VK_BUFFER_USAGE_PUSH_DESCRIPTORS_DESCRIPTOR_BUFFER_BIT_EXT`, `address` **must** be an address within a valid buffer that was created with `VK_BUFFER_USAGE_PUSH_DESCRIPTORS_DESCRIPTOR_BUFFER_BIT_EXT`. 
Valid Usage (Implicit)

- VUID-VkDescriptorBufferBindingInfoEXT-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_DESCRIPTOR_BUFFER_BINDING_INFO_EXT

- VUID-VkDescriptorBufferBindingInfoEXT-pNext-pNext
  
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkBufferUsageFlags2CreateInfoKHR or VkDescriptorBufferBindingPushDescriptorBufferHandleEXT

- VUID-VkDescriptorBufferBindingInfoEXT-sType-unique
  
  The sType value of each struct in the pNext chain must be unique

When the VkPhysicalDeviceDescriptorBufferPropertiesEXT::bufferlessPushDescriptors property is VK_FALSE, the VkBuffer handle of the buffer for push descriptors is passed in a VkDescriptorBufferBindingPushDescriptorBufferHandleEXT structure:

```
// Provided by VK_EXT_descriptor_buffer
typedef struct VkDescriptorBufferBindingPushDescriptorBufferHandleEXT {
    VkStructureType sType;
    void* pNext;
    VkBuffer buffer;
} VkDescriptorBufferBindingPushDescriptorBufferHandleEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- buffer is the VkBuffer handle of the buffer for push descriptors.

Valid Usage

- VUID-VkDescriptorBufferBindingPushDescriptorBufferHandleEXT-bufferlessPushDescriptors-08059
  
  VkPhysicalDeviceDescriptorBufferPropertiesEXT::bufferlessPushDescriptors must be VK_FALSE

Valid Usage (Implicit)

- VUID-VkDescriptorBufferBindingPushDescriptorBufferHandleEXT-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_DESCRIPTOR_BUFFER_BINDING_PUSH_DESCRIPTOR_BUFFER_HANDLE_EXT

- VUID-VkDescriptorBufferBindingPushDescriptorBufferHandleEXT-buffer-parameter
  
  buffer must be a valid VkBuffer handle

To set descriptor buffer offsets in a command buffer, call:
// Provided by VK_EXT_descriptor_buffer
void vkCmdSetDescriptorBufferOffsetsEXT(
  VkCommandBuffer commandBuffer,
  VkPipelineBindPoint pipelineBindPoint,
  VkPipelineLayout layout,
  uint32_t firstSet,
  uint32_t setCount,
  const uint32_t* pBufferIndices,
  const VkDeviceSize* pOffsets);

- **commandBuffer** is the command buffer in which the descriptor buffer offsets will be set.
- **pipelineBindPoint** is a **VkPipelineBindPoint** indicating the type of the pipeline that will use the descriptors.
- **layout** is a **VkPipelineLayout** object used to program the bindings.
- **firstSet** is the number of the first set to be bound.
- **setCount** is the number of elements in the **pBufferIndices** and **pOffsets** arrays.
- **pBufferIndices** is a pointer to an array of indices into the descriptor buffer binding points set by **vkCmdBindDescriptorBuffersEXT**.
- **pOffsets** is a pointer to an array of **VkDeviceSize** offsets to apply to the bound descriptor buffers.

**vkCmdSetDescriptorBufferOffsetsEXT** binds **setCount** pairs of descriptor buffers, specified by indices into the binding points bound using **vkCmdBindDescriptorBuffersEXT**, and buffer offsets to set numbers \([\text{firstSet..firstSet} + \text{descriptorSetCount} - 1]\) for subsequent **bound pipeline commands** set by **pipelineBindPoint**. Set \([\text{firstSet} + \text{i}]\) is bound to the descriptor buffer at binding **pBufferIndices**[i] at an offset of **pOffsets**[i]. Any bindings that were previously applied via these sets, or calls to **vkCmdBindDescriptorSets**, are no longer valid. Other sets will also be invalidated upon calling this command if **layout** differs from the pipeline layout used to bind those other sets, as described in **Pipeline Layout Compatibility**.

After binding descriptors, applications **can** modify descriptor memory either by performing writes on the host or with device commands. When descriptor memory is updated with device commands, visibility for the shader stage accessing a descriptor is ensured with the **VK_ACCESS_2_DESCRIPTOR_BUFFER_READ_BIT_EXT** access flag. Implementations **must** not access resources referenced by these descriptors unless they are dynamically accessed by shaders. Descriptors bound with this call **can** be undefined if they are not dynamically accessed by shaders.

Implementations **may** read descriptor data for any statically accessed descriptor if the binding in **layout** is not declared with the **VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT** flag. If the binding in **layout** is declared with **VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT**, implementations **must** not read descriptor data that is not dynamically accessed.

Applications **must** ensure that any descriptor which the implementation **may** read **must** be in-bounds of the underlying descriptor buffer binding.

---

1352
Applications can freely decide how large a variable descriptor buffer binding is, so it may not be safe to read such descriptor payloads statically. The intention of these rules is to allow implementations to speculatively prefetch descriptor payloads where feasible.

Dynamically accessing a resource through descriptor data from an unbound region of a sparse partially-resident buffer will result in invalid descriptor data being read, and therefore undefined behavior.

**Note**
For descriptors written by the host, visibility is implied through the automatic visibility operation on queue submit, and there is no need to consider VK_ACCESS_2_DESCRIPTOR_BUFFER_READ_BIT. Explicit synchronization for descriptors is only required when descriptors are updated on the device.

**Note**
The requirements above imply that all descriptor bindings have been defined with the equivalent of VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT, VK_DESCRIPTOR_BINDING_UPDATEUnusedWhilePendingBit and VK_DESCRIPTOR_BINDING_PartiallyBoundBit, but enabling those features is not required to get this behavior.

### Valid Usage

- **VUID-vkCmdSetDescriptorBufferOffsetsEXT-pOffsets-08061**
The offsets in `pOffsets` **must** be aligned to `VkPhysicalDeviceDescriptorBufferPropertiesEXT::descriptorBufferOffsetAlignment`

- **VUID-vkCmdSetDescriptorBufferOffsetsEXT-pOffsets-08063**
The offsets in `pOffsets` **must** be small enough such that any descriptor binding referenced by layout without the VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT flag computes a valid address inside the underlying `VkBuffer`

- **VUID-vkCmdSetDescriptorBufferOffsetsEXT-pOffsets-08126**
The offsets in `pOffsets` **must** be small enough such that any location accessed by a shader as a sampler descriptor **must** be within `VkPhysicalDeviceDescriptorBufferPropertiesEXT::maxSamplerDescriptorBufferRange` of the sampler descriptor buffer binding

- **VUID-vkCmdSetDescriptorBufferOffsetsEXT-pOffsets-08127**
The offsets in `pOffsets` **must** be small enough such that any location accessed by a shader as a resource descriptor **must** be within `VkPhysicalDeviceDescriptorBufferPropertiesEXT::maxResourceDescriptorBufferRange` of the resource descriptor buffer binding

- **VUID-vkCmdSetDescriptorBufferOffsetsEXT-pBufferIndices-08064**
Each element of `pBufferIndices` **must** be less than `VkPhysicalDeviceDescriptorBufferPropertiesEXT::maxDescriptorBufferBindings`

- **VUID-vkCmdSetDescriptorBufferOffsetsEXT-pBufferIndices-08065**
Each element of pBufferIndices must reference a valid descriptor buffer binding set by a previous call to vkCmdBindDescriptorBuffersEXT in commandBuffer

- VUID-vkCmdSetDescriptorBufferOffsetsEXT-firstSet-08066
  The sum of firstSet and setCount must be less than or equal to VkPipelineLayoutCreateInfo::setLayoutCount provided when layout was created.

- VUID-vkCmdSetDescriptorBufferOffsetsEXT-firstSet-09006
  The VkDescriptorSetLayout for each set from firstSet to firstSet + setCount when layout was created must have been created with the VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT bit set.

- VUID-vkCmdSetDescriptorBufferOffsetsEXT-None-08060
  The descriptorBuffer feature must be enabled.

- VUID-vkCmdSetDescriptorBufferOffsetsEXT-pipelineBindPoint-08067
  pipelineBindPoint must be supported by the commandBuffer’s parent VkCommandPool’s queue family.

Valid Usage (Implicit)

- VUID-vkCmdSetDescriptorBufferOffsetsEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle.

- VUID-vkCmdSetDescriptorBufferOffsetsEXT-pipelineBindPoint-parameter
  pipelineBindPoint must be a valid VkPipelineBindPoint value.

- VUID-vkCmdSetDescriptorBufferOffsetsEXT-layout-parameter
  layout must be a valid VkPipelineLayout handle.

- VUID-vkCmdSetDescriptorBufferOffsetsEXT-pBufferIndices-parameter
  pBufferIndices must be a valid pointer to an array of setCount uint32_t values.

- VUID-vkCmdSetDescriptorBufferOffsetsEXT-pOffsets-parameter
  pOffsets must be a valid pointer to an array of setCount VkDeviceSize values.

- VUID-vkCmdSetDescriptorBufferOffsetsEXT-commandBuffer-recording
  commandBuffer must be in the recording state.

- VUID-vkCmdSetDescriptorBufferOffsetsEXT-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations.

- VUID-vkCmdSetDescriptorBufferOffsetsEXT-videocoding
  This command must only be called outside of a video coding scope.

- VUID-vkCmdSetDescriptorBufferOffsetsEXT-setCount-arraylength
  setCount must be greater than 0.

- VUID-vkCmdSetDescriptorBufferOffsetsEXT-commonparent
  Both of commandBuffer, and layout must have been created, allocated, or retrieved from the same VkDevice.
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

Alternatively, to set descriptor buffer offsets in a command buffer, call:

```c
// Provided by VK_KHR_maintenance6 with VK_EXT_descriptor_buffer
void vkCmdSetDescriptorBufferOffsets2EXT(
    VkCommandBuffer commandBuffer,
    const VkSetDescriptorBufferOffsetsInfoEXT* pSetDescriptorBufferOffsetsInfo);
```

- `commandBuffer` is the command buffer in which the descriptor buffer offsets will be set.
- `pSetDescriptorBufferOffsetsInfo` is a pointer to a `VkSetDescriptorBufferOffsetsInfoEXT` structure.

Valid Usage

- VUID-vkCmdSetDescriptorBufferOffsets2EXT-descriptorBuffer-09470
  The `descriptorBuffer` feature must be enabled
- VUID-vkCmdSetDescriptorBufferOffsets2EXT-pSetDescriptorBufferOffsetsInfo-09471
  Each bit in `pSetDescriptorBufferOffsetsInfo->stageFlags` must be a stage supported by the `commandBuffer`’s parent `VkCommandPool`’s queue family

Valid Usage (Implicit)

- VUID-vkCmdSetDescriptorBufferOffsets2EXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDescriptorBufferOffsets2EXT-pSetDescriptorBufferOffsetsInfo-parameter
  `pSetDescriptorBufferOffsetsInfo` must be a valid pointer to a valid `VkSetDescriptorBufferOffsetsInfoEXT` structure
- VUID-vkCmdSetDescriptorBufferOffsets2EXT-commandBuffer-recording
  `commandBuffer` must be in the recording state
The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations.

This command must only be called outside of a video coding scope.

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics, Compute</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The `VkSetDescriptorBufferOffsetsInfoEXT` structure is defined as:

```c
// Provided by VK_KHR_maintenance6 with VK_EXT_descriptor_buffer
typedef struct VkSetDescriptorBufferOffsetsInfoEXT {
    VkStructureType    sType;
    const void*         pNext;
    VkShaderStageFlags stageFlags;
    VkPipelineLayout   layout;
    uint32_t            firstSet;
    uint32_t            setCount;
    const uint32_t*     pBufferIndices;
    const VkDeviceSize* pOffsets;
} VkSetDescriptorBufferOffsetsInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stageFlags` is a bitmask of `VkShaderStageFlagBits` specifying the shader stages the descriptor sets will be bound to.
- `layout` is a `VkPipelineLayout` object used to program the bindings. If the `dynamicPipelineLayout` feature is enabled, `layout` can be `VK_NULL_HANDLE` and the layout must be specified by chaining `VkPipelineLayoutCreateInfo` structure off the `pNext`.
- `firstSet` is the number of the first set to be bound.
- **setCount** is the number of elements in the pBufferIndices and pOffsets arrays.
- **pBufferIndices** is a pointer to an array of indices into the descriptor buffer binding points set by vkCmdBindDescriptorBuffersEXT.
- **pOffsets** is a pointer to an array of VkDeviceSize offsets to apply to the bound descriptor buffers.

If stageFlags specifies a subset of all stages corresponding to one or more pipeline bind points, the binding operation still affects all stages corresponding to the given pipeline bind point(s) as if the equivalent original version of this command had been called with the same parameters. For example, specifying a stageFlags value of VK_SHADER_STAGE_VERTEX_BIT | VK_SHADER_STAGE_FRAGMENT_BIT | VK_SHADER_STAGE_COMPUTE_BIT is equivalent to calling the original version of this command once with VK_PIPELINE_BIND_POINT_GRAPHICS and once with VK_PIPELINE_BIND_POINT_COMPUTE.

**Valid Usage**

- VUID-VkSetDescriptorBufferOffsetsInfoEXT-pOffsets-08061
  The offsets in pBufferIndices must be aligned to VkPhysicalDeviceDescriptorBufferPropertiesEXT::descriptorBufferOffsetAlignment

- VUID-VkSetDescriptorBufferOffsetsInfoEXT-pOffsets-08063
  The offsets in pOffsets must be small enough such that any descriptor binding referenced by layout without the VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT flag computes a valid address inside the underlying VkBuffer

- VUID-VkSetDescriptorBufferOffsetsInfoEXT-pOffsets-08126
  The offsets in pOffsets must be small enough such that any location accessed by a shader as a sampler descriptor must be within VkPhysicalDeviceDescriptorBufferPropertiesEXT::maxSamplerDescriptorBufferRange of the sampler descriptor buffer binding

- VUID-VkSetDescriptorBufferOffsetsInfoEXT-pOffsets-08127
  The offsets in pOffsets must be small enough such that any location accessed by a shader as a resource descriptor must be within VkPhysicalDeviceDescriptorBufferPropertiesEXT::maxResourceDescriptorBufferRange of the resource descriptor buffer binding

- VUID-VkSetDescriptorBufferOffsetsInfoEXT-pBufferIndices-08064
  Each element of pBufferIndices must be less than VkPhysicalDeviceDescriptorBufferPropertiesEXT::maxDescriptorBufferBindings

- VUID-VkSetDescriptorBufferOffsetsInfoEXT-pBufferIndices-08065
  Each element of pBufferIndices must reference a valid descriptor buffer binding set by a previous call to vkCmdBindDescriptorBuffersEXT in commandBuffer

- VUID-VkSetDescriptorBufferOffsetsInfoEXT-firstSet-08066
  The sum of firstSet and setCount must be less than or equal to VkPipelineLayoutCreateInfo::setLayoutCount provided when layout was created

- VUID-VkSetDescriptorBufferOffsetsInfoEXT-firstSet-09006
  The VkDescriptorSetLayout for each set from firstSet to firstSet + setCount when layout was created must have been created with the
VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT bit set

- VUID-VkSetDescriptorBufferOffsetsInfoEXT-None-09495
  If the dynamicPipelineLayout feature is not enabled, layout must be a valid VkPipelineLayout handle

- VUID-VkSetDescriptorBufferOffsetsInfoEXT-layout-09496
  If layout is VK_NULL_HANDLE, the pNext chain must include a valid VkPipelineLayoutCreateInfo structure

---

Valid Usage (Implicit)

- VUID-VkSetDescriptorBufferOffsetsInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_SET_DESCRIPTOR_BUFFER_OFFSETS_INFO_EXT

- VUID-VkSetDescriptorBufferOffsetsInfoEXT-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkPipelineLayoutCreateInfo

- VUID-VkSetDescriptorBufferOffsetsInfoEXT-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkSetDescriptorBufferOffsetsInfoEXT-stageFlags-parameter
  stageFlags must be a valid combination of VkShaderStageFlagBits values

- VUID-VkSetDescriptorBufferOffsetsInfoEXT-stageFlags-requiredbitmask
  stageFlags must not be 0

- VUID-VkSetDescriptorBufferOffsetsInfoEXT-layout-parameter
  If layout is not VK_NULL_HANDLE, layout must be a valid VkPipelineLayout handle

- VUID-VkSetDescriptorBufferOffsetsInfoEXT-pBufferIndices-parameter
  pBufferIndices must be a valid pointer to an array of setCount uint32_t values

- VUID-VkSetDescriptorBufferOffsetsInfoEXT-pOffsets-parameter
  pOffsets must be a valid pointer to an array of setCount VkDeviceSize values

- VUID-VkSetDescriptorBufferOffsetsInfoEXT-setCount-arraylength
  setCount must be greater than 0

To bind an embedded immutable sampler set to a command buffer, call:

```c
// Provided by VK_EXT_descriptor_buffer
void vkCmdBindDescriptorBufferEmbeddedSamplersEXT(
    VkCommandBuffer commandBuffer,
    VkPipelineBindPoint pipelineBindPoint,
    VkPipelineLayout layout,
    uint32_t set);
```

- commandBuffer is the command buffer that the embedded immutable samplers will be bound to.
- pipelineBindPoint is a VkPipelineBindPoint indicating the type of the pipeline that will use the embedded immutable samplers.
• **layout** is a `VkPipelineLayout` object used to program the bindings.

• **set** is the number of the set to be bound.

`vkCmdBindDescriptorBufferEmbeddedSamplersEXT` binds the embedded immutable samplers in **set** of **layout** to **set** for the command buffer for subsequent **bound pipeline commands** set by `pipelineBindPoint`. Any previous binding to this set by `vkCmdSetDescriptorBufferOffsetsEXT` or this command is overwritten. Any sets that were last bound by a call to `vkCmdBindDescriptorSets` are invalidated upon calling this command. Other sets will also be invalidated upon calling this command if **layout** differs from the pipeline layout used to bind those other sets, as described in Pipeline Layout Compatibility.

### Valid Usage

- VUID-vkCmdBindDescriptorBufferEmbeddedSamplersEXT-set-08070
  The `VkDescriptorSetLayout` at index **set** when **layout** was created **must** have been created with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_EMBEDDED_IMMUTABLE_SAMPLERS_BIT_EXT` bit set.

- VUID-vkCmdBindDescriptorBufferEmbeddedSamplersEXT-set-08071
  **set** **must** be less than or equal to `VkPipelineLayoutCreateInfo::setLayoutCount` provided when **layout** was created.

- VUID-vkCmdBindDescriptorBufferEmbeddedSamplersEXT-None-08068
  The `descriptorBuffer` feature **must** be enabled.

- VUID-vkCmdBindDescriptorBufferEmbeddedSamplersEXT-pipelineBindPoint-08069
  `pipelineBindPoint` **must** be supported by the `commandBuffer`'s parent `VkCommandPool`'s queue family.

### Valid Usage (Implicit)

- VUID-vkCmdBindDescriptorBufferEmbeddedSamplersEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle.

- VUID-vkCmdBindDescriptorBufferEmbeddedSamplersEXT-pipelineBindPoint-parameter
  `pipelineBindPoint` **must** be a valid `VkPipelineBindPoint` value.

- VUID-vkCmdBindDescriptorBufferEmbeddedSamplersEXT-layout-parameter
  `layout` **must** be a valid `VkPipelineLayout` handle.

- VUID-vkCmdBindDescriptorBufferEmbeddedSamplersEXT-commandBuffer-recording
  `commandBuffer` **must** be in the `recording state`.

- VUID-vkCmdBindDescriptorBufferEmbeddedSamplersEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, or compute operations.

- VUID-vkCmdBindDescriptorBufferEmbeddedSamplersEXT-videocoding
  This command **must** only be called outside of a video coding scope.

- VUID-vkCmdBindDescriptorBufferEmbeddedSamplersEXT-commonparent
  Both of `commandBuffer`, and `layout` **must** have been created, allocated, or retrieved from the same `VkDevice`.  

1359
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

The `VkBindDescriptorBufferEmbeddedSamplersInfoEXT` structure is defined as:

- `commandBuffer` must be in the recording state
- The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations
- This command must only be called outside of a video coding scope
If `stageFlags` specifies a subset of all stages corresponding to one or more pipeline bind points, the binding operation still affects all stages corresponding to the given pipeline bind point(s) as if the equivalent original version of this command had been called with the same parameters. For example, specifying a `stageFlags` value of `VK_SHADER_STAGE_VERTEX_BIT | VK_SHADER_STAGE_FRAGMENT_BIT | VK_SHADER_STAGE_COMPUTE_BIT` is equivalent to calling the original version of this command once with `VK_PIPELINE_BIND_POINT_GRAPHICS` and once with `VK_PIPELINE_BIND_POINT_COMPUTE`.

### Valid Usage

- **VUID-VkBindDescriptorBufferEmbeddedSamplersInfoEXT-set-08070**
  The `VkDescriptorSetLayout` at index `set` when `layout` was created must have been created with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_EMBEDDED_IMMUTABLE_SAMPLERS_BIT_EXT` bit set.

- **VUID-VkBindDescriptorBufferEmbeddedSamplersInfoEXT-set-08071**
  `set` must be less than or equal to `VkPipelineLayoutCreateInfo::setLayoutCount` provided when `layout` was created.

- **VUID-VkBindDescriptorBufferEmbeddedSamplersInfoEXT-None-09495**
  If the `dynamicPipelineLayout` feature is not enabled, `layout` must be a valid `VkPipelineLayout` handle.

- **VUID-VkBindDescriptorBufferEmbeddedSamplersInfoEXT-layout-09496**
  If `layout` is `VK_NULL_HANDLE`, the `pNext` chain must include a valid `VkPipelineLayoutCreateInfo` structure.

### Valid Usage (Implicit)

- **VUID-VkBindDescriptorBufferEmbeddedSamplersInfoEXT-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_BIND_DESCRIPTOR_BUFFER_EMBEDDED_SAMPLERS_INFO_EXT`.

- **VUID-VkBindDescriptorBufferEmbeddedSamplersInfoEXT-pNext-pNext**
  `pNext` must be `NULL` or a pointer to a valid instance of `VkPipelineLayoutCreateInfo`.

- **VUID-VkBindDescriptorBufferEmbeddedSamplersInfoEXT-sType-unique**
  The `sType` value of each struct in the `pNext` chain must be unique.

- **VUID-VkBindDescriptorBufferEmbeddedSamplersInfoEXT-stageFlags-parameter**
  `stageFlags` must be a valid combination of `VkShaderStageFlagBits` values.

- **VUID-VkBindDescriptorBufferEmbeddedSamplersInfoEXT-stageFlags-requiredbitmask**
  `stageFlags` must not be `0`.

- **VUID-VkBindDescriptorBufferEmbeddedSamplersInfoEXT-layout-parameter**
  If `layout` is not `VK_NULL_HANDLE`, `layout` must be a valid `VkPipelineLayout` handle.

### 14.4.3. Updating Descriptor Buffers

Updates to descriptor data in buffers can be performed by any operation on either the host or device that can access memory.
Descriptor buffer reads can be synchronized using \texttt{VK_ACCESS_2_DESCRIPTOR_BUFFER_READ_BIT_EXT} in the relevant shader stage.

### 14.4.4. Push Descriptors With Descriptor Buffers

If the \texttt{descriptorBufferPushDescriptors} feature is enabled, push descriptors can be used with descriptor buffers in the same way as with descriptor sets.

The \texttt{VkPhysicalDeviceDescriptorBufferPropertiesEXT::bufferlessPushDescriptors} property indicates whether the implementation requires a buffer to back push descriptors. If the property is \texttt{VK_FALSE} then before recording any push descriptors the application must bind exactly 1 descriptor buffer that was created with the \texttt{VK_BUFFER_USAGE_PUSH_DESCRIPTORS_DESCRIPTOR_BUFFER_BIT_EXT} bit set. When this buffer is bound any previously recorded push descriptors that are required for a subsequent command must be recorded again.

### 14.4.5. Capture and Replay

In a similar way to \texttt{bufferDeviceAddressCaptureReplay}, the \texttt{descriptorBufferCaptureReplay} feature allows the creation of opaque handles for objects at capture time that can be passed into object creation calls in a future replay, causing descriptors to be created with the same data. The opaque memory address for any memory used by these resources must have been captured using \texttt{vkGetDeviceMemoryOpaqueCaptureAddress} and be replayed using \texttt{VkMemoryOpaqueCaptureAddressAllocateInfo}.

To get the opaque descriptor data for a buffer, call:

```c
// Provided by VK_EXT_descriptor_buffer
VkResult vkGetBufferOpaqueCaptureDescriptorDataEXT(
    VkDevice device,
    const VkBufferCaptureDescriptorDataInfoEXT* pInfo,
    void* pData);
```

- \texttt{device} is the logical device that gets the data.
- \texttt{pInfo} is a pointer to a \texttt{VkBufferCaptureDescriptorDataInfoEXT} structure specifying the buffer.
- \texttt{pData} is a pointer to a user-allocated buffer where the data will be written.

#### Valid Usage

- VUID-vkGetBufferOpaqueCaptureDescriptorDataEXT-None-08072
  The \texttt{descriptorBufferCaptureReplay} feature must be enabled
- VUID-vkGetBufferOpaqueCaptureDescriptorDataEXT-pData-08073
  \texttt{pData} must point to a buffer that is at least \texttt{VkPhysicalDeviceDescriptorBufferPropertiesEXT::bufferCaptureReplayDescriptorDataSize} bytes in size
- VUID-vkGetBufferOpaqueCaptureDescriptorDataEXT-device-08074
  If \texttt{device} was created with multiple physical devices, then the
Valid Usage (Implicit)

- VUID-vkGetBufferOpaqueCaptureDescriptorDataEXT-device-parameter
device must be a valid VkDevice handle

- VUID-vkGetBufferOpaqueCaptureDescriptorDataEXT-pInfo-parameter
pInfo must be a valid pointer to a valid VkBufferCaptureDescriptorDataInfoEXT structure

- VUID-vkGetBufferOpaqueCaptureDescriptorDataEXT-pData-parameter
pData must be a pointer value

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

Information about the buffer to get descriptor buffer capture data for is passed in a
VkBufferCaptureDescriptorDataInfoEXT structure:

```c
// Provided by VK_EXT_descriptor_buffer
typedef struct VkBufferCaptureDescriptorDataInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkBuffer buffer;
} VkBufferCaptureDescriptorDataInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `buffer` is the VkBuffer handle of the buffer to get opaque capture data for.

Valid Usage

- VUID-VkBufferCaptureDescriptorDataInfoEXT-buffer-08075
buffer must have been created with
VK_BUFFER_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT set in VkBufferCreateInfo
::flags
Valid Usage (Implicit)

- VUID-VkBufferCaptureDescriptorDataInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_BUFFER_CAPTURE_DESCRIPTOR_DATA_INFO_EXT

- VUID-VkBufferCaptureDescriptorDataInfoEXT-pNext-pNext
  pNext must be NULL

- VUID-VkBufferCaptureDescriptorDataInfoEXT-buffer-parameter
  buffer must be a valid VkBuffer handle

To get the opaque capture descriptor data for an image, call:

```c
// Provided by VK_EXT_descriptor_buffer
VkResult vkGetImageOpaqueCaptureDescriptorDataEXT(
    VkDevice device,
    const VkImageCaptureDescriptorDataInfoEXT* pInfo,
    void* pData);
```

- `device` is the logical device that gets the data.
- `pInfo` is a pointer to a VkImageCaptureDescriptorDataInfoEXT structure specifying the image.
- `pData` is a pointer to a user-allocated buffer where the data will be written.

Valid Usage

- VUID-vkGetImageOpaqueCaptureDescriptorDataEXT-None-08076
  The descriptorBufferCaptureReplay feature must be enabled

- VUID-vkGetImageOpaqueCaptureDescriptorDataEXT-pData-08077
  pData must point to a buffer that is at least
  VkPhysicalDeviceDescriptorBufferPropertiesEXT::imageCaptureReplayDescriptorDataSize
  bytes in size

- VUID-vkGetImageOpaqueCaptureDescriptorDataEXT-device-08078
  If device was created with multiple physical devices, then the
  bufferDeviceAddressMultiDevice feature must be enabled

Valid Usage (Implicit)

- VUID-vkGetImageOpaqueCaptureDescriptorDataEXT-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetImageOpaqueCaptureDescriptorDataEXT-pInfo-parameter
  pInfo must be a valid pointer to a valid VkImageCaptureDescriptorDataInfoEXT structure

- VUID-vkGetImageOpaqueCaptureDescriptorDataEXT-pData-parameter
  pData must be a pointer value
Return Codes

Success

• VK_SUCCESS

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

Information about the image to get descriptor buffer capture data for is passed in a `VkImageCaptureDescriptorDataInfoEXT` structure:

```c
// Provided by VK_EXT_descriptor_buffer
typedef struct VkImageCaptureDescriptorDataInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkImage image;
} VkImageCaptureDescriptorDataInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `image` is the `VkImage` handle of the image to get opaque capture data for.

Valid Usage

- VUID-VkImageCaptureDescriptorDataInfoEXT-image-08079 `image` must have been created with `VK_IMAGE_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT` set in `VkImageCreateInfo` ::flags

Valid Usage (Implicit)

- VUID-VkImageCaptureDescriptorDataInfoEXT-sType-sType `sType` must be `VK_STRUCTURE_TYPE_IMAGE_CAPTURE_DESCRIPTOR_DATA_INFO_EXT`
- VUID-VkImageCaptureDescriptorDataInfoEXT-pNext-pNext `pNext` must be `NULL`
- VUID-VkImageCaptureDescriptorDataInfoEXT-image-parameter `image` must be a valid `VkImage` handle

To get the opaque capture descriptor data for an image view, call:

```c
// Provided by VK_EXT_descriptor_buffer
```
VkResult vkGetImageViewOpaqueCaptureDescriptorDataEXT(
    VkDevice device,
    const VkImageViewCaptureDescriptorDataInfoEXT* pInfo,
    void* pData);

- **device** is the logical device that gets the data.
- **pInfo** is a pointer to a `VkImageViewCaptureDescriptorDataInfoEXT` structure specifying the image view.
- **pData** is a pointer to a user-allocated buffer where the data will be written.

### Valid Usage

- **VUID-vkGetImageViewOpaqueCaptureDescriptorDataEXT-None-08080**
  The `descriptorBufferCaptureReplay` feature **must** be enabled.

- **VUID-vkGetImageViewOpaqueCaptureDescriptorDataEXT-pData-08081**
  **pData** **must** point to a buffer that is at least `VkPhysicalDeviceDescriptorBufferPropertiesEXT::imageViewCaptureReplayDescriptorDataSize` bytes in size.

- **VUID-vkGetImageViewOpaqueCaptureDescriptorDataEXT-device-08082**
  If **device** was created with multiple physical devices, then the `bufferDeviceAddressMultiDevice` feature **must** be enabled.

### Valid Usage (Implicit)

- **VUID-vkGetImageViewOpaqueCaptureDescriptorDataEXT-device-parameter**
  **device** **must** be a valid `VkDevice` handle.

- **VUID-vkGetImageViewOpaqueCaptureDescriptorDataEXT-pInfo-parameter**
  **pInfo** **must** be a valid pointer to a valid `VkImageViewCaptureDescriptorDataInfoEXT` structure.

- **VUID-vkGetImageViewOpaqueCaptureDescriptorDataEXT-pData-parameter**
  **pData** **must** be a pointer value.

### Return Codes

- **Success**
  - `VK_SUCCESS`

- **Failure**
  - `VK_ERROR_OUT_OF_HOST_MEMORY`
  - `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Information about the image view to get descriptor buffer capture data for is passed in a
**VkImageViewCaptureDescriptorDataInfoEXT structure:**

```c
// Provided by VK_EXT_descriptor_buffer
typedef struct VkImageViewCaptureDescriptorDataInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkImageView imageView;
} VkImageViewCaptureDescriptorDataInfoEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **imageView** is the `VkImageView` handle of the image view to get opaque capture data for.

**Valid Usage**

- VUID-VkImageViewCaptureDescriptorDataInfoEXT-imageView-08083
  ```
  imageView must have been created with VK_IMAGE_VIEW_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT set in VkImageViewCreateInfo::flags
  ```

**Valid Usage (Implicit)**

- VUID-VkImageViewCaptureDescriptorDataInfoEXT-sType-sType
  ```
  sType must be VK_STRUCTURE_TYPE_IMAGE_VIEW_CAPTURE_DESCRIPTOR_DATA_INFO_EXT
  ```
- VUID-VkImageViewCaptureDescriptorDataInfoEXT-pNext-pNext
  ```
  pNext must be NULL
  ```
- VUID-VkImageViewCaptureDescriptorDataInfoEXT-imageView-parameter
  ```
  imageView must be a valid VkImageView handle
  ```

To get the opaque capture descriptor data for a sampler, call:

```c
// Provided by VK_EXT_descriptor_buffer
VkResult vkGetSamplerOpaqueCaptureDescriptorDataEXT(
    VkDevice device,
    const VkSamplerCaptureDescriptorDataInfoEXT* pInfo,
    void* pData);
```

- **device** is the logical device that gets the data.
- **pInfo** is a pointer to a `VkSamplerCaptureDescriptorDataInfoEXT` structure specifying the sampler.
- **pData** is a pointer to a user-allocated buffer where the data will be written.
Valid Usage

• VUID-vkGetSamplerOpaqueCaptureDescriptorDataEXT-None-08084
  The `descriptorBufferCaptureReplay` feature must be enabled

• VUID-vkGetSamplerOpaqueCaptureDescriptorDataEXT-pData-08085
  `pData` must point to a buffer that is at least `VkPhysicalDeviceDescriptorBufferPropertiesEXT::samplerCaptureReplayDescriptorDataSize` bytes in size

• VUID-vkGetSamplerOpaqueCaptureDescriptorDataEXT-device-08086
  If `device` was created with multiple physical devices, then the `bufferDeviceAddressMultiDevice` feature must be enabled

Valid Usage (Implicit)

• VUID-vkGetSamplerOpaqueCaptureDescriptorDataEXT-device-parameter
  `device` must be a valid `VkDevice` handle

• VUID-vkGetSamplerOpaqueCaptureDescriptorDataEXT-pInfo-parameter
  `pInfo` must be a valid pointer to a valid `VkSamplerCaptureDescriptorDataInfoEXT` structure

• VUID-vkGetSamplerOpaqueCaptureDescriptorDataEXT-pData-parameter
  `pData` must be a pointer value

Return Codes

Success

• `VK_SUCCESS`

Failure

• `VK_ERROR_OUT_OF_HOST_MEMORY`
  • `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Information about the sampler to get descriptor buffer capture data for is passed in a `VkSamplerCaptureDescriptorDataInfoEXT` structure:

```c
// Provided by VK_EXT_descriptor_buffer
typedef struct VkSamplerCaptureDescriptorDataInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkSampler sampler;
} VkSamplerCaptureDescriptorDataInfoEXT;
```

• `sType` is a `VkStructureType` value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• sampler is the VkSampler handle of the sampler to get opaque capture data for.

Valid Usage

• VUID-VkSamplerCaptureDescriptorDataInfoEXT-sampler-08087
  sampler must have been created with
  VK_SAMPLER_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT set in VkSamplerCreateInfo::flags

Valid Usage (Implicit)

• VUID-VkSamplerCaptureDescriptorDataInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_SAMPLER_CAPTURE_DESCRIPTOR_DATA_INFO_EXT
• VUID-VkSamplerCaptureDescriptorDataInfoEXT-pNext-pNext
  pNext must be NULL
• VUID-VkSamplerCaptureDescriptorDataInfoEXT-sampler-parameter
  sampler must be a valid VkSampler handle

To get the opaque capture descriptor data for an acceleration structure, call:

```c
// Provided by VK_EXT_descriptor_buffer with VK_KHR_acceleration_structure or
// VK_NV_ray_tracing
VkResult vkGetAccelerationStructureOpaqueCaptureDescriptorDataEXT(
  VkDevice device,
  const VkAccelerationStructureCaptureDescriptorDataInfoEXT* pInfo,
  void* pData);
```

• device is the logical device that gets the data.
• pInfo is a pointer to a VkAccelerationStructureCaptureDescriptorDataInfoEXT structure
  specifying the acceleration structure.
• pData is a pointer to a user-allocated buffer where the data will be written.

Valid Usage

• VUID-vkGetAccelerationStructureOpaqueCaptureDescriptorDataEXT-None-08088
  The descriptorBufferCaptureReplay feature must be enabled
• VUID-vkGetAccelerationStructureOpaqueCaptureDescriptorDataEXT-pData-08089
  pData must point to a buffer that is at least
  VkPhysicalDeviceDescriptorBufferPropertiesEXT::accelerationStructureCaptureReplayDesc-
  riptorDataSize bytes in size
• VUID-vkGetAccelerationStructureOpaqueCaptureDescriptorDataEXT-device-08090
If device was created with multiple physical devices, then the bufferDeviceAddressMultiDevice feature must be enabled.

Valid Usage (Implicit)

- VUID-vkGetAccelerationStructureOpaqueCaptureDescriptorDataEXT-device-parameter device must be a valid VkDevice handle
- VUID-vkGetAccelerationStructureOpaqueCaptureDescriptorDataEXT-pInfo-parameter pInfo must be a valid pointer to a valid VkAccelerationStructureCaptureDescriptorDataInfoEXT structure
- VUID-vkGetAccelerationStructureOpaqueCaptureDescriptorDataEXT-pData-parameter pData must be a pointer value

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

Information about the acceleration structure to get descriptor buffer capture data for is passed in a VkAccelerationStructureCaptureDescriptorDataInfoEXT structure:

```c
typedef struct VkAccelerationStructureCaptureDescriptorDataInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkAccelerationStructureKHR accelerationStructure;
    VkAccelerationStructureNV accelerationStructureNV;
} VkAccelerationStructureCaptureDescriptorDataInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- accelerationStructure is the VkAccelerationStructureKHR handle of the acceleration structure to get opaque capture data for.
- accelerationStructureNV is the VkAccelerationStructureNV handle of the acceleration structure to get opaque capture data for.
Valid Usage

- VUID-VkAccelerationStructureCaptureDescriptorDataInfoEXT-accelerationStructure-08091
  If `accelerationStructure` is not `VK_NULL_HANDLE` then `accelerationStructure` must have been created with `VK_ACCELERATION_STRUCTURE_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT` set in `VkAccelerationStructureCreateInfoKHR::createFlags`

- VUID-VkAccelerationStructureCaptureDescriptorDataInfoEXT-accelerationStructureNV-08092
  If `accelerationStructureNV` is not `VK_NULL_HANDLE` then `accelerationStructureNV` must have been created with `VK_ACCELERATION_STRUCTURE_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT` set in `VkAccelerationStructureCreateInfoNV::info.flags`

- VUID-VkAccelerationStructureCaptureDescriptorDataInfoEXT-accelerationStructure-08093
  If `accelerationStructure` is not `VK_NULL_HANDLE` then `accelerationStructureNV` must be `VK_NULL_HANDLE`

- VUID-VkAccelerationStructureCaptureDescriptorDataInfoEXT-accelerationStructureNV-08094
  If `accelerationStructureNV` is not `VK_NULL_HANDLE` then `accelerationStructure` must be `VK_NULL_HANDLE`

Valid Usage (Implicit)

- VUID-VkAccelerationStructureCaptureDescriptorDataInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_CAPTURE_DESCRIPTOR_DATA_INFO_EXT`

- VUID-VkAccelerationStructureCaptureDescriptorDataInfoEXT-pNext-pNext
  `pNext` must be `NULL`

- VUID-VkAccelerationStructureCaptureDescriptorDataInfoEXT-accelerationStructure-parameter
  If `accelerationStructure` is not `VK_NULL_HANDLE`, `accelerationStructure` must be a valid `VkAccelerationStructureKHR` handle

- VUID-VkAccelerationStructureCaptureDescriptorDataInfoEXT-accelerationStructureNV-parameter
  If `accelerationStructureNV` is not `VK_NULL_HANDLE`, `accelerationStructureNV` must be a valid `VkAccelerationStructureNV` handle

- VUID-VkAccelerationStructureCaptureDescriptorDataInfoEXT-commonparent
  Both of `accelerationStructure`, and `accelerationStructureNV` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`
The `VkOpaqueCaptureDescriptorDataCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_descriptor_buffer
typedef struct VkOpaqueCaptureDescriptorDataCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    const void* opaqueCaptureDescriptorData;
} VkOpaqueCaptureDescriptorDataCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `opaqueCaptureDescriptorData` is a pointer to a user-allocated buffer containing opaque capture data retrieved using `vkGetBufferOpaqueCaptureDescriptorDataEXT`, `vkGetImageOpaqueCaptureDescriptorDataEXT`, `vkGetImageViewOpaqueCaptureDescriptorDataEXT`, `vkGetSamplerOpaqueCaptureDescriptorDataEXT`, or `vkGetAccelerationStructureOpaqueCaptureDescriptorDataEXT`.

During replay, opaque descriptor capture data can be specified by adding a `VkOpaqueCaptureDescriptorDataCreateInfoEXT` structure to the relevant `pNext` chain of a `VkBufferCreateInfo`, `VkImageCreateInfo`, `VkImageViewCreateInfo`, `VkSamplerCreateInfo`, `VkAccelerationStructureCreateInfoNV` or `VkAccelerationStructureCreateInfoKHR` structure.

**Valid Usage (Implicit)**

- VUID-VkOpaqueCaptureDescriptorDataCreateInfoEXT-sType-sType `sType` must be `VK_STRUCTURE_TYPE_OPAQUE_CAPTURE_DESCRIPTOR_DATA_CREATE_INFO_EXT`
- VUID-VkOpaqueCaptureDescriptorDataCreateInfoEXT-opaqueCaptureDescriptorData-parameter `opaqueCaptureDescriptorData` must be a pointer value
Chapter 15. Shader Interfaces

When a pipeline is created, the set of shaders specified in the corresponding `VkPipelineCreateInfo` structure are implicitly linked at a number of different interfaces.

- Shader Input and Output Interface
- Vertex Input Interface
- Fragment Output Interface
- Fragment Tile Image Interface
- Fragment Input Attachment Interface
- Ray Tracing Pipeline Interface
- Shader Resource Interface
- Geometry Shader Passthrough

This chapter describes valid uses for a set of SPIR-V decorations. Any other use of one of these decorations is invalid, with the exception that, when using SPIR-V versions 1.4 and earlier: `Block`, `BufferBlock`, `Offset`, `ArrayStride`, and `MatrixStride` can also decorate types and type members used by variables in the `Private` and `Function` storage classes.

**Note**

In this chapter, there are references to SPIR-V terms such as the `MeshNV` execution model. These terms will appear even in a build of the specification which does not support any extensions. This is as intended, since these terms appear in the unified SPIR-V specification without such qualifiers.

15.1. Shader Input and Output Interfaces

When multiple stages are present in a pipeline, the outputs of one stage form an interface with the inputs of the next stage. When such an interface involves a shader, shader outputs are matched against the inputs of the next stage, and shader inputs are matched against the outputs of the previous stage.

All the variables forming the shader input and output *interfaces* are listed as operands to the `OpEntryPoint` instruction and are declared with the `Input` or `Output` storage classes, respectively, in the SPIR-V module. These generally form the interfaces between consecutive shader stages, regardless of any non-shader stages between the consecutive shader stages.

There are two classes of variables that can be matched between shader stages, built-in variables and user-defined variables. Each class has a different set of matching criteria.

*Output* variables of a shader stage have undefined values until the shader writes to them or uses the `Initializer` operand when declaring the variable.
15.1.1. Built-in Interface Block

Shader built-in variables meeting the following requirements define the built-in interface block. They must

- be explicitly declared (there are no implicit built-ins),
- be identified with a BuiltIn decoration,
- form object types as described in the Built-in Variables section, and
- be declared in a block whose top-level members are the built-ins.

There must be no more than one built-in interface block per shader per interface, except for the mesh output interface where there must be at most one built-in interface block decorated with the PerPrimitiveEXT decoration and at most one built-in interface block without this decoration.

Built-ins must not have any Location or Component decorations.

15.1.2. User-defined Variable Interface

The non-built-in variables listed by OpEntryPoint with the Input or Output storage class form the user-defined variable interface. These must have numeric type or, recursively, composite types of such types. If an implementation supports storageInputOutput16, components can have a width of 16 bits. These variables must be identified with a Location decoration and can also be identified with a Component decoration.

15.1.3. Interface Matching

An output variable, block, or structure member in a given shader stage has an interface match with an input variable, block, or structure member in a subsequent shader stage if they both adhere to the following conditions:

- They have equivalent decorations, other than:
  - XfbBuffer, XfbStride, Offset, and Stream
  - one is not decorated with Component and the other is declared with a Component of 0
  - Interpolation decorations
  - RelaxedPrecision if one is an input variable and the other an output variable

- Their types match as follows:
  - if the input is declared in a tessellation control or geometry shader as an OpTypeArray with an Element Type equivalent to the OpType* declaration of the output, and neither is a structure member; or
  - if the maintenance4 feature is enabled, they are declared as OpTypeVector variables, and the output has a Component Count value higher than that of the input but the same Component Type; or
  - if the output is declared in a mesh shader as an OpTypeArray with an Element Type equivalent to the OpType* declaration of the input, and neither is a structure member; or
if the input is decorated with `PerVertexKHR`, and is declared in a fragment shader as an `OpTypeArray` with an `Element Type` equivalent to the `OpType*` declaration of the output, and neither the input nor the output is a structure member; or

- if in any other case they are declared with an equivalent `OpType*` declaration.

• If both are structures and every member has an interface match.

**Note**
The word “structure” above refers to both variables that have an `OpTypeStruct` type and interface blocks (which are also declared as `OpTypeStruct`).

If the pipeline is compiled as separate graphics pipeline libraries and the `graphicsPipelineLibraryIndependentInterpolationDecoration` limit is not supported, matches are not found if the interpolation decorations differ between the last pre-rasterization shader stage and the fragment shader stage.

All input variables and blocks **must** have an interface match in the preceding shader stage, except for built-in variables in fragment shaders. Shaders **can** declare and write to output variables that are not declared or read by the subsequent stage.

Matching rules for **passthrough geometry shaders** are slightly different and are described in the [Passthrough Interface Matching](#) section.

The value of an input variable is undefined if the preceding stage does not write to a matching output variable, as described above.

### 15.1.4. Location Assignment

This section describes **Location** assignments for user-defined variables and how many **Location** slots are consumed by a given user-variable type. As mentioned above, some inputs and outputs have an additional level of arrayness relative to other shader inputs and outputs. This outer array level is removed from the type before considering how many **Location** slots the type consumes.

The **Location** value specifies an interface slot comprised of a 32-bit four-component vector conveyed between stages. The **Component** specifies word components within these vector **Location** slots. Only types with widths of 16, 32 or 64 are supported in shader interfaces.

Inputs and outputs of the following types consume a single interface **Location**:

- 16-bit scalar and vector types, and
- 32-bit scalar and vector types, and
- 64-bit scalar and 2-component vector types.

64-bit three- and four-component vectors consume two consecutive **Location** slots.

If a declared input or output is an array of size `n` and each element takes `m` **Location** slots, it will be assigned `m \times n` consecutive **Location** slots starting with the specified **Location**.

If the declared input or output is an `n \times m` 16-, 32- or 64-bit matrix, it will be assigned multiple
Location slots starting with the specified Location. The number of Location slots assigned for each matrix will be the same as for an n-element array of m-component vectors.

An OpVariable with a structure type that is not a block must be decorated with a Location.

When an OpVariable with a structure type (either block or non-block) is decorated with a Location, the members in the structure type must not be decorated with a Location. The OpVariable’s members are assigned consecutive Location slots in declaration order, starting from the first member, which is assigned the Location decoration from the OpVariable.

When a block-type OpVariable is declared without a Location decoration, each member in its structure type must be decorated with a Location. Types nested deeper than the top-level members must not have Location decorations.

The Location slots consumed by block and structure members are determined by applying the rules above in a depth-first traversal of the instantiated members as though the structure or block member were declared as an input or output variable of the same type.

Any two inputs listed as operands on the same OpEntryPoint must not be assigned the same Location slot and Component word, either explicitly or implicitly. Any two outputs listed as operands on the same OpEntryPoint must not be assigned the same Location slot and Component word, either explicitly or implicitly.

The number of input and output Location slots available for a shader input or output interface is limited, and dependent on the shader stage as described in Shader Input and Output Locations. All variables in both the built-in interface block and the user-defined variable interface count against these limits. Each effective Location must have a value less than the number of Location slots available for the given interface, as specified in the “Locations Available” column in Shader Input and Output Locations.

**15.1.5. Component Assignment**

The Component decoration allows the Location to be more finely specified for scalars and vectors, down to the individual Component word within a Location slot that are consumed. The Component word within a Location are 0, 1, 2, and 3. A variable or block member starting at Component N will consume Component words N, N+1, N+2, ... up through its size. For 16-, and 32-bit types, it is invalid if this sequence of Component words gets larger than 3. A scalar 64-bit type will consume two of these Component words in sequence, and a two-component 64-bit vector type will consume all four Component words available within a Location. A three- or four-component 64-bit vector type must not specify a non-zero Component decoration. A three-component 64-bit vector type will consume all four Component words of the first Location and Component 0 and 1 of the second Location. This leaves Component 2 and 3 available for other component-qualified declarations.

A scalar or two-component 64-bit data type must not specify a Component decoration of 1 or 3. A Component decoration must not be specified for any type that is not a scalar or vector.

A four-component 64-bit data type will consume all four Component words of the first Location and all four Component words of the second Location.

### 15.2. Vertex Input Interface

When the vertex stage is present in a pipeline, the vertex shader input variables form an interface with the vertex input attributes. The vertex shader input variables are matched by the Location and Component decorations to the vertex input attributes specified in the pVertexInputState member of the VkGraphicsPipelineCreateInfo structure.

The vertex shader input variables listed by OpEntryPoint with the Input storage class form the vertex input interface. These variables must be identified with a Location decoration and can also be identified with a Component decoration.

For the purposes of interface matching: variables declared without a Component decoration are considered to have a Component decoration of zero. The number of available vertex input Location slots is given by the maxVertexInputAttributes member of the VkPhysicalDeviceLimits structure.

See Attribute Location and Component Assignment for details.

All vertex shader inputs declared as above must have a corresponding attribute and binding in the pipeline.

### 15.3. Fragment Output Interface

When the fragment stage is present in a pipeline, the fragment shader outputs form an interface with the output attachments defined by a render pass instance. The fragment shader output
variables are matched by the Location and Component decorations to specified color attachments.

The fragment shader output variables listed by OpEntryPoint with the Output storage class form the fragment output interface. These variables must be identified with a Location decoration. They can also be identified with a Component decoration and/or an Index decoration. For the purposes of interface matching: variables declared without a Component decoration are considered to have a Component decoration of zero, and variables declared without an Index decoration are considered to have an Index decoration of zero.

A fragment shader output variable identified with a Location decoration of i is associated with the color attachment indicated by VkRenderingInfo::pColorAttachments[i]. When using render pass objects, it is associated with the color attachment indicated by VkSubpassDescription::pColorAttachments[i]. Values are written to those attachments after passing through the blending unit as described in Blending, if enabled. Locations are consumed as described in Location Assignment. The number of available fragment output Location slots is given by the maxFragmentOutputAttachments member of the VkPhysicalDeviceLimits structure.

If the dynamicRenderingLocalRead feature is supported, fragment output locations can be remapped when using dynamic rendering.

To set the fragment output location mappings during rendering, call:

```c
// Provided by VK_KHR_dynamic_rendering_local_read
void vkCmdSetRenderingAttachmentLocationsKHR(
    VkCommandBuffer commandBuffer,
    const VkRenderingAttachmentLocationInfoKHR* pLocationInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pLocationInfo` is a VkRenderingAttachmentLocationInfoKHR structure indicating the new mappings.

This command sets the attachment location mappings for subsequent drawing commands, and must match the mappings provided to the currently bound pipeline, if one is bound, which can be set by chaining VkRenderingAttachmentLocationInfoKHR to VkGraphicsPipelineCreateInfo.

Until this command is called, mappings in the command buffer state are treated as each color attachment specified in vkCmdBeginRendering having a location equal to its index in VkRenderingInfo::pColorAttachments. This state is reset whenever vkCmdBeginRendering is called.

**Valid Usage**

- VUID-vkCmdSetRenderingAttachmentLocationsKHR-dynamicRenderingLocalRead-09509 dynamicRenderingLocalRead must be enabled
- VUID-vkCmdSetRenderingAttachmentLocationsKHR-pLocationInfo-09510 pLocationInfo->colorAttachmentCount must be equal to the value of VkRenderingInfo::colorAttachmentCount used to begin the current render pass instance
- VUID-vkCmdSetRenderingAttachmentLocationsKHR-commandBuffer-09511
The current render pass instance must have been started or resumed by `vkCmdBeginRendering` in this `commandBuffer`.

**Valid Usage (Implicit)**

- VUID-vkCmdSetRenderingAttachmentLocationsKHR-commandBuffer-parameter
  - `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetRenderingAttachmentLocationsKHR-pLocationInfo-parameter
  - `pLocationInfo` must be a valid pointer to a valid `VkRenderingAttachmentLocationInfoKHR` structure
- VUID-vkCmdSetRenderingAttachmentLocationsKHR-commandBuffer-recording
  - `commandBuffer` must be in the recording state
- VUID-vkCmdSetRenderingAttachmentLocationsKHR-commandBuffer-cmdpool
  - The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetRenderingAttachmentLocationsKHR-renderpass
  - This command must only be called inside of a render pass instance
- VUID-vkCmdSetRenderingAttachmentLocationsKHR-videocoding
  - This command must only be called outside of a video coding scope

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Inside</td>
<td>Outside</td>
<td>Graphics</td>

<td></td>
</tr>
</tbody>
</table>

The `VkRenderingAttachmentLocationInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_dynamic_rendering_local_read
typedef struct VkRenderingAttachmentLocationInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t colorAttachmentCount;
    const uint32_t* pColorAttachmentLocations;
} VkRenderingAttachmentLocationInfoKHR;
```
• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `colorAttachmentCount` is the number of elements in `pColorAttachmentLocations`.
• `pColorAttachmentLocations` is a pointer to an array of `colorAttachmentCount` `uint32_t` values defining remapped locations for color attachments.

This structure allows applications to remap the locations of color attachments to different fragment shader output locations.

Each element of `pColorAttachmentLocations` set to `VK_ATTACHMENT_UNUSED` will be inaccessible to this pipeline as a color attachment; no location will map to it. Each element of `pColorAttachmentLocations` set to any other value will map the specified location value to the color attachment specified in the render pass at the corresponding index in the `pColorAttachmentLocations` array. Any writes to a fragment output location that is not mapped to an attachment must be discarded.

If `pColorAttachmentLocations` is `NULL`, it is equivalent to setting each element to its index within the array.

This structure can be included in the `pNext` chain of a `VkGraphicsPipelineCreateInfo` structure to set this state for a pipeline. If this structure is not included in the `pNext` chain of `VkGraphicsPipelineCreateInfo`, it is equivalent to specifying this structure with the following properties:

• `colorAttachmentCount` set to `VkPipelineRenderingCreateInfo::colorAttachmentCount`.
• `pColorAttachmentLocations` set to `NULL`.

This structure can be included in the `pNext` chain of a `VkCommandBufferInheritanceInfo` structure to specify inherited state from the primary command buffer. If `VkCommandBufferInheritanceInfo::renderPass` is not `VK_NULL_HANDLE`, or `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT` is not specified in `VkCommandBufferBeginInfo::flags`, members of this structure are ignored. If this structure is not included in the `pNext` chain of `VkCommandBufferInheritanceInfo`, it is equivalent to specifying this structure with the following properties:

• `colorAttachmentCount` set to `VkCommandBufferInheritanceRenderingInfo::colorAttachmentCount`.
• `pColorAttachmentLocations` set to `NULL`.

Valid Usage

• VUID-VkRenderingAttachmentLocationInfoKHR-dynamicRenderingLocalRead-09512 If the `dynamicRenderingLocalRead` feature is not enabled, and `pColorAttachmentLocations` is not `NULL`, each element must be set to the value of its index within the array
• VUID-VkRenderingAttachmentLocationInfoKHR-pColorAttachmentLocations-09513
Elements of `pColorAttachmentLocations` that are not `VK_ATTACHMENT_UNUSED` must each be unique

- VUID-VkRenderingAttachmentLocationInfoKHR-colorAttachmentCount-09514 `colorAttachmentCount` must be less than or equal to `maxColorAttachments`
- VUID-VkRenderingAttachmentLocationInfoKHR-pColorAttachmentLocations-09515 Each element of `pColorAttachmentLocations` must be less than `maxColorAttachments`

**Valid Usage (Implicit)**

- VUID-VkRenderingAttachmentLocationInfoKHR-sType-sType `sType` must be `VK_STRUCTURE_TYPE_RENDERING_ATTACHMENT_LOCATION_INFO_KHR`

When an active fragment shader invocation finishes, the values of all fragment shader outputs are copied out and used as blend inputs or color attachments writes. If the invocation does not set a value for them, the input values to those blending or color attachment writes are undefined.

Components of the output variables are assigned as described in Component Assignment. Output Component words identified as 0, 1, 2, and 3 will be directed to the R, G, B, and A inputs to the blending unit, respectively, or to the output attachment if blending is disabled. If two variables are placed within the same Location, they must have the same underlying type (floating-point or integer). Component words which do not correspond to any fragment shader output will also result in undefined values for blending or color attachment writes.

Fragment outputs identified with an Index of zero are directed to the first input of the blending unit associated with the corresponding Location. Outputs identified with an Index of one are directed to the second input of the corresponding blending unit.

There must be no output variable which has the same Location, Component, and Index as any other, either explicitly declared or implied.

Output values written by a fragment shader must be declared with either `OpTypeFloat` or `OpTypeInt`, and a Width of 32. If `storageInputOutput16` is supported, output values written by a fragment shader can be also declared with either `OpTypeFloat` or `OpTypeInt` and a Width of 16. Composites of these types are also permitted. If the color attachment has a signed or unsigned normalized fixed-point format, color values are assumed to be floating-point and are converted to fixed-point as described in Conversion From Floating-Point to Normalized Fixed-Point; If the color attachment has an integer format, color values are assumed to be integers and converted to the bit-depth of the target. Any value that cannot be represented in the attachment's format is undefined. For any other attachment format no conversion is performed. If the type of the values written by the fragment shader do not match the format of the corresponding color attachment, the resulting values are undefined for those components.

### 15.4. Legacy Dithering

The application can enable dithering to be applied to the color output of a subpass, by using the `VK_SUBPASS_DESCRIPTION_ENABLE_LEGACY_DITHERING_BIT_EXT`
When dithering is enabled, the implementation may modify the output color value \( c \) by one ULP. This modification must only depend on the framebuffer coordinates \((x_f, y_f)\) of the sample, as well as on the value of \( c \).

The exact details of the dithering algorithm are unspecified, including the algorithm itself, the formats dithering is applied to, and the stage in which it is applied.

**Note**

This extension is intended only for use by OpenGL emulation layers, and as such the dithering algorithm applied to the subpass should be equivalent to the vendor's OpenGL implementation, if any.

### 15.5. Fragment Tile Image Interface

When a fragment stage is present in a pipeline, the fragment shader tile image variables decorated with `Location` form an interface with the color attachments defined by the render pass instance. The fragment shader tile image variables are matched by `Location` decorations to the color attachments specified in the `pColorAttachments` array of the `VkRenderingInfoKHR` structure describing the render pass instance the fragment shader is executed in.

The fragment shader variables listed by `OpEntryPoint` with the `TileImageEXT` storage class and a decoration of `Location` form the fragment tile image interface. These variables must be declared with a type of `OpTypeImage`, and a `Dim` operand of `TileImageDataEXT`. The `Component` decoration is not supported for these variables.

Reading from a tile image variable with a `Location` decoration of \( i \) reads from the color attachment identified by the element of `VkRenderingInfoKHR::pColorAttachments` with a `location` equal to \( i \). If the tile image variable is declared as an array of size \( N \), it consumes \( N \) consecutive tile image locations, starting with the index specified. There must not be more than one tile image variable with the same `Location` whether explicitly declared or implied by an array declaration. The number of available tile image locations is the same as the number of available fragment output locations as given by the `maxFragmentOutputAttachments` member of the `VkPhysicalDeviceLimits` structure.

The basic data type (floating-point, integer, unsigned integer) of the tile image variable must match the basic format of the corresponding color attachment, or the values read from the tile image variables are undefined.

### 15.6. Fragment Input Attachment Interface

When a fragment stage is present in a pipeline, the fragment shader subpass inputs form an interface with the input attachments of the current subpass. The fragment shader subpass input variables are matched by `InputAttachmentIndex` decorations to the input attachments specified in the `pInputAttachments` array of the `VkSubpassDescription` structure describing the subpass that the fragment shader is executed in.

The fragment shader subpass input variables with the `UniformConstant` storage class and a
decoration of `InputAttachmentIndex` that are statically used by `OpEntryPoint` form the **fragment input attachment interface**. These variables **must** be declared with a type of `OpTypeImage`, a `Dim` operand of `SubpassData`, an `Arrayed` operand of 0, and a `Sampled` operand of 2. The `MS` operand of the `OpTypeImage` **must** be 0 if the `samples` field of the corresponding `VkAttachmentDescription` is `VK_SAMPLE_COUNT_1_BIT` and `multisampled-render-to-single-sampled` is not enabled, and 1 otherwise.

A subpass input variable identified with an `InputAttachmentIndex` decoration of `i` reads from the input attachment indicated by `pInputAttachments[i]` member of `VkSubpassDescription`. If the subpass input variable is declared as an array of size `N`, it consumes `N` consecutive input attachments, starting with the index specified. There **must** not be more than one input variable with the same `InputAttachmentIndex` whether explicitly declared or implied by an array declaration per image aspect. A multi-aspect image (e.g. a depth/stencil format) **can** use the same input variable. The number of available input attachment indices is given by the `maxPerStageDescriptorInputAttachments` member of the `VkPhysicalDeviceLimits` structure.

When using dynamic rendering with the `dynamicRenderingLocalRead` feature enabled, a subpass input variable with a `InputAttachmentIndex` decoration of `i` can be mapped to a color, depth, or stencil attachment.

To set the input attachment index mappings during dynamic rendering, call:

```c
void vkCmdSetRenderingInputAttachmentIndicesKHR(
    VkCommandBuffer commandBuffer, 
    const VkRenderingInputAttachmentIndexInfoKHR* pLocationInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pInputAttachmentIndexInfo` is a `VkRenderingInputAttachmentIndexInfoKHR` structure indicating the new mappings.

This command sets the input attachment index mappings for subsequent drawing commands, and **must** match the mappings provided to the currently bound pipeline, if one is bound, which **can** be set by chaining `VkRenderingInputAttachmentIndexInfoKHR` to `VkGraphicsPipelineCreateInfo`. Until this command is called, mappings in the command buffer state are treated as each color attachment specified in `vkCmdBeginRendering` mapping to subpass inputs with a `InputAttachmentIndex` equal to its index in `VkRenderingInfo::pColorAttachments`, and depth/stencil attachments mapping to input attachments without these decorations. This state is reset whenever `vkCmdBeginRendering` is called.

### Valid Usage

- VUID-vkCmdSetRenderingInputAttachmentIndicesKHR-dynamicRenderingLocalRead-09516
  `dynamicRenderingLocalRead` **must** be enabled
- VUID-vkCmdSetRenderingInputAttachmentIndicesKHR-pInputAttachmentIndexInfo-09517

1384
**Valid Usage (Implicit)**

- VUID-vkCmdSetRenderingInputAttachmentIndicesKHR-commandBuffer-parameter
  - commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetRenderingInputAttachmentIndicesKHR-pLocationInfo-parameter
  - pLocationInfo must be a valid pointer to a valid VkRenderingInputAttachmentIndexInfoKHR structure
- VUID-vkCmdSetRenderingInputAttachmentIndicesKHR-commandBuffer-recording
  - commandBuffer must be in the recording state
- VUID-vkCmdSetRenderingInputAttachmentIndicesKHR-commandBuffer-cmdpool
  - The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdSetRenderingInputAttachmentIndicesKHR-renderpass
  - This command must only be called inside of a render pass instance
- VUID-vkCmdSetRenderingInputAttachmentIndicesKHR-videocoding
  - This command must only be called outside of a video coding scope

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Inside</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The VkRenderingInputAttachmentIndexInfoKHR structure is defined as:

```c
// Provided by VK_KHR_dynamic_rendering_local_read
typedef struct VkRenderingInputAttachmentIndexInfoKHR {
```
VkStructureType  sType;
    const void*   pNext;
    uint32_t     colorAttachmentCount;
    const uint32_t*  pColorAttachmentInputIndices;
    const uint32_t*  pDepthInputAttachmentIndex;
    const uint32_t*  pStencilInputAttachmentIndex;
} VkRenderingInputAttachmentIndexInfoKHR;

• `sType` is a `VkStructureType` value identifying this structure.

• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `colorAttachmentCount` is the number of elements in `pColorAttachmentInputIndices`.

• `pColorAttachmentInputIndices` is a pointer to an array of `colorAttachmentCount` `uint32_t` values defining indices for color attachments to be used as input attachments.

• `pDepthInputAttachmentIndex` is either `NULL`, or a pointer to a `uint32_t` value defining the index for the depth attachment to be used as an input attachment.

• `pStencilInputAttachmentIndex` is either `NULL`, or a pointer to a `uint32_t` value defining the index for the stencil attachment to be used as an input attachment.

This structure allows applications to remap attachments to different input attachment indices.

Each element of `pColorAttachmentInputIndices` set to a value of `VK_ATTACHMENT_UNUSED` indicates that the corresponding attachment will not be used as an input attachment in this pipeline. Any other value in each of those elements will map the corresponding attachment to a `InputAttachmentIndex` value defined in shader code.

If `pColorAttachmentInputIndices` is `NULL`, it is equivalent to setting each element to its index within the array.

If `pDepthInputAttachmentIndex` or `pStencilInputAttachmentIndex` are set to `NULL`, they map to input attachments without a `InputAttachmentIndex` decoration. If they point to a value of `VK_ATTACHMENT_UNUSED`, it indicates that the corresponding attachment will not be used as an input attachment in this pipeline. If they point to any other value it maps the corresponding attachment to a `InputAttachmentIndex` value defined in shader code.

This structure can be included in the `pNext` chain of a `VkGraphicsPipelineCreateInfo` structure to set this state for a pipeline. If this structure is not included in the `pNext` chain of `VkGraphicsPipelineCreateInfo`, it is equivalent to specifying this structure with the following properties:

• `colorAttachmentCount` set to `VkPipelineRenderingCreateInfo::colorAttachmentCount`.

• `pColorAttachmentInputIndices` set to `NULL`.

• `pDepthInputAttachmentIndex` set to `NULL`.

• `pStencilInputAttachmentIndex` set to `NULL`.

This structure can be included in the `pNext` chain of a `VkCommandBufferInheritanceInfo` structure to specify inherited state from the primary command buffer. If this structure is not included in the
pNext chain of VkCommandBufferInheritanceInfo, it is equivalent to specifying this structure with the following properties:

- colorAttachmentCount set to VkCommandBufferInheritanceRenderingInfo::colorAttachmentCount.
- pColorAttachmentInputIndices set to NULL.
- pDepthInputAttachmentIndex set to NULL.
- pStencilInputAttachmentIndex set to NULL.

### Valid Usage

- **VUID-VkRenderingInputAttachmentIndexInfoKHR-dynamicRenderingLocalRead-09519**
  If the dynamicRenderingLocalRead feature is not enabled, and pColorAttachmentInputIndices is not NULL, each element **must** be set to VK_ATTACHMENT_UNUSED

- **VUID-VkRenderingInputAttachmentIndexInfoKHR-dynamicRenderingLocalRead-09520**
  If the dynamicRenderingLocalRead feature is not enabled, pDepthInputAttachmentIndex **must** be a valid pointer to a value of VK_ATTACHMENT_UNUSED

- **VUID-VkRenderingInputAttachmentIndexInfoKHR-dynamicRenderingLocalRead-09521**
  If the dynamicRenderingLocalRead feature is not enabled, pStencilInputAttachmentIndex **must** be a valid pointer to a value of VK_ATTACHMENT_UNUSED

- **VUID-VkRenderingInputAttachmentIndexInfoKHR-pColorAttachmentInputIndices-09522**
  Elements of pColorAttachmentInputIndices that are not VK_ATTACHMENT_UNUSED **must** each be unique

- **VUID-VkRenderingInputAttachmentIndexInfoKHR-pColorAttachmentInputIndices-09523**
  Elements of pColorAttachmentInputIndices that are not VK_ATTACHMENT_UNUSED **must** not take the same value as the content of pDepthInputAttachmentIndex

- **VUID-VkRenderingInputAttachmentIndexInfoKHR-pColorAttachmentInputIndices-09524**
  Elements of pColorAttachmentInputIndices that are not VK_ATTACHMENT_UNUSED **must** not take the same value as the content of pStencilInputAttachmentIndex

- **VUID-VkRenderingInputAttachmentIndexInfoKHR-colorAttachmentCount-09525**
  colorAttachmentCount **must** be less than or equal to maxColorAttachments

### Valid Usage (Implicit)

- **VUID-VkRenderingInputAttachmentIndexInfoKHR-sType-sType**
  sType **must** be VK_STRUCTURE_TYPE_RENDERING_INPUT_ATTACHMENT_INDEX_INFO_KHR

- **VUID-VkRenderingInputAttachmentIndexInfoKHR-pColorAttachmentInputIndices-parameter**
  If colorAttachmentCount is not 0, and pColorAttachmentInputIndices is not NULL, pColorAttachmentInputIndices **must** be a valid pointer to an array of colorAttachmentCount uint32_t values

- **VUID-VkRenderingInputAttachmentIndexInfoKHR-pDepthInputAttachmentIndex-parameter**
If `pDepthInputAttachmentIndex` is not `NULL`, `pDepthInputAttachmentIndex` must be a valid pointer to a valid `uint32_t` value.

- VUID-VkRenderingInputAttachmentIndexInfoKHR-pStencilInputAttachmentIndex-parameter
  If `pStencilInputAttachmentIndex` is not `NULL`, `pStencilInputAttachmentIndex` must be a valid pointer to a valid `uint32_t` value.

Variables identified with the `InputAttachmentIndex` must only be used by a fragment stage. The numeric format of the subpass input must match the format of the corresponding input attachment, or the values of subpass loads from these variables are undefined. If the framebuffer attachment contains both depth and stencil aspects, the numeric format of the subpass input determines if depth or stencil aspect is accessed by the shader.

See Input Attachment for more details.

### 15.6.1. Fragment Input Attachment Compatibility

An input attachment that is statically accessed by a fragment shader must be backed by a descriptor that is equivalent to the `VkImageView` in the `VkFramebuffer`, except for `subresourceRange.aspectMask`. The `aspectMask` must be equal to the aspect accessed by the shader.

### 15.7. Ray Tracing Pipeline Interface

Ray tracing pipelines may have more stages than other pipelines with multiple instances of each stage and more dynamic interactions between the stages, but still have interface structures that obey the same general rules as interfaces between shader stages in other pipelines. The three types of inter-stage interface variables for ray tracing pipelines are:

- Ray payloads containing data tracked for the entire lifetime of the ray.
- Hit attributes containing data about a specific hit for the duration of its processing.
- Callable data for passing data into and out of a callable shader.

Ray payloads and callable data are used in explicit shader call instructions, so they have an incoming variant to distinguish the parameter passed to the invocation from any other payloads or data being used by subsequent shader call instructions.

An interface structure used between stages must match between the stages using it. Specifically:

- The hit attribute structure read in an any-hit or closest hit shader must be the same structure as the hit attribute structure written in the corresponding intersection shader in the same hit group.
- The incoming callable data for a callable shader must be the same structure as the callable data referenced by the execute callable instruction in the calling shader.
- The ray payload for a shader invoked by a ray tracing command must be the same structure for all shader stages using the payload for that ray.
Any shader with an incoming ray payload, incoming callable data, or hit attribute must only declare one variable of that type.

15.8. Shader Resource Interface

When a shader stage accesses buffer or image resources, as described in the Resource Descriptors section, the shader resource variables must be matched with the pipeline layout that is provided at pipeline creation time.

The set of shader variables that form the shader resource interface for a stage are the variables statically used by that stage's OpEntryPoint with a storage class of Uniform, UniformConstant, StorageBuffer, or PushConstant. For the fragment shader, this includes the fragment input attachment interface.

The shader resource interface consists of two sub-interfaces: the push constant interface and the descriptor set interface.

15.8.1. Push Constant Interface

The shader variables defined with a storage class of PushConstant that are statically used by the shader entry points for the pipeline define the push constant interface. They must be:

- typed as OpTypeStruct,
- identified with a Block decoration, and
- laid out explicitly using the Offset, ArrayStride, and MatrixStride decorations as specified in Offset and Stride Assignment.

There must be no more than one push constant block statically used per shader entry point.

Each statically used member of a push constant block must be placed at an Offset such that the entire member is entirely contained within the VkPushConstantRange for each OpEntryPoint that uses it, and the stageFlags for that range must specify the appropriate VkShaderStageFlagBits for that stage. The Offset decoration for any member of a push constant block must not cause the
space required for that member to extend outside the range \([0, \text{maxPushConstantsSize})\).

Any member of a push constant block that is declared as an array must only be accessed with *dynamically uniform* indices.

### 15.8.2. Descriptor Set Interface

The *descriptor set interface* is comprised of the shader variables with the storage class of *StorageBuffer, Uniform* or *UniformConstant* (including the variables in the *fragment input attachment interface*) that are statically used by the shader entry points for the pipeline.

These variables must have *DescriptorSet* and *Binding* decorations specified, which are assigned and matched with the *VkDescriptorSetLayout* objects in the pipeline layout as described in *DescriptorSet and Binding Assignment*.

The *Image Format* of an *OpTypeImage* declaration must not be *Unknown*, for variables which are used for *OpImageRead, OpImageSparseRead*, or *OpImageWrite* operations, except under the following conditions:

- For *OpImageWrite*, if the image format is listed in the *storage without format* list and if the *shaderStorageImageWriteWithoutFormat* feature is enabled and the shader module declares the *StorageImageWriteWithoutFormat* capability.
- For *OpImageWrite*, if the image format supports *VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT* and the shader module declares the *StorageImageWriteWithoutFormat* capability.
- For *OpImageRead* or *OpImageSparseRead*, if the image format is listed in the *storage without format* list and if the *shaderStorageImageReadWithoutFormat* feature is enabled and the shader module declares the *StorageImageReadWithoutFormat* capability.
- For *OpImageRead* or *OpImageSparseRead*, if the image format supports *VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT* and the shader module declares the *StorageImageReadWithoutFormat* capability.
- For *OpImageRead*, if *Dim* is *SubpassData* (indicating a read from an input attachment).

The *Image Format* of an *OpTypeImage* declaration must not be *Unknown*, for variables which are used for *OpAtomic* operations.

Variables identified with the *Uniform* storage class are used to access transparent buffer backed resources. Such variables must be:

- typed as *OpTypeStruct*, or an array of this type,
- identified with a *Block* or *BufferBlock* decoration, and
- laid out explicitly using the *Offset*, *ArrayStride*, and *MatrixStride* decorations as specified in *Offset and Stride Assignment*.

Variables identified with the *StorageBuffer* storage class are used to access transparent buffer backed resources. Such variables must be:

- typed as *OpTypeStruct*, or an array of this type,
• identified with a Block decoration, and
• laid out explicitly using the Offset, ArrayStride, and MatrixStride decorations as specified in Offset and Stride Assignment.

The Offset decoration for any member of a Block-decorated variable in the Uniform storage class must not cause the space required for that variable to extend outside the range \([0, \text{maxUniformBufferRange})\). The Offset decoration for any member of a Block-decorated variable in the StorageBuffer storage class must not cause the space required for that variable to extend outside the range \([0, \text{maxStorageBufferRange})\).

Variables identified with the Uniform storage class can also be used to access transparent descriptor set backed resources when the variable is assigned to a descriptor set layout binding with a descriptorType of \(\text{VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK}\). In this case the variable must be typed as OpTypeStruct and cannot be aggregated into arrays of that type. Further, the Offset decoration for any member of such a variable must not cause the space required for that variable to extend outside the range \([0, \text{maxInlineUniformBlockSize})\).

Variables identified with a storage class of UniformConstant and a decoration of InputAttachmentIndex must be declared as described in Fragment Input Attachment Interface.

SPIR-V variables decorated with a descriptor set and binding that identify a combined image sampler descriptor can have a type of OpTypeImage, OpTypeSampler (Sampled=1), or OpTypeSampledImage.

Arrays of any of these types can be indexed with constant integral expressions. The following features must be enabled and capabilities must be declared in order to index such arrays with dynamically uniform or non-uniform indices:

• Storage images (except storage texel buffers and input attachments):
  ◦ Dynamically uniform: shaderStorageImageArrayDynamicIndexing and StorageImageArrayDynamicIndexing
  ◦ Non-uniform: shaderStorageImageArrayNonUniformIndexing and StorageImageArrayNonUniformIndexing

• Storage texel buffers:
  ◦ Dynamically uniform: shaderStorageTexelBufferArrayDynamicIndexing and StorageTexelBufferArrayDynamicIndexing
  ◦ Non-uniform: shaderStorageTexelBufferArrayNonUniformIndexing and StorageTexelBufferArrayNonUniformIndexing

• Input attachments:
  ◦ Dynamically uniform: shaderInputAttachmentArrayDynamicIndexing and InputAttachmentArrayDynamicIndexing
  ◦ Non-uniform: shaderInputAttachmentArrayNonUniformIndexing and InputAttachmentArrayNonUniformIndexing

• Sampled images (except uniform texel buffers), samplers and combined image samplers:
  ◦ Dynamically uniform: shaderSampledImageArrayDynamicIndexing and SampledImageArrayDynamicIndexing
• Non-uniform: \texttt{shaderSampledImageArrayNonUniformIndexing} and \texttt{SampledImageArrayNonUniformIndexing}

Uniform texel buffers:

• Dynamically uniform: \texttt{shaderUniformTexelBufferArrayDynamicIndexing} and \texttt{UniformTexelBufferArrayDynamicIndexing}

• Non-uniform: \texttt{shaderUniformTexelBufferArrayNonUniformIndexing} and \texttt{UniformTexelBufferArrayNonUniformIndexing}

Uniform buffers:

• Dynamically uniform: \texttt{shaderUniformBufferArrayDynamicIndexing} and \texttt{UniformBufferArrayDynamicIndexing}

• Non-uniform: \texttt{shaderUniformBufferArrayNonUniformIndexing} and \texttt{UniformBufferArrayNonUniformIndexing}

Storage buffers:

• Dynamically uniform: \texttt{shaderStorageBufferArrayDynamicIndexing} and \texttt{StorageBufferArrayDynamicIndexing}

• Non-uniform: \texttt{shaderStorageBufferArrayNonUniformIndexing} and \texttt{StorageBufferArrayNonUniformIndexing}

Acceleration structures:

• Dynamically uniform: Always supported.

• Non-uniform: Always supported.

• weight image:

• Dynamically uniform: Always supported.

• Non-uniform: Never supported.

• Block matching image:

• Dynamically uniform: Always supported.

• Non-uniform: Never supported.

If an instruction loads from or stores to a resource (including atomics and image instructions) and the resource descriptor being accessed is not dynamically uniform, then the corresponding non-uniform indexing feature \textbf{must} be enabled and the capability \textbf{must} be declared. If an instruction loads from or stores to a resource (including atomics and image instructions) and the resource descriptor being accessed is loaded from an array element with a non-constant index, then the corresponding dynamic or non-uniform indexing feature \textbf{must} be enabled and the capability \textbf{must} be declared.

If the combined image sampler enables sampler \(Y'CbCr\) conversion or samples a \textit{subsampling image}, it \textbf{must} be indexed only by constant integral expressions when aggregated into arrays in shader code, irrespective of the \texttt{shaderSampledImageArrayDynamicIndexing} feature.

1
Where `OpTypeImage` is referenced, the `Dim` values Buffer and Subpassdata are only accepted where they are specifically referenced. They do not correspond to resource types where a generic `OpTypeImage` is specified.

2
In addition to DescriptorSet and Binding.

**15.8.3. DescriptorSet and Binding Assignment**

A variable decorated with a DescriptorSet decoration of s and a Binding decoration of b indicates that this variable is associated with the VkDescriptorSetLayoutBinding that has a binding equal to b in pSetLayouts[s] that was specified in VkPipelineLayoutCreateInfo.

DescriptorSet decoration values must be between zero and maxBoundDescriptorSets minus one, inclusive. Binding decoration values can be any 32-bit unsigned integer value, as described in Descriptor Set Layout. Each descriptor set has its own binding name space.

If the Binding decoration is used with an array, the entire array is assigned that binding value. The array must be a single-dimensional array and size of the array must be no larger than the number of descriptors in the binding. If the array is runtime-sized, then array elements greater than or equal to the size of that binding in the bound descriptor set must not be used. If the array is runtime-sized, the runtimeDescriptorArray feature must be enabled and the RuntimeDescriptorArray capability must be declared. The index of each element of the array is referred to as the arrayElement. For the purposes of interface matching and descriptor set operations, if a resource variable is not an array, it is treated as if it has an arrayElement of zero.

There is a limit on the number of resources of each type that can be accessed by a pipeline stage as shown in Shader Resource Limits. The “Resources Per Stage” column gives the limit on the number each type of resource that can be statically used for an entry point in any given stage in a pipeline.
The “Resource Types” column lists which resource types are counted against the limit. Some resource types count against multiple limits. The `VK_DESCRIPTOR_TYPE_MUTABLE_EXT` descriptor type counts as one individual resource and one for every unique resource limit per descriptor set type that is present in the associated binding’s `VkMutableDescriptorTypeListEXT`. If multiple descriptor types in `VkMutableDescriptorTypeListEXT` map to the same resource limit, only one descriptor is consumed for purposes of computing resource limits.

The pipeline layout **may** include descriptor sets and bindings which are not referenced by any variables statically used by the entry points for the shader stages in the binding’s `stageflags`.

However, if a variable assigned to a given `DescriptorSet` and `Binding` is statically used by the entry point for a shader stage, the pipeline layout **must** contain a descriptor set layout binding in that descriptor set layout and for that binding number, and that binding’s `stageflags must` include the appropriate `VkShaderStageFlagBits` for that stage. The variable **must** be of a valid resource type determined by its SPIR-V type and storage class, as defined in `Shader Resource and Storage Class Correspondence`. The descriptor set layout binding **must** be of a corresponding descriptor type, as defined in `Shader Resource and Descriptor Type Correspondence`.

**Note**

There are no limits on the number of shader variables that can have overlapping set and binding values in a shader; but which resources are **statically used** has an impact. If any shader variable identifying a resource is **statically used** in a shader, then the underlying descriptor bound at the declared set and binding must support the declared type in the shader when the shader executes.

If multiple shader variables are declared with the same set and binding values, and with the same underlying descriptor type, they can all be statically used within the same shader. However, accesses are not automatically synchronized, and **Aliased** decorations should be used to avoid data hazards (see section 2.18.2 `Aliasing in the SPIR-V specification`).

If multiple shader variables with the same set and binding values are declared in a single shader, but with different declared types, where any of those are not supported by the relevant bound descriptor, that shader can only be executed if the variables with the unsupported type are not statically used.

A noteworthy example of using multiple statically-used shader variables sharing the same descriptor set and binding values is a descriptor of type `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` that has multiple corresponding shader variables in the `UniformConstant` storage class, where some could be `OpTypeImage (Sampled=1)`, some could be `OpTypeSampler`, and some could be `OpTypeSampledImage`.

### 15.8.4. Offset and Stride Assignment

Certain objects **must** be explicitly laid out using the `Offset`, `ArrayStride`, and `MatrixStride`, as described in SPIR-V explicit layout validation rules. All such layouts also **must** conform to the following requirements.

**Note**

The numeric order of `Offset` decorations does not need to follow member declaration order.

### Alignment Requirements

There are different alignment requirements depending on the specific resources and on the features enabled on the device.

---

1396
Matrix types are defined in terms of arrays as follows:

- A column-major matrix with \(C\) columns and \(R\) rows is equivalent to a \(C\) element array of vectors with \(R\) components.
- A row-major matrix with \(C\) columns and \(R\) rows is equivalent to an \(R\) element array of vectors with \(C\) components.

The **scalar alignment** of the type of an `OpTypeStruct` member is defined recursively as follows:

- A scalar of size \(N\) has a scalar alignment of \(N\).
- A vector type has a scalar alignment equal to that of its component type.
- An array type has a scalar alignment equal to that of its element type.
- A structure has a scalar alignment equal to the largest scalar alignment of any of its members.
- A matrix type inherits scalar alignment from the equivalent array declaration.

The **base alignment** of the type of an `OpTypeStruct` member is defined recursively as follows:

- A scalar has a base alignment equal to its scalar alignment.
- A two-component vector has a base alignment equal to twice its scalar alignment.
- A three- or four-component vector has a base alignment equal to four times its scalar alignment.
- An array has a base alignment equal to the base alignment of its element type.
- A structure has a base alignment equal to the largest base alignment of any of its members. An empty structure has a base alignment equal to the size of the smallest scalar type permitted by the capabilities declared in the SPIR-V module. (e.g., for a 1 byte aligned empty struct in the `StorageBuffer` storage class, `StorageBuffer8BitAccess` or `UniformAndStorageBuffer8BitAccess` must be declared in the SPIR-V module.)
- A matrix type inherits base alignment from the equivalent array declaration.

The **extended alignment** of the type of an `OpTypeStruct` member is similarly defined as follows:

- A scalar or vector type has an extended alignment equal to its base alignment.
- An array or structure type has an extended alignment equal to the largest extended alignment of any of its members, rounded up to a multiple of 16.
- A matrix type inherits extended alignment from the equivalent array declaration.

A member is defined to **improperly straddle** if either of the following are true:

- It is a vector with total size less than or equal to 16 bytes, and has `Offset` decorations placing its first byte at \(F\) and its last byte at \(L\), where `floor(F / 16) != floor(L / 16)`.
- It is a vector with total size greater than 16 bytes and has its `Offset` decorations placing its first byte at a non-integer multiple of 16.

**Standard Buffer Layout**

Every member of an `OpTypeStruct` that is required to be explicitly laid out **must** be aligned...
according to the first matching rule as follows. If the struct is contained in pointer types of multiple storage classes, it must satisfy the requirements for every storage class used to reference it.

1. If the scalarBlockLayout feature is enabled on the device and the storage class is Uniform, StorageBuffer, PhysicalStorageBuffer, ShaderRecordBufferKHR, or PushConstant then every member must be aligned according to its scalar alignment.

2. If the工作组MemoryExplicitLayoutScalarBlockLayout feature is enabled on the device and the storage class is Workgroup then every member must be aligned according to its scalar alignment.

3. All vectors must be aligned according to their scalar alignment.

4. If the uniformBufferStandardLayout feature is not enabled on the device, then any member of an OpTypeStruct with a storage class of Uniform and a decoration of Block must be aligned according to its extended alignment.

5. Every other member must be aligned according to its base alignment.

```
Note
Even if scalar alignment is supported, it is generally more performant to use the base alignment.
```

The memory layout must obey the following rules:

- The Offset decoration of any member must be a multiple of its alignment.
- Any ArrayStride or MatrixStride decoration must be a multiple of the alignment of the array or matrix as defined above.

If one of the conditions below applies

- The storage class is Uniform, StorageBuffer, PhysicalStorageBuffer, ShaderRecordBufferKHR, or PushConstant, and the scalarBlockLayout feature is not enabled on the device.
- The storage class is Workgroup, and either the struct member is not part of a Block or the工作组MemoryExplicitLayoutScalarBlockLayout feature is not enabled on the device.
- The storage class is any other storage class.

the memory layout must also obey the following rules:

- Vectors must not improperly straddle, as defined above.
- The Offset decoration of a member must not place it between the end of a structure, an array or a matrix and the next multiple of the alignment of that structure, array or matrix.

