Chapter 1. Preamble

Copyright 2014-2024 The Khronos Group Inc.

This Specification is protected by copyright laws and contains material proprietary to Khronos. Except as described by these terms, it or any components may not be reproduced, republished, distributed, transmitted, displayed, broadcast or otherwise exploited in any manner without the express prior written permission of Khronos.

Khronos grants a conditional copyright license to use and reproduce the unmodified Specification for any purpose, without fee or royalty, EXCEPT no licenses to any patent, trademark or other intellectual property rights are granted under these terms.

Khronos makes no, and expressly disclaims any, representations or warranties, express or implied, regarding this Specification, including, without limitation: merchantability, fitness for a particular purpose, non-infringement of any intellectual property, correctness, accuracy, completeness, timeliness, and reliability. Under no circumstances will Khronos, or any of its Promoters, Contributors or Members, or their respective partners, officers, directors, employees, agents or representatives be liable for any damages, whether direct, indirect, special or consequential damages for lost revenues, lost profits, or otherwise, arising from or in connection with these materials.

This Specification has been created under the Khronos Intellectual Property Rights Policy, which is Attachment A of the Khronos Group Membership Agreement available at https://www.khronos.org/files/member_agreement.pdf. Parties desiring to implement the Specification and make use of Khronos trademarks in relation to that implementation, and receive reciprocal patent license protection under the Khronos Intellectual Property Rights Policy must become Adopters and confirm the implementation as conformant under the process defined by Khronos for this Specification; see https://www.khronos.org/adopters.

This Specification contains substantially unmodified functionality from, and is a successor to, Khronos specifications including OpenGL, OpenGL ES and OpenCL.

The Khronos Intellectual Property Rights Policy defines the terms 'Scope', 'Compliant Portion', and 'Necessary Patent Claims'.

Some parts of this Specification are purely informative and so are EXCLUDED the Scope of this Specification. The Document Conventions section of the Introduction defines how these parts of the Specification are identified.

Where this Specification uses technical terminology, defined in the Glossary or otherwise, that refer to enabling technologies that are not expressly set forth in this Specification, those enabling technologies are EXCLUDED from the Scope of this Specification. For clarity, enabling technologies not disclosed with particularity in this Specification (e.g. semiconductor manufacturing technology, hardware architecture, processor architecture or microarchitecture, memory architecture, compiler technology, object oriented technology, basic operating system technology, compression technology, algorithms, and so on) are NOT to be considered expressly set forth; only those application program interfaces and data structures disclosed with particularity are included in the Scope of this Specification.
For purposes of the Khronos Intellectual Property Rights Policy as it relates to the definition of Necessary Patent Claims, all recommended or optional features, behaviors and functionality set forth in this Specification, if implemented, are considered to be included as Compliant Portions.

Where this Specification identifies specific sections of external references, only those specifically identified sections define normative functionality. The Khronos Intellectual Property Rights Policy excludes external references to materials and associated enabling technology not created by Khronos from the Scope of this Specification, and any licenses that may be required to implement such referenced materials and associated technologies must be obtained separately and may involve royalty payments.

Khronos and Vulkan are registered trademarks, and SPIR-V is a trademark of The Khronos Group Inc. OpenCL is a trademark of Apple Inc., used under license by Khronos. OpenGL is a registered trademark and the OpenGL ES logo is a trademark of Hewlett Packard Enterprise, used under license by Khronos. ASTC is a trademark of ARM Holdings PLC. All other product names, trademarks, and/or company names are used solely for identification and belong to their respective owners.
Chapter 2. Introduction

This document, referred to as the “Vulkan Specification” or just the “Specification” hereafter, describes the Vulkan Application Programming Interface (API). Vulkan is a C99 API designed for explicit control of low-level graphics and compute functionality.

The canonical version of the Specification is available in the official Vulkan Registry (https://registry.khronos.org/vulkan/). The source files used to generate the Vulkan specification are stored in the Vulkan Documentation Repository (https://github.com/KhronosGroup/Vulkan-Docs).

The source repository additionally has a public issue tracker and allows the submission of pull requests that improve the specification.

2.1. Document Conventions

The Vulkan specification is intended for use by both implementors of the API and application developers seeking to make use of the API, forming a contract between these parties. Specification text may address either party; typically the intended audience can be inferred from context, though some sections are defined to address only one of these parties. (For example, Valid Usage sections only address application developers). Any requirements, prohibitions, recommendations or options defined by normative terminology are imposed only on the audience of that text.

Note
Structure and enumerated types defined in extensions that were promoted to core in a later version of Vulkan are now defined in terms of the equivalent Vulkan core interfaces. This affects the Vulkan Specification, the Vulkan header files, and the corresponding XML Registry.

2.1.1. Ratification

Ratification of a Vulkan core version or extension is a status conferred by vote of the Khronos Board of Promoters, bringing that core version or extension under the umbrella of the Khronos IP Policy.

All Vulkan core versions and KHR extensions (including provisional specifications) are ratified, as are some multi-vendor EXT extensions. Ratification status of extensions is described in the Layers & Extensions (Informative) appendix.

Note
Ratification status is primarily of interest to IHVs developing GPU hardware and Vulkan implementations

For developers, ratification does not necessarily mean that an extension is “better”; has a more stable API; or is more widely supported than alternative ways of achieving that functionality.

Interactions between ratified and non-ratified extensions are not themselves
2.1.2. Informative Language

Some language in the specification is purely informative, intended to give background or suggestions to implementors or developers.

If an entire chapter or section contains only informative language, its title will be suffixed with “(Informative)”.

All NOTEs are implicitly informative.

2.1.3. Normative Terminology

Within this specification, the key words must, required, should, recommended, may, and optional are to be interpreted as described in RFC 2119 - Key words for use in RFCs to Indicate Requirement Levels (https://www.ietf.org/rfc/rfc2119.txt). The additional key word optionally is an alternate form of optional, for use where grammatically appropriate.

These key words are highlighted in the specification for clarity. In text addressing application developers, their use expresses requirements that apply to application behavior. In text addressing implementors, their use expresses requirements that apply to implementations.

In text addressing application developers, the additional key words can and cannot are to be interpreted as describing the capabilities of an application, as follows:

**can**

This word means that the application is able to perform the action described.

**cannot**

This word means that the API and/or the execution environment provide no mechanism through which the application can express or accomplish the action described.

These key words are never used in text addressing implementors.

---

**Note**

There is an important distinction between cannot and must not, as used in this Specification. Cannot means something the application literally is unable to express or accomplish through the API, while must not means something that the application is capable of expressing through the API, but that the consequences of doing so are undefined and potentially unrecoverable for the implementation (see Valid Usage).

---

Unless otherwise noted in the section heading, all sections and appendices in this document are normative.

2.1.4. Technical Terminology

The Vulkan Specification makes use of common engineering and graphics terms such as Pipeline,
Shader, and Host to identify and describe Vulkan API constructs and their attributes, states, and behaviors. The Glossary defines the basic meanings of these terms in the context of the Specification. The Specification text provides fuller definitions of the terms and may elaborate, extend, or clarify the Glossary definitions. When a term defined in the Glossary is used in normative language within the Specification, the definitions within the Specification govern and supersede any meanings the terms may have in other technical contexts (i.e. outside the Specification).

2.1.5. Normative References

References to external documents are considered normative references if the Specification uses any of the normative terms defined in Normative Terminology to refer to them or their requirements, either as a whole or in part.

The following documents are referenced by normative sections of the specification:

Chapter 3. Fundamentals

This chapter introduces fundamental concepts including the Vulkan architecture and execution model, API syntax, queues, pipeline configurations, numeric representation, state and state queries, and the different types of objects and shaders. It provides a framework for interpreting more specific descriptions of commands and behavior in the remainder of the Specification.

3.1. Host and Device Environment

The Vulkan Specification assumes and requires: the following properties of the host environment with respect to Vulkan implementations:

- The host must have runtime support for 8, 16, 32 and 64-bit signed and unsigned two's-complement integers, all addressable at the granularity of their size in bytes.

- The host must have runtime support for 32- and 64-bit floating-point types satisfying the range and precision constraints in the Floating Point Computation section.

- The representation and endianness of these types on the host must match the representation and endianness of the same types on every physical device supported.

Note

Since a variety of data types and structures in Vulkan may be accessible by both host and physical device operations, the implementation should be able to access such data efficiently in both paths in order to facilitate writing portable and performant applications.

3.2. Execution Model

This section outlines the execution model of a Vulkan system.

Vulkan exposes one or more devices, each of which exposes one or more queues which may process work asynchronously to one another. The set of queues supported by a device is partitioned into families. Each family supports one or more types of functionality and may contain multiple queues with similar characteristics. Queues within a single family are considered compatible with one another, and work produced for a family of queues can be executed on any queue within that family. This specification defines the following types of functionality that queues may support: graphics, compute, video decode, video encode, protected memory management, sparse memory management, and transfer.

Note

A single device may report multiple similar queue families rather than, or as well as, reporting multiple members of one or more of those families. This indicates that while members of those families have similar capabilities, they are not directly compatible with one another.

Device memory is explicitly managed by the application. Each device may advertise one or more
heaps, representing different areas of memory. Memory heaps are either device-local or host-local, but are always visible to the device. Further detail about memory heaps is exposed via memory types available on that heap. Examples of memory areas that may be available on an implementation include:

• *device-local* is memory that is physically connected to the device.
• *device-local, host visible* is device-local memory that is visible to the host.
• *host-local, host visible* is memory that is local to the host and visible to the device and host.

On other architectures, there may only be a single heap that can be used for any purpose.

3.2.1. Queue Operation

Vulkan queues provide an interface to the execution engines of a device. Commands for these execution engines are recorded into command buffers ahead of execution time, and then submitted to a queue for execution. Once submitted to a queue, command buffers will begin and complete execution without further application intervention, though the order of this execution is dependent on a number of implicit and explicit ordering constraints.

Work is submitted to queues using *queue submission commands* that typically take the form `vkQueue*` (e.g. `vkQueueSubmit`, `vkQueueBindSparse`), and can take a list of semaphores upon which to wait before work begins and a list of semaphores to signal once work has completed. The work itself, as well as signaling and waiting on the semaphores are all *queue operations*. Queue submission commands return control to the application once queue operations have been submitted - they do not wait for completion.

There are no implicit ordering constraints between queue operations on different queues, or between queues and the host, so these may operate in any order with respect to each other. Explicit ordering constraints between different queues or with the host can be expressed with semaphores and fences.

Command buffer submissions to a single queue respect submission order and other implicit ordering guarantees, but otherwise may overlap or execute out of order. Other types of batches and queue submissions against a single queue (e.g. sparse memory binding) have no implicit ordering constraints with any other queue submission or batch. Additional explicit ordering constraints between queue submissions and individual batches can be expressed with semaphores and fences.

Before a fence or semaphore is signaled, it is guaranteed that any previously submitted queue operations have completed execution, and that memory writes from those queue operations are available to future queue operations. Waiting on a signaled semaphore or fence guarantees that previous writes that are available are also visible to subsequent commands.

Command buffer boundaries, both between primary command buffers of the same or different batches or submissions as well as between primary and secondary command buffers, do not introduce any additional ordering constraints. In other words, submitting the set of command buffers (which can include executing secondary command buffers) between any semaphore or fence operations execute the recorded commands as if they had all been recorded into a single primary command buffer, except that the current state is reset on each boundary. Explicit ordering constraints can be expressed with explicit synchronization primitives.
There are a few implicit ordering guarantees between commands within a command buffer, but only covering a subset of execution. Additional explicit ordering constraints can be expressed with the various explicit synchronization primitives.

Note
Implementations have significant freedom to overlap execution of work submitted to a queue, and this is common due to deep pipelining and parallelism in Vulkan devices.

Commands recorded in command buffers can perform actions, set state that persists across commands, synchronize other commands, or indirectly launch other commands, with some commands fulfilling several of these roles. The “Command Properties” section for each such command lists which of these roles the command takes. State setting commands update the current state of the command buffer. Some commands that perform actions (e.g. draw/dispatch) do so based on the current state set cumulatively since the start of the command buffer. The work involved in performing action commands is often allowed to overlap or to be reordered, but doing so must not alter the state to be used by each action command. In general, action commands are those commands that alter framebuffer attachments, read/write buffer or image memory, or write to query pools.

Synchronization commands introduce explicit execution and memory dependencies between two sets of action commands, where the second set of commands depends on the first set of commands. These dependencies enforce both that the execution of certain pipeline stages in the later set occurs after the execution of certain stages in the source set, and that the effects of memory accesses performed by certain pipeline stages occur in order and are visible to each other. When not enforced by an explicit dependency or implicit ordering guarantees, action commands may overlap execution or execute out of order, and may not see the side effects of each other’s memory accesses.

3.3. Object Model

The devices, queues, and other entities in Vulkan are represented by Vulkan objects. At the API level, all objects are referred to by handles. There are two classes of handles, dispatchable and non-dispatchable. Dispatchable handle types are a pointer to an opaque type. This pointer may be used by layers as part of intercepting API commands, and thus each API command takes a dispatchable type as its first parameter. Each object of a dispatchable type must have a unique handle value during its lifetime.

Non-dispatchable handle types are a 64-bit integer type whose meaning is implementation-dependent. If the privateData feature is enabled for a VkDevice, each object of a non-dispatchable type created on that device must have a handle value that is unique among objects created on that device, for the duration of the object’s lifetime. Otherwise, non-dispatchable handles may encode object information directly in the handle rather than acting as a reference to an underlying object, and thus may not have unique handle values. If handle values are not unique, then destroying one such handle must not cause identical handles of other types to become invalid, and must not cause identical handles of the same type to become invalid if that handle value has been created more times than it has been destroyed.
All objects created or allocated from a `VkDevice` (i.e. with a `VkDevice` as the first parameter) are private to that device, and **must** not be used on other devices.

### 3.3.1. Object Lifetime

Objects are created or allocated by `vkCreate*` and `vkAllocate*` commands, respectively. Once an object is created or allocated, its “structure” is considered to be immutable, though the contents of certain object types is still free to change. Objects are destroyed or freed by `vkDestroy*` and `vkFree*` commands, respectively.

Objects that are allocated (rather than created) take resources from an existing pool object or memory heap, and when freed return resources to that pool or heap. While object creation and destruction are generally expected to be low-frequency occurrences during runtime, allocating and freeing objects can occur at high frequency. Pool objects help accommodate improved performance of the allocations and frees.

It is an application’s responsibility to track the lifetime of Vulkan objects, and not to destroy them while they are still in use.

The ownership of application-owned memory is immediately acquired by any Vulkan command it is passed into. Ownership of such memory **must** be released back to the application at the end of the duration of the command, unless that command was deferred, so that the application can alter or free this memory as soon as all the commands that acquired it have returned. If the command was **deferred**, ownership of such memory is released back to the application when the deferred operation is complete.

The following object types are consumed when they are passed into a Vulkan command and not further accessed by the objects they are used to create. They **must** not be destroyed in the duration of any API command they are passed into:

- `VkShaderModule`
- `VkPipelineCache`

A `VkRenderPass` or `VkPipelineLayout` object passed as a parameter to create another object is not further accessed by that object after the duration of the command it is passed into. A `VkRenderPass` used in a command buffer follows the rules described below.

`VkDescriptorSetLayout` objects **may** be accessed by commands that operate on descriptor sets allocated using that layout, and those descriptor sets **must** not be updated with `vkUpdateDescriptorSets` after the descriptor set layout has been destroyed. Otherwise, a `VkDescriptorSetLayout` object passed as a parameter to create another object is not further accessed by that object after the duration of the command it is passed into.

The application **must** not destroy any other type of Vulkan object until all uses of that object by the device (such as via command buffer execution) have completed.

The following Vulkan objects **must** not be destroyed while any command buffers using the object are in the **pending state**:

- `VkEvent`
• VkQueryPool
• VkBuffer
• VkBufferView
• VkImage
• VkImageView
• VkPipeline
• VkSampler
• VkSamplerYcbcrConversion
• VkDescriptorPool
• VkFramebuffer
• VkRenderPass
• VkCommandBuffer
• VkCommandPool
• VkDeviceMemory
• VkDescriptorSet
• VkAccelerationStructureKHR
• VkVideoSessionKHR
• VkVideoSessionParametersKHR

Destroying these objects will move any command buffers that are in the recording or executable state, and are using those objects, to the invalid state.

The following Vulkan objects must not be destroyed while any queue is executing commands that use the object:

• VkFence
• VkSemaphore
• VkCommandBuffer
• VkCommandPool

In general, objects can be destroyed or freed in any order, even if the object being freed is involved in the use of another object (e.g. use of a resource in a view, use of a view in a descriptor set, use of a pipeline library in another pipeline, use of a bottom level acceleration structure in an instance referenced by a top level acceleration structure, use of an object in a command buffer, binding of a memory allocation to a resource), as long as any object that uses the freed object is not further used in any way except to be destroyed or to be reset in such a way that it no longer uses the other object (such as resetting a command buffer). If the object has been reset, then it can be used as if it never used the freed object. An exception to this is when there is a parent/child relationship between objects. In this case, the application must not destroy a parent object before its children, except when the parent is explicitly defined to free its children when it is destroyed (e.g. for pool objects, as defined below).
VkCommandPool objects are parents of VkCommandBuffer objects. VkDescriptorPool objects are parents of VkDescriptorSet objects. VkDevice objects are parents of many object types (all that take a VkDevice as a parameter to their creation).

The following Vulkan objects have specific restrictions for when they can be destroyed:

- VkQueue objects cannot be explicitly destroyed. Instead, they are implicitly destroyed when the VkDevice object they are retrieved from is destroyed.
- Destroying a pool object implicitly frees all objects allocated from that pool. Specifically, destroying VkCommandPool frees all VkCommandBuffer objects that were allocated from it, and destroying VkDescriptorPool frees all VkDescriptorSet objects that were allocated from it.
- VkDevice objects can be destroyed when all VkQueue objects retrieved from them are idle, and all objects created from them have been destroyed.
  - This includes the following objects:
    - VkFence
    - VkSemaphore
    - VkEvent
    - VkQueryPool
    - VkBuffer
    - VkBufferView
    - VkImage
    - VkImageView
    - VkShaderModule
    - VkPipelineCache
    - VkPipeline
    - VkPipelineLayout
    - VkSampler
    - VkSamplerYcbcrConversion
    - VkDescriptorSetLayout
    - VkDescriptorPool
    - VkFramebuffer
    - VkRenderPass
    - VkCommandPool
    - VkCommandBuffer
    - VkDeviceMemory
    - VkAccelerationStructureKHR
    - VkVideoSessionKHR
VkVideoSessionParametersKHR

- VkPhysicalDevice objects **cannot** be explicitly destroyed. Instead, they are implicitly destroyed when the VkInstance object they are retrieved from is destroyed.
- VkInstance objects **can** be destroyed once all VkDevice objects created from any of its VkPhysicalDevice objects have been destroyed.

### 3.3.2. External Object Handles

As defined above, the scope of object handles created or allocated from a VkDevice is limited to that logical device. Objects which are not in scope are said to be external. To bring an external object into scope, an external handle **must** be exported from the object in the source scope and imported into the destination scope.

*Note*

The scope of external handles and their associated resources **may** vary according to their type, but they **can** generally be shared across process and API boundaries.

### 3.4. Application Binary Interface

The mechanism by which Vulkan is made available to applications is platform- or implementation-defined. On many platforms the C interface described in this Specification is provided by a shared library. Since shared libraries can be changed independently of the applications that use them, they present particular compatibility challenges, and this Specification places some requirements on them.

Shared library implementations **must** use the default Application Binary Interface (ABI) of the standard C compiler for the platform, or provide customized API headers that cause application code to use the implementation's non-default ABI. An ABI in this context means the size, alignment, and layout of C data types; the procedure calling convention; and the naming convention for shared library symbols corresponding to C functions. Customizing the calling convention for a platform is usually accomplished by defining calling convention macros appropriately in vk_platform.h.

On platforms where Vulkan is provided as a shared library, library symbols beginning with “vk” and followed by a digit or uppercase letter are reserved for use by the implementation. Applications which use Vulkan **must** not provide definitions of these symbols. This allows the Vulkan shared library to be updated with additional symbols for new API versions or extensions without causing symbol conflicts with existing applications.

Shared library implementations **should** provide library symbols for commands in the highest version of this Specification they support, and for Window System Integration extensions relevant to the platform. They **may** also provide library symbols for commands defined by additional extensions.

*Note*

These requirements and recommendations are intended to allow implementors to take advantage of platform-specific conventions for SDKs, ABIs, library versioning
mechanisms, etc. while still minimizing the code changes necessary to port applications or libraries between platforms. Platform vendors, or providers of the de facto standard Vulkan shared library for a platform, are encouraged to document what symbols the shared library provides and how it will be versioned when new symbols are added.

Applications should only rely on shared library symbols for commands in the minimum core version required by the application. vkGetInstanceProcAddr and vkGetDeviceProcAddr should be used to obtain function pointers for commands in core versions beyond the application’s minimum required version.

3.5. Command Syntax and Duration

The Specification describes Vulkan commands as functions or procedures using C99 syntax. Language bindings for other languages such as C++ and JavaScript may allow for stricter parameter passing, or object-oriented interfaces.

Vulkan uses the standard C types for the base type of scalar parameters (e.g. types from <stdint.h>), with exceptions described below, or elsewhere in the text when appropriate:

VkBool32 represents boolean True and False values, since C does not have a sufficiently portable built-in boolean type:

```c
// Provided by VK_VERSION_1_0
typedef uint32_t VkBool32;
```

VK_TRUE represents a boolean True (unsigned integer 1) value, and VK_FALSE a boolean False (unsigned integer 0) value.

All values returned from a Vulkan implementation in a VkBool32 will be either VK_TRUE or VK_FALSE.

Applications must not pass any other values than VK_TRUE or VK_FALSE into a Vulkan implementation where a VkBool32 is expected.

VK_TRUE is a constant representing a VkBool32 True value.

```c
#define VK_TRUE 1U
```

VK_FALSE is a constant representing a VkBool32 False value.

```c
#define VK_FALSE 0U
```

VkDeviceSize represents device memory size and offset values:

```c
// Provided by VK_VERSION_1_0
```
typedef uint64_t VkDeviceSize;

VkDeviceAddress represents device buffer address values:

// Provided by VK_VERSION_1_0
typedef uint64_t VkDeviceAddress;

Commands that create Vulkan objects are of the form vkCreate* and take Vk*CreateInfo structures with the parameters needed to create the object. These Vulkan objects are destroyed with commands of the form vkDestroy*.

The last in-parameter to each command that creates or destroys a Vulkan object is pAllocator. The pAllocator parameter can be set to a non-NULL value such that allocations for the given object are delegated to an application provided callback; refer to the Memory Allocation chapter for further details.

Commands that allocate Vulkan objects owned by pool objects are of the form vkAllocate*, and take Vk*AllocateInfo structures. These Vulkan objects are freed with commands of the form vkFree*. These objects do not take allocators; if host memory is needed, they will use the allocator that was specified when their parent pool was created.

Commands are recorded into a command buffer by calling API commands of the form vkCmd*. Each such command may have different restrictions on where it can be used: in a primary and/or secondary command buffer, inside and/or outside a render pass, and in one or more of the supported queue types. These restrictions are documented together with the definition of each such command.

The duration of a Vulkan command refers to the interval between calling the command and its return to the caller.

3.5.1. Lifetime of Retrieved Results

Information is retrieved from the implementation with commands of the form vkGet* and vkEnumerate*.

Unless otherwise specified for an individual command, the results are invariant; that is, they will remain unchanged when retrieved again by calling the same command with the same parameters, so long as those parameters themselves all remain valid.

3.6. Threading Behavior

Vulkan is intended to provide scalable performance when used on multiple host threads. All commands support being called concurrently from multiple threads, but certain parameters, or components of parameters are defined to be externally synchronized. This means that the caller must guarantee that no more than one thread is using such a parameter at a given time.

More precisely, Vulkan commands use simple stores to update the state of Vulkan objects. A parameter declared as externally synchronized may have its contents updated at any time during
the host execution of the command. If two commands operate on the same object and at least one of the commands declares the object to be externally synchronized, then the caller must guarantee not only that the commands do not execute simultaneously, but also that the two commands are separated by an appropriate memory barrier (if needed).

Note
Memory barriers are particularly relevant for hosts based on the ARM CPU architecture, which is more weakly ordered than many developers are accustomed to from x86/x64 programming. Fortunately, most higher-level synchronization primitives (like the pthread library) perform memory barriers as a part of mutual exclusion, so mutual exclusion, so mutexing Vulkan objects via these primitives will have the desired effect.

Similarly the application must avoid any potential data hazard of application-owned memory that has its ownership temporarily acquired by a Vulkan command. While the ownership of application-owned memory remains acquired by a command the implementation may read the memory at any point, and it may write non-const qualified memory at any point. Parameters referring to non-const qualified application-owned memory are not marked explicitly as externally synchronized in the Specification.

If an application is using deferred host operations in a command, and that operation is successfully deferred, object parameters and application-owned memory passed to that command may be accessed at any time until the deferred operation is complete.

Many object types are immutable, meaning the objects cannot change once they have been created. These types of objects never need external synchronization, except that they must not be destroyed while they are in use on another thread. In certain special cases mutable object parameters are internally synchronized, making external synchronization unnecessary. Any command parameters that are not labeled as externally synchronized are either not mutated by the command or are internally synchronized. Additionally, certain objects related to a command’s parameters (e.g. command pools and descriptor pools) may be affected by a command, and must also be externally synchronized. These implicit parameters are documented as described below.

Parameters of commands that are externally synchronized are listed below.

### Externally Synchronized Parameters

- The `instance` parameter in `vkDestroyInstance`
- The `device` parameter in `vkDestroyDevice`
- The `queue` parameter in `vkQueueSubmit`
- The `fence` parameter in `vkQueueSubmit`
- The `queue` parameter in `vkQueueWaitIdle`
- The `memory` parameter in `vkFreeMemory`
- The `memory` parameter in `vkMapMemory`
- The `memory` parameter in `vkUnmapMemory`
The buffer parameter in `vkBindBufferMemory`

The image parameter in `vkBindImageMemory`

The queue parameter in `vkQueueBindSparse`

The fence parameter in `vkQueueBindSparse`

The fence parameter in `vkDestroyFence`

The semaphore parameter in `vkDestroySemaphore`

The event parameter in `vkDestroyEvent`

The event parameter in `vkSetEvent`

The event parameter in `vkResetEvent`

The queryPool parameter in `vkDestroyQueryPool`

The buffer parameter in `vkDestroyBuffer`

The bufferView parameter in `vkDestroyBufferView`

The image parameter in `vkDestroyImage`

The imageView parameter in `vkDestroyImageView`

The shaderModule parameter in `vkDestroyShaderModule`

The pipelineCache parameter in `vkDestroyPipelineCache`

The dstCache parameter in `vkMergePipelineCaches`

The pipeline parameter in `vkDestroyPipeline`

The pipelineLayout parameter in `vkDestroyPipelineLayout`

The sampler parameter in `vkDestroySampler`

The descriptorSetLayout parameter in `vkDestroyDescriptorSetLayout`

The descriptorPool parameter in `vkDestroyDescriptorPool`

The descriptorPool parameter in `vkResetDescriptorPool`

The descriptorPool member of the pAllocateInfo parameter in `vkAllocateDescriptorSets`

The framebuffer parameter in `vkFreeDescriptorSets`

The renderPass parameter in `vkDestroyRenderPass`

The commandPool parameter in `vkDestroyCommandPool`

The commandPool parameter in `vkResetCommandPool`

The commandPool member of the pAllocateInfo parameter in `vkAllocateCommandBuffers`

The commandPool parameter in `vkFreeCommandBuffers`

The commandBuffer parameter in `vkBeginCommandBuffer`

The commandBuffer parameter in `vkEndCommandBuffer`

The commandBuffer parameter in `vkResetCommandBuffer`

The commandBuffer parameter in `vkCmdBindPipeline`
• The `commandBuffer` parameter in `vkCmdSetViewport`
• The `commandBuffer` parameter in `vkCmdSetScissor`
• The `commandBuffer` parameter in `vkCmdSetLineWidth`
• The `commandBuffer` parameter in `vkCmdSetDepthBias`
• The `commandBuffer` parameter in `vkCmdSetBlendConstants`
• The `commandBuffer` parameter in `vkCmdSetDepthBounds`
• The `commandBuffer` parameter in `vkCmdSetStencilCompareMask`
• The `commandBuffer` parameter in `vkCmdSetStencilWriteMask`
• The `commandBuffer` parameter in `vkCmdSetStencilReference`
• The `commandBuffer` parameter in `vkCmdBindDescriptorSets`
• The `commandBuffer` parameter in `vkCmdBindIndexBuffer`
• The `commandBuffer` parameter in `vkCmdBindVertexBuffers`
• The `commandBuffer` parameter in `vkCmdDraw`
• The `commandBuffer` parameter in `vkCmdDrawIndexed`
• The `commandBuffer` parameter in `vkCmdDrawIndirect`
• The `commandBuffer` parameter in `vkCmdDrawIndexedIndirect`
• The `commandBuffer` parameter in `vkCmdDispatch`
• The `commandBuffer` parameter in `vkCmdDispatchIndirect`
• The `commandBuffer` parameter in `vkCmdCopyBuffer`
• The `commandBuffer` parameter in `vkCmdCopyImage`
• The `commandBuffer` parameter in `vkCmdBlitImage`
• The `commandBuffer` parameter in `vkCmdCopyBufferToImage`
• The `commandBuffer` parameter in `vkCmdCopyImageToBuffer`
• The `commandBuffer` parameter in `vkCmdUpdateBuffer`
• The `commandBuffer` parameter in `vkCmdFillBuffer`
• The `commandBuffer` parameter in `vkCmdClearColorImage`
• The `commandBuffer` parameter in `vkCmdClearDepthStencilImage`
• The `commandBuffer` parameter in `vkCmdClearAttachments`
• The `commandBuffer` parameter in `vkCmdResolveImage`
• The `commandBuffer` parameter in `vkCmdSetEvent`
• The `commandBuffer` parameter in `vkCmdResetEvent`
• The `commandBuffer` parameter in `vkCmdWaitEvents`
• The `commandBuffer` parameter in `vkCmdPipelineBarrier`
• The `commandBuffer` parameter in `vkCmdBeginQuery`
• The `commandBuffer` parameter in `vkCmdEndQuery`
- The `commandBuffer` parameter in `vkCmdResetQueryPool`
- The `commandBuffer` parameter in `vkCmdWriteTimestamp`
- The `commandBuffer` parameter in `vkCmdCopyQueryPoolResults`
- The `commandBuffer` parameter in `vkCmdPushConstants`
- The `commandBuffer` parameter in `vkCmdBeginRenderPass`
- The `commandBuffer` parameter in `vkCmdNextSubpass`
- The `commandBuffer` parameter in `vkCmdEndRenderPass`
- The `commandBuffer` parameter in `vkCmdExecuteCommands`
- The `commandBuffer` parameter in `vkCmdSetDeviceMask`
- The `commandBuffer` parameter in `vkCmdDispatchBase`
- The `commandPool` parameter in `vkTrimCommandPool`
- The `ycbcrConversion` parameter in `vkDestroySamplerYcbcrConversion`
- The `descriptorUpdateTemplate` parameter in `vkDestroyDescriptorUpdateTemplate`
- The `commandBuffer` parameter in `vkCmdDrawIndirectCount`
- The `commandBuffer` parameter in `vkCmdDrawIndexedIndirectCount`
- The `commandBuffer` parameter in `vkCmdBeginRenderPass2`
- The `commandBuffer` parameter in `vkCmdNextSubpass2`
- The `commandBuffer` parameter in `vkCmdEndRenderPass2`
- The `privateDataSlot` parameter in `vkDestroyPrivateDataSlot`
- The `commandBuffer` parameter in `vkCmdSetEvent2`
- The `commandBuffer` parameter in `vkCmdResetEvent2`
- The `commandBuffer` parameter in `vkCmdWaitEvents2`
- The `commandBuffer` parameter in `vkCmdPipelineBarrier2`
- The `commandBuffer` parameter in `vkCmdWriteTimestamp2`
- The `queue` parameter in `vkQueueSubmit2`
- The `fence` parameter in `vkQueueSubmit2`
- The `commandBuffer` parameter in `vkCmdCopyBuffer2`
- The `commandBuffer` parameter in `vkCmdCopyImage2`
- The `commandBuffer` parameter in `vkCmdCopyBufferToImage2`
- The `commandBuffer` parameter in `vkCmdCopyImageToBuffer2`
- The `commandBuffer` parameter in `vkCmdBlitImage2`
- The `commandBuffer` parameter in `vkCmdResolveImage2`
- The `commandBuffer` parameter in `vkCmdBeginRendering`
- The `commandBuffer` parameter in `vkCmdEndRendering`
- The `commandBuffer` parameter in `vkCmdSetCullMode`
• The `commandBuffer` parameter in `vkCmdSetFrontFace`
• The `commandBuffer` parameter in `vkCmdSetPrimitiveTopology`
• The `commandBuffer` parameter in `vkCmdSetViewportWithCount`
• The `commandBuffer` parameter in `vkCmdSetScissorWithCount`
• The `commandBuffer` parameter in `vkCmdBindVertexBuffers2`
• The `commandBuffer` parameter in `vkCmdSetDepthTestEnable`
• The `commandBuffer` parameter in `vkCmdSetDepthWriteEnable`
• The `commandBuffer` parameter in `vkCmdSetDepthCompareOp`
• The `commandBuffer` parameter in `vkCmdSetDepthBoundsTestEnable`
• The `commandBuffer` parameter in `vkCmdSetStencilTestEnable`
• The `commandBuffer` parameter in `vkCmdSetStencilOp`
• The `commandBuffer` parameter in `vkCmdSetRasterizerDiscardEnable`
• The `commandBuffer` parameter in `vkCmdSetDepthBiasEnable`
• The `commandBuffer` parameter in `vkCmdSetPrimitiveRestartEnable`
• The `surface` parameter in `vkDestroySurfaceKHR`
• The `surface` member of the `pCreateInfo` parameter in `vkCreateSwapchainKHR`
• The `oldSwapchain` member of the `pCreateInfo` parameter in `vkCreateSwapchainKHR`
• The `swapchain` parameter in `vkDestroySwapchainKHR`
• The `swapchain` parameter in `vkAcquireNextImageKHR`
• The `semaphore` parameter in `vkAcquireNextImageKHR`
• The `queue` parameter in `vkQueuePresentKHR`
• The `surface` parameter in `vkGetDeviceGroupSurfacePresentModesKHR`
• The `surface` parameter in `vkGetPhysicalDevicePresentRectanglesKHR`
• The `display` parameter in `vkCreateDisplayModeKHR`
• The `mode` parameter in `vkGetDisplayPlaneCapabilitiesKHR`
• The `videoSession` parameter in `vkDestroyVideoSessionKHR`
• The `videoSession` parameter in `vkBindVideoSessionMemoryKHR`
• The `videoSessionParameters` parameter in `vkDestroyVideoSessionParametersKHR`
• The `commandBuffer` parameter in `vkCmdBeginVideoCodingKHR`
• The `commandBuffer` parameter in `vkCmdEndVideoCodingKHR`
• The `commandBuffer` parameter in `vkCmdControlVideoCodingKHR`
• The `commandBuffer` parameter in `vkCmdDecodeVideoKHR`
• The `commandBuffer` parameter in `vkCmdBeginRenderingKHR`
• The `commandBuffer` parameter in `vkCmdEndRenderingKHR`
The `commandBuffer` parameter in `vkCmdSetDeviceMaskKHR`

The `commandBuffer` parameter in `vkCmdDispatchBaseKHR`

The `commandPool` parameter in `vkTrimCommandPoolKHR`

The `commandBuffer` parameter in `vkCmdPushDescriptorSetKHR`

The `commandBuffer` parameter in `vkCmdPushDescriptorSetWithTemplateKHR`

The `descriptorUpdateTemplate` parameter in `vkDestroyDescriptorUpdateTemplateKHR`

The `commandBuffer` parameter in `vkCmdBeginRenderPass2KHR`

The `commandBuffer` parameter in `vkCmdNextSubpass2KHR`

The `commandBuffer` parameter in `vkCmdEndRenderPass2KHR`

The `swapchain` parameter in `vkGetSwapchainStatusKHR`

The `ycbcrConversion` parameter in `vkDestroySamplerYcbcrConversionKHR`

The `commandBuffer` parameter in `vkCmdDrawIndirectCountKHR`

The `commandBuffer` parameter in `vkCmdDrawIndexedIndirectCountKHR`

The `commandBuffer` parameter in `vkCmdSetFragmentShadingRateKHR`

The `commandBuffer` parameter in `vkCmdSetRenderingAttachmentLocationsKHR`

The `commandBuffer` parameter in `vkCmdSetRenderingInputAttachmentIndicesKHR`

The `swapchain` parameter in `vkWaitForPresentKHR`

The `operation` parameter in `vkDestroyDeferredOperationKHR`

The `commandBuffer` parameter in `vkCmdEncodeVideoKHR`

The `commandBuffer` parameter in `vkCmdSetEvent2KHR`

The `commandBuffer` parameter in `vkCmdResetEvent2KHR`

The `commandBuffer` parameter in `vkCmdWaitEvents2KHR`

The `commandBuffer` parameter in `vkCmdPipelineBarrier2KHR`

The `queue` parameter in `vkQueueWriteTimestamp2KHR`

The `fence` parameter in `vkQueueSubmit2KHR`

The `commandBuffer` parameter in `vkCmdWriteBufferMarker2AMD`

The `commandBuffer` parameter in `vkCmdCopyBuffer2KHR`

The `commandBuffer` parameter in `vkCmdCopyImage2KHR`

The `commandBuffer` parameter in `vkCmdCopyBufferToImage2KHR`

The `commandBuffer` parameter in `vkCmdCopyImageToBuffer2KHR`

The `commandBuffer` parameter in `vkCmdBlitImage2KHR`

The `commandBuffer` parameter in `vkCmdResolveImage2KHR`

The `commandBuffer` parameter in `vkCmdTraceRaysIndirect2KHR`

The `commandBuffer` parameter in `vkCmdBindIndexBuffer2KHR`
• The `commandBuffer` parameter in `vkCmdSetLineStippleKHR`
• The `commandBuffer` parameter in `vkCmdBindDescriptorSets2KHR`
• The `commandBuffer` parameter in `vkCmdPushConstants2KHR`
• The `commandBuffer` parameter in `vkCmdPushDescriptorSet2KHR`
• The `commandBuffer` parameter in `vkCmdPushDescriptorSetWithTemplate2KHR`
• The `commandBuffer` parameter in `vkCmdSetDescriptorBufferOffsets2EXT`
• The `commandBuffer` parameter in `vkCmdBindDescriptorBufferEmbeddedSamplers2EXT`
• The `commandBuffer` parameter in `vkCmdSetDiscardRectangleEXT`
• The `commandBuffer` parameter in `vkCmdSetDiscardRectangleEnableEXT`
• The `commandBuffer` parameter in `vkCmdSetDiscardRectangleModeEXT`
• The `commandBuffer` parameter in `vkCmdSetDepthBias2EXT`
• The `micromap` parameter in `vkDestroyMicromapEXT`
• The `commandBuffer` parameter in `vkCmdBuildMicromapsEXT`
• The `commandBuffer` parameter in `vkCmdCopyMicromapEXT`
• The `commandBuffer` parameter in `vkCmdCopyMicromapToMemoryEXT`
• The `commandBuffer` parameter in `vkCmdWriteMicromapsPropertiesEXT`
• The `commandBuffer` parameter in `vkCmdSetDepthClampEnableEXT`
• The `commandBuffer` parameter in `vkCmdSetPolygonModeEXT`
• The `commandBuffer` parameter in `vkCmdSetRasterizationSamplesEXT`
• The `commandBuffer` parameter in `vkCmdSetSampleMaskEXT`
• The `commandBuffer` parameter in `vkCmdSetAlphaToCoverageEnableEXT`
• The `commandBuffer` parameter in `vkCmdSetAlphaToOneEnableEXT`
• The `commandBuffer` parameter in `vkCmdSetLogicOpEnableEXT`
• The `commandBuffer` parameter in `vkCmdSetColorBlendEnableEXT`
• The `commandBuffer` parameter in `vkCmdSetColorBlendEquationEXT`
• The `commandBuffer` parameter in `vkCmdSetColorWriteMaskEXT`
• The `commandBuffer` parameter in `vkCmdSetTessellationDomainOriginEXT`
• The `commandBuffer` parameter in `vkCmdSetRasterizationStreamEXT`
• The `commandBuffer` parameter in `vkCmdSetConservativeRasterizationModeEXT`
• The `commandBuffer` parameter in `vkCmdSetExtraPrimitiveOverestimationSizeEXT`
• The `commandBuffer` parameter in `vkCmdSetDepthClipEnableEXT`
• The `commandBuffer` parameter in `vkCmdSetSampleLocationsEnableEXT`

• The `accelerationStructure` parameter in `vkDestroyAccelerationStructureKHR`
• The `commandBuffer` parameter in `vkCmdBuildAccelerationStructuresKHR`
• The `commandBuffer` parameter in `vkCmdBuildAccelerationStructuresIndirectKHR`
• The `commandBuffer` parameter in `vkCmdCopyAccelerationStructureKHR`
• The `commandBuffer` parameter in `vkCmdCopyAccelerationStructureToMemoryKHR`
• The `commandBuffer` parameter in `vkCmdWriteAccelerationStructuresPropertiesKHR`
• The `commandBuffer` parameter in `vkCmdTraceRaysKHR`
• The `commandBuffer` parameter in `vkCmdTraceRaysIndirectKHR`
• The `commandBuffer` parameter in `vkCmdCopyAccelerationStructureToMemoryKHR`
• The `commandBuffer` parameter in `vkCmdCopyMemoryToAccelerationStructureKHR`
• The `commandBuffer` parameter in `vkCmdWriteAccelerationStructuresPropertiesKHR`
• The `commandBuffer` parameter in `vkCmdSetRayTracingPipelineStackSizeKHR`

For `VkPipelineCache` objects created with flags containing `VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT`, the above table is extended with the `pipelineCache` parameter to `vkCreate*Pipelines` being externally synchronized.

There are also a few instances where a command can take in a user allocated list whose contents are externally synchronized parameters. In these cases, the caller must guarantee that at most one thread is using a given element within the list at a given time. These parameters are listed below.

**Externally Synchronized Parameter Lists**

• Each element of the `pFences` parameter in `vkResetFences`
• Each element of the `pDescriptorSets` parameter in `vkFreeDescriptorSets`
• Each element of the `pCommandBuffers` parameter in `vkFreeCommandBuffers`
• Each element of the `pWaitSemaphores` member of the `pPresentInfo` parameter in `vkQueuePresentKHR`
• Each element of the `pSwapchains` member of the `pPresentInfo` parameter in `vkQueuePresentKHR`
• The `surface` member of each element of the `pCreateInfos` parameter in `vkCreateSharedSwapchainsKHR`
• The `oldSwapchain` member of each element of the `pCreateInfos` parameter in `vkCreateSharedSwapchainsKHR`

In addition, there are some implicit parameters that need to be externally synchronized. For example, when a `commandBuffer` parameter needs to be externally synchronized, it implies that the `commandPool` from which that command buffer was allocated also needs to be externally synchronized. The implicit parameters and their associated object are listed below.

**Implicit Externally Synchronized Parameters**

• All `VkPhysicalDevice` objects enumerated from `instance` in `vkDestroyInstance`
- All `VkQueue` objects created from `device` in `vkDestroyDevice`
- All `VkQueue` objects created from `device` in `vkDeviceWaitIdle`
- Any `VkDescriptorSet` objects allocated from `descriptorPool` in `vkResetDescriptorPool`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkBeginCommandBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkEndCommandBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkResetCommandBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkCmdBindPipeline`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkCmdSetViewport`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkCmdSet_scissor`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkCmdSetLine_width`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkCmdSet_DepthBias`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkCmdSetBlenderConstants`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkCmdSetDepthBounds`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkCmdBindDescriptorSets`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkCmdBindIndexBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkCmdBindVertexBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkCmdDraw`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkCmdDispatch`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkCmdDispatchIndirect`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkCmdCopyBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkCmdCopyImage`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkCmdBlitImage`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkCmdCopyBufferToImage`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkCmdCopyImageToBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkCmdUpdateBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkCmdFillBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkCmdClearColorImage`

3.7. Valid Usage

Valid usage defines a set of conditions which **must** be met in order to achieve well-defined runtime behavior in an application. These conditions depend only on Vulkan state, and the parameters or objects whose usage is constrained by the condition.

The core layer assumes applications are using the API correctly. Except as documented elsewhere in the Specification, the behavior of the core layer to an application using the API incorrectly is undefined, and **may** include program termination. However, implementations **must** ensure that incorrect usage by an application does not affect the integrity of the operating system, the Vulkan implementation, or other Vulkan client applications in the system. In particular, any guarantees made by an operating system about whether memory from one process **can** be visible to another process or not **must** not be violated by a Vulkan implementation for any memory allocation. Vulkan implementations are not **required** to make additional security or integrity guarantees beyond those provided by the OS unless explicitly directed by the application's use of a particular feature or extension.

**Note**

For instance, if an operating system guarantees that data in all its memory allocations are set to zero when newly allocated, the Vulkan implementation **must** make the same guarantees for any allocations it controls (e.g. `VkDeviceMemory`).

Similarly, if an operating system guarantees that use-after-free of host allocations will not result in values written by another process becoming visible, the same guarantees **must** be made by the Vulkan implementation for device memory.

If the `protectedMemory` feature is supported, the implementation provides additional guarantees when invalid usage occurs to prevent values in protected memory from being accessed or inferred outside of protected operations, as described in Protected Memory Access Rules.

Some valid usage conditions have dependencies on runtime limits or feature availability. It is possible to validate these conditions against Vulkan's minimum supported values for these limits and features, or some subset of other known values.

Valid usage conditions **do not** cover conditions where well-defined behavior (including returning an error code) exists.

Valid usage conditions **should** apply to the command or structure where complete information
about the condition would be known during execution of an application. This is such that a
validation layer or linter can be written directly against these statements at the point they are
specified.

Note
This does lead to some non-obvious places for valid usage statements. For instance, the valid values for a structure might depend on a separate value in the calling command. In this case, the structure itself will not reference this valid usage as it is impossible to determine validity from the structure that it is invalid - instead this valid usage would be attached to the calling command.

Another example is draw state - the state setters are independent, and can cause a legitimately invalid state configuration between draw calls; so the valid usage statements are attached to the place where all state needs to be valid - at the drawing command.

Valid usage conditions are described in a block labelled “Valid Usage” following each command or structure they apply to.

3.7.1. Usage Validation

Vulkan is a layered API. The lowest layer is the core Vulkan layer, as defined by this Specification. The application can use additional layers above the core for debugging, validation, and other purposes.

One of the core principles of Vulkan is that building and submitting command buffers should be highly efficient. Thus error checking and validation of state in the core layer is minimal, although more rigorous validation can be enabled through the use of layers.

Validation of correct API usage is left to validation layers. Applications should be developed with validation layers enabled, to help catch and eliminate errors. Once validated, released applications should not enable validation layers by default.

3.7.2. Implicit Valid Usage

Some valid usage conditions apply to all commands and structures in the API, unless explicitly denoted otherwise for a specific command or structure. These conditions are considered implicit, and are described in a block labelled “Valid Usage (Implicit)” following each command or structure they apply to. Implicit valid usage conditions are described in detail below.

Valid Usage for Object Handles

Any input parameter to a command that is an object handle must be a valid object handle, unless otherwise specified. An object handle is valid if:

- It has been created or allocated by a previous, successful call to the API. Such calls are noted in the Specification.
- It has not been deleted or freed by a previous call to the API. Such calls are noted in the Specification.
• Any objects used by that object, either as part of creation or execution, **must** also be valid.

The reserved values **VK_NULL_HANDLE** and **NULL** can be used in place of valid non-dispatchable handles and dispatchable handles, respectively, when *explicitly called out in the Specification*. Any command that creates an object successfully **must** not return these values. It is valid to pass these values to **vkDestroy** or **vkFree** commands, which will silently ignore these values.

**Valid Usage for Pointers**

Any parameter that is a pointer **must** be a **valid pointer** only if it is explicitly called out by a Valid Usage statement.

A pointer is “valid” if it points at memory containing values of the number and type(s) expected by the command, and all fundamental types accessed through the pointer (e.g. as elements of an array or as members of a structure) satisfy the alignment requirements of the host processor.

**Valid Usage for Strings**

Any parameter that is a pointer to **char** **must** be a finite sequence of values terminated by a null character, or if *explicitly called out in the Specification*, **can** be **NULL**.

**Valid Usage for Enumerated Types**

Any parameter of an enumerated type **must** be a valid enumerant for that type. Use of an enumerant is valid if the following conditions are true:

• The enumerant is defined as part of the enumerated type.

• The enumerant is not a value suffixed with **_MAX_ENUM**.
  ◦ This value exists only to ensure that C **enum** types are 32 bits in size and **must** not be used by applications.

• If the enumerant is used in a function that has a **VkInstance** as its first parameter and either:
  ◦ it was added by a core version that is supported (as reported by **vkEnumerateInstanceVersion**) and the value of **VkApplicationInfo::apiVersion** is greater than or equal to the version that added it; or
  ◦ it was added by an **instance extension** that was enabled for the instance.

• If the enumerant is used in a function that has a **VkPhysicalDevice** object as its first parameter and either:
  ◦ it was added by a core version that is supported by that device (as reported by **VkPhysicalDeviceProperties::apiVersion**);
  ◦ it was added by an **instance extension** that was enabled for the instance; or
  ◦ it was added by a **device extension** that is supported by that device.

• If the enumerant is used in a function that has any other dispatchable object as its first parameter and either:
  ◦ it was added by a core version that is supported for the device (as reported by **VkPhysicalDeviceProperties::apiVersion**); or
it was added by a device extension that was enabled for the device.

Additionally, if maintenance is supported, any integer value representable in the range valid for the defined type is valid when used in a function that has a VkPhysicalDevice object as its first parameter. Physical device queries will either return results indicating lack of support, or ignore unsupported values when used as a bit flag in a Vk*Flags parameter.

Any enumerated type returned from a query command or otherwise output from Vulkan to the application must not have a reserved value. Reserved values are values not defined by any extension for that enumerated type.

Note
In some special cases, an enumerant is only meaningful if a feature defined by an extension is also enabled, as well as the extension itself. The global “valid enumerant” rule described here does not address such cases.

Note
This language is intended to accommodate cases such as “hidden” extensions known only to driver internals, or layers enabling extensions without knowledge of the application, without allowing return of values not defined by any extension.

Note
Application developers are encouraged to be careful when using switch statements with Vulkan API enums. This is because new extensions can add new values to existing enums. Using a default: statement within a switch may avoid future compilation issues.

This is particularly true for enums such as VkDriverId, which may have values added that do not belong to a corresponding new extension.

Valid Usage for Flags

A collection of flags is represented by a bitmask using the type VkFlags:

```c
// Provided by VK_VERSION_1_0
typedef uint32_t VkFlags;
```

Bitmasks are passed to many commands and structures to compactly represent options, but VkFlags is not used directly in the API. Instead, a Vk*Flags type which is an alias of VkFlags, and whose name matches the corresponding Vk*FlagBits that are valid for that type, is used.

Any Vk*Flags member or parameter used in the API as an input must be a valid combination of bit flags. A valid combination is either zero or the bitwise OR of valid bit flags.

An individual bit flag is valid for a Vk*Flags type if it would be a valid enumerant when used with the equivalent Vk*FlagBits type, where the bits type is obtained by taking the flag type and replacing the trailing Flags with FlagBits. For example, a flag value of type VkColorComponentFlags...
must contain only bit flags defined by VkColorComponentFlagBits.

Any Vk*Flags member or parameter returned from a query command or otherwise output from Vulkan to the application may contain bit flags undefined in its corresponding Vk*FlagBits type. An application cannot rely on the state of these unspecified bits.

Only the low-order 31 bits (bit positions zero through 30) are available for use as flag bits.

Note
This restriction is due to poorly defined behavior by C compilers given a C enumerant value of 0x80000000. In some cases adding this enumerant value may increase the size of the underlying Vk*FlagBits type, breaking the ABI.

A collection of 64-bit flags is represented by a bitmask using the type VkFlags64:

```
#define VK_VERSION_1_3, VK_KHR_synchronization2
typedef uint64_t VkFlags64;
```

When the 31 bits available in VkFlags are insufficient, the VkFlags64 type can be passed to commands and structures to represent up to 64 options. VkFlags64 is not used directly in the API. Instead, a Vk*Flags2 type which is an alias of VkFlags64, and whose name matches the corresponding Vk*FlagBits2 that are valid for that type, is used.

Any Vk*Flags2 member or parameter used in the API as an input must be a valid combination of bit flags. A valid combination is either zero or the bitwise OR of valid bit flags.

An individual bit flag is valid for a Vk*Flags2 type if it would be a valid enumerant when used with the equivalent Vk*FlagBits2 type, where the bits type is obtained by taking the flag type and replacing the trailing Flags2 with FlagBits2. For example, a flag value of type VkAccessFlags2KHR must contain only bit flags defined by VkAccessFlagBits2KHR.

Any Vk*Flags2 member or parameter returned from a query command or otherwise output from Vulkan to the application may contain bit flags undefined in its corresponding Vk*FlagBits2 type. An application cannot rely on the state of these unspecified bits.

Note
Both the Vk*FlagBits2 type, and the individual bits defined for that type, are defined as uint64_t integers in the C API. This is in contrast to the 32-bit types, where the Vk*FlagBits type is defined as a C enum and the individual bits as enumerants belonging to that enum. As a result, there is less compile time type checking possible for the 64-bit types. This is unavoidable since there is no sufficiently portable way to define a 64-bit enum type in C99.

Valid Usage for Structure Types

Any parameter that is a structure containing a sType member must have a value of sType which is a valid VkStructureType value matching the type of the structure.
Valid Usage for Structure Pointer Chains

Any parameter that is a structure containing a `void* pNext` member must have a value of `pNext` that is either `NULL`, or is a pointer to a valid extending structure, containing `sType` and `pNext` members as described in the Vulkan Documentation and Extensions document in the section “Extending Structures”. The set of structures connected by `pNext` pointers is referred to as a `pNext chain`.

Each structure included in the `pNext` chain must be defined at runtime by either:

- a core version which is supported
- an extension which is enabled
- a supported device extension in the case of physical-device-level functionality added by the device extension

Each type of extending structure must not appear more than once in a `pNext` chain, including any aliases. This general rule may be explicitly overridden for specific structures.

Any component of the implementation (the loader, any enabled layers, and drivers) must skip over, without processing (other than reading the `sType` and `pNext` members) any extending structures in the chain not defined by core versions or extensions supported by that component.

As a convenience to implementations and layers needing to iterate through a structure pointer chain, the Vulkan API provides two base structures. These structures allow for some type safety, and can be used by Vulkan API functions that operate on generic inputs and outputs.

The `VkBaseInStructure` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBaseInStructure {
    VkStructureType sType;
    const struct VkBaseInStructure* pNext;
} VkBaseInStructure;
```

- `sType` is the structure type of the structure being iterated through.
- `pNext` is `NULL` or a pointer to the next structure in a structure chain.

`VkBaseInStructure` can be used to facilitate iterating through a read-only structure pointer chain.

The `VkBaseOutStructure` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBaseOutStructure {
    VkStructureType sType;
    struct VkBaseOutStructure* pNext;
} VkBaseOutStructure;
```

- `sType` is the structure type of the structure being iterated through.
• `pNext` is `NULL` or a pointer to the next structure in a structure chain.

`VkBaseOutStructure` can be used to facilitate iterating through a structure pointer chain that returns data back to the application.

**Valid Usage for Nested Structures**

The above conditions also apply recursively to members of structures provided as input to a command, either as a direct argument to the command, or themselves a member of another structure.

Specifics on valid usage of each command are covered in their individual sections.

**Valid Usage for Extensions**

Instance-level functionality or behavior added by an instance extension to the API must not be used unless that extension is supported by the instance as determined by `vkEnumerateInstanceExtensionProperties`, and that extension is enabled in `VkInstanceCreateInfo`.

Physical-device-level functionality or behavior added by an instance extension to the API must not be used unless that extension is supported by the instance as determined by `vkEnumerateInstanceExtensionProperties`, and that extension is enabled in `VkInstanceCreateInfo`.

Physical-device-level functionality or behavior added by a device extension to the API must not be used unless the conditions described in Extending Physical Device Core Functionality are met.

Device-level functionality added by a device extension that is dispatched from a `VkDevice`, or from a child object of a `VkDevice` must not be used unless that extension is supported by the device as determined by `vkEnumerateDeviceExtensionProperties`, and that extension is enabled in `VkDeviceCreateInfo`.

**Valid Usage for Newer Core Versions**

Instance-level functionality or behavior added by a new core version of the API must not be used unless it is supported by the instance as determined by `vkEnumerateInstanceVersion` and the specified version of `VkApplicationInfo::apiVersion`.

Physical-device-level functionality or behavior added by a new core version of the API must not be used unless it is supported by the physical device as determined by `VkPhysicalDeviceProperties::apiVersion` and the specified version of `VkApplicationInfo::apiVersion`.

Device-level functionality or behavior added by a new core version of the API must not be used unless it is supported by the device as determined by `VkPhysicalDeviceProperties::apiVersion` and the specified version of `VkApplicationInfo::apiVersion`.

### 3.8. VkResult Return Codes

While the core Vulkan API is not designed to capture incorrect usage, some circumstances still require return codes. Commands in Vulkan return their status via return codes that are in one of two categories:
Successful completion codes are returned when a command needs to communicate success or status information. All successful completion codes are non-negative values.

Run time error codes are returned when a command needs to communicate a failure that could only be detected at runtime. All runtime error codes are negative values.

All return codes in Vulkan are reported via `VkResult` return values. The possible codes are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkResult {
    VK_SUCCESS = 0,
    VK_NOT_READY = 1,
    VK_TIMEOUT = 2,
    VK_EVENT_SET = 3,
    VK_EVENT_RESET = 4,
    VK_INCOMPLETE = 5,
    VK_ERROR_OUT_OF_HOST_MEMORY = -1,
    VK_ERROR_OUT_OF_DEVICE_MEMORY = -2,
    VK_ERROR_INITIALIZATION_FAILED = -3,
    VK_ERROR_DEVICE_LOST = -4,
    VK_ERROR_MEMORY_MAP_FAILED = -5,
    VK_ERROR_LAYER_NOT_PRESENT = -6,
    VK_ERROR_EXTENSION_NOT_PRESENT = -7,
    VK_ERROR_FEATURE_NOT_PRESENT = -8,
    VK_ERROR_INCOMPATIBLE_DRIVER = -9,
    VK_ERROR_TOO_MANY_OBJECTS = -10,
    VK_ERROR_FORMAT_NOT_SUPPORTED = -11,
    VK_ERROR_FRAGMENTED_POOL = -12,
    VK_ERROR_UNKNOWN = -13,

// Provided by VK_VERSION_1_1
    VK_ERROR_OUT_OF_POOL_MEMORY = -1000069000,

// Provided by VK_VERSION_1_1
    VK_ERROR_INVALID_EXTERNAL_HANDLE = -1000072003,

// Provided by VK_VERSION_1_2
    VK_ERROR_FRAGMENTATION = -1000161000,

// Provided by VK_VERSION_1_2
    VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS = -1000257000,

// Provided by VK_VERSION_1_3
    VK_PIPELINE_COMPILE_REQUIRED = 1000297000,

// Provided by VK_KHR_surface
    VK_ERROR_SURFACE_LOST_KHR = -1000000000,

// Provided by VK_KHR_surface
    VK_ERROR_NATIVE_WINDOW_IN_USE_KHR = -1000000001,

// Provided by VK_KHR_swapchain
    VK_SUBOPTIMAL_KHR = 100001003,

// Provided by VK_KHR_swapchain
    VK_ERROR_OUT_OF_DATE_KHR = -1000001004,

// Provided by VK_KHR_swapchain
    VK_ERROR_INCOMPATIBLE_DISPLAY_KHR = -1000003001,

// Provided by VK_KHR_video_queue
    VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR = -1000023000,

// Provided by VK_KHR_video_queue
    VK_ERROR_IMAGE usage_NOT_SUPPORTED_KHR = -1000023000,
```
Success Codes

- **VK_SUCCESS** Command successfully completed
- **VK_NOT_READY** A fence or query has not yet completed
- **VK_TIMEOUT** A wait operation has not completed in the specified time
- **VK_EVENT_SET** An event is signaled
- **VK_EVENT_RESET** An event is unsignaled
- **VK_INCOMPLETE** A return array was too small for the result
- **VK_SUBOPTIMAL_KHR** A swapchain no longer matches the surface properties exactly, but can still be used to present to the surface successfully.
- **VK_THREAD_IDLE_KHR** A deferred operation is not complete but there is currently no work for this thread to do at the time of this call.
- **VK_THREAD_DONE_KHR** A deferred operation is not complete but there is no work remaining to assign to additional threads.
• **VK_OPERATION_DEFERRED_KHR** A deferred operation was requested and at least some of the work was deferred.

• **VK_OPERATION_NOT_DEFERRED_KHR** A deferred operation was requested and no operations were deferred.

• **VK_PIPELINE_COMPILE_REQUIRED** A requested pipeline creation would have required compilation, but the application requested compilation to not be performed.

**Error codes**

• **VK_ERROR_OUT_OF_HOST_MEMORY** A host memory allocation has failed.

• **VK_ERROR_OUT_OF_DEVICE_MEMORY** A device memory allocation has failed.

• **VK_ERROR_INITIALIZATION_FAILED** Initialization of an object could not be completed for implementation-specific reasons.

• **VK_ERROR_DEVICE_LOST** The logical or physical device has been lost. See Lost Device

• **VK_ERROR_MEMORY_MAP_FAILED** Mapping of a memory object has failed.

• **VK_ERROR_LAYER_NOT_PRESENT** A requested layer is not present or could not be loaded.

• **VK_ERROR_EXTENSION_NOT_PRESENT** A requested extension is not supported.

• **VK_ERROR_FEATURE_NOT_PRESENT** A requested feature is not supported.

• **VK_ERROR_INCOMPATIBLE_DRIVER** The requested version of Vulkan is not supported by the driver or is otherwise incompatible for implementation-specific reasons.

• **VK_ERROR_TOO_MANY_OBJECTS** Too many objects of the type have already been created.

• **VK_ERROR_FORMAT_NOT_SUPPORTED** A requested format is not supported on this device.

• **VK_ERROR_FRAGMENTED_POOL** A pool allocation has failed due to fragmentation of the pool's memory. This must only be returned if no attempt to allocate host or device memory was made to accommodate the new allocation. This should be returned in preference to **VK_ERROR_OUT_OF_POOL_MEMORY**, but only if the implementation is certain that the pool allocation failure was due to fragmentation.

• **VK_ERROR_SURFACE_LOST_KHR** A surface is no longer available.

• **VK_ERROR_NATIVE_WINDOW_IN_USE_KHR** The requested window is already in use by Vulkan or another API in a manner which prevents it from being used again.

• **VK_ERROR_OUT_OF_DATE_KHR** A surface has changed in such a way that it is no longer compatible with the swapchain, and further presentation requests using the swapchain will fail. Applications must query the new surface properties and recreate their swapchain if they wish to continue presenting to the surface.

• **VK_ERROR_INCOMPATIBLE_DISPLAY_KHR** The display used by a swapchain does not use the same presentable image layout, or is incompatible in a way that prevents sharing an image.

• **VK_ERROR_OUT_OF_POOL_MEMORY** A pool memory allocation has failed. This must only be returned if no attempt to allocate host or device memory was made to accommodate the new allocation. If the failure was definitely due to fragmentation of the pool, **VK_ERROR_FRAGMENTED_POOL** should be returned instead.

• **VK_ERROR_INVALID_EXTERNAL_HANDLE** An external handle is not a valid handle of the specified type.
• **VK_ERROR_FRAGMENTATION** A descriptor pool creation has failed due to fragmentation.

• **VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS** A buffer creation or memory allocation failed because the requested address is not available. A shader group handle assignment failed because the requested shader group handle information is no longer valid.

• **VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR** The requested *VkImageUsageFlags* are not supported.

• **VK_ERROR_VIDEO_PICTURE_LAYOUT_NOT_SUPPORTED_KHR** The requested video picture layout is not supported.

• **VK_ERROR_VIDEO_PROFILE_OPERATION_NOT_SUPPORTED_KHR** A video profile operation specified via *VkVideoProfileInfoKHR::videoCodecOperation* is not supported.

• **VK_ERROR_VIDEO_PROFILE_FORMAT_NOT_SUPPORTED_KHR** Format parameters in a requested *VkVideoProfileInfoKHR* chain are not supported.

• **VK_ERROR_VIDEO_PROFILE_CODEC_NOT_SUPPORTED_KHR** Codec-specific parameters in a requested *VkVideoProfileInfoKHR* chain are not supported.

• **VK_ERROR_VIDEO_STD_VERSION_NOT_SUPPORTED_KHR** The specified video Std header version is not supported.

• **VK_ERROR_VIDEO_PROFILE_CODEC_NOT_SUPPORTED_KHR** Codec-specific parameters in a requested *VkVideoProfileInfoKHR* chain are not supported.

• **VK_ERROR_VIDEO_PROFILE_OPERATION_NOT_SUPPORTED_KHR** A video profile operation specified via *VkVideoProfileInfoKHR::videoCodecOperation* is not supported.

• **VK_ERROR_VIDEO_PROFILE_FORMAT_NOT_SUPPORTED_KHR** Format parameters in a requested *VkVideoProfileInfoKHR* chain are not supported.

• **VK_ERROR_VIDEO_PROFILE_CODEC_NOT_SUPPORTED_KHR** Codec-specific parameters in a requested *VkVideoProfileInfoKHR* chain are not supported.

• **VK_ERROR_VIDEO_STD_VERSION_NOT_SUPPORTED_KHR** The specified video Std header version is not supported.

• **VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR** The specified Video Std parameters do not adhere to the syntactic or semantic requirements of the used video compression standard, or values derived from parameters according to the rules defined by the used video compression standard do not adhere to the capabilities of the video compression standard or the implementation.

• **VK_ERROR_INCOMPATIBLE_SHADER_BINARY_EXT** The provided binary shader code is not compatible with this device.

• **VK_ERROR_UNKNOWN** An unknown error has occurred; either the application has provided invalid input, or an implementation failure has occurred.

If a command returns a runtime error, unless otherwise specified any output parameters will have undefined contents, except that if the output parameter is a structure with *sType* and *pNext* fields, those fields will be unmodified. Any structures chained from *pNext* will also have undefined contents, except that *sType* and *pNext* will be unmodified.

**VK_ERROR_OUT_OF_*_MEMORY** errors do not modify any currently existing Vulkan objects. Objects that have already been successfully created can still be used by the application.

---

**Note**

As a general rule, Free, Release, and Reset commands do not return **VK_ERROR_OUT_OF_HOST_MEMORY**, while any other command with a return code may return it. Any exceptions from this rule are described for those commands.

**VK_ERROR_UNKNOWN** will be returned by an implementation when an unexpected error occurs that cannot be attributed to valid behavior of the application and implementation. Under these conditions, it may be returned from any command returning a *VkResult*.

---

**Note**

**VK_ERROR_UNKNOWN** is not expected to ever be returned if the application behavior is
valid, and if the implementation is bug-free. If VK_ERROR_UNKNOWN is received, the application should be checked against the latest validation layers to verify correct behavior as much as possible. If no issues are identified it could be an implementation issue, and the implementor should be contacted for support.

Performance-critical commands generally do not have return codes. If a runtime error occurs in such commands, the implementation will defer reporting the error until a specified point. For commands that record into command buffers (vkCmd*) runtime errors are reported by vkEndCommandBuffer.

### 3.9. Numeric Representation and Computation

Implementations normally perform computations in floating-point, and must meet the range and precision requirements defined under “Floating-Point Computation” below.

These requirements only apply to computations performed in Vulkan operations outside of shader execution, such as texture image specification and sampling, and per-fragment operations. Range and precision requirements during shader execution differ and are specified by the Precision and Operation of SPIR-V Instructions section.

In some cases, the representation and/or precision of operations is implicitly limited by the specified format of vertex or texel data consumed by Vulkan. Specific floating-point formats are described later in this section.

#### 3.9.1. Floating-Point Computation

Most floating-point computation is performed in SPIR-V shader modules. The properties of computation within shaders are constrained as defined by the Precision and Operation of SPIR-V Instructions section.

Some floating-point computation is performed outside of shaders, such as viewport and depth range calculations. For these computations, we do not specify how floating-point numbers are to be represented, or the details of how operations on them are performed, but only place minimal requirements on representation and precision as described in the remainder of this section.

We require simply that numbers’ floating-point parts contain enough bits and that their exponent fields are large enough so that individual results of floating-point operations are accurate to about $1$ part in $10^5$. The maximum representable magnitude for all floating-point values must be at least $2^{32}$.

$x \times 0 = 0 \times x = 0$ for any non-infinite and non-NaN $x$.

$1 \times x = x \times 1 = x$.

$x + 0 = 0 + x = x$. 

42
Occasionally, further requirements will be specified. Most single-precision floating-point formats meet these requirements.

The special values Inf and -Inf encode values with magnitudes too large to be represented; the special value NaN encodes “Not A Number” values resulting from undefined arithmetic operations such as 0 / 0. Implementations may support Inf and NaN in their floating-point computations. Any computation which does not support either Inf or NaN, for which that value is an input or output will yield an undefined value.

3.9.2. Floating-Point Format Conversions

When a value is converted to a defined floating-point representation, finite values falling between two representable finite values are rounded to one or the other. The rounding mode is not defined. Finite values whose magnitude is larger than that of any representable finite value may be rounded either to the closest representable finite value or to the appropriately signed infinity. For unsigned destination formats any negative values are converted to zero. Positive infinity is converted to positive infinity; negative infinity is converted to negative infinity in signed formats and to zero in unsigned formats; and any NaN is converted to a NaN.

3.9.3. 16-Bit Floating-Point Numbers

16-bit floating point numbers are defined in the “16-bit floating point numbers” section of the Khronos Data Format Specification.

3.9.4. Unsigned 11-Bit Floating-Point Numbers

Unsigned 11-bit floating point numbers are defined in the “Unsigned 11-bit floating point numbers” section of the Khronos Data Format Specification.

3.9.5. Unsigned 10-Bit Floating-Point Numbers

Unsigned 10-bit floating point numbers are defined in the “Unsigned 10-bit floating point numbers” section of the Khronos Data Format Specification.

3.9.6. General Requirements

Any representable floating-point value in the appropriate format is legal as input to a Vulkan command that requires floating-point data. The result of providing a value that is not a floating-point number to such a command is unspecified, but must not lead to Vulkan interruption or termination. For example, providing a negative zero (where applicable) or a denormalized number to a Vulkan command must yield deterministic results, while providing a NaN or Inf yields unspecified results.

Some calculations require division. In such cases (including implied divisions performed by vector normalization), division by zero produces an unspecified result but must not lead to Vulkan interruption or termination.
3.10. Fixed-Point Data Conversions

When generic vertex attributes and pixel color or depth components are represented as integers, they are often (but not always) considered to be normalized. Normalized integer values are treated specially when being converted to and from floating-point values, and are usually referred to as normalized fixed-point.

In the remainder of this section, \( b \) denotes the bit width of the fixed-point integer representation. When the integer is one of the types defined by the API, \( b \) is the bit width of that type. When the integer comes from an image containing color or depth component texels, \( b \) is the number of bits allocated to that component in its specified image format.

The signed and unsigned fixed-point representations are assumed to be \( b \)-bit binary two’s-complement integers and binary unsigned integers, respectively.

### 3.10.1. Conversion From Normalized Fixed-Point to Floating-Point

Unsigned normalized fixed-point integers represent numbers in the range \([0,1]\). The conversion from an unsigned normalized fixed-point value \( c \) to the corresponding floating-point value \( f \) is defined as

\[
f = \frac{c}{2^b - 1}
\]

Signed normalized fixed-point integers represent numbers in the range \([-1,1]\). The conversion from a signed normalized fixed-point value \( c \) to the corresponding floating-point value \( f \) is performed using

\[
f = \max\left(\frac{c}{2^b - 1}, -1.0\right)
\]

Only the range \([-2^{b-1} + 1, 2^{b-1} - 1]\) is used to represent signed fixed-point values in the range \([-1,1]\). For example, if \( b = 8 \), then the integer value -127 corresponds to -1.0 and the value 127 corresponds to 1.0. This equation is used everywhere that signed normalized fixed-point values are converted to floating-point.

Note that while zero is exactly expressible in this representation, one value (-128 in the example) is outside the representable range, and implementations must clamp it to -1.0. Where the value is subject to further processing by the implementation, e.g. during texture filtering, values less than -1.0 may be used but the result must be clamped before the value is returned to shaders.

### 3.10.2. Conversion From Floating-Point to Normalized Fixed-Point

The conversion from a floating-point value \( f \) to the corresponding unsigned normalized fixed-point value \( c \) is defined by first clamping \( f \) to the range \([0,1]\), then computing

\[
c = \text{convertFloatToUint}(f \times (2^b - 1), b)
\]

where \( \text{convertFloatToUint}(r,b) \) returns one of the two unsigned binary integer values with exactly \( b \)
bits which are closest to the floating-point value \( r \). Implementations **should** round to nearest. If \( r \) is equal to an integer, then that integer value **must** be returned. In particular, if \( f \) is equal to 0.0 or 1.0, then \( c \) **must** be assigned 0 or \( 2^b - 1 \), respectively.

The conversion from a floating-point value \( f \) to the corresponding signed normalized fixed-point value \( c \) is performed by clamping \( f \) to the range \([-1,1]\), then computing

\[
c = \text{convertFloatToInt}(f \times (2^b - 1), b)
\]

where \( \text{convertFloatToInt}(r,b) \) returns one of the two signed two’s-complement binary integer values with exactly \( b \) bits which are closest to the floating-point value \( r \). Implementations **should** round to nearest. If \( r \) is equal to an integer, then that integer value **must** be returned. In particular, if \( f \) is equal to -1.0, 0.0, or 1.0, then \( c \) **must** be assigned \(-2^{b-1} - 1\), 0, or \( 2^b - 1 \), respectively.

This equation is used everywhere that floating-point values are converted to signed normalized fixed-point.

### 3.11. Common Object Types

Some types of Vulkan objects are used in many different structures and command parameters, and are described here. These types include *offsets*, *extents*, and *rectangles*.

#### 3.11.1. Offsets

Offsets are used to describe a pixel location within an image or framebuffer, as an \((x,y)\) location for two-dimensional images, or an \((x,y,z)\) location for three-dimensional images.

A two-dimensional offset is defined by the structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkOffset2D {
    int32_t x;
    int32_t y;
} VkOffset2D;
```

- \( x \) is the \( x \) offset.
- \( y \) is the \( y \) offset.

A three-dimensional offset is defined by the structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkOffset3D {
    int32_t x;
    int32_t y;
    int32_t z;
} VkOffset3D;
```
• $x$ is the $x$ offset.
• $y$ is the $y$ offset.
• $z$ is the $z$ offset.

### 3.11.2. Extents

Extents are used to describe the size of a rectangular region of pixels within an image or framebuffer, as (width,height) for two-dimensional images, or as (width,height,depth) for three-dimensional images.

A two-dimensional extent is defined by the structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkExtent2D {
    uint32_t width;
    uint32_t height;
} VkExtent2D;
```

• $width$ is the width of the extent.
• $height$ is the height of the extent.

A three-dimensional extent is defined by the structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkExtent3D {
    uint32_t width;
    uint32_t height;
    uint32_t depth;
} VkExtent3D;
```

• $width$ is the width of the extent.
• $height$ is the height of the extent.
• $depth$ is the depth of the extent.

### 3.11.3. Rectangles

Rectangles are used to describe a specified rectangular region of pixels within an image or framebuffer. Rectangles include both an offset and an extent of the same dimensionality, as described above. Two-dimensional rectangles are defined by the structure

```c
// Provided by VK_VERSION_1_0
typedef struct VkRect2D {
    VkOffset2D offset;
    VkExtent2D extent;
} VkRect2D;
```
• offset is a `VkOffset2D` specifying the rectangle offset.

• extent is a `VkExtent2D` specifying the rectangle extent.

### 3.11.4. Structure Types

Each value corresponds to a particular structure with a sType member with a matching name. As a general rule, the name of each `VkStructureType` value is obtained by taking the name of the structure, stripping the leading `Vk`, prefixing each capital letter with `_`, converting the entire resulting string to upper case, and prefixing it with `VK_STRUCTURE_TYPE_`. For example, structures of type `VkImageCreateInfo` correspond to a `VkStructureType` value of `VK_STRUCTURE_TYPE_IMAGE_CREATE_INFO`, and thus a structure of this type must have its sType member set to this value before it is passed to the API.

The values `VK_STRUCTURE_TYPE_LOADER_INSTANCE_CREATE_INFO` and `VK_STRUCTURE_TYPE_LOADER_DEVICE_CREATE_INFO` are reserved for internal use by the loader, and do not have corresponding Vulkan structures in this Specification.

Structure types supported by the Vulkan API include:

```c
typedef enum VkStructureType {
    VK_STRUCTURE_TYPE_APPLICATION_INFO = 0,
    VK_STRUCTURE_TYPE_INSTANCE_CREATE_INFO = 1,
    VK_STRUCTURE_TYPE_DEVICE_QUEUE_CREATE_INFO = 2,
    VK_STRUCTURE_TYPE_DEVICE_CREATE_INFO = 3,
    VK_STRUCTURE_TYPE_SUBMIT_INFO = 4,
    VK_STRUCTURE_TYPE_MEMORY_ALLOCATE_INFO = 5,
    VK_STRUCTURE_TYPE_MAPPED_MEMORY_RANGE = 6,
    VK_STRUCTURE_TYPE_BIND_SPARSE_INFO = 7,
    VK_STRUCTURE_TYPE_FENCE_CREATE_INFO = 8,
    VK_STRUCTURE_TYPE_SEMAPHORE_CREATE_INFO = 9,
    VK_STRUCTURE_TYPE_EVENT_CREATE_INFO = 10,
    VK_STRUCTURE_TYPE_QUERY_POOL_CREATE_INFO = 11,
    VK_STRUCTURE_TYPE_BUFFER_CREATE_INFO = 12,
    VK_STRUCTURE_TYPE_BUFFER_VIEW_CREATE_INFO = 13,
    VK_STRUCTURE_TYPE_IMAGE_CREATE_INFO = 14,
    VK_STRUCTURE_TYPE_IMAGE_VIEW_CREATE_INFO = 15,
    VK_STRUCTURE_TYPE_SHADER_MODULE_CREATE_INFO = 16,
    VK_STRUCTURE_TYPE_PIPELINE_CACHE_CREATE_INFO = 17,
    VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_CREATE_INFO = 18,
    VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_STATE_CREATE_INFO = 19,
    VK_STRUCTURE_TYPE_PIPELINE_INPUT_ASSEMBLY_STATE_CREATE_INFO = 20,
    VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_STATE_CREATE_INFO = 21,
    VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_STATE_CREATE_INFO = 22,
    VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_STATE_CREATE_INFO = 23,
    VK_STRUCTURE_TYPE_PIPELINE_MULTISAMPLE_STATE_CREATE_INFO = 24,
    VK_STRUCTURE_TYPE_PIPELINE_DEPTH_STENCIL_STATE_CREATE_INFO = 25,
    VK_STRUCTURE_TYPE_PIPELINE_COLOR_BLEND_STATE_CREATE_INFO = 26,
    VK_STRUCTURE_TYPE_PIPELINE_DYNAMIC_STATE_CREATE_INFO = 27,
} VkStructureType;
```
VK_STRUCTURE_TYPE_GRAPHICS_PIPELINE_CREATE_INFO = 28,
VK_STRUCTURE_TYPE_COMPUTE_PIPELINE_CREATE_INFO = 29,
VK_STRUCTURE_TYPE_PIPELINE_LAYOUT_CREATE_INFO = 30,
VK_STRUCTURE_TYPE_SAMPLER_CREATE_INFO = 31,
VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_CREATE_INFO = 32,
VK_STRUCTURE_TYPE_DESCRIPTOR_POOL_CREATE_INFO = 33,
VK_STRUCTURE_TYPE_DESCRIPTOR_SET_ALLOCATE_INFO = 34,
VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET = 35,
VK_STRUCTURE_TYPE_COPY_DESCRIPTOR_SET = 36,
VK_STRUCTURE_TYPE_FRAMEBUFFER_CREATE_INFO = 37,
VK_STRUCTURE_TYPE_RENDER_PASS_CREATE_INFO = 38,
VK_STRUCTURE_TYPE_COMMAND_POOL_CREATE_INFO = 39,
VK_STRUCTURE_TYPE_COMMAND_BUFFER_ALLOCATE_INFO = 40,
VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_INFO = 41,
VK_STRUCTURE_TYPE_COMMAND_BUFFER_BEGIN_INFO = 42,
VK_STRUCTURE_TYPE_RENDER_PASS_BEGIN_INFO = 43,
VK_STRUCTURE_TYPE_BUFFER_MEMORY_BARRIER = 44,
VK_STRUCTURE_TYPE_IMAGE_MEMORY_BARRIER = 45,
VK_STRUCTURE_TYPE_MEMORY_BARRIER = 46,
VK_STRUCTURE_TYPE_LOADER_INSTANCE_CREATE_INFO = 47,
VK_STRUCTURE_TYPE_LOADER_DEVICE_CREATE_INFO = 48,
// Provided by VK_VERSION_1_1
VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SUBGROUP_PROPERTIES = 1000094000,
// Provided by VK_VERSION_1_1
VK_STRUCTURE_TYPE_BIND_BUFFER_MEMORY_INFO = 1000157000,
// Provided by VK_VERSION_1_1
VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_INFO = 1000157001,
// Provided by VK_VERSION_1_1
VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_16BIT_STORAGE_FEATURES = 1000083000,
// Provided by VK_VERSION_1_1
VK_STRUCTURE_TYPE_MEMORY_DEDICATED_REQUIREMENTS = 1000127000,
// Provided by VK_VERSION_1_1
VK_STRUCTURE_TYPE_MEMORY_DEDICATED_ALLOCATE_INFO = 1000127001,
// Provided by VK_VERSION_1_1
VK_STRUCTURE_TYPE_MEMORY_ALLOCATE_FLAGS_INFO = 1000060000,
// Provided by VK_VERSION_1_1
VK_STRUCTURE_TYPE_DEVICE_GROUP_RENDER_PASS_BEGIN_INFO = 1000060003,
// Provided by VK_VERSION_1_1

3.12. API Name Aliases

A small number of APIs did not follow the naming conventions when initially defined. For consistency, when we discover an API name that violates the naming conventions, we rename it in the Specification, XML, and header files. For backwards compatibility, the original (incorrect) name is retained as a “typo alias”. The alias is deprecated and should not be used, but will be retained indefinitely.

Note

VK_STENCIL_FRONT_AND_BACK is an example of a typo alias. It was initially defined as part of VkStencilFaceFlagBits. Once the naming inconsistency was noticed, it was renamed to VK_STENCIL_FACE_FRONT_AND_BACK, and the old name was aliased to the correct name.
Chapter 4. Initialization

Before using Vulkan, an application must initialize it by loading the Vulkan commands, and creating a VkInstance object.

4.1. Command Function Pointers

Vulkan commands are not necessarily exposed by static linking on a platform. Commands to query function pointers for Vulkan commands are described below.

Note

When extensions are promoted or otherwise incorporated into another extension or Vulkan core version, command aliases may be included. Whilst the behavior of each command alias is identical, the behavior of retrieving each alias's function pointer is not. A function pointer for a given alias can only be retrieved if the extension or version that introduced that alias is supported and enabled, irrespective of whether any other alias is available.

Function pointers for all Vulkan commands can be obtained by calling:

```c
// Provided by VK_VERSION_1_0
PFN_vkVoidFunction vkGetInstanceProcAddr(
    VkInstance instance,
    const char* pName);
```

- **instance** is the instance that the function pointer will be compatible with, or NULL for commands not dependent on any instance.
- **pName** is the name of the command to obtain.

vkGetInstanceProcAddr itself is obtained in a platform- and loader- specific manner. Typically, the loader library will export this command as a function symbol, so applications can link against the loader library, or load it dynamically and look up the symbol using platform-specific APIs.

The table below defines the various use cases for vkGetInstanceProcAddr and expected return value (“fp” is “function pointer”) for each case. A valid returned function pointer (“fp”) must not be NULL.

The returned function pointer is of type PFN_vkVoidFunction, and must be cast to the type of the command being queried before use.

<td>fp&lt;sup&gt;3&lt;/sup&gt;</td>
</tr>
<tr>
<td>any other case, not covered above</td>
<td></td>
<td>NULL</td>
</tr>
</tbody>
</table>

1

"*" means any representable value for the parameter (including valid values, invalid values, and NULL).

2

The global commands are: `vkEnumerateInstanceVersion`, `vkEnumerateInstanceExtensionProperties`, `vkEnumerateInstanceLayerProperties`, and `vkCreateInstance`. Dispatchable commands are all other commands which are not global.

3

The returned function pointer must only be called with a dispatchable object (the first parameter) that is instance or a child of instance, e.g. VkInstance, VkPhysicalDevice, VkDevice, VkQueue, or VkCommandBuffer.

4

An “available device extension” is a device extension supported by any physical device enumerated by instance.

5

Starting with Vulkan 1.2, `vkGetInstanceProcAddr` can resolve itself with a NULL instance pointer.

**Valid Usage (Implicit)**

- VUID-vkGetInstanceProcAddr-instance-parameter
  If instance is not NULL, instance must be a valid VkInstance handle
- VUID-vkGetInstanceProcAddr-pName-parameter
  pName must be a null-terminated UTF-8 string

In order to support systems with multiple Vulkan implementations, the function pointers returned by `vkGetInstanceProcAddr` may point to dispatch code that calls a different real implementation for different VkDevice objects or their child objects. The overhead of the internal dispatch for VkDevice
objects can be avoided by obtaining device-specific function pointers for any commands that use a
device or device-child object as their dispatchable object. Such function pointers can be obtained by calling:

```c
// Provided by VK_VERSION_1_0
PFN_vkVoidFunction vkGetDeviceProcAddr(
    VkDevice device,
    const char* pName);
```

The table below defines the various use cases for `vkGetDeviceProcAddr` and expected return value
(“fp” is “function pointer”) for each case. A valid returned function pointer (“fp”) must not be `NULL`.

The returned function pointer is of type `PFN_vkVoidFunction`, and must be cast to the type of the
command being queried before use. The function pointer must only be called with a dispatchable
object (the first parameter) that is `device` or a child of `device`.

**Table 2. `vkGetDeviceProcAddr` behavior**

<table>
<thead>
<tr>
<th>device</th>
<th>pName</th>
<th>return value</th>
</tr>
</thead>
<tbody>
<tr>
<td>NULL</td>
<td>*1</td>
<td>undefined</td>
</tr>
<tr>
<td>invalid device</td>
<td>*1</td>
<td>undefined</td>
</tr>
<tr>

<td>device-level dispatchable command³</td>
<td>fp⁴</td>
</tr>
<tr>
<td>device</td>
<td>enabled extension</td>
<td></td>
</tr>
<tr>
<td></td>
<td>device-level dispatchable command³</td>
<td>fp⁴</td>
</tr>
<tr>
<td>any other case, not covered above</td>
<td></td>
<td>NULL</td>
</tr>
</tbody>
</table>

1

"*" means any representable value for the parameter (including valid values, invalid values, and
`NULL`).

2

Device-level commands which are part of the core version specified by `VkApplicationInfo
::apiVersion` when creating the instance will always return a valid function pointer. If the
`maintenance5` feature is enabled, core commands beyond that version which are supported by the
implementation will return `NULL`, otherwise the implementation may either return `NULL` or a
function pointer. If a function pointer is returned, it must not be called.

3

In this function, device-level excludes all physical-device-level commands.

4

The returned function pointer must only be called with a dispatchable object (the first
parameter) that is device or a child of device e.g. VkDevice, VkQueue, or VkCommandBuffer.

Valid Usage (Implicit)

- VUID-vkGetDeviceProcAddr-device-parameter
device must be a valid VkDevice handle
- VUID-vkGetDeviceProcAddr-pName-parameter
pName must be a null-terminated UTF-8 string

The definition of PFN_vkVoidFunction is:

```c
// Provided by VK_VERSION_1_0
typedef void (VKAPI_PTR *PFN_vkVoidFunction)(void);
```

This type is returned from command function pointer queries, and must be cast to an actual command function pointer before use.

4.1.1. Extending Physical Device Core Functionality

New core physical-device-level functionality can be used when the physical-device version is greater than or equal to the version of Vulkan that added the new functionality. The Vulkan version supported by a physical device can be obtained by calling vkGetPhysicalDeviceProperties.

4.1.2. Extending Physical Device From Device Extensions

When the VK_KHR_get_physical_device_properties2 extension is enabled, or when both the instance and the physical-device versions are at least 1.1, physical-device-level functionality of a device extension can be used with a physical device if the corresponding extension is enumerated by vkEnumerateDeviceExtensionProperties for that physical device, even before a logical device has been created.

To obtain a function pointer for a physical-device-level command from a device extension, an application can use vkGetInstanceProcAddr. This function pointer may point to dispatch code, which calls a different real implementation for different VkPhysicalDevice objects. Applications must not use a VkPhysicalDevice in any command added by an extension or core version that is not supported by that physical device.

Device extensions may define structures that can be added to the pNext chain of physical-device-level commands.

4.2. Instances

There is no global state in Vulkan and all per-application state is stored in a VkInstance object. Creating a VkInstance object initializes the Vulkan library and allows the application to pass information about itself to the implementation.
Instances are represented by `VkInstance` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkInstance)
```

To query the version of instance-level functionality supported by the implementation, call:

```c
// Provided by VK_VERSION_1_1
VkResult vkEnumerateInstanceVersion(
    uint32_t* pApiVersion);
```

- `pApiVersion` is a pointer to a `uint32_t`, which is the version of Vulkan supported by instance-level functionality, encoded as described in Version Numbers.

**Note**

The intended behaviour of `vkEnumerateInstanceVersion` is that an implementation should not need to perform memory allocations and should unconditionally return `VK_SUCCESS`. The loader, and any enabled layers, may return `VK_ERROR_OUT_OF_HOST_MEMORY` in the case of a failed memory allocation.

**Valid Usage (Implicit)**

- `VUID-vkEnumerateInstanceVersion-pApiVersion-parameter` `pApiVersion` must be a valid pointer to a `uint32_t` value

**Return Codes**

- **Success**
  - `VK_SUCCESS`
- **Failure**
  - `VK_ERROR_OUT_OF_HOST_MEMORY`

To create an instance object, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateInstance(
    const VkInstanceCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkInstance* pInstance);
```

- `pCreateInfo` is a pointer to a `VkInstanceCreateInfo` structure controlling creation of the instance.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
• **pInstance** points a **VkInstance** handle in which the resulting instance is returned.

`vkCreateInstance` verifies that the requested layers exist. If not, `vkCreateInstance` will return `VK_ERROR_LAYER_NOT_PRESENT`. Next `vkCreateInstance` verifies that the requested extensions are supported (e.g. in the implementation or in any enabled instance layer) and if any requested extension is not supported, `vkCreateInstance` must return `VK_ERROR_EXTENSION_NOT_PRESENT`. After verifying and enabling the instance layers and extensions the **VkInstance** object is created and returned to the application. If a requested extension is only supported by a layer, both the layer and the extension need to be specified at `vkCreateInstance` time for the creation to succeed.

### Valid Usage

- VUID-vkCreateInstance-ppEnabledExtensionNames-01388
  All **required extensions** for each extension in the **VkInstanceCreateInfo** ::**ppEnabledExtensionNames** list must also be present in that list

### Valid Usage (Implicit)

- VUID-vkCreateInstance-pCreateInfo-parameter
  **pCreateInfo** must be a valid pointer to a valid **VkInstanceCreateInfo** structure

- VUID-vkCreateInstance-pAllocator-parameter
  If **pAllocator** is not NULL, **pAllocator** must be a valid pointer to a valid **VkAllocationCallbacks** structure

- VUID-vkCreateInstance-pInstance-parameter
  **pInstance** must be a valid pointer to a **VkInstance** handle

### Return Codes

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_INITIALIZATION_FAILED**
- **VK_ERROR_LAYER_NOT_PRESENT**
- **VK_ERROR_EXTENSION_NOT_PRESENT**
- **VK_ERROR_INCOMPATIBLE_DRIVER**

The **VkInstanceCreateInfo** structure is defined as:

```c
// Provided by VK_VERSION_1_0
```

---

80
typedef struct VkInstanceCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkInstanceCreateFlags flags;
    const VkApplicationInfo* pApplicationInfo;
    uint32_t enabledLayerCount;
    const char* const* ppEnabledLayerNames;
    uint32_t enabledExtensionCount;
    const char* const* ppEnabledExtensionNames;
} VkInstanceCreateInfo;

• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `flags` is a bitmask of `VkInstanceCreateFlagBits` indicating the behavior of the instance.
• `pApplicationInfo` is `NULL` or a pointer to a `VkApplicationInfo` structure. If not `NULL`, this information helps implementations recognize behavior inherent to classes of applications. `VkApplicationInfo` is defined in detail below.
• `enabledLayerCount` is the number of global layers to enable.
• `ppEnabledLayerNames` is a pointer to an array of `enabledLayerCount` null-terminated UTF-8 strings containing the names of layers to enable for the created instance. The layers are loaded in the order they are listed in this array, with the first array element being the closest to the application, and the last array element being the closest to the driver. See the `Layers` section for further details.
• `enabledExtensionCount` is the number of global extensions to enable.
• `ppEnabledExtensionNames` is a pointer to an array of `enabledExtensionCount` null-terminated UTF-8 strings containing the names of extensions to enable.

### Valid Usage

• VUID-VkInstanceCreateInfo-flags-06559
  If `flags` has the `VK_INSTANCE_CREATE_ENUMERATE_PORTABILITY_BIT_KHR` bit set, the list of enabled extensions in `ppEnabledExtensionNames` must contain `VK_KHR_portability Enumeration`

### Valid Usage (Implicit)

• VUID-VkInstanceCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_INSTANCE_CREATE_INFO`

• VUID-VkInstanceCreateInfo-pNext-pNext
  `pNext` must be `NULL` or a pointer to a valid instance of `VkLayerSettingsCreateInfoEXT`

• VUID-VkInstanceCreateInfo-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique, with the exception of structures of type `VkLayerSettingsCreateInfoEXT`
• VUID-VkInstanceCreateInfo-flags-parameter
  flags must be a valid combination of VkInstanceCreateFlagBits values

• VUID-VkInstanceCreateInfo-pApplicationInfo-parameter
  If pApplicationInfo is not NULL, pApplicationInfo must be a valid pointer to a valid
  VkApplicationInfo structure

• VUID-VkInstanceCreateInfo-ppEnabledLayerNames-parameter
  If enabledLayerCount is not 0, ppEnabledLayerNames must be a valid pointer to an array of
  enabledLayerCount null-terminated UTF-8 strings

• VUID-VkInstanceCreateInfo-ppEnabledExtensionNames-parameter
  If enabledExtensionCount is not 0, ppEnabledExtensionNames must be a valid pointer to an
  array of enabledExtensionCount null-terminated UTF-8 strings

// Provided by VK_VERSION_1_0
typedef enum VkInstanceCreateFlagBits {
  // Provided by VK_KHR_portability_enumeration
  VK_INSTANCE_CREATE_ENUMERATE_PORTABILITY_BIT_KHR = 0x00000001,
} VkInstanceCreateFlagBits;

* VK_INSTANCE_CREATE_ENUMERATE_PORTABILITY_BIT_KHR specifies that the instance will enumerate
available Vulkan Portability-compliant physical devices and groups in addition to the Vulkan
physical devices and groups that are enumerated by default.

// Provided by VK_VERSION_1_0
typedef VkFlags VkInstanceCreateFlags;

VkInstanceCreateFlags is a bitmask type for setting a mask of zero or more
VkInstanceCreateFlagBits.

To create a Vulkan instance with a specific configuration of layer settings, add
VkLayerSettingsCreateInfoEXT structures to the pNext chain of the VkInstanceCreateInfo structure,
specifying the settings to be configured.

// Provided by VK_EXT_layer_settings
typedef struct VkLayerSettingsCreateInfoEXT {
  VkStructureType sType;
  const void* pNext;
  uint32_t settingCount;
  const VkLayerSettingEXT* pSettings;
} VkLayerSettingsCreateInfoEXT;

* sType is a VkStructureType value identifying this structure.
* pNext is NULL or a pointer to a structure extending this structure.
* settingCount is the number of settings to configure.
• `pSettings` is a pointer to an array of `settingCount` `VkLayerSettingEXT` values specifying the setting to be configured.

Valid Usage (Implicit)

• VUID-VkLayerSettingsCreateInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_LAYER_SETTINGS_CREATE_INFO_EXT`

• VUID-VkLayerSettingsCreateInfoEXT-pSettings-parameter
  If `settingCount` is not 0, `pSettings` must be a valid pointer to an array of `settingCount` valid `VkLayerSettingEXT` structures

The values of elements of the `VkLayerSettingsCreateInfoEXT::pSettings` array, specifying layer settings to be configured, are:

```c
// Provided by VK_EXT_layer_settings
typedef struct VkLayerSettingEXT {
  const char*              pLayerName;
  const char*              pSettingName;
  VkLayerSettingTypeEXT    type;
  uint32_t                 valueCount;
  const void*              pValues;
} VkLayerSettingEXT;
```

• `pLayerName` is a pointer to a null-terminated UTF-8 string naming the layer to configure the setting from.

• `pSettingName` is a pointer to a null-terminated UTF-8 string naming the setting to configure. Unknown `pSettingName` by the layer are ignored.

• `type` is a `VkLayerSettingTypeEXT` value specifying the type of the `pValues` values.

• `count` is the number of values used to configure the layer setting.

• `pValues` is a pointer to an array of `count` values of the type indicated by `type` to configure the layer setting.

When multiple `VkLayerSettingsCreateInfoEXT` structures are chained and the same `pSettingName` is referenced for the same `pLayerName`, the value of the first reference of the layer setting is used.

Valid Usage (Implicit)

• VUID-VkLayerSettingEXT-pLayerName-parameter
  `pLayerName` must be a null-terminated UTF-8 string

• VUID-VkLayerSettingEXT-pSettingName-parameter
  `pSettingName` must be a null-terminated UTF-8 string

• VUID-VkLayerSettingEXT-type-parameter
  `type` must be a valid `VkLayerSettingTypeEXT` value
If `valueCount` is not 0, `pValues` must be a valid pointer to an array of `valueCount` bytes.

Possible values of `VkLayerSettingEXT::type`, specifying the type of the data returned in `VkLayerSettingEXT::pValues`, are:

```c
// Provided by VK_EXT_layer_settings
typedef enum VkLayerSettingTypeEXT {
    VK_LAYER_SETTING_TYPE_BOOL32_EXT = 0,
    VK_LAYER_SETTING_TYPE_INT32_EXT = 1,
    VK_LAYER_SETTING_TYPE_INT64_EXT = 2,
    VK_LAYER_SETTING_TYPE_UINT32_EXT = 3,
    VK_LAYER_SETTING_TYPE_UINT64_EXT = 4,
    VK_LAYER_SETTING_TYPE_FLOAT32_EXT = 5,
    VK_LAYER_SETTING_TYPE_FLOAT64_EXT = 6,
    VK_LAYER_SETTING_TYPE_STRING_EXT = 7,
} VkLayerSettingTypeEXT;
```

- `VK_LAYER_SETTING_TYPE_BOOL32_EXT` specifies that the layer setting’s type is `VkBool32`.
- `VK_LAYER_SETTING_TYPE_INT32_EXT` specifies that the layer setting’s type is signed 32-bit integer.
- `VK_LAYER_SETTING_TYPE_INT64_EXT` specifies that the layer setting’s type is signed 64-bit integer.
- `VK_LAYER_SETTING_TYPE_UINT32_EXT` specifies that the layer setting’s type is unsigned 32-bit integer.
- `VK_LAYER_SETTING_TYPE_UINT64_EXT` specifies that the layer setting’s type is unsigned 64-bit integer.
- `VK_LAYER_SETTING_TYPE_FLOAT32_EXT` specifies that the layer setting’s type is 32-bit floating-point.
- `VK_LAYER_SETTING_TYPE_FLOAT64_EXT` specifies that the layer setting’s type is 64-bit floating-point.
- `VK_LAYER_SETTING_TYPE_STRING_EXT` specifies that the layer setting’s type is a pointer to a null-terminated UTF-8 string.

The `VkApplicationInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkApplicationInfo {
    VkStructureType            sType;
    const void*                pNext;
    const char*                pApplicationName;
    uint32_t                    applicationVersion;
    const char*                pEngineName;
    uint32_t                    engineVersion;
    uint32_t                    apiVersion;
} VkApplicationInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.

• pApplicationName is NULL or is a pointer to a null-terminated UTF-8 string containing the name of the application.

• applicationVersion is an unsigned integer variable containing the developer-supplied version number of the application.

• pEngineName is NULL or is a pointer to a null-terminated UTF-8 string containing the name of the engine (if any) used to create the application.

• engineVersion is an unsigned integer variable containing the developer-supplied version number of the engine used to create the application.

• apiVersion must be the highest version of Vulkan that the application is designed to use, encoded as described in Version Numbers. The patch version number specified in apiVersion is ignored when creating an instance object. The variant version of the instance must match that requested in apiVersion.

Vulkan 1.0 implementations were required to return VK_ERROR_INCOMPATIBLE_DRIVER if apiVersion was larger than 1.0. Implementations that support Vulkan 1.1 or later must not return VK_ERROR_INCOMPATIBLE_DRIVER for any value of apiVersion.

Note
Because Vulkan 1.0 implementations may fail with VK_ERROR_INCOMPATIBLE_DRIVER, applications should determine the version of Vulkan available before calling vkCreateInstance. If the vkGetInstanceProcAddr returns NULL for vkEnumerateInstanceVersion, it is a Vulkan 1.0 implementation. Otherwise, the application can call vkEnumerateInstanceVersion to determine the version of Vulkan.

As long as the instance supports at least Vulkan 1.1, an application can use different versions of Vulkan with an instance than it does with a device or physical device.

Note
The Khronos validation layers will treat apiVersion as the highest API version the application targets, and will validate API usage against the minimum of that version and the implementation version (instance or device, depending on context). If an application tries to use functionality from a greater version than this, a validation error will be triggered.

For example, if the instance supports Vulkan 1.1 and three physical devices support Vulkan 1.0, Vulkan 1.1, and Vulkan 1.2, respectively, and if the application sets apiVersion to 1.2, the application can use the following versions of Vulkan:

• Vulkan 1.0 can be used with the instance and with all physical devices.

• Vulkan 1.1 can be used with the instance and with the physical devices that support Vulkan 1.1 and Vulkan 1.2.

• Vulkan 1.2 can be used with the physical device that supports Vulkan 1.2.
If we modify the above example so that the application sets `apiVersion` to 1.1, then the application must not use Vulkan 1.2 functionality on the physical device that supports Vulkan 1.2.

*Note*

Providing a `NULL` `VkInstanceCreateInfo::pApplicationInfo` or providing an `apiVersion` of 0 is equivalent to providing an `apiVersion` of `VK_MAKE_API_VERSION(0,1,0,0)`.

---

**Valid Usage**

- VUID-VkApplicationInfo-apiVersion-04010
  If `apiVersion` is not 0, then it must be greater than or equal to `VK_API_VERSION_1_0`

---

**Valid Usage (Implicit)**

- VUID-VkApplicationInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_APPLICATION_INFO`

- VUID-VkApplicationInfo-pNext-pNext
  `pNext` must be `NULL`

- VUID-VkApplicationInfo-pApplicationName-parameter
  If `pApplicationName` is not `NULL`, `pApplicationName` must be a null-terminated UTF-8 string

- VUID-VkApplicationInfo-pEngineName-parameter
  If `pEngineName` is not `NULL`, `pEngineName` must be a null-terminated UTF-8 string

---

To destroy an instance, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyInstance(
    VkInstance instance,
    const VkAllocationCallbacks* pAllocator);
```

- `instance` is the handle of the instance to destroy.
- `pAllocator` controls host memory allocation as described in the *Memory Allocation* chapter.

---

**Valid Usage**

- VUID-vkDestroyInstance-instance-00629
  All child objects created using `instance` must have been destroyed prior to destroying `instance`

- VUID-vkDestroyInstance-instance-00630
  If `VkAllocationCallbacks` were provided when `instance` was created, a compatible set of
callbacks must be provided here

- VUID-vkDestroyInstance-instance-00631
  If no `VkAllocationCallbacks` were provided when `instance` was created, `pAllocator` must be `NULL`

### Valid Usage (Implicit)

- VUID-vkDestroyInstance-instance-parameter
  If `instance` is not `NULL`, `instance` must be a valid `VkInstance` handle
- VUID-vkDestroyInstance-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

### Host Synchronization

- Host access to `instance` must be externally synchronized
- Host access to all `VkPhysicalDevice` objects enumerated from `instance` must be externally synchronized
Chapter 5. Devices and Queues

Once Vulkan is initialized, devices and queues are the primary objects used to interact with a Vulkan implementation.

Vulkan separates the concept of physical and logical devices. A physical device usually represents a single complete implementation of Vulkan (excluding instance-level functionality) available to the host, of which there are a finite number. A logical device represents an instance of that implementation with its own state and resources independent of other logical devices.

Physical devices are represented by VkPhysicalDevice handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkPhysicalDevice)
```

### 5.1. Physical Devices

To retrieve a list of physical device objects representing the physical devices installed in the system, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkEnumeratePhysicalDevices(
    VkInstance instance,
    uint32_t* pPhysicalDeviceCount,
    VkPhysicalDevice* pPhysicalDevices);
```

- `instance` is a handle to a Vulkan instance previously created with `vkCreateInstance`.
- `pPhysicalDeviceCount` is a pointer to an integer related to the number of physical devices available or queried, as described below.
- `pPhysicalDevices` is either NULL or a pointer to an array of VkPhysicalDevice handles.

If `pPhysicalDevices` is NULL, then the number of physical devices available is returned in `pPhysicalDeviceCount`. Otherwise, `pPhysicalDeviceCount` must point to a variable set by the user to the number of elements in the `pPhysicalDevices` array, and on return the variable is overwritten with the number of handles actually written to `pPhysicalDevices`. If `pPhysicalDeviceCount` is less than the number of physical devices available, at most `pPhysicalDeviceCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available physical devices were returned.

---

**Valid Usage (Implicit)**

- VUID-vkEnumeratePhysicalDevices-instance-parameter 
  `instance` must be a valid `VkInstance` handle
- VUID-vkEnumeratePhysicalDevices-pPhysicalDeviceCount-parameter
**Return Codes**

**Success**
- VK_SUCCESS
- VK_INCOMPLETE

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INITIALIZATION_FAILED

To query general properties of physical devices once enumerated, call:

```c
// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceProperties(
    VkPhysicalDevice physicalDevice,
    VkPhysicalDeviceProperties* pProperties);
```

- `physicalDevice` is the handle to the physical device whose properties will be queried.
- `pProperties` is a pointer to a `VkPhysicalDeviceProperties` structure in which properties are returned.

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceProperties-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceProperties-pProperties-parameter
  `pProperties` must be a valid pointer to a `VkPhysicalDeviceProperties` structure

The `VkPhysicalDeviceProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPhysicalDeviceProperties {
    uint32_t apiVersion;
    uint32_t driverVersion;
    uint32_t vendorID;
} VkPhysicalDeviceProperties;
```
### VkPhysicalDeviceProperties

- **apiVersion** is the version of Vulkan supported by the device, encoded as described in Version Numbers.
- **driverVersion** is the vendor-specified version of the driver.
- **vendorID** is a unique identifier for the vendor of the physical device.
- **deviceID** is a unique identifier for the physical device among devices available from the vendor.
- **deviceType** is a VkPhysicalDeviceType specifying the type of device.
- **deviceName** is an array of VK_MAX_PHYSICAL_DEVICE_NAME_SIZE char containing a null-terminated UTF-8 string which is the name of the device.
- **pipelineCacheUUID** is an array of VK_UUID_SIZE uint8_t values representing a universally unique identifier for the device.
- **limits** is the VkPhysicalDeviceLimits structure specifying device-specific limits of the physical device. See Limits for details.
- **sparseProperties** is the VkPhysicalDeviceSparseProperties structure specifying various sparse related properties of the physical device. See Sparse Properties for details.

#### Note

The value of **apiVersion** may be different than the version returned by vkEnumerateInstanceVersion; either higher or lower. In such cases, the application must not use functionality that exceeds the version of Vulkan associated with a given object. The **pApiVersion** parameter returned by vkEnumerateInstanceVersion is the version associated with a VkInstance and its children, except for a VkPhysicalDevice and its children. VkPhysicalDeviceProperties::apiVersion is the version associated with a VkPhysicalDevice and its children.

#### Note

The encoding of **driverVersion** is implementation-defined. It may not use the same encoding as **apiVersion**. Applications should follow information from the vendor on how to extract the version information from **driverVersion**.

On implementations that claim support for the Roadmap 2022 profile, the major and minor version expressed by **apiVersion** must be at least Vulkan 1.3.

The **vendorID** and **deviceID** fields are provided to allow applications to adapt to device characteristics that are not adequately exposed by other Vulkan queries.
Note
These may include performance profiles, hardware errata, or other characteristics.

The vendor identified by vendorID is the entity responsible for the most salient characteristics of the underlying implementation of the VkPhysicalDevice being queried.

Note
For example, in the case of a discrete GPU implementation, this should be the GPU chipset vendor. In the case of a hardware accelerator integrated into a system-on-chip (SoC), this should be the supplier of the silicon IP used to create the accelerator.

If the vendor has a PCI vendor ID, the low 16 bits of vendorID must contain that PCI vendor ID, and the remaining bits must be set to zero. Otherwise, the value returned must be a valid Khronos vendor ID, obtained as described in the Vulkan Documentation and Extensions: Procedures and Conventions document in the section “Registering a Vendor ID with Khronos”. Khronos vendor IDs are allocated starting at 0x10000, to distinguish them from the PCI vendor ID namespace. Khronos vendor IDs are symbolically defined in the VkVendorId type.

The vendor is also responsible for the value returned in deviceID. If the implementation is driven primarily by a PCI device with a PCI device ID, the low 16 bits of deviceID must contain that PCI device ID, and the remaining bits must be set to zero. Otherwise, the choice of what values to return may be dictated by operating system or platform policies - but should uniquely identify both the device version and any major configuration options (for example, core count in the case of multicore devices).

Note
The same device ID should be used for all physical implementations of that device version and configuration. For example, all uses of a specific silicon IP GPU version and configuration should use the same device ID, even if those uses occur in different SoCs.

Khronos vendor IDs which may be returned in VkPhysicalDeviceProperties::vendorID are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkVendorId {
    VK_VENDOR_ID_VIV = 0x10001,
    VK_VENDOR_ID_VSI = 0x10002,
    VK_VENDOR_ID_KAZAN = 0x10003,
    VK_VENDOR_ID_CODEPLAY = 0x10004,
    VK_VENDOR_ID_MESA = 0x10005,
    VK_VENDOR_ID_POCL = 0x10006,
    VK_VENDOR_ID_MOBILEYE = 0x10007,
} VkVendorId;
```
Khronos vendor IDs may be allocated by vendors at any time. Only the latest canonical versions of this Specification, of the corresponding `vk.xml` API Registry, and of the corresponding `vulkan_core.h` header file must contain all reserved Khronos vendor IDs.

Only Khronos vendor IDs are given symbolic names at present. PCI vendor IDs returned by the implementation can be looked up in the PCI-SIG database.

`VK_MAX_PHYSICAL_DEVICE_NAME_SIZE` is the length in `char` values of an array containing a physical device name string, as returned in `VkPhysicalDeviceProperties::deviceName`.

```c
#define VK_MAX_PHYSICAL_DEVICE_NAME_SIZE 256U
```

The physical device types which may be returned in `VkPhysicalDeviceProperties::deviceType` are:

```c
typedef enum VkPhysicalDeviceType {
    VK_PHYSICAL_DEVICE_TYPE_OTHER = 0,
    VK_PHYSICAL_DEVICE_TYPE_INTEGRATED_GPU = 1,
    VK_PHYSICAL_DEVICE_TYPE_DISCRETE_GPU = 2,
    VK_PHYSICAL_DEVICE_TYPE_VIRTUAL_GPU = 3,
    VK_PHYSICAL_DEVICE_TYPE_CPU = 4,
} VkPhysicalDeviceType;
```

- `VK_PHYSICAL_DEVICE_TYPE_OTHER` - the device does not match any other available types.
- `VK_PHYSICAL_DEVICE_TYPE_INTEGRATED_GPU` - the device is typically one embedded in or tightly coupled with the host.
- `VK_PHYSICAL_DEVICE_TYPE_DISCRETE_GPU` - the device is typically a separate processor connected to the host via an interlink.
- `VK_PHYSICAL_DEVICE_TYPE_VIRTUAL_GPU` - the device is typically a virtual node in a virtualization environment.
- `VK_PHYSICAL_DEVICE_TYPE_CPU` - the device is typically running on the same processors as the host.

The physical device type is advertised for informational purposes only, and does not directly affect the operation of the system. However, the device type may correlate with other advertised properties or capabilities of the system, such as how many memory heaps there are.

To query general properties of physical devices once enumerated, call:

```c
void vkGetPhysicalDeviceProperties2(
    VkPhysicalDevice physicalDevice,
    VkPhysicalDeviceProperties2* pProperties);
```
or the equivalent command

```c
// Provided by VK_KHR_get_physical_device_properties2
void vkGetPhysicalDeviceProperties2KHR(
    VkPhysicalDevice physicalDevice,
    VkPhysicalDeviceProperties2* pProperties);
```

- `physicalDevice` is the handle to the physical device whose properties will be queried.
- `pProperties` is a pointer to a `VkPhysicalDeviceProperties2` structure in which properties are returned.

Each structure in `pProperties` and its `pNext` chain contains members corresponding to implementation-dependent properties, behaviors, or limits. `vkGetPhysicalDeviceProperties2` fills in each member to specify the corresponding value for the implementation.

### Valid Usage (Implicit)

- `VUID-vkGetPhysicalDeviceProperties2-physicalDevice-parameter` physicalDevice must be a valid `VkPhysicalDevice` handle
- `VUID-vkGetPhysicalDeviceProperties2-pProperties-parameter` pProperties must be a valid pointer to a `VkPhysicalDeviceProperties2` structure

The `VkPhysicalDeviceProperties2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceProperties2 {  
    VkStructureType sType;              
    void* pNext;                       
    VkPhysicalDeviceProperties properties;
} VkPhysicalDeviceProperties2;
```

or the equivalent

```c
// Provided by VK_KHR_get_physical_device_properties2
typedef VkPhysicalDeviceProperties2 VkPhysicalDeviceProperties2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `properties` is a `VkPhysicalDeviceProperties` structure describing properties of the physical device. This structure is written with the same values as if it were written by `vkGetPhysicalDeviceProperties`.

The `pNext` chain of this structure is used to extend the structure with properties defined by extensions.
Valid Usage (Implicit)

- VUID-VkPhysicalDeviceProperties2-sType-sType
  The sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PROPERTIES_2

- VUID-VkPhysicalDeviceProperties2-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of
  - VkPhysicalDeviceAccelerationStructurePropertiesKHR,
  - VkPhysicalDeviceCooperativeMatrixPropertiesKHR,
  - VkPhysicalDeviceDepthStencilResolveProperties,
  - VkPhysicalDeviceDescriptorIndexingProperties,
  - VkPhysicalDeviceDiscardRectanglePropertiesEXT,
  - VkPhysicalDeviceDriverProperties,
  - VkPhysicalDeviceExtendedDynamicState3PropertiesEXT,
  - VkPhysicalDeviceDescriptorIndexingProperties,
  - VkPhysicalDeviceDiscardRectanglePropertiesEXT,
  - VkPhysicalDeviceDriverProperties,
  - VkPhysicalDeviceExtendedDynamicState3PropertiesEXT,
  - VkPhysicalDeviceDescriptorIndexingProperties,
  - VkPhysicalDeviceDiscardRectanglePropertiesEXT,
  - VkPhysicalDeviceDriverProperties,
  - VkPhysicalDeviceExtendedDynamicState3PropertiesEXT,
  - VkPhysicalDeviceDescriptorIndexingProperties,
  - VkPhysicalDeviceDiscardRectanglePropertiesEXT,
  - VkPhysicalDeviceDriverProperties,
  -VkPhysicalDeviceExtendedDynamicState3PropertiesEXT,
  - VkPhysicalDeviceDescriptorIndexingProperties,
  - VkPhysicalDeviceDiscardRectanglePropertiesEXT,
  - VkPhysicalDeviceDriverProperties,
  - VkPhysicalDeviceExtendedDynamicState3PropertiesEXT,
  - VkPhysicalDeviceDescriptorIndexingProperties,
  - VkPhysicalDeviceDiscardRectanglePropertiesEXT,
  - VkPhysicalDeviceDriverProperties,
  - VkPhysicalDeviceExtendedDynamicState3PropertiesEXT,
  - VkPhysicalDeviceDescriptorIndexingProperties,
  - VkPhysicalDeviceDiscardRectanglePropertiesEXT,
  - VkPhysicalDeviceDriverProperties,
  - VkPhysicalDeviceExtendedDynamicState3PropertiesEXT,
  - VkPhysicalDeviceDescriptorIndexingProperties,
  - VkPhysicalDeviceDiscardRectanglePropertiesEXT,
  - VkPhysicalDeviceDriverProperties,
  - VkPhysicalDeviceExtendedDynamicState3PropertiesEXT,
  - VkPhysicalDeviceDescriptorIndexingProperties,
  - VkPhysicalDeviceDiscardRectanglePropertiesEXT,
  - VkPhysicalDeviceDriverProperties,
  - VkPhysicalDeviceExtendedDynamicState3PropertiesEXT,
  - VkPhysicalDeviceDescriptorIndexingProperties,
  - VkPhysicalDeviceDiscardRectanglePropertiesEXT,
  - VkPhysicalDeviceDriverProperties,
  - VkPhysicalDeviceExtendedDynamicState3PropertiesEXT,
  - VkPhysicalDeviceDescriptorIndexingProperties,
  - VkPhysicalDeviceDiscardRectanglePropertiesEXT,
  - VkPhysicalDeviceDriverProperties,
  - VkPhysicalDeviceExtendedDynamicState3PropertiesEXT,
  - VkPhysicalDeviceDescriptorIndexingProperties,
  - VkPhysicalDeviceDiscardRectanglePropertiesEXT,
  - VkPhysicalDeviceDriverProperties,
  - VkPhysicalDeviceExtendedDynamicState3PropertiesEXT,
  - VkPhysicalDeviceDescriptorIndexingProperties,
  - VkPhysicalDeviceDiscardRectanglePropertiesEXT,
  - VkPhysicalDeviceDriverProperties,
  - VkPhysicalDeviceExtendedDynamicState3PropertiesEXT,
  - VkPhysicalDeviceDescriptorIndexingProperties,
  - VkPhysicalDeviceDiscardRectanglePropertiesEXT,
  - VkPhysicalDeviceDriverProperties,
  - VkPhysicalDeviceExtendedDynamicState3PropertiesEXT,
  - VkPhysicalDeviceDescriptorIndexingProperties,
  - VkPhysicalDeviceDiscardRectanglePropertiesEXT,
  - VkPhysicalDeviceDriverProperties,
  - VkPhysicalDeviceExtendedDynamicState3PropertiesEXT,
  - VkPhysicalDeviceDescriptorIndexingProperties,
  - VkPhysicalDeviceDiscardRectanglePropertiesEXT,
  - VkPhysicalDeviceDriverProperties,
  - VkPhysicalDeviceExtendedDynamicState3PropertiesEXT,
  - VkPhysicalDeviceDescriptorIndexingProperties,
  - VkPhysicalDeviceDiscardRectanglePropertiesEXT,
  - VkPhysicalDeviceDriverProperties,
  - VkPhysicalDeviceExtendedDynamicState3PropertiesEXT,
  - VkPhysicalDeviceDescriptorIndexingProperties,
  - VkPhysicalDeviceDiscardRectanglePropertiesEXT,
  - VkPhysicalDeviceDriverProperties,
  - VkPhysicalDeviceExtendedDynamicState3PropertiesEXT,
  - VkPhysicalDeviceDescriptorIndexingProperties,
  - VkPhysicalDeviceDiscardRectanglePropertiesEXT,
  - VkPhysicalDeviceDriverProperties,
  - VkPhysicalDeviceExtendedDynamicState3PropertiesEXT,
  - VkPhysicalDeviceDescriptorIndexingProperties,
  - VkPhysicalDeviceDiscardRectanglePropertiesEXT,
  - VkPhysicalDeviceDriverProperties,
  - VkPhysicalDeviceExtendedDynamicState3PropertiesEXT,
  - VkPhysicalDeviceDescriptorIndexingProperties,
  - VkPhysicalDeviceDiscardRectanglePropertiesEXT,
  - VkPhysicalDeviceDriverProperties,
  - VkPhysicalDeviceExtendedDynamicState3PropertiesEXT,
  - VkPhysicalDeviceDescriptorIndexingProperties,
  - VkPhysicalDeviceDiscardRectanglePropertiesEXT,
  - VkPhysicalDeviceDriverProperties,
  - VkPhysicalDeviceExtendedDynamicState3PropertiesEXT,
  - VkPhysicalDeviceDescriptorIndexingProperties,
  - VkPhysicalDeviceDiscardRectanglePropertiesEXT,
  - VkPhysicalDeviceDriverProperties,

  - VkPhysicalDeviceDescriptorIndexingProperties,
  - VkPhysicalDeviceDiscardRectanglePropertiesEXT,
  - VkPhysicalDeviceDriverProperties,
  - VkPhysicalDeviceExtendedDynamicState3PropertiesEXT,
  - VkPhysicalDeviceDescriptorIndexingProperties,
  - VkPhysicalDeviceDiscardRectanglePropertiesEXT,
  - VkPhysicalDeviceDriverProperties,
  - VkPhysicalDeviceExtendedDynamicState3PropertiesEXT,
  - VkPhysicalDeviceDescriptorIndexingProperties,
  - VkPhysicalDeviceDiscardRectanglePropertiesEXT,
  - VkPhysicalDeviceDriverProperties,
  - VkPhysicalDeviceExtendedDynamicState3PropertiesEXT,
// Provided by VK_VERSION_1_2

typedef struct VkPhysicalDeviceVulkan11Properties {
    VkStructureType sType;
    void* pNext;
    uint8_t deviceUUID[VK_UUID_SIZE];
    uint8_t driverUUID[VK_UUID_SIZE];
    uint8_t deviceLUID[VK_LUID_SIZE];
    VkBool32 deviceLUIDValid;
    uint32_t subgroupSize;
    VkShaderStageFlags subgroupSupportedStages;
    VkSubgroupFeatureFlags subgroupSupportedOperations;
    VkBool32 subgroupQuadOperationsInAllStages;
    VkPointClippingBehavior pointClippingBehavior;
    uint32_t maxMultiviewViewCount;
    uint32_t maxMultiviewInstanceIndex;
    VkBool32 protectedNoFault;
    uint32_t maxPerSetDescriptors;
    VkDeviceSize maxMemoryAllocationSize;
} VkPhysicalDeviceVulkan11Properties;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **deviceUUID** is an array of `VK_UUID_SIZE uint8_t` values representing a universally unique identifier for the device.
- **driverUUID** is an array of `VK_UUID_SIZE uint8_t` values representing a universally unique identifier for the driver build in use by the device.
- **deviceLUID** is an array of `VK_LUID_SIZE uint8_t` values representing a locally unique identifier for the device.
- **deviceNodeMask** is a `uint32_t` bitfield identifying the node within a linked device adapter corresponding to the device.
- **deviceLUIDValid** is a boolean value that will be `VK_TRUE` if `deviceLUID` contains a valid LUID and `deviceNodeMask` contains a valid node mask, and `VK_FALSE` if they do not.
- **subgroupSize** is the default number of invocations in each subgroup. `subgroupSize` is at least 1 if any of the physical device’s queues support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`. `subgroupSize` is a power-of-two.
- **subgroupSupportedStages** is a bitfield of `VkShaderStageFlagBits` describing the shader stages that group operations with subgroup scope are supported in. `subgroupSupportedStages` will have the `VK_SHADER_STAGE_COMPUTE_BIT` bit set if any of the physical device’s queues support `VK_QUEUE_COMPUTE_BIT`.
- **subgroupSupportedOperations** is a bitmask of `VkSubgroupFeatureFlagBits` specifying the sets of group operations with subgroup scope supported on this device. `subgroupSupportedOperations` will have the `VK_SUBGROUP_FEATURE_BASIC_BIT` bit set if any of the physical device’s queues support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`.

95
• `subgroupQuadOperationsInAllStages` is a boolean specifying whether quad group operations are available in all stages, or are restricted to fragment and compute stages.

• `pointClippingBehavior` is a `VkPointClippingBehavior` value specifying the point clipping behavior supported by the implementation.

• `maxMultiviewViewCount` is one greater than the maximum view index that can be used in a subpass.

• `maxMultiviewInstanceIndex` is the maximum valid value of instance index allowed to be generated by a drawing command recorded within a subpass of a multiview render pass instance.

• `protectedNoFault` specifies how an implementation behaves when an application attempts to write to unprotected memory in a protected queue operation, read from protected memory in an unprotected queue operation, or perform a query in a protected queue operation. If this limit is `VK_TRUE`, such writes will be discarded or have undefined values written, reads and queries will return undefined values. If this limit is `VK_FALSE`, applications must not perform these operations. See Protected Memory Access Rules for more information.

• `maxPerSetDescriptors` is a maximum number of descriptors (summed over all descriptor types) in a single descriptor set that is guaranteed to satisfy any implementation-dependent constraints on the size of a descriptor set itself. Applications can query whether a descriptor set that goes beyond this limit is supported using `vkGetDescriptorSetLayoutSupport`.

• `maxMemoryAllocationSize` is the maximum size of a memory allocation that can be created, even if there is more space available in the heap.

If the `VkPhysicalDeviceVulkan11Properties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These properties correspond to Vulkan 1.1 functionality.

The members of `VkPhysicalDeviceVulkan11Properties` have the same values as the corresponding members of `VkPhysicalDeviceIDProperties`, `VkPhysicalDeviceSubgroupProperties`, `VkPhysicalDevicePointClippingProperties`, `VkPhysicalDeviceMultiviewProperties`, `VkPhysicalDeviceProtectedMemoryProperties`, and `VkPhysicalDeviceMaintenance3Properties`.

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• driverID is a unique identifier for the driver of the physical device.
• driverName is an array of VK_MAX_DRIVER_NAME_SIZE char containing a null-terminated UTF-8 string which is the name of the driver.
• driverInfo is an array of VK_MAX_DRIVER_INFO_SIZE char containing a null-terminated UTF-8 string with additional information about the driver.
• conformanceVersion is the version of the Vulkan conformance test this driver is conformant against (see VkConformanceVersion).
• denormBehaviorIndependence is a VkShaderFloatControlsIndependence value indicating whether, and how, denorm behavior can be set independently for different bit widths.
• roundingModeIndependence is a VkShaderFloatControlsIndependence value indicating whether, and how, rounding modes can be set independently for different bit widths.
• shaderSignedZeroInfNanPreserveFloat16 is a boolean value indicating whether sign of a zero, Nans and ±∞ can be preserved in 16-bit floating-point computations. It also indicates whether the SignedZeroInfNanPreserve execution mode can be used for 16-bit floating-point types.
• shaderSignedZeroInfNanPreserveFloat32 is a boolean value indicating whether sign of a zero, Nans and ±∞ can be preserved in 32-bit floating-point computations. It also indicates whether the SignedZeroInfNanPreserve execution mode can be used for 32-bit floating-point types.
• shaderSignedZeroInfNanPreserveFloat64 is a boolean value indicating whether sign of a zero, Nans and ±∞ can be preserved in 64-bit floating-point computations. It also indicates whether the SignedZeroInfNanPreserve execution mode can be used for 64-bit floating-point types.
• shaderDenormPreserveFloat16 is a boolean value indicating whether denormals can be preserved in 16-bit floating-point computations. It also indicates whether the DenormPreserve execution mode can be used for 16-bit floating-point types.
• shaderDenormPreserveFloat32 is a boolean value indicating whether denormals can be preserved
in 32-bit floating-point computations. It also indicates whether the DenormPreserve execution mode can be used for 32-bit floating-point types.

- shaderDenormPreserveFloat64 is a boolean value indicating whether denormals can be preserved in 64-bit floating-point computations. It also indicates whether the DenormPreserve execution mode can be used for 64-bit floating-point types.

- shaderDenormFlushToZeroFloat16 is a boolean value indicating whether denormals can be flushed to zero in 16-bit floating-point computations. It also indicates whether the DenormFlushToZero execution mode can be used for 16-bit floating-point types.

- shaderDenormFlushToZeroFloat32 is a boolean value indicating whether denormals can be flushed to zero in 32-bit floating-point computations. It also indicates whether the DenormFlushToZero execution mode can be used for 32-bit floating-point types.

- shaderDenormFlushToZeroFloat64 is a boolean value indicating whether denormals can be flushed to zero in 64-bit floating-point computations. It also indicates whether the DenormFlushToZero execution mode can be used for 64-bit floating-point types.

- shaderRoundingModeRTEFloat16 is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 16-bit floating-point arithmetic and conversion instructions. It also indicates whether the RoundingModeRTE execution mode can be used for 16-bit floating-point types.

- shaderRoundingModeRTEFloat32 is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 32-bit floating-point arithmetic and conversion instructions. It also indicates whether the RoundingModeRTE execution mode can be used for 32-bit floating-point types.

- shaderRoundingModeRTEFloat64 is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 64-bit floating-point arithmetic and conversion instructions. It also indicates whether the RoundingModeRTE execution mode can be used for 64-bit floating-point types.

- shaderRoundingModeRTZFloat16 is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 16-bit floating-point arithmetic and conversion instructions. It also indicates whether the RoundingModeRTZ execution mode can be used for 16-bit floating-point types.

- shaderRoundingModeRTZFloat32 is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 32-bit floating-point arithmetic and conversion instructions. It also indicates whether the RoundingModeRTZ execution mode can be used for 32-bit floating-point types.

- shaderRoundingModeRTZFloat64 is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 64-bit floating-point arithmetic and conversion instructions. It also indicates whether the RoundingModeRTZ execution mode can be used for 64-bit floating-point types.

- maxUpdateAfterBindDescriptorsInAllPools is the maximum number of descriptors (summed over all descriptor types) that can be created across all pools that are created with the VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT bit set. Pool creation may fail when this limit is exceeded, or when the space this limit represents is unable to satisfy a pool creation due to fragmentation.
• **shaderUniformBufferArrayNonUniformIndexingNative** is a boolean value indicating whether uniform buffer descriptors natively support nonuniform indexing. If this is `VK_FALSE`, then a single dynamic instance of an instruction that nonuniformly indexes an array of uniform buffers may execute multiple times in order to access all the descriptors.

• **shaderSampledImageArrayNonUniformIndexingNative** is a boolean value indicating whether sampler and image descriptors natively support nonuniform indexing. If this is `VK_FALSE`, then a single dynamic instance of an instruction that nonuniformly indexes an array of samplers or images may execute multiple times in order to access all the descriptors.

• **shaderStorageBufferArrayNonUniformIndexingNative** is a boolean value indicating whether storage buffer descriptors natively support nonuniform indexing. If this is `VK_FALSE`, then a single dynamic instance of an instruction that nonuniformly indexes an array of storage buffers may execute multiple times in order to access all the descriptors.

• **shaderStorageImageArrayNonUniformIndexingNative** is a boolean value indicating whether storage image descriptors natively support nonuniform indexing. If this is `VK_FALSE`, then a single dynamic instance of an instruction that nonuniformly indexes an array of storage images may execute multiple times in order to access all the descriptors.

• **shaderInputAttachmentArrayNonUniformIndexingNative** is a boolean value indicating whether input attachment descriptors natively support nonuniform indexing. If this is `VK_FALSE`, then a single dynamic instance of an instruction that nonuniformly indexes an array of input attachments may execute multiple times in order to access all the descriptors.

• **robustBufferAccessUpdateAfterBind** is a boolean value indicating whether `robustBufferAccess` can be enabled on a device simultaneously with `descriptorBindingUniformBufferUpdateAfterBind`, `descriptorBindingStorageBufferUpdateAfterBind`, `descriptorBindingUniformTexelBufferUpdateAfterBind`, and/or `descriptorBindingStorageTexelBufferUpdateAfterBind`. If this is `VK_FALSE`, then either `robustBufferAccess` must be disabled or all of these update-after-bind features must be disabled.

• **quadDivergentImplicitLod** is a boolean value indicating whether implicit LOD calculations for image operations have well-defined results when the image and/or sampler objects used for the instruction are not uniform within a quad. See **Derivative Image Operations**.

• **maxPerStageDescriptorUpdateAfterBindSamplers** is similar to **maxPerStageDescriptorSamplers** but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

• **maxPerStageDescriptorUpdateAfterBindUniformBuffers** is similar to **maxPerStageDescriptorUniformBuffers** but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

• **maxPerStageDescriptorUpdateAfterBindStorageBuffers** is similar to **maxPerStageDescriptorStorageBuffers** but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

• **maxPerStageDescriptorUpdateAfterBindSampledImages** is similar to **maxPerStageDescriptorSampledImages** but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

• **maxPerStageDescriptorUpdateAfterBindStorageImages** is similar to **maxPerStageDescriptorStorageImages** but counts descriptors from descriptor sets created with or
without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set.

- **maxPerStageDescriptorUpdateAfterBindInputAttachments** is similar to **maxPerStageDescriptorInputAttachments** but counts descriptors from descriptor sets created with or without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set.

- **maxPerStageUpdateAfterBindResources** is similar to **maxPerStageResources** but counts descriptors from descriptor sets created with or without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set.

- **maxDescriptorSetUpdateAfterBindSamplers** is similar to **maxDescriptorSetSamplers** but counts descriptors from descriptor sets created with or without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set.

- **maxDescriptorSetUpdateAfterBindUniformBuffers** is similar to **maxDescriptorSetUniformBuffers** but counts descriptors from descriptor sets created with or without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set.

- **maxDescriptorSetUpdateAfterBindUniformBuffersDynamic** is similar to **maxDescriptorSetUniformBuffersDynamic** but counts descriptors from descriptor sets created with or without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set. While an application can allocate dynamic uniform buffer descriptors from a pool created with the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT, bindings for these descriptors must not be present in any descriptor set layout that includes bindings created with VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT.

- **maxDescriptorSetUpdateAfterBindStorageBuffers** is similar to **maxDescriptorSetStorageBuffers** but counts descriptors from descriptor sets created with or without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set.

- **maxDescriptorSetUpdateAfterBindStorageBuffersDynamic** is similar to **maxDescriptorSetStorageBuffersDynamic** but counts descriptors from descriptor sets created with or without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set. While an application can allocate dynamic storage buffer descriptors from a pool created with the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT, bindings for these descriptors must not be present in any descriptor set layout that includes bindings created with VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT.

- **maxDescriptorSetUpdateAfterBindSampledImages** is similar to **maxDescriptorSetSampledImages** but counts descriptors from descriptor sets created with or without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set.

- **maxDescriptorSetUpdateAfterBindStorageImages** is similar to **maxDescriptorSetStorageImages** but counts descriptors from descriptor sets created with or without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set.

- **maxDescriptorSetUpdateAfterBindInputAttachments** is similar to **maxDescriptorSetInputAttachments** but counts descriptors from descriptor sets created with or without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set.

- **supportedDepthResolveModes** is a bitmask of VkResolveModeFlagBits indicating the set of supported depth resolve modes. VK_RESOLVE_MODE_SAMPLE_ZERO_BIT must be included in the set but implementations may support additional modes.

- **supportedStencilResolveModes** is a bitmask of VkResolveModeFlagBits indicating the set of
supported stencil resolve modes. \texttt{VK\_RESOLVE\_MODE\_SAMPLE\_ZERO\_BIT} \textbf{must} be included in the set but implementations \textbf{may} support additional modes. \texttt{VK\_RESOLVE\_MODE\_AVERAGE\_BIT} \textbf{must} not be included in the set.

- \texttt{independentResolveNone} \textbf{is} \texttt{VK\_TRUE} \textbf{if} the implementation supports setting the depth and stencil resolve modes to different values when one of those modes is \texttt{VK\_RESOLVE\_MODE\_NONE}. Otherwise the implementation only supports setting both modes to the same value.

- \texttt{independentResolve} \textbf{is} \texttt{VK\_TRUE} \textbf{if} the implementation supports all combinations of the supported depth and stencil resolve modes, including setting either depth or stencil resolve mode to \texttt{VK\_RESOLVE\_MODE\_NONE}. An implementation that supports \texttt{independentResolve} \textbf{must} also support \texttt{independentResolveNone}.

- \texttt{filterMinmaxSingleComponentFormats} \textbf{is} a boolean value indicating whether a minimum set of required formats support min/max filtering.

- \texttt{filterMinmaxImageComponentMapping} \textbf{is} a boolean value indicating whether the implementation supports non-identity component mapping of the image when doing min/max filtering.

- \texttt{maxTimelineSemaphoreValueDifference} \textbf{indicates} the maximum difference allowed by the implementation between the current value of a timeline semaphore and any pending signal or wait operations.

- \texttt{framebufferIntegerColorSampleCounts} \textbf{is} a bitmask of \texttt{VkSampleCountFlagBits} indicating the color sample counts that are supported for all framebuffer color attachments with integer formats.

If the \texttt{VkPhysicalDeviceVulkan12Properties} structure is included in the \texttt{pNext} chain of the \texttt{VkPhysicalDeviceProperties2} structure passed to \texttt{vkGetPhysicalDeviceProperties2}, it is filled in with each corresponding implementation-dependent property.

These properties correspond to Vulkan 1.2 functionality.

The members of \texttt{VkPhysicalDeviceVulkan12Properties} \textbf{must} have the same values as the corresponding members of \texttt{VkPhysicalDeviceDriverProperties}, \texttt{VkPhysicalDeviceFloatControlsProperties}, \texttt{VkPhysicalDeviceDescriptorIndexingProperties}, \texttt{VkPhysicalDeviceDepthStencilResolveProperties}, \texttt{VkPhysicalDeviceSamplerFilterMinmaxProperties}, and \texttt{VkPhysicalDeviceTimelineSemaphoreProperties}.

### Valid Usage (Implicit)

- \texttt{VUID-VkPhysicalDeviceVulkan12Properties-sType-sType} \textbf{sType} \textbf{must} be \texttt{VK\_STRUCTURE\_TYPE\_PHYSICAL\_DEVICE\_VULKAN\_1\_2\_PROPERTIES}

The \texttt{VkPhysicalDeviceVulkan13Properties} structure is defined as:

```c

}

VkPhysicalDeviceVulkan13Properties;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.

- **minSubgroupSize** is the minimum subgroup size supported by this device. `minSubgroupSize` is at least one if any of the physical device’s queues support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`. `minSubgroupSize` is a power-of-two. `minSubgroupSize` is less than or equal to `maxSubgroupSize`. `minSubgroupSize` is less than or equal to `subgroupSize`.

- **maxSubgroupSize** is the maximum subgroup size supported by this device. `maxSubgroupSize` is at least one if any of the physical device’s queues support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`. `maxSubgroupSize` is a power-of-two. `maxSubgroupSize` is greater than or equal to `minSubgroupSize`. `maxSubgroupSize` is greater than or equal to `subgroupSize`.

- **maxComputeWorkgroupSubgroups** is the maximum number of subgroups supported by the implementation within a workgroup.

- **requiredSubgroupSizeStages** is a bitfield of what shader stages support having a required subgroup size specified.

- **maxInlineUniformBlockSize** is the maximum size in bytes of an inline uniform block binding.

- **maxPerStageDescriptorInlineUniformBlocks** is the maximum number of inline uniform block bindings that can be accessible to a single shader stage in a pipeline layout. Descriptor bindings with a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` count against this limit. Only descriptor bindings in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit.

- **maxPerStageDescriptorUpdateAfterBindInlineUniformBlocks** is similar to `maxPerStageDescriptorInlineUniformBlocks` but counts descriptor bindings from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

- **maxDescriptorSetInlineUniformBlocks** is the maximum number of inline uniform block bindings that can be included in descriptor bindings in a pipeline layout across all pipeline shader stages and descriptor set numbers. Descriptor bindings with a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` count against this limit. Only descriptor bindings in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit.

- **maxDescriptorSetUpdateAfterBindInlineUniformBlocks** is similar to `maxDescriptorSetInlineUniformBlocks` but counts descriptor bindings from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

- **maxInlineUniformTotalSize** is the maximum total size in bytes of all inline uniform block
bindings, across all pipeline shader stages and descriptor set numbers, that can be included in a pipeline layout. Descriptor bindings with a descriptor type of \texttt{VK\_DESCRIPTOR\_TYPE\_INLINE\_UNIFORM\_BLOCK} count against this limit.

- \texttt{integerDotProduct8BitUnsignedAccelerated} is a boolean that will be \texttt{VK\_TRUE} if the support for 8-bit unsigned dot product operations using the \texttt{OpUDotKHR} SPIR-V instruction is accelerated as defined below.

- \texttt{integerDotProduct8BitSignedAccelerated} is a boolean that will be \texttt{VK\_TRUE} if the support for 8-bit signed dot product operations using the \texttt{OpSDotKHR} SPIR-V instruction is accelerated as defined below.

- \texttt{integerDotProduct8BitMixedSignednessAccelerated} is a boolean that will be \texttt{VK\_TRUE} if the support for 8-bit mixed signedness dot product operations using the \texttt{OpSUDotKHR} SPIR-V instruction is accelerated as defined below.

- \texttt{integerDotProduct4x8BitPackedUnsignedAccelerated} is a boolean that will be \texttt{VK\_TRUE} if the support for 8-bit unsigned dot product operations from operands packed into 32-bit integers using the \texttt{OpUDotKHR} SPIR-V instruction is accelerated as defined below.

- \texttt{integerDotProduct4x8BitPackedSignedAccelerated} is a boolean that will be \texttt{VK\_TRUE} if the support for 8-bit signed dot product operations from operands packed into 32-bit integers using the \texttt{OpSDotKHR} SPIR-V instruction is accelerated as defined below.

- \texttt{integerDotProduct4x8BitPackedMixedSignednessAccelerated} is a boolean that will be \texttt{VK\_TRUE} if the support for 8-bit mixed signedness dot product operations from operands packed into 32-bit integers using the \texttt{OpSUDotKHR} SPIR-V instruction is accelerated as defined below.

- \texttt{integerDotProduct16BitUnsignedAccelerated} is a boolean that will be \texttt{VK\_TRUE} if the support for 16-bit unsigned dot product operations using the \texttt{OpUDotKHR} SPIR-V instruction is accelerated as defined below.

- \texttt{integerDotProduct16BitSignedAccelerated} is a boolean that will be \texttt{VK\_TRUE} if the support for 16-bit signed dot product operations using the \texttt{OpSDotKHR} SPIR-V instruction is accelerated as defined below.

- \texttt{integerDotProduct16BitMixedSignednessAccelerated} is a boolean that will be \texttt{VK\_TRUE} if the support for 16-bit mixed signedness dot product operations using the \texttt{OpSUDotKHR} SPIR-V instruction is accelerated as defined below.

- \texttt{integerDotProduct32BitUnsignedAccelerated} is a boolean that will be \texttt{VK\_TRUE} if the support for 32-bit unsigned dot product operations using the \texttt{OpUDotKHR} SPIR-V instruction is accelerated as defined below.

- \texttt{integerDotProduct32BitSignedAccelerated} is a boolean that will be \texttt{VK\_TRUE} if the support for 32-bit signed dot product operations using the \texttt{OpSDotKHR} SPIR-V instruction is accelerated as defined below.

- \texttt{integerDotProduct32BitMixedSignednessAccelerated} is a boolean that will be \texttt{VK\_TRUE} if the support for 32-bit mixed signedness dot product operations using the \texttt{OpSUDotKHR} SPIR-V instruction is accelerated as defined below.

- \texttt{integerDotProduct64BitUnsignedAccelerated} is a boolean that will be \texttt{VK\_TRUE} if the support for 64-bit unsigned dot product operations using the \texttt{OpUDotKHR} SPIR-V instruction is accelerated as defined below.
• integerDotProduct64BitSignedAccelerated is a boolean that will be \textit{VK_TRUE} if the support for 64-bit signed dot product operations using the \texttt{OpSDotKHR} SPIR-V instruction is accelerated as defined below.

• integerDotProduct64BitMixedSignednessAccelerated is a boolean that will be \textit{VK_TRUE} if the support for 64-bit mixed signedness dot product operations using the \texttt{OpSUDotKHR} SPIR-V instruction is accelerated as defined below.

• integerDotProductAccumulatingSaturating8BitUnsignedAccelerated is a boolean that will be \textit{VK_TRUE} if the support for 8-bit unsigned accumulating saturating dot product operations using the \texttt{OpUDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

• integerDotProductAccumulatingSaturating8BitSignedAccelerated is a boolean that will be \textit{VK_TRUE} if the support for 8-bit signed accumulating saturating dot product operations using the \texttt{OpSDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

• integerDotProductAccumulatingSaturating8BitMixedSignednessAccelerated is a boolean that will be \textit{VK_TRUE} if the support for 8-bit mixed signedness accumulating saturating dot product operations using the \texttt{OpSUDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

• integerDotProductAccumulatingSaturating4x8BitPackedUnsignedAccelerated is a boolean that will be \textit{VK_TRUE} if the support for 8-bit unsigned accumulating saturating dot product operations from operands packed into 32-bit integers using the \texttt{OpUDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

• integerDotProductAccumulatingSaturating4x8BitPackedSignedAccelerated is a boolean that will be \textit{VK_TRUE} if the support for 8-bit signed accumulating saturating dot product operations from operands packed into 32-bit integers using the \texttt{OpSDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

• integerDotProductAccumulatingSaturating4x8BitPackedMixedSignednessAccelerated is a boolean that will be \textit{VK_TRUE} if the support for 8-bit mixed signedness accumulating saturating dot product operations from operands packed into 32-bit integers using the \texttt{OpSUDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

• integerDotProductAccumulatingSaturating16BitUnsignedAccelerated is a boolean that will be \textit{VK_TRUE} if the support for 16-bit unsigned accumulating saturating dot product operations using the \texttt{OpUDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

• integerDotProductAccumulatingSaturating16BitSignedAccelerated is a boolean that will be \textit{VK_TRUE} if the support for 16-bit signed accumulating saturating dot product operations using the \texttt{OpSDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

• integerDotProductAccumulatingSaturating16BitMixedSignednessAccelerated is a boolean that will be \textit{VK_TRUE} if the support for 16-bit mixed signedness accumulating saturating dot product operations using the \texttt{OpSUDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

• integerDotProductAccumulatingSaturating32BitUnsignedAccelerated is a boolean that will be \textit{VK_TRUE} if the support for 32-bit unsigned accumulating saturating dot product operations using the \texttt{OpUDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

• integerDotProductAccumulatingSaturating32BitSignedAccelerated is a boolean that will be \textit{VK_TRUE} if the support for 32-bit signed accumulating saturating dot product operations using the \texttt{OpSDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

• integerDotProductAccumulatingSaturating32BitMixedSignednessAccelerated is a boolean that will
be VK_TRUE if the support for 32-bit mixed signedness accumulating saturating dot product operations using the OpSUDotAccSatAccumulating Saturating Dot ProductKHR SPIR-V instruction is accelerated as defined below.

• integerDotProductAccumulatingSaturating64BitUnsignedAccelerated is a boolean that will be VK_TRUE if the support for 64-bit unsigned accumulating saturating dot product operations using the OpUDotAccSatKHR SPIR-V instruction is accelerated as defined below.

• integerDotProductAccumulatingSaturating64BitSignedAccelerated is a boolean that will be VK_TRUE if the support for 64-bit signed accumulating saturating dot product operations using the OpSDotAccSatKHR SPIR-V instruction is accelerated as defined below.

• integerDotProductAccumulatingSaturating64BitMixedSignednessAccelerated is a boolean that will be VK_TRUE if the support for 64-bit mixed signedness accumulating saturating dot product operations using the OpSUDotAccSatKHR SPIR-V instruction is accelerated as defined below.

• storageTexelBufferOffsetAlignmentBytes is a byte alignment that is sufficient for a storage texel buffer of any format. The value must be a power of two.

• storageTexelBufferOffsetSingleTexelAlignment indicates whether single texel alignment is sufficient for a storage texel buffer of any format.

• uniformTexelBufferOffsetAlignmentBytes is a byte alignment that is sufficient for a uniform texel buffer of any format. The value must be a power of two.

• uniformTexelBufferOffsetSingleTexelAlignment indicates whether single texel alignment is sufficient for a uniform texel buffer of any format.

• maxBufferSize is the maximum size VkBuffer that can be created.

If the VkPhysicalDeviceVulkan13Properties structure is included in the pNext chain of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with each corresponding implementation-dependent property.

These properties correspond to Vulkan 1.3 functionality.

The members of VkPhysicalDeviceVulkan13Properties must have the same values as the corresponding members of VkPhysicalDeviceInlineUniformBlockProperties and VkPhysicalDeviceSubgroupSizeControlProperties.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVulkan13Properties-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_1_3_PROPERTIES

The VkPhysicalDeviceIDProperties structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceIDProperties {
    VkStructureType   sType;
    void*              pNext;
    uint8_t            deviceUUID[VK_UUID_SIZE];
    uint8_t            driverUUID[VK_UUID_SIZE];
} VkPhysicalDeviceIDProperties;
```
typedef VkPhysicalDeviceIDProperties VkPhysicalDeviceIDPropertiesKHR;

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.

- **deviceUUID** is an array of **VK_UUID_SIZE** `uint8_t` values representing a universally unique identifier for the device.
- **driverUUID** is an array of **VK_UUID_SIZE** `uint8_t` values representing a universally unique identifier for the driver build in use by the device.
- **deviceLUID** is an array of **VK_LUID_SIZE** `uint8_t` values representing a locally unique identifier for the device.
- **deviceNodeMask** is a `uint32_t` bitfield identifying the node within a linked device adapter corresponding to the device.
- **deviceLUIDValid** is a boolean value that will be **VK_TRUE** if **deviceLUID** contains a valid LUID and **deviceNodeMask** contains a valid node mask, and **VK_FALSE** if they do not.

If the `VkPhysicalDeviceIDProperties` structure is included in the **pNext** chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

**deviceUUID** must be immutable for a given device across instances, processes, driver APIs, driver versions, and system reboots.

Applications can compare the **driverUUID** value across instance and process boundaries, and can make similar queries in external APIs to determine whether they are capable of sharing memory objects and resources using them with the device.

deviceUUID and/or driverUUID must be used to determine whether a particular external object can be shared between driver components, where such a restriction exists as defined in the compatibility table for the particular object type:

- **External memory handle types compatibility**
- **External semaphore handle types compatibility**
- **External fence handle types compatibility**

If **deviceLUIDValid** is **VK_FALSE**, the values of **deviceLUID** and **deviceNodeMask** are undefined. If **deviceLUIDValid** is **VK_TRUE** and Vulkan is running on the Windows operating system, the contents of
deviceLUID can be cast to an LUID object and must be equal to the locally unique identifier of a IDXGIAdapter1 object that corresponds to physicalDevice. If deviceLUIDValid is VK_TRUE, deviceNodeMask must contain exactly one bit. If Vulkan is running on an operating system that supports the Direct3D 12 API and physicalDevice corresponds to an individual device in a linked device adapter, deviceNodeMask identifies the Direct3D 12 node corresponding to physicalDevice. Otherwise, deviceNodeMask must be 1.

Note

Although they have identical descriptions, VkPhysicalDeviceIDProperties::deviceUUID may differ from VkPhysicalDeviceProperties2::pipelineCacheUUID. The former is intended to identify and correlate devices across API and driver boundaries, while the latter is used to identify a compatible device and driver combination to use when serializing and de-serializing pipeline state.

Implementations should return deviceUUID values which are likely to be unique even in the presence of multiple Vulkan implementations (such as a GPU driver and a software renderer; two drivers for different GPUs; or the same Vulkan driver running on two logically different devices).

Khronos' conformance testing is unable to guarantee that deviceUUID values are actually unique, so implementors should make their own best efforts to ensure this. In particular, hard-coded deviceUUID values, especially all-0 bits, should never be used.

A combination of values unique to the vendor, the driver, and the hardware environment can be used to provide a deviceUUID which is unique to a high degree of certainty. Some possible inputs to such a computation are:

- Information reported by vkGetPhysicalDeviceProperties
- PCI device ID (if defined)
- PCI bus ID, or similar system configuration information.
- Driver binary checksums.

Note

While VkPhysicalDeviceIDProperties::deviceUUID is specified to remain consistent across driver versions and system reboots, it is not intended to be usable as a serializable persistent identifier for a device. It may change when a device is physically added to, removed from, or moved to a different connector in a system while that system is powered down. Further, there is no reasonable way to verify with conformance testing that a given device retains the same UUID in a given system across all driver versions supported in that system. While implementations should make every effort to report consistent device UUIDs across driver versions, applications should avoid relying on the persistence of this value for uses other than identifying compatible devices for external object sharing purposes.
Valid Usage (Implicit)

- **VK_UUID_SIZE** is the length in `uint8_t` values of an array containing a universally unique device or driver build identifier, as returned in `VkPhysicalDeviceIDProperties::deviceUUID` and `VkPhysicalDeviceIDProperties::driverUUID`.

```c
#define VK_UUID_SIZE                      16U
```

- **VK_LUID_SIZE** is the length in `uint8_t` values of an array containing a locally unique device identifier, as returned in `VkPhysicalDeviceIDProperties::deviceLUID`.

```c
#define VK_LUID_SIZE                      8U
```

or the equivalent

```c
#define VK_LUID_SIZE_KHR                  VK_LUID_SIZE
```

The `VkPhysicalDeviceDriverProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceDriverProperties {
    VkStructureType sType;
    void* pNext;
    VkDriverId driverID;
    char driverName[VK_MAX_DRIVER_NAME_SIZE];
    char driverInfo[VK_MAX_DRIVER_INFO_SIZE];
    VkConformanceVersion conformanceVersion;
} VkPhysicalDeviceDriverProperties;
```

or the equivalent

```c
// Provided by VK_KHR_driver_properties
typedef VkPhysicalDeviceDriverProperties VkPhysicalDeviceDriverPropertiesKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **driverID** is a unique identifier for the driver of the physical device.
- **driverName** is an array of `VK_MAX_DRIVER_NAME_SIZE` `char` containing a null-terminated UTF-8 string.
which is the name of the driver.