```
Note
The std430 layout in GLSL satisfies these rules for types using the base alignment. The std140 layout satisfies the rules for types using the extended alignment.
```

15.9. Built-In Variables

Built-in variables are accessed in shaders by declaring a variable decorated with a BuiltIn SPIR-V
The meaning of each `BuiltIn` decoration is as follows. In the remainder of this section, the name of a built-in is used interchangeably with a term equivalent to a variable decorated with that particular built-in. Built-ins that represent integer values can be declared as either signed or unsigned 32-bit integers.

As mentioned above, some inputs and outputs have an additional level of arrayness relative to other shader inputs and outputs. This level of arrayness is not included in the type descriptions below, but must be included when declaring the built-in.

### BaryCoordKHR

The `BaryCoordKHR` decoration can be used to decorate a fragment shader input variable. This variable will contain a three-component floating-point vector with barycentric weights that indicate the location of the fragment relative to the screen-space locations of vertices of its primitive, obtained using perspective interpolation.

**Valid Usage**

- **VUID-BaryCoordKHR-BaryCoordKHR-04154**
  The `BaryCoordKHR` decoration must be used only within the Fragment Execution Model.

- **VUID-BaryCoordKHR-BaryCoordKHR-04155**
  The variable decorated with `BaryCoordKHR` must be declared using the Input Storage Class.

- **VUID-BaryCoordKHR-BaryCoordKHR-04156**
  The variable decorated with `BaryCoordKHR` must be declared as a three-component vector of 32-bit floating-point values.

### BaryCoordNoPerspAMD

The `BaryCoordNoPerspAMD` decoration can be used to decorate a fragment shader input variable. This variable will contain the (I,J) pair of the barycentric coordinates corresponding to the fragment evaluated using linear interpolation at the fragment's center. The K coordinate of the barycentric coordinates can be derived given the identity I + J + K = 1.0.

**Valid Usage**

- **VUID-BaryCoordNoPerspAMD-BaryCoordNoPerspAMD-04157**
  The `BaryCoordNoPerspAMD` decoration must be used only within the Fragment Execution Model.

- **VUID-BaryCoordNoPerspAMD-BaryCoordNoPerspAMD-04158**
  The variable decorated with `BaryCoordNoPerspAMD` must be declared using the Input Storage Class.

- **VUID-BaryCoordNoPerspAMD-BaryCoordNoPerspAMD-04159**
  The variable decorated with `BaryCoordNoPerspAMD` must be declared as a two-component vector of 32-bit floating-point values.

### BaryCoordNoPerspKHR

The `BaryCoordNoPerspKHR` decoration can be used to decorate a fragment shader input variable.
This variable will contain a three-component floating-point vector with barycentric weights that indicate the location of the fragment relative to the screen-space locations of vertices of its primitive, obtained using linear interpolation.

**Valid Usage**

- VUID-BaryCoordNoPerspKHR-BaryCoordNoPerspKHR-04160
  The BaryCoordNoPerspKHR decoration must be used only within the Fragment Execution Model

- VUID-BaryCoordNoPerspKHR-BaryCoordNoPerspKHR-04161
  The variable decorated with BaryCoordNoPerspKHR must be declared using the Input Storage Class

- VUID-BaryCoordNoPerspKHR-BaryCoordNoPerspKHR-04162
  The variable decorated with BaryCoordNoPerspKHR must be declared as a three-component vector of 32-bit floating-point values

**BaryCoordNoPerspCentroidAMD**

The BaryCoordNoPerspCentroidAMD decoration can be used to decorate a fragment shader input variable. This variable will contain the (I,J) pair of the barycentric coordinates corresponding to the fragment evaluated using linear interpolation at the centroid. The K coordinate of the barycentric coordinates can be derived given the identity I + J + K = 1.0.

**Valid Usage**

- VUID-BaryCoordNoPerspCentroidAMD-BaryCoordNoPerspCentroidAMD-04163
  The BaryCoordNoPerspCentroidAMD decoration must be used only within the Fragment Execution Model

- VUID-BaryCoordNoPerspCentroidAMD-BaryCoordNoPerspCentroidAMD-04164
  The variable decorated with BaryCoordNoPerspCentroidAMD must be declared using the Input Storage Class

- VUID-BaryCoordNoPerspCentroidAMD-BaryCoordNoPerspCentroidAMD-04165
  The variable decorated with BaryCoordNoPerspCentroidAMD must be declared as a three-component vector of 32-bit floating-point values

**BaryCoordNoPerspSampleAMD**

The BaryCoordNoPerspSampleAMD decoration can be used to decorate a fragment shader input variable. This variable will contain the (I,J) pair of the barycentric coordinates corresponding to the fragment evaluated using linear interpolation at each covered sample. The K coordinate of the barycentric coordinates can be derived given the identity I + J + K = 1.0.

**Valid Usage**

- VUID-BaryCoordNoPerspSampleAMD-BaryCoordNoPerspSampleAMD-04166
  The BaryCoordNoPerspSampleAMD decoration must be used only within the Fragment Execution Model
The variable decorated with `BaryCoordNoPerspSampleAMD` must be declared using the `Input Storage Class`.

The variable decorated with `BaryCoordNoPerspSampleAMD` must be declared as a two-component vector of 32-bit floating-point values.

**BaryCoordPullModelAMD**

The `BaryCoordPullModelAMD` decoration can be used to decorate a fragment shader input variable. This variable will contain \((1/W, 1/I, 1/J)\) evaluated at the fragment center and can be used to calculate gradients and then interpolate I, J, and W at any desired sample location.

**Valid Usage**

- **VUID-BaryCoordPullModelAMD-BaryCoordPullModelAMD-04169**
  The `BaryCoordPullModelAMD` decoration must be used only within the `Fragment Execution Model`.

- **VUID-BaryCoordPullModelAMD-BaryCoordPullModelAMD-04170**
  The variable decorated with `BaryCoordPullModelAMD` must be declared using the `Input Storage Class`.

- **VUID-BaryCoordPullModelAMD-BaryCoordPullModelAMD-04171**
  The variable decorated with `BaryCoordPullModelAMD` must be declared as a three-component vector of 32-bit floating-point values.

**BaryCoordSmoothAMD**

The `BaryCoordSmoothAMD` decoration can be used to decorate a fragment shader input variable. This variable will contain the \((I,J)\) pair of the barycentric coordinates corresponding to the fragment evaluated using perspective interpolation at the fragment's center. The K coordinate of the barycentric coordinates can be derived given the identity \(I + J + K = 1.0\).

**Valid Usage**

- **VUID-BaryCoordSmoothAMD-BaryCoordSmoothAMD-04172**
  The `BaryCoordSmoothAMD` decoration must be used only within the `Fragment Execution Model`.

- **VUID-BaryCoordSmoothAMD-BaryCoordSmoothAMD-04173**
  The variable decorated with `BaryCoordSmoothAMD` must be declared using the `Input Storage Class`.

- **VUID-BaryCoordSmoothAMD-BaryCoordSmoothAMD-04174**
  The variable decorated with `BaryCoordSmoothAMD` must be declared as a two-component vector of 32-bit floating-point values.

**BaryCoordSmoothCentroidAMD**

The `BaryCoordSmoothCentroidAMD` decoration can be used to decorate a fragment shader input...
variable. This variable will contain the (I,J) pair of the barycentric coordinates corresponding to the fragment evaluated using perspective interpolation at the centroid. The K coordinate of the barycentric coordinates can be derived given the identity \( I + J + K = 1.0 \).

### Valid Usage

- **VUID-BaryCoordSmoothCentroidAMD-BaryCoordSmoothCentroidAMD-04175**
  The `BaryCoordSmoothCentroidAMD` decoration **must** be used only within the Fragment Execution Model.

- **VUID-BaryCoordSmoothCentroidAMD-BaryCoordSmoothCentroidAMD-04176**
  The variable decorated with `BaryCoordSmoothCentroidAMD` **must** be declared using the Input Storage Class.

- **VUID-BaryCoordSmoothCentroidAMD-BaryCoordSmoothCentroidAMD-04177**
  The variable decorated with `BaryCoordSmoothCentroidAMD` **must** be declared as a two-component vector of 32-bit floating-point values.

**BaryCoordSmoothSampleAMD**

The `BaryCoordSmoothSampleAMD` decoration **can** be used to decorate a fragment shader input variable. This variable will contain the (I,J) pair of the barycentric coordinates corresponding to the fragment evaluated using perspective interpolation at each covered sample. The K coordinate of the barycentric coordinates can be derived given the identity \( I + J + K = 1.0 \).

### Valid Usage

- **VUID-BaryCoordSmoothSampleAMD-BaryCoordSmoothSampleAMD-04178**
  The `BaryCoordSmoothSampleAMD` decoration **must** be used only within the Fragment Execution Model.

- **VUID-BaryCoordSmoothSampleAMD-BaryCoordSmoothSampleAMD-04179**
  The variable decorated with `BaryCoordSmoothSampleAMD` **must** be declared using the Input Storage Class.

- **VUID-BaryCoordSmoothSampleAMD-BaryCoordSmoothSampleAMD-04180**
  The variable decorated with `BaryCoordSmoothSampleAMD` **must** be declared as a two-component vector of 32-bit floating-point values.

**BaseInstance**

Decorating a variable with the `BaseInstance` built-in will make that variable contain the integer value corresponding to the first instance that was passed to the command that invoked the current vertex shader invocation. `BaseInstance` is the `firstInstance` parameter to a *direct drawing command* or the `firstInstance` member of a structure consumed by an *indirect drawing command*.

### Valid Usage

- **VUID-BaseInstance-BaseInstance-04181**
The **BaseInstance** decoration must be used only within the **Vertex Execution Model**

- VUID-BaseInstance-BaseInstance-04182
  The variable decorated with **BaseInstance** must be declared using the **Input Storage Class**

- VUID-BaseInstance-BaseInstance-04183
  The variable decorated with **BaseInstance** must be declared as a scalar 32-bit integer value

**BaseVertex**

Decorating a variable with the **BaseVertex** built-in will make that variable contain the integer value corresponding to the first vertex or vertex offset that was passed to the command that invoked the current vertex shader invocation. For **non-indexed drawing commands**, this variable is the **firstVertex** parameter to a **direct drawing command** or the **firstVertex** member of the structure consumed by an **indirect drawing command**. For **indexed drawing commands**, this variable is the **vertexOffset** parameter to a **direct drawing command** or the **vertexOffset** member of the structure consumed by an **indirect drawing command**.

**Valid Usage**

- VUID-BaseVertex-BaseVertex-04184
  The **BaseVertex** decoration must be used only within the **Vertex Execution Model**

- VUID-BaseVertex-BaseVertex-04185
  The variable decorated with **BaseVertex** must be declared using the **Input Storage Class**

- VUID-BaseVertex-BaseVertex-04186
  The variable decorated with **BaseVertex** must be declared as a scalar 32-bit integer value

**ClipDistance**

Decorating a variable with the **ClipDistance** built-in decoration will make that variable contain the mechanism for controlling user clipping. **ClipDistance** is an array such that the i\(^{th}\) element of the array specifies the clip distance for plane i. A clip distance of 0 means the vertex is on the plane, a positive distance means the vertex is inside the clip half-space, and a negative distance means the vertex is outside the clip half-space.

**Note**

The array variable decorated with **ClipDistance** is explicitly sized by the shader.

**Note**

In the last **pre-rasterization shader stage**, these values will be linearly interpolated across the primitive and the portion of the primitive with interpolated distances less than 0 will be considered outside the clip volume. If **ClipDistance** is then used by a fragment shader, **ClipDistance** contains these linearly interpolated values.
**Valid Usage**

- **VUID-ClipDistance-ClipDistance-04187**
  The **ClipDistance** decoration **must** be used only within the **MeshEXT**, **MeshNV**, **Vertex**, **Fragment**, **TessellationControl**, **TessellationEvaluation**, or **Geometry Execution Model**

- **VUID-ClipDistance-ClipDistance-04188**
  The variable decorated with **ClipDistance** within the **MeshEXT**, **MeshNV**, or **Vertex Execution Model** **must** be declared using the **Output Storage Class**

- **VUID-ClipDistance-ClipDistance-04189**
  The variable decorated with **ClipDistance** within the **Fragment Execution Model** **must** be declared using the **Input Storage Class**

- **VUID-ClipDistance-ClipDistance-04190**
  The variable decorated with **ClipDistance** within the **TessellationControl**, **TessellationEvaluation**, or **Geometry Execution Model** **must** not be declared in a Storage Class other than **Input** or **Output**

- **VUID-ClipDistance-ClipDistance-04191**
  The variable decorated with **ClipDistance** **must** be declared as an array of 32-bit floating-point values

**ClipDistancePerViewNV**

Decorating a variable with the **ClipDistancePerViewNV** built-in decoration will make that variable contain the per-view clip distances. The per-view clip distances have the same semantics as **ClipDistance**.

**Valid Usage**

- **VUID-ClipDistancePerViewNV-ClipDistancePerViewNV-04192**
  The **ClipDistancePerViewNV** decoration **must** be used only within the **MeshNV Execution Model**

- **VUID-ClipDistancePerViewNV-ClipDistancePerViewNV-04193**
  The variable decorated with **ClipDistancePerViewNV** **must** be declared using the **Output Storage Class**

- **VUID-ClipDistancePerViewNV-ClipDistancePerViewNV-04194**
  The variable decorated with **ClipDistancePerViewNV** **must** also be decorated with the **PerViewNV** decoration

- **VUID-ClipDistancePerViewNV-ClipDistancePerViewNV-04195**
  The variable decorated with **ClipDistancePerViewNV** **must** be declared as a two-dimensional array of 32-bit floating-point values

**ClusterIDHUWEI**

The **ClusterIDHUWEI** decoration can be used to decorate a cluster culling shader output variable, this variable will contain an integer value that specifies the id of cluster being rendered by this drawing command. When Cluster Culling Shader enable, **ClusterIDHUWEI** will replace gl_DrawID pass to vertex shader for cluster-related information fetching.
Valid Usage

- VUID-ClusterIDHUAWEI-ClusterIDHUAWEI-07797
  The `ClusterIDHUAWEI` decoration must be used only within the `ClusterCullingHUAWEI` Execution Model.

- VUID-ClusterIDHUAWEI-ClusterIDHUAWEI-07798
  The variable decorated with `ClusterIDHUAWEI` must be declared as a scalar 32-bit integer value.

**ClusterShadingRateHUAWEI**

The `ClusterShadingRateHUAWEI` decoration can be used to decorate a cluster culling shader output variable. This variable will contain an integer value specifying the shading rate of a rendering cluster.

Valid Usage

- VUID-ClusterShadingRateHUAWEI-ClusterShadingRateHUAWEI-09448
  The `ClusterShadingRateHUAWEI` decoration must be used only within the `ClusterCullingHUAWEI` Execution Model.

- VUID-ClusterShadingRateHUAWEI-ClusterShadingRateHUAWEI-09449
  The variable decorated with `ClusterShadingRateHUAWEI` must be declared as a scalar 32-bit integer value.

**CullDistance**

Decorating a variable with the `CullDistance` built-in decoration will make that variable contain the mechanism for controlling user culling. If any member of this array is assigned a negative value for all vertices belonging to a primitive, then the primitive is discarded before rasterization.

**Note**

In fragment shaders, the values of the `CullDistance` array are linearly interpolated across each primitive.

**Note**

If `CullDistance` decorates an input variable, that variable will contain the corresponding value from the `CullDistance` decorated output variable from the previous shader stage.

Valid Usage

- VUID-CullDistance-CullDistance-04196
  The `CullDistance` decoration must be used only within the `MeshEXT`, `MeshNV`, `Vertex`, `Fragment`, `TessellationControl`, `TessellationEvaluation`, or `Geometry Execution Model`. 
The variable decorated with `CullDistance` within the `MeshEXT, MeshNV` or `Vertex` Execution Model **must** be declared using the `Output Storage Class`.

The variable decorated with `CullDistance` within the `Fragment Execution Model` **must** be declared using the `Input Storage Class`.

The variable decorated with `CullDistance` within the `TessellationControl, TessellationEvaluation, or Geometry Execution Model` **must** not be declared using a `Storage Class` other than `Input` or `Output`.

The variable decorated with `CullDistance` **must** be declared as an array of 32-bit floating-point values.

**CullDistancePerViewNV**

Decorating a variable with the `CullDistancePerViewNV` built-in decoration will make that variable contain the per-view cull distances. The per-view cull distances have the same semantics as `CullDistance`.

**Valid Usage**

- **VUID-CullDistancePerViewNV-CullDistancePerViewNV-04201**
  The `CullDistancePerViewNV` decoration **must** be used only within the `MeshNV Execution Model`.

- **VUID-CullDistancePerViewNV-CullDistancePerViewNV-04202**
  The variable decorated with `CullDistancePerViewNV` **must** be declared using the `Output Storage Class`.

- **VUID-CullDistancePerViewNV-CullDistancePerViewNV-04203**
  The variable decorated with `CullDistancePerViewNV` **must** also be decorated with the `PerViewNV` decoration.

- **VUID-CullDistancePerViewNV-CullDistancePerViewNV-04204**
  The variable decorated with `CullDistancePerViewNV` **must** be declared as a two-dimensional array of 32-bit floating-point values.

**CullPrimitiveEXT**

Decorating a variable with the `CullPrimitiveEXT` built-in decoration will make that variable contain the culling state of output primitives. If the per-primitive boolean value is `true`, the primitive will be culled, if it is `false` it will not be culled.

**Valid Usage**

- **VUID-CullPrimitiveEXT-CullPrimitiveEXT-07034**
  The `CullPrimitiveEXT` decoration **must** be used only within the `MeshEXT Execution Model`.

- **VUID-CullPrimitiveEXT-CullPrimitiveEXT-07035**
  The `CullPrimitiveEXT` decoration **must** be used only within the `MeshEXT Execution Model`.
The variable decorated with `CullPrimitiveEXT` must be declared using the `Output Storage Class`.

- VUID-CullPrimitiveEXT-CullPrimitiveEXT-07036
  The variable decorated with `CullPrimitiveEXT` must be declared as an array of boolean values.

- VUID-CullPrimitiveEXT-CullPrimitiveEXT-07037
  The size of the array decorated with `CullPrimitiveEXT` must match the value specified by `OutputPrimitivesEXT`.

- VUID-CullPrimitiveEXT-CullPrimitiveEXT-07038
  The variable decorated with `CullPrimitiveEXT` within the `MeshEXT Execution Model` must also be decorated with the `PerPrimitiveEXT` decoration.

**CullMaskKHR**

A variable decorated with the `CullMaskKHR` decoration will specify the cull mask of the ray being processed. The value is given by the `Cull Mask` parameter passed into one of the `OpTrace*` instructions.

### Valid Usage

- VUID-CullMaskKHR-CullMaskKHR-06735
  The `CullMaskKHR` decoration must be used only within the `IntersectionKHR, AnyHitKHR, ClosestHitKHR, or MissKHR Execution Model`.

- VUID-CullMaskKHR-CullMaskKHR-06736
  The variable decorated with `CullMaskKHR` must be declared using the `Input Storage Class`.

- VUID-CullMaskKHR-CullMaskKHR-06737
  The variable decorated with `CullMaskKHR` must be declared as a scalar 32-bit integer value.

**CurrentRayTimeNV**

A variable decorated with the `CurrentRayTimeNV` decoration contains the time value passed in to `OpTraceRayMotionNV` which called this shader.

### Valid Usage

- VUID-CurrentRayTimeNV-CurrentRayTimeNV-04942
  The `CurrentRayTimeNV` decoration must be used only within the `IntersectionKHR, AnyHitKHR, ClosestHitKHR, or MissKHR Execution Model`.

- VUID-CurrentRayTimeNV-CurrentRayTimeNV-04943
  The variable decorated with `CurrentRayTimeNV` must be declared using the `Input Storage Class`.

- VUID-CurrentRayTimeNV-CurrentRayTimeNV-04944
  The variable decorated with `CurrentRayTimeNV` must be declared as a scalar 32-bit floating-point value.
**DeviceIndex**

The `DeviceIndex` decoration can be applied to a shader input which will be filled with the device index of the physical device that is executing the current shader invocation. This value will be in the range \([0, \max(1, \text{physicalDeviceCount}))\), where `physicalDeviceCount` is the `physicalDeviceCount` member of `VkDeviceGroupDeviceCreateInfo`.

---

**Valid Usage**

- VUID-DeviceIndex-DeviceIndex-04205
  The variable decorated with `DeviceIndex` must be declared using the `Input Storage Class`
- VUID-DeviceIndex-DeviceIndex-04206
  The variable decorated with `DeviceIndex` must be declared as a scalar 32-bit integer value

---

**DrawIndex**

Decorating a variable with the `DrawIndex` built-in will make that variable contain the integer value corresponding to the zero-based index of the draw that invoked the current task, mesh, or vertex shader invocation. For indirect drawing commands, `DrawIndex` begins at zero and increments by one for each draw executed. The number of draws is given by the `drawCount` parameter. For direct drawing commands, if `vkCmdDrawMultiEXT` or `vkCmdDrawMultiIndexedEXT` is used, this variable contains the integer value corresponding to the zero-based index of the draw. Otherwise `DrawIndex` is always zero. `DrawIndex` is dynamically uniform.

When task or mesh shaders are used, only the first active stage will have proper access to the variable. The value read by other stages is undefined.

---

**Valid Usage**

- VUID-DrawIndex-DrawIndex-04207
  The `DrawIndex` decoration must be used only within the `Vertex`, `MeshEXT`, `TaskEXT`, `MeshNV`, or `TaskNV Execution Model`
- VUID-DrawIndex-DrawIndex-04208
  The variable decorated with `DrawIndex` must be declared using the `Input Storage Class`
- VUID-DrawIndex-DrawIndex-04209
  The variable decorated with `DrawIndex` must be declared as a scalar 32-bit integer value

---

**FirstIndexHUAWEI**

The `FirstIndexHUAWEI` decoration can be used to decorate a cluster culling shader output variable, this indexed mode specific variable will contain an integer value that specifies the base index within the index buffer corresponding to a cluster.

---

**Valid Usage**

- VUID-FirstIndexHUAWEI-FirstIndexHUAWEI-07799
The `FirstIndexHUAWEI` decoration **must** be used only within the `ClusterCullingHUAWEI Execution Model`.

- `VUID-FirstIndexHUAWEI-FirstIndexHUAWEI-07800`
  The variable decorated with `FirstIndexHUAWEI` **must** be declared as a scalar 32-bit integer value.

**FragCoord**

Decorating a variable with the `FragCoord` built-in decoration will make that variable contain the framebuffer coordinate \((x, y, z, \frac{1}{w})\) of the fragment being processed. The \((x,y)\) coordinate \((0,0)\) is the upper left corner of the upper left pixel in the framebuffer.

When **Sample Shading** is enabled, the \(x\) and \(y\) components of `FragCoord` reflect the location of one of the samples corresponding to the shader invocation.

Otherwise, the \(x\) and \(y\) components of `FragCoord` reflect the location of the center of the fragment.

The \(z\) component of `FragCoord` is the interpolated depth value of the primitive.

The \(w\) component is the interpolated \(\frac{1}{z}\).

The `Centroid` interpolation decoration is ignored, but allowed, on `FragCoord`.

**Valid Usage**

- `VUID-FragCoord-FragCoord-04210`
  The `FragCoord` decoration **must** be used only within the `Fragment Execution Model`.

- `VUID-FragCoord-FragCoord-04211`
  The variable decorated with `FragCoord` **must** be declared using the `Input Storage Class`.

- `VUID-FragCoord-FragCoord-04212`
  The variable decorated with `FragCoord` **must** be declared as a four-component vector of 32-bit floating-point values.

**FragDepth**

To have a shader supply a fragment-depth value, the shader **must** declare the `DepthReplacing` execution mode. Such a shader's fragment-depth value will come from the variable decorated with the `FragDepth` built-in decoration.

This value will be used for any subsequent depth testing performed by the implementation or writes to the depth attachment. See `fragment shader depth replacement` for details.

**Valid Usage**

- `VUID-FragDepth-FragDepth-04213`
  The `FragDepth` decoration **must** be used only within the `Fragment Execution Model`.
The variable decorated with `FragDepth` must be declared using the Output Storage Class.

The variable decorated with `FragDepth` must be declared as a scalar 32-bit floating-point value.

If the shader dynamically writes to the variable decorated with `FragDepth`, the DepthReplacing Execution Mode must be declared.

**FirstInstanceHUWEI**

The `FirstInstanceHUWEI` decoration can be used to decorate a cluster culling shader output variable, this variable will contain an integer value that specifies the instance ID of the first instance to draw.

**Valid Usage**

- VUID-FirstInstanceHUWEI-FirstInstanceHUWEI-07801
  The `FirstInstanceHUWEI` decoration must be used only within the `ClusterCullingHUWEI` Execution Model.

- VUID-FirstInstanceHUWEI-FirstInstanceHUWEI-07802
  The variable decorated with `FirstInstanceHUWEI` must be declared as a scalar 32-bit integer value.

**FirstVertexHUWEI**

The `FirstVertexHUWEI` decoration can be used to decorate a cluster culling shader output variable, this non-indexed mode specific variable will contain an integer value that specifies the index of the first vertex in a cluster to draw.

**Valid Usage**

- VUID-FirstVertexHUWEI-FirstVertexHUWEI-07803
  The `FirstVertexHUWEI` decoration must be used only within the `FirstVertexHUWEI` Execution Model.

- VUID-FirstVertexHUWEI-FirstVertexHUWEI-07804
  The variable decorated with `FirstVertexHUWEI` must be declared as a scalar 32-bit integer value.

**FragInvocationCountEXT**

Decorating a variable with the `FragInvocationCountEXT` built-in decoration will make that variable contain the maximum number of fragment shader invocations for the fragment, as determined by `minSampleShading`.

If Sample Shading is not enabled, `FragInvocationCountEXT` will be filled with a value of 1.
Valid Usage

- VUID-FragInvocationCountEXT-FragInvocationCountEXT-04217
  The `FragInvocationCountEXT` decoration must be used only within the `Fragment Execution Model`

- VUID-FragInvocationCountEXT-FragInvocationCountEXT-04218
  The variable decorated with `FragInvocationCountEXT` must be declared using the `Input Storage Class`

- VUID-FragInvocationCountEXT-FragInvocationCountEXT-04219
  The variable decorated with `FragInvocationCountEXT` must be declared as a scalar 32-bit integer value

**FragSizeEXT**

Decorating a variable with the `FragSizeEXT` built-in decoration will make that variable contain the dimensions in pixels of the area that the fragment covers for that invocation.

If fragment density map is not enabled, `FragSizeEXT` will be filled with a value of (1,1).

Valid Usage

- VUID-FragSizeEXT-FragSizeEXT-04220
  The `FragSizeEXT` decoration must be used only within the `Fragment Execution Model`

- VUID-FragSizeEXT-FragSizeEXT-04221
  The variable decorated with `FragSizeEXT` must be declared using the `Input Storage Class`

- VUID-FragSizeEXT-FragSizeEXT-04222
  The variable decorated with `FragSizeEXT` must be declared as a two-component vector of 32-bit integer values

**FragStencilRefEXT**

Decorating a variable with the `FragStencilRefEXT` built-in decoration will make that variable contain the new stencil reference value for all samples covered by the fragment. This value will be used as the stencil reference value used in stencil testing.

To write to `FragStencilRefEXT`, a shader must declare the `StencilRefReplacingEXT` execution mode. If a shader declares the `StencilRefReplacingEXT` execution mode and there is an execution path through the shader that does not set `FragStencilRefEXT`, then the fragment’s stencil reference value is undefined for executions of the shader that take that path.

Only the least significant $s$ bits of the integer value of the variable decorated with `FragStencilRefEXT` are considered for stencil testing, where $s$ is the number of bits in the stencil framebuffer attachment, and higher order bits are discarded.

See fragment shader stencil reference replacement for more details.
Valid Usage

- VUID-FragStencilRefEXT-FragStencilRefEXT-04223
  The FragStencilRefEXT decoration must be used only within the Fragment Execution Model

- VUID-FragStencilRefEXT-FragStencilRefEXT-04224
  The variable decorated with FragStencilRefEXT must be declared using the Output Storage Class

- VUID-FragStencilRefEXT-FragStencilRefEXT-04225
  The variable decorated with FragStencilRefEXT must be declared as a scalar integer value

FragmentSizeNV
Decorating a variable with the FragmentSizeNV built-in decoration will make that variable contain the width and height of the fragment.

Valid Usage

- VUID-FragmentSizeNV-FragmentSizeNV-04226
  The FragmentSizeNV decoration must be used only within the Fragment Execution Model

- VUID-FragmentSizeNV-FragmentSizeNV-04227
  The variable decorated with FragmentSizeNV must be declared using the Input Storage Class

- VUID-FragmentSizeNV-FragmentSizeNV-04228
  The variable decorated with FragmentSizeNV must be declared as a two-component vector of 32-bit integer values

FrontFacing
Decorating a variable with the FrontFacing built-in decoration will make that variable contain whether the fragment is front or back facing. This variable is non-zero if the current fragment is considered to be part of a front-facing polygon primitive or of a non-polygon primitive and is zero if the fragment is considered to be part of a back-facing polygon primitive.

Valid Usage

- VUID-FrontFacing-FrontFacing-04229
  The FrontFacing decoration must be used only within the Fragment Execution Model

- VUID-FrontFacing-FrontFacing-04230
  The variable decorated with FrontFacing must be declared using the Input Storage Class

- VUID-FrontFacing-FrontFacing-04231
  The variable decorated with FrontFacing must be declared as a boolean value

FullyCoveredEXT
Decorating a variable with the FullyCoveredEXT built-in decoration will make that variable
indicate whether the fragment area is fully covered by the generating primitive. This variable is non-zero if conservative rasterization is enabled and the current fragment area is fully covered by the generating primitive, and is zero if the fragment is not covered or partially covered, or conservative rasterization is disabled.

**Valid Usage**

- **VUID-FullyCoveredEXT-FullyCoveredEXT-04232**
  The `FullyCoveredEXT` decoration must be used only within the Fragment Execution Model

- **VUID-FullyCoveredEXT-FullyCoveredEXT-04233**
  The variable decorated with `FullyCoveredEXT` must be declared using the Input Storage Class

- **VUID-FullyCoveredEXT-FullyCoveredEXT-04234**
  The variable decorated with `FullyCoveredEXT` must be declared as a boolean value

- **VUID-FullyCoveredEXT-conservativeRasterizationPostDepthCoverage-04235**
  If the `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::conservativeRasterizationPostDepthCoverage` is not supported the PostDepthCoverage Execution Mode must not be declared, when a variable with the `FullyCoveredEXT` decoration is declared

**GlobalInvocationId**

Decorating a variable with the `GlobalInvocationId` built-in decoration will make that variable contain the location of the current invocation within the global workgroup. Each component is equal to the index of the local workgroup multiplied by the size of the local workgroup plus `LocalInvocationId`.

**Valid Usage**

- **VUID-GlobalInvocationId-GlobalInvocationId-04236**
  The `GlobalInvocationId` decoration must be used only within the GLCompute, MeshEXT, TaskEXT, MeshNV, or TaskNV Execution Model

- **VUID-GlobalInvocationId-GlobalInvocationId-04237**
  The variable decorated with `GlobalInvocationId` must be declared using the Input Storage Class

- **VUID-GlobalInvocationId-GlobalInvocationId-04238**
  The variable decorated with `GlobalInvocationId` must be declared as a three-component vector of 32-bit integer values

**HelperInvocation**

Decorating a variable with the `HelperInvocation` built-in decoration will make that variable contain whether the current invocation is a helper invocation. This variable is non-zero if the current fragment being shaded is a helper invocation and zero otherwise. A helper invocation is an invocation of the shader that is produced to satisfy internal requirements such as the generation of derivatives.
Note
It is very likely that a helper invocation will have a value of SampleMask fragment shader input value that is zero.

Valid Usage

- VUID-HelperInvocation-HelperInvocation-04239
  The HelperInvocation decoration must be used only within the Fragment Execution Model

- VUID-HelperInvocation-HelperInvocation-04240
  The variable decorated with HelperInvocation must be declared using the Input Storage Class

- VUID-HelperInvocation-HelperInvocation-04241
  The variable decorated with HelperInvocation must be declared as a boolean value

HitKindKHR

A variable decorated with the HitKindKHR decoration will describe the intersection that triggered the execution of the current shader. The values are determined by the intersection shader. For user-defined intersection shaders this is the value that was passed to the “Hit Kind” operand of OpReportIntersectionKHR. For triangle intersection candidates, this will be one of HitKindFrontFacingTriangleKHR or HitKindBackFacingTriangleKHR.

Valid Usage

- VUID-HitKindKHR-HitKindKHR-04242
  The HitKindKHR decoration must be used only within the AnyHitKHR or ClosestHitKHR Execution Model

- VUID-HitKindKHR-HitKindKHR-04243
  The variable decorated with HitKindKHR must be declared using the Input Storage Class

- VUID-HitKindKHR-HitKindKHR-04244
  The variable decorated with HitKindKHR must be declared as a scalar 32-bit integer value

HitTNV

A variable decorated with the HitTNV decoration is equivalent to a variable decorated with the RayTmaxKHR decoration.

Valid Usage

- VUID-HitTNV-HitTNV-04245
  The HitTNV decoration must be used only within the AnyHitNV or ClosestHitNV Execution Model

- VUID-HitTNV-HitTNV-04246
  The variable decorated with HitTNV must be declared using the Input Storage Class
The variable decorated with `HitTNV` **must** be declared as a scalar 32-bit floating-point value.

**HitTriangleVertexPositionsKHR**

A variable decorated with the `HitTriangleVertexPositionsKHR` decoration will specify the object space vertices of the triangle at the current intersection in application-provided order. The positions returned are transformed by the geometry transform, which is performed at standard **floating point** precision, but without a specifically defined order of floating point operations to perform the matrix multiplication.

**Valid Usage**

- **VUID-HitTriangleVertexPositionsKHR-HitTriangleVertexPositionsKHR-08747**
  The `HitTriangleVertexPositionsKHR` decoration **must** be used only within the `AnyHitKHR` or `ClosestHitKHR` Execution Model.

- **VUID-HitTriangleVertexPositionsKHR-HitTriangleVertexPositionsKHR-08748**
  The variable decorated with `HitTriangleVertexPositionsKHR` **must** be declared using the **Input Storage Class**.

- **VUID-HitTriangleVertexPositionsKHR-HitTriangleVertexPositionsKHR-08749**
  The variable decorated with `HitTriangleVertexPositionsKHR` **must** be declared as an array of three vectors of three 32-bit float values.

- **VUID-HitTriangleVertexPositionsKHR-HitTriangleVertexPositionsKHR-08750**
  The variable decorated with `HitTriangleVertexPositionsKHR` **must** be used only if the value of `HitKindKHR` is `HitKindFrontFacingTriangleKHR` or `HitKindBackFacingTriangleKHR`.

- **VUID-HitTriangleVertexPositionsKHR-None-08751**
  The acceleration structure corresponding to the current intersection **must** have been built with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DATA_ACCESS_KHR`.

**IncomingRayFlagsKHR**

A variable with the `IncomingRayFlagsKHR` decoration will contain the ray flags passed in to the trace call that invoked this particular shader. Setting pipeline flags on the raytracing pipeline **must** not cause any corresponding flags to be set in variables with this decoration.

**Valid Usage**

- **VUID-IncomingRayFlagsKHR-IncomingRayFlagsKHR-04248**
  The `IncomingRayFlagsKHR` decoration **must** be used only within the `IntersectionKHR`, `AnyHitKHR`, `ClosestHitKHR`, or `MissKHR` Execution Model.

- **VUID-IncomingRayFlagsKHR-IncomingRayFlagsKHR-04249**
  The variable decorated with `IncomingRayFlagsKHR` **must** be declared using the **Input Storage Class**.

- **VUID-IncomingRayFlagsKHR-IncomingRayFlagsKHR-04250**
The variable decorated with `IncomingRayFlagsKHR` must be declared as a scalar 32-bit integer value.

**IndexCountHUAWEI**

The `IndexCountHUAWEI` decoration can be used to decorate a cluster culling shader output variable; this indexed mode specific variable will contain an integer value that specifies the number of indexed vertices in a cluster to draw.

**Valid Usage**

- VUID-IndexCountHUAWEI-IndexCountHUAWEI-07805
  The `IndexCountHUAWEI` decoration must be used only within the `ClusterCullingHUAWEI` Execution Model.
- VUID-IndexCountHUAWEI-IndexCountHUAWEI-07806
  The variable decorated with `IndexCountHUAWEI` must be declared as a scalar 32-bit integer value.

**InstanceCountHUAWEI**

The `InstanceCountHUAWEI` decoration can be used to decorate a cluster culling shader output variable; this variable will contain an integer value that specifies the number of instance to draw in a cluster.

**Valid Usage**

- VUID-InstanceCountHUAWEI-InstanceCountHUAWEI-07807
  The `InstanceCountHUAWEI` decoration must be used only within the `ClusterCullingHUAWEI` Execution Model.
- VUID-InstanceCountHUAWEI-InstanceCountHUAWEI-07808
  The variable decorated with `InstanceCountHUAWEI` must be declared as a scalar 32-bit integer value.

**InstanceCustomIndexKHR**

A variable decorated with the `InstanceCustomIndexKHR` decoration will contain the application-defined value of the instance that intersects the current ray. This variable contains the value that was specified in `VkAccelerationStructureInstanceKHR::instanceCustomIndex` for the current acceleration structure instance in the lower 24 bits and the upper 8 bits will be zero.

**Valid Usage**

- VUID-InstanceCustomIndexKHR-InstanceCustomIndexKHR-04251
  The `InstanceCustomIndexKHR` decoration must be used only within the `IntersectionKHR`, `AnyHitKHR`, or `ClosestHitKHR` Execution Model.
- VUID-InstanceCustomIndexKHR-InstanceCustomIndexKHR-04252
  The variable decorated with `InstanceCustomIndexKHR` must be declared as a scalar 32-bit integer value.
The variable decorated with `InstanceCustomIndexKHR` must be declared using the `Input Storage Class`

- VUID-InstanceCustomIndexKHR-InstanceCustomIndexKHR-04253
  The variable decorated with `InstanceCustomIndexKHR` must be declared as a scalar 32-bit integer value

### InstanceId

Decorating a variable in an intersection, any-hit, or closest hit shader with the `InstanceId` decoration will make that variable contain the index of the instance that intersects the current ray.

### Valid Usage

- VUID-InstanceId-InstanceId-04254
  The `InstanceId` decoration must be used only within the `IntersectionKHR`, `AnyHitKHR`, or `ClosestHitKHR` Execution Model

- VUID-InstanceId-InstanceId-04255
  The variable decorated with `InstanceId` must be declared using the `Input Storage Class`

- VUID-InstanceId-InstanceId-04256
  The variable decorated with `InstanceId` must be declared as a scalar 32-bit integer value

### InvocationId

Decorating a variable with the `InvocationId` built-in decoration will make that variable contain the index of the current shader invocation in a geometry shader, or the index of the output patch vertex in a tessellation control shader.

In a geometry shader, the index of the current shader invocation ranges from zero to the number of `instances` declared in the shader minus one. If the instance count of the geometry shader is one or is not specified, then `InvocationId` will be zero.

### Valid Usage

- VUID-InvocationId-InvocationId-04257
  The `InvocationId` decoration must be used only within the `TessellationControl` or `Geometry Execution Model`

- VUID-InvocationId-InvocationId-04258
  The variable decorated with `InvocationId` must be declared using the `Input Storage Class`

- VUID-InvocationId-InvocationId-04259
  The variable decorated with `InvocationId` must be declared as a scalar 32-bit integer value

### InvocationsPerPixelNV

Decorating a variable with the `InvocationsPerPixelNV` built-in decoration will make that variable
contain the maximum number of fragment shader invocations per pixel, as derived from the effective shading rate for the fragment. If a primitive does not fully cover a pixel, the number of fragment shader invocations for that pixel may be less than the value of `InvocationsPerPixelNV`. If the shading rate indicates a fragment covering multiple pixels, then `InvocationsPerPixelNV` will be one.

### Valid Usage

- **VUID-InvocationsPerPixelNV-InvocationsPerPixelNV-04260**
  - The `InvocationsPerPixelNV` decoration must be used only within the Fragment Execution Model.

- **VUID-InvocationsPerPixelNV-InvocationsPerPixelNV-04261**
  - The variable decorated with `InvocationsPerPixelNV` must be declared using the Input Storage Class.

- **VUID-InvocationsPerPixelNV-InvocationsPerPixelNV-04262**
  - The variable decorated with `InvocationsPerPixelNV` must be declared as a scalar 32-bit integer value.

### InstanceIndex

Decorating a variable in a vertex shader with the `InstanceIndex` built-in decoration will make that variable contain the index of the instance that is being processed by the current vertex shader invocation. `InstanceIndex` begins at the `firstInstance` parameter to `vkCmdDraw` or `vkCmdDrawIndexed` or at the `firstInstance` member of a structure consumed by `vkCmdDrawIndirect` or `vkCmdDrawIndexedIndirect`.

### Valid Usage

- **VUID-InstanceIndex-InstanceIndex-04263**
  - The `InstanceIndex` decoration must be used only within the Vertex Execution Model.

- **VUID-InstanceIndex-InstanceIndex-04264**
  - The variable decorated with `InstanceIndex` must be declared using the Input Storage Class.

- **VUID-InstanceIndex-InstanceIndex-04265**
  - The variable decorated with `InstanceIndex` must be declared as a scalar 32-bit integer value.

### LaunchIdKHR

A variable decorated with the `LaunchIdKHR` decoration will specify the index of the work item being processed. One work item is generated for each of the `width × height × depth` items dispatched by a `vkCmdTraceRaysKHR` command. All shader invocations inherit the same value for variables decorated with `LaunchIdKHR`.

### Valid Usage

- **VUID-LaunchIdKHR-LaunchIdKHR-04266**
  - The variable decorated with `LaunchIdKHR` must be declared as a scalar 32-bit integer value.
The `LaunchIdKHR` decoration **must** be used only within the `RayGenerationKHR`, `IntersectionKHR`, `AnyHitKHR`, `ClosestHitKHR`, `MissKHR`, or `CallableKHR` Execution Model

- VUID-LaunchIdKHR-LaunchIdKHR-04267
  The variable decorated with `LaunchIdKHR` **must** be declared using the `Input Storage Class`

- VUID-LaunchIdKHR-LaunchIdKHR-04268
  The variable decorated with `LaunchIdKHR` **must** be declared as a three-component vector of 32-bit integer values

`LaunchSizeKHR`

A variable decorated with the `LaunchSizeKHR` decoration will contain the `width`, `height`, and `depth` dimensions passed to the `vkCmdTraceRaysKHR` command that initiated this shader execution. The `width` is in the first component, the `height` is in the second component, and the `depth` is in the third component.

**Valid Usage**

- VUID-LaunchSizeKHR-LaunchSizeKHR-04269
  The `LaunchSizeKHR` decoration **must** be used only within the `RayGenerationKHR`, `IntersectionKHR`, `AnyHitKHR`, `ClosestHitKHR`, `MissKHR`, or `CallableKHR` Execution Model

- VUID-LaunchSizeKHR-LaunchSizeKHR-04270
  The variable decorated with `LaunchSizeKHR` **must** be declared using the `Input Storage Class`

- VUID-LaunchSizeKHR-LaunchSizeKHR-04271
  The variable decorated with `LaunchSizeKHR` **must** be declared as a three-component vector of 32-bit integer values

`Layer`

Decorating a variable with the `Layer` built-in decoration will make that variable contain the select layer of a multi-layer framebuffer attachment.

In a mesh, vertex, tessellation evaluation, or geometry shader, any variable decorated with `Layer` can be written with the framebuffer layer index to which the primitive produced by that shader will be directed.

The last active **pre-rasterization shader stage** (in pipeline order) controls the `Layer` that is used. Outputs in previous shader stages are not used, even if the last stage fails to write the `Layer`.

If the last active **pre-rasterization shader stage** shader entry point’s interface does not include a variable decorated with `Layer`, then the first layer is used. If a **pre-rasterization shader stage** shader entry point’s interface includes a variable decorated with `Layer`, it **must** write the same value to `Layer` for all output vertices of a given primitive. If the `Layer` value is less than 0 or greater than or equal to the number of layers in the framebuffer, then primitives **may** still be rasterized, fragment shaders **may** be executed, and the framebuffer values for all layers are undefined. In a mesh shader this also applies when the `Layer` value is greater than or equal to the `maxMeshOutputLayers` limit.
If a variable with the `Layer` decoration is also decorated with `ViewportRelativeNV`, then the `ViewportIndex` is added to the layer that is used for rendering and that is made available in the fragment shader.

If the shader writes to a variable decorated `ViewportMaskNV`, then the layer selected has a different value for each viewport a primitive is rendered to.

In a fragment shader, a variable decorated with `Layer` contains the layer index of the primitive that the fragment invocation belongs to.

### Valid Usage

- **VUID-Layer-Layer-04272**
  The `Layer` decoration **must** be used only within the `MeshEXT`, `MeshNV`, `Vertex`, `TessellationEvaluation`, `Geometry`, or `Fragment Execution Model`

- **VUID-Layer-Layer-04273**
  If the `shaderOutputLayer` feature is not enabled then the `Layer` decoration **must** be used only within the `Geometry` or `Fragment Execution Model`

- **VUID-Layer-Layer-04274**
  The variable decorated with `Layer` within the `MeshEXT`, `MeshNV`, `Vertex`, `TessellationEvaluation`, or `Geometry Execution Model` **must** be declared using the `Output Storage Class`

- **VUID-Layer-Layer-04275**
  The variable decorated with `Layer` within the `Fragment Execution Model` **must** be declared using the `Input Storage Class`

- **VUID-Layer-Layer-04276**
  The variable decorated with `Layer` **must** be declared as a scalar 32-bit integer value

- **VUID-Layer-Layer-07039**
  The variable decorated with `Layer` within the `MeshEXT Execution Model` **must** also be decorated with the `PerPrimitiveEXT` decoration

### LayerPerViewNV

Decorating a variable with the `LayerPerViewNV` built-in decoration will make that variable contain the per-view layer information. The per-view layer has the same semantics as `Layer`, for each view.

### Valid Usage

- **VUID-LayerPerViewNV-LayerPerViewNV-04277**
  The `LayerPerViewNV` decoration **must** be used only within the `MeshNV Execution Model`

- **VUID-LayerPerViewNV-LayerPerViewNV-04278**
  The variable decorated with `LayerPerViewNV` **must** be declared using the `Output Storage Class`

- **VUID-LayerPerViewNV-LayerPerViewNV-04279**
The variable decorated with `LayerPerViewNV` must also be decorated with the `PerViewNV` decoration

- VUID-LayerPerViewNV-LayerPerViewNV-04280
  The variable decorated with `LayerPerViewNV` must be declared as an array of scalar 32-bit integer values

**LocalInvocationId**

Decorating a variable with the `LocalInvocationId` built-in decoration will make that variable contain the location of the current cluster culling, task, mesh, or compute shader invocation within the local workgroup. Each component ranges from zero through to the size of the workgroup in that dimension minus one.

*Note*

If the size of the workgroup in a particular dimension is one, then the `LocalInvocationId` in that dimension will be zero. If the workgroup is effectively two-dimensional, then `LocalInvocationId.z` will be zero. If the workgroup is effectively one-dimensional, then both `LocalInvocationId.y` and `LocalInvocationId.z` will be zero.

**Valid Usage**

- VUID-LocalInvocationId-LocalInvocationId-04281
  The `LocalInvocationId` decoration must be used only within the `GLCompute`, `MeshEXT`, `TaskEXT`, `MeshNV`, or `TaskNV` Execution Model

- VUID-LocalInvocationId-LocalInvocationId-04282
  The variable decorated with `LocalInvocationId` must be declared using the Input Storage Class

- VUID-LocalInvocationId-LocalInvocationId-04283
  The variable decorated with `LocalInvocationId` must be declared as a three-component vector of 32-bit integer values

**LocalInvocationIndex**

Decorating a variable with the `LocalInvocationIndex` built-in decoration will make that variable contain a one-dimensional representation of `LocalInvocationId`. This is computed as:

```
LocalInvocationIndex = 
  LocalInvocationId.z * WorkgroupSize.x * WorkgroupSize.y +
  LocalInvocationId.y * WorkgroupSize.x +
  LocalInvocationId.x;
```

**Valid Usage**

- VUID-LocalInvocationIndex-LocalInvocationIndex-04284
The `LocalInvocationIndex` decoration must be used only within the `GLCompute`, `MeshEXT`, `TaskEXT`, `MeshNV`, or `TaskNV` Execution Model.

- VUID-LocalInvocationIndex-LocalInvocationIndex-04285
  The variable decorated with `LocalInvocationIndex` must be declared using the Input Storage Class.

- VUID-LocalInvocationIndex-LocalInvocationIndex-04286
  The variable decorated with `LocalInvocationIndex` must be declared as a scalar 32-bit integer value.

**MeshViewCountNV**

Decorating a variable with the `MeshViewCountNV` built-in decoration will make that variable contain the number of views processed by the current mesh or task shader invocations.

**Valid Usage**

- VUID-MeshViewCountNV-MeshViewCountNV-04287
  The `MeshViewCountNV` decoration must be used only within the `MeshNV` or `TaskNV` Execution Model.

- VUID-MeshViewCountNV-MeshViewCountNV-04288
  The variable decorated with `MeshViewCountNV` must be declared using the Input Storage Class.

- VUID-MeshViewCountNV-MeshViewCountNV-04289
  The variable decorated with `MeshViewCountNV` must be declared as a scalar 32-bit integer value.

**MeshViewIndicesNV**

Decorating a variable with the `MeshViewIndicesNV` built-in decoration will make that variable contain the mesh view indices. The mesh view indices is an array of values where each element holds the view number of one of the views being processed by the current mesh or task shader invocations. The values of array elements with indices greater than or equal to `MeshViewCountNV` are undefined. If the value of `MeshViewIndicesNV[i]` is `j`, then any outputs decorated with `PerViewNV` will take on the value of array element `i` when processing primitives for view index `j`.

**Valid Usage**

- VUID-MeshViewIndicesNV-MeshViewIndicesNV-04290
  The `MeshViewIndicesNV` decoration must be used only within the `MeshNV` or `TaskNV` Execution Model.

- VUID-MeshViewIndicesNV-MeshViewIndicesNV-04291
  The variable decorated with `MeshViewIndicesNV` must be declared using the Input Storage Class.

- VUID-MeshViewIndicesNV-MeshViewIndicesNV-04292
  The variable decorated with `MeshViewIndicesNV` must be declared as an array of scalar 32-
**NumSubgroups**

Decorating a variable with the `NumSubgroups` built-in decoration will make that variable contain the number of subgroups in the local workgroup.

### Valid Usage

- VUID-NumSubgroups-NumSubgroups-04293
  The `NumSubgroups` decoration **must** be used only within the GLCompute, MeshEXT, TaskEXT, MeshNV, or TaskNV Execution Model

- VUID-NumSubgroups-NumSubgroups-04294
  The variable decorated with `NumSubgroups` **must** be declared using the Input Storage Class

- VUID-NumSubgroups-NumSubgroups-04295
  The variable decorated with `NumSubgroups` **must** be declared as a scalar 32-bit integer value

**NumWorkgroups**

Decorating a variable with the `NumWorkgroups` built-in decoration will make that variable contain the number of local workgroups that are part of the dispatch that the invocation belongs to. Each component is equal to the values of the workgroup count parameters passed into the dispatching commands.

### Valid Usage

- VUID-NumWorkgroups-NumWorkgroups-04296
  The `NumWorkgroups` decoration **must** be used only within the GLCompute, MeshEXT, or TaskEXT Execution Model

- VUID-NumWorkgroups-NumWorkgroups-04297
  The variable decorated with `NumWorkgroups` **must** be declared using the Input Storage Class

- VUID-NumWorkgroups-NumWorkgroups-04298
  The variable decorated with `NumWorkgroups` **must** be declared as a three-component vector of 32-bit integer values

**ObjectRayDirectionKHR**

A variable decorated with the `ObjectRayDirectionKHR` decoration will specify the direction of the ray being processed, in object space.

### Valid Usage

- VUID-ObjectRayDirectionKHR-ObjectRayDirectionKHR-04299
  The `ObjectRayDirectionKHR` decoration **must** be used only within the IntersectionKHR, AnyHitKHR, or ClosestHitKHR Execution Model
The variable decorated with `ObjectRayDirectionKHR` must be declared using the `Input Storage Class`.

The variable decorated with `ObjectRayDirectionKHR` must be declared as a three-component vector of 32-bit floating-point values.

**ObjectRayOriginKHR**

A variable decorated with the `ObjectRayOriginKHR` decoration will specify the origin of the ray being processed, in object space.

**Valid Usage**

- **VUID-ObjectRayOriginKHR-ObjectRayOriginKHR-04302**
  The `ObjectRayOriginKHR` decoration must be used only within the `IntersectionKHR`, `AnyHitKHR`, or `ClosestHitKHR` Execution Model.

- **VUID-ObjectRayOriginKHR-ObjectRayOriginKHR-04303**
  The variable decorated with `ObjectRayOriginKHR` must be declared using the `Input Storage Class`.

- **VUID-ObjectRayOriginKHR-ObjectRayOriginKHR-04304**
  The variable decorated with `ObjectRayOriginKHR` must be declared as a three-component vector of 32-bit floating-point values.

**ObjectToWorldKHR**

A variable decorated with the `ObjectToWorldKHR` decoration will contain the current object-to-world transformation matrix, which is determined by the instance of the current intersection.

**Valid Usage**

- **VUID-ObjectToWorldKHR-ObjectToWorldKHR-04305**
  The `ObjectToWorldKHR` decoration must be used only within the `IntersectionKHR`, `AnyHitKHR`, or `ClosestHitKHR` Execution Model.

- **VUID-ObjectToWorldKHR-ObjectToWorldKHR-04306**
  The variable decorated with `ObjectToWorldKHR` must be declared using the `Input Storage Class`.

- **VUID-ObjectToWorldKHR-ObjectToWorldKHR-04307**
  The variable decorated with `ObjectToWorldKHR` must be declared as a matrix with four columns of three-component vectors of 32-bit floating-point values.

**PatchVertices**

Decorating a variable with the `PatchVertices` built-in decoration will make that variable contain the number of vertices in the input patch being processed by the shader. In a Tessellation Control Shader, this is the same as the `name:patchControlPoints` member of...
In a Tessellation Evaluation Shader, `PatchVertices` is equal to the tessellation control output patch size. When the same shader is used in different pipelines where the patch sizes are configured differently, the value of the `PatchVertices` variable will also differ.

**Valid Usage**

- VUID-PatchVertices-PatchVertices-04308
  The `PatchVertices` decoration must be used only within the `TessellationControl` or `TessellationEvaluation Execution Model`.

- VUID-PatchVertices-PatchVertices-04309
  The variable decorated with `PatchVertices` must be declared using the `Input Storage Class`.

- VUID-PatchVertices-PatchVertices-04310
  The variable decorated with `PatchVertices` must be declared as a scalar 32-bit integer value.

**PointCoord**

Decorating a variable with the `PointCoord` built-in decoration will make that variable contain the coordinate of the current fragment within the point being rasterized, normalized to the size of the point with origin in the upper left corner of the point, as described in `Basic Point Rasterization`. If the primitive the fragment shader invocation belongs to is not a point, then the variable decorated with `PointCoord` contains an undefined value.

*Note*

Depending on how the point is rasterized, `PointCoord` may never reach (0,0) or (1,1).

**Valid Usage**

- VUID-PointCoord-PointCoord-04311
  The `PointCoord` decoration must be used only within the `Fragment Execution Model`.

- VUID-PointCoord-PointCoord-04312
  The variable decorated with `PointCoord` must be declared using the `Input Storage Class`.

- VUID-PointCoord-PointCoord-04313
  The variable decorated with `PointCoord` must be declared as a two-component vector of 32-bit floating-point values.

**PointSize**

Decorating a variable with the `PointSize` built-in decoration will make that variable contain the size of point primitives or the final rasterization of polygons if `polygon mode` is `VK_POLYGON_MODE_POINT` when `VkPhysicalDeviceMaintenance5PropertiesKHR::polygonModePointSize` is set to `VK_TRUE` . The value written to the variable decorated with `PointSize` by the last pre-rasterization shader stage in the pipeline is used as the framebuffer-space size of points.
produced by rasterization. If `maintenance5` is enabled and a value is not written to a variable decorated with `PointSize`, a value of 1.0 is used as the size of points.

*Note*

When `PointSize` decorates a variable in the **Input Storage Class**, it contains the data written to the output variable decorated with `PointSize` from the previous shader stage.

### Valid Usage

- **VUID-PointSize-PointSize-04314**
  *The `PointSize` decoration must be used only within the `MeshEXT`, `MeshNV`, `Vertex`, `TessellationControl`, `TessellationEvaluation`, or `Geometry Execution Model`*

- **VUID-PointSize-PointSize-04315**
  *The variable decorated with `PointSize` within the `MeshEXT`, `MeshNV`, or `Vertex Execution Model` must be declared using the **Output Storage Class***

- **VUID-PointSize-PointSize-04316**
  *The variable decorated with `PointSize` within the `TessellationControl`, `TessellationEvaluation`, or `Geometry Execution Model` must not be declared using a **Storage Class** other than **Input** or **Output***

- **VUID-PointSize-PointSize-04317**
  *The variable decorated with `PointSize` must be declared as a scalar 32-bit floating-point value*

### Position

Decorating a variable with the `Position` built-in decoration will make that variable contain the position of the current vertex. In the last **pre-rasterization shader stage**, the value of the variable decorated with `Position` is used in subsequent primitive assembly, clipping, and rasterization operations.

*Note*

When `Position` decorates a variable in the **Input Storage Class**, it contains the data written to the output variable decorated with `Position` from the previous shader stage.

### Valid Usage

- **VUID-Position-Position-04318**
  *The `Position` decoration must be used only within the `MeshEXT`, `MeshNV`, `Vertex`, `TessellationControl`, `TessellationEvaluation`, or `Geometry Execution Model`*

- **VUID-Position-Position-04319**
  *The variable decorated with `Position` within the `MeshEXT`, `MeshNV`, or `Vertex Execution Model` must be declared using the **Output Storage Class***
The variable decorated with `Position` within the `TessellationControl`, `TessellationEvaluation`, or `Geometry Execution Model` must not be declared using a `Storage Class` other than `Input` or `Output`.

The variable decorated with `Position` must be declared as a four-component vector of 32-bit floating-point values.

---

**PositionPerViewNV**

Decorating a variable with the `PositionPerViewNV` built-in decoration will make that variable contain the position of the current vertex, for each view.

Elements of the array correspond to views in a multiview subpass, and those elements corresponding to views in the view mask of the subpass the shader is compiled against will be used as the position value for those views. For the final pre-rasterization shader stage in the pipeline, values written to an output variable decorated with `PositionPerViewNV` are used in subsequent primitive assembly, clipping, and rasterization operations, as with `Position`. `PositionPerViewNV` output in an earlier pre-rasterization shader stage is available as an input in the subsequent pre-rasterization shader stage.

If a shader is compiled against a subpass that has the `VK_SUBPASS_DESCRIPTION_PER_VIEW_POSITION_X_ONLY_BIT_NVX` bit set, then the position values for each view must not differ in any component other than the X component. If the values do differ, one will be chosen in an implementation-dependent manner.

---

**Valid Usage**

- **VUID-PositionPerViewNV-PositionPerViewNV-04322**
  The `PositionPerViewNV` decoration must be used only within the `MeshNV, Vertex, TessellationControl, TessellationEvaluation, or Geometry Execution Model`

- **VUID-PositionPerViewNV-PositionPerViewNV-04323**
  The variable decorated with `PositionPerViewNV` within the `Vertex, or MeshNV Execution Model` must be declared using the `Output Storage Class`

- **VUID-PositionPerViewNV-PositionPerViewNV-04324**
  The variable decorated with `PositionPerViewNV` within the `TessellationControl, TessellationEvaluation, or Geometry Execution Model` must not be declared using a `Storage Class` other than `Input` or `Output`

- **VUID-PositionPerViewNV-PositionPerViewNV-04325**
  The variable decorated with `PositionPerViewNV` must be declared as an array of four-component vector of 32-bit floating-point values with at least as many elements as the maximum view in the subpass's view mask plus one

- **VUID-PositionPerViewNV-PositionPerViewNV-04326**
  The array variable decorated with `PositionPerViewNV` must only be indexed by a constant or specialization constant
**PrimitiveCountNV**

Decorating a variable with the `PrimitiveCountNV` decoration will make that variable contain the primitive count. The primitive count specifies the number of primitives in the output mesh produced by the mesh shader that will be processed by subsequent pipeline stages.

**Valid Usage**

- **VUID-PrimitiveCountNV-PrimitiveCountNV-04327**
  The `PrimitiveCountNV` decoration must be used only within the `MeshNV Execution Model`.

- **VUID-PrimitiveCountNV-PrimitiveCountNV-04328**
  The variable decorated with `PrimitiveCountNV` must be declared using the `Output Storage Class`.

- **VUID-PrimitiveCountNV-PrimitiveCountNV-04329**
  The variable decorated with `PrimitiveCountNV` must be declared as a scalar 32-bit integer value.

**PrimitiveId**

Decorating a variable with the `PrimitiveId` built-in decoration will make that variable contain the index of the current primitive.

The index of the first primitive generated by a drawing command is zero, and the index is incremented after every individual point, line, or triangle primitive is processed.

For triangles drawn as points or line segments (see Polygon Mode), the primitive index is incremented only once, even if multiple points or lines are eventually drawn.

Variables decorated with `PrimitiveId` are reset to zero between each instance drawn.

Restarting a primitive topology using primitive restart has no effect on the value of variables decorated with `PrimitiveId`.

In tessellation control and tessellation evaluation shaders, it will contain the index of the patch within the current set of rendering primitives that corresponds to the shader invocation.

In a geometry shader, it will contain the number of primitives presented as input to the shader since the current set of rendering primitives was started.

In a fragment shader, it will contain the primitive index written by the mesh shader if a mesh shader is present, or the primitive index written by the geometry shader if a geometry shader is present, or with the value that would have been presented as input to the geometry shader had it been present.

In an intersection, any-hit, or closest hit shader, it will contain the index within the geometry of the triangle or bounding box being processed.

**Note**

When the `PrimitiveId` decoration is applied to an output variable in the mesh...
shader or geometry shader, the resulting value is seen through the `PrimitiveId` decorated input variable in the fragment shader.

The fragment shader using `PrimitiveId` will need to declare either the `MeshShadingNV`, `MeshShadingEXT`, `Geometry` or `Tessellation` capability to satisfy the requirement SPIR-V has to use `PrimitiveId`.

---

**Valid Usage**

- **VUID-PrimitiveId-PrimitiveId-04330**
  The `PrimitiveId` decoration must be used only within the `MeshEXT`, `MeshNV`, `IntersectionKHR`, `AnyHitKHR`, `ClosestHitKHR`, `TessellationControl`, `TessellationEvaluation`, `Geometry`, or `Fragment Execution Model`.

- **VUID-PrimitiveId-Fragment-04331**
  If pipeline contains both the `Fragment` and `Geometry Execution Model` and a variable decorated with `PrimitiveId` is read from `Fragment` shader, then the `Geometry` shader must write to the output variables decorated with `PrimitiveId` in all execution paths.

- **VUID-PrimitiveId-Fragment-04332**
  If pipeline contains both the `Fragment` and `MeshEXT` or `MeshNV Execution Model` and a variable decorated with `PrimitiveId` is read from `Fragment` shader, then the `MeshEXT` or `MeshNV` shader must write to the output variables decorated with `PrimitiveId` in all execution paths.

- **VUID-PrimitiveId-Fragment-04333**
  If `Fragment Execution Model` contains a variable decorated with `PrimitiveId`, then either the `MeshShadingEXT`, `MeshShadingNV`, `Geometry` or `Tessellation` capability must also be declared.

- **VUID-PrimitiveId-PrimitiveId-04334**
  The variable decorated with `PrimitiveId` within the `TessellationControl`, `TessellationEvaluation`, `Fragment`, `IntersectionKHR`, `AnyHitKHR`, or `ClosestHitKHR Execution Model` must be declared using the `Input Storage Class`.

- **VUID-PrimitiveId-PrimitiveId-04335**
  The variable decorated with `PrimitiveId` within the `Geometry Execution Model` must be declared using the `Input` or `Output Storage Class`.

- **VUID-PrimitiveId-PrimitiveId-04336**
  The variable decorated with `PrimitiveId` within the `MeshEXT` or `MeshNV Execution Model` must be declared using the `Output Storage Class`.

- **VUID-PrimitiveId-PrimitiveId-04337**
  The variable decorated with `PrimitiveId` must be declared as a scalar 32-bit integer value.

- **VUID-PrimitiveId-PrimitiveId-07040**
  The variable decorated with `PrimitiveId` within the `MeshEXT Execution Model` must also be decorated with the `PerPrimitiveEXT` decoration.

---

**PrimitiveIndicesNV**

Decorating a variable with the `PrimitiveIndicesNV` decoration will make that variable contain the
output array of vertex index values. Depending on the output primitive type declared using the execution mode, the indices are split into groups of one (OutputPoints), two (OutputLinesNV), or three (OutputTrianglesNV) indices and each group generates a primitive.

**Valid Usage**

- **VUID-PrimitiveIndicesNV-PrimitiveIndicesNV-04338**
The PrimitiveIndicesNV decoration **must** be used only within the MeshNV Execution Model

- **VUID-PrimitiveIndicesNV-PrimitiveIndicesNV-04339**
The variable decorated with PrimitiveIndicesNV **must** be declared using the Output Storage Class

- **VUID-PrimitiveIndicesNV-PrimitiveIndicesNV-04340**
The variable decorated with PrimitiveIndicesNV **must** be declared as an array of scalar 32-bit integer values

- **VUID-PrimitiveIndicesNV-PrimitiveIndicesNV-04341**
All index values of the array decorated with PrimitiveIndicesNV **must** be in the range [0, N-1], where N is the value specified by the OutputVertices Execution Mode

- **VUID-PrimitiveIndicesNV-OutputPoints-04342**
If the Execution Mode is OutputPoints, then the array decorated with PrimitiveIndicesNV **must** be the size of the value specified by OutputPrimitivesNV

- **VUID-PrimitiveIndicesNV-OutputLinesNV-04343**
If the Execution Mode is OutputLinesNV, then the array decorated with PrimitiveIndicesNV **must** be the size of two times the value specified by OutputPrimitivesNV

- **VUID-PrimitiveIndicesNV-OutputTrianglesNV-04344**
If the Execution Mode is OutputTrianglesNV, then the array decorated with PrimitiveIndicesNV **must** be the size of three times the value specified by OutputPrimitivesNV

**PrimitivePointIndicesEXT**

Decorating a variable with the PrimitivePointIndicesEXT decoration will make that variable contain the output array of vertex index values for point primitives.

**Valid Usage**

- **VUID-PrimitivePointIndicesEXT-PrimitivePointIndicesEXT-07041**
The PrimitivePointIndicesEXT decoration **must** be used only within the MeshEXT Execution Model

- **VUID-PrimitivePointIndicesEXT-PrimitivePointIndicesEXT-07042**
The PrimitivePointIndicesEXT decoration **must** be used with the OutputPoints Execution Mode

- **VUID-PrimitivePointIndicesEXT-PrimitivePointIndicesEXT-07043**
The variable decorated with PrimitivePointIndicesEXT **must** be declared using the Output Storage Class
The variable decorated with `PrimitivePointIndicesEXT` must be declared as an array of scalar 32-bit integer values.

All index values of the array decorated with `PrimitivePointIndicesEXT` must be in the range [0, N-1], where N is the value specified by the `OutputVertices Execution Mode`.

The size of the array decorated with `PrimitivePointIndicesEXT` must match the value specified by `OutputPrimitivesEXT`.

### PrimitiveLineIndicesEXT

Decorating a variable with the `PrimitiveLineIndicesEXT` decoration will make that variable contain the output array of vertex index values for line primitives.

### Valid Usage

- **VUID-PrimitiveLineIndicesEXT-PrimitiveLineIndicesEXT-07047**
  The `PrimitiveLineIndicesEXT` decoration must be used only within the `MeshEXT Execution Model`.

- **VUID-PrimitiveLineIndicesEXT-PrimitiveLineIndicesEXT-07048**
  The `PrimitiveLineIndicesEXT` decoration must be used with the `OutputLinesEXT Execution Mode`.

- **VUID-PrimitiveLineIndicesEXT-PrimitiveLineIndicesEXT-07049**
  The variable decorated with `PrimitiveLineIndicesEXT` must be declared using the `Output Storage Class`.

- **VUID-PrimitiveLineIndicesEXT-PrimitiveLineIndicesEXT-07050**
  The variable decorated with `PrimitiveLineIndicesEXT` must be declared as an array of two component vector 32-bit integer values.

- **VUID-PrimitiveLineIndicesEXT-PrimitiveLineIndicesEXT-07051**
  All index values of the array decorated with `PrimitiveLineIndicesEXT` must be in the range [0, N-1], where N is the value specified by the `OutputVertices Execution Mode`.

- **VUID-PrimitiveLineIndicesEXT-PrimitiveLineIndicesEXT-07052**
  The size of the array decorated with `PrimitiveLineIndicesEXT` must match the value specified by `OutputPrimitivesEXT`.

### PrimitiveTriangleIndicesEXT

Decorating a variable with the `PrimitiveTriangleIndicesEXT` decoration will make that variable contain the output array of vertex index values for triangle primitives.

### Valid Usage

- **VUID-PrimitiveTriangleIndicesEXT-PrimitiveTriangleIndicesEXT-07053**
  The `PrimitiveTriangleIndicesEXT` decoration must be used only within the `MeshEXT`.
Execution Model

- **VUID-PrimitiveTriangleIndicesEXT-PrimitiveTriangleIndicesEXT-07054**
  The `PrimitiveTriangleIndicesEXT` decoration **must** be used with the `OutputTrianglesEXT` Execution Mode.

- **VUID-PrimitiveTriangleIndicesEXT-PrimitiveTriangleIndicesEXT-07055**
  The variable decorated with `PrimitiveTriangleIndicesEXT` **must** be declared using the `Output Storage Class`.

- **VUID-PrimitiveTriangleIndicesEXT-PrimitiveTriangleIndicesEXT-07056**
  The variable decorated with `PrimitiveTriangleIndicesEXT` **must** be declared as an array of three component vector 32-bit integer values.

- **VUID-PrimitiveTriangleIndicesEXT-PrimitiveTriangleIndicesEXT-07057**
  All index values of the array decorated with `PrimitiveTriangleIndicesEXT` **must** be in the range `[0, N-1]`, where N is the value specified by the `OutputVertices Execution Mode`.

- **VUID-PrimitiveTriangleIndicesEXT-PrimitiveTriangleIndicesEXT-07058**
  The size of the array decorated with `PrimitiveTriangleIndicesEXT` **must** match the value specified by `OutputPrimitivesEXT`.

**PrimitiveShadingRateKHR**

Decorating a variable with the `PrimitiveShadingRateKHR` built-in decoration will make that variable contain the **primitive fragment shading rate**.

The value written to the variable decorated with `PrimitiveShadingRateKHR` by the last **pre-rasterization shader stage** in the pipeline is used as the **primitive fragment shading rate**. Outputs in previous shader stages are ignored.

If the last active **pre-rasterization shader stage** shader entry point's interface does not include a variable decorated with `PrimitiveShadingRateKHR`, then it is as if the shader specified a fragment shading rate value of 0, indicating a horizontal and vertical rate of 1 pixel.

If a shader has `PrimitiveShadingRateKHR` in the output interface and there is an execution path through the shader that does not write to it, its value is undefined for executions of the shader that take that path.

**Valid Usage**

- **VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04484**
  The `PrimitiveShadingRateKHR` decoration **must** be used only within the `MeshEXT`, `MeshNV`, `Vertex`, or `Geometry Execution Model`.

- **VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04485**
  The variable decorated with `PrimitiveShadingRateKHR` **must** be declared using the `Output Storage Class`.

- **VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04486**
  The variable decorated with `PrimitiveShadingRateKHR` **must** be declared as a scalar 32-bit integer value.
The value written to `PrimitiveShadingRateKHR` must include no more than one of `Vertical2Pixels` and `Vertical4Pixels`.

The value written to `PrimitiveShadingRateKHR` must include no more than one of `Horizontal2Pixels` and `Horizontal4Pixels`.

The value written to `PrimitiveShadingRateKHR` must not have any bits set other than those defined by `Fragment Shading Rate Flags` enumerants in the SPIR-V specification.

The variable decorated with `PrimitiveShadingRateKHR` within the `MeshEXT Execution Model` must also be decorated with the `PerPrimitiveEXT` decoration.

**RayGeometryIndexKHR**

A variable decorated with the `RayGeometryIndexKHR` decoration will contain the geometry index for the acceleration structure geometry currently being shaded.

**Valid Usage**

- The `RayGeometryIndexKHR` decoration must be used only within the `IntersectionKHR`, `AnyHitKHR`, or `ClosestHitKHR` Execution Model.
- The variable decorated with `RayGeometryIndexKHR` must be declared using the Input Storage Class.
- The variable decorated with `RayGeometryIndexKHR` must be declared as a scalar 32-bit integer value.

**RayTmaxKHR**

A variable decorated with the `RayTmaxKHR` decoration will contain the parametric \( t_{\text{max}} \) value of the ray being processed. The value is independent of the space in which the ray origin and direction exist. The value is initialized to the parameter passed into the `pipeline trace ray` instruction.

The \( t_{\text{max}} \) value changes throughout the lifetime of the ray that produced the intersection. In the closest hit shader, the value reflects the closest distance to the intersected primitive. In the any-hit shader, it reflects the distance to the primitive currently being intersected. In the intersection shader, it reflects the distance to the closest primitive intersected so far or the initial value. The value can change in the intersection shader after calling `OpReportIntersectionKHR` if the corresponding any-hit shader does not ignore the intersection. In a miss shader, the value is identical to the parameter passed into the `pipeline trace ray` instruction.
Valid Usage

- **VUID-RayTmaxKHR-RayTmaxKHR-04348**
  The `RayTmaxKHR` decoration must be used only within the `IntersectionKHR`, `AnyHitKHR`, `ClosestHitKHR`, or `MissKHR` Execution Model.

- **VUID-RayTmaxKHR-RayTmaxKHR-04349**
  The variable decorated with `RayTmaxKHR` must be declared using the `Input Storage Class`.

- **VUID-RayTmaxKHR-RayTmaxKHR-04350**
  The variable decorated with `RayTmaxKHR` must be declared as a scalar 32-bit floating-point value.

**RayTminKHR**

A variable decorated with the `RayTminKHR` decoration will contain the parametric $t_{\text{min}}$ value of the ray being processed. The value is independent of the space in which the ray origin and direction exist. The value is the parameter passed into the pipeline trace ray instruction.

The $t_{\text{min}}$ value remains constant for the duration of the ray query.

Valid Usage

- **VUID-RayTminKHR-RayTminKHR-04351**
  The `RayTminKHR` decoration must be used only within the `IntersectionKHR`, `AnyHitKHR`, `ClosestHitKHR`, or `MissKHR` Execution Model.

- **VUID-RayTminKHR-RayTminKHR-04352**
  The variable decorated with `RayTminKHR` must be declared using the `Input Storage Class`.

- **VUID-RayTminKHR-RayTminKHR-04353**
  The variable decorated with `RayTminKHR` must be declared as a scalar 32-bit floating-point value.

**SampleId**

Decorating a variable with the `SampleId` built-in decoration will make that variable contain the coverage index for the current fragment shader invocation. `SampleId` ranges from zero to the number of samples in the framebuffer minus one. If a fragment shader entry point's interface includes an input variable decorated with `SampleId`, Sample Shading is considered enabled with a `minSampleShading` value of 1.0.

Valid Usage

- **VUID-SampleId-SampleId-04354**
  The `SampleId` decoration must be used only within the `Fragment Execution Model`.

- **VUID-SampleId-SampleId-04355**
  The variable decorated with `SampleId` must be declared using the `Input Storage Class`.

- **VUID-SampleId-SampleId-04356**
The variable decorated with \texttt{SampleId} \textbf{must} be declared as a scalar 32-bit integer value

**SampleMask**

Decorating a variable with the \texttt{SampleMask} built-in decoration will make any variable contain the sample mask for the current fragment shader invocation.

A variable in the \texttt{Input} storage class decorated with \texttt{SampleMask} will contain a bitmask of the set of samples covered by the primitive generating the fragment during rasterization. It has a sample bit set if and only if the sample is considered covered for this fragment shader invocation. \texttt{SampleMask[]} is an array of integers. Bits are mapped to samples in a manner where bit $B$ of mask $M$ ($\text{SampleMask}[M]$) corresponds to sample $32 \times M + B$.

A variable in the \texttt{Output} storage class decorated with \texttt{SampleMask} is an array of integers forming a bit array in a manner similar to an input variable decorated with \texttt{SampleMask}, but where each bit represents coverage as computed by the shader. This computed \texttt{SampleMask} is combined with the generated coverage mask in the \texttt{multisample coverage} operation.

Variables decorated with \texttt{SampleMask} \textbf{must} be either an unsized array, or explicitly sized to be no larger than the implementation-dependent maximum sample-mask (as an array of 32-bit elements), determined by the maximum number of samples.

If a fragment shader entry point's interface includes an output variable decorated with \texttt{SampleMask}, the sample mask will be undefined for any array elements of any fragment shader invocations that fail to assign a value. If a fragment shader entry point's interface does not include an output variable decorated with \texttt{SampleMask}, the sample mask has no effect on the processing of a fragment.

**Valid Usage**

- VUID-SampleMask-SampleMask-04357
  - The \texttt{SampleMask} decoration \textbf{must} be used only within the \texttt{Fragment Execution Model}

- VUID-SampleMask-SampleMask-04358
  - The variable decorated with \texttt{SampleMask} \textbf{must} be declared using the \texttt{Input} or \texttt{Output Storage Class}

- VUID-SampleMask-SampleMask-04359
  - The variable decorated with \texttt{SampleMask} \textbf{must} be declared as an array of 32-bit integer values

**SamplePosition**

Decorating a variable with the \texttt{SamplePosition} built-in decoration will make that variable contain the sub-pixel position of the sample being shaded. The top left of the pixel is considered to be at coordinate $(0,0)$ and the bottom right of the pixel is considered to be at coordinate $(1,1)$.

If the render pass has a fragment density map attachment, the variable will instead contain the sub-fragment position of the sample being shaded. The top left of the fragment is considered to be at coordinate $(0,0)$ and the bottom right of the fragment is considered to be at coordinate $(1,1)$.
for any fragment area.

If a fragment shader entry point’s interface includes an input variable decorated with `SamplePosition`, **Sample Shading** is considered enabled with a `minSampleShading` value of 1.0.

If the current pipeline uses custom sample locations the value of any variable decorated with the `SamplePosition` built-in decoration is undefined.

---

**Valid Usage**

- **VUID-SamplePosition-SamplePosition-04360**
  The `SamplePosition` decoration **must** be used only within the **Fragment Execution Model**

- **VUID-SamplePosition-SamplePosition-04361**
  The variable decorated with `SamplePosition` **must** be declared using the **Input Storage Class**

- **VUID-SamplePosition-SamplePosition-04362**
  The variable decorated with `SamplePosition` **must** be declared as a two-component vector of 32-bit floating-point values

**ShadingRateKHR**

Decorating a variable with the `ShadingRateKHR` built-in decoration will make that variable contain the **fragment shading rate** for the current fragment invocation.

---

**Valid Usage**

- **VUID-ShadingRateKHR-ShadingRateKHR-04490**
  The `ShadingRateKHR` decoration **must** be used only within the **Fragment Execution Model**

- **VUID-ShadingRateKHR-ShadingRateKHR-04491**
  The variable decorated with `ShadingRateKHR` **must** be declared using the **Input Storage Class**

- **VUID-ShadingRateKHR-ShadingRateKHR-04492**
  The variable decorated with `ShadingRateKHR` **must** be declared as a scalar 32-bit integer value

**SMCountNV**

Decorating a variable with the `SMCountNV` built-in decoration will make that variable contain the number of SMs on the device.

---

**Valid Usage**

- **VUID-SMCountNV-SMCountNV-04363**
  The variable decorated with `SMCountNV` **must** be declared using the **Input Storage Class**

- **VUID-SMCountNV-SMCountNV-04364**
  The variable decorated with `SMCountNV` **must** be declared as a scalar 32-bit integer value
SMIDNV
Decorating a variable with the SMIDNV built-in decoration will make that variable contain the ID of the SM on which the current shader invocation is running. This variable is in the range [0, SMCountNV-1].

Valid Usage
- VUID-SMIDNV-SMIDNV-04365
  The variable decorated with SMIDNV must be declared using the Input Storage Class
- VUID-SMIDNV-SMIDNV-04366
  The variable decorated with SMIDNV must be declared as a scalar 32-bit integer value

SubgroupId
Decorating a variable with the SubgroupId built-in decoration will make that variable contain the index of the subgroup within the local workgroup. This variable is in range [0, NumSubgroups-1].

Valid Usage
- VUID-SubgroupId-SubgroupId-04367
  The SubgroupId decoration must be used only within the GLCompute, MeshEXT, TaskEXT, MeshNV, or TaskNV Execution Model
- VUID-SubgroupId-SubgroupId-04368
  The variable decorated with SubgroupId must be declared using the Input Storage Class
- VUID-SubgroupId-SubgroupId-04369
  The variable decorated with SubgroupId must be declared as a scalar 32-bit integer value

SubgroupEqMask
Decorating a variable with the SubgroupEqMask builtin decoration will make that variable contain the subgroup mask of the current subgroup invocation. The bit corresponding to the SubgroupLocalInvocationId is set in the variable decorated with SubgroupEqMask. All other bits are set to zero.

SubgroupEqMaskKHR is an alias of SubgroupEqMask.

Valid Usage
- VUID-SubgroupEqMask-SubgroupEqMask-04370
  The variable decorated with SubgroupEqMask must be declared using the Input Storage Class
- VUID-SubgroupEqMask-SubgroupEqMask-04371
  The variable decorated with SubgroupEqMask must be declared as a four-component vector of 32-bit integer values
**SubgroupGeMask**

Decorating a variable with the `SubgroupGeMask` builtin decoration will make that variable contain the *subgroup mask* of the current subgroup invocation. The bits corresponding to the invocations greater than or equal to `SubgroupLocalInvocationId` through `SubgroupSize-1` are set in the variable decorated with `SubgroupGeMask`. All other bits are set to zero.

`SubgroupGeMaskKHR` is an alias of `SubgroupGeMask`.

---

**Valid Usage**

- **VUID-SubgroupGeMask-SubgroupGeMask-04372**
  The variable decorated with `SubgroupGeMask` **must** be declared using the *Input Storage Class*

- **VUID-SubgroupGeMask-SubgroupGeMask-04373**
  The variable decorated with `SubgroupGeMask` **must** be declared as a four-component vector of 32-bit integer values

---

**SubgroupGtMask**

Decorating a variable with the `SubgroupGtMask` builtin decoration will make that variable contain the *subgroup mask* of the current subgroup invocation. The bits corresponding to the invocations greater than `SubgroupLocalInvocationId` through `SubgroupSize-1` are set in the variable decorated with `SubgroupGtMask`. All other bits are set to zero.

`SubgroupGtMaskKHR` is an alias of `SubgroupGtMask`.

---

**Valid Usage**

- **VUID-SubgroupGtMask-SubgroupGtMask-04374**
  The variable decorated with `SubgroupGtMask` **must** be declared using the *Input Storage Class*

- **VUID-SubgroupGtMask-SubgroupGtMask-04375**
  The variable decorated with `SubgroupGtMask` **must** be declared as a four-component vector of 32-bit integer values

---

**SubgroupLeMask**

Decorating a variable with the `SubgroupLeMask` builtin decoration will make that variable contain the *subgroup mask* of the current subgroup invocation. The bits corresponding to the invocations less than or equal to `SubgroupLocalInvocationId` are set in the variable decorated with `SubgroupLeMask`. All other bits are set to zero.

`SubgroupLeMaskKHR` is an alias of `SubgroupLeMask`.

---

**Valid Usage**

- **VUID-SubgroupLeMask-SubgroupLeMask-04376**
  The variable decorated with `SubgroupLeMask` **must** be declared using the *Input Storage Class*
The variable decorated with `SubgroupLeMask` must be declared using the `Input Storage Class`.

- VUID-SubgroupLeMask-SubgroupLeMask-04377
  The variable decorated with `SubgroupLeMask` must be declared as a four-component vector of 32-bit integer values.

**SubgroupLtMask**

Decorating a variable with the `SubgroupLtMask` builtin decoration will make that variable contain the *subgroup mask* of the current subgroup invocation. The bits corresponding to the invocations less than `SubgroupLocalInvocationId` are set in the variable decorated with `SubgroupLtMask`. All other bits are set to zero.

`SubgroupLtMaskKHR` is an alias of `SubgroupLtMask`.

**Valid Usage**

- VUID-SubgroupLtMask-SubgroupLtMask-04378
  The variable decorated with `SubgroupLtMask` must be declared using the `Input Storage Class`.

- VUID-SubgroupLtMask-SubgroupLtMask-04379
  The variable decorated with `SubgroupLtMask` must be declared as a four-component vector of 32-bit integer values.

**SubgroupLocalInvocationId**

Decorating a variable with the `SubgroupLocalInvocationId` builtin decoration will make that variable contain the index of the invocation within the subgroup. This variable is in range [0, `SubgroupSize`-1].

If `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT` is specified, or if module declares SPIR-V version 1.6 or higher, and the local workgroup size in the X dimension of the stage is a multiple of `SubgroupSize`, full subgroups are enabled for that pipeline stage. When full subgroups are enabled, subgroups must be launched with all invocations active, i.e., there is an active invocation with `SubgroupLocalInvocationId` for each value in range [0, `SubgroupSize`-1].

**Note**

There is no direct relationship between `SubgroupLocalInvocationId` and `LocalInvocationId` or `LocalInvocationIndex`. If the pipeline or shader object was created with full subgroups applications can compute their own local invocation index to serve the same purpose:

\[
\text{index} = \text{SubgroupLocalInvocationId} + \text{SubgroupId} \times \text{SubgroupSize}
\]

If full subgroups are not enabled, some subgroups may be dispatched with inactive invocations that do not correspond to a local workgroup invocation, making the value of index unreliable.
**Valid Usage**

- **VUID-SubgroupLocalInvocationId-SubgroupLocalInvocationId-04380**
  The variable decorated with `SubgroupLocalInvocationId` **must** be declared using the Input Storage Class

- **VUID-SubgroupLocalInvocationId-SubgroupLocalInvocationId-04381**
  The variable decorated with `SubgroupLocalInvocationId` **must** be declared as a scalar 32-bit integer value

**SubgroupSize**

Decorating a variable with the `SubgroupSize` builtin decoration will make that variable contain the implementation-dependent number of invocations in a subgroup. This value **must** be a power-of-two integer.

If the pipeline was created with the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` flag set, or the shader object was created with the `VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT` flag set, or the SPIR-V module is at least version 1.6, the `SubgroupSize` decorated variable will contain the subgroup size for each subgroup that gets dispatched. This value **must** be between `minSubgroupSize` and `maxSubgroupSize` and **must** be uniform with subgroup scope. The value **may** vary across a single draw call, and for fragment shaders **may** vary across a single primitive. In compute dispatches, `SubgroupSize` **must** be uniform with command scope.

If the pipeline was created with a chained `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure, or the shader object was created with a chained `VkShaderRequiredSubgroupSizeCreateInfoEXT` structure, the `SubgroupSize` decorated variable will match `requiredSubgroupSize`.

If SPIR-V module is less than version 1.6 and the pipeline was not created with the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` flag set and no `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure was chained, and the shader was not created with the `VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT` flag set and no `VkShaderRequiredSubgroupSizeCreateInfoEXT` structure was chained, the variable decorated with `SubgroupSize` will match `subgroupSize`.

The maximum number of invocations that an implementation can support per subgroup is 128.

**Note**

The old behavior for `SubgroupSize` is considered deprecated as certain compute
algorithms cannot be easily implemented without the guarantees of
VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT and
VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT.

Valid Usage

- VUID-SubgroupSize-SubgroupSize-04382
  The variable decorated with SubgroupSize must be declared using the Input Storage Class

- VUID-SubgroupSize-SubgroupSize-04383
  The variable decorated with SubgroupSize must be declared as a scalar 32-bit integer value

TaskCountNV

Decorating a variable with the TaskCountNV decoration will make that variable contain the task count. The task count specifies the number of subsequent mesh shader workgroups that get generated upon completion of the task shader.

Valid Usage

- VUID-TaskCountNV-TaskCountNV-04384
  The TaskCountNV decoration must be used only within the TaskNV Execution Model

- VUID-TaskCountNV-TaskCountNV-04385
  The variable decorated with TaskCountNV must be declared using the Output Storage Class

- VUID-TaskCountNV-TaskCountNV-04386
  The variable decorated with TaskCountNV must be declared as a scalar 32-bit integer value

TessCoord

Decorating a variable with the TessCoord built-in decoration will make that variable contain the three-dimensional (u,v,w) barycentric coordinate of the tessellated vertex within the patch. u, v, and w are in the range [0,1] and vary linearly across the primitive being subdivided. For the tessellation modes of Quads or Isolines, the third component is always zero.

Valid Usage

- VUID-TessCoord-TessCoord-04387
  The TessCoord decoration must be used only within the TessellationEvaluation Execution Model

- VUID-TessCoord-TessCoord-04388
  The variable decorated with TessCoord must be declared using the Input Storage Class

- VUID-TessCoord-TessCoord-04389
  The variable decorated with TessCoord must be declared as a three-component vector of 32-bit floating-point values
**TessLevelOuter**

Decorating a variable with the `TessLevelOuter` built-in decoration will make that variable contain the outer tessellation levels for the current patch.

In tessellation control shaders, the variable decorated with `TessLevelOuter` can be written to, controlling the tessellation factors for the resulting patch. These values are used by the tessellator to control primitive tessellation and can be read by tessellation evaluation shaders.

In tessellation evaluation shaders, the variable decorated with `TessLevelOuter` can read the values written by the tessellation control shader.

**Valid Usage**

- VUID-TessLevelOuter-TessLevelOuter-04390
  The `TessLevelOuter` decoration must be used only within the `TessellationControl` or `TessellationEvaluation` Execution Model

- VUID-TessLevelOuter-TessLevelOuter-04391
  The variable decorated with `TessLevelOuter` within the `TessellationControl` Execution Model must be declared using the Output Storage Class

- VUID-TessLevelOuter-TessLevelOuter-04392
  The variable decorated with `TessLevelOuter` within the `TessellationEvaluation` Execution Model must be declared using the Input Storage Class

- VUID-TessLevelOuter-TessLevelOuter-04393
  The variable decorated with `TessLevelOuter` must be declared as an array of size four, containing 32-bit floating-point values

**TessLevelInner**

Decorating a variable with the `TessLevelInner` built-in decoration will make that variable contain the inner tessellation levels for the current patch.

In tessellation control shaders, the variable decorated with `TessLevelInner` can be written to, controlling the tessellation factors for the resulting patch. These values are used by the tessellator to control primitive tessellation and can be read by tessellation evaluation shaders.

In tessellation evaluation shaders, the variable decorated with `TessLevelInner` can read the values written by the tessellation control shader.

**Valid Usage**

- VUID-TessLevelInner-TessLevelInner-04394
  The `TessLevelInner` decoration must be used only within the `TessellationControl` or `TessellationEvaluation` Execution Model

- VUID-TessLevelInner-TessLevelInner-04395
  The variable decorated with `TessLevelInner` within the `TessellationControl` Execution Model must be declared using the Output Storage Class
The variable decorated with `TessLevelInner` within the `TessellationEvaluation Execution Model` must be declared using the `Input Storage Class`.

The variable decorated with `TessLevelInner` must be declared as an array of size two, containing 32-bit floating-point values.

**VertexCountHUAWEI**

The `VertexCountHUAWEI` decoration can be used to decorate a cluster culling shader output variable, this non-indexed mode specific variable will contain an integer value that specifies the number of vertices in a cluster to draw.

**Valid Usage**

- The `VertexCountHUAWEI` decoration must be used only within the `ClusterCullingHUAWEI Execution Model`.
- The variable decorated with `VertexCountHUAWEI` must be declared as a scalar 32-bit integer value.

**VertexIndex**

Decorating a variable with the `VertexIndex` built-in decoration will make that variable contain the index of the vertex that is being processed by the current vertex shader invocation. For non-indexed draws, this variable begins at the `firstVertex` parameter to `vkCmdDraw` or the `firstVertex` member of a structure consumed by `vkCmdDrawIndirect` and increments by one for each vertex in the draw. For indexed draws, its value is the content of the index buffer for the vertex plus the `vertexOffset` parameter to `vkCmdDrawIndexed` or the `vertexOffset` member of the structure consumed by `vkCmdDrawIndexedIndirect`.

**Note**

`VertexIndex` starts at the same starting value for each instance.

**Valid Usage**

- The `VertexIndex` decoration must be used only within the `Vertex Execution Model`.
- The variable decorated with `VertexIndex` must be declared using the `Input Storage Class`.
- The variable decorated with `VertexIndex` must be declared as a scalar 32-bit integer value.
VertexOffsetHUAWEI
decoration can be used to decorate a cluster culling shader output variable, this indexed mode specific variable will contain an integer value that specifies a offset value added to the vertex index of a cluster before indexing into the vertex buffer.

Valid Usage

- VUID-VertexOffsetHUAWEI-VertexOffsetHUAWEI-07811
  The VertexOffsetHUAWEI decoration must be used only within the ClusterCullingHUAWEI Execution Model

- VUID-VertexOffsetHUAWEI-VertexOffsetHUAWEI-07812
  The variable decorated with VertexOffsetHUAWEI must be declared as a scalar 32-bit integer value

ViewIndex
decoration can be applied to a shader input which will be filled with the index of the view that is being processed by the current shader invocation.

If multiview is enabled in the render pass, this value will be one of the bits set in the view mask of the subpass the pipeline is compiled against. If multiview is not enabled in the render pass, this value will be zero.

Valid Usage

- VUID-ViewIndex-ViewIndex-04401
  The ViewIndex decoration must be used only within the MeshEXT, Vertex, Geometry, TessellationControl, TessellationEvaluation or Fragment Execution Model

- VUID-ViewIndex-ViewIndex-04402
  The variable decorated with ViewIndex must be declared using the Input Storage Class

- VUID-ViewIndex-ViewIndex-04403
  The variable decorated with ViewIndex must be declared as a scalar 32-bit integer value

ViewportIndex
Decorating a variable with the ViewportIndex built-in decoration will make that variable contain the index of the viewport.

In a mesh, vertex, tessellation evaluation, or geometry shader, the variable decorated with ViewportIndex can be written to with the viewport index to which the primitive produced by that shader will be directed.

The selected viewport index is used to select the viewport transform, scissor rectangle, and exclusive scissor rectangle.

The last active pre-rasterization shader stage (in pipeline order) controls the ViewportIndex that is used. Outputs in previous shader stages are not used, even if the last stage fails to write the
If the last active pre-rasterization shader stage shader entry point's interface does not include a variable decorated with `ViewportIndex`, and if `multiviewPerViewViewports` is not enabled, then the first viewport is used. If a pre-rasterization shader stage shader entry point's interface includes a variable decorated with `ViewportIndex`, it must write the same value to `ViewportIndex` for all output vertices of a given primitive.

In a fragment shader, the variable decorated with `ViewportIndex` contains the viewport index of the primitive that the fragment invocation belongs to.

If `multiviewPerViewViewports` is enabled, and if the last active pre-rasterization shader stage shader entry point's interface does not include a variable decorated with `ViewportIndex`, then the value of `ViewIndex` is used as an index to select the viewport transform and scissor rectangle, and the value of `ViewportIndex` in the fragment shader is undefined.

### Valid Usage

- **VUID-ViewportIndex-ViewportIndex-04404**
  The `ViewportIndex` decoration must be used only within the `MeshEXT`, `MeshNV`, `Vertex`, `TessellationEvaluation`, `Geometry`, or `Fragment Execution Model`.

- **VUID-ViewportIndex-ViewportIndex-04405**
  If the `shaderOutputViewportIndex` feature is not enabled then the `ViewportIndex` decoration must be used only within the `Geometry` or `Fragment Execution Model`.

- **VUID-ViewportIndex-ViewportIndex-04406**
  The variable decorated with `ViewportIndex` within the `MeshEXT`, `MeshNV`, `Vertex`, `TessellationEvaluation`, or `Geometry Execution Model` must be declared using the `Output Storage Class`.

- **VUID-ViewportIndex-ViewportIndex-04407**
  The variable decorated with `ViewportIndex` within the `Fragment Execution Model` must be declared using the `Input Storage Class`.

- **VUID-ViewportIndex-ViewportIndex-04408**
  The variable decorated with `ViewportIndex` must be declared as a scalar 32-bit integer value.

- **VUID-ViewportIndex-ViewportIndex-07060**
  The variable decorated with `ViewportIndex` within the `MeshEXT Execution Model` must also be decorated with the `PerPrimitiveEXT` decoration.

### ViewportMaskNV

Decorating a variable with the `ViewportMaskNV` built-in decoration will make that variable contain the viewport mask.

In a mesh, vertex, tessellation evaluation, or geometry shader, the variable decorated with `ViewportMaskNV` can be written to with the mask of which viewports the primitive produced by that shader will directed.
The `ViewportMaskNV` variable **must** be an array that has \( \lceil \frac{\text{VkPhysicalDeviceLimits::maxViewports}}{32} \rceil \) elements. When a shader writes to this variable, bit \( B \) of element \( M \) controls whether a primitive is emitted to viewport \( 32 \times M + B \). The viewports indicated by the mask are used to select the viewport transform, scissor rectangle, and exclusive scissor rectangle that a primitive will be transformed by.

The last active **pre-rasterization shader stage** (in pipeline order) controls the `ViewportMaskNV` that is used. Outputs in previous shader stages are not used, even if the last stage fails to write the `ViewportMaskNV`. When `ViewportMaskNV` is written by the final **pre-rasterization shader stage**, any variable decorated with `ViewportIndex` in the fragment shader will have the index of the viewport that was used in generating that fragment.

If a **pre-rasterization shader stage** shader entry point’s interface includes a variable decorated with `ViewportMaskNV`, it **must** write the same value to `ViewportMaskNV` for all output vertices of a given primitive.

### Valid Usage

- **VUID-ViewportMaskNV-ViewportMaskNV-04409**
  The `ViewportMaskNV` decoration **must** be used only within the `Vertex`, `MeshNV`, `TessellationEvaluation`, or `Geometry Execution Model`

- **VUID-ViewportMaskNV-ViewportMaskNV-04410**
  The variable decorated with `ViewportMaskNV` **must** be declared using the `Output Storage Class`

- **VUID-ViewportMaskNV-ViewportMaskNV-04411**
  The variable decorated with `ViewportMaskNV` **must** be declared as an array of 32-bit integer values

### `ViewportMaskPerViewNV`

Decorating a variable with the `ViewportMaskPerViewNV` built-in decoration will make that variable contain the mask of viewports primitives are broadcast to, for each view.

The value written to an element of `ViewportMaskPerViewNV` in the last **pre-rasterization shader stage** is a bitmask indicating which viewports the primitive will be directed to. The primitive will be broadcast to the viewport corresponding to each non-zero bit of the bitmask, and that viewport index is used to select the viewport transform, scissor rectangle, and exclusive scissor rectangle, for each view. The same values **must** be written to all vertices in a given primitive, or else the set of viewports used for that primitive is undefined.

Elements of the array correspond to views in a multiview subpass, and those elements corresponding to views in the view mask of the subpass the shader is compiled against will be used as the viewport mask value for those views. `ViewportMaskPerViewNV` output in an earlier **pre-rasterization shader stage** is not available as an input in the subsequent **pre-rasterization shader stage**.

Although `ViewportMaskNV` is an array, `ViewportMaskPerViewNV` is not a two-dimensional array. Instead, `ViewportMaskPerViewNV` is limited to 32 viewports.
Valid Usage

• VUID-ViewportMaskPerViewNV-ViewportMaskPerViewNV-04412
  The `ViewportMaskPerViewNV` decoration **must** be used only within the `Vertex`, `MeshNV`, `TessellationControl`, `TessellationEvaluation`, or `Geometry Execution Model`.

• VUID-ViewportMaskPerViewNV-ViewportMaskPerViewNV-04413
  The variable decorated with `ViewportMaskPerViewNV` **must** be declared using the `Output Storage Class`.

• VUID-ViewportMaskPerViewNV-ViewportMaskPerViewNV-04414
  The variable decorated with `ViewportMaskPerViewNV` **must** be declared as an array of 32-bit integer values.

• VUID-ViewportMaskPerViewNV-ViewportMaskPerViewNV-04415
  The array decorated with `ViewportMaskPerViewNV` **must** be a size less than or equal to 32.

• VUID-ViewportMaskPerViewNV-ViewportMaskPerViewNV-04416
  The array decorated with `ViewportMaskPerViewNV` **must** be a size greater than the maximum view in the subpass's view mask.

• VUID-ViewportMaskPerViewNV-ViewportMaskPerViewNV-04417
  The array variable decorated with `ViewportMaskPerViewNV` **must** only be indexed by a constant or specialization constant.

**WarpsPerSMNV**

Decorating a variable with the `WarpsPerSMNV` built-in decoration will make that variable contain the maximum number of warps executing on a SM.

Valid Usage

• VUID-WarpsPerSMNV-WarpsPerSMNV-04418
  The variable decorated with `WarpsPerSMNV` **must** be declared using the `Input Storage Class`.

• VUID-WarpsPerSMNV-WarpsPerSMNV-04419
  The variable decorated with `WarpsPerSMNV` **must** be declared as a scalar 32-bit integer value.

**WarpIDNV**

Decorating a variable with the `WarpIDNV` built-in decoration will make that variable contain the ID of the warp on a SM on which the current shader invocation is running. This variable is in the range [0, `WarpsPerSMNV`-1].

Valid Usage

• VUID-WarpIDNV-WarpIDNV-04420
  The variable decorated with `WarpIDNV` **must** be declared using the `Input Storage Class`.

• VUID-WarpIDNV-WarpIDNV-04421
The variable decorated with WarpIDNV must be declared as a scalar 32-bit integer value.

**WorkgroupId**

Decorating a variable with the WorkgroupId built-in decoration will make that variable contain the global workgroup that the current invocation is a member of. Each component ranges from a base value to a base + count value, based on the parameters passed into the dispatching commands.

**Valid Usage**

- VUID-WorkgroupId-WorkgroupId-04422
  The WorkgroupId decoration must be used only within the GLCompute, MeshEXT, TaskEXT, MeshNV, or TaskNV Execution Model

- VUID-WorkgroupId-WorkgroupId-04423
  The variable decorated with WorkgroupId must be declared using the Input Storage Class

- VUID-WorkgroupId-WorkgroupId-04424
  The variable decorated with WorkgroupId must be declared as a three-component vector of 32-bit integer values

**WorkgroupSize**

**Note**

SPIR-V 1.6 deprecated WorkgroupSize in favor of using the LocalSizeId Execution Mode instead. Support for LocalSizeId was added with VK_KHR_maintenance4 and promoted to core in Version 1.3.

Decorating an object with the WorkgroupSize built-in decoration will make that object contain the dimensions of a local workgroup. If an object is decorated with the WorkgroupSize decoration, this takes precedence over any LocalSize or LocalSizeId execution mode.

**Valid Usage**

- VUID-WorkgroupSize-WorkgroupSize-04425
  The WorkgroupSize decoration must be used only within the GLCompute, MeshEXT, TaskEXT, MeshNV, or TaskNV Execution Model

- VUID-WorkgroupSize-WorkgroupSize-04426
  The variable decorated with WorkgroupSize must be a specialization constant or a constant

- VUID-WorkgroupSize-WorkgroupSize-04427
  The variable decorated with WorkgroupSize must be declared as a three-component vector of 32-bit integer values

**WorldRayDirectionKHR**

A variable decorated with the WorldRayDirectionKHR decoration will specify the direction of the...
ray being processed, in world space. The value is the parameter passed into the pipeline trace ray instruction.

### Valid Usage

- **VUID-WorldRayDirectionKHR-WorldRayDirectionKHR-04428**
  The WorldRayDirectionKHR decoration **must** be used only within the IntersectionKHR, AnyHitKHR, ClosestHitKHR, or MissKHR Execution Model

- **VUID-WorldRayDirectionKHR-WorldRayDirectionKHR-04429**
  The variable decorated with WorldRayDirectionKHR **must** be declared using the Input Storage Class

- **VUID-WorldRayDirectionKHR-WorldRayDirectionKHR-04430**
  The variable decorated with WorldRayDirectionKHR **must** be declared as a three-component vector of 32-bit floating-point values

### WorldRayOriginKHR

A variable decorated with the WorldRayOriginKHR decoration will specify the origin of the ray being processed, in world space. The value is the parameter passed into the pipeline trace ray instruction.

### Valid Usage

- **VUID-WorldRayOriginKHR-WorldRayOriginKHR-04431**
  The WorldRayOriginKHR decoration **must** be used only within the IntersectionKHR, AnyHitKHR, ClosestHitKHR, or MissKHR Execution Model

- **VUID-WorldRayOriginKHR-WorldRayOriginKHR-04432**
  The variable decorated with WorldRayOriginKHR **must** be declared using the Input Storage Class

- **VUID-WorldRayOriginKHR-WorldRayOriginKHR-04433**
  The variable decorated with WorldRayOriginKHR **must** be declared as a three-component vector of 32-bit floating-point values

### WorldToObjectKHR

A variable decorated with the WorldToObjectKHR decoration will contain the current world-to-object transformation matrix, which is determined by the instance of the current intersection.

### Valid Usage

- **VUID-WorldToObjectKHR-WorldToObjectKHR-04434**
  The WorldToObjectKHR decoration **must** be used only within the IntersectionKHR, AnyHitKHR, ClosestHitKHR, or ClosestHitKHR Execution Model

- **VUID-WorldToObjectKHR-WorldToObjectKHR-04435**
  The variable decorated with WorldToObjectKHR **must** be declared using the Input Storage
Class

- VUID-WorldToObjectKHR-WorldToObjectKHR-04436
  The variable decorated with WorldToObjectKHR must be declared as a matrix with four columns of three-component vectors of 32-bit floating-point values.

CoreCountARM

Decorating a variable with the CoreCountARM built-in decoration will make that variable contain the number of cores on the device.

Valid Usage

- VUID-CoreCountARM-CoreCountARM-07595
  The variable decorated with CoreCountARM must be declared using the Input Storage Class.
- VUID-CoreCountARM-CoreCountARM-07596
  The variable decorated with CoreCountARM must be declared as a scalar 32-bit integer value.

CoreMaxIDARM

Decorating a variable with the CoreMaxIDARM built-in decoration will make that variable contain the max ID of any shader core on the device on which the current shader invocation is running.

Valid Usage

- VUID-CoreMaxIDARM-CoreMaxIDARM-07597
  The variable decorated with CoreMaxIDARM must be declared using the Input Storage Class.
- VUID-CoreMaxIDARM-CoreMaxIDARM-07598
  The variable decorated with CoreMaxIDARM must be declared as a scalar 32-bit integer value.

CoreIDARM

Decorating a variable with the CoreIDARM built-in decoration will make that variable contain the ID of the core on which the current shader invocation is running. This variable is in the range \([0, \text{CoreMaxIDARM}]\).

Valid Usage

- VUID-CoreIDARM-CoreIDARM-07599
  The variable decorated with CoreIDARM must be declared using the Input Storage Class.
- VUID-CoreIDARM-CoreIDARM-07600
  The variable decorated with CoreIDARM must be declared as a scalar 32-bit integer value.
WarpMaxIDARM

Decorating a variable with the WarpMaxIDARM built-in decoration will make that variable contain the maximum warp ID for the core on which the current invocation is running.

Valid Usage

• VUID-WarpMaxIDARM-WarpMaxIDARM-07601
  The variable decorated with WarpMaxIDARM must be declared using the Input Storage Class

• VUID-WarpMaxIDARM-WarpMaxIDARM-07602
  The variable decorated with WarpMaxIDARM must be declared as a scalar 32-bit integer value

WarpIDARM

Decorating a variable with the WarpIDARM built-in decoration will make that variable contain the ID of the warp on a core on which the current shader invocation is running. This variable is in the range [0, WarpMaxIDARM].

Valid Usage

• VUID-WarpIDARM-WarpIDARM-07603
  The variable decorated with WarpIDARM must be declared using the Input Storage Class

• VUID-WarpIDARM-WarpIDARM-07604
  The variable decorated with WarpIDARM must be declared as a scalar 32-bit integer value

CoalescedInputCountAMDX

Decorating a variable with the CoalescedInputCountAMDX built-in decoration will make that variable contain the number of node dispatches that the implementation coalesced into the input for the current shader. This variable will take a value in the range [1, arraySize), where arraySize is the maximum size of the input payload array for the shader.

Valid Usage

• VUID-CoalescedInputCountAMDX-CoalescedInputCountAMDX-09172
  The variable decorated with CoalescedInputCountAMDX must be declared using the Input Storage Class

• VUID-CoalescedInputCountAMDX-CoalescedInputCountAMDX-09173
  If a variable is decorated with CoalescedInputCountAMDX, the CoalescingAMDX execution mode must be declared

• VUID-CoalescedInputCountAMDX-CoalescedInputCountAMDX-09174
  The variable decorated with CoalescedInputCountAMDX must be declared as a scalar 32-bit integer value
**ShaderIndexAMDX**

Decorating a variable with the `ShaderIndexAMDX` built-in decoration will make that variable contain the index of the shader specified when it was compiled, either via `VkPipelineShaderStageNodeCreateInfoAMDX::index` or by the `ShaderIndexAMDX` execution mode.

### Valid Usage

- **VUID-ShaderIndexAMDX-ShaderIndexAMDX-09175**
  The variable decorated with `ShaderIndexAMDX` must be declared using the Input Storage Class

- **VUID-ShaderIndexAMDX-ShaderIndexAMDX-09176**
  The variable decorated with `ShaderIndexAMDX` must be declared as a scalar 32-bit integer value
Chapter 16. Image Operations

16.1. Image Operations Overview

Vulkan Image Operations are operations performed by those SPIR-V Image Instructions which take an OpTypeImage (representing a VkImageView) or OpTypeSampledImage (representing a (VkImageView, VkSampler) pair). Read, write, and atomic operations also take texel coordinates as operands, and return a value based on a neighborhood of texture elements (texels) within the image. Query operations return properties of the bound image or of the lookup itself. The “Depth” operand of OpTypeImage is ignored.

**Note**

Texel is a term which is a combination of the words texture and element. Early interactive computer graphics supported texture operations on textures, a small subset of the image operations on images described here. The discrete samples remain essentially equivalent, however, so we retain the historical term texel to refer to them.

Image Operations include the functionality of the following SPIR-V Image Instructions:

- **OpImageSample* and OpImageSparseSample* read one or more neighboring texels of the image, and filter the texel values based on the state of the sampler.**
  - Instructions with ImplicitLod in the name determine the LOD used in the sampling operation based on the coordinates used in neighboring fragments.
  - Instructions with ExplicitLod in the name determine the LOD used in the sampling operation based on additional coordinates.
  - Instructions with Proj in the name apply homogeneous projection to the coordinates.

- **OpImageFetch and OpImageSparseFetch** return a single texel of the image. No sampler is used.

- **OpImage*Gather and OpImageSparse*Gather** read neighboring texels and return a single component of each.

- **OpImageRead** (and **OpImageSparseRead**) and **OpImageWrite** read and write, respectively, a texel in the image. No sampler is used.

- **OpImageSampleFootprintNV** identifies and returns information about the set of texels in the image that would be accessed by an equivalent OpImageSample* instruction.

- **OpImage*Dref* instructions apply depth comparison on the texel values.**

- **OpImageSparse* instructions additionally return a sparse residency code.**

- **OpImageQuerySize, OpImageQuerySizeLod, OpImageQueryLevels, and OpImageQuerySamples** return properties of the image descriptor that would be accessed. The image itself is not accessed.

- **OpImageQueryLod** returns the LOD parameters that would be used in a sample operation. The actual operation is not performed.

- **OpImageWeightedSampleQCOM** reads a 2D neighborhood of texels and computes a weighted average using weight values from a separate weight texture.
• **opImageBlockMatchSADQCOM** and **opTextureBlockMatchSSD** compare 2D neighborhoods of texels from two textures.

• **OpImageBoxFilterQCOM** reads a 2D neighborhood of texels and computes a weighted average of the texels.

• **opImageBlockMatchWindowSADQCOM** and **opImageBlockMatchWindowSSDQCOM** compare 2D neighborhoods of texels from two textures with the comparison repeated across a window region in the target texture.

• **opImageBlockMatchGatherSADQCOM** and **opImageBlockMatchWindowSSDQCOM** compares four 2D neighborhoods of texels from a target texture with a single 2D neighborhood in the reference texture. The R component of each comparison is gathered and returned in the output.

### 16.1.1. Texel Coordinate Systems

Images are addressed by *texel coordinates*. There are three *texel coordinate systems*:

- normalized texel coordinates \([0.0, 1.0]\)
- unnormalized texel coordinates \([0.0, \text{width} / \text{height} / \text{depth}]\)
- integer texel coordinates \([0, \text{width} / \text{height} / \text{depth}]\)

Other image instructions can use either normalized or unnormalized texel coordinates (selected by the `unnormalizedCoordinates` state of the sampler used in the instruction), but there are limitations on what operations, image state, and sampler state is supported. Normalized coordinates are logically converted to unnormalized as part of image operations, and certain steps are only performed on normalized coordinates. The array layer coordinate is always treated as unnormalized even when other coordinates are normalized.

Normalized texel coordinates are referred to as \((s, t, r, q, a)\), with the coordinates having the following meanings:

- \(s\): Coordinate in the first dimension of an image.
- \(t\): Coordinate in the second dimension of an image.
- \(r\): Coordinate in the third dimension of an image.
  - \((s, t, r)\) are interpreted as a direction vector for Cube images.
- \(q\): Fourth coordinate, for homogeneous (projective) coordinates.
- \(a\): Coordinate for array layer.

The coordinates are extracted from the SPIR-V operand based on the dimensionality of the image variable and type of instruction. For Proj instructions, the components are in order \((s, [t], [r], q)\), with \(t\) and \(r\) being conditionally present based on the Dim of the image. For non-Proj instructions, the coordinates are \((s, [t], [r], [a])\), with \(t\) and \(r\) being conditionally present based on the Dim of the image and \(a\) being conditionally present based on the Arrayed property of the image. Projective
image instructions are not supported on *Arrayed* images.

Unnormalized texel coordinates are referred to as \((u,v,w,a)\), with the coordinates having the following meanings:

- **u**: Coordinate in the first dimension of an image.
- **v**: Coordinate in the second dimension of an image.
- **w**: Coordinate in the third dimension of an image.
- **a**: Coordinate for array layer.

Only the \(u\) and \(v\) coordinates are directly extracted from the SPIR-V operand, because only 1D and 2D (non-*Arrayed*) dimensionalities support unnormalized coordinates. The components are in order \((u \[,v\])\), with \(v\) being conditionally present when the dimensionality is 2D. When normalized coordinates are converted to unnormalized coordinates, all four coordinates are used.

Integer texel coordinates are referred to as \((i,j,k,l,n)\), with the coordinates having the following meanings:

- **i**: Coordinate in the first dimension of an image.
- **j**: Coordinate in the second dimension of an image.
- **k**: Coordinate in the third dimension of an image.
- **l**: Coordinate for array layer.
- **n**: Index of the sample within the texel.

They are extracted from the SPIR-V operand in order \((i \[,j\] \[,k\] \[,l\] \[,n\])\), with \(j\) and \(k\) conditionally present based on the *Dim* of the image, and \(l\) conditionally present based on the *Arrayed* property of the image. \(n\) is conditionally present and is taken from the *Sample* image operand.

If an accessed image was created from a view using `VkImageViewSlicedCreateInfoEXT` and accessed through a *VK_DESCRIPTOR_TYPE_STORAGE_IMAGE* descriptor, then the value of \(k\) is incremented by `VkImageViewSlicedCreateInfoEXT::sliceOffset`, giving \(k \leftarrow \text{sliceOffset} + k\). The image's accessible range in the third dimension is \(k < \text{sliceOffset} + \text{sliceCount}\). If `VkImageViewSlicedCreateInfoEXT::sliceCount` is *VK_REMAINING_3D_SLICES_EXT*, the range is inherited from the image's depth extent as specified by *Image Mip Level Sizing*.

For all coordinate types, unused coordinates are assigned a value of zero.
The Texel Coordinate Systems - For the example shown of an $8 \times 4$ texel two dimensional image.

- **Normalized texel coordinates:**
  - The $s$ coordinate goes from 0.0 to 1.0.
  - The $t$ coordinate goes from 0.0 to 1.0.

- **Unnormalized texel coordinates:**
  - The $u$ coordinate within the range 0.0 to 8.0 is within the image, otherwise it is outside the image.
  - The $v$ coordinate within the range 0.0 to 4.0 is within the image, otherwise it is outside the image.

- **Integer texel coordinates:**
  - The $i$ coordinate within the range 0 to 7 addresses texels within the image, otherwise it is outside the image.
  - The $j$ coordinate within the range 0 to 3 addresses texels within the image, otherwise it is outside the image.

- **Also shown for linear filtering:**
  - Given the unnormalized coordinates $(u,v)$, the four texels selected are $i_{0j_0}, i_{1j_0}, i_{0j_1},$ and $i_{1j_1}$.
  - The fractions $\alpha$ and $\beta$.
  - Given the offset $\Delta_i$ and $\Delta_j$, the four texels selected by the offset are $i_{0j'_0}, i_{1j'_0}, i_{0j'_1},$ and $i_{1j'_1}$.

**Note**

For formats with reduced-resolution components, $\Delta_i$ and $\Delta_j$ are relative to the resolution of the highest-resolution component, and therefore may be divided by two relative to the unnormalized coordinate space of the lower-resolution component.
The Texel Coordinate Systems - For the example shown of an 8×4 texel two dimensional image.

- Texel coordinates as above. Also shown for nearest filtering:
  - Given the unnormalized coordinates \((u,v)\), the texel selected is \(ij\).
  - Given the offset \(\Delta i\) and \(\Delta j\), the texel selected by the offset is \(ij'\).

For corner-sampled images, the texel samples are located at the grid intersections instead of the texel centers.
16.2. Conversion Formulas

16.2.1. RGB to Shared Exponent Conversion

An RGB color (red, green, blue) is transformed to a shared exponent color (red\textsubscript{shared}, green\textsubscript{shared}, blue\textsubscript{shared}, exp\textsubscript{shared}) as follows:

First, the components (red, green, blue) are clamped to (red\textsubscript{clamped}, green\textsubscript{clamped}, blue\textsubscript{clamped}) as:

\[
\begin{align*}
\text{red}_{\text{clamped}} & = \max(0, \min(\text{sharedexp}_{\text{max}}, \text{red})) \\
\text{green}_{\text{clamped}} & = \max(0, \min(\text{sharedexp}_{\text{max}}, \text{green})) \\
\text{blue}_{\text{clamped}} & = \max(0, \min(\text{sharedexp}_{\text{max}}, \text{blue}))
\end{align*}
\]

where:

- \( N = 9 \)  
  - number of mantissa bits per component
- \( B = 15 \)  
  - exponent bias
- \( E_{\text{max}} = 31 \)  
  - maximum possible biased exponent value
- \( \text{sharedexp}_{\text{max}} = \frac{(2^N - 1)}{2^N} \times 2^{(E_{\text{max}} - B)} \)  
  - shared exponent maximum

\textit{Note}

NaN, if supported, is handled as in
IEEE 754-2008 $\text{minNum}(\cdot)$ and $\text{maxNum}(\cdot)$. This results in any NaN being mapped to zero.

The largest clamped component, $\max_{\text{clamped}}$ is determined:

$$\max_{\text{clamped}} = \max(\text{red}_{\text{clamped}}, \text{green}_{\text{clamped}}, \text{blue}_{\text{clamped}})$$

A preliminary shared exponent $\exp'$ is computed:

$$\exp' = \begin{cases} \lfloor \log_2(\max_{\text{clamped}}) \rfloor + (B + 1) & \text{for } \max_{\text{clamped}} > 2^{-(B + 1)} \\ 0 & \text{for } \max_{\text{clamped}} \leq 2^{-(B + 1)} \end{cases}$$

The shared exponent $\exp_{\text{shared}}$ is computed:

$$\max_{\text{shared}} = \left\lfloor \frac{\max_{\text{clamped}}}{2^{(\exp' - B - N)}} + \frac{1}{2} \right\rfloor$$

$$\exp_{\text{shared}} = \begin{cases} \exp' & \text{for } 0 \leq \max_{\text{shared}} < 2^N \\ \exp' + 1 & \text{for } \max_{\text{shared}} = 2^N \end{cases}$$

Finally, three integer values in the range 0 to $2^N$ are computed:

$$\text{red}_{\text{shared}} = \left\lfloor \frac{\text{red}_{\text{clamped}}}{2^{(\exp_{\text{shared}} - B - N)}} + \frac{1}{2} \right\rfloor$$

$$\text{green}_{\text{shared}} = \left\lfloor \frac{\text{green}_{\text{clamped}}}{2^{(\exp_{\text{shared}} - B - N)}} + \frac{1}{2} \right\rfloor$$

$$\text{blue}_{\text{shared}} = \left\lfloor \frac{\text{blue}_{\text{clamped}}}{2^{(\exp_{\text{shared}} - B - N)}} + \frac{1}{2} \right\rfloor$$

### 16.2.2. Shared Exponent to RGB

A shared exponent color ($\text{red}_{\text{shared}}, \text{green}_{\text{shared}}, \text{blue}_{\text{shared}}, \exp_{\text{shared}}$) is transformed to an RGB color ($\text{red}$, $\text{green}$, $\text{blue}$) as follows:

$$\text{red} = \text{red}_{\text{shared}} \times 2^{(\exp_{\text{shared}} - B - N)}$$

$$\text{green} = \text{green}_{\text{shared}} \times 2^{(\exp_{\text{shared}} - B - N)}$$

$$\text{blue} = \text{blue}_{\text{shared}} \times 2^{(\exp_{\text{shared}} - B - N)}$$

where:
N = 9 (number of mantissa bits per component)

B = 15 (exponent bias)

16.3. Texel Input Operations

*Texel input instructions* are SPIR-V image instructions that read from an image. *Texel input operations* are a set of steps that are performed on state, coordinates, and texel values while processing a texel input instruction, and which are common to some or all texel input instructions. They include the following steps, which are performed in the listed order:

- **Validation operations**
  - Instruction/Sampler/Image validation
  - Coordinate validation
  - Sparse validation
  - Layout validation
- **Format conversion**
- **Texel replacement**
- **Depth comparison**
- **Conversion to RGBA**
- **Component swizzle**
- **Chroma reconstruction**
- **Y″C_bC_r conversion**

For texel input instructions involving multiple texels (for sampling or gathering), these steps are applied for each texel that is used in the instruction. Depending on the type of image instruction, other steps are conditionally performed between these steps or involving multiple coordinate or texel values.

If *Chroma Reconstruction* is implicit, *Texel Filtering* instead takes place during chroma reconstruction, before sampler Y″C_bC_r conversion occurs.

The operations described in *block matching* and *weight image sampling* are performed before *Conversion to RGBA* and *Component swizzle*.

16.3.1. Texel Input Validation Operations

*Texel input validation operations* inspect instruction/image/sampler state or coordinates, and in certain circumstances cause the texel value to be replaced or become undefined. There are a series of validations that the texel undergoes.
Instruction/Sampler/Image View Validation

There are a number of cases where a SPIR-V instruction can mismatch with the sampler, the image view, or both, and a number of further cases where the sampler can mismatch with the image view. In such cases the value of the texel returned is undefined.

These cases include:

- The sampler `borderColor` is an integer type and the image view format is not one of the `VkFormat` integer types or a stencil component of a depth/stencil format.

- The sampler `borderColor` is a float type and the image view format is not one of the `VkFormat` float types or a depth component of a depth/stencil format.

- The sampler `borderColor` is one of the opaque black colors (VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK or VK_BORDER_COLOR_INT_OPAQUE_BLACK) and the image view `VkComponentSwizzle` for any of the `VkComponentMapping` components is not the identity swizzle, and `VkPhysicalDeviceBorderColorSwizzleFeaturesEXT::borderColorSwizzleFromImage` feature is not enabled, and `VkSamplerBorderColorComponentMappingCreateInfoEXT` is not specified.

- `VkSamplerBorderColorComponentMappingCreateInfoEXT::components`, if specified, has a component swizzle that does not match the component swizzle of the image view, and either component swizzle is not a form of identity swizzle.

- `VkSamplerBorderColorComponentMappingCreateInfoEXT::srgb`, if specified, does not match the sRGB encoding of the image view.

- The sampler `borderColor` is a custom color (VK_BORDER_COLOR_FLOAT_CUSTOM_EXT or VK_BORDER_COLOR_INT_CUSTOM_EXT) and the supplied `VkSamplerCustomBorderColorCreateInfoEXT::customBorderColor` is outside the bounds of the values representable in the image view's format.

- The sampler `borderColor` is a custom color (VK_BORDER_COLOR_FLOAT_CUSTOM_EXT or VK_BORDER_COLOR_INT_CUSTOM_EXT) and the image view `VkComponentSwizzle` for any of the `VkComponentMapping` components is not the identity swizzle, and `VkPhysicalDeviceBorderColorSwizzleFeaturesEXT::borderColorSwizzleFromImage` feature is not enabled, and `VkSamplerBorderColorComponentMappingCreateInfoEXT` is not specified.

- The `VkImageLayout` of any subresource in the image view does not match the `VkDescriptorImageInfo::imageLayout` used to write the image descriptor.

- The SPIR-V Image Format is not compatible with the image view's format.

- The sampler `unnormalizedCoordinates` is VK_TRUE and any of the limitations of unnormalized coordinates are violated.

- The sampler was created with `flags` containing VK_SAMPLER_CREATE_SUBSAMPLER_BIT_EXT and the image was not created with `flags` containing VK_IMAGE_CREATE_SUBSAMPLER_BIT_EXT.

- The sampler was not created with `flags` containing VK_SAMPLER_CREATE_SUBSAMPLER_BIT_EXT and the image was created with `flags` containing VK_IMAGE_CREATE_SUBSAMPLER_BIT_EXT.

- The sampler was created with `flags` containing VK_SAMPLER_CREATE_SUBSAMPLER_BIT_EXT and is used with a function that is not OpImageSampleImplicitLod or OpImageSampleExplicitLod, or is used with operands Offset or ConstOffsets.

- The SPIR-V instruction is one of the OpImage*Dref* instructions and the sampler compareEnable is
The SPIR-V instruction is not one of the `OpImage*Dref*` instructions and the sampler `compareEnable` is `VK_TRUE`.

The SPIR-V instruction is one of the `OpImage*Dref*` instructions, the image view `format` is one of the depth/stencil formats, and the image view aspect is not `VK_IMAGE_ASPECT_DEPTH_BIT`.

The SPIR-V instruction's image variable's properties are not compatible with the image view:

- Rules for `viewType`:
  - `VK_IMAGE_VIEW_TYPE_1D` must have `Dim = 1D, Arrayed = 0, MS = 0`.
  - `VK_IMAGE_VIEW_TYPE_2D` must have `Dim = 2D, Arrayed = 0`.
  - `VK_IMAGE_VIEW_TYPE_3D` must have `Dim = 3D, Arrayed = 0, MS = 0`.
  - `VK_IMAGE_VIEW_TYPE_CUBE` must have `Dim = Cube, Arrayed = 0, MS = 0`.
  - `VK_IMAGE_VIEW_TYPE_1D_ARRAY` must have `Dim = 1D, Arrayed = 1, MS = 0`.
  - `VK_IMAGE_VIEW_TYPE_2D_ARRAY` must have `Dim = 2D, Arrayed = 1`.
  - `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY` must have `Dim = Cube, Arrayed = 1, MS = 0`.

- If the image was created with `VkImageCreateInfo::samples` equal to `VK_SAMPLE_COUNT_1_BIT`, the instruction must have `MS = 0`.

- If the image was created with `VkImageCreateInfo::samples` not equal to `VK_SAMPLE_COUNT_1_BIT`, the instruction must have `MS = 1`.

- If the `Sampled Type` of the `OpTypeImage` does not match the SPIR-V Type.

- If the signedness of any read or sample operation does not match the signedness of the image's format.

- If the image was created with `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV`, the sampler addressing modes must only use a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

- The SPIR-V instruction is `OpImageSampleFootprintNV` with `Dim = 2D` and `addressModeU` or `addressModeV` in the sampler is not `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

- The SPIR-V instruction is `OpImageSampleFootprintNV` with `Dim = 3D` and `addressModeU`, `addressModeV`, or `addressModeW` in the sampler is not `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

- The sampler was created with a specified `VkSamplerCustomBorderColorCreateInfoEXT::format` which does not match the `VkFormat` of the image view(s) it is sampling.

- The sampler is sampling an image view of `VK_FORMAT_B4G4R4A4_UNORM_PACK16`, `VK_FORMAT_B5G6R5_UNORM_PACK16`, or `VK_FORMAT_B5G5R5A1_UNORM_PACK16` format without a specified `VkSamplerCustomBorderColorCreateInfoEXT::format`.

Only `OpImageSample*` and `OpImageSparseSample*` can be used with a sampler or image view that enables sampler Y′C′B′C′R conversion.

`OpImageFetch`, `OpImageSparseFetch`, `OpImage*Gather`, and `OpImageSparse*Gather` must not be used with a sampler or image view that enables sampler Y′C′B′C′R conversion.

The `ConstOffset` and `Offset` operands must not be used with a sampler or image view that enables
sampler Y'C_bC_r conversion.

If the underlying VkImage format has an X component in its format description, undefined values are read from those bits.

Note

If the VkImage format and VkImageView format are the same, these bits will be unused by format conversion and this will have no effect. However, if the VkImageView format is different, then some bits of the result may be undefined. For example, when a VK_FORMAT_R10X6_UNORM_PACK16 VkImage is sampled via a VK_FORMAT_R16_UNORM VkImageView, the low 6 bits of the value before format conversion are undefined and format conversion may return a range of different values.

Integer Texel Coordinate Validation

Integer texel coordinates are validated against the size of the image level, and the number of layers and number of samples in the image. For SPIR-V instructions that use integer texel coordinates, this is performed directly on the integer coordinates. For instructions that use normalized or unnormalized texel coordinates, this is performed on the coordinates that result after conversion to integer texel coordinates.

If the integer texel coordinates do not satisfy all of the conditions

\[ 0 \leq i < w_s \]
\[ 0 \leq j < h_s \]
\[ 0 \leq k < d_s \]
\[ 0 \leq l < \text{layers} \]
\[ 0 \leq n < \text{samples} \]

where:

\[ w_s = \text{width of the image level} \]
\[ h_s = \text{height of the image level} \]
\[ d_s = \text{depth of the image level} \]
layers = number of layers in the image

samples = number of samples per texel in the image

then the texel fails integer texel coordinate validation.

There are four cases to consider:

1. Valid Texel Coordinates
   - If the texel coordinates pass validation (that is, the coordinates lie within the image), then the texel value comes from the value in image memory.

2. Border Texel
   - If the texel coordinates fail validation, and
     - If the read is the result of an image sample instruction or image gather instruction, and
     - If the image is not a cube image, or if a sampler created with
       `VK_SAMPLER_CREATE_NON_SEAMLESS_CUBE_MAP_BIT_EXT` is used,
       then the texel is a border texel and **texel replacement** is performed.

3. Invalid Texel
   - If the texel coordinates fail validation, and
     - If the read is the result of an image fetch instruction, image read instruction, or atomic instruction,
       then the texel is an invalid texel and **texel replacement** is performed.

4. Cube Map Edge or Corner
   - Otherwise the texel coordinates lie beyond the edges or corners of the selected cube map face, and **Cube map edge handling** is performed.

**Cube Map Edge Handling**

If the texel coordinates lie beyond the edges or corners of the selected cube map face (as described in the prior section), the following steps are performed. Note that this does not occur when using `VK_FILTER_NEAREST` filtering within a mip level, since `VK_FILTER_NEAREST` is treated as using `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

- Cube Map Edge Texel
  - If the texel lies beyond the selected cube map face in either only i or only j, then the coordinates (i,j) and the array layer l are transformed to select the adjacent texel from the appropriate neighboring face.

- Cube Map Corner Texel
If the texel lies beyond the selected cube map face in both i and j, then there is no unique neighboring face from which to read that texel. The texel should be replaced by the average of the three values of the adjacent texels in each incident face. However, implementations may replace the cube map corner texel by other methods. The methods are subject to the constraint that for linear filtering if the three available texels have the same value, the resulting filtered texel must have that value, and for cubic filtering if the twelve available samples have the same value, the resulting filtered texel must have that value.

Sparse Validation

If the texel reads from an unbound region of a sparse image, the texel is a sparse unbound texel, and processing continues with texel replacement.

Layout Validation

If all planes of a disjoint multi-planar image are not in the same image layout, the image must not be sampled with sampler Y’CnCq conversion enabled.

16.3.2. Format Conversion

Texels undergo a format conversion from the VkFormat of the image view to a vector of either floating point or signed or unsigned integer components, with the number of components based on the number of components present in the format.

- Color formats have one, two, three, or four components, according to the format.
- Depth/stencil formats are one component. The depth or stencil component is selected by the aspectMask of the image view.

Each component is converted based on its type and size (as defined in the Format Definition section for each VkFormat), using the appropriate equations in 16-Bit Floating-Point Numbers, Unsigned 11-Bit Floating-Point Numbers, Unsigned 10-Bit Floating-Point Numbers, Fixed-Point Data Conversion, and Shared Exponent to RGB. Signed integer components smaller than 32 bits are sign-extended.

If the image view format is sRGB, the color components are first converted as if they are UNORM, and then sRGB to linear conversion is applied to the R, G, and B components as described in the “sRGB EOTF” section of the Khronos Data Format Specification. The A component, if present, is unchanged.

If VkSamplerYcbcrConversionYcbcrDegammaCreateInfoQCOM::enableYDegamma is equal to VK_TRUE, then sRGB to linear conversion is applied to the G component as described in the “sRGB EOTF” section of the Khronos Data Format Specification. If VkSamplerYcbcrConversionYcbcrDegammaCreateInfoQCOM::enableCbCrDegamma is equal to VK_TRUE, then sRGB to linear conversion is applied to the R and B components as described in the “sRGB EOTF” section of the Khronos Data Format Specification. The A component, if present, is unchanged.

If the image view format is block-compressed, then the texel value is first decoded, then converted based on the type and number of components defined by the compressed format.
16.3.3. Texel Replacement

A texel is replaced if it is one (and only one) of:

- a border texel,
- an invalid texel, or
- a sparse unbound texel.

Border texels are replaced with a value based on the image format and the `borderColor` of the sampler. The border color is:

<table>
<thead>
<tr>
<th>Sampler <code>borderColor</code></th>
<th>Corresponding Border Color</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_BORDER_COLOR_FLOAT_TRANSPARENT_BLACK</td>
<td>([B_r, B_g, B_b, B_a] = [0.0, 0.0, 0.0, 0.0])</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK</td>
<td>([B_r, B_g, B_b, B_a] = [0.0, 0.0, 0.0, 1.0])</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_FLOAT_OPAQUE_WHITE</td>
<td>([B_r, B_g, B_b, B_a] = [1.0, 1.0, 1.0, 1.0])</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_INT_TRANSPARENT_BLACK</td>
<td>([B_r, B_g, B_b, B_a] = [0, 0, 0, 0])</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_INT_OPAQUE_BLACK</td>
<td>([B_r, B_g, B_b, B_a] = [0, 0, 0, 1])</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_INT_OPAQUE_WHITE</td>
<td>([B_r, B_g, B_b, B_a] = [1, 1, 1, 1])</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_FLOAT_CUSTOM_EXT</td>
<td>([B_r, B_g, B_b, B_a] = [U_r, U_g, U_b, U_a])</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_INT_CUSTOM_EXT</td>
<td>([B_r, B_g, B_b, B_a] = [U_r, U_g, U_b, U_a])</td>
</tr>
</tbody>
</table>

The custom border color \((U)\) **may** be rounded by implementations prior to texel replacement, but the error introduced by such a rounding **must** not exceed one ULP of the image’s format.

**Note**

The names `VK_BORDER_COLOR_*_TRANSPARENT_BLACK`, `VK_BORDER_COLOR_*_OPAQUE_BLACK`, and `VK_BORDER_COLOR_*_OPAQUE_WHITE` are meant to describe which components are zeros and ones in the vocabulary of compositing, and are not meant to imply that the numerical value of `VK_BORDER_COLOR_INT_OPAQUE_WHITE` is a saturating value for integers.

This is substituted for the texel value by replacing the number of components in the image format

<table>
<thead>
<tr>
<th>Texel Aspect or Format</th>

<td>([\text{Color}_r, \text{Color}_g, \text{Color}_b] = [B_r, B_g, B_b])</td>
</tr>
<tr>
<td>Texel Aspect or Format</td>
<td>Component Assignment</td>
</tr>
<tr>
<td>-----------------------</td>
<td>----------------------</td>
</tr>
<tr>
<td>Four component color format</td>
<td>[Color_r, Color_g, Color_b, Color_a] = [B_r, B_g, B_b, B_a]</td>
</tr>
<tr>
<td>Single component alpha format</td>
<td>[Color_r, Color_g, Color_b, Color_a] = [0, 0, 0, B_a]</td>
</tr>
</tbody>
</table>

† S = B₈ may be substituted as the replacement method by the implementation when
VkSamplerCreateInfo::borderColor is VK_BORDER_COLOR_INT_CUSTOM_EXT and
VkSamplerCustomBorderColorCreateInfoEXT::format is VK_FORMAT_UNDEFINED. Implementations should use S = B₈ as the replacement method.

The value returned by a read of an invalid texel is undefined, unless that read operation is from a buffer resource and the robustBufferAccess feature is enabled. In that case, an invalid texel is replaced as described by the robustBufferAccess feature. If the access is to an image resource and the x, y, z, or layer coordinate validation fails and the robustImageAccess feature is enabled, then zero must be returned for the R, G, and B components, if present. Either zero or one must be returned for the A component, if present. If the robustImageAccess2 feature is enabled, zero values must be returned. If only the sample index was invalid, the values returned are undefined.

Additionally, if the robustImageAccess feature is enabled, but the robustImageAccess2 feature is not, any invalid texels may be expanded to four components prior to texel replacement. This means that components not present in the image format may be replaced with 0 or may undergo conversion to RGBA as normal.

Loads from a null descriptor return a four component color value of all zeros. However, for storage images and storage texel buffers using an explicit SPIR-V Image Format, loads from a null descriptor may return an alpha value of 1 (float or integer, depending on format) if the format does not include alpha.

If the VkPhysicalDeviceSparseProperties::residencyNonResidentStrict property is VK_TRUE, a sparse unbound texel is replaced with 0 or 0.0 values for integer and floating-point components of the image format, respectively.

If residencyNonResidentStrict is VK_FALSE, the value of the sparse unbound texel is undefined.

### 16.3.4. Depth Compare Operation

If the image view has a depth/stencil format, the depth component is selected by the aspectMask, and the operation is an OpImage*Dref* instruction, a depth comparison is performed. The result is 1.0 if the comparison evaluates to true, and 0.0 otherwise. This value replaces the depth component D.

The compare operation is selected by the VkCompareOp value set by VkSamplerCreateInfo::compareOp. The reference value from the SPIR-V operand D_ref and the texel depth value D_tex are used as the reference and test values, respectively, in that operation.

If the image being sampled has an unsigned normalized fixed-point format, then D_ref is clamped to [0,1] before the compare operation.
16.3.5. Conversion to RGBA

The texel is expanded from one, two, or three components to four components based on the image base color:

Table 26. Texel Color After Conversion To RGBA

<table>
<thead>
<tr>
<th>Texel Aspect or Format</th>
<th>RGBA Color</th>
</tr>
</thead>
<tbody>
<tr>
<td>Depth aspect</td>
<td>[Color_r, Color_g, Color_b, Color_a] = [D, 0, 0, one]</td>
</tr>
<tr>

<td>[Color_r, Color_g, Color_b, Color_a] = [S, 0, 0, one]</td>
</tr>
<tr>
<td>One component color format</td>
<td>[Color_r, Color_g, Color_b, Color_a] = [Color_r, 0, 0, one]</td>
</tr>
<tr>
<td>Two component color format</td>
<td>[Color_r, Color_g, Color_b, Color_a] = [Color_r, Color_g, 0, one]</td>
</tr>
<tr>
<td>Three component color format</td>
<td>[Color_r, Color_g, Color_b, Color_a] = [Color_r, Color_g, Color_b, one]</td>
</tr>
<tr>
<td>Four component color format</td>
<td>[Color_r, Color_g, Color_b, Color_a] = [Color_r, Color_g, Color_b, Color_a]</td>
</tr>
<tr>
<td>One alpha component color format</td>
<td>[Color_r, Color_g, Color_b, Color_a] = [0, 0, 0, Color_a]</td>
</tr>
</tbody>
</table>

where one = 1.0f for floating-point formats and depth aspects, and one = 1 for integer formats and stencil aspects.

16.3.6. Component Swizzle

All texel input instructions apply a swizzle based on:

- the VkComponentSwizzle enums in the components member of the VkImageViewCreateInfo structure for the image being read if sampler Y’C_bC_r conversion is not enabled, and
- the VkComponentSwizzle enums in the components member of the VkSamplerYcbcrConversionCreateInfo structure for the sampler Y’C_bC_r conversion if sampler Y’C_bC_r conversion is enabled.

The swizzle can rearrange the components of the texel, or substitute zero or one for any components. It is defined as follows for each color component:

\[
\text{Color }'_{\text{component}} = \begin{cases} 
\text{Color}_r & \text{for RED swizzle} \\
\text{Color}_g & \text{for GREEN swizzle} \\
\text{Color}_b & \text{for BLUE swizzle} \\
\text{Color}_a & \text{for ALPHA swizzle} \\
0 & \text{for ZERO swizzle} \\
\text{one} & \text{for ONE swizzle} \\
\text{identity} & \text{for IDENTITY swizzle} 
\end{cases}
\]

where:
If the border color is one of the VkBorderColor_*_OPAQUE_BLACK enums and the VkComponentSwizzle is not the identity swizzle for all components, the value of the texel after swizzle is undefined.

If the image view has a depth/stencil format and the VkComponentSwizzle is VK_COMPONENT_SWIZZLE_ONE, and VkPhysicalDeviceMaintenance5PropertiesKHR::depthStencilSwizzleOneSupport is not set to VK_TRUE, the value of the texel after swizzle is undefined.

### 16.3.7. Sparse Residency

OpImageSparse* instructions return a structure which includes a residency code indicating whether any texels accessed by the instruction are sparse unbound texels. This code can be interpreted by the OpImageSparseTexelsResident instruction which converts the residency code to a boolean value.

### 16.3.8. Chroma Reconstruction

In some color models, the color representation is defined in terms of monochromatic light intensity (often called “luma”) and color differences relative to this intensity, often called “chroma”. It is common for color models other than RGB to represent the chroma components at lower spatial resolution than the luma component. This approach is used to take advantage of the eye’s lower spatial sensitivity to color compared with its sensitivity to brightness. Less commonly, the same approach is used with additive color, since the green component dominates the eye’s sensitivity to light intensity and the spatial sensitivity to color introduced by red and blue is lower.

Lower-resolution components are “downsampled” by resizing them to a lower spatial resolution than the component representing luminance. This process is also commonly known as “chroma subsampling”. There is one luminance sample in each texture texel, but each chrominance sample may be shared among several texels in one or both texture dimensions.

- “_444” formats do not spatially downsample chroma values compared with luma: there are unique chroma samples for each texel.
- “_422” formats have downsampling in the x dimension (corresponding to u or s coordinates): they are sampled at half the resolution of luma in that dimension.
- “_420” formats have downsampling in the x dimension (corresponding to u or s coordinates) and the y dimension (corresponding to v or t coordinates): they are sampled at half the resolution of luma in both dimensions.

The process of reconstructing a full color value for texture access involves accessing both chroma
and luma values at the same location. To generate the color accurately, the values of the lower-resolution components at the location of the luma samples must be reconstructed from the lower-resolution sample locations, an operation known here as “chroma reconstruction” irrespective of the actual color model.

The location of the chroma samples relative to the luma coordinates is determined by the xChromaOffset and yChromaOffset members of the VkSamplerYcbcrConversionCreateInfo structure used to create the sampler Y’C_bC_r conversion.

The following diagrams show the relationship between unnormalized \((u,v)\) coordinates and \((i,j)\) integer texel positions in the luma component (shown in black, with circles showing integer sample positions) and the texel coordinates of reduced-resolution chroma components, shown as crosses in red.

\[\text{Note}\]

If the chroma values are reconstructed at the locations of the luma samples by means of interpolation, chroma samples from outside the image bounds are needed; these are determined according to Wrapping Operation. These diagrams represent this by showing the bounds of the “chroma texel” extending beyond the image bounds, and including additional chroma sample positions where required for interpolation. The limits of a sample for NEAREST sampling is shown as a grid.

Figure 6. 422 downsampling, xChromaOffset=COSITED_EVEN
Figure 7. 422 downsampling, xChromaOffset=MIDPOINT

Figure 8. 420 downsampling, xChromaOffset=COSITED_EVEN, yChromaOffset=COSITED_EVEN
Figure 9. 420 downsampling, xChromaOffset=MIDPOINT, yChromaOffset=COSITED_EVEN

Figure 10. 420 downsampling, xChromaOffset=COSITED_EVEN, yChromaOffset=MIDPOINT
Reconstruction is implemented in one of two ways:

If the format of the image that is to be sampled sets `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT`, or the `VkSamplerYcbcrConversionCreateInfo`’s `forceExplicitReconstruction` is set to `VK_TRUE`, reconstruction is performed as an explicit step independent of filtering, described in the Explicit Reconstruction section.

If the format of the image that is to be sampled does not set `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT` and if the `VkSamplerYcbcrConversionCreateInfo`’s `forceExplicitReconstruction` is set to `VK_FALSE`, reconstruction is performed as an implicit part of filtering prior to color model conversion, with no separate post-conversion texel filtering step, as described in the Implicit Reconstruction section.

**Explicit Reconstruction**

- If the `chromaFilter` member of the `VkSamplerYcbcrConversionCreateInfo` structure is `VK_FILTER_NEAREST`:
  - If the format’s R and B components are reduced in resolution in just width by a factor of two relative to the G component (i.e. this is a “ _422 ” format), the \( \tau_{ijk}[level] \) values accessed by texel filtering are reconstructed as follows:
    \[
    \tau_R'(i, j) = \tau_R([i \times 0.5], j)[level] \\
    \tau_B'(i, j) = \tau_B([i \times 0.5], j)[level]
    \]
  - If the format’s R and B components are reduced in resolution in width and height by a factor of two relative to the G component (i.e. this is a “ _420 ” format), the \( \tau_{ijk}[level] \) values accessed by texel filtering are reconstructed as follows:
\[
\begin{align*}
\tau_R'(i, j) &= \tau_R([i \times 0.5], [j \times 0.5])|_{\text{level}} \\
\tau_B'(i, j) &= \tau_B([i \times 0.5], [j \times 0.5])|_{\text{level}}
\end{align*}
\]

Note

xChromaOffset and yChromaOffset have no effect if chromaFilter is VK_FILTER_NEAREST for explicit reconstruction.

- If the chromaFilter member of the VkSamplerYcbcrConversionCreateInfo structure is VK_FILTER_LINEAR:
  - If the format’s R and B components are reduced in resolution in just width by a factor of two relative to the G component (i.e. this is a “_422” format):
    - If xChromaOffset is VK_CHROMA_LOCATION_COSITED_EVEN:
      \[
      \tau_{RB}'(i, j) = \begin{cases} 
      \tau_{RB}([i \times 0.5], [j \times 0.5])|_{\text{level}}, & 0.5 \times i = [0.5 \times i] \\
      0.5 \times \tau_{RB}([i \times 0.5], [j \times 0.5])|_{\text{level}} + \\
      0.5 \times \tau_{RB}([i \times 0.5] + 1, [j \times 0.5])|_{\text{level}}, & 0.5 \times i \neq [0.5 \times i]
      \end{cases}
      \]
    - If xChromaOffset is VK_CHROMA_LOCATION_MIDPOINT:
      \[
      \tau_{RB}'(i, j) = \begin{cases} 
      0.25 \times \tau_{RB}([i \times 0.5] - 1, [j \times 0.5])|_{\text{level}} + \\
      0.75 \times \tau_{RB}([i \times 0.5], [j \times 0.5])|_{\text{level}}, & 0.5 \times i = [0.5 \times i] \\
      0.75 \times \tau_{RB}([i \times 0.5], [j \times 0.5])|_{\text{level}} + \\
      0.25 \times \tau_{RB}([i \times 0.5] + 1, [j \times 0.5])|_{\text{level}}, & 0.5 \times i \neq [0.5 \times i]
      \end{cases}
      \]
  - If the format’s R and B components are reduced in resolution in width and height by a factor of two relative to the G component (i.e. this is a “_420” format), a similar relationship applies. Due to the number of options, these formulae are expressed more concisely as follows:
    \[
    \begin{align*}
    i_{RB} &= \begin{cases} 
    0.5 \times (i) & \text{xChromaOffset=\text{COSITED\_EVEN}} \\
    0.5 \times (i - 0.5) & \text{xChromaOffset=\text{MIDPOINT}}
    \end{cases} \\
    j_{RB} &= \begin{cases} 
    0.5 \times (j) & \text{yChromaOffset=\text{COSITED\_EVEN}} \\
    0.5 \times (j - 0.5) & \text{yChromaOffset=\text{MIDPOINT}}
    \end{cases}
    \end{align*}
    \]
    \[
    \begin{align*}
    i_{floor} &= \lfloor i_{RB} \rfloor \\
    j_{floor} &= \lfloor j_{RB} \rfloor \\
    i_{frac} &= i_{RB} - i_{floor} \\
    j_{frac} &= j_{RB} - j_{floor}
    \end{align*}
    \]
    \[
    \tau_{RB}'(i, j) = \tau_{RB}(i_{floor}, j_{floor})|_{\text{level}} \times (1 - i_{frac}) \times (1 - j_{frac}) + \\
    \tau_{RB}(1 + i_{floor}, j_{floor})|_{\text{level}} \times (i_{frac}) \times (1 - j_{frac}) + \\
    \tau_{RB}(i_{floor}, 1 + j_{floor})|_{\text{level}} \times (1 - i_{frac}) \times (j_{frac}) + \\
    \tau_{RB}(1 + i_{floor}, 1 + j_{floor})|_{\text{level}} \times (i_{frac}) \times (j_{frac})
    \]

Note

In the case where the texture itself is bilinearly interpolated as described in Texel
Filtering, thus requiring four full-color samples for the filtering operation, and where the reconstruction of these samples uses bilinear interpolation in the chroma components due to `chromaFilter=VK_FILTER_LINEAR`, up to nine chroma samples may be required, depending on the sample location.

**Implicit Reconstruction**

Implicit reconstruction takes place by the samples being interpolated, as required by the filter settings of the sampler, except that `chromaFilter` takes precedence for the chroma samples.

If `chromaFilter` is `VK_FILTER_NEAREST`, an implementation *may* behave as if `xChromaOffset` and `yChromaOffset` were both `VK_CHROMA_LOCATION_MIDPOINT`, irrespective of the values set.

![Note](image)

This will not have any visible effect if the locations of the luma samples coincide with the location of the samples used for rasterization.

The sample coordinates are adjusted by the downsample factor of the component (such that, for example, the sample coordinates are divided by two if the component has a downsample factor of two relative to the luma component):

\[
\begin{align*}
    u_{RB}'(422/420) &= \begin{cases} 
        0.5 \times (u + 0.5), & \text{if } xChromaOffset=\text{COSITED\_EVEN} \\
        0.5 \times u, & \text{if } xChromaOffset=\text{MIDPOINT} 
    \end{cases} \\
    v_{RB}' &= \begin{cases} 
        0.5 \times (v + 0.5), & \text{if } yChromaOffset=\text{COSITED\_EVEN} \\
        0.5 \times v, & \text{if } yChromaOffset=\text{MIDPOINT} 
    \end{cases}
\end{align*}
\]

**16.3.9. Sampler Y'CbCr Conversion**

Sampler Y'CbCr conversion performs the following operations, which an implementation *may* combine into a single mathematical operation:

- **Sampler Y'CbCr Range Expansion**
- **Sampler Y'CbCr Model Conversion**

**Sampler Y'CbCr Range Expansion**

Sampler Y'CbCr range expansion is applied to color component values after all texel input operations which are not specific to sampler Y'CbCr conversion. For example, the input values to this stage have been converted using the normal format conversion rules.

The input values to this stage may have been converted using sRGB to linear conversion if `ycbcrDegamma` is enabled.

Sampler Y'CbCr range expansion is not applied if `ycbcrModel` is `VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY`. That is, the shader receives the vector C_{rgba} as output by the Component Swizzle stage without further modification.

For other values of `ycbcrModel`, range expansion is applied to the texel component values output by
the Component Swizzle defined by the components member of `VkSamplerYcbcrConversionCreateInfo`. Range expansion applies independently to each component of the image. For the purposes of range expansion and Y’C_bC_r model conversion, the R and B components contain color difference (chroma) values and the G component contains luma. The A component is not modified by sampler Y’C_bC_r range expansion.

The range expansion to be applied is defined by the `ycbcrRange` member of the `VkSamplerYcbcrConversionCreateInfo` structure:

- If `ycbcrRange` is `VK_SAMPLER_YCBCR_RANGE_ITU_FULL`, the following transformations are applied:

\[
Y' = \frac{C'_{rgba} [G]}{2^{(n-1)}} - \frac{2(n-1)}{(2^n) - 1} \\
C_B = \frac{C'_{rgba} [B]}{2^{(n-1)}} - \frac{2(n-1)}{(2^n) - 1} \\
C_R = \frac{C'_{rgba} [R]}{2^{(n-1)}} - \frac{2(n-1)}{(2^n) - 1}
\]

**Note**

These formulae correspond to the “full range” encoding in the “Quantization schemes” chapter of the Khronos Data Format Specification.

Should any future amendments be made to the ITU specifications from which these equations are derived, the formulae used by Vulkan may also be updated to maintain parity.

- If `ycbcrRange` is `VK_SAMPLER_YCBCR_RANGE_ITU_NARROW`, the following transformations are applied:

\[
Y' = \frac{C'_{rgba} [G] \times (2^n - 1) - 16 \times 2^n - 8}{219 \times 2^n - 8} \\
C_B = \frac{C'_{rgba} [B] \times (2^n - 1) - 128 \times 2^n - 8}{224 \times 2^n - 8} \\
C_R = \frac{C'_{rgba} [R] \times (2^n - 1) - 128 \times 2^n - 8}{224 \times 2^n - 8}
\]

**Note**

These formulae correspond to the “narrow range” encoding in the “Quantization schemes” chapter of the Khronos Data Format Specification.

- \( n \) is the bit-depth of the components in the format.

The precision of the operations performed during range expansion must be at least that of the source format.

An implementation may clamp the results of these range expansion operations such that \( Y' \) falls in the range \([0,1]\), and/or such that \( C_b \) and \( C_r \) fall in the range \([-0.5,0.5]\).
Sampler Y’C_bC_R Model Conversion

The range-expanded values are converted between color models, according to the color model conversion specified in the `ycbcrModel` member:

**VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY**

The color components are not modified by the color model conversion since they are assumed already to represent the desired color model in which the shader is operating; Y’C_bC_R range expansion is also ignored.

**VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY**

The color components are not modified by the color model conversion and are assumed to be treated as though in Y’C_bC_R form both in memory and in the shader; Y’C_bC_R range expansion is applied to the components as for other Y’C_bC_R models, with the vector (C_R, Y', C_b, A) provided to the shader.

**VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_709**

The color components are transformed from a Y’C_bC_R representation to an R’G’B’ representation as described in the “BT.709 Y’C_bC_R conversion” section of the Khronos Data Format Specification.

**VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_601**

The color components are transformed from a Y’C_bC_R representation to an R’G’B’ representation as described in the “BT.601 Y’C_bC_R conversion” section of the Khronos Data Format Specification.

**VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_2020**

The color components are transformed from a Y’C_bC_R representation to an R’G’B’ representation as described in the “BT.2020 Y’C_bC_R conversion” section of the Khronos Data Format Specification.

In this operation, each output component is dependent on each input component.

An implementation may clamp the R’G’B’ results of these conversions to the range [0,1].

The precision of the operations performed during model conversion must be at least that of the source format.

The alpha component is not modified by these model conversions.

---

**Note**

Sampling operations in a non-linear color space can introduce color and intensity shifts at sharp transition boundaries. To avoid this issue, the technically precise color correction sequence described in the “Introduction to Color Conversions” chapter of the Khronos Data Format Specification may be performed as follows:

- Calculate the unnormalized texel coordinates corresponding to the desired sample position.
- For a `minFilter` or `magFilter` of `VK_FILTER_NEAREST`:
  1. Calculate (i,j) for the sample location as described under the “nearest
filtering” formulae in \((u,v,w,a)\) to \((i,j,k,l,n)\) Transformation and Array Layer Selection

2. Calculate the normalized texel coordinates corresponding to these integer coordinates.

3. Sample using sampler Y’C_b conversion at this location.

- For a minFilter or magFilter of VK_FILTER_LINEAR:
  1. Calculate \((i_{0,1},j_{0,1})\) for the sample location as described under the “linear filtering” formulae in \((u,v,w,a)\) to \((i,j,k,l,n)\) Transformation and Array Layer Selection
  2. Calculate the normalized texel coordinates corresponding to these integer coordinates.
  3. Sample using sampler Y’C_b conversion at each of these locations.
  4. Convert the non-linear A’R’G’B’ outputs of the Y’C_bC_r conversions to linear ARGB values as described in the “Transfer Functions” chapter of the Khronos Data Format Specification.
  5. Interpolate the linear ARGB values using the \(\alpha\) and \(\beta\) values described in the “linear filtering” section of \((u,v,w,a)\) to \((i,j,k,l,n)\) Transformation and Array Layer Selection and the equations in Texel Filtering.

The additional calculations and, especially, additional number of sampling operations in the VK_FILTER_LINEAR case can be expected to have a performance impact compared with using the outputs directly. Since the variations from “correct” results are subtle for most content, the application author should determine whether a more costly implementation is strictly necessary.

If chromaFilter, and minFilter or magFilter are both VK_FILTER_NEAREST, these operations are redundant and sampling using sampler Y’C_bC_r conversion at the desired sample coordinates will produce the “correct” results without further processing.

### 16.4. Texel Output Operations

**Texel output instructions** are SPIR-V image instructions that write to an image. **Texel output operations** are a set of steps that are performed on state, coordinates, and texel values while processing a texel output instruction, and which are common to some or all texel output instructions. They include the following steps, which are performed in the listed order:

- **Validation operations**
  - Format validation
  - Type validation
  - Coordinate validation
  - Sparse validation
- **Texel output format conversion**
16.4.1. Texel Output Validation Operations

*Texel output validation operations* inspect instruction/image state or coordinates, and in certain circumstances cause the write to have no effect. There are a series of validations that the texel undergoes.

**Texel Format Validation**

If the image format of the `OpTypeImage` is not compatible with the `VkImageView`'s format, the write causes the contents of the image's memory to become undefined.

**Texel Type Validation**

If the `Sampled Type` of the `OpTypeImage` does not match the SPIR-V Type, the write causes the value of the texel to become undefined. For integer types, if the signedness of the access does not match the signedness of the accessed resource, the write causes the value of the texel to become undefined.

16.4.2. Integer Texel Coordinate Validation

The integer texel coordinates are validated according to the same rules as for texel input coordinate validation.

If the texel fails integer texel coordinate validation, then the write has no effect.

16.4.3. Sparse Texel Operation

If the texel attempts to write to an unbound region of a sparse image, the texel is a sparse unbound texel. In such a case, if the `VkPhysicalDeviceSparseProperties::residencyNonResidentStrict` property is `VK_TRUE`, the sparse unbound texel write has no effect. If `residencyNonResidentStrict` is `VK_FALSE`, the write may have a side effect that becomes visible to other accesses to unbound texels in any resource, but will not be visible to any device memory allocated by the application.

16.4.4. Texel Output Format Conversion

If the image format is sRGB, a linear to sRGB conversion is applied to the R, G, and B components as described in the “sRGB EOTF” section of the Khronos Data Format Specification. The A component, if present, is unchanged.

Texels then undergo a format conversion from the floating point, signed, or unsigned integer type of the texel data to the `VkFormat` of the image view. If the number of components in the texel data is larger than the number of components in the format, additional components are discarded.

Each component is converted based on its type and size (as defined in the Format Definition section for each `VkFormat`). Floating-point outputs are converted as described in Floating-Point Format Conversions and Fixed-Point Data Conversion. Integer outputs are converted such that their value is preserved. The converted value of any integer that cannot be represented in the target format is undefined.

If the `VkImageView` format has an X component in its format description, undefined values are written to those bits.
If the underlying \texttt{VkImage} format has an X component in its format description, undefined values are also written to those bits, even if result format conversion produces a valid value for those bits because the \texttt{VkImageView} format is different.

### 16.5. Normalized Texel Coordinate Operations

If the image sampler instruction provides normalized texel coordinates, some of the following operations are performed.

#### 16.5.1. Projection Operation

For \texttt{Proj} image operations, the normalized texel coordinates \((s,t,r,q,a)\) and (if present) the \(D_{\text{ref}}\) coordinate are transformed as follows:

\[
\begin{align*}
    s &= \frac{s}{q}, & \text{for 1D, 2D, or 3D image} \\
    t &= \frac{t}{q}, & \text{for 2D or 3D image} \\
    r &= \frac{r}{q}, & \text{for 3D image} \\
    D_{\text{ref}} &= \frac{D_{\text{ref}}}{q}, & \text{if provided}
\end{align*}
\]

#### 16.5.2. Derivative Image Operations

Derivatives are used for LOD selection. These derivatives are either implicit (in an \texttt{ImplicitLod} image instruction in a fragment shader) or explicit (provided explicitly by shader to the image instruction in any shader).

For implicit derivatives image instructions, the derivatives of texel coordinates are calculated in the same manner as derivative operations. That is:

\[
\begin{align*}
    \frac{\partial s}{\partial x} &= dPdx(s), & \frac{\partial s}{\partial y} &= dPdy(s), & \text{for 1D, 2D, Cube, or 3D image} \\
    \frac{\partial t}{\partial x} &= dPdx(t), & \frac{\partial t}{\partial y} &= dPdy(t), & \text{for 2D, Cube, or 3D image} \\
    \frac{\partial r}{\partial x} &= dPdx(r), & \frac{\partial r}{\partial y} &= dPdy(r), & \text{for Cube or 3D image}
\end{align*}
\]

Partial derivatives not defined above for certain image dimensionalities are set to zero.

For explicit LOD image instructions, if the \texttt{optional} SPIR-V operand \texttt{Grad} is provided, then the operand values are used for the derivatives. The number of components present in each derivative for a given image dimensionality matches the number of partial derivatives computed above.

If the \texttt{optional} SPIR-V operand \texttt{Lod} is provided, then derivatives are set to zero, the cube map derivative transformation is skipped, and the scale factor operation is skipped. Instead, the floating point scalar coordinate is directly assigned to \(\lambda_{\text{base}}\) as described in LOD Operation.

If the image or sampler object used by an implicit derivative image instruction is not uniform across the quad and \texttt{quadDivergentImplicitLod} is not supported, then the derivative and LOD values...
are undefined. Implicit derivatives are well-defined when the image and sampler and control flow are uniform across the quad, even if they diverge between different quads.

If quadDivergentImplicitLod is supported, then derivatives and implicit LOD values are well-defined even if the image or sampler object are not uniform within a quad. The derivatives are computed as specified above, and the implicit LOD calculation proceeds for each shader invocation using its respective image and sampler object.

### 16.5.3. Cube Map Face Selection and Transformations

For cube map image instructions, the (s,t,r) coordinates are treated as a direction vector \((r_x, r_y, r_z)\). The direction vector is used to select a cube map face. The direction vector is transformed to a per-face texel coordinate system \((s_{\text{face}}, t_{\text{face}})\). The direction vector is also used to transform the derivatives to per-face derivatives.

### 16.5.4. Cube Map Face Selection

The direction vector selects one of the cube map’s faces based on the largest magnitude coordinate direction (the major axis direction). Since two or more coordinates can have identical magnitude, the implementation must have rules to disambiguate this situation.

The rules should have as the first rule that \(r_z\) wins over \(r_y\) and \(r_x\), and the second rule that \(r_y\) wins over \(r_x\). An implementation may choose other rules, but the rules must be deterministic and depend only on \((r_x, r_y, r_z)\).

The layer number (corresponding to a cube map face), the coordinate selections for \(s_c\), \(t_c\), \(r_c\), and the selection of derivatives, are determined by the major axis direction as specified in the following two tables.

#### Table 27. Cube map face and coordinate selection

### 16.5.5. Cube Map Coordinate Transformation

\[
\begin{align*}
s_{\text{face}} &= \frac{1}{2} \times \frac{s_c}{|r_c|} + \frac{1}{2} \\
t_{\text{face}} &= \frac{1}{2} \times \frac{t_c}{|r_c|} + \frac{1}{2}
\end{align*}
\]

### 16.5.6. Cube Map Derivative Transformation

**For the Major Axis Direction**

\[
\begin{align*}
\frac{\partial s_{\text{face}}}{\partial x} &= \frac{1}{2} \times \frac{\partial}{\partial x} \left( \frac{s_c}{|r_c|} + \frac{1}{2} \right) \\
\frac{\partial s_{\text{face}}}{\partial y} &= \frac{1}{2} \times \frac{\partial}{\partial y} \left( \frac{s_c}{|r_c|} \right) \\
\frac{\partial s_{\text{face}}}{\partial z} &= \frac{1}{2} \times \left( \frac{|r_c| \times \partial s_c / \partial x - s_c \times \partial r_c / \partial x}{(r_c)^2} - \frac{|r_c| \times \partial s_c / \partial y - s_c \times \partial r_c / \partial y}{(r_c)^2} \right) \\
\frac{\partial t_{\text{face}}}{\partial x} &= \frac{1}{2} \times \left( \frac{|r_c| \times \partial t_c / \partial x - t_c \times \partial r_c / \partial x}{(r_c)^2} - \frac{|r_c| \times \partial t_c / \partial y - t_c \times \partial r_c / \partial y}{(r_c)^2} \right) \\
\frac{\partial t_{\text{face}}}{\partial y} &= \frac{1}{2} \times \left( \frac{|r_c| \times \partial t_c / \partial y - t_c \times \partial r_c / \partial y}{(r_c)^2} - \frac{|r_c| \times \partial t_c / \partial z - t_c \times \partial r_c / \partial z}{(r_c)^2} \right)
\end{align*}
\]

### 16.5.7. Scale Factor Operation, LOD Operation and Image Level(s) Selection

LOD selection can be either explicit (provided explicitly by the image instruction) or implicit (determined from a scale factor calculated from the derivatives). The LOD must be computed with \texttt{mipmapPrecisionBits} of accuracy.

**Scale Factor Operation**

The magnitude of the derivatives are calculated by:
\[ m_{ux} = |\partial s/\partial x| \times w_{base} \]

\[ m_{ux} = |\partial t/\partial x| \times h_{base} \]

\[ m_{wx} = |\partial r/\partial x| \times d_{base} \]

\[ m_{uy} = |\partial s/\partial y| \times w_{base} \]

\[ m_{vy} = |\partial t/\partial y| \times h_{base} \]

\[ m_{vy} = |\partial r/\partial y| \times d_{base} \]

where:

\[ \partial t/\partial x = \partial t/\partial y = 0 \quad \text{for 1D images} \]

\[ \partial r/\partial x = \partial r/\partial y = 0 \quad \text{for 1D, 2D or Cube images} \]

and:

\[ w_{base} = \text{image.w} \]

\[ h_{base} = \text{image.h} \]

\[ d_{base} = \text{image.d} \]

(for the baseMipLevel, from the image descriptor).

For corner-sampled images, the \( w_{base}, h_{base}, \) and \( d_{base} \) are instead:

\[ w_{base} = \text{image.w} - 1 \]

\[ h_{base} = \text{image.h} - 1 \]

\[ d_{base} = \text{image.d} - 1 \]
A point sampled in screen space has an elliptical footprint in texture space. The minimum and maximum scale factors \((\rho_{\text{min}}, \rho_{\text{max}})\) **should** be the minor and major axes of this ellipse.

The **scale factors** \(\rho_x\) and \(\rho_y\), calculated from the magnitude of the derivatives in \(x\) and \(y\), are used to compute the minimum and maximum scale factors.

\(\rho_x\) and \(\rho_y\) **may** be approximated with functions \(f_x\) and \(f_y\), subject to the following constraints:

- \(f_x\) is continuous and monotonically increasing in each of \(m_{ux}, m_{vx}, \text{and } m_{wx}\)
- \(f_y\) is continuous and monotonically increasing in each of \(m_{uy}, m_{vy}, \text{and } m_{wy}\)

\[
\begin{align*}
\max(|m_{ux}|, |m_{vx}|, |m_{wx}|) & \leq f_x \leq \sqrt{2(|m_{ux}| + |m_{vx}| + |m_{wx}|)} \\
\max(|m_{uy}|, |m_{vy}|, |m_{wy}|) & \leq f_y \leq \sqrt{2(|m_{uy}| + |m_{vy}| + |m_{wy}|)}
\end{align*}
\]

The minimum and maximum scale factors \((\rho_{\text{min}}, \rho_{\text{max}})\) are determined by:

\[
\rho_{\text{max}} = \max(\rho_x, \rho_y)
\]

\[
\rho_{\text{min}} = \min(\rho_x, \rho_y)
\]

The ratio of anisotropy is determined by:

\[
\eta = \min(\frac{\rho_{\text{max}}}{\rho_{\text{min}}}, \max_{\text{Aniso}})
\]

where:

- \(\text{sampler.max}_{\text{Aniso}} = \max_{\text{Anisotropy}}\) (from sampler descriptor)
- \(\text{limits.max}_{\text{Aniso}} = \max_{\text{SamplerAnisotropy}}\) (from physical device limits)

\[
\max_{\text{Aniso}} = \min(\text{sampler.max}_{\text{Aniso}}, \text{limits.max}_{\text{Aniso}})
\]

If \(\rho_{\text{max}} = \rho_{\text{min}} = 0\), then all the partial derivatives are zero, the fragment’s footprint in texel space is a point, and \(\eta\) **should** be treated as 1. If \(\rho_{\text{max}} \neq 0\) and \(\rho_{\text{min}} = 0\) then all partial derivatives along one axis are zero, the fragment’s footprint in texel space is a line segment, and \(\eta\) **should** be treated as \(\max_{\text{Aniso}}\). However, anytime the footprint is small in texel space the implementation **may** use a smaller value of \(\eta\), even when \(\rho_{\text{min}}\) is zero or close to zero. If either \(\text{VkPhysicalDeviceFeatures}::\text{samplerAnisotropy}\) or \(\text{VkSamplerCreateInfo}::\text{anisotropyEnable}\) are \(\text{VK_FALSE}\), \(\max_{\text{Aniso}}\) is set to 1.

If \(\eta = 1\), sampling is isotropic. If \(\eta > 1\), sampling is anisotropic.

The sampling rate \((N)\) is derived as:
An implementation **may** round \( N \) up to the nearest supported sampling rate. An implementation **may** use the value of \( N \) as an approximation of \( \eta \).

### LOD Operation

The LOD parameter \( \lambda \) is computed as follows:

\[
\lambda_{\text{base}}(x, y) = \begin{cases} 
    \text{shaderOp.Lod} & \text{(from optional SPIR-V operand)} \\
    \log_2\left\lceil \frac{\eta}{\eta} \right\rceil & \text{otherwise}
\end{cases}
\]

\[
\lambda'(x, y) = \lambda_{\text{base}} + \text{clamp}(\text{sampler.bias + shaderOp.bias, } - \text{maxSamplerLodBias, maxSamplerLodBias})
\]

\[
\lambda = \begin{cases} 
    \text{lod}_{\text{max}}, & \lambda' > \text{lod}_{\text{max}} \\
    \lambda', & \text{lod}_{\text{min}} \leq \lambda' \leq \text{lod}_{\text{max}} \\
    \text{lod}_{\text{min}}, & \lambda' < \text{lod}_{\text{min}} \\
    \text{undefined}, & \text{lod}_{\text{min}} > \text{lod}_{\text{max}}
\end{cases}
\]

where:

\[
\text{sampler.bias} = \text{mipLodBias} \quad \text{(from sampler descriptor)}
\]

\[
\text{shaderOp.bias} = \begin{cases} 
    \text{Bias} & \text{(from optional SPIR-V operand)} \\
    0 & \text{otherwise}
\end{cases}
\]

\[
\text{sampler.lod}_{\min} = \text{minLod} \quad \text{(from sampler descriptor)}
\]

\[
\text{shaderOp.lod}_{\min} = \begin{cases} 
    \text{MinLod} & \text{(from optional SPIR-V operand)} \\
    0 & \text{otherwise}
\end{cases}
\]

\[
\text{lod}_{\min} = \text{max}(\text{sampler.lod}_{\min}, \text{shaderOp.lod}_{\min})
\]

\[
\text{lod}_{\max} = \text{maxLod} \quad \text{(from sampler descriptor)}
\]

and maxSamplerLodBias is the value of the `VkPhysicalDeviceLimits` feature `maxSamplerLodBias`.

### Image Level(s) Selection

The image level(s) \( d, d_{\text{hi}}, \) and \( d_{\text{lo}} \) which texels are read from are determined by an image-level parameter \( d_l \), which is computed based on the LOD parameter, as follows:

\[
d_l = \begin{cases} 
    \text{nearest}(d'), & \text{mipmapMode is VK_SAMPLER_MIPMAP_MODE_NEAREST} \\
    d', & \text{otherwise}
\end{cases}
\]

where:

\[
d' = \text{max}(\text{level}_{\text{base}} + \text{clamp}(\lambda, 0, q), \text{minLod}_{\text{imageView}})
\]

\[
\text{nearest}(d') = \begin{cases} 
    \lfloor d' + 0.5 \rfloor - 1, & \text{preferred} \\
    \lfloor d' + 0.5 \rfloor, & \text{alternative}
\end{cases}
\]

and:
\[
\begin{align*}
\text{minLod}_{\text{imageView}} &= \begin{cases} 
\text{minLodFloat}_{\text{imageView}}, & \text{preferred} \\
\text{minLodInteger}_{\text{imageView}}, & \text{alternative}
\end{cases} \\
\text{level}_{\text{base}} &= \text{baseMipLevel} \\
q &= \text{levelCount} - 1
\end{align*}
\]

\text{baseMipLevel} \text{ and } \text{levelCount} \text{ are taken from the subresourceRange of the image view.}

\text{minLod}_{\text{imageView}} \text{ must be less or equal to } \text{level}_{\text{base}} + q.

If the sampler’s \text{mipmapMode} \text{ is } \text{VK_SAMPLER_MIPMAP_MODE_NEAREST}, \text{ then the level selected is } d = d_i.

If the sampler’s \text{mipmapMode} \text{ is } \text{VK_SAMPLER_MIPMAP_MODE_LINEAR}, \text{ two neighboring levels are selected:}

\[
\begin{align*}
d_{hi} &= \lfloor d_i \rfloor \\
d_{lo} &= \min(d_{hi} + 1, \text{level}_{\text{base}} + q) \\
\delta &= d_i - d_{hi}
\end{align*}
\]

\(\delta\) is the fractional value, quantized to the number of \text{mipmap precision bits}, used for \text{linear filtering} between levels.

### 16.5.8. (s,t,r,q,a) to (u,v,w,a) Transformation

The normalized texel coordinates are scaled by the image level dimensions and the array layer is selected.

This transformation is performed once for each level used in \text{filtering} (either \(d\), or \(d_{hi}\) and \(d_{lo}\)).

\[
\begin{align*}
u(x, y) &= s(x, y) \times \text{width}_{\text{scale}} + \Delta_i \\
v(x, y) &= \begin{cases} 0 & \text{for 1D images} \\
t(x, y) \times \text{height}_{\text{scale}} + \Delta_j & \text{otherwise}
\end{cases} \\
w(x, y) &= \begin{cases} 0 & \text{for 2D or Cube images} \\
r(x, y) \times \text{depth}_{\text{scale}} + \Delta_k & \text{otherwise}
\end{cases} \\
a(x, y) &= \begin{cases} a(x, y) & \text{for array images} \\
0 & \text{otherwise}
\end{cases}
\end{align*}
\]

where:

\[
\begin{align*}
\text{width}_{\text{scale}} &= \text{width}_{\text{level}} \\
\text{height}_{\text{scale}} &= \text{height}_{\text{level}} \\
\text{depth}_{\text{scale}} &= \text{depth}_{\text{level}}
\end{align*}
\]

for conventional images, and:
width_{scale} = \text{width}_{level} - 1

height_{scale} = \text{height}_{level} - 1

depth_{scale} = \text{depth}_{level} - 1

for corner-sampled images.

and where \( (\Delta_x, \Delta_y, \Delta_z) \) are taken from the image instruction if it includes a ConstOffset or Offset operand, otherwise they are taken to be zero.

Operations then proceed to Unnormalized Texel Coordinate Operations.

### 16.6. Unnormalized Texel Coordinate Operations

#### 16.6.1. \((u,v,w,a)\) to \((i,j,k,l,n)\) Transformation and Array Layer Selection

The unnormalized texel coordinates are transformed to integer texel coordinates relative to the selected mipmap level.

The layer index \( l \) is computed as:

\[
l = \text{clamp}(\text{RNE}(a), 0, \text{layerCount} - 1) + \text{baseArrayLayer}
\]

where \text{layerCount} is the number of layers in the image subresource range of the image view, \text{baseArrayLayer} is the first layer from the subresource range, and where:

\[
\text{RNE}(a) = \begin{cases} 
\text{roundTiesToEven}(a) & \text{preferred, from IEEE Std 754-2008 Floating-Point Arithmetic} \\
\lfloor a + 0.5 \rfloor & \text{alternative}
\end{cases}
\]

The sample index \( n \) is assigned the value 0.

Nearest filtering (VK_FILTER_NEAREST) computes the integer texel coordinates that the unnormalized coordinates lie within:

\[
i = \lfloor u + \text{shift} \rfloor \\
j = \lfloor v + \text{shift} \rfloor \\
k = \lfloor w + \text{shift} \rfloor
\]

where:

\[
\text{shift} = 0.0
\]

for conventional images, and:
shift = 0.5
for corner-sampled images.

Linear filtering (VK_FILTER_LINEAR) computes a set of neighboring coordinates which bound the unnormalized coordinates. The integer texel coordinates are combinations of $i_0$ or $i_1$, $j_0$ or $j_1$, $k_0$ or $k_1$, as well as weights $\alpha$, $\beta$, and $\gamma$.

\[
\begin{align*}
    i_0 &= \lfloor u - shift \rfloor \\
    i_1 &= i_0 + 1 \\
    j_0 &= \lfloor v - shift \rfloor \\
    j_1 &= j_0 + 1 \\
    k_0 &= \lfloor w - shift \rfloor \\
    k_1 &= k_0 + 1
\end{align*}
\]

\[
\begin{align*}
    \alpha &= \text{frac} (u - shift) \\
    \beta &= \text{frac} (v - shift) \\
    \gamma &= \text{frac} (w - shift)
\end{align*}
\]

where:

\[
\begin{align*}
    \text{shift} &= 0.5 \\
    \text{for conventional images, and:}
\end{align*}
\]

\[
\begin{align*}
    \text{shift} &= 0.0 \\
    \text{for corner-sampled images, and where:}
\end{align*}
\]

\[
\begin{align*}
    \text{frac} (x) &= x - \lfloor x \rfloor
\end{align*}
\]

where the number of fraction bits retained is specified by \texttt{VkPhysicalDeviceLimits::subTexelPrecisionBits}.

Cubic filtering (VK_FILTER_CUBIC_EXT) computes a set of neighboring coordinates which bound the unnormalized coordinates. The integer texel coordinates are combinations of $i_0$, $i_1$, $i_2$, or $i_3$, $j_0$, $j_1$, $j_2$, or $j_3$, $k_0$, $k_1$, $k_2$, or $k_3$, as well as weights $\alpha$, $\beta$, and $\gamma$.

\[
\begin{align*}
    i_0 &= \lfloor u - \frac{3}{2} \rfloor \\
    i_1 &= i_0 + 1 \\
    i_2 &= i_1 + 1 \\
    i_3 &= i_2 + 1 \\
    j_0 &= \lfloor v - \frac{3}{2} \rfloor \\
    j_1 &= j_0 + 1 \\
    j_2 &= j_1 + 1 \\
    j_3 &= j_2 + 1 \\
    k_0 &= \lfloor w - \frac{3}{2} \rfloor \\
    k_1 &= k_0 + 1 \\
    k_2 &= k_1 + 1 \\
    k_3 &= k_2 + 1
\end{align*}
\]
\[
\alpha = \text{frac} \left( u - \frac{1}{2} \right)
\]
\[
\beta = \text{frac} \left( v - \frac{1}{2} \right)
\]
\[
\gamma = \text{frac} \left( w - \frac{1}{2} \right)
\]

where:
\[
\text{frac} \left( x \right) = x - \lfloor x \rfloor
\]

where the number of fraction bits retained is specified by \text{VkPhysicalDeviceLimits}::\text{subTexelPrecisionBits}.

16.7. Integer Texel Coordinate Operations

Integer texel coordinate operations \textbf{may} supply a LOD which texels are to be read from or written to using the optional SPIR-V operand \textit{Lod}. If the \textit{Lod} is provided then it \textbf{must} be an integer.

The image level selected is:

\[
d = \text{level}_{base} + \begin{cases} 
\text{Lod} & \text{(from optional SPIR-V operand)} \\
0 & \text{otherwise}
\end{cases}
\]

If \(d\) does not lie in the range \([\text{baseMipLevel}, \text{baseMipLevel} + \text{levelCount})\) or \(d\) is less than \(\text{minLodInteger}_{\text{imageView}}\), then any values fetched are zero if the \text{robustImageAccess2} feature is enabled, otherwise are undefined, and any writes (if supported) are discarded.

16.8. Image Sample Operations

16.8.1. Wrapping Operation

If the used sampler was created without \text{VK_SAMPLER_CREATE_NON_SEAMLESS_CUBE_MAP_BIT_EXT}, Cube images ignore the wrap modes specified in the sampler. Instead, if \text{VK_FILTER_NEAREST} is used within a mip level then \text{VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE} is used, and if \text{VK_FILTER_LINEAR} is used within a mip level then sampling at the edges is performed as described earlier in the \text{Cube map edge handling} section.

The first integer texel coordinate \(i\) is transformed based on the \text{addressModeU} parameter of the sampler.
where:

\[
\text{mirror}(n) = \begin{cases} 
  n & \text{for } n \geq 0 \\
  -(1 + n) & \text{otherwise}
\end{cases}
\]

\(j\) (for 2D and Cube image) and \(k\) (for 3D image) are similarly transformed based on the \text{addressModeV} and \text{addressModeW} parameters of the sampler, respectively.

### 16.8.2. Texel Gathering

SPIR-V instructions with \texttt{Gather} in the name return a vector derived from 4 texels in the base level of the image view. The rules for the \texttt{VK_FILTER_LINEAR} minification filter are applied to identify the four selected texels. Each texel is then converted to an RGBA value according to conversion to RGBA and then \texttt{swizzled}. A four-component vector is then assembled by taking the component indicated by the \texttt{Component} value in the instruction from the swizzled color value of the four texels. If the operation does not use the \texttt{ConstOffsets} image operand then the four texels form the 2\(\times\)2 rectangle used for texture filtering:

\[
\begin{align*}
\tau[R] &= \tau_{i0j1}[\text{level}_\text{base},\text{comp}] \\
\tau[G] &= \tau_{i1j1}[\text{level}_\text{base},\text{comp}] \\
\tau[B] &= \tau_{i1j0}[\text{level}_\text{base},\text{comp}] \\
\tau[A] &= \tau_{i0j0}[\text{level}_\text{base},\text{comp}]
\end{align*}
\]

If the operation does use the \texttt{ConstOffsets} image operand then the offsets allow a custom filter to be defined:

\[
\begin{align*}
\tau[R] &= \tau_{i0j0} + \Delta_0[\text{level}_\text{base},\text{comp}] \\
\tau[G] &= \tau_{i0j0} + \Delta_1[\text{level}_\text{base},\text{comp}] \\
\tau[B] &= \tau_{i0j0} + \Delta_2[\text{level}_\text{base},\text{comp}] \\
\tau[A] &= \tau_{i0j0} + \Delta_3[\text{level}_\text{base},\text{comp}]
\end{align*}
\]

where:

\[
\tau[\text{level}_\text{base},\text{comp}] = \begin{cases} 
  \tau[\text{level}_\text{base},R], & \text{for } \text{comp} = 0 \\
  \tau[\text{level}_\text{base},G], & \text{for } \text{comp} = 1 \\
  \tau[\text{level}_\text{base},B], & \text{for } \text{comp} = 2 \\
  \tau[\text{level}_\text{base},A], & \text{for } \text{comp} = 3
\end{cases}
\]

\(\text{comp}\) from SPIR-V operand Component
**OpImage*Gather must** not be used on a sampled image with **sampler Y’C_bC_r conversion** enabled.

If \( \text{level}_{\text{base}} < \text{minLodInteger}_{\text{imageView}} \), then any values fetched are zero if **robustImageAccess2** is enabled. Otherwise values are undefined.

### 16.8.3. Texel Filtering

Texel filtering is first performed for each level (either \( d \) or \( d_{hi} \) and \( d_{lo} \)).

If \( \lambda \) is less than or equal to zero, the texture is said to be **magnified**, and the filter mode within a mip level is selected by the **magFilter** in the sampler. If \( \lambda \) is greater than zero, the texture is said to be **minified**, and the filter mode within a mip level is selected by the **minFilter** in the sampler.

#### Texel Nearest Filtering

Within a mip level, **VK_FILTER_NEAREST** filtering selects a single value using the \((i, j, k)\) texel coordinates, with all texels taken from layer \( l \).

\[
\tau[\text{level}] = \begin{cases} 
\tau_{i,j,k}[\text{level}], & \text{for 3D image} \\
\tau_{i,j}[\text{level}], & \text{for 2D or Cube image} \\
\tau_{i}[\text{level}], & \text{for 1D image}
\end{cases}
\]

#### Texel Linear Filtering

Within a mip level, **VK_FILTER_LINEAR** filtering combines 8 (for 3D), 4 (for 2D or Cube), or 2 (for 1D) texel values, together with their linear weights. The linear weights are derived from the fractions computed earlier:

\[
\begin{align*}
\omega_{i_0} &= (1 - \alpha) \\
\omega_{i_1} &= \alpha \\
\omega_{j_0} &= (1 - \beta) \\
\omega_{j_1} &= \beta \\
\omega_{k_0} &= (1 - \gamma) \\
\omega_{k_1} &= \gamma
\end{align*}
\]

The values of multiple texels, together with their weights, are combined to produce a filtered value.

The **VkSamplerReductionModeCreateInfo::reductionMode** can control the process by which multiple texels, together with their weights, are combined to produce a filtered texture value.

When the **reductionMode** is set (explicitly or implicitly) to **VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE**, a weighted average is computed:
\[ \tau_{3D} = \sum_{k=k_0}^{k_1} \sum_{j=j_0}^{j_1} \sum_{i=i_0}^{i_1} (w_i)(w_j)(w_k)\tau_{ijk} \]
\[ \tau_{2D} = \sum_{j=j_0}^{j_1} \sum_{i=i_0}^{i_1} (w_i)(w_j)\tau_{ij} \]
\[ \tau_{1D} = \sum_{i=i_0}^{i_1} (w_i)\tau_i \]

However, if the reduction mode is `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX`, the process operates on the above set of multiple texels, together with their weights, computing a component-wise minimum or maximum, respectively, of the components of the set of texels with non-zero weights.

**Texel Cubic Filtering**

Within a mip level, `VK_FILTER_CUBIC_EXT`, filtering computes a weighted average of 64 (for 3D), 16 (for 2D), or 4 (for 1D) texel values, together with their Catmull-Rom, Zero Tangent Cardinal, B-Spline, or Mitchell-Netravali weights as specified by `VkSamplerCubicWeightsCreateInfoQCOM`.

Catmull-Rom weights specified by `VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM` are derived from the fractions computed earlier.

\[
\begin{bmatrix}
  w_{i_0} & w_{i_1} & w_{i_2} & w_{i_3}
\end{bmatrix} = \frac{1}{2} \begin{bmatrix}
  1 & \alpha & \alpha^2 & \alpha^3
\end{bmatrix} \begin{bmatrix}
  0 & 2 & 0 & 0 \\
  -1 & 0 & 1 & 0 \\
  2 & -5 & 4 & -1 \\
  -1 & 3 & -3 & 1
\end{bmatrix}
\]

\[
\begin{bmatrix}
  w_{j_0} & w_{j_1} & w_{j_2} & w_{j_3}
\end{bmatrix} = \frac{1}{2} \begin{bmatrix}
  1 & \beta & \beta^2 & \beta^3
\end{bmatrix} \begin{bmatrix}
  0 & 2 & 0 & 0 \\
  -1 & 0 & 1 & 0 \\
  2 & -5 & 4 & -1 \\
  -1 & 3 & -3 & 1
\end{bmatrix}
\]

\[
\begin{bmatrix}
  w_{k_0} & w_{k_1} & w_{k_2} & w_{k_3}
\end{bmatrix} = \frac{1}{2} \begin{bmatrix}
  1 & \gamma & \gamma^2 & \gamma^3
\end{bmatrix} \begin{bmatrix}
  0 & 2 & 0 & 0 \\
  -1 & 0 & 1 & 0 \\
  2 & -5 & 4 & -1 \\
  -1 & 3 & -3 & 1
\end{bmatrix}
\]

Zero Tangent Cardinal weights specified by `VK_CUBIC_FILTER_WEIGHTS_ZERO_TANGENT_CARDINAL_QCOM` are derived from the fractions computed earlier.
B-Spline weights specified by `VK_CUBIC_FILTER_WEIGHTS_B_SPLINE_QCOM` are derived from the fractions computed earlier.

\[
\begin{bmatrix}
  w_0 & w_1 & w_2 & w_3
\end{bmatrix} = \frac{1}{2} \begin{bmatrix}
  1 & \alpha & \alpha^2 & \alpha^3
\end{bmatrix}
\]

\[
\begin{bmatrix}
  0 & 2 & 0 & 0 \\
  4 & -4 & 2 & -2 \\
  -2 & 2 & -2 & 1
\end{bmatrix}
\]

\[
\begin{bmatrix}
  w_{j_0} & w_{j_1} & w_{j_2} & w_{j_3}
\end{bmatrix} = \frac{1}{2} \begin{bmatrix}
  1 & \beta & \beta^2 & \beta^3
\end{bmatrix}
\]

\[
\begin{bmatrix}
  0 & 2 & 0 & 0 \\
  4 & -4 & 2 & -2 \\
  -2 & 2 & -2 & 1
\end{bmatrix}
\]

\[
\begin{bmatrix}
  w_{k_0} & w_{k_1} & w_{k_2} & w_{k_3}
\end{bmatrix} = \frac{1}{2} \begin{bmatrix}
  1 & \gamma & \gamma^2 & \gamma^3
\end{bmatrix}
\]

\[
\begin{bmatrix}
  0 & 2 & 0 & 0 \\
  4 & -4 & 2 & -2 \\
  -2 & 2 & -2 & 1
\end{bmatrix}
\]

Mitchell-Netravali weights specified by `VK_CUBIC_FILTER_WEIGHTS_MITCHELL_NETRAVALI_QCOM` are derived from the fractions computed earlier.

\[
\begin{bmatrix}
  w_0 & w_1 & w_2 & w_3
\end{bmatrix} = \frac{1}{3} \begin{bmatrix}
  1 & \alpha & \alpha^2 & \alpha^3
\end{bmatrix}
\]

\[
\begin{bmatrix}
  1 & 4 & 1 & 0 \\
  3 & -6 & 3 & 0 \\
  -1 & 3 & -3 & 1
\end{bmatrix}
\]

\[
\begin{bmatrix}
  w_{j_0} & w_{j_1} & w_{j_2} & w_{j_3}
\end{bmatrix} = \frac{1}{3} \begin{bmatrix}
  1 & \beta & \beta^2 & \beta^3
\end{bmatrix}
\]

\[
\begin{bmatrix}
  1 & 4 & 1 & 0 \\
  3 & -6 & 3 & 0 \\
  -1 & 3 & -3 & 1
\end{bmatrix}
\]

\[
\begin{bmatrix}
  w_{k_0} & w_{k_1} & w_{k_2} & w_{k_3}
\end{bmatrix} = \frac{1}{3} \begin{bmatrix}
  1 & \gamma & \gamma^2 & \gamma^3
\end{bmatrix}
\]

\[
\begin{bmatrix}
  1 & 4 & 1 & 0 \\
  3 & -6 & 3 & 0 \\
  -1 & 3 & -3 & 1
\end{bmatrix}
\]

The values of multiple texels, together with their weights, are combined to produce a filtered value.

The `VkSamplerReductionModeCreateInfo::reductionMode` can control the process by which multiple texels, together with their weights, are combined to produce a filtered texture value.
When the `reductionMode` is set (explicitly or implicitly) to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE` or `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM`, a weighted average is computed:

\[
\tau_{3D} = \sum_{k=j_0}^{k_3} \sum_{j=j_0}^{j_3} \sum_{i=i_0}^{i_3} (w_i)(w_j)(w_k)\tau_{ijk}
\]
\[
\tau_{2D} = \sum_{j=j_0}^{j_3} \sum_{i=i_0}^{i_3} (w_i)(w_j)\tau_{ij}
\]
\[
\tau_{1D} = \sum_{i=i_0}^{i_3} (w_i)\tau_{i}
\]

However, if the reduction mode is `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX`, the process operates on the above set of multiple texels, together with their weights, computing a component-wise minimum or maximum, respectively, of the components of the set of texels with non-zero weights.

**Texel Range Clamp**

When the `reductionMode` is set to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM`, the weighted average is clamped to be within the component-wise minimum and maximum of the set of texels with non-zero weights.

**Texel Mipmap Filtering**

`VK_SAMPLER_MIPMAP_MODE_NEAREST` filtering returns the value of a single mipmap level, \(\tau = \tau[d]\).

`VK_SAMPLER_MIPMAP_MODE_LINEAR` filtering combines the values of multiple mipmap levels (\(\tau[hi]\) and \(\tau[lo]\)), together with their linear weights.

The linear weights are derived from the fraction computed earlier:

\[
w_{hi} = (1 - \delta)
\]
\[
w_{lo} = (\delta)
\]

The values of multiple mipmap levels, together with their weights, are combined to produce a final filtered value.

The `VkSamplerReductionModeCreateInfo::reductionMode` can control the process by which multiple texels, together with their weights, are combined to produce a filtered texture value.

When the `reductionMode` is set (explicitly or implicitly) to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, a weighted average is computed:

\[
\tau = (w_{hi})\tau[hi] + (w_{lo})\tau[lo]
\]
However, if the reduction mode is `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX`, the process operates on the above values, together with their weights, computing a component-wise minimum or maximum, respectively, of the components of the values with non-zero weights.

**Texel Anisotropic Filtering**

Anisotropic filtering is enabled by the `anisotropyEnable` in the sampler. When enabled, the image filtering scheme accounts for a degree of anisotropy.

The particular scheme for anisotropic texture filtering is implementation-dependent. Implementations *should* consider the `magFilter`, `minFilter` and `mipmapMode` of the sampler to control the specifics of the anisotropic filtering scheme used. In addition, implementations *should* consider `minLod` and `maxLod` of the sampler.

**Note**

For historical reasons, vendor implementations of anisotropic filtering interpret these sampler parameters in different ways, particularly in corner cases such as `magFilter`, `minFilter` of NEAREST or `maxAnisotropy` equal to 1.0. Applications should not expect consistent behavior in such cases, and should use anisotropic filtering only with parameters which are expected to give a quality improvement relative to LINEAR filtering.

The following describes one particular approach to implementing anisotropic filtering for the 2D Image case; implementations *may* choose other methods:

Given a `magFilter`, `minFilter` of `VK_FILTER_LINEAR` and a `mipmapMode` of `VK_SAMPLER_MIPMAP_MODE_NEAREST`:

Instead of a single isotropic sample, N isotropic samples are sampled within the image footprint of the image level d to approximate an anisotropic filter. The sum $\tau_{2D \text{aniso}}$ is defined using the single isotropic $\tau_{2D}(u,v)$ at level d.

$$
\tau_{2D \text{aniso}} = \frac{1}{N} \sum_{i=1}^{N} \tau_{2D} \left( u\left(x - \frac{1}{2} + \frac{i}{N+1}, y\right), v\left(x - \frac{1}{2} + \frac{i}{N+1}, y\right) \right), \quad \text{when } \rho_x > \rho_y
$$

$$
\tau_{2D \text{aniso}} = \frac{1}{N} \sum_{i=1}^{N} \tau_{2D} \left( u\left(x, y - \frac{1}{2} + \frac{i}{N+1} \right), v\left(x, y - \frac{1}{2} + \frac{i}{N+1} \right) \right), \quad \text{when } \rho_y \geq \rho_x
$$

When `VkSamplerReductionModeCreateInfo::reductionMode` is set to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, the above summation is used. However, if the reduction mode is `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX`, the process operates on the above values, together with their weights, computing a component-wise minimum or maximum, respectively, of the components of the values with non-zero weights.

### 16.9. Texel Footprint Evaluation

The SPIR-V instruction `OpImageSampleFootprintNV` evaluates the set of texels from a single mip level that would be accessed during a texel filtering operation. In addition to the inputs that would be
accepted by an equivalent `OpImageSample*` instruction, `OpImageSampleFootprintNV` accepts two additional inputs. The **Granularity** input is an integer identifying the size of texel groups used to evaluate the footprint. Each bit in the returned footprint mask corresponds to an aligned block of texels whose size is given by the following table:

Table 29. Texel footprint granularity values

<table>
<thead>

</tr>
</tbody>
</table>

The **Coarse** input is used to select between the two mip levels that may be accessed during texel filtering when using a `mipmapMode` of `VK_SAMPLER_MIPMAP_MODE_LINEAR`. When filtering between two mip levels, a `Coarse` value of `true` requests the footprint in the lower-resolution mip level (higher level number), while `false` requests the footprint in the higher-resolution mip level. If texel filtering would access only a single mip level, the footprint in that level would be returned when `Coarse` is set to `false`; an empty footprint would be returned when `Coarse` is set to `true`.

The footprint for `OpImageSampleFootprintNV` is returned in a structure with six members:

- The first member is a boolean value that is true if the texel filtering operation would access only a single mip level.
- The second member is a two- or three-component integer vector holding the footprint anchor location. For two-dimensional images, the returned components are in units of eight texel groups. For three-dimensional images, the returned components are in units of four texel groups.
- The third member is a two- or three-component integer vector holding a footprint offset relative to the anchor. All returned components are in units of texel groups.
• The fourth member is a two-component integer vector mask, which holds a bitfield identifying the set of texel groups in an 8x8 or 4x4x4 neighborhood relative to the anchor and offset.

• The fifth member is an integer identifying the mip level containing the footprint identified by the anchor, offset, and mask.

• The sixth member is an integer identifying the granularity of the returned footprint.

For footprints in two-dimensional images (Dim2D), the mask returned by \texttt{OpImageSampleFootprintNV} indicates whether each texel group in a 8x8 local neighborhood of texel groups would have one or more texels accessed during texel filtering. In the mask, the texel group with local group coordinates \((lgx, lgy)\) is considered covered if and only if

\[
0 \neq ((mask.x + (mask.y<<32))&(1<<(lgy \times 8+lgx))
\]

where:

• \(0 \leq lgx<8\) and \(0 \leq lgy<8\); and

• \(mask\) is the returned two-component mask.

The local group with coordinates \((lgx, lgy)\) in the mask is considered covered if and only if the texel filtering operation would access one or more texels \(\tau_{ij}\) in the returned mip level where:

\[
i0 = \begin{cases} 
\text{gran}.x \times (8 \times \text{anchor}.x + lgx), & \text{if } lgx + offset.x<8 \\
\text{gran}.x \times (8 \times (\text{anchor}.x - 1) + lgx), & \text{otherwise}
\end{cases} \\
i1 = i0 + \text{gran}.x - 1
\]

\[
j0 = \begin{cases} 
\text{gran}.y \times (8 \times \text{anchor}.y + lgy), & \text{if } lgy + offset.y<8 \\
\text{gran}.y \times (8 \times (\text{anchor}.y - 1) + lgy), & \text{otherwise}
\end{cases} \\
j1 = j0 + \text{gran}.y - 1
\]

and

• \(i0 \leq i \leq i1\) and \(j0 \leq j \leq j1\);

• \(\text{gran}\) is a two-component vector holding the width and height of the texel group identified by the granularity;

• \(\text{anchor}\) is the returned two-component anchor vector; and

• \(\text{offset}\) is the returned two-component offset vector.

For footprints in three-dimensional images (Dim3D), the mask returned by \texttt{OpImageSampleFootprintNV} indicates whether each texel group in a 4x4x4 local neighborhood of texel groups would have one or more texels accessed during texel filtering. In the mask, the texel group with local group coordinates \((lgx, lgy, lgz)\), is considered covered if and only if:

\[
0 \neq ((mask.x + (mask.y<<32))&(1<<(lgz \times 16+lgy \times 4+lgx))
\]

where:

• \(0 \leq lgx<4\), \(0 \leq lgy<4\), and \(0 \leq lgz<4\); and
• **mask** is the returned two-component mask.

The local group with coordinates \((lgx, lgy, lgz)\) in the mask is considered covered if and only if the texel filtering operation would access one or more texels \(t_{ijk}\) in the returned mip level where:

\[
\begin{align*}
i_0 &= \begin{cases} 
gran_x \times (4 \times \text{anchor}_x + lgx), & \text{if } lgx + offset_x < 4 \\
gran_x \times (4 \times (\text{anchor}_x - 1) + lgx), & \text{otherwise} \end{cases} \\
i_1 &= i_0 + \gran_x - 1 \\
j_0 &= \begin{cases} 
gran_y \times (4 \times \text{anchor}_y + lgy), & \text{if } lgy + offset_y < 4 \\
gran_y \times (4 \times (\text{anchor}_y - 1) + lgy), & \text{otherwise} \end{cases} \\
j_1 &= j_0 + \gran_y - 1 \\
k_0 &= \begin{cases} 
gran_z \times (4 \times \text{anchor}_z + lgz), & \text{if } lgz + offset_z < 4 \\
gran_z \times (4 \times (\text{anchor}_z - 1) + lgz), & \text{otherwise} \end{cases} \\
k_1 &= k_0 + \gran_z - 1
\end{align*}
\]

and

• \(i_0 \leq i \leq i_1, j_0 \leq j \leq j_1, k_0 \leq k \leq k_1\);

• \(\gran\) is a three-component vector holding the width, height, and depth of the texel group identified by the granularity;

• \(\text{anchor}\) is the returned three-component anchor vector; and

• \(offset\) is the returned three-component offset vector.

If the sampler used by \texttt{OpImageSampleFootprintNV} enables anisotropic texel filtering via \texttt{anisotropyEnable}, it is possible that the set of texel groups accessed in a mip level may be too large to be expressed using an 8x8 or 4x4x4 mask using the granularity requested in the instruction. In this case, the implementation uses a texel group larger than the requested granularity. When a larger texel group size is used, \texttt{OpImageSampleFootprintNV} returns an integer granularity value that can be interpreted in the same manner as the granularity value provided to the instruction to determine the texel group size used. If anisotropic texel filtering is disabled in the sampler, or if an anisotropic footprint can be represented as an 8x8 or 4x4x4 mask with the requested granularity, \texttt{OpImageSampleFootprintNV} will use the requested granularity as-is and return a granularity value of zero.

\texttt{OpImageSampleFootprintNV} supports only two- and three-dimensional image accesses (\texttt{Dim2D} and \texttt{Dim3D}), and the footprint returned is undefined if a sampler uses an addressing mode other than \texttt{VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE}.

### 16.10. Weight Image Sampling

The SPIR-V instruction \texttt{OpImageWeightedSampleQCOM} specifies a texture sampling operation involving two images: the \textit{sampled image} and the \textit{weight image}. It is similar to bilinear filtering except more than 2x2 texels may participate in the filter and the filter weights are user-specified rather than computed by fixed-function hardware. The weight image view defines a 2D kernel weights used during sampling.
The `OpImageWeightedSampleQCOM` support normalized or unnormalized texel coordinates. In addition to the inputs that would be accepted by an equivalent `OpImageSample*` instruction, `OpImageWeightedSampleQCOM` accepts a `weight` input that specifies the view of a sample weight image.

The input `weight` must be a view of a 2D or 1D image with `miplevels` equal to 1, `samples` equal to `VK_SAMPLE_COUNT_1_BIT`, created with an identity swizzle, and created with `usage` that includes `VK_IMAGE_USAGE_SAMPLE_WEIGHT_BIT_QCOM`. The `VkImageViewSampleWeightCreateInfoQCOM` specifies additional parameters of the view: `filterCenter`, `filterSize`, and `numPhases`, described in more detail below.

The `weight` input must be bound using a `sample weight image` descriptor type. The `weight` view defines a filtering kernel that is a region of view's subresource range. The kernel spans a region from integer texel coordinate (0,0) to `(filterSize.x-1, filterSize.y-1)`. It is valid for the view's subresource to have dimensions larger than the kernel but the texels with integer coordinates greater than `(filterSize.width-1, filterSize.height-1)` are ignored by weight sampling. The value returned by queries `OpImageQuerySize`, `OpImageQuerySizeLod`, `OpImageQueryLevels`, and `OpImageQuerySamples` return for a weight image is undefined.

`filterCenter` designates an integer texel coordinate within the filter kernel as being the 'center' of the kernel. The center must be in the range (0,0) to `(filterSize.x-1, filterSize.y-1)`. `numPhases` describes the number of filter phases used to provide sub-pixel filtering. Both are described in more detail below.

### 16.10.1. Weight Image Layout

The weight image specifies filtering kernel weight values. A 2D image view can be used to specify a 2D matrix of filter weights. For separable filters, a 1D image view can be used to specify the horizontal and vertical weights.

#### 2D Non-Separable Weight Filters

A 2D image view defined with `VkImageViewSampleWeightCreateInfoQCOM` describes a 2D matrix `(filterSize.width × filterSize.height)` of weight elements with filter's center point at `filterCenter`. Note that `filterSize` can be smaller than the view's subresource, but the filter will always be located starting at integer texel coordinate (0,0).

The following figure illustrates a 2D convolution filter having `filterSize` of (4,3) and `filterCenter` at (1,1).
For a 2D weight filter, the phases are stored as layers of a 2D array image. The width and height of the view’s subresource range must be less than or equal to VkPhysicalDeviceImageProcessingPropertiesQCOM::maxWeightFilterDimension. The layers are stored in horizontal phase major order. Expressed as a formula, the layer index for each filter phase is computed as:

\[
\text{layerIndex}(\text{horizPhase}, \text{vertPhase}, \text{horizPhaseCount}) = (\text{vertPhase} \times \text{horizPhaseCount}) + \text{horizPhase}
\]

1D Separable Weight Filters

A separable weight filter is a 2D filter that can be specified by two 1D filters in the x and y directions such that their product yields the 2D filter. The following example shows a 2D filter and its associated separable 1D horizontal and vertical filters.
A 1D array image view defined with `VkImageViewSampleWeightCreateInfoQCOM` and with `layerCount` equal to `2` describes a separable weight filter. The horizontal weights are specified in slice `0` and the vertical weights in slice `1`. The `filterSize` and `filterCenter` specify the size and origin of the of the horizontal and vertical filters. For many use cases, 1D separable filters can offer a performance advantage over 2D filters.

For a 1D separable weight filter, the phases are arranged into a 1D array image with two layers. The horizontal weights are stored in layer `0` and the vertical weights in layer `1`. Within each layer of the 1D array image, the weights are arranged into groups of `4`, and then arranged by phase. Expressed as a formula, the 1D texel offset for each weight within each layer is computed as:

```
// Let horizontal weights have a weightIndex of [0, filterSize.width - 1]
// Let vertical weights have a weightIndex of [0, filterSize.height - 1]
// Let phaseCount be the number of phases in either the vertical or horizontal
direction.

texelOffset(phaseIndex, weightIndex, phaseCount) = (phaseCount * 4 * (weightIndex / 4))
+ (phaseIndex * 4) + (weightIndex % 4)
```

### 16.10.2. Weight Sampling Phases

When using weight image sampling, the texture coordinates may not align with a texel center in the sampled image. In this case, the filter weights can be adjusted based on the subpixel location. This is termed “subpixel filtering” to indicate that the origin of the filter lies at a subpixel location other than the texel center. Conceptually, this means that the weight filter is positioned such that filter taps do not align with sampled texels exactly. In such a case, modified filter weights may be needed to adjust for the off-center filter taps. Unlike bilinear filtering where the subpixel weights are computed by the implementation, subpixel weight image sampling requires that the per-phase filter weights are pre-computed by the application and stored in an array where each slice of the array is a “filter phase”. The array is indexed by the implementation based on subpixel positioning. Rather than a single 2D kernel of filter weights, the application provides an array of kernels, one set of filter weights per phase.

The number of phases are restricted by following requirements, which apply to both separable and non-separable filters:

- The number of phases in the vertical direction, `phaseCount_vert`, **must** be a power of two (i.e., `1`, `2`, `4`, etc.).
- The number of phases in the horizontal direction `phaseCount_horiz`, **must** equal `phaseCount_vert`.
- The total number of phases, `phaseCount_vert` × `phaseCount_horiz`, **must** be less than or equal to `VkPhysicalDeviceImageProcessingPropertiesQCOM::maxWeightFilterPhases`.

### 16.10.3. Weight Sampler Parameters

Weight sampling requires `VkSamplerCreateInfo` `addressModeU` and `addressModeV` **must** be set to `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE` or `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER`. If `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER` is used, then the border color **must** be set to transparent.
16.10.4. Weight Sampling Operation

The 2D unnormalized texel coordinates \((u, v)\) are transformed by \(filterCenter\) to specify coordinates \(i_0, j_0\).

\[
\begin{align*}
i_0 &= \lfloor u - filterCenter_x \rfloor \\
j_0 &= \lfloor v - filterCenter_y \rfloor
\end{align*}
\]

where \(filterCenter\) is specified by \(VkImageViewSampleWeightCreateInfoQCOM::filterCenter\).

Two sets of neighboring integer 2D texel coordinates are generated. The first set is used for selecting texels from the sampled image \(\tau\) and the second set used for selecting texels from the weight image \(w\). The first set of neighboring coordinates are combinations of \(i_0\) to \(i_{filterWidth - 1}\) and \(j_0\) to \(j_{filterHeight - 1}\). The second set of neighboring coordinates are combinations of \(k_0\) to \(k_{filterWidth - 1}\) and \(l_0\) to \(l_{filterHeight - 1}\). The first and second sets each contain \((filterWidth \times filterHeight)\) pairs of \((i, j)\) and \((k, l)\) coordinates respectively.

\[
\begin{align*}
i_q^i &= filterWidth - 1 = i_0 + q \\
\{j_q^j\} &= filterHeight - 1 = j_0 + q \\
\{k_q^k\} &= filterWidth - 1 = q \\
\{l_q^l\} &= filterHeight - 1 = q
\end{align*}
\]

where \(filterWidth\) and \(filterHeight\) are specified by \(VkImageViewSampleWeightCreateInfoQCOM::filterSize\).

Each of the generated integer coordinates \((i_q, j_q)\) is transformed by texture wrapping operation, followed by integer texel coordinate validation. If any coordinate fails coordinate validation, it is a Border Texel and texel replacement is performed.

The phase index \(\psi\) is computed from the fraction bits of the unnormalized 2D texel coordinates:

\[
\begin{align*}
phaseCount_h &= phaseCount_v = \sqrt{\text{numPhases}} \\
hPhase &= \lfloor \text{frac} (u) \times phaseCount_h \rfloor \\
vPhase &= \lfloor \text{frac} (v) \times phaseCount_v \rfloor \\
\psi &= (vPhase \times phaseCount_h) + hPhase
\end{align*}
\]

where the number of fraction bits retained is \(\log_2(\text{numPhases})\) specified by \(VkImageViewSampleWeightCreateInfoQCOM::numPhases\).

Each pair of texel coordinates \((i, j)\) in the first set selects a single texel value \(\tau_{ij}\) from the sampled image. Each pair of texel coordinates \((k, l)\) in the second set, combined with phaseIndex \(\psi\), selects a
single weight from the weight image \( w(k, l, \psi) \).

\[
w(k, l, \psi) = \begin{cases} 
  w_{k\psi} & (\psi \text{ as layer index}) \quad \text{for 2D array view (non-separable filter)} \\
  weight_h \times weight_v & \text{for 1D array view (separable filter)}
\end{cases}
\]

If \( w \) is a 2D array view, then non-separable filtering is specified, and integer coordinates \((k, l)\) are used to select texels from layer \( \psi \) of \( w \). If \( w \) is a 1D array view, then separable filtering is specified and integer coordinates \((k, l)\) are transformed to \((k_{\text{packed}}, l_{\text{packed}})\), and used to select horizontal weight \( weight_h \) and vertical weight \( weight_v \) texels from layer 0 and layer 1 of \( w \) respectively.

\[
k_{\text{packed}} = (\text{phaseCount}_h \times 4 \times [k / 4]) + (h\text{Phase} \times 4) + (k \% 4)
\]

\[
l_{\text{packed}} = (\text{phaseCount}_v \times 4 \times [l / 4]) + (v\text{Phase} \times 4) + (l \% 4)
\]

\[
weight_h = w_{k_{\text{packed}}}[0] \quad \text{(horizontal weights packed in layer 0)}
\]

\[
weight_v = w_{l_{\text{packed}}}[1] \quad \text{(vertical weights packed in layer 1)}
\]

Where \( \% \) refers to the integer modulo operator.

The values of multiple texels, together with their weights, are combined to produce a filtered value.

\[
\tau_{\text{weightSampling}} = \sum_{j = j_0}^{j_{\text{blockHeight}} - 1} \sum_{l = l_0}^{l_{\text{blockHeight}} - 1} \sum_{i = i_0}^{i_{\text{blockWidth}} - 1} \sum_{k = k_0}^{k_{\text{blockWidth}} - 1} w(k, l, \psi) \tau_{i,j}
\]

When \( \text{VkSamplerReductionModeCreateInfo::reductionMode} \) is set to \( \text{VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE} \), the above summation is used. However, if the reduction mode is \( \text{VK_SAMPLER_REDUCTION_MODE_MIN} \) or \( \text{VK_SAMPLER_REDUCTION_MODE_MAX} \), the process operates on the above values, computing a component-wise minimum or maximum of the texels with non-zero weights. If the reduction mode is \( \text{VK_SAMPLER_REDUCTION_MODE_MIN} \) or \( \text{VK_SAMPLER_REDUCTION_MODE_MAX} \), each \( w(k, l, \psi) \) weight must be equal to 0.0 or 1.0, otherwise the undefined values are returned.

Finally, the operations described in Conversion to RGBA and Component swizzle are performed and the final result is returned to the shader.

### 16.11. Block Matching

The SPIR-V instruction \text{opImageBlockMatchSAD} \text{ and } \text{opImageBlockMatchSSD} \text{ specify texture block matching operations where a block or region of texels within a target image is compared with a same-sized region a reference image. The instructions make use of two image views: the target view and the reference view. The target view and reference view can be the same view, allowing block matching of two blocks within a single image.}

Similar to an equivalent \text{OpImageFetch} instruction, \text{opImageBlockMatchSAD} \text{ and } \text{opImageBlockMatchSSD} \text{ specify an image and an integer texel coordinate which which describes the bottom-left texel of the target block. There are three additional inputs. The reference and refCoodinate specifies bottom-left
texel of the reference block. The \texttt{blockSize} specifies the integer width and height of the target and reference blocks to be compared, and \textbf{must} not be greater than \emph{VkPhysicalDeviceImageProcessingPropertiesQCOM}\_maxBlockMatchRegion.

\texttt{opImageBlockMatchWindowSAD} and \texttt{opImageBlockMatchWindowSSD} take the same input parameters as the corresponding non-window instructions. The block matching comparison is performed for all pixel values within a 2D window whose dimensions are specified in the sampler.

### 16.11.1. Block Matching Sampler Parameters

For \texttt{opImageBlockMatchSAD} and \texttt{opImageBlockMatchSSD}, the input \texttt{sampler} \textbf{must} be created with \texttt{addressModeU} and \texttt{addressModeV}, equal to \texttt{VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE}, or \texttt{VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER} with \texttt{VK_BORDER_COLOR_FLOAT_TRANSPARENT_BLACK}. The input \texttt{sampler} \textbf{must} be created with \texttt{unnormalizedCoordinates} equal to \texttt{VK_TRUE}. The input \texttt{sampler} \textbf{must} be created with \texttt{components} equal to \texttt{VK_COMPONENT_SWIZZLE_IDENTITY}.

For \texttt{opImageBlockMatchWindowSAD} and \texttt{opImageBlockMatchWindowSSD} instructions, the \textbf{target} \texttt{sampler} \textbf{must} have been created with \texttt{VkSamplerBlockMatchWindowCreateInfoQCOM} in the \texttt{pNext} chain.

For \texttt{opImageBlockMatchWindowSAD}, \texttt{opImageBlockMatchWindowSSD}, \texttt{opImageBlockMatchGatherSAD}, or \texttt{opImageBlockMatchGatherSSD} instructions, the input \texttt{sampler} \textbf{must} be created with \texttt{addressModeU} and \texttt{addressModeV}, equal to \texttt{VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER} with \texttt{VK_BORDER_COLOR_FLOAT_TRANSPARENT_BLACK}.

Other sampler states are ignored.

### 16.11.2. Block Matching Operation

Block matching SPIR-V instructions \texttt{opImageBlockMatchSAD} and \texttt{opImageBlockMatchSSD} specify two sets of 2D integer texel coordinates: target coordinates \((u, v)\) and reference coordinates \((s, t)\).

The coordinates define the bottom-left texel of the target block \((i_0, j_0)\) and the reference block \((k_0, l_0)\).

\[
\begin{align*}
i_0 &= u \\
j_0 &= v \\
k_0 &= s \\
l_0 &= t
\end{align*}
\]

For the target block, a set of neighboring integer texel coordinates are generated. The neighboring coordinates are combinations of \(i_0\) to \(i_{\text{blockWidth} - 1}\) and \(j_0\) to \(j_{\text{blockHeight} - 1}\). The set is of size \(\text{blockWidth} \times \text{blockHeight}\).

\[
\begin{align*}
\{i_q\}^q &= \text{blockWidth} - 1 \\
= i_0 + q \\
\{j_q\}^q &= \text{blockHeight} - 1 \\
= j_0 + q
\end{align*}
\]

where \texttt{blockWidth} and \texttt{blockHeight} is specified by the \texttt{blockSize} operand.
If any target integer texel coordinate \((i, j)\) in the set fails integer texel coordinate validation, then the texel is an invalid texel and texel replacement is performed.

Similarly for the reference block, a set of neighboring integer texel coordinates are generated.

\[
\begin{align*}
\{k_q\} & = \text{blockWidth} - 1 = k_0 + q \\
\{l_q\} & = \text{blockHeight} - 1 = l_0 + q
\end{align*}
\]

Each reference texel coordinate \((k, l)\) in the set must not fail integer texel coordinate validation. To avoid undefined behavior, application shader should guarantee that the reference block is fully within the bounds of the reference image.

Each pair of texel coordinates \((i, j)\) in the set selects a single texel value from the target image \(\tau_{ij}\). Each pair of texel coordinates \((k, l)\) in the set selects a single texel value from the reference image \(v_{kl}\).

The difference between target and reference texel values is summed to compute a difference metric. The \texttt{opTextureBlockMatchSAD} computes the sum of absolute differences.

\[
\tau_{SAD} = \sum_{j = j_0}^{\text{blockHeight} - 1} \sum_{i = i_0}^{\text{blockWidth} - 1} |v_{kl} - \tau_{ij}|
\]

The \texttt{opImageBlockMatchSSD} computes the sum of the squared differences.

\[
\tau_{SSD} = \sum_{j = j_0}^{\text{blockHeight} - 1} \sum_{i = i_0}^{\text{blockWidth} - 1} |v_{kl} - \tau_{ij}|^2
\]

When \texttt{VkSamplerReductionModeCreateInfo::reductionMode} is set to \texttt{VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE}, the above summation is used. However, if the reduction mode is \texttt{VK_SAMPLER_REDUCTION_MODE_MIN} or \texttt{VK_SAMPLER_REDUCTION_MODE_MAX}, the process operates on the above values, computing a component-wise minimum or maximum of \(|v_{kl} - \tau_{ij}|\), respectively. For \(\tau_{SAD}\), the minimum or maximum difference is computed and for \(\tau_{SSD}\), the square of the minimum or maximum is computed.

Finally, the operations described in Conversion to RGBA and Component swizzle are performed and the final result is returned to the shader. The component swizzle is specified by the target image descriptor; any swizzle specified by the reference image descriptor is ignored.

**Block Matching Window Operation**

Window block matching SPIR-V instructions \texttt{opImageBlockMatchWindowSAD} and \texttt{opImageBlockMatchWindowSSD} specify two sets of 2D integer texel coordinates: target coordinates \((u, v)\) and reference coordinates \((s, t)\). The block matching operation is performed repeatedly, for multiple
sets of target integer coordinates within the specified window. These instructions effectively search a region or “window” within the target texture and identify the window coordinates where the minimum or maximum error metric is found. These instructions only support single component image formats.

The target coordinates are combinations of coordinates from \((u, v)\) to \((u + \text{windowWidth} - 1, v + \text{windowHeight} - 1)\) where \(\text{windowHeight}\) and \(\text{windowWidth}\) are specified by \text{VkSamplerBlockMatchWindowCreateInfoQCOM}::\text{windowExtent}. At each each target coordinate, a block matching operation is performed, resulting in a difference metric. The reference coordinate \((s, t)\) is fixed. The block matching operation is repeated \(\text{windowWidth} \times \text{windowHeight}\) times.

The resulting minimum or maximum error is returned in the R component of the output. The integer window coordinates \((x, y)\) are returned in the G and B components of the output. The A component is 0. The minimum or maximum behavior is selected by \text{VkSamplerBlockMatchWindowCreateInfoQCOM}::\text{windowCompareMode}.

The following pseudocode describes the operation \text{opImageBlockMatchWindowSAD}. The pseudocode for \text{opImageBlockMatchWindowSSD} follows an identical pattern.