- **driverInfo** is an array of `VK_MAX_DRIVER_INFO_SIZE` char containing a null-terminated UTF-8 string with additional information about the driver.

- **conformanceVersion** is the version of the Vulkan conformance test this driver is conformant against (see `VkConformanceVersion`).

If the `VkPhysicalDeviceDriverProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These are properties of the driver corresponding to a physical device.

**driverID** must be immutable for a given driver across instances, processes, driver versions, and system reboots.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceDriverProperties-sType-sType**

  **sType** must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DRIVER_PROPERTIES`

Khronos driver IDs which may be returned in `VkPhysicalDeviceDriverProperties::driverID` are:

```c
// Provided by VK_VERSION_1_2
typedef enum VkDriverId {
    VK_DRIVER_ID_AMD_PROPRIETARY = 1,
    VK_DRIVER_ID_AMD_OPEN_SOURCE = 2,
    VK_DRIVER_ID_MESA_RADV = 3,
    VK_DRIVER_ID_NVIDIA_PROPRIETARY = 4,
    VK_DRIVER_ID_INTEL_PROPRIETARY_WINDOWS = 5,
    VK_DRIVER_ID_INTEL_OPEN_SOURCE_MESA = 6,
    VK_DRIVER_ID_IMAGINATION_PROPRIETARY = 7,
    VK_DRIVER_ID_QUALCOMM_PROPRIETARY = 8,
    VK_DRIVER_ID_ARM_PROPRIETARY = 9,

    VK_DRIVER_ID_MESA_VENUS = 22,
or the equivalent

```c
// Provided by VK_KHR_driver_properties
typedef VkDriverId VkDriverIdKHR;
```

**Note**
Khronos driver IDs may be allocated by vendors at any time. There may be multiple driver IDs for the same vendor, representing different drivers (for e.g. different platforms, proprietary or open source, etc.). Only the latest canonical versions of this Specification, of the corresponding `vk.xml` API Registry, and of the corresponding `vulkan_core.h` header file **must** contain all reserved Khronos driver IDs.

Only driver IDs registered with Khronos are given symbolic names. There **may** be unregistered driver IDs returned.

`VK_MAX_DRIVER_NAME_SIZE` is the length in `char` values of an array containing a driver name string, as returned in `VkPhysicalDeviceDriverProperties::driverName`. 
#define VK_MAX_DRIVER_NAME_SIZE 256U

or the equivalent

#define VK_MAX_DRIVER_NAME_SIZE_KHR VK_MAX_DRIVER_NAME_SIZE

VK_MAX_DRIVER_INFO_SIZE is the length in char values of an array containing a driver information string, as returned in VkPhysicalDeviceDriverProperties::driverInfo.

#define VK_MAX_DRIVER_INFO_SIZE 256U

or the equivalent

#define VK_MAX_DRIVER_INFO_SIZE_KHR VK_MAX_DRIVER_INFO_SIZE

The conformance test suite version an implementation is compliant with is described with the VkConformanceVersion structure:

// Provided by VK_VERSION_1_2
typedef struct VkConformanceVersion {
    uint8_t major;
    uint8_t minor;
    uint8_t subminor;
    uint8_t patch;
} VkConformanceVersion;

or the equivalent

// Provided by VK_KHR_driver_properties
typedef VkConformanceVersion VkConformanceVersionKHR;

- major is the major version number of the conformance test suite.
- minor is the minor version number of the conformance test suite.
- subminor is the subminor version number of the conformance test suite.
- patch is the patch version number of the conformance test suite.

The VkPhysicalDeviceShaderIntegerDotProductProperties structure is defined as:

// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceShaderIntegerDotProductProperties {
    VkStructureType sType;
    void* pNext;
} VkPhysicalDeviceShaderIntegerDotProductProperties;
VkBool32 integerDotProduct8BitUnsignedAccelerated;
VkBool32 integerDotProduct8BitSignedAccelerated;
VkBool32 integerDotProduct8BitMixedSignednessAccelerated;
VkBool32 integerDotProduct4x8BitPackedUnsignedAccelerated;
VkBool32 integerDotProduct4x8BitPackedSignedAccelerated;
VkBool32 integerDotProduct4x8BitPackedMixedSignednessAccelerated;
VkBool32 integerDotProduct16BitUnsignedAccelerated;
VkBool32 integerDotProduct16BitSignedAccelerated;
VkBool32 integerDotProduct16BitMixedSignednessAccelerated;
VkBool32 integerDotProduct32BitUnsignedAccelerated;
VkBool32 integerDotProduct32BitSignedAccelerated;
VkBool32 integerDotProduct32BitMixedSignednessAccelerated;
VkBool32 integerDotProduct64BitUnsignedAccelerated;
VkBool32 integerDotProduct64BitSignedAccelerated;

VkBool32 integerDotProductAccumulatingSaturating4x8BitPackedSignedAccelerated;
VkBool32 integerDotProductAccumulatingSaturating4x8BitPackedMixedSignednessAccelerated;
VkBool32 integerDotProductAccumulatingSaturating16BitUnsignedAccelerated;
VkBool32 integerDotProductAccumulatingSaturating16BitSignedAccelerated;
VkBool32 integerDotProductAccumulatingSaturating16BitMixedSignednessAccelerated;
VkBool32 integerDotProductAccumulatingSaturating32BitUnsignedAccelerated;
VkBool32 integerDotProductAccumulatingSaturating32BitSignedAccelerated;
VkBool32 integerDotProductAccumulatingSaturating32BitMixedSignednessAccelerated;
VkBool32 integerDotProductAccumulatingSaturating64BitUnsignedAccelerated;
VkBool32 integerDotProductAccumulatingSaturating64BitSignedAccelerated;
VkBool32 integerDotProductAccumulatingSaturating64BitMixedSignednessAccelerated;
}

or the equivalent

```c
// Provided by VK_KHR_shader_integer_dot_product
typedef VkPhysicalDeviceShaderIntegerDotProductProperties
    VkPhysicalDeviceShaderIntegerDotProductPropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
• \texttt{pNext} is NULL or a pointer to a structure extending this structure.

• \texttt{integerDotProduct8BitUnsignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 8-bit unsigned dot product operations using the \texttt{OpUDotKHR} SPIR-V instruction is accelerated as defined below.

• \texttt{integerDotProduct8BitSignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 8-bit signed dot product operations using the \texttt{OpSDotKHR} SPIR-V instruction is accelerated as defined below.

• \texttt{integerDotProduct8BitMixedSignednessAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 8-bit mixed signedness dot product operations using the \texttt{OpSUDotKHR} SPIR-V instruction is accelerated as defined below.

• \texttt{integerDotProduct4x8BitPackedUnsignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 8-bit unsigned dot product operations from operands packed into 32-bit integers using the \texttt{OpUDotKHR} SPIR-V instruction is accelerated as defined below.

• \texttt{integerDotProduct4x8BitPackedSignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 8-bit signed dot product operations from operands packed into 32-bit integers using the \texttt{OpSDotKHR} SPIR-V instruction is accelerated as defined below.

• \texttt{integerDotProduct4x8BitPackedMixedSignednessAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 8-bit mixed signedness dot product operations from operands packed into 32-bit integers using the \texttt{OpSUDotKHR} SPIR-V instruction is accelerated as defined below.

• \texttt{integerDotProduct16BitUnsignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 16-bit unsigned dot product operations using the \texttt{OpUDotKHR} SPIR-V instruction is accelerated as defined below.

• \texttt{integerDotProduct16BitSignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 16-bit signed dot product operations using the \texttt{OpSDotKHR} SPIR-V instruction is accelerated as defined below.

• \texttt{integerDotProduct16BitMixedSignednessAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 16-bit mixed signedness dot product operations using the \texttt{OpSUDotKHR} SPIR-V instruction is accelerated as defined below.

• \texttt{integerDotProduct32BitUnsignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 32-bit unsigned dot product operations using the \texttt{OpUDotKHR} SPIR-V instruction is accelerated as defined below.

• \texttt{integerDotProduct32BitSignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 32-bit signed dot product operations using the \texttt{OpSDotKHR} SPIR-V instruction is accelerated as defined below.

• \texttt{integerDotProduct32BitMixedSignednessAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 32-bit mixed signedness dot product operations using the \texttt{OpSUDotKHR} SPIR-V instruction is accelerated as defined below.

• \texttt{integerDotProduct64BitUnsignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 64-bit unsigned dot product operations using the \texttt{OpUDotKHR} SPIR-V instruction is accelerated as defined below.

• \texttt{integerDotProduct64BitSignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 64-bit signed dot product operations using the \texttt{OpSDotKHR} SPIR-V instruction is accelerated as defined below.
defined below.

• `integerDotProduct64BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit mixed signedness dot product operations using the `OpSU DotKHR` SPIR-V instruction is accelerated as defined below.

• `integerDotProductAccumulatingSaturating8BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit unsigned accumulating saturating dot product operations using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• `integerDotProductAccumulatingSaturating8BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit signed accumulating saturating dot product operations using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• `integerDotProductAccumulatingSaturating8BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit mixed signedness accumulating saturating dot product operations using the `OpSU DotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• `integerDotProductAccumulatingSaturating4x8BitPackedUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit unsigned accumulating saturating dot product operations from operands packed into 32-bit integers using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• `integerDotProductAccumulatingSaturating4x8BitPackedSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit signed accumulating saturating dot product operations from operands packed into 32-bit integers using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• `integerDotProductAccumulatingSaturating4x8BitPackedMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit mixed signedness accumulating saturating dot product operations from operands packed into 32-bit integers using the `OpSU DotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• `integerDotProductAccumulatingSaturating16BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 16-bit unsigned accumulating saturating dot product operations using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• `integerDotProductAccumulatingSaturating16BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 16-bit signed accumulating saturating dot product operations using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• `integerDotProductAccumulatingSaturating16BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 16-bit mixed signedness accumulating saturating dot product operations using the `OpSU DotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• `integerDotProductAccumulatingSaturating32BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 32-bit unsigned accumulating saturating dot product operations using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• `integerDotProductAccumulatingSaturating32BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 32-bit signed accumulating saturating dot product operations using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• `integerDotProductAccumulatingSaturating32BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 32-bit mixed signedness accumulating saturating dot product operations using the `OpSU DotAccSatKHR` SPIR-V instruction is accelerated as defined below.
• `integerDotProductAccumulatingSaturating64BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit unsigned accumulating saturating dot product operations using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• `integerDotProductAccumulatingSaturating64BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit signed accumulating saturating dot product operations using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• `integerDotProductAccumulatingSaturating64BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit mixed signedness accumulating saturating dot product operations using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

If the `VkPhysicalDeviceShaderIntegerDotProductProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These are properties of the integer dot product acceleration information of a physical device.

---

**Note**

A dot product operation is deemed accelerated if its implementation provides a performance advantage over application-provided code composed from elementary instructions and/or other dot product instructions, either because the implementation uses optimized machine code sequences whose generation from application-provided code cannot be guaranteed or because it uses hardware features that cannot otherwise be targeted from application-provided code.

---

**Valid Usage (Implicit)**

• `VUID-VkPhysicalDeviceShaderIntegerDotProductProperties-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_INTEGER_DOT_PRODUCT_PROPERTIES`.

The `VkPhysicalDeviceShaderTileImagePropertiesEXT` structure is defined as:

```c
// Provided by VK_EXT_shader_tile_image
typedef struct VkPhysicalDeviceShaderTileImagePropertiesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderTileImageCoherentReadAccelerated;
    VkBool32 shaderTileImageReadSampleFromPixelRateInvocation;
    VkBool32 shaderTileImageReadFromHelperInvocation;
} VkPhysicalDeviceShaderTileImagePropertiesEXT;
```

• `sType` is a `VkStructureType` value identifying this structure.

• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `shaderTileImageCoherentReadAccelerated` is a boolean that will be `VK_TRUE` if coherent reads of tile image data is accelerated.
• shaderTileImageReadSampleFromPixelRateInvocation is a boolean that will be VK_TRUE if reading from samples from a pixel rate fragment invocation is supported when VkPipelineMultisampleStateCreateInfo::rasterizationSamples > 1.

• shaderTileImageReadFromHelperInvocation is a boolean that will be VK_TRUE if reads of tile image data from helper fragment invocations result in valid values.

If the VkPhysicalDeviceShaderTileImagePropertiesEXT structure is included in the pNext chain of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with each corresponding implementation-dependent property.

These are properties of the tile image information of a physical device.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceShaderTileImagePropertiesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_TILE_IMAGE_PROPERTIES_EXT

To query properties of queues available on a physical device, call:

```c
// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceQueueFamilyProperties(
    VkPhysicalDevice physicalDevice, 
    uint32_t* pQueueFamilyPropertyCount, 
    VkQueueFamilyProperties* pQueueFamilyProperties);
```

• physicalDevice is the handle to the physical device whose properties will be queried.

• pQueueFamilyPropertyCount is a pointer to an integer related to the number of queue families available or queried, as described below.

• pQueueFamilyProperties is either NULL or a pointer to an array of VkQueueFamilyProperties structures.

If pQueueFamilyProperties is NULL, then the number of queue families available is returned in pQueueFamilyPropertyCount. Implementations must support at least one queue family. Otherwise, pQueueFamilyPropertyCount must point to a variable set by the user to the number of elements in the pQueueFamilyProperties array, and on return the variable is overwritten with the number of structures actually written to pQueueFamilyProperties. If pQueueFamilyPropertyCount is less than the number of queue families available, at most pQueueFamilyPropertyCount structures will be written.

Valid Usage (Implicit)

• VUID-vkGetPhysicalDeviceQueueFamilyProperties-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

• VUID-vkGetPhysicalDeviceQueueFamilyProperties-pQueueFamilyPropertyCount-parameter
  pQueueFamilyPropertyCount must be a valid pointer to a uint32_t value
If the value referenced by pQueueFamilyPropertyCount is not 0, and pQueueFamilyProperties is not NULL, pQueueFamilyProperties must be a valid pointer to an array of pQueueFamilyPropertyCount VkQueueFamilyProperties structures.

The VkQueueFamilyProperties structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkQueueFamilyProperties {
    VkQueueFlags queueFlags;
    uint32_t queueCount;
    uint32_t timestampValidBits;
    VkExtent3D minImageTransferGranularity;
} VkQueueFamilyProperties;
```

- **queueFlags** is a bitmask of VkQueueFlagBits indicating capabilities of the queues in this queue family.
- **queueCount** is the unsigned integer count of queues in this queue family. Each queue family must support at least one queue.
- **timestampValidBits** is the unsigned integer count of meaningful bits in the timestamps written via vkCmdWriteTimestamp2 or vkCmdWriteTimestamp. The valid range for the count is 36 to 64 bits, or a value of 0, indicating no support for timestamps. Bits outside the valid range are guaranteed to be zeros.
- **minImageTransferGranularity** is the minimum granularity supported for image transfer operations on the queues in this queue family.

The value returned in minImageTransferGranularity has a unit of compressed texel blocks for images having a block-compressed format, and a unit of texels otherwise.

Possible values of minImageTransferGranularity are:

- (0,0,0) specifies that only whole mip levels must be transferred using the image transfer operations on the corresponding queues. In this case, the following restrictions apply to all offset and extent parameters of image transfer operations:
  - The x, y, and z members of a VkOffset3D parameter must always be zero.
  - The width, height, and depth members of a VkExtent3D parameter must always match the width, height, and depth of the image subresource corresponding to the parameter, respectively.
- (A_x, A_y, A_z) where A_x, A_y, and A_z are all integer powers of two. In this case the following restrictions apply to all image transfer operations:
  - x, y, and z of a VkOffset3D parameter must be integer multiples of A_x, A_y, and A_z, respectively.
  - width of a VkExtent3D parameter must be an integer multiple of A_x, or else x + width must equal the width of the image subresource corresponding to the parameter.
◦ **height** of a `VkExtent3D` parameter **must** be an integer multiple of \( A_y \), or else \( y + \text{height} \) **must** equal the height of the image subresource corresponding to the parameter.

◦ **depth** of a `VkExtent3D` parameter **must** be an integer multiple of \( A_z \), or else \( z + \text{depth} \) **must** equal the depth of the image subresource corresponding to the parameter.

◦ If the format of the image corresponding to the parameters is one of the block-compressed formats then for the purposes of the above calculations the granularity **must** be scaled up by the compressed texel block dimensions.

Queues supporting graphics and/or compute operations **must** report \((1,1,1)\) in `minImageTransferGranularity`, meaning that there are no additional restrictions on the granularity of image transfer operations for these queues. Other queues supporting image transfer operations are only **required** to support whole mip level transfers, thus `minImageTransferGranularity` for queues belonging to such queue families **may** be \((0,0,0)\).

The **Device Memory** section describes memory properties queried from the physical device.

For physical device feature queries see the **Features** chapter.

Bits which **may** be set in `VkQueueFamilyProperties::queueFlags`, indicating capabilities of queues in a queue family are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkQueueFlagBits {
    VK_QUEUE_GRAPHICS_BIT = 0x00000001,
    VK_QUEUE_COMPUTE_BIT = 0x00000002,
    VK_QUEUE_TRANSFER_BIT = 0x00000004,
    VK_QUEUE_SPARSE_BINDING_BIT = 0x00000008,
    // Provided by VK_VERSION_1_1
    VK_QUEUE_PROTECTED_BIT = 0x00000010,
    // Provided by VK_KHR_video_decode_queue
    VK_QUEUE_VIDEO_DECODE_BIT_KHR = 0x00000020,
    // Provided by VK_KHR_video_encode_queue
    VK_QUEUE_VIDEO_ENCODE_BIT_KHR = 0x00000040,
} VkQueueFlagBits;
```

- **VK_QUEUE_GRAPHICS_BIT** specifies that queues in this queue family support graphics operations.
- **VK_QUEUE_COMPUTE_BIT** specifies that queues in this queue family support compute operations.
- **VK_QUEUE_TRANSFER_BIT** specifies that queues in this queue family support transfer operations.
- **VK_QUEUE_SPARSE_BINDING_BIT** specifies that queues in this queue family support sparse memory management operations (see **Sparse Resources**). If any of the sparse resource features are enabled, then at least one queue family **must** support this bit.
- **VK_QUEUE_VIDEO_DECODE_BIT_KHR** specifies that queues in this queue family support video decode operations.
- **VK_QUEUE_VIDEO_ENCODE_BIT_KHR** specifies that queues in this queue family support video encode operations.
• **VK_QUEUE_PROTECTED_BIT** specifies that queues in this queue family support the **VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT** bit. (see Protected Memory). If the physical device supports the protectedMemory feature, at least one of its queue families must support this bit.

If an implementation exposes any queue family that supports graphics operations, at least one queue family of at least one physical device exposed by the implementation must support both graphics and compute operations.

Furthermore, if the protectedMemory physical device feature is supported, then at least one queue family of at least one physical device exposed by the implementation must support graphics operations, compute operations, and protected memory operations.

Note

All commands that are allowed on a queue that supports transfer operations are also allowed on a queue that supports either graphics or compute operations. Thus, if the capabilities of a queue family include **VK_QUEUE_GRAPHICS_BIT** or **VK_QUEUE_COMPUTE_BIT**, then reporting the **VK_QUEUE_TRANSFER_BIT** capability separately for that queue family is optional.

For further details see Queues.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkQueueFlags;
```

**VkQueueFlags** is a bitmask type for setting a mask of zero or more **VkQueueFlagBits**.

To query properties of queues available on a physical device, call:

```c
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceQueueFamilyProperties2(
    VkPhysicalDevice physicalDevice,
    uint32_t* pQueueFamilyPropertyCount,
    VkQueueFamilyProperties2* pQueueFamilyProperties);
```

or the equivalent command

```c
// Provided by VK_KHR_get_physical_device_properties2
void vkGetPhysicalDeviceQueueFamilyProperties2KHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pQueueFamilyPropertyCount,
    VkQueueFamilyProperties2* pQueueFamilyProperties);
```

• **physicalDevice** is the handle to the physical device whose properties will be queried.

• **pQueueFamilyPropertyCount** is a pointer to an integer related to the number of queue families available or queried, as described in **vkGetPhysicalDeviceQueueFamilyProperties**.
• **pQueueFamilyProperties** is either **NULL** or a pointer to an array of **VkQueueFamilyProperties2** structures.

The **VkQueueFamilyProperties2** structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkQueueFamilyProperties2 {
    VkStructureType sType;
    void* pNext;
    VkQueueFamilyProperties2KHR queueFamilyProperties;
} VkQueueFamilyProperties2;
```

or the equivalent

```c
// Provided by VK_KHR_get_physical_device_properties2
typedef VkQueueFamilyProperties2 VkQueueFamilyProperties2KHR;
```

• **sType** is a **VkStructureType** value identifying this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **queueFamilyProperties** is a **VkQueueFamilyProperties** structure which is populated with the same values as in **vkGetPhysicalDeviceQueueFamilyProperties** structure.

The **VkQueueFamilyProperties2** behaves similarly to **vkGetPhysicalDeviceQueueFamilyProperties**, with the ability to return extended information in a **pNext** chain of output structures.

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceQueueFamilyProperties2-physicalDevice-parameter
  **physicalDevice** must be a valid **VkPhysicalDevice** handle

- VUID-vkGetPhysicalDeviceQueueFamilyProperties2-pQueueFamilyPropertyCount-parameter
  **pQueueFamilyPropertyCount** must be a valid pointer to a **uint32_t** value

- VUID-vkGetPhysicalDeviceQueueFamilyProperties2-pQueueFamilyProperties-parameter
  If the value referenced by **pQueueFamilyPropertyCount** is not 0, and **pQueueFamilyProperties** is not **NULL**, **pQueueFamilyProperties** must be a valid pointer to an array of **pQueueFamilyPropertyCount** **VkQueueFamilyProperties2** structures

**Valid Usage (Implicit)**

- VUID-VkQueueFamilyProperties2-sType-sType
  **sType** must be **VK_STRUCTURE_TYPE_QUEUE_FAMILY_PROPERTIES_2**

- VUID-VkQueueFamilyProperties2-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkQueueFamilyCheckpointProperties2NV`, `VkQueueFamilyGlobalPriorityPropertiesKHR`, `VkQueueFamilyQueryResultStatusPropertiesKHR`, or `VkQueueFamilyVideoPropertiesKHR`.

- VUID-VkQueueFamilyProperties2-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique

The definition of `VkQueueFamilyGlobalPriorityPropertiesKHR` is:

```c
// Provided by VK_KHR_global_priority
typedef struct VkQueueFamilyGlobalPriorityPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    uint32_t priorityCount;
    VkQueueGlobalPriorityKHR priorities[VK_MAX_GLOBAL_PRIORITY_SIZE_KHR];
} VkQueueFamilyGlobalPriorityPropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `priorityCount` is the number of supported global queue priorities in this queue family, and it must be greater than 0.
- `priorities` is an array of `VK_MAX_GLOBAL_PRIORITY_SIZE_EXT` `VkQueueGlobalPriorityEXT` enums representing all supported global queue priorities in this queue family. The first `priorityCount` elements of the array will be valid.

If the `VkQueueFamilyGlobalPriorityPropertiesKHR` structure is included in the `pNext` chain of the `VkQueueFamilyProperties2` structure passed to `vkGetPhysicalDeviceQueueFamilyProperties2`, it is filled in with the list of supported global queue priorities for the indicated family.

The valid elements of `priorities` must not contain any duplicate values.

The valid elements of `priorities` must be a continuous sequence of `VkQueueGlobalPriorityKHR` enums in the ascending order.

**Note**

For example, returning `priorityCount` as 3 with supported `priorities` as `VK_QUEUE_GLOBAL_PRIORITY_LOW_KHR`, `VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR` and `VK_QUEUE_GLOBAL_PRIORITY_REALTIME_KHR` is not allowed.

**Valid Usage (Implicit)**

- VUID-VkQueueFamilyGlobalPriorityPropertiesKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_QUEUE_FAMILY_GLOBAL_PRIORITY_PROPERTIES_KHR`

- VUID-VkQueueFamilyGlobalPriorityPropertiesKHR-priorities-parameter
  Each element of `priorities` must be a valid `VkQueueGlobalPriorityKHR` value
VK_MAX_GLOBAL_PRIORITY_SIZE_KHR is the length of an array of VkQueueGlobalPriorityKHR enumerants representing supported queue priorities, as returned in VkQueueFamilyGlobalPriorityPropertiesKHR::priorities.

#define VK_MAX_GLOBAL_PRIORITY_SIZE_KHR   16U

The VkQueueFamilyVideoPropertiesKHR structure is defined as:

```c
typedef struct VkQueueFamilyVideoPropertiesKHR {  
    VkStructureType    sType;  
    void*              pNext;  
    VkVideoCodecOperationFlagsKHR videoCodecOperations;
} VkQueueFamilyVideoPropertiesKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **videoCodecOperations** is a bitmask of VkVideoCodecOperationFlagBitsKHR that indicates the set of video codec operations supported by the queue family.

If this structure is included in the **pNext** chain of the VkQueueFamilyProperties2 structure passed to vkGetPhysicalDeviceQueueFamilyProperties2, then it is filled with the set of video codec operations supported by the specified queue family.

Valid Usage (Implicit)

- **VUID-VkQueueFamilyVideoPropertiesKHR-sType-sType**
  - **sType** must be VK_STRUCTURE_TYPE_QUEUE_FAMILY_VIDEO_PROPERTIES_KHR

The VkQueueFamilyQueryResultStatusPropertiesKHR structure is defined as:

```c
typedef struct VkQueueFamilyQueryResultStatusPropertiesKHR {  
    VkStructureType    sType;  
    void*              pNext;  
    VkBool32           queryResultStatusSupport;
} VkQueueFamilyQueryResultStatusPropertiesKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **queryResultStatusSupport** reports VK_TRUE if query type VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR and use of VK_QUERY_RESULT_WITH_STATUS_BIT_KHR are supported.

If this structure is included in the **pNext** chain of the VkQueueFamilyProperties2 structure passed to
vkGetPhysicalDeviceQueueFamilyProperties2, then it is filled with information about whether result status queries are supported by the specified queue family.

### Valid Usage (Implicit)

- **VUID-VkQueueFamilyQueryResultStatusPropertiesKHR-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_QUEUE_FAMILY_QUERY_RESULT_STATUS_PROPERTIES_KHR`

To enumerate the performance query counters available on a queue family of a physical device, call:

```c
// Provided by VK_KHR_performance_query
VkResult vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    uint32_t* pCounterCount,
    VkPerformanceCounterKHR* pCounters,
    VkPerformanceCounterDescriptionKHR* pCounterDescriptions);
```

- **physicalDevice** is the handle to the physical device whose queue family performance query counter properties will be queried.
- **queueFamilyIndex** is the index into the queue family of the physical device we want to get properties for.
- **pCounterCount** is a pointer to an integer related to the number of counters available or queried, as described below.
- **pCounters** is either `NULL` or a pointer to an array of `VkPerformanceCounterKHR` structures.
- **pCounterDescriptions** is either `NULL` or a pointer to an array of ` VkPerformanceCounterDescriptionKHR` structures.

If `pCounters` is `NULL` and `pCounterDescriptions` is `NULL`, then the number of counters available is returned in `pCounterCount`. Otherwise, `pCounterCount` must point to a variable set by the user to the number of elements in the `pCounters`, `pCounterDescriptions`, or both arrays and on return the variable is overwritten with the number of structures actually written out. If `pCounterCount` is less than the number of counters available, at most `pCounterCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available counters were returned.

### Valid Usage (Implicit)

- **VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR-physicalDevice-parameter**
  - `physicalDevice` must be a valid `VkPhysicalDevice` handle
- **VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR-pCounterCount-parameter**
**pCounterCount** must be a valid pointer to a `uint32_t` value

- **VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR-pCounters-parameter**
  If the value referenced by **pCounterCount** is not 0, and **pCounters** is not NULL, **pCounters** must be a valid pointer to an array of **pCounterCount** `VkPerformanceCounterKHR` structures

- **VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR-pCounterDescriptions-parameter**
  If the value referenced by **pCounterCount** is not 0, and **pCounterDescriptions** is not NULL, **pCounterDescriptions** must be a valid pointer to an array of **pCounterCount** `VkPerformanceCounterDescriptionKHR` structures

### Return Codes

**Success**
- **VK_SUCCESS**
- **VK_INCOMPLETE**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_INITIALIZATION_FAILED**

The **VkPerformanceCounterKHR** structure is defined as:

```c
// Provided by VK_KHR_performance_query
typedef struct VkPerformanceCounterKHR {
    VkStructureType sType;
    void* pNext;
    VkPerformanceCounterUnitKHR unit;
    VkPerformanceCounterScopeKHR scope;
    VkPerformanceCounterStorageKHR storage;
    uint8_t uuid[VK_UUID_SIZE];
} VkPerformanceCounterKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **unit** is a `VkPerformanceCounterUnitKHR` specifying the unit that the counter data will record.
- **scope** is a `VkPerformanceCounterScopeKHR` specifying the scope that the counter belongs to.
- **storage** is a `VkPerformanceCounterStorageKHR` specifying the storage type that the counter’s data uses.
- **uuid** is an array of size `VK_UUID_SIZE`, containing 8-bit values that represent a universally unique identifier for the counter of the physical device.
Valid Usage (Implicit)

- VUID-VkPerformanceCounterKHR-sType-sType
  *sType must be* VK_STRUCTURE_TYPE_PERFORMANCE_COUNTER_KHR

- VUID-VkPerformanceCounterKHR-pNext-pNext
  *pNext must be NULL*

Performance counters have an associated unit. This unit describes how to interpret the performance counter result.

The performance counter unit types which *may* be returned in VkPerformanceCounterKHR::unit are:

```c
// Provided by VK_KHR_performance_query
typedef enum VkPerformanceCounterUnitKHR {
    VK_PERFORMANCE_COUNTER_UNIT_GENERIC_KHR = 0,
    VK_PERFORMANCE_COUNTER_UNIT_PERCENTAGE_KHR = 1,
    VK_PERFORMANCE_COUNTER_UNIT_NANOSECONDS_KHR = 2,
    VK_PERFORMANCE_COUNTER_UNIT_BYTES_KHR = 3,
    VK_PERFORMANCE_COUNTER_UNIT_BYTES_PER_SECOND_KHR = 4,
    VK_PERFORMANCE_COUNTER_UNIT_KELVIN_KHR = 5,
    VK_PERFORMANCE_COUNTER_UNIT_WATTS_KHR = 6,
    VK_PERFORMANCE_COUNTER_UNIT_VOLTS_KHR = 7,
    VK_PERFORMANCE_COUNTER_UNIT_AMPS_KHR = 8,
    VK_PERFORMANCE_COUNTER_UNIT_HERTZ_KHR = 9,
    VK_PERFORMANCE_COUNTER_UNIT_CYCLES_KHR = 10,
} VkPerformanceCounterUnitKHR;
```

- VK_PERFORMANCE_COUNTER_UNIT_GENERIC_KHR - the performance counter unit is a generic data point.
- VK_PERFORMANCE_COUNTER_UNIT_PERCENTAGE_KHR - the performance counter unit is a percentage (%).
- VK_PERFORMANCE_COUNTER_UNIT_NANOSECONDS_KHR - the performance counter unit is a value of nanoseconds (ns).
- VK_PERFORMANCE_COUNTER_UNIT_BYTES_KHR - the performance counter unit is a value of bytes.
- VK_PERFORMANCE_COUNTER_UNIT_BYTES_PER_SECOND_KHR - the performance counter unit is a value of bytes/s.
- VK_PERFORMANCE_COUNTER_UNIT_KELVIN_KHR - the performance counter unit is a temperature reported in Kelvin.
- VK_PERFORMANCE_COUNTER_UNIT_WATTS_KHR - the performance counter unit is a value of watts (W).
- VK_PERFORMANCE_COUNTER_UNIT_VOLTS_KHR - the performance counter unit is a value of volts (V).
- VK_PERFORMANCE_COUNTER_UNIT_AMPS_KHR - the performance counter unit is a value of amps (A).
- VK_PERFORMANCE_COUNTER_UNIT_HERTZ_KHR - the performance counter unit is a value of hertz (Hz).
- VK_PERFORMANCE_COUNTER_UNIT_CYCLES_KHR - the performance counter unit is a value of cycles.
Performance counters have an associated scope. This scope describes the granularity of a performance counter.

The performance counter scope types which may be returned in `VkPerformanceCounterKHR::scope` are:

```c
// Provided by VK_KHR_performance_query
typedef enum VkPerformanceCounterScopeKHR {
    VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR = 0,
    VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR = 1,
    VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_KHR = 2,
    VK_QUERY_SCOPE_COMMAND_BUFFER_KHR = VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR,
    VK_QUERY_SCOPE_RENDER_PASS_KHR = VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR,
    VK_QUERY_SCOPE_COMMAND_KHR = VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_KHR,
} VkPerformanceCounterScopeKHR;
```

- **VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR** - the performance counter scope is a single complete command buffer.
- **VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR** - the performance counter scope is zero or more complete render passes. The performance query containing the performance counter must begin and end outside a render pass instance.
- **VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_KHR** - the performance counter scope is zero or more commands.

Performance counters have an associated storage. This storage describes the payload of a counter result.

The performance counter storage types which may be returned in `VkPerformanceCounterKHR::storage` are:

```c
// Provided by VK_KHR_performance_query
typedef enum VkPerformanceCounterStorageKHR {
    VK_PERFORMANCE_COUNTER_STORAGE_INT32_KHR = 0,
    VK_PERFORMANCE_COUNTER_STORAGE_INT64_KHR = 1,
    VK_PERFORMANCE_COUNTER_STORAGE_UINT32_KHR = 2,
    VK_PERFORMANCE_COUNTER_STORAGE_UINT64_KHR = 3,
    VK_PERFORMANCE_COUNTER_STORAGE_FLOAT32_KHR = 4,
    VK_PERFORMANCE_COUNTER_STORAGE_FLOAT64_KHR = 5,
} VkPerformanceCounterStorageKHR;
```

- **VK_PERFORMANCE_COUNTER_STORAGE_INT32_KHR** - the performance counter storage is a 32-bit signed integer.
- **VK_PERFORMANCE_COUNTER_STORAGE_INT64_KHR** - the performance counter storage is a 64-bit signed integer.
- **VK_PERFORMANCE_COUNTER_STORAGE_UINT32_KHR** - the performance counter storage is a 32-bit
unsigned integer.

- **VK_PERFORMANCE_COUNTER_STORAGE_UINT64_KHR** - the performance counter storage is a 64-bit unsigned integer.
- **VK_PERFORMANCE_COUNTER_STORAGE_FLOAT32_KHR** - the performance counter storage is a 32-bit floating-point.
- **VK_PERFORMANCE_COUNTER_STORAGE_FLOAT64_KHR** - the performance counter storage is a 64-bit floating-point.

The **VkPerformanceCounterDescriptionKHR** structure is defined as:

```c
// Provided by VK_KHR_performance_query
typedef struct VkPerformanceCounterDescriptionKHR {
    VkStructureType sType;
    void* pNext;
    VkPerformanceCounterDescriptionFlagsKHR flags;
    char name[VK_MAX_DESCRIPTION_SIZE];
    char category[VK_MAX_DESCRIPTION_SIZE];
    char description[VK_MAX_DESCRIPTION_SIZE];
} VkPerformanceCounterDescriptionKHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is a bitmask of **VkPerformanceCounterDescriptionFlagBitsKHR** indicating the usage behavior for the counter.
- **name** is an array of size **VK_MAX_DESCRIPTION_SIZE**, containing a null-terminated UTF-8 string specifying the name of the counter.
- **category** is an array of size **VK_MAX_DESCRIPTION_SIZE**, containing a null-terminated UTF-8 string specifying the category of the counter.
- **description** is an array of size **VK_MAX_DESCRIPTION_SIZE**, containing a null-terminated UTF-8 string specifying the description of the counter.

### Valid Usage (Implicit)

- **VUID-VkPerformanceCounterDescriptionKHR-sType-sType**
  - **sType** must be **VK_STRUCTURE_TYPE_PERFORMANCE_COUNTER_DESCRIPTION_KHR**
- **VUID-VkPerformanceCounterDescriptionKHR-pNext-pNext**
  - **pNext** must be **NULL**

Bits which can be set in **VkPerformanceCounterDescriptionKHR::flags**, specifying usage behavior of a performance counter, are:

```c
// Provided by VK_KHR_performance_query
typedef enum VkPerformanceCounterDescriptionFlagBitsKHR {
```
VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_BIT_KHR = 0x00000001,
VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_BIT_KHR = 0x00000002,
VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_KHR =
VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_BIT_KHR,
VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_KHR =
VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_BIT_KHR,
} VkPerformanceCounterDescriptionFlagBitsKHR;

- **VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_BIT_KHR** specifies that recording the counter may have a noticeable performance impact.
- **VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_BIT_KHR** specifies that concurrently recording the counter while other submitted command buffers are running may impact the accuracy of the recording.

```c
// Provided by VK_KHR_performance_query
typedef VkFlags VkPerformanceCounterDescriptionFlagsKHR;
```

VkPerformanceCounterDescriptionFlagsKHR is a bitmask type for setting a mask of zero or more VkPerformanceCounterDescriptionFlagBitsKHR.

### 5.2. Devices

Device objects represent logical connections to physical devices. Each device exposes a number of *queue families* each having one or more *queues*. All queues in a queue family support the same operations.

As described in **Physical Devices**, a Vulkan application will first query for all physical devices in a system. Each physical device **can** then be queried for its capabilities, including its queue and queue family properties. Once an acceptable physical device is identified, an application will create a corresponding logical device. The created logical device is then the primary interface to the physical device.

How to enumerate the physical devices in a system and query those physical devices for their queue family properties is described in the **Physical Device Enumeration** section above.

A single logical device **can** be created from multiple physical devices, if those physical devices belong to the same device group. A *device group* is a set of physical devices that support accessing each other’s memory and recording a single command buffer that **can** be executed on all the physical devices. Device groups are enumerated by calling **vkEnumeratePhysicalDeviceGroups**, and a logical device is created from a subset of the physical devices in a device group by passing the physical devices through **VkDeviceGroupDeviceCreateInfo**. For two physical devices to be in the same device group, they must support identical extensions, features, and properties.

**Note**

Physical devices in the same device group **must** be so similar because there are no rules for how different features/properties would interact. They **must** return the same values for nearly every invariant vkGetPhysicalDevice* feature, property,
capability, etc., but could potentially differ for certain queries based on things like having a different display connected, or a different compositor. The specification does not attempt to enumerate which state is in each category, because such a list would quickly become out of date.

To retrieve a list of the device groups present in the system, call:

```c
// Provided by VK_VERSION_1_1
VkResult vkEnumeratePhysicalDeviceGroups(
    VkInstance instance,
    uint32_t* pPhysicalDeviceGroupCount,
    VkPhysicalDeviceGroupProperties* pPhysicalDeviceGroupProperties);
```

or the equivalent command

```c
// Provided by VK_KHR_device_group_creation
VkResult vkEnumeratePhysicalDeviceGroupsKHR(
    VkInstance instance,
    uint32_t* pPhysicalDeviceGroupCount,
    VkPhysicalDeviceGroupProperties* pPhysicalDeviceGroupProperties);
```

- `instance` is a handle to a Vulkan instance previously created with `vkCreateInstance`.
- `pPhysicalDeviceGroupCount` is a pointer to an integer related to the number of device groups available or queried, as described below.
- `pPhysicalDeviceGroupProperties` is either `NULL` or a pointer to an array of `VkPhysicalDeviceGroupProperties` structures.

If `pPhysicalDeviceGroupProperties` is `NULL`, then the number of device groups available is returned in `pPhysicalDeviceGroupCount`. Otherwise, `pPhysicalDeviceGroupCount` must point to a variable set by the user to the number of elements in the `pPhysicalDeviceGroupProperties` array, and on return the variable is overwritten with the number of structures actually written to `pPhysicalDeviceGroupProperties`. If `pPhysicalDeviceGroupCount` is less than the number of device groups available, at most `pPhysicalDeviceGroupCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available device groups were returned.

Every physical device must be in exactly one device group.

**Valid Usage (Implicit)**

- VUID-vkEnumeratePhysicalDeviceGroups-instance-parameter
  - `instance` must be a valid `VkInstance` handle
- VUID-vkEnumeratePhysicalDeviceGroups-pPhysicalDeviceGroupCount-parameter
  - `pPhysicalDeviceGroupCount` must be a valid pointer to a `uint32_t` value
- VUID-vkEnumeratePhysicalDeviceGroups-pPhysicalDeviceGroupProperties-parameter
If the value referenced by `pPhysicalDeviceGroupCount` is not 0, and `pPhysicalDeviceGroupProperties` is not NULL, `pPhysicalDeviceGroupProperties` must be a valid pointer to an array of `pPhysicalDeviceGroupCount` `VkPhysicalDeviceGroupProperties` structures.

### Return Codes

**Success**
- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INITIALIZATION_FAILED`

The `VkPhysicalDeviceGroupProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceGroupProperties {
    VkStructureType sType;
    void* pNext;
    uint32_t physicalDeviceCount;
    VkPhysicalDevice physicalDevices[VK_MAX_DEVICE_GROUP_SIZE];
    VkBool32 subsetAllocation;
} VkPhysicalDeviceGroupProperties;
```

or the equivalent

```c
// Provided by VK_KHR_device_group_creation
typedef VkPhysicalDeviceGroupProperties VkPhysicalDeviceGroupPropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `physicalDeviceCount` is the number of physical devices in the group.
- `physicalDevices` is an array of `VK_MAX_DEVICE_GROUP_SIZE` `VkPhysicalDevice` handles representing all physical devices in the group. The first `physicalDeviceCount` elements of the array will be valid.
- `subsetAllocation` specifies whether logical devices created from the group support allocating device memory on a subset of devices, via the `deviceMask` member of the `VkMemoryAllocateFlagsInfo`. If this is `VK_FALSE`, then all device memory allocations are made across all physical devices in the group. If `physicalDeviceCount` is 1, then `subsetAllocation` **must**
be VK_FALSE.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceGroupProperties-sType-sType
  - `sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_GROUP_PROPERTIES`
- VUID-VkPhysicalDeviceGroupProperties-pNext-pNext
  - `pNext must be NULL`

**VK_MAX_DEVICE_GROUP_SIZE** is the length of an array containing VkPhysicalDevice handle values representing all physical devices in a group, as returned in VkPhysicalDeviceGroupProperties::physicalDevices.

```c
#define VK_MAX_DEVICE_GROUP_SIZE          32U
```

or the equivalent

```c
#define VK_MAX_DEVICE_GROUP_SIZE_KHR      VK_MAX_DEVICE_GROUP_SIZE
```

### 5.2.1. Device Creation

Logical devices are represented by VkDevice handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkDevice)
```

A logical device is created as a *connection* to a physical device. To create a logical device, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateDevice(
    VkPhysicalDevice physicalDevice,
    const VkDeviceCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkDevice* pDevice);
```

- `physicalDevice must be one of the device handles returned from a call to vkEnumeratePhysicalDevices` (see Physical Device Enumeration).
- `pCreateInfo` is a pointer to a VkDeviceCreateInfo structure containing information about how to create the device.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pDevice` is a pointer to a handle in which the created VkDevice is returned.
vkCreateDevice verifies that extensions and features requested in the ppEnabledExtensionNames and pEnabledFeatures members of pCreateInfo, respectively, are supported by the implementation. If any requested extension is not supported, vkCreateDevice must return VK_ERROR_EXTENSION_NOT_PRESENT. If any requested feature is not supported, vkCreateDevice must return VK_ERROR_FEATURE_NOT_PRESENT. Support for extensions can be checked before creating a device by querying vkEnumerateDeviceExtensionProperties. Support for features can similarly be checked by querying vkGetPhysicalDeviceFeatures.

After verifying and enabling the extensions the VkDevice object is created and returned to the application.

Multiple logical devices can be created from the same physical device. Logical device creation may fail due to lack of device-specific resources (in addition to other errors). If that occurs, vkCreateDevice will return VK_ERROR_TOO_MANY_OBJECTS.

### Valid Usage

- **VUID-vkCreateDevice-ppEnabledExtensionNames-01387**
  All required device extensions for each extension in the VkDeviceCreateInfo::ppEnabledExtensionNames list must also be present in that list

### Valid Usage (Implicit)

- **VUID-vkCreateDevice-physicalDevice-parameter**
  physicalDevice must be a valid VkPhysicalDevice handle

- **VUID-vkCreateDevice-pCreateInfo-parameter**
  pCreateInfo must be a valid pointer to a valid VkDeviceCreateInfo structure

- **VUID-vkCreateDevice-pAllocator-parameter**
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- **VUID-vkCreateDevice-pDevice-parameter**
  pDevice must be a valid pointer to a VkDevice handle

### Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_EXTENSION_NOT_PRESENT
VK_ERROR_FEATURE_NOT_PRESENT
VK_ERROR_TOO_MANY_OBJECTS
VK_ERROR_DEVICE_LOST

The `VkDeviceCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDeviceCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkDeviceCreateFlags flags;
    uint32_t queueCreateInfoCount;
    const VkDeviceQueueCreateInfo* pQueueCreateInfos;
    uint32_t enabledLayerCount;
    const char** ppEnabledLayerNames;
    uint32_t enabledExtensionCount;
    const char** ppEnabledExtensionNames;
    const VkPhysicalDeviceFeatures* pEnabledFeatures;
} VkDeviceCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `queueCreateInfoCount` is the unsigned integer size of the `pQueueCreateInfos` array. Refer to the Queue Creation section below for further details.
- `pQueueCreateInfos` is a pointer to an array of `VkDeviceQueueCreateInfo` structures describing the queues that are requested to be created along with the logical device. Refer to the Queue Creation section below for further details.
- `enabledLayerCount` is deprecated and ignored.
- `ppEnabledLayerNames` is deprecated and ignored. See Device Layer Deprecation.
- `enabledExtensionCount` is the number of device extensions to enable.
- `ppEnabledExtensionNames` is a pointer to an array of `enabledExtensionCount` null-terminated UTF-8 strings containing the names of extensions to enable for the created device. See the Extensions section for further details.
- `pEnabledFeatures` is `NULL` or a pointer to a `VkPhysicalDeviceFeatures` structure containing boolean indicators of all the features to be enabled. Refer to the Features section for further details.

**Valid Usage**

- VUID-VkDeviceCreateInfo-queueFamilyIndex-02802
  The `queueFamilyIndex` member of each element of `pQueueCreateInfos` must be unique.
within `pQueueCreateInfos`, except that two members can share the same `queueFamilyIndex` if one describes protected-capable queues and one describes queues that are not protected-capable.

- **VUID-VkDeviceCreateInfo-pQueueCreateInfos-06755**
  If multiple elements of `pQueueCreateInfos` share the same `queueFamilyIndex`, the sum of their `queueCount` members **must** be less than or equal to the `queueCount` member of the `VkQueueFamilyProperties` structure, as returned by `vkGetPhysicalDeviceQueueFamilyProperties` in the `pQueueFamilyProperties[queueFamilyIndex]`.

- **VUID-VkDeviceCreateInfo-pQueueCreateInfos-06654**
  If multiple elements of `pQueueCreateInfos` share the same `queueFamilyIndex`, then all of such elements **must** have the same global priority level, which **can** be specified explicitly by the including a `VkDeviceQueueGlobalPriorityCreateInfoKHR` structure in the `pNext` chain, or by the implicit default value.

- **VUID-VkDeviceCreateInfo-pNext-00373**
  If the `pNext` chain includes a `VkPhysicalDeviceFeatures2` structure, then `pEnabledFeatures` **must** be `NULL`.

- **VUID-VkDeviceCreateInfo-pNext-02829**
  If the `pNext` chain includes a `VkPhysicalDeviceVulkan11Features` structure, then it **must** not include a `VkPhysicalDevice16BitStorageFeatures`, `VkPhysicalDeviceMultiviewFeatures`, `VkPhysicalDeviceProtectedMemoryFeatures`, `VkPhysicalDeviceSamplerYcbcrConversionFeatures`, or `VkPhysicalDeviceShaderDrawParametersFeatures` structure.

- **VUID-VkDeviceCreateInfo-pNext-02830**
  If the `pNext` chain includes a `VkPhysicalDeviceVulkan12Features` structure, then it **must** not include a `VkPhysicalDevice8BitStorageFeatures`, `VkPhysicalDeviceShaderAtomicInt64Features`, `VkPhysicalDeviceShaderFloat16Int8Features`, `VkPhysicalDeviceDescriptorIndexedFeatures`, `VkPhysicalDeviceScalarBlockLayoutFeatures`, `VkPhysicalDeviceImagelessFramebufferFeatures`, `VkPhysicalDeviceUniformBufferStandardLayoutFeatures`, `VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures`, `VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures`, `VkPhysicalDeviceHostQueryResetFeatures`, `VkPhysicalDeviceTimelineSemaphoreFeatures`, `VkPhysicalDeviceBufferDeviceAddressFeatures`, or `VkPhysicalDeviceVulkanMemoryModelFeatures` structure.

- **VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-04476**
  If `ppEnabledExtensionNames` contains "VK_KHR_shader_draw_parameters" and the `pNext` chain includes a `VkPhysicalDeviceVulkan11Features` structure, then `VkPhysicalDeviceVulkan11Features::shaderDrawParameters` **must** be `VK_TRUE`.

- **VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-02831**
  If `ppEnabledExtensionNames` contains "VK_KHR_draw_indirect_count" and the `pNext` chain
includes a `VkPhysicalDeviceVulkan12Features` structure, then `VkPhysicalDeviceVulkan12Features::drawIndirectCount` must be `VK_TRUE`

- **VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-02832**
  If `ppEnabledExtensionNames` contains "VK_KHR_sampler_mirror_clamp_to_edge" and the `pNext` chain includes a `VkPhysicalDeviceVulkan12Features` structure, then `VkPhysicalDeviceVulkan12Features::samplerMirrorClampToEdge` must be `VK_TRUE`

- **VUID-VkDeviceCreateInfo-pNext-06532**
  If the `pNext` chain includes a `VkPhysicalDeviceVulkan13Features` structure, then it must not include a `VkPhysicalDeviceDynamicRenderingFeatures`, `VkPhysicalDeviceImageRobustnessFeatures`, `VkPhysicalDeviceInlineUniformBlockFeatures`, `VkPhysicalDeviceMaintenance4Features`, `VkPhysicalDevicePipelineCreationCacheControlFeatures`, `VkPhysicalDevicePrivateDataFeatures`, `VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures`, `VkPhysicalDeviceShaderIntegerDotProductFeatures`, `VkPhysicalDeviceShaderTerminateInvocationFeatures`, `VkPhysicalDeviceSubgroupSizeControlFeatures`, `VkPhysicalDeviceSynchronization2Features`, `VkPhysicalDeviceTextureCompressionASTCHDRFeatures`, or `VkPhysicalDeviceZeroInitializeWorkgroupMemoryFeatures` structure.

- **VUID-VkDeviceCreateInfo-pProperties-04451**
  If the `VK_KHR_portability_subset` extension is included in `pProperties` of `vkEnumerateDeviceExtensionProperties`, `ppEnabledExtensionNames` must include "VK_KHR_portability_subset"

---

### Valid Usage (Implicit)

- **VUID-VkDeviceCreateInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_DEVICE_CREATE_INFO`

- **VUID-VkDeviceCreateInfo-pNext-pNext**
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkDeviceGroupDeviceCreateInfo`, `VkDevicePrivateDataCreateInfo`, `VkPhysicalDevice16BitStorageFeatures`, `VkPhysicalDevice8BitStorageFeatures`, `VkPhysicalDeviceAccelerationStructureFeaturesKHR`, `VkPhysicalDeviceAttachmentFeedbackLoopDynamicStateFeaturesEXT`, `VkPhysicalDeviceAttachmentFeedbackLoopLayoutFeaturesEXT`, `VkPhysicalDeviceBufferDeviceAddressFeatures`, `VkPhysicalDeviceCooperativeMatrixFeaturesKHR`, `VkPhysicalDeviceDepthBiasControlFeaturesEXT`, `VkPhysicalDeviceDescriptorIndexingFeatures`, `VkPhysicalDeviceDynamicRenderingFeatures`, `VkPhysicalDeviceDynamicRenderingLocalReadFeaturesKHR`, `VkPhysicalDeviceDynamicRenderingUnusedAttachmentsFeaturesEXT`, `VkPhysicalDeviceExtendedDynamicState3FeaturesEXT`, `VkPhysicalDeviceFeatures2`, etc.

- VUID-VkDeviceCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique, with the exception of structures of type VkDevicePrivateDataCreateInfo

- VUID-VkDeviceCreateInfo-flags-zero bitmask
  flags must be 0

- VUID-VkDeviceCreateInfo-pQueueCreateInfos-parameter
  pQueueCreateInfos must be a valid pointer to an array of queueCreateInfoCount valid VkDeviceQueueCreateInfo structures

- VUID-VkDeviceCreateInfo-ppEnabledLayerNames-parameter
  If enabledLayerCount is not 0, ppEnabledLayerNames must be a valid pointer to an array of enabledLayerCount null-terminated UTF-8 strings

- VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-parameter
  If enabledExtensionCount is not 0, ppEnabledExtensionNames must be a valid pointer to an array of enabledExtensionCount null-terminated UTF-8 strings

- VUID-VkDeviceCreateInfo-pEnabledFeatures-parameter
  If pEnabledFeatures is not NULL, pEnabledFeatures must be a valid pointer to a valid VkPhysicalDeviceFeatures structure

- VUID-VkDeviceCreateInfo-queueCreateInfoCount-arraylength
  queueCreateInfoCount must be greater than 0

// Provided by VK_VERSION_1_0
typedef VkFlags VkDeviceCreateFlags;

VkDeviceCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

A logical device can be created that connects to one or more physical devices by adding a VkDeviceGroupDeviceCreateInfo structure to the pNext chain of VkDeviceCreateInfo. The VkDeviceGroupDeviceCreateInfo structure is defined as:

// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupDeviceCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t physicalDeviceCount;
    const VkPhysicalDevice* pPhysicalDevices;
} VkDeviceGroupDeviceCreateInfo;
or the equivalent

```c
// Provided by VK_KHR_device_group_creation
typedef VkDeviceGroupDeviceCreateInfo VkDeviceGroupDeviceCreateInfoKHR;
```

• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **physicalDeviceCount** is the number of elements in the `pPhysicalDevices` array.
• **pPhysicalDevices** is a pointer to an array of physical device handles belonging to the same device group.

The elements of the `pPhysicalDevices` array are an ordered list of the physical devices that the logical device represents. These **must** be a subset of a single device group, and need not be in the same order as they were enumerated. The order of the physical devices in the `pPhysicalDevices` array determines the device index of each physical device, with element `i` being assigned a device index of `i`. Certain commands and structures refer to one or more physical devices by using device indices or device masks formed using device indices.

A logical device created without using `VkDeviceGroupDeviceCreateInfo`, or with `physicalDeviceCount` equal to zero, is equivalent to a `physicalDeviceCount` of one and `pPhysicalDevices` pointing to the `physicalDevice` parameter to `vkCreateDevice`. In particular, the device index of that physical device is zero.

### Valid Usage

- **VUID-VkDeviceGroupDeviceCreateInfo-pPhysicalDevices-00375**
  Each element of `pPhysicalDevices` **must** be unique

- **VUID-VkDeviceGroupDeviceCreateInfo-pPhysicalDevices-00376**
  All elements of `pPhysicalDevices` **must** be in the same device group as enumerated by `vkEnumeratePhysicalDeviceGroups`

- **VUID-VkDeviceGroupDeviceCreateInfo-physicalDeviceCount-00377**
  If `physicalDeviceCount` is not 0, the `physicalDevice` parameter of `vkCreateDevice` **must** be an element of `pPhysicalDevices`

### Valid Usage (Implicit)

- **VUID-VkDeviceGroupDeviceCreateInfo-sType-sType**
  `sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_GROUP_DEVICE_CREATE_INFO`

- **VUID-VkDeviceGroupDeviceCreateInfo-pPhysicalDevices-parameter**
  If `physicalDeviceCount` is not 0, `pPhysicalDevices` **must** be a valid pointer to an array of `physicalDeviceCount` valid `VkPhysicalDevice` handles

To reserve private data storage slots, add a `VkDevicePrivateDataCreateInfo` structure to the `pNext`
chain of the VkDeviceCreateInfo structure. Reserving slots in this manner is not strictly necessary, but doing so may improve performance.

```c
// Provided by VK_VERSION_1_3
typedef struct VkDevicePrivateDataCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t privateDataSlotRequestCount;
} VkDevicePrivateDataCreateInfo;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `privateDataSlotRequestCount` is the amount of slots to reserve.

**Valid Usage (Implicit)**

- VUID-VkDevicePrivateDataCreateInfo-sType-sType
  - `sType` must be VK_STRUCTURE_TYPE_DEVICE_PRIVATE_DATA_CREATE_INFO

### 5.2.2. Device Use

The following is a high-level list of VkDevice uses along with references on where to find more information:

- Creation of queues. See the Queues section below for further details.
- Creation and tracking of various synchronization constructs. See Synchronization and Cache Control for further details.
- Allocating, freeing, and managing memory. See Memory Allocation and Resource Creation for further details.
- Creation and destruction of command buffers and command buffer pools. See Command Buffers for further details.
- Creation, destruction, and management of graphics state. See Pipelines and Resource Descriptors, among others, for further details.

### 5.2.3. Lost Device

A logical device may become lost for a number of implementation-specific reasons, indicating that pending and future command execution may fail and cause resources and backing memory to become undefined.

**Note**

Typical reasons for device loss will include things like execution timing out (to prevent denial of service), power management events, platform resource management, implementation errors.
Applications not adhering to valid usage may also result in device loss being reported, however this is not guaranteed. Even if device loss is reported, the system may be in an unrecoverable state, and further usage of the API is still considered invalid.

When this happens, certain commands will return VK_ERROR_DEVICE_LOST. After any such event, the logical device is considered lost. It is not possible to reset the logical device to a non-lost state, however the lost state is specific to a logical device (VkDevice), and the corresponding physical device (VkPhysicalDevice) may be otherwise unaffected.

In some cases, the physical device may also be lost, and attempting to create a new logical device will fail, returning VK_ERROR_DEVICE_LOST. This is usually indicative of a problem with the underlying implementation, or its connection to the host. If the physical device has not been lost, and a new logical device is successfully created from that physical device, it must be in the non-lost state.

Note
Whilst logical device loss may be recoverable, in the case of physical device loss, it is unlikely that an application will be able to recover unless additional, unaffected physical devices exist on the system. The error is largely informational and intended only to inform the user that a platform issue has occurred, and should be investigated further. For example, underlying hardware may have developed a fault or become physically disconnected from the rest of the system. In many cases, physical device loss may cause other more serious issues such as the operating system crashing; in which case it may not be reported via the Vulkan API.

When a device is lost, its child objects are not implicitly destroyed and their handles are still valid. Those objects must still be destroyed before their parents or the device can be destroyed (see the Object Lifetime section). The host address space corresponding to device memory mapped using vkMapMemory is still valid, and host memory accesses to these mapped regions are still valid, but the contents are undefined. It is still legal to call any API command on the device and child objects.

Once a device is lost, command execution may fail, and certain commands that return a VkResult may return VK_ERROR_DEVICE_LOST. These commands can be identified by the inclusion of VK_ERROR_DEVICE_LOST in the Return Codes section for each command. Commands that do not allow runtime errors must still operate correctly for valid usage and, if applicable, return valid data.

Commands that wait indefinitely for device execution (namely vkDeviceWaitIdle, vkQueueWaitIdle, vkWaitForFences or vkAcquireNextImageKHR with a maximum timeout, and vkGetQueryPoolResults with the VK_QUERY_RESULT_WAIT_BIT bit set in flags) must return in finite time even in the case of a lost device, and return either VK_SUCCESS or VK_ERROR_DEVICE_LOST. For any command that may return VK_ERROR_DEVICE_LOST, for the purpose of determining whether a command buffer is in the pending state, or whether resources are considered in-use by the device, a return value of VK_ERROR_DEVICE_LOST is equivalent to VK_SUCCESS.

If a device was created with the maintenance5 feature enabled, and any device command returns VK_ERROR_DEVICE_LOST, then all device commands for which VK_ERROR_DEVICE_LOST is a valid return value and which happen-after it on the same host thread must return VK_ERROR_DEVICE_LOST.
Device commands executing on other threads must begin returning VK_ERROR_DEVICE_LOST within finite time.

The content of any external memory objects that have been exported from or imported to a lost device become undefined. Objects on other logical devices or in other APIs which are associated with the same underlying memory resource as the external memory objects on the lost device are unaffected other than their content becoming undefined. The layout of subresources of images on other logical devices that are bound to VkDeviceMemory objects associated with the same underlying memory resources as external memory objects on the lost device becomes VK_IMAGE_LAYOUT_UNDEFINED.

The state of VkSemaphore objects on other logical devices created by importing a semaphore payload with temporary permanence which was exported from the lost device is undefined. The state of VkSemaphore objects on other logical devices that permanently share a semaphore payload with a VkSemaphore object on the lost device is undefined, and remains undefined following any subsequent signal operations. Implementations must ensure pending and subsequently submitted wait operations on such semaphores behave as defined in Semaphore State Requirements For Wait Operations for external semaphores not in a valid state for a wait operation.

5.2.4. Device Destruction

To destroy a device, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyDevice(  
    VkDevice device,  
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

To ensure that no work is active on the device, vkDeviceWaitIdle can be used to gate the destruction of the device. Prior to destroying a device, an application is responsible for destroying/freeing any Vulkan objects that were created using that device as the first parameter of the corresponding vkCreate* or vkAllocate* command.

Note

The lifetime of each of these objects is bound by the lifetime of the VkDevice object. Therefore, to avoid resource leaks, it is critical that an application explicitly free all of these resources prior to calling vkDestroyDevice.

Valid Usage

- VUID-vkDestroyDevice-device-05137
  All child objects created on device must have been destroyed prior to destroying device
- VUID-vkDestroyDevice-device-00379
If `VkAllocationCallbacks` were provided when `device` was created, a compatible set of callbacks **must** be provided here

- VUID-vkDestroyDevice-device-00380

If no `VkAllocationCallbacks` were provided when `device` was created, `pAllocator` **must be NULL**

### Valid Usage (Implicit)

- VUID-vkDestroyDevice-device-parameter
  - If `device` is not `NULL`, `device` **must be** a valid `VkDevice` handle
- VUID-vkDestroyDevice-pAllocator-parameter
  - If `pAllocator` is not `NULL`, `pAllocator` **must be** a valid pointer to a valid `VkAllocationCallbacks` structure

### Host Synchronization

- Host access to `device` **must be** externally synchronized
- Host access to all `VkQueue` objects created from `device` **must be** externally synchronized

## 5.3. Queues

### 5.3.1. Queue Family Properties

As discussed in the Physical Device Enumeration section above, the `vkGetPhysicalDeviceQueueFamilyProperties` command is used to retrieve details about the queue families and queues supported by a device.

Each index in the `pQueueFamilyProperties` array returned by `vkGetPhysicalDeviceQueueFamilyProperties` describes a unique queue family on that physical device. These indices are used when creating queues, and they correspond directly with the `queueFamilyIndex` that is passed to the `vkCreateDevice` command via the `VkDeviceQueueCreateInfo` structure as described in the Queue Creation section below.

Grouping of queue families within a physical device is implementation-dependent.

**Note**

The general expectation is that a physical device groups all queues of matching capabilities into a single family. However, while implementations **should** do this, it is possible that a physical device **may** return two separate queue families with the same capabilities.

Once an application has identified a physical device with the queue(s) that it desires to use, it will create those queues in conjunction with a logical device. This is described in the following section.
5.3.2. Queue Creation

Creating a logical device also creates the queues associated with that device. The queues to create are described by a set of `VkDeviceQueueCreateInfo` structures that are passed to `vkCreateDevice` in `pQueueCreateInfos`.

Queues are represented by `VkQueue` handles:

```cpp
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkQueue)
```

The `VkDeviceQueueCreateInfo` structure is defined as:

```cpp
// Provided by VK_VERSION_1_0
typedef struct VkDeviceQueueCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkDeviceQueueCreateFlags flags;
    uint32_t queueFamilyIndex;
    uint32_t queueCount;
    const float* pQueuePriorities;
} VkDeviceQueueCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask indicating behavior of the queues.
- `queueFamilyIndex` is an unsigned integer indicating the index of the queue family in which to create the queues on this device. This index corresponds to the index of an element of the `pQueueFamilyProperties` array that was returned by `vkGetPhysicalDeviceQueueFamilyProperties`.
- `queueCount` is an unsigned integer specifying the number of queues to create in the queue family indicated by `queueFamilyIndex`, and with the behavior specified by `flags`.
- `pQueuePriorities` is a pointer to an array of `queueCount` normalized floating point values, specifying priorities of work that will be submitted to each created queue. See `Queue Priority` for more information.

### Valid Usage

- **VUID-VkDeviceQueueCreateInfo-queueFamilyIndex-00381**
  `queueFamilyIndex` must be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties`

- **VUID-VkDeviceQueueCreateInfo-queueCount-00382**
  `queueCount` must be less than or equal to the `queueCount` member of the `VkQueueFamilyProperties` structure, as returned by `vkGetPhysicalDeviceQueueFamilyProperties`
pQueueFamilyProperties[queueFamilyIndex]

- VUID-VkDeviceQueueCreateInfo-pQueuePriorities-00383
  Each element of `pQueuePriorities` must be between 0.0 and 1.0 inclusive

- VUID-VkDeviceQueueCreateInfo-flags-02861
  If the protectedMemory feature is not enabled, the `VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT` bit of `flags` must not be set

- VUID-VkDeviceQueueCreateInfo-flags-06449
  If `flags` includes `VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT`, `queueFamilyIndex` must be the index of a queue family that includes the `VK_QUEUE_PROTECTED_BIT` capability

### Valid Usage (Implicit)

- VUID-VkDeviceQueueCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_DEVICE_QUEUE_CREATE_INFO`

- VUID-VkDeviceQueueCreateInfo-pNext-pNext
  `pNext` must be `NULL` or a pointer to a valid instance of `VkDeviceQueueGlobalPriorityCreateInfoKHR`

- VUID-VkDeviceQueueCreateInfo-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique

- VUID-VkDeviceQueueCreateInfo-flags-parameter
  `flags` must be a valid combination of `VkDeviceQueueCreateFlagBits` values

- VUID-VkDeviceQueueCreateInfo-pQueuePriorities-parameter
  `pQueuePriorities` must be a valid pointer to an array of `queueCount` float values

- VUID-VkDeviceQueueCreateInfo-queueCount-arraylength
  `queueCount` must be greater than 0

Bits which can be set in `VkDeviceQueueCreateInfo::flags`, specifying usage behavior of a queue, are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkDeviceQueueCreateFlagBits {
    // Provided by VK_VERSION_1_1
    VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT = 0x00000001,
} VkDeviceQueueCreateFlagBits;
```

- **VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT** specifies that the device queue is a protected-capable queue.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkDeviceQueueCreateFlags;
```

`VkDeviceQueueCreateFlags` is a bitmask type for setting a mask of zero or more
 VkDeviceQueueCreateFlagBits.

Queues can be created with a system-wide priority by adding a `VkDeviceQueueGlobalPriorityCreateInfoKHR` structure to the `pNext` chain of `VkDeviceQueueCreateInfo`.

The `VkDeviceQueueGlobalPriorityCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_global_priority
typedef struct VkDeviceQueueGlobalPriorityCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkQueueGlobalPriorityKHR globalPriority;
} VkDeviceQueueGlobalPriorityCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `globalPriority` is the system-wide priority associated to these queues as specified by `VkQueueGlobalPriorityEXT`.

Queues created without specifying `VkDeviceQueueGlobalPriorityCreateInfoKHR` will default to `VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR`.

### Valid Usage (Implicit)

- `VUID-VkDeviceQueueGlobalPriorityCreateInfoKHR-sType-sType` 
  
  `sType` must be `VK_STRUCTURE_TYPE_DEVICE_QUEUE_GLOBAL_PRIORITY_CREATE_INFO_KHR`.

- `VUID-VkDeviceQueueGlobalPriorityCreateInfoKHR-globalPriority-parameter` 
  
  `globalPriority` must be a valid `VkQueueGlobalPriorityKHR` value.

Possible values of `VkDeviceQueueGlobalPriorityCreateInfoKHR::globalPriority`, specifying a system-wide priority level are:

```c
// Provided by VK_KHR_global_priority
typedef enum VkQueueGlobalPriorityKHR {
    VK_QUEUE_GLOBAL_PRIORITY_LOW_KHR = 128,
    VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR = 256,
    VK_QUEUE_GLOBAL_PRIORITY_HIGH_KHR = 512,
    VK_QUEUE_GLOBAL_PRIORITY_REALTIME_KHR = 1024,
    VK_QUEUE_GLOBAL_PRIORITY_LOW_EXT = VK_QUEUE_GLOBAL_PRIORITY_LOW_KHR,
    VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_EXT = VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR,
    VK_QUEUE_GLOBAL_PRIORITY_HIGH_EXT = VK_QUEUE_GLOBAL_PRIORITY_HIGH_KHR,
    VK_QUEUE_GLOBAL_PRIORITY_REALTIME_EXT = VK_QUEUE_GLOBAL_PRIORITY_REALTIME_KHR,
} VkQueueGlobalPriorityKHR;
```

Priority values are sorted in ascending order. A comparison operation on the enum values can be
used to determine the priority order.

- **VK_QUEUE_GLOBAL_PRIORITY_LOW_KHR** is below the system default. Useful for non-interactive tasks.
- **VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR** is the system default priority.
- **VK_QUEUE_GLOBAL_PRIORITY_HIGH_KHR** is above the system default.
- **VK_QUEUE_GLOBAL_PRIORITY_REALTIME_KHR** is the highest priority. Useful for critical tasks.

Queues with higher system priority **may** be allotted more processing time than queues with lower priority. An implementation **may** allow a higher-priority queue to starve a lower-priority queue until the higher-priority queue has no further commands to execute.

Priorities imply no ordering or scheduling constraints.

No specific guarantees are made about higher priority queues receiving more processing time or better quality of service than lower priority queues.

The global priority level of a queue takes precedence over the per-process queue priority (VkDeviceQueueCreateInfo::pQueuePriorities).

Abuse of this feature **may** result in starving the rest of the system of implementation resources. Therefore, the driver implementation **may** deny requests to acquire a priority above the default priority (**VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR**) if the caller does not have sufficient privileges. In this scenario **VK_ERROR_NOT_PERMITTED_KHR** is returned.

The driver implementation **may** fail the queue allocation request if resources required to complete the operation have been exhausted (either by the same process or a different process). In this scenario **VK_ERROR_INITIALIZATION_FAILED** is returned.

If the globalPriorityQuery feature is enabled and the requested global priority is not reported via VkQueueFamilyGlobalPriorityPropertiesKHR, the driver implementation **must** fail the queue creation. In this scenario, **VK_ERROR_INITIALIZATION_FAILED** is returned.

To retrieve a handle to a VkQueue object, call:

```c
// Provided by VK_VERSION_1_0
void vkGetDeviceQueue(
    VkDevice device,
    uint32_t queueFamilyIndex,
    uint32_t queueIndex,
    VkQueue* pQueue);
```

- **device** is the logical device that owns the queue.
- **queueFamilyIndex** is the index of the queue family to which the queue belongs.
- **queueIndex** is the index within this queue family of the queue to retrieve.
- **pQueue** is a pointer to a VkQueue object that will be filled with the handle for the requested queue.
vkGetDeviceQueue must only be used to get queues that were created with the flags parameter of VkDeviceQueueCreateInfo set to zero. To get queues that were created with a non-zero flags parameter use vkGetDeviceQueue2.

Valid Usage

- VUID-vkGetDeviceQueue-queueFamilyIndex-00384
  queueFamilyIndex must be one of the queue family indices specified when device was created, via the VkDeviceQueueCreateInfo structure

- VUID-vkGetDeviceQueue-queueIndex-00385
  queueIndex must be less than the value of VkDeviceQueueCreateInfo::queueCount for the queue family indicated by queueFamilyIndex when device was created

- VUID-vkGetDeviceQueue-flags-01841
  VkDeviceQueueCreateInfo::flags must have been set to zero when device was created

Valid Usage (Implicit)

- VUID-vkGetDeviceQueue-device-parameter
device must be a valid VkDevice handle

- VUID-vkGetDeviceQueue-pQueue-parameter
  pQueue must be a valid pointer to a VkQueue handle

To retrieve a handle to a VkQueue object with specific VkDeviceQueueCreateFlags creation flags, call:

```c
// Provided by VK_VERSION_1_1
void vkGetDeviceQueue2(
    VkDevice device,
    const VkDeviceQueueInfo2* pQueueInfo,
    VkQueue* pQueue);
```

- device is the logical device that owns the queue.

- pQueueInfo is a pointer to a VkDeviceQueueInfo2 structure, describing parameters of the device queue to be retrieved.

- pQueue is a pointer to a VkQueue object that will be filled with the handle for the requested queue.

Valid Usage (Implicit)

- VUID-vkGetDeviceQueue2-device-parameter
device must be a valid VkDevice handle

- VUID-vkGetDeviceQueue2-pQueueInfo-parameter
**pQueueInfo** must be a valid pointer to a valid **VkDeviceQueueInfo2** structure

- **VUID-vkGetDeviceQueue2-pQueue-parameter**

  **pQueue** must be a valid pointer to a **VkQueue** handle

The **VkDeviceQueueInfo2** structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDeviceQueueInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkDeviceQueueCreateFlags flags;
    uint32_t queueFamilyIndex;
    uint32_t queueIndex;
} VkDeviceQueueInfo2;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure. The **pNext** chain of **VkDeviceQueueInfo2** can be used to provide additional device queue parameters to **vkGetDeviceQueue2**.
- **flags** is a **VkDeviceQueueCreateFlags** value indicating the flags used to create the device queue.
- **queueFamilyIndex** is the index of the queue family to which the queue belongs.
- **queueIndex** is the index of the queue to retrieve from within the set of queues that share both the queue family and flags specified.

The queue returned by **vkGetDeviceQueue2** must have the same **flags** value from this structure as that used at device creation time in a **VkDeviceQueueCreateInfo** structure.

**Note**

Normally, if you create both protected-capable and non-protected-capable queues with the same family, they are treated as separate lists of queues and **queueIndex** is relative to the start of the list of queues specified by both **queueFamilyIndex** and **flags**. However, for historical reasons, some implementations may exhibit different behavior. These divergent implementations instead concatenate the lists of queues and treat **queueIndex** as relative to the start of the first list of queues with the given **queueFamilyIndex**. This only matters in cases where an application has created both protected-capable and non-protected-capable queues from the same queue family.

For such divergent implementations, the maximum value of **queueIndex** is equal to the sum of **VkDeviceQueueCreateInfo::queueCount** minus one, for all **VkDeviceQueueCreateInfo** structures that share a common **queueFamilyIndex**.

Such implementations will return **NULL** for either the protected or unprotected queues when calling **vkGetDeviceQueue2** with **queueIndex** in the range zero to **VkDeviceQueueCreateInfo::queueCount** minus one. In cases where these
implementations returned \texttt{NULL}, the corresponding queues are instead located in the extended range described in the preceding two paragraphs.

This behaviour will not be observed on any driver that has passed Vulkan conformance test suite version 1.3.3.0, or any subsequent version. This information can be found by querying \texttt{VkPhysicalDeviceDriverProperties::conformanceVersion}.

\begin{center}
\begin{tcolorbox}
\textbf{Valid Usage}

- \texttt{VUID-VkDeviceQueueInfo2-queueFamilyIndex-01842}
  \texttt{queueFamilyIndex} \textbf{must} be one of the queue family indices specified when \texttt{device} was created, via the \texttt{VkDeviceQueueCreateInfo} structure

- \texttt{VUID-VkDeviceQueueInfo2-flags-06225}
  \texttt{flags} \textbf{must} be equal to \texttt{VkDeviceQueueCreateInfo::flags} for a \texttt{VkDeviceQueueCreateInfo} structure for the queue family indicated by \texttt{queueFamilyIndex} when \texttt{device} was created

- \texttt{VUID-VkDeviceQueueInfo2-queueIndex-01843}
  \texttt{queueIndex} \textbf{must} be less than \texttt{VkDeviceQueueCreateInfo::queueCount} for the corresponding queue family and flags indicated by \texttt{queueFamilyIndex} and \texttt{flags} when \texttt{device} was created

\end{tcolorbox}
\end{center}

\begin{center}
\begin{tcolorbox}
\textbf{Valid Usage (Implicit)}

- \texttt{VUID-VkDeviceQueueInfo2-sType-sType}
  \texttt{sType} \textbf{must} be \texttt{VK_STRUCTURE_TYPE_DEVICE_QUEUE_INFO_2}

- \texttt{VUID-VkDeviceQueueInfo2-pNext-pNext}
  \texttt{pNext} \textbf{must} be \texttt{NULL}

- \texttt{VUID-VkDeviceQueueInfo2-flags-parameter}
  \texttt{flags} \textbf{must} be a valid combination of \texttt{VkDeviceQueueCreateFlagBits} values

\end{tcolorbox}
\end{center}

\section*{5.3.3. Queue Family Index}

The queue family index is used in multiple places in Vulkan in order to tie operations to a specific family of queues.

When retrieving a handle to the queue via \texttt{vkGetDeviceQueue}, the queue family index is used to select which queue family to retrieve the \texttt{VkQueue} handle from as described in the previous section.

When creating a \texttt{VkCommandPool} object (see \texttt{Command Pools}), a queue family index is specified in the \texttt{VkCommandPoolCreateInfo} structure. Command buffers from this pool \textbf{can} only be submitted on queues corresponding to this queue family.

When creating \texttt{VkImage} (see \texttt{Images}) and \texttt{VkBuffer} (see \texttt{Buffers}) resources, a set of queue families is included in the \texttt{VkImageCreateInfo} and \texttt{VkBufferCreateInfo} structures to specify the queue families that \textbf{can} access the resource.
When inserting a VkBufferMemoryBarrier or VkImageMemoryBarrier (see Pipeline Barriers), a source and destination queue family index is specified to allow the ownership of a buffer or image to be transferred from one queue family to another. See the Resource Sharing section for details.

### 5.3.4. Queue Priority

Each queue is assigned a priority, as set in the VkDeviceQueueCreateInfo structures when creating the device. The priority of each queue is a normalized floating point value between 0.0 and 1.0, which is then translated to a discrete priority level by the implementation. Higher values indicate a higher priority, with 0.0 being the lowest priority and 1.0 being the highest.

Within the same device, queues with higher priority may be allotted more processing time than queues with lower priority. The implementation makes no guarantees with regards to ordering or scheduling among queues with the same priority, other than the constraints defined by any explicit synchronization primitives. The implementation makes no guarantees with regards to queues across different devices.

An implementation may allow a higher-priority queue to starve a lower-priority queue on the same VkDevice until the higher-priority queue has no further commands to execute. The relationship of queue priorities must not cause queues on one VkDevice to starve queues on another VkDevice.

No specific guarantees are made about higher priority queues receiving more processing time or better quality of service than lower priority queues.

### 5.3.5. Queue Submission

Work is submitted to a queue via *queue submission* commands such as vkQueueSubmit2 or vkQueueSubmit. Queue submission commands define a set of *queue operations* to be executed by the underlying physical device, including synchronization with semaphores and fences.

Submission commands take as parameters a target queue, zero or more *batches* of work, and an *optional* fence to signal upon completion. Each batch consists of three distinct parts:

1. Zero or more semaphores to wait on before execution of the rest of the batch.
   - If present, these describe a *semaphore wait operation*.
2. Zero or more work items to execute.
   - If present, these describe a *queue operation* matching the work described.
3. Zero or more semaphores to signal upon completion of the work items.
   - If present, these describe a *semaphore signal operation*.

If a fence is present in a queue submission, it describes a *fence signal operation*.

All work described by a queue submission command must be submitted to the queue before the command returns.

**Sparse Memory Binding**

In Vulkan it is possible to sparsely bind memory to buffers and images as described in the Sparse
Sparse memory binding is a queue operation. A queue whose flags include the `VK_QUEUE_SPARSE_BINDING_BIT` must be able to support the mapping of a virtual address to a physical address on the device. This causes an update to the page table mappings on the device. This update must be synchronized on a queue to avoid corrupting page table mappings during execution of graphics commands. By binding the sparse memory resources on queues, all commands that are dependent on the updated bindings are synchronized to only execute after the binding is updated. See the Synchronization and Cache Control chapter for how this synchronization is accomplished.

### 5.3.6. Queue Destruction

Queues are created along with a logical device during `vkCreateDevice`. All queues associated with a logical device are destroyed when `vkDestroyDevice` is called on that device.
Chapter 6. Command Buffers

Command buffers are objects used to record commands which can be subsequently submitted to a device queue for execution. There are two levels of command buffers - primary command buffers, which can execute secondary command buffers, and which are submitted to queues, and secondary command buffers, which can be executed by primary command buffers, and which are not directly submitted to queues.

Command buffers are represented by VkCommandBuffer handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkCommandBuffer)
```

Recorded commands include commands to bind pipelines and descriptor sets to the command buffer, commands to modify dynamic state, commands to draw (for graphics rendering), commands to dispatch (for compute), commands to execute secondary command buffers (for primary command buffers only), commands to copy buffers and images, and other commands.

Each command buffer manages state independently of other command buffers. There is no inheritance of state across primary and secondary command buffers, or between secondary command buffers. When a command buffer begins recording, all state in that command buffer is undefined. When secondary command buffer(s) are recorded to execute on a primary command buffer, the secondary command buffer inherits no state from the primary command buffer, and all state of the primary command buffer is undefined after an execute secondary command buffer command is recorded. There is one exception to this rule - if the primary command buffer is inside a render pass instance, then the render pass and subpass state is not disturbed by executing secondary command buffers. For state dependent commands (such as draws and dispatches), any state consumed by those commands must not be undefined.

Unless otherwise specified, and without explicit synchronization, the various commands submitted to a queue via command buffers may execute in arbitrary order relative to each other, and/or concurrently. Also, the memory side effects of those commands may not be directly visible to other commands without explicit memory dependencies. This is true within a command buffer, and across command buffers submitted to a given queue. See the synchronization chapter for information on implicit and explicit synchronization between commands.

6.1. Command Buffer Lifecycle

Each command buffer is always in one of the following states:

**Initial**

When a command buffer is allocated, it is in the initial state. Some commands are able to reset a command buffer (or a set of command buffers) back to this state from any of the executable, recording or invalid state. Command buffers in the initial state can only be moved to the recording state, or freed.
Recording

`vkBeginCommandBuffer` changes the state of a command buffer from the initial state to the *recording state*. Once a command buffer is in the recording state, `vkCmd*` commands can be used to record to the command buffer.

Executable

`vkEndCommandBuffer` ends the recording of a command buffer, and moves it from the recording state to the *executable state*. Executable command buffers can be submitted, reset, or recorded to another command buffer.

Pending

*Queue submission* of a command buffer changes the state of a command buffer from the executable state to the *pending state*. Whilst in the pending state, applications must not attempt to modify the command buffer in any way - as the device may be processing the commands recorded to it. Once execution of a command buffer completes, the command buffer either reverts back to the *executable state*, or if it was recorded with `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT`, it moves to the *invalid state*. A synchronization command should be used to detect when this occurs.

Invalid

Some operations, such as modifying or deleting a resource that was used in a command recorded to a command buffer, will transition the state of that command buffer into the *invalid state*. Command buffers in the invalid state can only be reset or freed.

![Figure 1. Lifecycle of a command buffer](image)

Any given command that operates on a command buffer has its own requirements on what state a command buffer must be in, which are detailed in the valid usage constraints for that command.

Resetting a command buffer is an operation that discards any previously recorded commands and puts a command buffer in the *initial state*. Resetting occurs as a result of `vkResetCommandBuffer` or `vkResetCommandPool`, or as part of `vkBeginCommandBuffer` (which additionally puts the command buffer in the *recording state*).

Secondary command buffers can be recorded to a primary command buffer via
vkCmdExecuteCommands. This partially ties the lifecycle of the two command buffers together - if the primary is submitted to a queue, both the primary and any secondaries recorded to it move to the pending state. Once execution of the primary completes, so it does for any secondary recorded within it. After all executions of each command buffer complete, they each move to their appropriate completion state (either to the executable state or the invalid state, as specified above).

If a secondary moves to the invalid state or the initial state, then all primary buffers it is recorded in move to the invalid state. A primary moving to any other state does not affect the state of a secondary recorded in it.

Note
Resetting or freeing a primary command buffer removes the lifecycle linkage to all secondary command buffers that were recorded into it.

6.2. Command Pools

Command pools are opaque objects that command buffer memory is allocated from, and which allow the implementation to amortize the cost of resource creation across multiple command buffers. Command pools are externally synchronized, meaning that a command pool must not be used concurrently in multiple threads. That includes use via recording commands on any command buffers allocated from the pool, as well as operations that allocate, free, and reset command buffers or the pool itself.

Command pools are represented by VkCommandPool handles:

// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkCommandPool)

To create a command pool, call:

// Provided by VK_VERSION_1_0
VkResult vkCreateCommandPool(
    device,
    pCreateInfo,
    pAllocator,
    pCommandPool);

- device is the logical device that creates the command pool.
- pCreateInfo is a pointer to a VkCommandPoolCreateInfo structure specifying the state of the command pool object.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.
- pCommandPool is a pointer to a VkCommandPool handle in which the created pool is returned.
Valid Usage

- VUID-vkCreateCommandPool-queueFamilyIndex-01937
  
  `pCreateInfo->queueFamilyIndex` must be the index of a queue family available in the logical device `device`.

Valid Usage (Implicit)

- VUID-vkCreateCommandPool-device-parameter
  `device` must be a valid `VkDevice` handle.

- VUID-vkCreateCommandPool-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid `VkCommandPoolCreateInfo` structure.

- VUID-vkCreateCommandPool-pAllocator-parameter
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.

- VUID-vkCreateCommandPool-pCommandPool-parameter
  `pCommandPool` must be a valid pointer to a `VkCommandPool` handle.

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkCommandPoolCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkCommandPoolCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkCommandPoolCreateFlags flags;
    uint32_t queueFamilyIndex;
} VkCommandPoolCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkCommandPoolCreateFlagBits` indicating usage behavior for the pool and command buffers allocated from it.
• **queueFamilyIndex** designates a queue family as described in section Queue Family Properties. All command buffers allocated from this command pool **must** be submitted on queues from the same queue family.

### Valid Usage

- **VUID-VkCommandPoolCreateInfo-flags-02860**
  - If the protectedMemory feature is not enabled, the **VK_COMMAND_POOL_CREATE_PROTECTED_BIT** bit of flags must not be set

### Valid Usage (Implicit)

- **VUID-VkCommandPoolCreateInfo-sType-sType**
  - sType must be **VK_STRUCTURE_TYPE_COMMAND_POOL_CREATE_INFO**

- **VUID-VkCommandPoolCreateInfo-pNext-pNext**
  - pNext must be NULL

- **VUID-VkCommandPoolCreateInfo-flags-parameter**
  - flags must be a valid combination of **VkCommandPoolCreateFlagBits** values

Bits which **can** be set in **VkCommandPoolCreateInfo::flags**, specifying usage behavior for a command pool, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCommandPoolCreateFlagBits {  
    VK_COMMAND_POOL_CREATE_TRANSIENT_BIT = 0x00000001,
    VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT = 0x00000002,
} VkCommandPoolCreateFlagBits;
```

- **VK_COMMAND_POOL_CREATE_TRANSIENT_BIT** specifies that command buffers allocated from the pool will be short-lived, meaning that they will be reset or freed in a relatively short timeframe. This flag **may** be used by the implementation to control memory allocation behavior within the pool.

- **VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT** allows any command buffer allocated from a pool to be individually reset to the initial state; either by calling **vkResetCommandBuffer**, or via the implicit reset when calling **vkBeginCommandBuffer**. If this flag is not set on a pool, then **vkResetCommandBuffer** **must** not be called for any command buffer allocated from that pool.

- **VK_COMMAND_POOL_CREATE_PROTECTED_BIT** specifies that command buffers allocated from the pool are protected command buffers.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkCommandPoolCreateFlags;
```
**VkCommandPoolCreateFlags** is a bitmask type for setting a mask of zero or more **VkCommandPoolCreateFlagBits**.

To trim a command pool, call:

```c
// Provided by VK_VERSION_1_1
void vkTrimCommandPool(
    VkDevice device,
    VkCommandPool commandPool,
    VkCommandPoolTrimFlags flags);
```

or the equivalent command

```c
// Provided by VK_KHR_maintenance1
void vkTrimCommandPoolKHR(
    VkDevice device,
    VkCommandPool commandPool,
    VkCommandPoolTrimFlags flags);
```

- **device** is the logical device that owns the command pool.
- **commandPool** is the command pool to trim.
- **flags** is reserved for future use.

Trimming a command pool recycles unused memory from the command pool back to the system. Command buffers allocated from the pool are not affected by the command.

**Note**
This command provides applications with some control over the internal memory allocations used by command pools.

Unused memory normally arises from command buffers that have been recorded and later reset, such that they are no longer using the memory. On reset, a command buffer can return memory to its command pool, but the only way to release memory from a command pool to the system requires calling **vkResetCommandPool**, which cannot be executed while any command buffers from that pool are still in use. Subsequent recording operations into command buffers will reuse this memory but since total memory requirements fluctuate over time, unused memory can accumulate.

In this situation, trimming a command pool **may** be useful to return unused memory back to the system, returning the total outstanding memory allocated by the pool back to a more “average” value.

Implementations utilize many internal allocation strategies that make it impossible to guarantee that all unused memory is released back to the system. For instance, an implementation of a command pool **may** involve allocating memory in bulk from the system and sub-allocating from that memory. In such an
implementation any live command buffer that holds a reference to a bulk allocation would prevent that allocation from being freed, even if only a small proportion of the bulk allocation is in use.

In most cases trimming will result in a reduction in allocated but unused memory, but it does not guarantee the “ideal” behavior.

Trimming may be an expensive operation, and should not be called frequently. Trimming should be treated as a way to relieve memory pressure after application-known points when there exists enough unused memory that the cost of trimming is “worth” it.

Valid Usage (Implicit)

- VUID-vkTrimCommandPool-device-parameter
  device must be a valid VkDevice handle
- VUID-vkTrimCommandPool-commandPool-parameter
  commandPool must be a valid VkCommandPool handle
- VUID-vkTrimCommandPool-flags-zerobitmask
  flags must be 0
- VUID-vkTrimCommandPool-commandPool-parent
  commandPool must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to commandPool must be externally synchronized

// Provided by VK_VERSION_1_1
typedef VkFlags VkCommandPoolTrimFlags;

or the equivalent

// Provided by VK_KHR_maintenance1
typedef VkCommandPoolTrimFlags VkCommandPoolTrimFlagsKHR;

VkCommandPoolTrimFlags is a bitmask type for setting a mask, but is currently reserved for future use.

To reset a command pool, call:

// Provided by VK_VERSION_1_0
VkResult vkResetCommandPool(
    VkDevice device,                     
    VkCommandPool commandPool,          
    VkCommandPoolTrimFlags trimFlags,   
    VkCommandPoolTrimFlagsKHR flags,   
    VkCommandPoolTrimFlagsKHR parent   
);
VkCommandPoolResetFlags

- `device` is the logical device that owns the command pool.
- `commandPool` is the command pool to reset.
- `flags` is a bitmask of `VkCommandPoolResetFlagBits` controlling the reset operation.

Resetting a command pool recycles all of the resources from all of the command buffers allocated from the command pool back to the command pool. All command buffers that have been allocated from the command pool are put in the initial state.

Any primary command buffer allocated from another `VkCommandPool` that is in the recording or executable state and has a secondary command buffer allocated from `commandPool` recorded into it, becomes invalid.

**Valid Usage**

- VUID-vkResetCommandPool-commandPool-00040
  All `VkCommandBuffer` objects allocated from `commandPool` must not be in the pending state

**Valid Usage (Implicit)**

- VUID-vkResetCommandPool-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkResetCommandPool-commandPool-parameter
  `commandPool` must be a valid `VkCommandPool` handle
- VUID-vkResetCommandPool-flags-parameter
  `flags` must be a valid combination of `VkCommandPoolResetFlagBits` values
- VUID-vkResetCommandPool-commandPool-parent
  `commandPool` must have been created, allocated, or retrieved from `device`

**Host Synchronization**

- Host access to `commandPool` must be externally synchronized

**Return Codes**

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
Bits which can be set in `vkResetCommandPool::flags`, controlling the reset operation, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCommandPoolResetFlagBits {
    VK_COMMAND_POOL_RESET_RELEASE_RESOURCES_BIT = 0x00000001,
} VkCommandPoolResetFlagBits;
```

- `VK_COMMAND_POOL_RESET_RELEASE_RESOURCES_BIT` specifies that resetting a command pool recycles all of the resources from the command pool back to the system.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkCommandPoolResetFlags;
```

`VkCommandPoolResetFlags` is a bitmask type for setting a mask of zero or more `VkCommandPoolResetFlagBits`.

To destroy a command pool, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyCommandPool(
    VkDevice device,
    VkCommandPool commandPool,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the command pool.
- `commandPool` is the handle of the command pool to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

When a pool is destroyed, all command buffers allocated from the pool are freed.

Any primary command buffer allocated from another `VkCommandPool` that is in the recording or executable state and has a secondary command buffer allocated from `commandPool` recorded into it, becomes invalid.

### Valid Usage

- **VUID-vkDestroyCommandPool-commandPool-00041**
  All `VkCommandBuffer` objects allocated from `commandPool` must not be in the pending state.

- **VUID-vkDestroyCommandPool-commandPool-00042**
  If `VkAllocationCallbacks` were provided when `commandPool` was created, a compatible set of callbacks must be provided here.

- **VUID-vkDestroyCommandPool-commandPool-00043**
  If no `VkAllocationCallbacks` were provided when `commandPool` was created, `pAllocator` must be `NULL`.
## Valid Usage (Implicit)

- **VUID-vkDestroyCommandPool-device-parameter**
  
  *device* must be a valid *VkDevice* handle

- **VUID-vkDestroyCommandPool-commandPool-parameter**
  
  If *commandPool* is not *VK_NULL_HANDLE*, *commandPool* must be a valid *VkCommandPool* handle

- **VUID-vkDestroyCommandPool-pAllocator-parameter**
  
  If *pAllocator* is not NULL, *pAllocator* must be a valid pointer to a valid *VkAllocationCallbacks* structure

- **VUID-vkDestroyCommandPool-commandPool-parent**
  
  If *commandPool* is a valid handle, it must have been created, allocated, or retrieved from *device*

## Host Synchronization

- Host access to *commandPool* must be externally synchronized

### 6.3. Command Buffer Allocation and Management

To allocate command buffers, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkAllocateCommandBuffers(
    VkDevice device,
    const VkCommandBufferAllocateInfo* pAllocateInfo,
    VkCommandBuffer* pCommandBuffers);
```

- *device* is the logical device that owns the command pool.
- *pAllocateInfo* is a pointer to a *VkCommandBufferAllocateInfo* structure describing parameters of the allocation.
- *pCommandBuffers* is a pointer to an array of *VkCommandBuffer* handles in which the resulting command buffer objects are returned. The array must be at least the length specified by the *commandBufferCount* member of *pAllocateInfo*. Each allocated command buffer begins in the initial state.

vkAllocateCommandBuffers can be used to allocate multiple command buffers. If the allocation of any of those command buffers fails, the implementation must free all successfully allocated command buffer objects from this command, set all entries of the *pCommandBuffers* array to NULL and return the error.

---

**Note**
Filling `pCommandBuffers` with NULL values on failure is an exception to the default error behavior that output parameters will have undefined contents.

When command buffers are first allocated, they are in the initial state.

### Valid Usage (Implicit)

- VUID-vkAllocateCommandBuffers-device-parameter  
  `device` **must** be a valid `VkDevice` handle
- VUID-vkAllocateCommandBuffers-pAllocateInfo-parameter  
  `pAllocateInfo` **must** be a valid pointer to a valid `VkCommandBufferAllocateInfo` structure
- VUID-vkAllocateCommandBuffers-pCommandBuffers-parameter  
  `pCommandBuffers` **must** be a valid pointer to an array of `pAllocateInfo->commandBufferCount` `VkCommandBuffer` handles
- VUID-vkAllocateCommandBuffers-pAllocateInfo::commandBufferCount-arraylength  
  `pAllocateInfo->commandBufferCount` **must** be greater than 0

### Host Synchronization

- Host access to `pAllocateInfo->commandPool` **must** be externally synchronized

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkCommandBufferAllocateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkCommandBufferAllocateInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkCommandPool             commandPool;
    VkCommandBufferLevel      level;
    uint32_t                   commandBufferCount;
} VkCommandBufferAllocateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.

• `commandPool` is the command pool from which the command buffers are allocated.

• `level` is a `VkCommandBufferLevel` value specifying the command buffer level.

• `commandBufferCount` is the number of command buffers to allocate from the pool.

### Valid Usage (Implicit)

- VUID-VkCommandBufferAllocateInfo-sType-sType
  
  `sType must be VK_STRUCTURE_TYPE_COMMAND_BUFFER_ALLOCATE_INFO`

- VUID-VkCommandBufferAllocateInfo-pNext-pNext
  
  `pNext must be NULL`

- VUID-VkCommandBufferAllocateInfo-commandPool-parameter
  
  `commandPool must be a valid VkCommandPool handle`

- VUID-VkCommandBufferAllocateInfo-level-parameter
  
  `level must be a valid VkCommandBufferLevel value`

Possible values of `VkCommandBufferAllocateInfo::level`, specifying the command buffer level, are:

```cpp
// Provided by VK_VERSION_1_0
typedef enum VkCommandBufferLevel {
    VK_COMMAND_BUFFER_LEVEL_PRIMARY = 0,
    VK_COMMAND_BUFFER_LEVEL_SECONDARY = 1,
} VkCommandBufferLevel;
```

- `VK_COMMAND_BUFFER_LEVEL_PRIMARY` specifies a primary command buffer.

- `VK_COMMAND_BUFFER_LEVEL_SECONDARY` specifies a secondary command buffer.

To reset a command buffer, call:

```cpp
// Provided by VK_VERSION_1_0
VkResult vkResetCommandBuffer(
    VkCommandBuffer commandBuffer,      // Provided by VK_VERSION_1_0
    VkCommandBufferResetFlags flags);  // Provided by VK_VERSION_1_0
```

- `commandBuffer` is the command buffer to reset. The command buffer can be in any state other than `pending`, and is moved into the `initial state`.

- `flags` is a bitmask of `VkCommandBufferResetFlagBits` controlling the reset operation.

Any primary command buffer that is in the `recording` or `executable state` and has `commandBuffer` recorded into it, becomes `invalid`. 
Valid Usage

- VUID-vkResetCommandBuffer-commandBuffer-00045
  `commandBuffer` must not be in the `pending` state

- VUID-vkResetCommandBuffer-commandBuffer-00046
  `commandBuffer` must have been allocated from a pool that was created with the `VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT`

Valid Usage (Implicit)

- VUID-vkResetCommandBuffer-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkResetCommandBuffer-flags-parameter
  `flags` must be a valid combination of `VkCommandBufferResetFlagBits` values

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Bits which can be set in `vkResetCommandBuffer::flags`, controlling the reset operation, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCommandBufferResetFlagBits {
    VK_COMMAND_BUFFER_RESET_RELEASE_RESOURCES_BIT = 0x00000001,
} VkCommandBufferResetFlagBits;
```

- `VK_COMMAND_BUFFER_RESET_RELEASE_RESOURCES_BIT` specifies that most or all memory resources currently owned by the command buffer should be returned to the parent command pool. If this flag is not set, then the command buffer may hold onto memory resources and reuse them when recording commands. `commandBuffer` is moved to the `initial` state.
VkCommandBufferResetFlags is a bitmask type for setting a mask of zero or more VkCommandBufferResetFlagBits.

To free command buffers, call:

```c
void vkFreeCommandBuffers(
    VkDevice device,
    VkCommandPool commandPool,
    uint32_t commandBufferCount,
    const VkCommandBuffer* pCommandBuffers);
```

- `device` is the logical device that owns the command pool.
- `commandPool` is the command pool from which the command buffers were allocated.
- `commandBufferCount` is the length of the `pCommandBuffers` array.
- `pCommandBuffers` is a pointer to an array of handles of command buffers to free.

Any primary command buffer that is in the recording or executable state and has any element of `pCommandBuffers` recorded into it, becomes invalid.

**Valid Usage**

- VUID-vkFreeCommandBuffers-pCommandBuffers-00047
  All elements of `pCommandBuffers` must not be in the pending state
- VUID-vkFreeCommandBuffers-pCommandBuffers-00048
  `pCommandBuffers` must be a valid pointer to an array of `commandBufferCount` VkCommandBuffer handles, each element of which must either be a valid handle or NULL

**Valid Usage (Implicit)**

- VUID-vkFreeCommandBuffers-device-parameter
  `device` must be a valid VkDevice handle
- VUID-vkFreeCommandBuffers-commandPool-parameter
  `commandPool` must be a valid VkCommandPool handle
- VUID-vkFreeCommandBuffers-commandBufferCount-arraylength
  `commandBufferCount` must be greater than 0
- VUID-vkFreeCommandBuffers-commandPool-parent
  `commandPool` must have been created, allocated, or retrieved from `device`
- VUID-vkFreeCommandBuffers-pCommandBuffers-parent
Each element of `pCommandBuffers` that is a valid handle must have been created, allocated, or retrieved from `commandPool`.

**Host Synchronization**

- Host access to `commandPool` must be externally synchronized
- Host access to each member of `pCommandBuffers` must be externally synchronized

### 6.4. Command Buffer Recording

To begin recording a command buffer, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkBeginCommandBuffer(
    VkCommandBuffer commandBuffer,
    const VkCommandBufferBeginInfo* pBeginInfo);
```

- `commandBuffer` is the handle of the command buffer which is to be put in the recording state.
- `pBeginInfo` is a pointer to a `VkCommandBufferBeginInfo` structure defining additional information about how the command buffer begins recording.

**Valid Usage**

- VUID-vkBeginCommandBuffer-commandBuffer-00049
  `commandBuffer` must not be in the recording or pending state
- VUID-vkBeginCommandBuffer-commandBuffer-00050
  If `commandBuffer` was allocated from a `VkCommandPool` which did not have the `VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT` flag set, `commandBuffer` must be in the initial state
- VUID-vkBeginCommandBuffer-commandBuffer-00051
  If `commandBuffer` is a secondary command buffer, the `pInheritanceInfo` member of `pBeginInfo` must be a valid `VkCommandBufferInheritanceInfo` structure
- VUID-vkBeginCommandBuffer-commandBuffer-00052
  If `commandBuffer` is a secondary command buffer and either the `occlusionQueryEnable` member of the `pInheritanceInfo` member of `pBeginInfo` is `VK_FALSE`, or the `occlusionQueryPrecise` feature is not enabled, then `pBeginInfo->pInheritanceInfo->queryFlags` must not contain `VK_QUERY_CONTROL_PRECISE_BIT`
- VUID-vkBeginCommandBuffer-commandBuffer-02840
  If `commandBuffer` is a primary command buffer, then `pBeginInfo->flags` must not set both the `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT` and the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flags
Valid Usage (Implicit)

- VUID-vkBeginCommandBuffer-commandBuffer-parameter
  
  *commandBuffer must be a valid VkCommandBuffer handle*

- VUID-vkBeginCommandBuffer-pBeginInfo-parameter
  
  *pBeginInfo must be a valid pointer to a valid VkCommandBufferBeginInfo structure*

Host Synchronization

- Host access to *commandBuffer* must be externally synchronized

- Host access to the VkCommandPool that *commandBuffer* was allocated from must be externally synchronized

Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY

- VK_ERROR_OUT_OF_DEVICE_MEMORY

The *VkCommandBufferBeginInfo* structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkCommandBufferBeginInfo {
    VkStructureType sType;
    const void* pNext;
    VkCommandBufferUsageFlags flags;
    const VkCommandBufferInheritanceInfo* pInheritanceInfo;
} VkCommandBufferBeginInfo;
```

- *sType* is a VkStructureType value identifying this structure.
- *pNext* is NULL or a pointer to a structure extending this structure.
- *flags* is a bitmask of VkCommandBufferUsageFlagBits specifying usage behavior for the command buffer.
- *pInheritanceInfo* is a pointer to a VkCommandBufferInheritanceInfo structure, used if *commandBuffer* is a secondary command buffer. If this is a primary command buffer, then this value is ignored.
Valid Usage

- VUID-VkCommandBufferBeginInfo-flags-09123
  If `flags` contains `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`, the `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- VUID-VkCommandBufferBeginInfo-flags-00055
  If `flags` contains `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`, the framebuffer member of `pInheritanceInfo` must be either `VK_NULL_HANDLE`, or a valid `VkFramebuffer` that is compatible with the `renderPass` member of `pInheritanceInfo`.

- VUID-VkCommandBufferBeginInfo-flags-09240
  If `flags` contains `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT` and the `dynamicRendering` feature is not enabled, the `renderPass` member of `pInheritanceInfo` must not be `VK_NULL_HANDLE`.

- VUID-VkCommandBufferBeginInfo-flags-06002
  If `flags` contains `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT` and the `renderPass` member of `pInheritanceInfo` is `VK_NULL_HANDLE`, the `pNext` chain of `pInheritanceInfo` must include a `VkCommandBufferInheritanceRenderingInfo` structure.

- VUID-VkCommandBufferBeginInfo-flags-06000
  If `flags` contains `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT` and the `renderPass` member of `pInheritanceInfo` is not `VK_NULL_HANDLE`, the `renderPass` member of `pInheritanceInfo` must be a valid `VkRenderPass`.

- VUID-VkCommandBufferBeginInfo-flags-06001
  If `flags` contains `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT` and the `renderPass` member of `pInheritanceInfo` is not `VK_NULL_HANDLE`, the `subpass` member of `pInheritanceInfo` must be a valid subpass index within the `renderPass` member of `pInheritanceInfo`.

Valid Usage (Implicit)

- VUID-VkCommandBufferBeginInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_BEGIN_INFO`.

- VUID-VkCommandBufferBeginInfo-pNext-pNext
  `pNext` must be `NULL` or a pointer to a valid instance of `VkDeviceGroupCommandBufferBeginInfo`.

- VUID-VkCommandBufferBeginInfo-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique.

- VUID-VkCommandBufferBeginInfo-flags-parameter
  `flags` must be a valid combination of `VkCommandBufferUsageFlagBits` values.

Bits which can be set in `VkCommandBufferBeginInfo::flags`, specifying usage behavior for a command buffer, are:
typedef enum VkCommandBufferUsageFlagBits {
    VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT = 0x00000001,
    VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT = 0x00000002,
    VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT = 0x00000004,
} VkCommandBufferUsageFlagBits;

- **VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT** specifies that each recording of the command buffer will only be submitted once, and the command buffer will be reset and recorded again between each submission.
- **VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT** specifies that a secondary command buffer is considered to be entirely inside a render pass. If this is a primary command buffer, then this bit is ignored.
- **VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT** specifies that a command buffer can be resubmitted to any queue of the same queue family while it is in the *pending state*, and recorded into multiple primary command buffers.

typedef VkFlags VkCommandBufferUsageFlags;

VkCommandBufferUsageFlags is a bitmask type for setting a mask of zero or more VkCommandBufferUsageFlagBits.

If the command buffer is a secondary command buffer, then the VkCommandBufferInheritanceInfo structure defines any state that will be inherited from the primary command buffer:

typedef struct VK_VERSION_1_0 VkCommandBufferInheritanceInfo {
    VkStructureType sType;  
    const void* pNext;      
    VkRenderPass renderPass; 
    uint32_t subpass;        
    VkFramebuffer framebuffer; 
    VkBool32 occlusionQueryEnable;  
    VkQueryControlFlags queryFlags;  
    VkQueryPipelineStatisticFlags pipelineStatistics;  
} VkCommandBufferInheritanceInfo;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **renderPass** is a VkRenderPass object defining which render passes the VkCommandBuffer will be compatible with and can be executed within.
- **subpass** is the index of the subpass within the render pass instance that the VkCommandBuffer will be executed within.
framebuffer can refer to the VkFramebuffer object that the VkCommandBuffer will be rendering to if it is executed within a render pass instance. It can be VK_NULL_HANDLE if the framebuffer is not known.

Note
Specifying the exact framebuffer that the secondary command buffer will be executed with may result in better performance at command buffer execution time.

occlusionQueryEnable specifies whether the command buffer can be executed while an occlusion query is active in the primary command buffer. If this is VK_TRUE, then this command buffer can be executed whether the primary command buffer has an occlusion query active or not. If this is VK_FALSE, then the primary command buffer must not have an occlusion query active.

queryFlags specifies the query flags that can be used by an active occlusion query in the primary command buffer when this secondary command buffer is executed. If this value includes the VK_QUERY_CONTROL_PRECISE_BIT bit, then the active query can return boolean results or actual sample counts. If this bit is not set, then the active query must not use the VK_QUERY_CONTROL_PRECISE_BIT bit.

pipelineStatistics is a bitmask of VkQueryPipelineStatisticFlagBits specifying the set of pipeline statistics that can be counted by an active query in the primary command buffer when this secondary command buffer is executed. If this value includes a given bit, then this command buffer can be executed whether the primary command buffer has a pipeline statistics query active that includes this bit or not. If this value excludes a given bit, then the active pipeline statistics query must not be from a query pool that counts that statistic.

If the VkCommandBuffer will not be executed within a render pass instance, or if the render pass instance was begun with vkCmdBeginRendering, renderPass, subpass, and framebuffer are ignored.

Valid Usage

• VUID-VkCommandBufferInheritanceInfo-occlusionQueryEnable-00056
  If the inheritedQueries feature is not enabled, occlusionQueryEnable must be VK_FALSE

• VUID-VkCommandBufferInheritanceInfo-queryFlags-00057
  If the inheritedQueries feature is enabled, queryFlags must be a valid combination of VkQueryControlFlagBits values

• VUID-VkCommandBufferInheritanceInfo-queryFlags-02788
  If the inheritedQueries feature is not enabled, queryFlags must be 0

• VUID-VkCommandBufferInheritanceInfo-pipelineStatistics-02789
  If the pipelineStatisticsQuery feature is enabled, pipelineStatistics must be a valid combination of VkQueryPipelineStatisticFlagBits values

• VUID-VkCommandBufferInheritanceInfo-pipelineStatistics-00058
  If the pipelineStatisticsQuery feature is not enabled, pipelineStatistics must be 0
Valid Usage (Implicit)

- VUID-VkCommandBufferInheritanceInfo-sType-sType
  *sType must be VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_INFO*

- VUID-VkCommandBufferInheritanceInfo-pNext-pNext
  Each *pNext* member of any structure (including this one) in the *pNext* chain must be either NULL or a pointer to a valid instance of `VkAttachmentSampleCountInfoAMD`, `VkCommandBufferInheritanceRenderingInfo`, `VkMultiviewPerViewAttributesInfoNVX`, `VkRenderingAttachmentLocationInfoKHR`, or `VkRenderingInputAttachmentIndexInfoKHR`

- VUID-VkCommandBufferInheritanceInfo-sType-unique
  The *sType* value of each struct in the *pNext* chain must be unique

- VUID-VkCommandBufferInheritanceInfo-commonparent
  Both of *framebuffer*, and *renderPass* that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

**Note**
On some implementations, not using the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` bit enables command buffers to be patched in-place if needed, rather than creating a copy of the command buffer.

If a command buffer is in the invalid, or executable state, and the command buffer was allocated from a command pool with the `VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT` flag set, then `vkBeginCommandBuffer` implicitly resets the command buffer, behaving as if `vkResetCommandBuffer` had been called with `VK_COMMAND_BUFFER_RESET_RELEASE_RESOURCES_BIT` not set. After the implicit reset, `commandBuffer` is moved to the recording state.

The `VkCommandBufferInheritanceRenderingInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkCommandBufferInheritanceRenderingInfo {
    VkStructureType sType;
    const void* pNext;
    VkRenderingFlags flags;
    uint32_t viewMask;
    uint32_t colorAttachmentCount;
    const VkFormat* pColorAttachmentFormats;
    VkFormat depthAttachmentFormat;
    VkFormat stencilAttachmentFormat;
    VkSampleCountFlagBits rasterizationSamples;
} VkCommandBufferInheritanceRenderingInfo;
```

or the equivalent

```c
// Provided by VK_KHR_dynamic_rendering
```
```c
typedef VkCommandBufferInheritanceRenderingInfo
VkCommandBufferInheritanceRenderingInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is a bitmask of `VkRenderingFlagBits` used by the render pass instance.
- **viewMask** is the view mask used for rendering.
- **colorAttachmentCount** is the number of color attachments specified in the render pass instance.
- **pColorAttachmentFormats** is a pointer to an array of `VkFormat` values defining the format of color attachments.
- **depthAttachmentFormat** is a `VkFormat` value defining the format of the depth attachment.
- **stencilAttachmentFormat** is a `VkFormat` value defining the format of the stencil attachment.
- **rasterizationSamples** is a `VkSampleCountFlagBits` specifying the number of samples used in rasterization.

If the **pNext** chain of `VkCommandBufferInheritanceInfo` includes a `VkCommandBufferInheritanceRenderingInfo` structure, then that structure controls parameters of dynamic render pass instances that the `VkCommandBuffer` can be executed within. If `VkCommandBufferInheritanceInfo::renderPass` is not `VK_NULL_HANDLE`, or `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT` is not specified in `VkCommandBufferBeginInfo::flags`, parameters of this structure are ignored.

If `colorAttachmentCount` is 0 and the **variableMultisampleRate** feature is enabled, **rasterizationSamples** is ignored.

If `depthAttachmentFormat`, `stencilAttachmentFormat`, or any element of `pColorAttachmentFormats` is `VK_FORMAT_UNDEFINED`, it indicates that the corresponding attachment is unused within the render pass and writes to those attachments are discarded.

---

**Valid Usage**

- **VUID-VkCommandBufferInheritanceRenderingInfo-colorAttachmentCount-06004**
  If `colorAttachmentCount` is not 0, **rasterizationSamples** must be a valid `VkSampleCountFlagBits` value.

- **VUID-VkCommandBufferInheritanceRenderingInfo-variableMultisampleRate-06005**
  If the **variableMultisampleRate** feature is not enabled, **rasterizationSamples** must be a valid `VkSampleCountFlagBits` value.

- **VUID-VkCommandBufferInheritanceRenderingInfo-depthAttachmentFormat-06540**
  If `depthAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, it must be a format that includes a depth component.

- **VUID-VkCommandBufferInheritanceRenderingInfo-depthAttachmentFormat-06007**
  If `depthAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, it must be a format with potential format features that include `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`. 

---

174
Once recording starts, an application records a sequence of commands (vkCmd*) to set state in the command buffer, draw, dispatch, and other commands.

To complete recording of a command buffer, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkEndCommandBuffer(
```
commandBuffer is the command buffer to complete recording.

The command buffer must have been in the recording state, and, if successful, is moved to the executable state.

If there was an error during recording, the application will be notified by an unsuccessful return code returned by vkEndCommandBuffer, and the command buffer will be moved to the invalid state.

In case the application recorded one or more video encode operations into the command buffer, implementations may return the VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR error if any of the specified Video Std parameters do not adhere to the syntactic or semantic requirements of the used video compression standard, or if values derived from parameters according to the rules defined by the used video compression standard do not adhere to the capabilities of the video compression standard or the implementation.

Note
Applications should not rely on the VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR error being returned by any command as a means to verify Video Std parameters, as implementations are not required to report the error in any specific set of cases.

Valid Usage

- VUID-vkEndCommandBuffer-commandBuffer-00059
  commandBuffer must be in the recording state
- VUID-vkEndCommandBuffer-commandBuffer-00060
  If commandBuffer is a primary command buffer, there must not be an active render pass instance
- VUID-vkEndCommandBuffer-commandBuffer-00061
  All queries made active during the recording of commandBuffer must have been made inactive
- VUID-vkEndCommandBuffer-None-06991
  There must be no video session object bound

Valid Usage (Implicit)

- VUID-vkEndCommandBuffer-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

Host Synchronization

- Host access to commandBuffer must be externally synchronized
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR

When a command buffer is in the executable state, it can be submitted to a queue for execution.

6.5. Command Buffer Submission

Note
Submission can be a high overhead operation, and applications should attempt to batch work together into as few calls to vkQueueSubmit or vkQueueSubmit2 as possible.

To submit command buffers to a queue, call:

```c
// Provided by VK_VERSION_1_3
VkResult vkQueueSubmit2(
    VkQueue queue,
    uint32_t submitCount,
    const VkSubmitInfo2* pSubmits,
    VkFence fence);
```
or the equivalent command

```c
// Provided by VK_KHR_synchronization2
VkResult vkQueueSubmit2KHR(
    VkQueue queue,
    uint32_t submitCount,
    const VkSubmitInfo2* pSubmits,
    VkFence fence);
```

• queue is the queue that the command buffers will be submitted to.
• submitCount is the number of elements in the pSubmits array.
• pSubmits is a pointer to an array of VkSubmitInfo2 structures, each specifying a command
buffer submission batch.

• fence is an optional handle to a fence to be signaled once all submitted command buffers have completed execution. If fence is not VK_NULL_HANDLE, it defines a fence signal operation.

vkQueueSubmit2 is a queue submission command, with each batch defined by an element of pSubmits.

Semaphore operations submitted with vkQueueSubmit2 have additional ordering constraints compared to other submission commands, with dependencies involving previous and subsequent queue operations. Information about these additional constraints can be found in the semaphore section of the synchronization chapter.

If any command buffer submitted to this queue is in the executable state, it is moved to the pending state. Once execution of all submissions of a command buffer complete, it moves from the pending state, back to the executable state. If a command buffer was recorded with the VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT flag, it instead moves back to the invalid state.

If vkQueueSubmit2 fails, it may return VK_ERROR_OUT_OF_HOST_MEMORY or VK_ERROR_OUT_OF_DEVICE_MEMORY. If it does, the implementation must ensure that the state and contents of any resources or synchronization primitives referenced by the submitted command buffers and any semaphores referenced by pSubmits is unaffected by the call or its failure. If vkQueueSubmit2 fails in such a way that the implementation is unable to make that guarantee, the implementation must return VK_ERROR_DEVICE_LOST. See Lost Device.

Valid Usage

• VUID-vkQueueSubmit2-fence-04894
  If fence is not VK_NULL_HANDLE, fence must be unsignaled

• VUID-vkQueueSubmit2-fence-04895
  If fence is not VK_NULL_HANDLE, fence must not be associated with any other queue command that has not yet completed execution on that queue

• VUID-vkQueueSubmit2-synchronization2-03866
  The synchronization2 feature must be enabled

• VUID-vkQueueSubmit2-commandBuffer-03867
  If a command recorded into the commandBuffer member of any element of the pCommandBufferInfos member of any element of pSubmits referenced an VkEvent, that event must not be referenced by a command that has been submitted to another queue and is still in the pending state

• VUID-vkQueueSubmit2-semaphore-03868
  The semaphore member of any binary semaphore element of the pSignalSemaphoreInfos member of any element of pSubmits must be unsignaled when the semaphore signal operation it defines is executed on the device

• VUID-vkQueueSubmit2-stageMask-03869
  The stageMask member of any element of the pSignalSemaphoreInfos member of any element of pSubmits must only include pipeline stages that are supported by the queue family which queue belongs to

• VUID-vkQueueSubmit2-stageMask-03870
The `stageMask` member of any element of the `pWaitSemaphoreInfos` member of any element of `pSubmits` must only include pipeline stages that are supported by the queue family which `queue` belongs to.

- **VUID-vkQueueSubmit2-semaphore-03871**
  When a semaphore wait operation for a binary semaphore is executed, as defined by the `semaphore` member of any element of the `pWaitSemaphoreInfos` member of any element of `pSubmits`, there must be no other queues waiting on the same semaphore.

- **VUID-vkQueueSubmit2-semaphore-03873**
  The `semaphore` member of any element of the `pWaitSemaphoreInfos` member of any element of `pSubmits` that was created with a `VkSemaphoreTypeKHR` of `VK_SEMAPHORE_TYPE_BINARY_KHR` must reference a semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends must have also been submitted for execution.

- **VUID-vkQueueSubmit2-commandBuffer-03874**
  The `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` must be in the pending or executable state.

- **VUID-vkQueueSubmit2-commandBuffer-03875**
  If a command recorded into the `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT`, it must not be in the pending state.

- **VUID-vkQueueSubmit2-commandBuffer-03876**
  Any secondary command buffers recorded into the `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` must be in the pending or executable state.

- **VUID-vkQueueSubmit2-commandBuffer-03877**
  If any secondary command buffers recorded into the `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT`, it must not be in the pending state.

- **VUID-vkQueueSubmit2-commandBuffer-03878**
  The `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` must have been allocated from a `VkCommandPool` that was created for the same queue family `queue` belongs to.

- **VUID-vkQueueSubmit2-commandBuffer-03879**
  If a command recorded into the `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` includes a Queue Family Transfer Acquire Operation, there must exist a previously submitted Queue Family Transfer Release Operation on a queue in the queue family identified by the acquire operation, with parameters matching the acquire operation as defined in the definition of such acquire operations, and which happens before the acquire operation.

- **VUID-vkQueueSubmit2-commandBuffer-03880**
  If a command recorded into the `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` was a `vkCmdBeginQuery` whose `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, the
profiling lock must have been held continuously on the VkDevice that queue was retrieved from, throughout recording of those command buffers

- VUID-vkQueueSubmit2-queue-06447
  If queue was not created with VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT, the flags member of any element of pSubmits must not include VK_SUBMIT_PROTECTED_BIT_KHR

Valid Usage (Implicit)

- VUID-vkQueueSubmit2-queue-parameter
  queue must be a valid VkQueue handle

- VUID-vkQueueSubmit2-pSubmits-parameter
  If submitCount is not 0, pSubmits must be a valid pointer to an array of submitCount valid VkSubmitInfo2 structures

- VUID-vkQueueSubmit2-fence-parameter
  If fence is not VK_NULL_HANDLE, fence must be a valid VkFence handle

- VUID-vkQueueSubmit2-commonparent
  Both of fence, and queue that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to queue must be externally synchronized
- Host access to fence must be externally synchronized

Return Codes

Success
  • VK_SUCCESS

Failure
  • VK_ERROR_OUT_OF_HOST_MEMORY
  • VK_ERROR_OUT_OF_DEVICE_MEMORY
  • VK_ERROR_DEVICE_LOST
The VkSubmitInfo2 structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkSubmitInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkSubmitFlags flags;
    uint32_t waitSemaphoreInfoCount;
    const VkSemaphoreSubmitInfo* pWaitSemaphoreInfos;
    uint32_t commandBufferInfoCount;
    const VkCommandBufferSubmitInfo* pCommandBufferInfos;
    uint32_t signalSemaphoreInfoCount;
    const VkSemaphoreSubmitInfo* pSignalSemaphoreInfos;
} VkSubmitInfo2;
```

or the equivalent

```
// Provided by VK_KHR_synchronization2
typedef VkSubmitInfo2 VkSubmitInfo2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkSubmitFlagBits`.
- `waitSemaphoreInfoCount` is the number of elements in `pWaitSemaphoreInfos`.
- `pWaitSemaphoreInfos` is a pointer to an array of `VkSemaphoreSubmitInfo` structures defining semaphore wait operations.
- `commandBufferInfoCount` is the number of elements in `pCommandBufferInfos` and the number of command buffers to execute in the batch.
- `pCommandBufferInfos` is a pointer to an array of `VkCommandBufferSubmitInfo` structures describing command buffers to execute in the batch.
- `signalSemaphoreInfoCount` is the number of elements in `pSignalSemaphoreInfos`.
- `pSignalSemaphoreInfos` is a pointer to an array of `VkSemaphoreSubmitInfo` describing semaphore signal operations.

**Valid Usage**

- **VUID-VkSubmitInfo2-semaphore-03881**
  If the same semaphore is used as the `semaphore` member of both an element of `pSignalSemaphoreInfos` and `pWaitSemaphoreInfos`, and that semaphore is a timeline semaphore, the `value` member of the `pSignalSemaphoreInfos` element **must** be greater than the `value` member of the `pWaitSemaphoreInfos` element.

- **VUID-VkSubmitInfo2-semaphore-03882**
  If the `semaphore` member of any element of `pSignalSemaphoreInfos` is a timeline semaphore,
the value member of that element must have a value greater than the current value of the semaphore when the semaphore signal operation is executed

- VUID-VkSubmitInfo2-semaphore-03883
  If the semaphore member of any element of pSignalSemaphoreInfos is a timeline semaphore, the value member of that element must have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on that semaphore by more than maxTimelineSemaphoreValueDifference

- VUID-VkSubmitInfo2-semaphore-03884
  If the semaphore member of any element of pWaitSemaphoreInfos is a timeline semaphore, the value member of that element must have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on that semaphore by more than maxTimelineSemaphoreValueDifference

- VUID-VkSubmitInfo2-flags-03886
  If flags includes VK_SUBMIT_PROTECTED_BIT, all elements of pCommandBuffers must be protected command buffers

- VUID-VkSubmitInfo2-flags-03887
  If flags does not include VK_SUBMIT_PROTECTED_BIT, each element of pCommandBuffers must not be a protected command buffer

- VUID-VkSubmitInfo2KHR-commandBuffer-06192
  If any commandBuffer member of an element of pCommandBufferInfos contains any resumed render pass instances, they must be suspended by a render pass instance earlier in submission order within pCommandBufferInfos

- VUID-VkSubmitInfo2KHR-commandBuffer-06010
  If any commandBuffer member of an element of pCommandBufferInfos contains any suspended render pass instances, they must be resumed by a render pass instance later in submission order within pCommandBufferInfos

- VUID-VkSubmitInfo2KHR-commandBuffer-06011
  If any commandBuffer member of an element of pCommandBufferInfos contains any suspended render pass instances, there must be no action or synchronization commands between that render pass instance and the render pass instance that resumes it

- VUID-VkSubmitInfo2KHR-commandBuffer-06012
  If any commandBuffer member of an element of pCommandBufferInfos contains any suspended render pass instances, there must be no render pass instances between that render pass instance and the render pass instance that resumes it

Valid Usage (Implicit)

- VUID-VkSubmitInfo2-sType-sType
  sType must be VK_STRUCTURE_TYPE_SUBMIT_INFO_2

- VUID-VkSubmitInfo2-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkFrameBoundaryEXT, VkPerformanceQuerySubmitInfoKHR, or VkWin32KeyedMutexAcquireReleaseInfoKHR
The `sType` value of each struct in the `pNext` chain must be unique.

Flags `must` be a valid combination of `VkSubmitFlagBits` values.

If `waitSemaphoreInfoCount` is not 0, `pWaitSemaphoreInfos` `must` be a valid pointer to an array of `VkSemaphoreSubmitInfo` structures.

If `commandBufferInfoCount` is not 0, `pCommandBufferInfos` `must` be a valid pointer to an array of `VkCommandBufferSubmitInfo` structures.

If `signalSemaphoreInfoCount` is not 0, `pSignalSemaphoreInfos` must be a valid pointer to an array of `VkSemaphoreSubmitInfo` structures.

Bits which can be set in `VkSubmitInfo2::flags`, specifying submission behavior, are:

```c
// Provided by VK_VERSION_1_3
typedef enum VkSubmitFlagBits {
    VK_SUBMIT_PROTECTED_BIT = 0x00000001,
    VK_SUBMIT_PROTECTED_BIT_KHR = VK_SUBMIT_PROTECTED_BIT,
} VkSubmitFlagBits;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkSubmitFlagBits VkSubmitFlagBitsKHR;
```

- `VK_SUBMIT_PROTECTED_BIT` specifies that this batch is a protected submission.

```c
// Provided by VK_VERSION_1_3
typedef VkFlags VkSubmitFlags;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkSubmitFlags VkSubmitFlagsKHR;
```

`VkSubmitFlags` is a bitmask type for setting a mask of zero or more `VkSubmitFlagBits`.

The `VkSemaphoreSubmitInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkSemaphoreSubmitInfo {
```
VkStructureType sType;
const void* pNext;
VkSemaphore semaphore;
uint64_t value;
VkPipelineStageFlags2 stageMask;
uint32_t deviceIndex;
} VkSemaphoreSubmitInfo;

or the equivalent

// Provided by VK_KHR_synchronization2
typedef VkSemaphoreSubmitInfo VkSemaphoreSubmitInfoKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **semaphore** is a `VkSemaphore` affected by this operation.
- **value** is either the value used to signal `semaphore` or the value waited on by `semaphore`, if `semaphore` is a timeline semaphore. Otherwise it is ignored.
- **stageMask** is a `VkPipelineStageFlags2` mask of pipeline stages which limit the first synchronization scope of a semaphore signal operation, or second synchronization scope of a semaphore wait operation as described in the semaphore wait operation and semaphore signal operation sections of the synchronization chapter.
- **deviceIndex** is the index of the device within a device group that executes the semaphore wait or signal operation.

Whether this structure defines a semaphore wait or signal operation is defined by how it is used.

### Valid Usage

- **VUID-VkSemaphoreSubmitInfo-stageMask-03929**  
  If the `geometryShader` feature is not enabled, **stageMask must not contain VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT**

- **VUID-VkSemaphoreSubmitInfo-stageMask-03930**  
  If the `tessellationShader` feature is not enabled, **stageMask must not contain VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT** or **VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT**

- **VUID-VkSemaphoreSubmitInfo-stageMask-07317**  
  If the `attachmentFragmentShadingRate` feature is not enabled, **stageMask must not contain VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR**

- **VUID-VkSemaphoreSubmitInfo-stageMask-07947**  
  If the `rayTracingPipeline` feature is not enabled, **stageMask must not contain VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR**

- **VUID-VkSemaphoreSubmitInfo-device-03888**
If the device that semaphore was created on is not a device group, deviceIndex must be 0

- VUID-VkSemaphoreSubmitInfo-device-03889
  If the device that semaphore was created on is a device group, deviceIndex must be a valid device index

### Valid Usage (Implicit)

- VUID-VkSemaphoreSubmitInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_SEMAPHORE_SUBMIT_INFO

- VUID-VkSemaphoreSubmitInfo-pNext-pNext
  pNext must be NULL

- VUID-VkSemaphoreSubmitInfo-semaphore-parameter
  semaphore must be a valid VkSemaphore handle

- VUID-VkSemaphoreSubmitInfo-stageMask-parameter
  stageMask must be a valid combination of VkPipelineStageFlagBits2 values

The VkCommandBufferSubmitInfo structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkCommandBufferSubmitInfo {
    VkStructureType sType;
    const void* pNext;
    VkCommandBuffer commandBuffer;
    uint32_t deviceMask;
} VkCommandBufferSubmitInfo;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkCommandBufferSubmitInfo VkCommandBufferSubmitInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **commandBuffer** is a VkCommandBuffer to be submitted for execution.
- **deviceMask** is a bitmask indicating which devices in a device group execute the command buffer. A deviceMask of 0 is equivalent to setting all bits corresponding to valid devices in the group to 1.

### Valid Usage

- VUID-VkCommandBufferSubmitInfo-commandBuffer-03890
  commandBuffer must not have been allocated with VK_COMMAND_BUFFER_LEVEL_SECONDARY
If `deviceMask` is not 0, it must be a valid device mask.

### Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_SUBMIT_INFO`
- `pNext` must be `NULL`
- `commandBuffer` must be a valid `VkCommandBuffer` handle

To submit command buffers to a queue, call:

```c
vkQueueSubmit(  
    queue,             
    submitCount,      
    pSubmits,         
    fence);           
```

- `queue` is the queue that the command buffers will be submitted to.
- `submitCount` is the number of elements in the `pSubmits` array.
- `pSubmits` is a pointer to an array of `VkSubmitInfo` structures, each specifying a command buffer submission batch.
- `fence` is an optional handle to a fence to be signaled once all submitted command buffers have completed execution. If `fence` is not `VK_NULL_HANDLE`, it defines a fence signal operation.

`vkQueueSubmit` is a queue submission command, with each batch defined by an element of `pSubmits`. Batches begin execution in the order they appear in `pSubmits`, but may complete out of order.

Fence and semaphore operations submitted with `vkQueueSubmit` have additional ordering constraints compared to other submission commands, with dependencies involving previous and subsequent queue operations. Information about these additional constraints can be found in the semaphore and fence sections of the synchronization chapter.

Details on the interaction of `pWaitDstStageMask` with synchronization are described in the semaphore wait operation section of the synchronization chapter.

The order that batches appear in `pSubmits` is used to determine submission order, and thus all the implicit ordering guarantees that respect it. Other than these implicit ordering guarantees and any explicit synchronization primitives, these batches may overlap or otherwise execute out of order.

If any command buffer submitted to this queue is in the executable state, it is moved to the pending state. Once execution of all submissions of a command buffer complete, it moves from the pending state.
state, back to the executable state. If a command buffer was recorded with the VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT flag, it instead moves to the invalid state.

If vkQueueSubmit fails, it may return VK_ERROR_OUT_OF_HOST_MEMORY or VK_ERROR_OUT_OF_DEVICE_MEMORY. If it does, the implementation must ensure that the state and contents of any resources or synchronization primitives referenced by the submitted command buffers and any semaphores referenced by pSubmits is unaffected by the call or its failure. If vkQueueSubmit fails in such a way that the implementation is unable to make that guarantee, the implementation must return VK_ERROR_DEVICE_LOST. See Lost Device.

Valid Usage

- VUID-vkQueueSubmit-fence-00063
  If fence is not VK_NULL_HANDLE, fence must be unsignaled

- VUID-vkQueueSubmit-fence-00064
  If fence is not VK_NULL_HANDLE, fence must not be associated with any other queue command that has not yet completed execution on that queue

- VUID-vkQueueSubmit-pCommandBuffers-00065
  Any calls to vkCmdSetEvent, vkCmdResetEvent or vkCmdWaitEvents that have been recorded into any of the command buffer elements of the pCommandBuffers member of any element of pSubmits, must not reference any VkEvent that is referenced by any of those commands in a command buffer that has been submitted to another queue and is still in the pending state

- VUID-vkQueueSubmit-pWaitDstStageMask-00066
  Any stage flag included in any element of the pWaitDstStageMask member of any element of pSubmits must be a pipeline stage supported by one of the capabilities of queue, as specified in the table of supported pipeline stages

- VUID-vkQueueSubmit-pSignalSemaphores-00067
  Each binary semaphore element of the pSignalSemaphores member of any element of pSubmits must be unsignaled when the semaphore signal operation it defines is executed on the device

- VUID-vkQueueSubmit-pWaitSemaphores-00068
  When a semaphore wait operation referring to a binary semaphore defined by any element of the pWaitSemaphores member of any element of pSubmits executes on queue, there must be no other queues waiting on the same semaphore

- VUID-vkQueueSubmit-pWaitSemaphores-03238
  All elements of the pWaitSemaphores member of all elements of pSubmits created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_BINARY must reference a semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends must have also been submitted for execution

- VUID-vkQueueSubmit-pCommandBuffers-00070
  Each element of the pCommandBuffers member of each element of pSubmits must be in the pending or executable state

- VUID-vkQueueSubmit-pCommandBuffers-00071
If any element of the `pCommandBuffers` member of any element of `pSubmits` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT`, it **must** not be in the pending state

- **VUID-vkQueueSubmit-pCommandBuffers-00072**
  Any secondary command buffers recorded into any element of the `pCommandBuffers` member of any element of `pSubmits` **must** be in the pending or executable state

- **VUID-vkQueueSubmit-pCommandBuffers-00073**
  If any secondary command buffers recorded into any element of the `pCommandBuffers` member of any element of `pSubmits` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT`, it **must** not be in the pending state

- **VUID-vkQueueSubmit-pCommandBuffers-00074**
  Each element of the `pCommandBuffers` member of each element of `pSubmits` **must** have been allocated from a `VkCommandPool` that was created for the same queue family `queue` belongs to

- **VUID-vkQueueSubmit-pSubmits-02207**
  If any element of `pSubmits->pCommandBuffers` includes a `Queue Family Transfer Acquire Operation`, there **must** exist a previously submitted `Queue Family Transfer Release Operation` on a queue in the queue family identified by the acquire operation, with parameters matching the acquire operation as defined in the definition of such acquire operations, and which happens-before the acquire operation

- **VUID-vkQueueSubmit-pCommandBuffers-03220**
  If a command recorded into any element of `pCommandBuffers` was a `vkCmdBeginQuery` whose `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, the **profiling lock** **must** have been held continuously on the `VkDevice` that `queue` was retrieved from, throughout recording of those command buffers

- **VUID-vkQueueSubmit-pSubmits-02808**
  Any resource created with `VK_SHARING_MODE_EXCLUSIVE` that is read by an operation specified by `pSubmits` **must** not be owned by any queue family other than the one which `queue` belongs to, at the time it is executed

- **VUID-vkQueueSubmit-pSubmits-04626**
  Any resource created with `VK_SHARING_MODE_CONCURRENT` that is accessed by an operation specified by `pSubmits` **must** have included the queue family of `queue` at resource creation time

- **VUID-vkQueueSubmit-queue-06448**
  If `queue` was not created with `VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT`, there **must** be no element of `pSubmits` that includes an `VkProtectedSubmitInfo` structure in its `pNext` chain with `protectedSubmit` equal to `VK_TRUE`

### Valid Usage (Implicit)

- **VUID-vkQueueSubmit-queue-parameter**
  `queue` **must** be a valid `VkQueue` handle

- **VUID-vkQueueSubmit-pSubmits-parameter**
If `submitCount` is not 0, `pSubmits` must be a valid pointer to an array of `submitCount` valid `VkSubmitInfo` structures.

- VUID-vkQueueSubmit-fence-parameter
  If `fence` is not `VK_NULL_HANDLE`, `fence` must be a valid `VkFence` handle.

- VUID-vkQueueSubmit-commonparent
  Both of `fence`, and `queue` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.

**Host Synchronization**

- Host access to `queue` must be externally synchronized.
- Host access to `fence` must be externally synchronized.

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>Any</td>
<td>-</td>
</tr>
</tbody>
</table>

**Return Codes**

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`

The `VkSubmitInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSubmitInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreCount;
    const VkSemaphore* pWaitSemaphores;
    const VkPipelineStageFlags* pWaitDstStageMask;
    uint32_t commandBufferCount;
    const VkCommandBuffer* pCommandBuffers;
    uint32_t signalSemaphoreCount;
    const VkSemaphore* pSignalSemaphores;
} VkSubmitInfo;
```
- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **waitSemaphoreCount** is the number of semaphores upon which to wait before executing the command buffers for the batch.
- **pWaitSemaphores** is a pointer to an array of `VkSemaphore` handles upon which to wait before the command buffers for this batch begin execution. If semaphores to wait on are provided, they define a semaphore wait operation.
- **pWaitDstStageMask** is a pointer to an array of pipeline stages at which each corresponding semaphore wait will occur.
- **commandBufferCount** is the number of command buffers to execute in the batch.
- **pCommandBuffers** is a pointer to an array of `VkCommandBuffer` handles to execute in the batch.
- **signalSemaphoreCount** is the number of semaphores to be signaled once the commands specified in `pCommandBuffers` have completed execution.
- **pSignalSemaphores** is a pointer to an array of `VkSemaphore` handles which will be signaled when the command buffers for this batch have completed execution. If semaphores to be signaled are provided, they define a semaphore signal operation.

The order that command buffers appear in `pCommandBuffers` is used to determine submission order, and thus all the implicit ordering guarantees that respect it. Other than these implicit ordering guarantees and any explicit synchronization primitives, these command buffers may overlap or otherwise execute out of order.

### Valid Usage

- **VUID-VkSubmitInfo-pWaitDstStageMask-04090**
  If the `geometryShader` feature is not enabled, `pWaitDstStageMask` must not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`

- **VUID-VkSubmitInfo-pWaitDstStageMask-04091**
  If the `tessellationShader` feature is not enabled, `pWaitDstStageMask` must not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`

- **VUID-VkSubmitInfo-pWaitDstStageMask-07319**
  If the `attachmentFragmentShadingRate` feature is not enabled, `pWaitDstStageMask` must not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- **VUID-VkSubmitInfo-pWaitDstStageMask-03937**
  If the `synchronization2` feature is not enabled, `pWaitDstStageMask` must not be `0`

- **VUID-VkSubmitInfo-pWaitDstStageMask-07950**
  If the `rayTracingPipeline` feature is not enabled, `pWaitDstStageMask` must not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`

- **VUID-VkSubmitInfo-pCommandBuffers-00075**
Each element of \texttt{pCommandBuffers} \textbf{must} not have been allocated with \texttt{VK_COMMAND_BUFFER_LEVEL_SECONDARY}

- VUID-VkSubmitInfo-pWaitDstStageMask-00078
  Each element of \texttt{pWaitDstStageMask} \textbf{must} not include \texttt{VK_PIPELINE_STAGE_HOST_BIT}

- VUID-VkSubmitInfo-pWaitSemaphores-03239
  If any element of \texttt{pWaitSemaphores} or \texttt{pSignalSemaphores} was created with a \texttt{VkSemaphoreType} of \texttt{VK_SEMAPHORE_TYPE_TIMELINE}, then the \texttt{pNext} chain \textbf{must} include a \texttt{VkTimelineSemaphoreSubmitInfo} structure

- VUID-VkSubmitInfo-pNext-03240
  If the \texttt{pNext} chain of this structure includes a \texttt{VkTimelineSemaphoreSubmitInfo} structure and any element of \texttt{pWaitSemaphores} was created with a \texttt{VkSemaphoreType} of \texttt{VK_SEMAPHORE_TYPE_TIMELINE}, then its \texttt{waitSemaphoreValueCount} member \textbf{must} equal \texttt{waitSemaphoreCount}

- VUID-VkSubmitInfo-pNext-03241
  If the \texttt{pNext} chain of this structure includes a \texttt{VkTimelineSemaphoreSubmitInfo} structure and any element of \texttt{pSignalSemaphores} was created with a \texttt{VkSemaphoreType} of \texttt{VK_SEMAPHORE_TYPE_TIMELINE}, then its \texttt{signalSemaphoreValueCount} member \textbf{must} equal \texttt{signalSemaphoreCount}

- VUID-VkSubmitInfo-pSignalSemaphores-03242
  For each element of \texttt{pSignalSemaphores} created with a \texttt{VkSemaphoreType} of \texttt{VK_SEMAPHORE_TYPE_TIMELINE} the corresponding element of \texttt{VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues} \textbf{must} have a value greater than the current value of the semaphore when the semaphore signal operation is executed

- VUID-VkSubmitInfo-pWaitSemaphores-03243
  For each element of \texttt{pWaitSemaphores} created with a \texttt{VkSemaphoreType} of \texttt{VK_SEMAPHORE_TYPE_TIMELINE} the corresponding element of \texttt{VkTimelineSemaphoreSubmitInfo::pWaitSemaphoreValues} \textbf{must} have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on that semaphore by more than \texttt{maxTimelineSemaphoreValueDifference}

- VUID-VkSubmitInfo-pSignalSemaphores-03244
  For each element of \texttt{pSignalSemaphores} created with a \texttt{VkSemaphoreType} of \texttt{VK_SEMAPHORE_TYPE_TIMELINE} the corresponding element of \texttt{VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues} \textbf{must} have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on that semaphore by more than \texttt{maxTimelineSemaphoreValueDifference}

- VUID-VkSubmitInfo-pNext-04120
  If the \texttt{pNext} chain of this structure does not include a \texttt{VkProtectedSubmitInfo} structure with \texttt{protectedSubmit} set to \texttt{VK_TRUE}, then each element of the \texttt{pCommandBuffers} array \textbf{must} be an unprotected command buffer

- VUID-VkSubmitInfo-pNext-04148
  If the \texttt{pNext} chain of this structure includes a \texttt{VkProtectedSubmitInfo} structure with
protectedSubmit set to VK_TRUE, then each element of the pCommandBuffers array must be a protected command buffer

- VUID-VkSubmitInfo-pCommandBuffers-06193
  If pCommandBuffers contains any resumed render pass instances, they must be suspended by a render pass instance earlier in submission order within pCommandBuffers

- VUID-VkSubmitInfo-pCommandBuffers-06014
  If pCommandBuffers contains any suspended render pass instances, they must be resumed by a render pass instance later in submission order within pCommandBuffers

- VUID-VkSubmitInfo-pCommandBuffers-06015
  If pCommandBuffers contains any suspended render pass instances, there must be no action or synchronization commands executed in a primary or secondary command buffer between that render pass instance and the render pass instance that resumes it

- VUID-VkSubmitInfo-pCommandBuffers-06016
  If pCommandBuffers contains any suspended render pass instances, there must be no render pass instances between that render pass instance and the render pass instance that resumes it

Valid Usage (Implicit)

- VUID-VkSubmitInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_SUBMIT_INFO

- VUID-VkSubmitInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkD3D12FenceSubmitInfoKHR, VkDeviceGroupSubmitInfo, VkPerformanceQuerySubmitInfoKHR, VkProtectedSubmitInfo, VkTimelineSemaphoreSubmitInfo, or VkWin32KeyedMutexAcquireReleaseInfoKHR

- VUID-VkSubmitInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkSubmitInfo-pWaitSemaphores-parameter
  If waitSemaphoreCount is not 0, pWaitSemaphores must be a valid pointer to an array of waitSemaphoreCount valid VkSemaphore handles

- VUID-VkSubmitInfo-pWaitDstStageMask-parameter
  If waitSemaphoreCount is not 0, pWaitDstStageMask must be a valid pointer to an array of waitSemaphoreCount valid combinations of VkPipelineStageFlagBits values

- VUID-VkSubmitInfo-pCommandBuffers-parameter
  If commandBufferCount is not 0, pCommandBuffers must be a valid pointer to an array of commandBufferCount valid VkCommandBuffer handles

- VUID-VkSubmitInfo-pSignalSemaphores-parameter
  If signalSemaphoreCount is not 0, pSignalSemaphores must be a valid pointer to an array of signalSemaphoreCount valid VkSemaphore handles

- VUID-VkSubmitInfo-commonparent
Each of the elements of pCommandBuffers, the elements of pSignalSemaphores, and the elements of pWaitSemaphores that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice.

To specify the values to use when waiting for and signaling semaphores created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE, add a VkTimelineSemaphoreSubmitInfo structure to the pNext chain of the VkSubmitInfo structure when using vkQueueSubmit or the VkBindSparseInfo structure when using vkQueueBindSparse. The VkTimelineSemaphoreSubmitInfo structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkTimelineSemaphoreSubmitInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreValueCount;
    const uint64_t* pWaitSemaphoreValues;
    uint32_t signalSemaphoreValueCount;
    const uint64_t* pSignalSemaphoreValues;
} VkTimelineSemaphoreSubmitInfo;
```

or the equivalent

```c
// Provided by VK_KHR_timeline_semaphore
typedef VkTimelineSemaphoreSubmitInfo VkTimelineSemaphoreSubmitInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **waitSemaphoreValueCount** is the number of semaphore wait values specified in pWaitSemaphoreValues.
- **pWaitSemaphoreValues** is a pointer to an array of waitSemaphoreValueCount values for the corresponding semaphores in VkSubmitInfo::pWaitSemaphores to wait for.
- **signalSemaphoreValueCount** is the number of semaphore signal values specified in pSignalSemaphoreValues.
- **pSignalSemaphoreValues** is a pointer to an array signalSemaphoreValueCount values for the corresponding semaphores in VkSubmitInfo::pSignalSemaphores to set when signaled.

If the semaphore in VkSubmitInfo::pWaitSemaphores or VkSubmitInfo::pSignalSemaphores corresponding to an entry in pWaitSemaphoreValues or pSignalSemaphoreValues respectively was not created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE, the implementation must ignore the value in the pWaitSemaphoreValues or pSignalSemaphoreValues entry.

**Valid Usage (Implicit)**

- VUID-VkTimelineSemaphoreSubmitInfo-sType-sType
sType must be VK_STRUCTURE_TYPE_TIMELINE_SEMAPHORE_SUBMIT_INFO

• VUID-VkTimelineSemaphoreSubmitInfo-pWaitSemaphoreValues-parameter
  If waitSemaphoreValueCount is not 0, and pWaitSemaphoreValues is not NULL, pWaitSemaphoreValues must be a valid pointer to an array of waitSemaphoreValueCount uint64_t values

• VUID-VkTimelineSemaphoreSubmitInfo-pSignalSemaphoreValues-parameter
  If signalSemaphoreValueCount is not 0, and pSignalSemaphoreValues is not NULL, pSignalSemaphoreValues must be a valid pointer to an array of signalSemaphoreValueCount uint64_t values

To specify the values to use when waiting for and signaling semaphores whose current payload refers to a Direct3D 12 fence, add a VkD3D12FenceSubmitInfoKHR structure to the pNext chain of the VkSubmitInfo structure. The VkD3D12FenceSubmitInfoKHR structure is defined as:

```
// Provided by VK_KHR_external_semaphore_win32
typedef struct VkD3D12FenceSubmitInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreValuesCount;
    const uint64_t* pWaitSemaphoreValues;
    uint32_t signalSemaphoreValuesCount;
    const uint64_t* pSignalSemaphoreValues;
} VkD3D12FenceSubmitInfoKHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• waitSemaphoreValuesCount is the number of semaphore wait values specified in pWaitSemaphoreValues.
• pWaitSemaphoreValues is a pointer to an array of waitSemaphoreValuesCount values for the corresponding semaphores in VkSubmitInfo::pWaitSemaphores to wait for.
• signalSemaphoreValuesCount is the number of semaphore signal values specified in pSignalSemaphoreValues.
• pSignalSemaphoreValues is a pointer to an array of signalSemaphoreValuesCount values for the corresponding semaphores in VkSubmitInfo::pSignalSemaphores to set when signaled.

If the semaphore in VkSubmitInfo::pWaitSemaphores or VkSubmitInfo::pSignalSemaphores corresponding to an entry in pWaitSemaphoreValues or pSignalSemaphoreValues respectively does not currently have a payload referring to a Direct3D 12 fence, the implementation must ignore the value in the pWaitSemaphoreValues or pSignalSemaphoreValues entry.

Note
As the introduction of the external semaphore handle type VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT predates that of timeline semaphores, support for importing semaphore payloads from external handles of
that type into semaphores created (implicitly or explicitly) with a VkSemaphoreType of VK_SEMAPHORE_TYPE_BINARY is preserved for backwards compatibility. However, applications should prefer importing such handle types into semaphores created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE, and use the VkTimelineSemaphoreSubmitInfo structure instead of the VkD3D12FenceSubmitInfoKHR structure to specify the values to use when waiting for and signaling such semaphores.

Valid Usage

- VUID-VkD3D12FenceSubmitInfoKHR-waitSemaphoreValuesCount-00079
  
  `waitSemaphoreValuesCount` must be the same value as `VkSubmitInfo::waitSemaphoreCount`, where this structure is in the `pNext` chain of a `VkSubmitInfo` structure

- VUID-VkD3D12FenceSubmitInfoKHR-signalSemaphoreValuesCount-00080
  
  `signalSemaphoreValuesCount` must be the same value as `VkSubmitInfo::signalSemaphoreCount`, where this structure is in the `pNext` chain of a `VkSubmitInfo` structure

Valid Usage (Implicit)

- VUID-VkD3D12FenceSubmitInfoKHR-sType-sType
  
  `sType` must be VK_STRUCTURE_TYPE_D3D12_FENCE_SUBMIT_INFO_KHR

- VUID-VkD3D12FenceSubmitInfoKHR-pWaitSemaphoreValues-parameter
  
  If `waitSemaphoreValuesCount` is not 0, and `pWaitSemaphoreValues` is not NULL, `pWaitSemaphoreValues` must be a valid pointer to an array of `waitSemaphoreValuesCount` uint64_t values

- VUID-VkD3D12FenceSubmitInfoKHR-pSignalSemaphoreValues-parameter
  
  If `signalSemaphoreValuesCount` is not 0, and `pSignalSemaphoreValues` is not NULL, `pSignalSemaphoreValues` must be a valid pointer to an array of `signalSemaphoreValuesCount` uint64_t values

When submitting work that operates on memory imported from a Direct3D 11 resource to a queue, the keyed mutex mechanism may be used in addition to Vulkan semaphores to synchronize the work. Keyed mutexes are a property of a properly created shareable Direct3D 11 resource. They can only be used if the imported resource was created with the D3D11_RESOURCE_MISC_SHARED_KEYEDMUTEX flag.

To acquire keyed mutexes before submitted work and/or release them after, add a VkWin32KeyedMutexAcquireReleaseInfoKHR structure to the `pNext` chain of the `VkSubmitInfo` structure.

The VkWin32KeyedMutexAcquireReleaseInfoKHR structure is defined as:

```c
// Provided by VK_KHR_win32_keyed_mutex
typedef struct VkWin32KeyedMutexAcquireReleaseInfoKHR {
```
VkStructureType sType;
const void* pNext;
uint32_t acquireCount;
const VkDeviceMemory* pAcquireSyncs;
const uint64_t* pAcquireKeys;
const uint32_t* pAcquireTimeouts;
uint32_t releaseCount;
const VkDeviceMemory* pReleaseSyncs;
const uint64_t* pReleaseKeys;

} VkWin32KeyedMutexAcquireReleaseInfoKHR;

• **sType** is a *VkStructureType* value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **acquireCount** is the number of entries in the *pAcquireSyncs*, *pAcquireKeys*, and *pAcquireTimeouts* arrays.

• **pAcquireSyncs** is a pointer to an array of *VkDeviceMemory* objects which were imported from Direct3D 11 resources.

• **pAcquireKeys** is a pointer to an array of mutex key values to wait for prior to beginning the submitted work. Entries refer to the keyed mutex associated with the corresponding entries in *pAcquireSyncs*.

• **pAcquireTimeouts** is a pointer to an array of timeout values, in millisecond units, for each acquire specified in *pAcquireKeys*.

• **releaseCount** is the number of entries in the *pReleaseSyncs* and *pReleaseKeys* arrays.

• **pReleaseSyncs** is a pointer to an array of *VkDeviceMemory* objects which were imported from Direct3D 11 resources.

• **pReleaseKeys** is a pointer to an array of mutex key values to set when the submitted work has completed. Entries refer to the keyed mutex associated with the corresponding entries in *pReleaseSyncs*.

### Valid Usage

- VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pAcquireSyncs-00081
  Each member of *pAcquireSyncs* and *pReleaseSyncs* must be a device memory object imported by setting *VkImportMemoryWin32HandleInfoKHR::handleType* to `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT` or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT`.