```cpp
vec4 opImageBlockMatchGatherSAD( sampler2D target,
                                  uvec2 targetCoord,
                                  samler2D reference,
                                  uvec2 refCoord,
                                  uvec2 blocksize) {
    // Two parameters are sourced from the VkSampler associated with
    // 'target':
    // compareMode (which can be either 'MIN' or 'MAX')
    // uvec2 window (which defines the search window)

    minSAD = INF;
    maxSAD = -INF;

    uvec2 minCoord;
    uvec2 maxCoord;

    for (uint x=0; x<\text{window.width}; x++) {
        for (uint y=0; y<\text{window.height}; y++) {
            float SAD = textureBlockMatchSAD(target,
                                              targetCoord + uvec2(x, y),
                                              reference,
                                              refCoord,
                                              blocksize).x;

            if (SAD < minSAD) {
                minSAD = SAD;
                minCoord = uvec2(x, y);
            }
            if (SAD > maxSAD) {
                maxSAD = SAD;
                maxCoord = uvec2(x, y);
            }
        }
    }
    return vec4(minSAD, minCoord.x, minCoord.y, 0.0);
}
```
if (compareMode == MIN) {
    return vec4(minSAD, minCoord.x, minCoord.y, 0.0);
} else {
    return vec4(maxSAD, maxCoord.x, maxCoord.y, 0.0);
}

Block Matching Gather Operation

Block matching Gather SPIR-V instructions opImageBlockMatchGatherSAD and opImageBlockMatchGatherSSD specify two sets of 2D integer texel coordinates: target coordinates \((u, v)\) and reference coordinates \((s, t)\).

These instructions perform the block matching operation 4 times, using integer target coordinates \((u, v), (u+1, v), (u+2, v),\) and \((u+3, v)\). The R component from each of those 4 operations is gathered and returned in the R, G, B, and A components of the output respectively. For each block match operation, the reference coordinate is \((s, t)\). For each block match operation, only the R component of the target and reference images are compared. The following pseudocode describes the operation opImageBlockMatchGatherSAD. The pseudocode for opImageBlockMatchGatherSSD follows an identical pattern.

```
vec4 opImageBlockMatchGatherSAD(sampler2D target, uvec2 targetCoord, sampler2D reference, uvec2 refCoord, uvec2 blocksize) {
    vec4 out;
    for (uint x=0; x<4; x++) {
        float SAD = textureBlockMatchSAD(target, targetCoord + uvec2(x, 0), reference, refCoord, blocksize).x;
        if (x == 0) {
            out.x = SAD;
        }
        if (x == 1) {
            out.y = SAD;
        }
        if (x == 2) {
            out.z = SAD;
        }
        if (x == 3) {
            out.w = SAD;
        }
    }
    return out;
}
```
16.12. Box Filter Sampling

The SPIR-V instruction `OpImageBoxFilterQCOM` specifies texture box filtering operation where a weighted average of a region of texels is computed, with the weights proportional to the coverage of each of the texels.

In addition to the inputs that would be accepted by an equivalent `OpImageSample*` instruction, `OpImageBoxFilterQCOM` accepts one additional input, `boxSize` which specifies the width and height in texels of the region to be averaged.

The figure below shows an example of using `OpImageBoxFilterQCOM` to sample from a $8 \times 4$ texel two-dimensional image, with unnormalized texture coordinates $(4.125, 2.625)$ and `boxSize` of $(2.75, 2.25)$. The filter will read 12 texel values and compute a weights based portion of each texel covered by the box.

If `boxSize` has height and width both equal to 1.0, then this instruction will behave as traditional bilinear filtering. The `boxSize` parameter must be greater than or equal to 1.0 and must not be greater than `VkPhysicalDeviceImageProcessingPropertiesQCOM.maxBoxFilterBlockSize`.

16.12.1. Box Filter Sampler Parameters

The input sampler must be created with `addressModeU` and `addressModeV`, equal to `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`, or `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER` with `VK_BORDER_COLOR_FLOAT_TRANSPARENT_BLACK`.

16.12.2. Box Filter Operation

The 2D unnormalized texel coordinates $(u, v)$ are transformed by `boxSize` to specify integer texel coordinates $(i_0, j_0)$ of the bottom left texel for the filter.
\[ i_0 = \lfloor u - \frac{\text{boxWidth}}{2} \rfloor \]
\[ j_0 = \lfloor v - \frac{\text{boxHeight}}{2} \rfloor \]

where \text{boxWidth} and \text{boxHeight} are specified by the code: (x, y) components of the \text{boxSize} operand.

The filter dimensions \((filterWidth \times filterHeight)\) are computed from the fractional portion of the \((u, v)\) coordinates and the \text{boxSize}.

\[
\text{startFracU} = \text{frac} \left( u - \frac{\text{boxWidth}}{2} \right)
\]
\[
\text{startFracV} = \text{frac} \left( v - \frac{\text{boxHeight}}{2} \right)
\]
\[
\text{endFracU} = \text{frac} \left( \text{startFracU} + \text{boxWidth} \right)
\]
\[
\text{endFracV} = \text{frac} \left( \text{startFracV} + \text{boxHeight} \right)
\]
\[
\text{filterWidth} = \lfloor \text{startFracU} + \text{boxWidth} \rfloor
\]
\[
\text{filterHeight} = \lfloor \text{startFracV} + \text{boxHeight} \rfloor
\]

where the number of fraction bits retained by \text{frac()} is specified by \text{VkPhysicalDeviceLimits::subTexelPrecisionBits}.

A set of neighboring integer texel coordinates are generated. The neighboring coordinates are combinations of \(i_0\) to \(i_{filterWidth - 1}\) and \(j_0\) to \(j_{filterHeight - 1}\), with \(i_0, j_0\) being the top-left coordinate of this set. The set is of size \((filterWidth \times filterHeight)\).

\[
\{i_q \}_{q = 0}^{filterWidth - 1} = i_0 + q
\]
\[
\{j_q \}_{q = 0}^{filterHeight - 1} = j_0 + q
\]

Each of the generated integer coordinates \((i_q, j_q)\) is transformed by \text{texture wrapping operation}, followed by \text{integer texel coordinate validation}, If any coordinate fails coordinate validation, it is a Border Texel and \text{texel replacement} is performed.

Horizontal weights \(\text{horizWeight}_0\) to \(\text{horizWeight}_{\text{boxWidth} - 1}\) and vertical weights \(\text{vertWeight}_0\) to \(\text{vertWeight}_{\text{boxHeight} - 1}\) are computed. Texels that are fully covered by the box will have a horizontal and vertical weight of 1. Texels partially covered by the box will have will have a reduced weights proportional to the coverage.

\[
\text{horizWeight}_i = \begin{cases} 
(1 - \text{startFracU}), & \text{for}(i = 0) \\
(\text{endFracU}), & \text{for}(i = \text{filterWidth} - 1)\text{and}(\text{endFracU}! = 0) \\
(1), & \text{otherwise}
\end{cases}
\]
\[ \text{vertWeight}_j = \begin{cases} 
(1 - \text{startFracV}), & \text{for } j = 0 \\
(\text{endFracV}), & \text{for } j = \text{filterHeight} - 1 \text{and } (\text{endFracV}! = 0) \\
(1), & \text{otherwise}
\end{cases} \]

The values of multiple texels, together with their horizontal and vertical weights, are combined to produce a box filtered value.

\[ \tau_{\text{boxFilter}} = \frac{1}{\text{boxHeight} \times \text{boxWidth}} \sum_{j = 0}^{\text{filterHeight} - 1} \sum_{i = 0}^{\text{filterWidth} - 1} (\text{horizWeight}_i)(\text{vertWeight}_j)\tau_{ij} \]

When \text{VkSamplerReductionModeCreateInfo::reductionMode} is set to \text{VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE}, the above summation is used. However, if the reduction mode is \text{VK_SAMPLER_REDUCTION_MODE_MIN} or \text{VK_SAMPLER_REDUCTION_MODE_MAX}, the process operates on the above values, computing a component-wise minimum or maximum of the texels.

### 16.13. Image Operation Steps

Each step described in this chapter is performed by a subset of the image instructions:

- Texel Input Validation Operations, Format Conversion, Texel Replacement, Conversion to RGBA, and Component Swizzle: Performed by all instructions except \text{OpImageWrite}.

- Depth Comparison: Performed by \text{OpImage*Dref} instructions.

- All Texel output operations: Performed by \text{OpImageWrite}.

- Projection: Performed by all \text{OpImage*Proj} instructions.

- Derivative Image Operations, Cube Map Operations, Scale Factor Operation, LOD Operation and Image Level(s) Selection, and Texel Anisotropic Filtering: Performed by all \text{OpImageSample*} and \text{OpImageSparseSample*} instructions.

- \((s,t,r,q,a)\) to \((u,v,w,a)\) Transformation, Wrapping, and \((u,v,w,a)\) to \((i,j,k,l,n)\) Transformation And Array Layer Selection: Performed by all \text{OpImageSample}, \text{OpImageSparseSample}, and \text{OpImage*Gather} instructions.

- Texel Gathering: Performed by \text{OpImage*Gather} instructions.

- Texel Footprint Evaluation: Performed by \text{OpImageSampleFootprint} instructions.

- Texel Filtering: Performed by all \text{OpImageSample*} and \text{OpImageSparseSample*} instructions.

- Sparse Residency: Performed by all \text{OpImageSparse*} instructions.

- \((s,t,r,q,a)\) to \((u,v,w,a)\) Transformation, Wrapping, and Weight Image Sampling: Performed by \text{OpImageWeightedSample*} instructions.

- \((s,t,r,q,a)\) to \((u,v,w,a)\) Transformation, Wrapping, and Block Matching: Performed by \text{opImageBlockMatch*} instructions.

- \((s,t,r,q,a)\) to \((u,v,w,a)\) Transformation, Wrapping, and Box Filter Sampling: Performed by \text{OpImageBoxFilter*} instructions.

16.14.1. Image Property Queries

OpImageQuerySize, OpImageQuerySizeLod, OpImageQueryLevels, and OpImageQuerySamples query properties of the image descriptor that would be accessed by a shader image operation. They return 0 if the bound descriptor is a null descriptor.

OpImageQuerySizeLod returns the size of the image level identified by the Level of Detail operand. If that level does not exist in the image, and the descriptor is not null, then the value returned is undefined.

16.14.2. Lod Query

OpImageQueryLod returns the Lod parameters that would be used in an image operation with the given image and coordinates. If the descriptor that would be accessed is a null descriptor then (0,0) is returned. Otherwise, the steps described in this chapter are performed as if for OpImageSampleImplicitLod, up to Scale Factor Operation, LOD Operation and Image Level(s) Selection. The return value is the vector ($\lambda'$, $d_l$). These values may be subject to implementation-specific maxima and minima for very large, out-of-range values.
Chapter 17. Fragment Density Map Operations

17.1. Fragment Density Map Operations Overview

When a fragment is generated in a render pass that has a fragment density map attachment, its area is determined by the properties of the local framebuffer region that the fragment occupies. The framebuffer is divided into a uniform grid of these local regions, and their fragment area property is derived from the density map with the following operations:

- Fetch density value
  - Component swizzle
  - Component mapping
- Fragment area conversion
  - Fragment area filter
  - Fragment area clamp

17.2. Fetch Density Value

Each local framebuffer region at center coordinate \((x,y)\) fetches a texel from the fragment density map.

First, the local framebuffer region center coordinate \((x,y)\) is offset by the value specified in `VkSubpassFragmentDensityMapOffsetEndInfoQCOM`. If no offset is specified, then the default offset \((0,0)\) is used. The offsetted coordinate \((x',y')\) is computed as follows:

\[
x' = \text{clamp}\left(x + p\text{FragmentDensityOffsets}[\text{layer}]_x, 0, \text{framebuffer}_{\text{width}} - 1\right)
\]

\[
y' = \text{clamp}\left(y + p\text{FragmentDensityOffsets}[\text{layer}]_y, 0, \text{framebuffer}_{\text{height}} - 1\right)
\]

The offsetted coordinate \((x',y')\) fetches a texel from the fragment density map at integer coordinates:

\(0.5,0.95){i = \left\lfloor \frac{x'}{\text{fragmentDensityTexelSize}_{\text{width}}} \right\rfloor}

\(0.5,0.96){j = \left\lfloor \frac{y'}{\text{fragmentDensityTexelSize}_{\text{height}}} \right\rfloor}

Where the size of each region in the framebuffer is:

\[
\text{fragmentDensityTexelSize}_{\text{width}} = 2^{\left\lceil \log_2\left(\frac{\text{framebuffer}_{\text{width}}}{\text{fragmentDensityMap}_{\text{width}}}\right) \right\rceil}
\]
This region is subject to the limits in `VkPhysicalDeviceFragmentDensityMapPropertiesEXT` and therefore the final region size is clamped:

\[
\text{fragmentDensityTexelSize}^\text{height} = 2^{\left\lceil \log_2 \left( \frac{\text{framebufferHeight}}{\text{FragmentDensityMapHeight}} \right) \right\rceil}
\]

When multiview is enabled for the render pass and the fragment density map attachment view was created with `layerCount` greater than 1, the layer used for offsets and for fetching from the fragment density map is:

\[
\text{layer} = \text{baseArrayLayer} + \text{ViewIndex}
\]

Otherwise:

\[
\text{layer} = \text{baseArrayLayer}
\]

The texel fetched from the density map at \((i,j,\text{layer})\) is next converted to density with the following operations.

### 17.2.1. Component Swizzle

The `components` member of `VkImageViewCreateInfo` is applied to the fetched texel as defined in Image component swizzle.

### 17.2.2. Component Mapping

The swizzled texel’s components are mapped to a density value:

\[
\text{densityValue}_{xy} = (C \cdot r, C \cdot g)
\]

### 17.3. Fragment Area Conversion

Fragment area for the framebuffer region is undefined if the density fetched is not a normalized floating-point value greater than 0.0. Otherwise, the fetched fragment area for that region is derived as:

\[
\text{fragmentArea}_{wh} = \frac{1.0}{\text{densityValue}_{xy}}
\]
17.3.1. Fragment Area Filter

Optional, the implementation may fetch additional density map texels in an implementation defined window around (i,j). The texels follow the standard conversion steps up to and including fragment area conversion.

A single fetched fragment area for the framebuffer region is chosen by the implementation and must have an area between the min and max areas of the fetched set.

17.3.2. Fragment Area Clamp

The implementation may clamp the fetched fragment area to one that it supports. The clamped fragment area must have a size less than or equal to the original fetched value. Implementations may vary the supported set of fragment areas per framebuffer region. Fragment area (1,1) must always be in the supported set.

Note

For example, if the fetched fragment area is (1,4) but the implementation only supports areas of {(1,1),(2,2)}, it could choose to clamp the area to (2,2) since it has the same size as (1,4). While this would produce fragments that have lower quality strictly in the x-axis, the overall density is maintained.

The clamped fragment area is assigned to the corresponding framebuffer region.
Chapter 18. Queries

Queries provide a mechanism to return information about the processing of a sequence of Vulkan commands. Query operations are asynchronous, and as such, their results are not returned immediately. Instead, their results, and their availability status are stored in a Query Pool. The state of these queries can be read back on the host, or copied to a buffer object on the device.

The supported query types are Occlusion Queries, Pipeline Statistics Queries, Result Status Queries, Video Encode Feedback Queries and Timestamp Queries. Performance Queries are supported if the associated extension is available. Transform Feedback Queries are supported if the associated extension is available. Intel Performance Queries are supported if the associated extension is available. Mesh Shader Queries are supported if the associated extension is available.

Several additional queries with specific purposes associated with ray tracing are available if the corresponding extensions are supported, as described for VkQueryType.

18.1. Query Pools

Queries are managed using query pool objects. Each query pool is a collection of a specific number of queries of a particular type.

Query pools are represented by VkQueryPool handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkQueryPool)
```

To create a query pool, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateQueryPool(
    VkDevice device, // device is the logical device that creates the query pool.
    const VkQueryPoolCreateInfo* pCreateInfo, // pCreateInfo is a pointer to a VkQueryPoolCreateInfo structure containing the number and type of queries to be managed by the pool.
    const VkAllocationCallbacks* pAllocator, // pAllocator controls host memory allocation as described in the Memory Allocation chapter.
    VkQueryPool* pQueryPool // pQueryPool is a pointer to a VkQueryPool handle in which the resulting query pool object is returned.
);
```

Valid Usage (Implicit)

- VUID-vkCreateQueryPool-device-parameter

1515
device must be a valid VkDevice handle

- VUID-vkCreateQueryPool-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkQueryPoolCreateInfo structure

- VUID-vkCreateQueryPool-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateQueryPool-pQueryPool-parameter
  pQueryPool must be a valid pointer to a VkQueryPool handle

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkQueryPoolCreateInfo structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkQueryPoolCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkQueryPoolCreateFlags flags;
    VkQueryType queryType;
    uint32_t queryCount;
    VkQueryPipelineStatisticFlags pipelineStatistics;
} VkQueryPoolCreateInfo;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is reserved for future use.
- queryType is a VkQueryType value specifying the type of queries managed by the pool.
- queryCount is the number of queries managed by the pool.
- pipelineStatistics is a bitmask of VkQueryPipelineStatisticFlagBits specifying which counters will be returned in queries on the new pool, as described below in Pipeline Statistics Queries.

pipelineStatistics is ignored if queryType is not VK_QUERY_TYPE_PIPELINE_STATISTICS.
Valid Usage

• VUID-VkQueryPoolCreateInfo-queryType-00791
  If the pipelineStatisticsQuery feature is not enabled, queryType must not be VK_QUERY_TYPE_PIPELINE_STATISTICS

• VUID-VkQueryPoolCreateInfo-meshShaderQueries-07068
  If the meshShaderQueries feature is not enabled, queryType must not be VK_QUERY_TYPE_MESH_PRIMITIVES_GENERATED_EXT

• VUID-VkQueryPoolCreateInfo-meshShaderQueries-07069
  If the meshShaderQueries feature is not enabled, and queryType is VK_QUERY_TYPE_PIPELINE_STATISTICS, pipelineStatistics must not contain VK_QUERY_PIPELINE_STATISTIC_TASK_SHADER_INVOCATIONS_BIT_EXT or VK_QUERY_PIPELINE_STATISTIC_MESH_SHADER_INVOCATIONS_BIT_EXT

• VUID-VkQueryPoolCreateInfo-queryType-00792
  If queryType is VK_QUERY_TYPE_PIPELINE_STATISTICS, pipelineStatistics must be a valid combination of VkQueryPipelineStatisticFlagBits values

• VUID-VkQueryPoolCreateInfo-queryType-09534
  If queryType is VK_QUERY_TYPE_PIPELINE_STATISTICS, pipelineStatistics must not be zero

• VUID-VkQueryPoolCreateInfo-queryType-03222
  If queryType is VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, the pNext chain must include a VkQueryPoolPerformanceCreateInfoKHR structure

• VUID-VkQueryPoolCreateInfo-queryCount-02763
  queryCount must be greater than 0

• VUID-VkQueryPoolCreateInfo-queryType-07133
  If queryType is VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR, then the pNext chain must include a VkVideoProfileInfoKHR structure with videoCodecOperation specifying an encode operation

• VUID-VkQueryPoolCreateInfo-queryType-07906
  If queryType is VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR, then the pNext chain must include a VkQueryPoolVideoEncodeFeedbackCreateInfoKHR structure

• VUID-VkQueryPoolCreateInfo-queryType-07907
  If queryType is VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR, and the pNext chain includes a VkVideoProfileInfoKHR structure and a VkQueryPoolVideoEncodeFeedbackCreateInfoKHR structure, then VkQueryPoolVideoEncodeFeedbackCreateInfoKHR::encodeFeedbackFlags must not contain any bits that are not set in VkVideoEncodeCapabilitiesKHR::supportedEncodeFeedbackFlags, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile described by VkVideoProfileInfoKHR and its pNext chain

Valid Usage (Implicit)

• VUID-VkQueryPoolCreateInfo-sType-sType
sType must be VK_STRUCTURE_TYPE_QUERY_POOL_CREATE_INFO

- **VUID-VkQueryPoolCreateInfo-pNext-pNext**
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkQueryPoolPerformanceCreateInfoKHR, VkQueryPoolPerformanceQueryCreateInfoINTEL, VkQueryPoolVideoEncodeFeedbackCreateInfoKHR, VkVideoDecodeAV1ProfileInfoKHR, VkVideoDecodeH264ProfileInfoKHR, VkVideoDecodeH265ProfileInfoKHR, or VkVideoProfileInfoKHR

- **VUID-VkQueryPoolCreateInfo-sType-unique**
  The sType value of each struct in the pNext chain must be unique

- **VUID-VkQueryPoolCreateInfo-flags-zerobitmask**
  flags must be 0

- **VUID-VkQueryPoolCreateInfo-queryType-parameter**
  queryType must be a valid VkQueryType value

---

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkQueryPoolCreateFlags;
```

VkQueryPoolCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

The VkQueryPoolPerformanceCreateInfoKHR structure is defined as:

---

```c
// Provided by VK_KHR_performance_query
typedef struct VkQueryPoolPerformanceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t queueFamilyIndex;
    uint32_t counterIndexCount;
    const uint32_t* pCounterIndices;
} VkQueryPoolPerformanceCreateInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **queueFamilyIndex** is the queue family index to create this performance query pool for.
- **counterIndexCount** is the length of the pCounterIndices array.
- **pCounterIndices** is a pointer to an array of indices into the vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR::pCounters to enable in this performance query pool.
Valid Usage

- VUID-VkQueryPoolPerformanceCreateInfoKHR-queueFamilyIndex-03236
  queueFamilyIndex must be a valid queue family index of the device.

- VUID-VkQueryPoolPerformanceCreateInfoKHR-performanceCounterQueryPools-03237
  The performanceCounterQueryPools feature must be enabled.

- VUID-VkQueryPoolPerformanceCreateInfoKHR-pCounterIndices-03321
  Each element of pCounterIndices must be in the range of counters reported by
  vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR for the queue family
  specified in queueFamilyIndex.

Valid Usage (Implicit)

- VUID-VkQueryPoolPerformanceCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_QUERY_POOL_PERFORMANCE_CREATE_INFO_KHR.

- VUID-VkQueryPoolPerformanceCreateInfoKHR-pCounterIndices-parameter
  pCounterIndices must be a valid pointer to an array of counterIndexCount uint32_t values.

- VUID-VkQueryPoolPerformanceCreateInfoKHR-counterIndexCount-arraylength
  counterIndexCount must be greater than 0.

To query the number of passes required to query a performance query pool on a physical device, call:

```c
// Provided by VK_KHR_performance_query
void vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR(
    VkPhysicalDevice physicalDevice,
    const VkQueryPoolPerformanceCreateInfoKHR* pPerformanceQueryCreateInfo,
    uint32_t* pNumPasses);
```

- physicalDevice is the handle to the physical device whose queue family performance query
  counter properties will be queried.

- pPerformanceQueryCreateInfo is a pointer to a VkQueryPoolPerformanceCreateInfoKHR of the
  performance query that is to be created.

- pNumPasses is a pointer to an integer related to the number of passes required to query the
  performance query pool, as described below.

The pPerformanceQueryCreateInfo member VkQueryPoolPerformanceCreateInfoKHR::queueFamilyIndex
must be a queue family of physicalDevice. The number of passes required to capture the counters
specified in the pPerformanceQueryCreateInfo member VkQueryPoolPerformanceCreateInfoKHR
::pCounters is returned in pNumPasses.
Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR-pPerformanceQueryCreateInfo-parameter
  pPerformanceQueryCreateInfo must be a valid pointer to a valid VkQueryPoolPerformanceCreateInfoKHR structure
- VUID-vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR-pNumPasses-parameter
  pNumPasses must be a valid pointer to a uint32_t value

To destroy a query pool, call:

```c
// Provided by VK_VERSION_1_0
def void vkDestroyQueryPool(
    VkDevice device,  
    VkQueryPool queryPool, 
    const VkAllocationCallbacks* pAllocator);
```

- device is the logical device that destroys the query pool.
- queryPool is the query pool to destroy.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyQueryPool-queryPool-00793
  All submitted commands that refer to queryPool must have completed execution
- VUID-vkDestroyQueryPool-queryPool-00794
  If VkAllocationCallbacks were provided when queryPool was created, a compatible set of callbacks must be provided here
- VUID-vkDestroyQueryPool-queryPool-00795
  If no VkAllocationCallbacks were provided when queryPool was created, pAllocator must be NULL

Note

Applications can verify that queryPool can be destroyed by checking that vkGetQueryPoolResults() without the VK_QUERY_RESULT_PARTIAL_BIT flag returns VK_SUCCESS for all queries that are used in command buffers submitted for execution.
Valid Usage (Implicit)

- **VUID-vkDestroyQueryPool-device-parameter**
  *device* must be a valid *VkDevice* handle

- **VUID-vkDestroyQueryPool-queryPool-parameter**
  If *queryPool* is not *VK_NULL_HANDLE*, *queryPool* must be a valid *VkQueryPool* handle

- **VUID-vkDestroyQueryPool-pAllocator-parameter**
  If *pAllocator* is not *NULL*, *pAllocator* must be a valid pointer to a valid *VkAllocationCallbacks* structure

- **VUID-vkDestroyQueryPool-queryPool-parent**
  If *queryPool* is a valid handle, it must have been created, allocated, or retrieved from *device*

Host Synchronization

- Host access to *queryPool* must be externally synchronized

Possible values of *VkQueryPoolCreateInfo::queryType*, specifying the type of queries managed by the pool, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkQueryType {
    VK_QUERY_TYPE_OCCLUSION = 0,
    VK_QUERY_TYPE_PIPELINE_STATISTICS = 1,
    VK_QUERY_TYPE_TIMESTAMP = 2,
    // Provided by VK_KHR_video_queue
    VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR = 1000023000,
    // Provided by VK_EXT_transform_feedback
    VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT = 1000028004,
    // Provided by VK_KHR_performance_query
    VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR = 1000116000,
    // Provided by VK_KHR_acceleration_structure
    VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR = 1000150000,
    // Provided by VK_KHR_acceleration_structure
    VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR = 1000150001,
    // Provided by VK_NV_ray_tracing
    VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_NV = 1000165000,
    // Provided by VK_INTEL_performance_query
    VK_QUERY_TYPE_PERFORMANCE_QUERY_INTEL = 1000210000,
    // Provided by VK_KHR_video_encode_queue
    VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR = 1000299000,
    // Provided by VK_EXT_mesh_shader
    VK_QUERY_TYPE_MESH_PRIMITIVES_GENERATED_EXT = 1000328000,
    // Provided by VK_EXT_primitives_generated_query
    VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT = 1000382000,
    // Provided by VK_KHR_ray_tracing_maintenance
    VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR = 1000150000
};
```
• VK_QUERY_TYPE_OCCLUSION specifies an occlusion query.
• VK_QUERY_TYPE_PIPELINE_STATISTICS specifies a pipeline statistics query.
• VK_QUERY_TYPE_TIMESTAMP specifies a timestamp query.
• VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR specifies a performance query.
• VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT specifies a transform feedback query.
• VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT specifies a primitives generated query.
• VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR specifies an acceleration structure size query for use with `vkCmdWriteAccelerationStructuresPropertiesKHR` or `vkWriteAccelerationStructuresPropertiesKHR`.
• VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR specifies an acceleration structure size query for use with `vkCmdWriteAccelerationStructuresPropertiesKHR` or `vkWriteAccelerationStructuresPropertiesKHR`.
• VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR specifies a serialization acceleration structure pointer count query.
• VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_NV specifies an acceleration structure size query for use with `vkCmdWriteAccelerationStructuresPropertiesNV`.
• VK_QUERY_TYPE_PERFORMANCE_QUERY_INTEL specifies an Intel performance query.
• VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR specifies a result status query.
• VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR specifies a video encode feedback query.
• VK_QUERY_TYPE_MESH_PRIMITIVES_GENERATED_EXT specifies a generated mesh primitives query.

18.2. Query Operation

The operation of queries is controlled by the commands `vkCmdBeginQuery`, `vkCmdEndQuery`, `vkCmdBeginQueryIndexedEXT`, `vkCmdEndQueryIndexedEXT`, `vkCmdResetQueryPool`, `vkCmdCopyQueryPoolResults`, `vkCmdWriteTimestamp2`, and `vkCmdWriteTimestamp`.

In order for a `VkCommandBuffer` to record query management commands, the queue family for which its `VkCommandPool` was created must support the appropriate type of operations (graphics, compute) suitable for the query type of a given query pool.
Each query in a query pool has a status that is either **unavailable** or **available**, and also has state to store the numerical results of a query operation of the type requested when the query pool was created. Resetting a query via `vkCmdResetQueryPool` or `vkResetQueryPool` sets the status to unavailable and makes the numerical results undefined. A query is made available by the operation of `vkCmdEndQuery`, `vkCmdEndQueryIndexedEXT`, `vkCmdWriteTimestamp2`, or `vkCmdWriteTimestamp`. Both the availability status and numerical results can be retrieved by calling either `vkGetQueryPoolResults` or `vkCmdCopyQueryPoolResults`.

After query pool creation, each query is in an uninitialized state and **must** be reset before it is used. Queries **must** also be reset between uses.

If a logical device includes multiple physical devices, then each command that writes a query **must** execute on a single physical device, and any call to `vkCmdBeginQuery` **must** execute the corresponding `vkCmdEndQuery` command on the same physical device.

To reset a range of queries in a query pool on a queue, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdResetQueryPool(
    VkCommandBuffer commandBuffer,
    VkQueryPool queryPool,
    uint32_t firstQuery,
    uint32_t queryCount);
```

- **commandBuffer** is the command buffer into which this command will be recorded.
- **queryPool** is the handle of the query pool managing the queries being reset.
- **firstQuery** is the initial query index to reset.
- **queryCount** is the number of queries to reset.

When executed on a queue, this command sets the status of query indices `[firstQuery, firstQuery + queryCount - 1]` to unavailable.

This command defines an execution dependency between other query commands that reference the same query.

The first synchronization scope includes all commands which reference the queries in `queryPool` indicated by `firstQuery` and `queryCount` that occur earlier in submission order.

The second synchronization scope includes all commands which reference the queries in `queryPool` indicated by `firstQuery` and `queryCount` that occur later in submission order.

The operation of this command happens after the first scope and happens before the second scope.

If the **queryType** used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, this command sets the status of query indices `[firstQuery, firstQuery + queryCount - 1]` to unavailable for each pass of `queryPool`, as indicated by a call to `vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR`.
Because `vkCmdResetQueryPool` resets all the passes of the indicated queries, applications must not record a `vkCmdResetQueryPool` command for a `queryPool` created with `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` in a command buffer that needs to be submitted multiple times as indicated by a call to `vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR`. Otherwise applications will never be able to complete the recorded queries.

**Valid Usage**

- VUID-vkCmdResetQueryPool-firstQuery-09436
  firstQuery **must** be less than the number of queries in `queryPool`

- VUID-vkCmdResetQueryPool-firstQuery-09437
  The sum of firstQuery and queryCount **must** be less than or equal to the number of queries in `queryPool`

- VUID-vkCmdResetQueryPool-None-02841
  All queries used by the command **must** not be active

- VUID-vkCmdResetQueryPool-firstQuery-02862
  If `queryPool` was created with `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, this command **must** not be recorded in a command buffer that, either directly or through secondary command buffers, also contains begin commands for a query from the set of queries \([firstQuery, firstQuery + queryCount - 1]\)

**Valid Usage (Implicit)**

- VUID-vkCmdResetQueryPool-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdResetQueryPool-queryPool-parameter
  `queryPool` **must** be a valid `VkQueryPool` handle

- VUID-vkCmdResetQueryPool-commandBuffer-recording
  `commandBuffer` **must** be in the recording state

- VUID-vkCmdResetQueryPool-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, compute, decode, encode, or optical flow operations

- VUID-vkCmdResetQueryPool-renderpass
  This command **must** only be called outside of a render pass instance

- VUID-vkCmdResetQueryPool-videocoding
  This command **must** only be called outside of a video coding scope

- VUID-vkCmdResetQueryPool-commonparent
  Both of `commandBuffer`, and `queryPool` **must** have been created, allocated, or retrieved from the same `VkDevice`
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>

To reset a range of queries in a query pool on the host, call:

```c
// Provided by VK_VERSION_1_2
void vkResetQueryPool(
    VkDevice device, 
    VkQueryPool queryPool, 
    uint32_t firstQuery, 
    uint32_t queryCount);
```

or the equivalent command

```c
// Provided by VK_EXT_host_query_reset
void vkResetQueryPoolEXT(
    VkDevice device, 
    VkQueryPool queryPool, 
    uint32_t firstQuery, 
    uint32_t queryCount);
```

- `device` is the logical device that owns the query pool.
- `queryPool` is the handle of the query pool managing the queries being reset.
- `firstQuery` is the initial query index to reset.
- `queryCount` is the number of queries to reset.

This command sets the status of query indices `[firstQuery, firstQuery + queryCount - 1]` to unavailable.

If `queryPool` is `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` this command sets the status of query indices
Valid Usage

- VUID-vkResetQueryPool-firstQuery-09436  
  \textit{firstQuery} must be less than the number of queries in \textit{queryPool}  

- VUID-vkResetQueryPool-firstQuery-09437  
  The sum of \textit{firstQuery} and \textit{queryCount} must be less than or equal to the number of queries in \textit{queryPool}  

- VUID-vkResetQueryPool-None-02665  
  The \textit{hostQueryReset} feature must be enabled  

- VUID-vkResetQueryPool-firstQuery-02741  
  Submitted commands that refer to the range specified by \textit{firstQuery} and \textit{queryCount} in \textit{queryPool} must have completed execution  

- VUID-vkResetQueryPool-firstQuery-02742  
  The range of queries specified by \textit{firstQuery} and \textit{queryCount} in \textit{queryPool} must not be in use by calls to \textit{vkGetQueryPoolResults} or \textit{vkResetQueryPool} in other threads  

Valid Usage (Implicit)

- VUID-vkResetQueryPool-device-parameter  
  \textit{device} must be a valid \textit{VkDevice} handle  

- VUID-vkResetQueryPool-queryPool-parameter  
  \textit{queryPool} must be a valid \textit{VkQueryPool} handle  

- VUID-vkResetQueryPool-queryPool-parent  
  \textit{queryPool} must have been created, allocated, or retrieved from \textit{device}  

Once queries are reset and ready for use, query commands can be issued to a command buffer. Occlusion queries and pipeline statistics queries count events - drawn samples and pipeline stage invocations, respectively - resulting from commands that are recorded between a \textit{vkCmdBeginQuery} command and a \textit{vkCmdEndQuery} command within a specified command buffer, effectively scoping a set of drawing and/or dispatching commands. Timestamp queries write timestamps to a query pool. Performance queries record performance counters to a query pool. A query must begin and end in the same command buffer, although if it is a primary command buffer, and the \textit{inheritedQueries} feature is enabled, it can execute secondary command buffers during the query operation. For a secondary command buffer to be executed while a query is active, it must set the \textit{occlusionQueryEnable}, \textit{queryFlags}, and/or \textit{pipelineStatistics} members of \textit{VkCommandBufferInheritanceInfo} to conservative values, as described in the \textit{Command Buffer Recording} section. A query must either begin and end inside the same subpass of a render pass instance, or must both begin and end outside of a render pass instance (i.e. contain entire render pass instances).
If queries are used while executing a render pass instance that has multiview enabled, the query uses N consecutive query indices in the query pool (starting at `query`) where N is the number of bits set in the view mask in the subpass the query is used in. How the numerical results of the query are distributed among the queries is implementation-dependent. For example, some implementations may write each view's results to a distinct query, while other implementations may write the total result to the first query and write zero to the other queries. However, the sum of the results in all the queries must accurately reflect the total result of the query summed over all views. Applications can sum the results from all the queries to compute the total result.

Queries used with multiview rendering must not span subpasses, i.e. they must begin and end in the same subpass.

A query must either begin and end inside the same video coding scope, or must both begin and end outside of a video coding scope and must not contain entire video coding scopes.

To begin a query, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdBeginQuery(
    VkCommandBuffer commandBuffer,
    VkQueryPool queryPool,
    uint32_t query,
    VkQueryControlFlags flags);
```

- `commandBuffer` is the command buffer into which this command will be recorded.
- `queryPool` is the query pool that will manage the results of the query.
- `query` is the query index within the query pool that will contain the results.
- `flags` is a bitmask of `VkQueryControlFlagBits` specifying constraints on the types of queries that can be performed.

If the `queryType` of the pool is `VK_QUERY_TYPE_OCCLUSION` and `flags` contains `VK_QUERY_CONTROL_PRECISE_BIT`, an implementation must return a result that matches the actual number of samples passed. This is described in more detail in Occlusion Queries.

Calling `vkCmdBeginQuery` is equivalent to calling `vkCmdBeginQueryIndexedEXT` with the `index` parameter set to zero.

After beginning a query, that query is considered active within the command buffer it was called in until that same query is ended. Queries active in a primary command buffer when secondary command buffers are executed are considered active for those secondary command buffers.

Furthermore, if the query is started within a video coding scope, the following command buffer states are initialized for the query type:

- The `active_query_index` is set to the value specified by `query`.
- The `last activatable query index` is also set to the value specified by `query`.

Each video coding operation stores a result to the query corresponding to the current active query.
index, followed by incrementing the active query index. If the active query index gets incremented past the last activatable query index, issuing any further video coding operations results in undefined behavior.

**Note**
In practice, this means that currently no more than a single video coding operation must be issued between a begin and end query pair.

This command defines an execution dependency between other query commands that reference the same query.

The first synchronization scope includes all commands which reference the queries in `queryPool` indicated by `query` that occur earlier in submission order.

The second synchronization scope includes all commands which reference the queries in `queryPool` indicated by `query` that occur later in submission order.

The operation of this command happens after the first scope and happens before the second scope.

---

### Valid Usage

- **VUID-vkCmdBeginQuery-None-00807**
  All queries used by the command must be unavailable

- **VUID-vkCmdBeginQuery-queryType-02804**
  The `queryType` used to create `queryPool` must not be `VK_QUERY_TYPE_TIMESTAMP`

- **VUID-vkCmdBeginQuery-queryType-04728**
  The `queryType` used to create `queryPool` must not be `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR` or `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR`

- **VUID-vkCmdBeginQuery-queryType-06741**
  The `queryType` used to create `queryPool` must not be `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR` or `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR`

- **VUID-vkCmdBeginQuery-queryType-04729**
  The `queryType` used to create `queryPool` must not be `VK.QueryType_ACCELERATION_STRUCTURE_COMPACTED_SIZE_NV`

- **VUID-vkCmdBeginQuery-queryType-00800**
  If the occlusionQueryPrecise feature is not enabled, or the `queryType` used to create `queryPool` was not `VK_QUERY_TYPE_OCCLUSION`, flags must not contain `VK_QUERY_CONTROL_PRECISE_BIT`

- **VUID-vkCmdBeginQuery-query-00802**
  `query` must be less than the number of queries in `queryPool`

- **VUID-vkCmdBeginQuery-queryType-00803**
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_OCCLUSION`, the `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PIPELINE_STATISTICS` and any of the `pipelineStatistics` indicate graphics operations, the `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PIPELINE_STATISTICS` and any of the `pipelineStatistics` indicate compute operations, the `VkCommandPool` that `commandBuffer` was allocated from must support compute operations.

`commandBuffer` must not be a protected command buffer.

If called within a render pass instance, the sum of `query` and the number of bits set in the current subpass's view mask must be less than or equal to the number of queries in `queryPool`.

If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR`, then the `VkCommandPool` that `commandBuffer` was allocated from must have been created with a queue family index that supports result status queries, as indicated by `VkQueueFamilyQueryResultStatusPropertiesKHR::queryResultStatusSupport`.

If there is a bound video session, then there must be no active queries.

If there is a bound video session, then it must not have been created with `VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR`.

If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR` and there is a bound video session, then `queryPool` must have been created with a `VkVideoProfileInfoKHR` structure included in the `pNext` chain of `VkQueryPoolCreateInfo` identical to the one specified in `VkVideoSessionCreateInfoKHR::pVideoProfile` the bound video session was created with.

If the `queryType` used to create `queryPool` was not `VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR` or `VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR`, then there must be no bound video session.

If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR` and there is a bound video session, then `queryPool` must have been created with a `VkVideoProfileInfoKHR` structure included in the `pNext` chain of `VkQueryPoolCreateInfo` identical to the one specified in `VkVideoSessionCreateInfoKHR::pVideoProfile` the bound video session was created with.

If the `queryType` used to create `queryPool` was not `VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR`, then there must be no bound video session.

If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR` and there is a bound video session, then `queryPool` must have been created with a `VkVideoProfileInfoKHR` structure included in the `pNext` chain of `VkQueryPoolCreateInfo` identical to the one specified in `VkVideoSessionCreateInfoKHR::pVideoProfile` the bound video session was created with.
queryPool must have been created with a queryType that differs from that of any queries that are active within commandBuffer

- VUID-vkCmdBeginQuery-queryType-07070
  If the queryType used to create queryPool was VK_QUERY_TYPE_MESH_PRIMITIVES_GENERATED_EXT the VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdBeginQuery-queryType-02327
  If the queryType used to create queryPool was VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT the VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdBeginQuery-queryType-02328
  If the queryType used to create queryPool was VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT then VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackQueries must be supported

- VUID-vkCmdBeginQuery-queryType-06687
  If the queryType used to create queryPool was VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT the VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdBeginQuery-queryType-06688
  If the queryType used to create queryPool was VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT then primitivesGeneratedQuery must be enabled

- VUID-vkCmdBeginQuery-queryPool-07289
  If queryPool was created with a queryType of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, then the VkQueryPoolPerformanceCreateInfoKHR::queueFamilyIndex queryPool was created with must equal the queue family index of the VkCommandPool that commandBuffer was allocated from

- VUID-vkCmdBeginQuery-queryPool-03223
  If queryPool was created with a queryType of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, the profiling lock must have been held before vkBeginCommandBuffer was called on commandBuffer

- VUID-vkCmdBeginQuery-queryPool-03224
  If queryPool was created with a queryType of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR and one of the counters used to create queryPool was VK_PERFORMANCE COUNTER_SCOPE_COMMAND_BUFFER_KHR, the query begin must be the first recorded command in commandBuffer

- VUID-vkCmdBeginQuery-queryPool-03225
  If queryPool was created with a queryType of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR and one of the counters used to create queryPool was VK_PERFORMANCE COUNTER_SCOPE_RENDER_PASS_KHR, the begin command must not be recorded within a render pass instance

- VUID-vkCmdBeginQuery-queryPool-03226
  If queryPool was created with a queryType of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR and another query pool with a queryType VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR has been used within commandBuffer, its parent primary command buffer or secondary command buffer
recorded within the same parent primary command buffer as `commandBuffer`, the `performanceCounterMultipleQueryPools` feature must be enabled

- VUID-vkCmdBeginQuery-None-02863
  If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, this command must not be recorded in a command buffer that, either directly or through secondary command buffers, also contains a `vkCmdResetQueryPool` command affecting the same query

**Valid Usage (Implicit)**

- VUID-vkCmdBeginQuery-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdBeginQuery-queryPool-parameter
  `queryPool` must be a valid `VkQueryPool` handle

- VUID-vkCmdBeginQuery-flags-parameter
  `flags` must be a valid combination of `VkQueryControlFlagBits` values

- VUID-vkCmdBeginQuery-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdBeginQuery-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, compute, decode, or encode operations

- VUID-vkCmdBeginQuery-commonparent
  Both of `commandBuffer`, and `queryPool` must have been created, allocated, or retrieved from the same `VkDevice`

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Both</td>
<td>Graphics Compute Decode Encode</td>
<td>Action State</td>
</tr>
</tbody>
</table>
To begin an indexed query, call:

```c
// Provided by VK_EXT_transform_feedback
void vkCmdBeginQueryIndexedEXT(
    VkCommandBuffer commandBuffer,
    VkQueryPool queryPool,
    uint32_t query,
    VkQueryControlFlags flags,
    uint32_t index);
```

- **commandBuffer** is the command buffer into which this command will be recorded.
- **queryPool** is the query pool that will manage the results of the query.
- **query** is the query index within the query pool that will contain the results.
- **flags** is a bitmask of `VkQueryControlFlagBits` specifying constraints on the types of queries that can be performed.
- **index** is the query type specific index. When the query type is `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` or `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT`, the index represents the vertex stream.

The `vkCmdBeginQueryIndexedEXT` command operates the same as the `vkCmdBeginQuery` command, except that it also accepts a query type specific `index` parameter.

This command defines an execution dependency between other query commands that reference the same query index.

The first **synchronization scope** includes all commands which reference the queries in `queryPool` indicated by `query` and `index` that occur earlier in submission order.

The second **synchronization scope** includes all commands which reference the queries in `queryPool` indicated by `query` and `index` that occur later in submission order.

The operation of this command happens after the first scope and happens before the second scope.

### Valid Usage

- **VUID-vkCmdBeginQueryIndexedEXT-None-00807**
  All queries used by the command **must be unavailable**

- **VUID-vkCmdBeginQueryIndexedEXT-queryType-02804**
  The `queryType` used to create `queryPool` **must not be** `VK_QUERY_TYPE_TIMESTAMP`

- **VUID-vkCmdBeginQueryIndexedEXT-queryType-04728**
  The `queryType` used to create `queryPool` **must not be** `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR` or `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR`

- **VUID-vkCmdBeginQueryIndexedEXT-queryType-06741**
  The `queryType` used to create `queryPool` **must not be**
VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR or
VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR

- **VUID-vkCmdBeginQueryIndexedEXT-queryType-04729**
  The `queryType` used to create `queryPool` must not be
  VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_NV

- **VUID-vkCmdBeginQueryIndexedEXT-queryType-00800**
  If the `occlusionQueryPrecise` feature is not enabled, or the `queryType` used to create
  `queryPool` was not VK_QUERY_TYPE_OCCLUSION, `flags` must not contain
  VK_QUERY_CONTROL_PRECISE_BIT

- **VUID-vkCmdBeginQueryIndexedEXT-query-00802**
  query must be less than the number of queries in `queryPool`

- **VUID-vkCmdBeginQueryIndexedEXT-queryType-00803**
  If the `queryType` used to create `queryPool` was VK_QUERY_TYPE_OCCLUSION, the `VkCommandPool` that
  `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdBeginQueryIndexedEXT-queryType-00804**
  If the `queryType` used to create `queryPool` was VK_QUERY_TYPE_PIPELINE_STATISTICS and any
  of the `pipelineStatistics` indicate graphics operations, the `VkCommandPool` that
  `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdBeginQueryIndexedEXT-queryType-00805**
  If the `queryType` used to create `queryPool` was VK_QUERY_TYPE_PIPELINE_STATISTICS and any
  of the `pipelineStatistics` indicate compute operations, the `VkCommandPool` that
  `commandBuffer` was allocated from must support compute operations

- **VUID-vkCmdBeginQueryIndexedEXT-commandBuffer-01885**
  commandBuffer must not be a protected command buffer

- **VUID-vkCmdBeginQueryIndexedEXT-queryType-00808**
  If called within a render pass instance, the sum of query and the number of bits set in the
  current subpass’s view mask must be less than or equal to the number of queries in
  `queryPool`

- **VUID-vkCmdBeginQueryIndexedEXT-queryType-07126**
  If the `queryType` used to create `queryPool` was VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR, then
  the `VkCommandPool` that `commandBuffer` was allocated from must have been created with a
  queue family index that supports result status queries, as indicated by
  VkQueueFamilyQueryResultStatusPropertiesKHR::queryResultStatusSupport

- **VUID-vkCmdBeginQueryIndexedEXT-None-07127**
  If there is a bound video session, then there must be no active queries

- **VUID-vkCmdBeginQueryIndexedEXT-None-08370**
  If there is a bound video session, then it must not have been created with
  VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR

- **VUID-vkCmdBeginQueryIndexedEXT-queryType-07128**
  If the `queryType` used to create `queryPool` was VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR and
  there is a bound video session, then `queryPool` must have been created with a
  VkVideoProfileInfoKHR structure included in the pNext chain of VkQueryPoolCreateInfo identical to the one specified in VkVideoSessionCreateInfoKHR::pVideoProfile the bound
video session was created with

- `VUID-vkCmdBeginQueryIndexedEXT-queryType-07129`
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR`, then there must be a bound video session

- `VUID-vkCmdBeginQueryIndexedEXT-queryType-07130`
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR` and there is a bound video session, then `queryPool` must have been created with a `VkVideoProfileInfoKHR` structure included in the `pNext` chain of `VkQueryPoolCreateInfo` identical to the one specified in `VkVideoSessionCreateInfoKHR::pVideoProfile` the bound video session was created with

- `VUID-vkCmdBeginQueryIndexedEXT-queryType-07131`
  If the `queryType` used to create `queryPool` was not `VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR` or `VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR`, then there must be no bound video session

- `VUID-vkCmdBeginQueryIndexedEXT-queryPool-04753`
  If the `queryPool` was created with the same `queryType` as that of another active query within `commandBuffer`, then `index` must not match the index used for the active query

- `VUID-vkCmdBeginQueryIndexedEXT-queryType-02338`
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` the `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- `VUID-vkCmdBeginQueryIndexedEXT-queryType-02339`
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` the `index` parameter must be less than `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams`

- `VUID-vkCmdBeginQueryIndexedEXT-queryType-06692`
  If the `queryType` used to create `queryPool` was not `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` and not `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT`, the `index` must be zero

- `VUID-vkCmdBeginQueryIndexedEXT-queryType-06689`
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` the `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- `VUID-vkCmdBeginQueryIndexedEXT-queryType-06690`
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` the `index` parameter must be less than `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams`

- `VUID-vkCmdBeginQueryIndexedEXT-queryType-06691`
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` and the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled, the `index` parameter must be zero

- `VUID-vkCmdBeginQueryIndexedEXT-queryType-06693`
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` then `primitivesGeneratedQuery` must be enabled

- `VUID-vkCmdBeginQueryIndexedEXT-queryType-02341`
If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` then `VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackQueries` must be supported

- VUID-vkCmdBeginQueryIndexedEXT-queryType-07071
  The `queryType` used to create `queryPool` must not be `VK_QUERY_TYPE_MESH_PRIMITIVES_GENERATED_EXT`

- VUID-vkCmdBeginQueryIndexedEXT-queryPool-07289
  If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, then the `VkQueryPoolPerformanceCreateInfoKHR::queueFamilyIndex` `queryPool` was created with must equal the queue family index of the `VkCommandPool` that `commandBuffer` was allocated from

- VUID-vkCmdBeginQueryIndexedEXT-queryPool-03223
  If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, the profiling lock must have been held before `vkBeginCommandBuffer` was called on `commandBuffer`

- VUID-vkCmdBeginQueryIndexedEXT-queryPool-03224
  If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` and one of the counters used to create `queryPool` was `VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR`, the query begin must be the first recorded command in `commandBuffer`

- VUID-vkCmdBeginQueryIndexedEXT-queryPool-03225
  If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` and another query pool with a `queryType` `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` has been used within `commandBuffer`, its parent primary command buffer or secondary command buffer recorded within the same parent primary command buffer as `commandBuffer`, the `performanceCounterMultipleQueryPools` feature must be enabled

- VUID-vkCmdBeginQueryIndexedEXT-None-02863
  If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, this command must not be recorded in a command buffer that, either directly or through secondary command buffers, also contains a `vkCmdResetQueryPool` command affecting the same query

## Valid Usage (Implicit)

- VUID-vkCmdBeginQueryIndexedEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdBeginQueryIndexedEXT-queryPool-parameter
  `queryPool` must be a valid `VkQueryPool` handle
• VUID-vkCmdBeginQueryIndexedEXT-flags-parameter
  flags must be a valid combination of VkQueryControlFlagBits values

• VUID-vkCmdBeginQueryIndexedEXT-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdBeginQueryIndexedEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, compute, decode, or encode operations

• VUID-vkCmdBeginQueryIndexedEXT-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdBeginQueryIndexedEXT-commonparent
  Both of commandBuffer, and queryPool must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

• Host access to commandBuffer must be externally synchronized
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics Compute Decode Encode</td>
<td>Action State</td>
</tr>
</tbody>
</table>

Bits which can be set in vkCmdBeginQuery::flags, specifying constraints on the types of queries that can be performed, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkQueryControlFlagBits {
    VK_QUERY_CONTROL_PRECISE_BIT = 0x00000001,
} VkQueryControlFlagBits;
```

• VK_QUERY_CONTROL_PRECISE_BIT specifies the precision of occlusion queries.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkQueryControlFlags;
```
VkQueryControlFlags is a bitmask type for setting a mask of zero or more VkQueryControlFlagBits.

To end a query after the set of desired drawing or dispatching commands is executed, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdEndQuery(
    VkCommandBuffer commandBuffer,
    VkQueryPool queryPool,
    uint32_t query);
```

- commandBuffer is the command buffer into which this command will be recorded.
- queryPool is the query pool that is managing the results of the query.
- query is the query index within the query pool where the result is stored.

The command completes the query in queryPool identified by query, and marks it as available.

This command defines an execution dependency between other query commands that reference the same query.

The first synchronization scope includes all commands which reference the queries in queryPool indicated by query that occur earlier in submission order.

The second synchronization scope includes only the operation of this command.

Calling `vkCmdEndQuery` is equivalent to calling `vkCmdEndQueryIndexedEXT` with the index parameter set to zero.

### Valid Usage

- VUID-vkCmdEndQuery-None-01923
  All queries used by the command must be active
- VUID-vkCmdEndQuery-query-00810
  query must be less than the number of queries in queryPool
- VUID-vkCmdEndQuery-commandBuffer-01886
  commandBuffer must not be a protected command buffer
- VUID-vkCmdEndQuery-query-00812
  If `vkCmdEndQuery` is called within a render pass instance, the sum of query and the number of bits set in the current subpass's view mask must be less than or equal to the number of queries in queryPool
- VUID-vkCmdEndQuery-queryPool-03227
  If queryPool was created with a `queryType` of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR and one or more of the counters used to create queryPool was VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR, the `vkCmdEndQuery` must be the last recorded command in commandBuffer
- VUID-vkCmdEndQuery-queryPool-03228

1537
If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` and one or more of the counters used to create `queryPool` was `VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR`, the `vkCmdEndQuery` must not be recorded within a render pass instance.

- **VUID-vkCmdEndQuery-None-07007**
  If called within a subpass of a render pass instance, the corresponding `vkCmdBeginQuery*` command must have been called previously within the same subpass.

---

**Valid Usage (Implicit)**

- **VUID-vkCmdEndQuery-commandBuffer-parameter**
  `commandBuffer must` be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdEndQuery-queryPool-parameter**
  `queryPool must` be a valid `VkQueryPool` handle.

- **VUID-vkCmdEndQuery-commandBuffer-recording**
  `commandBuffer must` be in the `recording state`.

- **VUID-vkCmdEndQuery-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer was allocated from must` support graphics, compute, decode, or encode operations.

- **VUID-vkCmdEndQuery-commonparent**
  Both of `commandBuffer`, and `queryPool must` have been created, allocated, or retrieved from the same `VkDevice`.

---

**Host Synchronization**

- Host access to `commandBuffer must` be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer was allocated from must` be externally synchronized.

---

**Command Properties**

<table>
<thead>

</tbody>
</table>

To end an indexed query after the set of desired drawing or dispatching commands is recorded, call:
// Provided by VK_EXT_transform_feedback

```c
void vkCmdEndQueryIndexedEXT(
    VkCommandBuffer commandBuffer,
    VkQueryPool queryPool,
    uint32_t query,
    uint32_t index);
```

- `commandBuffer` is the command buffer into which this command will be recorded.
- `queryPool` is the query pool that is managing the results of the query.
- `query` is the query index within the query pool where the result is stored.
- `index` is the query type specific index.

The command completes the query in `queryPool` identified by `query` and `index`, and marks it as available.

The `vkCmdEndQueryIndexedEXT` command operates the same as the `vkCmdEndQuery` command, except that it also accepts a query type specific `index` parameter.

This command defines an execution dependency between other query commands that reference the same query index.

The first synchronization scope includes all commands which reference the queries in `queryPool` indicated by `query` that occur earlier in submission order.

The second synchronization scope includes only the operation of this command.

**Valid Usage**

- VUID-vkCmdEndQueryIndexedEXT-None-02342
  All queries used by the command must be active

- VUID-vkCmdEndQueryIndexedEXT-query-02343
  `query` must be less than the number of queries in `queryPool`

- VUID-vkCmdEndQueryIndexedEXT-commandBuffer-02344
  `commandBuffer` must not be a protected command buffer

- VUID-vkCmdEndQueryIndexedEXT-query-02345
  If `vkCmdEndQueryIndexedEXT` is called within a render pass instance, the sum of `query` and the number of bits set in the current subpass’s view mask must be less than or equal to the number of queries in `queryPool`

- VUID-vkCmdEndQueryIndexedEXT-queryType-06694
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` or `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT`, the `index` parameter must be less than `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams`

- VUID-vkCmdEndQueryIndexedEXT-queryType-06695
  If the `queryType` used to create `queryPool` was not `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` and not...
VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT, the index must be zero

• VUID-vkCmdEndQueryIndexedEXT-queryType-06696
  If the queryType used to create queryPool was VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT or VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT, index must equal the index used to begin the query

• VUID-vkCmdEndQueryIndexedEXT-None-07007
  If called within a subpass of a render pass instance, the corresponding vkCmdBeginQuery* command must have been called previously within the same subpass

Valid Usage (Implicit)

• VUID-vkCmdEndQueryIndexedEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdEndQueryIndexedEXT-queryPool-parameter
  queryPool must be a valid VkQueryPool handle

• VUID-vkCmdEndQueryIndexedEXT-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdEndQueryIndexedEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, compute, decode, or encode operations

• VUID-vkCmdEndQueryIndexedEXT-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdEndQueryIndexedEXT-commonparent
  Both of commandBuffer, and queryPool must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

</table>
An application can retrieve results either by requesting they be written into application-provided memory, or by requesting they be copied into a `VkBuffer`. In either case, the layout in memory is defined as follows:

- The first query's result is written starting at the first byte requested by the command, and each subsequent query's result begins `stride` bytes later.

- Occlusion queries, pipeline statistics queries, transform feedback queries, primitives generated queries, mesh shader queries, video encode feedback queries, and timestamp queries store results in a tightly packed array of unsigned integers, either 32- or 64-bits as requested by the command, storing the numerical results and, if requested, the availability status.

- Performance queries store results in a tightly packed array whose type is determined by the `unit` member of the corresponding `VkPerformanceCounterKHR`.

- If `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT` is used, the final element of each query's result is an integer indicating whether the query's result is available, with any non-zero value indicating that it is available.

- If `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR` is used, the final element of each query's result is an integer value indicating that status of the query result. Positive values indicate success, negative values indicate failure, and 0 indicates that the result is not yet available. Specific error codes are encoded in the `VkQueryResultStatusKHR` enumeration.

- Occlusion queries write one integer value - the number of samples passed. Pipeline statistics queries write one integer value for each bit that is enabled in the `pipelineStatistics` when the pool is created, and the statistics values are written in bit order starting from the least significant bit. Timestamp queries write one integer value. Performance queries write one `VkPerformanceCounterResultKHR` value for each `VkPerformanceCounterKHR` in the query. Transform feedback queries write two integers; the first integer is the number of primitives successfully written to the corresponding transform feedback buffer and the second is the number of primitives output to the vertex stream, regardless of whether they were successfully captured or not. In other words, if the transform feedback buffer was sized too small for the number of primitives output by the vertex stream, the first integer represents the number of primitives actually written and the second is the number that would have been written if all the transform feedback buffers associated with that vertex stream were large enough. Primitives generated queries write the number of primitives output to the vertex stream, regardless of whether transform feedback is active or not, or whether they were successfully captured by transform feedback or not. This is identical to the second integer of the transform feedback queries if transform feedback is active. Mesh shader queries write a single integer. Video encode feedback queries write one or more integer values for each bit that is enabled in `VkQueryPoolVideoEncodeFeedbackCreateInfoKHR::encodeFeedbackFlags` when the pool is created, and the feedback values are written in bit order starting from the least significant bit, as described here.

- If more than one query is retrieved and `stride` is not at least as large as the size of the array of values corresponding to a single query, the values written to memory are undefined.

To retrieve status and results for a set of queries, call:

```
// Provided by VK_VERSION_1_0
```
VkResult vkGetQueryPoolResults(
    VkDevice device,
    VkQueryPool queryPool,
    uint32_t firstQuery,
    uint32_t queryCount,
    size_t dataSize,
    void* pData,
    VkDeviceSize stride,
    VkQueryResultFlags flags);

- **device** is the logical device that owns the query pool.
- **queryPool** is the query pool managing the queries containing the desired results.
- **firstQuery** is the initial query index.
- **queryCount** is the number of queries to read.
- **dataSize** is the size in bytes of the buffer pointed to by **pData**.
- **pData** is a pointer to a user-allocated buffer where the results will be written.
- **stride** is the stride in bytes between results for individual queries within **pData**.
- **flags** is a bitmask of **VkQueryResultFlagBits** specifying how and when results are returned.

Any results written for a query are written according to a layout dependent on the query type.

If no bits are set in **flags**, and all requested queries are in the available state, results are written as an array of 32-bit unsigned integer values. Behavior when not all queries are available is described below.

If **VK_QUERY_RESULT_WITH_AVAILABILITY_BIT** is set, results for all queries in **queryPool** identified by **firstQuery** and **queryCount** are copied to **pData**, along with an extra availability or status value written directly after the results of each query and interpreted as an unsigned integer. A value of zero indicates that the results are not yet available, otherwise the query is complete and results are available. The size of the availability or status values is 64 bits if **VK_QUERY_RESULT_64_BIT** is set in **flags**. Otherwise, it is 32 bits.

If **VK_QUERY_RESULT_WITH_STATUS_BIT_KHR** is set, results for all queries in **queryPool** identified by **firstQuery** and **queryCount** are copied to **pData**, along with an extra status value written directly after the results of each query and interpreted as a signed integer. A value of zero indicates that the results are not yet available. Positive values indicate that the operations within the query completed successfully, and the query results are valid. Negative values indicate that the operations within the query completed unsuccessfully.

**VkQueryResultStatusKHR** defines specific meaning for values returned here, though implementations are free to return other values.

If the status value written is negative, indicating that the operations within the query completed unsuccessfully, then all other results written by this command are undefined unless otherwise specified for any of the results of the used query type.

**Note**
If `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT` or `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR` is set, the layout of data in the buffer is a `(result, availability)` or `(result, status)` pair for each query returned, and `stride` is the stride between each pair.

Results for any available query written by this command are final and represent the final result of the query. If `VK_QUERY_RESULT_PARTIAL_BIT` is set, then for any query that is unavailable, an intermediate result between zero and the final result value is written for that query. Otherwise, any result written by this command is undefined.

If `VK_QUERY_RESULT_64_BIT` is set, results and, if returned, availability or status values for all queries are written as an array of 64-bit values. If the `queryPool` was created with `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, results for each query are written as an array of the type indicated by `VkPerformanceCounterKHR::storage` for the counter being queried. Otherwise, results and availability or status values are written as an array of 32-bit values. If an unsigned integer query's value overflows the result type, the value may either wrap or saturate. If a signed integer query's value overflows the result type, the value is undefined. If a floating point query's value is not representable as the result type, the value is undefined.

If `VK_QUERY_RESULT_WAIT_BIT` is set, this command defines an execution dependency with any earlier commands that writes one of the identified queries. The first synchronization scope includes all instances of `vkCmdEndQuery`, `vkCmdEndQueryIndexedEXT`, `vkCmdWriteTimestamp2`, and `vkCmdWriteTimestamp` that reference any query in `queryPool` indicated by `firstQuery` and `queryCount`. The second synchronization scope includes the host operations of this command.

If `VK_QUERY_RESULT_WAIT_BIT` is not set, `vkGetQueryPoolResults` may return `VK_NOT_READY` if there are queries in the unavailable state.

Note
Applications **must** take care to ensure that use of the `VK_QUERY_RESULT_WAIT_BIT` bit has the desired effect.

For example, if a query has been used previously and a command buffer records the commands `vkCmdResetQueryPool`, `vkCmdBeginQuery`, and `vkCmdEndQuery` for that query, then the query will remain in the available state until `vkResetQueryPool` is called or the `vkCmdResetQueryPool` command executes on a queue. Applications **can** use fences or events to ensure that a query has already been reset before checking for its results or availability status. Otherwise, a stale value could be returned from a previous use of the query.

The above also applies when `VK_QUERY_RESULT_WAIT_BIT` is used in combination with `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT`. In this case, the returned availability status **may** reflect the result of a previous use of the query unless `vkResetQueryPool` is called or the `vkCmdResetQueryPool` command has been executed since the last use of the query.

A similar situation can arise with the `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR` flag.

Note
Applications can double-buffer query pool usage, with a pool per frame, and reset queries at the end of the frame in which they are read.

**Valid Usage**

- VUID-vkGetQueryPoolResults-firstQuery-09436
  firstQuery must be less than the number of queries in queryPool

- VUID-vkGetQueryPoolResults-firstQuery-09437
  The sum of firstQuery and queryCount must be less than or equal to the number of queries in queryPool

- VUID-vkGetQueryPoolResults-queryCount-09438
  If queryCount is greater than 1, stride must not be zero

- VUID-vkGetQueryPoolResults-queryType-09439
  If the queryType used to create queryPool was VK_QUERY_TYPE_TIMESTAMP, flags must not contain VK_QUERY_RESULT_PARTIAL_BIT

- VUID-vkGetQueryPoolResults-queryType-09440
  If the queryType used to create queryPool was VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, flags must not contain VK_QUERY_RESULT_WITH_AVAILABILITY_BIT, VK_QUERY_RESULT_WITH_STATUS_BIT_KHR, or VK_QUERY_RESULT_64_BIT

- VUID-vkGetQueryPoolResults-queryType-09441
  If the queryType used to create queryPool was VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, the queryPool must have been recorded once for each pass as retrieved via a call to vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR

- VUID-vkGetQueryPoolResults-queryType-09442
  If the queryType used to create queryPool was VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR, then flags must include VK_QUERY_RESULT_WITH_STATUS_BIT_KHR

- VUID-vkGetQueryPoolResults-flags-09443
  If flags includes VK_QUERY_RESULT_WITH_STATUS_BIT_KHR, then it must not include VK_QUERY_RESULT_WITH_AVAILABILITY_BIT

- VUID-vkGetQueryPoolResults-None-09401
  All queries used by the command must not be uninitialized

- VUID-vkGetQueryPoolResults-flags-02828
  If VK_QUERY_RESULT_64_BIT is not set in flags and the queryType used to create queryPool was not VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, then pData and stride must be multiples of 4

- VUID-vkGetQueryPoolResults-flags-00815
  If VK_QUERY_RESULT_64_BIT is set in flags then pData and stride must be multiples of 8

- VUID-vkGetQueryPoolResults-stride-08993
  If VK_QUERY_RESULT_WITH_AVAILABILITY_BIT is set, stride must be large enough to contain the unsigned integer representing availability or status in addition to the query result.

- VUID-vkGetQueryPoolResults-queryType-03229
  If the queryType used to create queryPool was VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, then...
pData and stride must be multiples of the size of VkPerformanceCounterResultKHR

- VUID-vkGetQueryPoolResults-queryType-04519
  If the queryType used to create queryPool was VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, then stride must be large enough to contain the VkQueryPoolPerformanceCreateInfoKHR::counterIndexCount used to create queryPool times the size of VkPerformanceCounterResultKHR

- VUID-vkGetQueryPoolResults-dataSize-00817
dataSize must be large enough to contain the result of each query, as described here

### Valid Usage (Implicit)

- VUID-vkGetQueryPoolResults-device-parameter
device must be a valid VkDevice handle

- VUID-vkGetQueryPoolResults-queryPool-parameter
queryPool must be a valid VkQueryPool handle

- VUID-vkGetQueryPoolResults-pData-parameter
pData must be a valid pointer to an array of dataSize bytes

- VUID-vkGetQueryPoolResults-flags-parameter
flags must be a valid combination of VkQueryResultFlagBits values

- VUID-vkGetQueryPoolResults-dataSize-arraylength
dataSize must be greater than 0

- VUID-vkGetQueryPoolResults-queryPool-parent
queryPool must have been created, allocated, or retrieved from device

### Return Codes

**Success**

- VK_SUCCESS
- VK_NOT_READY

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST

Bits which can be set in VkQueryPoolResults::flags and vkCmdCopyQueryPoolResults::flags, specifying how and when results are returned, are:

```c
typedef enum VkQueryResultFlagBits {
    VK_QUERY_RESULT_64_BIT = 0x00000001,
};
```
VK_QUERY_RESULT_WAIT_BIT = 0x00000002,
VK_QUERY_RESULT_WITH_AVAILABILITY_BIT = 0x00000004,
VK_QUERY_RESULT_PARTIAL_BIT = 0x00000008,
// Provided by VK_KHR_video_queue
VK_QUERY_RESULT_WITH_STATUS_BIT_KHR = 0x00000010,
} VkQueryResultFlagBits;

• VK_QUERY_RESULT_64_BIT specifies the results will be written as an array of 64-bit unsigned integer values. If this bit is not set, the results will be written as an array of 32-bit unsigned integer values.

• VK_QUERY_RESULT_WAIT_BIT specifies that Vulkan will wait for each query’s status to become available before retrieving its results.

• VK_QUERY_RESULT_WITH_AVAILABILITY_BIT specifies that the availability status accompanies the results.

• VK_QUERY_RESULT_PARTIAL_BIT specifies that returning partial results is acceptable.

• VK_QUERY_RESULT_WITH_STATUS_BIT_KHR specifies that the last value returned in the query is a VkQueryResultStatusKHR value. See result status query for information on how an application can determine whether the use of this flag bit is supported.

// Provided by VK_VERSION_1_0
typedef VkFlags VkQueryResultFlags;

VkQueryResultFlags is a bitmask type for setting a mask of zero or more VkQueryResultFlagBits.

Specific status codes that can be returned from a query are:

// Provided by VK_KHR_video_queue
typedef enum VkQueryResultStatusKHR {
    VK_QUERY_RESULT_STATUS_ERROR_KHR = -1,
    VK_QUERY_RESULT_STATUS_NOT_READY_KHR = 0,
    VK_QUERY_RESULT_STATUS_COMPLETE_KHR = 1,
    // Provided by VK_KHR_video_encode_queue
    VK_QUERY_RESULT_STATUS_INSUFFICIENT_BITSTREAM_BUFFER_RANGE_KHR = -1000299000,
} VkQueryResultStatusKHR;

• VK_QUERY_RESULT_STATUS_NOT_READY_KHR indicates that the query result is not yet available.

• VK_QUERY_RESULT_STATUS_ERROR_KHR indicates that operations did not complete successfully.

• VK_QUERY_RESULT_STATUS_COMPLETE_KHR indicates that operations completed successfully and the query result is available.

• VK_QUERY_RESULT_STATUS_INSUFFICIENT_BITSTREAM_BUFFER_RANGE_KHR indicates that a video encode operation did not complete successfully due to the destination video bitstream buffer range not being sufficiently large to fit the encoded bitstream data.

To copy query statuses and numerical results directly to buffer memory, call:
void vkCmdCopyQueryPoolResults(
    VkCommandBuffer commandBuffer,
    VkQueryPool queryPool,
    uint32_t firstQuery,
    uint32_t queryCount,
    VkBuffer dstBuffer,
    VkDeviceSize dstOffset,
    VkDeviceSize stride,
    VkQueryResultFlags flags);
specified for any of the results of the used query type.

Results for any available query written by this command are final and represent the final result of the query. If `VK_QUERY_RESULT_PARTIAL_BIT` is set, then for any query that is unavailable, an intermediate result between zero and the final result value is written for that query. Otherwise, any result written by this command is undefined.

If `VK_QUERY_RESULT_64_BIT` is set, results and availability or status values for all queries are written as an array of 64-bit values. If the `queryPool` was created with `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, results for each query are written as an array of the type indicated by `VkPerformanceCounterKHR::storage` for the counter being queried. Otherwise, results and availability or status values are written as an array of 32-bit values. If an unsigned integer query's value overflows the result type, the value may either wrap or saturate. If a signed integer query's value overflows the result type, the value is undefined. If a floating point query's value is not representable as the result type, the value is undefined.

This command defines an execution dependency between other query commands that reference the same query.

The first synchronization scope includes all commands which reference the queries in `queryPool` indicated by `query` that occur earlier in submission order. If `flags` does not include `VK_QUERY_RESULT_WAIT_BIT`, `vkCmdEndQueryIndexedEXT`, `vkCmdWriteTimestamp2`, `vkCmdEndQuery`, and `vkCmdWriteTimestamp` are excluded from this scope.

The second synchronization scope includes all commands which reference the queries in `queryPool` indicated by `query` that occur later in submission order.

The operation of this command happens after the first scope and happens before the second scope.

`vkCmdCopyQueryPoolResults` is considered to be a transfer operation, and its writes to buffer memory must be synchronized using `VK_PIPELINE_STAGE_TRANSFER_BIT` and `VK_ACCESS_TRANSFER_WRITE_BIT` before using the results.

---

**Valid Usage**

- VUID-vkCmdCopyQueryPoolResults-firstQuery-09436
  *firstQuery* must be less than the number of queries in `queryPool`

- VUID-vkCmdCopyQueryPoolResults-firstQuery-09437
  The sum of *firstQuery* and *queryCount* must be less than or equal to the number of queries in `queryPool`

- VUID-vkCmdCopyQueryPoolResults-queryCount-09438
  If *queryCount* is greater than 1, *stride* must not be zero

- VUID-vkCmdCopyQueryPoolResults-queryType-09439
  If the *queryType* used to create `queryPool` was `VK_QUERY_TYPE_TIMESTAMP`, flags must not contain `VK_QUERY_RESULT_PARTIAL_BIT`

- VUID-vkCmdCopyQueryPoolResults-queryType-09440
  If the *queryType* used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, flags
must not contain 

VK_QUERY_RESULT_WITH_AVAILABILITY_BIT, 
VK_QUERY_RESULT_WITH_STATUS_BIT_KHR, 
VK_QUERY_RESULT_PARTIAL_BIT, or 
VK_QUERY_RESULT_64_BIT

• VUID-vkCmdCopyQueryPoolResults-queryType-09441
  If the queryType used to create queryPool was VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, the queryPool must have been recorded once for each pass as retrieved via a call to 
vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR

• VUID-vkCmdCopyQueryPoolResults-queryType-09442
  If the queryType used to create queryPool was VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR, then flags must include VK_QUERY_RESULT_WITH_STATUS_BIT_KHR

• VUID-vkCmdCopyQueryPoolResults-flags-09443
  If flags includes VK_QUERY_RESULT_WITH_STATUS_BIT_KHR, then it must not include VK_QUERY_RESULT_WITH_AVAILABILITY_BIT

• VUID-vkCmdCopyQueryPoolResults-None-09402
  All queries used by the command must not be uninitialized when the command is executed

• VUID-vkCmdCopyQueryPoolResults-dstOffset-00819
  dstOffset must be less than the size of dstBuffer

• VUID-vkCmdCopyQueryPoolResults-flags-00822
  If VK_QUERY_RESULT_64_BIT is not set in flags then dstOffset and stride must be multiples of 4

• VUID-vkCmdCopyQueryPoolResults-flags-00823
  If VK_QUERY_RESULT_64_BIT is set in flags then dstOffset and stride must be multiples of 8

• VUID-vkCmdCopyQueryPoolResults-dstBuffer-00824
  dstBuffer must have enough storage, from dstOffset, to contain the result of each query, as described here

• VUID-vkCmdCopyQueryPoolResults-dstBuffer-00825
  dstBuffer must have been created with VK_BUFFER_USAGE_TRANSFER_DST_BIT usage flag

• VUID-vkCmdCopyQueryPoolResults-dstBuffer-00826
  If dstBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-vkCmdCopyQueryPoolResults-queryType-03232
  If the queryType used to create queryPool was VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, VkPhysicalDevicePerformanceQueryPropertiesKHR::allowCommandBufferQueryCopies must be VK_TRUE

• VUID-vkCmdCopyQueryPoolResults-queryType-02734
  vkCmdCopyQueryPoolResults must not be called if the queryType used to create queryPool was VK_QUERY_TYPE_PERFORMANCE_QUERY_INTEL

• VUID-vkCmdCopyQueryPoolResults-None-07429
  All queries used by the command must not be active

• VUID-vkCmdCopyQueryPoolResults-None-08752
  All queries used by the command must have been made available by prior executed
Valid Usage (Implicit)

- VUID-vkCmdCopyQueryPoolResults-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdCopyQueryPoolResults-queryPool-parameter
  queryPool must be a valid VkQueryPool handle
- VUID-vkCmdCopyQueryPoolResults-dstBuffer-parameter
  dstBuffer must be a valid VkBuffer handle
- VUID-vkCmdCopyQueryPoolResults-flags-parameter
  flags must be a valid combination of VkQueryResultFlagBits values
- VUID-vkCmdCopyQueryPoolResults-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdCopyQueryPoolResults-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations
- VUID-vkCmdCopyQueryPoolResults-renderpass
  This command must only be called outside of a render pass instance
- VUID-vkCmdCopyQueryPoolResults-videocoding
  This command must only be called outside of a video coding scope
- VUID-vkCmdCopyQueryPoolResults-commonparent
  Each of commandBuffer, dstBuffer, and queryPool must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Rendering operations such as clears, MSAA resolves, attachment load/store operations, and blits may count towards the results of queries. This behavior is implementation-dependent and may
vary depending on the path used within an implementation. For example, some implementations have several types of clears, some of which may include vertices and some not.

18.3. Occlusion Queries

Occlusion queries track the number of samples that pass the per-fragment tests for a set of drawing commands. As such, occlusion queries are only available on queue families supporting graphics operations. The application can then use these results to inform future rendering decisions. An occlusion query is begun and ended by calling \texttt{vkCmdBeginQuery} and \texttt{vkCmdEndQuery}, respectively. When an occlusion query begins, the count of passing samples always starts at zero. For each drawing command, the count is incremented as described in \textit{Sample Counting}. If \texttt{flags} does not contain \texttt{VK_QUERY_CONTROL_PRECISE_BIT} an implementation may generate any non-zero result value for the query if the count of passing samples is non-zero.

\textit{Note}

Not setting \texttt{VK_QUERY_CONTROL_PRECISE_BIT} mode may be more efficient on some implementations, and should be used where it is sufficient to know a boolean result on whether any samples passed the per-fragment tests. In this case, some implementations may only return zero or one, indifferent to the actual number of samples passing the per-fragment tests.

Setting \texttt{VK_QUERY_CONTROL_PRECISE_BIT} does not guarantee that different implementations return the same number of samples in an occlusion query. Some implementations may kill fragments in the pre-rasterization shader stage, and these killed fragments do not contribute to the final result of the query. It is possible that some implementations generate a zero result value for the query, while others generate a non-zero value.

When an occlusion query finishes, the result for that query is marked as available. The application can then either copy the result to a buffer (via \texttt{vkCmdCopyQueryPoolResults}) or request it be put into host memory (via \texttt{vkGetQueryPoolResults}).

\textit{Note}

If occluding geometry is not drawn first, samples can pass the depth test, but still not be visible in a final image.

18.4. Pipeline Statistics Queries

Pipeline statistics queries allow the application to sample a specified set of \texttt{VkPipeline} counters. These counters are accumulated by Vulkan for a set of either drawing or dispatching commands while a pipeline statistics query is active. As such, pipeline statistics queries are available on queue families supporting either graphics or compute operations. The availability of pipeline statistics queries is indicated by the \texttt{pipelineStatisticsQuery} member of the \texttt{VkPhysicalDeviceFeatures} object (see \texttt{vkGetPhysicalDeviceFeatures} and \texttt{vkCreateDevice} for detecting and requesting this query type on a \texttt{VkDevice}).

A pipeline statistics query is begun and ended by calling \texttt{vkCmdBeginQuery} and \texttt{vkCmdEndQuery},
respectively. When a pipeline statistics query begins, all statistics counters are set to zero. While the query is active, the pipeline type determines which set of statistics are available, but these must be configured on the query pool when it is created. If a statistic counter is issued on a command buffer that does not support the corresponding operation, the value of that counter is undefined after the query has been made available. At least one statistic counter relevant to the operations supported on the recording command buffer must be enabled.

Bits which can be set in VkQueryPoolCreateInfo::pipelineStatistics for query pools and in VkCommandBufferInheritanceInfo::pipelineStatistics for secondary command buffers, individually enabling pipeline statistics counters, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkQueryPipelineStatisticFlagBits {
    VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_VERTICES_BIT = 0x00000001,
    VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_PRIMITIVES_BIT = 0x00000002,
    VK_QUERY_PIPELINE_STATISTIC_VERTEX_SHADER_INVOCATIONS_BIT = 0x00000004,
    VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_INVOCATIONS_BIT = 0x00000008,
    VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_PRIMITIVES_BIT = 0x00000010,
    VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT = 0x00000020,
    VK_QUERY_PIPELINE_STATISTIC_CLIPPING_PRIMITIVES_BIT = 0x00000040,
    VK_QUERY_PIPELINE_STATISTIC_FRAGMENT_SHADER_INVOCATIONS_BIT = 0x00000080,
    VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_CONTROL_SHADER_PATCHES_BIT = 0x00000100,
    VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_EVALUATION_SHADER_INVOCATIONS_BIT = 0x00000200,
    VK_QUERY_PIPELINE_STATISTIC_COMPUTE_SHADER_INVOCATIONS_BIT = 0x00000400,
    // Provided by VK_EXT_mesh_shader
    VK_QUERY_PIPELINE_STATISTIC_TASK_SHADER_INVOCATIONS_BIT_EXT = 0x00000800,
    // Provided by VK_EXT_mesh_shader
    VK_QUERY_PIPELINE_STATISTIC_MESH_SHADER_INVOCATIONS_BIT_EXT = 0x00001000,
    // Provided by VK_HUAWEI_cluster_culling_shader
    VK_QUERY_PIPELINE_STATISTIC_CLUSTER_CULLING_SHADER_INVOCATIONS_BIT_HUAWEI = 0x00002000,
    } VkQueryPipelineStatisticFlagBits;
```

- **VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_VERTICES_BIT** specifies that queries managed by the pool will count the number of vertices processed by the input assembly stage. Vertices corresponding to incomplete primitives may contribute to the count.

- **VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_PRIMITIVES_BIT** specifies that queries managed by the pool will count the number of primitives processed by the input assembly stage. If primitive restart is enabled, restarting the primitive topology has no effect on the count. Incomplete primitives may be counted.

- **VK_QUERY_PIPELINE_STATISTIC_VERTEX_SHADER_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of vertex shader invocations. This counter’s value is incremented each time a vertex shader is invoked.

- **VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of geometry shader invocations. This counter’s value is incremented each time a geometry shader is invoked. In the case of instanced geometry
shaders, the geometry shader invocations count is incremented for each separate instanced invocation.

- **VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_PRIMITIVES_BIT** specifies that queries managed by the pool will count the number of primitives generated by geometry shader invocations. The counter's value is incremented each time the geometry shader emits a primitive. Restarting primitive topology using the SPIR-V instructions `OpEndPrimitive` or `OpEndStreamPrimitive` has no effect on the geometry shader output primitives count.

- **VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of primitives processed by the Primitive Clipping stage of the pipeline. The counter's value is incremented each time a primitive reaches the primitive clipping stage.

- **VK_QUERY_PIPELINE_STATISTIC_CLIPPING_PRIMITIVES_BIT** specifies that queries managed by the pool will count the number of primitives output by the Primitive Clipping stage of the pipeline. The actual number of primitives output by the primitive clipping stage for a particular input primitive is implementation-dependent but must satisfy the following conditions:
  - If at least one vertex of the input primitive lies inside the clipping volume, the counter is incremented by one or more.
  - Otherwise, the counter is incremented by zero or more.

- **VK_QUERY_PIPELINE_STATISTIC_FRAGMENT_SHADER_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of fragment shader invocations. The counter's value is incremented each time the fragment shader is invoked.

- **VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_CONTROL_SHADER_PATCHES_BIT** specifies that queries managed by the pool will count the number of patches processed by the tessellation control shader. The counter's value is incremented once for each patch for which a tessellation control shader is invoked.

- **VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_EVALUATION_SHADER_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of invocations of the tessellation evaluation shader. The counter's value is incremented each time the tessellation evaluation shader is invoked.

- **VK_QUERY_PIPELINE_STATISTIC_COMPUTE_SHADER_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of compute shader invocations. The counter's value is incremented every time the compute shader is invoked. Implementations may skip the execution of certain compute shader invocations or execute additional compute shader invocations for implementation-dependent reasons as long as the results of rendering otherwise remain unchanged.

- **VK_QUERY_PIPELINE_STATISTIC_TASK_SHADER_INVOCATIONS_BIT_EXT** specifies that queries managed by the pool will count the number of task shader invocations. The counter's value is incremented every time the task shader is invoked.

- **VK_QUERY_PIPELINE_STATISTIC_MESH_SHADER_INVOCATIONS_BIT_EXT** specifies that queries managed by the pool will count the number of mesh shader invocations. The counter's value is incremented every time the mesh shader is invoked.

These values are intended to measure relative statistics on one implementation. Various device
architectures will count these values differently. Any or all counters may be affected by the issues described in Query Operation.

This counting difference is especially true if the pipeline contains mesh or task shaders, which may affect several of the counters in unexpected ways.

**Note**
For example, tile-based rendering devices may need to replay the scene multiple times, affecting some of the counts.

If a pipeline has rasterizerDiscardEnable enabled, implementations may discard primitives after the final pre-rasterization shader stage. As a result, if rasterizerDiscardEnable is enabled, the clipping input and output primitives counters may not be incremented.

When a pipeline statistics query finishes, the result for that query is marked as available. The application can copy the result to a buffer (via vkCmdCopyQueryPoolResults), or request it be put into host memory (via vkGetQueryPoolResults).

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkQueryPipelineStatisticFlags;
```

VkQueryPipelineStatisticFlags is a bitmask type for setting a mask of zero or more VkQueryPipelineStatisticFlagBits.

### 18.5. Timestamp Queries

Timestamps provide applications with a mechanism for timing the execution of commands. A timestamp is an integer value generated by the VkPhysicalDevice. Unlike other queries, timestamps do not operate over a range, and so do not use vkCmdBeginQuery or vkCmdEndQuery. The mechanism is built around a set of commands that allow the application to tell the VkPhysicalDevice to write timestamp values to a query pool and then either read timestamp values on the host (using vkGetQueryPoolResults) or copy timestamp values to a VkBuffer (using vkCmdCopyQueryPoolResults). The application can then compute differences between timestamps to determine execution time.

The number of valid bits in a timestamp value is determined by the VkQueueFamilyProperties::timestampValidBits property of the queue on which the timestamp is written. Timestamps are supported on any queue which reports a non-zero value for timestampValidBits via vkGetPhysicalDeviceQueueFamilyProperties. If the timestampComputeAndGraphics limit is VK_TRUE, timestamps are supported by every queue family that supports either graphics or compute operations (see VkQueueFamilyProperties).

The number of nanoseconds it takes for a timestamp value to be incremented by 1 can be obtained from VkPhysicalDeviceLimits::timestampPeriod after a call to vkGetPhysicalDeviceProperties.

To request a timestamp and write the value to memory, call:
void vkCmdWriteTimestamp2(
    VkCommandBuffer commandBuffer,
    VkPipelineStageFlags2 stage,
    VkQueryPool queryPool,
    uint32_t query);

or the equivalent command

void vkCmdWriteTimestamp2KHR(
    VkCommandBuffer commandBuffer,
    VkPipelineStageFlags2 stage,
    VkQueryPool queryPool,
    uint32_t query);

- commandBuffer is the command buffer into which the command will be recorded.
- stage specifies a stage of the pipeline.
- queryPool is the query pool that will manage the timestamp.
- query is the query within the query pool that will contain the timestamp.

When vkCmdWriteTimestamp2 is submitted to a queue, it defines an execution dependency on commands that were submitted before it, and writes a timestamp to a query pool.

The first synchronization scope includes all commands that occur earlier in submission order. The synchronization scope is limited to operations on the pipeline stage specified by stage.

The second synchronization scope includes only the timestamp write operation.

Note
Implementations may write the timestamp at any stage that is logically later than stage.

Any timestamp write that happens-after another timestamp write in the same submission must not have a lower value unless its value overflows the maximum supported integer bit width of the query. If VK_KHR_calibrated_timestamps or VK_EXT_calibrated_timestamps is enabled, this extends to timestamp writes across all submissions on the same logical device: any timestamp write that happens-after another must not have a lower value unless its value overflows the maximum supported integer bit width of the query. Timestamps written by this command must be in the VK_TIME_DOMAIN_DEVICE_KHR time domain. If an overflow occurs, the timestamp value must wrap back to zero.

Note
Comparisons between timestamps should be done between timestamps where they are guaranteed to not decrease. For example, subtracting an older timestamp
from a newer one to determine the execution time of a sequence of commands is only a reliable measurement if the two timestamp writes were performed in the same submission, or if the writes were performed on the same logical device and `VK_KHR_calibrated_timestamps` or `VK_EXT_calibrated_timestamps` is enabled.

If `vkCmdWriteTimestamp2` is called while executing a render pass instance that has multiview enabled, the timestamp uses N consecutive query indices in the query pool (starting at `query`) where N is the number of bits set in the view mask of the subpass the command is executed in. The resulting query values are determined by an implementation-dependent choice of one of the following behaviors:

- The first query is a timestamp value and (if more than one bit is set in the view mask) zero is written to the remaining queries. If two timestamps are written in the same subpass, the sum of the execution time of all views between those commands is the difference between the first query written by each command.

- All N queries are timestamp values. If two timestamps are written in the same subpass, the sum of the execution time of all views between those commands is the sum of the difference between corresponding queries written by each command. The difference between corresponding queries may be the execution time of a single view.

In either case, the application can sum the differences between all N queries to determine the total execution time.

**Valid Usage**

- **VUID-vkCmdWriteTimestamp2-stage-03929**
  If the `geometryShader` feature is not enabled, stage must not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`

- **VUID-vkCmdWriteTimestamp2-stage-03930**
  If the `tessellationShader` feature is not enabled, stage must not contain `VK_PIPELINE_STAGE_2_TESSellation_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_2_TESSellation_EVALuATION_SHADER_BIT`

- **VUID-vkCmdWriteTimestamp2-stage-03931**
  If the `conditionalRendering` feature is not enabled, stage must not contain `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT`

- **VUID-vkCmdWriteTimestamp2-stage-03932**
  If the `fragmentDensityMap` feature is not enabled, stage must not contain `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

- **VUID-vkCmdWriteTimestamp2-stage-03933**
  If the `transformFeedback` feature is not enabled, stage must not contain `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`

- **VUID-vkCmdWriteTimestamp2-stage-03934**
  If the `meshShader` feature is not enabled, stage must not contain `VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT`

- **VUID-vkCmdWriteTimestamp2-stage-03935**
  If the `taskShader` feature is not enabled, stage must not contain
• VUID-vkCmdWriteTimestamp2-stage-07316
  If neither the `shadingRateImage` or `attachmentFragmentShadingRate` are enabled, stage **must** not contain `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

• VUID-vkCmdWriteTimestamp2-stage-04957
  If the `subpassShading` feature is not enabled, stage **must** not contain `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI`

• VUID-vkCmdWriteTimestamp2-stage-04995
  If the `invocationMask` feature is not enabled, stage **must** not contain `VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI`

• VUID-vkCmdWriteTimestamp2-stage-07946
  If neither the `VK_NV_ray_tracing` extension or `rayTracingPipeline` feature are enabled, stage **must** not contain `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`

• VUID-vkCmdWriteTimestamp2-synchronization2-03858
  The `synchronization2` feature **must** be enabled

• VUID-vkCmdWriteTimestamp2-stage-03859
  stage **must** only include a single pipeline stage

• VUID-vkCmdWriteTimestamp2-stage-03860
  stage **must** only include stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from

• VUID-vkCmdWriteTimestamp2-queryPool-03861
  queryPool **must** have been created with a `queryType` of `VK_QUERY_TYPE_TIMESTAMP`

• VUID-vkCmdWriteTimestamp2-timestampValidBits-03863
  The command pool's queue family **must** support a non-zero `timestampValidBits`

• VUID-vkCmdWriteTimestamp2-query-04903
  query **must** be less than the number of queries in `queryPool`

• VUID-vkCmdWriteTimestamp2-None-03864
  All queries used by the command **must be unavailable**

• VUID-vkCmdWriteTimestamp2-query-03865
  If `vkCmdWriteTimestamp2` is called within a render pass instance, the sum of `query` and the number of bits set in the current subpass's view mask **must** be less than or equal to the number of queries in `queryPool`

---

**Valid Usage (Implicit)**

• VUID-vkCmdWriteTimestamp2-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

• VUID-vkCmdWriteTimestamp2-stage-parameter
  `stage` **must** be a valid combination of `VkPipelineStageFlagBits2` values

• VUID-vkCmdWriteTimestamp2-queryPool-parameter
  `queryPool` **must** be a valid `VkQueryPool` handle
• VUID-vkCmdWriteTimestamp2-commandBuffer-recording
commandBuffer must be in the recording state

• VUID-vkCmdWriteTimestamp2-commandBuffer-cmdpool
The VkCommandPool that commandBuffer was allocated from must support transfer, graphics, compute, decode, or encode operations

• VUID-vkCmdWriteTimestamp2-commonparent
Both of commandBuffer, and queryPool must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

• Host access to commandBuffer must be externally synchronized
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Both</td>
<td>Transfer, Graphics, Compute, Decode, Encode</td>

</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To request a timestamp and write the value to memory, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdWriteTimestamp(
    VkCommandBuffer commandBuffer,
    VkPipelineStageFlagBits pipelineStage,
    VkQueryPool queryPool,
    uint32_t query);
```

• commandBuffer is the command buffer into which the command will be recorded.
• pipelineStage is a VkPipelineStageFlagBits value, specifying a stage of the pipeline.
• queryPool is the query pool that will manage the timestamp.
• query is the query within the query pool that will contain the timestamp.