### Valid Usage (Implicit)

- VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-sType-sType
  *sType* must be `VK_STRUCTURE_TYPE_WIN32_KEYED_MUTEX_ACQUIRE_RELEASE_INFO_KHR`.

- VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pAcquireSyncs-parameter
  If **acquireCount** is not 0, *pAcquireSyncs* must be a valid pointer to an array of **acquireCount**
valid VkDeviceMemory handles

- **VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pAcquireKeys-parameter**
  If acquireCount is not 0, **pAcquireKeys must** be a valid pointer to an array of acquireCount uint64_t values

- **VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pAcquireTimeouts-parameter**
  If acquireCount is not 0, **pAcquireTimeouts must** be a valid pointer to an array of acquireCount uint32_t values

- **VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pReleaseSyncs-parameter**
  If releaseCount is not 0, **pReleaseSyncs must** be a valid pointer to an array of releaseCount valid VkDeviceMemory handles

- **VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pReleaseKeys-parameter**
  If releaseCount is not 0, **pReleaseKeys must** be a valid pointer to an array of releaseCount uint64_t values

- **VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-commonparent**
  Both of the elements of **pAcquireSyncs**, and the elements of **pReleaseSyncs** that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same VkDevice

If the **pNext** chain of VkSubmitInfo includes a VkProtectedSubmitInfo structure, then the structure indicates whether the batch is protected. The VkProtectedSubmitInfo structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkProtectedSubmitInfo {
    VkStructureType sType;
    const void* pNext;
    VkBool32 protectedSubmit;
} VkProtectedSubmitInfo;
```

- **protectedSubmit** specifies whether the batch is protected. If **protectedSubmit** is VK_TRUE, the batch is protected. If **protectedSubmit** is VK_FALSE, the batch is unprotected. If the VkSubmitInfo::pNext chain does not include this structure, the batch is unprotected.

**Valid Usage (Implicit)**

- **VUID-VkProtectedSubmitInfo-sType-sType**
  **sType must** be VK_STRUCTURE_TYPE_PROTECTED_SUBMIT_INFO

If the **pNext** chain of VkSubmitInfo includes a VkDeviceGroupSubmitInfo structure, then that structure includes device indices and masks specifying which physical devices execute semaphore operations and command buffers.

The VkDeviceGroupSubmitInfo structure is defined as:

```
// Provided by VK_VERSION_1_1
```
typedef struct VkDeviceGroupSubmitInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreCount;
    const uint32_t* pWaitSemaphoreDeviceIndices;
    uint32_t commandBufferCount;
    const uint32_t* pCommandBufferDeviceMasks;
    uint32_t signalSemaphoreCount;
    const uint32_t* pSignalSemaphoreDeviceIndices;
} VkDeviceGroupSubmitInfo;

or the equivalent

// Provided by VK_KHR_device_group
typedef VkDeviceGroupSubmitInfo VkDeviceGroupSubmitInfoKHR;

• **sType** is a *VkStructureType* value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **waitSemaphoreCount** is the number of elements in the *pWaitSemaphoreDeviceIndices* array.
• **pWaitSemaphoreDeviceIndices** is a pointer to an array of *waitSemaphoreCount* device indices indicating which physical device executes the semaphore wait operation in the corresponding element of *VkSubmitInfo::pWaitSemaphores*.
• **commandBufferCount** is the number of elements in the *pCommandBufferDeviceMasks* array.
• **pCommandBufferDeviceMasks** is a pointer to an array of *commandBufferCount* device masks indicating which physical devices execute the command buffer in the corresponding element of *VkSubmitInfo::pCommandBuffers*. A physical device executes the command buffer if the corresponding bit is set in the mask.
• **signalSemaphoreCount** is the number of elements in the *pSignalSemaphoreDeviceIndices* array.
• **pSignalSemaphoreDeviceIndices** is a pointer to an array of *signalSemaphoreCount* device indices indicating which physical device executes the semaphore signal operation in the corresponding element of *VkSubmitInfo::pSignalSemaphores*.

If this structure is not present, semaphore operations and command buffers execute on device index zero.

### Valid Usage

- VUID-VkDeviceGroupSubmitInfo-waitSemaphoreCount-00082
  waitSemaphoreCount must equal *VkSubmitInfo::waitSemaphoreCount*
- VUID-VkDeviceGroupSubmitInfo-commandBufferCount-00083
  commandBufferCount must equal *VkSubmitInfo::commandBufferCount*
- VUID-VkDeviceGroupSubmitInfo-signalSemaphoreCount-00084
  signalSemaphoreCount must equal *VkSubmitInfo::signalSemaphoreCount*
All elements of `pWaitSemaphoreDeviceIndices` and `pSignalSemaphoreDeviceIndices` must be valid device indices.

All elements of `pCommandBufferDeviceMasks` must be valid device masks.

### Valid Usage (Implicit)

- **VUID-VkDeviceGroupSubmitInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_DEVICE_GROUP_SUBMIT_INFO`.

- **VUID-VkDeviceGroupSubmitInfo-pWaitSemaphoreDeviceIndices-parameter**
  If `waitSemaphoreCount` is not 0, `pWaitSemaphoreDeviceIndices` must be a valid pointer to an array of `waitSemaphoreCount uint32_t` values.

- **VUID-VkDeviceGroupSubmitInfo-pCommandBufferDeviceMasks-parameter**
  If `commandBufferCount` is not 0, `pCommandBufferDeviceMasks` must be a valid pointer to an array of `commandBufferCount uint32_t` values.

- **VUID-VkDeviceGroupSubmitInfo-pSignalSemaphoreDeviceIndices-parameter**
  If `signalSemaphoreCount` is not 0, `pSignalSemaphoreDeviceIndices` must be a valid pointer to an array of `signalSemaphoreCount uint32_t` values.

If the `pNext` chain of `VkSubmitInfo` includes a `VkPerformanceQuerySubmitInfoKHR` structure, then the structure indicates which counter pass is active for the batch in that submit.

The `VkPerformanceQuerySubmitInfoKHR` structure is defined as:

```c
typedef struct VkPerformanceQuerySubmitInfoKHR {
    VkStructureType sType; // Provided by VK_KHR_performance_query
    const void* pNext;
    uint32_t counterPassIndex;
} VkPerformanceQuerySubmitInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `counterPassIndex` specifies which counter pass index is active.

If the `VkSubmitInfo::pNext` chain does not include this structure, the batch defaults to use counter pass index 0.

### Valid Usage

- **VUID-VkPerformanceQuerySubmitInfoKHR-counterPassIndex-03221**
  `counterPassIndex` must be less than the number of counter passes required by any queries.
within the batch. The required number of counter passes for a performance query is obtained by calling `vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR`.

### Valid Usage (Implicit)

- VUID-VkPerformanceQuerySubmitInfoKHR-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PERFORMANCE_QUERY_SUBMIT_INFO_KHR`.

### 6.6. Queue Forward Progress

When using binary semaphores, the application **must** ensure that command buffer submissions will be able to complete without any subsequent operations by the application on any queue. After any call to `vkQueueSubmit` (or other queue operation), for every queued wait on a semaphore created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY` there **must** be a prior signal of that semaphore that will not be consumed by a different wait on the semaphore.

When using timeline semaphores, wait-before-signal behavior is well-defined and applications **can** submit work via `vkQueueSubmit` defining a timeline semaphore wait operation before submitting a corresponding semaphore signal operation. For each timeline semaphore wait operation defined by a call to `vkQueueSubmit`, the application **must** ensure that a corresponding semaphore signal operation is executed before forward progress can be made.

If a command buffer submission waits for any events to be signaled, the application **must** ensure that command buffer submissions will be able to complete without any subsequent operations by the application. Events signaled by the host **must** be signaled before the command buffer waits on those events.

**Note**

The ability for commands to wait on the host to set an events was originally added to allow low-latency updates to resources between host and device. However, to ensure quality of service, implementations would necessarily detect extended stalls in execution and timeout after a short period. As this period is not defined in the Vulkan specification, it is impossible to correctly validate any application with any wait period. Since the original users of this functionality were highly limited and platform-specific, this functionality is now considered defunct and should not be used.

### 6.7. Secondary Command Buffer Execution

Secondary command buffers **must** not be directly submitted to a queue. To record a secondary command buffer to execute as part of a primary command buffer, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdExecuteCommands(
    VkCommandBuffer
    commandBuffer,
```
**uint32_t**

**const VkCommandBuffer**

```c
(uint32_t commandBufferCount,
const VkCommandBuffer* pCommandBuffers);
```

- `commandBuffer` is a handle to a primary command buffer that the secondary command buffers are executed in.
- `commandBufferCount` is the length of the `pCommandBuffers` array.
- `pCommandBuffers` is a pointer to an array of `commandBufferCount` secondary command buffer handles, which are recorded to execute in the primary command buffer in the order they are listed in the array.

If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, and it was recorded into any other primary command buffer which is currently in the executable or recording state, that primary command buffer becomes **invalid**.

If the `nestedCommandBuffer` feature is enabled it is valid usage for `vkCmdExecuteCommands` to also be recorded to a **secondary command buffer**.

---

### Valid Usage

- **VUID-vkCmdExecuteCommands-pCommandBuffers-00088**
  Each element of `pCommandBuffers` must have been allocated with a level of `VK_COMMAND_BUFFER_LEVEL_SECONDARY`

- **VUID-vkCmdExecuteCommands-pCommandBuffers-00089**
  Each element of `pCommandBuffers` must be in the pending or executable state

- **VUID-vkCmdExecuteCommands-pCommandBuffers-00091**
  If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, it must not be in the pending state

- **VUID-vkCmdExecuteCommands-pCommandBuffers-00092**
  If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, it must not have already been recorded to `commandBuffer`

- **VUID-vkCmdExecuteCommands-pCommandBuffers-00093**
  If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, it must not appear more than once in `pCommandBuffers`

- **VUID-vkCmdExecuteCommands-pCommandBuffers-00094**
  Each element of `pCommandBuffers` must have been allocated from a `VkCommandPool` that was created for the same queue family as the `VkCommandPool` from which `commandBuffer` was allocated

- **VUID-vkCmdExecuteCommands-pCommandBuffers-00096**
  If `vkCmdExecuteCommands` is being called within a render pass instance, each element of `pCommandBuffers` must have been recorded with the `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`
If \texttt{vkCmdExecuteCommands} is being called within a render pass instance, and any element of \texttt{pCommandBuffers} was recorded with \texttt{VkCommandBufferInheritanceInfo::framebuffer} not equal to \texttt{VK_NULL_HANDLE}, that \texttt{VkFramebuffer} must match the \texttt{VkFramebuffer} used in the current render pass instance.

If \texttt{vkCmdExecuteCommands} is being called within a render pass instance begun with \texttt{vkCmdBeginRenderPass}, its \texttt{contents} parameter must have been set to \texttt{VK_SUBPASS_CONTENTS_SECONDARY_COMMAND_BUFFERS}, or \texttt{VK_SUBPASS_CONTENTS_INLINE_AND_SECONDARY_COMMAND_BUFFERS_EXT}.

If \texttt{vkCmdExecuteCommands} is being called within a render pass instance begun with \texttt{vkCmdBeginRenderPass}, each element of \texttt{pCommandBuffers} must have been recorded with \texttt{VkCommandBufferInheritanceInfo::subpass} set to the index of the subpass which the given command buffer will be executed in.

If \texttt{vkCmdExecuteCommands} is being called within a render pass instance begun with \texttt{vkCmdBeginRenderPass}, the render passes specified in the \texttt{pBeginInfo->pInheritanceInfo->renderPass} members of the \texttt{vkBeginCommandBuffer} commands used to begin recording each element of \texttt{pCommandBuffers} must be compatible with the current render pass.

If \texttt{vkCmdExecuteCommands} is not being called within a render pass instance, each element of \texttt{pCommandBuffers} must not have been recorded with the \texttt{VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT}.

If the \texttt{inheritedQueries} feature is not enabled, \texttt{commandBuffer} must not have any queries active.

If \texttt{commandBuffer} has a \texttt{VK_QUERY_TYPE_OCCLUSION} query active, then each element of \texttt{pCommandBuffers} must have been recorded with \texttt{VkCommandBufferInheritanceInfo::occlusionQueryEnable} set to \texttt{VK_TRUE}.

If \texttt{commandBuffer} has a \texttt{VK_QUERY_TYPE_OCCLUSION} query active, then each element of \texttt{pCommandBuffers} must have been recorded with \texttt{VkCommandBufferInheritanceInfo::queryFlags} having all bits set that are set for the query.

If \texttt{commandBuffer} has a \texttt{VK_QUERY_TYPE_PIPELINE_STATISTICS} query active, then each element of \texttt{pCommandBuffers} must have been recorded with \texttt{VkCommandBufferInheritanceInfo::pipelineStatistics} having all bits set that are set in the \texttt{VkQueryPool} the query uses.

Each element of \texttt{pCommandBuffers} must not begin any query types that are active in \texttt{commandBuffer}.

\texttt{commandBuffer} must not have any queries other than \texttt{VK_QUERY_TYPE_OCCLUSION} and...
• **VK_QUERY_TYPE_PIPELINE_STATISTICS active**

  • VUID-vkCmdExecuteCommands-commandBuffer-01820
    If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, each element of `pCommandBuffers` **must** be a protected command buffer.

  • VUID-vkCmdExecuteCommands-commandBuffer-01821
    If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, each element of `pCommandBuffers` **must** be an unprotected command buffer.

  • VUID-vkCmdExecuteCommands-commandBuffer-06533
    If `vkCmdExecuteCommands` is being called within a render pass instance and any recorded command in `commandBuffer` in the current subpass will write to an image subresource as an attachment, commands recorded in elements of `pCommandBuffers` **must** not read from the memory backing that image subresource in any other way.

  • VUID-vkCmdExecuteCommands-commandBuffer-06534
    If `vkCmdExecuteCommands` is being called within a render pass instance and any recorded command in a given element of `pCommandBuffers` will write to an image subresource as an attachment, commands recorded in elements of `pCommandBuffers` at a higher index **must** not write to that image subresource as an attachment.

  • VUID-vkCmdExecuteCommands-pCommandBuffers-06535
    If `vkCmdExecuteCommands` is being called within a render pass instance and any recorded command in a given element of `pCommandBuffers` will read from an image subresource used as an attachment in any way other than as an attachment, commands recorded in elements of `pCommandBuffers` at a higher index **must** not read from the memory backing that image subresource in any other way.

  • VUID-vkCmdExecuteCommands-pCommandBuffers-06536
    If `vkCmdExecuteCommands` is being called within a render pass instance and any recorded command in a given element of `pCommandBuffers` will read from an image subresource used as an attachment in any way other than as an attachment, commands recorded in elements of `pCommandBuffers` at a higher index **must** not write to that image subresource as an attachment.

  • VUID-vkCmdExecuteCommands-pCommandBuffers-06021
    If `pCommandBuffers` contains any suspended render pass instances, there **must** be no action or synchronization commands between that render pass instance and any render pass instance that resumes it.

  • VUID-vkCmdExecuteCommands-pCommandBuffers-06022
    If `pCommandBuffers` contains any suspended render pass instances, there **must** be no render pass instances between that render pass instance and any render pass instance that resumes it.

  • VUID-vkCmdExecuteCommands-flags-06024
    If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, its `VkRenderingInfo::flags` parameter **must** have included `VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT`.

  • VUID-vkCmdExecuteCommands-pBeginInfo-06025
    If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, the render passes specified in the `pBeginInfo->pInheritanceInfo->renderPass` members of the `vkBeginCommandBuffer` commands used to begin recording...
each element of `pCommandBuffers` must be `VK_NULL_HANDLE`.

- **VUID-vkCmdExecuteCommands-flags-06026**
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, the `flags` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` must be equal to the `VkRenderingInfo::flags` parameter to `vkCmdBeginRendering`, excluding `VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT`.

- **VUID-vkCmdExecuteCommands-colorAttachmentCount-06027**
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, the `colorAttachmentCount` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` must be equal to the `VkRenderingInfo::colorAttachmentCount` parameter to `vkCmdBeginRendering`.

- **VUID-vkCmdExecuteCommands-imageView-06028**
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, if the `imageView` member of an element of the `VkRenderingInfo::pColorAttachments` parameter to `vkCmdBeginRendering` is not `VK_NULL_HANDLE`, the corresponding element of the `pColorAttachmentFormats` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` must be equal to the format used to create that image view.

- **VUID-vkCmdExecuteCommands-imageView-07606**
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, if the `imageView` member of an element of the `VkRenderingInfo::pColorAttachments` parameter to `vkCmdBeginRendering` is `VK_NULL_HANDLE`, the corresponding element of the `pColorAttachmentFormats` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` must be `VK_FORMAT_UNDEFINED`.

- **VUID-vkCmdExecuteCommands-pDepthAttachment-06029**
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, if the `VkRenderingInfo::pDepthAttachment->imageView` parameter to `vkCmdBeginRendering` is not `VK_NULL_HANDLE`, the value of the `depthAttachmentFormat` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` must be equal to the format used to create that image view.

- **VUID-vkCmdExecuteCommands-pStencilAttachment-06030**
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, if the `VkRenderingInfo::pStencilAttachment->imageView` parameter to `vkCmdBeginRendering` is not `VK_NULL_HANDLE`, the value of the `stencilAttachmentFormat` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` must be equal to the format used to create that image view.
used to begin recording each element of pCommandBuffers must be equal to the format used
to create that image view

• VUID-vkCmdExecuteCommands-pDepthAttachment-06774
  If vkCmdExecuteCommands is being called within a render pass instance begun with
  vkCmdBeginRendering and the VkRenderingInfo::pDepthAttachment->imageView parameter
to vkCmdBeginRendering was VK_NULL_HANDLE, the value of the depthAttachmentFormat
  member of the VkCommandBufferInheritanceRenderingInfo structure included in the
  pNext chain of VkCommandBufferBeginInfo::pInheritanceInfo used to begin recording
each element of pCommandBuffers must be VK_FORMAT_UNDEFINED

• VUID-vkCmdExecuteCommands-pStencilAttachment-06775
  If vkCmdExecuteCommands is being called within a render pass instance begun with
  vkCmdBeginRendering and the VkRenderingInfo::pStencilAttachment->imageView parameter
to vkCmdBeginRendering was VK_NULL_HANDLE, the value of the stencilAttachmentFormat
  member of the VkCommandBufferInheritanceRenderingInfo structure included in the
  pNext chain of VkCommandBufferBeginInfo::pInheritanceInfo used to begin recording
each element of pCommandBuffers must be VK_FORMAT_UNDEFINED

• VUID-vkCmdExecuteCommands-viewMask-06031
  If vkCmdExecuteCommands is being called within a render pass instance begun with
  vkCmdBeginRendering, the viewMask member of the
  VkCommandBufferInheritanceRenderingInfo structure included in the pNext chain of
  VkCommandBufferBeginInfo::pInheritanceInfo used to begin recording each element of
  pCommandBuffers must be equal to the VkRenderingInfo::viewMask parameter to
  vkCmdBeginRendering

• VUID-vkCmdExecuteCommands-commandBuffer-09375
  commandBuffer must not be a secondary command buffer unless the nestedCommandBuffer
  feature is enabled

• VUID-vkCmdExecuteCommands-nestedCommandBuffer-09376
  If the nestedCommandBuffer feature is enabled, the command buffer nesting level of each
  element of pCommandBuffers must be less than maxCommandBufferNestingLevel

• VUID-vkCmdExecuteCommands-nestedCommandBufferRendering-09377
  If the nestedCommandBufferRendering feature is not enabled, and commandBuffer is a
  secondary command buffer, commandBuffer must not have been recorded with
  VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT

• VUID-vkCmdExecuteCommands-nestedCommandBufferSimultaneousUse-09378
  If the nestedCommandBufferSimultaneousUse feature is not enabled, and commandBuffer is a
  secondary command buffer, each element of pCommandBuffers must not have been
  recorded with VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT

• VUID-vkCmdExecuteCommands-pCommandBuffers-09504
  If vkCmdExecuteCommands is being called within a render pass instance begun with
  vkCmdBeginRendering, the color attachment mapping state specified by
  VkRenderingAttachmentLocationInfoKHR in the inheritance info of each element of
  pCommandBuffers and in the current state of commandBuffer must match

• VUID-vkCmdExecuteCommands-pCommandBuffers-09505
  If vkCmdExecuteCommands is being called within a render pass instance begun with
vkCmdBeginRendering, the input attachment mapping state specified by VkRenderingInputAttachmentIndexInfoKHR in the inheritance info of each element of pCommandBuffers and in the current state of commandBuffer must match

Valid Usage (Implicit)

- VUID-vkCmdExecuteCommands-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdExecuteCommands-pCommandBuffers-parameter
  pCommandBuffers must be a valid pointer to an array of commandBufferCount valid VkCommandBuffer handles
- VUID-vkCmdExecuteCommands-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdExecuteCommands-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support transfer, graphics, or compute operations
- VUID-vkCmdExecuteCommands-videoencoding
  This command must only be called outside of a video coding scope
- VUID-vkCmdExecuteCommands-commandBufferCount-arraylength
  commandBufferCount must be greater than 0
- VUID-vkCmdExecuteCommands-commonparent
  Both of commandBuffer, and the elements of pCommandBuffers must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

6.8. Nested Command Buffers

In addition to secondary command buffer execution from primary command buffers, an implementation may support nested command buffers, which enable secondary command buffers to be executed from other secondary command buffers. If the nestedCommandBuffer feature is enabled, the implementation supports nested command buffers.

Nested command buffer execution works the same as primary-to-secondary execution, except that it is subject to some additional implementation-defined limits.

Each secondary command buffer has a command buffer nesting level, which is determined at vkEndCommandBuffer time and evaluated at vkCmdExecuteCommands time. A secondary command buffer that executes no other secondary command buffers has a command buffer nesting level of zero. Otherwise, the command buffer nesting level of a secondary command buffer is equal to the maximum nesting level of all secondary command buffers executed by that command buffer plus one. Some implementations may have a limit on the maximum nesting level of secondary command buffers that can be recorded. This limit is advertised in maxCommandBufferNestingLevel.

If the nestedCommandBufferRendering feature is enabled, the implementation supports calling vkCmdExecuteCommands inside secondary command buffers recorded with VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT. If the nestedCommandBufferSimultaneousUse feature is enabled, the implementation supports calling vkCmdExecuteCommands with secondary command buffers recorded with VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT.

Whenever vkCmdExecuteCommands is recorded inside a secondary command buffer recorded with VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT, each member of pCommandBuffers must have been recorded with a VkCommandBufferBeginInfo with VkCommandBufferInheritanceInfo compatible with the VkCommandBufferInheritanceInfo of the command buffer into which the vkCmdExecuteCommands call is being recorded. The VkCommandBufferInheritanceRenderingInfo structures are compatible when the VkCommandBufferInheritanceRenderingInfo::renderpass are compatible, or if they are VK_NULL_HANDLE then the VkCommandBufferInheritanceRenderingInfo members match, and all other members of VkCommandBufferInheritanceRenderingInfo match. This requirement applies recursively, down to the most nested command buffer and up to the command buffer where the render pass was originally begun.

6.9. Command Buffer Device Mask

Each command buffer has a piece of state storing the current device mask of the command buffer. This mask controls which physical devices within the logical device all subsequent commands will execute on, including state-setting commands, action commands, and synchronization commands.

Scissor and viewport state (excluding the count of each) can be set to different values on each physical device (only when set as dynamic state), and each physical device will render using its local copy of the state. Other state is shared between physical devices, such that all physical devices use the most recently set values for the state. However, when recording an action command that uses a piece of state, the most recent command that set that state must have included all physical
devices that execute the action command in its current device mask.

The command buffer's device mask is orthogonal to the `pCommandBufferDeviceMasks` member of `VkDeviceGroupSubmitInfo`. Commands only execute on a physical device if the device index is set in both device masks.

If the `pNext` chain of `VkCommandBufferBeginInfo` includes a `VkDeviceGroupCommandBufferBeginInfo` structure, then that structure includes an initial device mask for the command buffer.

The `VkDeviceGroupCommandBufferBeginInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupCommandBufferBeginInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t deviceMask;
} VkDeviceGroupCommandBufferBeginInfo;
```

or the equivalent

```c
// Provided by VK_KHR_device_group
typedef VkDeviceGroupCommandBufferBeginInfo VkDeviceGroupCommandBufferBeginInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `deviceMask` is the initial value of the command buffer's device mask.

The initial device mask also acts as an upper bound on the set of devices that can ever be in the device mask in the command buffer.

If this structure is not present, the initial value of a command buffer's device mask is set to include all physical devices in the logical device when the command buffer begins recording.

**Valid Usage**

- VUID-VkDeviceGroupCommandBufferBeginInfo-deviceMask-00106
  `deviceMask` must be a valid device mask value

- VUID-VkDeviceGroupCommandBufferBeginInfo-deviceMask-00107
  `deviceMask` must not be zero

**Valid Usage (Implicit)**

- VUID-VkDeviceGroupCommandBufferBeginInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_DEVICE_GROUP_COMMAND_BUFFER_BEGIN_INFO`
To update the current device mask of a command buffer, call:

```c
// Provided by VK_VERSION_1_1
void vkCmdSetDeviceMask(
    VkCommandBuffer commandBuffer,
    uint32_t deviceMask);
```
or the equivalent command

```c
// Provided by VK_KHR_device_group
void vkCmdSetDeviceMaskKHR(
    VkCommandBuffer commandBuffer,
    uint32_t deviceMask);
```

- `commandBuffer` is command buffer whose current device mask is modified.
- `deviceMask` is the new value of the current device mask.

`deviceMask` is used to filter out subsequent commands from executing on all physical devices whose bit indices are not set in the mask, except commands beginning a render pass instance, commands transitioning to the next subpass in the render pass instance, and commands ending a render pass instance, which always execute on the set of physical devices whose bit indices are included in the `deviceMask` member of the `VkDeviceGroupRenderPassBeginInfo` structure passed to the command beginning the corresponding render pass instance.

### Valid Usage

- VUID-vkCmdSetDeviceMask-deviceMask-00108
  `deviceMask` must be a valid device mask value

- VUID-vkCmdSetDeviceMask-deviceMask-00109
  `deviceMask` must not be zero

- VUID-vkCmdSetDeviceMask-deviceMask-00110
  `deviceMask` must not include any set bits that were not in the `VkDeviceGroupCommandBufferBeginInfo::deviceMask` value when the command buffer began recording

- VUID-vkCmdSetDeviceMask-deviceMask-00111
  If `vkCmdSetDeviceMask` is called inside a render pass instance, `deviceMask` must not include any set bits that were not in the `VkDeviceGroupRenderPassBeginInfo::deviceMask` value when the render pass instance began recording

### Valid Usage (Implicit)

- VUID-vkCmdSetDeviceMask-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
• VUID-vkCmdSetDeviceMask-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdSetDeviceMask-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, compute, or transfer operations

**Host Synchronization**

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Chapter 7. Synchronization and Cache Control

Synchronization of access to resources is primarily the responsibility of the application in Vulkan. The order of execution of commands with respect to the host and other commands on the device has few implicit guarantees, and needs to be explicitly specified. Memory caches and other optimizations are also explicitly managed, requiring that the flow of data through the system is largely under application control.

Whilst some implicit guarantees exist between commands, five explicit synchronization mechanisms are exposed by Vulkan:

Fences
Fences can be used to communicate to the host that execution of some task on the device has completed, controlling resource access between host and device.

Semaphores
Semaphores can be used to control resource access across multiple queues.

Events
Events provide a fine-grained synchronization primitive which can be signaled either within a command buffer or by the host, and can be waited upon within a command buffer or queried on the host. Events can be used to control resource access within a single queue.

Pipeline Barriers
Pipeline barriers also provide synchronization control within a command buffer, but at a single point, rather than with separate signal and wait operations. Pipeline barriers can be used to control resource access within a single queue.

Render Passes
Render passes provide a useful synchronization framework for most rendering tasks, built upon the concepts in this chapter. Many cases that would otherwise need an application to use other synchronization primitives can be expressed more efficiently as part of a render pass. Render pass objects can be used to control resource access within a single queue.

7.1. Execution and Memory Dependencies

An operation is an arbitrary amount of work to be executed on the host, a device, or an external entity such as a presentation engine. Synchronization commands introduce explicit execution dependencies, and memory dependencies between two sets of operations defined by the command’s two synchronization scopes.

The synchronization scopes define which other operations a synchronization command is able to create execution dependencies with. Any type of operation that is not in a synchronization command’s synchronization scopes will not be included in the resulting dependency. For example, for many synchronization commands, the synchronization scopes can be limited to just operations executing in specific pipeline stages, which allows other pipeline stages to be excluded from a
dependency. Other scoping options are possible, depending on the particular command.

An execution dependency is a guarantee that for two sets of operations, the first set must happen-before the second set. If an operation happens-before another operation, then the first operation must complete before the second operation is initiated. More precisely:

- Let $\text{Ops}_1$ and $\text{Ops}_2$ be separate sets of operations.
- Let $\text{Sync}$ be a synchronization command.
- Let $\text{Scope}_{1\text{st}}$ and $\text{Scope}_{2\text{nd}}$ be the synchronization scopes of $\text{Sync}$.
- Let $\text{ScopedOps}_1$ be the intersection of sets $\text{Ops}_1$ and $\text{Scope}_{1\text{st}}$.
- Let $\text{ScopedOps}_2$ be the intersection of sets $\text{Ops}_2$ and $\text{Scope}_{2\text{nd}}$.
- Submitting $\text{Ops}_1$, $\text{Sync}$ and $\text{Ops}_2$ for execution, in that order, will result in execution dependency $\text{ExeDep}$ between $\text{ScopedOps}_1$ and $\text{ScopedOps}_2$.
- Execution dependency $\text{ExeDep}$ guarantees that $\text{ScopedOps}_1$ happen-before $\text{ScopedOps}_2$.

An execution dependency chain is a sequence of execution dependencies that form a happens-before relation between the first dependency’s $\text{ScopedOps}_1$ and the final dependency’s $\text{ScopedOps}_2$. For each consecutive pair of execution dependencies, a chain exists if the intersection of $\text{Scope}_{2\text{nd}}$ in the first dependency and $\text{Scope}_{1\text{st}}$ in the second dependency is not an empty set. The formation of a single execution dependency from an execution dependency chain can be described by substituting the following in the description of execution dependencies:

- Let $\text{Sync}$ be a set of synchronization commands that generate an execution dependency chain.
- Let $\text{Scope}_{1\text{st}}$ be the first synchronization scope of the first command in $\text{Sync}$.
- Let $\text{Scope}_{2\text{nd}}$ be the second synchronization scope of the last command in $\text{Sync}$.

Execution dependencies alone are not sufficient to guarantee that values resulting from writes in one set of operations can be read from another set of operations.

Three additional types of operations are used to control memory access. Availability operations cause the values generated by specified memory write accesses to become available to a memory domain for future access. Any available value remains available until a subsequent write to the same memory location occurs (whether it is made available or not) or the memory is freed. Memory domain operations cause writes that are available to a source memory domain to become available to a destination memory domain (an example of this is making writes available to the host domain available to the device domain). Visibility operations cause values available to a memory domain to become visible to specified memory accesses.

Availability, visibility, memory domains, and memory domain operations are formally defined in the Availability and Visibility section of the Memory Model chapter. Which API operations perform each of these operations is defined in Availability, Visibility, and Domain Operations.

A memory dependency is an execution dependency which includes availability and visibility operations such that:

- The first set of operations happens-before the availability operation.
• The availability operation happens-before the visibility operation.
• The visibility operation happens-before the second set of operations.

Once written values are made visible to a particular type of memory access, they can be read or written by that type of memory access. Most synchronization commands in Vulkan define a memory dependency.

The specific memory accesses that are made available and visible are defined by the access scopes of a memory dependency. Any type of access that is in a memory dependency’s first access scope and occurs in ScopedOps₁ is made available. Any type of access that is in a memory dependency’s second access scope and occurs in ScopedOps₂ has any available writes made visible to it. Any type of operation that is not in a synchronization command’s access scopes will not be included in the resulting dependency.

A memory dependency enforces availability and visibility of memory accesses and execution order between two sets of operations. Adding to the description of execution dependency chains:

• Let MemOps₁ be the set of memory accesses performed by ScopedOps₁.
• Let MemOps₂ be the set of memory accesses performed by ScopedOps₂.
• Let AccessScope₁st be the first access scope of the first command in the Sync chain.
• Let AccessScope₂nd be the second access scope of the last command in the Sync chain.
• Let ScopedMemOps₁ be the intersection of sets MemOps₁ and AccessScope₁st.
• Let ScopedMemOps₂ be the intersection of sets MemOps₂ and AccessScope₂nd.
• Submitting Ops₁, Sync, and Ops₂ for execution, in that order, will result in a memory dependency MemDep between ScopedOps₁ and ScopedOps₂.
• Memory dependency MemDep guarantees that:
  ◦ Memory writes in ScopedMemOps₁ are made available.
  ◦ Available memory writes, including those from ScopedMemOps₁, are made visible to ScopedMemOps₂.

Note
Execution and memory dependencies are used to solve data hazards, i.e. to ensure that read and write operations occur in a well-defined order. Write-after-read hazards can be solved with just an execution dependency, but read-after-write and write-after-write hazards need appropriate memory dependencies to be included between them. If an application does not include dependencies to solve these hazards, the results and execution orders of memory accesses are undefined.

7.1.1. Image Layout Transitions
Image subresources can be transitioned from one layout to another as part of a memory dependency (e.g. by using an image memory barrier). When a layout transition is specified in a memory dependency, it happens-after the availability operations in the memory dependency, and happens-before the visibility operations. Image layout transitions may perform read and write
accesses on all memory bound to the image subresource range, so applications must ensure that all memory writes have been made available before a layout transition is executed. Available memory is automatically made visible to a layout transition, and writes performed by a layout transition are automatically made available.

Layout transitions always apply to a particular image subresource range, and specify both an old layout and new layout. The old layout must either be VK_IMAGE_LAYOUT_UNDEFINED, or match the current layout of the image subresource range. If the old layout matches the current layout of the image subresource range, the transition preserves the contents of that range. If the old layout is VK_IMAGE_LAYOUT_UNDEFINED, the contents of that range may be discarded.

Note
Image layout transitions with VK_IMAGE_LAYOUT_UNDEFINED allow the implementation to discard the image subresource range, which can provide performance or power benefits. Tile-based architectures may be able to avoid flushing tile data to memory, and immediate style renderers may be able to achieve fast metadata clears to reinitialize frame buffer compression state, or similar.

If the contents of an attachment are not needed after a render pass completes, then applications should use VK_ATTACHMENT_STORE_OP_DONT_CARE.

As image layout transitions may perform read and write accesses on the memory bound to the image, if the image subresource affected by the layout transition is bound to peer memory for any device in the current device mask then the memory heap the bound memory comes from must support the VK_PEER_MEMORY_FEATURE_GENERIC_SRC_BIT and VK_PEER_MEMORY_FEATURE_GENERIC_DST_BIT capabilities as returned by vkGetDeviceGroupPeerMemoryFeatures.

Note
Applications must ensure that layout transitions happen-after all operations accessing the image with the old layout, and happen-before any operations that will access the image with the new layout. Layout transitions are potentially read/write operations, so not defining appropriate memory dependencies to guarantee this will result in a data race.

Image layout transitions interact with memory aliasing.

Layout transitions that are performed via image memory barriers execute in their entirety in submission order, relative to other image layout transitions submitted to the same queue, including those performed by render passes. In effect there is an implicit execution dependency from each such layout transition to all layout transitions previously submitted to the same queue.

7.1.2. Pipeline Stages

The work performed by an action command consists of multiple operations, which are performed as a sequence of logically independent steps known as pipeline stages. The exact pipeline stages executed depend on the particular command that is used, and current command buffer state when the command was recorded.
Note

Operations performed by synchronization commands (e.g. availability and visibility operations) are not executed by a defined pipeline stage. However other commands can still synchronize with them by using the synchronization scopes to create a dependency chain.

Execution of operations across pipeline stages must adhere to implicit ordering guarantees, particularly including pipeline stage order. Otherwise, execution across pipeline stages may overlap or execute out of order with regards to other stages, unless otherwise enforced by an execution dependency.

Several of the synchronization commands include pipeline stage parameters, restricting the synchronization scopes for that command to just those stages. This allows fine grained control over the exact execution dependencies and accesses performed by action commands. Implementations should use these pipeline stages to avoid unnecessary stalls or cache flushing.

Bits which can be set in a VkPipelineStageFlags2 mask, specifying stages of execution, are:

```c
// Provided by VK_VERSION_1_3
// Flag bits for VkPipelineStageFlagBits2
typedef VkFlags64 VkPipelineStageFlagBits2;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_NONE = 0ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_NONE_KHR = 0ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_TOP_OF_PIPE_BIT = 0x00000001ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_TOP_OF_PIPE_BIT_KHR = 0x00000001ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT = 0x00000002ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT_KHR = 0x00000002ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT = 0x00000004ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT_KHR = 0x00000004ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT = 0x00000008ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT_KHR = 0x00000008ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT = 0x00000010ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT_KHR = 0x00000010ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT = 0x00000020ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT_KHR = 0x00000020ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT = 0x00000040ULL;
```

static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT_KHR = 0x00000040ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT_KHR = 0x00000080ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT_KHR = 0x00000080ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT_KHR = 0x00000100ULL;

// Provided by VK_KHR_ray_tracing_maintenance1 with VK_KHR_synchronization2
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR = 0x10000000ULL;

// Provided by VK_KHR_synchronization2
typedef VkPipelineStageFlagBits2 VkPipelineStageFlagBits2KHR;

• VK_PIPELINE_STAGE_2_NONE specifies no stages of execution.
• VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT specifies the stage of the pipeline where indirect command parameters are consumed.
• VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT specifies the stage of the pipeline where index buffers are consumed.
• VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT specifies the stage of the pipeline where vertex buffers are consumed.
• VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT specifies the vertex shader stage.
• VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT specifies the tessellation control shader stage.
• VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT specifies the tessellation evaluation shader stage.
• VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT specifies the geometry shader stage.
• **VK_PIPELINE_STAGE_2_PRE_RASTERIZATION_SHADERS_BIT** is equivalent to specifying all supported pre-rasterization shader stages:
  ◦ **VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT**
  ◦ **VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT**
  ◦ **VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT**
  ◦ **VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT**

• **VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT** specifies the fragment shader stage.

• **VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT** specifies the stage of the pipeline where early fragment tests (depth and stencil tests before fragment shading) are performed. This stage also includes **render pass operations** for framebuffer attachments with a depth/stencil format.

• **VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT** specifies the stage of the pipeline where late fragment tests (depth and stencil tests after fragment shading) are performed. This stage also includes **render pass store operations** for framebuffer attachments with a depth/stencil format.

• **VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT** specifies the stage of the pipeline where final color values are output from the pipeline. This stage includes **blending, logic operations, render pass load and store operations** for color attachments, **render pass multisample resolve operations**, and **vkCmdClearAttachments**.

• **VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT** specifies the compute shader stage.

• **VK_PIPELINE_STAGE_2_HOST_BIT** specifies a pseudo-stage indicating execution on the host of reads/writes of device memory. This stage is not invoked by any commands recorded in a command buffer.

• **VK_PIPELINE_STAGE_2_COPY_BIT** specifies the execution of all **copy commands**, including **vkCmdCopyQueryPoolResults**.

• **VK_PIPELINE_STAGE_2_BLIT_BIT** specifies the execution of **vkCmdBlitImage**.

• **VK_PIPELINE_STAGE_2_RESOLVE_BIT** specifies the execution of **vkCmdResolveImage**.

• **VK_PIPELINE_STAGE_2_CLEAR_BIT** specifies the execution of **clear commands**, with the exception of **vkCmdClearAttachments**.

• **VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT** is equivalent to specifying all of:
  ◦ **VK_PIPELINE_STAGE_2_COPY_BIT**
  ◦ **VK_PIPELINE_STAGE_2_BLIT_BIT**
  ◦ **VK_PIPELINE_STAGE_2_RESOLVE_BIT**
  ◦ **VK_PIPELINE_STAGE_2_CLEAR_BIT**
  ◦ **VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR**

• **VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR** specifies the execution of the ray tracing shader stages.

• **VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR** specifies the execution of acceleration structure commands or acceleration structure copy commands.

• **VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR** specifies the execution of acceleration structure copy commands.
• **VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT** specifies the execution of all graphics pipeline stages, and is equivalent to the logical OR of:
  
  ◦ **VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT**
  ◦ **VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT**
  ◦ **VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT**
  ◦ **VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT**
  ◦ **VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT**
  ◦ **VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT**
  ◦ **VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT**
  ◦ **VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT**
  ◦ **VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT**
  ◦ **VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT**
  ◦ **VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR**

• **VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT** specifies all operations performed by all commands supported on the queue it is used with.

• **VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR** specifies the stage of the pipeline where the fragment shading rate attachment is read to determine the fragment shading rate for portions of a rasterized primitive.

• **VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR** specifies the execution of video decode operations.

• **VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR** specifies the execution of video encode operations.

• **VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT** specifies the execution of micromap commands.

• **VK_PIPELINE_STAGE_2_TOP_OF_PIPE_BIT** is equivalent to **VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT** with VkAccessFlags2 set to 0 when specified in the second synchronization scope, but equivalent to **VK_PIPELINE_STAGE_2_NONE** in the first scope.

• **VK_PIPELINE_STAGE_2_BOTTOM_OF_PIPE_BIT** is equivalent to **VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT** with VkAccessFlags2 set to 0 when specified in the first synchronization scope, but equivalent to **VK_PIPELINE_STAGE_2_NONE** in the second scope.

**Note**

The **TOP** and **BOTTOM** pipeline stages are deprecated, and applications should prefer **VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT** and **VK_PIPELINE_STAGE_2_NONE**.

**Note**

The **VkPipelineStageFlags2** bitmask goes beyond the 31 individual bit flags allowable within a C99 enum, which is how **VkPipelineStageFlagBits** is defined. The first 31 values are common to both, and are interchangeable.

**VkPipelineStageFlags2** is a bitmask type for setting a mask of zero or more **VkPipelineStageFlagBits2** flags:
typedef VkFlags64 VkPipelineStageFlags2;

or the equivalent

typedef VkPipelineStageFlags2 VkPipelineStageFlags2KHR;

Bits which **can** be set in a `VkPipelineStageFlags` mask, specifying stages of execution, are:

```cpp
typedef enum VK_VERSION_1_0
    VkPipelineStageFlagBits {
    VK_PIPELINE_STAGE_TOP_OF_PIPE_BIT = 0x00000001,
    VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT = 0x00000002,
    VK_PIPELINE_STAGE_VERTEX_INPUT_BIT = 0x00000004,
    VK_PIPELINE_STAGE_VERTEX_SHADER_BIT = 0x00000008,
    VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT = 0x00000010,
    VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT = 0x00000020,
    VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT = 0x00000040,

    // Provided by VK_KHR_acceleration_structure
    VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR = 0x02000000,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR = 0x00200000,
    // Provided by VK_KHR_fragment_shading_rate
    VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR = 0x00400000,
    // Provided by VK_KHR_synchronization2
    VK_PIPELINE_STAGE_NONE_KHR = VK_PIPELINE_STAGE_NONE
    } VkPipelineStageFlagBits;
```

These values all have the same meaning as the equivalently named values for `VkPipelineStageFlags2`.

- **VK_PIPELINE_STAGE_NONE** specifies no stages of execution.
- **VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT** specifies the stage of the pipeline where `VkDrawIndirect*` / `VkDispatchIndirect*` / `VkTraceRaysIndirect*` data structures are consumed.
• **VK_PIPELINE_STAGE_VERTEX_INPUT_BIT** specifies the stage of the pipeline where vertex and index buffers are consumed.

• **VK_PIPELINE_STAGE_VERTEX_SHADER_BIT** specifies the vertex shader stage.

• **VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT** specifies the tessellation control shader stage.

• **VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT** specifies the tessellation evaluation shader stage.

• **VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT** specifies the geometry shader stage.

• **VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT** specifies the fragment shader stage.

• **VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT** specifies the stage of the pipeline where early fragment tests (depth and stencil tests before fragment shading) are performed. This stage also includes render pass load operations for framebuffer attachments with a depth/stencil format.

• **VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT** specifies the stage of the pipeline where late fragment tests (depth and stencil tests after fragment shading) are performed. This stage also includes render pass store operations for framebuffer attachments with a depth/stencil format.

• **VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT** specifies the stage of the pipeline after blending where the final color values are output from the pipeline. This stage includes blending, logic operations, render pass load and store operations for color attachments, render pass multisample resolve operations, and **vkCmdClearAttachments**.

• **VK_PIPELINE_STAGE_COMPUTE_SHADER_BIT** specifies the execution of a compute shader.

• **VK_PIPELINE_STAGE_TRANSFER_BIT** specifies the following commands:
  - All copy commands, including **vkCmdCopyQueryPoolResults**
  - **vkCmdBlitImage2** and **vkCmdBlitImage**
  - **vkCmdResolveImage2** and **vkCmdResolveImage**
  - All clear commands, with the exception of **vkCmdClearAttachments**

• **VK_PIPELINE_STAGE_HOST_BIT** specifies a pseudo-stage indicating execution on the host of reads/writes of device memory. This stage is not invoked by any commands recorded in a command buffer.

• **VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR** specifies the execution of **vkCmdBuildAccelerationStructuresKHR**, **vkCmdBuildAccelerationStructuresIndirectKHR**, **vkCmdCopyAccelerationStructureKHR**, **vkCmdCopyAccelerationStructureToMemoryKHR**, **vkCmdCopyMemoryToAccelerationStructureKHR**, and **vkCmdWriteAccelerationStructuresPropertiesKHR**.

• **VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR** specifies the execution of the ray tracing shader stages, via **vkCmdTraceRaysKHR**, or **vkCmdTraceRaysIndirectKHR**.

• **VK_PIPELINE_STAGE_ALL_GRAPHICS_BIT** specifies the execution of all graphics pipeline stages, and is equivalent to the logical OR of:
  - **VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT**
  - **VK_PIPELINE_STAGE_VERTEX_INPUT_BIT**
  - **VK_PIPELINE_STAGE_VERTEX_SHADER_BIT**
- VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT
- VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT
- VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT
- VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT
- VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT
- VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT
- VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT
- VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR
  - VK_PIPELINE_STAGE_ALL_COMMANDS_BIT specifies all operations performed by all commands supported on the queue it is used with.
  - VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR specifies the stage of the pipeline where the fragment shading rate attachment is read to determine the fragment shading rate for portions of a rasterized primitive.
  - VK_PIPELINE_STAGE_TOP_OF_PIPE_BIT is equivalent to VK_PIPELINE_STAGE_ALL_COMMANDS_BIT with VkAccessFlags set to 0 when specified in the second synchronization scope, but specifies no stage of execution when specified in the first scope.
  - VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT is equivalent to VK_PIPELINE_STAGE_ALL_COMMANDS_BIT with VkAccessFlags set to 0 when specified in the first synchronization scope, but specifies no stage of execution when specified in the second scope.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineStageFlags;
```

VkPipelineStageFlags is a bitmask type for setting a mask of zero or more VkPipelineStageFlagBits.

If a synchronization command includes a source stage mask, its first synchronization scope only includes execution of the pipeline stages specified in that mask and any logically earlier stages. Its first access scope only includes memory accesses performed by pipeline stages explicitly specified in the source stage mask.

If a synchronization command includes a destination stage mask, its second synchronization scope only includes execution of the pipeline stages specified in that mask and any logically later stages. Its second access scope only includes memory accesses performed by pipeline stages explicitly specified in the destination stage mask.

**Note**

Note that access scopes do not interact with the logically earlier or later stages for either scope - only the stages the app specifies are considered part of each access scope.

Certain pipeline stages are only available on queues that support a particular set of operations. The following table lists, for each pipeline stage flag, which queue capability flag must be supported by the queue. When multiple flags are enumerated in the second column of the table, it means that the
pipeline stage is supported on the queue if it supports any of the listed capability flags. For further details on queue capabilities see [Physical Device Enumeration](#) and [Queues](#).

**Table 3. Supported pipeline stage flags**

</tbody>
</table>

Pipeline stages that execute as a result of a command logically complete execution in a specific order, such that completion of a logically later pipeline stage must not happen-before completion of a logically earlier stage. This means that including any stage in the source stage mask for a particular synchronization command also implies that any logically earlier stages are included in Scope\textsubscript{1st} for that command.

Similarly, initiation of a logically earlier pipeline stage must not happen-after initiation of a logically later pipeline stage. Including any given stage in the destination stage mask for a particular synchronization command also implies that any logically later stages are included in Scope\textsubscript{2nd} for that command.

**Note**

Implementations may not support synchronization at every pipeline stage for every synchronization operation. If a pipeline stage that an implementation does not support synchronization for appears in a source stage mask, it may substitute any logically later stage in its place for the first synchronization scope. If a pipeline stage that an implementation does not support synchronization for appears in a destination stage mask, it may substitute any logically earlier stage in its place for the second synchronization scope.

For example, if an implementation is unable to signal an event immediately after vertex shader execution is complete, it may instead signal the event after color attachment output has completed.

If an implementation makes such a substitution, it must not affect the semantics of execution or memory dependencies or image and buffer memory barriers.

**Graphics pipelines** are executable on queues supporting \texttt{VK_QUEUE_GRAPHICS_BIT}. Stages executed by graphics pipelines can only be specified in commands recorded for queues supporting \texttt{VK_QUEUE_GRAPHICS_BIT}.

The graphics pipeline executes the following stages, with the logical ordering of the stages matching the order specified here:
• VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT
• VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT
• VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT
• VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT
• VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT
• VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT
• VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT
• VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR
• VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT
• VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT
• VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT
• VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT

For the compute pipeline, the following stages occur in this order:

• VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT
• VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT

For the transfer pipeline, the following stages occur in this order:

• VK_PIPELINE_STAGE_2_TRANSFER_BIT

For host operations, only one pipeline stage occurs, so no order is guaranteed:

• VK_PIPELINE_STAGE_2_HOST_BIT

For acceleration structure build operations, only one pipeline stage occurs, so no order is guaranteed:

• VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR

For acceleration structure copy operations, only one pipeline stage occurs, so no order is guaranteed:

• VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR

For opacity micromap build operations, only one pipeline stage occurs, so no order is guaranteed:

• VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT

For the ray tracing pipeline, the following stages occur in this order:

• VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT
• VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR

For the video decode pipeline, the following stages occur in this order:
For the video encode pipeline, the following stages occur in this order:

- VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR

### 7.1.3. Access Types

Memory in Vulkan can be accessed from within shader invocations and via some fixed-function stages of the pipeline. The access type is a function of the descriptor type used, or how a fixed-function stage accesses memory.

Some synchronization commands take sets of access types as parameters to define the access scopes of a memory dependency. If a synchronization command includes a source access mask, its first access scope only includes accesses via the access types specified in that mask. Similarly, if a synchronization command includes a destination access mask, its second access scope only includes accesses via the access types specified in that mask.

Bits which can be set in the `srcAccessMask` and `dstAccessMask` members of `VkMemoryBarrier2KHR`, `VkImageMemoryBarrier2KHR`, and `VkBufferMemoryBarrier2KHR`, specifying access behavior, are:

```c
// Provided by VK_VERSION_1_3
// Flag bits for VkAccessFlagBits2
typedef VkFlags64 VkAccessFlagBits2;
static const VkAccessFlagBits2 VK_ACCESS_2_NONE = 0ULL;

or the equivalent

// Provided by VK_KHR_synchronization2
typedef VkAccessFlagBits2 VkAccessFlagBits2KHR;

- **VK_ACCESS_2_NONE** specifies no accesses.
- **VK_ACCESS_2_MEMORY_READ_BIT** specifies all read accesses. It is always valid in any access mask, and is treated as equivalent to setting all READ access flags that are valid where it is used.
- **VK_ACCESS_2_MEMORY_WRITE_BIT** specifies all write accesses. It is always valid in any access mask,
and is treated as equivalent to setting all WRITE access flags that are valid where it is used.

- **VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT** specifies read access to command data read from indirect buffers as part of an indirect build, trace, drawing or dispatch command. Such access occurs in the **VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT** pipeline stage.

- **VK_ACCESS_2_INDEX_READ_BIT** specifies read access to an index buffer as part of an indexed drawing command, bound by `vkCmdBindIndexBuffer2KHR` and `vkCmdBindIndexBuffer`. Such access occurs in the **VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT** pipeline stage.

- **VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT** specifies read access to a vertex buffer as part of a drawing command, bound by `vkCmdBindVertexBuffers`. Such access occurs in the **VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT** pipeline stage.

- **VK_ACCESS_2_UNIFORM_READ_BIT** specifies read access to a uniform buffer in any shader pipeline stage.

- **VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT** specifies read access to an input attachment within a render pass during fragment shading. Such access occurs in the **VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT** pipeline stage.

- **VK_ACCESS_2_SHADER_SAMPLED_READ_BIT** specifies read access to a uniform texel buffer or sampled image in any shader pipeline stage.

- **VK_ACCESS_2_SHADER_STORAGE_READ_BIT** specifies read access to a storage buffer, physical storage buffer, storage texel buffer, or storage image in any shader pipeline stage.

- **VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR** specifies read access to a shader binding table in any shader pipeline stage.

- **VK_ACCESS_2_SHADER_READ_BIT** is equivalent to the logical OR of:
  - **VK_ACCESS_2_SHADER_SAMPLED_READ_BIT**
  - **VK_ACCESS_2_SHADER_STORAGE_READ_BIT**
  - **VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR**

- **VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT** specifies write access to a storage buffer, physical storage buffer, storage texel buffer, or storage image in any shader pipeline stage.

- **VK_ACCESS_2_SHADER_WRITE_BIT** is equivalent to **VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT**.

- **VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT** specifies read access to a color attachment, such as via blending, logic operations or certain render pass load operations in the **VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT** pipeline stage or via fragment shader tile image reads in the **VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT** pipeline stage.

- **VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT** specifies write access to a color attachment during a render pass or via certain render pass load, store, and multisample resolve operations. Such access occurs in the **VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT** pipeline stage.

- **VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT** specifies read access to a depth/stencil attachment, via depth or stencil operations or certain render pass load operations in the **VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT** or **VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT** pipeline stages or via fragment shader tile image reads in the **VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT** pipeline stage.

- **VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT** specifies write access to a depth/stencil attachment, via depth or stencil operations or certain render pass load operations in the **VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT** or **VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT** pipeline stages or via fragment shader tile image reads in the **VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT** pipeline stage.
attachment, via depth or stencil operations or certain render pass load and store operations. Such access occurs in the VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT or VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT pipeline stages.

- **VK_ACCESS_2_TRANSFER_READ_BIT** specifies read access to an image or buffer in a copy operation. Such access occurs in the VK_PIPELINE_STAGE_2_COPY_BIT, VK_PIPELINE_STAGE_2_BLIT_BIT, or VK_PIPELINE_STAGE_2_RESOLVE_BIT pipeline stages.

- **VK_ACCESS_2_TRANSFER_WRITE_BIT** specifies write access to an image or buffer in a clear or copy operation. Such access occurs in the VK_PIPELINE_STAGE_2_COPY_BIT, VK_PIPELINE_STAGE_2_BLIT_BIT, VK_PIPELINE_STAGE_2_CLEAR_BIT, or VK_PIPELINE_STAGE_2_RESOLVE_BIT pipeline stages.

- **VK_ACCESS_2_HOST_READ_BIT** specifies read access by a host operation. Accesses of this type are not performed through a resource, but directly on memory. Such access occurs in the VK_PIPELINE_STAGE_2_HOST_BIT pipeline stage.

- **VK_ACCESS_2_HOST_WRITE_BIT** specifies write access by a host operation. Accesses of this type are not performed through a resource, but directly on memory. Such access occurs in the VK_PIPELINE_STAGE_2_HOST_BIT pipeline stage.

- **VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR** specifies read access to an acceleration structure as part of a trace, build, or copy command, or to an acceleration structure scratch buffer as part of a build command. Such access occurs in the VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR or VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage.

- **VK_ACCESS_2_ACCELERATION_STRUCTURE_WRITE_BIT_KHR** specifies write access to an acceleration structure or acceleration structure scratch buffer as part of a build or copy command. Such access occurs in the VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage.

- **VK_ACCESS_2_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR** specifies read access to a fragment shading rate attachment during rasterization. Such access occurs in the VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR pipeline stage.

- **VK_ACCESS_2_VIDEO_DECODE_READ_BIT_KHR** specifies read access to an image or buffer resource in a video decode operation. Such access occurs in the VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR pipeline stage.

- **VK_ACCESS_2_VIDEO_DECODE_WRITE_BIT_KHR** specifies write access to an image or buffer resource in a video decode operation. Such access occurs in the VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR pipeline stage.

- **VK_ACCESS_2_VIDEO_ENCODE_READ_BIT_KHR** specifies read access to an image or buffer resource in a video encode operation. Such access occurs in the VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR pipeline stage.

- **VK_ACCESS_2_VIDEO_ENCODE_WRITE_BIT_KHR** specifies write access to an image or buffer resource in a video encode operation. Such access occurs in the VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR pipeline stage.

- **VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT** specifies write access to a micromap object. Such access occurs in the VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT pipeline stage.

- **VK_ACCESS_2_MICROMAP_READ_BIT_EXT** specifies read access to a micromap object. Such access occurs in the VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT pipeline stage.
Note
In situations where an application wishes to select all access types for a given set of pipeline stages, `VK_ACCESS_2_MEMORY_READ_BIT` or `VK_ACCESS_2_MEMORY_WRITE_BIT` can be used. This is particularly useful when specifying stages that only have a single access type.

Note
The `VkAccessFlags2` bitmask goes beyond the 31 individual bit flags allowable within a C99 enum, which is how `VkAccessFlagBits` is defined. The first 31 values are common to both, and are interchangeable.

`VkAccessFlags2` is a bitmask type for setting a mask of zero or more `VkAccessFlagBits2`:

```c
// Provided by VK_VERSION_1_3
typedef VkFlags64 VkAccessFlags2;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkAccessFlags2 VkAccessFlags2KHR;
```

Bits which **can** be set in the `srcAccessMask` and `dstAccessMask` members of `VkSubpassDependency`, `VkSubpassDependency2`, `VkMemoryBarrier`, `VkBufferMemoryBarrier`, and `VkImageMemoryBarrier`, specifying access behavior, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkAccessFlagBits {
    VK_ACCESS_INDIRECT_COMMAND_READ_BIT = 0x00000001,
    VK_ACCESS_INDEX_READ_BIT = 0x00000002,
    VK_ACCESS_VERTEX_ATTRIBUTE_READ_BIT = 0x00000004,
    VK_ACCESS_UNIFORM_READ_BIT = 0x00000008,
    VK_ACCESS_INPUT_ATTACHMENT_READ_BIT = 0x00000010,
    VK_ACCESS_SHADER_READ_BIT = 0x00000020,
    VK_ACCESS_SHADER_WRITE_BIT = 0x00000040,
    VK_ACCESS_COLOR_ATTACHMENT_READ_BIT = 0x00000080,
    VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT = 0x00000100,
    VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT = 0x00000200,
    VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT = 0x00000400,
    VK_ACCESS_TRANSFER_READ_BIT = 0x00000800,
    VK_ACCESS_TRANSFER_WRITE_BIT = 0x00001000,
    VK_ACCESS_HOST_READ_BIT = 0x00002000,
    VK_ACCESS_HOST_WRITE_BIT = 0x00004000,
    VK_ACCESS_MEMORY_READ_BIT = 0x00008000,
    VK_ACCESS_MEMORY_WRITE_BIT = 0x00010000,
```

---

`VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stages.
These values all have the same meaning as the equivalently named values for `VkAccessFlags2`.

- **VK_ACCESS_NONE** specifies no accesses.
- **VK_ACCESS_MEMORY_READ_BIT** specifies all read accesses. It is always valid in any access mask, and is treated as equivalent to setting all `READ` access flags that are valid where it is used.
- **VK_ACCESS_MEMORY_WRITE_BIT** specifies all write accesses. It is always valid in any access mask, and is treated as equivalent to setting all `WRITE` access flags that are valid where it is used.
- **VK_ACCESS_INDIRECT_COMMAND_READ_BIT** specifies read access to indirect command data read as part of an indirect build, trace, drawing or dispatching command. Such access occurs in the `VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT` pipeline stage.
- **VK_ACCESS_INDEX_READ_BIT** specifies read access to an index buffer as part of an indexed drawing command, bound by `vkCmdBindIndexBuffer2KHR` and `vkCmdBindIndexBuffer`. Such access occurs in the `VK_PIPELINE_STAGE_VERTEX_INPUT_BIT` pipeline stage.
- **VK_ACCESS_VERTEX_ATTRIBUTE_READ_BIT** specifies read access to a vertex buffer as part of a drawing command, bound by `vkCmdBindVertexBuffers`. Such access occurs in the `VK_PIPELINE_STAGE_VERTEX_INPUT_BIT` pipeline stage.
- **VK_ACCESS_UNIFORM_READ_BIT** specifies read access to a uniform buffer in any shader pipeline stage.
- **VK_ACCESS_INPUT_ATTACHMENT_READ_BIT** specifies read access to an input attachment within a render pass during fragment shading. Such access occurs in the `VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT` pipeline stage.
- **VK_ACCESS_SHADER_READ_BIT** specifies read access to a uniform texel buffer, sampled image, storage buffer, physical storage buffer, shader binding table, storage texel buffer, or storage image in any shader pipeline stage.
- **VK_ACCESS_SHADER_WRITE_BIT** specifies write access to a storage buffer, physical storage buffer, storage texel buffer, or storage image in any shader pipeline stage.
- **VK_ACCESS_COLOR_ATTACHMENT_READ_BIT** specifies read access to a color attachment, such as via blending, logic operations or certain render pass load operations in the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage or via fragment shader tile image reads in the `VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT` pipeline stage.
- **VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT** specifies write access to a color, resolve, or depth/stencil resolve attachment during a render pass or via certain render pass load and store operations.
Such access occurs in the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage.

- **VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT** specifies read access to a depth/stencil attachment, via depth or stencil operations or certain render pass load operations in the `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT` or `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT` pipeline stages or via fragment shader tile image reads in the `VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT` pipeline stage.

- **VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT** specifies write access to a depth/stencil attachment, via depth or stencil operations or certain render pass load and store operations. Such access occurs in the `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT` or `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT` pipeline stages.

- **VK_ACCESS_TRANSFER_READ_BIT** specifies read access to an image or buffer in a copy operation. Such access occurs in the `VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT` pipeline stage.

- **VK_ACCESS_TRANSFER_WRITE_BIT** specifies write access to an image or buffer in a clear or copy operation. Such access occurs in the `VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT` pipeline stage.

- **VK_ACCESS_HOST_READ_BIT** specifies read access by a host operation. Accesses of this type are not performed through a resource, but directly on memory. Such access occurs in the `VK_PIPELINE_STAGE_HOST_BIT` pipeline stage.

- **VK_ACCESS_HOST_WRITE_BIT** specifies write access by a host operation. Accesses of this type are not performed through a resource, but directly on memory. Such access occurs in the `VK_PIPELINE_STAGE_HOST_BIT` pipeline stage.

- **VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR** specifies read access to an acceleration structure as part of a trace, build, or copy command, or to an acceleration structure scratch buffer as part of a build command. Such access occurs in the `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR` pipeline stage or `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage.

- **VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR** specifies write access to an acceleration structure or acceleration structure scratch buffer as part of a build or copy command. Such access occurs in the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage.

- **VK_ACCESS_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR** specifies read access to a fragment shading rate attachment during rasterization. Such access occurs in the `VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT_KHR` pipeline stage.

Certain access types are only performed by a subset of pipeline stages. Any synchronization command that takes both stage masks and access masks uses both to define the access scopes - only the specified access types performed by the specified stages are included in the access scope. An application must not specify an access flag in a synchronization command if it does not include a pipeline stage in the corresponding stage mask that is able to perform accesses of that type. The following table lists, for each access flag, which pipeline stages can perform that type of access.

**Table 4. Supported access types**

// Provided by VK_VERSION_1_0
typedef VkFlags VkAccessFlags;

VkAccessFlags is a bitmask type for setting a mask of zero or more VkAccessFlagBits.

If a memory object does not have the VK_MEMORY_PROPERTY_HOST_COHERENT_BIT property, then vkFlushMappedMemoryRanges must be called in order to guarantee that writes to the memory object from the host are made available to the host domain, where they can be further made available to the device domain via a domain operation. Similarly, vkInvalidateMappedMemoryRanges must be called to guarantee that writes which are available to the host domain are made visible to host operations.

If the memory object does have the VK_MEMORY_PROPERTY_HOST_COHERENT_BIT property flag, writes to the memory object from the host are automatically made available to the host domain. Similarly, writes made available to the host domain are automatically made visible to the host.

Note
Queue submission commands automatically perform a domain operation from host to device for all writes performed before the command executes, so in most cases an explicit memory barrier is not needed for this case. In the few circumstances where a submit does not occur between the host write and the device read access, writes can be made available by using an explicit memory barrier.

7.1.4. Framebuffer Region Dependencies

Pipeline stages that operate on, or with respect to, the framebuffer are collectively the framebuffer-space pipeline stages. These stages are:

- VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT
- VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT
For these pipeline stages, an execution or memory dependency from the first set of operations to the second set can either be a single framebuffer-global dependency, or split into multiple framebuffer-local dependencies. A dependency with non-framebuffer-space pipeline stages is neither framebuffer-global nor framebuffer-local.

A framebuffer region is a set of sample (x, y, layer, sample) coordinates that is a subset of the entire framebuffer.

Both synchronization scopes of a framebuffer-local dependency include only the operations performed within corresponding framebuffer regions (as defined below). No ordering guarantees are made between different framebuffer regions for a framebuffer-local dependency.

Both synchronization scopes of a framebuffer-global dependency include operations on all framebuffer-regions.

If the first synchronization scope includes operations on pixels/fragments with N samples and the second synchronization scope includes operations on pixels/fragments with M samples, where N does not equal M, then a framebuffer region containing all samples at a given (x, y, layer) coordinate in the first synchronization scope corresponds to a region containing all samples at the same coordinate in the second synchronization scope. In other words, it is a pixel granularity dependency. If N equals M, then a framebuffer region containing a single (x, y, layer, sample) coordinate in the first synchronization scope corresponds to a region containing the same sample at the same coordinate in the second synchronization scope. In other words, it is a sample granularity dependency.

Note
Since fragment shader invocations are not specified to run in any particular groupings, the size of a framebuffer region is implementation-dependent, not known to the application, and must be assumed to be no larger than specified above.

Note
Practically, the pixel vs. sample granularity dependency means that if an input attachment has a different number of samples than the pipeline's rasterizationSamples, then a fragment can access any sample in the input attachment's pixel even if it only uses framebuffer-local dependencies. If the input attachment has the same number of samples, then the fragment can only access the covered samples in its input SampleMask (i.e. the fragment operations happen-after a framebuffer-local dependency for each sample the fragment covers). To access samples that are not covered, a framebuffer-global dependency is required.

If a synchronization command includes a dependencyFlags parameter, and specifies the VK_DEPENDENCY_BY_REGION_BIT flag, then it defines framebuffer-local dependencies for the framebuffer-space pipeline stages in that synchronization command, for all framebuffer regions. If no dependencyFlags parameter is included, or the VK_DEPENDENCY_BY_REGION_BIT flag is not specified,
then a framebuffer-global dependency is specified for those stages. The `VK_DEPENDENCY_BY_REGION_BIT` flag does not affect the dependencies between non-framebuffer-space pipeline stages, nor does it affect the dependencies between framebuffer-space and non-framebuffer-space pipeline stages.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>Framebuffer-local dependencies are more efficient for most architectures; particularly tile-based architectures - which can keep framebuffer-regions entirely in on-chip registers and thus avoid external bandwidth across such a dependency. Including a framebuffer-global dependency in your rendering will usually force all implementations to flush data to memory, or to a higher level cache, breaking any potential locality optimizations.</td>
</tr>
</tbody>
</table>

### 7.1.5. View-Local Dependencies

In a render pass instance that has `multiview` enabled, dependencies can be either view-local or view-global.

A view-local dependency only includes operations from a single source view from the source subpass in the first synchronization scope, and only includes operations from a single destination view from the destination subpass in the second synchronization scope. A view-global dependency includes all views in the view mask of the source and destination subpasses in the corresponding synchronization scopes.

If a synchronization command includes a `dependencyFlags` parameter and specifies the `VK_DEPENDENCY_VIEW_LOCAL_BIT` flag, then it defines view-local dependencies for that synchronization command, for all views. If no `dependencyFlags` parameter is included or the `VK_DEPENDENCY_VIEW_LOCAL_BIT` flag is not specified, then a view-global dependency is specified.

### 7.1.6. Device-Local Dependencies

Dependencies can be either device-local or non-device-local. A device-local dependency acts as multiple separate dependencies, one for each physical device that executes the synchronization command, where each dependency only includes operations from that physical device in both synchronization scopes. A non-device-local dependency is a single dependency where both synchronization scopes include operations from all physical devices that participate in the synchronization command. For subpass dependencies, all physical devices in the `VkDeviceGroupRenderPassBeginInfo::deviceMask` participate in the dependency, and for pipeline barriers all physical devices that are set in the command buffer's current device mask participate in the dependency.

If a synchronization command includes a `dependencyFlags` parameter and specifies the `VK_DEPENDENCY_DEVICE_GROUP_BIT` flag, then it defines a non-device-local dependency for that synchronization command. If no `dependencyFlags` parameter is included or the `VK_DEPENDENCY_DEVICE_GROUP_BIT` flag is not specified, then it defines device-local dependencies for that synchronization command, for all participating physical devices.

Semaphore and event dependencies are device-local and only execute on the one physical device
7.2. Implicit Synchronization Guarantees

A small number of implicit ordering guarantees are provided by Vulkan, ensuring that the order in which commands are submitted is meaningful, and avoiding unnecessary complexity in common operations.

Submission order is a fundamental ordering in Vulkan, giving meaning to the order in which action and synchronization commands are recorded and submitted to a single queue. Explicit and implicit ordering guarantees between commands in Vulkan all work on the premise that this ordering is meaningful. This order does not itself define any execution or memory dependencies; synchronization commands and other orderings within the API use this ordering to define their scopes.

Submission order for any given set of commands is based on the order in which they were recorded to command buffers and then submitted. This order is determined as follows:

1. The initial order is determined by the order in which `vkQueueSubmit` and `vkQueueSubmit2` commands are executed on the host, for a single queue, from first to last.

2. The order in which `VkSubmitInfo` structures are specified in the `pSubmits` parameter of `vkQueueSubmit`, or in which `VkSubmitInfo2` structures are specified in the `pSubmits` parameter of `vkQueueSubmit2`, from lowest index to highest.

3. The order in which command buffers are specified in the `pCommandBuffers` member of `VkSubmitInfo` or `VkSubmitInfo2` from lowest index to highest.

4. The order in which commands were recorded to a command buffer on the host, from first to last:
   - For commands recorded outside a render pass, this includes all other commands recorded outside a render pass, including `vkCmdBeginRenderPass` and `vkCmdEndRenderPass` commands; it does not directly include commands inside a render pass.
   - For commands recorded inside a render pass, this includes all other commands recorded inside the same subpass, including the `vkCmdBeginRenderPass` and `vkCmdEndRenderPass` commands that delimit the same render pass instance; it does not include commands recorded to other subpasses. State commands do not execute any operations on the device, instead they set the state of the command buffer when they execute on the host, in the order that they are recorded. Action commands consume the current state of the command buffer when they are recorded, and will execute state changes on the device as required to match the recorded state.

The order of primitives passing through the graphics pipeline and image layout transitions as part of an image memory barrier provide additional guarantees based on submission order.

Execution of pipeline stages within a given command also has a loose ordering, dependent only on a single command.

Signal operation order is a fundamental ordering in Vulkan, giving meaning to the order in which semaphore and fence signal operations occur when submitted to a single queue. The signal...
operation order for queue operations is determined as follows:

1. The initial order is determined by the order in which \texttt{vkQueueSubmit} and \texttt{vkQueueSubmit2} commands are executed on the host, for a single queue, from first to last.

2. The order in which \texttt{VkSubmitInfo} structures are specified in the \texttt{pSubmits} parameter of \texttt{vkQueueSubmit}, or in which \texttt{VkSubmitInfo2} structures are specified in the \texttt{pSubmits} parameter of \texttt{vkQueueSubmit2}, from lowest index to highest.

3. The fence signal operation defined by the \texttt{fence} parameter of a \texttt{vkQueueSubmit} or \texttt{vkQueueSubmit2} or \texttt{vkQueueBindSparse} command is ordered after all semaphore signal operations defined by that command.

Semaphore signal operations defined by a single \texttt{VkSubmitInfo} or \texttt{VkSubmitInfo2} or \texttt{VkBindSparseInfo} structure are unordered with respect to other semaphore signal operations defined within the same structure.

The \texttt{vkSignalSemaphore} command does not execute on a queue but instead performs the signal operation from the host. The semaphore signal operation defined by executing a \texttt{vkSignalSemaphore} command happens-after the \texttt{vkSignalSemaphore} command is invoked and happens-before the command returns.

\textit{Note}

When signaling timeline semaphores, it is the responsibility of the application to ensure that they are ordered such that the semaphore value is strictly increasing. Because the first synchronization scope for a semaphore signal operation contains all semaphore signal operations which occur earlier in submission order, all semaphore signal operations contained in any given batch are guaranteed to happen-after all semaphore signal operations contained in any previous batches. However, no ordering guarantee is provided between the semaphore signal operations defined within a single batch. This, combined with the requirement that timeline semaphore values strictly increase, means that it is invalid to signal the same timeline semaphore twice within a single batch.

If an application wishes to ensure that some semaphore signal operation happens-after some other semaphore signal operation, it can submit a separate batch containing only semaphore signal operations, which will happen-after the semaphore signal operations in any earlier batches.

When signaling a semaphore from the host, the only ordering guarantee is that the signal operation happens-after when \texttt{vkSignalSemaphore} is called and happens-before it returns. Therefore, it is invalid to call \texttt{vkSignalSemaphore} while there are any outstanding signal operations on that semaphore from any queue submissions unless those queue submissions have some dependency which ensures that they happen-after the host signal operation. One example of this would be if the pending signal operation is, itself, waiting on the same semaphore at a lower value and the call to \texttt{vkSignalSemaphore} signals that lower value. Furthermore, if there are two or more processes or threads signaling the same timeline semaphore from the host, the application must ensure that the \texttt{vkSignalSemaphore} with the lower semaphore value returns before \texttt{vkSignalSemaphore} is called with the higher value.
7.3. Fences

Fences are a synchronization primitive that can be used to insert a dependency from a queue to the host. Fences have two states - signaled and unsignaled. A fence can be signaled as part of the execution of a queue submission command. Fences can be unsignaled on the host with vkResetFences. Fences can be waited on by the host with the vkWaitForFences command, and the current state can be queried with vkGetFenceStatus.

The internal data of a fence may include a reference to any resources and pending work associated with signal or unsignal operations performed on that fence object, collectively referred to as the fence’s payload. Mechanisms to import and export that internal data to and from fences are provided below. These mechanisms indirectly enable applications to share fence state between two or more fences and other synchronization primitives across process and API boundaries.

Fences are represented by VkFence handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkFence)
```

To create a fence, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateFence(  
  VkDevice device,  
  const VkFenceCreateInfo* pCreateInfo,  
  const VkAllocationCallbacks* pAllocator,  
  VkFence* pFence);
```

- `device` is the logical device that creates the fence.
- `pCreateInfo` is a pointer to a VkFenceCreateInfo structure containing information about how the fence is to be created.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pFence` is a pointer to a handle in which the resulting fence object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateFence-device-parameter
  device must be a valid VkDevice handle
- VUID-vkCreateFence-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkFenceCreateInfo structure
- VUID-vkCreateFence-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateFence-pFence-parameter
**pFence** must be a valid pointer to a **VkFence** handle

---

### Return Codes

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

---

The **VkFenceCreateInfo** structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkFenceCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkFenceCreateFlags flags;
} VkFenceCreateInfo;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is a bitmask of **VkFenceCreateFlagBits** specifying the initial state and behavior of the fence.

---

### Valid Usage (Implicit)

- **VUID-VkFenceCreateInfo-sType-sType**
  - **sType** must be **VK_STRUCTURE_TYPE_FENCE_CREATE_INFO**

- **VUID-VkFenceCreateInfo-pNext-pNext**
  - Each **pNext** member of any structure (including this one) in the **pNext** chain must be either **NULL** or a pointer to a valid instance of **VkExportFenceCreateInfo** or **VkExportFenceWin32HandleInfoKHR**

- **VUID-VkFenceCreateInfo-sType-unique**
  - The **sType** value of each struct in the **pNext** chain must be unique

- **VUID-VkFenceCreateInfo-flags-parameter**
  - **flags** must be a valid combination of **VkFenceCreateFlagBits** values

---

```c
// Provided by VK_VERSION_1_0
typedef enum VkFenceCreateFlagBits {
    VK_FENCE_CREATE_SIGNALED_BIT = 0x00000001,
    // Other values...
} VkFenceCreateFlagBits;
```
VkFenceCreateFlagBits specifies that the fence object is created in the signaled state. Otherwise, it is created in the unsignaled state.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkFenceCreateFlags;
```

VkFenceCreateFlags is a bitmask type for setting a mask of zero or more VkFenceCreateFlagBits.

To create a fence whose payload can be exported to external handles, add a VkExportFenceCreateInfo structure to the pNext chain of the VkFenceCreateInfo structure. The VkExportFenceCreateInfo structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkExportFenceCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkExternalFenceHandleTypeFlags handleTypes;
} VkExportFenceCreateInfo;
```

or the equivalent

```
// Provided by VK_KHR_external_fence
typedef VkExportFenceCreateInfo VkExportFenceCreateInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- handleTypes is a bitmask of VkExternalFenceHandleTypeFlagBits specifying one or more fence handle types the application can export from the resulting fence. The application can request multiple handle types for the same fence.

### Valid Usage

- VUID-VkExportFenceCreateInfo-handleTypes-01446
  The bits in handleTypes must be supported and compatible, as reported by VkExternalFenceProperties

### Valid Usage (Implicit)

- VUID-VkExportFenceCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_EXPORT_FENCE_CREATE_INFO

- VUID-VkExportFenceCreateInfo-handleTypes-parameter

245
handleTypes must be a valid combination of VkExternalFenceHandleTypeFlagBits values

To specify additional attributes of NT handles exported from a fence, add a VkExportFenceWin32HandleInfoKHR structure to the pNext chain of the VkFenceCreateInfo structure. The VkExportFenceWin32HandleInfoKHR structure is defined as:

```
// Provided by VK_KHR_external_fence_win32
typedef struct VkExportFenceWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const SECURITY_ATTRIBUTES* pAttributes;
    DWORD dwAccess;
    LPCWSTR name;
} VkExportFenceWin32HandleInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **pAttributes** is a pointer to a Windows SECURITY_ATTRIBUTES structure specifying security attributes of the handle.
- **dwAccess** is a DWORD specifying access rights of the handle.
- **name** is a null-terminated UTF-16 string to associate with the underlying synchronization primitive referenced by NT handles exported from the created fence.

If VkExportFenceCreateInfo is not included in the same pNext chain, this structure is ignored.

If VkExportFenceCreateInfo is included in the pNext chain of VkFenceCreateInfo with a Windows handleType, but either VkExportFenceWin32HandleInfoKHR is not included in the pNext chain, or it is included but pAttributes is set to NULL, default security descriptor values will be used, and child processes created by the application will not inherit the handle, as described in the MSDN documentation for “Synchronization Object Security and Access Rights”. Further, if the structure is not present, the access rights will be DXGI_SHARED_RESOURCE_READ | DXGI_SHARED_RESOURCE_WRITE

for handles of the following types:

VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT

1

**Valid Usage**

- VUID-VkExportFenceWin32HandleInfoKHR-handleTypes-01447
  If VkExportFenceCreateInfo::handleTypes does not include
VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT, a VkExportFenceWin32HandleInfoKHR structure must not be included in the pNext chain of VkFenceCreateInfo

Valid Usage (Implicit)

- VUID-VkExportFenceWin32HandleInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_EXPORT_FENCE_WIN32_HANDLE_INFO_KHR

- VUID-VkExportFenceWin32HandleInfoKHR-pAttributes-parameter
  If pAttributes is not NULL, pAttributes must be a valid pointer to a valid SECURITY_ATTRIBUTES value

To export a Windows handle representing the state of a fence, call:

```c
// Provided by VK_KHR_external_fence_win32
VkResult vkGetFenceWin32HandleKHR(
    VkDevice device,
    const VkFenceGetWin32HandleInfoKHR* pGetWin32HandleInfo,
    HANDLE* pHandle);
```

- `device` is the logical device that created the fence being exported.
- `pGetWin32HandleInfo` is a pointer to a VkFenceGetWin32HandleInfoKHR structure containing parameters of the export operation.
- `pHandle` will return the Windows handle representing the fence state.

For handle types defined as NT handles, the handles returned by `vkGetFenceWin32HandleKHR` are owned by the application. To avoid leaking resources, the application must release ownership of them using the `CloseHandle` system call when they are no longer needed.

Exporting a Windows handle from a fence may have side effects depending on the transference of the specified handle type, as described in Importing Fence Payloads.

Valid Usage (Implicit)

- VUID-vkGetFenceWin32HandleKHR-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkGetFenceWin32HandleKHR-pGetWin32HandleInfo-parameter
  `pGetWin32HandleInfo` must be a valid pointer to a valid `VkFenceGetWin32HandleInfoKHR` structure

- VUID-vkGetFenceWin32HandleKHR-pHandle-parameter
  `pHandle` must be a valid pointer to a HANDLE value
Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_OUT_OF_HOST_MEMORY

The `VkFenceGetWin32HandleInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_fence_win32
typedef struct VkFenceGetWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkFence fence;
    VkExternalFenceHandleTypeFlagBits handleType;
} VkFenceGetWin32HandleInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `fence` is the fence from which state will be exported.
- `handleType` is a `VkExternalFenceHandleTypeFlagBits` value specifying the type of handle requested.

The properties of the handle returned depend on the value of `handleType`. See `VkExternalFenceHandleTypeFlagBits` for a description of the properties of the defined external fence handle types.

**Valid Usage**

- VUID-VkFenceGetWin32HandleInfoKHR-handleType-01448
  handleType must have been included in `VkExportFenceCreateInfo::handleTypes` when the fence’s current payload was created

- VUID-VkFenceGetWin32HandleInfoKHR-handleType-01449
  If `handleType` is defined as an NT handle, `vkGetFenceWin32HandleKHR` must be called no more than once for each valid unique combination of `fence` and `handleType`

- VUID-VkFenceGetWin32HandleInfoKHR-fence-01450
  `fence` must not currently have its payload replaced by an imported payload as described below in Importing Fence Payloads unless that imported payload’s handle type was included in `VkExternalFenceProperties::exportFromImportedHandleTypes` for `handleType`

- VUID-VkFenceGetWin32HandleInfoKHR-handleType-01451
  If `handleType` refers to a handle type with copy payload transference semantics, `fence` must be signaled, or have an associated fence signal operation pending execution
Valid Usage (Implicit)

- **VUID-VkFenceGetWin32HandleInfoKHR-handleType** handleType must be defined as an NT handle or a global share handle

- **VUID-VkFenceGetWin32HandleInfoKHR-sType** sType must be VK_STRUCTURE_TYPE_FENCE_GET_WIN32_HANDLE_INFO_KHR

- **VUID-VkFenceGetWin32HandleInfoKHR-pNext** pNext must be NULL

- **VUID-VkFenceGetWin32HandleInfoKHR-fence** fence must be a valid VkFence handle

- **VUID-VkFenceGetWin32HandleInfoKHR-handleType** handleType must be a valid VkExternalFenceHandleTypeFlagBits value

To export a POSIX file descriptor representing the payload of a fence, call:

```c
// Provided by VK_KHR_external_fence_fd
VkResult vkGetFenceFdKHR(
    VkDevice device,
    const VkFenceGetFdInfoKHR* pGetFdInfo,
    int* pFd)
```

- **device** is the logical device that created the fence being exported.

- **pGetFdInfo** is a pointer to a VkFenceGetFdInfoKHR structure containing parameters of the export operation.

- **pFd** will return the file descriptor representing the fence payload.

Each call to **vkGetFenceFdKHR** must create a new file descriptor and transfer ownership of it to the application. To avoid leaking resources, the application must release ownership of the file descriptor when it is no longer needed.

**Note**

Ownership can be released in many ways. For example, the application can call `close()` on the file descriptor, or transfer ownership back to Vulkan by using the file descriptor to import a fence payload.

If pGetFdInfo->handleType is VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT and the fence is signaled at the time **vkGetFenceFdKHR** is called, **pFd** may return the value `-1` instead of a valid file descriptor.

Where supported by the operating system, the implementation must set the file descriptor to be closed automatically when an `execve` system call is made.

Exporting a file descriptor from a fence may have side effects depending on the transference of the specified handle type, as described in Importing Fence State.
Valid Usage (Implicit)

- VUID-vkGetFenceFdKHR-device-parameter
devicemust be a valid VkDevice handle

- VUID-vkGetFenceFdKHR-pGetFdInfo-parameter
pGetFdInfo must be a valid pointer to a valid VkFenceGetFdInfoKHR structure

- VUID-vkGetFenceFdKHR-pFd-parameter
pFdmust be a valid pointer to an int value

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_OUT_OF_HOST_MEMORY

The VkFenceGetFdInfoKHR structure is defined as:

```c
// Provided by VK_KHR_external_fence_fd
typedef struct VkFenceGetFdInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkFence fence;
    VkExternalFenceHandleTypeFlagBits handleType;
} VkFenceGetFdInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `fence` is the fence from which state will be exported.
- `handleType` is a VkExternalFenceHandleTypeFlagBits value specifying the type of handle requested.

The properties of the file descriptor returned depend on the value of `handleType`. See VkExternalFenceHandleTypeFlagBits for a description of the properties of the defined external fence handle types.

Valid Usage

- VUID-VkFenceGetFdInfoKHR-handleType-01453
handleType must have been included in VkExportFenceCreateInfo::handleTypes when fence's current payload was created
If `handleType` refers to a handle type with copy payload transference semantics, `fence` must be signaled, or have an associated `fence signal operation` pending execution.

`fence` must not currently have its payload replaced by an imported payload as described below in *Importing Fence Payloads* unless that imported payload's handle type was included in `VkExternalFenceProperties::exportFromImportedHandleTypes` for `handleType`.

`handleType` must be defined as a POSIX file descriptor handle.

### Valid Usage (Implicit)

- **sType** must be `VK_STRUCTURE_TYPE_FENCE_GET_FD_INFO_KHR`.
- `pNext` must be `NULL`.
- `fence` must be a valid `VkFence` handle.
- `handleType` must be a valid `VkExternalFenceHandleTypeFlagBits` value.

To destroy a fence, call:

```c
void vkDestroyFence(
    VkDevice device,
    VkFence fence,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the fence.
- `fence` is the handle of the fence to destroy.
- `pAllocator` controls host memory allocation as described in the *Memory Allocation* chapter.

### Valid Usage

- **fence** must have completed execution.
- If `VkAllocationCallbacks` were provided when `fence` was created, a compatible set of callbacks must be provided here.
- If no `VkAllocationCallbacks` were provided when `fence` was created, `pAllocator` must be
Valid Usage (Implicit)

- VUID-vkDestroyFence-device-parameter
  
  `device` must be a valid `VkDevice` handle

- VUID-vkDestroyFence-fence-parameter
  
  If `fence` is not `VK_NULL_HANDLE`, `fence` must be a valid `VkFence` handle

- VUID-vkDestroyFence-pAllocator-parameter
  
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkDestroyFence-fence-parent
  
  If `fence` is a valid handle, it must have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `fence` must be externally synchronized

To query the status of a fence from the host, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkGetFenceStatus(
    VkDevice device,  
    VkFence fence);  
```

- `device` is the logical device that owns the fence.
- `fence` is the handle of the fence to query.

Upon success, `vkGetFenceStatus` returns the status of the fence object, with the following return codes:

<table>
<thead>
<tr>
<th>Status</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>VK_SUCCESS</code></td>
<td>The fence specified by <code>fence</code> is signaled.</td>
</tr>
<tr>
<td><code>VK_NOT_READY</code></td>
<td>The fence specified by <code>fence</code> is unsignaled.</td>
</tr>
<tr>
<td><code>VK_ERROR_DEVICE_LOST</code></td>
<td>The device has been lost. See Lost Device.</td>
</tr>
</tbody>
</table>

If a `queue submission` command is pending execution, then the value returned by this command may immediately be out of date.
If the device has been lost (see Lost Device), `vkGetFenceStatus` may return any of the above status codes. If the device has been lost and `vkGetFenceStatus` is called repeatedly, it will eventually return either `VK_SUCCESS` or `VK_ERROR_DEVICE_LOST`.

### Valid Usage (Implicit)

- **VUID-vkGetFenceStatus-device-parameter**
  - `device` must be a valid `VkDevice` handle
- **VUID-vkGetFenceStatus-fence-parameter**
  - `fence` must be a valid `VkFence` handle
- **VUID-vkGetFenceStatus-fence-parent**
  - `fence` must have been created, allocated, or retrieved from `device`

### Return Codes

**Success**

- `VK_SUCCESS`
- `VK_NOT_READY`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`

To set the state of fences to unsignaled from the host, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkResetFences(
    VkDevice device,
    uint32_t fenceCount,
    const VkFence* pFences);
```

- `device` is the logical device that owns the fences.
- `fenceCount` is the number of fences to reset.
- `pFences` is a pointer to an array of fence handles to reset.

If any member of `pFences` currently has its payload imported with temporary permanence, that fence’s prior permanent payload is first restored. The remaining operations described therefore operate on the restored payload.

When `vkResetFences` is executed on the host, it defines a fence unsignal operation for each fence, which resets the fence to the unsignaled state.
If any member of \texttt{pFences} is already in the unsignaled state when \texttt{vkResetFences} is executed, then \texttt{vkResetFences} has no effect on that fence.

### Valid Usage

- VUID-vkResetFences-pFences-01123  
  Each element of \texttt{pFences} \textbf{must} not be currently associated with any queue command that has not yet completed execution on that queue

### Valid Usage (Implicit)

- VUID-vkResetFences-device-parameter  
  \texttt{device} \textbf{must} be a valid \texttt{VkDevice} handle

- VUID-vkResetFences-pFences-parameter  
  \texttt{pFences} \textbf{must} be a valid pointer to an array of \texttt{fenceCount} valid \texttt{VkFence} handles

- VUID-vkResetFences-fenceCount-arraylength  
  \texttt{fenceCount} \textbf{must} be greater than 0

- VUID-vkResetFences-pFences-parent  
  Each element of \texttt{pFences} \textbf{must} have been created, allocated, or retrieved from \texttt{device}

### Host Synchronization

- Host access to each member of \texttt{pFences} \textbf{must} be externally synchronized

### Return Codes

**Success**

- \texttt{VK_SUCCESS}

**Failure**

- \texttt{VK_ERROR_OUT_OF_DEVICE_MEMORY}

When a fence is submitted to a queue as part of a \texttt{queue submission} command, it defines a memory dependency on the batches that were submitted as part of that command, and defines a \textit{fence signal operation} which sets the fence to the signaled state.

The first \textit{synchronization scope} includes every batch submitted in the same \texttt{queue submission} command. Fence signal operations that are defined by \texttt{vkQueueSubmit} or \texttt{vkQueueSubmit2} additionally include in the first synchronization scope all commands that occur earlier in \texttt{submission order}. Fence signal operations that are defined by \texttt{vkQueueSubmit} or \texttt{vkQueueSubmit2} or \texttt{vkQueueBindSparse} additionally include in the first synchronization scope any semaphore and fence signal operations that occur earlier in \textit{signal operation order}. 

254
The second synchronization scope only includes the fence signal operation.

The first access scope includes all memory access performed by the device.

The second access scope is empty.

To wait for one or more fences to enter the signaled state on the host, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkWaitForFences(
    VkDevice device,                  // device is the logical device that owns the fences.
    uint32_t fenceCount,              // fenceCount is the number of fences to wait on.
    const VkFence* pFences,           // pfences is a pointer to an array of fenceCount fence handles.
    VkBool32 waitAll,                 // waitAll is the condition that must be satisfied to successfully unblock the wait. If waitAll is VK_TRUE, then the condition is that all fences in pFences are signaled. Otherwise, the condition is that at least one fence in pFences is signaled.
    uint64_t timeout);                // timeout is the timeout period in units of nanoseconds. timeout is adjusted to the closest value allowed by the implementation-dependent timeout accuracy, which may be substantially longer than one nanosecond, and may be longer than the requested period.
```

If the condition is satisfied when `vkWaitForFences` is called, then `vkWaitForFences` returns immediately. If the condition is not satisfied at the time `vkWaitForFences` is called, then `vkWaitForFences` will block and wait until the condition is satisfied or the `timeout` has expired, whichever is sooner.

If `timeout` is zero, then `vkWaitForFences` does not wait, but simply returns the current state of the fences. `VK_TIMEOUT` will be returned in this case if the condition is not satisfied, even though no actual wait was performed.

If the condition is satisfied before the `timeout` has expired, `vkWaitForFences` returns `VK_SUCCESS`. Otherwise, `vkWaitForFences` returns `VK_TIMEOUT` after the `timeout` has expired.

If device loss occurs (see Lost Device) before the timeout has expired, `vkWaitForFences` must return in finite time with either `VK_SUCCESS` or `VK_ERROR_DEVICE_LOST`.

**Note**

While we guarantee that `vkWaitForFences` must return in finite time, no guarantees are made that it returns immediately upon device loss. However, the client can reasonably expect that the delay will be on the order of seconds and that calling `vkWaitForFences` will not result in a permanently (or seemingly permanently) dead process.
Valid Usage (Implicit)

- VUID-vkWaitForFences-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkWaitForFences-pFences-parameter
  - `pFences` must be a valid pointer to an array of `fenceCount` valid `VkFence` handles
- VUID-vkWaitForFences-fenceCount-arraylength
  - `fenceCount` must be greater than 0
- VUID-vkWaitForFences-pFences-parent
  - Each element of `pFences` must have been created, allocated, or retrieved from `device`

Return Codes

**Success**
- `VK_SUCCESS`
- `VK_TIMEOUT`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`

An execution dependency is defined by waiting for a fence to become signaled, either via `vkWaitForFences` or by polling on `vkGetFenceStatus`.

The first synchronization scope includes only the fence signal operation.

The second synchronization scope includes the host operations of `vkWaitForFences` or `vkGetFenceStatus` indicating that the fence has become signaled.

**Note**
Signaling a fence and waiting on the host does not guarantee that the results of memory accesses will be visible to the host, as the access scope of a memory dependency defined by a fence only includes device access. A memory barrier or other memory dependency must be used to guarantee this. See the description of host access types for more information.

7.3.1. Importing Fence Payloads

Applications can import a fence payload into an existing fence using an external fence handle. The effects of the import operation will be either temporary or permanent, as specified by the application. If the import is temporary, the fence will be restored to its permanent state the next time that fence is passed to `vkResetFences`.
Note

Restoring a fence to its prior permanent payload is a distinct operation from resetting a fence payload. See `vkResetFences` for more detail.

Performing a subsequent temporary import on a fence before resetting it has no effect on this requirement; the next unsignal of the fence **must** still restore its last permanent state. A permanent payload import behaves as if the target fence was destroyed, and a new fence was created with the same handle but the imported payload. Because importing a fence payload temporarily or permanently detaches the existing payload from a fence, similar usage restrictions to those applied to `vkDestroyFence` are applied to any command that imports a fence payload. Which of these import types is used is referred to as the import operation’s *permanence*. Each handle type supports either one or both types of permanence.

The implementation **must** perform the import operation by either referencing or copying the payload referred to by the specified external fence handle, depending on the handle’s type. The import method used is referred to as the handle type’s *transference*. When using handle types with reference transference, importing a payload to a fence adds the fence to the set of all fences sharing that payload. This set includes the fence from which the payload was exported. Fence signaling, waiting, and resetting operations performed on any fence in the set **must** behave as if the set were a single fence. Importing a payload using handle types with copy transference creates a duplicate copy of the payload at the time of import, but makes no further reference to it. Fence signaling, waiting, and resetting operations performed on the target of copy imports **must** not affect any other fence or payload.

Export operations have the same transference as the specified handle type’s import operations. Additionally, exporting a fence payload to a handle with copy transference has the same side effects on the source fence’s payload as executing a fence reset operation. If the fence was using a temporarily imported payload, the fence’s prior permanent payload will be restored.

Note

The tables *Handle Types Supported by VkImportFenceWin32HandleInfoKHR* and *Handle Types Supported by VkImportFenceFdInfoKHR* define the permanence and transference of each handle type.

**External synchronization** allows implementations to modify an object’s internal state, i.e. payload, without internal synchronization. However, for fences sharing a payload across processes, satisfying the external synchronization requirements of `VkFence` parameters as if all fences in the set were the same object is sometimes infeasible. Satisfying valid usage constraints on the state of a fence would similarly require impractical coordination or levels of trust between processes. Therefore, these constraints only apply to a specific fence handle, not to its payload. For distinct fence objects which share a payload:

- If multiple commands which queue a signal operation, or which unsignal a fence, are called concurrently, behavior will be as if the commands were called in an arbitrary sequential order.
- If a queue submission command is called with a fence that is sharing a payload, and the payload is already associated with another queue command that has not yet completed execution, either one or both of the commands will cause the fence to become signaled when they complete
If a fence payload is reset while it is associated with a queue command that has not yet completed execution, the payload will become unsignaled, but may become signaled again when the command completes execution.

In the preceding cases, any of the devices associated with the fences sharing the payload may be lost, or any of the queue submission or fence reset commands may return VK_ERROR_INITIALIZATION_FAILED.

Other than these non-deterministic results, behavior is well defined. In particular:

- The implementation must not crash or enter an internally inconsistent state where future valid Vulkan commands might cause undefined results,
- Timeouts on future wait commands on fences sharing the payload must be effective.

These rules allow processes to synchronize access to shared memory without trusting each other. However, such processes must still be cautious not to use the shared fence for more than synchronizing access to the shared memory. For example, a process should not use a fence with shared payload to tell when commands it submitted to a queue have completed and objects used by those commands may be destroyed, since the other process can accidentally or maliciously cause the fence to signal before the commands actually complete.

When a fence is using an imported payload, its VkExportFenceCreateInfo::handleTypes value is specified when creating the fence from which the payload was exported, rather than specified when creating the fence. Additionally, VkExternalFenceProperties::exportFromImportedHandleTypes restricts which handle types can be exported from such a fence based on the specific handle type used to import the current payload. Passing a fence to vkAcquireNextImageKHR is equivalent to temporarily importing a fence payload to that fence.

Because the exportable handle types of an imported fence correspond to its current imported payload, and vkAcquireNextImageKHR behaves the same as a temporary import operation for which the source fence is opaque to the application, applications have no way of determining whether any external handle types can be exported from a fence in this state. Therefore, applications must not attempt to export handles from fences using a temporarily imported payload from vkAcquireNextImageKHR.

When importing a fence payload, it is the responsibility of the application to ensure the external handles meet all valid usage requirements. However, implementations must perform sufficient validation of external handles to ensure that the operation results in a valid fence which will not cause program termination, device loss, queue stalls, host thread stalls, or corruption of other resources when used as allowed according to its import parameters. If the external handle provided does not meet these requirements, the implementation must fail the fence payload import operation with the error code VK_ERROR_INVALID_EXTERNAL_HANDLE.
To import a fence payload from a Windows handle, call:

```c
// Provided by VK_KHR_external_fence_win32
VkResult vkImportFenceWin32HandleKHR(
    VkDevice device,
    const VkImportFenceWin32HandleInfoKHR* pImportFenceWin32HandleInfo);
```

- `device` is the logical device that created the fence.
- `pImportFenceWin32HandleInfo` is a pointer to a `VkImportFenceWin32HandleInfoKHR` structure specifying the fence and import parameters.

Importing a fence payload from Windows handles does not transfer ownership of the handle to the Vulkan implementation. For handle types defined as NT handles, the application must release ownership using the `CloseHandle` system call when the handle is no longer needed.

Applications can import the same fence payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

### Valid Usage

- VUID-vkImportFenceWin32HandleKHR-fence-04448
  - `fence` must not be associated with any queue command that has not yet completed execution on that queue

### Valid Usage (Implicit)

- VUID-vkImportFenceWin32HandleKHR-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkImportFenceWin32HandleKHR-pImportFenceWin32HandleInfo-parameter
  - `pImportFenceWin32HandleInfo` must be a valid pointer to a valid `VkImportFenceWin32HandleInfoKHR` structure

### Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_INVALID_EXTERNAL_HANDLE

The `VkImportFenceWin32HandleInfoKHR` structure is defined as:
typedef struct VkImportFenceWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkFence fence;
    VkFenceImportFlags flags;
    VkExternalFenceHandleTypeFlagBits handleType;
    HANDLE handle;
    LPCWSTR name;
} VkImportFenceWin32HandleInfoKHR;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **fence** is the fence into which the state will be imported.
- **flags** is a bitmask of VkFenceImportFlagBits specifying additional parameters for the fence payload import operation.
- **handleType** is a VkExternalFenceHandleTypeFlagBits value specifying the type of handle.
- **handle** is NULL or the external handle to import.
- **name** is NULL or a null-terminated UTF-16 string naming the underlying synchronization primitive to import.

The handle types supported by handleType are:

<table>
<thead>
<tr>
<th>Handle Type</th>
<th>Transference</th>
<th>Permanence Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT</td>
<td>Reference</td>
<td>Temporary,Permanent</td>
</tr>
<tr>
<td>VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_KMT_B</td>
<td>Reference</td>
<td>Temporary,Permanent</td>
</tr>
</tbody>
</table>

**Valid Usage**

- VUID-VkImportFenceWin32HandleInfoKHR-handleType-01457
  - **handleType** must be a value included in the Handle Types Supported by VkImportFenceWin32HandleInfoKHR table

- VUID-VkImportFenceWin32HandleInfoKHR-handleType-01459
  - If **handleType** is not VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT, name must be NULL

- VUID-VkImportFenceWin32HandleInfoKHR-handleType-01460
  - If **handle** is NULL, name must name a valid synchronization primitive of the type specified by **handleType**

- VUID-VkImportFenceWin32HandleInfoKHR-handleType-01461
  - If **name** is NULL, **handle** must be a valid handle of the type specified by **handleType**
If `handle` is not `NULL`, `name` must be `NULL`

If `handle` is not `NULL`, it must obey any requirements listed for `handleType` in `external fence handle types compatibility`

If `name` is not `NULL`, it must obey any requirements listed for `handleType` in `external fence handle types compatibility`

### Valid Usage (Implicit)

- **VUID-VkImportFenceWin32HandleInfoKHR-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_IMPORT_FENCE_WIN32_HANDLE_INFO_KHR`

- **VUID-VkImportFenceWin32HandleInfoKHR-pNext-pNext**
  
  `pNext` must be `NULL`

- **VUID-VkImportFenceWin32HandleInfoKHR-fence-parameter**
  
  `fence` must be a valid `VkFence` handle

- **VUID-VkImportFenceWin32HandleInfoKHR-flags-parameter**
  
  `flags` must be a valid combination of `VkFenceImportFlagBits` values

### Host Synchronization

- Host access to `fence` must be externally synchronized

To import a fence payload from a POSIX file descriptor, call:

```c
// Provided by VK_KHR_external_fence_fd
VkResult vkImportFenceFdKHR(
    VkDevice device,
    const VkImportFenceFdInfoKHR* pImportFenceFdInfo);
```

- `device` is the logical device that created the fence.

- `pImportFenceFdInfo` is a pointer to a `VkImportFenceFdInfoKHR` structure specifying the fence and import parameters.

Importing a fence payload from a file descriptor transfers ownership of the file descriptor from the application to the Vulkan implementation. The application must not perform any operations on the file descriptor after a successful import.

Applications can import the same fence payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.
Valid Usage

- VUID-vkImportFenceFdKHR-fence-01463
  fence must not be associated with any queue command that has not yet completed execution on that queue

Valid Usage (Implicit)

- VUID-vkImportFenceFdKHR-device-parameter
device must be a valid VkDevice handle

- VUID-vkImportFenceFdKHR-pImportFenceFdInfo-parameter
  pImportFenceFdInfo must be a valid pointer to a valid VkImportFenceFdInfoKHR structure

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_INVALID_EXTERNAL_HANDLE

The VkImportFenceFdInfoKHR structure is defined as:

```c
// Provided by VK_KHR_external_fence_fd
typedef struct VkImportFenceFdInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkFence fence;
    VkFenceImportFlags flags;
    VkExternalFenceHandleTypeFlagBits handleType;
    int fd;
} VkImportFenceFdInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `fence` is the fence into which the payload will be imported.
- `flags` is a bitmask of VkFenceImportFlagBits specifying additional parameters for the fence payload import operation.
- `handleType` is a VkExternalFenceHandleTypeFlagBits value specifying the type of `fd`.
- `fd` is the external handle to import.
The handle types supported by `handleType` are:

<table>
<thead>
<tr>
<th>Handle Type</th>
<th>Transference</th>
<th>Permanence Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_FD_BIT</td>
<td>Reference</td>
<td>Temporary,Permanent</td>
</tr>
<tr>
<td>VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT</td>
<td>Copy</td>
<td>Temporary</td>
</tr>
</tbody>
</table>

**Valid Usage**

- VUID-VkImportFenceFdInfoKHR-handleType-01464
  `handleType` **must** be a value included in the Handle Types Supported by VkImportFenceFdInfoKHR table

- VUID-VkImportFenceFdInfoKHR-fd-01541
  `fd` **must** obey any requirements listed for `handleType` in external fence handle types compatibility

- VUID-VkImportFenceFdInfoKHR-handleType-07306
  If `handleType` refers to a handle type with copy payload transference semantics, `flags` **must** contain `VK_FENCE_IMPORT_TEMPORARY_BIT`

If `handleType` is VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT, the special value -1 for `fd` is treated like a valid sync file descriptor referring to an object that has already signaled. The import operation will succeed and the `VkFence` will have a temporarily imported payload as if a valid file descriptor had been provided.

**Note**

This special behavior for importing an invalid sync file descriptor allows easier interoperability with other system APIs which use the convention that an invalid sync file descriptor represents work that has already completed and does not need to be waited for. It is consistent with the option for implementations to return a -1 file descriptor when exporting a VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT from a `VkFence` which is signaled.

**Valid Usage (Implicit)**

- VUID-VkImportFenceFdInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_IMPORT_FENCE_FD_INFO_KHR`

- VUID-VkImportFenceFdInfoKHR-pNext-pNext
  `pNext` **must** be NULL

- VUID-VkImportFenceFdInfoKHR-fence-parameter
  `fence` **must** be a valid `VkFence` handle

- VUID-VkImportFenceFdInfoKHR-flags-parameter
  `flags` **must** be a valid combination of `VkFenceImportFlagBits` values
• **VUID-VkImportFenceFdInfoKHR-handleType-parameter**

  `handleType` must be a valid `VkExternalFenceHandleTypeFlagBits` value

---

**Host Synchronization**

• Host access to `fence` must be externally synchronized

Bits which **can** be set in

• `VkImportFenceWin32HandleInfoKHR::flags`

• `VkImportFenceFdInfoKHR::flags`

specifying additional parameters of a fence import operation are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkFenceImportFlagBits {
    VK_FENCE_IMPORT_TEMPORARY_BIT = 0x00000001,
    // Provided by VK_KHR_external_fence
    VK_FENCE_IMPORT_TEMPORARY_BIT_KHR = VK_FENCE_IMPORT_TEMPORARY_BIT,
} VkFenceImportFlagBits;
```

or the equivalent

```c
// Provided by VK_KHR_external_fence
typedef VkFenceImportFlagBits VkFenceImportFlagBitsKHR;
```

• **VK_FENCE_IMPORT_TEMPORARY_BIT** specifies that the fence payload will be imported only temporarily, as described in Importing Fence Payloads, regardless of the permanence of `handleType`.

```c
// Provided by VK_VERSION_1_1
typedef VkFlags VkFenceImportFlags;
```

or the equivalent

```c
// Provided by VK_KHR_external_fence
typedef VkFenceImportFlags VkFenceImportFlagsKHR;
```

`VkFenceImportFlags` is a bitmask type for setting a mask of zero or more `VkFenceImportFlagBits`.

### 7.4. Semaphores

Semaphores are a synchronization primitive that **can** be used to insert a dependency between
queue operations or between a queue operation and the host. Binary semaphores have two states - signaled and unsignaled. Timeline semaphores have a strictly increasing 64-bit unsigned integer payload and are signaled with respect to a particular reference value. A semaphore can be signaled after execution of a queue operation is completed, and a queue operation can wait for a semaphore to become signaled before it begins execution. A timeline semaphore can additionally be signaled from the host with the `vkSignalSemaphore` command and waited on from the host with the `vkWaitSemaphores` command.

The internal data of a semaphore may include a reference to any resources and pending work associated with signal or unsignal operations performed on that semaphore object, collectively referred to as the semaphore's payload. Mechanisms to import and export that internal data to and from semaphores are provided below. These mechanisms indirectly enable applications to share semaphore state between two or more semaphores and other synchronization primitives across process and API boundaries.

Semaphores are represented by `VkSemaphore` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSemaphore)
```

To create a semaphore, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateSemaphore(
    VkDevice device,           // device is the logical device that creates the semaphore.
    const VkSemaphoreCreateInfo* pCreateInfo,    // pCreateInfo is a pointer to a `VkSemaphoreCreateInfo` structure containing information about how the semaphore is to be created.
    const VkAllocationCallbacks* pAllocator,     // pAllocator controls host memory allocation as described in the Memory Allocation chapter.
    VkSemaphore* pSemaphore);  // pSemaphore is a pointer to a handle in which the resulting semaphore object is returned.
```

**Valid Usage (Implicit)**

- VUID-vkCreateSemaphore-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkCreateSemaphore-pCreateInfo-parameter
  - `pCreateInfo` must be a valid pointer to a valid `VkSemaphoreCreateInfo` structure
- VUID-vkCreateSemaphore-pAllocator-parameter
  - If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
• VUID-vkCreateSemaphore-pSemaphore-parameter
  pSemaphore must be a valid pointer to a VkSemaphore handle

## Return Codes

### Success

- VK_SUCCESS

### Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkSemaphoreCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSemaphoreCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkSemaphoreCreateFlags flags;
} VkSemaphoreCreateInfo;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.

## Valid Usage (Implicit)

- **VUID-VkSemaphoreCreateInfo-sType-sType**
  sType must be VK_STRUCTURE_TYPE_SEMAPHORE_CREATE_INFO

- **VUID-VkSemaphoreCreateInfo-pNext-pNext**
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkExportSemaphoreCreateInfo, VkExportSemaphoreWin32HandleInfoKHR, or VkSemaphoreTypeCreateInfo

- **VUID-VkSemaphoreCreateInfo-sType-unique**
  The sType value of each struct in the pNext chain must be unique

- **VUID-VkSemaphoreCreateInfo-flags-zerobitmask**
  flags must be 0

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkSemaphoreCreateFlags;
```

VkSemaphoreCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.
The `VkSemaphoreTypeCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkSemaphoreTypeCreateInfo {
  VkStructureType       sType;
  const void*            pNext;
  VkSemaphoreType        semaphoreType;
  uint64_t               initialValue;
} VkSemaphoreTypeCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreTypeCreateInfo VkSemaphoreTypeCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `semaphoreType` is a `VkSemaphoreType` value specifying the type of the semaphore.
- `initialValue` is the initial payload value if `semaphoreType` is `VK_SEMAPHORE_TYPE_TIMELINE`.

To create a semaphore of a specific type, add a `VkSemaphoreTypeCreateInfo` structure to the `VkSemaphoreCreateInfo`::`pNext` chain.

If no `VkSemaphoreTypeCreateInfo` structure is included in the `pNext` chain of `VkSemaphoreCreateInfo`, then the created semaphore will have a default `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY`.

**Valid Usage**

- VUID-VkSemaphoreTypeCreateInfo-timelineSemaphore-03252
  If the `timelineSemaphore` feature is not enabled, `semaphoreType` must not equal `VK_SEMAPHORE_TYPE_TIMELINE`

- VUID-VkSemaphoreTypeCreateInfo-semaphoreType-03279
  If `semaphoreType` is `VK_SEMAPHORE_TYPE_BINARY`, `initialValue` must be zero

**Valid Usage (Implicit)**

- VUID-VkSemaphoreTypeCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_SEMAPHORE_TYPE_CREATE_INFO`

- VUID-VkSemaphoreTypeCreateInfo-semaphoreType-parameter
  `semaphoreType` must be a valid `VkSemaphoreType` value

Possible values of `VkSemaphoreTypeCreateInfo::semaphoreType`, specifying the type of a semaphore, are:
typedef enum VkSemaphoreType {
    VK_SEMAPHORE_TYPE_BINARY = 0,
    VK_SEMAPHORE_TYPE_TIMELINE = 1,
} VkSemaphoreType;

or the equivalent

typedef VkSemaphoreType VkSemaphoreTypeKHR;

• VK_SEMAPHORE_TYPE_BINARY specifies a binary semaphore type that has a boolean payload indicating whether the semaphore is currently signaled or unsignaled. When created, the semaphore is in the unsignaled state.

• VK_SEMAPHORE_TYPE_TIMELINE specifies a timeline semaphore type that has a strictly increasing 64-bit unsigned integer payload indicating whether the semaphore is signaled with respect to a particular reference value. When created, the semaphore payload has the value given by the initialValue field of VkSemaphoreTypeCreateInfo.

To create a semaphore whose payload can be exported to external handles, add a VkExportSemaphoreCreateInfo structure to the pNext chain of the VkSemaphoreCreateInfo structure. The VkExportSemaphoreCreateInfo structure is defined as:

typedef struct VkExportSemaphoreCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkExternalSemaphoreHandleTypeFlags handleTypes;
} VkExportSemaphoreCreateInfo;

or the equivalent

typedef VkExportSemaphoreCreateInfo VkExportSemaphoreCreateInfoKHR;

• sType is a VkStructureType value identifying this structure.

• pNext is NULL or a pointer to a structure extending this structure.

• handleTypes is a bitmask of VkExternalSemaphoreHandleTypeFlagBits specifying one or more semaphore handle types the application can export from the resulting semaphore. The application can request multiple handle types for the same semaphore.
Valid Usage

- VUID-VkExportSemaphoreCreateInfo-handleTypes-01124
  The bits in `handleTypes` must be supported and compatible, as reported by `VkExternalSemaphoreProperties`

Valid Usage (Implicit)

- VUID-VkExportSemaphoreCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_EXPORT_SEMAPHORE_CREATE_INFO`

- VUID-VkExportSemaphoreCreateInfo-handleTypes-parameter
  `handleTypes` must be a valid combination of `VkExternalSemaphoreHandleTypeFlagBits` values

To specify additional attributes of NT handles exported from a semaphore, add a `VkExportSemaphoreWin32HandleInfoKHR` structure to the `pNext` chain of the `VkSemaphoreCreateInfo` structure. The `VkExportSemaphoreWin32HandleInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_semaphore_win32
typedef struct VkExportSemaphoreWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const SECURITY_ATTRIBUTES* pAttributes;
    DWORD dwAccess;
    LPCWSTR name;
} VkExportSemaphoreWin32HandleInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pAttributes` is a pointer to a Windows `SECURITY_ATTRIBUTES` structure specifying security attributes of the handle.
- `dwAccess` is a `DWORD` specifying access rights of the handle.
- `name` is a null-terminated UTF-16 string to associate with the underlying synchronization primitive referenced by NT handles exported from the created semaphore.

If `VkExportSemaphoreCreateInfo` is not included in the same `pNext` chain, this structure is ignored.

If `VkExportSemaphoreCreateInfo` is included in the `pNext` chain of `VkSemaphoreCreateInfo` with a Windows `handleType`, but either `VkExportSemaphoreWin32HandleInfoKHR` is not included in the `pNext` chain, or it is included but `pAttributes` is set to `NULL`, default security descriptor values will be used, and child processes created by the application will not inherit the handle, as described in the MSDN documentation for “Synchronization Object Security and Access Rights”. Further, if the structure is not present, the access rights used depend on the handle type.
For handles of the following types:

\texttt{VK\_EXTERNAL\_SEMAPHORE\_HANDLE\_TYPE\_OPAQUE\_WIN32\_BIT}

The implementation \textbf{must} ensure the access rights allow both signal and wait operations on the semaphore.

For handles of the following types:

\texttt{VK\_EXTERNAL\_SEMAPHORE\_HANDLE\_TYPE\_D3D12\_FENCE\_BIT}

The access rights \textbf{must} be:

\texttt{GENERIC\_ALL}

1

---

### Valid Usage

- VUID-VkExportSemaphoreWin32HandleInfoKHR-handleTypes-01125

If \texttt{VkExportSemaphoreCreateInfo::handleTypes} does not include \texttt{VK\_EXTERNAL\_SEMAPHORE\_HANDLE\_TYPE\_OPAQUE\_WIN32\_BIT} or \texttt{VK\_EXTERNAL\_SEMAPHORE\_HANDLE\_TYPE\_D3D12\_FENCE\_BIT}, \texttt{VkExportSemaphoreWin32HandleInfoKHR} must not be included in the \texttt{pNext} chain of \texttt{VkSemaphoreCreateInfo}

### Valid Usage (Implicit)

- VUID-VkExportSemaphoreWin32HandleInfoKHR-sType-sType

\texttt{sType} must be \texttt{VK\_STRUCTURE\_TYPE\_EXPORT\_SEMAPHORE\_WIN32\_HANDLE\_INFO\_KHR}

- VUID-VkExportSemaphoreWin32HandleInfoKHR-pAttributes-parameter

If \texttt{pAttributes} is not \texttt{NULL}, \texttt{pAttributes} must be a valid pointer to a valid \texttt{SECURITY\_ATTRIBUTES} value

---

To export a Windows handle representing the payload of a semaphore, call:

```c
// Provided by VK\_KHR\_external\_semaphore\_win32
VkResult \texttt{vkGetSemaphoreWin32HandleKHR}(  
    VkDevice device,  
    const VkSemaphoreGetWin32HandleInfoKHR* pGetWin32HandleInfo,  
    HANDLE* pHandle);  
```

- \texttt{device} is the logical device that created the semaphore being exported.

- \texttt{pGetWin32HandleInfo} is a pointer to a \texttt{VkSemaphoreGetWin32HandleInfoKHR} structure containing parameters of the export operation.
• `pHandle` will return the Windows handle representing the semaphore state.

For handle types defined as NT handles, the handles returned by `vkGetSemaphoreWin32HandleKHR` are owned by the application. To avoid leaking resources, the application **must** release ownership of them using the `CloseHandle` system call when they are no longer needed.

Exporting a Windows handle from a semaphore **may** have side effects depending on the transference of the specified handle type, as described in Importing Semaphore Payloads.

### Valid Usage (Implicit)

- VUID-vkGetSemaphoreWin32HandleKHR-device-parameter
  - `device` **must** be a valid `VkDevice` handle
- VUID-vkGetSemaphoreWin32HandleKHR-pGetWin32HandleInfo-parameter
  - `pGetWin32HandleInfo` **must** be a valid pointer to a valid `VkSemaphoreGetWin32HandleInfoKHR` structure
- VUID-vkGetSemaphoreWin32HandleKHR-pHandle-parameter
  - `pHandle` **must** be a valid pointer to a `HANDLE` value

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkSemaphoreGetWin32HandleInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_semaphore_win32
typedef struct VkSemaphoreGetWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
} VkSemaphoreGetWin32HandleInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `semaphore` is the semaphore from which state will be exported.
- `handleType` is a `VkExternalSemaphoreHandleTypeFlagBits` value specifying the type of handle requested.
The properties of the handle returned depend on the value of `handleType`. See `VkExternalSemaphoreHandleTypeFlagBits` for a description of the properties of the defined external semaphore handle types.

**Valid Usage**

- **VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01126**
  
  `handleType` must have been included in `VkExportSemaphoreCreateInfo::handleTypes` when the semaphore's current payload was created.

- **VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01127**

  If `handleType` is defined as an NT handle, `vkGetSemaphoreWin32HandleKHR` must be called no more than once for each valid unique combination of semaphore and `handleType`.

- **VUID-VkSemaphoreGetWin32HandleInfoKHR-semaphore-01128**

  Semaphore must not currently have its payload replaced by an imported payload as described below in Importing Semaphore Payloads unless that imported payload's handle type was included in `VkExternalSemaphoreProperties::exportFromImportedHandleTypes` for `handleType`.

- **VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01129**

  If `handleType` refers to a handle type with copy payload transference semantics, as defined below in Importing Semaphore Payloads, there must be no queue waiting on semaphore.

- **VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01130**

  If `handleType` refers to a handle type with copy payload transference semantics, semaphore must be signaled, or have an associated semaphore signal operation pending execution.

- **VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01131**

  `handleType` must be defined as an NT handle or a global share handle.

**Valid Usage (Implicit)**

- **VUID-VkSemaphoreGetWin32HandleInfoKHR-sType-sType**

  `sType` must be `VK_STRUCTURE_TYPE_SEMAPHORE_GET_WIN32_HANDLE_INFO_KHR`.

- **VUID-VkSemaphoreGetWin32HandleInfoKHR-pNext-pNext**

  `pNext` must be `NULL`.

- **VUID-VkSemaphoreGetWin32HandleInfoKHR-semaphore-01128**

  Semaphore must be a valid `VkSemaphore` handle.

- **VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-parameter**

  `handleType` must be a valid `VkExternalSemaphoreHandleTypeFlagBits` value.

To export a POSIX file descriptor representing the payload of a semaphore, call:

```c
// Provided by VK_KHR_external_semaphore_fd
VkResult vkGetSemaphoreFdKHR(
  VkDevice device,
  
);```
const VkSemaphoreGetFdInfoKHR* pGetFdInfo,
int* pFd);

• device is the logical device that created the semaphore being exported.
• pGetFdInfo is a pointer to a VkSemaphoreGetFdInfoKHR structure containing parameters of the export operation.
• pFd will return the file descriptor representing the semaphore payload.

Each call to vkGetSemaphoreFdKHR must create a new file descriptor and transfer ownership of it to the application. To avoid leaking resources, the application must release ownership of the file descriptor when it is no longer needed.

Note
Ownership can be released in many ways. For example, the application can call close() on the file descriptor, or transfer ownership back to Vulkan by using the file descriptor to import a semaphore payload.

Where supported by the operating system, the implementation must set the file descriptor to be closed automatically when an execve system call is made.

Exporting a file descriptor from a semaphore may have side effects depending on the transference of the specified handle type, as described in Importing Semaphore State.

Valid Usage (Implicit)

• VUID-vkGetSemaphoreFdKHR-device-parameter
device must be a valid VkDevice handle

• VUID-vkGetSemaphoreFdKHR-pGetFdInfo-parameter
pGetFdInfo must be a valid pointer to a valid VkSemaphoreGetFdInfoKHR structure

• VUID-vkGetSemaphoreFdKHR-pFd-parameter
pFd must be a valid pointer to an int value

Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_TOO_MANY_OBJECTS
• VK_ERROR_OUT_OF_HOST_MEMORY

The VkSemaphoreGetFdInfoKHR structure is defined as:

// Provided by VK_KHR_external_semaphore_fd
typedef struct VkSemaphoreGetFdInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
} VkSemaphoreGetFdInfoKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **semaphore** is the semaphore from which state will be exported.
- **handleType** is a `VkExternalSemaphoreHandleTypeFlagBits` value specifying the type of handle requested.

The properties of the file descriptor returned depend on the value of **handleType**. See `VkExternalSemaphoreHandleTypeFlagBits` for a description of the properties of the defined external semaphore handle types.

### Valid Usage

- **VUID-VkSemaphoreGetFdInfoKHR-handleType-01132**
  - `handleType` must have been included in `VkExportSemaphoreCreateInfo::handleTypes` when `semaphore`'s current payload was created

- **VUID-VkSemaphoreGetFdInfoKHR-semaphore-01133**
  - `semaphore` must not currently have its payload replaced by an imported payload as described below in Importing Semaphore Payloads unless that imported payload's handle type was included in `VkExternalSemaphoreProperties::exportFromImportedHandleTypes` for `handleType`

- **VUID-VkSemaphoreGetFdInfoKHR-handleType-01134**
  - If `handleType` refers to a handle type with copy payload transference semantics, as defined below in Importing Semaphore Payloads, there must be no queue waiting on `semaphore`

- **VUID-VkSemaphoreGetFdInfoKHR-handleType-01135**
  - If `handleType` refers to a handle type with copy payload transference semantics, `semaphore` must be signaled, or have an associated semaphore signal operation pending execution

- **VUID-VkSemaphoreGetFdInfoKHR-handleType-01136**
  - `handleType` must be defined as a POSIX file descriptor handle

- **VUID-VkSemaphoreGetFdInfoKHR-handleType-03253**
  - If `handleType` refers to a handle type with copy payload transference semantics, `semaphore` must have been created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY`

- **VUID-VkSemaphoreGetFdInfoKHR-handleType-03254**
  - If `handleType` refers to a handle type with copy payload transference semantics, `semaphore` must have an associated semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends must have also been submitted for execution
Valid Usage (Implicit)

- VUID-VkSemaphoreGetFdInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_SEMAPHORE_GET_FD_INFO_KHR`

- VUID-VkSemaphoreGetFdInfoKHR-pNext-pNext
  `pNext` must be `NULL`

- VUID-VkSemaphoreGetFdInfoKHR-semaphore-parameter
  `semaphore` must be a valid `VkSemaphore` handle

- VUID-VkSemaphoreGetFdInfoKHR-handleType-parameter
  `handleType` must be a valid `VkExternalSemaphoreHandleTypeFlagBits` value

To destroy a semaphore, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroySemaphore(
    VkDevice device,
    VkSemaphore semaphore,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the semaphore.
- `semaphore` is the handle of the semaphore to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroySemaphore-semaphore-05149
  All submitted batches that refer to `semaphore` must have completed execution

- VUID-vkDestroySemaphore-semaphore-01138
  If `VkAllocationCallbacks` were provided when `semaphore` was created, a compatible set of callbacks must be provided here

- VUID-vkDestroySemaphore-semaphore-01139
  If no `VkAllocationCallbacks` were provided when `semaphore` was created, `pAllocator` must be `NULL`

Valid Usage (Implicit)

- VUID-vkDestroySemaphore-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkDestroySemaphore-semaphore-parameter
  If `semaphore` is not `VK_NULL_HANDLE`, `semaphore` must be a valid `VkSemaphore` handle

- VUID-vkDestroySemaphore-pAllocator-parameter

If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure. If semaphore is a valid handle, it must have been created, allocated, or retrieved from device.

**Host Synchronization**

- Host access to semaphore must be externally synchronized

### 7.4.1. Semaphore Signaling

When a batch is submitted to a queue via a *queue submission*, and it includes semaphores to be signaled, it defines a memory dependency on the batch, and defines *semaphore signal operations* which set the semaphores to the signaled state.

In case of semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the semaphore is considered signaled with respect to the counter value set to be signaled as specified in `VkTimelineSemaphoreSubmitInfo` or `VkSemaphoreSignalInfo`.

The first *synchronization scope* includes every command submitted in the same batch. In the case of `vkQueueSubmit2`, the first synchronization scope is limited to the pipeline stage specified by `VkSemaphoreSubmitInfo::stageMask`. Semaphore signal operations that are defined by `vkQueueSubmit` or `vkQueueSubmit2` additionally include all commands that occur earlier in submission order. Semaphore signal operations that are defined by `vkQueueSubmit` or `vkQueueSubmit2` or `vkQueueBindSparse` additionally include in the first synchronization scope any semaphore and fence signal operations that occur earlier in signal operation order.

The second *synchronization scope* includes only the semaphore signal operation.

The first *access scope* includes all memory access performed by the device.

The second *access scope* is empty.

### 7.4.2. Semaphore Waiting

When a batch is submitted to a queue via a *queue submission*, and it includes semaphores to be waited on, it defines a memory dependency between prior semaphore signal operations and the batch, and defines *semaphore wait operations*.

Such semaphore wait operations set the semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY` to the unsignaled state. In case of semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` a prior semaphore signal operation defines a memory dependency with a semaphore wait operation if the value the semaphore is signaled with is greater than or equal to the value the semaphore is waited with, thus the semaphore will continue to be considered signaled with respect to the counter value waited on as specified in `VkTimelineSemaphoreSubmitInfo`. 
The first synchronization scope includes all semaphore signal operations that operate on semaphores waited on in the same batch, and that happen-before the wait completes.

The second synchronization scope includes every command submitted in the same batch. In the case of `vkQueueSubmit`, the second synchronization scope is limited to operations on the pipeline stages determined by the destination stage mask specified by the corresponding element of `pWaitDstStageMask`. In the case of `vkQueueSubmit2`, the second synchronization scope is limited to the pipeline stage specified by `VkSemaphoreSubmitInfo: :stageMask`. Also, in the case of either `vkQueueSubmit2` or `vkQueueSubmit`, the second synchronization scope additionally includes all commands that occur later in submission order.

The first access scope is empty.

The second access scope includes all memory access performed by the device.

The semaphore wait operation happens-after the first set of operations in the execution dependency, and happens-before the second set of operations in the execution dependency.

**Note**

Unlike timeline semaphores, fences or events, the act of waiting for a binary semaphore also unsignals that semaphore. Applications must ensure that between two such wait operations, the semaphore is signaled again, with execution dependencies used to ensure these occur in order. Binary semaphore waits and signals should thus occur in discrete 1:1 pairs.

**Note**

A common scenario for using `pWaitDstStageMask` with values other than `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT` is when synchronizing a window system presentation operation against subsequent command buffers which render the next frame. In this case, a presentation image must not be overwritten until the presentation operation completes, but other pipeline stages can execute without waiting. A mask of `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` prevents subsequent color attachment writes from executing until the semaphore signals. Some implementations may be able to execute transfer operations and/or pre-rasterization work before the semaphore is signaled.

If an image layout transition needs to be performed on a presentable image before it is used in a framebuffer, that can be performed as the first operation submitted to the queue after acquiring the image, and should not prevent other work from overlapping with the presentation operation. For example, a `VkImageMemoryBarrier` could use:

- `srcStageMask = VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT`
- `srcAccessMask = 0`
- `dstStageMask = VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT`
- `dstAccessMask = VK_ACCESS_COLOR_ATTACHMENT_READ_BIT | VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`.
oldLayout = VK_IMAGE_LAYOUT_PRESENT_SRC_KHR
newLayout = VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL

Alternatively, oldLayout can be VK_IMAGE_LAYOUT_UNDEFINED, if the image's contents need not be preserved.

This barrier accomplishes a dependency chain between previous presentation operations and subsequent color attachment output operations, with the layout transition performed in between, and does not introduce a dependency between previous work and any pre-rasterization shader stages. More precisely, the semaphore signals after the presentation operation completes, the semaphore wait stalls the VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT stage, and there is a dependency from that same stage to itself with the layout transition performed in between.

### 7.4.3. Semaphore State Requirements for Wait Operations

Before waiting on a semaphore, the application must ensure the semaphore is in a valid state for a wait operation. Specifically, when a semaphore wait operation is submitted to a queue:

- A binary semaphore must be signaled, or have an associated semaphore signal operation that is pending execution.
- Any semaphore signal operations on which the pending binary semaphore signal operation depends must also be completed or pending execution.
- There must be no other queue waiting on the same binary semaphore when the operation executes.

### 7.4.4. Host Operations on Semaphores

In addition to semaphore signal operations and semaphore wait operations submitted to device queues, timeline semaphores support the following host operations:

- Query the current counter value of the semaphore using the vkGetSemaphoreCounterValue command.
- Wait for a set of semaphores to reach particular counter values using the vkWaitSemaphores command.
- Signal the semaphore with a particular counter value from the host using the vkSignalSemaphore command.

To query the current counter value of a semaphore created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE from the host, call:

```c
// Provided by VK_VERSION_1_2
VkResult vkGetSemaphoreCounterValue(
    VkDevice device,
    VkSemaphore semaphore,
```
or the equivalent command

```c
// Provided by VK_KHR_timeline_semaphore
VkResult vkGetSemaphoreCounterValueKHR(
    VkDevice device,
    VkSemaphore semaphore,
    uint64_t* pValue);
```

- `device` is the logical device that owns the semaphore.
- `semaphore` is the handle of the semaphore to query.
- `pValue` is a pointer to a 64-bit integer value in which the current counter value of the semaphore is returned.

**Note**

If a queue submission command is pending execution, then the value returned by this command may immediately be out of date.

**Valid Usage**

- VUID-vkGetSemaphoreCounterValue-semaphore-03255
  `semaphore` must have been created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`

**Valid Usage (Implicit)**

- VUID-vkGetSemaphoreCounterValue-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkGetSemaphoreCounterValue-semaphore-parameter
  `semaphore` must be a valid `VkSemaphore` handle
- VUID-vkGetSemaphoreCounterValue-pValue-parameter
  `pValue` must be a valid pointer to a `uint64_t` value
- VUID-vkGetSemaphoreCounterValue-semaphore-parent
  `semaphore` must have been created, allocated, or retrieved from `device`

**Return Codes**

**Success**

- `VK_SUCCESS`
To wait for a set of semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` to reach particular counter values on the host, call:

```c
// Provided by VK_VERSION_1_2
VkResult vkWaitSemaphores(
    VkDevice device,
    const VkSemaphoreWaitInfo* pWaitInfo,
    uint64_t timeout);
```

or the equivalent command

```c
// Provided by VK_KHR_timeline_semaphore
VkResult vkWaitSemaphoresKHR(
    VkDevice device,
    const VkSemaphoreWaitInfo* pWaitInfo,
    uint64_t timeout);
```

- `device` is the logical device that owns the semaphores.
- `pWaitInfo` is a pointer to a `VkSemaphoreWaitInfo` structure containing information about the wait condition.
- `timeout` is the timeout period in units of nanoseconds. `timeout` is adjusted to the closest value allowed by the implementation-dependent timeout accuracy, which may be substantially longer than one nanosecond, and may be longer than the requested period.

If the condition is satisfied when `vkWaitSemaphores` is called, then `vkWaitSemaphores` returns immediately. If the condition is not satisfied at the time `vkWaitSemaphores` is called, then `vkWaitSemaphores` will block and wait until the condition is satisfied or the `timeout` has expired, whichever is sooner.

If `timeout` is zero, then `vkWaitSemaphores` does not wait, but simply returns information about the current state of the semaphores. `VK_TIMEOUT` will be returned in this case if the condition is not satisfied, even though no actual wait was performed.

If the condition is satisfied before the `timeout` has expired, `vkWaitSemaphores` returns `VK_SUCCESS`. Otherwise, `vkWaitSemaphores` returns `VK_TIMEOUT` after the `timeout` has expired.

If device loss occurs (see Lost Device) before the timeout has expired, `vkWaitSemaphores` must return in finite time with either `VK_SUCCESS` or `VK_ERROR_DEVICE_LOST`. 

---

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`
Valid Usage (Implicit)

- VUID-vkWaitSemaphores-device-parameter
  device must be a valid VkDevice handle

- VUID-vkWaitSemaphores-pWaitInfo-parameter
  pWaitInfo must be a valid pointer to a valid VkSemaphoreWaitInfo structure

Return Codes

Success
- VK_SUCCESS
- VK_TIMEOUT

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST

The VkSemaphoreWaitInfo structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkSemaphoreWaitInfo {
    VkStructureType sType;
    const void* pNext;
    VkSemaphoreWaitFlags flags;
    uint32_t semaphoreCount;
    const VkSemaphore* pSemaphores;
    const uint64_t* pValues;
} VkSemaphoreWaitInfo;
```

or the equivalent

```
// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreWaitInfo VkSemaphoreWaitInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is a bitmask of VkSemaphoreWaitFlagBits specifying additional parameters for the semaphore wait operation.
- semaphoreCount is the number of semaphores to wait on.
- pSemaphores is a pointer to an array of semaphoreCount semaphore handles to wait on.
• **pValues** is a pointer to an array of **semaphoreCount** timeline semaphore values.

### Valid Usage

- **VUID-VkSemaphoreWaitInfo-pSemaphores-03256**
  
  All of the elements of **pSemaphores** must reference a semaphore that was created with a **VkSemaphoreType** of **VK_SEMAPHORE_TYPE_TIMELINE**

### Valid Usage (Implicit)

- **VUID-VkSemaphoreWaitInfo-sType-sType**
  
  **sType** must be **VK_STRUCTURE_TYPE_SEMAPHORE_WAIT_INFO**

- **VUID-VkSemaphoreWaitInfo-pNext-pNext**
  
  **pNext** must be **NULL**

- **VUID-VkSemaphoreWaitInfo-flags-parameter**
  
  **flags** must be a valid combination of **VkSemaphoreWaitFlagBits** values

- **VUID-VkSemaphoreWaitInfo-pSemaphores-parameter**
  
  **pSemaphores** must be a valid pointer to an array of **semaphoreCount** valid **VkSemaphore** handles

- **VUID-VkSemaphoreWaitInfo-pValues-parameter**
  
  **pValues** must be a valid pointer to an array of **semaphoreCount** int64_t values

- **VUID-VkSemaphoreWaitInfo-semaphoreCount-arraylength**
  
  **semaphoreCount** must be greater than **0**

Bits which can be set in **VkSemaphoreWaitInfo::flags**, specifying additional parameters of a semaphore wait operation, are:

```c
// Provided by VK_VERSION_1_2
typedef enum VkSemaphoreWaitFlagBits {
    VK_SEMAPHORE_WAIT_ANY_BIT = 0x00000001,
    // Provided by VK_KHR_timeline_semaphore
    VK_SEMAPHORE_WAIT_ANY_BIT_KHR = VK_SEMAPHORE_WAIT_ANY_BIT,
} VkSemaphoreWaitFlagBits;
```

or the equivalent

```c
// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreWaitFlagBits VkSemaphoreWaitFlagBitsKHR;
```

- **VK_SEMAPHORE_WAIT_ANY_BIT** specifies that the semaphore wait condition is that at least one of the semaphores in **VkSemaphoreWaitInfo::pSemaphores** has reached the value specified by the corresponding element of **VkSemaphoreWaitInfo::pValues**. If **VK_SEMAPHORE_WAIT_ANY_BIT** is not set,
the semaphore wait condition is that all of the semaphores in `VkSemaphoreWaitInfo::pSemaphores` have reached the value specified by the corresponding element of `VkSemaphoreWaitInfo::pValues`.

```c
// Provided by VK_VERSION_1_2
typedef VkFlags VkSemaphoreWaitFlags;
```

or the equivalent

```c
// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreWaitFlags VkSemaphoreWaitFlagsKHR;
```

`VkSemaphoreWaitFlags` is a bitmask type for setting a mask of zero or more `VkSemaphoreWaitFlagBits`.

To signal a semaphore created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` with a particular counter value, on the host, call:

```c
// Provided by VK_VERSION_1_2
VkResult vkSignalSemaphore(
    VkDevice device,
    const VkSemaphoreSignalInfo* pSignalInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_timeline_semaphore
VkResult vkSignalSemaphoreKHR(
    VkDevice device,
    const VkSemaphoreSignalInfo* pSignalInfo);
```

- `device` is the logical device that owns the semaphore.
- `pSignalInfo` is a pointer to a `VkSemaphoreSignalInfo` structure containing information about the signal operation.

When `vkSignalSemaphore` is executed on the host, it defines and immediately executes a *semaphore signal operation* which sets the timeline semaphore to the given value.

The first synchronization scope is defined by the host execution model, but includes execution of `vkSignalSemaphore` on the host and anything that happened-before it.

The second synchronization scope is empty.

---

**Valid Usage (Implicit)**

- VUID-vkSignalSemaphore-device-parameter
  - `device` must be a valid `VkDevice` handle
pSignalInfo must be a valid pointer to a valid VkSemaphoreSignalInfo structure.

### Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkSemaphoreSignalInfo structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkSemaphoreSignalInfo {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    uint64_t value;
} VkSemaphoreSignalInfo;
```

or the equivalent

```
// Provided by VK_KHR_timelineSemaphore
typedef VkSemaphoreSignalInfo VkSemaphoreSignalInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **semaphore** is the handle of the semaphore to signal.
- **value** is the value to signal.

### Valid Usage

- VUID-vkSemaphoreSignalSemaphore-pSignalInfo-parameter
  - semaphore must have been created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE
- VUID-VkSemaphoreSignalInfo-value-03258
  - value must have a value greater than the current value of the semaphore
- VUID-VkSemaphoreSignalInfo-value-03259
  - value must be less than the value of any pending semaphore signal operations
- VUID-VkSemaphoreSignalInfo-value-03260

---

284
Valid Usage (Implicit)

- VUID-VkSemaphoreSignalInfo-sType-sType
  - sType must be VK_STRUCTURE_TYPE_SEMAPHORE_SIGNAL_INFO
- VUID-VkSemaphoreSignalInfo-pNext-pNext
  - pNext must be NULL
- VUID-VkSemaphoreSignalInfo-semaphore-parameter
  - semaphore must be a valid VkSemaphore handle

7.4.5. Importing Semaphore Payloads

Applications can import a semaphore payload into an existing semaphore using an external semaphore handle. The effects of the import operation will be either temporary or permanent, as specified by the application. If the import is temporary, the implementation must restore the semaphore to its prior permanent state after submitting the next semaphore wait operation. Performing a subsequent temporary import on a semaphore before performing a semaphore wait has no effect on this requirement; the next wait submitted on the semaphore must still restore its last permanent state. A permanent payload import behaves as if the target semaphore was destroyed, and a new semaphore was created with the same handle but the imported payload. Because importing a semaphore payload temporarily or permanently detaches the existing payload from a semaphore, similar usage restrictions to those applied to vkDestroySemaphore are applied to any command that imports a semaphore payload. Which of these import types is used is referred to as the import operation’s permanence. Each handle type supports either one or both types of permanence.

The implementation must perform the import operation by either referencing or copying the payload referred to by the specified external semaphore handle, depending on the handle’s type. The import method used is referred to as the handle type’s transference. When using handle types with reference transference, importing a payload to a semaphore adds the semaphore to the set of all semaphores sharing that payload. This set includes the semaphore from which the payload was exported. Semaphore signaling and waiting operations performed on any semaphore in the set must behave as if the set were a single semaphore. Importing a payload using handle types with copy transference creates a duplicate copy of the payload at the time of import, but makes no further reference to it. Semaphore signaling and waiting operations performed on the target of copy imports must not affect any other semaphore or payload.

Export operations have the same transference as the specified handle type’s import operations. Additionally, exporting a semaphore payload to a handle with copy transference has the same side effects on the source semaphore’s payload as executing a semaphore wait operation. If the semaphore was using a temporarily imported payload, the semaphore’s prior permanent payload will be restored.
The permanence and transference of handle types can be found in:

- Handle Types Supported by `VkImportSemaphoreWin32HandleInfoKHR`
- Handle Types Supported by `VkImportSemaphoreFdInfoKHR`

External synchronization allows implementations to modify an object's internal state, i.e. payload, without internal synchronization. However, for semaphores sharing a payload across processes, satisfying the external synchronization requirements of `VkSemaphore` parameters as if all semaphores in the set were the same object is sometimes infeasible. Satisfying the wait operation state requirements would similarly require impractical coordination or levels of trust between processes. Therefore, these constraints only apply to a specific semaphore handle, not to its payload. For distinct semaphore objects which share a payload, if the semaphores are passed to separate queue submission commands concurrently, behavior will be as if the commands were called in an arbitrary sequential order. If the wait operation state requirements are violated for the shared payload by a queue submission command, or if a signal operation is queued for a shared payload that is already signaled or has a pending signal operation, effects must be limited to one or more of the following:

- Returning `VK_ERROR_INITIALIZATION_FAILED` from the command which resulted in the violation.
- Losing the logical device on which the violation occurred immediately or at a future time, resulting in a `VK_ERROR_DEVICE_LOST` error from subsequent commands, including the one causing the violation.
- Continuing execution of the violating command or operation as if the semaphore wait completed successfully after an implementation-dependent timeout. In this case, the state of the payload becomes undefined, and future operations on semaphores sharing the payload will be subject to these same rules. The semaphore must be destroyed or have its payload replaced by an import operation to again have a well-defined state.

These rules allow processes to synchronize access to shared memory without trusting each other. However, such processes must still be cautious not to use the shared semaphore for more than synchronizing access to the shared memory. For example, a process should not use a shared semaphore as part of an execution dependency chain that, when complete, leads to objects being destroyed, if it does not trust other processes sharing the semaphore payload.

When a semaphore is using an imported payload, its `VkExportSemaphoreCreateInfo::handleTypes` value is specified when creating the semaphore from which the payload was exported, rather than specified when creating the semaphore. Additionally, `VkExternalSemaphoreProperties::exportFromImportedHandleTypes` restricts which handle types can be exported from such a semaphore based on the specific handle type used to import the current payload. Passing a semaphore to `vkAcquireNextImageKHR` is equivalent to temporarily importing a semaphore payload to that semaphore.
Because the exportable handle types of an imported semaphore correspond to its current imported payload, and \texttt{vkAcquireNextImageKHR} behaves the same as a temporary import operation for which the source semaphore is opaque to the application, applications have no way of determining whether any external handle types \textbf{can} be exported from a semaphore in this state. Therefore, applications \textbf{must} not attempt to export external handles from semaphores using a temporarily imported payload from \texttt{vkAcquireNextImageKHR}.

When importing a semaphore payload, it is the responsibility of the application to ensure the external handles meet all valid usage requirements. However, implementations \textbf{must} perform sufficient validation of external handles to ensure that the operation results in a valid semaphore which will not cause program termination, device loss, queue stalls, or corruption of other resources when used as allowed according to its import parameters, and excepting those side effects allowed for violations of the \textbf{valid semaphore state for wait operations} rules. If the external handle provided does not meet these requirements, the implementation \textbf{must} fail the semaphore payload import operation with the error code \texttt{VK\_ERROR\_INVALID\_EXTERNAL\_HANDLE}.

In addition, when importing a semaphore payload that is not compatible with the payload type corresponding to the \texttt{VkSemaphoreType} the semaphore was created with, the implementation \textbf{may} fail the semaphore payload import operation with the error code \texttt{VK\_ERROR\_INVALID\_EXTERNAL\_HANDLE}.

\textbf{Note}

As the introduction of the external semaphore handle type \texttt{VK\_EXTERNAL\_SEMAPHORE\_HANDLE\_TYPE\_D3D12\_FENCE\_BIT} predates that of timeline semaphores, support for importing semaphore payloads from external handles of that type into semaphores created (implicitly or explicitly) with a \texttt{VkSemaphoreType} of \texttt{VK\_SEMAPHORE\_TYPE\_BINARY} is preserved for backwards compatibility. However, applications \textbf{should} prefer importing such handle types into semaphores created with a \texttt{VkSemaphoreType} of \texttt{VK\_SEMAPHORE\_TYPE\_TIMELINE}.

To import a semaphore payload from a Windows handle, call:

\begin{verbatim}
// Provided by VK\_KHR\_external\_semaphore\_win32
VkResult vkImportSemaphoreWin32HandleKHR(
    VkDevice device,
    const VkImportSemaphoreWin32HandleInfoKHR* pImportSemaphoreWin32HandleInfo);
\end{verbatim}

- \texttt{device} is the logical device that created the semaphore.
- \texttt{pImportSemaphoreWin32HandleInfo} is a pointer to a \texttt{VkImportSemaphoreWin32HandleInfoKHR} structure specifying the semaphore and import parameters.

Importing a semaphore payload from Windows handles does not transfer ownership of the handle to the Vulkan implementation. For handle types defined as NT handles, the application \textbf{must} release ownership using the \texttt{CloseHandle} system call when the handle is no longer needed.

Applications \textbf{can} import the same semaphore payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.
Valid Usage (Implicit)

- VUID-vkImportSemaphoreWin32HandleKHR-device-parameter
device must be a valid VkDevice handle

- VUID-vkImportSemaphoreWin32HandleKHR-pImportSemaphoreWin32HandleInfo-para
ument
pImportSemaphoreWin32HandleInfo must be a valid pointer to a valid VkImportSemaphoreWin32HandleInfoKHR structure

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_INVALID_EXTERNAL_HANDLE

The VkImportSemaphoreWin32HandleInfoKHR structure is defined as:

```c
// Provided by VK_KHR_external_semaphore_win32
typedef struct VkImportSemaphoreWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    VkSemaphoreImportFlags flags;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
    HANDLE handle;
    LPCWSTR name;
} VkImportSemaphoreWin32HandleInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **semaphore** is the semaphore into which the payload will be imported.
- **flags** is a bitmask of VkSemaphoreImportFlagBits specifying additional parameters for the semaphore payload import operation.
- **handleType** is a VkExternalSemaphoreHandleTypeFlagBits value specifying the type of handle.
- **handle** is NULL or the external handle to import.
- **name** is NULL or a null-terminated UTF-16 string naming the underlying synchronization primitive to import.

The handle types supported by handleType are:
Table 8. Handle Types Supported by VkImportSemaphoreWin32HandleInfoKHR

<table>
<thead>
<tr>
<th>Handle Type</th>
<th>Transference</th>
<th>Permanence Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT</td>
<td>Reference</td>
<td>Temporary,Permanent</td>
</tr>
<tr>
<td>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT</td>
<td>Reference</td>
<td>Temporary,Permanent</td>
</tr>
<tr>
<td>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT</td>
<td>Reference</td>
<td>Temporary,Permanent</td>
</tr>
</tbody>
</table>

Valid Usage

- VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01140
  handleType must be a value included in the Handle Types Supported by VkImportSemaphoreWin32HandleInfoKHR table.

- VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01466
  If handleType is not VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT or VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT, name must be NULL.

- VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01467
  If handle is NULL, name must name a valid synchronization primitive of the type specified by handleType.

- VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01468
  If name is NULL, handle must be a valid handle of the type specified by handleType.

- VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01469
  If handle is not NULL, name must be NULL.

- VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01542
  If handle is not NULL, it must obey any requirements listed for handleType in external semaphore handle types compatibility.

- VUID-VkImportSemaphoreWin32HandleInfoKHR-name-01543
  If name is not NULL, it must obey any requirements listed for handleType in external semaphore handle types compatibility.

- VUID-VkImportSemaphoreWin32HandleInfoKHR-flags-03322
  If flags contains VK_SEMAPHORE_IMPORT_TEMPORARY_BIT, the VkSemaphoreTypeCreateInfo::semaphoreType field must match that of the semaphore from which handle or name was exported.
::semaphoreType field of the semaphore from which handle or name was exported must not be VK_SEMAPHORE_TYPE_TIMELINE

**Valid Usage (Implicit)**

- VUID-VkImportSemaphoreWin32HandleInfoKHR-sType-sType
  - sType must be VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_WIN32_HANDLE_INFO_KHR
- VUID-VkImportSemaphoreWin32HandleInfoKHR-pNext-pNext
  - pNext must be NULL
- VUID-VkImportSemaphoreWin32HandleInfoKHR-semaphore-parameter
  - semaphore must be a valid VkSemaphore handle
- VUID-VkImportSemaphoreWin32HandleInfoKHR-flags-parameter
  - flags must be a valid combination of VkSemaphoreImportFlagBits values

**Host Synchronization**

- Host access to semaphore must be externally synchronized

To import a semaphore payload from a POSIX file descriptor, call:

```c
// Provided by VK_KHR_external_semaphore_fd
VkResult vkImportSemaphoreFdKHR(
    VkDevice device,
    const VkImportSemaphoreFdInfoKHR* pImportSemaphoreFdInfo);
```

- device is the logical device that created the semaphore.
- pImportSemaphoreFdInfo is a pointer to a VkImportSemaphoreFdInfoKHR structure specifying the semaphore and import parameters.

Importing a semaphore payload from a file descriptor transfers ownership of the file descriptor from the application to the Vulkan implementation. The application must not perform any operations on the file descriptor after a successful import.

Applications can import the same semaphore payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

**Valid Usage**

- VUID-vkImportSemaphoreFdKHR-semaphore-01142
  - semaphore must not be associated with any queue command that has not yet completed execution on that queue
Valid Usage (Implicit)

- **VUID-vkImportSemaphoreFdKHR-device-parameter**
  - `device` **must** be a valid `VkDevice` handle

- **VUID-vkImportSemaphoreFdKHR-pImportSemaphoreFdInfo-parameter**
  - `pImportSemaphoreFdInfo` **must** be a valid pointer to a valid `VkImportSemaphoreFdInfoKHR` structure

Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_INVALID_EXTERNAL_HANDLE`

The `VkImportSemaphoreFdInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_semaphore_fd
typedef struct VkImportSemaphoreFdInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    VkSemaphoreImportFlags flags;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
    int fd;
} VkImportSemaphoreFdInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `semaphore` is the semaphore into which the payload will be imported.
- `flags` is a bitmask of `VkSemaphoreImportFlagBits` specifying additional parameters for the semaphore payload import operation.
- `handleType` is a `VkExternalSemaphoreHandleTypeFlagBits` value specifying the type of `fd`.
- `fd` is the external handle to import.

The handle types supported by `handleType` are:

Table 9. Handle Types Supported by `VkImportSemaphoreFdInfoKHR`
<table>
<thead>
<tr>
<th>Handle Type</th>
<th>Transference</th>
<th>Permanence Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT</td>
<td>Reference</td>
<td>Temporary,Permanent</td>
</tr>
<tr>
<td>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT</td>
<td>Copy</td>
<td>Temporary</td>
</tr>
</tbody>
</table>

### Valid Usage

- VUID-VkImportSemaphoreFdInfoKHR-handleType-01143
  - `handleType` must be a value included in the Handle Types Supported by `VkImportSemaphoreFdInfoKHR` table.
- VUID-VkImportSemaphoreFdInfoKHR-fd-01544
  - `fd` must obey any requirements listed for `handleType` in the external semaphore handle types compatibility.
- VUID-VkImportSemaphoreFdInfoKHR-handleType-03263
  - If `handleType` is `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT`, the `VkSemaphoreCreateInfo::flags` field must match that of the semaphore from which `fd` was exported.
- VUID-VkImportSemaphoreFdInfoKHR-handleType-07307
  - If `handleType` refers to a handle type with copy payload transference semantics, `flags` must contain `VK_SEMAPHORE_IMPORT_TEMPORARY_BIT`.
- VUID-VkImportSemaphoreFdInfoKHR-handleType-03264
  - If `handleType` is `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT`, the `VkSemaphoreTypeCreateInfo::semaphoreType` field must match that of the semaphore from which `fd` was exported.
- VUID-VkImportSemaphoreFdInfoKHR-flags-03323
  - If `flags` contains `VK_SEMAPHORE_IMPORT_TEMPORARY_BIT`, the `VkSemaphoreTypeCreateInfo::semaphoreType` field of the semaphore from which `fd` was exported must not be `VK_SEMAPHORE_TYPE_TIMELINE`.