When vkCmdWriteTimestamp is submitted to a queue, it defines an execution dependency on commands that were submitted before it, and writes a timestamp to a query pool.
The first synchronization scope includes all commands that occur earlier in submission order. The synchronization scope is limited to operations on the pipeline stage specified by pipelineStage.

The second synchronization scope includes only the timestamp write operation.

Note
Implementations may write the timestamp at any stage that is logically later than stage.

Any timestamp write that happens-after another timestamp write in the same submission must not have a lower value unless its value overflows the maximum supported integer bit width of the query. If VK_KHR_calibrated_timestamps or VK_EXT_calibrated_timestamps is enabled, this extends to timestamp writes across all submissions on the same logical device: any timestamp write that happens-after another must not have a lower value unless its value overflows the maximum supported integer bit width of the query. Timestamps written by this command must be in the VK_TIME_DOMAIN_DEVICE_KHR time domain. If an overflow occurs, the timestamp value must wrap back to zero.

Note
Comparisons between timestamps should be done between timestamps where they are guaranteed to not decrease. For example, subtracting an older timestamp from a newer one to determine the execution time of a sequence of commands is only a reliable measurement if the two timestamp writes were performed in the same submission, or if the writes were performed on the same logical device and VK_KHR_calibrated_timestamps or VK_EXT_calibrated_timestamps is enabled.

If vkCmdWriteTimestamp is called while executing a render pass instance that has multiview enabled, the timestamp uses N consecutive query indices in the query pool (starting at query) where N is the number of bits set in the view mask of the subpass the command is executed in. The resulting query values are determined by an implementation-dependent choice of one of the following behaviors:

• The first query is a timestamp value and (if more than one bit is set in the view mask) zero is written to the remaining queries. If two timestamps are written in the same subpass, the sum of the execution time of all views between those commands is the difference between the first query written by each command.

• All N queries are timestamp values. If two timestamps are written in the same subpass, the sum of the execution time of all views between those commands is the sum of the difference between corresponding queries written by each command. The difference between corresponding queries may be the execution time of a single view.

In either case, the application can sum the differences between all N queries to determine the total execution time.

Valid Usage

• VUID-vkCmdWriteTimestamp-pipelineStage-04074 pipelineStage must be a valid stage for the queue family that was used to create the
command pool that `commandBuffer` was allocated from

- **VUID-vkCmdWriteTimestamp-pipelineStage-04075**
  If the `geometryShader` feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`

- **VUID-vkCmdWriteTimestamp-pipelineStage-04076**
  If the `tessellationShader` feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`

- **VUID-vkCmdWriteTimestamp-pipelineStage-04077**
  If the `conditionalRendering` feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`

- **VUID-vkCmdWriteTimestamp-pipelineStage-04078**
  If the `fragmentDensityMap` feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

- **VUID-vkCmdWriteTimestamp-pipelineStage-04079**
  If the `transformFeedback` feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`

- **VUID-vkCmdWriteTimestamp-pipelineStage-04080**
  If the `meshShader` feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT`

- **VUID-vkCmdWriteTimestamp-pipelineStage-07077**
  If the `taskShader` feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT`

- **VUID-vkCmdWriteTimestamp-shadingRateImage-07314**
  If neither the `shadingRateImage` or `attachmentFragmentShadingRate` are enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- **VUID-vkCmdWriteTimestamp-synchronization2-06489**
  If the `synchronization2` feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_NONE`

- **VUID-vkCmdWriteTimestamp-rayTracingPipeline-07943**
  If neither the `VK_NV_ray_tracing` extension or `rayTracingPipeline feature` are enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`

- **VUID-vkCmdWriteTimestamp-queryPool-01416**
  `queryPool` must have been created with a `queryType` of `VK_QUERY_TYPE_TIMESTAMP`

- **VUID-vkCmdWriteTimestamp-query-04904**
  `query` must be less than the number of queries in `queryPool`

- **VUID-vkCmdWriteTimestamp-None-00830**
  All queries used by the command must be unavailable

- **VUID-vkCmdWriteTimestamp-query-00831**
  If `vkCmdWriteTimestamp` is called within a render pass instance, the sum of `query` and the
number of bits set in the current subpass's view mask must be less than or equal to the number of queries in queryPool

**Valid Usage (Implicit)**

- VUID-vkCmdWriteTimestamp-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdWriteTimestamp-pipelineStage-parameter
  pipelineStage must be a valid VkPipelineStageFlagBits value

- VUID-vkCmdWriteTimestamp-queryPool-parameter
  queryPool must be a valid VkQueryPool handle

- VUID-vkCmdWriteTimestamp-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdWriteTimestamp-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support transfer, graphics, compute, decode, encode, or optical flow operations

- VUID-vkCmdWriteTimestamp-commonparent
  Both of commandBuffer, and queryPool must have been created, allocated, or retrieved from the same VkDevice

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

**Command Properties**

18.6. Performance Queries

Performance queries provide applications with a mechanism for getting performance counter
information about the execution of command buffers, render passes, and commands.

Each queue family advertises the performance counters that can be queried on a queue of that family via a call to `vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR`. Implementations may limit access to performance counters based on platform requirements or only to specialized drivers for development purposes.

```
Note
This may include no performance counters being enumerated, or a reduced set. Please refer to platform-specific documentation for guidance on any such restrictions.
```

Performance queries use the existing `vkCmdBeginQuery` and `vkCmdEndQuery` to control what command buffers, render passes, or commands to get performance information for.

Implementations may require multiple passes where the command buffer, render passes, or commands being recorded are the same and are executed on the same queue to record performance counter data. This is achieved by submitting the same batch and providing a `VkPerformanceQuerySubmitInfoKHR` structure containing a counter pass index. The number of passes required for a given performance query pool can be queried via a call to `vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR`.

```
Note
Command buffers created with `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT` must not be re-submitted. Changing command buffer usage bits may affect performance. To avoid this, the application should re-record any command buffers with the `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT` when multiple counter passes are required.
```

Performance counter results from a performance query pool can be obtained with the command `vkGetQueryPoolResults`.

The `VkPerformanceCounterResultKHR` union is defined as:

```c
typedef union VkPerformanceCounterResultKHR {
    int32_t int32;
    int64_t int64;
    uint32_t uint32;
    uint64_t uint64;
    float float32;
    double float64;
} VkPerformanceCounterResultKHR;
```

- int32 is a 32-bit signed integer value.
- int64 is a 64-bit signed integer value.
- uint32 is a 32-bit unsigned integer value.
- `uint64` is a 64-bit unsigned integer value.
- `float32` is a 32-bit floating-point value.
- `float64` is a 64-bit floating-point value.

Performance query results are returned in an array of `VkPerformanceCounterResultKHR` unions containing the data associated with each counter in the query, stored in the same order as the counters supplied in `pCounterIndices` when creating the performance query. `VkPerformanceCounterKHR::storage` specifies how to parse the counter data.

### 18.6.1. Profiling Lock

To record and submit a command buffer containing a performance query pool the profiling lock **must** be held. The profiling lock **must** be acquired prior to any call to `vkBeginCommandBuffer` that will be using a performance query pool. The profiling lock **must** be held while any command buffer containing a performance query pool is in the *recording*, *executable*, or *pending state*. To acquire the profiling lock, call:

```c
// Provided by VK_KHR_performance_query
VkResult vkAcquireProfilingLockKHR(VkDevice device, const VkAcquireProfilingLockInfoKHR* pInfo);
```

- `device` is the logical device to profile.
- `pInfo` is a pointer to a `VkAcquireProfilingLockInfoKHR` structure containing information about how the profiling is to be acquired.

Implementations **may** allow multiple actors to hold the profiling lock concurrently.

#### Valid Usage (Implicit)

- VUID-vkAcquireProfilingLockKHR-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkAcquireProfilingLockKHR-pInfo-parameter
  - `pInfo` must be a valid pointer to a valid `VkAcquireProfilingLockInfoKHR` structure

#### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_TIMEOUT`
The `VkAcquireProfilingLockInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_performance_query
typedef struct VkAcquireProfilingLockInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkAcquireProfilingLockFlagsKHR flags;
    uint64_t timeout;
} VkAcquireProfilingLockInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `timeout` indicates how long the function waits, in nanoseconds, if the profiling lock is not available.

### Valid Usage (Implicit)

- `VUID-VkAcquireProfilingLockInfoKHR-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_ACQUIRE_PROFILING_LOCK_INFO_KHR`  
- `VUID-VkAcquireProfilingLockInfoKHR-pNext-pNext`  
  `pNext` must be `NULL`  
- `VUID-VkAcquireProfilingLockInfoKHR-flags-zerobitmask`  
  `flags` must be `0`  

If `timeout` is 0, `vkAcquireProfilingLockKHR` will not block while attempting to acquire the profiling lock. If `timeout` is `UINT64_MAX`, the function will not return until the profiling lock was acquired.

```c
// Provided by VK_KHR_performance_query
typedef enum VkAcquireProfilingLockFlagBitsKHR {
} VkAcquireProfilingLockFlagBitsKHR;
```

```c
// Provided by VK_KHR_performance_query
typedef VkFlags VkAcquireProfilingLockFlagsKHR;
```

`VkAcquireProfilingLockFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

To release the profiling lock, call:

```c
// Provided by VK_KHR_performance_query
void vkReleaseProfilingLockKHR();
```
• `device` is the logical device to cease profiling on.

### Valid Usage

- **VUID-vkReleaseProfilingLockKHR-device-03235**
  The profiling lock of `device` **must** have been held via a previous successful call to `vkAcquireProfilingLockKHR`.

### Valid Usage (Implicit)

- **VUID-vkReleaseProfilingLockKHR-device-parameter**
  `device` **must** be a valid `VkDevice` handle.

## 18.7. Transform Feedback Queries

Transform feedback queries track the number of primitives attempted to be written and actually written, by the vertex stream being captured, to a transform feedback buffer. This query is updated during drawing commands while transform feedback is active. The number of primitives actually written will be less than the number attempted to be written if the bound transform feedback buffer size was too small for the number of primitives actually drawn. Primitives are not written beyond the bound range of the transform feedback buffer. A transform feedback query is begun and ended by calling `vkCmdBeginQuery` and `vkCmdEndQuery`, respectively to query for vertex stream zero. `vkCmdBeginQueryIndexedEXT` and `vkCmdEndQueryIndexedEXT` can be used to begin and end transform feedback queries for any supported vertex stream. When a transform feedback query begins, the count of primitives written and primitives needed starts from zero. For each drawing command, the count is incremented as vertex attribute outputs are captured to the transform feedback buffers while transform feedback is active.

When a transform feedback query finishes, the result for that query is marked as available. The application **can** then either copy the result to a buffer (via `vkCmdCopyQueryPoolResults`) or request it be put into host memory (via `vkGetQueryPoolResults`).

## 18.8. Primitives Generated Queries

When a generated primitive query for a vertex stream is active, the primitives-generated count is incremented every time a primitive emitted to that stream reaches the transform feedback stage, whether or not transform feedback is active. A primitives generated query is begun and ended by calling `vkCmdBeginQuery` and `vkCmdEndQuery`, respectively to query for vertex stream zero. `vkCmdBeginQueryIndexedEXT` and `vkCmdEndQueryIndexedEXT` can be used to begin and end primitives generated queries for any supported vertex stream. When a primitives generated query begins, the count of primitives generated starts from zero.

When a primitives generated query finishes, the result for that query is marked as available. The
application can then either copy the result to a buffer (via `vkCmdCopyQueryPoolResults`) or request it be put into host memory (via `vkGetQueryPoolResults`).

**Note**
The result of this query is typically identical to `VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT`, but the primitives generated query is deterministic, i.e. it must be identical to the number of primitives processed. `VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT` may vary for implementation-dependent reasons, e.g. the same primitive may be processed multiple times for purposes of clipping.

### 18.9. Mesh Shader Queries

When a generated mesh primitives query is active, the mesh-primitives-generated count is incremented every time a primitive emitted from the mesh shader stage reaches the fragment shader stage. When a generated mesh primitives query begins, the mesh-primitives-generated count starts from zero.

Mesh and task shader pipeline statistics queries function the same way that invocation queries work for other shader stages, counting the number of times the respective shader stage has been run. When the statistics query begins, the invocation counters start from zero.

### 18.10. Intel Performance Queries

Intel performance queries allow an application to capture performance data for a set of commands. Performance queries are used in a similar way than other types of queries. A main difference with existing queries is that the resulting data should be handed over to a library capable to produce human readable results rather than being read directly by an application.

Prior to creating a performance query pool, initialize the device for performance queries with the call:

```c
// Provided by VK_INTEL_performance_query
VkResult vkInitializePerformanceApiINTEL(
    VkDevice device,
    const VkInitializePerformanceApiInfoINTEL* pInitializeInfo);
```

- `device` is the logical device used for the queries.
- `pInitializeInfo` is a pointer to a `VkInitializePerformanceApiInfoINTEL` structure specifying initialization parameters.

**Valid Usage (Implicit)**

- `VUID-vkInitializePerformanceApiINTEL-device-parameter` *device* must be a valid `VkDevice` handle
Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_OUT_OF_HOST_MEMORY

The VkInitializePerformanceApiInfoINTEL structure is defined as:

```c
// Provided by VK_INTEL_performance_query
typedef struct VkInitializePerformanceApiInfoINTEL {
    VkStructureType sType;
    const void* pNext;
    void* pUserData;
} VkInitializePerformanceApiInfoINTEL;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `pUserData` is a pointer for application data.

Valid Usage (Implicit)

- VUID-VkInitializePerformanceApiInfoINTEL-sType-sType
  `sType` must be VK_STRUCTURE_TYPE_INITIALIZE_PERFORMANCE_API_INFO_INTEL
- VUID-VkInitializePerformanceApiInfoINTEL-pNext-pNext
  `pNext` must be NULL

Once performance query operations have completed, uninitialized the device for performance queries with the call:

```c
// Provided by VK_INTEL_performance_query
void vkUninitializePerformanceApiINTEL(
    VkDevice device);
```

- `device` is the logical device used for the queries.
Some performance query features of a device can be discovered with the call:

```c
// Provided by VK_INTEL_performance_query
VkResult vkGetPerformanceParameterINTEL(
    VkDevice device,
    VkPerformanceParameterTypeINTEL parameter,
    VkPerformanceValueINTEL* pValue);
```

- `device` is the logical device to query.
- `parameter` is the parameter to query.
- `pValue` is a pointer to a `VkPerformanceValueINTEL` structure in which the type and value of the parameter are returned.

**Valid Usage (Implicit)**

- VUID-vkUninitializePerformanceApiINTEL-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkGetPerformanceParameterINTEL-parameter-parameter
  `parameter` must be a valid `VkPerformanceParameterTypeINTEL` value

- VUID-vkGetPerformanceParameterINTEL-pValue-parameter
  `pValue` must be a valid pointer to a `VkPerformanceValueINTEL` structure

**Return Codes**

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

Possible values of `vkGetPerformanceParameterINTEL::parameter`, specifying a performance query feature, are:

```c
// Provided by VK_INTEL_performance_query
typedef enum VkPerformanceParameterTypeINTEL {
    VK_PERFORMANCE_PARAMETER_TYPE_HW_COUNTERS_SUPPORTED_INTEL = 0,
```
VK_PERFORMANCE_PARAMETER_TYPE_STREAM_MARKER_VALID_BITS_INTEL = 1,
} VkPerformanceParameterTypeINTEL;

- VK_PERFORMANCE_PARAMETER_TYPE_HW_COUNTERS_SUPPORTED_INTEL has a boolean result which tells whether hardware counters can be captured.

- VK_PERFORMANCE_PARAMETER_TYPE_STREAM_MARKER_VALID_BITS_INTEL has a 32 bits integer result which tells how many bits can be written into the VkPerformanceValueINTEL value.

The VkPerformanceValueINTEL structure is defined as:

```c
// Provided by VK_INTEL_performance_query
typedef struct VkPerformanceValueINTEL {
    VkPerformanceValueTypeINTEL type;
    VkPerformanceValueDataINTEL data;
} VkPerformanceValueINTEL;
```

- `type` is a VkPerformanceValueTypeINTEL value specifying the type of the returned data.
- `data` is a VkPerformanceValueDataINTEL union specifying the value of the returned data.

Possible values of VkPerformanceValueINTEL::type, specifying the type of the data returned in VkPerformanceValueINTEL::data, are:

- VK_PERFORMANCE_VALUE_TYPE_UINT32_INTEL specifies that unsigned 32-bit integer data is returned in data.value32.
- VK_PERFORMANCE_VALUE_TYPE_UINT64_INTEL specifies that unsigned 64-bit integer data is returned in data.value64.
- VK_PERFORMANCE_VALUE_TYPE_FLOAT_INTEL specifies that floating-point data is returned in data.valueFloat.
- VK_PERFORMANCE_VALUE_TYPE_BOOL_INTEL specifies that VkBool32 data is returned in data.valueBool.
- VK_PERFORMANCE_VALUE_TYPE_STRING_INTEL specifies that a pointer to a null-terminated UTF-8 string is returned in data.valueString. The pointer is valid for the lifetime of the device parameter passed to vkGetPerformanceParameterINTEL.

```c
// Provided by VK_INTEL_performance_query
typedef enum VkPerformanceValueTypeINTEL {
    VK_PERFORMANCE_VALUE_TYPE_UINT32_INTEL = 0,
    VK_PERFORMANCE_VALUE_TYPE_UINT64_INTEL = 1,
    VK_PERFORMANCE_VALUE_TYPE_FLOAT_INTEL = 2,
    VK_PERFORMANCE_VALUE_TYPE_BOOL_INTEL = 3,
    VK_PERFORMANCE_VALUE_TYPE_STRING_INTEL = 4,
} VkPerformanceValueTypeINTEL;
```

The VkPerformanceValueDataINTEL union is defined as:
typedef union VkPerformanceValueDataINTEL {
    uint32_t value32;
    uint64_t value64;
    float valueFloat;
    VkBool32 valueBool;
    const char* valueString;
} VkPerformanceValueDataINTEL;

- data.value32 represents 32-bit integer data.
- data.value64 represents 64-bit integer data.
- data.valueFloat represents floating-point data.
- data.valueBool represents VkBool32 data.
- data.valueString represents a pointer to a null-terminated UTF-8 string.

The correct member of the union is determined by the associated VkPerformanceValueTypeINTEL value.

The VkQueryPoolPerformanceQueryCreateInfoINTEL structure is defined as:

// Provided by VK_INTEL_performance_query
typedef struct VkQueryPoolPerformanceQueryCreateInfoINTEL {
    VkStructureType sType;
    const void* pNext;
    VkQueryPoolSamplingModeINTEL performanceCountersSampling;
} VkQueryPoolPerformanceQueryCreateInfoINTEL;

To create a pool for Intel performance queries, set VkQueryPoolCreateInfo::queryType to VK_QUERY_TYPE_PERFORMANCE_QUERY_INTEL and add a VkQueryPoolPerformanceQueryCreateInfoINTEL structure to the pNext chain of the VkQueryPoolCreateInfo structure.

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- performanceCountersSampling describe how performance queries should be captured.

Valid Usage (Implicit)

- VUID-VkQueryPoolPerformanceQueryCreateInfoINTEL-sType-sType
  sType must be VK_STRUCTURE_TYPE_QUERY_POOL_PERFORMANCE_QUERY_CREATE_INFO_INTEL
- VUID-VkQueryPoolPerformanceQueryCreateInfoINTEL-performanceCountersSampling-
parameter
performanceCountersSampling must be a valid VkQueryPoolSamplingModeINTEL value.

Possible values of VkQueryPoolQueryCreateInfoINTEL::performanceCountersSampling are:

```
// Provided by VK_INTEL_performance_query
typedef enum VkQueryPoolSamplingModeINTEL {
    VK_QUERY_POOL_SAMPLING_MODE_MANUAL_INTEL = 0,
} VkQueryPoolSamplingModeINTEL;
```

- **VK_QUERY_POOL_SAMPLING_MODE_MANUAL_INTEL** is the default mode in which the application calls `vkCmdBeginQuery` and `vkCmdEndQuery` to record performance data.

To help associate query results with a particular point at which an application emitted commands, markers can be set into the command buffers with the call:

```
// Provided by VK_INTEL_performance_query
VkResult vkCmdSetPerformanceMarkerINTEL(
    VkCommandBuffer commandBuffer,
    const VkPerformanceMarkerInfoINTEL* pMarkerInfo);
```

The last marker set onto a command buffer before the end of a query will be part of the query result.

**Valid Usage (Implicit)**

- VUID-vkCmdSetPerformanceMarkerINTEL-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetPerformanceMarkerINTEL-pMarkerInfo-parameter
  pMarkerInfo must be a valid pointer to a valid VkPerformanceMarkerInfoINTEL structure
- VUID-vkCmdSetPerformanceMarkerINTEL-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetPerformanceMarkerINTEL-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, compute, or transfer operations
- VUID-vkCmdSetPerformanceMarkerINTEL-videocoding
  This command must only be called outside of a video coding scope

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally
synchronized

## Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>

<td>Action State</td>
</tr>
</tbody>
</table>

## Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_OUT_OF_HOST_MEMORY

The `VkPerformanceMarkerInfoINTEL` structure is defined as:

```c
// Provided by VK_INTEL_performance_query
typedef struct VkPerformanceMarkerInfoINTEL {
    VkStructureType sType;
    const void* pNext;
    uint64_t marker;
} VkPerformanceMarkerInfoINTEL;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `marker` is the marker value that will be recorded into the opaque query results.

## Valid Usage (Implicit)

- VUID-VkPerformanceMarkerInfoINTEL-sType-sType `sType` must be `VK_STRUCTURE_TYPE_PERFORMANCE_MARKER_INFO_INTEL`
- VUID-VkPerformanceMarkerInfoINTEL-pNext-pNext `pNext` must be `NULL`

When monitoring the behavior of an application within the dataset generated by the entire set of applications running on the system, it is useful to identify draw calls within a potentially huge
amount of performance data. To do so, application can generate stream markers that will be used to trace back a particular draw call with a particular performance data item.

```c
// Provided by VK_INTEL_performance_query
VkResult vkCmdSetPerformanceStreamMarkerINTEL(
    VkCommandBuffer commandBuffer,
    const VkPerformanceStreamMarkerInfoINTEL* pMarkerInfo);
```

- `commandBuffer` is a `VkCommandBuffer` into which a stream marker is added.
- `pMarkerInfo` is a pointer to a `VkPerformanceStreamMarkerInfoINTEL` structure describing the marker to insert.

**Valid Usage (Implicit)**

- VUID-vkCmdSetPerformanceStreamMarkerINTEL-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetPerformanceStreamMarkerINTEL-pMarkerInfo-parameter
  `pMarkerInfo` must be a valid pointer to a valid `VkPerformanceStreamMarkerInfoINTEL` structure
- VUID-vkCmdSetPerformanceStreamMarkerINTEL-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetPerformanceStreamMarkerINTEL-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, compute, or transfer operations
- VUID-vkCmdSetPerformanceStreamMarkerINTEL-videocoding
  This command must only be called outside of a video coding scope

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>

</tbody>
</table>
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_TOO_MANY_OBJECTS
• VK_ERROR_OUT_OF_HOST_MEMORY

The VkPerformanceStreamMarkerInfoINTEL structure is defined as:

```c
// Provided by VK_INTEL_performance_query
typedef struct VkPerformanceStreamMarkerInfoINTEL {
    VkStructureType sType;
    const void* pNext;
    uint32_t marker;
} VkPerformanceStreamMarkerInfoINTEL;
```

• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `marker` is the marker value that will be recorded into the reports consumed by an external application.

Valid Usage

• VUID-VkPerformanceStreamMarkerInfoINTEL-marker-02735
  The value written by the application into `marker` must only use the valid bits as reported by
  `vkGetPerformanceParameterINTEL` with the
  `VK_PERFORMANCE_PARAMETER_TYPE_STREAM_MARKER_VALID_BITS_INTEL`

Valid Usage (Implicit)

• VUID-VkPerformanceStreamMarkerInfoINTEL-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PERFORMANCE_STREAM_MARKER_INFO_INTEL`
• VUID-VkPerformanceStreamMarkerInfoINTEL-pNext-pNext
  `pNext` must be `NULL`

Some applications might want to measure the effect of a set of commands with a different setting. It is possible to override a particular setting using:

```c
// Provided by VK_INTEL_performance_query
VkResult vkCmdSetPerformanceOverrideINTEL( VkCommandBuffer commandBuffer,
```
const VkPerformanceOverrideInfoINTEL* pOverrideInfo);

- `commandBuffer` is the command buffer where the override takes place.
- `pOverrideInfo` is a pointer to a `VkPerformanceOverrideInfoINTEL` structure selecting the parameter to override.

### Valid Usage

- VUID-vkCmdSetPerformanceOverrideINTEL-pOverrideInfo-02736
  `pOverrideInfo must` not be used with a `VkPerformanceOverrideTypeINTEL` that is not reported available by `vkGetPerformanceParameterINTEL`

### Valid Usage (Implicit)

- VUID-vkCmdSetPerformanceOverrideINTEL-commandBuffer-parameter
  `commandBuffer must` be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetPerformanceOverrideINTEL-pOverrideInfo-parameter
  `pOverrideInfo must` be a valid pointer to a valid `VkPerformanceOverrideInfoINTEL` structure
- VUID-vkCmdSetPerformanceOverrideINTEL-commandBuffer-recording
  `commandBuffer must` be in the `recording state`
- VUID-vkCmdSetPerformanceOverrideINTEL-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer was allocated from must` support graphics, compute, or transfer operations
- VUID-vkCmdSetPerformanceOverrideINTEL-videocoding
  This command `must` only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer must` be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer was allocated from must` be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>

</tbody>
</table>
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_TOO_MANY_OBJECTS
• VK_ERROR_OUT_OF_HOST_MEMORY

The `VkPerformanceOverrideInfoINTEL` structure is defined as:

```c
// Provided by VK_INTEL_performance_query
typedef struct VkPerformanceOverrideInfoINTEL {
    VkStructureType sType;
    const void* pNext;
    VkPerformanceOverrideTypeINTEL type;
    VkBool32 enable;
    uint64_t parameter;
} VkPerformanceOverrideInfoINTEL;
```

- `type` is the particular `VkPerformanceOverrideTypeINTEL` to set.
- `enable` defines whether the override is enabled.
- `parameter` is a potential required parameter for the override.

Valid Usage (Implicit)

- VUID-VkPerformanceOverrideInfoINTEL-sType-sType `sType` must be `VK_STRUCTURE_TYPE_PERFORMANCE_OVERRIDE_INFO_INTEL`
- VUID-VkPerformanceOverrideInfoINTEL-pNext-pNext `pNext` must be `NULL`
- VUID-VkPerformanceOverrideInfoINTEL-type-parameter `type` must be a valid `VkPerformanceOverrideTypeINTEL` value

Possible values of `VkPerformanceOverrideInfoINTEL::type`, specifying performance override types, are:

```c
// Provided by VK_INTEL_performance_query
typedef enum VkPerformanceOverrideTypeINTEL {
    VK_PERFORMANCE_OVERRIDE_TYPE_NULL_HARDWARE_INTEL = 0,
    VK_PERFORMANCE_OVERRIDE_TYPE_FLUSH_GPU_CACHES_INTEL = 1,
} VkPerformanceOverrideTypeINTEL;
```

- `VK_PERFORMANCE_OVERRIDE_TYPE_NULL_HARDWARE_INTEL` turns all rendering operations into noop.
VK_PERFORMANCE_OVERRIDE_TYPE_FLUSH_GPU_CACHES_INTEL stalls the stream of commands until all previously emitted commands have completed and all caches been flushed and invalidated.

Before submitting command buffers containing performance queries commands to a device queue, the application must acquire and set a performance query configuration. The configuration can be released once all command buffers containing performance query commands are not in a pending state.

```c
// Provided by VK_INTEL_performance_query
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPerformanceConfigurationINTEL)
```

To acquire a device performance configuration, call:

```c
// Provided by VK_INTEL_performance_query
VkResult vkAcquirePerformanceConfigurationINTEL(
    VkDevice device,
    const VkPerformanceConfigurationAcquireInfoINTEL* pAcquireInfo,
    VkPerformanceConfigurationINTEL* pConfiguration);
```

- `device` is the logical device that the performance query commands will be submitted to.
- `pAcquireInfo` is a pointer to a `VkPerformanceConfigurationAcquireInfoINTEL` structure, specifying the performance configuration to acquire.
- `pConfiguration` is a pointer to a `VkPerformanceConfigurationINTEL` handle in which the resulting configuration object is returned.

### Valid Usage (Implicit)

- VUID-vkAcquirePerformanceConfigurationINTEL-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkAcquirePerformanceConfigurationINTEL-pAcquireInfo-parameter
  - `pAcquireInfo` must be a valid pointer to a valid `VkPerformanceConfigurationAcquireInfoINTEL` structure
- VUID-vkAcquirePerformanceConfigurationINTEL-pConfiguration-parameter
  - `pConfiguration` must be a valid pointer to a `VkPerformanceConfigurationINTEL` handle

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
The VkPerformanceConfigurationAcquireInfoINTEL structure is defined as:

```c
// Provided by VK_INTEL_performance_query
typedef struct VkPerformanceConfigurationAcquireInfoINTEL {
    VkStructureType    sType;
    const void*        pNext;
    VkPerformanceConfigurationTypeINTEL type;
} VkPerformanceConfigurationAcquireInfoINTEL;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **type** is one of the `VkPerformanceConfigurationTypeINTEL` type of performance configuration that will be acquired.

Valid Usage (Implicit)

- VUID-VkPerformanceConfigurationAcquireInfoINTEL-sType-sType
  
  **sType** must be `VK_STRUCTURE_TYPE_PERFORMANCE_CONFIGURATION_ACQUIRE_INFO_INTEL`

- VUID-VkPerformanceConfigurationAcquireInfoINTEL-pNext-pNext
  
  **pNext** must be `NULL`

- VUID-VkPerformanceConfigurationAcquireInfoINTEL-type-parameter
  
  **type** must be a valid `VkPerformanceConfigurationTypeINTEL` value

Possible values of `VkPerformanceConfigurationAcquireInfoINTEL::type`, specifying performance configuration types, are:

```c
// Provided by VK_INTEL_performance_query
typedef enum VkPerformanceConfigurationTypeINTEL {
    VK_PERFORMANCE_CONFIGURATION_TYPE_COMMAND_QUEUE_METRICS_DISCOVERY_ACTIVATED_INTEL = 0,
} VkPerformanceConfigurationTypeINTEL;
```

To set a performance configuration, call:

```c
// Provided by VK_INTEL_performance_query
VkResult vkQueueSetPerformanceConfigurationINTEL(
    VkQueue            queue,
    VkPerformanceConfigurationINTEL configuration);
```

- **queue** is the queue on which the configuration will be used.
- **configuration** is the configuration to use.
Valid Usage (Implicit)

- VUID-vkQueueSetPerformanceConfigurationINTEL-queue-parameter
  queue must be a valid VkQueue handle

- VUID-vkQueueSetPerformanceConfigurationINTEL-configuration-parameter
  configuration must be a valid VkPerformanceConfigurationINTEL handle

- VUID-vkQueueSetPerformanceConfigurationINTEL-commonparent
  Both of configuration, and queue must have been created, allocated, or retrieved from the same VkDevice

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>Any</td>
<td>-</td>
</tr>
</tbody>
</table>

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_OUT_OF_HOST_MEMORY

To release a device performance configuration, call:

```c
// Provided by VK_INTEL_performance_query
VkResult vkReleasePerformanceConfigurationINTEL(
    VkDevice device,
    VkPerformanceConfigurationINTEL configuration);
```

- device is the device associated to the configuration object to release.
- configuration is the configuration object to release.

Valid Usage

- VUID-vkReleasePerformanceConfigurationINTEL-configuration-02737
  configuration must not be released before all command buffers submitted while the configuration was set are in pending state
Valid Usage (Implicit)

- VUID-vkReleasePerformanceConfigurationINTEL-device-parameter
  device must be a valid VkDevice handle

- VUID-vkReleasePerformanceConfigurationINTEL-configuration-parameter
  If configuration is not VK_NULL_HANDLE, configuration must be a valid VkPerformanceConfigurationINTEL handle

- VUID-vkReleasePerformanceConfigurationINTEL-configuration-parent
  If configuration is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to configuration must be externally synchronized

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_OUT_OF_HOST_MEMORY

18.11. Result Status Queries

Result status queries serve a single purpose: allowing the application to determine whether a set of operations have completed successfully or not, as indicated by the VkQueryResultStatusKHR value written when retrieving the result of a query using the VK_QUERY_RESULT_WITH_STATUS_BIT_KHR flag.

Unlike other query types, result status queries do not track or maintain any other data beyond the completion status, thus no other data is written when retrieving their results.

Support for result status queries is indicated by VkQueueFamilyQueryResultStatusPropertiesKHR::queryResultStatusSupport, as returned by vkGetPhysicalDeviceQueueFamilyProperties2 for the queue family in question.

18.12. Video Encode Feedback Queries

Video encode feedback queries allow the application to capture feedback values generated by video encode operations. As such, video encode feedback queries are available on queue families supporting video encode operations. The availability of individual video encode feedback values is indicated by the bits of VkVideoEncodeCapabilitiesKHR::supportedEncodeFeedbackFlags, as returned
by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile the queries are intended to be used with.

The set of enabled video encode feedback values **must** be configured on the query pool when it is created using the `encodeFeedbackFlags` member of the `VkQueryPoolVideoEncodeFeedbackCreateInfoKHR` included in the `pNext` chain of `VkQueryPoolCreateInfoKHR`.

The `VkQueryPoolVideoEncodeFeedbackCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_encode_queue
typedef struct VkQueryPoolVideoEncodeFeedbackCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoEncodeFeedbackFlagsKHR encodeFeedbackFlags;
} VkQueryPoolVideoEncodeFeedbackCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `encodeFeedbackFlags` is a bitmask of `VkVideoEncodeFeedbackFlagBitsKHR` values specifying the set of enabled video encode feedback values captured by queries of the new pool.

### Valid Usage (Implicit)

- VUID-VkQueryPoolVideoEncodeFeedbackCreateInfoKHR-sType-sType `sType` must be `VK_STRUCTURE_TYPE_QUERY_POOL_VIDEO_ENCODE_FEEDBACK_CREATE_INFO_KHR`
- VUID-VkQueryPoolVideoEncodeFeedbackCreateInfoKHR-encodeFeedbackFlags-parameter `encodeFeedbackFlags` must be a valid combination of `VkVideoEncodeFeedbackFlagBitsKHR` values
- VUID-VkQueryPoolVideoEncodeFeedbackCreateInfoKHR-encodeFeedbackFlags-requiredbitmask `encodeFeedbackFlags` must not be `0`

Bits which **can** be set in `VkQueryPoolVideoEncodeFeedbackCreateInfoKHR::encodeFeedbackFlags` for video encode feedback query pools are:

```c
// Provided by VK_KHR_video_encode_queue
typedef enum VkVideoEncodeFeedbackFlagBitsKHR {
    VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_BUFFER_OFFSET_BIT_KHR = 0x00000001,
    VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_BYTES_WRITTEN_BIT_KHR = 0x00000002,
    VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_HAS_OVERRIDES_BIT_KHR = 0x00000004,
} VkVideoEncodeFeedbackFlagBitsKHR;
```

- `VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_BUFFER_OFFSET_BIT_KHR` specifies that queries managed by the pool will capture the byte offset of the bitstream data written by the video encode operation.
to the bitstream buffer specified in `VkVideoEncodeInfoKHR::dstBuffer` relative to the offset specified in `VkVideoEncodeInfoKHR::dstBufferOffset`. For the first video encode operation issued by any video encode command, this value will always be zero, meaning that bitstream data is always written to the buffer specified in `VkVideoEncodeInfoKHR::dstBuffer` starting from the offset specified in `VkVideoEncodeInfoKHR::dstBufferOffset`.

- `VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_BYTES_WRITTEN_BIT_KHR` specifies that queries managed by the pool will capture the number of bytes written by the video encode operation to the bitstream buffer specified in `VkVideoEncodeInfoKHR::dstBuffer`.

- `VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_HAS_OVERRIDES_BIT_KHR` specifies that queries managed by the pool will capture a boolean value indicating that the data written to the bitstream buffer specified in `VkVideoEncodeInfoKHR::dstBuffer` contains overridden parameters.

When retrieving the results of video encode feedback queries, the values corresponding to each enabled video encode feedback are written in the order of the bits defined above, followed by an optional value indicating availability or result status if `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT` or `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR` is specified, respectively.

If the result status of a video encode feedback query is negative, then the results of all enabled video encode feedback values will be undefined.

```
// Provided by VK_KHR_video_encode_queue
typedef VkFlags VkVideoEncodeFeedbackFlagsKHR;
```

`VkVideoEncodeFeedbackFlagsKHR` is a bitmask type for setting a mask of zero or more `VkVideoEncodeFeedbackFlagBitsKHR`.

---

**Note**

Thus it is recommended that applications always specify `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR` when retrieving the results of video encode feedback queries and ignore such undefined video encode feedback values for any unsuccessfully completed video encode operations.
Chapter 19. Clear Commands

19.1. Clearing Images Outside a Render Pass Instance

Color and depth/stencil images can be cleared outside a render pass instance using `vkCmdClearColorImage` or `vkCmdClearDepthStencilImage`, respectively. These commands are only allowed outside of a render pass instance.

To clear one or more subranges of a color image, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdClearColorImage(
    VkCommandBuffer commandBuffer,
    VkImage image,
    VkImageLayout imageLayout,
    const VkClearColorValue* pColor,
    uint32_t rangeCount,
    const VkImageSubresourceRange* pRanges);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `image` is the image to be cleared.
- `imageLayout` specifies the current layout of the image subresource ranges to be cleared, and must be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`.
- `pColor` is a pointer to a `VkClearColorValue` structure containing the values that the image subresource ranges will be cleared to (see Clear Values below).
- `rangeCount` is the number of image subresource range structures in `pRanges`.
- `pRanges` is a pointer to an array of `VkImageSubresourceRange` structures describing a range of mipmap levels, array layers, and aspects to be cleared, as described in Image Views.

Each specified range in `pRanges` is cleared to the value specified by `pColor`.

Valid Usage

- VUID-vkCmdClearColorImage-image-01993
  The format features of `image` must contain `VK_FORMAT_FEATURE_TRANSFER_DST_BIT`

- VUID-vkCmdClearColorImage-image-00002
  `image` must have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT` usage flag

- VUID-vkCmdClearColorImage-image-01545
  `image` must not use any of the formats that require a sampler Y’C₉C₈ conversion

- VUID-vkCmdClearColorImage-image-00003
  If `image` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-vkCmdClearColorImage-imageLayout-00004
  `imageLayout` must specify the layout of the image subresource ranges of `image` specified in `pRanges` at the time this command is executed on a `VkDevice`.

- VUID-vkCmdClearColorImage-imageLayout-01394
  `imageLayout` must be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` or `VK_IMAGE_LAYOUT_GENERAL`.

- VUID-vkCmdClearColorImage-aspectMask-02498
  The `VkImageSubresourceRange::aspectMask` members of the elements of the `pRanges` array must each only include `VK_IMAGE_ASPECT_COLOR_BIT`.

- VUID-vkCmdClearColorImage-baseMipLevel-01470
  The `VkImageSubresourceRange::baseMipLevel` members of the elements of the `pRanges` array must each be less than the `mipLevels` specified in `VkImageCreateInfo` when `image` was created.

- VUID-vkCmdClearColorImage-pRanges-01692
  For each `VkImageSubresourceRange` element of `pRanges`, if the `levelCount` member is not `VK_REMAINING_MIP_LEVELS`, then `baseMipLevel + levelCount` must be less than or equal to the `mipLevels` specified in `VkImageCreateInfo` when `image` was created.

- VUID-vkCmdClearColorImage-baseArrayLayer-01472
  The `VkImageSubresourceRange::baseArrayLayer` members of the elements of the `pRanges` array must each be less than the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created.

- VUID-vkCmdClearColorImage-pRanges-01693
  For each `VkImageSubresourceRange` element of `pRanges`, if the `layerCount` member is not `VK_REMAINING_ARRAY_LAYERS`, then `baseArrayLayer + layerCount` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created.

- VUID-vkCmdClearColorImage-image-00007
  `image` must not have a compressed or depth/stencil format.

- VUID-vkCmdClearColorImage-pColor-04961
  `pColor` must be a valid pointer to a `VkClearColorValue` union.

- VUID-vkCmdClearColorImage-commandBuffer-01805
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `image` must not be a protected image.

- VUID-vkCmdClearColorImage-commandBuffer-01806
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `must` not be an unprotected image.

---

**Valid Usage (Implicit)**

- VUID-vkCmdClearColorImage-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- VUID-vkCmdClearColorImage-image-parameter
  `image` must be a valid `VkImage` handle.
To clear one or more subranges of a depth/stencil image, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdClearColorImage(  
    VkCommandBuffer commandBuffer,  
    VkImage image,  
    VkImageLayout imageLayout,  
    const VkClearColorValue* pClearColorValue,  
    uint32_t rangeCount,  
    const VkImageSubresourceRange* pImageSubresourceRanges)
```

- **VUID-vkCmdClearColorImage-imageLayout-parameter**
  `imageLayout must` be a valid `VkImageLayout` value

- **VUID-vkCmdClearColorImage-pRanges-parameter**
  `pRanges must` be a valid pointer to an array of `rangeCount` valid `VkImageSubresourceRange` structures

- **VUID-vkCmdClearColorImage-commandBuffer-recording**
  `commandBuffer must` be in the recording state

- **VUID-vkCmdClearColorImage-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

- **VUID-vkCmdClearColorImage-renderpass**
  This command must only be called outside of a render pass instance

- **VUID-vkCmdClearColorImage-videocoding**
  This command must only be called outside of a video coding scope

- **VUID-vkCmdClearColorImage-rangeCount-arraylength**
  `rangeCount must` be greater than 0

- **VUID-vkCmdClearColorImage-commonparent**
  Both of `commandBuffer`, and `image must` have been created, allocated, or retrieved from the same `VkDevice`

---

**Host Synchronization**

- Host access to `commandBuffer must` be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

---

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Graphics, Compute</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td>Outside</td>
<td>Outside</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

---

```c
// Provided by VK_VERSION_1_0
void vkCmdClearColorImage(  
    VkCommandBuffer commandBuffer,  
    VkImage image,  
    VkImageLayout imageLayout,  
    const VkClearColorValue* pClearColorValue,  
    uint32_t rangeCount,  
    const VkImageSubresourceRange* pImageSubresourceRanges)
```
uint32_t rangeCount,
const VkImageSubresourceRange* pRanges);

- **commandBuffer** is the command buffer into which the command will be recorded.
- **image** is the image to be cleared.
- **imageLayout** specifies the current layout of the image subresource ranges to be cleared, and **must** be `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`.
- **pDepthStencil** is a pointer to a `VkClearDepthStencilValue` structure containing the values that the depth and stencil image subresource ranges will be cleared to (see **Clear Values** below).
- **rangeCount** is the number of image subresource range structures in **pRanges**.
- **pRanges** is a pointer to an array of `VkImageSubresourceRange` structures describing a range of mipmap levels, array layers, and aspects to be cleared, as described in **Image Views**.

### Valid Usage

- **VUID-vkCmdClearDepthStencilImage-image-01994**  
The format features of **image** **must** contain `VK_FORMAT_FEATURE_TRANSFER_DST_BIT`

- **VUID-vkCmdClearDepthStencilImage-pRanges-02658**  
If the **aspect** member of any element of **pRanges** includes `VK_IMAGE_ASPECT_STENCIL_BIT`, and **image** was created with separate stencil usage, `VK_IMAGE_USAGE_TRANSFER_DST_BIT` **must** have been included in the `VkImageStencilUsageCreateInfo::stencilUsage` used to create **image**

- **VUID-vkCmdClearDepthStencilImage-pRanges-02659**  
If the **aspect** member of any element of **pRanges** includes `VK_IMAGE_ASPECT_STENCIL_BIT`, and **image** was not created with separate stencil usage, `VK_IMAGE_USAGE_TRANSFER_DST_BIT` **must** have been included in the `VkImageCreateInfo::usage` used to create **image**

- **VUID-vkCmdClearDepthStencilImage-pRanges-02660**  
If the **aspect** member of any element of **pRanges** includes `VK_IMAGE_ASPECT_DEPTH_BIT`, `VK_IMAGE_USAGE_TRANSFER_DST_BIT` **must** have been included in the `VkImageCreateInfo::usage` used to create **image**

- **VUID-vkCmdClearDepthStencilImage-image-00010**  
If **image** is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdClearDepthStencilImage-imageLayout-00011**  
**imageLayout** **must** specify the layout of the image subresource ranges of **image** specified in **pRanges** at the time this command is executed on a `VkDevice`

- **VUID-vkCmdClearDepthStencilImage-imageLayout-00012**  
**imageLayout** **must** be either of `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` or `VK_IMAGE_LAYOUT_GENERAL`

- **VUID-vkCmdClearDepthStencilImage-aspectMask-02824**  
The `VkImageSubresourceRange::aspectMask` member of each element of the **pRanges** array **must** not include bits other than `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT`
If the image's format does not have a stencil component, then the `VkImageSubresourceRange::aspectMask` member of each element of the `pRanges` array must not include the `VK_IMAGE_ASPECT_STENCIL_BIT` bit.

If the image's format does not have a depth component, then the `VkImageSubresourceRange::aspectMask` member of each element of the `pRanges` array must not include the `VK_IMAGE_ASPECT_DEPTH_BIT` bit.

The `VkImageSubresourceRange::baseMipLevel` members of the elements of the `pRanges` array must each be less than the `mipLevels` specified in `VkImageCreateInfo` when `image` was created.

For each `VkImageSubresourceRange` element of `pRanges`, if the `levelCount` member is not `VK_REMAINING_MIP_LEVELS`, then `baseMipLevel + levelCount` must be less than or equal to the `mipLevels` specified in `VkImageCreateInfo` when `image` was created.

The `VkImageSubresourceRange::baseArrayLayer` members of the elements of the `pRanges` array must each be less than the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created.

For each `VkImageSubresourceRange` element of `pRanges`, if the `layerCount` member is not `VK_REMAINING_ARRAY_LAYERS`, then `baseArrayLayer + layerCount` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created.

image must have a depth/stencil format.

If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `image` must not be a protected image.

If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `image` must not be an unprotected image.

Valid Usage (Implicit)

`commandBuffer` must be a valid `VkCommandBuffer` handle.

`image` must be a valid `VkImage` handle.

`imageLayout` must be a valid `VkImageLayout` value.

`pDepthStencil` parameter.
pDepthStencil must be a valid pointer to a valid VkClearDepthStencilValue structure

- VUID-vkCmdClearDepthStencilImage-pRanges-parameter
  pRanges must be a valid pointer to an array of rangeCount valid VkImageSubresourceRange structures

- VUID-vkCmdClearDepthStencilImage-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdClearDepthStencilImage-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdClearDepthStencilImage-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdClearDepthStencilImage-videoencoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdClearDepthStencilImage-rangeCount-arraylength
  rangeCount must be greater than 0

- VUID-vkCmdClearDepthStencilImage-commonparent
  Both of commandBuffer, and image must have been created, allocated, or retrieved from the same VkDevice

### Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

### Command Properties

Clears outside render pass instances are treated as transfer operations for the purposes of memory barriers.

### 19.2. Clearing Images Inside a Render Pass Instance

To clear one or more regions of color and depth/stencil attachments inside a render pass instance, call:
void vkCmdClearAttachments(
 VkCommandBuffer commandBuffer,
  uint32_t attachmentCount,
  const VkClearAttachment* pAttachments,
  uint32_t rectCount,
  const VkClearRect* pRects);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `attachmentCount` is the number of entries in the `pAttachments` array.
- `pAttachments` is a pointer to an array of `VkClearAttachment` structures defining the attachments to clear and the clear values to use.
- `rectCount` is the number of entries in the `pRects` array.
- `pRects` is a pointer to an array of `VkClearRect` structures defining regions within each selected attachment to clear.

If the render pass has a fragment density map attachment, clears follow the operations of fragment density maps as if each clear region was a primitive which generates fragments. The clear color is applied to all pixels inside each fragment's area regardless if the pixels lie outside of the clear region. Clears may have a different set of supported fragment areas than draws.

Unlike other clear commands, `vkCmdClearAttachments` is not a transfer command. It performs its operations in rasterization order. For color attachments, the operations are executed as color attachment writes, by the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` stage. For depth/stencil attachments, the operations are executed as depth writes and stencil writes by the `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT` and `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT` stages.

`vkCmdClearAttachments` is not affected by the bound pipeline state.

**Note**

It is generally preferable to clear attachments by using the `VK_ATTACHMENT_LOAD_OP_CLEAR` load operation at the start of rendering, as it is more efficient on some implementations.

If any attachment's `aspectMask` to be cleared is not backed by an image view, the clear has no effect on that aspect.

If an attachment being cleared refers to an image view created with an `aspectMask` equal to one of `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT` or `VK_IMAGE_ASPECT_PLANE_2_BIT`, it is considered to be `VK_IMAGE_ASPECT_COLOR_BIT` for purposes of this command, and must be cleared with the `VK_IMAGE_ASPECT_COLOR_BIT` aspect as specified by image view creation.

**Valid Usage**

- **VUID-vkCmdClearAttachments-aspectMask-07884**
  If the current render pass instance does not use dynamic rendering, and the `aspectMask`
member of any element of `pAttachments` contains VK_IMAGE_ASPECT_DEPTH_BIT, the current subpass instance’s depth-stencil attachment must be either VK_ATTACHMENT_UNUSED or the attachment format must contain a depth component

- VUID-vkCmdClearAttachments-aspectMask-07885
If the current render pass instance does not use dynamic rendering, and the aspectMask member of any element of `pAttachments` contains VK_IMAGE_ASPECT_STENCIL_BIT, the current subpass instance’s depth-stencil attachment must be either VK_ATTACHMENT_UNUSED or the attachment format must contain a stencil component

- VUID-vkCmdClearAttachments-aspectMask-07271
If the aspectMask member of any element of `pAttachments` contains VK_IMAGE_ASPECT_COLOR_BIT, the colorAttachment must be a valid color attachment index in the current render pass instance

- VUID-vkCmdClearAttachments-rect-02682
The rect member of each element of `pRects` must have an extent.width greater than 0

- VUID-vkCmdClearAttachments-rect-02683
The rect member of each element of `pRects` must have an extent.height greater than 0

- VUID-vkCmdClearAttachments-pRects-00016
The rectangular region specified by each element of `pRects` must be contained within the render area of the current render pass instance

- VUID-vkCmdClearAttachments-pRects-06937
The layers specified by each element of `pRects` must be contained within every attachment that `pAttachments` refers to, i.e. for each element of `pRects`, VkClearRect::baseArrayLayer + VkClearRect::layerCount must be less than or equal to the number of layers rendered to in the current render pass instance

- VUID-vkCmdClearAttachments-layerCount-01934
The layerCount member of each element of `pRects` must not be 0

- VUID-vkCmdClearAttachments-commandBuffer-02504
If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, each attachment to be cleared must not be a protected image

- VUID-vkCmdClearAttachments-commandBuffer-02505
If commandBuffer is a protected command buffer and protectedNoFault is not supported, each attachment to be cleared must not be an unprotected image

- VUID-vkCmdClearAttachments-baseArrayLayer-00018
If the render pass instance this is recorded in uses multiview, then baseArrayLayer must be zero and layerCount must be one

- VUID-vkCmdClearAttachments-colorAttachment-09503
The colorAttachment member of each element of `pAttachments` must not identify a color attachment that is currently mapped to VK_ATTACHMENT_UNUSED in commandBuffer via VkRenderingAttachmentLocationInfoKHR

- VUID-vkCmdClearAttachments-aspectMask-09298
If the subpass this is recorded in performs an external format resolve, the aspectMask member of any element of `pAttachments` must not include VK_IMAGE_ASPECT_PLANE_i_BIT for any index i
Valid Usage (Implicit)

- VUID-vkCmdClearAttachments-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdClearAttachments-pAttachments-parameter
  `pAttachments` must be a valid pointer to an array of `attachmentCount` valid `VkClearAttachment` structures
- VUID-vkCmdClearAttachments-pRects-parameter
  `pRects` must be a valid pointer to an array of `rectCount` `VkClearRect` structures
- VUID-vkCmdClearAttachments-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdClearAttachments-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdClearAttachments-renderpass
  This command must only be called inside of a render pass instance
- VUID-vkCmdClearAttachments-videocoding
  This command must only be called outside of a video coding scope
- VUID-vkCmdClearAttachments-attachmentCount-arraylength
  `attachmentCount` must be greater than 0
- VUID-vkCmdClearAttachments-rectCount-arraylength
  `rectCount` must be greater than 0

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Inside</td>
<td>Outside</td>
<td>Graphics</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The `VkClearRect` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkClearRect {
```
VkRect2D rect;
uint32_t baseArrayLayer;
uint32_t layerCount;
} VkClearRect;

• **rect** is the two-dimensional region to be cleared.
• **baseArrayLayer** is the first layer to be cleared.
• **layerCount** is the number of layers to clear.

The layers \([\text{baseArrayLayer}, \text{baseArrayLayer} + \text{layerCount}]\) counting from the base layer of the attachment image view are cleared.

The **VkClearAttachment** structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkClearAttachment {
    VkImageAspectFlags aspectMask;
    uint32_t colorAttachment;
    VkClearValue clearValue;
} VkClearAttachment;
```

• **aspectMask** is a mask selecting the color, depth and/or stencil aspects of the attachment to be cleared.
• **colorAttachment** is only meaningful if **VK_IMAGE_ASPECT_COLOR_BIT** is set in **aspectMask**, in which case it is an index into the currently bound color attachments.
• **clearValue** is the color or depth/stencil value to clear the attachment to, as described in **Clear Values** below.

**Valid Usage**

• **VUID-VkClearAttachment-aspectMask-00019** If **aspectMask** includes **VK_IMAGE_ASPECT_COLOR_BIT**, it must not include **VK_IMAGE_ASPECT_DEPTH_BIT** or **VK_IMAGE_ASPECT_STENCIL_BIT**

• **VUID-VkClearAttachment-aspectMask-00020** **aspectMask** must not include **VK_IMAGE_ASPECT_METADATA_BIT**

• **VUID-VkClearAttachment-aspectMask-02246** **aspectMask** must not include **VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT** for any index \(i\)

**Valid Usage (Implicit)**

• **VUID-VkClearAttachment-aspectMask-parameter** **aspectMask** must be a valid combination of **VkImageAspectFlagBits** values

• **VUID-VkClearAttachment-aspectMask-requiredbitmask**
19.3. Clear Values

The `VkClearColorValue` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef union VkClearColorValue {
    float float32[4];
    int32_t int32[4];
    uint32_t uint32[4];
} VkClearColorValue;
```

- `float32` are the color clear values when the format of the image or attachment is one of the numeric formats with a numeric type that is floating-point. Floating point values are automatically converted to the format of the image, with the clear value being treated as linear if the image is sRGB.

- `int32` are the color clear values when the format of the image or attachment has a numeric type that is signed integer (`SINT`). Signed integer values are converted to the format of the image by casting to the smaller type (with negative 32-bit values mapping to negative values in the smaller type). If the integer clear value is not representable in the target type (e.g. would overflow in conversion to that type), the clear value is undefined.

- `uint32` are the color clear values when the format of the image or attachment has a numeric type that is unsigned integer (`UINT`). Unsigned integer values are converted to the format of the image by casting to the integer type with fewer bits.

The four array elements of the clear color map to R, G, B, and A components of image formats, in order.

If the image has more than one sample, the same value is written to all samples for any pixels being cleared.

The `VkClearDepthStencilValue` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkClearDepthStencilValue {
    float depth;
    uint32_t stencil;
} VkClearDepthStencilValue;
```

- `depth` is the clear value for the depth aspect of the depth/stencil attachment. It is a floating-point value which is automatically converted to the attachment’s format.

- `stencil` is the clear value for the stencil aspect of the depth/stencil attachment. It is a 32-bit integer value which is converted to the attachment’s format by taking the appropriate number of LSBs.
Valid Usage

- VUID-VkClearDepthStencilValue-depth-00022
  Unless the VK_EXT_depth_range_unrestricted extension is enabled depth must be between 0.0 and 1.0, inclusive

The VkClearValue union is defined as:

```c
// Provided by VK_VERSION_1_0
typedef union VkClearValue {
    VkClearColorValue color;
    VkClearDepthStencilValue depthStencil;
} VkClearValue;
```

- color specifies the color image clear values to use when clearing a color image or attachment.
- depthStencil specifies the depth and stencil clear values to use when clearing a depth/stencil image or attachment.

This union is used where part of the API requires either color or depth/stencil clear values, depending on the attachment, and defines the initial clear values in the VkRenderPassBeginInfo structure.

19.4. Filling Buffers

To clear buffer data, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdFillBuffer(
    VkCommandBuffer commandBuffer,
    VkBuffer dstBuffer,
    VkDeviceSize dstOffset,
    VkDeviceSize size,
    uint32_t data);
```

- commandBuffer is the command buffer into which the command will be recorded.
- dstBuffer is the buffer to be filled.
- dstOffset is the byte offset into the buffer at which to start filling, and must be a multiple of 4.
- size is the number of bytes to fill, and must be either a multiple of 4, or VK_WHOLE_SIZE to fill the range from offset to the end of the buffer. If VK_WHOLE_SIZE is used and the remaining size of the buffer is not a multiple of 4, then the nearest smaller multiple is used.
- data is the 4-byte word written repeatedly to the buffer to fill size bytes of data. The data word is written to memory according to the host endianness.

vkCmdFillBuffer is treated as a “transfer” operation for the purposes of synchronization barriers.
The **VK_BUFFER_USAGE_TRANSFER_DST_BIT** must be specified in usage of **VkBufferCreateInfo** in order for the buffer to be compatible with **vkCmdFillBuffer**.

### Valid Usage

- **VUID-vkCmdFillBuffer-dstOffset-00024**
  - dstOffset must be less than the size of dstBuffer

- **VUID-vkCmdFillBuffer-dstOffset-00025**
  - dstOffset must be a multiple of 4

- **VUID-vkCmdFillBuffer-size-00026**
  - If size is not equal to **VK_WHOLE_SIZE**, size must be greater than 0

- **VUID-vkCmdFillBuffer-size-00027**
  - If size is not equal to **VK_WHOLE_SIZE**, size must be less than or equal to the size of dstBuffer minus dstOffset

- **VUID-vkCmdFillBuffer-size-00028**
  - If size is not equal to **VK_WHOLE_SIZE**, size must be a multiple of 4

- **VUID-vkCmdFillBuffer-dstBuffer-00029**
  - dstBuffer must have been created with **VK_BUFFER_USAGE_TRANSFER_DST_BIT** usage flag

- **VUID-vkCmdFillBuffer-apiVersion-07894**
  - If the **VK_KHR_maintenance1** extension is not enabled and **VkPhysicalDeviceProperties::apiVersion** is less than Vulkan 1.1, the **VkCommandPool** that commandBuffer was allocated from must support graphics or compute operations

- **VUID-vkCmdFillBuffer-dstBuffer-00031**
  - If dstBuffer is non-sparse then it must be bound completely and contiguously to a single **VkDeviceMemory** object

- **VUID-vkCmdFillBuffer-commandBuffer-01811**
  - If commandBuffer is an unprotected command buffer and **protectedNoFault** is not supported, dstBuffer must not be a protected buffer

- **VUID-vkCmdFillBuffer-commandBuffer-01812**
  - If commandBuffer is a protected command buffer and **protectedNoFault** is not supported, dstBuffer must not be an unprotected buffer

### Valid Usage (Implicit)

- **VUID-vkCmdFillBuffer-commandBuffer-parameter**
  - commandBuffer must be a valid **VkCommandBuffer** handle

- **VUID-vkCmdFillBuffer-dstBuffer-parameter**
  - dstBuffer must be a valid **VkBuffer** handle

- **VUID-vkCmdFillBuffer-commandBuffer-recording**
  - commandBuffer must be in the recording state

- **VUID-vkCmdFillBuffer-commandBuffer-cmdpool**
  - The **VkCommandPool** that commandBuffer was allocated from must support transfer, graphics
or compute operations

- **VUID-vkCmdFillBuffer-renderpass**
  This command must only be called outside of a render pass instance

- **VUID-vkCmdFillBuffer-videocoding**
  This command must only be called outside of a video coding scope

- **VUID-vkCmdFillBuffer-commonparent**
  Both of `commandBuffer`, and `dstBuffer` must have been created, allocated, or retrieved from the same `VkDevice`

## Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

## Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Outside</td>
<td>Outside</td>

<td>Action</td>
</tr>
</tbody>
</table>

### 19.5. Updating Buffers

To update buffer data inline in a command buffer, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdUpdateBuffer(
    VkCommandBuffer commandBuffer,
    VkBuffer dstBuffer,
    VkDeviceSize dstOffset,
    VkDeviceSize dataSize,
    const void* pData);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `dstBuffer` is a handle to the buffer to be updated.
- `dstOffset` is the byte offset into the buffer to start updating, and must be a multiple of 4.
- `dataSize` is the number of bytes to update, and must be a multiple of 4.
- `pData` is a pointer to the source data for the buffer update, and must be at least `dataSize` bytes in
**dataSize must** be less than or equal to 65536 bytes. For larger updates, applications **can** use buffer to buffer copies.

**Note**

Buffer updates performed with `vkCmdUpdateBuffer` first copy the data into command buffer memory when the command is recorded (which requires additional storage and may incur an additional allocation), and then copy the data from the command buffer into `dstBuffer` when the command is executed on a device.

The additional cost of this functionality compared to buffer to buffer copies means it is only recommended for very small amounts of data, and is why it is limited to only 65536 bytes.

Applications **can** work around this by issuing multiple `vkCmdUpdateBuffer` commands to different ranges of the same buffer, but it is strongly recommended that they **should** not.

The source data is copied from the user pointer to the command buffer when the command is called.

`vkCmdUpdateBuffer` is only allowed outside of a render pass. This command is treated as a “transfer” operation for the purposes of synchronization barriers. The `VK_BUFFER_USAGE_TRANSFER_DST_BIT` must be specified in usage of `VkBufferCreateInfo` in order for the buffer to be compatible with `vkCmdUpdateBuffer`.

---

**Valid Usage**

- **VUID-vkCmdUpdateBuffer-dstOffset-00032**
  
  `dstOffset` **must** be less than the size of `dstBuffer`

- **VUID-vkCmdUpdateBuffer-dataSize-00033**
  
  `dataSize` **must** be less than or equal to the size of `dstBuffer` minus `dstOffset`

- **VUID-vkCmdUpdateBuffer-dstBuffer-00034**
  
  `dstBuffer` **must** have been created with `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage flag

- **VUID-vkCmdUpdateBuffer-dstBuffer-00035**
  
  If `dstBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdUpdateBuffer-dstOffset-00036**
  
  `dstOffset` **must** be a multiple of 4

- **VUID-vkCmdUpdateBuffer-dataSize-00037**
  
  `dataSize` **must** be less than or equal to 65536

- **VUID-vkCmdUpdateBuffer-dataSize-00038**
  
  `dataSize` **must** be a multiple of 4
• VUID-vkCmdUpdateBuffer-commandBuffer-01813
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstBuffer` must not be a protected buffer

• VUID-vkCmdUpdateBuffer-commandBuffer-01814
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstBuffer` must not be an unprotected buffer

### Valid Usage (Implicit)

• VUID-vkCmdUpdateBuffer-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

• VUID-vkCmdUpdateBuffer-dstBuffer-parameter
  `dstBuffer` must be a valid `VkBuffer` handle

• VUID-vkCmdUpdateBuffer-pData-parameter
  `pData` must be a valid pointer to an array of `dataSize` bytes

• VUID-vkCmdUpdateBuffer-commandBuffer-recording
  `commandBuffer` must be in the `recording` state

• VUID-vkCmdUpdateBuffer-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations

• VUID-vkCmdUpdateBuffer-renderpass
  This command must only be called outside of a render pass instance

• VUID-vkCmdUpdateBuffer-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdUpdateBuffer-dataSize-arraylength
  `dataSize` must be greater than 0

• VUID-vkCmdUpdateBuffer-commonparent
  Both of `commandBuffer`, and `dstBuffer` must have been created, allocated, or retrieved from the same `VkDevice`

### Host Synchronization

• Host access to `commandBuffer` must be externally synchronized

• Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
## Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Transfer Graphics Compute</td>
<td>Action</td>

<td></td>
<td></td>
</tr>
</tbody>
</table>

*Note*

The `pData` parameter was of type `uint32_t*` instead of `void*` prior to version 1.0.19 of the Specification and `VK_HEADER_VERSION` 19 of the [Vulkan Header Files](https://www.khronos.org/vulkan/specs/1.1-extensions/man.html). This was a historical anomaly, as the source data may be of other types.
Chapter 20. Copy Commands

An application can copy buffer and image data using several methods described in this chapter, depending on the type of data transfer.

All copy commands are treated as “transfer” operations for the purposes of synchronization barriers.

All copy commands that have a source format with an X component in its format description read undefined values from those bits.

All copy commands that have a destination format with an X component in its format description write undefined values to those bits.

20.1. Copying Data Between Buffers

To copy data between buffer objects, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdCopyBuffer(
    VkCommandBuffer commandBuffer,
    VkBuffer srcBuffer,
    VkBuffer dstBuffer,
    uint32_t regionCount,
    const VkBufferCopy* pRegions);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `srcBuffer` is the source buffer.
- `dstBuffer` is the destination buffer.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkBufferCopy` structures specifying the regions to copy.

Each source region specified by `pRegions` is copied from the source buffer to the destination region of the destination buffer. If any of the specified regions in `srcBuffer` overlaps in memory with any of the specified regions in `dstBuffer`, values read from those overlapping regions are undefined.

Valid Usage

- VUID-vkCmdCopyBuffer-commandBuffer-01822
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcBuffer` must not be a protected buffer

- VUID-vkCmdCopyBuffer-commandBuffer-01823
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstBuffer` must not be a protected buffer

- VUID-vkCmdCopyBuffer-commandBuffer-01824
If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstBuffer` must not be an unprotected buffer

- VUID-vkCmdCopyBuffer-srcOffset-00113
  The `srcOffset` member of each element of `pRegions` must be less than the size of `srcBuffer`

- VUID-vkCmdCopyBuffer-dstOffset-00114
  The `dstOffset` member of each element of `pRegions` must be less than the size of `dstBuffer`

- VUID-vkCmdCopyBuffer-size-00115
  The `size` member of each element of `pRegions` must be less than or equal to the size of `srcBuffer` minus `srcOffset`

- VUID-vkCmdCopyBuffer-size-00116
  The `size` member of each element of `pRegions` must be less than or equal to the size of `dstBuffer` minus `dstOffset`

- VUID-vkCmdCopyBuffer-pRegions-00117
  The union of the source regions, and the union of the destination regions, specified by the elements of `pRegions`, must not overlap in memory

- VUID-vkCmdCopyBuffer-srcBuffer-00118
  `srcBuffer` must have been created with `VK_BUFFER_USAGE_TRANSFER_SRC_BIT` usage flag

- VUID-vkCmdCopyBuffer-srcBuffer-00119
  If `srcBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdCopyBuffer-dstBuffer-00120
  `dstBuffer` must have been created with `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage flag

- VUID-vkCmdCopyBuffer-dstBuffer-00121
  If `dstBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

**Valid Usage (Implicit)**

- VUID-vkCmdCopyBuffer-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdCopyBuffer-srcBuffer-parameter
  `srcBuffer` must be a valid `VkBuffer` handle

- VUID-vkCmdCopyBuffer-dstBuffer-parameter
  `dstBuffer` must be a valid `VkBuffer` handle

- VUID-vkCmdCopyBuffer-pRegions-parameter
  `pRegions` must be a valid pointer to an array of `regionCount` valid `VkBufferCopy` structures

- VUID-vkCmdCopyBuffer-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdCopyBuffer-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations
• VUID-vkCmdCopyBuffer-renderpass
  This command must only be called outside of a render pass instance

• VUID-vkCmdCopyBuffer-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdCopyBuffer-regionCount-arraylength
  regionCount must be greater than 0

• VUID-vkCmdCopyBuffer-commonparent
  Each of commandBuffer, dstBuffer, and srcBuffer must have been created, allocated, or retrieved from the same VkDevice

**Host Synchronization**

• Host access to commandBuffer must be externally synchronized
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Transfer Graphics</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td>Compute</td>
<td></td>
</tr>
</tbody>
</table>

The VkBufferCopy structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBufferCopy {
    VkDeviceSize srcOffset;
    VkDeviceSize dstOffset;
    VkDeviceSize size;
} VkBufferCopy;
```

• srcOffset is the starting offset in bytes from the start of srcBuffer.
• dstOffset is the starting offset in bytes from the start of dstBuffer.
• size is the number of bytes to copy.

**Valid Usage**

• VUID-VkBufferCopy-size-01988
  The size must be greater than 0
A more extensible version of the copy buffer command is defined below.

To copy data between buffer objects, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdCopyBuffer2(
  VkCommandBuffer commandBuffer,
  const VkCopyBufferInfo2* pCopyBufferInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_copy_commands2
void vkCmdCopyBuffer2KHR(
  VkCommandBuffer commandBuffer,
  const VkCopyBufferInfo2* pCopyBufferInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pCopyBufferInfo` is a pointer to a `VkCopyBufferInfo2` structure describing the copy parameters.

Each source region specified by `pCopyBufferInfo->pRegions` is copied from the source buffer to the destination region of the destination buffer. If any of the specified regions in `pCopyBufferInfo->srcBuffer` overlaps in memory with any of the specified regions in `pCopyBufferInfo->dstBuffer`, values read from those overlapping regions are undefined.

**Valid Usage**

- VUID-vkCmdCopyBuffer2-commandBuffer-01822
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcBuffer` must not be a protected buffer

- VUID-vkCmdCopyBuffer2-commandBuffer-01823
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstBuffer` must not be a protected buffer

- VUID-vkCmdCopyBuffer2-commandBuffer-01824
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstBuffer` must not be an unprotected buffer

**Valid Usage (Implicit)**

- VUID-vkCmdCopyBuffer2-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdCopyBuffer2-pCopyBufferInfo-parameter
  `pCopyBufferInfo` must be a valid pointer to a valid `VkCopyBufferInfo2` structure

- VUID-vkCmdCopyBuffer2-commandBuffer-recording
**Host Synchronization**

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

**Command Properties**

The `VkCopyBufferInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkCopyBufferInfo2 {
    VkStructureType       sType;
    const void*            pNext;
    VkBuffer               srcBuffer;
    VkBuffer               dstBuffer;
    uint32_t               regionCount;
    const VkBufferCopy2*   pRegions;
} VkCopyBufferInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkCopyBufferInfo2 VkCopyBufferInfo2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **srcBuffer** is the source buffer.
- **dstBuffer** is the destination buffer.
- **regionCount** is the number of regions to copy.
- **pRegions** is a pointer to an array of `VkBufferCopy2` structures specifying the regions to copy.

### Valid Usage

- VUID-VkCopyBufferInfo2-srcOffset-00113
  The `srcOffset` member of each element of `pRegions` must be less than the size of `srcBuffer`
- VUID-VkCopyBufferInfo2-dstOffset-00114
  The `dstOffset` member of each element of `pRegions` must be less than the size of `dstBuffer`
- VUID-VkCopyBufferInfo2-size-00115
  The `size` member of each element of `pRegions` must be less than or equal to the size of `srcBuffer` minus `srcOffset`
- VUID-VkCopyBufferInfo2-size-00116
  The `size` member of each element of `pRegions` must be less than or equal to the size of `dstBuffer` minus `dstOffset`
- VUID-VkCopyBufferInfo2-pRegions-00117
  The union of the source regions, and the union of the destination regions, specified by the elements of `pRegions`, must not overlap in memory
- VUID-VkCopyBufferInfo2-srcBuffer-00118
  `srcBuffer` must have been created with `VK_BUFFER_USAGE_TRANSFER_SRC_BIT` usage flag
- VUID-VkCopyBufferInfo2-srcBuffer-00119
  If `srcBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-VkCopyBufferInfo2-dstBuffer-00120
  `dstBuffer` must have been created with `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage flag
- VUID-VkCopyBufferInfo2-dstBuffer-00121
  If `dstBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

### Valid Usage (Implicit)

- VUID-VkCopyBufferInfo2-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_COPY_BUFFER_INFO_2`
- VUID-VkCopyBufferInfo2-pNext-pNext
  `pNext` must be `NULL`
- VUID-VkCopyBufferInfo2-srcBuffer-parameter
  `srcBuffer` must be a valid `VkBuffer` handle
• VUID-VkCopyBufferInfo2-dstBuffer-parameter
dstBuffer must be a valid VkBuffer handle

• VUID-VkCopyBufferInfo2-pRegions-parameter
pRegions must be a valid pointer to an array of regionCount valid VkBufferCopy2 structures

• VUID-VkCopyBufferInfo2-regionCount-arraylength
regionCount must be greater than 0

• VUID-VkCopyBufferInfo2-commonparent
Both of dstBuffer, and srcBuffer must have been created, allocated, or retrieved from the same VkDevice

The VkBufferCopy2 structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkBufferCopy2 {
    VkStructureType sType;
    const void* pNext;
    VkDeviceSize srcOffset;
    VkDeviceSize dstOffset;
    VkDeviceSize size;
} VkBufferCopy2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkBufferCopy2 VkBufferCopy2KHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• srcOffset is the starting offset in bytes from the start of srcBuffer.
• dstOffset is the starting offset in bytes from the start of dstBuffer.
• size is the number of bytes to copy.

Valid Usage

• VUID-VkBufferCopy2-size-01988
The size must be greater than 0

Valid Usage (Implicit)

• VUID-VkBufferCopy2-sType-sType
sType must be VK_STRUCTURE_TYPE_BUFFER_COPY_2
20.2. Copying Data Between Images

To copy data between image objects, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdCopyImage(
    VkCommandBuffer commandBuffer,
    VkImage srcImage,
    VkImageLayout srcImageLayout,
    VkImage dstImage,
    VkImageLayout dstImageLayout,
    uint32_t regionCount,
    const VkImageCopy* pRegions);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `srcImage` is the source image.
- `srcImageLayout` is the current layout of the source image subresource.
- `dstImage` is the destination image.
- `dstImageLayout` is the current layout of the destination image subresource.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkImageCopy` structures specifying the regions to copy.

Each source region specified by `pRegions` is copied from the source image to the destination region of the destination image. If any of the specified regions in `srcImage` overlaps in memory with any of the specified regions in `dstImage`, values read from those overlapping regions are undefined.

**Multi-planar images** can only be copied on a per-plane basis, and the subresources used in each region when copying to or from such images must specify only one plane, though different regions can specify different planes. When copying planes of multi-planar images, the format considered is the compatible format for that plane, rather than the format of the multi-planar image.

If the format of the destination image has a different block extent than the source image (e.g. one is a compressed format), the offset and extent for each of the regions specified is scaled according to the block extents of each format to match in size. Copy regions for each image must be aligned to a multiple of the texel block extent in each dimension, except at the edges of the image, where region extents must match the edge of the image.

Image data can be copied between images with different image types. If one image is `VK_IMAGE_TYPE_3D` and the other image is `VK_IMAGE_TYPE_2D` with multiple layers, then each slice is copied to or from a different layer; depth slices in the 3D image correspond to `layerCount` layers in the 2D image, with an effective depth of 1 used for the 2D image. If `maintenance5` is enabled, all other combinations are allowed and function as if 1D images are 2D images with a height of 1. Otherwise,
other combinations of image types are disallowed.

Valid Usage

• VUID-vkCmdCopyImage-commandBuffer-01825
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, srcImage must not be a protected image

• VUID-vkCmdCopyImage-commandBuffer-01826
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, dstImage must not be a protected image

• VUID-vkCmdCopyImage-commandBuffer-01827
  If commandBuffer is a protected command buffer and protectedNoFault is not supported, dstImage must not be an unprotected image

• VUID-vkCmdCopyImage-pRegions-00124
  The union of all source regions, and the union of all destination regions, specified by the elements of pRegions, must not overlap in memory

• VUID-vkCmdCopyImage-srcImage-01995
  The format features of srcImage must contain VK_FORMAT_FEATURE_TRANSFER_SRC_BIT

• VUID-vkCmdCopyImage-srcImageLayout-00128
  srcImageLayout must specify the layout of the image subresources of srcImage specified in pRegions at the time this command is executed on a VkDevice

• VUID-vkCmdCopyImage-srcImageLayout-01917
  srcImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL, or VK_IMAGE_LAYOUT_GENERAL

• VUID-vkCmdCopyImage-srcImage-09460
  If srcImage and dstImage are the same, and any elements of pRegions contains the srcSubresource and dstSubresource with matching mipmap and overlapping array layers, then the srcImageLayout and dstImageLayout must be VK_IMAGE_LAYOUT_GENERAL or VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR

• VUID-vkCmdCopyImage-dstImage-01996
  The format features of dstImage must contain VK_FORMAT_FEATURE_TRANSFER_DST_BIT

• VUID-vkCmdCopyImage-dstImageLayout-00133
  dstImageLayout must specify the layout of the image subresources of dstImage specified in pRegions at the time this command is executed on a VkDevice

• VUID-vkCmdCopyImage-dstImageLayout-01395
  dstImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL, or VK_IMAGE_LAYOUT_GENERAL

• VUID-vkCmdCopyImage-srcImage-01548
  If the VkFormat of each of srcImage and dstImage is not a multi-planar format, the VkFormat of each of srcImage and dstImage must be size-compatible

• VUID-vkCmdCopyImage-None-01549
  In a copy to or from a plane of a multi-planar image, the VkFormat of the image and plane
must be compatible according to the description of compatible planes for the plane being copied

- VUID-vkCmdCopyImage-srcImage-09247
  If the VkFormat of each of srcImage and dstImage is a compressed image format, the formats must have the same texel block extent

- VUID-vkCmdCopyImage-srcImage-00136
  The sample count of srcImage and dstImage must match

- VUID-vkCmdCopyImage-srcOffset-01783
  The srcOffset and extent members of each element of pRegions must respect the image transfer granularity requirements of commandBuffer’s command pool’s queue family, as described in VkQueueFamilyProperties

- VUID-vkCmdCopyImage-dstOffset-01784
  The dstOffset and extent members of each element of pRegions must respect the image transfer granularity requirements of commandBuffer’s command pool’s queue family, as described in VkQueueFamilyProperties

- VUID-vkCmdCopyImage-srcImage-01551
  If neither srcImage nor dstImage has a multi-planar image format then for each element of pRegions, srcSubresource.aspectMask and dstSubresource.aspectMask must match

- VUID-vkCmdCopyImage-srcImage-01556
  If srcImage has a multi-planar image format and the dstImage does not have a multi-planar image format, then for each element of pRegions, dstSubresource.aspectMask must be VK_IMAGE_ASPECT_COLOR_BIT

- VUID-vkCmdCopyImage-dstImage-01557
  If dstImage has a multi-planar image format and the srcImage does not have a multi-planar image format, then for each element of pRegions, srcSubresource.aspectMask must be VK_IMAGE_ASPECT_COLOR_BIT
dstSubresource.baseArrayLayer must be 0 and dstSubresource.layerCount must be 1

• VUID-vkCmdCopyImage-aspectMask-00142
  For each element of pRegions, srcSubresource.aspectMask must specify aspects present in srcImage

• VUID-vkCmdCopyImage-aspectMask-00143
  For each element of pRegions, dstSubresource.aspectMask must specify aspects present in dstImage

• VUID-vkCmdCopyImage-srcOffset-00144
  For each element of pRegions, srcOffset.x and (extent.width + srcOffset.x) must both be greater than or equal to 0 and less than or equal to the width of the specified srcSubresource of srcImage

• VUID-vkCmdCopyImage-srcOffset-00145
  For each element of pRegions, srcOffset.y and (extent.height + srcOffset.y) must both be greater than or equal to 0 and less than or equal to the height of the specified srcSubresource of srcImage

• VUID-vkCmdCopyImage-srcImage-00146
  If srcImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, srcOffset.y must be 0 and extent.height must be 1

• VUID-vkCmdCopyImage-srcOffset-00147
  If srcImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions, srcOffset.z and (extent.depth + srcOffset.z) must both be greater than or equal to 0 and less than or equal to the depth of the specified srcSubresource of srcImage

• VUID-vkCmdCopyImage-srcImage-01785
  If srcImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, srcOffset.z must be 0 and extent.depth must be 1

• VUID-vkCmdCopyImage-dstImage-01786
  If dstImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, dstOffset.z must be 0 and extent.depth must be 1

• VUID-vkCmdCopyImage-srcImage-01787
  If srcImage is of type VK_IMAGE_TYPE_2D, then for each element of pRegions, srcOffset.z must be 0

• VUID-vkCmdCopyImage-dstImage-01788
  If dstImage is of type VK_IMAGE_TYPE_2D, then for each element of pRegions, dstOffset.z must be 0

• VUID-vkCmdCopyImage-apiVersion-07933
  If the VK_KHR_maintenance1 extension is not enabled, and VkPhysicalDeviceProperties::apiVersion is less than Vulkan 1.1, srcImage and dstImage must have the same VkImageType

• VUID-vkCmdCopyImage-apiVersion-08969
  If the VK_KHR_maintenance1 extension is not enabled, and VkPhysicalDeviceProperties::apiVersion is less than Vulkan 1.1, srcImage or dstImage is of type VK_IMAGE_TYPE_2D, then for each element of pRegions, extent.depth must be 1

• VUID-vkCmdCopyImage-srcImage-07743
If `srcImage` and `dstImage` have a different `VkImageType`, and `maintenance5` is not enabled, one **must** be `VK_IMAGE_TYPE_3D` and the other **must** be `VK_IMAGE_TYPE_2D`.

- **VUID-vkCmdCopyImage-srcImage-08793**
  If `srcImage` and `dstImage` have the same `VkImageType`, for each element of `pRegions`, if neither of the `layerCount` members of `srcSubresource` or `dstSubresource` are `VK_REMAINING_ARRAY_LAYERS`, the `layerCount` members of `srcSubresource` or `dstSubresource` **must** match.

- **VUID-vkCmdCopyImage-srcImage-08794**
  If `srcImage` and `dstImage` have the same `VkImageType`, and one of the `layerCount` members of `srcSubresource` or `dstSubresource` is `VK_REMAINING_ARRAY_LAYERS`, the other member **must** be either `VK_REMAINING_ARRAY_LAYERS` or equal to the `arrayLayers` member of the `VkImageCreateInfo` used to create the image minus `baseArrayLayer`.

- **VUID-vkCmdCopyImage-srcImage-01790**
  If `srcImage` and `dstImage` are both of type `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `extent.depth` **must** be 1.

- **VUID-vkCmdCopyImage-srcImage-01791**
  If `srcImage` is of type `VK_IMAGE_TYPE_2D`, and `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `extent.depth` **must** equal `srcSubresource.layerCount`.

- **VUID-vkCmdCopyImage-dstImage-01792**
  If `dstImage` is of type `VK_IMAGE_TYPE_2D`, and `srcImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `extent.depth` **must** equal `dstSubresource.layerCount`.

- **VUID-vkCmdCopyImage-dstOffset-00150**
  For each element of `pRegions, dstOffset.x` and `(extent.width + dstOffset.x)` **must** both be greater than or equal to 0 and less than or equal to the width of the specified `dstSubresource` of `dstImage`.

- **VUID-vkCmdCopyImage-dstOffset-00151**
  For each element of `pRegions, dstOffset.y` and `(extent.height + dstOffset.y)` **must** both be greater than or equal to 0 and less than or equal to the height of the specified `dstSubresource` of `dstImage`.

- **VUID-vkCmdCopyImage-dstImage-00152**
  If `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions, dstOffset.y` **must** be 0 and `extent.height` **must** be 1.

- **VUID-vkCmdCopyImage-dstOffset-00153**
  If `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions, dstOffset.z` and `(extent.depth + dstOffset.z)` **must** both be greater than or equal to 0 and less than or equal to the depth of the specified `dstSubresource` of `dstImage`.

- **VUID-vkCmdCopyImage-pRegions-07278**
  For each element of `pRegions, srcOffset.x` **must** be a multiple of the texel block extent width of the `VkFormat` of `srcImage`.

- **VUID-vkCmdCopyImage-pRegions-07279**
  For each element of `pRegions, srcOffset.y` **must** be a multiple of the texel block extent height of the `VkFormat` of `srcImage`.

- **VUID-vkCmdCopyImage-pRegions-07280**
For each element of \( p\text{Regions} \), \( \text{srcOffset.z} \) must be a multiple of the texel block extent depth of the \( \text{VkFormat} \) of \( \text{srcImage} \)

- VUID-vkCmdCopyImage-pRegions-07281
  For each element of \( p\text{Regions}, \text{dstOffset.x} \) must be a multiple of the texel block extent width of the \( \text{VkFormat} \) of \( \text{dstImage} \)

- VUID-vkCmdCopyImage-pRegions-07282
  For each element of \( p\text{Regions}, \text{dstOffset.y} \) must be a multiple of the texel block extent height of the \( \text{VkFormat} \) of \( \text{dstImage} \)

- VUID-vkCmdCopyImage-pRegions-07283
  For each element of \( p\text{Regions}, \text{dstOffset.z} \) must be a multiple of the texel block extent depth of the \( \text{VkFormat} \) of \( \text{dstImage} \)

- VUID-vkCmdCopyImage-srcImage-01728
  For each element of \( p\text{Regions} \), if the sum of \( \text{srcOffset.x} \) and \( \text{extent.width} \) does not equal the width of the subresource specified by \( \text{srcSubresource}, \text{extent.width} \) must be a multiple of the texel block extent width of the \( \text{VkFormat} \) of \( \text{srcImage} \)

- VUID-vkCmdCopyImage-srcImage-01729
  For each element of \( p\text{Regions} \), if the sum of \( \text{srcOffset.y} \) and \( \text{extent.height} \) does not equal the height of the subresource specified by \( \text{srcSubresource}, \text{extent.height} \) must be a multiple of the texel block extent height of the \( \text{VkFormat} \) of \( \text{srcImage} \)

- VUID-vkCmdCopyImage-srcImage-01730
  For each element of \( p\text{Regions} \), if the sum of \( \text{srcOffset.z} \) and \( \text{extent.depth} \) does not equal the depth of the subresource specified by \( \text{srcSubresource}, \text{extent.depth} \) must be a multiple of the texel block extent depth of the \( \text{VkFormat} \) of \( \text{srcImage} \)

- VUID-vkCmdCopyImage-dstImage-01732
  For each element of \( p\text{Regions} \), if the sum of \( \text{dstOffset.x} \) and \( \text{extent.width} \) does not equal the width of the subresource specified by \( \text{dstSubresource}, \text{extent.width} \) must be a multiple of the texel block extent width of the \( \text{VkFormat} \) of \( \text{dstImage} \)

- VUID-vkCmdCopyImage-dstImage-01733
  For each element of \( p\text{Regions} \), if the sum of \( \text{dstOffset.y} \) and \( \text{extent.height} \) does not equal the height of the subresource specified by \( \text{dstSubresource}, \text{extent.height} \) must be a multiple of the texel block extent height of the \( \text{VkFormat} \) of \( \text{dstImage} \)

- VUID-vkCmdCopyImage-dstImage-01734
  For each element of \( p\text{Regions} \), if the sum of \( \text{dstOffset.z} \) and \( \text{extent.depth} \) does not equal the depth of the subresource specified by \( \text{dstSubresource}, \text{extent.depth} \) must be a multiple of the texel block extent depth of the \( \text{VkFormat} \) of \( \text{dstImage} \)

- VUID-vkCmdCopyImage-aspect-06662
  If the aspect member of any element of \( p\text{Regions} \) includes any flag other than \( \text{VK_IMAGE_ASPECT_STENCIL_BIT} \) or \( \text{srcImage} \) was not created with separate stencil usage, \( \text{VK_IMAGE_USAGE_TRANSFER_SRC_BIT} \) must have been included in the \( \text{VkImageCreateInfo}::\text{usage} \) used to create \( \text{srcImage} \)

- VUID-vkCmdCopyImage-aspect-06663
  If the aspect member of any element of \( p\text{Regions} \) includes any flag other than \( \text{VK_IMAGE_ASPECT_STENCIL_BIT} \) or \( \text{dstImage} \) was not created with separate stencil usage,
VK_IMAGE_USAGE_TRANSFER_DST_BIT must have been included in the VkImageCreateInfo::usage used to create dstImage

- VUID-vkCmdCopyImage-aspect-06664
  If the aspect member of any element of pRegions includes VK_IMAGE_ASPECT_STENCIL_BIT, and srcImage was created with separate stencil usage, VK_IMAGE_USAGE_TRANSFER_SRC_BIT must have been included in the VkImageStencilUsageCreateInfo::stencilUsage used to create srcImage

- VUID-vkCmdCopyImage-aspect-06665
  If the aspect member of any element of pRegions includes VK_IMAGE_ASPECT_STENCIL_BIT, and dstImage was created with separate stencil usage, VK_IMAGE_USAGE_TRANSFER_DST_BIT must have been included in the VkImageStencilUsageCreateInfo::stencilUsage used to create dstImage

- VUID-vkCmdCopyImage-srcImage-07966
  If srcImage is non-sparse then the image or the specified disjoint plane must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdCopyImage-srcSubresource-07967
  The srcSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when srcImage was created

- VUID-vkCmdCopyImage-srcSubresource-07968
  If srcSubresource.layerCount is not VK_REMAINING_ARRAY_LAYERS, srcSubresource.baseArrayLayer + srcSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when srcImage was created

- VUID-vkCmdCopyImage-srcImage-07969
  srcImage must not have been created with flags containing VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT

- VUID-vkCmdCopyImage-dstImage-07966
  If dstImage is non-sparse then the image or the specified disjoint plane must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdCopyImage-dstSubresource-07967
  The dstSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when dstImage was created

- VUID-vkCmdCopyImage-dstSubresource-07968
  If dstSubresource.layerCount is not VK_REMAINING_ARRAY_LAYERS, dstSubresource.baseArrayLayer + dstSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when dstImage was created

- VUID-vkCmdCopyImage-dstImage-07969
  dstImage must not have been created with flags containing VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT
Valid Usage (Implicit)

- VUID-vkCmdCopyImage-commandBuffer-parameter
  \texttt{commandBuffer must} be a valid \texttt{VkCommandBuffer} handle

- VUID-vkCmdCopyImage-srcImage-parameter
  \texttt{srcImage must} be a valid \texttt{VkImage} handle

- VUID-vkCmdCopyImage-srcImageLayout-parameter
  \texttt{srcImageLayout must} be a valid \texttt{VkImageLayout} value

- VUID-vkCmdCopyImage-dstImage-parameter
  \texttt{dstImage must} be a valid \texttt{VkImage} handle

- VUID-vkCmdCopyImage-dstImageLayout-parameter
  \texttt{dstImageLayout must} be a valid \texttt{VkImageLayout} value

- VUID-vkCmdCopyImage-pRegions-parameter
  \texttt{pRegions must} be a valid pointer to an array of \texttt{regionCount} valid \texttt{VkImageCopy} structures

- VUID-vkCmdCopyImage-commandBuffer-recording
  \texttt{commandBuffer must} be in the \texttt{recording} state

- VUID-vkCmdCopyImage-commandBuffer-cmdpool
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \texttt{must} support transfer, graphics, or compute operations

- VUID-vkCmdCopyImage-renderpass
  This command \texttt{must} only be called outside of a render pass instance

- VUID-vkCmdCopyImage-videocoding
  This command \texttt{must} only be called outside of a video coding scope

- VUID-vkCmdCopyImage-regionCount-arraylength
  \texttt{regionCount must} be greater than \texttt{0}

- VUID-vkCmdCopyImage-commonparent
  Each of \texttt{commandBuffer, dstImage, and srcImage must} have been created, allocated, or retrieved from the same \texttt{VkDevice}

Host Synchronization

- Host access to \texttt{commandBuffer must} be externally synchronized

- Host access to the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \texttt{must} be externally synchronized
The **VkImageCopy** structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageCopy {
    VkImageSubresourceLayers srcSubresource;
    VkOffset3D srcOffset;
    VkImageSubresourceLayers dstSubresource;
    VkOffset3D dstOffset;
    VkExtent3D extent;
} VkImageCopy;
```

- **srcSubresource** and **dstSubresource** are **VkImageSubresourceLayers** structures specifying the image subresources of the images used for the source and destination image data, respectively.
- **srcOffset** and **dstOffset** select the initial x, y, and z offsets in texels of the sub-regions of the source and destination image data.
- **extent** is the size in texels of the image to copy in width, height and depth.

### Valid Usage

- **VUID-VkImageCopy-apiVersion-07940**
  If the **VK_KHR_sampler_ycbcr_conversion** extension is not enabled, and **VkPhysicalDeviceProperties::apiVersion** is less than Vulkan 1.1, the **aspectMask** member of **srcSubresource** and **dstSubresource** must match

- **VUID-VkImageCopy-apiVersion-07941**
  If the **VK_KHR_maintenance1** extension is not enabled, and **VkPhysicalDeviceProperties::apiVersion** is less than Vulkan 1.1, the **layerCount** member of **srcSubresource** and **dstSubresource** must match

- **VUID-VkImageCopy-extent-06668**
  **extent.width** must not be 0

- **VUID-VkImageCopy-extent-06669**
  **extent.height** must not be 0

- **VUID-VkImageCopy-extent-06670**
  **extent.depth** must not be 0
Valid Usage (Implicit)

- VUID-VkImageCopy-srcSubresource-parameter
  `srcSubresource` must be a valid `VkImageSubresourceLayers` structure

- VUID-VkImageCopy-dstSubresource-parameter
  `dstSubresource` must be a valid `VkImageSubresourceLayers` structure

The `VkImageSubresourceLayers` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageSubresourceLayers {
    VkImageAspectFlags aspectMask;
    uint32_t mipLevel;
    uint32_t baseArrayLayer;
    uint32_t layerCount;
} VkImageSubresourceLayers;
```

- `aspectMask` is a combination of `VkImageAspectFlagBits`, selecting the color, depth and/or stencil aspects to be copied.
- `mipLevel` is the mipmap level to copy
- `baseArrayLayer` and `layerCount` are the starting layer and number of layers to copy.

Valid Usage

- VUID-VkImageSubresourceLayers-aspectMask-00167
  If `aspectMask` contains `VK_IMAGE_ASPECT_COLOR_BIT`, it must not contain either of `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT`

- VUID-VkImageSubresourceLayers-aspectMask-00168
  `aspectMask` must not contain `VK_IMAGE_ASPECT_METADATA_BIT`

- VUID-VkImageSubresourceLayers-aspectMask-02247
  `aspectMask` must not include `VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT` for any index `i`

- VUID-VkImageSubresourceLayers-layerCount-09243
  If the maintenance5 feature is not enabled, `layerCount` must not be `VK_REMAINING_ARRAY_LAYERS`

- VUID-VkImageSubresourceLayers-layerCount-01700
  If `layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, it must be greater than 0

Valid Usage (Implicit)

- VUID-VkImageSubresourceLayers-aspectMask-parameter
  `aspectMask` must be a valid combination of `VkImageAspectFlagBits` values

- VUID-VkImageSubresourceLayers-aspectMask-requiredbitmask
A more extensible version of the copy image command is defined below.

To copy data between image objects, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdCopyImage2(
    VkCommandBuffer commandBuffer,
    const VkCopyImageInfo2* pCopyImageInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_copy_commands2
void vkCmdCopyImage2KHR(
    VkCommandBuffer commandBuffer,
    const VkCopyImageInfo2* pCopyImageInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pCopyImageInfo` is a pointer to a `VkCopyImageInfo2` structure describing the copy parameters.