If `handleType` is `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT`, the special value `-1` for `fd` is treated like a valid sync file descriptor referring to an object that has already signaled. The import operation will succeed and the `VkSemaphore` will have a temporarily imported payload as if a valid file descriptor had been provided.

**Note**

This special behavior for importing an invalid sync file descriptor allows easier interoperability with other system APIs which use the convention that an invalid sync file descriptor represents work that has already completed and does not need to be waited for. It is consistent with the option for implementations to return a `-1` file descriptor when exporting a `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT` from a `VkSemaphore` which is signaled.
Valid Usage (Implicit)

- VUID-VkImportSemaphoreFdInfoKHR-sType-sType
  \textit{sType} \textbf{must} be \texttt{VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_FD_INFO_KHR}

- VUID-VkImportSemaphoreFdInfoKHR-pNext-pNext
  \textit{pNext} \textbf{must} be \texttt{NULL}

- VUID-VkImportSemaphoreFdInfoKHR-semaphore-parameter
  \textit{semaphore} \textbf{must} be a valid \texttt{VkSemaphore} handle

- VUID-VkImportSemaphoreFdInfoKHR-flags-parameter
  \textit{flags} \textbf{must} be a valid combination of \texttt{VkSemaphoreImportFlagBits} values

- VUID-VkImportSemaphoreFdInfoKHR-handleType-parameter
  \textit{handleType} \textbf{must} be a valid \texttt{VkExternalSemaphoreHandleTypeFlagBits} value

Host Synchronization

- Host access to \textit{semaphore} \textbf{must} be externally synchronized

Bits which \textbf{can} be set in

- \texttt{VkImportSemaphoreWin32HandleInfoKHR::flags}
- \texttt{VkImportSemaphoreFdInfoKHR::flags}

specifying additional parameters of a semaphore import operation are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkSemaphoreImportFlagBits {
    VK_SEMAPHORE_IMPORT_TEMPORARY_BIT = 0x00000001,
// Provided by VK_KHR_external_semaphore
    VK_SEMAPHORE_IMPORT_TEMPORARY_BIT_KHR = VK_SEMAPHORE_IMPORT_TEMPORARY_BIT,
} VkSemaphoreImportFlagBits;
```

or the equivalent

```c
// Provided by VK_KHR_external_semaphore
typedef VkSemaphoreImportFlagBits VkSemaphoreImportFlagBitsKHR;
```

These bits have the following meanings:

- \texttt{VK_SEMAPHORE_IMPORT_TEMPORARY_BIT} specifies that the semaphore payload will be imported only temporarily, as described in Importing Semaphore Payloads, regardless of the permanence of \textit{handleType}.
typedef VkFlags VkSemaphoreImportFlags;

or the equivalent

```c
// Provided by VK_KHR_external_semaphore
typedef VkSemaphoreImportFlags VkSemaphoreImportFlagsKHR;
```

VkSemaphoreImportFlags is a bitmask type for setting a mask of zero or more VkSemaphoreImportFlagBits.

### 7.5. Events

Events are a synchronization primitive that can be used to insert a fine-grained dependency between commands submitted to the same queue, or between the host and a queue. Events must not be used to insert a dependency between commands submitted to different queues. Events have two states - signaled and unsignaled. An application can signal or unsignal an event either on the host or on the device. A device can be made to wait for an event to become signaled before executing further operations. No command exists to wait for an event to become signaled on the host, but the current state of an event can be queried.

Events are represented by VkEvent handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkEvent)
```

To create an event, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateEvent(
    VkDevice device,                      // device
    const VkEventCreateInfo* pCreateInfo, // pCreateInfo
    const VkAllocationCallbacks* pAllocator, // pAllocator
    VkEvent* pEvent                     // pEvent
);
```

- **device** is the logical device that creates the event.
- **pCreateInfo** is a pointer to a VkEventCreateInfo structure containing information about how the event is to be created.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pEvent** is a pointer to a handle in which the resulting event object is returned.

When created, the event object is in the unsignaled state.
**Valid Usage**

- VUID-vkCreateEvent-events-04468
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::events is VK_FALSE, then the implementation does not support events, and vkCreateEvent must not be used.

**Valid Usage (Implicit)**

- VUID-vkCreateEvent-device-parameter
device must be a valid VkDevice handle

- VUID-vkCreateEvent-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkEventCreateInfo structure

- VUID-vkCreateEvent-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateEvent-pEvent-parameter
  pEvent must be a valid pointer to a VkEvent handle

**Return Codes**

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkEventCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkEventCreateInfo {  
    VkStructureType          sType;
    const void*              pNext;
    VkEventCreateFlags       flags;
} VkEventCreateInfo;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkEventCreateFlagBits defining additional creation parameters.
Valid Usage (Implicit)

- VUID-VkEventCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_EVENT_CREATE_INFO
- VUID-VkEventCreateInfo-pNext-pNext
  pNext must be NULL
- VUID-VkEventCreateInfo-flags-parameter
  flags must be a valid combination of VkEventCreateFlagBits values

// Provided by VK_VERSION_1_0
typedef enum VkEventCreateFlagBits {
    // Provided by VK_VERSION_1_3
    VK_EVENT_CREATE_DEVICE_ONLY_BIT = 0x00000001,
    // Provided by VK_KHR_synchronization2
    VK_EVENT_CREATE_DEVICE_ONLY_BIT_KHR = VK_EVENT_CREATEDEVICEONLYBIT,
} VkEventCreateFlagBits;

• VK_EVENT_CREATE_DEVICE_ONLY_BIT specifies that host event commands will not be used with this event.

// Provided by VK_VERSION_1_0
typedef VkFlags VkEventCreateFlags;

VkEventCreateFlags is a bitmask type for setting a mask of VkEventCreateFlagBits.

To destroy an event, call:

// Provided by VK_VERSION_1_0
void vkDestroyEvent(
    VkDevice device,            // Provided by VK_VERSION_1_0
    VkEvent event,             // Provided by VK_VERSION_1_0
    const VkAllocationCallbacks* pAllocator);

• device is the logical device that destroys the event.
• event is the handle of the event to destroy.
• pAllocator controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyEvent-event-01145
  All submitted commands that refer to event must have completed execution
- VUID-vkDestroyEvent-event-01146
If `VkAllocationCallbacks` were provided when `event` was created, a compatible set of callbacks **must** be provided here

- VUID-vkDestroyEvent-event-01147
  
  If no `VkAllocationCallbacks` were provided when `event` was created, `pAllocator` **must** be `NULL`

**Valid Usage (Implicit)**

- VUID-vkDestroyEvent-device-parameter
  
  `device` **must** be a valid `VkDevice` handle

- VUID-vkDestroyEvent-event-parameter
  
  If `event` is not `VK_NULL_HANDLE`, `event` **must** be a valid `VkEvent` handle

- VUID-vkDestroyEvent-pAllocator-parameter
  
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkDestroyEvent-event-parent
  
  If `event` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

**Host Synchronization**

- Host access to `event` **must** be externally synchronized

To query the state of an event from the host, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkGetEventStatus(
    VkDevice device,
    VkEvent event);
```

- `device` is the logical device that owns the event.
- `event` is the handle of the event to query.

Upon success, `vkGetEventStatus` returns the state of the event object with the following return codes:

**Table 10. Event Object Status Codes**

<table>
<thead>
<tr>
<th>Status</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_EVENT_SET</td>
<td>The event specified by <code>event</code> is signaled.</td>
</tr>
<tr>
<td>VK_EVENT_RESET</td>
<td>The event specified by <code>event</code> is unsignaled.</td>
</tr>
</tbody>
</table>

If a `vkCmdSetEvent` or `vkCmdResetEvent` command is in a command buffer that is in the pending state,
then the value returned by this command may immediately be out of date.

The state of an event can be updated by the host. The state of the event is immediately changed, and subsequent calls to `vkGetEventStatus` will return the new state. If an event is already in the requested state, then updating it to the same state has no effect.

### Valid Usage

- VUID-vkGetEventStatus-event-03940
  - event must not have been created with `VK_EVENT_CREATE_DEVICE_ONLY_BIT`

### Valid Usage (Implicit)

- VUID-vkGetEventStatus-device-parameter
  - device must be a valid `VkDevice` handle
- VUID-vkGetEventStatus-event-parameter
  - event must be a valid `VkEvent` handle
- VUID-vkGetEventStatus-event-parent
  - event must have been created, allocated, or retrieved from device

### Return Codes

**Success**

- `VK_EVENT_SET`
- `VK_EVENT_RESET`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`

To set the state of an event to signaled from the host, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkSetEvent(
    VkDevice device,
    VkEvent event);
```

- `device` is the logical device that owns the event.
- `event` is the event to set.

When `vkSetEvent` is executed on the host, it defines an event signal operation which sets the event
to the signaled state.

If \texttt{event} is already in the signaled state when \texttt{vkSetEvent} is executed, then \texttt{vkSetEvent} has no effect, and no event signal operation occurs.

\begin{itemize}
  \item \textbf{Valid Usage} \hfill \textbf{VUID-vkSetEvent-event-03941}
    \begin{itemize}
      \item \texttt{event} \textbf{must} not have been created with \texttt{VK_EVENT_CREATE_DEVICE_ONLY_BIT}
    \end{itemize}
  \item \textbf{Valid Usage (Implicit)} \hfill \textbf{VUID-vkSetEvent-event-09543}
    \begin{itemize}
      \item \texttt{event} \textbf{must} not be waited on by a command buffer in the \texttt{pending state}
    \end{itemize}
  \item \textbf{Host Synchronization} \hfill \textbf{VUID-vkSetEvent-event-parent}
    \begin{itemize}
      \item \texttt{event} \textbf{must} have been created, allocated, or retrieved from \texttt{device}
    \end{itemize}
  \item \textbf{Return Codes} \hfill \textbf{VUID-vkSetEvent-event-parameter}
    \begin{itemize}
      \item \textbf{Success} \hfill \textbf{VK_SUCCESS}
      \item \textbf{Failure} \hfill \texttt{VK_ERROR_OUT_OF_HOST_MEMORY} \hfill \texttt{VK_ERROR_OUT_OF_DEVICE_MEMORY}
    \end{itemize}
\end{itemize}

To set the state of an event to unsignaled from the host, call:

\begin{verbatim}
// Provided by VK_VERSION_1_0
\end{verbatim}
VkResult *vkResetEvent*

```c
VkDevice
VkEvent
```

- `device` is the logical device that owns the event.
- `event` is the event to reset.

When `vkResetEvent` is executed on the host, it defines an event unsignal operation which resets the event to the unsignaled state.

If `event` is already in the unsignaled state when `vkResetEvent` is executed, then `vkResetEvent` has no effect, and no event unsignal operation occurs.

### Valid Usage

- VUID-vkResetEvent-event-03821
  There must be an execution dependency between `vkResetEvent` and the execution of any `vkCmdWaitEvents` that includes `event` in its `pEvents` parameter

- VUID-vkResetEvent-event-03822
  There must be an execution dependency between `vkResetEvent` and the execution of any `vkCmdWaitEvents2` that includes `event` in its `pEvents` parameter

- VUID-vkResetEvent-event-03823
  `event` must not have been created with `VK_EVENT_CREATE_DEVICEONLY_BIT`

### Valid Usage (Implicit)

- VUID-vkResetEvent-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkResetEvent-event-parameter
  `event` must be a valid `VkEvent` handle

- VUID-vkResetEvent-event-parent
  `event` must have been created, allocated, or retrieved from `device`

### Host Synchronization

- Host access to `event` must be externally synchronized

### Return Codes

**Success**

- `VK_SUCCESS`
The state of an event can also be updated on the device by commands inserted in command buffers.

To signal an event from a device, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetEvent2(VkCommandBuffer commandBuffer, VkEvent event, const VkDependencyInfo* pDependencyInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_synchronization2
void vkCmdSetEvent2KHR(VkCommandBuffer commandBuffer, VkEvent event, const VkDependencyInfo* pDependencyInfo);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `event` is the event that will be signaled.
- `pDependencyInfo` is a pointer to a `VkDependencyInfo` structure defining the first scopes of this operation.

When `vkCmdSetEvent2` is submitted to a queue, it defines the first half of memory dependencies defined by `pDependencyInfo`, as well as an event signal operation which sets the event to the signaled state. A memory dependency is defined between the event signal operation and commands that occur earlier in submission order.

The first **synchronization scope** and **access scope** are defined by the union of all the memory dependencies defined by `pDependencyInfo`, and are applied to all operations that occur earlier in submission order. Queue family ownership transfers and image layout transitions defined by `pDependencyInfo` are also included in the first scopes.

The second **synchronization scope** includes only the event signal operation, and any queue family ownership transfers and image layout transitions defined by `pDependencyInfo`. The second **access scope** includes only queue family ownership transfers and image layout transitions.

Future `vkCmdWaitEvents2` commands rely on all values of each element in `pDependencyInfo` matching exactly with those used to signal the corresponding event. `vkCmdWaitEvents` must not be used to wait on the result of a signal operation defined by `vkCmdSetEvent2`. 
The extra information provided by `vkCmdSetEvent2` compared to `vkCmdSetEvent` allows implementations to more efficiently schedule the operations required to satisfy the requested dependencies. With `vkCmdSetEvent`, the full dependency information is not known until `vkCmdWaitEvents` is recorded, forcing implementations to insert the required operations at that point and not before.

If `event` is already in the signaled state when `vkCmdSetEvent2` is executed on the device, then `vkCmdSetEvent2` has no effect, no event signal operation occurs, and no dependency is generated.

### Valid Usage

- **VUID-vkCmdSetEvent2-synchronization2-03824**
  The `synchronization2` feature **must** be enabled

- **VUID-vkCmdSetEvent2-dependencyFlags-03825**
  The `dependencyFlags` member of `pDependencyInfo` **must** be 0

- **VUID-vkCmdSetEvent2-srcStageMask-09391**
  The `srcStageMask` member of any element of the `pMemoryBarriers`, `pBufferMemoryBarriers`, or `pImageMemoryBarriers` members of `pDependencyInfo` **must** not include `VK_PIPELINE_STAGE_2_HOST_BIT`

- **VUID-vkCmdSetEvent2-dstStageMask-09392**
  The `dstStageMask` member of any element of the `pMemoryBarriers`, `pBufferMemoryBarriers`, or `pImageMemoryBarriers` members of `pDependencyInfo` **must** not include `VK_PIPELINE_STAGE_2_HOST_BIT`

- **VUID-vkCmdSetEvent2-commandBuffer-03826**
  The current device mask of `commandBuffer` **must** include exactly one physical device

- **VUID-vkCmdSetEvent2-srcStageMask-03827**
  The `srcStageMask` member of any element of the `pMemoryBarriers`, `pBufferMemoryBarriers`, or `pImageMemoryBarriers` members of `pDependencyInfo` **must** only include pipeline stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from

- **VUID-vkCmdSetEvent2-dstStageMask-03828**
  The `dstStageMask` member of any element of the `pMemoryBarriers`, `pBufferMemoryBarriers`, or `pImageMemoryBarriers` members of `pDependencyInfo` **must** only include pipeline stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from

### Valid Usage (Implicit)

- **VUID-vkCmdSetEvent2-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetEvent2-event-parameter**
  `event` **must** be a valid `VkEvent` handle
VUID-vkCmdSetEvent2-pDependencyInfo-parameter

pDependencyInfo must be a valid pointer to a valid VkDependencyInfo structure

VUID-vkCmdSetEvent2-commandBuffer-recording

commandBuffer must be in the recording state

VUID-vkCmdSetEvent2-commandBuffer-cmdpool

The VkCommandPool that commandBuffer was allocated from must support graphics, compute, decode, or encode operations

VUID-vkCmdSetEvent2-renderpass

This command must only be called outside of a render pass instance

VUID-vkCmdSetEvent2-commonparent

Both of commandBuffer, and event must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>

The VkDependencyInfo structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkDependencyInfo {
    VkStructureType sType;
    const void* pNext;
    VkDependencyFlags dependencyFlags;
    uint32_t memoryBarrierCount;
    const VkMemoryBarrier2* pMemoryBarriers;
    uint32_t bufferMemoryBarrierCount;
    const VkBufferMemoryBarrier2* pBufferMemoryBarriers;
    uint32_t imageMemoryBarrierCount;
    const VkImageMemoryBarrier2* pImageMemoryBarriers;
} VkDependencyInfo;
```
or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkDependencyInfo VkDependencyInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `dependencyFlags` is a bitmask of `VkDependencyFlagBits` specifying how execution and memory dependencies are formed.
- `memoryBarrierCount` is the length of the `pMemoryBarriers` array.
- `pMemoryBarriers` is a pointer to an array of `VkMemoryBarrier2` structures defining memory dependencies between any memory accesses.
- `bufferMemoryBarrierCount` is the length of the `pBufferMemoryBarriers` array.
- `pBufferMemoryBarriers` is a pointer to an array of `VkBufferMemoryBarrier2` structures defining memory dependencies between buffer ranges.
- `imageMemoryBarrierCount` is the length of the `pImageMemoryBarriers` array.
- `pImageMemoryBarriers` is a pointer to an array of `VkImageMemoryBarrier2` structures defining memory dependencies between image subresources.

This structure defines a set of memory dependencies, as well as queue family transfer operations and image layout transitions.

Each member of `pMemoryBarriers`, `pBufferMemoryBarriers`, and `pImageMemoryBarriers` defines a separate memory dependency.

### Valid Usage (Implicit)

- **VUID-VkDependencyInfo-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_DEPENDENCY_INFO`

- **VUID-VkDependencyInfo-pNext-pNext**
  
  `pNext` must be `NULL`

- **VUID-VkDependencyInfo-dependsOnFlags-flags**
  
  `dependencyFlags` must be a valid combination of `VkDependencyFlagBits` values

- **VUID-VkDependencyInfo-pMemoryBarriers-parameter**
  
  If `memoryBarrierCount` is not 0, `pMemoryBarriers` must be a valid pointer to an array of `VkMemoryBarrier2` structures

- **VUID-VkDependencyInfo-pBufferMemoryBarriers-parameter**
  
  If `bufferMemoryBarrierCount` is not 0, `pBufferMemoryBarriers` must be a valid pointer to an array of `VkBufferMemoryBarrier2` structures

- **VUID-VkDependencyInfo-pImageMemoryBarriers-parameter**
  
  If `imageMemoryBarrierCount` is not 0, `pImageMemoryBarriers` must be a valid pointer to an array of `VkImageMemoryBarrier2` structures
To set the state of an event to signaled from a device, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetEvent(
    VkCommandBuffer commandBuffer,
    VkEvent event,
    VkPipelineStageFlags stageMask);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `event` is the event that will be signaled.
- `stageMask` specifies the source stage mask used to determine the first synchronization scope.

`vkCmdSetEvent` behaves identically to `vkCmdSetEvent2`, except that it does not define an access scope, and must only be used with `vkCmdWaitEvents`, not `vkCmdWaitEvents2`.

**Valid Usage**

- VUID-vkCmdSetEvent-stageMask-04090
  If the geometryShader feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`

- VUID-vkCmdSetEvent-stageMask-04091
  If the tessellationShader feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`

- VUID-vkCmdSetEvent-stageMask-07319
  If the attachmentFragmentShadingRate feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-vkCmdSetEvent-stageMask-03937
  If the synchronization2 feature is not enabled, `stageMask` must not be 0

- VUID-vkCmdSetEvent-stageMask-07950
  If the rayTracingPipeline feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`

- VUID-vkCmdSetEvent-stageMask-06457
  Any pipeline stage included in `stageMask` must be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the table of supported pipeline stages

- VUID-vkCmdSetEvent-stageMask-01149
  `stageMask` must not include `VK_PIPELINE_STAGE_HOST_BIT`

- VUID-vkCmdSetEvent-commandBuffer-01152
  The current device mask of `commandBuffer` must include exactly one physical device
Valid Usage (Implicit)

- **VUID-vkCmdSetEvent-commandBuffer-parameter**
  
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetEvent-event-parameter**
  
  `event` **must** be a valid `VkEvent` handle

- **VUID-vkCmdSetEvent-stageMask-parameter**
  
  `stageMask` **must** be a valid combination of `VkPipelineStageFlagBits` values

- **VUID-vkCmdSetEvent-commandBuffer-recording**
  
  `commandBuffer` **must** be in the recording state

- **VUID-vkCmdSetEvent-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, compute, decode, or encode operations

- **VUID-vkCmdSetEvent-renderpass**
  
  This command **must** only be called outside of a render pass instance

- **VUID-vkCmdSetEvent-commonparent**
  
  Both of `commandBuffer`, and `event` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>

</tbody>
</table>

To unsignal the event from a device, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdResetEvent2(
    VkCommandBuffer commandBuffer,
    VkEvent event,
```
VkPipelineStageFlags2 stageMask);

or the equivalent command

```
// Provided by VK_KHR_synchronization2
void vkCmdResetEvent2KHR(
    VkCommandBuffer commandBuffer,  
    VkEvent event,  
    VkPipelineStageFlags2 stageMask);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `event` is the event that will be unsignaled.
- `stageMask` is a `VkPipelineStageFlags2` mask of pipeline stages used to determine the first synchronization scope.

When `vkCmdResetEvent2` is submitted to a queue, it defines an execution dependency on commands that were submitted before it, and defines an event unsignal operation which resets the event to the unsignaled state.

The first synchronization scope includes all commands that occur earlier in submission order. The synchronization scope is limited to operations by `stageMask` or stages that are logically earlier than `stageMask`.

The second synchronization scope includes only the event unsignal operation.

If `event` is already in the unsignaled state when `vkCmdResetEvent2` is executed on the device, then this command has no effect, no event unsignal operation occurs, and no execution dependency is generated.

---

**Valid Usage**

- VUID-vkCmdResetEvent2-stageMask-03929
  If the `geometryShader` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`

- VUID-vkCmdResetEvent2-stageMask-03930
  If the `tessellationShader` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_TESSellation_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_2_TESSellation_EVALUATION_SHADER_BIT`

- VUID-vkCmdResetEvent2-stageMask-07317
  If the `attachmentFragmentShadingRate` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-vkCmdResetEvent2-stageMask-07947
  If the `rayTracingPipeline` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`

- VUID-vkCmdResetEvent2-synchronization2-03829
The synchronization feature must be enabled

- VUID-vkCmdResetEvent2-stageMask-03830
  stageMask must not include VK_PIPELINE_STAGE_2_HOST_BIT

- VUID-vkCmdResetEvent2-event-03831
  There must be an execution dependency between vkCmdResetEvent2 and the execution of any vkCmdWaitEvents that includes event in its pEvents parameter

- VUID-vkCmdResetEvent2-event-03832
  There must be an execution dependency between vkCmdResetEvent2 and the execution of any vkCmdWaitEvents2 that includes event in its pEvents parameter

- VUID-vkCmdResetEvent2-commandBuffer-03833
  commandBuffer’s current device mask must include exactly one physical device

Valid Usage (Implicit)

- VUID-vkCmdResetEvent2-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdResetEvent2-event-parameter
  event must be a valid VkEvent handle

- VUID-vkCmdResetEvent2-stageMask-parameter
  stageMask must be a valid combination of VkPipelineStageFlagBits2 values

- VUID-vkCmdResetEvent2-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdResetEvent2-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, compute, decode, or encode operations

- VUID-vkCmdResetEvent2-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdResetEvent2-commonparent
  Both of commandBuffer, and event must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
Command Properties

<table>

To set the state of an event to unsignaled from a device, call:

```c
// Provided by VK_VERSION_1_0
define void vkCmdResetEvent(
    VkCommandBuffer commandBuffer,
    VkEvent event,
    VkPipelineStageFlags stageMask);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `event` is the event that will be unsignaled.
- `stageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the source stage mask used to determine when the `event` is unsignaled.

`vkCmdResetEvent` behaves identically to `vkCmdResetEvent2`.

Valid Usage

- VUID-vkCmdResetEvent-stageMask-04090
  If the `geometryShader` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`

- VUID-vkCmdResetEvent-stageMask-04091
  If the `tessellationShader` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_TESSellation_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSellation_EVALUATION_SHADER_BIT`

- VUID-vkCmdResetEvent-stageMask-07319
  If the `attachmentFragmentShadingRate` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-vkCmdResetEvent-stageMask-03937
  If the `synchronization2` feature is not enabled, `stageMask` must not be 0

- VUID-vkCmdResetEvent-stageMask-07950
  If the `rayTracingPipeline` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`
Any pipeline stage included in `stageMask` **must** be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the table of supported pipeline stages.

- **VUID-vkCmdResetEvent-stageMask-01153**
  `stageMask` **must** not include `VK_PIPELINE_STAGE_HOST_BIT`

- **VUID-vkCmdResetEvent-event-03834**
  There **must** be an execution dependency between `vkCmdResetEvent` and the execution of any `vkCmdWaitEvents` that includes `event` in its `pEvents` parameter.

- **VUID-vkCmdResetEvent-event-03835**
  There **must** be an execution dependency between `vkCmdResetEvent` and the execution of any `vkCmdWaitEvents2` that includes `event` in its `pEvents` parameter.

- **VUID-vkCmdResetEvent-commandBuffer-01157**
  `commandBuffer`’s current device mask **must** include exactly one physical device.

### Valid Usage (Implicit)

- **VUID-vkCmdResetEvent-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdResetEvent-event-parameter**
  `event` **must** be a valid `VkEvent` handle.

- **VUID-vkCmdResetEvent-stageMask-parameter**
  `stageMask` **must** be a valid combination of `VkPipelineStageFlagBits` values.

- **VUID-vkCmdResetEvent-commandBuffer-recording**
  `commandBuffer` **must** be in the recording state.

- **VUID-vkCmdResetEvent-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, compute, decode, or encode operations.

- **VUID-vkCmdResetEvent-renderpass**
  This command **must** only be called outside of a render pass instance.

- **VUID-vkCmdResetEvent-commonparent**
  Both of `commandBuffer`, and `event` **must** have been created, allocated, or retrieved from the same `VkDevice`.

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized.
To wait for one or more events to enter the signalled state on a device, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdWaitEvents2(
    VkCommandBuffer commandBuffer,
    uint32_t eventCount,
    const VkEvent* pEvents,
    const VkDependencyInfo* pDependencyInfos);
```
or the equivalent command

```c
// Provided by VK_KHR_synchronization2
void vkCmdWaitEvents2KHR(
    VkCommandBuffer commandBuffer,
    uint32_t eventCount,
    const VkEvent* pEvents,
    const VkDependencyInfo* pDependencyInfos);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `eventCount` is the length of the `pEvents` array.
- `pEvents` is a pointer to an array of `eventCount` events to wait on.
- `pDependencyInfos` is a pointer to an array of `eventCount` `VkDependencyInfo` structures, defining the second synchronization scope.

When `vkCmdWaitEvents2` is submitted to a queue, it inserts memory dependencies according to the elements of `pDependencyInfos` and each corresponding element of `pEvents`. `vkCmdWaitEvents2` must not be used to wait on event signal operations occurring on other queues, or signal operations executed by `vkCmdSetEvent`.

The first synchronization scope and access scope of each memory dependency defined by any element `i` of `pDependencyInfos` are applied to operations that occurred earlier in submission order than the last event signal operation on element `i` of `pEvents`.

Signal operations for an event at index `i` are only included if:
• The event was signaled by a `vkCmdSetEvent2` command that occurred earlier in submission order with a `dependencyInfo` parameter exactly equal to the element of `pDependencyInfos` at index `i`; or

• The event was created without `VK_EVENT-create-device-only-bit`, and the first synchronization scope defined by the element of `pDependencyInfos` at index `i` only includes host operations (`VK_PIPELINE_STAGE-Z_HOST_BIT`).

The second synchronization scope and access scope of each memory dependency defined by any element `i` of `pDependencyInfos` are applied to operations that occurred later in submission order than `vkCmdWaitEvents2`.

**Note**
`vkCmdWaitEvents2` is used with `vkCmdSetEvent2` to define a memory dependency between two sets of action commands, roughly in the same way as pipeline barriers, but split into two commands such that work between the two may execute unhindered.

**Note**
Applications should be careful to avoid race conditions when using events. There is no direct ordering guarantee between `vkCmdSetEvent2` and `vkCmdResetEvent2`, `vkCmdResetEvent`, or `vkCmdSetEvent`. Another execution dependency (e.g. a pipeline barrier or semaphore with `VK_PIPELINE-STAGE-Z_ALL_COMMANDS_BIT`) is needed to prevent such a race condition.

**Valid Usage**

- **VUID-vkCmdWaitEvents2-synchronization2-03836**
The `synchronization2` feature **must** be enabled

- **VUID-vkCmdWaitEvents2-pEvents-03837**
Members of `pEvents` **must** not have been signaled by `vkCmdSetEvent`

- **VUID-vkCmdWaitEvents2-pEvents-03838**
For any element `i` of `pEvents`, if that event is signaled by `vkCmdSetEvent2`, that command’s `dependencyInfo` parameter **must** be exactly equal to the `i`th element of `pDependencyInfos`

- **VUID-vkCmdWaitEvents2-pEvents-03839**
For any element `i` of `pEvents`, if that event is signaled by `vkSetEvent`, barriers in the `i`th element of `pDependencyInfos` **must** include only host operations in their first synchronization scope

- **VUID-vkCmdWaitEvents2-pEvents-03840**
For any element `i` of `pEvents`, if barriers in the `i`th element of `pDependencyInfos` include only host operations, the `i`th element of `pEvents` **must** be signaled before `vkCmdWaitEvents2` is executed

- **VUID-vkCmdWaitEvents2-pEvents-03841**
For any element `i` of `pEvents`, if barriers in the `i`th element of `pDependencyInfos` do not include host operations, the `i`th element of `pEvents` **must** be signaled by a corresponding
vkCmdSetEvent2 that occurred earlier in submission order

- VUID-vkCmdWaitEvents2-srcStageMask-03842
  The srcStageMask member of any element of the pMemoryBarriers, pBufferMemoryBarriers, or pImageMemoryBarriers members of pDependencyInfos must either include only pipeline stages valid for the queue family that was used to create the command pool that commandBuffer was allocated from.

- VUID-vkCmdWaitEvents2-dstStageMask-03843
  The dstStageMask member of any element of the pMemoryBarriers, pBufferMemoryBarriers, or pImageMemoryBarriers members of pDependencyInfos must only include pipeline stages valid for the queue family that was used to create the command pool that commandBuffer was allocated from.

- VUID-vkCmdWaitEvents2-dependencyFlags-03844
  If vkCmdWaitEvents2 is being called inside a render pass instance, the srcStageMask member of any element of the pMemoryBarriers, pBufferMemoryBarriers, or pImageMemoryBarriers members of pDependencyInfos must not include VK_PIPELINE_STAGE_2_HOST_BIT.

- VUID-vkCmdWaitEvents2-commandBuffer-03846
  commandBuffer's current device mask must include exactly one physical device.

Valid Usage (Implicit)

- VUID-vkCmdWaitEvents2-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle.

- VUID-vkCmdWaitEvents2-pEvents-parameter
  pEvents must be a valid pointer to an array of eventCount valid VkEvent handles.

- VUID-vkCmdWaitEvents2-pDependencyInfos-parameter
  pDependencyInfos must be a valid pointer to an array of eventCount valid VkDependencyInfo structures.

- VUID-vkCmdWaitEvents2-commandBuffer-recording
  commandBuffer must be in the recording state.

- VUID-vkCmdWaitEvents2-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, compute, decode, or encode operations.

- VUID-vkCmdWaitEvents2-eventCount-arraylength
  eventCount must be greater than 0.

- VUID-vkCmdWaitEvents2-commonparent
  Both of commandBuffer, and the elements of pEvents must have been created, allocated, or retrieved from the same VkDevice.

Host Synchronization

- Host access to commandBuffer must be externally synchronized.
Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Both</td>
<td>Graphics, Compute, Decode, Encode</td>
<td>Synchronization</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To wait for one or more events to enter the signaled state on a device, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdWaitEvents(
    VkCommandBuffer commandBuffer,
    uint32_t eventCount,
    const VkEvent* pEvents,
    VkPipelineStageFlags srcStageMask,
    VkPipelineStageFlags dstStageMask,
    uint32_t memoryBarrierCount,
    const VkMemoryBarrier* pMemoryBarriers,
    uint32_t bufferMemoryBarrierCount,
    const VkBufferMemoryBarrier* pBufferMemoryBarriers,
    uint32_t imageMemoryBarrierCount,
    const VkImageMemoryBarrier* pImageMemoryBarriers);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `eventCount` is the length of the `pEvents` array.
- `pEvents` is a pointer to an array of event object handles to wait on.
- `srcStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the source stage mask.
- `dstStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the destination stage mask.
- `memoryBarrierCount` is the length of the `pMemoryBarriers` array.
- `pMemoryBarriers` is a pointer to an array of `VkMemoryBarrier` structures.
- `bufferMemoryBarrierCount` is the length of the ` pBufferMemoryBarriers` array.
- ` pBufferMemoryBarriers` is a pointer to an array of `VkBufferMemoryBarrier` structures.
- `imageMemoryBarrierCount` is the length of the `pImageMemoryBarriers` array.
- `pImageMemoryBarriers` is a pointer to an array of `VkImageMemoryBarrier` structures.

`vkCmdWaitEvents` is largely similar to `vkCmdWaitEvents2`, but can only wait on signal operations defined by `vkCmdSetEvent`. As `vkCmdSetEvent` does not define any access scopes, `vkCmdWaitEvents`...
defines the first access scope for each event signal operation in addition to its own access scopes.

Note
Since `vkCmdSetEvent` does not have any dependency information beyond a stage mask, implementations do not have the same opportunity to perform availability and visibility operations or image layout transitions in advance as they do with `vkCmdSetEvent2` and `vkCmdWaitEvents2`.

When `vkCmdWaitEvents` is submitted to a queue, it defines a memory dependency between prior event signal operations on the same queue or the host, and subsequent commands. `vkCmdWaitEvents` must not be used to wait on event signal operations occurring on other queues.

The first synchronization scope only includes event signal operations that operate on members of `pEvents`, and the operations that happened-before the event signal operations. Event signal operations performed by `vkCmdSetEvent` that occur earlier in submission order are included in the first synchronization scope, if the logically latest pipeline stage in their `stageMask` parameter is logically earlier than or equal to the logically latest pipeline stage in `srcStageMask`. Event signal operations performed by `vkSetEvent` are only included in the first synchronization scope if `VK_PIPELINE_STAGE_HOST_BIT` is included in `srcStageMask`.

The second synchronization scope includes all commands that occur later in submission order. The second synchronization scope is limited to operations on the pipeline stages determined by the destination stage mask specified by `dstStageMask`.

The first access scope is limited to accesses in the pipeline stages determined by the source stage mask specified by `srcStageMask`. Within that, the first access scope only includes the first access scopes defined by elements of the `pMemoryBarriers`, `pBufferMemoryBarriers` and `pImageMemoryBarriers` arrays, which each define a set of memory barriers. If no memory barriers are specified, then the first access scope includes no accesses.

The second access scope is limited to accesses in the pipeline stages determined by the destination stage mask specified by `dstStageMask`. Within that, the second access scope only includes the second access scopes defined by elements of the `pMemoryBarriers`, `pBufferMemoryBarriers` and `pImageMemoryBarriers` arrays, which each define a set of memory barriers. If no memory barriers are specified, then the second access scope includes no accesses.

Valid Usage

- VUID-vkCmdWaitEvents-srcStageMask-04090
  If the geometryShader feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`

- VUID-vkCmdWaitEvents-srcStageMask-04091
  If the tessellationShader feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`

- VUID-vkCmdWaitEvents-srcStageMask-07319
  If the attachmentFragmentShadingRate feature is not enabled, `srcStageMask` must not contain
- If the *synchronization2* feature is not enabled, *srcStageMask* must not be 0
- If the *rayTracingPipeline* feature is not enabled, *srcStageMask* must not contain *VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR*
- If the *rayQuery* feature is not enabled, *srcStageMask* must not include any of the *VK_PIPELINE_STAGE_*_SHADER_BIT* stages except *VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR*
- If the *geometryShader* feature is not enabled, *dstStageMask* must not contain *VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT*
- If the *tessellationShader* feature is not enabled, *dstStageMask* must not contain *VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT* or *VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT*
- If the *attachmentFragmentShadingRate* feature is not enabled, *dstStageMask* must not contain *VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR*
- If the *synchronization2* feature is not enabled, *dstStageMask* must not be 0
- If the *rayTracingPipeline* feature is not enabled, *dstStageMask* must not contain *VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR*
- If the *rayQuery* feature is not enabled and a memory barrier *srcAccessMask* includes *VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR*, *srcStageMask* must not include any of the *VK_PIPELINE_STAGE_*_SHADER_BIT* stages except *VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR*
- The *srcAccessMask* member of each element of *pMemoryBarriers* must only include access flags that are supported by one or more of the pipeline stages in *srcStageMask*, as specified in the table of supported access types
- The *dstAccessMask* member of each element of *pMemoryBarriers* must only include access flags that are supported by one or more of the pipeline stages in *dstStageMask*, as specified in the table of supported access types
- For any element of *pBufferMemoryBarriers*, if its *srcQueueFamilyIndex* and
dstQueueFamilyIndex members are equal, or if its srcQueueFamilyIndex is the queue family index that was used to create the command pool that commandBuffer was allocated from, then its srcAccessMask member must only contain access flags that are supported by one or more of the pipeline stages in srcStageMask, as specified in the table of supported access types.

- VUID-vkCmdWaitEvents-pBufferMemoryBarriers-02818
For any element of pBufferMemoryBarriers, if its srcQueueFamilyIndex and dstQueueFamilyIndex members are equal, or if its dstQueueFamilyIndex is the queue family index that was used to create the command pool that commandBuffer was allocated from, then its dstAccessMask member must only contain access flags that are supported by one or more of the pipeline stages in dstStageMask, as specified in the table of supported access types.

- VUID-vkCmdWaitEvents-pImageMemoryBarriers-02819
For any element of pImageMemoryBarriers, if its srcQueueFamilyIndex and dstQueueFamilyIndex members are equal, or if its srcQueueFamilyIndex is the queue family index that was used to create the command pool that commandBuffer was allocated from, then its srcAccessMask member must only contain access flags that are supported by one or more of the pipeline stages in srcStageMask, as specified in the table of supported access types.

- VUID-vkCmdWaitEvents-pImageMemoryBarriers-02820
For any element of pImageMemoryBarriers, if its srcQueueFamilyIndex and dstQueueFamilyIndex members are equal, or if its dstQueueFamilyIndex is the queue family index that was used to create the command pool that commandBuffer was allocated from, then its dstAccessMask member must only contain access flags that are supported by one or more of the pipeline stages in dstStageMask, as specified in the table of supported access types.

- VUID-vkCmdWaitEvents-srcStageMask-06459
Any pipeline stage included in srcStageMask must be supported by the capabilities of the queue family specified by the queueFamilyIndex member of the VkCommandPoolCreateInfo structure that was used to create the VkCommandPool that commandBuffer was allocated from, as specified in the table of supported pipeline stages.

- VUID-vkCmdWaitEvents-dstStageMask-06460
Any pipeline stage included in dstStageMask must be supported by the capabilities of the queue family specified by the queueFamilyIndex member of the VkCommandPoolCreateInfo structure that was used to create the VkCommandPool that commandBuffer was allocated from, as specified in the table of supported pipeline stages.

- VUID-vkCmdWaitEvents-srcStageMask-01158
srcStageMask must be the bitwise OR of the stageMask parameter used in previous calls to vkCmdSetEvent with any of the elements of pEvents and VK_PIPELINE_STAGE_HOST_BIT if any of the elements of pEvents was set using vkSetEvent.

- VUID-vkCmdWaitEvents-srcQueueFamilyIndex-02803
The srcQueueFamilyIndex and dstQueueFamilyIndex members of any element of...
 pBufferMemoryBarriers or pImageMemoryBarriers must be equal

- VUID-vkCmdWaitEvents-commandBuffer-01167
  commandBuffer's current device mask must include exactly one physical device

- VUID-vkCmdWaitEvents-pEvents-03847
  Elements of pEvents must not have been signaled by vkCmdSetEvent2

**Valid Usage (Implicit)**

- VUID-vkCmdWaitEvents-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdWaitEvents-pEvents-parameter
  pEvents must be a valid pointer to an array of eventCount valid VkEvent handles

- VUID-vkCmdWaitEvents-srcStageMask-parameter
  srcStageMask must be a valid combination of VkPipelineStageFlagBits values

- VUID-vkCmdWaitEvents-dstStageMask-parameter
  dstStageMask must be a valid combination of VkPipelineStageFlagBits values

- VUID-vkCmdWaitEvents-pMemoryBarriers-parameter
  If memoryBarrierCount is not 0, pMemoryBarriers must be a valid pointer to an array of memoryBarrierCount valid VkMemoryBarrier structures

- VUID-vkCmdWaitEvents-pBufferMemoryBarriers-parameter
  If bufferMemoryBarrierCount is not 0, pBufferMemoryBarriers must be a valid pointer to an array of bufferMemoryBarrierCount valid VkBufferMemoryBarrier structures

- VUID-vkCmdWaitEvents-pImageMemoryBarriers-parameter
  If imageMemoryBarrierCount is not 0, pImageMemoryBarriers must be a valid pointer to an array of imageMemoryBarrierCount valid VkImageMemoryBarrier structures

- VUID-vkCmdWaitEvents-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdWaitEvents-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, compute, decode, or encode operations

- VUID-vkCmdWaitEvents-eventCount-arraylength
  eventCount must be greater than 0

- VUID-vkCmdWaitEvents-commonparent
  Both of commandBuffer, and the elements of pEvents must have been created, allocated, or retrieved from the same VkDevice

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally
7.6. Pipeline Barriers

To record a pipeline barrier, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdPipelineBarrier2(
    VkCommandBuffer commandBuffer,
    const VkDependencyInfo* pDependencyInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_synchronization2
void vkCmdPipelineBarrier2KHR(
    VkCommandBuffer commandBuffer,
    const VkDependencyInfo* pDependencyInfo);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `pDependencyInfo` is a pointer to a `VkDependencyInfo` structure defining the scopes of this operation.

When `vkCmdPipelineBarrier2` is submitted to a queue, it defines memory dependencies between commands that were submitted to the same queue before it, and those submitted to the same queue after it.

The first synchronization scope and access scope of each memory dependency defined by `pDependencyInfo` are applied to operations that occurred earlier in submission order.

The second synchronization scope and access scope of each memory dependency defined by `pDependencyInfo` are applied to operations that occurred later in submission order.

If `vkCmdPipelineBarrier2` is recorded within a render pass instance, the synchronization scopes are limited to operations within the same subpass, or must follow the restrictions for Tile Image Access Synchronization if the render pass instance was started with `vkCmdBeginRendering`.

<td></td>
</tr>
</tbody>
</table>

**Command Properties**
Valid Usage

• VUID-vkCmdPipelineBarrier2-None-07889
  If `vkCmdPipelineBarrier2` is called within a render pass instance using a `VkRenderPass` object, the render pass **must** have been created with at least one subpass dependency that expresses a dependency from the current subpass to itself, does not include `VK_DEPENDENCY_BY_REGION_BIT` if this command does not, does not include `VK_DEPENDENCY_VIEW_LOCAL_BIT` if this command does not, and has synchronization scopes and access scopes that are all supersets of the scopes defined in this command.

• VUID-vkCmdPipelineBarrier2-bufferMemoryBarrierCount-01178
  If `vkCmdPipelineBarrier2` is called within a render pass instance using a `VkRenderPass` object, it **must** not include any buffer memory barriers.

• VUID-vkCmdPipelineBarrier2-image-04073
  If `vkCmdPipelineBarrier2` is called within a render pass instance using a `VkRenderPass` object, the `image` member of any image memory barrier included in this command **must** be an attachment used in the current subpass both as an input attachment, and as either a color, or depth/stencil attachment.

• VUID-vkCmdPipelineBarrier2-oldLayout-01181
  If `vkCmdPipelineBarrier2` is called within a render pass instance, the `oldLayout` and `newLayout` members of any image memory barrier included in this command **must** be equal.

• VUID-vkCmdPipelineBarrier2-srcQueueFamilyIndex-01182
  If `vkCmdPipelineBarrier2` is called within a render pass instance, the `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members of any memory barrier included in this command **must** be equal.

• VUID-vkCmdPipelineBarrier2-None-07890
  If `vkCmdPipelineBarrier2` is called within a render pass instance, and the source stage masks of any memory barriers include framebuffer-space stages, destination stage masks of all memory barriers **must** only include framebuffer-space stages.

• VUID-vkCmdPipelineBarrier2-dependencyFlags-07891
  If `vkCmdPipelineBarrier2` is called within a render pass instance, and the source stage masks of any memory barriers include framebuffer-space stages, then `dependencyFlags` **must** include `VK_DEPENDENCY_BY_REGION_BIT`.

• VUID-vkCmdPipelineBarrier2-None-07892
  If `vkCmdPipelineBarrier2` is called within a render pass instance, and there is more than one view in the current subpass, dependency flags **must** include `VK_DEPENDENCY_VIEW_LOCAL_BIT`.

• VUID-vkCmdPipelineBarrier2-dependencyFlags-01186
  If `vkCmdPipelineBarrier2` is called outside of a render pass instance, the dependency flags **must** not include `VK_DEPENDENCY_VIEW_LOCAL_BIT`.

• VUID-vkCmdPipelineBarrier2-None-07893
  If `vkCmdPipelineBarrier2` is called inside a render pass instance, and there is more than one view in the current subpass, dependency flags **must** include `VK_DEPENDENCY_VIEW_LOCAL_BIT`.
If neither the shaderTileImageColorReadAccess nor shaderTileImageDepthReadAccess features are enabled, and the dynamicRenderingLocalRead feature is not enabled, `vkCmdPipelineBarrier2` must not be called within a render pass instance started with `vkCmdBeginRendering`.

If the dynamicRenderingLocalRead feature is not enabled, and `vkCmdPipelineBarrier2` is called within a render pass instance started with `vkCmdBeginRendering`, there must be no buffer or image memory barriers specified by this command.

If `vkCmdPipelineBarrier2` is called within a render pass instance started with `vkCmdBeginRendering`, and the image member of any image memory barrier is used as an attachment in the current render pass instance, it must be in the `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR` or `VK_IMAGE_LAYOUT_GENERAL` layout.

If `vkCmdPipelineBarrier2` is called within a render pass instance started with `vkCmdBeginRendering`, this command must only specify framebuffer-space stages in `srcStageMask` and `dstStageMask`.

The synchronization2 feature must be enabled.

The `srcStageMask` member of any element of the `pMemoryBarriers`, `pBufferMemoryBarriers`, or `pImageMemoryBarriers` members of `pDependencyInfo` must only include pipeline stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from.

The `dstStageMask` member of any element of the `pMemoryBarriers`, `pBufferMemoryBarriers`, or `pImageMemoryBarriers` members of `pDependencyInfo` must only include pipeline stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from.

Valid Usage (Implicit)

- `commandBuffer` must be a valid `VkCommandBuffer` handle.
- `pDependencyInfo` must be a valid pointer to a valid `VkDependencyInfo` structure.
- `commandBuffer` must be in the recording state.
- The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, compute, decode, or encode operations.
Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Both</td>
<td>Transfer Graphics Compute Decode Encode</td>
<td>Synchronization</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To record a pipeline barrier, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdPipelineBarrier(
    VkCommandBuffer commandBuffer,
    VkPipelineStageFlags srcStageMask,
    VkPipelineStageFlags dstStageMask,
    VkDependencyFlags dependencyFlags,
    uint32_t memoryBarrierCount,
    const VkMemoryBarrier* pMemoryBarriers,
    uint32_t bufferMemoryBarrierCount,
    const VkBufferMemoryBarrier* pBufferMemoryBarriers,
    uint32_t imageMemoryBarrierCount,
    const VkImageMemoryBarrier* pImageMemoryBarriers);
```

- **commandBuffer** is the command buffer into which the command is recorded.
- **srcStageMask** is a bitmask of `VkPipelineStageFlagBits` specifying the **source stages**.
- **dstStageMask** is a bitmask of `VkPipelineStageFlagBits` specifying the **destination stages**.
- **dependencyFlags** is a bitmask of `VkDependencyFlagBits` specifying how execution and memory dependencies are formed.
- **memoryBarrierCount** is the length of the **pMemoryBarriers** array.
- **pMemoryBarriers** is a pointer to an array of `VkMemoryBarrier` structures.
- **bufferMemoryBarrierCount** is the length of the **pBufferMemoryBarriers** array.
- **pBufferMemoryBarriers** is a pointer to an array of `VkBufferMemoryBarrier` structures.
- **imageMemoryBarrierCount** is the length of the **pImageMemoryBarriers** array.
• `pImageMemoryBarriers` is a pointer to an array of `VkImageMemoryBarrier` structures.

`vkCmdPipelineBarrier` operates almost identically to `vkCmdPipelineBarrier2`, except that the scopes and barriers are defined as direct parameters rather than being defined by an `VkDependencyInfo`.

When `vkCmdPipelineBarrier` is submitted to a queue, it defines a memory dependency between commands that were submitted to the same queue before it, and those submitted to the same queue after it.

If `vkCmdPipelineBarrier` was recorded outside a render pass instance, the first synchronization scope includes all commands that occur earlier in submission order. If `vkCmdPipelineBarrier` was recorded inside a render pass instance, the first synchronization scope includes only commands that occur earlier in submission order within the same subpass. In either case, the first synchronization scope is limited to operations on the pipeline stages determined by the source stage mask specified by `srcStageMask`.

If `vkCmdPipelineBarrier` was recorded outside a render pass instance, the second synchronization scope includes all commands that occur later in submission order. If `vkCmdPipelineBarrier` was recorded inside a render pass instance, the second synchronization scope includes only commands that occur later in submission order within the same subpass. In either case, the second synchronization scope is limited to operations on the pipeline stages determined by the destination stage mask specified by `dstStageMask`.

The first access scope is limited to accesses in the pipeline stages determined by the source stage mask specified by `srcStageMask`. Within that, the first access scope only includes the first access scopes defined by elements of the `pMemoryBarriers`, `pBufferMemoryBarriers` and `pImageMemoryBarriers` arrays, which each define a set of memory barriers. If no memory barriers are specified, then the first access scope includes no accesses.

The second access scope is limited to accesses in the pipeline stages determined by the destination stage mask specified by `dstStageMask`. Within that, the second access scope only includes the second access scopes defined by elements of the `pMemoryBarriers`, `pBufferMemoryBarriers` and `pImageMemoryBarriers` arrays, which each define a set of memory barriers. If no memory barriers are specified, then the second access scope includes no accesses.

If `dependencyFlags` includes `VK_DEPENDENCY_BY_REGION_BIT`, then any dependency between framebuffer-space pipeline stages is framebuffer-local - otherwise it is framebuffer-global.

### Valid Usage

- **VUID-vkCmdPipelineBarrier-srcStageMask-04090**  
  If the `geometryShader` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`

- **VUID-vkCmdPipelineBarrier-srcStageMask-04091**  
  If the `tessellationShader` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`

- **VUID-vkCmdPipelineBarrier-srcStageMask-07319**
If the `attachmentFragmentShadingRate` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- **VUID-vkCmdPipelineBarrier-srcStageMask-03937**
  If the `synchronization2` feature is not enabled, `srcStageMask` **must** not be 0.

- **VUID-vkCmdPipelineBarrier-srcStageMask-07950**
  If the `rayTracingPipeline` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`.

- **VUID-vkCmdPipelineBarrier-srcAccessMask-06257**
  If the `rayQuery` feature is not enabled and a memory barrier `srcAccessMask` includes `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR`, `srcStageMask` **must** not include any of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages **except** `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`.

- **VUID-vkCmdPipelineBarrier-dstStageMask-04090**
  If the `geometryShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`.

- **VUID-vkCmdPipelineBarrier-dstStageMask-04091**
  If the `tessellationShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`.

- **VUID-vkCmdPipelineBarrier-dstStageMask-07319**
  If the `attachmentFragmentShadingRate` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- **VUID-vkCmdPipelineBarrier-dstStageMask-03937**
  If the `synchronization2` feature is not enabled, `dstStageMask` **must** not be 0.

- **VUID-vkCmdPipelineBarrier-dstStageMask-07950**
  If the `rayTracingPipeline` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`.

- **VUID-vkCmdPipelineBarrier-dstAccessMask-06257**
  If the `rayQuery` feature is not enabled and a memory barrier `dstAccessMask` includes `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR`, `dstStageMask` **must** not include any of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages **except** `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`.

- **VUID-vkCmdPipelineBarrier-srcAccessMask-02815**
  The `srcAccessMask` member of each element of `pMemoryBarriers` **must** only include access flags that are supported by one or more of the pipeline stages in `srcStageMask`, as specified in the table of supported access types.

- **VUID-vkCmdPipelineBarrier-dstAccessMask-02816**
  The `dstAccessMask` member of each element of `pMemoryBarriers` **must** only include access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the table of supported access types.

- **VUID-vkCmdPipelineBarrier-pBufferMemoryBarriers-02817**
For any element of `pBufferMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `srcQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `srcAccessMask` member **must** only contain access flags that are supported by one or more of the pipeline stages in `srcStageMask`, as specified in the table of supported access types.

- VUID-vkCmdPipelineBarrier-pBufferMemoryBarriers-02818
  For any element of `pBufferMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `srcQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `dstAccessMask` member **must** only contain access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the table of supported access types.

- VUID-vkCmdPipelineBarrier-pImageMemoryBarriers-02819
  For any element of `pImageMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `srcQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `srcAccessMask` member **must** only contain access flags that are supported by one or more of the pipeline stages in `srcStageMask`, as specified in the table of supported access types.

- VUID-vkCmdPipelineBarrier-pImageMemoryBarriers-02820
  For any element of `pImageMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `dstQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `dstAccessMask` member **must** only contain access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the table of supported access types.

- VUID-vkCmdPipelineBarrier-None-07889
  If `vkCmdPipelineBarrier` is called within a render pass instance using a `VkRenderPass` object, the render pass **must** have been created with at least one subpass dependency that expresses a dependency from the current subpass to itself, does not include `VK_DEPENDENCY_BY_REGION_BIT` if this command does not, does not include `VK_DEPENDENCY_VIEW_LOCAL_BIT` if this command does not, and has synchronization scopes and access scopes that are all supersets of the scopes defined in this command.

- VUID-vkCmdPipelineBarrier-bufferMemoryBarrierCount-01178
  If `vkCmdPipelineBarrier` is called within a render pass instance using a `VkRenderPass` object, it **must** not include any buffer memory barriers.

- VUID-vkCmdPipelineBarrier-image-04073
  If `vkCmdPipelineBarrier` is called within a render pass instance using a `VkRenderPass` object, the `image` member of any image memory barrier included in this command **must** be an attachment used in the current subpass both as an input attachment, and as either a color, or depth/stencil attachment.

- VUID-vkCmdPipelineBarrier-oldLayout-01181
  If `vkCmdPipelineBarrier` is called within a render pass instance, the `oldLayout` and `newLayout` members of any image memory barrier included in this command **must** be
• VUID-vkCmdPipelineBarrier-srcQueueFamilyIndex-01182
  If `vkCmdPipelineBarrier` is called within a render pass instance, the `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members of any memory barrier included in this command must be equal

• VUID-vkCmdPipelineBarrier-None-07890
  If `vkCmdPipelineBarrier` is called within a render pass instance, and the source stage masks of any memory barriers include framebuffer-space stages, destination stage masks of all memory barriers must only include framebuffer-space stages

• VUID-vkCmdPipelineBarrier-dependencyFlags-07891
  If `vkCmdPipelineBarrier` is called within a render pass instance, and the source stage masks of any memory barriers include framebuffer-space stages, then `dependencyFlags` must include `VK_DEPENDENCY_BY_REGION_BIT`

• VUID-vkCmdPipelineBarrier-None-07892
  If `vkCmdPipelineBarrier` is called within a render pass instance, the source and destination stage masks of any memory barriers must only include graphics pipeline stages

• VUID-vkCmdPipelineBarrier-dependencyFlags-01186
  If `vkCmdPipelineBarrier` is called outside of a render pass instance, the dependency flags must not include `VK_DEPENDENCY_VIEW_LOCAL_BIT`

• VUID-vkCmdPipelineBarrier-None-07893
  If `vkCmdPipelineBarrier` is called inside a render pass instance, and there is more than one view in the current subpass, dependency flags must include `VK_DEPENDENCY_VIEW_LOCAL_BIT`

• VUID-vkCmdPipelineBarrier-None-09553
  If neither the `shaderTileImageColorReadAccess` nor `shaderTileImageDepthReadAccess` features are enabled, and the `dynamicRenderingLocalRead` feature is not enabled, `vkCmdPipelineBarrier` must not be called within a render pass instance started with `vkCmdBeginRendering`

• VUID-vkCmdPipelineBarrier-None-09554
  If the `dynamicRenderingLocalRead` feature is not enabled, and `vkCmdPipelineBarrier` is called within a render pass instance started with `vkCmdBeginRendering`, there must be no buffer or image memory barriers specified by this command

• VUID-vkCmdPipelineBarrier-image-09555
  If `vkCmdPipelineBarrier` is called within a render pass instance started with `vkCmdBeginRendering`, and the `image` member of any image memory barrier is used as an attachment in the current render pass instance, it must be in the `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR` or `VK_IMAGE_LAYOUT_GENERAL` layout

• VUID-vkCmdPipelineBarrier-srcStageMask-09556
  If `vkCmdPipelineBarrier` is called within a render pass instance started with `vkCmdBeginRendering`, this command must only specify framebuffer-space stages in `srcStageMask` and `dstStageMask`

• VUID-vkCmdPipelineBarrier-srcStageMask-06461
  Any pipeline stage included in `srcStageMask` must be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the
VkCommandPoolCreateInfo structure that was used to create the VkCommandPool that
commandBuffer was allocated from, as specified in the table of supported pipeline stages

- VUID-vkCmdPipelineBarrier-dstStageMask-06462
  Any pipeline stage included in dstStageMask must be supported by the capabilities of the
  queue family specified by the queueFamilyIndex member of the VkCommandPoolCreateInfo structure that was used to create the VkCommandPool that
  commandBuffer was allocated from, as specified in the table of supported pipeline stages

Valid Usage (Implicit)

- VUID-vkCmdPipelineBarrier-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdPipelineBarrier-srcStageMask-parameter
  srcStageMask must be a valid combination of VkPipelineStageFlagBits values

- VUID-vkCmdPipelineBarrier-dstStageMask-parameter
  dstStageMask must be a valid combination of VkPipelineStageFlagBits values

- VUID-vkCmdPipelineBarrier-dependencyFlags-parameter
  dependencyFlags must be a valid combination of VkDependencyFlagBits values

- VUID-vkCmdPipelineBarrier-pMemoryBarriers-parameter
  If memoryBarrierCount is not 0, pMemoryBarriers must be a valid pointer to an array of
  memoryBarrierCount valid VkMemoryBarrier structures

- VUID-vkCmdPipelineBarrier-pBufferMemoryBarriers-parameter
  If bufferMemoryBarrierCount is not 0, pBufferMemoryBarriers must be a valid pointer to an
  array of bufferMemoryBarrierCount valid VkBufferMemoryBarrier structures

- VUID-vkCmdPipelineBarrier-pImageMemoryBarriers-parameter
  If imageMemoryBarrierCount is not 0, pImageMemoryBarriers must be a valid pointer to an
  array of imageMemoryBarrierCount valid VkImageMemoryBarrier structures

- VUID-vkCmdPipelineBarrier-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdPipelineBarrier-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support transfer, graphics,
  compute, decode, or encode operations

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally
  synchronized
Bits which can be set in `vkCmdPipelineBarrier::dependencyFlags`, specifying how execution and memory dependencies are formed, are:

```c
typedef enum VkDependencyFlagBits {
    VK_DEPENDENCY_BY_REGION_BIT = 0x00000001,
    // Provided by VK_VERSION_1_1
    VK_DEPENDENCY_DEVICE_GROUP_BIT = 0x00000004,
    // Provided by VK_VERSION_1_1
    VK_DEPENDENCY_VIEW_LOCAL_BIT = 0x00000002,
    // Provided by VK_EXT_attachment_feedback_loop_layout
    VK_DEPENDENCY_FEEDBACK_LOOP_BIT_EXT = 0x00000008,
    // Provided by VK_KHR_multiview
    VK_DEPENDENCY_DEVICE_GROUP_BIT_KHR = VK_DEPENDENCY_DEVICE_GROUP_BIT,
    // Provided by VK_KHR_device_group
    VK_DEPENDENCY_DEVICE_GROUP_BIT_KHR = VK_DEPENDENCY_DEVICE_GROUP_BIT
} VkDependencyFlagBits;
```

- `VK_DEPENDENCY_BY_REGION_BIT` specifies that dependencies will be framebuffer-local.
- `VK_DEPENDENCY_VIEW_LOCAL_BIT` specifies that dependencies will be view-local.
- `VK_DEPENDENCY_DEVICE_GROUP_BIT` specifies that dependencies are non-device-local.
- `VK_DEPENDENCY_FEEDBACK_LOOP_BIT_EXT` specifies that the render pass will write to and read from the same image using the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` layout.

```c
typedef VkFlags VkDependencyFlags;
```

`VkDependencyFlags` is a bitmask type for setting a mask of zero or more `VkDependencyFlagBits`.

### 7.6.1. Explicit Render Pass Tile Image Access Synchronization

A fragment shader can declare `NonCoherentColorAttachmentReadEXT`, `NonCoherentDepthAttachmentReadEXT`, or `NonCoherentStencilAttachmentReadEXT` execution modes to enable non-coherent tile image reads for color, depth, or stencil, respectively. When non-coherent
tile image reads are enabled, writes via color, depth and stencil attachments are not automatically made visible to the corresponding attachment reads via tile images. For the writes to be made visible, an explicit memory dependency must be inserted between when the attachment is written to and when it is read from by later fragments. Such memory dependencies must be inserted every time a fragment will read values at a particular sample (x, y, layer, sample) coordinate, if those values have been written since the most recent pipeline barrier; or since the start of the render pass instance, if there have been no pipeline barriers since the start of the render pass instance. When such memory dependencies are used the values at all sample locations inside the fragment area are made visible, regardless of coverage.

To insert a memory dependency for explicit render pass tile image synchronization, call vkCmdPipelineBarrier2 inside a render pass instance started with vkCmdBeginRendering. The following restrictions apply for such pipeline barriers:

- dependencyFlags must include VK_DEPENDENCY_BY_REGION_BIT.
- The pipeline barriers can only include memory barriers. That is, buffer memory barriers and image memory barriers must not be used.
- The stages in VkMemoryBarrier2::srcStageMask and VkMemoryBarrier2::dstStageMask are restricted to framebuffer space stages.
- The access types in VkMemoryBarrier2::srcAccessMask and VkMemoryBarrier2::dstAccessMask are restricted to the following types: VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT, VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT, VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT, and VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT.

### 7.7. Memory Barriers

Memory barriers are used to explicitly control access to buffer and image subresource ranges. Memory barriers are used to transfer ownership between queue families, change image layouts, and define availability and visibility operations. They explicitly define the access types and buffer and image subresource ranges that are included in the access scopes of a memory dependency that is created by a synchronization command that includes them.

#### 7.7.1. Global Memory Barriers

Global memory barriers apply to memory accesses involving all memory objects that exist at the time of its execution.

The VkMemoryBarrier2 structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkMemoryBarrier2 {
    VkStructureType sType;
    const void* pNext;
    VkPipelineStageFlags2 srcStageMask;
    VkAccessFlags2 srcAccessMask;
    VkPipelineStageFlags2 dstStageMask;
    VkAccessFlags2 dstAccessMask;
} VkMemoryBarrier2;
```
or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkMemoryBarrier2 VkMemoryBarrier2KHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **srcStageMask** is a `VkPipelineStageFlags2` mask of pipeline stages to be included in the first synchronization scope.
- **srcAccessMask** is a `VkAccessFlags2` mask of access flags to be included in the first access scope.
- **dstStageMask** is a `VkPipelineStageFlags2` mask of pipeline stages to be included in the second synchronization scope.
- **dstAccessMask** is a `VkAccessFlags2` mask of access flags to be included in the second access scope.

This structure defines a memory dependency affecting all device memory.

The first synchronization scope and access scope described by this structure include only operations and memory accesses specified by `srcStageMask` and `srcAccessMask`.

The second synchronization scope and access scope described by this structure include only operations and memory accesses specified by `dstStageMask` and `dstAccessMask`.

### Valid Usage

- **VUID-VkMemoryBarrier2-srcStageMask-03929**
  If the `geometryShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`.

- **VUID-VkMemoryBarrier2-srcStageMask-03930**
  If the `tessellationShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`.

Valid Usage (Implicit)

- VUID-VkMemoryBarrier2-sType-sType
  sType must be VK_STRUCTURE_TYPE_MEMORY_BARRIER_2

- VUID-VkMemoryBarrier2-srcStageMask-parameter
The `VkMemoryBarrier` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkMemoryBarrier {
    VkStructureType sType;
    const void* pNext;
    VkAccessFlags srcAccessMask;
    VkAccessFlags dstAccessMask;
} VkMemoryBarrier;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcAccessMask` is a bitmask of `VkAccessFlagBits` specifying a source access mask.
- `dstAccessMask` is a bitmask of `VkAccessFlagBits` specifying a destination access mask.

The first access scope is limited to access types in the source access mask specified by `srcAccessMask`.

The second access scope is limited to access types in the destination access mask specified by `dstAccessMask`.

### Valid Usage (Implicit)

- VUID-VkMemoryBarrier-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_MEMORY_BARRIER`

- VUID-VkMemoryBarrier-pNext-pNext
  
  `pNext` must be `NULL`

- VUID-VkMemoryBarrier-srcAccessMask-parameter
  
  `srcAccessMask` must be a valid combination of `VkAccessFlagBits` values

- VUID-VkMemoryBarrier-dstAccessMask-parameter
  
  `dstAccessMask` must be a valid combination of `VkAccessFlagBits` values

### 7.7.2. Buffer Memory Barriers

Buffer memory barriers only apply to memory accesses involving a specific buffer range. That is, a memory dependency formed from a buffer memory barrier is scoped to access via the specified
buffer range. Buffer memory barriers can also be used to define a queue family ownership transfer for the specified buffer range.

The VkBufferMemoryBarrier2 structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkBufferMemoryBarrier2 {
    VkStructureType sType;
    const void* pNext;
    VkPipelineStageFlags2 srcStageMask;
    VkAccessFlags2 srcAccessMask;
    VkPipelineStageFlags2 dstStageMask;
    VkAccessFlags2 dstAccessMask;
    uint32_t srcQueueFamilyIndex;
    uint32_t dstQueueFamilyIndex;
    VkBuffer buffer;
    VkDeviceSize offset;
    VkDeviceSize size;
} VkBufferMemoryBarrier2;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkBufferMemoryBarrier2 VkBufferMemoryBarrier2KHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `srcStageMask` is a VkPipelineStageFlags2 mask of pipeline stages to be included in the first synchronization scope.
- `srcAccessMask` is a VkAccessFlags2 mask of access flags to be included in the first access scope.
- `dstStageMask` is a VkPipelineStageFlags2 mask of pipeline stages to be included in the second synchronization scope.
- `dstAccessMask` is a VkAccessFlags2 mask of access flags to be included in the second access scope.
- `srcQueueFamilyIndex` is the source queue family for a queue family ownership transfer.
- `dstQueueFamilyIndex` is the destination queue family for a queue family ownership transfer.
- `buffer` is a handle to the buffer whose backing memory is affected by the barrier.
- `offset` is an offset in bytes into the backing memory for `buffer`; this is relative to the base offset as bound to the buffer (see `vkBindBufferMemory`).
- `size` is a size in bytes of the affected area of backing memory for `buffer`, or VK_WHOLE_SIZE to use the range from `offset` to the end of the buffer.

This structure defines a memory dependency limited to a range of a buffer, and can define a queue family transfer operation for that range.
The first synchronization scope and access scope described by this structure include only operations and memory accesses specified by srcStageMask and srcAccessMask.

The second synchronization scope and access scope described by this structure include only operations and memory accesses specified by dstStageMask and dstAccessMask.

Both access scopes are limited to only memory accesses to buffer in the range defined by offset and size.

If buffer was created with VK_SHARING_MODE_EXCLUSIVE, and srcQueueFamilyIndex is not equal to dstQueueFamilyIndex, this memory barrier defines a queue family transfer operation. When executed on a queue in the family identified by srcQueueFamilyIndex, this barrier defines a queue family release operation for the specified buffer range, and the second synchronization and access scopes do not synchronize operations on that queue. When executed on a queue in the family identified by dstQueueFamilyIndex, this barrier defines a queue family acquire operation for the specified buffer range, and the first synchronization and access scopes do not synchronize operations on that queue.

A queue family transfer operation is also defined if the values are not equal, and either is one of the special queue family values reserved for external memory ownership transfers, as described in Queue Family Ownership Transfer. A queue family release operation is defined when dstQueueFamilyIndex is one of those values, and a queue family acquire operation is defined when srcQueueFamilyIndex is one of those values.

### Valid Usage

- **VUID-VkBufferMemoryBarrier2-srcStageMask-03929**
  
  If the geometryShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT.

- **VUID-VkBufferMemoryBarrier2-srcStageMask-03930**
  
  If the tessellationShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT or VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT.

- **VUID-VkBufferMemoryBarrier2-srcStageMask-07317**
  
  If the attachmentFragmentShadingRate feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR.

- **VUID-VkBufferMemoryBarrier2-srcStageMask-07947**
  
  If the rayTracingPipeline feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR.

- **VUID-VkBufferMemoryBarrier2-srcAccessMask-03900**
  
  If srcAccessMask includes VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT, srcStageMask must include VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT.

- **VUID-VkBufferMemoryBarrier2-srcAccessMask-03901**
  
  If srcAccessMask includes VK_ACCESS_2_INDEX_READ_BIT, srcStageMask must include...
VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT, VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkBufferMemoryBarrier2-srcAccessMask-03902

If \( \text{dstAccessMask} \) includes \( \text{VK_ACCESS_2_MICROMAP_READ_BIT_EXT} \), \( \text{dstStageMask} \) must include \( \text{VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT} \) or \( \text{VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR} \).

Offset \( \text{offset} \) must be less than the size of \( \text{buffer} \).

If \( \text{size} \) is not equal to \( \text{VK_WHOLE_SIZE} \), \( \text{size} \) must be greater than 0.

If \( \text{size} \) is not equal to \( \text{VK_WHOLE_SIZE} \), \( \text{size} \) must be less than or equal to than the size of \( \text{buffer} \) minus \( \text{offset} \).

If \( \text{buffer} \) is non-sparse then it must be bound completely and contiguously to a single \( \text{VkDeviceMemory} \) object.
• VUID-VkBufferMemoryBarrier2-buffer-09095
  If `buffer` was created with a sharing mode of `VK_SHARING_MODE_EXCLUSIVE`, and `srcQueueFamilyIndex` and `dstQueueFamilyIndex` are not equal, `srcQueueFamilyIndex` must be `VK_QUEUE_FAMILY_EXTERNAL`, or a valid queue family.

• VUID-VkBufferMemoryBarrier2-buffer-09096
  If `buffer` was created with a sharing mode of `VK_SHARING_MODE_EXCLUSIVE`, and `srcQueueFamilyIndex` and `dstQueueFamilyIndex` are not equal, `dstQueueFamilyIndex` must be `VK_QUEUE_FAMILY_EXTERNAL`, or a valid queue family.

• VUID-VkBufferMemoryBarrier2-srcQueueFamilyIndex-04087
  If `srcQueueFamilyIndex` is not equal to `dstQueueFamilyIndex`, at least one of `srcQueueFamilyIndex` or `dstQueueFamilyIndex` must not be `VK_QUEUE_FAMILY_EXTERNAL`.

• VUID-VkBufferMemoryBarrier2-None-09097
  If the `VK_KHR_external_memory` extension is not enabled, and the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` is not greater than or equal to Version 1.1, `srcQueueFamilyIndex` must not be `VK_QUEUE_FAMILY_EXTERNAL`.

• VUID-VkBufferMemoryBarrier2-None-09098
  If the `VK_KHR_external_memory` extension is not enabled, and the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` is not greater than or equal to Version 1.1, `dstQueueFamilyIndex` must not be `VK_QUEUE_FAMILY_EXTERNAL`.

• VUID-VkBufferMemoryBarrier2-srcStageMask-03851
  If either `srcStageMask` or `dstStageMask` includes `VK_PIPELINE_STAGE_2_HOST_BIT`, `srcQueueFamilyIndex` and `dstQueueFamilyIndex` must be equal.

**Valid Usage (Implicit)**

• VUID-VkBufferMemoryBarrier2-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_BUFFER_MEMORY_BARRIER_2`.

• VUID-VkBufferMemoryBarrier2-pNext-pNext
  `pNext` must be `NULL` or a pointer to a valid instance of `VkExternalMemoryAcquireUnmodifiedEXT`.

• VUID-VkBufferMemoryBarrier2-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique.

• VUID-VkBufferMemoryBarrier2-srcStageMask-parameter
  `srcStageMask` must be a valid combination of `VkPipelineStageFlagBits2` values.

• VUID-VkBufferMemoryBarrier2-srcAccessMask-parameter
  `srcAccessMask` must be a valid combination of `VkAccessFlagBits2` values.

• VUID-VkBufferMemoryBarrier2-dstStageMask-parameter
  `dstStageMask` must be a valid combination of `VkPipelineStageFlagBits2` values.

• VUID-VkBufferMemoryBarrier2-dstAccessMask-parameter
  `dstAccessMask` must be a valid combination of `VkAccessFlagBits2` values.

• VUID-VkBufferMemoryBarrier2-buffer-parameter
  `buffer` must be a valid `VkBuffer` handle.
The `VkBufferMemoryBarrier` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBufferMemoryBarrier {
    VkStructureType sType;
    const void* pNext;
    VkAccessFlags srcAccessMask;
    VkAccessFlags dstAccessMask;
    uint32_t srcQueueFamilyIndex;
    uint32_t dstQueueFamilyIndex;
    VkBuffer buffer;
    VkDeviceSize offset;
    VkDeviceSize size;
} VkBufferMemoryBarrier;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **srcAccessMask** is a bitmask of `VkAccessFlagBits` specifying a source access mask.
- **dstAccessMask** is a bitmask of `VkAccessFlagBits` specifying a destination access mask.
- **srcQueueFamilyIndex** is the source queue family for a queue family ownership transfer.
- **dstQueueFamilyIndex** is the destination queue family for a queue family ownership transfer.
- **buffer** is a handle to the buffer whose backing memory is affected by the barrier.
- **offset** is an offset in bytes into the backing memory for `buffer`; this is relative to the base offset as bound to the buffer (see `vkBindBufferMemory`).
- **size** is a size in bytes of the affected area of backing memory for `buffer`, or `VK_WHOLE_SIZE` to use the range from `offset` to the end of the buffer.

The first access scope is limited to access to memory through the specified buffer range, via access types in the source access mask specified by `srcAccessMask`. If `srcAccessMask` includes `VK_ACCESS_HOST_WRITE_BIT`, a memory domain operation is performed where available memory in the host domain is also made available to the device domain.

The second access scope is limited to access to memory through the specified buffer range, via access types in the destination access mask specified by `dstAccessMask`. If `dstAccessMask` includes `VK_ACCESS_HOST_WRITE_BIT` or `VK_ACCESS_HOST_READ_BIT`, a memory domain operation is performed where available memory in the device domain is also made available to the host domain.

**Note**

When `VK_MEMORY_PROPERTY_HOST_COHERENT_BIT` is used, available memory in host domain is automatically made visible to host domain, and any host write is automatically made available to host domain.

If `srcQueueFamilyIndex` is not equal to `dstQueueFamilyIndex`, and `srcQueueFamilyIndex` is equal to the current queue family, then the memory barrier defines a queue family release operation for the specified buffer range, and the second access scope includes no access, as if `dstAccessMask` was 0.
If $dstQueueFamilyIndex$ is not equal to $srcQueueFamilyIndex$, and $dstQueueFamilyIndex$ is equal to the current queue family, then the memory barrier defines a queue family acquire operation for the specified buffer range, and the first access scope includes no access, as if $srcAccessMask$ was 0.

If the synchronization feature is not enabled, and buffer was created with a sharing mode of VK_SHARING_MODE_CONCURRENT, dstQueueFamilyIndex must be VK_QUEUE_FAMILY_IGNORED or VK_QUEUE_FAMILY_EXTERNAL.

### Valid Usage (Implicit)

- **VUID-VkBufferMemoryBarrier-sType-sType**
  - sType must be VK_STRUCTURE_TYPE_BUFFER_MEMORY_BARRIER
- **VUID-VkBufferMemoryBarrier-pNext-pNext**
  - pNext must be NULL or a pointer to a valid instance of VkExternalMemoryAcquireUnmodifiedEXT
- **VUID-VkBufferMemoryBarrier-sType-unique**
  - The sType value of each struct in the pNext chain must be unique
- **VUID-VkBufferMemoryBarrier-buffer-parameter**
  - buffer must be a valid VkBuffer handle

VK_WHOLE_SIZE is a special value indicating that the entire remaining length of a buffer following a given offset should be used. It can be specified for VkBufferMemoryBarrier::size and other structures.