This command is functionally identical to `vkCmdCopyImage`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

### Valid Usage

- VUID-vkCmdCopyImage2-commandBuffer-01825
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcImage` must not be a protected image

- VUID-vkCmdCopyImage2-commandBuffer-01826
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstImage` must not be a protected image

- VUID-vkCmdCopyImage2-commandBuffer-01827
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstImage` must not be an unprotected image

### Valid Usage (Implicit)

- VUID-vkCmdCopyImage2-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdCopyImage2-pCopyImageInfo-parameter
  `pCopyImageInfo` must be a valid pointer to a valid `VkCopyImageInfo2` structure

- VUID-vkCmdCopyImage2-commandBuffer-recording

---

.aspectMask must not be 0

---
commandBuffer must be in the recording state

- VUID-vkCmdCopyImage2-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support transfer, graphics, or compute operations

- VUID-vkCmdCopyImage2-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdCopyImage2-videocoding
  This command must only be called outside of a video coding scope

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>

</tbody>
</table>

The VkCopyImageInfo2 structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkCopyImageInfo2 {
    VkStructureType     sType;
    const void*         pNext;
    VkImage             srcImage;
    VkImageLayout       srcImageLayout;
    VkImage             dstImage;
    VkImageLayout       dstImageLayout;
    uint32_t            regionCount;
    const VkImageCopy2* pRegions;
} VkCopyImageInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkCopyImageInfo2 VkCopyImageInfo2KHR;
```
• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• srcImage is the source image.
• srcImageLayout is the current layout of the source image subresource.
• dstImage is the destination image.
• dstImageLayout is the current layout of the destination image subresource.
• regionCount is the number of regions to copy.
• pRegions is a pointer to an array of VkImageCopy2 structures specifying the regions to copy.

Valid Usage

• VUID-VkCopyImageInfo2-pRegions-00124
  The union of all source regions, and the union of all destination regions, specified by the elements of pRegions, must not overlap in memory

• VUID-VkCopyImageInfo2-srcImage-01995
  The format features of srcImage must contain VK_FORMAT_FEATURE_TRANSFER_SRC_BIT

• VUID-VkCopyImageInfo2-srcImageLayout-00128
  srcImageLayout must specify the layout of the image subresources of srcImage specified in pRegions at the time this command is executed on a VkDevice

• VUID-VkCopyImageInfo2-srcImageLayout-01917
  srcImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL, or VK_IMAGE_LAYOUT_GENERAL

• VUID-VkCopyImageInfo2-dstImage-01996
  The format features of dstImage must contain VK_FORMAT_FEATURE_TRANSFER_DST_BIT

• VUID-VkCopyImageInfo2-dstImageLayout-00133
  dstImageLayout must specify the layout of the image subresources of dstImage specified in pRegions at the time this command is executed on a VkDevice

• VUID-VkCopyImageInfo2-dstImageLayout-01395
  dstImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL, or VK_IMAGE_LAYOUT_GENERAL

• VUID-VkCopyImageInfo2-srcImage-01548
  If the VkFormat of each of srcImage and dstImage is not a multi-planar format, the VkFormat of each of srcImage and dstImage must be size-compatible

• VUID-VkCopyImageInfo2-None-01549
  In a copy to or from a plane of a multi-planar image, the VkFormat of the image and plane must be compatible according to the description of compatible planes for the plane being
• VUID-VkCopyImageInfo2-srcImage-09247
  If the VkFormat of each of srcImage and dstImage is a compressed image format, the formats must have the same texel block extent

• VUID-VkCopyImageInfo2-srcImage-00136
  The sample count of srcImage and dstImage must match

• VUID-VkCopyImageInfo2-srcOffset-01783
  The srcOffset and extent members of each element of pRegions must respect the image transfer granularity requirements of commandBuffer’s command pool’s queue family, as described in VkQueueFamilyProperties

• VUID-VkCopyImageInfo2-dstOffset-01784
  The dstOffset and extent members of each element of pRegions must respect the image transfer granularity requirements of commandBuffer’s command pool’s queue family, as described in VkQueueFamilyProperties

• VUID-VkCopyImageInfo2-srcImage-01551
  If neither srcImage nor dstImage has a multi-planar image format then for each element of pRegions, srcSubresource.aspectMask and dstSubresource.aspectMask must match

• VUID-VkCopyImageInfo2-srcImage-08713
  If srcImage has a multi-planar image format, then for each element of pRegions, srcSubresource.aspectMask must be a single valid multi-planar aspect mask bit

• VUID-VkCopyImageInfo2-dstImage-08714
  If dstImage has a multi-planar image format, then for each element of pRegions, dstSubresource.aspectMask must be a single valid multi-planar aspect mask bit

• VUID-VkCopyImageInfo2-srcImage-01556
  If srcImage has a multi-planar image format and the dstImage does not have a multi-planar image format, then for each element of pRegions, dstSubresource.aspectMask must be VK_IMAGE_ASPECT_COLOR_BIT

• VUID-VkCopyImageInfo2-dstImage-01557
  If dstImage has a multi-planar image format and the srcImage does not have a multi-planar image format, then for each element of pRegions, srcSubresource.aspectMask must be VK_IMAGE_ASPECT_COLOR_BIT

• VUID-VkCopyImageInfo2-apiVersion-07932
  If the VK_KHR_maintenance1 extension is not enabled, or VkPhysicalDeviceProperties::apiVersion is less than Vulkan 1.1, and either srcImage or dstImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions, srcSubresource.baseArrayLayer and dstSubresource.baseArrayLayer must both be 0, and srcSubresource.layerCount and dstSubresource.layerCount must both be 1

• VUID-VkCopyImageInfo2-srcImage-04443
  If srcImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions, srcSubresource.baseArrayLayer must be 0 and srcSubresource.layerCount must be 1

• VUID-VkCopyImageInfo2-dstImage-04444
  If dstImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions, dstSubresource.baseArrayLayer must be 0 and dstSubresource.layerCount must be 1
For each element of `pRegions`, `srcSubresource.aspectMask` must specify aspects present in `srcImage`.

For each element of `pRegions`, `dstSubresource.aspectMask` must specify aspects present in `dstImage`.

For each element of `pRegions`, `srcOffset.x` and `(extent.width + srcOffset.x)` must both be greater than or equal to 0 and less than or equal to the width of the specified `srcSubresource` of `srcImage`.

For each element of `pRegions`, `srcOffset.y` and `(extent.height + srcOffset.y)` must both be greater than or equal to 0 and less than or equal to the height of the specified `srcSubresource` of `srcImage`.

If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `srcOffset.y` must be 0 and `extent.height` must be 1.

If `srcImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `srcOffset.z` and `(extent.depth + srcOffset.z)` must both be greater than or equal to 0 and less than or equal to the depth of the specified `srcSubresource` of `srcImage`.

If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `srcOffset.z` must be 0 and `extent.depth` must be 1.

If `srcImage` and `dstImage` have a different `VkImageType`, and `maintenance5` is not enabled, `srcImage` and `dstImage` must have the same `VkImageType`.

If the `VK_KHR_maintenance1` extension is not enabled, and `VkPhysicalDeviceProperties::apiVersion` is less than Vulkan 1.1, `srcImage` and `dstImage` must have the same `VkImageType`.

If the `VK_KHR_maintenance1` extension is not enabled, and `VkPhysicalDeviceProperties::apiVersion` is less than Vulkan 1.1, `srcImage` or `dstImage` is of type `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `extent.depth` must be 1.
one **must** be **VK_IMAGE_TYPE_3D** and the other **must** be **VK_IMAGE_TYPE_2D**

- VUID-VkCopyImageInfo2-srcImage-08793
  If `srcImage` and `dstImage` have the same `VkImageType`, for each element of `pRegions`, if neither of the `layerCount` members of `srcSubresource` or `dstSubresource` are `VK_REMAINING_ARRAY_LAYERS`, the `layerCount` members of `srcSubresource` or `dstSubresource` **must** match

- VUID-VkCopyImageInfo2-srcImage-08794
  If `srcImage` and `dstImage` have the same `VkImageType`, and one of the `layerCount` members of `srcSubresource` or `dstSubresource` is `VK_REMAINING_ARRAY_LAYERS`, the other member **must** be either `VK_REMAINING_ARRAY_LAYERS` or equal to the `arrayLayers` member of the `VkImageCreateInfo` used to create the image minus `baseArrayLayer`

- VUID-VkCopyImageInfo2-srcImage-01790
  If `srcImage` and `dstImage` are both of type `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `extent.depth` **must** be 1

- VUID-VkCopyImageInfo2-srcImage-01791
  If `srcImage` is of type `VK_IMAGE_TYPE_2D`, and `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `extent.depth` **must** equal `srcSubresource.layerCount`

- VUID-VkCopyImageInfo2-dstImage-01792
  If `dstImage` is of type `VK_IMAGE_TYPE_2D`, and `srcImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `extent.depth` **must** equal `dstSubresource.layerCount`

- VUID-VkCopyImageInfo2-dstOffset-00150
  For each element of `pRegions`, `dstOffset.x` and `(extent.width + dstOffset.x)` **must** both be greater than or equal to 0 and less than or equal to the width of the specified `dstSubresource` of `dstImage`

- VUID-VkCopyImageInfo2-dstOffset-00151
  For each element of `pRegions`, `dstOffset.y` and `(extent.height + dstOffset.y)` **must** both be greater than or equal to 0 and less than or equal to the height of the specified `dstSubresource` of `dstImage`

- VUID-VkCopyImageInfo2-dstOffset-00152
  If `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `dstOffset.z` **must** be 0 and `extent.height` **must** be 1

- VUID-VkCopyImageInfo2-dstOffset-00153
  If `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `dstOffset.z` and `(extent.depth + dstOffset.z)` **must** both be greater than or equal to 0 and less than or equal to the depth of the specified `dstSubresource` of `dstImage`

- VUID-VkCopyImageInfo2-pRegions-07278
  For each element of `pRegions`, `srcOffset.x` **must** be a multiple of the `texel block extent width` of the `VkFormat` of `srcImage`

- VUID-VkCopyImageInfo2-pRegions-07279
  For each element of `pRegions`, `srcOffset.y` **must** be a multiple of the `texel block extent height` of the `VkFormat` of `srcImage`

- VUID-VkCopyImageInfo2-pRegions-07280
  For each element of `pRegions`, `srcOffset.z` **must** be a multiple of the `texel block extent...`
depth of the VkFormat of srcImage

- VUID-VkCopyImageInfo2-pRegions-07281
  For each element of pRegions, dstOffset.x must be a multiple of the texel block extent width of the VkFormat of dstImage

- VUID-VkCopyImageInfo2-pRegions-07282
  For each element of pRegions, dstOffset.y must be a multiple of the texel block extent height of the VkFormat of dstImage

- VUID-VkCopyImageInfo2-pRegions-07283
  For each element of pRegions, dstOffset.z must be a multiple of the texel block extent depth of the VkFormat of dstImage

- VUID-VkCopyImageInfo2-srcImage-01728
  For each element of pRegions, if the sum of srcOffset.x and extent.width does not equal the width of the subresource specified by srcSubresource, extent.width must be a multiple of the texel block extent width of the VkFormat of srcImage

- VUID-VkCopyImageInfo2-srcImage-01729
  For each element of pRegions, if the sum of srcOffset.y and extent.height does not equal the height of the subresource specified by srcSubresource, extent.height must be a multiple of the texel block extent height of the VkFormat of srcImage

- VUID-VkCopyImageInfo2-srcImage-01730
  For each element of pRegions, if the sum of srcOffset.z and extent.depth does not equal the depth of the subresource specified by srcSubresource, extent.depth must be a multiple of the texel block extent depth of the VkFormat of srcImage

- VUID-VkCopyImageInfo2-dstImage-01732
  For each element of pRegions, if the sum of dstOffset.x and extent.width does not equal the width of the subresource specified by dstSubresource, extent.width must be a multiple of the texel block extent width of the VkFormat of dstImage

- VUID-VkCopyImageInfo2-dstImage-01733
  For each element of pRegions, if the sum of dstOffset.y and extent.height does not equal the height of the subresource specified by dstSubresource, extent.height must be a multiple of the texel block extent height of the VkFormat of dstImage

- VUID-VkCopyImageInfo2-dstImage-01734
  For each element of pRegions, if the sum of dstOffset.z and extent.depth does not equal the depth of the subresource specified by dstSubresource, extent.depth must be a multiple of the texel block extent depth of the VkFormat of dstImage

- VUID-VkCopyImageInfo2-aspect-06662
  If the aspect member of any element of pRegions includes any flag other than VK_IMAGE_ASPECT_STENCIL_BIT or srcImage was not created with separate stencil usage, VK_IMAGE_USAGE_TRANSFER_SRC_BIT must have been included in the VkImageCreateInfo::usage used to create srcImage

- VUID-VkCopyImageInfo2-aspect-06663
  If the aspect member of any element of pRegions includes any flag other than VK_IMAGE_ASPECT_STENCIL_BIT or dstImage was not created with separate stencil usage, VK_IMAGE_USAGE_TRANSFER_DST_BIT must have been included in the VkImageCreateInfo::usage used to create dstImage
::usage used to create dstImage

- VUID-VkCopyImageInfo2-aspect-06664
  If the aspect member of any element of pRegions includes VK_IMAGE_ASPECT_STENCIL_BIT, and srcImage was created with separate stencil usage, VK_IMAGE_USAGE_TRANSFER_SRC_BIT must have been included in the VkImageStencilUsageCreateInfo::stencilUsage used to create srcImage.

- VUID-VkCopyImageInfo2-aspect-06665
  If the aspect member of any element of pRegions includes VK_IMAGE_ASPECT_STENCIL_BIT, and dstImage was created with separate stencil usage, VK_IMAGE_USAGE_TRANSFER_DST_BIT must have been included in the VkImageStencilUsageCreateInfo::stencilUsage used to create dstImage.

- VUID-VkCopyImageInfo2-srcImage-07966
  If srcImage is non-sparse then the image or the specified disjoint plane must be bound completely and contiguously to a single VkDeviceMemory object.

- VUID-VkCopyImageInfo2-srcSubresource-07967
  The srcSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when srcImage was created.

- VUID-VkCopyImageInfo2-srcSubresource-07968
  If srcSubresource.layerCount is not VK_REMAINING_ARRAY_LAYERS, srcSubresource.baseArrayLayer + srcSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when srcImage was created.

- VUID-VkCopyImageInfo2-srcImage-07969
  srcImage must not have been created with flags containing VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT.

- VUID-VkCopyImageInfo2-dstImage-07966
  If dstImage is non-sparse then the image or the specified disjoint plane must be bound completely and contiguously to a single VkDeviceMemory object.

- VUID-VkCopyImageInfo2-dstSubresource-07967
  The dstSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when dstImage was created.

- VUID-VkCopyImageInfo2-dstSubresource-07968
  If dstSubresource.layerCount is not VK_REMAINING_ARRAY_LAYERS, dstSubresource.baseArrayLayer + dstSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when dstImage was created.

- VUID-VkCopyImageInfo2-dstImage-07969
  dstImage must not have been created with flags containing VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT.
Valid Usage (Implicit)

- VUID-VkCopyImageInfo2-sType-sType
  
  **sType** must be **VK_STRUCTURE_TYPE_COPY_IMAGE_INFO_2**

- VUID-VkCopyImageInfo2-pNext-pNext
  
  **pNext** must be **NULL**

- VUID-VkCopyImageInfo2-srcImage-parameter
  
  **srcImage** must be a valid **VkImage** handle

- VUID-VkCopyImageInfo2-srcImageLayout-parameter
  
  **srcImageLayout** must be a valid **VkImageLayout** value

- VUID-VkCopyImageInfo2-dstImage-parameter
  
  **dstImage** must be a valid **VkImage** handle

- VUID-VkCopyImageInfo2-dstImageLayout-parameter
  
  **dstImageLayout** must be a valid **VkImageLayout** value

- VUID-VkCopyImageInfo2-pRegions-parameter
  
  **pNext** must be a valid pointer to an array of **regionCount** valid **VkImageCopy2**

- VUID-VkCopyImageInfo2-regionCount-arraylength
  
  **regionCount** must be greater than 0

- VUID-VkCopyImageInfo2-commonparent
  
  Both of **dstImage**, and **srcImage** must have been created, allocated, or retrieved from the same **VkDevice**

The **VkImageCopy2** structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkImageCopy2 {
    VkStructureType sType;
    const void* pNext;
    VkImageSubresourceLayers srcSubresource;
    VkOffset3D srcOffset;
    VkImageSubresourceLayers dstSubresource;
    VkOffset3D dstOffset;
    VkExtent3D extent;
} VkImageCopy2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkImageCopy2 VkImageCopy2KHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.

• `srcSubresource` and `dstSubresource` are `VkImageSubresourceLayers` structures specifying the image subresources of the images used for the source and destination image data, respectively.

• `srcOffset` and `dstOffset` select the initial `x`, `y`, and `z` offsets in texels of the sub-regions of the source and destination image data.

• `extent` is the size in texels of the image to copy in `width`, `height` and `depth`.

### Valid Usage

• VUID-VkImageCopy2-apiVersion-07940
  If the `VK_KHR_sampler_ycbcr_conversion` extension is not enabled, and `VkPhysicalDeviceProperties::apiVersion` is less than Vulkan 1.1, the `aspectMask` member of `srcSubresource` and `dstSubresource` must match.

• VUID-VkImageCopy2-apiVersion-07941
  If the `VK_KHR_maintenance1` extension is not enabled, and `VkPhysicalDeviceProperties::apiVersion` is less than Vulkan 1.1, the `layerCount` member of `srcSubresource` and `dstSubresource` must match.

• VUID-VkImageCopy2-extent-06668
  `extent.width` must not be 0

• VUID-VkImageCopy2-extent-06669
  `extent.height` must not be 0

• VUID-VkImageCopy2-extent-06670
  `extent.depth` must not be 0

### Valid Usage (Implicit)

• VUID-VkImageCopy2-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_IMAGE_COPY_2`

• VUID-VkImageCopy2-pNext-pNext
  `pNext` must be NULL

• VUID-VkImageCopy2-srcSubresource-parameter
  `srcSubresource` must be a valid `VkImageSubresourceLayers` structure

• VUID-VkImageCopy2-dstSubresource-parameter
  `dstSubresource` must be a valid `VkImageSubresourceLayers` structure

### 20.3. Copying Data Between Buffers and Images

Data can be copied between buffers and images, enabling applications to load and store data between images and user defined offsets in buffer memory.

When copying between a buffer and an image, whole texel blocks are always copied; each texel block in the specified extent in the image to be copied will be written to a region in the buffer,
specified according to the position of the texel block, and the texel block extent and size of the format being copied.

For a set of coordinates \((x,y,z,\text{layer})\), where:

\[
x \text{ is in the range } \left[ \frac{\text{imageOffset.x}}{\text{blockWidth}}, \left\lceil \frac{\text{imageOffset.x} + \text{imageExtent.width}}{\text{blockWidth}} \right\rceil \right],
\]

\[
y \text{ is in the range } \left[ \frac{\text{imageOffset.y}}{\text{blockHeight}}, \left\lceil \frac{\text{imageOffset.y} + \text{imageExtent.height}}{\text{blockHeight}} \right\rceil \right],
\]

\[
z \text{ is in the range } \left[ \frac{\text{imageOffset.z}}{\text{blockDepth}}, \left\lceil \frac{\text{imageOffset.z} + \text{imageExtent.depth}}{\text{blockDepth}} \right\rceil \right],
\]

\[
\text{layer} \text{ is in the range } \left[ \frac{\text{imageSubresource.baseArrayLayer}}{\text{imageSubresource.baseArrayLayer} + \text{imageSubresource.layerCount}} \right),
\]

and where blockWidth, blockHeight, and blockDepth are the dimensions of the texel block extent of the image’s format.

For each \((x,y,z,\text{layer})\) coordinate, texels in the image layer selected by layer are accessed in the following ranges:

\[
\left[ x \times \text{blockWidth}, \max( (x \times \text{blockWidth}) + \text{blockWidth}, \text{imageWidth}) \right)
\]

\[
\left[ y \times \text{blockHeight}, \max( (y \times \text{blockHeight}) + \text{blockHeight}, \text{imageHeight}) \right)
\]

\[
\left[ z \times \text{blockDepth}, \max( (z \times \text{blockDepth}) + \text{blockDepth}, \text{imageDepth}) \right)
\]

where imageWidth, imageHeight, and imageDepth are the dimensions of the image subresource.

For each \((x,y,z,\text{layer})\) coordinate, bytes in the buffer are accessed at offsets in the range \([\text{texelOffset}, \text{texelOffset} + \text{blockSize})\), where:

\[
\text{texelOffset} = \text{bufferOffset} + (x \times \text{blockSize}) + (y \times \text{rowExtent}) + (z \times \text{sliceExtent}) + (\text{layer} \times \text{layerExtent})
\]

blockSize is the size of the block in bytes for the format

\[
\text{rowExtent} = \max(\text{bufferRowLength}, \left\lceil \frac{\text{imageExtent.width}}{\text{blockWidth}} \times \text{blockSize} \right\rceil)
\]
sliceExtent = max(bufferImageHeight, imageExtent.height \times rowExtent)

layerExtent = imageExtent.depth \times sliceExtent

If a rotation is specified by \texttt{VkCopyCommandTransformInfoQCOM}, the 2D region of the image being addressed is rotated around the offset, modifying the range of x and y coordinates for the image address according to the specified \texttt{VkSurfaceTransformFlagBitsKHR}:

- If \texttt{VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR} is specified, no rotation is performed:
  
  \[
  \begin{align*}
  &x' \text{ is in the same range as } x \\
  &y' \text{ is in the same range as } y \\
  &\text{blockWidth}' = \text{blockWidth} \\
  &\text{blockHeight}' = \text{blockHeight} \\
  &\text{imageWidth}' = \text{imageWidth} \\
  &\text{imageHeight}' = \text{imageHeight}
  \end{align*}
  \]

- If \texttt{VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR} is specified
  
  \[
  \begin{align*}
  &x' \text{ is in the range } [\lceil (\text{imageOffset.x - imageExtent.height}) / \text{blockHeight} \rceil, (\text{imageOffset.x - image/ blockHeight})] \\
  &y' \text{ is in the range } [\lceil \text{imageOffset.y} / \text{blockWidth} \rceil, (\text{imageOffset.y} + \text{imageExtent.width}) / \text{blockWidth}] \\
  &\text{blockWidth}' = \text{blockHeight} \\
  &\text{blockHeight}' = \text{blockWidth} \\
  &\text{imageWidth}' = \text{imageHeight}
  \end{align*}
  \]
imageHeight’ = imageWidth

- If VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR is specified:

  \( x' \) is in the range \([\lceil (imageOffset.x - imageExtent.width) / blockWidth \rceil, \frac{imageOffset.x}{blockWidth}]\),
  
  \( y' \) is in the range \([\lceil (imageOffset.x + imageExtent.height) / blockHeight \rceil, \frac{imageOffset.x}{blockHeight}]\),

  blockWidth’ = blockWidth

  blockHeight’ = blockHeight

  imageWidth’ = imageWidth

  imageHeight’ = imageHeight

- If VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR is specified:

  \( x \) is in the range \([\frac{imageOffset.x}{blockHeight}, \lceil (imageOffset.x + imageExtent.height) / blockHeight \rceil]\)
  
  \( y \) is in the range \([\lceil (imageOffset.y - imageExtent.width) / blockWidth \rceil, \frac{imageOffset.y}{blockWidth}]\).

  blockWidth’ = blockHeight

  blockHeight’ = blockWidth

  imageWidth’ = imageHeight

  imageHeight’ = imageWidth

When rotation is performed, for each \((x,y,z,layer)\) coordinate, texels in the image layer selected by layer are instead accessed in the following ranges:
Buffer addressing calculations are unaffected by this rotation.

When copying between a buffer and the depth or stencil aspect of an image, data in the buffer is assumed to be laid out as separate planes rather than interleaved. Addressing calculations are thus performed for a different format than the base image, according to the aspect, as described in the following table:

Table 30. Depth/Stencil Aspect Copy Table

<table>
<thead>
<tr>
<th>Base Format</th>

</tbody>
</table>

When copying between a buffer and any plane of a multi-planar image, addressing calculations are performed using the compatible format for that plane, rather than the format of the multi-planar image.

Each texel block is copied from one resource to the other according to the above addressing equations.

To copy data from a buffer object to an image object, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdCopyBufferToImage(
    VkCommandBuffer commandBuffer,
    VkBuffer srcBuffer,
    VkImage dstImage,
    VkImageLayout dstImageLayout,
    uint32_t regionCount,
    const VkBufferImageCopy* pRegions);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
• **srcBuffer** is the source buffer.
• **dstImage** is the destination image.
• **dstImageLayout** is the layout of the destination image subresources for the copy.
• **regionCount** is the number of regions to copy.
• **pRegions** is a pointer to an array of *VkBufferImageCopy* structures specifying the regions to copy.

Each source region specified by *pRegions* is copied from the source buffer to the destination region of the destination image according to the addressing calculations for each resource. If any of the specified regions in *srcBuffer* overlaps in memory with any of the specified regions in *dstImage*, values read from those overlapping regions are undefined. If any region accesses a depth aspect in *dstImage* and the *VK_EXT_depth_range_unrestricted* extension is not enabled, values copied from *srcBuffer* outside of the range [0,1] will be written as undefined values to the destination image.

Copy regions for the image **must** be aligned to a multiple of the texel block extent in each dimension, except at the edges of the image, where region extents **must** match the edge of the image.

### Valid Usage

- **VUID-vkCmdCopyBufferToImage-dstImage-07966**
  If *dstImage* is non-sparse then the image or the specified disjoint plane **must** be bound completely and contiguously to a single *VkDeviceMemory* object.

- **VUID-vkCmdCopyBufferToImage-imageSubresource-07967**
  The *imageSubresource.mipLevel* member of each element of *pRegions** must** be less than the *mipLevels* specified in *VkImageCreateInfo* when *dstImage* was created.

- **VUID-vkCmdCopyBufferToImage-imageSubresource-07968**
  If *imageSubresource.layerCount is not* *VK_REMAINING_ARRAY_LAYERS*, *imageSubresource.baseArrayLayer + imageSubresource.layerCount* of each element of *pRegions** must** be less than or equal to the *arrayLayers* specified in *VkImageCreateInfo* when *dstImage* was created.

- **VUID-vkCmdCopyBufferToImage-dstImage-07969**
  *dstImage** must not have been created with flags containing *VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT*.

- **VUID-vkCmdCopyBufferToImage-imageSubresource-07970**
  The image region specified by each element of *pRegions** must** be contained within the specified *imageSubresource* of *dstImage*.

- **VUID-vkCmdCopyBufferToImage-imageSubresource-07971**
  For each element of *pRegions, imageOffset.x* and (*imageExtent.width + imageOffset.x*) **must** both be greater than or equal to 0 and less than or equal to the width of the specified *imageSubresource* of *dstImage*.

- **VUID-vkCmdCopyBufferToImage-imageSubresource-07972**
  For each element of *pRegions, imageOffset.y* and (*imageExtent.height + imageOffset.y*) **must** both be greater than or equal to 0 and less than or equal to the height of the specified *imageSubresource* of *dstImage*.
• VUID-vkCmdCopyBufferToImage-dstImage-07973
dstImage must have a sample count equal to VK_SAMPLE_COUNT_1_BIT

• VUID-vkCmdCopyBufferToImage-commandBuffer-01828
If commandBuffer is an unprotected command buffer and protectedNoFault is not supported,
srcBuffer must not be a protected buffer

• VUID-vkCmdCopyBufferToImage-commandBuffer-01829
If commandBuffer is an unprotected command buffer and protectedNoFault is not supported,
dstImage must not be a protected image

• VUID-vkCmdCopyBufferToImage-commandBuffer-01830
If commandBuffer is a protected command buffer and protectedNoFault is not supported,
dstImage must not be an unprotected image

• VUID-vkCmdCopyBufferToImage-commandBuffer-07737
If the queue family used to create the VkCommandPool which commandBuffer was allocated
from does not support VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT, the bufferOffset
member of any element of pRegions must be a multiple of 4

• VUID-vkCmdCopyBufferToImage-imageOffset-07738
The imageOffset and imageExtent members of each element of pRegions must respect the
image transfer granularity requirements of commandBuffer’s command pool’s queue family,
as described in VkQueueFamilyProperties

• VUID-vkCmdCopyBufferToImage-commandBuffer-07739
If the queue family used to create the VkCommandPool which commandBuffer was allocated
from does not support VK_QUEUE_GRAPHICS_BIT, for each element of pRegions, the aspectMask
member of imageSubresource must not be VK_IMAGE_ASPECT_DEPTH_BIT or
VK_IMAGE_ASPECT_STENCIL_BIT

• VUID-vkCmdCopyBufferToImage-pRegions-00171
srcBuffer must be large enough to contain all buffer locations that are accessed according
to Buffer and Image Addressing, for each element of pRegions

• VUID-vkCmdCopyBufferToImage-pRegions-00173
The union of all source regions, and the union of all destination regions, specified by the
elements of pRegions, must not overlap in memory

• VUID-vkCmdCopyBufferToImage-srcBuffer-00174
srcBuffer must have been created with VK_BUFFER_USAGE_TRANSFER_SRC_BIT usage flag

• VUID-vkCmdCopyBufferToImage-dstImage-01997
The format features of dstImage must contain VK_FORMAT_FEATURE_TRANSFER_DST_BIT

• VUID-vkCmdCopyBufferToImage-srcBuffer-00176
If srcBuffer is non-sparse then it must be bound completely and contiguously to a single
VkDeviceMemory object

• VUID-vkCmdCopyBufferToImage-dstImage-00177
dstImage must have been created with VK_IMAGE_USAGE_TRANSFER_DST_BIT usage flag

• VUID-vkCmdCopyBufferToImage-dstImageLayout-00180
dstImageLayout must specify the layout of the image subresources of dstImage specified in
pRegions at the time this command is executed on a VkDevice
• VUID-vkCmdCopyBufferToImage-dstImageLayout-01396
dstImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR,
VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL, or VK_IMAGE_LAYOUT_GENERAL.

• VUID-vkCmdCopyBufferToImage-pRegions-07931
If VK_EXT_depth_range_unrestricted is not enabled, for each element of pRegions whose
imageSubresource contains a depth aspect, the data in srcBuffer must be in the range [0,1]

• VUID-vkCmdCopyBufferToImage-dstImage-07979
If dstImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, imageOffset.y must be 0 and imageExtent.height must be 1

• VUID-vkCmdCopyBufferToImage-imageOffset-09104
For each element of pRegions, imageOffset.z and (imageExtent.depth + imageOffset.z) must be greater than or equal to 0 and less than or equal to the depth of the specified imageSubresource of dstImage

• VUID-vkCmdCopyBufferToImage-dstImage-07980
If dstImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, imageOffset.z must be 0 and imageExtent.depth must be 1

• VUID-vkCmdCopyBufferToImage-dstImage-07274
For each element of pRegions, imageOffset.x must be a multiple of the texel block extent width of the VkFormat of dstImage

• VUID-vkCmdCopyBufferToImage-dstImage-07275
For each element of pRegions, imageOffset.y must be a multiple of the texel block extent height of the VkFormat of dstImage

• VUID-vkCmdCopyBufferToImage-dstImage-07276
For each element of pRegions, imageOffset.z must be a multiple of the texel block extent depth of the VkFormat of dstImage

• VUID-vkCmdCopyBufferToImage-dstImage-00207
For each element of pRegions, if the sum of imageOffset.x and extent.width does not equal the width of the subresource specified by srcSubresource, extent.width must be a multiple of the texel block extent width of the VkFormat of dstImage

• VUID-vkCmdCopyBufferToImage-dstImage-00208
For each element of pRegions, if the sum of imageOffset.y and extent.height does not equal the height of the subresource specified by srcSubresource, extent.height must be a multiple of the texel block extent height of the VkFormat of dstImage

• VUID-vkCmdCopyBufferToImage-dstImage-00209
For each element of pRegions, if the sum of imageOffset.z and extent.depth does not equal the depth of the subresource specified by srcSubresource, extent.depth must be a multiple of the texel block extent depth of the VkFormat of dstImage

• VUID-vkCmdCopyBufferToImage-imageSubresource-09105
For each element of pRegions, imageSubresource.aspectMask must specify aspects present in dstImage

• VUID-vkCmdCopyBufferToImage-dstImage-07981
If dstImage has a multi-planar image format, then for each element of pRegions, imageSubresource.aspectMask must be a single valid multi-planar aspect mask bit
• **VUID-vkCmdCopyBufferToImage-dstImage-07983**
  If `dstImage` is of type `VK_IMAGE_TYPE_3D`, for each element of `pRegions`, `imageSubresource.baseArrayLayer` must be 0 and `imageSubresource.layerCount` must be 1.

• **VUID-vkCmdCopyBufferToImage-bufferRowLength-09106**
  For each element of `pRegions`, `bufferRowLength` must be a multiple of the texel block extent width of the `VkFormat` of `dstImage`.

• **VUID-vkCmdCopyBufferToImage-bufferImageHeight-09107**
  For each element of `pRegions`, `bufferImageHeight` must be a multiple of the texel block extent height of the `VkFormat` of `dstImage`.

• **VUID-vkCmdCopyBufferToImage-bufferRowLength-09108**
  For each element of `pRegions`, `bufferRowLength` divided by the texel block extent width and then multiplied by the texel block size of `dstImage` must be less than or equal to $2^{31}-1$.

• **VUID-vkCmdCopyBufferToImage-dstImage-07975**
  If `dstImage` does not have either a depth/stencil format or a multi-planar format, then for each element of `pRegions`, `bufferOffset` must be a multiple of the texel block size.

• **VUID-vkCmdCopyBufferToImage-dstImage-07976**
  If `dstImage` has a multi-planar format, then for each element of `pRegions`, `bufferOffset` must be a multiple of the element size of the compatible format for the format and the `aspectMask` of the `imageSubresource` as defined in Compatible Formats of Planes of Multi-Planar Formats.

• **VUID-vkCmdCopyBufferToImage-dstImage-07978**
  If `dstImage` has a depth/stencil format, the `bufferOffset` member of any element of `pRegions` must be a multiple of 4.

---

### Valid Usage (Implicit)

• **VUID-vkCmdCopyBufferToImage-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

• **VUID-vkCmdCopyBufferToImage-srcBuffer-parameter**
  `srcBuffer` must be a valid `VkBuffer` handle.

• **VUID-vkCmdCopyBufferToImage-dstImage-parameter**
  `dstImage` must be a valid `VkImage` handle.

• **VUID-vkCmdCopyBufferToImage-dstImageLayout-parameter**
  `dstImageLayout` must be a valid `VkImageLayout` value.

• **VUID-vkCmdCopyBufferToImage-pRegions-parameter**
  `pRegions` must be a valid pointer to an array of `regionCount` valid `VkBufferImageCopy` structures.

• **VUID-vkCmdCopyBufferToImage-commandBuffer-recording**
  `commandBuffer` must be in the recording state.

• **VUID-vkCmdCopyBufferToImage-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics,
or compute operations

- **VUID-vkCmdCopyBufferToImage-renderpass**
  This command **must** only be called outside of a render pass instance

- **VUID-vkCmdCopyBufferToImage-videocoding**
  This command **must** only be called outside of a video coding scope

- **VUID-vkCmdCopyBufferToImage-regionCount-arraylength**
  regionCount **must** be greater than 0

- **VUID-vkCmdCopyBufferToImage-commonparent**
  Each of `commandBuffer`, `dstImage`, and `srcBuffer` **must** have been created, allocated, or retrieved from the same `VkDevice`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>

To copy data from an image object to a buffer object, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdCopyImageToBuffer(
    VkCommandBuffer commandBuffer,
    VkImage srcImage,
    VkImageLayout srcImageLayout,
    VkBuffer dstBuffer,
    uint32_t regionCount,
    const VkBufferImageCopy* pRegions);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `srcImage` is the source image.
- `srcImageLayout` is the layout of the source image subresources for the copy.
- `dstBuffer` is the destination buffer.
• **regionCount** is the number of regions to copy.

• **pRegions** is a pointer to an array of [VkBufferImageCopy](#) structures specifying the regions to copy.

Each source region specified by **pRegions** is copied from the source image to the destination region of the destination buffer according to the addressing calculations for each resource. If any of the specified regions in **srcImage** overlaps in memory with any of the specified regions in **dstBuffer**, values read from those overlapping regions are undefined.

Copy regions for the image **must** be aligned to a multiple of the texel block extent in each dimension, except at the edges of the image, where region extents **must** match the edge of the image.

### Valid Usage

- **VUID-vkCmdCopyImageToBuffer-srcImage-07966**
  If **srcImage** is non-sparse then the image or the specified disjoint plane **must** be bound completely and contiguously to a single [VkDeviceMemory](#) object

- **VUID-vkCmdCopyImageToBuffer-imageSubresource-07967**
  The **imageSubresource.mipLevel** member of each element of **pRegions** **must** be less than the **mipLevels** specified in [VkImageCreateInfo](#) when **srcImage** was created

- **VUID-vkCmdCopyImageToBuffer-imageSubresource-07968**
  If **imageSubresource.layerCount** is not **VK_REMAINING_ARRAY_LAYERS**, **imageSubresource.baseArrayLayer + imageSubresource.layerCount** of each element of **pRegions** must be less than or equal to the **arrayLayers** specified in [VkImageCreateInfo](#) when **srcImage** was created

- **VUID-vkCmdCopyImageToBuffer-srcImage-07969**
  **srcImage** must not have been created with flags containing **VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT**

- **VUID-vkCmdCopyImageToBuffer-imageSubresource-07970**
  The image region specified by each element of **pRegions** **must** be contained within the specified **imageSubresource** of **srcImage**

- **VUID-vkCmdCopyImageToBuffer-imageSubresource-07971**
  For each element of **pRegions**, **imageOffset.x** and **(imageExtent.width + imageOffset.x)** **must** both be greater than or equal to 0 and less than or equal to the width of the specified **imageSubresource** of **srcImage**

- **VUID-vkCmdCopyImageToBuffer-imageSubresource-07972**
  For each element of **pRegions**, **imageOffset.y** and **(imageExtent.height + imageOffset.y)** **must** both be greater than or equal to 0 and less than or equal to the height of the specified **imageSubresource** of **srcImage**

- **VUID-vkCmdCopyImageToBuffer-srcImage-07973**
  **srcImage** must have a sample count equal to **VK_SAMPLE_COUNT_1_BIT**

- **VUID-vkCmdCopyImageToBuffer-commandBuffer-01831**
  If **commandBuffer** is an unprotected command buffer and **protectedNoFault** is not supported,
**srcImage must not be a protected image**

- **VUID-vkCmdCopyImageToBuffer-commandBuffer-01832**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstBuffer must not be a protected buffer`

- **VUID-vkCmdCopyImageToBuffer-commandBuffer-01833**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstBuffer must not be an unprotected buffer`

- **VUID-vkCmdCopyImageToBuffer-commandBuffer-07746**
  If the queue family used to create the `VkCommandPool` which `commandBuffer` was allocated from does not support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`, the `bufferOffset` member of any element of `pRegions` must be a multiple of 4

- **VUID-vkCmdCopyImageToBuffer-imageOffset-07747**
  The `imageOffset` and `imageExtent` members of each element of `pRegions` must respect the image transfer granularity requirements of `commandBuffer`'s command pool's queue family, as described in `VkQueueFamilyProperties`

- **VUID-vkCmdCopyImageToBuffer-pRegions-00183**
  `dstBuffer must be large enough to contain all buffer locations that are accessed according to Buffer and Image Addressing`, for each element of `pRegions`

- **VUID-vkCmdCopyImageToBuffer-pRegions-00184**
  The union of all source regions, and the union of all destination regions, specified by the elements of `pRegions`, must not overlap in memory

- **VUID-vkCmdCopyImageToBuffer-srcImage-00186**
  `srcImage must have been created with VK_IMAGE_USAGE_TRANSFER_SRC_BIT usage flag`

- **VUID-vkCmdCopyImageToBuffer-srcImage-01998**
  The format features of `srcImage must contain VK_FORMAT_FEATURE_TRANSFER_SRC_BIT`

- **VUID-vkCmdCopyImageToBuffer-dstBuffer-00191**
  `dstBuffer must have been created with VK_BUFFER_USAGE_TRANSFER_DST_BIT usage flag`

- **VUID-vkCmdCopyImageToBuffer-dstBuffer-00192**
  If `dstBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdCopyImageToBuffer-srcImageLayout-00189**
  `srcImageLayout must specify the layout of the image subresources of `srcImage` specified in `pRegions` at the time this command is executed on a `VkDevice`

- **VUID-vkCmdCopyImageToBuffer-srcImageLayout-01397**
  `srcImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL, or VK_IMAGE_LAYOUT_GENERAL`

- **VUID-vkCmdCopyImageToBuffer-srcImage-07979**
  If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `imageOffset.y must be 0` and `imageExtent.height must be 1`

- **VUID-vkCmdCopyImageToBuffer-imageOffset-09104**
  For each element of `pRegions`, `imageOffset.z` and `(imageExtent.depth + imageOffset.z)` must
both be greater than or equal to 0 and less than or equal to the depth of the specified imageSubresource of srcImage

- VUID-vkCmdCopyImageToBuffer-srcImage-07980
  If srcImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, imageOffset.z must be 0 and imageExtent.depth must be 1

- VUID-vkCmdCopyImageToBuffer-srcImage-07274
  For each element of pRegions, imageOffset.x must be a multiple of the texel block extent width of the VkFormat of srcImage

- VUID-vkCmdCopyImageToBuffer-srcImage-07275
  For each element of pRegions, imageOffset.y must be a multiple of the texel block extent height of the VkFormat of srcImage

- VUID-vkCmdCopyImageToBuffer-srcImage-07276
  For each element of pRegions, imageOffset.z must be a multiple of the texel block extent depth of the VkFormat of srcImage

- VUID-vkCmdCopyImageToBuffer-srcImage-00207
  For each element of pRegions, if the sum of imageOffset.x and extent.width does not equal the width of the subresource specified by srcSubresource, extent.width must be a multiple of the texel block extent width of the VkFormat of srcImage

- VUID-vkCmdCopyImageToBuffer-srcImage-00208
  For each element of pRegions, if the sum of imageOffset.y and extent.height does not equal the height of the subresource specified by srcSubresource, extent.height must be a multiple of the texel block extent height of the VkFormat of srcImage

- VUID-vkCmdCopyImageToBuffer-srcImage-00209
  For each element of pRegions, if the sum of imageOffset.z and extent.depth does not equal the depth of the subresource specified by srcSubresource, extent.depth must be a multiple of the texel block extent depth of the VkFormat of srcImage

- VUID-vkCmdCopyImageToBuffer-imageSubresource-09105
  For each element of pRegions, imageSubresource.aspectMask must specify aspects present in srcImage

- VUID-vkCmdCopyImageToBuffer-srcImage-07981
  If srcImage has a multi-planar image format, then for each element of pRegions, imageSubresource.aspectMask must be a single valid multi-planar aspect mask bit

- VUID-vkCmdCopyImageToBuffer-srcImage-07983
  If srcImage is of type VK_IMAGE_TYPE_3D, for each element of pRegions, imageSubresource.baseArrayLayer must be 0 and imageSubresource.layerCount must be 1

- VUID-vkCmdCopyImageToBuffer-bufferRowLength-09106
  For each element of pRegions, bufferRowLength must be a multiple of the texel block extent width of the VkFormat of srcImage

- VUID-vkCmdCopyImageToBuffer-bufferImageHeight-09107
  For each element of pRegions, bufferImageHeight must be a multiple of the texel block extent height of the VkFormat of srcImage

- VUID-vkCmdCopyImageToBuffer-bufferRowLength-09108
For each element of \( pRegions \), \( \text{bufferRowLength} \) divided by the \( \text{texel block extent width} \) and then multiplied by the \( \text{texel block size of srcImage} \) must be less than or equal to \( 2^{31} - 1 \).

- **VUID-vkCmdCopyImageToBuffer-srcImage-07975**
  If \( \text{srcImage} \) does not have either a depth/stencil format or a multi-planar format, then for each element of \( pRegions \), \( \text{bufferOffset} \) must be a multiple of the \( \text{texel block size} \).

- **VUID-vkCmdCopyImageToBuffer-srcImage-07976**
  If \( \text{srcImage} \) has a multi-planar format, then for each element of \( pRegions \), \( \text{bufferOffset} \) must be a multiple of the \( \text{texel block size} \).

- **VUID-vkCmdCopyImageToBuffer-srcImage-07978**
  If \( \text{srcImage} \) has a depth/stencil format, the \( \text{bufferOffset} \) member of any element of \( pRegions \) must be a multiple of 4.

### Valid Usage (Implicit)

- **VUID-vkCmdCopyImageToBuffer-commandBuffer-parameter**
  \( \text{commandBuffer} \) must be a valid \( \text{VkCommandBuffer} \) handle.

- **VUID-vkCmdCopyImageToBuffer-srcImage-parameter**
  \( \text{srcImage} \) must be a valid \( \text{VkImage} \) handle.

- **VUID-vkCmdCopyImageToBuffer-srcImageLayout-parameter**
  \( \text{srcImageLayout} \) must be a valid \( \text{VkImageLayout} \) value.

- **VUID-vkCmdCopyImageToBuffer-dstBuffer-parameter**
  \( \text{dstBuffer} \) must be a valid \( \text{VkBuffer} \) handle.

- **VUID-vkCmdCopyImageToBuffer-pRegions-parameter**
  \( pRegions \) must be a valid pointer to an array of \( \text{regionCount} \) valid \( \text{VkBufferImageCopy} \) structures.

- **VUID-vkCmdCopyImageToBuffer-commandBuffer-recording**
  \( \text{commandBuffer} \) must be in the \( \text{recording state} \).

- **VUID-vkCmdCopyImageToBuffer-commandBuffer-cmdpool**
  The \( \text{VkCommandPool} \) that \( \text{commandBuffer} \) was allocated from must support transfer, graphics, or compute operations.

- **VUID-vkCmdCopyImageToBuffer-renderpass**
  This command must only be called outside of a render pass instance.

- **VUID-vkCmdCopyImageToBuffer-videocoding**
  This command must only be called outside of a video coding scope.

- **VUID-vkCmdCopyImageToBuffer-regionCount-arraylength**
  \( \text{regionCount} \) must be greater than 0.

- **VUID-vkCmdCopyImageToBuffer-commonparent**
  Each of \( \text{commandBuffer} \), \( \text{dstBuffer} \), and \( \text{srcImage} \) must have been created, allocated, or retrieved from the same \( \text{VkDevice} \).
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>

<td>Graphics</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Compute</td>
<td></td>
</tr>
</tbody>
</table>

For both `vkCmdCopyBufferToImage` and `vkCmdCopyImageToBuffer`, each element of `pRegions` is a structure defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBufferImageCopy {
    VkDeviceSize bufferOffset;
    uint32_t bufferRowLength;
    uint32_t bufferImageHeight;
    VkImageSubresourceLayers imageSubresource;
    VkOffset3D imageOffset;
    VkExtent3D imageExtent;
} VkBufferImageCopy;
```

- `bufferOffset` is the offset in bytes from the start of the buffer object where the image data is copied from or to.
- `bufferRowLength` and `bufferImageHeight` specify in texels a subregion of a larger two- or three-dimensional image in buffer memory, and control the addressing calculations. If either of these values is zero, that aspect of the buffer memory is considered to be tightly packed according to the `imageExtent`.
- `imageSubresource` is a `VkImageSubresourceLayers` used to specify the specific image subresources of the image used for the source or destination image data.
- `imageOffset` selects the initial x, y, z offsets in texels of the sub-region of the source or destination image data.
- `imageExtent` is the size in texels of the image to copy in width, height and depth.

Valid Usage

- VUID-VkBufferImageCopy-bufferRowLength-09101
bufferRowLength must be 0, or greater than or equal to the width member of imageExtent

- VUID-VkBufferImageCopy-bufferImageHeight-09102
  bufferImageHeight must be 0, or greater than or equal to the height member of imageExtent

- VUID-VkBufferImageCopy-aspectMask-09103
  The aspectMask member of imageSubresource must only have a single bit set

- VUID-VkBufferImageCopy-imageExtent-06659
  imageExtent.width must not be 0

- VUID-VkBufferImageCopy-imageExtent-06660
  imageExtent.height must not be 0

- VUID-VkBufferImageCopy-imageExtent-06661
  imageExtent.depth must not be 0

Valid Usage (Implicit)

- VUID-VkBufferImageCopy-imageSubresource-parameter
  imageSubresource must be a valid VkImageSubresourceLayers structure

More extensible versions of the commands to copy between buffers and images are defined below.

To copy data from a buffer object to an image object, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdCopyBufferToImage2(
  VkCommandBuffer commandBuffer,
  const VkCopyBufferToImageInfo2* pCopyBufferToImageInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_copy_commands2
void vkCmdCopyBufferToImage2KHR(
  VkCommandBuffer commandBuffer,
  const VkCopyBufferToImageInfo2* pCopyBufferToImageInfo);
```

- commandBuffer is the command buffer into which the command will be recorded.
- pCopyBufferToImageInfo is a pointer to a VkCopyBufferToImageInfo2 structure describing the copy parameters.

This command is functionally identical to vkCmdCopyBufferToImage, but includes extensible sub-structures that include sType and pNext parameters, allowing them to be more easily extended.

Valid Usage

- VUID-vkCmdCopyBufferToImage2-commandBuffer-01828
If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcBuffer` must not be a protected buffer

- **VUID-vkCmdCopyBufferToImage2-commandBuffer-01829**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstImage` must not be a protected image

- **VUID-vkCmdCopyBufferToImage2-commandBuffer-01830**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstImage` must not be an unprotected image

- **VUID-vkCmdCopyBufferToImage2-commandBuffer-07737**
  If the queue family used to create the `VkCommandPool` which `commandBuffer` was allocated from does not support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`, the `bufferOffset` member of any element of `pCopyBufferToImageInfo->pRegions` must be a multiple of 4

- **VUID-vkCmdCopyBufferToImage2-imageOffset-07738**
  The `imageOffset` and `imageExtent` members of each element of `pCopyBufferToImageInfo->pRegions` must respect the image transfer granularity requirements of `commandBuffer`'s command pool's queue family, as described in `VkQueueFamilyProperties`

- **VUID-vkCmdCopyBufferToImage2-commandBuffer-07739**
  If the queue family used to create the `VkCommandPool` which `commandBuffer` was allocated from does not support `VK_QUEUE_GRAPHICS_BIT`, for each element of `pCopyBufferToImageInfo->pRegions`, the `aspectMask` member of `imageSubresource` must not be `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT`

---

**Valid Usage (Implicit)**

- **VUID-vkCmdCopyBufferToImage2-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdCopyBufferToImage2-pCopyBufferToImageInfo-parameter**
  `pCopyBufferToImageInfo` must be a valid pointer to a valid `VkCopyBufferToImageInfo2` structure

- **VUID-vkCmdCopyBufferToImage2-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdCopyBufferToImage2-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations

- **VUID-vkCmdCopyBufferToImage2-renderpass**
  This command must only be called outside of a render pass instance

- **VUID-vkCmdCopyBufferToImage2-videocoding**
  This command must only be called outside of a video coding scope

---

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Transfer Graphics</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td>Compute</td>
<td></td>
</tr>
</tbody>
</table>

The `VkCopyBufferToImageInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkCopyBufferToImageInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkBuffer srcBuffer;
    VkImage dstImage;
    VkImageLayout dstImageLayout;
    uint32_t regionCount;
    const VkBufferImageCopy2* pRegions;
} VkCopyBufferToImageInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkCopyBufferToImageInfo2 VkCopyBufferToImageInfo2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcBuffer` is the source buffer.
- `dstImage` is the destination image.
- `dstImageLayout` is the layout of the destination image subresources for the copy.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkBufferImageCopy2` structures specifying the regions to copy.

### Valid Usage

- `VUID-VkCopyBufferToImageInfo2-pRegions-04565`

The image region specified by each element of `pRegions` that does not contain
 VkCopyCommandTransformInfoQCOM in its `pNext` chain must be contained within the specified `imageSubresource` of `dstImage`.

- VUID-VkCopyBufferToImageInfo2KHR-pRegions-04554
  If the image region specified by each element of `pRegions` contains `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, the rotated destination region as described in [copies-buffers-images-rotation-addressing] must be contained within `dstImage`.

- VUID-VkCopyBufferToImageInfo2KHR-pRegions-04555
  If any element of `pRegions` contains `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, then `dstImage` must have a 1x1x1 texel block extent.

- VUID-VkCopyBufferToImageInfo2KHR-pRegions-06203
  If any element of `pRegions` contains `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, then `dstImage` must be of type `VK_IMAGE_TYPE_2D`.

- VUID-VkCopyBufferToImageInfo2KHR-pRegions-06204
  If any element of `pRegions` contains `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, then `dstImage` must not have a multi-planar format.

- VUID-VkCopyBufferToImageInfo2-pRegions-00171
  `srcBuffer` must be large enough to contain all buffer locations that are accessed according to Buffer and Image Addressing, for each element of `pRegions`.

- VUID-VkCopyBufferToImageInfo2-pRegions-00173
  The union of all source regions, and the union of all destination regions, specified by the elements of `pRegions`, must not overlap in memory.

- VUID-VkCopyBufferToImageInfo2-srcBuffer-00174
  `srcBuffer` must have been created with `VK_BUFFER_USAGE_TRANSFER_SRC_BIT` usage flag.

- VUID-VkCopyBufferToImageInfo2-dstImage-00176
  If `srcBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- VUID-VkCopyBufferToImageInfo2-dstImage-01997
  The format features of `dstImage` must contain `VK_FORMAT_FEATURE_TRANSFER_DST_BIT`.

- VUID-VkCopyBufferToImageInfo2-dstImageLayout-00180
  `dstImageLayout` must specify the layout of the image subresources of `dstImage` specified in `pRegions` at the time this command is executed on a `VkDevice`.

- VUID-VkCopyBufferToImageInfo2-dstImageLayout-01396
  `dstImageLayout` must be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`, or `VK_IMAGE_LAYOUT_GENERAL`.

- VUID-VkCopyBufferToImageInfo2-pRegions-07931
  If `VK_EXT_depth_range_unrestricted` is not enabled, for each element of `pRegions` whose `imageSubresource` contains a depth aspect, the data in `srcBuffer` must be in the range [0,1].

- VUID-VkCopyBufferToImageInfo2-dstImage-07966
If \( \text{dstImage} \) is non-sparse then the image or the specified \textit{disjoint} plane \textbf{must} be bound completely and contiguously to a single \texttt{VkDeviceMemory} object.

- VUID-VkCopyBufferToImageInfo2-imageSubresource-07967
  The `imageSubresource.mipLevel` member of each element of `pRegions` \textbf{must} be less than the `mipLevels` specified in `VkImageCreateInfo` when `dstImage` was created.

- VUID-VkCopyBufferToImageInfo2-imageSubresource-07968
  If `imageSubresource.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `imageSubresource.baseArrayLayer + imageSubresource.layerCount` of each element of `pRegions` \textbf{must} be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `dstImage` was created.

- VUID-VkCopyBufferToImageInfo2-dstImage-07969
  \textbf{dstImage} \textbf{must} not have been created with flags containing `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`.

- VUID-VkCopyBufferToImageInfo2-dstImage-07973
  \textbf{dstImage} \textbf{must} have a sample count equal to `VK_SAMPLE_COUNT_1_BIT`.

- VUID-VkCopyBufferToImageInfo2-dstImage-07979
  If `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `imageOffset.y` \textbf{must} be 0 and `imageExtent.height` \textbf{must} be 1.

- VUID-VkCopyBufferToImageInfo2-dstImage-07980
  If `dstImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions` \textbf{must} be 0 and `imageExtent.depth` \textbf{must} be 1.

- VUID-VkCopyBufferToImageInfo2-dstImage-07274
  For each element of `pRegions`, `imageOffset.x` \textbf{must} be a multiple of the texel block extent width of the `VkFormat` of `dstImage`.

- VUID-VkCopyBufferToImageInfo2-dstImage-07275
  For each element of `pRegions`, `imageOffset.y` \textbf{must} be a multiple of the texel block extent height of the `VkFormat` of `dstImage`.

- VUID-VkCopyBufferToImageInfo2-dstImage-07276
  For each element of `pRegions`, `imageOffset.z` \textbf{must} be a multiple of the texel block extent depth of the `VkFormat` of `dstImage`.

- VUID-VkCopyBufferToImageInfo2-dstImage-00207
  For each element of `pRegions`, if the sum of `imageOffset.x` and `extent.width` does not equal the width of the subresource specified by `srcSubresource`, `extent.width` \textbf{must} be a multiple of the texel block extent width of the `VkFormat` of `dstImage`.

- VUID-VkCopyBufferToImageInfo2-dstImage-00208
  For each element of `pRegions`, if the sum of `imageOffset.y` and `extent.height` does not equal the height of the subresource specified by `srcSubresource`, `extent.height` \textbf{must} be a multiple of the texel block extent height of the `VkFormat` of `dstImage`.
For each element of `pRegions`, if the sum of `imageOffset.z` and `extent.depth` does not equal the depth of the subresource specified by `srcSubresource`, `extent.depth` must be a multiple of the texel block extent depth of the `VkFormat` of `dstImage`.

For each element of `pRegions`, `imageSubresource.aspectMask` must specify aspects present in `dstImage`.

If `dstImage` has a multi-planar image format, then for each element of `pRegions`, `imageSubresource.aspectMask` must be a single valid multi-planar aspect mask bit.

If `dstImage` is of type `VK_IMAGE_TYPE_3D`, for each element of `pRegions`, `imageSubresource.baseArrayLayer` must be 0 and `imageSubresource.layerCount` must be 1.

For each element of `pRegions`, `bufferRowLength` must be a multiple of the texel block extent width of the `VkFormat` of `dstImage`.

For each element of `pRegions`, `bufferImageHeight` must be a multiple of the texel block extent height of the `VkFormat` of `dstImage`.

For each element of `pRegions`, `bufferRowLength` divided by the texel block extent width and then multiplied by the texel block size of `dstImage` must be less than or equal to $2^{31} - 1$.

If `dstImage` does not have either a depth/stencil format or a multi-planar format, then for each element of `pRegions`, `bufferOffset` must be a multiple of the texel block size.

If `dstImage` has a multi-planar format, then for each element of `pRegions`, `bufferOffset` must be a multiple of the element size of the compatible format for the format and the aspectMask of the `imageSubresource` as defined in Compatible Formats of Planes of Multi-Planar Formats.

If `dstImage` has a depth/stencil format, the `bufferOffset` member of any element of `pRegions` must be a multiple of 4.

For each element of `pRegions` not containing `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, `imageOffset.x` and `(imageExtent.width + imageOffset.x)` must both be greater than or equal to 0 and less than or equal to the width of the specified `imageSubresource` of `dstImage`.

For each element of `pRegions` not containing `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, `imageOffset.y` and `(imageExtent.height + imageOffset.y)` must both be greater than or equal to 0 and less than or equal to the height of the specified `imageSubresource` of `dstImage`. 
Valid Usage (Implicit)

- **VUID-VkCopyBufferToImageInfo2-sType-sType**
  - `sType` **must** be `VK_STRUCTURE_TYPE_COPY_BUFFER_TO_IMAGE_INFO_2`

- **VUID-VkCopyBufferToImageInfo2-pNext-pNext**
  - `pNext` **must** be `NULL`

- **VUID-VkCopyBufferToImageInfo2-srcBuffer-parameter**
  - `srcBuffer` **must** be a valid `VkBuffer` handle

- **VUID-VkCopyBufferToImageInfo2-dstImage-parameter**
  - `dstImage` **must** be a valid `VkImage` handle

- **VUID-VkCopyBufferToImageInfo2-dstImageLayout-parameter**
  - `dstImageLayout` **must** be a valid `VkImageLayout` value

- **VUID-VkCopyBufferToImageInfo2-pRegions-parameter**
  - `pRegions` **must** be a valid pointer to an array of `regionCount` valid `VkBufferImageCopy2` structures

- **VUID-VkCopyBufferToImageInfo2-regionCount-arraylength**
  - `regionCount` **must** be greater than 0

- **VUID-VkCopyBufferToImageInfo2-commonparent**
  - Both of `dstImage`, and `srcBuffer` **must** have been created, allocated, or retrieved from the same `VkDevice`

To copy data from an image object to a buffer object, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdCopyImageToBuffer2(
    VkCommandBuffer commandBuffer,
    const VkCopyImageToBufferInfo2* pCopyImageToBufferInfo);
```

or the equivalent command:

```c
// Provided by VK_KHR_copy_commands2
void vkCmdCopyImageToBuffer2KHR(
    VkCommandBuffer commandBuffer,
    const VkCopyImageToBufferInfo2* pCopyImageToBufferInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pCopyImageToBufferInfo` is a pointer to a `VkCopyImageToBufferInfo2` structure describing the copy parameters.

This command is functionally identical to `vkCmdCopyImageToBuffer`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.
Valid Usage

• VUID-vkCmdCopyImageToBuffer2-commandBuffer-01831
  If \texttt{commandBuffer} is an unprotected command buffer and \texttt{protectedNoFault} is not supported, \texttt{srcImage} must not be a protected image

• VUID-vkCmdCopyImageToBuffer2-commandBuffer-01832
  If \texttt{commandBuffer} is an unprotected command buffer and \texttt{protectedNoFault} is not supported, \texttt{dstBuffer} must not be a protected buffer

• VUID-vkCmdCopyImageToBuffer2-commandBuffer-01833
  If \texttt{commandBuffer} is a protected command buffer and \texttt{protectedNoFault} is not supported, \texttt{dstBuffer} must not be an unprotected buffer

• VUID-vkCmdCopyImageToBuffer2-commandBuffer-07746
  If the queue family used to create the \texttt{VkCommandPool} which \texttt{commandBuffer} was allocated from does not support \texttt{VK_QUEUE_GRAPHICS_BIT} or \texttt{VK_QUEUE_COMPUTE_BIT}, the \texttt{bufferOffset} member of any element of \texttt{pCopyImageToBufferInfo->pRegions} must be a multiple of 4

• VUID-vkCmdCopyImageToBuffer2-commandBuffer-07747
  The \texttt{imageOffset} and \texttt{imageExtent} members of each element of \texttt{pCopyImageToBufferInfo->pRegions} must respect the image transfer granularity requirements of \texttt{commandBuffer}'s command pool's queue family, as described in \texttt{VkQueueFamilyProperties}

Valid Usage (Implicit)

• VUID-vkCmdCopyImageToBuffer2-commandBuffer-parameter
  \texttt{commandBuffer} must be a valid \texttt{VkCommandBuffer} handle

• VUID-vkCmdCopyImageToBuffer2-pCopyImageToBufferInfo-parameter
  \texttt{pCopyImageToBufferInfo} must be a valid pointer to a valid \texttt{VkCopyImageToBufferInfo2} structure

• VUID-vkCmdCopyImageToBuffer2-commandBuffer-recording
  \texttt{commandBuffer} must be in the \texttt{recording} state

• VUID-vkCmdCopyImageToBuffer2-commandBuffer-cmdpool
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must support transfer, graphics, or compute operations

• VUID-vkCmdCopyImageToBuffer2-renderpass
  This command must only be called outside of a render pass instance

• VUID-vkCmdCopyImageToBuffer2-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

• Host access to \texttt{commandBuffer} must be externally synchronized

• Host access to the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must be externally
The `VkCopyImageToBufferInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkCopyImageToBufferInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkImage srcImage;
    VkImageLayout srcImageLayout;
    VkBuffer dstBuffer;
    uint32_t regionCount;
    const VkBufferImageCopy2* pRegions;
} VkCopyImageToBufferInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkCopyImageToBufferInfo2 VkCopyImageToBufferInfo2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcImage` is the source image.
- `srcImageLayout` is the layout of the source image subresources for the copy.
- `dstBuffer` is the destination buffer.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkBufferImageCopy2` structures specifying the regions to copy.

### Valid Usage

- VUID-VkCopyImageToBufferInfo2-pRegions-04566
  The image region specified by each element of `pRegions` that does not contain `VkCopyCommandTransformInfoQCOM` in its `pNext` chain **must** be contained within the...
specified imageSubresource of srcImage

- VUID-VkCopyImageToBufferInfo2KHR-pRegions-04557
  If the image region specified by each element of pRegions contains VkCopyCommandTransformInfoQCOM in its pNext chain, the rotated source region as described in [copies-buffers-images-rotation-addressing] must be contained within srcImage

- VUID-VkCopyImageToBufferInfo2KHR-pRegions-04558
  If any element of pRegions contains VkCopyCommandTransformInfoQCOM in its pNext chain, then srcImage must have a 1x1x1 texel block extent

- VUID-VkCopyImageToBufferInfo2KHR-pRegions-06205
  If any element of pRegions contains VkCopyCommandTransformInfoQCOM in its pNext chain, then srcImage must be of type VK_IMAGE_TYPE_2D

- VUID-VkCopyImageToBufferInfo2KHR-pRegions-06206
  If any element of pRegions contains VkCopyCommandTransformInfoQCOM in its pNext chain, then srcImage must not have a multi-planar format

- VUID-VkCopyImageToBufferInfo2-pRegions-00183
  dstBuffer must be large enough to contain all buffer locations that are accessed according to Buffer and Image Addressing, for each element of pRegions

- VUID-VkCopyImageToBufferInfo2-pRegions-00184
  The union of all source regions, and the union of all destination regions, specified by the elements of pRegions, must not overlap in memory

- VUID-VkCopyImageToBufferInfo2-srcImage-00186
  srcImage must have been created with VK_IMAGE_USAGE_TRANSFER_SRC_BIT usage flag

- VUID-VkCopyImageToBufferInfo2-srcImage-01998
  The format features of srcImage must contain VK_FORMAT_FEATURE_TRANSFER_SRC_BIT

- VUID-VkCopyImageToBufferInfo2-dstBuffer-00191
  dstBuffer must have been created with VK_BUFFER_USAGE_TRANSFER_DST_BIT usage flag

- VUID-VkCopyImageToBufferInfo2-dstBuffer-00192
  If dstBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-VkCopyImageToBufferInfo2-srcImageLayout-00189
  srcImageLayout must specify the layout of the image subresources of srcImage specified in pRegions at the time this command is executed on a VkDevice

- VUID-VkCopyImageToBufferInfo2-srcImageLayout-01397
  srcImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL, or VK_IMAGE_LAYOUT_GENERAL

- VUID-VkCopyImageToBufferInfo2-srcImage-07966
  If srcImage is non-sparse then the image or the specified disjoint plane must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-VkCopyImageToBufferInfo2-imageSubresource-07967
  The imageSubresource.mipLevel member of each element of pRegions must be less than the
mipLevels specified in VkImageCreateInfo when srcImage was created

- VUID-VkCopyImageToBufferInfo2-imageSubresource-07968
  If imageSubresource.layerCount is not VK_REMAINING_ARRAY_LAYERS, imageSubresource.baseArrayLayer + imageSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when srcImage was created

- VUID-VkCopyImageToBufferInfo2-srcImage-07969
  srcImage must not have been created with flags containing VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT

- VUID-VkCopyImageToBufferInfo2-srcImage-07973
  srcImage must have a sample count equal to VK_SAMPLE_COUNT_1_BIT

- VUID-VkCopyImageToBufferInfo2-srcImage-07979
  If srcImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, imageOffset.y must be 0 and imageExtent.height must be 1

- VUID-VkCopyImageToBufferInfo2-imageOffset-09104
  For each element of pRegions, imageOffset.z and (imageExtent.depth + imageOffset.z) must both be greater than or equal to 0 and less than or equal to the depth of the specified imageSubresource of srcImage

- VUID-VkCopyImageToBufferInfo2-srcImage-07980
  If srcImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, imageOffset.z must be 0 and imageExtent.depth must be 1

- VUID-VkCopyImageToBufferInfo2-srcImage-07274
  For each element of pRegions, imageOffset.x must be a multiple of the texel block extent width of the VkFormat of srcImage

- VUID-VkCopyImageToBufferInfo2-srcImage-07275
  For each element of pRegions, imageOffset.y must be a multiple of the texel block extent height of the VkFormat of srcImage

- VUID-VkCopyImageToBufferInfo2-srcImage-07276
  For each element of pRegions, imageOffset.z must be a multiple of the texel block extent depth of the VkFormat of srcImage

- VUID-VkCopyImageToBufferInfo2-srcImage-00207
  For each element of pRegions, if the sum of imageOffset.x and extent.width does not equal the width of the subresource specified by srcSubresource, extent.width must be a multiple of the texel block extent width of the VkFormat of srcImage

- VUID-VkCopyImageToBufferInfo2-srcImage-00208
  For each element of pRegions, if the sum of imageOffset.y and extent.height does not equal the height of the subresource specified by srcSubresource, extent.height must be a multiple of the texel block extent height of the VkFormat of srcImage

- VUID-VkCopyImageToBufferInfo2-srcImage-00209
  For each element of pRegions, if the sum of imageOffset.z and extent.depth does not equal the depth of the subresource specified by srcSubresource, extent.depth must be a multiple of the texel block extent depth of the VkFormat of srcImage
For each element of $pRegions$, $imageSubresource.aspectMask$ must specify aspects present in $srcImage$.

If $srcImage$ has a multi-planar image format, then for each element of $pRegions$, $imageSubresource.aspectMask$ must be a single valid multi-planar aspect mask bit.

If $srcImage$ is of type $VK_IMAGE_TYPE_3D$, for each element of $pRegions$, $imageSubresource.baseArrayLayer$ must be 0 and $imageSubresource.layerCount$ must be 1.

For each element of $pRegions$, $bufferRowLength$ must be a multiple of the **texel block extent width** of the $VkFormat$ of $srcImage$.

For each element of $pRegions$, $bufferImageHeight$ must be a multiple of the **texel block extent height** of the $VkFormat$ of $srcImage$.

For each element of $pRegions$, $bufferRowLength$ divided by the **texel block extent width** and then multiplied by the texel block size of $srcImage$ must be less than or equal to $2^{31} - 1$.

If $srcImage$ does not have either a depth/stencil format or a multi-planar format, then for each element of $pRegions$, $bufferOffset$ must be a multiple of the **texel block size**.

If $srcImage$ has a multi-planar format, then for each element of $pRegions$, $bufferOffset$ must be a multiple of the element size of the compatible format for the format and the aspectMask of the $imageSubresource$ as defined in **Compatible Formats of Planes of Multi-Planar Formats**.

If $srcImage$ has a depth/stencil format, the $bufferOffset$ member of any element of $pRegions$ must be a multiple of 4.

For each element of $pRegions$ not containing $VkCopyCommandTransformInfoQCOM$ in its $pNext$ chain, $imageOffset.x$ and $(imageExtent.width + imageOffset.x)$ must both be greater than or equal to 0 and less than or equal to the width of the specified $imageSubresource$ of $srcImage$.

For each element of $pRegions$ not containing $VkCopyCommandTransformInfoQCOM$ in its $pNext$ chain, $imageOffset.y$ and $(imageExtent.height + imageOffset.y)$ must both be greater than or equal to 0 and less than or equal to the height of the specified $imageSubresource$ of $srcImage$.

**Valid Usage (Implicit)**

- VUID-VkCopyImageToBufferInfo2-sType-sType
sType must be VK_STRUCTURE_TYPE_COPY_IMAGE_TO_BUFFER_INFO_2

- VUID-VkCopyImageToBufferInfo2-pNext-pNext
  pNext must be NULL

- VUID-VkCopyImageToBufferInfo2-srcImage-parameter
  srcImage must be a valid VkImage handle

- VUID-VkCopyImageToBufferInfo2-srcImageLayout-parameter
  srcImageLayout must be a valid VkImageLayout value

- VUID-VkCopyImageToBufferInfo2-dstBuffer-parameter
  dstBuffer must be a valid VkBuffer handle

- VUID-VkCopyImageToBufferInfo2-pRegions-parameter
  pRegions must be a valid pointer to an array of regionCount valid VkBufferImageCopy2 structures

- VUID-VkCopyImageToBufferInfo2-regionCount-arraylength
  regionCount must be greater than 0

- VUID-VkCopyImageToBufferInfo2-commonparent
  Both of dstBuffer, and srcImage must have been created, allocated, or retrieved from the same VkDevice

For both vkCmdCopyBufferToImage2 and vkCmdCopyImageToBuffer2, each element of pRegions is a structure defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkBufferImageCopy2 {
    VkStructureType sType;
    const void* pNext;
    VkDeviceSize bufferOffset;
    uint32_t bufferRowLength;
    uint32_t bufferImageHeight;
    VkImageSubresourceLayers imageSubresource;
    VkOffset3D imageOffset;
    VkExtent3D imageExtent;
} VkBufferImageCopy2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkBufferImageCopy2 VkBufferImageCopy2KHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- bufferOffset is the offset in bytes from the start of the buffer object where the image data is copied from or to.
• bufferRowLength and bufferImageHeight specify in texels a subregion of a larger two- or three-dimensional image in buffer memory, and control the addressing calculations. If either of these values is zero, that aspect of the buffer memory is considered to be tightly packed according to the imageExtent.

• imageSubresource is a VkImageSubresourceLayers used to specify the specific image subresources of the image used for the source or destination image data.

• imageOffset selects the initial x, y, z offsets in texels of the sub-region of the source or destination image data.

• imageExtent is the size in texels of the image to copy in width, height and depth.

This structure is functionally identical to VkBufferImageCopy, but adds sType and pNext parameters, allowing it to be more easily extended.

### Valid Usage

- VUID-VkBufferImageCopy2-bufferRowLength-09101
  bufferRowLength must be 0, or greater than or equal to the width member of imageExtent

- VUID-VkBufferImageCopy2-bufferImageHeight-09102
  bufferImageHeight must be 0, or greater than or equal to the height member of imageExtent

- VUID-VkBufferImageCopy2-aspectMask-09103
  The aspectMask member of imageSubresource must only have a single bit set

- VUID-VkBufferImageCopy2-imageExtent-06659
  imageExtent.width must not be 0

- VUID-VkBufferImageCopy2-imageExtent-06660
  imageExtent.height must not be 0

- VUID-VkBufferImageCopy2-imageExtent-06661
  imageExtent.depth must not be 0

### Valid Usage (Implicit)

- VUID-VkBufferImageCopy2-sType-sType
  sType must be VK_STRUCTURE_TYPE_BUFFER_IMAGE_COPY_2

- VUID-VkBufferImageCopy2-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkCopyCommandTransformInfoQCOM

- VUID-VkBufferImageCopy2-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkBufferImageCopy2-imageSubresource-parameter
  imageSubresource must be a valid VkImageSubresourceLayers structure

The VkCopyCommandTransformInfoQCOM structure is defined as:
typedef struct VkCopyCommandTransformInfoQCOM {
    VkStructureType sType;
    const void* pNext;
    VkSurfaceTransformFlagBitsKHR transform;
} VkCopyCommandTransformInfoQCOM;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• transform is a VkSurfaceTransformFlagBitsKHR value describing the transform to be applied.

Including this structure in the pNext chain of VkBufferImageCopy2 defines a rotation to be performed when copying between an image and a buffer. Including this structure in the pNext chain of VkBlitImageInfo2 defines a rotation to be performed when blitting between two images. If this structure is not specified in either case, the implementation behaves as if it was specified with a transform equal to VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR.

Specifying a transform for a copy between an image and a buffer rotates the region accessed in the image around the offset. Specifying a transform for a blit performs a similar transform as described in Image Blits with Scaling and Rotation.

Rotations other than VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR can only be specified for single-plane 2D images with a 1x1x1 texel block extent.

Valid Usage

• VUID-VkCopyCommandTransformInfoQCOM-transform-04560
  transform must be VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR,
  VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR, VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR, or
  VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR

Valid Usage (Implicit)

• VUID-VkCopyCommandTransformInfoQCOM-sType-sType
  sType must be VK_STRUCTURE_TYPE_COPY_COMMAND_TRANSFORM_INFO_QCOM

The following commands can be used to copy between host memory and images.

To copy data from host memory to an image object, call:

// Provided by VK_EXT_host_image_copy
VkResult vkCopyMemoryToImageEXT(
    VkDevice device,
    const VkCopyMemoryToImageInfoEXT* pCopyMemoryToImageInfo);
• *device* is the device which owns `pCopyMemoryToImageInfo->dstImage`.

• `pCopyMemoryToImageInfo` is a pointer to a `VkCopyMemoryToImageInfoEXT` structure describing the copy parameters.

This command is functionally similar to `vkCmdCopyBufferToImage2`, except it is executed on the host and reads from host memory instead of a buffer.

### Valid Usage

- VUID-vkCopyMemoryToImageEXT-hostImageCopy-09058

  The `hostImageCopy` feature **must** be enabled

### Valid Usage (Implicit)

- VUID-vkCopyMemoryToImageEXT-device-parameter

  *device* **must** be a valid `VkDevice` handle

- VUID-vkCopyMemoryToImageEXT-pCopyMemoryToImageInfo-parameter

  `pCopyMemoryToImageInfo` **must** be a valid pointer to a valid `VkCopyMemoryToImageInfoEXT` structure

### Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_MEMORY_MAP_FAILED

The `VkCopyMemoryToImageInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_host_image_copy
typedef struct VkCopyMemoryToImageInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkHostImageCopyFlagsEXT flags;
    VkImage dstImage;
    VkImageLayout dstImageLayout;
    uint32_t regionCount;
    const VkMemoryToImageCopyEXT* pRegions;
} VkCopyMemoryToImageInfoEXT;
```
• **sType** is a **VkStructureType** value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **flags** is a bitmask of **VkHostImageCopyFlagBitsEXT** values describing additional copy parameters.
• **dstImage** is the destination image.
• **dstImageLayout** is the layout of the destination image subresources for the copy.
• **regionCount** is the number of regions to copy.
• **pRegions** is a pointer to an array of **VkMemoryToImageCopyEXT** structures specifying the regions to copy.

**vkCopyMemoryToImageEXT** does not check whether the device memory associated with **dstImage** is currently in use before performing the copy. The application must guarantee that any previously submitted command that reads from or writes to the copy regions has completed before the host performs the copy.

Copy regions for the image must be aligned to a multiple of the texel block extent in each dimension, except at the edges of the image, where region extents must match the edge of the image.

---

**Valid Usage**

• VUID-VkCopyMemoryToImageInfoEXT-dstImage-09109  
  If **dstImage** is sparse then all memory ranges accessed by the copy command must be bound as described in Binding Resource Memory

• VUID-VkCopyMemoryToImageInfoEXT-dstImage-09111  
  If the stencil aspect of **dstImage** is accessed, and **dstImage** was not created with separate stencil usage, **dstImage** must have been created with **VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT** set in **VkImageCreateInfo::usage**

• VUID-VkCopyMemoryToImageInfoEXT-dstImage-09112  
  If the stencil aspect of **dstImage** is accessed, and **dstImage** was created with separate stencil usage, **dstImage** must have been created with **VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT** set in **VkImageStencilUsageCreateInfo::stencilUsage**

• VUID-VkCopyMemoryToImageInfoEXT-dstImage-09113  
  If non-stencil aspects of **dstImage** are accessed, **dstImage** must have been created with **VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT** set in **VkImageCreateInfo::usage**

• VUID-VkCopyMemoryToImageInfoEXT-imageOffset-09114  
  If **flags** contains **VK_HOST_IMAGE_COPY_MEMCPY_EXT**, the x, y, and z members of the **imageOffset** member of each element of **pRegions** must be 0

• VUID-VkCopyMemoryToImageInfoEXT-dstImage-09115  
  If **flags** contains **VK_HOST_IMAGE_COPY_MEMCPY_EXT**, the **imageExtent** member of each element of **pRegions** must equal the extents of **dstImage** identified by **imageSubresource**

• VUID-VkCopyMemoryToImageInfoEXT-dstImage-07966  
  If **dstImage** is non-sparse then the image or the specified disjoint plane must be bound
completely and contiguously to a single VkDeviceMemory object

• VUID-VkCopyMemoryToImageInfoEXT-imageSubresource-07967
  The imageSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when dstImage was created

• VUID-VkCopyMemoryToImageInfoEXT-imageSubresource-07968
  If imageSubresource.layerCount is not VK_REMAINING_ARRAY_LAYERS, imageSubresource.baseArrayLayer + imageSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when dstImage was created

• VUID-VkCopyMemoryToImageInfoEXT-dstImage-07969
  dstImage must not have been created with flags containing VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT

• VUID-VkCopyMemoryToImageInfoEXT-imageSubresource-07970
  The image region specified by each element of pRegions must be contained within the specified imageSubresource of dstImage

• VUID-VkCopyMemoryToImageInfoEXT-imageSubresource-07971
  For each element of pRegions, imageOffset.x and (imageExtent.width + imageOffset.x) must both be greater than or equal to 0 and less than or equal to the width of the specified imageSubresource of dstImage

• VUID-VkCopyMemoryToImageInfoEXT-imageSubresource-07972
  For each element of pRegions, imageOffset.y and (imageExtent.height + imageOffset.y) must both be greater than or equal to 0 and less than or equal to the height of the specified imageSubresource of dstImage

• VUID-VkCopyMemoryToImageInfoEXT-dstImage-07973
  dstImage must have a sample count equal to VK_SAMPLE_COUNT_1_BIT

• VUID-VkCopyMemoryToImageInfoEXT-dstImage-07979
  If dstImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, imageOffset.y must be 0 and imageExtent.height must be 1

• VUID-VkCopyMemoryToImageInfoEXT-imageOffset-09104
  For each element of pRegions, imageOffset.z and (imageExtent.depth + imageOffset.z) must both be greater than or equal to 0 and less than or equal to the depth of the specified imageSubresource of dstImage

• VUID-VkCopyMemoryToImageInfoEXT-dstImage-07980
  If dstImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, imageOffset.z must be 0 and imageExtent.depth must be 1

• VUID-VkCopyMemoryToImageInfoEXT-dstImage-07274
  For each element of pRegions, imageOffset.x must be a multiple of the texel block extent width of the VkFormat of dstImage

• VUID-VkCopyMemoryToImageInfoEXT-dstImage-07275
  For each element of pRegions, imageOffset.y must be a multiple of the texel block extent height of the VkFormat of dstImage
For each element of `pRegions`, `imageOffset.z` must be a multiple of the texel block extent depth of `dstImage`.

For each element of `pRegions`, if the sum of `imageOffset.x` and `extent.width` does not equal the width of the subresource specified by `srcSubresource`, `extent.width` must be a multiple of the texel block extent width of `dstImage`.

For each element of `pRegions`, if the sum of `imageOffset.y` and `extent.height` does not equal the height of the subresource specified by `srcSubresource`, `extent.height` must be a multiple of the texel block extent height of `dstImage`.

For each element of `pRegions`, if the sum of `imageOffset.z` and `extent.depth` does not equal the depth of the subresource specified by `srcSubresource`, `extent.depth` must be a multiple of the texel block extent depth of `dstImage`.

For each element of `pRegions`, `imageSubresource.aspectMask` must specify aspects present in `dstImage`.

If `dstImage` has a multi-planar image format, then for each element of `pRegions`, `imageSubresource.aspectMask` must be a single valid multi-planar aspect mask bit.

If `dstImage` is of type `VK_IMAGE_TYPE_3D`, for each element of `pRegions`, `imageSubresource.baseArrayLayer` must be 0 and `imageSubresource.layerCount` must be 1.

For each element of `pRegions`, `memoryRowLength` must be a multiple of the texel block extent width of `dstImage`.

For each element of `pRegions`, `memoryImageHeight` must be a multiple of the texel block extent height of `dstImage`.

For each element of `pRegions`, `memoryRowLength` divided by the texel block extent width and then multiplied by the texel block size of `dstImage` must be less than or equal to $2^{31}$-1.

`dstImageLayout` must specify the current layout of the image subresources of `dstImage` specified in `pRegions`.

`dstImageLayout` must be one of the image layouts returned in `VkPhysicalDeviceHostImageCopyPropertiesEXT::pCopyDstLayouts`.

If `flags` includes `VK_HOST_IMAGE_COPY_MEMCPY_EXT`, for each region in `pRegions`, `memoryRowLength` and `memoryImageHeight` must both be 0.
Valid Usage (Implicit)

- **VUID-VkCopyMemoryToImageInfoEXT-sType-sType**
  
  *sType must be VK_STRUCTURE_TYPE_COPY_MEMORY_TO_IMAGE_INFO_EXT*

- **VUID-VkCopyMemoryToImageInfoEXT-pNext-pNext**
  
  *pNext must be NULL*

- **VUID-VkCopyMemoryToImageInfoEXT-flags-parameter**
  
  *flags must be a valid combination of VkHostImageCopyFlagBitsEXT values*

- **VUID-VkCopyMemoryToImageInfoEXT-dstImage-parameter**
  
  *dstImage must be a valid VkImage handle*

- **VUID-VkCopyMemoryToImageInfoEXT-dstImageLayout-parameter**
  
  *dstImageLayout must be a valid VkImageLayout value*

- **VUID-VkCopyMemoryToImageInfoEXT-pRegions-parameter**
  
  *pRegions must be a valid pointer to an array of regionCount valid VkMemoryToImageCopyEXT structures*

- **VUID-VkCopyMemoryToImageInfoEXT-regionCount-arraylength**
  
  *regionCount must be greater than 0*

Each element of **VkCopyMemoryToImageInfoEXT::pRegions** is a structure defined as:

```c
// Provided by VK_EXT_host_image_copy
typedef struct VkMemoryToImageCopyEXT {
    VkStructureType sType;
    const void* pNext;
    const void* pHostPointer;
    uint32_t memoryRowLength;
    uint32_t memoryImageHeight;
    VkImageSubresourceLayers imageSubresource;
    VkOffset3D imageOffset;
    VkExtent3D imageExtent;
} VkMemoryToImageCopyEXT;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **pHostPointer** is the host memory address which is the source of the copy.
- **memoryRowLength** and **memoryImageHeight** specify in texels a subregion of a larger two- or three-dimensional image in host memory, and control the addressing calculations. If either of these values is zero, that aspect of the host memory is considered to be tightly packed according to the **imageExtent**.
- **imageSubresource** is a VkImageSubresourceLayers used to specify the specific image subresources of the image used for the source or destination image data.
- **imageOffset** selects the initial x, y, z offsets in texels of the sub-region of the destination image
data.

- **imageExtent** is the size in texels of the image to copy in **width**, **height** and **depth**.

This structure is functionally similar to **VkBufferImageCopy2**, except it defines host memory as the source of copy instead of a buffer. In particular, the same data packing rules and restrictions as that structure apply here as well.

### Valid Usage

- **VUID-VkMemoryToImageCopyEXT-pHostPointer-09061**
  
  `pHostPointer` **must** point to memory that is large enough to contain all memory locations that are accessed according to **Buffer and Image Addressing**, for each element of **pRegions**

- **VUID-VkMemoryToImageCopyEXT-pRegions-09062**
  
  The union of all source regions, and the union of all destination regions, specified by the elements of **pRegions**, **must** not overlap in memory

- **VUID-VkMemoryToImageCopyEXT-memoryRowLength-09101**
  
  `memoryRowLength` **must** be 0, or greater than or equal to the **width** member of **imageExtent**

- **VUID-VkMemoryToImageCopyEXT-memoryImageHeight-09102**
  
  `memoryImageHeight` **must** be 0, or greater than or equal to the **height** member of **imageExtent**

- **VUID-VkMemoryToImageCopyEXT-aspectMask-09103**
  
  The **aspectMask** member of **imageSubresource** **must** only have a single bit set

- **VUID-VkMemoryToImageCopyEXT-imageExtent-06659**
  
  **imageExtent.width** **must** not be 0

- **VUID-VkMemoryToImageCopyEXT-imageExtent-06660**
  
  **imageExtent.height** **must** not be 0

- **VUID-VkMemoryToImageCopyEXT-imageExtent-06661**
  
  **imageExtent.depth** **must** not be 0

### Valid Usage (Implicit)

- **VUID-VkMemoryToImageCopyEXT-sType-sType**
  
  `sType` **must** be **VK_STRUCTURE_TYPE_MEMORY_TO_IMAGE_COPY_EXT**

- **VUID-VkMemoryToImageCopyEXT-pNext-pNext**
  
  `pNext` **must** be **NULL**

- **VUID-VkMemoryToImageCopyEXT-pHostPointer-parameter**
  
  `pHostPointer` **must** be a pointer value

- **VUID-VkMemoryToImageCopyEXT-imageSubresource-parameter**
  
  `imageSubresource` **must** be a valid **VkImageSubresourceLayers** structure

To copy data from an image object to host memory, call:
VkResult vkCopyImageToMemoryEXT(VkDevice device, const VkCopyImageToMemoryInfoEXT* pCopyImageToMemoryInfo);

- `device` is the device which owns `pCopyImageToMemoryInfo->srcImage`.
- `pCopyImageToMemoryInfo` is a pointer to a `VkCopyImageToMemoryInfoEXT` structure describing the copy parameters.

This command is functionally similar to `vkCmdCopyImageToBuffer2`, except it is executed on the host and writes to host memory instead of a buffer.

### Valid Usage

- VUID-vkCopyImageToMemoryEXT-hostImageCopy-09063
  The `hostImageCopy` feature must be enabled

### Valid Usage (Implicit)

- VUID-vkCopyImageToMemoryEXT-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkCopyImageToMemoryEXT-pCopyImageToMemoryInfo-parameter
  `pCopyImageToMemoryInfo` must be a valid pointer to a valid `VkCopyImageToMemoryInfoEXT` structure

### Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_MEMORY_MAP_FAILED

The `VkCopyImageToMemoryInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_host_image_copy
typedef struct VkCopyImageToMemoryInfoEXT {
    VkStructureType sType;
    const void* pNext;
} VkCopyImageToMemoryInfoEXT;
```
VkCopyImageToMemoryInfoEXT

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is a bitmask of `VkHostImageCopyFlagBitsEXT` values describing additional copy parameters.
- **srcImage** is the source image.
- **srcImageLayout** is the layout of the source image subresources for the copy.
- **regionCount** is the number of regions to copy.
- **pRegions** is a pointer to an array of `VkImageToMemoryCopyEXT` structures specifying the regions to copy.

`vkCopyImageToMemoryEXT` does not check whether the device memory associated with `srcImage` is currently in use before performing the copy. The application must guarantee that any previously submitted command that writes to the copy regions has completed before the host performs the copy.

Copy regions for the image must be aligned to a multiple of the texel block extent in each dimension, except at the edges of the image, where region extents must match the edge of the image.

---

**Valid Usage**

- **VUID-VkCopyImageToMemoryInfoEXT-srcImage-09109**
  If `srcImage` is sparse then all memory ranges accessed by the copy command must be bound as described in `Binding Resource Memory`.

- **VUID-VkCopyImageToMemoryInfoEXT-srcImage-09111**
  If the stencil aspect of `srcImage` is accessed, and `srcImage` was not created with separate stencil usage, `srcImage` must have been created with `VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT` set in `VkImageCreateInfo::usage`.

  If the stencil aspect of `srcImage` is accessed, and `srcImage` was created with separate stencil usage, `srcImage` must have been created with `VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT` set in `VkImageStencilUsageCreateInfo::stencilUsage`.

- **VUID-VkCopyImageToMemoryInfoEXT-srcImage-09113**
  If non-stencil aspects of `srcImage` are accessed, `srcImage` must have been created with `VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT` set in `VkImageCreateInfo::usage`.

- **VUID-VkCopyImageToMemoryInfoEXT-imageOffset-09114**
  If `flags` contains `VK_HOST_IMAGE_COPY_MEMCPY_EXT`, the x, y, and z members of the...
imageOffset member of each element of pRegions must be 0

• VUID-VkCopyImageToMemoryInfoEXT-srcImage-09115
  If flags contains VK_HOST_IMAGE_COPY_MEMCPY_EXT, the imageExtent member of each element of pRegions must equal the extents of srcImage identified by imageSubresource

• VUID-VkCopyImageToMemoryInfoEXT-srcImage-07966
  If srcImage is non-sparse then the image or the specified disjoint plane must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-VkCopyImageToMemoryInfoEXT-imageSubresource-07967
  The imageSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when srcImage was created

• VUID-VkCopyImageToMemoryInfoEXT-imageSubresource-07968
  If imageSubresource.layerCount is not VK_REMAINING_ARRAY_LAYERS, imageSubresource.baseArrayLayer + imageSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when srcImage was created

• VUID-VkCopyImageToMemoryInfoEXT-srcImage-07969
  srcImage must not have been created with flags containing VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT

• VUID-VkCopyImageToMemoryInfoEXT-imageSubresource-07970
  The image region specified by each element of pRegions must be contained within the specified imageSubresource of srcImage

• VUID-VkCopyImageToMemoryInfoEXT-imageSubresource-07971
  For each element of pRegions, imageOffset.x and (imageExtent.width + imageOffset.x) must both be greater than or equal to 0 and less than or equal to the width of the specified imageSubresource of srcImage

• VUID-VkCopyImageToMemoryInfoEXT-imageSubresource-07972
  For each element of pRegions, imageOffset.y and (imageExtent.height + imageOffset.y) must both be greater than or equal to 0 and less than or equal to the height of the specified imageSubresource of srcImage

• VUID-VkCopyImageToMemoryInfoEXT-srcImage-07973
  srcImage must have a sample count equal to VK_SAMPLE_COUNT_1_BIT

• VUID-VkCopyImageToMemoryInfoEXT-srcImage-07979
  If srcImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, imageOffset.y must be 0 and imageExtent.height must be 1

• VUID-VkCopyImageToMemoryInfoEXT-imageOffset-09104
  For each element of pRegions, imageOffset.z and (imageExtent.depth + imageOffset.z) must both be greater than or equal to 0 and less than or equal to the depth of the specified imageSubresource of srcImage

• VUID-VkCopyImageToMemoryInfoEXT-srcImage-07980
  If srcImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, imageOffset.z must be 0 and imageExtent.depth must be 1
For each element of \( p_{\text{Regions}} \), \( \text{imageOffset.x} \) must be a multiple of the texel block extent width of the \( \text{VkFormat} \) of \( \text{srcImage} \).

For each element of \( p_{\text{Regions}} \), \( \text{imageOffset.y} \) must be a multiple of the texel block extent height of the \( \text{VkFormat} \) of \( \text{srcImage} \).

For each element of \( p_{\text{Regions}} \), \( \text{imageOffset.z} \) must be a multiple of the texel block extent depth of the \( \text{VkFormat} \) of \( \text{srcImage} \).

For each element of \( p_{\text{Regions}} \), if the sum of \( \text{imageOffset.x} \) and \( \text{extent.width} \) does not equal the width of the subresource specified by \( \text{srcSubresource} \), \( \text{extent.width} \) must be a multiple of the texel block extent width of the \( \text{VkFormat} \) of \( \text{srcImage} \).

For each element of \( p_{\text{Regions}} \), if the sum of \( \text{imageOffset.y} \) and \( \text{extent.height} \) does not equal the height of the subresource specified by \( \text{srcSubresource} \), \( \text{extent.height} \) must be a multiple of the texel block extent height of the \( \text{VkFormat} \) of \( \text{srcImage} \).

For each element of \( p_{\text{Regions}} \), if the sum of \( \text{imageOffset.z} \) and \( \text{extent.depth} \) does not equal the depth of the subresource specified by \( \text{srcSubresource} \), \( \text{extent.depth} \) must be a multiple of the texel block extent depth of the \( \text{VkFormat} \) of \( \text{srcImage} \).

For each element of \( p_{\text{Regions}} \), \( \text{imageSubresource.aspectMask} \) must specify aspects present in \( \text{srcImage} \).

If \( \text{srcImage} \) has a multi-planar image format, then for each element of \( p_{\text{Regions}} \), \( \text{imageSubresource.aspectMask} \) must be a single valid multi-planar aspect mask bit.

If \( \text{srcImage} \) is of type \( \text{VK_IMAGE_TYPE_3D} \), for each element of \( p_{\text{Regions}} \), \( \text{imageSubresource.baseArrayLayer} \) must be 0 and \( \text{imageSubresource.layerCount} \) must be 1.

For each element of \( p_{\text{Regions}} \), \( \text{memoryRowLength} \) must be a multiple of the texel block extent width of the \( \text{VkFormat} \) of \( \text{srcImage} \).

For each element of \( p_{\text{Regions}} \), \( \text{memoryImageHeight} \) must be a multiple of the texel block extent height of the \( \text{VkFormat} \) of \( \text{srcImage} \).

For each element of \( p_{\text{Regions}} \), \( \text{memoryRowLength} \) divided by the texel block size of \( \text{srcImage} \) must be less than or equal to \( 2^{31} - 1 \).

\( \text{srcImageLayout} \) must specify the current layout of the image subresources of \( \text{srcImage} \) specified in \( p_{\text{Regions}} \).
• VUID-VkCopyImageToMemoryInfoEXT-srcImageLayout-09065
  srcImageLayout must be one of the image layouts returned in
  VkPhysicalDeviceHostImageCopyPropertiesEXT::pCopySrcLayouts

• VUID-VkCopyImageToMemoryInfoEXT-flags-09394
  If flags includes VK_HOST_IMAGE_COPY_MEMCPY_EXT, for each region in pRegions,
  memoryRowLength and memoryImageHeight must both be 0

Valid Usage (Implicit)

• VUID-VkCopyImageToMemoryInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_COPY_IMAGE_TO_MEMORY_INFO_EXT

• VUID-VkCopyImageToMemoryInfoEXT-pNext-pNext
  pNext must be NULL

• VUID-VkCopyImageToMemoryInfoEXT-flags-parameter
  flags must be a valid combination of VkHostImageCopyFlagBitsEXT values

• VUID-VkCopyImageToMemoryInfoEXT-srcImage-parameter
  srcImage must be a valid VkImage handle

• VUID-VkCopyImageToMemoryInfoEXT-srcImageLayout-parameter
  srcImageLayout must be a valid VkImageLayout value

• VUID-VkCopyImageToMemoryInfoEXT-pRegions-parameter
  pRegions must be a valid pointer to an array of regionCount valid
  VkImageToMemoryCopyEXT structures

• VUID-VkCopyImageToMemoryInfoEXT-regionCount-arraylength
  regionCount must be greater than 0

Each element of VkCopyImageToMemoryInfoEXT::pRegions is a structure defined as:

```c
typedef struct VkImageToMemoryCopyEXT {
    VkStructureType sType;
    const void* pNext;
    void* pHostPointer;
    uint32_t memoryRowLength;
    uint32_t memoryImageHeight;
    VkImageSubresourceLayers imageSubresource;
    VkOffset3D imageOffset;
    VkExtent3D imageExtent;
} VkImageToMemoryCopyEXT;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• pHostPointer is the host memory address which is the destination of the copy.
• `memoryRowLength` and `memoryImageHeight` specify in texels a subregion of a larger two- or three-dimensional image in host memory, and control the addressing calculations. If either of these values is zero, that aspect of the host memory is considered to be tightly packed according to the `imageExtent`.

• `imageSubresource` is a `VkImageSubresourceLayers` used to specify the specific image subresources of the image used for the source or destination image data.

• `imageOffset` selects the initial x, y, z offsets in texels of the sub-region of the source image data.

• `imageExtent` is the size in texels of the image to copy in width, height and depth.

This structure is functionally similar to `VkBufferImageCopy2`, except it defines host memory as the target of copy instead of a buffer. In particular, the same data packing rules and restrictions as that structure apply here as well.

### Valid Usage

- **VUID-VkImageToMemoryCopyEXT-pHostPointer-09066**
  - `pHostPointer` must point to memory that is large enough to contain all memory locations that are accessed according to Buffer and Image Addressing, for each element of `pRegions`.

- **VUID-VkImageToMemoryCopyEXT-pRegions-09067**
  - The union of all source regions, and the union of all destination regions, specified by the elements of `pRegions`, must not overlap in memory.

- **VUID-VkImageToMemoryCopyEXT-memoryRowLength-09101**
  - `memoryRowLength` must be 0, or greater than or equal to the `width` member of `imageExtent`.

- **VUID-VkImageToMemoryCopyEXT-memoryImageHeight-09102**
  - `memoryImageHeight` must be 0, or greater than or equal to the `height` member of `imageExtent`.

- **VUID-VkImageToMemoryCopyEXT-aspectMask-09103**
  - The `aspectMask` member of `imageSubresource` must only have a single bit set.

- **VUID-VkImageToMemoryCopyEXT-imageExtent-06659**
  - `imageExtent.width` must not be 0.

- **VUID-VkImageToMemoryCopyEXT-imageExtent-06660**
  - `imageExtent.height` must not be 0.

- **VUID-VkImageToMemoryCopyEXT-imageExtent-06661**
  - `imageExtent.depth` must not be 0.

### Valid Usage (Implicit)

- **VUID-VkImageToMemoryCopyEXT-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_IMAGE_TO_MEMORY_COPY_EXT`.

- **VUID-VkImageToMemoryCopyEXT-pNext-pNext**
  - `pNext` must be `NULL`.

- **VUID-VkImageToMemoryCopyEXT-pHostPointer-parameter**
**pHostPointer** must be a pointer value

- VUID-VkImageToMemoryCopyEXT-imageSubresource-parameter
  imageSubresource must be a valid *VkImageSubresourceLayers* structure

Bits which can be set in *VkCopyMemoryToImageInfoEXT::flags*, *VkCopyImageToMemoryInfoEXT::flags*, and *VkCopyImageToImageInfoEXT::flags*, specifying additional copy parameters are:

```c
// Provided by VK_EXT_host_image_copy
typedef enum VkHostImageCopyFlagBitsEXT {
    VK_HOST_IMAGE_COPY_MEMCPY_EXT = 0x00000001,
} VkHostImageCopyFlagBitsEXT;
```

- **VK_HOST_IMAGE_COPY_MEMCPY_EXT** specifies that no memory layout swizzling is to be applied during data copy. For copies between memory and images, this flag indicates that image data in host memory is swizzled in exactly the same way as the image data on the device. Using this flag indicates that the implementations may use a simple memory copy to transfer the data between the host memory and the device memory. The format of the swizzled data in host memory is platform dependent and is not defined in this specification.

```c
// Provided by VK_EXT_host_image_copy
typedef VkFlags VkHostImageCopyFlagsEXT;
```

*VkHostImageCopyFlagsEXT* is a bitmask type for setting a mask of zero or more *VkHostImageCopyFlagBitsEXT*.

To copy data from an image object to another image object using the host, call:

```c
// Provided by VK_EXT_host_image_copy
VkResult vkCopyImageToImageEXT(
    VkDevice device,
    const VkCopyImageToImageInfoEXT* pCopyImageToImageInfo);
```

- *device* is the device which owns *pCopyImageToMemoryInfo->srcImage*.
- *pCopyImageToImageInfo* is a pointer to a *VkCopyImageToImageInfoEXT* structure describing the copy parameters.

This command is functionally similar to *vkCmdCopyImage2*, except it is executed on the host.

**Valid Usage**

- VUID-vkCopyImageToImageEXT-hostImageCopy-09068
  The *hostImageCopy* feature must be enabled
Valid Usage (Implicit)

- VUID-vkCopyImageToImageEXT-device-parameter
  device must be a valid VkDevice handle

- VUID-vkCopyImageToImageEXT-pCopyImageToImageInfo-parameter
  pCopyImageToImageInfo must be a valid pointer to a valid VkCopyImageToImageInfoEXT structure

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_MEMORY_MAP_FAILED

The VkCopyImageToImageInfoEXT structure is defined as:

```c
// Provided by VK_EXT_host_image_copy
typedef struct VkCopyImageToImageInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkHostImageCopyFlagsEXT flags;
    VkImage srcImage;
    VkImageLayout srcImageLayout;
    VkImage dstImage;
    VkImageLayout dstImageLayout;
    uint32_t regionCount;
    const VkImageCopy2* pRegions;
} VkCopyImageToImageInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkHostImageCopyFlagBitsEXT values describing additional copy parameters.
- `srcImage` is the source image.
- `srcImageLayout` is the layout of the source image subresources for the copy.
- `dstImage` is the destination image.
- `dstImageLayout` is the layout of the destination image subresources for the copy.
• **regionCount** is the number of regions to copy.

• **pRegions** is a pointer to an array of VkImageCopy2 structures specifying the regions to copy.

vkCopyImageToImageEXT does not check whether the device memory associated with **srcImage** or **dstImage** is currently in use before performing the copy. The application must guarantee that any previously submitted command that writes to the copy regions has completed before the host performs the copy.

### Valid Usage

- **VUID-VkCopyImageToImageInfoEXT-srcImage-09069**
  srcImage and dstImage must have been created with identical image creation parameters.

- **VUID-VkCopyImageToImageInfoEXT-srcImage-09109**
  If srcImage is sparse then all memory ranges accessed by the copy command must be bound as described in Binding Resource Memory.

- **VUID-VkCopyImageToImageInfoEXT-srcImage-09111**
  If the stencil aspect of srcImage is accessed, and srcImage was not created with separate stencil usage, srcImage must have been created with VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT set in VkImageCreateInfo::usage.

- **VUID-VkCopyImageToImageInfoEXT-srcImage-09112**
  If the stencil aspect of srcImage is accessed, and srcImage was created with separate stencil usage, srcImage must have been created with VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT set in VkImageStencilUsageCreateInfo::stencilUsage.

- **VUID-VkCopyImageToImageInfoEXT-srcImage-09113**
  If non-stencil aspects of srcImage are accessed, srcImage must have been created with VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT set in VkImageCreateInfo::usage.

- **VUID-VkCopyImageToImageInfoEXT-srcOffset-09114**
  If flags contains VK_HOST_IMAGE_COPY_MEMCPY_EXT, the x, y, and z members of the srcOffset member of each element of pRegions must be 0.

- **VUID-VkCopyImageToImageInfoEXT-srcImage-09115**
  If flags contains VK_HOST_IMAGE_COPY_MEMCPY_EXT, the extent member of each element of pRegions must equal the extents of srcImage identified by srcSubresource.

- **VUID-VkCopyImageToImageInfoEXT-srcImage-07966**
  If srcImage is non-sparse then the image or the specified disjoint plane must be bound completely and contiguously to a single VkDeviceMemory object.

- **VUID-VkCopyImageToImageInfoEXT-srcSubresource-07967**
  The srcSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when srcImage was created.

- **VUID-VkCopyImageToImageInfoEXT-srcSubresource-07968**
  If srcSubresource.layerCount is not VK_REMAINING_ARRAY_LAYERS, srcSubresource.baseArrayLayer + srcSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when srcImage was created.
• VUID-VkCopyImageToImageInfoEXT-srcImage-07969
  srcImage must not have been created with flags containing
  VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT

• VUID-VkCopyImageToImageInfoEXT-srcSubresource-07970
  The image region specified by each element of pRegions must be contained within the
  specified srcSubresource of srcImage

• VUID-VkCopyImageToImageInfoEXT-srcSubresource-07971
  For each element of pRegions, srcOffset.x and (extent.width + srcOffset.x) must both be
  greater than or equal to 0 and less than or equal to the width of the specified
  srcSubresource of srcImage

• VUID-VkCopyImageToImageInfoEXT-srcSubresource-07972
  For each element of pRegions, srcOffset.y and (extent.height + srcOffset.y) must both be
  greater than or equal to 0 and less than or equal to the height of the specified
  srcSubresource of srcImage

• VUID-VkCopyImageToImageInfoEXT-srcImage-07979
  If srcImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, srcOffset.y
  must be 0 and extent.height must be 1

• VUID-VkCopyImageToImageInfoEXT-srcOffset-09104
  For each element of pRegions, srcOffset.z and (extent.depth + srcOffset.z) must both be
  greater than or equal to 0 and less than or equal to the depth of the specified
  srcSubresource of srcImage

• VUID-VkCopyImageToImageInfoEXT-srcImage-07980
  If srcImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of
  pRegions, srcOffset.z must be 0 and extent.depth must be 1

• VUID-VkCopyImageToImageInfoEXT-srcImage-07274
  For each element of pRegions, srcOffset.x must be a multiple of the texel block extent
  width of the VkFormat of srcImage

• VUID-VkCopyImageToImageInfoEXT-srcImage-07275
  For each element of pRegions, srcOffset.y must be a multiple of the texel block extent
  height of the VkFormat of srcImage

• VUID-VkCopyImageToImageInfoEXT-srcImage-07276
  For each element of pRegions, srcOffset.z must be a multiple of the texel block extent
  depth of the VkFormat of srcImage

• VUID-VkCopyImageToImageInfoEXT-srcImage-00207
  For each element of pRegions, if the sum of srcOffset.x and extent.width does not equal
  the width of the subresource specified by srcSubresource, extent.width must be a multiple
  of the texel block extent width of the VkFormat of srcImage

• VUID-VkCopyImageToImageInfoEXT-srcImage-00208
  For each element of pRegions, if the sum of srcOffset.y and extent.height does not equal
  the height of the subresource specified by srcSubresource, extent.height must be a multiple
  of the texel block extent height of the VkFormat of srcImage

• VUID-VkCopyImageToImageInfoEXT-srcImage-00209
For each element of pRegions, if the sum of srcOffset.z and extent.depth does not equal the depth of the subresource specified by srcSubresource, extent.depth must be a multiple of the texel block extent depth of the VkFormat of srcImage.

• VUID-VkCopyImageToImageInfoEXT-srcSubresource-09105
  For each element of pRegions, srcSubresource.aspectMask must specify aspects present in srcImage.

• VUID-VkCopyImageToImageInfoEXT-srcImage-07981
  If srcImage has a multi-planar image format, then for each element of pRegions, srcSubresource.aspectMask must be a single valid multi-planar aspect mask bit.

• VUID-VkCopyImageToImageInfoEXT-srcImage-07983
  If srcImage is of type VK_IMAGE_TYPE_3D, for each element of pRegions, srcSubresource.baseArrayLayer must be 0 and srcSubresource.layerCount must be 1.

• VUID-VkCopyImageToImageInfoEXT-dstImage-09109
  If dstImage is sparse then all memory ranges accessed by the copy command must be bound as described in Binding Resource Memory.

• VUID-VkCopyImageToImageInfoEXT-dstImage-09111
  If the stencil aspect of dstImage is accessed, and dstImage was not created with separate stencil usage, dstImage must have been created with VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT set in VkImageCreateInfo::usage.

• VUID-VkCopyImageToImageInfoEXT-dstImage-09112
  If the stencil aspect of dstImage is accessed, and dstImage was created with separate stencil usage, dstImage must have been created with VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT set in VkImageStencilUsageCreateInfo::stencilUsage.

• VUID-VkCopyImageToImageInfoEXT-dstImage-09113
  If non-stencil aspects of dstImage are accessed, dstImage must have been created with VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT set in VkImageCreateInfo::usage.

• VUID-VkCopyImageToImageInfoEXT-dstOffset-09114
  If flags contains VK_HOST_IMAGE_COPY_MEMCPY_EXT, the x, y, and z members of the dstOffset member of each element of pRegions must be 0.

• VUID-VkCopyImageToImageInfoEXT-dstImage-09115
  If flags contains VK_HOST_IMAGE_COPY_MEMCPY_EXT, the extent member of each element of pRegions must equal the extents of dstImage identified by dstSubresource.

• VUID-VkCopyImageToImageInfoEXT-dstImage-07966
  If dstImage is non-sparse then the image or the specified disjoint plane must be bound completely and contiguously to a single VkDeviceMemory object.

• VUID-VkCopyImageToImageInfoEXT-dstSubresource-07967
  The dstSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when dstImage was created.

• VUID-VkCopyImageToImageInfoEXT-dstSubresource-07968
  If dstSubresource.layerCount is not VK_REMAINING_ARRAY_LAYERS, dstSubresource.baseArrayLayer + dstSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when
**dstImage** was created

- **VUID-VkCopyImageToImageInfoEXT-dstImage-07969**
  
  **dstImage must not have been created with flags containing VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT**

- **VUID-VkCopyImageToImageInfoEXT-dstSubresource-07970**
  
  The image region specified by each element of **pRegions** must be contained within the specified **dstSubresource** of **dstImage**

- **VUID-VkCopyImageToImageInfoEXT-dstSubresource-07971**
  
  For each element of **pRegions**, **dstOffset.x** and 
  
  (extent.width + dstOffset.x) **must** both be greater than or equal to 0 and less than or equal to the width of the specified **dstSubresource** of **dstImage**

- **VUID-VkCopyImageToImageInfoEXT-dstSubresource-07972**
  
  For each element of **pRegions**, **dstOffset.y** and 
  
  (extent.height + dstOffset.y) **must** both be greater than or equal to 0 and less than or equal to the height of the specified **dstSubresource** of **dstImage**

- **VUID-VkCopyImageToImageInfoEXT-dstImage-07979**
  
  If **dstImage** is of type **VK_IMAGE_TYPE_1D**, then for each element of **pRegions**, **dstOffset.y** **must** be 0 and extent.height **must** be 1

- **VUID-VkCopyImageToImageInfoEXT-dstOffset-09104**
  
  For each element of **pRegions**, **dstOffset.z** and 
  
  (extent.depth + dstOffset.z) **must** both be greater than or equal to 0 and less than or equal to the depth of the specified **dstSubresource** of **dstImage**

- **VUID-VkCopyImageToImageInfoEXT-dstImage-07980**
  
  If **dstImage** is of type **VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D**, then for each element of **pRegions**, **dstOffset.z** **must** be 0 and extent.depth **must** be 1

- **VUID-VkCopyImageToImageInfoEXT-dstImage-07274**
  
  For each element of **pRegions**, **dstOffset.x** **must** be a multiple of the texel block extent width of the **VkFormat** of **dstImage**

- **VUID-VkCopyImageToImageInfoEXT-dstImage-07275**
  
  For each element of **pRegions**, **dstOffset.y** **must** be a multiple of the texel block extent height of the **VkFormat** of **dstImage**

- **VUID-VkCopyImageToImageInfoEXT-dstImage-07276**
  
  For each element of **pRegions**, **dstOffset.z** **must** be a multiple of the texel block extent depth of the **VkFormat** of **dstImage**

- **VUID-VkCopyImageToImageInfoEXT-dstImage-00207**
  
  For each element of **pRegions**, if the sum of **dstOffset.x** and extent.width does not equal the width of the subresource specified by srcSubresource, extent.width **must** be a multiple of the texel block extent width of the **VkFormat** of **dstImage**

- **VUID-VkCopyImageToImageInfoEXT-dstImage-00208**
  
  For each element of **pRegions**, if the sum of **dstOffset.y** and extent.height does not equal the height of the subresource specified by srcSubresource, extent.height **must** be a multiple of the texel block extent height of the **VkFormat** of **dstImage**
For each element of `pRegions`, if the sum of `dstOffset.z` and `extent.depth` does not equal the depth of the subresource specified by `srcSubresource`, `extent.depth` must be a multiple of the texel block extent depth of the `VkFormat` of `dstImage`.

For each element of `pRegions`, `dstSubresource.aspectMask` must specify aspects present in `dstImage`.

If `dstImage` has a multi-planar image format, then for each element of `pRegions`, `dstSubresource.aspectMask` must be a single valid multi-planar aspect mask bit.

If `dstImage` is of type `VK_IMAGE_TYPE_3D`, for each element of `pRegions`, `dstSubresource.baseArrayLayer` must be 0 and `dstSubresource.layerCount` must be 1.

`srcImageLayout` must specify the current layout of the image subresources of `srcImage` specified in `pRegions`.

`dstImageLayout` must specify the current layout of the image subresources of `dstImage` specified in `pRegions`.

`srcImageLayout` must be one of the image layouts returned in `VkPhysicalDeviceHostImageCopyPropertiesEXT::pCopySrcLayouts`.

`dstImageLayout` must be one of the image layouts returned in `VkPhysicalDeviceHostImageCopyPropertiesEXT::pCopyDstLayouts`.

Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_COPY_IMAGE_TO_IMAGE_INFO_EXT`.
- `pNext` must be `NULL`.
- `flags` must be a valid combination of `VkHostImageCopyFlagBitsEXT` values.
- `srcImage` must be a valid `VkImage` handle.
- `srcImageLayout` must be a valid `VkImageLayout` value.
- `dstImage` must be a valid `VkImage` handle.
- `dstImageLayout` must be a valid `VkImageLayout` value.
20.4. Indirect Copies

An application can use indirect copies when the copy parameters are not known during the command buffer creation time.

To copy data between two memory regions by specifying copy parameters indirectly in a buffer, call:

```c
// Provided by VK_NV_copy_memory_indirect
void vkCmdCopyMemoryIndirectNV(
    VkCommandBuffer commandBuffer,          // Provided by VK_NV_copy_memory_indirect
    VkDeviceAddress copyBufferAddress,      // Provided by VK_NV_copy_memory_indirect
    uint32_t copyCount,                     // Provided by VK_NV_copy_memory_indirect
    uint32_t stride);                      // Provided by VK_NV_copy_memory_indirect
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `copyBufferAddress` is the buffer address specifying the copy parameters. This buffer is laid out in memory as an array of `VkCopyMemoryIndirectCommandNV` structures.
- `copyCount` is the number of copies to execute, and can be zero.
- `stride` is the stride in bytes between successive sets of copy parameters.

Each region read from `copyBufferAddress` is copied from the source region to the specified destination region. The results are undefined if any of the source and destination regions overlap in memory.

### Valid Usage

- VUID-vkCmdCopyMemoryIndirectNV-None-07653
  The `indirectCopy` feature must be enabled
- VUID-vkCmdCopyMemoryIndirectNV-copyBufferAddress-07654
  `copyBufferAddress` must be 4 byte aligned
- VUID-vkCmdCopyMemoryIndirectNV-stride-07655
  `stride` must be a multiple of 4 and must be greater than or equal to `sizeof(VkCopyMemoryIndirectCommandNV)`
• VUID-vkCmdCopyMemoryIndirectNV-commandBuffer-07656
  The VkCommandPool that commandBuffer was allocated from must support at least one of the VkPhysicalDeviceCopyMemoryIndirectPropertiesNV::supportedQueues

Valid Usage (Implicit)

• VUID-vkCmdCopyMemoryIndirectNV-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdCopyMemoryIndirectNV-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdCopyMemoryIndirectNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support transfer, graphics, or compute operations

• VUID-vkCmdCopyMemoryIndirectNV-renderpass
  This command must only be called outside of a render pass instance

• VUID-vkCmdCopyMemoryIndirectNV-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Transfer, Graphics, Compute</td>

The structure describing source and destination memory regions, VkCopyMemoryIndirectCommandNV is defined as:

```c
// Provided by VK_NV_copy_memory_indirect
typedef struct VkCopyMemoryIndirectCommandNV {
    VkDeviceAddress srcAddress;
    VkDeviceAddress dstAddress;
    VkDeviceSize size;
};
```
VkCopyMemoryIndirectCommandNV;

- **srcAddress** is the starting address of the source device memory to copy from.
- **dstAddress** is the starting address of the destination device memory to copy to.
- **size** is the size of the copy in bytes.

**Valid Usage**

- VUID-VkCopyMemoryIndirectCommandNV-srcAddress-07657
  The **srcAddress** must be 4 byte aligned
- VUID-VkCopyMemoryIndirectCommandNV-dstAddress-07658
  The **dstAddress** must be 4 byte aligned
- VUID-VkCopyMemoryIndirectCommandNV-size-07659
  The **size** must be 4 byte aligned

To copy data from a memory region to an image object by specifying copy parameters in a buffer, call:

```c
// Provided by VK_NV_copy_memory_indirect
void vkCmdCopyMemoryToImageIndirectNV(
    VkCommandBuffer commandBuffer,
    VkDeviceAddress copyBufferAddress,
    uint32_t copyCount,
    uint32_t stride,
    VkImage dstImage,
    VkImageLayout dstImageLayout,
    const VkImageSubresourceLayers* pImageSubresources);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **copyBufferAddress** is the buffer address specifying the copy parameters. This buffer is laid out in memory as an array of **VkCopyMemoryToImageIndirectCommandNV** structures.
- **copyCount** is the number of copies to execute, and can be zero.
- **stride** is the byte stride between successive sets of copy parameters.
- **dstImage** is the destination image.
- **dstImageLayout** is the layout of the destination image subresources for the copy.
- **pImageSubresources** is a pointer to an array of size copyCount of **VkImageSubresourceLayers** used to specify the specific image subresource of the destination image data for that copy.

Each region in **copyBufferAddress** is copied from the source memory region to an image region in the destination image. If the destination image is of type **VK_IMAGE_TYPE_3D**, the starting slice and number of slices to copy are specified in pImageSubresources->baseArrayLayer and pImageSubresources->layerCount respectively. The copy **must** be performed on a queue that supports
indirect copy operations, see VkPhysicalDeviceCopyMemoryIndirectPropertiesNV.

Valid Usage

- VUID-vkCmdCopyMemoryToImageIndirectNV-None-07660
  The indirectCopy feature must be enabled

- VUID-vkCmdCopyMemoryToImageIndirectNV-dstImage-07661
  dstImage must not be a protected image

- VUID-vkCmdCopyMemoryToImageIndirectNV-aspectMask-07662
  The aspectMask member for every subresource in pImageSubresources must only have a single bit set

- VUID-vkCmdCopyMemoryToImageIndirectNV-dstImage-07663
  The image region specified by each element in copyBufferAddress must be a region that is contained within dstImage

- VUID-vkCmdCopyMemoryToImageIndirectNV-dstImage-07664
  dstImage must have been created with VK_IMAGE_USAGE_TRANSFER_DST_BIT usage flag

- VUID-vkCmdCopyMemoryToImageIndirectNV-dstImage-07665
  If dstImage is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdCopyMemoryToImageIndirectNV-dstImage-07973
  dstImage must have a sample count equal to VK_SAMPLE_COUNT_1_BIT

- VUID-vkCmdCopyMemoryToImageIndirectNV-dstImageLayout-07667
  dstImageLayout must specify the layout of the image subresources of dstImage at the time this command is executed on a VkDevice

- VUID-vkCmdCopyMemoryToImageIndirectNV-dstImageLayout-07669
  dstImageLayout must be VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL, VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, or VK_IMAGE_LAYOUT_GENERAL

- VUID-vkCmdCopyMemoryToImageIndirectNV-mipLevel-07670
  The specified mipLevel of each region must be less than the mipLevels specified in VkImageCreateInfo when dstImage was created

- VUID-vkCmdCopyMemoryToImageIndirectNV-layerCount-08764
  If layerCount is not VK_REMAINING_ARRAY_LAYERS, the specified baseArrayLayer + layerCount of each region must be less than or equal to the arrayLayers specified in VkImageCreateInfo when dstImage was created

- VUID-vkCmdCopyMemoryToImageIndirectNV-imageOffset-07672
  The imageOffset and imageExtent members of each region must respect the image transfer granularity requirements of commandBuffer’s command pool’s queue family, as described in VkQueueFamilyProperties

- VUID-vkCmdCopyMemoryToImageIndirectNV-dstImage-07673
  dstImage must not have been created with flags containing VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT

- VUID-vkCmdCopyMemoryToImageIndirectNV-commandBuffer-07674
If the queue family used to create the `VkCommandPool` which `commandBuffer` was allocated from does not support `VK_QUEUE_GRAPHICS_BIT`, for each region, the `aspectMask` member of `pImageSubresources` must not be `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT`.

- **VUID-vkCmdCopyMemoryToImageIndirectNV-imageOffset-07675**
  For each region in `copyBufferAddress`, `imageOffset.y` and `(imageExtent.height + imageOffset.y)` must both be greater than or equal to 0 and less than or equal to the height of the specified subresource.

- **VUID-vkCmdCopyMemoryToImageIndirectNV-offset-07676**
  `offset` must be 4 byte aligned.

- **VUID-vkCmdCopyMemoryToImageIndirectNV-stride-07677**
  `stride` must be a multiple of 4 and `must` be greater than or equal to `sizeof(VkCopyMemoryToImageIndirectCommandNV)`.

### Valid Usage (Implicit)

- **VUID-vkCmdCopyMemoryToImageIndirectNV-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdCopyMemoryToImageIndirectNV-dstImage-parameter**
  `dstImage` must be a valid `VkImage` handle.

- **VUID-vkCmdCopyMemoryToImageIndirectNV-dstImageLayout-parameter**
  `dstImageLayout` must be a valid `VkImageLayout` value.

- **VUID-vkCmdCopyMemoryToImageIndirectNV-pImageSubresources-parameter**
  `pImageSubresources` must be a valid pointer to an array of `copyCount` valid `VkImageSubresourceLayers` structures.

- **VUID-vkCmdCopyMemoryToImageIndirectNV-commandBuffer-recording**
  `commandBuffer` must be in the recording state.

- **VUID-vkCmdCopyMemoryToImageIndirectNV-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations.

- **VUID-vkCmdCopyMemoryToImageIndirectNV-renderpass**
  This command must only be called outside of a render pass instance.

- **VUID-vkCmdCopyMemoryToImageIndirectNV-videocoding**
  This command must only be called outside of a video coding scope.

- **VUID-vkCmdCopyMemoryToImageIndirectNV-copyCount-arraylength**
  `copyCount` must be greater than 0.

- **VUID-vkCmdCopyMemoryToImageIndirectNV-commonparent**
  Both of `commandBuffer`, and `dstImage` must have been created, allocated, or retrieved from the same `VkDevice`
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

</tbody>
</table>

The `VkCopyMemoryToImageIndirectCommandNV` is defined as:

```c
// Provided by VK_NV_copy_memory_indirect
typedef struct VkCopyMemoryToImageIndirectCommandNV {
    VkDeviceAddress   srcAddress;
    uint32_t          bufferRowLength;
    uint32_t          bufferImageHeight;
    VkImageSubresourceLayers imageSubresource;
    VkOffset3D        imageOffset;
    VkExtent3D        imageExtent;
} VkCopyMemoryToImageIndirectCommandNV;
```

- `srcAddress` is the starting address of the source device memory to copy from.
- `bufferRowLength` and `bufferImageHeight` specify in texels a subregion of a larger two- or three-dimensional image in buffer memory, and control the addressing calculations. If either of these values is zero, that aspect of the buffer memory is considered to be tightly packed according to the `imageExtent`.
- `imageSubresource` is a `VkImageSubresourceLayers` used to specify the specific image subresources of the image used for the destination image data, which must match the values specified in `pImageSubresources` parameter of `vkCmdCopyMemoryToImageIndirectNV` during command recording.
- `imageOffset` selects the initial `x`, `y`, `z` offsets in texels of the sub-region of the destination image data.
- `imageExtent` is the size in texels of the destination image in `width`, `height` and `depth`.

Valid Usage

- VUID-VkCopyMemoryToImageIndirectCommandNV-srcAddress-07678
The `srcAddress` must be 4 byte aligned

- VUID-VkCopyMemoryToImageIndirectCommandNV-bufferRowLength-07679
  `bufferRowLength` must be 0, or greater than or equal to the `width` member of `imageExtent`

- VUID-VkCopyMemoryToImageIndirectCommandNV-bufferImageHeight-07680
  `bufferImageHeight` must be 0, or greater than or equal to the `height` member of `imageExtent`

- VUID-VkCopyMemoryToImageIndirectCommandNV-imageOffset-07681
  `imageOffset` must specify a valid offset in the destination image

- VUID-VkCopyMemoryToImageIndirectCommandNV-imageExtent-07682
  `imageExtent` must specify a valid region in the destination image and can be 0

Valid Usage (Implicit)

- VUID-VkCopyMemoryToImageIndirectCommandNV-imageSubresource-parameter
  `imageSubresource` must be a valid `VkImageSubresourceLayers` structure

20.5. Image Copies With Scaling

To copy regions of a source image into a destination image, potentially performing format conversion, arbitrary scaling, and filtering, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdBlitImage(
    VkCommandBuffer commandBuffer,
    VkImage srcImage,
    VkImageLayout srcImageLayout,
    VkImage dstImage,
    VkImageLayout dstImageLayout,
    uint32_t regionCount,
    const VkImageBlit* pRegions,
    VkFilter filter);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `srcImage` is the source image.
- `srcImageLayout` is the layout of the source image subresources for the blit.
- `dstImage` is the destination image.
- `dstImageLayout` is the layout of the destination image subresources for the blit.
- `regionCount` is the number of regions to blit.
- `pRegions` is a pointer to an array of `VkImageBlit` structures specifying the regions to blit.
- `filter` is a `VkFilter` specifying the filter to apply if the blits require scaling.

`vkCmdBlitImage` must not be used for multisampled source or destination images. Use
vkCmdResolveImage for this purpose.

As the sizes of the source and destination extents can differ in any dimension, texels in the source extent are scaled and filtered to the destination extent. Scaling occurs via the following operations:

- For each destination texel, the integer coordinate of that texel is converted to an unnormalized texture coordinate, using the effective inverse of the equations described in unnormalized to integer conversion:

  \[
  u_{\text{base}} = i + \frac{1}{2} \\
  v_{\text{base}} = j + \frac{1}{2} \\
  w_{\text{base}} = k + \frac{1}{2}
  \]

- These base coordinates are then offset by the first destination offset:

  \[
  u_{\text{offset}} = u_{\text{base}} - x_{\text{dst}0} \\
  v_{\text{offset}} = v_{\text{base}} - y_{\text{dst}0} \\
  w_{\text{offset}} = w_{\text{base}} - z_{\text{dst}0} \\
  a_{\text{offset}} = a - \text{baseArrayCount}_{\text{dst}}
  \]

- The scale is determined from the source and destination regions, and applied to the offset coordinates:

  \[
  \text{scale}_u = (x_{\text{src}1} - x_{\text{src}0}) / (x_{\text{dst}1} - x_{\text{dst}0}) \\
  \text{scale}_v = (y_{\text{src}1} - y_{\text{src}0}) / (y_{\text{dst}1} - y_{\text{dst}0}) \\
  \text{scale}_w = (z_{\text{src}1} - z_{\text{src}0}) / (z_{\text{dst}1} - z_{\text{dst}0}) \\
  u_{\text{scaled}} = u_{\text{offset}} \times \text{scale}_u \\
  v_{\text{scaled}} = v_{\text{offset}} \times \text{scale}_v
  \]
Finally the source offset is added to the scaled coordinates, to determine the final unnormalized coordinates used to sample from `srcImage`:

\[
\begin{align*}
    u &= u_{\text{scaled}} + x_{\text{src0}} \\
    v &= v_{\text{scaled}} + y_{\text{src0}} \\
    w &= w_{\text{scaled}} + z_{\text{src0}} \\
    q &= \text{mipLevel} \\
    a &= a_{\text{offset}} + \text{baseArrayCount}_{\text{src}}
\end{align*}
\]

These coordinates are used to sample from the source image, as described in the Image Operations chapter, with the filter mode equal to that of `filter`, a mipmap mode of `VK_SAMPLER_MIPMAP_MODE_NEAREST` and an address mode of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`. Implementations must clamp at the edge of the source image, and may additionally clamp to the edge of the source region.

**Note**

Due to allowable rounding errors in the generation of the source texture coordinates, it is not always possible to guarantee exactly which source texels will be sampled for a given blit. As rounding errors are implementation-dependent, the exact results of a blitting operation are also implementation-dependent.

Blits are done layer by layer starting with the `baseArrayLayer` member of `srcSubresource` for the source and `dstSubresource` for the destination. `layerCount` layers are blitted to the destination image.

When blitting 3D textures, slices in the destination region bounded by `dstOffsets[0].z` and `dstOffsets[1].z` are sampled from slices in the source region bounded by `srcOffsets[0].z` and `srcOffsets[1].z`. If the `filter` parameter is `VK_FILTER_LINEAR` then the value sampled from the source image is taken by doing linear filtering using the interpolated `z` coordinate represented by `w` in the previous equations. If the `filter` parameter is `VK_FILTER_NEAREST` then the value sampled from the source image is taken from the single nearest slice, with an implementation-dependent arithmetic rounding mode.

The following filtering and conversion rules apply:

- Integer formats **can** only be converted to other integer formats with the same signedness.
- No format conversion is supported between depth/stencil images. The formats **must** match.
• Format conversions on unorm, snorm, scaled and packed float formats of the copied aspect of
  the image are performed by first converting the pixels to float values.

• For sRGB source formats, nonlinear RGB values are converted to linear representation prior to
  filtering.

• After filtering, the float values are first clamped and then cast to the destination image format.
  In case of sRGB destination format, linear RGB values are converted to nonlinear representation
  before writing the pixel to the image.

Signed and unsigned integers are converted by first clamping to the representable range of the
destination format, then casting the value.

Valid Usage

• VUID-vkCmdBlitImage-commandBuffer-01834
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported,
  srcImage must not be a protected image

• VUID-vkCmdBlitImage-commandBuffer-01835
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported,
  dstImage must not be a protected image

• VUID-vkCmdBlitImage-commandBuffer-01836
  If commandBuffer is a protected command buffer and protectedNoFault is not supported,
  dstImage must not be an unprotected image

• VUID-vkCmdBlitImage-pRegions-00215
  The source region specified by each element of pRegions must be a region that is
  contained within srcImage

• VUID-vkCmdBlitImage-pRegions-00216
  The destination region specified by each element of pRegions must be a region that is
  contained within dstImage

• VUID-vkCmdBlitImage-pRegions-00217
  The union of all destination regions, specified by the elements of pRegions, must not
  overlap in memory with any texel that may be sampled during the blit operation

• VUID-vkCmdBlitImage-srcImage-01999
  The format features of srcImage must contain VK_FORMAT_FEATURE_BLIT_SRC_BIT

• VUID-vkCmdBlitImage-srcImage-06421
  srcImage must not use a format that requires a sampler YCbCr conversion

• VUID-vkCmdBlitImage-srcImage-00219
  srcImage must have been created with VK_IMAGE_USAGE_TRANSFER_SRC_BIT usage flag

• VUID-vkCmdBlitImage-srcImageLayout-00220
  If srcImage is non-sparse then it must be bound completely and contiguously to a single
  VkDeviceMemory object

• VUID-vkCmdBlitImage-srcImageLayout-00221
  srcImageLayout must specify the layout of the image subresources of srcImage specified in
  pRegions at the time this command is executed on a VkDevice
• VUID-vkCmdBlitImage-srcImageLayout-01398
  srcImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR,
  VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL

• VUID-vkCmdBlitImage-srcImage-09459
  If srcImage and dstImage are the same, and an elements of pRegions contains the
  srcSubresource and dstSubresource with matching mipLevel and overlapping array layers,
  then the srcImageLayout and dstImageLayout must be VK_IMAGE_LAYOUT_GENERAL or
  VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR

• VUID-vkCmdBlitImage-dstImage-02000
  The format features of dstImage must contain VK_FORMAT_FEATURE_BLIT_DST_BIT

• VUID-vkCmdBlitImage-dstImage-06422
  dstImage must not use a format that requires a sampler Y′C_C_B_R conversion

• VUID-vkCmdBlitImage-dstImage-00224
  dstImage must have been created with VK_IMAGE_USAGE_TRANSFER_DST_BIT usage flag

• VUID-vkCmdBlitImage-dstImage-00225
  If dstImage is non-sparse then it must be bound completely and contiguously to a single
  VkDeviceMemory object

• VUID-vkCmdBlitImage-dstImageLayout-00226
  dstImageLayout must specify the layout of the image subresources of dstImage specified in
  pRegions at the time this command is executed on a VkDevice

• VUID-vkCmdBlitImage-dstImageLayout-01399
  dstImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR,
  VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL

• VUID-vkCmdBlitImage-srcImage-00229
  If either of srcImage or dstImage was created with a signed integer VkFormat, the other
  must also have been created with a signed integer VkFormat

• VUID-vkCmdBlitImage-srcImage-00230
  If either of srcImage or dstImage was created with an unsigned integer VkFormat, the other
  must also have been created with an unsigned integer VkFormat

• VUID-vkCmdBlitImage-srcImage-00231
  If either of srcImage or dstImage was created with a depth/stencil format, the other must
  have exactly the same format

• VUID-vkCmdBlitImage-srcImage-00232
  If srcImage was created with a depth/stencil format, filter must be VK_FILTER_NEAREST

• VUID-vkCmdBlitImage-dstImage-00234
  dstImage must have been created with a samples value of VK_SAMPLE_COUNT_1_BIT

• VUID-vkCmdBlitImage-srcImage-00233
  srcImage must have been created with a samples value of VK_SAMPLE_COUNT_1_BIT

• VUID-vkCmdBlitImage-dstImage-00234
  dstImage must have been created with a samples value of VK_SAMPLE_COUNT_1_BIT

• VUID-vkCmdBlitImage-filter-02001
  If filter is VK_FILTER_LINEAR, then the format features of srcImage must contain
  VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

• VUID-vkCmdBlitImage-filter-02002
If `filter` is VK_FILTER_CUBIC_EXT, then the format features of `srcImage` must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT.

- VUID-vkCmdBlitImage-filter-00237
  If `filter` is VK_FILTER_CUBIC_EXT, `srcImage` must be of type VK_IMAGE_TYPE_2D.

- VUID-vkCmdBlitImage-srcSubresource-01705
  The `srcSubresource.mipLevel` member of each element of `pRegions` must be less than the `mipLevels` specified in `VkImageCreateInfo` when `srcImage` was created.

- VUID-vkCmdBlitImage-dstSubresource-01706
  The `dstSubresource.mipLevel` member of each element of `pRegions` must be less than the `mipLevels` specified in `VkImageCreateInfo` when `dstImage` was created.

- VUID-vkCmdBlitImage-srcSubresource-01707
  If `srcSubresource.layerCount` is not VK_REMAINING_ARRAY_LAYERS, `srcSubresource.baseArrayLayer + srcSubresource.layerCount` of each element of `pRegions` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `srcImage` was created.

- VUID-vkCmdBlitImage-dstSubresource-01708
  If `srcSubresource.layerCount` is not VK_REMAINING_ARRAY_LAYERS, `dstSubresource.baseArrayLayer + dstSubresource.layerCount` of each element of `pRegions` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `dstImage` was created.

- VUID-vkCmdBlitImage-dstImage-02545
  `dstImage` and `srcImage` must not have been created with `flags` containing VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT.

- VUID-vkCmdBlitImage-srcImage-00240
  If either `srcImage` or `dstImage` is of type VK_IMAGE_TYPE_3D, then for each element of `pRegions`, `srcSubresource.baseArrayLayer` and `dstSubresource.baseArrayLayer` must each be 0, and `srcSubresource.layerCount` and `dstSubresource.layerCount` must each be 1.

- VUID-vkCmdBlitImage-aspectMask-00241
  For each element of `pRegions`, `srcSubresource.aspectMask` must specify aspects present in `srcImage`.

- VUID-vkCmdBlitImage-aspectMask-00242
  For each element of `pRegions`, `dstSubresource.aspectMask` must specify aspects present in `dstImage`.

- VUID-vkCmdBlitImage-srcOffset-00243
  For each element of `pRegions`, `srcOffsets[0].x` and `srcOffsets[1].x` must both be greater than or equal to 0 and less than or equal to the width of the specified `srcSubresource` of `srcImage`.

- VUID-vkCmdBlitImage-srcOffset-00244
  For each element of `pRegions`, `srcOffsets[0].y` and `srcOffsets[1].y` must both be greater than or equal to 0 and less than or equal to the height of the specified `srcSubresource` of `srcImage`.

- VUID-vkCmdBlitImage-srcImage-00245
  If `srcImage` is of type VK_IMAGE_TYPE_1D, then for each element of `pRegions`, `srcOffsets[0].y`
must be 0 and srcOffsets[1].y must be 1

- VUID-vkCmdBlitImage-srcOffsets-00246
  For each element of pRegions, srcOffsets[0].z and srcOffsets[1].z must both be greater than or equal to 0 and less than or equal to the depth of the specified srcSubresource of srcImage

- VUID-vkCmdBlitImage-srcImage-00247
  If srcImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, srcOffsets[0].z must be 0 and srcOffsets[1].z must be 1

- VUID-vkCmdBlitImage-dstOffset-00248
  For each element of pRegions, dstOffsets[0].x and dstOffsets[1].x must both be greater than or equal to 0 and less than or equal to the width of the specified dstSubresource of dstImage

- VUID-vkCmdBlitImage-dstImage-00249
  If dstImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, dstOffsets[0].y must be 0 and dstOffsets[1].y must be 1

- VUID-vkCmdBlitImage-dstImage-00250
  If dstImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, dstOffsets[0].y must be 0 and dstOffsets[1].y must be 1

- VUID-vkCmdBlitImage-dstImage-00251
  For each element of pRegions, dstOffsets[0].z and dstOffsets[1].z must both be greater than or equal to 0 and less than or equal to the depth of the specified dstSubresource of dstImage

- VUID-vkCmdBlitImage-dstImage-00252
  If dstImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, dstOffsets[0].z must be 0 and dstOffsets[1].z must be 1

Valid Usage (Implicit)

- VUID-vkCmdBlitImage-commandBuffer-parameter
commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdBlitImage-srcImage-parameter
srcImage must be a valid VkImage handle

- VUID-vkCmdBlitImage-srcImageLayout-parameter
srcImageLayout must be a valid VkImageLayout value

- VUID-vkCmdBlitImage-dstImage-parameter
dstImage must be a valid VkImage handle

- VUID-vkCmdBlitImage-dstImageLayout-parameter
dstImageLayout must be a valid VkImageLayout value

- VUID-vkCmdBlitImage-pRegions-parameter
pRegions must be a valid pointer to an array of regionCount valid VkImageBlit structures

- VUID-vkCmdBlitImage-filter-parameter
filter must be a valid VkFilter value

- VUID-vkCmdBlitImage-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdBlitImage-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdBlitImage-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdBlitImage-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdBlitImage-regionCount-arraylength
  regionCount must be greater than 0

- VUID-vkCmdBlitImage-commonparent
  Each of commandBuffer, dstImage, and srcImage must have been created, allocated, or retrieved from the same VkDevice

---

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

---

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>

The VkImageBlit structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageBlit {
    VkImageSubresourceLayers srcSubresource;
    VkOffset3D srcOffsets[2];
    VkImageSubresourceLayers dstSubresource;
    VkOffset3D dstOffsets[2];
} VkImageBlit;
```

- srcSubresource is the subresource to blit from.
- srcOffsets is a pointer to an array of two VkOffset3D structures specifying the bounds of the
source region within srcSubresource.

- dstSubresource is the subresource to blit into.
- dstOffsets is a pointer to an array of two VkOffset3D structures specifying the bounds of the destination region within dstSubresource.

For each element of the pRegions array, a blit operation is performed for the specified source and destination regions.

Valid Usage

- VUID-VkImageBlit-aspectMask-00238
  The aspectMask member of srcSubresource and dstSubresource must match

- VUID-VkImageBlit-layerCount-08800
  If neither of the layerCount members of srcSubresource or dstSubresource are VK_REMAINING_ARRAY_LAYERS, the layerCount members of srcSubresource or dstSubresource must match

- VUID-VkImageBlit-layerCount-08801
  If one of the layerCount members of srcSubresource or dstSubresource is VK_REMAINING_ARRAY_LAYERS, the other member must be either VK_REMAINING_ARRAY_LAYERS or equal to the arrayLayers member of the VkImageCreateInfo used to create the image minus baseArrayLayer

Valid Usage (Implicit)

- VUID-VkImageBlit-srcSubresource-parameter
  srcSubresource must be a valid VkImageSubresourceLayers structure

- VUID-VkImageBlit-dstSubresource-parameter
  dstSubresource must be a valid VkImageSubresourceLayers structure

A more extensible version of the blit image command is defined below.

To copy regions of a source image into a destination image, potentially performing format conversion, arbitrary scaling, and filtering, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdBlitImage2(
    VkCommandBuffer commandBuffer,
    const VkBlitImageInfo2* pBlitImageInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_copy_commands2
void vkCmdBlitImage2KHR(
```
VkCommandBuffer commandBuffer,
const VkBlitImageInfo2* pBlitImageInfo);

• `commandBuffer` is the command buffer into which the command will be recorded.
• `pBlitImageInfo` is a pointer to a `VkBlitImageInfo2` structure describing the blit parameters.

This command is functionally identical to `vkCmdBlitImage`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

### Valid Usage

- **VUID-vkCmdBlitImage2-commandBuffer-01834**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcImage` must not be a protected image

- **VUID-vkCmdBlitImage2-commandBuffer-01835**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstImage` must not be a protected image

- **VUID-vkCmdBlitImage2-commandBuffer-01836**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstImage` must not be an unprotected image

### Valid Usage (Implicit)

- **VUID-vkCmdBlitImage2-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdBlitImage2-pBlitImageInfo-parameter**
  `pBlitImageInfo` must be a valid pointer to a valid `VkBlitImageInfo2` structure

- **VUID-vkCmdBlitImage2-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdBlitImage2-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdBlitImage2-renderpass**
  This command must only be called outside of a render pass instance

- **VUID-vkCmdBlitImage2-videocoding**
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
The `VkBlitImageInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkBlitImageInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkImage srcImage;
    VkImageLayout srcImageLayout;
    VkImage dstImage;
    VkImageLayout dstImageLayout;
    uint32_t regionCount;
    const VkImageBlit2* pRegions;
    VkFilter filter;
} VkBlitImageInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkBlitImageInfo2 VkBlitImageInfo2KHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **srcImage** is the source image.
- **srcImageLayout** is the layout of the source image subresources for the blit.
- **dstImage** is the destination image.
- **dstImageLayout** is the layout of the destination image subresources for the blit.
- **regionCount** is the number of regions to blit.
- **pRegions** is a pointer to an array of `VkImageBlit2` structures specifying the regions to blit.
- **filter** is a `VkFilter` specifying the filter to apply if the blits require scaling.

### Valid Usage

- VUID-VkBlitImageInfo2-pRegions-00215
  The source region specified by each element of `pRegions` must be a region that is
The destination region specified by each element of pRegions must be a region that is contained within dstImage.

The union of all destination regions, specified by the elements of pRegions, must not overlap in memory with any texel that may be sampled during the blit operation.

The format features of srcImage must contain VK_FORMAT_FEATURE_BLIT_SRC_BIT.

srcImage must not use a format that requires a sampler Y′CbCr conversion.

srcImage must have been created with VK_IMAGE_USAGE_TRANSFER_SRC_BIT usage flag.

If srcImage is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object.

srcImageLayout must specify the layout of the image subresources of srcImage specified in pRegions at the time this command is executed on a VkDevice.

srcImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL, or VK_IMAGE_LAYOUT_GENERAL.

If srcImage and dstImage are the same, and an elements of pRegions contains the srcSubresource and dstSubresource with matching mipLevel and overlapping array layers, then the srcImageLayout and dstImageLayout must be VK_IMAGE_LAYOUT_GENERAL or VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR.

The format features of dstImage must contain VK_FORMAT_FEATURE_BLIT_DST_BIT.

dstImage must not use a format that requires a sampler Y′CbCr conversion.

dstImage must have been created with VK_IMAGE_USAGE_TRANSFER_DST_BIT usage flag.

If dstImage is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object.

dstImageLayout must specify the layout of the image subresources of dstImage specified in pRegions at the time this command is executed on a VkDevice.

dstImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL, or VK_IMAGE_LAYOUT_GENERAL.
• VUID-VkBlitImageInfo2-srcImage-00229
  If either of `srcImage` or `dstImage` was created with a signed integer `VkFormat`, the other must also have been created with a signed integer `VkFormat`.

• VUID-VkBlitImageInfo2-srcImage-00230
  If either of `srcImage` or `dstImage` was created with an unsigned integer `VkFormat`, the other must also have been created with an unsigned integer `VkFormat`.

• VUID-VkBlitImageInfo2-srcImage-00231
  If either of `srcImage` or `dstImage` was created with a depth/stencil format, the other must have exactly the same format.

• VUID-VkBlitImageInfo2-srcImage-00232
  If `srcImage` was created with a depth/stencil format, filter must be `VK_FILTER_NEAREST`.

• VUID-VkBlitImageInfo2-srcImage-00233
  `srcImage` must have been created with a `samples` value of `VK_SAMPLE_COUNT_1_BIT`.

• VUID-VkBlitImageInfo2-srcSubresource-01705
  The `srcSubresource.mipLevel` member of each element of `pRegions` must be less than the `mipLevels` specified in `VkImageCreateInfo` when `srcImage` was created.

• VUID-VkBlitImageInfo2-srcSubresource-01707
  If `srcSubresource.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `srcSubresource.baseArrayLayer + srcSubresource.layerCount` of each element of `pRegions` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `srcImage` was created.

• VUID-VkBlitImageInfo2-dstSubresource-01706
  The `dstSubresource.mipLevel` member of each element of `pRegions` must be less than the `mipLevels` specified in `VkImageCreateInfo` when `dstImage` was created.

• VUID-VkBlitImageInfo2-dstSubresource-01708
  If `srcSubresource.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `dstSubresource.baseArrayLayer + dstSubresource.layerCount` of each element of `pRegions` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `dstImage` was created.

• VUID-VkBlitImageInfo2-dstImage-02545
  `dstImage` and `srcImage` must not have been created with `flags` containing `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`.
If either `srcImage` or `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `srcSubresource.baseArrayLayer` and `dstSubresource.baseArrayLayer` must each be 0, and `srcSubresource.layerCount` and `dstSubresource.layerCount` must each be 1.

For each element of `pRegions`, `srcSubresource.aspectMask` must specify aspects present in `srcImage`.

For each element of `pRegions`, `dstSubresource.aspectMask` must specify aspects present in `dstImage`.

For each element of `pRegions`, `srcOffsets[0].x` and `srcOffsets[1].x` must both be greater than or equal to 0 and less than or equal to the width of the specified `srcSubresource` of `srcImage`.

For each element of `pRegions`, `srcOffsets[0].y` and `srcOffsets[1].y` must both be greater than or equal to 0 and less than or equal to the height of the specified `srcSubresource` of `srcImage`.

If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `srcOffsets[0].y` must be 0 and `srcOffsets[1].y` must be 1.

For each element of `pRegions`, `srcOffsets[0].z` and `srcOffsets[1].z` must both be greater than or equal to 0 and less than or equal to the depth of the specified `srcSubresource` of `srcImage`.

If `srcImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `srcOffsets[0].z` must be 0 and `srcOffsets[1].z` must be 1.

For each element of `pRegions`, `dstOffsets[0].x` and `dstOffsets[1].x` must both be greater than or equal to 0 and less than or equal to the width of the specified `dstSubresource` of `dstImage`.

For each element of `pRegions`, `dstOffsets[0].y` and `dstOffsets[1].y` must both be greater than or equal to 0 and less than or equal to the height of the specified `dstSubresource` of `dstImage`.

If `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `dstOffsets[0].y` must be 0 and `dstOffsets[1].y` must be 1.

For each element of `pRegions`, `dstOffsets[0].z` and `dstOffsets[1].z` must both be greater than or equal to 0 and less than or equal to the depth of the specified `dstSubresource` of `dstImage`.
VUID-VkBlitImageInfo2-dstImage-00252
If \( \text{dstImage} \) is of type \( \text{VK_IMAGE_TYPE_1D} \) or \( \text{VK_IMAGE_TYPE_2D} \), then for each element of \( \text{pRegions} \), \( \text{dstOffsets}[0].z \) must be 0 and \( \text{dstOffsets}[1].z \) must be 1.

VUID-VkBlitImageInfo2-pRegions-04561
If any element of \( \text{pRegions} \) contains \( \text{VkCopyCommandTransformInfoQCOM} \) in its \( \text{pNext} \) chain, then \( \text{srcImage} \) and \( \text{dstImage} \) must not be block-compressed images.

VUID-VkBlitImageInfo2KHR-pRegions-06207
If any element of \( \text{pRegions} \) contains \( \text{VkCopyCommandTransformInfoQCOM} \) in its \( \text{pNext} \) chain, then \( \text{srcImage} \) and \( \text{dstImage} \) must not be block-compressed images.

VUID-VkBlitImageInfo2KHR-pRegions-06208
If any element of \( \text{pRegions} \) contains \( \text{VkCopyCommandTransformInfoQCOM} \) in its \( \text{pNext} \) chain, then \( \text{srcImage} \) must be of type \( \text{VK_IMAGE_TYPE_2D} \).

VUID-VkBlitImageInfo2-filter-09204
If \( \text{filter} \) is \( \text{VK_FILTER_CUBIC_EXT} \) and if the \text{selectableCubicWeights} feature is not enabled then the cubic weights must be \( \text{VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM} \).

Valid Usage (Implicit)

VUID-VkBlitImageInfo2-sType-sType
\( \text{sType} \) must be \( \text{VK_STRUCTURE_TYPE_BLIT_IMAGE_INFO_2} \).

VUID-VkBlitImageInfo2-pNext-pNext
\( \text{pNext} \) must be \( \text{NULL} \) or a pointer to a valid instance of \( \text{VkBlitImageCubicWeightsInfoQCOM} \).

VUID-VkBlitImageInfo2-sType-unique
The \( \text{sType} \) value of each struct in the \( \text{pNext} \) chain must be unique.

VUID-VkBlitImageInfo2-srcImage-parameter
\( \text{srcImage} \) must be a valid \( \text{VkImage} \) handle.

VUID-VkBlitImageInfo2-srcImageLayout-parameter
\( \text{srcImageLayout} \) must be a valid \( \text{VkImageLayout} \) value.

VUID-VkBlitImageInfo2-dstImage-parameter
\( \text{dstImage} \) must be a valid \( \text{VkImage} \) handle.

VUID-VkBlitImageInfo2-dstImageLayout-parameter
\( \text{dstImageLayout} \) must be a valid \( \text{VkImageLayout} \) value.

VUID-VkBlitImageInfo2-pRegions-parameter
\( \text{pRegions} \) must be a valid pointer to an array of \( \text{regionCount} \) valid \( \text{VkImageBlit2} \) structures.

VUID-VkBlitImageInfo2-filter-parameter
\( \text{filter} \) must be a valid \( \text{VkFilter} \) value.

VUID-VkBlitImageInfo2-regionCount-arraylength
\( \text{regionCount} \) must be greater than 0.

VUID-VkBlitImageInfo2-commonparent
Both of \( \text{dstImage} \), and \( \text{srcImage} \) must have been created, allocated, or retrieved from the same \( \text{VkDevice} \).
If `filter` is `VK_FILTER_CUBIC_EXT` and if the `pNext` chain of `VkBlitImageInfo2` includes a `VkBlitImageCubicWeightsInfoQCOM` structure, then that structure specifies cubic weights are used in the blit. If that structure is not present, then cubic weights are considered to be `VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM`.

The `VkBlitImageCubicWeightsInfoQCOM` structure is defined as:

```c
// Provided by VK_QCOM_filter_cubic_weights
typedef struct VkBlitImageCubicWeightsInfoQCOM {
    VkStructureType sType;
    const void* pNext;
    VkCubicFilterWeightsQCOM cubicWeights;
} VkBlitImageCubicWeightsInfoQCOM;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `cubicWeights` is a `VkCubicFilterWeightsQCOM` value controlling cubic filter weights for the blit.

**Valid Usage (Implicit)**

- `VUID-VkBlitImageCubicWeightsInfoQCOM-sType-sType`
  `sType` must be `VK_STRUCTURE_TYPE_BLIT_IMAGE_CUBIC_WEIGHTS_INFO_QCOM`

- `VUID-VkBlitImageCubicWeightsInfoQCOM-cubicWeights-parameter`
  `cubicWeights` must be a valid `VkCubicFilterWeightsQCOM` value

The `VkImageBlit2` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkImageBlit2 {
    VkStructureType sType;
    const void* pNext;
    VkImageSubresourceLayers srcSubresource;
    VkOffset3D srcOffsets[2];
    VkImageSubresourceLayers dstSubresource;
    VkOffset3D dstOffsets[2];
} VkImageBlit2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkImageBlit2 VkImageBlit2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
• **srcSubresource** is the subresource to blit from.
• **srcOffsets** is a pointer to an array of two `VkOffset3D` structures specifying the bounds of the source region within `srcSubresource`.
• **dstSubresource** is the subresource to blit into.
• **dstOffsets** is a pointer to an array of two `VkOffset3D` structures specifying the bounds of the destination region within `dstSubresource`.

For each element of the `pRegions` array, a blit operation is performed for the specified source and destination regions.

### Valid Usage

- **VUID-VkImageBlit2-aspectMask-00238**
  The `aspectMask` member of `srcSubresource` and `dstSubresource` **must** match

- **VUID-VkImageBlit2-layerCount-08800**
  If neither of the `layerCount` members of `srcSubresource` or `dstSubresource` are `VK_REMAINING_ARRAY_LAYERS`, the `layerCount` members of `srcSubresource` or `dstSubresource` **must** match

- **VUID-VkImageBlit2-layerCount-08801**
  If one of the `layerCount` members of `srcSubresource` or `dstSubresource` is `VK_REMAINING_ARRAY_LAYERS`, the other member **must** be either `VK_REMAINING_ARRAY_LAYERS` or equal to the `arrayLayers` member of the `VkImageCreateInfo` used to create the image minus `baseArrayLayer`

### Valid Usage (Implicit)

- **VUID-VkImageBlit2-sType-sType**
  `sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_BLIT_2`

- **VUID-VkImageBlit2-pNext-pNext**
  `pNext` **must** be `NULL` or a pointer to a valid instance of `VkCopyCommandTransformInfoQCOM`

- **VUID-VkImageBlit2-sType-unique**
  The `sType` value of each struct in the `pNext` chain **must** be unique

- **VUID-VkImageBlit2-srcSubresource-parameter**
  `srcSubresource` **must** be a valid `VkImageSubresourceLayers` structure

- **VUID-VkImageBlit2-dstSubresource-parameter**
  `dstSubresource` **must** be a valid `VkImageSubresourceLayers` structure

For `vkCmdBlitImage2`, each region copied can include a rotation. To specify a rotated region, add `VkCopyCommandTransformInfoQCOM` to the `pNext` chain of `VkImageBlit2`. For each region with a rotation specified, *Image Blits with Scaling and Rotation* specifies how coordinates are rotated prior to sampling from the source image. When rotation is specified, the source and destination images
must each be 2D images, have a 1x1x1 texel block extent, and only one plane.

### 20.5.1. Image Blits With Scaling and Rotation

When VkCopyCommandTransformInfoQCOM is in the pNext chain of VkImageBlit2, the specified region is rotated during the blit. The following description of rotated addressing replaces the description in vkCmdBlitImage.

The following code computes rotation of normalized coordinates.

```c
// rotation of normalized coordinates
VkOffset2D RotateNormUV(VkOffset2D in, VkSurfaceTransformFlagBitsKHR flags)
{
    VkOffset2D output;
    switch (flags)
    {
        case VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR:
            out.x = in.x;
            out.y = in.y;
            break;
        case VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR:
            out.x = in.y;
            out.y = 1.0 - in.x;
            break;
        case VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR:
            out.x = 1.0 - in.x;
            out.y = 1.0 - in.y;
            break;
        case VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR:
            out.x = 1.0 - in.y;
            out.y = in.x;
            break;
    }
    return out;
}
```

* For each destination texel, the integer coordinate of that texel is converted to an unnormalized texture coordinate, using the effective inverse of the equations described in unnormalized to integer conversion:

\[
\begin{align*}
    u_{\text{base}} &= i + \frac{1}{2} \\
    v_{\text{base}} &= j + \frac{1}{2} \\
    w_{\text{base}} &= k + \frac{1}{2}
\end{align*}
\]
• These base coordinates are then offset by the first destination offset:

$$u_{offset} = u_{base} - x_{dst0}$$

$$v_{offset} = v_{base} - y_{dst0}$$

$$w_{offset} = w_{base} - z_{dst0}$$

$$a_{offset} = a - baseArrayCount_{dst}$$

• The UV destination coordinates are scaled by the destination region, rotated, and scaled by the source region.

$$u_{dest\_scaled} = \frac{u_{offset}}{(x_{dst1} - x_{dst0})}$$

$$v_{dest\_scaled} = \frac{v_{offset}}{(y_{dst1} - y_{dst0})}$$

$$(u_{src\_scaled}, v_{src\_scaled}) = RotateNormUV(u_{dest\_scaled}, v_{dest\_scaled}, transform)$$

$$u_{scaled} = u_{src\_scaled} \times (x_{Src1} - x_{Src0})$$

$$v_{scaled} = v_{src\_scaled} \times (y_{Src1} - y_{Src0})$$

• The W coordinate is unaffected by rotation. The scale is determined from the ratio of source and destination regions, and applied to the offset coordinate:

$$scale_w = \frac{(z_{Src1} - z_{Src0})}{(z_{dst1} - z_{dst0})}$$

$$w_{scaled} = w_{offset} \times scale_w$$

• Finally the source offset is added to the scaled source coordinates, to determine the final unnormalized coordinates used to sample from srcImage:

$$u = u_{scaled} + x_{Src0}$$

$$v = v_{scaled} + y_{Src0}$$
These coordinates are used to sample from the source image as described for Image Operations, with the filter mode equal to that of filter; a mipmap mode of VK_SAMPLER_MIPMAP_MODE_NEAREST; and an address mode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE. Implementations must clamp at the edge of the source image, and may additionally clamp to the edge of the source region.

## 20.6. Resolving Multisample Images

To resolve a multisample color image to a non-multisample color image, call:

```
// Provided by VK_VERSION_1_0
void vkCmdResolveImage(
    VkCommandBuffer commandBuffer,
    VkImage srcImage,
    VkImageLayout srcImageLayout,
    VkImage dstImage,
    VkImageLayout dstImageLayout,
    uint32_t regionCount,
    const VkImageResolve* pRegions);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `srcImage` is the source image.
- `srcImageLayout` is the layout of the source image subresources for the resolve.
- `dstImage` is the destination image.
- `dstImageLayout` is the layout of the destination image subresources for the resolve.
- `regionCount` is the number of regions to resolve.
- `pRegions` is a pointer to an array of `VkImageResolve` structures specifying the regions to resolve.

During the resolve the samples corresponding to each pixel location in the source are converted to a single sample before being written to the destination. If the source formats are floating-point or normalized types, the sample values for each pixel are resolved in an implementation-dependent manner. If the source formats are integer types, a single sample’s value is selected for each pixel.

`srcOffset` and `dstOffset` select the initial x, y, and z offsets in texels of the sub-regions of the source and destination image data. `extent` is the size in texels of the source image to resolve in width, height and depth. Each element of `pRegions` must be a region that is contained within its corresponding image.
Resolves are done layer by layer starting with \texttt{baseArrayLayer} member of \texttt{srcSubresource} for the source and \texttt{dstSubresource} for the destination. \texttt{layerCount} layers are resolved to the destination image.

### Valid Usage

- **VUID-vkCmdResolveImage-commandBuffer-01837**
  - If \texttt{commandBuffer} is an unprotected command buffer and \texttt{protectedNoFault} is not supported, \texttt{srcImage} must not be a protected image.

- **VUID-vkCmdResolveImage-commandBuffer-01838**
  - If \texttt{commandBuffer} is an unprotected command buffer and \texttt{protectedNoFault} is not supported, \texttt{dstImage} must not be a protected image.

- **VUID-vkCmdResolveImage-commandBuffer-01839**
  - If \texttt{commandBuffer} is a protected command buffer and \texttt{protectedNoFault} is not supported, \texttt{dstImage} must not be an unprotected image.

- **VUID-vkCmdResolveImage-pRegions-00255**
  - The union of all source regions, and the union of all destination regions, specified by the elements of \texttt{pRegions}, must not overlap in memory.

- **VUID-vkCmdResolveImage-srcImage-00256**
  - If \texttt{srcImage} is non-sparse then it must be bound completely and contiguously to a single \texttt{VkDeviceMemory} object.

- **VUID-vkCmdResolveImage-srcImage-00257**
  - \texttt{srcImage} must have a sample count equal to any valid sample count value other than \texttt{VK_SAMPLE_COUNT_1_BIT}.

- **VUID-vkCmdResolveImage-dstImage-00258**
  - If \texttt{dstImage} is non-sparse then it must be bound completely and contiguously to a single \texttt{VkDeviceMemory} object.

- **VUID-vkCmdResolveImage-dstImage-00259**
  - \texttt{dstImage} must have a sample count equal to \texttt{VK_SAMPLE_COUNT_1_BIT}.

- **VUID-vkCmdResolveImage-srcImageLayout-00260**
  - \texttt{srcImageLayout} must specify the layout of the image subresources of \texttt{srcImage} specified in \texttt{pRegions} at the time this command is executed on a \texttt{VkDevice}.

- **VUID-vkCmdResolveImage-dstImageLayout-00262**
  - \texttt{dstImageLayout} must specify the layout of the image subresources of \texttt{dstImage} specified in \texttt{pRegions} at the time this command is executed on a \texttt{VkDevice}.

- **VUID-vkCmdResolveImage-dstImageLayout-01400**
  - \texttt{srcImageLayout} must be \texttt{VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR}, \texttt{VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL} or \texttt{VK_IMAGE_LAYOUT_GENERAL}.

- **VUID-vkCmdResolveImage-dstImageLayout-01401**
  - \texttt{dstImageLayout} must be \texttt{VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR}, \texttt{VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL} or \texttt{VK_IMAGE_LAYOUT_GENERAL}.

- **VUID-vkCmdResolveImage-dstImage-02003**
The format features of dstImage must contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT.

- **VUID-vkCmdResolveImage-linearColorAttachment-06519**
  If the linearColorAttachment feature is enabled and the image is created with VK_IMAGE_TILING_LINEAR, the format features of dstImage must contain VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV.

- **VUID-vkCmdResolveImage-srcImage-01386**
  srcImage and dstImage must have been created with the same image format.

- **VUID-vkCmdResolveImage-srcSubresource-01709**
  The srcSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when srcImage was created.

- **VUID-vkCmdResolveImage-dstSubresource-01710**
  The dstSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when dstImage was created.

- **VUID-vkCmdResolveImage-srcSubresource-01711**
  If srcSubresource.layerCount is not VK_REMAINING_ARRAY_LAYERS, srcSubresource.baseArrayLayer + srcSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when srcImage was created.

- **VUID-vkCmdResolveImage-dstSubresource-01712**
  If dstSubresource.layerCount is not VK_REMAINING_ARRAY_LAYERS, dstSubresource.baseArrayLayer + dstSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when dstImage was created.

- **VUID-vkCmdResolveImage-dstImage-02546**
  dstImage and srcImage must not have been created with flags containing VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT.

- **VUID-vkCmdResolveImage-srcImage-04446**
  If dstImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions, srcSubresource.layerCount must be 1.

- **VUID-vkCmdResolveImage-srcImage-04447**
  If dstImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions, dstSubresource.baseArrayLayer must be 0 and dstSubresource.layerCount must be 1.

- **VUID-vkCmdResolveImage-srcOffset-00269**
  For each element of pRegions, srcOffset.x and (extent.width + srcOffset.x) must both be greater than or equal to 0 and less than or equal to the width of the specified srcSubresource of srcImage.

- **VUID-vkCmdResolveImage-srcOffset-00270**
  For each element of pRegions, srcOffset.y and (extent.height + srcOffset.y) must both be greater than or equal to 0 and less than or equal to the height of the specified srcSubresource of srcImage.

- **VUID-vkCmdResolveImage-srcImage-00271**
  If srcImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, srcOffset.y must be 0 and extent.height must be 1.
For each element of `pRegions`, `srcOffset.z` and `(extent.depth + srcOffset.z)` must both be greater than or equal to 0 and less than or equal to the depth of the specified `srcSubresource` of `srcImage`.

If `srcImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `srcOffset.z` must be 0 and `extent.depth` must be 1.

For each element of `pRegions`, `dstOffset.x` and `(extent.width + dstOffset.x)` must both be greater than or equal to 0 and less than or equal to the width of the specified `dstSubresource` of `dstImage`.

For each element of `pRegions`, `dstOffset.y` and `(extent.height + dstOffset.y)` must both be greater than or equal to 0 and less than or equal to the height of the specified `dstSubresource` of `dstImage`.

If `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `dstOffset.y` must be 0 and `extent.height` must be 1.

For each element of `pRegions`, `dstOffset.z` and `(extent.depth + dstOffset.z)` must both be greater than or equal to 0 and less than or equal to the depth of the specified `dstSubresource` of `dstImage`.

If `dstImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `dstOffset.z` must be 0 and `extent.depth` must be 1.

`srcImage` must have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` usage flag.

The format features of `srcImage` must contain `VK_FORMAT_FEATURE_TRANSFER_SRC_BIT`.

`dstImage` must have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT` usage flag.

The format features of `dstImage` must contain `VK_FORMAT_FEATURE_TRANSFER_DST_BIT`.

Valid Usage (Implicit)

- `commandBuffer` must be a valid `VkCommandBuffer` handle.
- `srcImage` must be a valid `VkImage` handle.
- `srcImageLayout` must be a valid `VkImageLayout` value.
• **VUID-vkCmdResolveImage-dstImage-parameter**
  *dstImage* must be a valid *VkImage* handle

• **VUID-vkCmdResolveImage-dstImageLayout-parameter**
  *dstImageLayout* must be a valid *VkImageLayout* value

• **VUID-vkCmdResolveImage-pRegions-parameter**
  *pRegions* must be a valid pointer to an array of *regionCount* valid *VkImageResolve* structures

• **VUID-vkCmdResolveImage-commandBuffer-recording**
  *commandBuffer* must be in the *recording* state

• **VUID-vkCmdResolveImage-commandBuffer-cmdpool**
  The *VkCommandPool* that *commandBuffer* was allocated from must support graphics operations

• **VUID-vkCmdResolveImage-renderpass**
  This command must only be called outside of a render pass instance

• **VUID-vkCmdResolveImage-videocoding**
  This command must only be called outside of a video coding scope

• **VUID-vkCmdResolveImage-regionCount-arraylength**
  *regionCount* must be greater than 0

• **VUID-vkCmdResolveImage-commonparent**
  Each of *commandBuffer*, *dstImage*, and *srcImage* must have been created, allocated, or retrieved from the same *VkDevice*

### Host Synchronization

• Host access to *commandBuffer* must be externally synchronized

• Host access to the *VkCommandPool* that *commandBuffer* was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>

</tr>
</tbody>
</table>

The *VkImageResolve* structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkImageResolve {
    VkImageSubresourceLayers srcSubresource;
    VkOffset3D srcOffset;
} VkImageResolve;
```
• **srcSubresource** and **dstSubresource** are **VkImageSubresourceLayers** structures specifying the image subresources of the images used for the source and destination image data, respectively. Resolve of depth/stencil images is not supported.

• **srcOffset** and **dstOffset** select the initial x, y, and z offsets in texels of the sub-regions of the source and destination image data.

• **extent** is the size in texels of the source image to resolve in width, height and depth.

### Valid Usage

- **VUID-VkImageResolve-aspectMask-00266**
  
  The aspectMask member of **srcSubresource** and **dstSubresource** must only contain **VK_IMAGE_ASPECT_COLOR_BIT**

- **VUID-VkImageResolve-layerCount-08803**
  
  If neither of the layerCount members of **srcSubresource** or **dstSubresource** are **VK_REMAINING_ARRAY_LAYERS**, the layerCount member of **srcSubresource** and **dstSubresource** must match

- **VUID-VkImageResolve-layerCount-08804**
  
  If one of the layerCount members of **srcSubresource** or **dstSubresource** is **VK_REMAINING_ARRAY_LAYERS**, the other member must be either **VK_REMAINING_ARRAY_LAYERS** or equal to the arrayLayers member of the **VkImageCreateInfo** used to create the image minus baseArrayLayer

### Valid Usage (Implicit)

- **VUID-VkImageResolve-srcSubresource-parameter**
  
  **srcSubresource** must be a valid **VkImageSubresourceLayers** structure

- **VUID-VkImageResolve-dstSubresource-parameter**
  
  **dstSubresource** must be a valid **VkImageSubresourceLayers** structure

A more extensible version of the resolve image command is defined below.

To resolve a multisample image to a non-multisample image, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdResolveImage2(
    VkCommandBuffer commandBuffer,
    const VkResolveImageInfo2* pResolveImageInfo);
```
or the equivalent command

```c
void vkCmdResolveImage2KHR(
    VkCommandBuffer commandBuffer,
    const VkResolveImageInfo2* pResolveImageInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pResolveImageInfo` is a pointer to a `VkResolveImageInfo2` structure describing the resolve parameters.

This command is functionally identical to `vkCmdResolveImage`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

### Valid Usage

- **VUID-vkCmdResolveImage2-commandBuffer-01837**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcImage` must not be a protected image
- **VUID-vkCmdResolveImage2-commandBuffer-01838**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstImage` must not be a protected image
- **VUID-vkCmdResolveImage2-commandBuffer-01839**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstImage` must not be an unprotected image

### Valid Usage (Implicit)

- **VUID-vkCmdResolveImage2-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- **VUID-vkCmdResolveImage2-pResolveImageInfo-parameter**
  `pResolveImageInfo` must be a valid pointer to a valid `VkResolveImageInfo2` structure
- **VUID-vkCmdResolveImage2-commandBuffer-recording**
  `commandBuffer` must be in the `recording` state
- **VUID-vkCmdResolveImage2-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- **VUID-vkCmdResolveImage2-renderpass**
  This command must only be called outside of a render pass instance
- **VUID-vkCmdResolveImage2-videocoding**
  This command must only be called outside of a video coding scope
Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Graphics</td>

The VkResolveImageInfo2 structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkResolveImageInfo2 {
    VkStructureType sType;
    const void*pNext;
    VkImage srcImage;
    VkImageLayout srcImageLayout;
    VkImage dstImage;
    VkImageLayout dstImageLayout;
    uint32_t regionCount;
    const VkImageResolve2* pRegions;
} VkResolveImageInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkResolveImageInfo2 VkResolveImageInfo2KHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `srcImage` is the source image.
- `srcImageLayout` is the layout of the source image subresources for the resolve.
- `dstImage` is the destination image.
- `dstImageLayout` is the layout of the destination image subresources for the resolve.
- `regionCount` is the number of regions to resolve.
- `pRegions` is a pointer to an array of VkImageResolve2 structures specifying the regions to resolve.
Valid Usage

- VUID-VkResolveImageInfo2-pRegions-00255
  The union of all source regions, and the union of all destination regions, specified by the elements of pRegions, must not overlap in memory.

- VUID-VkResolveImageInfo2-srcImage-00256
  If srcImage is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object.

- VUID-VkResolveImageInfo2-srcImage-00257
  srcImage must have a sample count equal to any valid sample count value other than VK_SAMPLE_COUNT_1_BIT.

- VUID-VkResolveImageInfo2-dstImage-00258
  If dstImage is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object.

- VUID-VkResolveImageInfo2-dstImage-00259
  dstImage must have a sample count equal to VK_SAMPLE_COUNT_1_BIT.

- VUID-VkResolveImageInfo2-srcImageLayout-00260
  srcImageLayout must specify the layout of the image subresources of srcImage specified in pRegions at the time this command is executed on a VkDevice.

- VUID-VkResolveImageInfo2-dstImageLayout-00262
  dstImageLayout must specify the layout of the image subresources of dstImage specified in pRegions at the time this command is executed on a VkDevice.

- VUID-VkResolveImageInfo2-dstImage-02003
  The format features of dstImage must contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT.

- VUID-VkResolveImageInfo2-linearColorAttachment-06519
  If the linearColorAttachment feature is enabled and the image is created with VK_IMAGE_TILING_LINEAR, the format features of dstImage must contain VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV.

- VUID-VkResolveImageInfo2-srcSubresource-01709
  srcImage and dstImage must have been created with the same image format.

- VUID-VkResolveImageInfo2-srcSubresource-01709
  The srcSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when srcImage was created.

- VUID-VkResolveImageInfo2-dstSubresource-01710
  The dstSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when dstImage was created.
- **VUID-VkResolveImageInfo2-srcSubresource-01711**
  If `srcSubresource.layerCount` is not `VK_REMAINING_ARRAY LAYERS`, `srcSubresource.baseArrayLayer + srcSubresource.layerCount` of each element of `pRegions` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `srcImage` was created.

- **VUID-VkResolveImageInfo2-dstSubresource-01712**
  If `dstSubresource.layerCount` is not `VK_REMAINING_ARRAY LAYERS`, `dstSubresource.baseArrayLayer + dstSubresource.layerCount` of each element of `pRegions` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `dstImage` was created.

- **VUID-VkResolveImageInfo2-dstImage-02546**
  `dstImage` and `srcImage` must not have been created with flags containing `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`.

- **VUID-VkResolveImageInfo2-srcImage-04446**
  If `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `srcSubresource.layerCount` must be 1.

- **VUID-VkResolveImageInfo2-srcImage-04447**
  If `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `dstSubresource.baseArrayLayer` must be 0 and `dstSubresource.layerCount` must be 1.

- **VUID-VkResolveImageInfo2-srcOffset-00269**
  For each element of `pRegions`, `srcOffset.x` and `(extent.width + srcOffset.x)` must both be greater than or equal to 0 and less than or equal to the width of the specified `srcSubresource` of `srcImage`.

- **VUID-VkResolveImageInfo2-srcOffset-00270**
  For each element of `pRegions`, `srcOffset.y` and `(extent.height + srcOffset.y)` must both be greater than or equal to 0 and less than or equal to the height of the specified `srcSubresource` of `srcImage`.

- **VUID-VkResolveImageInfo2-srcOffset-00271**
  If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `srcOffset.y` must be 0 and `extent.height` must be 1.

- **VUID-VkResolveImageInfo2-srcOffset-00272**
  For each element of `pRegions`, `srcOffset.z` and `(extent.depth + srcOffset.z)` must both be greater than or equal to 0 and less than or equal to the depth of the specified `srcSubresource` of `srcImage`.

- **VUID-VkResolveImageInfo2-srcImage-00273**
  If `srcImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `srcOffset.z` must be 0 and `extent.depth` must be 1.

- **VUID-VkResolveImageInfo2-dstOffset-00274**
  For each element of `pRegions`, `dstOffset.x` and `(extent.width + dstOffset.x)` must both be greater than or equal to 0 and less than or equal to the width of the specified `dstSubresource` of `dstImage`.

- **VUID-VkResolveImageInfo2-dstOffset-00275**
  For each element of `pRegions`, `dstOffset.y` and `(extent.height + dstOffset.y)` must both be
greater than or equal to 0 and less than or equal to the height of the specified dstSubresource of dstImage

- VUID-VkResolveImageInfo2-dstImage-00276
  If dstImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, dstOffset.y must be 0 and extent.height must be 1

- VUID-VkResolveImageInfo2-dstOffset-00277
  For each element of pRegions, dstOffset.z and (extent.depth + dstOffset.z) must both be greater than or equal to 0 and less than or equal to the depth of the specified dstSubresource of dstImage

- VUID-VkResolveImageInfo2-dstImage-00278
  If dstImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, dstOffset.z must be 0 and extent.depth must be 1

Valid Usage (Implicit)

- VUID-VkResolveImageInfo2-sType-sType
  sType must be VK_STRUCTURE_TYPE_RESOLVE_IMAGE_INFO_2

- VUID-VkResolveImageInfo2-pNext-pNext
  pNext must be NULL

- VUID-VkResolveImageInfo2-srcImage-parameter
  srcImage must be a valid VkImage handle

- VUID-VkResolveImageInfo2-srcImageLayout-parameter
  srcImageLayout must be a valid VkImageLayout value

- VUID-VkResolveImageInfo2-dstImage-parameter
  dstImage must be a valid VkImage handle

- VUID-VkResolveImageInfo2-dstImageLayout-parameter
  dstImageLayout must be a valid VkImageLayout value

- VUID-VkResolveImageInfo2-pRegions-parameter
  pRegions must be a valid pointer to an array of regionCount valid VkImageResolve2 structures

- VUID-VkResolveImageInfo2-regionCount-arraylength
  regionCount must be greater than 0

- VUID-VkResolveImageInfo2-commonparent
Both of \texttt{dstImage}, and \texttt{srcImage} must have been created, allocated, or retrieved from the same \texttt{VkDevice}.

The \texttt{VkImageResolve2} structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkImageResolve2 {
    VkStructureType sType;
    const void* pNext;
    VkImageSubresourceLayers srcSubresource;
    VkOffset3D srcOffset;
    VkImageSubresourceLayers dstSubresource;
    VkOffset3D dstOffset;
    VkExtent3D extent;
} VkImageResolve2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkImageResolve2 VkImageResolve2KHR;
```

- \texttt{sType} is a \texttt{VkStructureType} value identifying this structure.
- \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
- \texttt{srcSubresource} and \texttt{dstSubresource} are \texttt{VkImageSubresourceLayers} structures specifying the image subresources of the images used for the source and destination image data, respectively. Resolve of depth/stencil images is not supported.
- \texttt{srcOffset} and \texttt{dstOffset} select the initial \(x\), \(y\), and \(z\) offsets in texels of the sub-regions of the source and destination image data.
- \texttt{extent} is the size in texels of the source image to resolve in \texttt{width}, \texttt{height} and \texttt{depth}.

### Valid Usage

- VUID-VkImageResolve2-aspectMask-00266
  The \texttt{aspectMask} member of \texttt{srcSubresource} and \texttt{dstSubresource} must only contain \texttt{VK_IMAGE_ASPECT_COLOR_BIT}

- VUID-VkImageResolve2-layerCount-08803
  If neither of the \texttt{layerCount} members of \texttt{srcSubresource} or \texttt{dstSubresource} are \texttt{VK_REMAINING_ARRAY_LAYERS}, the \texttt{layerCount} member of \texttt{srcSubresource} and \texttt{dstSubresource} must match

- VUID-VkImageResolve2-layerCount-08804
  If one of the \texttt{layerCount} members of \texttt{srcSubresource} or \texttt{dstSubresource} is \texttt{VK_REMAINING_ARRAY_LAYERS}, the other member \texttt{must} be either \texttt{VK_REMAINING_ARRAY_LAYERS} or equal to the \texttt{arrayLayers} member of the \texttt{VkImageCreateInfo} used to create the image
Valid Usage (Implicit)

- **VUID-VkImageResolve2-sType-sType**
  - `sType` **must** be `.VK_STRUCTURE_TYPE_IMAGE_RESOLVE_2`
- **VUID-VkImageResolve2-pNext-pNext**
  - `pNext` **must** be `NULL`
- **VUID-VkImageResolve2-srcSubresource-parameter**
  - `srcSubresource` **must** be a valid `VkImageSubresourceLayers` structure
- **VUID-VkImageResolve2-dstSubresource-parameter**
  - `dstSubresource` **must** be a valid `VkImageSubresourceLayers` structure

20.7. Buffer Markers

To write a 32-bit marker value into a buffer as a pipelined operation, call:

```c
// Provided by VK_KHR_synchronization2 with VK_AMD_buffer_marker
void vkCmdWriteBufferMarker2AMD(
    VkCommandBuffer commandBuffer,  // commandBuffer is the command buffer into which the command will be recorded.
    VkPipelineStageFlags2 stage,    // stage specifies the pipeline stage whose completion triggers the marker write.
    VkBuffer dstBuffer,            // dstBuffer is the buffer where the marker will be written.
    VkDeviceSize dstOffset,        // dstOffset is the byte offset into the buffer where the marker will be written.
    uint32_t marker);              // marker is the 32-bit value of the marker.
```

The command will write the 32-bit marker value into the buffer only after all preceding commands have finished executing up to at least the specified pipeline stage. This includes the completion of other preceding `vkCmdWriteBufferMarker2AMD` commands so long as their specified pipeline stages occur either at the same time or earlier than this command’s specified `stage`.

While consecutive buffer marker writes with the same `stage` parameter implicitly complete in submission order, memory and execution dependencies between buffer marker writes and other operations **must** still be explicitly ordered using synchronization commands. The access scope for buffer marker writes falls under the `VK_ACCESS_TRANSFER_WRITE_BIT`, and the pipeline stages for identifying the synchronization scope **must** include both `stage` and `VK_PIPELINE_STAGE_TRANSFER_BIT`.

---

Note
Similar to `vkCmdWriteTimestamp2`, if an implementation is unable to write a marker at any specific pipeline stage, it **may** instead do so at any logically later stage.

**Note**
Implementations **may** only support a limited number of pipelined marker write operations in flight at a given time. Thus an excessive number of marker write operations **may** degrade command execution performance.

**Valid Usage**

- VUID-vkCmdWriteBufferMarker2AMD-stage-03929
  If the `geometryShader` feature is not enabled, **stage** must not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`

- VUID-vkCmdWriteBufferMarker2AMD-stage-03930
  If the `tessellationShader` feature is not enabled, **stage** must not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`

- VUID-vkCmdWriteBufferMarker2AMD-stage-03931
  If the `conditionalRendering` feature is not enabled, **stage** must not contain `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT`

- VUID-vkCmdWriteBufferMarker2AMD-stage-03932
  If the `fragmentDensityMap` feature is not enabled, **stage** must not contain `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

- VUID-vkCmdWriteBufferMarker2AMD-stage-03933
  If the `transformFeedback` feature is not enabled, **stage** must not contain `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`

- VUID-vkCmdWriteBufferMarker2AMD-stage-03934
  If the `meshShader` feature is not enabled, **stage** must not contain `VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT`

- VUID-vkCmdWriteBufferMarker2AMD-stage-03935
  If the `taskShader` feature is not enabled, **stage** must not contain `VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT`

- VUID-vkCmdWriteBufferMarker2AMD-stage-07316
  If neither the `shadingRateImage` or `attachmentFragmentShadingRate` are enabled, **stage** must not contain `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-vkCmdWriteBufferMarker2AMD-stage-04957
  If the `subpassShading` feature is not enabled, **stage** must not contain `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI`

- VUID-vkCmdWriteBufferMarker2AMD-stage-04995
  If the `invocationMask` feature is not enabled, **stage** must not contain `VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI`

- VUID-vkCmdWriteBufferMarker2AMD-stage-07946
  If neither the `VK_NV_ray_tracing` extension or `rayTracingPipeline` feature are enabled,
**stage must** not contain `VK_PIPELINE_STAGE_2RAY_TRACING_SHADER_BIT_KHR`

- VUID-vkCmdWriteBufferMarker2AMD-synchronization2-03893
  The synchronization2 feature **must** be enabled

- VUID-vkCmdWriteBufferMarker2AMD-stage-03894
  stage **must** include only a single pipeline stage

- VUID-vkCmdWriteBufferMarker2AMD-stage-03895
  stage **must** include only stages that are valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from

- VUID-vkCmdWriteBufferMarker2AMD-dstOffset-03896
  dstOffset **must** be less than or equal to the size of `dstBuffer` minus 4

- VUID-vkCmdWriteBufferMarker2AMD-dstBuffer-03897
  dstBuffer **must** have been created with the `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage flag

- VUID-vkCmdWriteBufferMarker2AMD-dstBuffer-03898
  If `dstBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdWriteBufferMarker2AMD-dstOffset-03899
  dstOffset **must** be a multiple of 4

---

**Valid Usage (Implicit)**

- VUID-vkCmdWriteBufferMarker2AMD-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdWriteBufferMarker2AMD-stage-parameter
  stage **must** be a valid combination of `VkPipelineStageFlagBits2` values

- VUID-vkCmdWriteBufferMarker2AMD-dstBuffer-parameter
  dstBuffer **must** be a valid `VkBuffer` handle

- VUID-vkCmdWriteBufferMarker2AMD-commandBuffer-recording
  `commandBuffer` **must** be in the recording state

- VUID-vkCmdWriteBufferMarker2AMD-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support transfer, graphics, or compute operations

- VUID-vkCmdWriteBufferMarker2AMD-videocoding
  This command **must** only be called outside of a video coding scope

- VUID-vkCmdWriteBufferMarker2AMD-commonparent
  Both of `commandBuffer`, and `dstBuffer` **must** have been created, allocated, or retrieved from the same `VkDevice`

---

**Host Synchronization**

- Host access to `commandBuffer` **must** be externally synchronized
Host access to the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must be externally synchronized.

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Transfer</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td>Graphics Compute</td>
<td></td>
</tr>
</tbody>
</table>

To write a 32-bit marker value into a buffer as a pipelined operation, call:

```plaintext
// Provided by VK_AMD_buffer_marker
void vkCmdWriteBufferMarkerAMD(
    VkCommandBuffer commandBuffer,
    VkPipelineStageFlagBits pipelineStage,
    VkBuffer dstBuffer,
    VkDeviceSize dstOffset,
    uint32_t marker);
```

- \texttt{commandBuffer} is the command buffer into which the command will be recorded.
- \texttt{pipelineStage} is a \texttt{VkPipelineStageFlagBits} value specifying the pipeline stage whose completion triggers the marker write.
- \texttt{dstBuffer} is the buffer where the marker will be written to.
- \texttt{dstOffset} is the byte offset into the buffer where the marker will be written to.
- \texttt{marker} is the 32-bit value of the marker.

The command will write the 32-bit marker value into the buffer only after all preceding commands have finished executing up to at least the specified pipeline stage. This includes the completion of other preceding \texttt{vkCmdWriteBufferMarkerAMD} commands so long as their specified pipeline stages occur either at the same time or earlier than this command's specified \texttt{pipelineStage}.

While consecutive buffer marker writes with the same \texttt{pipelineStage} parameter are implicitly complete in submission order, memory and execution dependencies between buffer marker writes and other operations must still be explicitly ordered using synchronization commands. The access scope for buffer marker writes falls under the \texttt{VK_ACCESS_TRANSFER_WRITE_BIT}, and the pipeline stages for identifying the synchronization scope must include both \texttt{pipelineStage} and \texttt{VK_PIPELINE_STAGE_TRANSFER_BIT}.

---

**Note**

Similar to \texttt{vkCmdWriteTimestamp}, if an implementation is unable to write a marker at any specific pipeline stage, it may instead do so at any logically later stage.
Implementations may only support a limited number of pipelined marker write operations in flight at a given time, thus excessive number of marker write operations may degrade command execution performance.

Valid Usage

- VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-04074
  pipelineStage must be a valid stage for the queue family that was used to create the command pool that commandBuffer was allocated from

- VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-04075
  If the geometryShader feature is not enabled, pipelineStage must not be VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT

- VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-04076
  If the tessellationShader feature is not enabled, pipelineStage must not be VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT or VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT

- VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-04077
  If the conditionalRendering feature is not enabled, pipelineStage must not be VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT

- VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-04078
  If the fragmentDensityMap feature is not enabled, pipelineStage must not be VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT

- VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-04079
  If the transformFeedback feature is not enabled, pipelineStage must not be VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT

- VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-04080
  If the meshShader feature is not enabled, pipelineStage must not be VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT

- VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-07077
  If the taskShader feature is not enabled, pipelineStage must not be VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT

- VUID-vkCmdWriteBufferMarkerAMD-shadingRateImage-07314
  If neither the shadingRateImage or attachmentFragmentShadingRate are enabled, pipelineStage must not be VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-vkCmdWriteBufferMarkerAMD-synchronization2-06489
  If the synchronization2 feature is not enabled, pipelineStage must not be VK_PIPELINE_STAGE_NONE

- VUID-vkCmdWriteBufferMarkerAMD-rayTracingPipeline-07943
  If neither the VK_NV_ray_tracing extension or rayTracingPipeline feature are enabled, pipelineStage must not be VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR

- VUID-vkCmdWriteBufferMarkerAMD-dstOffset-01798
$dstOffset$ must be less than or equal to the size of $dstBuffer$ minus 4

- VUID-vkCmdWriteBufferMarkerAMD-dstBuffer-01799
  $dstBuffer$ must have been created with VK_BUFFER_USAGE_TRANSFER_DST_BIT usage flag

- VUID-vkCmdWriteBufferMarkerAMD-dstBuffer-01800
  If $dstBuffer$ is non-sparse then it must be bound completely and contiguously to a single $VkDeviceMemory$ object

- VUID-vkCmdWriteBufferMarkerAMD-dstOffset-01801
  $dstOffset$ must be a multiple of 4

### Valid Usage (Implicit)

- VUID-vkCmdWriteBufferMarkerAMD-commandBuffer-parameter
  $commandBuffer$ must be a valid $VkCommandBuffer$ handle

- VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-parameter
  If $pipelineStage$ is not 0, $pipelineStage$ must be a valid $VkPipelineStageFlagBits$ value

- VUID-vkCmdWriteBufferMarkerAMD-dstBuffer-parameter
  $dstBuffer$ must be a valid $VkBuffer$ handle

- VUID-vkCmdWriteBufferMarkerAMD-commandBuffer-recording
  $commandBuffer$ must be in the recording state

- VUID-vkCmdWriteBufferMarkerAMD-commandBuffer-cmdpool
  The $VkCommandPool$ that $commandBuffer$ was allocated from must support transfer, graphics, or compute operations

- VUID-vkCmdWriteBufferMarkerAMD-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdWriteBufferMarkerAMD-commonparent
  Both of $commandBuffer$, and $dstBuffer$ must have been created, allocated, or retrieved from the same $VkDevice$

### Host Synchronization

- Host access to $commandBuffer$ must be externally synchronized

- Host access to the $VkCommandPool$ that $commandBuffer$ was allocated from must be externally synchronized

Chapter 21. Drawing Commands

_Drawing commands_ (commands with _Draw_ in the name) provoke work in a graphics pipeline. Drawing commands are recorded into a command buffer and when executed by a queue, will produce work which executes according to the bound graphics pipeline, or if the _shaderObject_ feature is enabled, any _shader objects_ bound to graphics stages. A graphics pipeline or a combination of one or more graphics shader objects _must_ be bound to a command buffer before any drawing commands are recorded in that command buffer.

Drawing can be achieved in two modes:

- **Programmable Mesh Shading**, the mesh shader assembles primitives, or
- **Programmable Primitive Shading**, the input primitives are assembled as follows.

Each draw is made up of zero or more vertices and zero or more instances, which are processed by the device and result in the assembly of primitives. Primitives are assembled according to the _pInputAssemblyState_ member of the _VkGraphicsPipelineCreateInfo_ structure, which is of type _VkPipelineInputAssemblyStateCreateInfo_:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineInputAssemblyStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineInputAssemblyStateCreateFlags flags;
    VkPrimitiveTopology topology;
    VkBool32 primitiveRestartEnable;
} VkPipelineInputAssemblyStateCreateInfo;
```

- _sType_ is a _VkStructureType_ value identifying this structure.
- _pNext_ is _NULL_ or a pointer to a structure extending this structure.
- _flags_ is reserved for future use.
- _topology_ is a _VkPrimitiveTopology_ defining the primitive topology, as described below.
- _primitiveRestartEnable_ controls whether a special vertex index value is treated as restarting the assembly of primitives. This enable only applies to indexed draws (_vkCmdDrawIndexed_, _vkCmdDrawMultiIndexedEXT_, and _vkCmdDrawIndexedIndirect_), and the special index value is either _0xFFFFFFFF_ when the _indexType_ parameter of _vkCmdBindIndexBuffer2KHR_ or _vkCmdBindIndexBuffer_ is equal to _VK_INDEX_TYPE_UINT32_, _0xFF_ when _indexType_ is equal to _VK_INDEX_TYPE_UINT8_KHR_, or _0xFFFF_ when _indexType_ is equal to _VK_INDEX_TYPE_UINT16_. Primitive restart is not allowed for “list” topologies, unless one of the features _primitiveTopologyPatchListRestart_ (for _VK_PRIMITIVE_TOPOLOGY_PATCH_LIST_) or _primitiveTopologyListRestart_ (for all other list topologies) is enabled.

Restarting the assembly of primitives discards the most recent index values if those elements formed an incomplete primitive, and restarts the primitive assembly using the subsequent indices, but only assembling the immediately following element through the end of the originally specified elements. The primitive restart index value comparison is performed before adding the
vertexOffset value to the index value.

Valid Usage

- **VUID-VkPipelineInputAssemblyStateCreateInfo-topology-06252**
  If the primitiveTopologyListRestart feature is not enabled, and topology is VK_PRIMITIVE_TOPOLOGY_POINT_LIST, VK_PRIMITIVE_TOPOLOGY_LINE_LIST, VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST, VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY, or VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY, primitiveRestartEnable must be VK_FALSE

- **VUID-VkPipelineInputAssemblyStateCreateInfo-topology-06253**
  If the primitiveTopologyPatchListRestart feature is not enabled, and topology is VK_PRIMITIVE_TOPOLOGY_PATCH_LIST, primitiveRestartEnable must be VK_FALSE

- **VUID-VkPipelineInputAssemblyStateCreateInfo-topology-00429**
  If the geometryShader feature is not enabled, topology must not be any of VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY, VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY, VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY or VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY

- **VUID-VkPipelineInputAssemblyStateCreateInfo-topology-00430**
  If the tessellationShader feature is not enabled, topology must not be VK_PRIMITIVE_TOPOLOGY_PATCH_LIST

- **VUID-VkPipelineInputAssemblyStateCreateInfo-triangleFans-04452**
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::triangleFans is VK_FALSE, topology must not be VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN

Valid Usage (Implicit)

- **VUID-VkPipelineInputAssemblyStateCreateInfo-sType-sType**
  sType must be VK_STRUCTURE_TYPE_PIPELINE_INPUT_ASSEMBLY_STATE_CREATE_INFO

- **VUID-VkPipelineInputAssemblyStateCreateInfo-pNext-pNext**
  pNext must be NULL

- **VUID-VkPipelineInputAssemblyStateCreateInfo-flags-zerobitmask**
  flags must be Φ

- **VUID-VkPipelineInputAssemblyStateCreateInfo-topology-parameter**
  topology must be a valid VkPrimitiveTopology value

// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineInputAssemblyStateCreateFlags;

VkPipelineInputAssemblyStateCreateFlags is a bitmask type for setting a mask, but is currently
reserved for future use.

To dynamically control whether a special vertex index value is treated as restarting the assembly of primitives, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetPrimitiveRestartEnable(
    VkCommandBuffer commandBuffer,
    VkBool32 primitiveRestartEnable);
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state2, VK_EXT_shader_object
void vkCmdSetPrimitiveRestartEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 primitiveRestartEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `primitiveRestartEnable` controls whether a special vertex index value is treated as restarting the assembly of primitives. It behaves in the same way as `VkPipelineInputAssemblyStateCreateInfo::primitiveRestartEnable`

This command sets the primitive restart enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineInputAssemblyStateCreateInfo::primitiveRestartEnable` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetPrimitiveRestartEnable-None-08970
  At least one of the following must be true:
  - the `extendedDynamicState2` feature is enabled
  - the `shaderObject` feature is enabled
  - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

### Valid Usage (Implicit)

- VUID-vkCmdSetPrimitiveRestartEnable-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetPrimitiveRestartEnable-commandBuffer-recording
  `commandBuffer` must be in the recording state
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

21.1. Primitive Topologies

*Primitive topology* determines how consecutive vertices are organized into primitives, and determines the type of primitive that is used at the beginning of the graphics pipeline. The effective topology for later stages of the pipeline is altered by tessellation or geometry shading (if either is in use) and depends on the execution modes of those shaders. In the case of mesh shading the only effective topology is defined by the execution mode of the mesh shader.

The primitive topologies defined by `VkPrimitiveTopology` are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPrimitiveTopology {
    VK_PRIMITIVE_TOPOLOGY_POINT_LIST = 0,
    VK_PRIMITIVE_TOPOLOGY_LINE_LIST = 1,
    VK_PRIMITIVE_TOPOLOGY_LINE_STRIP = 2,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST = 3,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP = 4,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN = 5,
    VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY = 6,
    VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY = 7,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY = 8,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY = 9,
    VK_PRIMITIVE_TOPOLOGY_PATCH_LIST = 10,
} VkPrimitiveTopology;
```
• **VK_PRIMITIVE_TOPOLOGY_POINT_LIST** specifies a series of separate point primitives.

• **VK_PRIMITIVE_TOPOLOGY_LINE_LIST** specifies a series of separate line primitives.

• **VK_PRIMITIVE_TOPOLOGY_LINE_STRIP** specifies a series of connected line primitives with consecutive lines sharing a vertex.

• **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST** specifies a series of separate triangle primitives.

• **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP** specifies a series of connected triangle primitives with consecutive triangles sharing an edge.

• **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN** specifies a series of connected triangle primitives with all triangles sharing a common vertex. If the **VK_KHR_portability_subset** extension is enabled, and **VkPhysicalDevicePortabilitySubsetFeaturesKHR::triangleFans** is **VK_FALSE**, then triangle fans are not supported by the implementation, and **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN** must not be used.

• **VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY** specifies a series of separate line primitives with adjacency.

• **VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY** specifies a series of connected line primitives with adjacency, with consecutive primitives sharing three vertices.

• **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY** specifies a series of separate triangle primitives with adjacency.

• **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY** specifies connected triangle primitives with adjacency, with consecutive triangles sharing an edge.

• **VK_PRIMITIVE_TOPOLOGY_PATCH_LIST** specifies separate patch primitives.

Each primitive topology, and its construction from a list of vertices, is described in detail below with a supporting diagram, according to the following key:

<table>
<thead>
<tr>
<th></th>
<th>Vertex</th>
<th>A point in 3-dimensional space. Positions chosen within the diagrams are arbitrary and for illustration only.</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>Vertex Number</td>
<td>Sequence position of a vertex within the provided vertex data.</td>
</tr>
<tr>
<td>🟥</td>
<td>Provoking Vertex</td>
<td>Provoking vertex within the main primitive. The tail is angled towards the relevant primitive. Used in flat shading.</td>
</tr>
<tr>
<td>——</td>
<td>Primitive Edge</td>
<td>An edge connecting the points of a main primitive.</td>
</tr>
<tr>
<td>————</td>
<td>Adjacency Edge</td>
<td>Points connected by these lines do not contribute to a main primitive, and are only accessible in a geometry shader.</td>
</tr>
<tr>
<td>⬇️</td>
<td>Winding Order</td>
<td>The relative order in which vertices are defined within a primitive, used in the facing determination. This ordering has no specific start or end point.</td>
</tr>
</tbody>
</table>

The diagrams are supported with mathematical definitions where the vertices \(v\) and primitives \(p\) are numbered starting from 0; \(v_0\) is the first vertex in the provided data and \(p_0\) is the first primitive in the set of primitives defined by the vertices and topology.

To dynamically set primitive topology, call:
// Provided by VK_VERSION_1_3
void vkCmdSetPrimitiveTopology(
    VkCommandBuffer commandBuffer,
    VkPrimitiveTopology primitiveTopology);

or the equivalent command

// Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object
void vkCmdSetPrimitiveTopologyEXT(
    VkCommandBuffer commandBuffer,
    VkPrimitiveTopology primitiveTopology);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `primitiveTopology` specifies the primitive topology to use for drawing.

This command sets the primitive topology for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineInputAssemblyStateCreateInfo::topology` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetPrimitiveTopology-None-08971
  At least one of the following must be true:
  - the `extendedDynamicState` feature is enabled
  - the `shaderObject` feature is enabled
  - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

### Valid Usage (Implicit)

- VUID-vkCmdSetPrimitiveTopology-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetPrimitiveTopology-primitiveTopology-parameter
  `primitiveTopology` must be a valid `VkPrimitiveTopology` value
- VUID-vkCmdSetPrimitiveTopology-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetPrimitiveTopology-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetPrimitiveTopology-videocoding
This command **must** only be called outside of a video coding scope

**Host Synchronization**

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

**Command Properties**

<table>
<thead>
<tr>

<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### 21.1.1. Topology Class

The primitive topologies are grouped into the following topology classes:

**Table 31. Topology classes**

<table>
<thead>
<tr>
<th>Topology Class</th>
<th>Primitive Topology</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>VK_PRIMITIVE_TOPOLOGY_POINT_LIST</td>
</tr>
<tr>
<td>Line</td>
<td>VK_PRIMITIVE_TOPOLOGY_LINE_LIST, VK_PRIMITIVE_TOPOLOGY_LINE_STRIP, VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY, VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY</td>
</tr>
<tr>
<td>Triangle</td>
<td>VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST, VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP, VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN, VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY, VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY</td>
</tr>
<tr>
<td>Patch</td>
<td>VK_PRIMITIVE_TOPOLOGY_PATCH_LIST</td>
</tr>
</tbody>
</table>

### 21.1.2. Point Lists

When the topology is `VK_PRIMITIVE_TOPOLOGY_POINT_LIST`, each consecutive vertex defines a single point primitive, according to the equation:

\[ p_i = \{v_i\} \]
As there is only one vertex, that vertex is the provoking vertex. The number of primitives generated is equal to \( \text{vertexCount} \).

![Diagram](image)

### 21.1.3. Line Lists

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_LINE_LIST`, each consecutive pair of vertices defines a single line primitive, according to the equation:

\[ p_i = \{ v_{2i}, v_{2i+1} \} \]

The number of primitives generated is equal to \( \lfloor \text{vertexCount}/2 \rfloor \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{2i} \).

![Diagram](image)

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{2i+1} \).

![Diagram](image)

### 21.1.4. Line Strips

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP`, one line primitive is defined by each vertex and the following vertex, according to the equation:
\( p_i = \{v_i, v_{i+1}\} \)

The number of primitives generated is equal to \( \max(0, \text{vertexCount} - 1) \).

When the \text{provokingVertexMode} is \text{VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT}, the provoking vertex for \( p_i \) is \( v_i \).

When the \text{provokingVertexMode} is \text{VK_PROVOKING.Vertex_MODE_LAST_VERTEX_EXT}, the provoking vertex for \( p_i \) is \( v_{i+1} \).

21.1.5. Triangle Lists

When the primitive topology is \text{VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST}, each consecutive set of three vertices defines a single triangle primitive, according to the equation:

\( p_i = \{v_{3i}, v_{3i+1}, v_{3i+2}\} \)

The number of primitives generated is equal to \( \lfloor \text{vertexCount}/3 \rfloor \).

When the \text{provokingVertexMode} is \text{VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT}, the provoking vertex for \( p_i \) is \( v_{3i} \).

When the \text{provokingVertexMode} is \text{VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT}, the provoking vertex for \( p_i \) is \( v_{3i+2} \).
21.1.6. Triangle Strips

When the primitive topology is \texttt{VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP}, one triangle primitive is defined by each vertex and the two vertices that follow it, according to the equation:

\[ p_i = \{v_i, v_{i+(1+i\%2)}, v_{i+(2-i\%2)}\} \]

The number of primitives generated is equal to \texttt{max(0,vertexCount-2)}.

When the \texttt{provokingVertexMode} is \texttt{VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT}, the provoking vertex for \( p_i \) is \( v_i \).

When the \texttt{provokingVertexMode} is \texttt{VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT}, the provoking vertex for \( p_i \) is \( v_{i+2} \).

\[ i \]

\textbf{Note}

The ordering of the vertices in each successive triangle is reversed, so that the winding order is consistent throughout the strip.

21.1.7. Triangle Fans

When the primitive topology is \texttt{VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN}, triangle primitives are defined around a shared common vertex, according to the equation:

\[ p_i = \{v_{i+1}, v_{i+2}, v_0\} \]

The number of primitives generated is equal to \texttt{max(0,vertexCount-2)}.

When the \texttt{provokingVertexMode} is \texttt{VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT}, the provoking vertex for \( p_i \) is \( v_{i+1} \).
When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for $p_i$ is $v_{i+2}$.

Note

If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::triangleFans` is `VK_FALSE`, then triangle fans are not supported by the implementation, and `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN` must not be used.

21.1.8. Line Lists With Adjacency

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY`, each consecutive set of four vertices defines a single line primitive with adjacency, according to the equation:

$$p_i = \{v_{4i}, v_{4i+1}, v_{4i+2}, v_{4i+3}\}$$

A line primitive is described by the second and third vertices of the total primitive, with the remaining two vertices only accessible in a geometry shader.

The number of primitives generated is equal to $\lfloor \text{vertexCount}/4 \rfloor$.

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for $p_i$ is $v_{4i+1}$.

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for $p_i$ is $v_{i+2}$.
for $p_i$ is $v_{4i+2}$.

21.1.9. Line Strips With Adjacency

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY`, one line primitive with adjacency is defined by each vertex and the following vertex, according to the equation:

$$p_i = \{v_i, v_{i+1}, v_{i+2}, v_{i+3}\}$$

A line primitive is described by the second and third vertices of the total primitive, with the remaining two vertices only accessible in a geometry shader.

The number of primitives generated is equal to $\max(0, \text{vertexCount}-3)$.

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for $p_i$ is $v_{i+1}$.

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for $p_i$ is $v_{i+2}$.

21.1.10. Triangle Lists With Adjacency

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY`, each consecutive set of six vertices defines a single triangle primitive with adjacency, according to the equations:

$$p_i = \{v_{6i}, v_{6i+1}, v_{6i+2}, v_{6i+3}, v_{6i+4}, v_{6i+5}\}$$

A triangle primitive is described by the first, third, and fifth vertices of the total primitive, with the remaining three vertices only accessible in a geometry shader.

The number of primitives generated is equal to $\floor{\text{vertexCount}/6}$.

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex
When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for $p_i$ is $v_{6i+4}$.

### 21.1.11. Triangle Strips With Adjacency

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY`, one triangle primitive with adjacency is defined by each vertex and the following 5 vertices.

The number of primitives generated, $n$, is equal to $\lfloor \max(0, \text{vertexCount} - 4)/2 \rfloor$.

If $n=1$, the primitive is defined as:

$$p = \{v_0, v_1, v_2, v_5, v_4, v_3\}$$

If $n>1$, the total primitive consists of different vertices according to where it is in the strip:

$$p_i = \{v_{2i}, v_{2i+1}, v_{2i+2}, v_{2i+6}, v_{2i+4}, v_{2i+3}\} \text{ when } i=0$$

$$p_i = \{v_{2i}, v_{2i+3}, v_{2i+4}, v_{2i+6}, v_{2i+2}, v_{2i+1}\} \text{ when } i>0, i<n-1, \text{ and } i\%2=1$$
\[ p_i = \{v_{2i}, v_{2i+2}, v_{2i-2}, v_{2i+6}, v_{2i+4}, v_{2i+3}\} \text{ when } i>0, \; i<n-1, \text{ and } i\%2=0 \]

\[ p_i = \{v_{2i}, v_{2i+3}, v_{2i+4}, v_{2i+5}, v_{2i+2}, v_{2i+2}\} \text{ when } i=n-1 \text{ and } i\%2=1 \]

\[ p_i = \{v_{2i}, v_{2i+2}, v_{2i}, v_{2i+4}, v_{2i+5}, v_{2i+3}\} \text{ when } i=n-1 \text{ and } i\%2=0 \]

A triangle primitive is described by the first, third, and fifth vertices of the total primitive in all cases, with the remaining three vertices only accessible in a geometry shader.

**Note**
The ordering of the vertices in each successive triangle is altered so that the winding order is consistent throughout the strip.

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for \( p_i \) is always \( v_{2i} \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for \( p_i \) is always \( v_{2i+4} \).
21.1.12. Patch Lists

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`, each consecutive set of \( m \) vertices defines a single patch primitive, according to the equation:

\[ p_i = \{ v_{mi}, v_{mi+1}, \ldots, v_{mi+(m-2)}, v_{mi+(m-1)} \} \]

where \( m \) is equal to `VkPipelineTessellationStateCreateInfo::patchControlPoints`.

Patch lists are never passed to vertex post-processing, and as such no provoking vertex is defined for patch primitives. The number of primitives generated is equal to \( \lfloor \text{vertexCount} / m \rfloor \).

The vertices comprising a patch have no implied geometry, and are used as inputs to tessellation shaders and the fixed-function tessellator to generate new point, line, or triangle primitives.

21.2. Primitive Order

Primitives generated by drawing commands progress through the stages of the graphics pipeline in primitive order. Primitive order is initially determined in the following way:

1. Submission order determines the initial ordering
2. For indirect drawing commands, the order in which accessed instances of the
VkDrawIndirectCommand are stored in buffer, from lower indirect buffer addresses to higher addresses.

3. If a drawing command includes multiple instances, the order in which instances are executed, from lower numbered instances to higher.

4. The order in which primitives are specified by a drawing command:
   - For non-indexed draws, from vertices with a lower numbered vertexIndex to a higher numbered vertexIndex.
   - For indexed draws, vertices sourced from a lower index buffer addresses to higher addresses.
   - For draws using mesh shaders, the order is provided by mesh shading.
   - For draws using cluster culling shaders, the order is provided by cluster culling shading.

Within this order implementations further sort primitives:

5. If tessellation shading is active, by an implementation-dependent order of new primitives generated by tessellation.

6. If geometry shading is active, by the order new primitives are generated by geometry shading.

7. If the polygon mode is not VK_POLYGON_MODE_FILL, or VK_POLYGON_MODE_FILL_RECTANGLE_NV, by an implementation-dependent ordering of the new primitives generated within the original primitive.

Primitive order is later used to define rasterization order, which determines the order in which fragments output results to a framebuffer.

### 21.3. Programmable Primitive Shading

Once primitives are assembled, they proceed to the vertex shading stage of the pipeline. If the draw includes multiple instances, then the set of primitives is sent to the vertex shading stage multiple times, once for each instance.

It is implementation-dependent whether vertex shading occurs on vertices that are discarded as part of incomplete primitives, but if it does occur then it operates as if they were vertices in complete primitives and such invocations can have side effects.

Vertex shading receives two per-vertex inputs from the primitive assembly stage - the vertexIndex and the instanceIndex. How these values are generated is defined below, with each command.

Drawing commands fall roughly into two categories:

- Non-indexed drawing commands present a sequential vertexIndex to the vertex shader. The sequential index is generated automatically by the device (see Fixed-Function Vertex Processing for details on both specifying the vertex attributes indexed by vertexIndex, as well as binding vertex buffers containing those attributes to a command buffer). These commands are:
  - vkCmdDraw
  - vkCmdDrawIndirect
• `vkCmdDrawIndirectCount`
• `vkCmdDrawIndirectCountKHR`
• `vkCmdDrawIndirectCountAMD`
• `vkCmdDrawMultiEXT`

• Indexed drawing commands read index values from an *index buffer* and use this to compute the *vertexIndex* value for the vertex shader. These commands are:

  • `vkCmdDrawIndexed`
  • `vkCmdDrawIndexedIndirect`
  • `vkCmdDrawIndexedIndirectCount`
  • `vkCmdDrawIndexedIndirectCountKHR`
  • `vkCmdDrawIndexedIndirectCountAMD`
  • `vkCmdDrawMultiIndexedEXT`

To bind an index buffer to a command buffer, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdBindIndexBuffer(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset,
    VkIndexType indexType);
```

• `commandBuffer` is the command buffer into which the command is recorded.
• `buffer` is the buffer being bound.
• `offset` is the starting offset in bytes within `buffer` used in index buffer address calculations.
• `indexType` is a `VkIndexType` value specifying the size of the indices.

If the maintenance6 feature is enabled, `buffer` can be `VK_NULL_HANDLE`. If `buffer` is `VK_NULL_HANDLE` and the `nullDescriptor` feature is enabled, every index fetched results in a value of zero.

### Valid Usage

- **VUID-vkCmdBindIndexBuffer-offset-08782**  
  `offset` must be less than the size of `buffer`

- **VUID-vkCmdBindIndexBuffer-offset-08783**  
  The sum of `offset` and the base address of the range of `VkDeviceMemory` object that is backing `buffer`, must be a multiple of the size of the type indicated by `indexType`

- **VUID-vkCmdBindIndexBuffer-buffer-08784**  
  `buffer` must have been created with the `VK_BUFFER_USAGE_INDEX_BUFFER_BIT` flag

- **VUID-vkCmdBindIndexBuffer-buffer-08785**
If buffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdBindIndexBuffer-indexType-08786
  indexType must not be VK_INDEX_TYPE_NONE_KHR

- VUID-vkCmdBindIndexBuffer-indexType-08787
  If indexType is VK_INDEX_TYPE_UINT8_KHR, the indexTypeUint8 feature must be enabled

- VUID-vkCmdBindIndexBuffer-None-09493
  If maintenance is not enabled, buffer must not be VK_NULL_HANDLE

- VUID-vkCmdBindIndexBuffer-buffer-09494
  If buffer is VK_NULL_HANDLE, offset must be zero

Valid Usage (Implicit)

- VUID-vkCmdBindIndexBuffer-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdBindIndexBuffer-buffer-parameter
  If buffer is not VK_NULL_HANDLE, buffer must be a valid VkBuffer handle

- VUID-vkCmdBindIndexBuffer-indexType-parameter
  indexType must be a valid VkIndexType value

- VUID-vkCmdBindIndexBuffer-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdBindIndexBuffer-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdBindIndexBuffer-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdBindIndexBuffer-commonparent
  Both of buffer, and commandBuffer that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
To bind an index buffer, along with its size, to a command buffer, call:

```c
// Provided by VK_KHR_maintenance5
void vkCmdBindIndexBuffer2KHR(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset,
    VkDeviceSize size,
    VkIndexType indexType);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer being bound.
- `offset` is the starting offset in bytes within `buffer` used in index buffer address calculations.
- `size` is the size in bytes of index data bound from `buffer`.
- `indexType` is a `VkIndexType` value specifying the size of the indices.

`size` specifies the bound size of the index buffer starting from `offset`. If `size` is `VK_WHOLE_SIZE` then the bound size is from `offset` to the end of the `buffer`.

If the `maintenance6` feature is enabled, `buffer` can be `VK_NULL_HANDLE`. If `buffer` is `VK_NULL_HANDLE` and the `nullDescriptor` feature is enabled, every index fetched results in a value of zero.

### Valid Usage

- VUID-vkCmdBindIndexBuffer2KHR-offset-08782  
  `offset` must be less than the size of `buffer`  

- VUID-vkCmdBindIndexBuffer2KHR-offset-08783  
  The sum of `offset` and the base address of the range of `VkDeviceMemory` object that is backing `buffer`, must be a multiple of the size of the type indicated by `indexType`.

- VUID-vkCmdBindIndexBuffer2KHR-buffer-08784  
  `buffer` must have been created with the `VK_BUFFER_USAGE_INDEX_BUFFER_BIT` flag.

- VUID-vkCmdBindIndexBuffer2KHR-buffer-08785  
  If `buffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.
- VUID-vkCmdBindIndexBuffer2KHR-indexType-08786
  indexType must not be VK_INDEX_TYPE_NONE_KHR

- VUID-vkCmdBindIndexBuffer2KHR-indexType-08787
  If indexType is VK_INDEX_TYPE_UINT8_KHR, the indexTypeUint8 feature must be enabled

- VUID-vkCmdBindIndexBuffer2KHR-None-09493
  If maintenance is not enabled, buffer must not be VK_NULL_HANDLE

- VUID-vkCmdBindIndexBuffer2KHR-buffer-09494
  If buffer is VK_NULL_HANDLE, offset must be zero

- VUID-vkCmdBindIndexBuffer2KHR-size-08767
  If size is not VK_WHOLE_SIZE, size must be a multiple of the size of the type indicated by indexType

- VUID-vkCmdBindIndexBuffer2KHR-size-08768
  If size is not VK_WHOLE_SIZE, the sum of offset and size must be less than or equal to the size of buffer

Valid Usage (Implicit)

- VUID-vkCmdBindIndexBuffer2KHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdBindIndexBuffer2KHR-buffer-parameter
  If buffer is not VK_NULL_HANDLE, buffer must be a valid VkBuffer handle

- VUID-vkCmdBindIndexBuffer2KHR-indexType-parameter
  indexType must be a valid VkIndexType value

- VUID-vkCmdBindIndexBuffer2KHR-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdBindIndexBuffer2KHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdBindIndexBuffer2KHR-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdBindIndexBuffer2KHR-commonparent
  Both of buffer, and commandBuffer that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
Possible values of `vkCmdBindIndexBuffer2KHR::indexType` and `vkCmdBindIndexBuffer::indexType`, specifying the size of indices, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkIndexType {
    VK_INDEX_TYPE_UINT16 = 0,
    VK_INDEX_TYPE_UINT32 = 1,
    // Provided by VK_KHR_acceleration_structure
    VK_INDEX_TYPE_NONE_KHR = 1000165000,
    // Provided by VK_KHR_index_type_uint8
    VK_INDEX_TYPE_UINT8_KHR = 1000265000,
    // Provided by VK_NV_ray_tracing
    VK_INDEX_TYPE_NONE_NV = VK_INDEX_TYPE_NONE_KHR,
    // Provided by VK_EXT_index_type_uint8
    VK_INDEX_TYPE_UINT8_EXT = VK_INDEX_TYPE_UINT8_KHR,
    } VkIndexType;
```

- **VK_INDEX_TYPE_UINT16** specifies that indices are 16-bit unsigned integer values.
- **VK_INDEX_TYPE_UINT32** specifies that indices are 32-bit unsigned integer values.
- **VK_INDEX_TYPE_NONE_KHR** specifies that no indices are provided.
- **VK_INDEX_TYPE_UINT8_KHR** specifies that indices are 8-bit unsigned integer values.

The parameters for each drawing command are specified directly in the command or read from buffer memory, depending on the command. Drawing commands that source their parameters from buffer memory are known as *indirect* drawing commands.

All drawing commands interact with the `robustBufferAccess` feature.

To record a non-indexed draw, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdDraw(VkCommandBuffer commandBuffer,
               uint32_t vertexCount,
               uint32_t instanceCount,
               uint32_t firstVertex,
               uint32_t firstInstance);
```
• **commandBuffer** is the command buffer into which the command is recorded.
• **vertexCount** is the number of vertices to draw.
• **instanceCount** is the number of instances to draw.
• **firstVertex** is the index of the first vertex to draw.
• **firstInstance** is the instance ID of the first instance to draw.

When the command is executed, primitives are assembled using the current primitive topology and **vertexCount** consecutive vertex indices with the first **vertexIndex** value equal to **firstVertex**. The primitives are drawn **instanceCount** times with **instanceIndex** starting with **firstInstance** and increasing sequentially for each instance. The assembled primitives execute the bound graphics pipeline.

### Valid Usage

- **VUID-vkCmdDraw-magFilter-04553**
  If a **VkSampler** created with **magFilter** or **minFilter** equal to **VK_FILTER_LINEAR** and **compareEnable** equal to **VK_FALSE** is used to sample a **VkImageView** as a result of this command, then the image view's format features **must** contain **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT**

- **VUID-vkCmdDraw-mipmapMode-04770**
  If a **VkSampler** created with **mipmapMode** equal to **VK_SAMPLER_MIPMAP_MODE_LINEAR** and **compareEnable** equal to **VK_FALSE** is used to sample a **VkImageView** as a result of this command, then the image view's format features **must** contain **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT**

- **VUID-vkCmdDraw-None-06479**
  If a **VkImageView** is sampled with **depth comparison**, the image view's format features **must** contain **VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT**

- **VUID-vkCmdDraw-None-02691**
  If a **VkImageView** is accessed using atomic operations as a result of this command, then the image view's format features **must** contain **VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT**

- **VUID-vkCmdDraw-None-07888**
  If a **VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER** descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features **must** contain **VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT**

- **VUID-vkCmdDraw-None-02692**
  If a **VkImageView** is sampled with **VK_FILTER_CUBIC_EXT** as a result of this command, then the image view's format features **must** contain **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT**

- **VUID-vkCmdDraw-None-02693**
  If the **VK_EXT_filter_cubic** extension is not enabled and any **VkImageView** is sampled with **VK_FILTER_CUBIC_EXT** as a result of this command, it **must** not have a **VkImageViewType** of **VK_IMAGE_VIEW_TYPE_3D**, **VK_IMAGE_VIEW_TYPE_CUBE**, or **VK_IMAGE_VIEW_TYPE_CUBE_ARRAY**
Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2

Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2

If the cubicRangeClamp feature is not enabled, then any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must not have a VkSamplerReductionModeCreateInfo::reductionMode equal to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGE_CLAMP_QCOM

Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE

Any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT
the `OpTypeImage` is `Unknown` then the view’s buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`

- **VUID-vkCmdDraw-None-08600**
  For each set $n$ that is statically used by a bound shader, a descriptor set must have been bound to $n$ at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set $n$, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` array used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility

- **VUID-vkCmdDraw-None-08601**
  For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` array used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility

- **VUID-vkCmdDraw-maintenance4-08602**
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` and `VkPushConstantRange` arrays used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility

- **VUID-vkCmdDraw-None-08114**
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid as described by descriptor validity if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command and the bound `VkPipeline` was not created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

- **VUID-vkCmdDraw-None-08115**
  If the descriptors used by the `VkPipeline` bound to the pipeline bind point were specified via `vkCmdBindDescriptorSets`, the bound `VkPipeline` must have been created without `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

- **VUID-vkCmdDraw-None-08116**
  Descriptors in bound descriptor buffers, specified via `vkCmdSetDescriptorBufferOffsetsEXT`, must be valid if they are dynamically used by the `VkPipeline` bound to the pipeline bind point used by this command and the bound `VkPipeline` was created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

- **VUID-vkCmdDraw-None-08117**
  If the descriptors used by the `VkPipeline` bound to the pipeline bind point were specified via `vkCmdSetDescriptorBufferOffsetsEXT`, the bound `VkPipeline` must have been created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`
• VUID-vkCmdDraw-None-08119
   If a descriptor is dynamically used with a VkPipeline created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory must be resident

• VUID-vkCmdDraw-None-08605
   If a descriptor is dynamically used with a VkShaderEXT created with VkDescriptorSetLayout that was created with VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory must be resident

• VUID-vkCmdDraw-None-08606
   If the shaderObject feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command

• VUID-vkCmdDraw-None-08608
   If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound

• VUID-vkCmdDraw-None-08609
   If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage

• VUID-vkCmdDraw-None-08610
   If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage

• VUID-vkCmdDraw-None-08611
   If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage

• VUID-vkCmdDraw-None-08607
   If the shaderObject is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command

• VUID-vkCmdDraw-uniformBuffers-06935
   If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers,
and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDraw-None-08612**
  If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDraw-storageBuffers-06936**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `storageBuffers`, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDraw-None-08613**
  If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDraw-commandBuffer-02707**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by `bound shaders` **must** not be a protected resource

- **VUID-vkCmdDraw-None-06550**
  If a `bound shader` accesses a `VkSampler` or `VkImageView` object that enables `sampler YCₐCₙ Cₜ` conversion, that object **must** only be used with `OpImageSample*` or `OpImageSparseSample*` instructions

- **VUID-vkCmdDraw-ConstOffset-06551**
  If a `bound shader` accesses a `VkSampler` or `VkImageView` object that enables `sampler YCₐCₙ Cₜ` conversion, that object **must** not use the `ConstOffset` and `Offset` operands

- **VUID-vkCmdDraw-viewType-07752**
  If a `VkImageView` is accessed as a result of this command, then the image view's `viewType` **must** match the `Dim` operand of the `OpTypeImage` as described in Instruction/Sampler/Image View Validation

- **VUID-vkCmdDraw-format-07753**
  If a `VkImageView` is accessed as a result of this command, then the numeric `type` of the image view's `format` and the `Sampled Type` operand of the `OpTypeImage` **must** match

- **VUID-vkCmdDraw-OpImageWrite-08795**
  If a `VkImageView` created with a format other than `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the image view's `format`

- **VUID-vkCmdDraw-OpImageWrite-08796**
  If a `VkImageView` created with the format `VK_FORMAT_A8_UNORM_KHR` is accessed using
OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have four components

- VUID-vkCmdDraw-OpImageWrite-04469
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view's format

- VUID-vkCmdDraw-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- VUID-vkCmdDraw-SampledType-04471
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- VUID-vkCmdDraw-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- VUID-vkCmdDraw-SampledType-04473
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- VUID-vkCmdDraw-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdDraw-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdDraw-OpImageWeightedSampleQCOM-06971
  If OpImageWeightedSampleQCOM is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM

- VUID-vkCmdDraw-OpImageWeightedSampleQCOM-06972
  If OpImageWeightedSampleQCOM uses a VkImageView as a sample weight image as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM

- VUID-vkCmdDraw-OpImageBoxFilterQCOM-06973
  If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM

- VUID-vkCmdDraw-OpImageBlockMatchSSDQCOM-06974
If `OpImageBlockMatchSSDQCOM` is used to read from an `VkImageView` as a result of this command, then the image view’s format features **must** contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

- VUID-vkCmdDraw-OpImageBlockMatchSADQCOM-06975
  If `OpImageBlockMatchSADQCOM` is used to read from an `VkImageView` as a result of this command, then the image view’s format features **must** contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

- VUID-vkCmdDraw-OpImageBlockMatchSADQCOM-06976
  If `OpImageBlockMatchSADQCOM` or `OpImageBlockMatchSSDQCOM` is used to read from a reference image as a result of this command, then the specified reference coordinates **must** not fail integer texel coordinate validation.

If `OpImageWeightedSampleQCOM`, `OpImageBlockMatchWindowSSDQCOM`, `OpImageBlockMatchWindowSADQCOM`, `OpImageBlockMatchGatherSSDQCOM`, `OpImageBlockMatchGatherSADQCOM`, or `OpImageBlockMatchSSDQCOM` uses a `VkSampler` as a result of this command, then the sampler **must** have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

- VUID-vkCmdDraw-OpImageWeightedSampleQCOM-06978
  If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchWindowSSDQCOM`, `OpImageBlockMatchWindowSADQCOM`, `OpImageBlockMatchGatherSSDQCOM`, `OpImageBlockMatchGatherSADQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler **must** not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

- VUID-vkCmdDraw-OpImageBlockMatchWindow-09215
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view’s format features **must** contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

- VUID-vkCmdDraw-OpImageBlockMatchWindow-09216
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view’s format **must** be a single-component format.

- VUID-vkCmdDraw-OpImageBlockMatchWindow-09217
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from a reference image as a result of this command, then the specified reference coordinates **must** not fail integer texel coordinate validation.

- VUID-vkCmdDraw-None-07288
  Any shader invocation executed by this command **must** terminate.

- VUID-vkCmdDraw-renderPass-02684
  The current render pass **must** be compatible with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

- VUID-vkCmdDraw-subpass-02685
  The subpass index of the current render pass **must** be equal to the `subpass` member of the.
VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS

• VUID-vkCmdDraw-None-07748
  If any shader statically accesses an input attachment, a valid descriptor must be bound to the pipeline via a descriptor set

• VUID-vkCmdDraw-OpTypeImage-07468
  If any shader executed by this pipeline accesses an OpTypeImage variable with a Dim operand of SubpassData, it must be decorated with an InputAttachmentIndex that corresponds to a valid input attachment in the current subpass

• VUID-vkCmdDraw-None-07469
  Input attachment views accessed in a subpass must be created with the same VkFormat as the corresponding subpass definition, and be created with a VkImageView that is compatible with the attachment referenced by the subpass’ pInputAttachments [InputAttachmentIndex] in the currently bound VkFramebuffer as specified by Fragment Input Attachment Compatibility

• VUID-vkCmdDraw-None-06537
  Memory backing image subresources used as attachments in the current render pass must not be written in any way other than as an attachment by this command

• VUID-vkCmdDraw-None-09000
  If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT image layout, and either:
  ◦ the VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT is set on the currently bound pipeline or
  ◦ the last call to vkCmdSetAttachmentFeedbackLoopEnableEXT included VK_IMAGE_ASPECT_COLOR_BIT and
    ▪ there is no currently bound graphics pipeline or
    ▪ the currently bound graphics pipeline was created with VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT it must not be accessed in any way other than as an attachment by this command

• VUID-vkCmdDraw-None-09001
  If a depth attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT image layout, and either:
  ◦ the VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT is set on the currently bound pipeline or
  ◦ the last call to vkCmdSetAttachmentFeedbackLoopEnableEXT included VK_IMAGE_ASPECT_DEPTH_BIT and
    ▪ there is no currently bound graphics pipeline or
    ▪ the currently bound graphics pipeline was created with VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT it must not be accessed in any way other than as an attachment by this command
If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, and either:

- the `VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACKLOOP_BIT_EXT` is set on the currently bound pipeline or
- the last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included `VK_IMAGE_ASPECT_STENCIL_BIT` and
  - there is no currently bound graphics pipeline or
  - the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACKLOOP_ENABLE_EXT` it must not be accessed in any way other than as an attachment by this command

If an attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it must not be accessed in any way other than as an attachment, storage image, or sampled image by this command.

If any previously recorded command in the current subpass accessed an image subresource used as an attachment in this subpass in any way other than as an attachment, this command must not write to that image subresource as an attachment.

If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, depth writes must be disabled.

If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect, both front and back writeMask are not zero, and stencil test is enabled, all stencil ops must be `VK_STENCIL_OP_KEEP`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT` dynamic state enabled then `vkCmdSetViewport` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR` dynamic state enabled then `vkCmdSetScissor` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_WIDTH` dynamic state enabled then `vkCmdSetLineWidth` must have been called in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to
vkCmdSetPolygonModeEXT in the current command buffer set polygonMode to VK_POLYGON_MODE_LINE, vkCmdSetLineWidth must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-08618
If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetPrimitiveTopology in the current command buffer set primitiveTopology to any line topology, vkCmdSetLineWidth must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-08619
If a shader object that outputs line primitives is bound to the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, vkCmdSetLineWidth must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-07834
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BIAS dynamic state enabled then vkCmdSetDepthBias or vkCmdSetDepthBias2EXT must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-08620
If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetDepthBiasEnable in the current command buffer set depthBiasEnable to VK_TRUE, vkCmdSetDepthBias or vkCmdSetDepthBias2EXT must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-07835
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_BLEND_CONSTANTS dynamic state enabled then vkCmdSetBlendConstants must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-08621
If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetColorBlendEnableEXT in the current command buffer set any element of pColorBlendEnables to VK_TRUE, and the most recent call to vkCmdSetColorBlendEquationEXT in the current command buffer set the same element of pColorBlendEquations to a VkColorBlendEquationEXT structure with any VkBlendFactor member with a value of VK_BLEND_FACTOR_CONSTANT_COLOR, VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR, VK_BLEND_FACTOR_CONSTANT_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA, vkCmdSetBlendConstants must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-07836
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BOUNDS
dynamic state enabled, and if the current depthBoundsTestEnable state is VK_TRUE, then vkCmdSetDepthBounds must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-08622**
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetDepthBoundsTestEnable in the current command buffer set depthBoundsTestEnable to VK_TRUE, then vkCmdSetDepthBounds must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-07837**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK dynamic state enabled, and if the current stencilTestEnable state is VK_TRUE, then vkCmdSetStencilCompareMask must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-08623**
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetStencilTestEnable in the current command buffer set stencilTestEnable to VK_TRUE, then vkCmdSetStencilCompareMask must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-07838**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_WRITE_MASK dynamic state enabled, and if the current stencilTestEnable state is VK_TRUE, then vkCmdSetStencilWriteMask must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-08624**
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetStencilTestEnable in the current command buffer set stencilTestEnable to VK_TRUE, then vkCmdSetStencilWriteMask must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-07839**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_REFERENCE dynamic state enabled, and if the current stencilTestEnable state is VK_TRUE, then vkCmdSetStencilReference must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-08625**
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetStencilTestEnable in the current command buffer set stencilTestEnable to VK_TRUE, then vkCmdSetStencilReference must have been called in the current command buffer
prior to this drawing command

- **VUID-vkCmdDraw-maxMultiviewInstanceIndex-02688**
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to \( \text{VkPhysicalDeviceMultiviewProperties} :: \text{maxMultiviewInstanceIndex} \)

- **VUID-vkCmdDraw-sampleLocationsEnable-02689**
  If the bound graphics pipeline was created with \( \text{VkPipelineSampleLocationsStateCreateInfoEXT} :: \text{sampleLocationsEnable} \) set to \( \text{VK_TRUE} \) and the current subpass has a depth/stencil attachment, then that attachment **must** have been created with the \( \text{VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT} \) bit set

- **VUID-vkCmdDraw-None-06666**
  If the bound graphics pipeline state was created with the \( \text{VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT} \) dynamic state enabled then \( \text{vkCmdSetSampleLocationsEXT} \) **must** have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-08626**
  If a shader object is bound to any graphics stage, and the most recent call to \( \text{vkCmdSetRasterizerDiscardEnable} \) in the current command buffer set \( \text{rasterizerDiscardEnable} \) to \( \text{VK_FALSE} \), and the most recent call to \( \text{vkCmdSetSampleLocationsEnableEXT} \) in the current command buffer set \( \text{sampleLocationsEnable} \) to \( \text{VK_TRUE} \), then \( \text{vkCmdSetSampleLocationsEXT} \) **must** have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-07840**
  If the bound graphics pipeline state was created with the \( \text{VK_DYNAMIC_STATE_CULL_MODE} \) dynamic state enabled then \( \text{vkCmdSetCullMode} \) **must** have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-08627**
  If a shader object is bound to any graphics stage, and the most recent call to \( \text{vkCmdSetRasterizerDiscardEnable} \) in the current command buffer set \( \text{rasterizerDiscardEnable} \) to \( \text{VK_FALSE} \), then \( \text{vkCmdSetCullMode} \) **must** have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-07841**
  If the bound graphics pipeline state was created with the \( \text{VK_DYNAMIC_STATE_FRONT_FACE} \) dynamic state enabled then \( \text{vkCmdSetFrontFace} \) **must** have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-08628**
  If a shader object is bound to any graphics stage, and the most recent call to \( \text{vkCmdSetRasterizerDiscardEnable} \) in the current command buffer set \( \text{rasterizerDiscardEnable} \) to \( \text{VK_FALSE} \), then \( \text{vkCmdSetFrontFace} \) **must** have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-07843**
  If the bound graphics pipeline state was created with the \( \text{VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE} \) dynamic state enabled then \( \text{vkCmdSetDepthTestEnable} \) **must** have been called in the current command buffer prior to
this drawing command

- **VUID-vkCmdDraw-None-08629**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthTestEnable` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-07844**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` dynamic state enabled then `vkCmdSetDepthWriteEnable` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-08630**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthWriteEnable` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-08631**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDepthTestEnable` in the current command buffer set `depthTestEnable` to `VK_TRUE`, then `vkCmdSetDepthCompareOp` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-08632**
  If a shader object is bound to any graphics stage, and the `depthBounds` feature is enabled, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then the `vkCmdSetDepthBoundsTestEnable` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-07846**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP` dynamic state enabled then `vkCmdSetDepthCompareOp` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-08633**
  If a shader object is bound to any graphics stage, and the `depthBounds` feature is enabled, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then the `vkCmdSetDepthBoundsTestEnable` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-07847**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE` dynamic state enabled then `vkCmdSetStencilTestEnable` must have been called in the current command buffer prior to this drawing command.
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetStencilTestEnable` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-07848**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_OP` dynamic state enabled then `vkCmdSetStencilOp` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-08634**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set `stencilTestEnable` to `VK_TRUE`, then `vkCmdSetStencilOp` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-viewportCount-03417**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must match the `VkPipelineViewportStateCreateInfo::viewportCount` of the pipeline.

- **VUID-vkCmdDraw-scissorCount-03418**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, then `vkCmdSetScissorWithCount` must have been called in the current command buffer prior to this drawing command, and the `scissorCount` parameter of `vkCmdSetScissorWithCount` must match the `VkPipelineViewportStateCreateInfo::viewportCount` of the pipeline.

- **VUID-vkCmdDraw-viewportCount-03419**
  If the bound graphics pipeline state was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic states enabled then both `vkCmdSetViewportWithCount` and `vkCmdSetScissorWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must match the `scissorCount` parameter of `vkCmdSetScissorWithCount`.

- **VUID-vkCmdDraw-None-08635**
  If a shader object is bound to any graphics stage, then both `vkCmdSetViewportWithCount` and `vkCmdSetScissorWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must match the `scissorCount` parameter of `vkCmdSetScissorWithCount`.

- **VUID-vkCmdDraw-viewportCount-04137**
  If the bound graphics pipeline state was created with the
**VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** dynamic state enabled, but not the **VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV** dynamic state enabled, then the bound graphics pipeline **must** have been created with `VkPipelineViewportWScalingStateCreateInfoNV`::`viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`

- **VUID-vkCmdDraw-viewportCount-04138**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** and **VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV** dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportWScalingNV` **must** be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`

- **VUID-vkCmdDraw-None-09232**
  If the **VK_NV_clip_space_w_scaling** extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetViewportWScalingEnableNV` in the current command buffer set `viewportWScalingEnable` to `VK_TRUE`, then `vkCmdSetViewportWScalingNV` **must** have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-08636**
  If the **VK_NV_clip_space_w_scaling** extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetViewportWScalingEnableNV` in the current command buffer set `viewportWScalingEnable` to `VK_TRUE`, then the `viewportCount` parameter in the last call to `vkCmdSetViewportWScalingNV` **must** be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`

- **VUID-vkCmdDraw-viewportCount-04139**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** dynamic state enabled, but not the **VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV** dynamic state enabled, then the bound graphics pipeline **must** have been created with `VkPipelineViewportShadingRateImageStateCreateInfoNV`::`viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`

- **VUID-vkCmdDraw-viewportCount-04140**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** and **VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV** dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportShadingRatePaletteNV` **must** be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`

- **VUID-vkCmdDraw-shadingRateImage-09233**
  If the `shadingRateImage` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetCoarseSampleOrderNV` **must** have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-shadingRateImage-09234**
  If the `shadingRateImage` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetCoarseSampleOrderNV` **must** have been called in the current command buffer prior to this drawing command
stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetShadingRateImageEnableNV` in the current command buffer set `shadingRateImageEnable` to `VK_TRUE`, then `vkCmdSetViewportShadingRatePaletteNV` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-08637**
  If the `shadingRateImage` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetShadingRateImageEnableNV` in the current command buffer set `shadingRateImageEnable` to `VK_TRUE`, then the `viewportCount` parameter in the last call to `vkCmdSetViewportShadingRatePaletteNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`

- **VUID-vkCmdDraw-VkPipelineViewportCreateInfo-04141**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportSwizzleStateCreateInfoNV` structure chained from `VkPipelineViewportStateCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`

- **VUID-vkCmdDraw-VkPipelineViewportCreateInfo-04142**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportExclusiveScissorStateCreateInfoNV` structure chained from `VkPipelineViewportStateCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`

- **VUID-vkCmdDraw-None-07878**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_ENABLE_NV` dynamic state enabled then `vkCmdSetExclusiveScissorEnableNV` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-07879**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_NV` dynamic state enabled then `vkCmdSetExclusiveScissorEnableNV` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-exclusiveScissor-09235**
  If the `exclusiveScissor` feature is enabled, and a shader object is bound to any graphics stage, then `vkCmdSetExclusiveScissorEnableNV` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-08638**
  If the `exclusiveScissor` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetExclusiveScissorEnableNV` in the current
command buffer set any element of `pExclusiveScissorEnables` to `VK_TRUE`, then `vkCmdSetExclusiveScissorNV` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-04876**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled then `vkCmdSetRasterizerDiscardEnable` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-08639**
  If a shader object is bound to any graphics stage, then `vkCmdSetRasterizerDiscardEnable` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-04877**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled then `vkCmdSetDepthBiasEnable` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-08640**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthBiasEnable` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-logicOp-04878**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled then `vkCmdSetLogicOpEXT` must have been called in the current command buffer prior to this drawing command and the `logicOp` must be a valid `VkLogicOp` value.

- **VUID-vkCmdDraw-None-08641**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetLogicOpEnableEXT` set `logicOpEnable` to `VK_TRUE`, then `vkCmdSetLogicOpEXT` must have been called in the current command buffer prior to this drawing command and the `logicOp` must be a valid `VkLogicOp` value.

- **VUID-vkCmdDraw-primitiveFragmentShadingRateWithMultipleViewports-04552**
  If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must be 1.

- **VUID-vkCmdDraw-primitiveFragmentShadingRateWithMultipleViewports-08642**
  If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, and any shader object bound to a graphics stage writes to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of
vkCmdSetViewportWithCount must be 1

- VUID-vkCmdDraw-blendEnable-04727
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view's format features do not contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the blendEnable member of the corresponding element of the pAttachments member of pColorBlendState must be VK_FALSE

- VUID-vkCmdDraw-None-08643
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then for each color attachment in the render pass, if the corresponding image view's format features do not contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the corresponding member of pColorBlendEnables in the most recent call to vkCmdSetColorBlendEnableEXT in the current command buffer that affected that attachment index must have been VK_FALSE

- VUID-vkCmdDraw-multisampledRenderToSingleSampled-07284
  If rasterization is not disabled in the bound graphics pipeline, and none of the following is enabled:
  - the VK_AMD_mixed_attachment_samples extension
  - the VK_NV_framebuffer_mixed_samples extension
  - the multisampledRenderToSingleSampled feature
  then rasterizationSamples for the currently bound graphics pipeline must be the same as the current subpass color and/or depth/stencil attachments

- VUID-vkCmdDraw-None-08644
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and none of the following is enabled:
  - the VK_AMD_mixed_attachment_samples extension
  - the VK_NV_framebuffer_mixed_samples extension
  - the multisampledRenderToSingleSampled feature
  then the most recent call to vkCmdSetRastertizationSamplesEXT in the current command buffer must have set rasterizationSamples to be the same as the number of samples for the current render pass color and/or depth/stencil attachments

- VUID-vkCmdDraw-None-08876
  If a shader object is bound to any graphics stage, the current render pass instance must have been begun with vkCmdBeginRendering

- VUID-vkCmdDraw-imageView-06172
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the depth attachment
If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, this command **must** not write any values to the depth attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, this command **must** not write any values to the depth attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo::viewMask` equal to `VkRenderingInfo::viewMask`.

If the `dynamicRenderingUnusedAttachments` feature is not enabled and the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo::colorAttachmentCount` equal to `VkRenderingInfo::colorAttachmentCount`.

If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the currently bound graphics pipeline.

If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the currently bound graphics pipeline.
If the `colorAttachmentCount` is greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `imageView` equal to `VK_NULL_HANDLE` must have the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the currently bound pipeline equal to `VK_FORMAT_UNDEFINED`.

**VUID-vkCmdDraw-dynamicRenderingUnusedAttachments-08911**
If the `dynamicRenderingUnusedAttachments` feature is enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `imageView` equal to `VK_NULL_HANDLE` must have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the currently bound graphics pipeline, or the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats`, if it exists, must be `VK_FORMAT_UNDEFINED`.

**VUID-vkCmdDraw-colorAttachmentCount-09362**
If the current render pass instance was begun with `vkCmdBeginRendering`, with a `VkRenderingInfo::colorAttachmentCount` equal to 1, there is no shader object bound to any graphics stage, and a color attachment with a resolve mode of `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`, each element of the `VkRenderingInfo::pColorAttachments` array with a `resolveImageView` not equal to `VK_NULL_HANDLE` must have been created with an image created with a `VkExternalFormatANDROID::externalFormat` value equal to the `VkExternalFormatANDROID::externalFormat` value used to create the currently bound graphics pipeline.

**VUID-vkCmdDraw-None-09363**
If there is no shader object bound to any graphics stage, the current render pass instance was begun with `vkCmdBeginRendering` and a ` VkRenderingInfo::colorAttachmentCount` equal to 1, and a color attachment with a resolve mode of `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`, each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with an image created with a `VkExternalFormatANDROID::externalFormat` value equal to the `VkExternalFormatANDROID::externalFormat` value used to create the currently bound graphics pipeline.

**VUID-vkCmdDraw-None-09364**
If the current render pass instance was begun with `vkCmdBeginRendering`, there is no shader object bound to any graphics stage, and the currently bound graphics pipeline was created with a non-zero `VkExternalFormatANDROID::externalFormat` value and with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled, then `vkCmdSetColorBlendEnableEXT` must have set the blend enable to `VK_FALSE` prior to this drawing command.

**VUID-vkCmdDraw-None-09365**
If the current render pass instance was begun with `vkCmdBeginRendering`, there is no shader object bound to any graphics stage, and the currently bound graphics pipeline was created with a non-zero `VkExternalFormatANDROID::externalFormat` value and with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` dynamic state enabled, then...
vkCmdSetRasterizationSamplesEXT must have set rasterizationSamples to VK_SAMPLE_COUNT_1_BIT prior to this drawing command

- VUID-vkCmdDraw-None-09366
  If there is a shader object bound to any graphics stage, and the current render pass includes a color attachment that uses the VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID resolve mode, then vkCmdSetColorBlendEnableEXT must have set blend enable to VK_FALSE prior to this drawing command

- VUID-vkCmdDraw-rasterizationSamples-09367
  If there is a shader object bound to any graphics stage, and the current render pass includes a color attachment that uses the VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID resolve mode, then vkCmdSetRasterizationSamplesEXT must have set rasterizationSamples to VK_SAMPLE_COUNT_1_BIT prior to this drawing command

- VUID-vkCmdDraw-None-09368
  If the current render pass instance was begun with vkCmdBeginRendering, there is no shader object bound to any graphics stage, and the currently bound graphics pipeline was created with a non-zero VkExternalFormatANDROID::externalFormat value and with the VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR dynamic state enabled, then vkCmdSetFragmentShadingRateKHR must have set pFragmentSize->width to 1 prior to this drawing command

- VUID-vkCmdDraw-None-09369
  If the current render pass instance was begun with vkCmdBeginRendering, there is no shader object bound to any graphics stage, and the currently bound graphics pipeline was created with a non-zero VkExternalFormatANDROID::externalFormat value and with the VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR dynamic state enabled, then vkCmdSetFragmentShadingRateKHR must have set pFragmentSize->height to 1 prior to this drawing command

- VUID-vkCmdDraw-pFragmentSize-09370
  If there is a shader object bound to any graphics stage, and the current render pass includes a color attachment that uses the VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID resolve mode, then vkCmdSetFragmentShadingRateKHR must have set pFragmentSize->width to 1 prior to this drawing command

- VUID-vkCmdDraw-pFragmentSize-09371
  If there is a shader object bound to any graphics stage, and the current render pass includes a color attachment that uses the VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID resolve mode, then vkCmdSetFragmentShadingRateKHR must have set pFragmentSize->height to 1 prior to this drawing command

- VUID-vkCmdDraw-None-07749
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT dynamic state enabled then vkCmdSetColorWriteEnableEXT must have been called in the current command buffer prior to this drawing command
If the `colorWriteEnable` feature is enabled on the device, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be greater than or equal to the `VkPipelineColorBlendStateCreateInfo::attachmentCount` of the currently bound graphics pipeline.

If the `colorWriteEnable` feature is enabled on the device, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then the `attachmentCount` parameter of the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer must be greater than or equal to the number of color attachments in the current render pass instance.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` dynamic state enabled then `vkCmdSetDiscardRectangleEXT` must have been called in the current command buffer prior to this drawing command for each discard rectangle in `VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleCount`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` dynamic state enabled then `vkCmdSetDiscardRectangleEnableEXT` must have been called in the current command buffer prior to this drawing command.

If the `VK_EXT_discard_rectangles` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDiscardRectangleEnableEXT` in the current command buffer set `discardRectangleEnable` to `VK_TRUE`, then `vkCmdSetDiscardRectangleEXT` must have been called in the current command buffer prior to this drawing command.

If the `VK_EXT_discard_rectangles` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDiscardRectangleEnableEXT` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` dynamic state enabled then `vkCmdSetDiscardRectangleEnableEXT` must have been called in the current command buffer prior to this drawing command.
**VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT** dynamic state enabled then **vkCmdSetDiscardRectangleModeEXT** must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-08649**
  If the **VK_EXT_discard_rectangles** extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to **vkCmdSetRasterizerDiscardEnable** in the current command buffer set `rasterizerDiscardEnable` to **VK_FALSE**, and the most recent call to **vkCmdSetDiscardRectangleEnableEXT** in the current command buffer set `discardRectangleEnable` to **VK_TRUE**, then **vkCmdSetDiscardRectangleModeEXT** must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-dynamicRenderingUnusedAttachments-08913**
  If the current render pass instance was begun with **vkCmdBeginRendering**, the **dynamicRenderingUnusedAttachments** feature is not enabled, and **VkRenderingInfo::pDepthAttachment->imageView** was **VK_NULL_HANDLE**, the value of **VkPipelineRenderingCreateInfo::depthAttachmentFormat** used to create the currently bound graphics pipeline must be equal to **VK_FORMAT_UNDEFINED**

- **VUID-vkCmdDraw-dynamicRenderingUnusedAttachments-08914**
  If the current render pass instance was begun with **vkCmdBeginRendering**, the **dynamicRenderingUnusedAttachments** feature is not enabled, and **VkRenderingInfo::pDepthAttachment->imageView** was not **VK_NULL_HANDLE**, the value of **VkPipelineRenderingCreateInfo::depthAttachmentFormat** used to create the currently bound graphics pipeline must be equal to the **VkFormat** used to create **VkRenderingInfo::pDepthAttachment->imageView**

- **VUID-vkCmdDraw-dynamicRenderingUnusedAttachments-08915**
  If the current render pass instance was begun with **vkCmdBeginRendering**, the **dynamicRenderingUnusedAttachments** feature is enabled, **VkRenderingInfo::pDepthAttachment->imageView** was not **VK_NULL_HANDLE**, and the value of **VkPipelineRenderingCreateInfo::depthAttachmentFormat** used to create the currently bound graphics pipeline was not equal to the **VkFormat** used to create **VkRenderingInfo::pDepthAttachment->imageView**, the value of the format must be **VK_FORMAT_UNDEFINED**

- **VUID-vkCmdDraw-dynamicRenderingUnusedAttachments-08916**
  If the current render pass instance was begun with **vkCmdBeginRendering**, the **dynamicRenderingUnusedAttachments** feature is not enabled, and **VkRenderingInfo::pStencilAttachment->imageView** was **VK_NULL_HANDLE**, the value of **VkPipelineRenderingCreateInfo::stencilAttachmentFormat** used to create the currently bound graphics pipeline must be equal to **VK_FORMAT_UNDEFINED**

- **VUID-vkCmdDraw-dynamicRenderingUnusedAttachments-08917**
  If the current render pass instance was begun with **vkCmdBeginRendering**, the **dynamicRenderingUnusedAttachments** feature is not enabled, and **VkRenderingInfo::pStencilAttachment->imageView** was not **VK_NULL_HANDLE**, the value of **VkPipelineRenderingCreateInfo::stencilAttachmentFormat** used to create the currently bound graphics pipeline must be equal to the **VkFormat** used to create **VkRenderingInfo::pStencilAttachment->imageView**

- **VUID-vkCmdDraw-dynamicRenderingUnusedAttachments-08918**
  If the current render pass instance was begun with **vkCmdBeginRendering**, the
If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT`.

If the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the corresponding element of the `pColorAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline.

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`.

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`.

If the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`.

If the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, and the value of the `format` must be `VK_FORMAT_UNDEFINED`.
colorAttachmentCount parameter greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a sample count equal to the value of rasterizationSamples for the currently bound graphics pipeline.

- VUID-vkCmdDraw-multisampledRenderToSingleSampled-07286
  If the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the multisampledRenderToSingleSampled feature is not enabled, and VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of rasterizationSamples for the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView.

- VUID-vkCmdDraw-multisampledRenderToSingleSampled-07287
  If the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the multisampledRenderToSingleSampled feature is not enabled, and VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of rasterizationSamples for the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pStencilAttachment->imageView.

- VUID-vkCmdDraw-pNext-07935
  If this command has been called inside a render pass instance started with vkCmdBeginRendering, and the pNext chain of VkRenderingInfo includes a VkMultisampledRenderToSingleSampledInfoEXT structure with multisampledRenderToSingleSampledEnable equal to VK_TRUE, then the value of rasterizationSamples for the currently bound graphics pipeline must be equal to VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples.

- VUID-vkCmdDraw-renderPass-06198
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline must have been created with a VkGraphicsPipelineCreateInfo::renderPass equal to VK_NULL_HANDLE.

- VUID-vkCmdDraw-pColorAttachments-08963
  If the current render pass instance was begun with vkCmdBeginRendering, there is a graphics pipeline bound with a fragment shader that statically writes to a color attachment, the color write mask is not zero, color writes are enabled, and the corresponding element of the VkRenderingInfo::pColorAttachments->imageView was not VK_NULL_HANDLE, then the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats used to create the pipeline must not be VK_FORMAT_UNDEFINED.

- VUID-vkCmdDraw-pDepthAttachment-08964
  If the current render pass instance was begun with vkCmdBeginRendering, there is a graphics pipeline bound, depth test is enabled, depth write is enabled, and the VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, then the VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the pipeline must not be VK_FORMAT_UNDEFINED.

- VUID-vkCmdDraw-pStencilAttachment-08965
  If the current render pass instance was begun with vkCmdBeginRendering, there is a graphics pipeline bound, stencil test is enabled and the VkRenderingInfo
If `pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, then the `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the pipeline must not be `VK_FORMAT_UNDEFINED`.

- **VUID-vkCmdDraw-primitivesGeneratedQueryWithRasterizerDiscard-06708**
  If the `primitivesGeneratedQueryWithRasterizerDiscard` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, rasterization discard must not be enabled.

- **VUID-vkCmdDraw-primitivesGeneratedQueryWithNonZeroStreams-06709**
  If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, the bound graphics pipeline must not have been created with a non-zero value in `VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream`.

- **VUID-vkCmdDraw-None-07619**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT` dynamic state enabled then `vkCmdSetTessellationDomainOriginEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-07620**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthClampEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-09237**
  If a shader object is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` stage, then `vkCmdSetTessellationDomainOriginEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-08650**
  If the `depthClamp` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthClampEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-07621**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_POLYGON_MODE_EXT` dynamic state enabled then `vkCmdSetPolygonModeEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-08651**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetPolygonModeEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-07622**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` dynamic state enabled then
vkCmdSetRasterizationSamplesEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-None-08652
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetRasterizationSamplesEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-None-07623
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_MASK_EXT dynamic state enabled then vkCmdSetSampleMaskEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-None-08653
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetSampleMaskEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-None-07624
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT dynamic state enabled then vkCmdSetAlphaToCoverageEnableEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-alphaToCoverageEnable-08919
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT dynamic state enabled, and alphaToCoverageEnable was VK_TRUE in the last call to vkCmdSetAlphaToCoverageEnableEXT, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0

- VUID-vkCmdDraw-None-08654
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetAlphaToCoverageEnableEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-alphaToCoverageEnable-08920
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetAlphaToCoverageEnableEXT in the current command buffer set alphaToCoverageEnable to VK_TRUE, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0

- VUID-vkCmdDraw-None-07625
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT dynamic state enabled then vkCmdSetAlphaToOneEnableEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-None-08655
  If the alphaToOne feature is enabled, and a shader object is bound to any graphics stage,
and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK\_FALSE}, then \texttt{vkCmdSetAlphaToOneEnableEXT} must have been called in the current command buffer prior to this drawing command

- \textbf{VUID-vkCmdDraw-None-07626}
  If the bound graphics pipeline state was created with the \texttt{VK\_DYNAMIC\_STATE\_LOGIC\_OP\_ENABLE\_EXT} dynamic state enabled then \texttt{vkCmdSetLogicOpEnableEXT} must have been called in the current command buffer prior to this drawing command

- \textbf{VUID-vkCmdDraw-None-08656}
  If the \texttt{logicOp} feature is enabled, and a shader object is bound to the \texttt{VK\_SHADER\_STAGE\_FRAGMENT\_BIT} stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK\_FALSE}, then \texttt{vkCmdSetLogicOpEnableEXT} must have been called in the current command buffer prior to this drawing command

- \textbf{VUID-vkCmdDraw-None-07627}
  If the bound graphics pipeline state was created with the \texttt{VK\_DYNAMIC\_STATE\_COLOR\_BLEND\_ENABLE\_EXT} dynamic state enabled then \texttt{vkCmdSetColorBlendEnableEXT} must have been called in the current command buffer prior to this drawing command

- \textbf{VUID-vkCmdDraw-None-08657}
  If a shader object is bound to the \texttt{VK\_SHADER\_STAGE\_FRAGMENT\_BIT} stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK\_FALSE}, then \texttt{vkCmdSetColorBlendEnableEXT} must have been called in the current command buffer prior to this drawing command

- \textbf{VUID-vkCmdDraw-None-07628}
  If the bound graphics pipeline state was created with the \texttt{VK\_DYNAMIC\_STATE\_COLOR\_BLEND\_EQUATION\_EXT} dynamic state enabled then \texttt{vkCmdSetColorBlendEquationEXT} must have been called in the current command buffer prior to this drawing command

- \textbf{VUID-vkCmdDraw-None-08658}
  If a shader object is bound to the \texttt{VK\_SHADER\_STAGE\_FRAGMENT\_BIT} stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK\_FALSE}, and the most recent call to \texttt{vkCmdSetColorBlendEnableEXT} for any attachment set that attachment's value in \texttt{pColorBlendEnables} to \texttt{VK\_TRUE}, then \texttt{vkCmdSetColorBlendEquationEXT} must have been called in the current command buffer prior to this drawing command

- \textbf{VUID-vkCmdDraw-None-07629}
  If the bound graphics pipeline state was created with the \texttt{VK\_DYNAMIC\_STATE\_COLOR\_WRITE\_MASK\_EXT} dynamic state enabled then \texttt{vkCmdSetColorWriteMaskEXT} must have been called in the current command buffer prior to this drawing command

- \textbf{VUID-vkCmdDraw-None-08659}
  If a shader object is bound to the \texttt{VK\_SHADER\_STAGE\_FRAGMENT\_BIT} stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK\_FALSE}, then \texttt{vkCmdSetColorWriteMaskEXT} must have been
called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-07630**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT` dynamic state enabled then `vkCmdSetRasterizationStreamEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-08660**
  If the `geometryStreams` feature is enabled, and a shader object is bound to the `VK_SHADER_STAGE_GEOMETRY_BIT` stage, then `vkCmdSetRasterizationStreamEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-07631**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT` dynamic state enabled then `vkCmdSetConservativeRasterizationModeEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-08661**
  If the `VK_EXT_conservative_rasterization` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetConservativeRasterizationModeEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-07632**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT` dynamic state enabled then `vkCmdSetExtraPrimitiveOverestimationSizeEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-08662**
  If the `VK_EXT_conservative_rasterization` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetConservativeRasterizationModeEXT` in the current command buffer set `conervativeRasterizationMode` to `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT`, then `vkCmdSetExtraPrimitiveOverestimationSizeEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-07633**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthClipEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-08663**
  If the `depthClipEnable` feature is enabled, and a shader object is bound to any graphics stage, then `vkCmdSetDepthClipEnableEXT` must have been called in the current command buffer prior to this drawing command
• VUID-vkCmdDraw-None-07634
If the bound graphics pipeline state was created with the
`VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` dynamic state enabled then `vkCmdSetSampleLocationsEnableEXT` must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-08664
If the `VK_EXT_sample_locations` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetSampleLocationsEnableEXT` must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-07635
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` dynamic state enabled then `vkCmdSetColorBlendAdvancedEXT` must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-rasterizerDiscardEnable-09416
If the `VK_EXT_blend_operation_advanced` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then at least one of `vkCmdSetColorBlendEquationEXT` and `vkCmdSetColorBlendAdvancedEXT` must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-07636
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT` dynamic state enabled then `vkCmdSetProvokingVertexModeEXT` must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-08665
If the `VK_EXT_provoking_vertex` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetProvokingVertexModeEXT` must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-07637
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic state enabled then `vkCmdSetLineRasterizationModeEXT` must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-08666
If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetPolygonModeEXT` in the current command buffer set `polygonMode` to
VK_POLYGON_MODE_LINE, then `vkCmdSetLineRasterizationModeEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-08667**
  If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a shader object is bound to the VK_SHADER_STAGE_VERTEX_BIT stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to VK_FALSE, and the most recent call to `vkCmdSetPrimitiveTopology` in the current command buffer set `primitiveTopology` to any line topology, then `vkCmdSetLineRasterizationModeEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-08668**
  If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a shader object that outputs line primitives is bound to the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to VK_FALSE, then `vkCmdSetLineRasterizationModeEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-07638**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT dynamic state enabled then `vkCmdSetLineStippleEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-08669**
  If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to VK_FALSE, and the most recent call to `vkCmdSetPolygonModeEXT` in the current command buffer set `polygonMode` to VK_POLYGON_MODE_LINE, then `vkCmdSetLineStippleEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-08670**
  If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a shader object is bound to the VK_SHADER_STAGE_VERTEX_BIT stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to VK_FALSE, and the most recent call to `vkCmdSetPrimitiveTopology` in the current command buffer set `primitiveTopology` to any line topology, then `vkCmdSetLineStippleEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-08671**
  If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a shader object that outputs line primitives is bound to the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to VK_FALSE, then `vkCmdSetLineStippleEnableEXT` must have been called in the current command buffer prior to this drawing command.
• VUID-vkCmdDraw-None-07849
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_KHR` dynamic state enabled then `vkCmdSetLineStippleKHR` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDraw-None-08672
If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetLineStippleEnableEXT` in the current command buffer set `stippledLineEnable` to `VK_TRUE`, then `vkCmdSetLineStippleEXT` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDraw-None-07639
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_CLIP_NEGATIVE_ONE_TO_ONE_EXT` dynamic state enabled then `vkCmdSetDepthClipNegativeOneToOneEXT` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDraw-None-08673
If the `depthClipControl` feature is enabled, and a shader object is bound to any graphics stage, then `vkCmdSetDepthClipNegativeOneToOneEXT` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDraw-None-07640
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_ENABLE_NV` dynamic state enabled then `vkCmdSetViewportWScalingEnableNV` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDraw-None-08674
If the `VK_NV_clip_space_w_scaling` extension is enabled, and a shader object is bound to any graphics stage, then `vkCmdSetViewportWScalingEnableNV` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDraw-None-07641
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV` dynamic state enabled then `vkCmdSetViewportSwizzleNV` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDraw-None-08675
If the `VK_NV_viewport_swizzle` extension is enabled, and a shader object is bound to any graphics stage, then `vkCmdSetViewportSwizzleNV` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDraw-None-07642
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV` dynamic state enabled then `vkCmdSetCoverageToColorEnableNV` must have been called in the current command buffer prior to this drawing command.
If the `VK_NV_fragment_coverage_to_color` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetCoverageToColorEnableNV` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_LOCATION_NV` dynamic state enabled then `vkCmdSetCoverageToColorLocationNV` must have been called in the current command buffer prior to this drawing command.

If the `VK_NV_fragment_coverage_to_color` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetCoverageToColorEnableNV` in the current command buffer set `coverageToColorEnable` to `VK_TRUE`, then `vkCmdSetCoverageToColorLocationNV` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_MODULATION_MODE_NV` dynamic state enabled then `vkCmdSetCoverageModulationModeNV` must have been called in the current command buffer prior to this drawing command.

If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetCoverageModulationModeNV` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV` dynamic state enabled then `vkCmdSetCoverageModulationTableEnableNV` must have been called in the current command buffer prior to this drawing command.

If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetCoverageModulationModeNV` in the current command buffer set `coverageModulationMode` to any value other than `VK_COVERAGE_MODULATION_MODE_NONE_NV`, then `vkCmdSetCoverageModulationTableEnableNV` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the
If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetCoverageModulationTableEnableNV` in the current command buffer set `coverageModulationTableEnable` to `VK_TRUE`, then `vkCmdSetCoverageModulationTableNV` must have been called in the current command buffer prior to this drawing command.

VUID-vkCmdDraw-None-07647

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SHADING_RATE_IMAGE_ENABLE_NV` dynamic state enabled then `vkCmdSetShadingRateImageEnableNV` must have been called in the current command buffer prior to this drawing command.

VUID-vkCmdDraw-pipelineFragmentShadingRate-09238

If the `pipelineFragmentShadingRate` feature is enabled, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetFragmentShadingRateKHR` must have been called in the current command buffer prior to this drawing command.

VUID-vkCmdDraw-None-08681

If the `shadingRateImage` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetShadingRateImageEnableNV` must have been called in the current command buffer prior to this drawing command.

VUID-vkCmdDraw-None-07648

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_REPRESENTATIVE_FRAGMENT_TEST_ENABLE_NV` dynamic state enabled then `vkCmdSetRepresentativeFragmentTestEnableNV` must have been called in the current command buffer prior to this drawing command.

VUID-vkCmdDraw-None-08682

If the `representativeFragmentTest` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetRepresentativeFragmentTestEnableNV` must have been called in the current command buffer prior to this drawing command.

VUID-vkCmdDraw-None-07649

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_REDUCTION_MODE_NV` dynamic state enabled then `vkCmdSetCoverageReductionModeNV` must have been called in the current command buffer prior to this drawing command.

VUID-vkCmdDraw-None-08683

If the `coverageReductionMode` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetCoverageReductionModeNV` must have been called in the current command buffer prior to this drawing command.
graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetCoverageReductionModeNV` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-pColorBlendEnables-07470**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` state enabled and the last call to `vkCmdSetColorBlendEnableEXT` set `pColorBlendEnables` for any attachment to `VK_TRUE`, then for those attachments in the subpass the corresponding image view's format features must contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`

- **VUID-vkCmdDraw-rasterizationSamples-07471**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the current subpass does not use any color and/or depth/stencil attachments, then the `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT` must follow the rules for a zero-attachment subpass

- **VUID-vkCmdDraw-samples-07472**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state disabled, then the `samples` parameter in the last call to `vkCmdSetSampleMaskEXT` must be greater or equal to the `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` parameter used to create the bound graphics pipeline

- **VUID-vkCmdDraw-samples-07473**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` state and `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` states enabled, then the `samples` parameter in the last call to `vkCmdSetSampleMaskEXT` must be greater or equal to the `rasterizationSamples` parameter in the last call to `vkCmdSetRasterizationSamplesEXT`

- **VUID-vkCmdDraw-rasterizationSamples-07474**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are enabled, then the `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT` must be the same as the current subpass color and/or depth/stencil attachments

- **VUID-vkCmdDraw-None-09211**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, or a shader object is bound to any graphics stage, and the current render pass instance includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure with `multisampledRenderToSingleSampledEnable` equal to `VK_TRUE`, then the `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT` must be the same as the `rasterizationSamples` member of that structure

- **VUID-vkCmdDraw-firstAttachment-07476**
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorBlendEnableEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEnableEXT` calls must specify an enable for all active color attachments in the current subpass

- **VUID-vkCmdDraw-rasterizerDiscardEnable-09417**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorBlendEnableEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEnableEXT` calls must specify an enable for all active color attachments in the current subpass

- **VUID-vkCmdDraw-firstAttachment-07477**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` dynamic state enabled then `vkCmdSetColorBlendEquationEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEquationEXT` calls must specify the blend equations for all active color attachments in the current subpass where blending is enabled

- **VUID-vkCmdDraw-rasterizerDiscardEnable-09418**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorBlendEquationEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEquationEXT` calls must specify the blend equations for all active color attachments in the current subpass where blending is enabled

- **VUID-vkCmdDraw-firstAttachment-07478**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic state enabled then `vkCmdSetColorWriteMaskEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorWriteMaskEXT` calls must specify the color write mask for all active color attachments in the current subpass

- **VUID-vkCmdDraw-rasterizerDiscardEnable-09419**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorWriteMaskEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorWriteMaskEXT` calls must specify the color write mask for all active color attachments in the current subpass
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` dynamic state enabled then `vkCmdSetColorBlendAdvancedEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendAdvancedEXT` calls must specify the advanced blend equations for all active color attachments in the current subpass where blending is enabled.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic states enabled and the last calls to `vkCmdSetColorBlendEnableEXT` and `vkCmdSetColorBlendAdvancedEXT` have enabled advanced blending, then the number of active color attachments in the current subpass must not exceed `advancedBlendMaxColorAttachments`.

If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, and the bound graphics pipeline was created with `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT` state enabled, the last call to `vkCmdSetRasterizationStreamEXT` must have set the `rasterizationStream` to zero.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state disabled, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsEXT` must equal the `rasterizationSamples` member of the `VkPipelineMultisampleStateCreateInfo` structure the bound graphics pipeline has been created with.

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, then that attachment must have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set.

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state
enabled and the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and if `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, then the `sampleLocationsInfo.sampleLocationGridSize.width` in the last call to `vkCmdSetSampleLocationsEXT` must evenly divide `VkMultisamplePropertiesEXT::sampleLocationGridSize.width` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling `rasterizationSamples`.

- **VUID-vkCmdDraw-sampleLocationsEnable-07486**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and if `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, then the `sampleLocationsInfo.sampleLocationGridSize.height` in the last call to `vkCmdSetSampleLocationsEXT` must evenly divide `VkMultisamplePropertiesEXT::sampleLocationGridSize.height` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling `rasterizationSamples`.

- **VUID-vkCmdDraw-sampleLocationsEnable-07487**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and if `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, the fragment shader code must not statically use the extended instruction `InterpolateAtSample`.

- **VUID-vkCmdDraw-sampleLocationsEnable-07936**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state disabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, the `sampleLocationsEnable` member of a `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` in the bound graphics pipeline is `VK_TRUE` or `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, then, `sampleLocationsInfo.sampleLocationGridSize.width` must evenly divide `VkMultisamplePropertiesEXT::sampleLocationGridSize.width` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling the value of `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT`.

- **VUID-vkCmdDraw-sampleLocationsEnable-07937**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state disabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, the `sampleLocationsEnable` member of a `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` in the bound graphics pipeline is `VK_TRUE` or `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, then, `sampleLocationsInfo.sampleLocationGridSize.height` must evenly divide `VkMultisamplePropertiesEXT::sampleLocationGridSize.height` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling the value of `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT`.

- **VUID-vkCmdDraw-sampleLocationsEnable-07938**
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state disabled and the
VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, the sampleLocationsEnable member of a VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable in the bound graphics pipeline is VK_TRUE or VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, then, sampleLocationsInfo.sampleLocationsPerPixel must equal rasterizationSamples in the last call to vkCmdSetRasterizationSamplesEXT

- VUID-vkCmdDraw-coverageModulationTableEnable-07488
If a shader object is bound to any graphics stage or the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV state enabled, and the last call to vkCmdSetCoverageModulationTableEnableNV set coverageModulationTableEnable to VK_TRUE, then the coverageModulationTableCount parameter in the last call to vkCmdSetCoverageModulationTableNV must equal the current rasterizationSamples divided by the number of color samples in the current subpass

- VUID-vkCmdDraw-rasterizationSamples-07489
If the VK_NV_framebuffer_mixed_samples extension is enabled, and if current subpass has a depth/stencil attachment and depth test, stencil test, or depth bounds test are enabled in the currently bound pipeline state, then the current rasterizationSamples must be the same as the sample count of the depth/stencil attachment

- VUID-vkCmdDraw-coverageToColorEnable-07490
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV state enabled and the last call to vkCmdSetCoverageToColorEnableNV set the coverageToColorEnable to VK_TRUE, then the current subpass must have a color attachment at the location selected by the last call to vkCmdSetCoverageToColorLocationNV coverageToColorLocation, with a VkFormat of VK_FORMAT_R8_UINT, VK_FORMAT_R8_SINT, VK_FORMAT_R16_UINT, VK_FORMAT_R16_SINT, VK_FORMAT_R32_UINT, or VK_FORMAT_R32_SINT

- VUID-vkCmdDraw-rasterizerDiscardEnable-09420
If the VK_NV_fragment_coverage_to_color extension is enabled, and a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the last call to vkCmdSetCoverageToColorEnableNV set the coverageToColorEnable to VK_TRUE, then the current subpass must have a color attachment at the location selected by the last call to vkCmdSetCoverageToColorLocationNV coverageToColorLocation, with a VkFormat of VK_FORMAT_R8_UINT, VK_FORMAT_R8_SINT, VK_FORMAT_R16_UINT, VK_FORMAT_R16_SINT, VK_FORMAT_R32_UINT, or VK_FORMAT_R32_SINT

- VUID-vkCmdDraw-coverageReductionMode-07491
If this VK_NV_coverage_reduction_mode extension is enabled, the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV and VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT states enabled, the current coverage reduction mode coverageReductionMode, then the current rasterizationSamples, and the sample counts for the color and depth/stencil attachments (if the subpass has them) must be a valid combination returned by vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV
• VUID-vkCmdDraw-viewportCount-07492
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV` dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportSwizzleStateCreateInfoNV ::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

• VUID-vkCmdDraw-viewportCount-07493
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportSwizzleNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

• VUID-vkCmdDraw-viewportCount-09421
If the `VK_NV_viewport_swizzle` extension is enabled, and a shader object is bound to any graphics stage, then the `viewportCount` parameter in the last call to `vkCmdSetViewportSwizzleNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

• VUID-vkCmdDraw-rasterizationSamples-07494
If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and if the current subpass has any color attachments and `rasterizationSamples` of the last call to `vkCmdSetRasterizationSamplesEXT` is greater than the number of color samples, then the pipeline `sampleShadingEnable` must be `VK_FALSE`.

• VUID-vkCmdDraw-stippledLineEnable-07495
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR`, then the `stippledRectangularLines` feature must be enabled.

• VUID-vkCmdDraw-stippledLineEnable-07496
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR`, then the `stippledBresenhamLines` feature must be enabled.

• VUID-vkCmdDraw-stippledLineEnable-07497
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR`, then the `stippledSmoothLines` feature must be enabled.

• VUID-vkCmdDraw-stippledLineEnable-07498

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_DEFAULT_KHR`, then the `stippledRectangularLines` feature must be enabled and `VkPhysicalDeviceLimits::strictLines` must be `VK_TRUE`.

- **VUID-vkCmdDraw-conservativePointAndLineRasterization-07499**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT` dynamic state enabled, `conservativePointAndLineRasterization` is not supported, and the effective primitive topology output by the last pre-rasterization shader stage is a line or point, then the `conservativeRasterizationMode` set by the last call to `vkCmdSetConservativeRasterizationModeEXT` must be `VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT`.

- **VUID-vkCmdDraw-stage-07073**
  If the currently bound pipeline was created with the `VkPipelineShaderStageCreateInfo`::`stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`, then Mesh Shader Queries must not be active.

- **VUID-vkCmdDraw-None-08877**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` dynamic state `vkCmdSetAttachmentFeedbackLoopEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-07850**
  If dynamic state was inherited from `VkCommandBufferInheritanceViewportScissorInfoNV`, it must be set in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-08684**
  If there is no bound graphics pipeline, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_VERTEX_BIT`.

- **VUID-vkCmdDraw-None-08685**
  If there is no bound graphics pipeline, and the `tessellationShader` feature is enabled, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`.

- **VUID-vkCmdDraw-None-08686**
  If there is no bound graphics pipeline, and the `tessellationShader` feature is enabled, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`.

- **VUID-vkCmdDraw-None-08687**
  If there is no bound graphics pipeline, and the `geometryShader` feature is enabled, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_GEOMETRY_BIT`.
• VUID-vkCmdDraw-None-08688
If there is no bound graphics pipeline, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_FRAGMENT_BIT`.

• VUID-vkCmdDraw-None-08689
If there is no bound graphics pipeline, and the `taskShader` feature is enabled, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_TASK_BIT_EXT`.

• VUID-vkCmdDraw-None-08690
If there is no bound graphics pipeline, and the `meshShader` feature is enabled, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_MESH_BIT_EXT`.

• VUID-vkCmdDraw-None-08693
If there is no bound graphics pipeline, and at least one of the `taskShader` and `meshShader` features is enabled, one of the `VK_SHADER_STAGE_VERTEX_BIT` or `VK_SHADER_STAGE_MESH_BIT_EXT` stages must have a valid `VkShaderEXT` bound, and the other must have no `VkShaderEXT` bound.

• VUID-vkCmdDraw-None-08694
If there is no bound graphics pipeline, and both the `taskShader` and `meshShader` features are enabled, and a valid `VkShaderEXT` is bound the to the `VK_SHADER_STAGE_MESH_BIT_EXT` stage, and that `VkShaderEXT` was created without the `VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT` flag, a valid `VkShaderEXT` must be bound to the `VK_SHADER_STAGE_TASK_BIT_EXT` stage.

• VUID-vkCmdDraw-None-08695
If there is no bound graphics pipeline, and both the `taskShader` and `meshShader` features are enabled, and a valid `VkShaderEXT` is bound the to the `VK_SHADER_STAGE_MESH_BIT_EXT` stage, and that `VkShaderEXT` was created with the `VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT` flag, there must be no `VkShaderEXT` bound to the `VK_SHADER_STAGE_TASK_BIT_EXT` stage.

• VUID-vkCmdDraw-None-08696
If there is no bound graphics pipeline, and a valid `VkShaderEXT` is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage, there must be no `VkShaderEXT` bound to either the `VK_SHADER_STAGE_TASK_BIT_EXT` stage or the `VK_SHADER_STAGE_MESH_BIT_EXT` stage.

• VUID-vkCmdDraw-None-08698
If any graphics shader is bound which was created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag, then all shaders created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag in the same `vkCreateShadersEXT` call must also be bound.

• VUID-vkCmdDraw-None-08699
If any graphics shader is bound which was created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag, any stages in between stages whose shaders which did not create a shader with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag as part of the same `vkCreateShadersEXT` call must not have any `VkShaderEXT` bound.

• VUID-vkCmdDraw-None-08878
All bound graphics shader objects must have been created with identical or identically defined push constant ranges.
All bound graphics shader objects must have been created with identical or identically defined arrays of descriptor set layouts.

If the current render pass instance was begun with vkCmdBeginRendering and a VkRenderingInfo::colorAttachmentCount equal to 1, a color attachment with a resolve mode of VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID, and a fragment shader is bound, it must not declare the DepthReplacing or StencilRefReplacingEXT execution modes.

If the attachmentFeedbackLoopDynamicState feature is enabled on the device, and a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetAttachmentFeedbackLoopEnableEXT must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state includes a fragment shader stage, was created with VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE set in VkPipelineDynamicStateCreateInfo ::pDynamicStates, and the fragment shader declares the EarlyFragmentTests execution mode and uses OpDepthAttachmentReadEXT, the depthWriteEnable parameter in the last call to vkCmdSetDepthWriteEnable must be VK_FALSE.

If the bound graphics pipeline state includes a fragment shader stage, was created with VK_DYNAMIC_STATE_STENCIL_WRITE_MASK set in VkPipelineDynamicStateCreateInfo ::pDynamicStates, and the fragment shader declares the EarlyFragmentTests execution mode and uses OpStencilAttachmentReadEXT, the writeMask parameter in the last call to vkCmdSetStencilWriteMask must be 0.

If a shader object is bound to any graphics stage or the currently bound graphics pipeline was created with VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT, and the format of any color attachment is VK_FORMAT_E5B9G9R9_UFLOAT_PACK32, the corresponding element of the pColorWriteMasks parameter of vkCmdSetColorWriteMaskEXT must either include all of VK_COLOR_COMPONENT_R_BIT, VK_COLOR_COMPONENT_G_BIT, and VK_COLOR_COMPONENT_B_BIT, or none of them.

If blending is enabled for any attachment where either the source or destination blend factors for that attachment use the secondary color input, the maximum value of Location for any output attachment statically used in the Fragment Execution Model executed by this command must be less than maxFragmentDualSrcAttachments.

If the current render pass was begun with vkCmdBeginRendering, and there is no shader object bound to any graphics stage, the value of each element of VkRenderingAttachmentLocationInfoKHR::pColorAttachmentLocations set by vkCmdSetRenderingAttachmentLocationsKHR must match the value set for the corresponding element in the currently bound pipeline.
If the current render pass was begun with `vkCmdBeginRendering`, and there is no shader object bound to any graphics stage, input attachment index mappings in the currently bound pipeline must match those set for the current render pass instance via `VkRenderingInputAttachmentIndexInfoKHR`.

- **VUID-vkCmdDraw-commandBuffer-02712**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, any resource written to by the `VkPipeline` object bound to the pipeline bind point used by this command must not be an unprotected resource.

- **VUID-vkCmdDraw-commandBuffer-02713**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, pipeline stages other than the framebuffer-space and compute stages in the `VkPipeline` object bound to the pipeline bind point used by this command must not write to any resource.

- **VUID-vkCmdDraw-commandBuffer-04617**
  If any of the shader stages of the `VkPipeline` bound to the pipeline bind point used by this command uses the `RayQueryKHR` capability, then `commandBuffer` must not be a protected command buffer.

- **VUID-vkCmdDraw-None-04007**
  All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must have either valid or `VK_NULL_HANDLE` buffers bound.

- **VUID-vkCmdDraw-None-04008**
  If the `nullDescriptor` feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must not be `VK_NULL_HANDLE`.

- **VUID-vkCmdDraw-None-02721**
  For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in `Vertex Input Description`.

- **VUID-vkCmdDraw-None-07842**
  If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` dynamic state enabled then `vkCmdSetPrimitiveTopology` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-dynamicPrimitiveTopologyUnrestricted-07500**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` dynamic state enabled and the `dynamicPrimitiveTopologyUnrestricted` is `VK_FALSE`, then the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopology` must be of the same `topology` class as the pipeline `VkPipelineInputAssemblyStateCreateInfo::topology` state.

- **VUID-vkCmdDraw-None-04912**
  If the bound graphics pipeline was created with both the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` and `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic states enabled, then `vkCmdSetVertexInputEXT` must have been called in the
current command buffer prior to this draw command

- VUID-vkCmdDraw-pStrides-04913
  If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled, but without the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdBindVertexBuffers2EXT` must have been called in the current command buffer prior to this draw command, and the `pStrides` parameter of `vkCmdBindVertexBuffers2EXT` must not be NULL

- VUID-vkCmdDraw-None-04914
  If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command

- VUID-vkCmdDraw-Input-07939
  If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled then all variables with the `Input` storage class decorated with `Location` in the `Vertex Execution Model OpEntryPoint` must contain a location in `VkVertexInputAttributeDescription2EXT::location`

- VUID-vkCmdDraw-Input-08734
  If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled then the numeric type associated with all `Input` variables of the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` must be the same as `VkVertexInputAttributeDescription2EXT::format`

- VUID-vkCmdDraw-format-08936
  If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled and `VkVertexInputAttributeDescription2EXT::format` has a 64-bit component, then the scalar width associated with all `Input` variables of the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` must be 64-bit

- VUID-vkCmdDraw-format-08937
  If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled and the scalar width associated with a `Location` decorated `Input` variable in the `Vertex Execution Model OpEntryPoint` is 64-bit, then the corresponding `VkVertexInputAttributeDescription2EXT::format` must have a 64-bit component

- VUID-vkCmdDraw-None-09203
  If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled and `VkVertexInputAttributeDescription2EXT::format` has a 64-bit component, then all `Input` variables at the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` must not use components that are not present in the format
recent call to `vkCmdSetPrimitiveTopology` in the current command buffer set `primitiveTopology` to `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`, or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled then `vkCmdSetPatchControlPointsEXT` **must** have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-04879**
  If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE` dynamic state enabled then `vkCmdSetPrimitiveRestartEnable` **must** have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-stage-06481**
  The bound graphics pipeline **must** not have been created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_TASK_BIT_EXT` or `VK_SHADER_STAGE_MESH_BIT_EXT`

- **VUID-vkCmdDraw-None-08885**
  There **must** be no shader object bound to either of the `VK_SHADER_STAGE_TASK_BIT_EXT` or `VK_SHADER_STAGE_MESH_BIT_EXT` stages

- **VUID-vkCmdDraw-pNext-09461**
  If the bound graphics pipeline state was created with `VkPipelineVertexInputDivisorStateCreateInfoKHR` in the `pNext` chain of `VkGraphicsPipelineCreateInfo::pVertexInputState`, any member of `VkPipelineVertexInputDivisorStateCreateInfoKHR::pVertexBindingDivisors` has a value other than 1 in `divisor`, and `VkPhysicalDeviceVertexAttributeDivisorPropertiesKHR::supportsNonZeroFirstInstance` is `VK_FALSE`, then `firstInstance` **must** be 0

- **VUID-vkCmdDraw-None-09462**
  If shader objects are used for drawing or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, any member of the `pVertexBindingDescriptions` parameter to the `vkCmdSetVertexInputEXT` call that sets this dynamic state has a value other than 1 in `divisor`, and `VkPhysicalDeviceVertexAttributeDivisorPropertiesKHR::supportsNonZeroFirstInstance` is `VK_FALSE`, then `firstInstance` **must** be 0

---

**Valid Usage (Implicit)**

- **VUID-vkCmdDraw-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdDraw-commandBuffer-recording**
  `commandBuffer` **must** be in the recording state

- **VUID-vkCmdDraw-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- **VUID-vkCmdDraw-renderpass**
This command **must** only be called inside of a render pass instance

- VUID-vkCmdDraw-videocoding
  This command **must** only be called outside of a video coding scope

### Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the **VkCommandPool** that **commandBuffer** was allocated from **must** be externally synchronized

To record an indexed draw, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdDrawIndexed(
    VkCommandBuffer commandBuffer,
    uint32_t indexCount,
    uint32_t instanceCount,
    uint32_t firstIndex,
    int32_t vertexOffset,
    uint32_t firstInstance);
```

- **commandBuffer** is the command buffer into which the command is recorded.
- **indexCount** is the number of vertices to draw.
- **instanceCount** is the number of instances to draw.
- **firstIndex** is the base index within the index buffer.
- **vertexOffset** is the value added to the vertex index before indexing into the vertex buffer.
- **firstInstance** is the instance ID of the first instance to draw.

When the command is executed, primitives are assembled using the current primitive topology and **indexCount** vertices whose indices are retrieved from the index buffer. The index buffer is treated as an array of tightly packed unsigned integers of size defined by the **vkCmdBindIndexBuffer2KHR::indexType** or the **vkCmdBindIndexBuffer::indexType** parameter with which the buffer was bound.

The first vertex index is at an offset of **firstIndex × indexSize + offset** within the bound index buffer, where **offset** is the offset specified by **vkCmdBindIndexBuffer** or **vkCmdBindIndexBuffer2KHR**,
and \textit{indexSize} is the byte size of the type specified by \textit{indexType}. Subsequent index values are retrieved from consecutive locations in the index buffer. Indices are first compared to the primitive restart value, then zero extended to 32 bits (if the \textit{indexType} is \texttt{VK_INDEX_TYPE_UINT8_KHR} or \texttt{VK_INDEX_TYPE_UINT16}) and have \textit{vertexOffset} added to them, before being supplied as the \textit{vertexIndex} value.

The primitives are drawn \textit{instanceCount} times with \textit{instanceIndex} starting with \textit{firstInstance} and increasing sequentially for each instance. The assembled primitives execute the bound graphics pipeline.

### Valid Usage

- **VUID-vkCmdDrawIndexed-magFilter-04553**
  If a \texttt{VkSampler} created with \texttt{magFilter} or \texttt{minFilter} equal to \texttt{VK_FILTER_LINEAR} and \texttt{compareEnable} equal to \texttt{VK_FALSE} is used to sample a \texttt{VkImageView} as a result of this command, then the image view's format features must contain \texttt{VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT}

- **VUID-vkCmdDrawIndexed-mipmapMode-04770**
  If a \texttt{VkSampler} created with \texttt{mipmapMode} equal to \texttt{VK_SAMPLER_MIPMAP_MODE_LINEAR} and \texttt{compareEnable} equal to \texttt{VK_FALSE} is used to sample a \texttt{VkImageView} as a result of this command, then the image view's format features must contain \texttt{VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT}

- **VUID-vkCmdDrawIndexed-None-06479**
  If a \texttt{VkImageView} is sampled with depth comparison, the image view's format features must contain \texttt{VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT}

- **VUID-vkCmdDrawIndexed-None-02691**
  If a \texttt{VkImageView} is accessed using atomic operations as a result of this command, then the image view's format features must contain \texttt{VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT}

- **VUID-vkCmdDrawIndexed-None-02692**
  If a \texttt{VkImageView} is sampled with \texttt{VK_FILTER_CUBIC_EXT} as a result of this command, then the image view's format features must contain \texttt{VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT}

- **VUID-vkCmdDrawIndexed-None-02693**
  If the \texttt{VK_EXT_filter_cubic} extension is not enabled and any \texttt{VkImageView} is sampled with \texttt{VK_FILTER_CUBIC_EXT} as a result of this command, it must not have a \texttt{VkImageViewType} of \texttt{VK_IMAGE_VIEW_TYPE_3D}, \texttt{VK_IMAGE_VIEW_TYPE_CUBE}, or \texttt{VK_IMAGE_VIEW_TYPE_CUBE_ARRAY}

- **VUID-vkCmdDrawIndexed-filterCubic-02694**
  Any \texttt{VkImageView} being sampled with \texttt{VK_FILTER_CUBIC_EXT} as a result of this command must have a \texttt{VkImageViewType} and format that supports cubic filtering, as specified by \texttt{VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic} returned by
vkGetPhysicalDeviceImageFormatProperties2

- VUID-vkCmdDrawIndexed-filterCubicMinmax-02695
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2

- VUID-vkCmdDrawIndexed-cubicRangeClamp-09212
  If the cubicRangeClamp feature is not enabled, then any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must not have a VkSamplerReductionModeCreateInfo::reductionMode equal to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM

- VUID-vkCmdDrawIndexed-reductionMode-09213
  Any VkImageView being sampled with a VkSamplerReductionModeCreateInfo::reductionMode equal to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM as a result of this command must sample with VK_FILTER_CUBIC_EXT

- VUID-vkCmdDrawIndexed-selectableCubicWeights-09214
  If the selectableCubicWeights feature is not enabled, then any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have VkSamplerCubicWeightsCreateInfoQCOM::cubicWeights equal to VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM

- VUID-vkCmdDrawIndexed-flags-02696
  Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE

- VUID-vkCmdDrawIndexed-OpTypeImage-07027
  For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view’s format features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawIndexed-OpTypeImage-07028
  For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view’s format features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawIndexed-OpTypeImage-07029
  For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawIndexed-OpTypeImage-07030
  Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawIndexed-None-08600
  For each set $n$ that is statically used by a bound shader, a descriptor set must have been
bound to \( n \) at the same pipeline bind point, with a \texttt{VkPipelineLayout} that is compatible for set \( n \), with the \texttt{VkPipelineLayout} used to create the current \texttt{VkPipeline} or the \texttt{VkDescriptorSetLayout} array used to create the current \texttt{VkShaderEXT}, as described in Pipeline Layout Compatibility.

- \texttt{VUID-vkCmdDrawIndexed-None-08601}
  For each push constant that is statically used by a bound shader, a push constant value \textbf{must} have been set for the same pipeline bind point, with a \texttt{VkPipelineLayout} that is compatible for push constants, with the \texttt{VkPipelineLayout} used to create the current \texttt{VkPipeline} or the \texttt{VkDescriptorSetLayout} array used to create the current \texttt{VkShaderEXT}, as described in Pipeline Layout Compatibility.

- \texttt{VUID-vkCmdDrawIndexed-maintenance4-08602}
  If the \texttt{maintenance4} feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value \textbf{must} have been set for the same pipeline bind point, with a \texttt{VkPipelineLayout} that is compatible for push constants, with the \texttt{VkPipelineLayout} used to create the current \texttt{VkPipeline} or the \texttt{VkDescriptorSetLayout} \texttt{VkPushConstantRange} arrays used to create the current \texttt{VkShaderEXT}, as described in Pipeline Layout Compatibility.

- \texttt{VUID-vkCmdDrawIndexed-None-08114}
  Descriptors in each bound descriptor set, specified via \texttt{vkCmdBindDescriptorSets}, \textbf{must} be valid as described by descriptor validity if they are statically used by the \texttt{VkPipeline} bound to the pipeline bind point used by this command and the bound \texttt{VkPipeline} was not created with \texttt{VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT}.

- \texttt{VUID-vkCmdDrawIndexed-None-08115}
  If the descriptors used by the \texttt{VkPipeline} bound to the pipeline bind point were specified via \texttt{vkCmdBindDescriptorSets}, the bound \texttt{VkPipeline} \textbf{must} have been created without \texttt{VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT}.

- \texttt{VUID-vkCmdDrawIndexed-None-08116}
  Descriptors in bound descriptor buffers, specified via \texttt{vkCmdSetDescriptorBufferOffsetsEXT}, \textbf{must} be valid if they are dynamically used by the \texttt{VkPipeline} bound to the pipeline bind point used by this command and the bound \texttt{VkPipeline} was created with \texttt{VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT}.

- \texttt{VUID-vkCmdDrawIndexed-None-08604}
  Descriptors in bound descriptor buffers, specified via \texttt{vkCmdSetDescriptorBufferOffsetsEXT}, \textbf{must} be valid if they are dynamically used by any \texttt{VkShaderEXT} bound to a stage corresponding to the pipeline bind point used by this command.

- \texttt{VUID-vkCmdDrawIndexed-None-08117}
  If the descriptors used by the \texttt{VkPipeline} bound to the pipeline bind point were specified via \texttt{vkCmdSetDescriptorBufferOffsetsEXT}, the bound \texttt{VkPipeline} \textbf{must} have been created with \texttt{VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT}.

- \texttt{VUID-vkCmdDrawIndexed-None-08119}
  If a descriptor is dynamically used with a \texttt{VkPipeline} created with \texttt{VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT}, the descriptor memory \textbf{must} be resident.

- \texttt{VUID-vkCmdDrawIndexed-None-08605}
If a descriptor is dynamically used with a `VkShaderEXT` created with a `VkDescriptorSetLayout` that was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, the descriptor memory **must** be resident.

- **VUID-vkCmdDrawIndexed-None-08606**
  If the `shaderObject` feature is not enabled, a valid pipeline **must** be bound to the pipeline bind point used by this command.

- **VUID-vkCmdDrawIndexed-None-08608**
  If a pipeline is bound to the pipeline bind point used by this command, there **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

- **VUID-vkCmdDrawIndexed-None-08609**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

- **VUID-vkCmdDrawIndexed-None-08610**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

- **VUID-vkCmdDrawIndexed-None-08611**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

- **VUID-vkCmdDrawIndexed-None-08607**
  If the `shaderObject` is enabled, either a valid pipeline **must** be bound to the pipeline bind point used by this command, or a valid combination of valid and `VK_NULL_HANDLE` shader objects **must** be bound to every supported shader stage corresponding to the pipeline bind point used by this command.

- **VUID-vkCmdDrawIndexed-uniformBuffers-06935**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `uniformBuffers`, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDrawIndexed-None-08612**
If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDrawIndexed-storageBuffers-06936**
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers, and the robustBufferAccess feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDrawIndexed-None-08613**
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDrawIndexed-commandBuffer-02707**
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by bound shaders **must** not be a protected resource.

- **VUID-vkCmdDrawIndexed-None-06550**
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y'C aC conversion, that object **must** only be used with OpImageSample* or OpImageSparseSample* instructions.

- **VUID-vkCmdDrawIndexed-ConstOffset-06551**
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y'C aC conversion, that object **must** not use the ConstOffset and Offset operands.

- **VUID-vkCmdDrawIndexed-viewType-07752**
  If a VkImageView is accessed as a result of this command, then the image view's viewType **must** match the Dim operand of the OpTypeImage as described in Instruction/Sampler/Image View Validation.

- **VUID-vkCmdDrawIndexed-format-07753**
  If a VkImageView is accessed as a result of this command, then the numeric type of the image view's format and the Sampled Type operand of the OpTypeImage **must** match.

- **VUID-vkCmdDrawIndexed-OpImageWrite-08795**
  If a VkImageView created with a format other than VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction **must** have at least as many components as the image view's format.

- **VUID-vkCmdDrawIndexed-OpImageWrite-08796**
  If a VkImageView created with the format VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction **must** have four components.

- **VUID-vkCmdDrawIndexed-OpImageWrite-04469**
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the
Type of the Texel operand of that instruction must have at least as many components as the buffer view's format

- **VUID-vkCmdDrawIndexed-SampledType-04470**
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- **VUID-vkCmdDrawIndexed-SampledType-04471**
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- **VUID-vkCmdDrawIndexed-SampledType-04472**
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- **VUID-vkCmdDrawIndexed-SampledType-04473**
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- **VUID-vkCmdDrawIndexed-sparseImageInt64Atomics-04474**
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- **VUID-vkCmdDrawIndexed-sparseImageInt64Atomics-04475**
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- **VUID-vkCmdDrawIndexed-OpImageWeightedSampleQCOM-06971**
  If OpImageWeightedSampleQCOM is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM

- **VUID-vkCmdDrawIndexed-OpImageWeightedSampleQCOM-06972**
  If OpImageWeightedSampleQCOM uses a VkImageView as a sample weight image as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM

- **VUID-vkCmdDrawIndexed-OpImageBoxFilterQCOM-06973**
  If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM

- **VUID-vkCmdDrawIndexed-OpImageBlockMatchSSDQCOM-06974**
  If OpImageBlockMatchSSDQCOM is used to read from a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

- **VUID-vkCmdDrawIndexed-OpImageBlockMatchSADQCOM-06975**
  If OpImageBlockMatchSADQCOM is used to read from a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BLOCK_MISMATCHING_BIT_QCOM
If `OpImageBlockMatchSADQCOM` is used to read from an `VkImageView` as a result of this command, then the image view’s format features **must** contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`

- **VUID-vkCmdDrawIndexed-OpImageBlockMatchSADQCOM-06976**
  If `OpImageBlockMatchSADQCOM` or `OpImageBlockMatchSSDQCOM` is used to read from a reference image as result of this command, then the specified reference coordinates **must** not fail integer texel coordinate validation

- **VUID-vkCmdDrawIndexed-OpImageWeightedSampleQCOM-06977**
  If `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchWindowSSDQCOM`, `OpImageBlockMatchWindowSADQCOM`, `OpImageBlockMatchGatherSSDQCOM`, `OpImageBlockMatchGatherSADQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler **must** have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`

- **VUID-vkCmdDrawIndexed-OpImageWeightedSampleQCOM-06978**
  If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchWindowSSDQCOM`, `OpImageBlockMatchWindowSADQCOM`, `OpImageBlockMatchGatherSSDQCOM`, `OpImageBlockMatchGatherSADQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler **must** not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`

- **VUID-vkCmdDrawIndexed-OpImageBlockMatchWindow-09215**
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view’s format features **must** contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`

- **VUID-vkCmdDrawIndexed-OpImageBlockMatchWindow-09216**
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view’s format **must** be a single-component format.

- **VUID-vkCmdDrawIndexed-OpImageBlockMatchWindow-09217**
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` read from a reference image as result of this command, then the specified reference coordinates **must** not fail integer texel coordinate validation

- **VUID-vkCmdDrawIndexed-None-07288**
  Any shader invocation executed by this command **must** terminate

- **VUID-vkCmdDrawIndexed-renderPass-02684**
  The current render pass **must** be compatible with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`

- **VUID-vkCmdDrawIndexed-subpass-02685**
  The subpass index of the current render pass **must** be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`

- **VUID-vkCmdDrawIndexed-None-07748**
  If any shader statically accesses an input attachment, a valid descriptor **must** be bound to
the pipeline via a descriptor set

- **VUID-vkCmdDrawIndexed-OpTypeImage-07468**
  If any shader executed by this pipeline accesses an `OpTypeImage` variable with a `Dim` operand of `SubpassData`, it **must** be decorated with an `InputAttachmentIndex` that corresponds to a valid input attachment in the current subpass

- **VUID-vkCmdDrawIndexed-None-07469**
  Input attachment views accessed in a subpass **must** be created with the same `VkFormat` as the corresponding subpass definition, and be created with a `VkImageView` that is compatible with the attachment referenced by the subpass' `pInputAttachments[InputAttachmentIndex]` in the currently bound `VkFramebuffer` as specified by **Fragment Input Attachment Compatibility**

- **VUID-vkCmdDrawIndexed-None-06537**
  Memory backing image subresources used as attachments in the current render pass **must** not be written in any way other than as an attachment by this command

- **VUID-vkCmdDrawIndexed-None-09000**
  If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, and either:
    - the `VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` is set on the currently bound pipeline or
    - the last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included `VK_IMAGE_ASPECT_COLOR_BIT` and
      - there is no currently bound graphics pipeline or
      - the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` it **must** not be accessed in any way other than as an attachment by this command

- **VUID-vkCmdDrawIndexed-None-09001**
  If a depth attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, and either:
    - the `VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` is set on the currently bound pipeline or
    - the last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included `VK_IMAGE_ASPECT_DEPTH_BIT` and
      - there is no currently bound graphics pipeline or
      - the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` it **must** not be accessed in any way other than as an attachment by this command

- **VUID-vkCmdDrawIndexed-None-09002**
  If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, and either:
- The `VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` is set on the currently bound pipeline or
- The last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included `VK_IMAGE_ASPECT_STENCIL_BIT` and
  - There is no currently bound graphics pipeline or
  - The currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` it must not be accessed in any way other than as an attachment by this command

- VUID-vkCmdDrawIndexed-None-09003
  If an attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it must not be accessed in any way other than as an attachment, storage image, or sampled image by this command

- VUID-vkCmdDrawIndexed-None-06539
  If any previously recorded command in the current subpass accessed an image subresource used as an attachment in this subpass in any way other than as an attachment, this command must not write to that image subresource as an attachment

- VUID-vkCmdDrawIndexed-None-06886
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, depth writes must be disabled

- VUID-vkCmdDrawIndexed-None-06887
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect, both front and back `writeMask` are not zero, and stencil test is enabled, all stencil ops must be `VK_STENCIL_OP_KEEP`

- VUID-vkCmdDrawIndexed-None-07831
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT` dynamic state enabled then `vkCmdSetViewport` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07832
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR` dynamic state enabled then `vkCmdSetScissor` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07833
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_WIDTH` dynamic state enabled then `vkCmdSetLineWidth` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-08617
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetPolygonModeEXT` in the current command buffer set `polygonMode` to `VK_POLYGON_MODE_LINE`, `vkCmdSetLineWidth` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-08618
If a shader object is bound to any graphics stage, and the most recent call to 
vkCmdSetRasterizerDiscardEnable in the current command buffer set 
rasterizerDiscardEnable to VK_FALSE, and the most recent call to 
vkCmdSetPrimitiveTopology in the current command buffer set primitiveTopology to any 
line topology, vkCmdSetLineWidth must have been called in the current command buffer 
prior to this drawing command

• VUID-vkCmdDrawIndexed-None-08619
If a shader object that outputs line primitives is bound to the 
VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT stage, and 
the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set 
rasterizerDiscardEnable to VK_FALSE, vkCmdSetLineWidth must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexed-None-07834
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BIAS 
dynamic state enabled then vkCmdSetDepthBias or vkCmdSetDepthBias2EXT must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexed-None-08620
If a shader object is bound to any graphics stage, and the most recent call to 
vkCmdSetRasterizerDiscardEnable in the current command buffer set 
rasterizerDiscardEnable to VK_FALSE, and the most recent call to 
vkCmdSetDepthBiasEnable in the current command buffer set depthBiasEnable to VK_TRUE, 
vkCmdSetDepthBias or vkCmdSetDepthBias2EXT must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexed-None-07835
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_BLEND_CONSTANTS dynamic state enabled then vkCmdSetBlendConstants must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexed-None-08621
If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent 
call to vkCmdSetRasterizerDiscardEnable in the current command buffer set 
rasterizerDiscardEnable to VK_FALSE, and the most recent call to 
vkCmdSetColorBlendEnableEXT in the current command buffer set any element of 
pColorBlendEnables to VK_TRUE, and the most recent call to 
vkCmdSetColorBlendEquationEXT in the current command buffer set the same element of 
pColorBlendEquations to a VkColorBlendEquationEXT structure with any VkBlendFactor 
member with a value of VK_BLEND_FACTOR_CONSTANT_COLOR, 
VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR, VK_BLEND_FACTOR_CONSTANT_ALPHA, or 
VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA, vkCmdSetBlendConstants must have been 
called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexed-None-07836
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BOUNDS 
dynamic state enabled, and if the current depthBoundsTestEnable state is VK_TRUE, then 
vkCmdSetDepthBounds must have been called in the current command buffer prior to 
this drawing command

• VUID-vkCmdDrawIndexed-None-08622
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDepthBoundsTestEnable` in the current command buffer set `depthBoundsTestEnable` to `VK_TRUE`, then `vkCmdSetDepthBounds` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexed-None-07837**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK` dynamic state enabled, and if the current `stencilTestEnable` state is `VK_TRUE`, then `vkCmdSetStencilCompareMask` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexed-None-08623**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set `stencilTestEnable` to `VK_TRUE`, `vkCmdSetStencilCompareMask` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexed-None-07838**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` dynamic state enabled, and if the current `stencilTestEnable` state is `VK_TRUE`, then `vkCmdSetStencilWriteMask` must have been called in the current command buffer prior to this drawing command.