```c
#define VK_WHOLE_SIZE (~0ULL)
```

### 7.7.3. Image Memory Barriers

Image memory barriers only apply to memory accesses involving a specific image subresource range. That is, a memory dependency formed from an image memory barrier is scoped to access via the specified image subresource range. Image memory barriers can also be used to define image layout transitions or a queue family ownership transfer for the specified image subresource range.

The VkImageMemoryBarrier2 structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkImageMemoryBarrier2 {
    VkStructureType sType;
    const void* pNext;
    VkPipelineStageFlags2 srcStageMask;
    VkAccessFlags2 srcAccessMask;
    VkPipelineStageFlags2 dstStageMask;
    VkAccessFlags2 dstAccessMask;
    VkImageLayout oldLayout;
    VkImageLayout newLayout;
    uint32_t srcQueueFamilyIndex;
} VkImageMemoryBarrier2;
```
## VkImageMemoryBarrier2

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcStageMask` is a `VkPipelineStageFlags2` mask of pipeline stages to be included in the first synchronization scope.
- `srcAccessMask` is a `VkAccessFlags2` mask of access flags to be included in the first access scope.
- `dstStageMask` is a `VkPipelineStageFlags2` mask of pipeline stages to be included in the second synchronization scope.
- `dstAccessMask` is a `VkAccessFlags2` mask of access flags to be included in the second access scope.
- `oldLayout` is the old layout in an image layout transition.
- `newLayout` is the new layout in an image layout transition.
- `srcQueueFamilyIndex` is the source queue family for a queue family ownership transfer.
- `dstQueueFamilyIndex` is the destination queue family for a queue family ownership transfer.
- `image` is a handle to the image affected by this barrier.
- `subresourceRange` describes the image subresource range within image that is affected by this barrier.

This structure defines a memory dependency limited to an image subresource range, and can define a queue family transfer operation and image layout transition for that subresource range.

The first synchronization scope and access scope described by this structure include only operations and memory accesses specified by `srcStageMask` and `srcAccessMask`.

The second synchronization scope and access scope described by this structure include only operations and memory accesses specified by `dstStageMask` and `dstAccessMask`.

Both access scopes are limited to only memory accesses to `image` in the subresource range defined by `subresourceRange`.

If `image` was created with `VK_SHARING_MODE_EXCLUSIVE`, and `srcQueueFamilyIndex` is not equal to `dstQueueFamilyIndex`, this memory barrier defines a queue family transfer operation. When executed on a queue in the family identified by `srcQueueFamilyIndex`, this barrier defines a queue family release operation for the specified image subresource range, and the second synchronization and access scopes do not synchronize operations on that queue. When executed on a queue in the family identified by `dstQueueFamilyIndex`, this barrier defines a queue family acquire operation.
operation for the specified image subresource range, and the first synchronization and access scopes do not synchronize operations on that queue.

A queue family transfer operation is also defined if the values are not equal, and either is one of the special queue family values reserved for external memory ownership transfers, as described in Queue Family Ownership Transfer. A queue family release operation is defined when dstQueueFamilyIndex is one of those values, and a queue family acquire operation is defined when srcQueueFamilyIndex is one of those values.

If oldLayout is not equal to newLayout, then the memory barrier defines an image layout transition for the specified image subresource range. If this memory barrier defines a queue family transfer operation, the layout transition is only executed once between the queues.

**Note**

When the old and new layout are equal, the layout values are ignored - data is preserved no matter what values are specified, or what layout the image is currently in.

If image has a multi-planar format and the image is disjoint, then including VK_IMAGE_ASPECT_COLOR_BIT in the aspectMask member of subresourceRange is equivalent to including VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, and (for three-plane formats only) VK_IMAGE_ASPECT_PLANE_2_BIT.

**Valid Usage**

- VUID-VkImageMemoryBarrier2-srcStageMask-03929  
  If the geometryShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT

- VUID-VkImageMemoryBarrier2-srcStageMask-03930  
  If the tessellationShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT or VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT

- VUID-VkImageMemoryBarrier2-srcStageMask-07317  
  If the attachmentFragmentShadingRate feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-VkImageMemoryBarrier2-srcStageMask-07947  
  If the rayTracingPipeline feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR

- VUID-VkImageMemoryBarrier2-srcAccessMask-03900  
  If srcAccessMask includes VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT, srcStageMask must include VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkImageMemoryBarrier2-srcAccessMask-03901  
  If srcAccessMask includes VK_ACCESS_2_INDEX_READ_BIT, srcStageMask must include
VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT, VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkImageMemoryBarrier2-srcAccessMask-03902
  If srcAccessMask includes VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT, srcStageMask must include VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT, VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkImageMemoryBarrier2-srcAccessMask-03903
  If srcAccessMask includes VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT, srcStageMask must include VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT, VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkImageMemoryBarrier2-srcAccessMask-03904
  If srcAccessMask includes VK_ACCESS_2_UNIFORM_READ_BIT, srcStageMask must include VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

- VUID-VkImageMemoryBarrier2-srcAccessMask-03905
  If srcAccessMask includes VK_ACCESS_2_SHADER_SAMPLED_READ_BIT, srcStageMask must include VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

- VUID-VkImageMemoryBarrier2-srcAccessMask-03906
  If srcAccessMask includes VK_ACCESS_2_SHADER_STORAGE_READ_BIT, srcStageMask must include VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

- VUID-VkImageMemoryBarrier2-srcAccessMask-03907
  If srcAccessMask includes VK_ACCESS_2_SHADER_WRITE_BIT, srcStageMask must include VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

- VUID-VkImageMemoryBarrier2-srcAccessMask-03908
  If srcAccessMask includes VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT, srcStageMask must include VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkImageMemoryBarrier2-srcAccessMask-03909
  If srcAccessMask includes VK_ACCESS_2_SHADER_WRITE_BIT, srcStageMask must include VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

- VUID-VkImageMemoryBarrier2-srcAccessMask-03910
  If srcAccessMask includes VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT, srcStageMask must include VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

- VUID-VkImageMemoryBarrier2-srcAccessMask-03911
  If srcAccessMask includes VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT, srcStageMask must
include VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT
or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkImageMemoryBarrier2-srcAccessMask-03912
  If srcAccessMask includes VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT, VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT,
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkImageMemoryBarrier2-srcAccessMask-03913
  If srcAccessMask includes VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT, VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT,
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkImageMemoryBarrier2-srcAccessMask-03914
  If srcAccessMask includes VK_ACCESS_2_TRANSFER_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_COPY_BIT, VK_PIPELINE_STAGE_2_BLIT_BIT, VK_PIPELINE_STAGE_2_RESOLVE_BIT,
  VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR,
  VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkImageMemoryBarrier2-srcAccessMask-03915
  If srcAccessMask includes VK_ACCESS_2_TRANSFER_WRITE_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_COPY_BIT, VK_PIPELINE_STAGE_2_BLIT_BIT, VK_PIPELINE_STAGE_2_RESOLVE_BIT,
  VK_PIPELINE_STAGE_2_CLEAR_BIT, VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR,
  VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkImageMemoryBarrier2-srcAccessMask-03916
  If srcAccessMask includes VK_ACCESS_2_HOST_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_HOST_BIT

- VUID-VkImageMemoryBarrier2-srcAccessMask-03917
  If srcAccessMask includes VK_ACCESS_2_HOST_WRITE_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_HOST_BIT

- VUID-VkImageMemoryBarrier2-srcAccessMask-03927
  If srcAccessMask includes VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR, srcStageMask must include
  VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR,
  VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

- VUID-VkImageMemoryBarrier2-srcAccessMask-03928
  If srcAccessMask includes VK_ACCESS_2_ACCELERATION_STRUCTURE_WRITE_BIT_KHR, srcStageMask must include
  VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR, or
  VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT
If the `rayQuery` feature is not enabled and `srcAccessMask` includes `VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR`, `srcStageMask` must not include any of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages except `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`.

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT` or `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`.

If `srcAccessMask` includes `VK_ACCESS_2_VIDEO_DECODE_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR`.

If `srcAccessMask` includes `VK_ACCESS_2_VIDEO_DECODE_WRITE_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR`.

If `srcAccessMask` includes `VK_ACCESS_2_VIDEO_ENCODE_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR`.

If `srcAccessMask` includes `VK_ACCESS_2_VIDEO_ENCODE_WRITE_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR`.

If `srcAccessMask` includes `VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` or `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`.

If the `geometryShader` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`.

If the `tessellationShader` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`.

If the `attachmentFragmentShadingRate` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

If the `rayTracingPipeline` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`.

If the `geometryShader` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`.
If dstAccessMask includes VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT, dstStageMask must include VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkImageMemoryBarrier2-dstAccessMask-03901
  If dstAccessMask includes VK_ACCESS_2_INDEX_READ_BIT, dstStageMask must include VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT, VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkImageMemoryBarrier2-dstAccessMask-03902

If `dstAccessMask` includes `VK_ACCESS_2_VIDEO_DECODE_READ_BIT_KHR`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR`.

If `dstAccessMask` includes `VK_ACCESS_2_VIDEO_DECODE_WRITE_BIT_KHR`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR`.

If `dstAccessMask` includes `VK_ACCESS_2_VIDEO_ENCODE_READ_BIT_KHR`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR`.

If `dstAccessMask` includes `VK_ACCESS_2_VIDEO_ENCODE_WRITE_BIT_KHR`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR`.

If `dstAccessMask` includes `VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT`.

If `dstAccessMask` includes `VK_ACCESS_2_MICROMAP_READ_BIT_EXT`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` or `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`. 
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL` then image **must** have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` then image **must** have been created with `VK_IMAGE_USAGE_SAMPLED_BIT` or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` then image **must** have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT`

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` then image **must** have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT`

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, oldLayout **must** be `VK_IMAGE_LAYOUT_UNDEFINED` or the current layout of the image subresources affected by the barrier

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, newLayout **must** not be `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` then image **must** have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` set.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL` then image must have been created with at least one of `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_SAMPLED_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` set.

If the `synchronization2` feature is not enabled, `oldLayout` must not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`.

If the `synchronization2` feature is not enabled, `newLayout` must not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR` then image must have been created with `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` set.

If `image` was created with a sharing mode of `VK_SHARING_MODE_EXCLUSIVE`, and `srcQueueFamilyIndex` and `dstQueueFamilyIndex` are not equal, `srcQueueFamilyIndex` must be `VK_QUEUE_FAMILY_EXTERNAL`, or a valid queue family.

If `image` was created with a sharing mode of `VK_SHARING_MODE_EXCLUSIVE`, and...
srcQueueFamilyIndex and dstQueueFamilyIndex are not equal, dstQueueFamilyIndex must be VK_QUEUE_FAMILY_EXTERNAL, or a valid queue family

• VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-04070
  If srcQueueFamilyIndex is not equal to dstQueueFamilyIndex, at least one of srcQueueFamilyIndex or dstQueueFamilyIndex must not be VK_QUEUE_FAMILY_EXTERNAL

• VUID-VkImageMemoryBarrier2-None-09119
  If the VK_KHR_external_memory extension is not enabled, and the value of VkApplicationInfo::apiVersion used to create the VkInstance is not greater than or equal to Version 1.1, srcQueueFamilyIndex must not be VK_QUEUE_FAMILY_EXTERNAL

• VUID-VkImageMemoryBarrier2-None-09120
  If the VK_KHR_external_memory extension is not enabled, and the value of VkApplicationInfo::apiVersion used to create the VkInstance is not greater than or equal to Version 1.1, dstQueueFamilyIndex must not be VK_QUEUE_FAMILY_EXTERNAL

• VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-07120
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_VIDEO_DECODE_SRC_KHR then image must have been created with VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR

• VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-07121
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR then image must have been created with VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR

• VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-07122
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR then image must have been created with VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR

• VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-07123
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_VIDEO_ENCODE_SRC_KHR then image must have been created with VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR

• VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-07124
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_VIDEO_ENCODE_DST_KHR then image must have been created with VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR

• VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-07125
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR then image must have been created with VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` then `image` must have been created with either the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage bits, and the `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_SAMPLED_BIT` usage bits, and the `VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` usage bit

- **VUID-VkImageMemoryBarrier2-attachmentFeedbackLoopLayout-07313**  
  If the `attachmentFeedbackLoopLayout` feature is not enabled, `newLayout` must not be `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT`

- **VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-09550**  
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR` then `image` must have been created with either `VK_IMAGE_USAGE_STORAGE_BIT`, or with both `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` and either of `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- **VUID-VkImageMemoryBarrier2-dynamicRenderingLocalRead-09551**  
  If the `dynamicRenderingLocalRead` feature is not enabled, `oldLayout` must not be `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR`

- **VUID-VkImageMemoryBarrier2-dynamicRenderingLocalRead-09552**  
  If the `dynamicRenderingLocalRead` feature is not enabled, `newLayout` must not be `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR`

- **VUID-VkImageMemoryBarrier2-subresourceRange-01486**  
  `subresourceRange.baseMipLevel` must be less than the `mipLevels` specified in `VkImageCreateInfo` when `image` was created

- **VUID-VkImageMemoryBarrier2-subresourceRange-01724**  
  If `subresourceRange.levelCount` is not `VK_REMAINING_MIP_LEVELS`, `subresourceRange.baseMipLevel + subresourceRange.levelCount` must be less than or equal to the `mipLevels` specified in `VkImageCreateInfo` when `image` was created

- **VUID-VkImageMemoryBarrier2-subresourceRange-01488**  
  `subresourceRange.baseArrayLayer` must be less than the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created

- **VUID-VkImageMemoryBarrier2-subresourceRange-01725**  
  If `subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `subresourceRange.baseArrayLayer + subresourceRange.layerCount` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created

- **VUID-VkImageMemoryBarrier2-image-01932**  
  If `image` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-VkImageMemoryBarrier2-image-09242**  
  If `image` has a color format that is single-plane, then the `aspectMask` member of `subresourceRange` must be `VK_IMAGE_ASPECT_COLOR_BIT`
If image has a color format and is not disjoint, then the aspectMask member of subresourceRange must be VK_IMAGE_ASPECT_COLOR_BIT

• VUID-VkImageMemoryBarrier2-image-01672
  If image has a multi-planar format and the image is disjoint, then the aspectMask member of subresourceRange must include at least one multi-planar aspect mask bit or VK_IMAGE_ASPECT_COLOR_BIT

• VUID-VkImageMemoryBarrier2-image-03320
  If image has a depth/stencil format with both depth and stencil and the separateDepthStencilLayouts feature is not enabled, then the aspectMask member of subresourceRange must include both VK_IMAGE_ASPECT_DEPTH_BIT and VK_IMAGE_ASPECT_STENCIL_BIT

• VUID-VkImageMemoryBarrier2-image-03319
  If image has a depth/stencil format with both depth and stencil and the separateDepthStencilLayouts feature is enabled, then the aspectMask member of subresourceRange must include either or both VK_IMAGE_ASPECT_DEPTH_BIT and VK_IMAGE_ASPECT_STENCIL_BIT

• VUID-VkImageMemoryBarrier2-aspectMask-08702
  If the aspectMask member of subresourceRange includes VK_IMAGE_ASPECT_DEPTH_BIT, oldLayout and newLayout must not be one of VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkImageMemoryBarrier2-aspectMask-08703
  If the aspectMask member of subresourceRange includes VK_IMAGE_ASPECT_STENCIL_BIT, oldLayout and newLayout must not be one of VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL

• VUID-VkImageMemoryBarrier2-srcStageMask-03854
  If either srcStageMask or dstStageMask includes VK_PIPELINE_STAGE_2_HOST_BIT, srcQueueFamilyIndex and dstQueueFamilyIndex must be equal

• VUID-VkImageMemoryBarrier2-srcStageMask-03855
  If srcStageMask includes VK_PIPELINE_STAGE_2_HOST_BIT, and srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, oldLayout must be one of VK_IMAGE_LAYOUT_PREINITIALIZED, VK_IMAGE_LAYOUT_UNDEFINED, or VK_IMAGE_LAYOUT_GENERAL

Valid Usage (Implicit)

• VUID-VkImageMemoryBarrier2-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMAGE_MEMORY_BARRIER_2

• VUID-VkImageMemoryBarrier2-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkExternalMemoryAcquireUnmodifiedEXT

• VUID-VkImageMemoryBarrier2-sType-unique
  The sType value of each struct in the pNext chain must be unique

• VUID-VkImageMemoryBarrier2-srcStageMask-parameter
**srcStageMask** must be a valid combination of **VkPipelineStageFlagBits2** values

- VUID-VkImageMemoryBarrier2-srcStageMask-parameter
  **srcStageMask** must be a valid combination of **VkPipelineStageFlagBits2** values

- VUID-VkImageMemoryBarrier2-dstStageMask-parameter
  **dstStageMask** must be a valid combination of **VkPipelineStageFlagBits2** values

- VUID-VkImageMemoryBarrier2-srcAccessMask-parameter
  **srcAccessMask** must be a valid combination of **VkAccessFlagBits2** values

- VUID-VkImageMemoryBarrier2-dstAccessMask-parameter
  **dstAccessMask** must be a valid combination of **VkAccessFlagBits2** values

- VUID-VkImageMemoryBarrier2-oldLayout-parameter
  **oldLayout** must be a valid **VkImageLayout** value

- VUID-VkImageMemoryBarrier2-newLayout-parameter
  **newLayout** must be a valid **VkImageLayout** value

- VUID-VkImageMemoryBarrier2-image-parameter
  **image** must be a valid **VkImage** handle

- VUID-VkImageMemoryBarrier2-subresourceRange-parameter
  **subresourceRange** must be a valid **VkImageSubresourceRange** structure

The **VkImageMemoryBarrier** structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageMemoryBarrier {
    VkStructureType          sType;
    const void*              pNext;
    VkAccessFlags            srcAccessMask;
    VkAccessFlags            dstAccessMask;
    VkImageLayout            oldLayout;
    VkImageLayout            newLayout;
    uint32_t                 srcQueueFamilyIndex;
    uint32_t                 dstQueueFamilyIndex;
    VkImage                  image;
    VkImageSubresourceRange  subresourceRange;
} VkImageMemoryBarrier;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **srcAccessMask** is a bitmask of **VkAccessFlagBits** specifying a **source access mask**.
- **dstAccessMask** is a bitmask of **VkAccessFlagBits** specifying a **destination access mask**.
- **oldLayout** is the old layout in an **image layout transition**.
- **newLayout** is the new layout in an **image layout transition**.
- **srcQueueFamilyIndex** is the source queue family for a **queue family ownership transfer**.
- **dstQueueFamilyIndex** is the destination queue family for a **queue family ownership transfer**.
- **image** is a handle to the image affected by this barrier.
• **subresourceRange** describes the **image subresource range** within **image** that is affected by this barrier.

The first **access scope** is limited to access to memory through the specified image subresource range, via access types in the **source access mask** specified by **srcAccessMask**. If **srcAccessMask** includes **VK_ACCESS_HOST_WRITE_BIT**, memory writes performed by that access type are also made visible, as that access type is not performed through a resource.

The second **access scope** is limited to access to memory through the specified image subresource range, via access types in the **destination access mask** specified by **dstAccessMask**. If **dstAccessMask** includes **VK_ACCESS_HOST_WRITE_BIT** or **VK_ACCESS_HOST_READ_BIT**, available memory writes are also made visible to accesses of those types, as those access types are not performed through a resource.

If **srcQueueFamilyIndex** is not equal to **dstQueueFamilyIndex**, and **srcQueueFamilyIndex** is equal to the current queue family, then the memory barrier defines a **queue family release operation** for the specified image subresource range, and the second access scope includes no access, as if **dstAccessMask** was 0.

If **dstQueueFamilyIndex** is not equal to **srcQueueFamilyIndex**, and **dstQueueFamilyIndex** is equal to the current queue family, then the memory barrier defines a **queue family acquire operation** for the specified image subresource range, and the first access scope includes no access, as if **srcAccessMask** was 0.

If the **synchronization2** feature is not enabled or **oldLayout** is not equal to **newLayout**, **oldLayout** and **newLayout** define an **image layout transition** for the specified image subresource range.

---

**Note**

If the **synchronization2** feature is enabled, when the old and new layout are equal, the layout values are ignored - data is preserved no matter what values are specified, or what layout the image is currently in.

If **image** has a multi-planar format and the image is **disjoint**, then including **VK_IMAGE_ASPECT_COLOR_BIT** in the **aspectMask** member of **subresourceRange** is equivalent to including **VK_IMAGE_ASPECT_PLANE_0_BIT**, **VK_IMAGE_ASPECT_PLANE_1_BIT**, and (for three-plane formats only) **VK_IMAGE_ASPECT_PLANE_2_BIT**.

---

**Valid Usage**

- **VUID-VkImageMemoryBarrier-oldLayout-01208**
  If **srcQueueFamilyIndex** and **dstQueueFamilyIndex** define a **queue family ownership transfer** or **oldLayout** and **newLayout** define an **image layout transition**, and **oldLayout** or **newLayout** is **VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL** then **image** must have been created with **VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT**

- **VUID-VkImageMemoryBarrier-oldLayout-01209**
  If **srcQueueFamilyIndex** and **dstQueueFamilyIndex** define a **queue family ownership transfer** or **oldLayout** and **newLayout** define an **image layout transition**, and **oldLayout** or **newLayout** is **VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL** then **image** must have been created with **VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT**
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_SAMPLED_BIT` or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT`.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT`.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_UNDEFINED` or the current layout of the image subresources affected by the barrier.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, `newLayout` must not be `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_SAMPLED_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`. 
If 
\textit{srcQueueFamilyIndex} and 
\textit{dstQueueFamilyIndex} define a queue family ownership transfer 
or 
\textit{oldLayout} and 
\textit{newLayout} define an image layout transition, 
and 
\textit{oldLayout} or 
\textit{newLayout} is 
\texttt{VK\_IMAGE\_LAYOUT\_DEPTH\_ATTACHMENT\_OPTIMAL} then image must have been created with 
\texttt{VK\_IMAGE\_USAGE\_DEPTH\_STENCIL\_ATTACHMENT\_BIT} set

If 
\textit{srcQueueFamilyIndex} and 
\textit{dstQueueFamilyIndex} define a queue family ownership transfer 
or 
\textit{oldLayout} and 
\textit{newLayout} define an image layout transition, 
and 
\textit{oldLayout} or 
\textit{newLayout} is 
\texttt{VK\_IMAGE\_LAYOUT\_STENCIL\_READ\_ONLY\_OPTIMAL} then image must have been created with at least one of 
\texttt{VK\_IMAGE\_USAGE\_DEPTH\_STENCIL\_ATTACHMENT\_BIT}, 
\texttt{VK\_IMAGE\_USAGE\_SAMPLED\_BIT}, or 
\texttt{VK\_IMAGE\_USAGE\_INPUT\_ATTACHMENT\_BIT}

If 
\textit{srcQueueFamilyIndex} and 
\textit{dstQueueFamilyIndex} define a queue family ownership transfer 
or 
\textit{oldLayout} and 
\textit{newLayout} define an image layout transition, 
and 
\textit{oldLayout} or 
\textit{newLayout} is 
\texttt{VK\_IMAGE\_LAYOUT\_ATTACHMENT\_OPTIMAL} 
image must have been created with 
\texttt{VK\_IMAGE\_USAGE\_COLOR\_ATTACHMENT\_BIT} or 
\texttt{VK\_IMAGE\_USAGE\_DEPTH\_STENCIL\_ATTACHMENT\_BIT}

If 
\textit{srcQueueFamilyIndex} and 
\textit{dstQueueFamilyIndex} define a queue family ownership transfer 
or 
\textit{oldLayout} and 
\textit{newLayout} define an image layout transition, 
and 
\textit{oldLayout} or 
\textit{newLayout} is 
\texttt{VK\_IMAGE\_LAYOUT\_READ\_ONLY\_OPTIMAL} 
image must have been created with at least one of 
\texttt{VK\_IMAGE\_USAGE\_DEPTH\_STENCIL\_ATTACHMENT\_BIT}, 
\texttt{VK\_IMAGE\_USAGE\_SAMPLED\_BIT}, or 
\texttt{VK\_IMAGE\_USAGE\_INPUT\_ATTACHMENT\_BIT}

If the synchronization2 feature is not enabled, 
\textit{oldLayout} must not be 
\texttt{VK\_IMAGE\_LAYOUT\_ATTACHMENT\_OPTIMAL\_KHR} or 
\texttt{VK\_IMAGE\_LAYOUT\_READ\_ONLY\_OPTIMAL\_KHR}

If the synchronization2 feature is not enabled, 
\textit{newLayout} must not be 
\texttt{VK\_IMAGE\_LAYOUT\_ATTACHMENT\_OPTIMAL\_KHR} or 
\texttt{VK\_IMAGE\_LAYOUT\_READ\_ONLY\_OPTIMAL\_KHR}

If \textit{srcQueueFamilyIndex} and \textit{dstQueueFamilyIndex} define a queue family ownership transfer 
or \textit{oldLayout} and \textit{newLayout} define an image layout transition, 
and \textit{oldLayout} or \textit{newLayout} is 
\texttt{VK\_IMAGE\_LAYOUT\_ATTACHMENT\_OPTIMAL}, 
image must have been created with at least one of 
\texttt{VK\_IMAGE\_USAGE\_COLOR\_ATTACHMENT\_BIT} or 
\texttt{VK\_IMAGE\_USAGE\_DEPTH\_STENCIL\_ATTACHMENT\_BIT}

If \textit{srcQueueFamilyIndex} and \textit{dstQueueFamilyIndex} define a queue family ownership transfer 
or \textit{oldLayout} and \textit{newLayout} define an image layout transition, 
and \textit{oldLayout} or \textit{newLayout} is 
\texttt{VK\_IMAGE\_LAYOUT\_READ\_ONLY\_OPTIMAL}, 
image must have been created with at least one of 
\texttt{VK\_IMAGE\_USAGE\_DEPTH\_STENCIL\_ATTACHMENT\_BIT}, 
\texttt{VK\_IMAGE\_USAGE\_SAMPLED\_BIT}, or 
\texttt{VK\_IMAGE\_USAGE\_INPUT\_ATTACHMENT\_BIT}

If \textit{srcQueueFamilyIndex} and \textit{dstQueueFamilyIndex} define a queue family ownership transfer 
or \textit{oldLayout} and \textit{newLayout} define an image layout transition, 
and \textit{oldLayout} or \textit{newLayout} is 
\texttt{VK\_IMAGE\_LAYOUT\_FRAGMENT\_SHADING\_RATE\_ATTACHMENT\_OPTIMAL\_KHR} then image must have been created with 
\texttt{VK\_IMAGE\_USAGE\_FRAGMENT\_SHADING\_RATE\_ATTACHMENT\_BIT\_KHR} set

If image was created with a sharing mode of \texttt{VK\_SHARING\_MODE\_EXCLUSIVE}, 
and \textit{srcQueueFamilyIndex} and \textit{dstQueueFamilyIndex} are not equal, \textit{srcQueueFamilyIndex} must be 
\texttt{VK\_QUEUE\_FAMILY\_EXTERNAL}, or a valid queue family

If image was created with a sharing mode of \texttt{VK\_SHARING\_MODE\_EXCLUSIVE}, and
srcQueueFamilyIndex and dstQueueFamilyIndex are not equal, dstQueueFamilyIndex must be VK_QUEUE_FAMILY_EXTERNAL, or a valid queue family

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-04070
  If srcQueueFamilyIndex is not equal to dstQueueFamilyIndex, at least one of srcQueueFamilyIndex or dstQueueFamilyIndex must not be VK_QUEUE_FAMILY_EXTERNAL

- VUID-VkImageMemoryBarrier-None-09119
  If the VK_KHR_external_memory extension is not enabled, and the value of VkApplicationInfo::apiVersion used to create the VkInstance is not greater than or equal to Version 1.1, srcQueueFamilyIndex must not be VK_QUEUE_FAMILY_EXTERNAL

- VUID-VkImageMemoryBarrier-None-09120
  If the VK_KHR_external_memory extension is not enabled, and the value of VkApplicationInfo::apiVersion used to create the VkInstance is not greater than or equal to Version 1.1, dstQueueFamilyIndex must not be VK_QUEUE_FAMILY_EXTERNAL

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-07120
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_VIDEO_DECODE_SRC_KHR then image must have been created with VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-07121
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR then image must have been created with VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-07122
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR then image must have been created with VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-07123
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_VIDEO_ENCODE_SRC_KHR then image must have been created with VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-07124
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_VIDEO_ENCODE_DST_KHR then image must have been created with VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-07125
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR then image must have been created with VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_EXT` then image must have been created with either the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage bits, and the `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_SAMPLED_BIT` usage bits, and the `VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` usage bit.

- **VUID-VkImageMemoryBarrier-attachmentFeedbackLoopLayout-07313**
  If the `attachmentFeedbackLoopLayout` feature is not enabled, `newLayout` must not be `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_EXT`

- **VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-09550**
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR` then image must have been created with either `VK_IMAGE_USAGE_STORAGE_BIT`, or with both `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` and either of `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

  - **VUID-VkImageMemoryBarrier-dynamicRenderingLocalRead-09551**
    If the `dynamicRenderingLocalRead` feature is not enabled, `oldLayout` must not be `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR`

  - **VUID-VkImageMemoryBarrier-dynamicRenderingLocalRead-09552**
    If the `dynamicRenderingLocalRead` feature is not enabled, `newLayout` must not be `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR`

- **VUID-VkImageMemoryBarrier-subresourceRange-01486**
  `subresourceRange.baseMipLevel` must be less than the `mipLevels` specified in `VkImageCreateInfo` when image was created

- **VUID-VkImageMemoryBarrier-subresourceRange-01724**
  If `subresourceRange.levelCount` is not `VK_REMAINING_MIP_LEVELS`, `subresourceRange.baseMipLevel + subresourceRange.levelCount` must be less than or equal to the `mipLevels` specified in `VkImageCreateInfo` when image was created

- **VUID-VkImageMemoryBarrier-subresourceRange-01488**
  `subresourceRange.baseArrayLayer` must be less than the `arrayLayers` specified in `VkImageCreateInfo` when image was created

- **VUID-VkImageMemoryBarrier-subresourceRange-01725**
  If `subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `subresourceRange.baseArrayLayer + subresourceRange.layerCount` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when image was created

- **VUID-VkImageMemoryBarrier-image-01932**
  If image is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-VkImageMemoryBarrier-image-09241**
  If image has a color format that is single-plane, then the `aspectMask` member of `subresourceRange` must be `VK_IMAGE_ASPECT_COLOR_BIT`

- **VUID-VkImageMemoryBarrier-image-09242**
  If image has a color format that is single-plane, then the `aspectMask` member of `subresourceRange` must be `VK_IMAGE_ASPECT_COLOR_BIT`
If `image` has a color format and is not disjoint, then the `aspectMask` member of `subresourceRange` must be `VK_IMAGE_ASPECT_COLOR_BIT`.

- **VUID-VkImageMemoryBarrier-image-01672**
  If `image` has a multi-planar format and the image is disjoint, then the `aspectMask` member of `subresourceRange` must include at least one multi-planar aspect mask bit or `VK_IMAGE_ASPECT_COLOR_BIT`.

- **VUID-VkImageMemoryBarrier-image-03320**
  If `image` has a depth/stencil format with both depth and stencil and the `separateDepthStencilLayouts` feature is not enabled, then the `aspectMask` member of `subresourceRange` must include both `VK_IMAGE_ASPECT_DEPTH_BIT` and `VK_IMAGE_ASPECT_STENCIL_BIT`.

- **VUID-VkImageMemoryBarrier-image-03319**
  If `image` has a depth/stencil format with both depth and stencil and the `separateDepthStencilLayouts` feature is enabled, then the `aspectMask` member of `subresourceRange` must include either or both `VK_IMAGE_ASPECT_DEPTH_BIT` and `VK_IMAGE_ASPECT_STENCIL_BIT`.

- **VUID-VkImageMemoryBarrier-aspectMask-08702**
  If the `aspectMask` member of `subresourceRange` includes `VK_IMAGE_ASPECT_DEPTH_BIT`, `oldLayout` and `newLayout` must not be one of `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`.

- **VUID-VkImageMemoryBarrier-aspectMask-08703**
  If the `aspectMask` member of `subresourceRange` includes `VK_IMAGE_ASPECT_STENCIL_BIT`, `oldLayout` and `newLayout` must not be one of `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`.

- **VUID-VkImageMemoryBarrier-None-09052**
  If the `synchronization2` feature is not enabled, and `image` was created with a sharing mode of `VK_SHARING_MODE_CONCURRENT`, at least one of `srcQueueFamilyIndex` and `dstQueueFamilyIndex` must be `VK_QUEUE_FAMILY_IGNORED`.

- **VUID-VkImageMemoryBarrier-None-09053**
  If the `synchronization2` feature is not enabled, and `image` was created with a sharing mode of `VK_SHARING_MODE_CONCURRENT`, `srcQueueFamilyIndex` must be `VK_QUEUE_FAMILY_IGNORED` or `VK_QUEUE_FAMILY_EXTERNAL`.

- **VUID-VkImageMemoryBarrier-None-09054**
  If the `synchronization2` feature is not enabled, and `image` was created with a sharing mode of `VK_SHARING_MODE_CONCURRENT`, `dstQueueFamilyIndex` must be `VK_QUEUE_FAMILY_IGNORED` or `VK_QUEUE_FAMILY_EXTERNAL`.

### Valid Usage (Implicit)

- **VUID-VkImageMemoryBarrier-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_IMAGE_MEMORY_BARRIER`.

- **VUID-VkImageMemoryBarrier-pNext-pNext**
  `pNext` must be `NULL` or a pointer to a valid instance of
To facilitate usage of images whose memory is initialized on the host, Vulkan allows image layout transitions to be performed by the host as well, albeit supporting limited layouts.

To perform an image layout transition on the host, call:

```c
// Provided by VK_EXT_host_image_copy
VkResult vkTransitionImageLayoutEXT(VkDevice device, uint32_t transitionCount, const VkHostImageLayoutTransitionInfoEXT* pTransitions);
```

- `device` is the device which owns `pTransitions[i].image`.
- `transitionCount` is the number of image layout transitions to perform.
- `pTransitions` is a pointer to an array of `VkHostImageLayoutTransitionInfoEXT` structures specifying the image and subresource ranges within them to transition.

**Valid Usage (Implicit)**

- **VUID-vkTransitionImageLayoutEXT-device-parameter**
  `device` must be a valid `VkDevice` handle

- **VUID-vkTransitionImageLayoutEXT-pTransitions-parameter**
  `pTransitions` must be a valid pointer to an array of `transitionCount` valid `VkHostImageLayoutTransitionInfoEXT` structures

- **VUID-vkTransitionImageLayoutEXT-transitionCount-arraylength**
  `transitionCount` must be greater than 0

**Return Codes**

**Success**

- `VK_SUCCESS`
Failure

- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_MEMORY_MAP_FAILED

The VkHostImageLayoutTransitionInfoEXT structure is defined as:

```c
// Provided by VK_EXT_host_image_copy
typedef struct VkHostImageLayoutTransitionInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkImage image;
    VkImageLayout oldLayout;
    VkImageLayout newLayout;
    VkImageSubresourceRange subresourceRange;
} VkHostImageLayoutTransitionInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `image` is a handle to the image affected by this layout transition.
- `oldLayout` is the old layout in an image layout transition.
- `newLayout` is the new layout in an image layout transition.
- `subresourceRange` describes the image subresource range within `image` that is affected by this layout transition.

`vkTransitionImageLayoutEXT` does not check whether the device memory associated with an image is currently in use before performing the layout transition. The application must guarantee that any previously submitted command that reads from or writes to this subresource has completed before the host performs the layout transition.

**Note**

Image layout transitions performed on the host do not require queue family ownership transfers as the physical layout of the image will not vary between queue families for the layouts supported by this function.

**Valid Usage**

- VUID-VkHostImageLayoutTransitionInfoEXT-image-09055
  `image` must have been created with `VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT`

- VUID-VkHostImageLayoutTransitionInfoEXT-subresourceRange-01486
  `subresourceRange.baseMipLevel` must be less than the `mipLevels` specified in
VkImageCreateInfo when image was created

- VUID-VkHostImageLayoutTransitionInfoEXT-subresourceRange-01724
  If subresourceRange.levelCount is not VK_REMAINING_MIP_LEVELS, subresourceRange.baseMipLevel + subresourceRange.levelCount must be less than or equal to the mipLevels specified in VkImageCreateInfo when image was created

- VUID-VkHostImageLayoutTransitionInfoEXT-subresourceRange-01488
  subresourceRange.baseArrayLayer must be less than the arrayLayers specified in VkImageCreateInfo when image was created

- VUID-VkHostImageLayoutTransitionInfoEXT-subresourceRange-01725
  If subresourceRange.layerCount is not VK_REMAINING_ARRAY_LAYERS, subresourceRange.baseArrayLayer + subresourceRange.layerCount must be less than or equal to the arrayLayers specified in VkImageCreateInfo when image was created

- VUID-VkHostImageLayoutTransitionInfoEXT-image-01932
  If image is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-VkHostImageLayoutTransitionInfoEXT-image-09241
  If image has a color format that is single-plane, then the aspectMask member of subresourceRange must be VK_IMAGE_ASPECT_COLOR_BIT

- VUID-VkHostImageLayoutTransitionInfoEXT-image-09242
  If image has a color format and is not disjoint, then the aspectMask member of subresourceRange must be VK_IMAGE_ASPECT_COLOR_BIT

- VUID-VkHostImageLayoutTransitionInfoEXT-image-01672
  If image has a multi-planar format and the image is disjoint, then the aspectMask member of subresourceRange must include at least one multi-planar aspect mask bit or VK_IMAGE_ASPECT_COLOR_BIT

- VUID-VkHostImageLayoutTransitionInfoEXT-image-03320
  If image has a depth/stencil format with both depth and stencil and the separateDepthStencilLayouts feature is not enabled, then the aspectMask member of subresourceRange must include both VK_IMAGE_ASPECT_DEPTH_BIT and VK_IMAGE_ASPECT_STENCIL_BIT

- VUID-VkHostImageLayoutTransitionInfoEXT-image-03319
  If image has a depth/stencil format with both depth and stencil and the separateDepthStencilLayouts feature is enabled, then the aspectMask member of subresourceRange must include either or both VK_IMAGE_ASPECT_DEPTH_BIT and VK_IMAGE_ASPECT_STENCIL_BIT

- VUID-VkHostImageLayoutTransitionInfoEXT-aspectMask-08702
  If the aspectMask member of subresourceRange includes VK_IMAGE_ASPECT_DEPTH_BIT, oldLayout and newLayout must not be one of VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkHostImageLayoutTransitionInfoEXT-aspectMask-08703
  If the aspectMask member of subresourceRange includes VK_IMAGE_ASPECT_STENCIL_BIT, oldLayout and newLayout must not be one of VK_IMAGE_LAYOUT_DEPTH_ATTACHMNT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL
oldLayout must be either VK_IMAGE_LAYOUT_UNDEFINED or the current layout of the image subresources as specified in subresourceRange

If oldLayout is not VK_IMAGE_LAYOUT_UNDEFINED or VK_IMAGE_LAYOUT_PREINITIALIZED, it must be one of the layouts in VkPhysicalDeviceHostImageCopyPropertiesEXT::pCopySrcLayouts

newLayout must be one of the layouts in VkPhysicalDeviceHostImageCopyPropertiesEXT::pCopyDstLayouts

Valid Usage (Implicit)

sType must be VK_STRUCTURE_TYPE_HOST_IMAGE_LAYOUT_TRANSITION_INFO_EXT

pNext must be NULL

image must be a valid VkImage handle

oldLayout must be a valid VkImageLayout value

newLayout must be a valid VkImageLayout value

subresourceRange must be a valid VkImageSubresourceRange structure

7.7.4. Queue Family Ownership Transfer

Resources created with a VkSharingMode of VK_SHARING_MODE_EXCLUSIVE must have their ownership explicitly transferred from one queue family to another in order to access their content in a well-defined manner on a queue in a different queue family.

The special queue family index VK_QUEUE_FAMILY_IGNORED indicates that a queue family parameter or member is ignored.

#define VK_QUEUE_FAMILY_IGNORED (~0U)

Resources shared with external APIs or instances using external memory must also explicitly manage ownership transfers between local and external queues (or equivalent constructs in external APIs) regardless of the VkSharingMode specified when creating them.

The special queue family index VK_QUEUE_FAMILY_EXTERNAL represents any queue external to the resource's current Vulkan instance, as long as the queue uses the same underlying device group or physical device, and the same driver version as the resource's VkDevice, as indicated by
VkPhysicalDeviceIDProperties::deviceUUID and VkPhysicalDeviceIDProperties::driverUUID.

```c
#define VK_QUEUE_FAMILY_EXTERNAL          (~1U)
```
or the equivalent

```c
#define VK_QUEUE_FAMILY_EXTERNAL_KHR      VK_QUEUE_FAMILY_EXTERNAL
```

If memory dependencies are correctly expressed between uses of such a resource between two queues in different families, but no ownership transfer is defined, the contents of that resource are undefined for any read accesses performed by the second queue family.

**Note**

If an application does not need the contents of a resource to remain valid when transferring from one queue family to another, then the ownership transfer should be skipped.

A queue family ownership transfer consists of two distinct parts:

1. Release exclusive ownership from the source queue family
2. Acquire exclusive ownership for the destination queue family

An application must ensure that these operations occur in the correct order by defining an execution dependency between them, e.g. using a semaphore.

A *release operation* is used to release exclusive ownership of a range of a buffer or image subresource range. A release operation is defined by executing a buffer memory barrier (for a buffer range) or an image memory barrier (for an image subresource range) using a pipeline barrier command, on a queue from the source queue family. The srcQueueFamilyIndex parameter of the barrier must be set to the source queue family index, and the dstQueueFamilyIndex parameter to the destination queue family index. dstAccessMask is ignored for such a barrier, such that no visibility operation is executed - the value of this mask does not affect the validity of the barrier. The release operation happens-after the availability operation, and happens-before operations specified in the second synchronization scope of the calling command.

An *acquire operation* is used to acquire exclusive ownership of a range of a buffer or image subresource range. An acquire operation is defined by executing a buffer memory barrier (for a buffer range) or an image memory barrier (for an image subresource range) using a pipeline barrier command, on a queue from the destination queue family. The buffer range or image subresource range specified in an acquire operation must match exactly that of a previous release operation. The srcQueueFamilyIndex parameter of the barrier must be set to the source queue family index, and the dstQueueFamilyIndex parameter to the destination queue family index. srcAccessMask is ignored for such a barrier, such that no availability operation is executed - the value of this mask does not affect the validity of the barrier. The acquire operation happens-after operations in the first synchronization scope of the calling command, and happens-before the visibility operation.
Whilst it is not invalid to provide destination or source access masks for memory barriers used for release or acquire operations, respectively, they have no practical effect. Access after a release operation has undefined results, and so visibility for those accesses has no practical effect. Similarly, write access before an acquire operation will produce undefined results for future access, so availability of those writes has no practical use. In an earlier version of the specification, these were required to match on both sides - but this was subsequently relaxed. These masks should be set to 0.

If the transfer is via an image memory barrier, and an image layout transition is desired, then the values of oldLayout and newLayout in the release operation's memory barrier must be equal to values of oldLayout and newLayout in the acquire operation's memory barrier. Although the image layout transition is submitted twice, it will only be executed once. A layout transition specified in this way happens-after the release operation and happens-before the acquire operation.

If the values of srcQueueFamilyIndex and dstQueueFamilyIndex are equal, no ownership transfer is performed, and the barrier operates as if they were both set to VK_QUEUE_FAMILY_IGNORED.

Queue family ownership transfers may perform read and write accesses on all memory bound to the image subresource or buffer range, so applications must ensure that all memory writes have been made available before a queue family ownership transfer is executed. Available memory is automatically made visible to queue family release and acquire operations, and writes performed by those operations are automatically made available.

Once a queue family has acquired ownership of a buffer range or image subresource range of a VK_SHARING_MODE_EXCLUSIVE resource, its contents are undefined to other queue families unless ownership is transferred. The contents of any portion of another resource which aliases memory that is bound to the transferred buffer or image subresource range are undefined after a release or acquire operation.

Because events cannot be used directly for inter-queue synchronization, and because vkCmdSetEvent does not have the queue family index or memory barrier parameters needed by a release operation, the release and acquire operations of a queue family ownership transfer can only be performed using vkCmdPipelineBarrier.

An acquire operation may have a performance penalty when acquiring ownership of a subresource range from one of the special queue families reserved for external memory ownership transfers described above. The application can reduce the performance penalty in some cases by adding a VkExternalMemoryAcquireUnmodifiedEXT structure to the pNext chain of the acquire operation's memory barrier structure.

The VkExternalMemoryAcquireUnmodifiedEXT structure is defined as:

```c
// Provided by VK_EXT_external_memory_acquire_unmodified
typedef struct VkExternalMemoryAcquireUnmodifiedEXT {
```
VkStructureType sType;
const void* pNext;
VkBool32 acquireUnmodifiedMemory;
} VkExternalMemoryAcquireUnmodifiedEXT;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `acquireUnmodifiedMemory` specifies, if `VK_TRUE`, that no range of `VkDeviceMemory` bound to the resource of the memory barrier's subresource range was modified at any time since the resource’s most recent release of ownership to the queue family specified by the memory barrier’s `srcQueueFamilyIndex`. If `VK_FALSE`, it specifies nothing.

If the application releases ownership of the subresource range to one of the special queue families reserved for external memory ownership transfers with a memory barrier structure, and later re-acquires ownership from the same queue family with a memory barrier structure, and if no range of `VkDeviceMemory` bound to the resource was modified at any time between the `release operation` and the `acquire operation`, then the application should add a `VkExternalMemoryAcquireUnmodifiedEXT` structure to the `pNext` chain of the `acquire operation`'s memory barrier structure because this may reduce the performance penalty.

This struct is ignored if `acquireUnmodifiedMemory` is `VK_FALSE`. In particular, `VK_FALSE` does not specify that memory was modified.

This struct is ignored if the memory barrier's `srcQueueFamilyIndex` is not a special queue family reserved for external memory ownership transfers.

**Note**

The method by which the application determines whether memory was modified between the `release operation` and `acquire operation` is outside the scope of Vulkan.

For any Vulkan operation that accesses a resource, the application must not assume the implementation accesses the resource's memory as read-only, even for apparently read-only operations such as transfer commands and shader reads.

The validity of `VkExternalMemoryAcquireUnmodifiedEXT`::`acquireUnmodifiedMemory` is independent of memory ranges outside the ranges of `VkDeviceMemory` bound to the resource. In particular, it is independent of any implementation-private memory associated with the resource.

**Valid Usage**

- VUID-VkExternalMemoryAcquireUnmodifiedEXT-acquireUnmodifiedMemory-08922
  If `acquireUnmodifiedMemory` is `VK_TRUE`, and the memory barrier's `srcQueueFamilyIndex` is a special queue family reserved for external memory ownership transfers (as described in Queue Family Ownership Transfer), then each range of `VkDeviceMemory` bound to the resource must have remained unmodified during all time since the resource's most recent release of ownership to the queue family.
Valid Usage (Implicit)

• VUID-VkExternalMemoryAcquireUnmodifiedEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_EXTERNAL_MEMORY_ACQUIRE_UNMODIFIED_EXT

7.8. Wait Idle Operations

To wait on the host for the completion of outstanding queue operations for a given queue, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkQueueWaitIdle(
  VkQueue queue);
```

• `queue` is the queue on which to wait.

`vkQueueWaitIdle` is equivalent to having submitted a valid fence to every previously executed queue submission command that accepts a fence, then waiting for all of those fences to signal using `vkWaitForFences` with an infinite timeout and `waitAll` set to `VK_TRUE`.

Valid Usage (Implicit)

• VUID-vkQueueWaitIdle-queue-parameter
  `queue` must be a valid VkQueue handle

Host Synchronization

• Host access to `queue` must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>Any</td>
<td>-</td>
</tr>
</tbody>
</table>

Return Codes

Success

• `VK_SUCCESS`

Failure

• `VK_ERROR_OUT_OF_HOST_MEMORY`
To wait on the host for the completion of outstanding queue operations for all queues on a given logical device, call:

```cpp
// Provided by VK_VERSION_1_0
VkResult vkDeviceWaitIdle(VkDevice device);
```

- `device` is the logical device to idle.

`vkDeviceWaitIdle` is equivalent to calling `vkQueueWaitIdle` for all queues owned by `device`.

### Valid Usage (Implicit)

- VUID-vkDeviceWaitIdle-device-parameter
  - `device` must be a valid `VkDevice` handle

### Host Synchronization

- Host access to all `VkQueue` objects created from `device` must be externally synchronized

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`

### 7.9. Host Write Ordering Guarantees

When batches of command buffers are submitted to a queue via a queue submission command, it defines a memory dependency with prior host operations, and execution of command buffers submitted to the queue.

The first synchronization scope includes execution of `vkQueueSubmit` on the host and anything that happened-before it, as defined by the host memory model.
Note

Some systems allow writes that do not directly integrate with the host memory model; these have to be synchronized by the application manually. One example of this is non-temporal store instructions on x86; to ensure these happen-before submission, applications should call `_mm_sfence()`.

The second synchronization scope includes all commands submitted in the same queue submission, and all commands that occur later in submission order.

The first access scope includes all host writes to mappable device memory that are available to the host memory domain.

The second access scope includes all memory access performed by the device.

### 7.10. Synchronization and Multiple Physical Devices

If a logical device includes more than one physical device, then fences, semaphores, and events all still have a single instance of the signaled state.

A fence becomes signaled when all physical devices complete the necessary queue operations.

Semaphore wait and signal operations all include a device index that is the sole physical device that performs the operation. These indices are provided in the `VkDeviceGroupSubmitInfo` and `VkDeviceGroupBindSparseInfo` structures. Semaphores are not exclusively owned by any physical device. For example, a semaphore can be signaled by one physical device and then waited on by a different physical device.

An event can only be waited on by the same physical device that signaled it (or the host).

### 7.11. Calibrated Timestamps

In order to be able to correlate the time a particular operation took place at on timelines of different time domains (e.g. a device operation vs. a host operation), Vulkan allows querying calibrated timestamps from multiple time domains.

To query calibrated timestamps from a set of time domains, call:

```c
// Provided by VK_KHR_calibrated_timestamps
VkResult vkGetCalibratedTimestampsKHR(  
    VkDevice device,  
    uint32_t timestampCount,  
    const VkCalibratedTimestampInfoKHR* pTimestampInfos,  
    uint64_t* pTimestamps,  
    uint64_t* pMaxDeviation);
```

- **device** is the logical device used to perform the query.
- **timestampCount** is the number of timestamps to query.
• `pTimestampInfos` is a pointer to an array of `timestampCount` `VkCalibratedTimestampInfoKHR` structures, describing the time domains the calibrated timestamps should be captured from.

• `pTimestamps` is a pointer to an array of `timestampCount` 64-bit unsigned integer values in which the requested calibrated timestamp values are returned.

• `pMaxDeviation` is a pointer to a 64-bit unsigned integer value in which the strictly positive maximum deviation, in nanoseconds, of the calibrated timestamp values is returned.

---

**Note**

The maximum deviation may vary between calls to `vkGetCalibratedTimestampsKHR` even for the same set of time domains due to implementation and platform specific reasons. It is the application's responsibility to assess whether the returned maximum deviation makes the timestamp values suitable for any particular purpose and can choose to re-issue the timestamp calibration call pursuing a lower deviation value.

Calibrated timestamp values can be extrapolated to estimate future coinciding timestamp values, however, depending on the nature of the time domains and other properties of the platform extrapolating values over a sufficiently long period of time may no longer be accurate enough to fit any particular purpose, so applications are expected to re-calibrate the timestamps on a regular basis.

---

**Valid Usage**

- VUID-vkGetCalibratedTimestampsEXT-timeDomain-09246
  The `timeDomain` value of each `VkCalibratedTimestampInfoEXT` in `pTimestampInfos` must be unique

---

**Valid Usage ( Implicit )**

- VUID-vkGetCalibratedTimestampsKHR-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkGetCalibratedTimestampsKHR-pTimestampInfos-parameter
  `pTimestampInfos` must be a valid pointer to an array of `timestampCount` valid `VkCalibratedTimestampInfoKHR` structures

- VUID-vkGetCalibratedTimestampsKHR-pTimestamps-parameter
  `pTimestamps` must be a valid pointer to an array of `timestampCount` `uint64_t` values

- VUID-vkGetCalibratedTimestampsKHR-pMaxDeviation-parameter
  `pMaxDeviation` must be a valid pointer to a `uint64_t` value

- VUID-vkGetCalibratedTimestampsKHR-timestampCount-arraylength
  `timestampCount` must be greater than 0
Return Codes

Success

• VK_SUCCESS

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkCalibratedTimestampInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_calibrated_timestamps
typedef struct VkCalibratedTimestampInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkTimeDomainKHR timeDomain;
} VkCalibratedTimestampInfoKHR;
```

• `sType` is a `VkStructureType` value identifying this structure.

• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `timeDomain` is a `VkTimeDomainKHR` value specifying the time domain from which the calibrated timestamp value should be returned.

Valid Usage

• VUID-VkCalibratedTimestampInfoEXT-timeDomain-02354
timeDomain must be one of the `VkTimeDomainKHR` values returned by `vkGetPhysicalDeviceCalibrateableTimeDomainsKHR`

Valid Usage (Implicit)

• VUID-VkCalibratedTimestampInfoKHR-sType-sType
  sType must be `VK_STRUCTURE_TYPE_CALIBRATED_TIMESTAMP_INFO_KHR`

• VUID-VkCalibratedTimestampInfoKHR-pNext-pNext
  pNext must be `NULL`

• VUID-VkCalibratedTimestampInfoKHR-timeDomain-parameter
  timeDomain must be a valid `VkTimeDomainKHR` value

The set of supported time domains consists of:

```c
// Provided by VK_KHR_calibrated_timestamps
typedef enum VkTimeDomainKHR {
```
VK_TIME_DOMAIN_DEVICE_KHR = 0,
VK_TIME_DOMAIN_CLOCK_MONOTONIC_KHR = 1,
VK_TIME_DOMAIN_CLOCK_MONOTONIC_RAW_KHR = 2,
VK_TIME_DOMAIN_QUERY_PERFORMANCE_COUNTER_KHR = 3,
} VkTimeDomainKHR;

- **VK_TIME_DOMAIN_DEVICE_KHR** specifies the device time domain. Timestamp values in this time domain use the same units and are comparable with device timestamp values captured using vkCmdWriteTimestamp or vkCmdWriteTimestamp2 and are defined to be incrementing according to the timestampPeriod of the device.

- **VK_TIME_DOMAIN_CLOCK_MONOTONIC_KHR** specifies the CLOCK_MONOTONIC time domain available on POSIX platforms. Timestamp values in this time domain are in units of nanoseconds and are comparable with platform timestamp values captured using the POSIX clock_gettime API as computed by this example:

  ```c
  struct timespec tv;
  clock_gettime(CLOCK_MONOTONIC, &tv);
  return tv.tv_nsec + tv.tv_sec*1000000000ull;
  ```

  _Note_
  An implementation supporting **VK_KHR_calibrated_timestamps** will use the same time domain for all its **VkQueue** so that timestamp values reported for **VK_TIME_DOMAIN_DEVICE_KHR** can be matched to any timestamp captured through vkCmdWriteTimestamp or vkCmdWriteTimestamp2.

- **VK_TIME_DOMAIN_CLOCK_MONOTONIC_RAW_KHR** specifies the CLOCK_MONOTONIC_RAW time domain available on POSIX platforms. Timestamp values in this time domain are in units of nanoseconds and are comparable with platform timestamp values captured using the POSIX clock_gettime API as computed by this example:

  ```c
  struct timespec tv;
  clock_gettime(CLOCK_MONOTONIC_RAW, &tv);
  return tv.tv_nsec + tv.tv_sec*1000000000ull;
  ```

- **VK_TIME_DOMAIN_QUERY_PERFORMANCE_COUNTER_KHR** specifies the performance counter (QPC) time domain available on Windows. Timestamp values in this time domain are in the same units as those provided by the Windows QueryPerformanceCounter API and are comparable with platform timestamp values captured using that API as computed by this example:

  ```c
  LARGE_INTEGER counter;
  QueryPerformanceCounter(&counter);
  return counter.QuadPart;
  ```
Chapter 8. Render Pass

Draw commands must be recorded within a render pass instance. Each render pass instance defines a set of image resources, referred to as attachments, used during rendering.

To begin a render pass instance, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdBeginRendering(
    VkCommandBuffer commandBuffer,
    const VkRenderingInfo* pRenderingInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_dynamic_rendering
void vkCmdBeginRenderingKHR(
    VkCommandBuffer commandBuffer,
    const VkRenderingInfo* pRenderingInfo);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pRenderingInfo` is a pointer to a `VkRenderingInfo` structure specifying details of the render pass instance to begin.

After beginning a render pass instance, the command buffer is ready to record draw commands.

If `pRenderingInfo->flags` includes `VK_RENDERING_RESUMING_BIT` then this render pass is resumed from a render pass instance that has been suspended earlier in submission order.

Valid Usage

- VUID-vkCmdBeginRendering-dynamicRendering-06446
  The dynamicRendering feature must be enabled

- VUID-vkCmdBeginRendering-commandBuffer-06068
  If `commandBuffer` is a secondary command buffer, and the nestedCommandBuffer feature is not enabled, `pRenderingInfo->flags` must not include `VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT`

Valid Usage (Implicit)

- VUID-vkCmdBeginRendering-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdBeginRendering-pRenderingInfo-parameter
  `pRenderingInfo` must be a valid pointer to a valid `VkRenderingInfo` structure
- VUID-vkCmdBeginRendering-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdBeginRendering-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdBeginRendering-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdBeginRendering-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

### Command Properties

<table>
<thead>

</tbody>
</table>

The VkRenderingInfo structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkRenderingInfo {
    VkStructureType sType;
    const void* pNext;
    VkRenderingFlags flags;
    VkRect2D renderArea;
    uint32_t layerCount;
    uint32_t viewMask;
    uint32_t colorAttachmentCount;
    const VkRenderingAttachmentInfo* pColorAttachments;
    const VkRenderingAttachmentInfo* pDepthAttachment;
    const VkRenderingAttachmentInfo* pStencilAttachment;
} VkRenderingInfo;
```

or the equivalent

```c
// Provided by VK_KHR_dynamic_rendering
```
typedef VkRenderingInfo VkRenderingInfoKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is a bitmask of `VkRenderingFlagBits`.
- **renderArea** is the render area that is affected by the render pass instance.
- **layerCount** is the number of layers rendered to in each attachment when `viewMask` is 0.
- **viewMask** is the view mask indicating the indices of attachment layers that will be rendered when it is not 0.
- **colorAttachmentCount** is the number of elements in `pColorAttachments`.
- **pColorAttachments** is a pointer to an array of `colorAttachmentCount` `VkRenderingAttachmentInfo` structures describing any color attachments used.
- **pDepthAttachment** is a pointer to a `VkRenderingAttachmentInfo` structure describing a depth attachment.
- **pStencilAttachment** is a pointer to a `VkRenderingAttachmentInfo` structure describing a stencil attachment.

If `viewMask` is not 0, multiview is enabled.

If there is an instance of `VkDeviceGroupRenderPassBeginInfo` included in the `pNext` chain and its `deviceRenderAreaCount` member is not 0, then `renderArea` is ignored, and the render area is defined per-device by that structure.

Each element of the `pColorAttachments` array corresponds to an output location in the shader, i.e. if the shader declares an output variable decorated with a `Location` value of X, then it uses the attachment provided in `pColorAttachments[X]`. If the `imageView` member of any element of `pColorAttachments` is `VK_NULL_HANDLE`, writes to the corresponding location by a fragment are discarded.

## Valid Usage

- VUID-VkRenderingInfo-viewMask-06069
  If `viewMask` is 0, `layerCount` must not be 0

- VUID-VkRenderingInfo-multisampledRenderToSingleSampled-06857
  `imageView` members of `pDepthAttachment`, `pStencilAttachment`, and elements of `pColorAttachments` that are not `VK_NULL_HANDLE` must have been created with the same `sampleCount`

- VUID-VkRenderingInfo-imageView-09429
  `imageView` members of elements of `pColorAttachments` that are not `VK_NULL_HANDLE` must have been created with the same `sampleCount`

- VUID-VkRenderingInfo-None-08994
  If `VkDeviceGroupRenderPassBeginInfo::deviceRenderAreaCount` is 0, `renderArea.extent.width` must be greater than 0
• VUID-VkDeviceGroupRenderPassBeginInfo::deviceRenderAreaCount is 0, renderArea.extent.height must be greater than 0

• VUID-VkDeviceGroupRenderPassBeginInfo-pNext-06077
  If the pNext chain does not contain VkDeviceGroupRenderPassBeginInfo or its deviceRenderAreaCount member is equal to 0, renderArea.extent.height must be greater than or equal to 0

• VUID-VkDeviceGroupRenderPassBeginInfo-pNext-06078
  If the pNext chain does not contain VkDeviceGroupRenderPassBeginInfo or its deviceRenderAreaCount member is equal to 0, renderArea.extent.height must be greater than or equal to 0

• VUID-VkDeviceGroupRenderPassBeginInfo-pNext-07815
  If the pNext chain does not contain VkDeviceGroupRenderPassBeginInfo or its deviceRenderAreaCount member is equal to 0, the sum of renderArea.extent.width and renderArea.offset.x must be less than or equal to maxFramebufferWidth

• VUID-VkDeviceGroupRenderPassBeginInfo-pNext-07816
  If the pNext chain does not contain VkDeviceGroupRenderPassBeginInfo or its deviceRenderAreaCount member is equal to 0, the sum of renderArea.extent.height and renderArea.offset.y must be less than or equal to maxFramebufferHeight

• VUID-VkDeviceGroupRenderPassBeginInfo-pNext-06079
  If the pNext chain does not contain VkDeviceGroupRenderPassBeginInfo or its deviceRenderAreaCount member is equal to 0, the width of the imageView member of any element of pColorAttachments, pDepthAttachment, or pStencilAttachment that is not VK_NULL_HANDLE must be greater than or equal to renderArea.extent.width

• VUID-VkDeviceGroupRenderPassBeginInfo-pNext-06080
  If the pNext chain does not contain VkDeviceGroupRenderPassBeginInfo or its deviceRenderAreaCount member is equal to 0, the height of the imageView member of any element of pColorAttachments, pDepthAttachment, or pStencilAttachment that is not VK_NULL_HANDLE must be greater than or equal to renderArea.extent.height

• VUID-VkDeviceGroupRenderPassBeginInfo-pNext-06083
  If the pNext chain contains VkDeviceGroupRenderPassBeginInfo, the width of the imageView member of any element of pColorAttachments, pDepthAttachment, or pStencilAttachment that is not VK_NULL_HANDLE must be greater than or equal to the sum of the offset.x and extent.width members of each element of pDeviceRenderAreas

• VUID-VkDeviceGroupRenderPassBeginInfo-pNext-06084
  If the pNext chain contains VkDeviceGroupRenderPassBeginInfo, the height of the imageView member of any element of pColorAttachments, pDepthAttachment, or pStencilAttachment that is not VK_NULL_HANDLE must be greater than or equal to the sum of the offset.y and extent.height members of each element of pDeviceRenderAreas

• VUID-VkDeviceGroupRenderPassBeginInfo-pDepthAttachment-06085
  If neither pDepthAttachment or pStencilAttachment are NULL and the imageView member of either structure is not VK_NULL_HANDLE, the imageView member of each structure must
be the same

• VUID-VkRenderingInfo-pDepthAttachment-06086
  If neither pDepthAttachment or pStencilAttachment are NULL, and the resolveMode member of each is not VK_RESOLVE_MODE_NONE, the resolveImageView member of each structure must be the same

• VUID-VkRenderingInfo-colorAttachmentCount-06087
  If colorAttachmentCount is not 0 and the imageView member of an element of pColorAttachments is not VK_NULL_HANDLE, that imageView must have been created with VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT

• VUID-VkRenderingInfo-colorAttachmentCount-09476
  If colorAttachmentCount is not 0 and there is an element of pColorAttachments with its imageView member not VK_NULL_HANDLE, and its resolveMode member not set to VK_RESOLVE_MODE_NONE, the resolveImageView member of that element of pColorAttachments must have been created with VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT

• VUID-VkRenderingInfo-pDepthAttachment-06547
  If pDepthAttachment is not NULL and pDepthAttachment->imageView is not VK_NULL_HANDLE, pDepthAttachment->imageView must have been created with a format that includes a depth component

• VUID-VkRenderingInfo-pDepthAttachment-06088
  If pDepthAttachment is not NULL and pDepthAttachment->imageView is not VK_NULL_HANDLE, pDepthAttachment->imageView must have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

• VUID-VkRenderingInfo-pDepthAttachment-09477
  If pDepthAttachment is not NULL and pDepthAttachment->resolveMode is not VK_RESOLVE_MODE_NONE, pDepthAttachment->resolveImageView must have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

• VUID-VkRenderingInfo-pStencilAttachment-06548
  If pStencilAttachment is not NULL and pStencilAttachment->imageView is not VK_NULL_HANDLE, pStencilAttachment->imageView must have been created with a format that includes a stencil aspect

• VUID-VkRenderingInfo-pStencilAttachment-06089
  If pStencilAttachment is not NULL and pStencilAttachment->imageView is not VK_NULL_HANDLE, pStencilAttachment->imageView must have been created with a stencil usage including VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

• VUID-VkRenderingInfo-pStencilAttachment-09478
  If pStencilAttachment is not NULL and pStencilAttachment->resolveMode is not VK_RESOLVE_MODE_NONE, pStencilAttachment->resolveImageView must have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

• VUID-VkRenderingInfo-colorAttachmentCount-06090
  If colorAttachmentCount is not 0 and the imageView member of an element of pColorAttachments is not VK_NULL_HANDLE, the layout member of that element of pColorAttachments must not be VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL
• VUID-VkRenderingInfo-colorAttachmentCount-06091
If `colorAttachmentCount` is not 0 and the `imageView` member of an element of `pColorAttachments` is not `VK_NULL_HANDLE`, if the `resolveMode` member of that element of `pColorAttachments` is not `VK_RESOLVE_MODE_NONE`, its `resolveImageLayout` member **must** not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`.

• VUID-VkRenderingInfo-pDepthAttachment-06092
If `pDepthAttachment` is not `NULL` and `pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, `pDepthAttachment->layout` **must** not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`.

• VUID-VkRenderingInfo-pDepthAttachment-06093
If `pDepthAttachment` is not `NULL`, `pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, and `pDepthAttachment->resolveMode` is not `VK_RESOLVE_MODE_NONE`, `pDepthAttachment->resolveImageLayout` **must** not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`.

• VUID-VkRenderingInfo-pStencilAttachment-06094
If `pStencilAttachment` is not `NULL` and `pStencilAttachment->imageView` is not `VK_NULL_HANDLE`, `pStencilAttachment->layout` **must** not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`.

• VUID-VkRenderingInfo-pStencilAttachment-06095
If `pStencilAttachment` is not `NULL`, `pStencilAttachment->imageView` is not `VK_NULL_HANDLE`, and `pStencilAttachment->resolveMode` is not `VK_RESOLVE_MODE_NONE`, `pStencilAttachment->resolveImageLayout` **must** not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`.

• VUID-VkRenderingInfo-colorAttachmentCount-06096
If `colorAttachmentCount` is not 0 and the `imageView` member of an element of `pColorAttachments` is not `VK_NULL_HANDLE`, the `layout` member of that element of `pColorAttachments` **must** not be `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`.

• VUID-VkRenderingInfo-colorAttachmentCount-06097
If `colorAttachmentCount` is not 0 and the `imageView` member of an element of `pColorAttachments` is not `VK_NULL_HANDLE`, if the `resolveMode` member of that element of `pColorAttachments` is not `VK_RESOLVE_MODE_NONE`, its `resolveImageLayout` member **must** not be `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`.

• VUID-VkRenderingInfo-pDepthAttachment-06098
If `pDepthAttachment` is not `NULL` and `pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, and `pDepthAttachment->resolveMode` is not `VK_RESOLVE_MODE_NONE`, `pDepthAttachment->resolveImageLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`.

• VUID-VkRenderingInfo-pStencilAttachment-06099
If `pStencilAttachment` is not `NULL`, `pStencilAttachment->imageView` is not `VK_NULL_HANDLE`, and `pStencilAttachment->resolveMode` is not `VK_RESOLVE_MODE_NONE`, `pStencilAttachment->resolveImageLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`.

• VUID-VkRenderingInfo-colorAttachmentCount-06100
If `colorAttachmentCount` is not 0 and the `imageView` member of an element of `pColorAttachments` is not `VK_NULL_HANDLE`, the layout member of that element of `pColorAttachments` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`.

- **VUID-VkRenderingInfo-colorAttachmentCount-06101**
  If `colorAttachmentCount` is not 0 and the `imageView` member of an element of `pColorAttachments` is not `VK_NULL_HANDLE`, if the `resolveMode` member of that element of `pColorAttachments` is not `VK_RESOLVE_MODE_NONE`, its `resolveImageLayout` member must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`.

- **VUID-VkRenderingInfo-pDepthAttachment-07732**
  If `pDepthAttachment` is not `NULL` and `pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, `pDepthAttachment->layout` must not be `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`.

- **VUID-VkRenderingInfo-pDepthAttachment-07733**
  If `pDepthAttachment` is not `NULL`, `pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, and `pDepthAttachment->resolveMode` is not `VK_RESOLVE_MODE_NONE`, `pDepthAttachment->resolveImageLayout` must not be `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`.

- **VUID-VkRenderingInfo-pStencilAttachment-07734**
  If `pStencilAttachment` is not `NULL` and `pStencilAttachment->imageView` is not `VK_NULL_HANDLE`, `pStencilAttachment->layout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`.

- **VUID-VkRenderingInfo-pStencilAttachment-07735**
  If `pStencilAttachment` is not `NULL`, `pStencilAttachment->imageView` is not `VK_NULL_HANDLE`, and `pStencilAttachment->resolveMode` is not `VK_RESOLVE_MODE_NONE`, `pStencilAttachment->resolveImageLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`.

- **VUID-VkRenderingInfo-pDepthAttachment-06102**
  If `pDepthAttachment` is not `NULL` and `pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, `pDepthAttachment->resolveMode` must be one of the bits set in `VkPhysicalDeviceDepthStencilResolveProperties::supportedDepthResolveModes`.

- **VUID-VkRenderingInfo-pStencilAttachment-06103**
  If `pStencilAttachment` is not `NULL` and `pStencilAttachment->imageView` is not `VK_NULL_HANDLE`, `pStencilAttachment->resolveMode` must be one of the bits set in `VkPhysicalDeviceDepthStencilResolveProperties::supportedStencilResolveModes`.

- **VUID-VkRenderingInfo-pDepthAttachment-06104**
  If `pDepthAttachment` or `pStencilAttachment` are both not `NULL`, `pDepthAttachment->imageView` and `pStencilAttachment->imageView` are both not `VK_NULL_HANDLE`, and `VkPhysicalDeviceDepthStencilResolveProperties::independentResolveNone` is `VK_FALSE`, the `resolveMode` of both structures must be the same value.

- **VUID-VkRenderingInfo-pDepthAttachment-06105**
If `pDepthAttachment` or `pStencilAttachment` are both not `NULL`, `pDepthAttachment->imageView` and `pStencilAttachment->imageView` are both not `VK_NULL_HANDLE`, `VkPhysicalDeviceDepthStencilResolveProperties::independentResolve` is `VK_FALSE`, and the `resolveMode` of neither structure is `VK_RESOLVE_MODE_NONE`, the `resolveMode` of both structures must be the same value.

- **VUID-VkRenderingInfo-colorAttachmentCount-06106**
  `colorAttachmentCount` must be less than or equal to `VkPhysicalDeviceLimits::maxColorAttachments`

- **VUID-VkRenderingInfo-pNext-06119**
  If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0 and the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, `imageView` must have a width greater than or equal to \[
\frac{\text{renderAreaX} + \text{renderAreaX\_width}}{\text{shadingRateAttachmentTexelSize\_width}}
\]

- **VUID-VkRenderingInfo-pNext-06121**
  If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0 and the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, `imageView` must have a height greater than or equal to \[
\frac{\text{renderAreaY} + \text{renderAreaY\_width}}{\text{shadingRateAttachmentTexelSize\_height}}
\]

- **VUID-VkRenderingInfo-pNext-06120**
  If the `pNext` chain contains a `VkDeviceGroupRenderPassBeginInfo` structure, its `deviceRenderAreaCount` member is not 0, and the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, `imageView` must have a width greater than or equal to \[
\frac{pDeviceRenderAreaX + pDeviceRenderArea\_width}{\text{shadingRateAttachmentTexelSize\_width}}
\] for each element of `pDeviceRenderAreas`

- **VUID-VkRenderingInfo-pNext-06122**
  If the `pNext` chain contains a `VkDeviceGroupRenderPassBeginInfo` structure, its `deviceRenderAreaCount` member is not 0, and the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, `imageView` must have a height greater than or equal to \[
\frac{pDeviceRenderAreaY + pDeviceRenderArea\_height}{\text{shadingRateAttachmentTexelSize\_height}}
\] for each element of `pDeviceRenderAreas`

- **VUID-VkRenderingInfo-layerCount-07817**
  `layerCount` must be less than or equal to `maxFramebufferLayers`

- **VUID-VkRenderingInfo-imageView-06123**
  If the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, and `viewMask` is `0`, `imageView` must have a `layerCount` that is either equal to `1` or greater than or equal to `layerCount`

- **VUID-VkRenderingInfo-imageView-06124**
  If the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, and `viewMask` is not `0`, `imageView` must have a `layerCount` that either equal to `1` or greater than or equal to the index of the most significant bit in `viewMask`
If the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, it must not be equal to the `imageView` or `resolveImageView` member of `pDepthAttachment`, `pStencilAttachment`, or any element of `pColorAttachments`.

If the `multiview` feature is not enabled, `viewMask` must be 0.

The index of the most significant bit in `viewMask` must be less than `maxMultiviewViewCount`.

Valid attachments specified by this structure must not be bound to memory locations that are bound to any other valid attachments specified by this structure.

If `flags` includes `VK_RENDERING_CONTENTS_INLINE_BIT_EXT` then the `nestedCommandBuffer` feature must be enabled.

If `colorAttachmentCount` is not 0 and the `imageView` member of an element of `pColorAttachments` is not `VK_NULL_HANDLE`, that `imageView` must have been created with the identity swizzle.

If `colorAttachmentCount` is not 0, and there is an element of `pColorAttachments` with its `imageView` member not set to `VK_NULL_HANDLE` and its `resolveMode` member not set to `VK_RESOLVE_MODE_NONE`, the `resolveImageView` member of that element of `pColorAttachments` must have been created with the identity swizzle.

If `pDepthAttachment` is not NULL and `pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, `pDepthAttachment->imageView` must have been created with the identity swizzle.

If `pDepthAttachment` is not NULL, `pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, and `pDepthAttachment->resolveMode` is not `VK_RESOLVE_MODE_NONE`, `pDepthAttachment->resolveImageView` must have been created with the identity swizzle.

If `pStencilAttachment` is not NULL and `pStencilAttachment->imageView` is not `VK_NULL_HANDLE`, `pStencilAttachment->imageView` must have been created with the identity swizzle.

If `pStencilAttachment` is not NULL, `pStencilAttachment->imageView` is not `VK_NULL_HANDLE`, and `pStencilAttachment->resolveMode` is not `VK_RESOLVE_MODE_NONE`, `pStencilAttachment->resolveImageView` must have been created with the identity swizzle.

If the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, it must have been created with the identity swizzle.
Bits which can be set in VkRenderingInfo::flags describing additional properties of the render pass are:

```c
// Provided by VK_VERSION_1_3
typedef enum VkRenderingFlagBits {
    VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT = 0x00000001,
    VK_RENDERING_SUSPENDING_BIT = 0x00000002,
    VK_RENDERING_RESUMING_BIT = 0x00000004,

    // Provided by VK_EXT_nested_command_buffer
    VK_RENDERING_CONTENTS_INLINE_BIT_EXT = 0x00000010,
    VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT_KHR = VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT,
    VK_RENDERING_SUSPENDING_BIT_KHR = VK_RENDERING_SUSPENDING_BIT,
    VK_RENDERING_RESUMING_BIT_KHR = VK_RENDERING_RESUMING_BIT,
} VkRenderingFlagBits;
```

or the equivalent

```c
// Provided by VK_KHR_dynamic_rendering
```
typedef VkRenderingFlagBits VkRenderingFlagBitsKHR;

- **VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT** specifies that draw calls for the render pass instance will be recorded in secondary command buffers. If the `nestedCommandBuffer` feature is enabled, the draw calls can come from both inline and `vkCmdExecuteCommands`.

- **VK_RENDERING_RESUMING_BIT** specifies that the render pass instance is resuming an earlier suspended render pass instance.

- **VK_RENDERING_SUSPENDING_BIT** specifies that the render pass instance will be suspended.

- **VK_RENDERING_CONTENTS_INLINE_BIT_EXT** specifies that draw calls for the render pass instance can be recorded inline within the current command buffer. When the `nestedCommandBuffer` feature is enabled this can be combined with the **VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT** bit to allow draw calls to be recorded both inline and in secondary command buffers.

  The contents of `pRenderingInfo` must match between suspended render pass instances and the render pass instances that resume them, other than the presence or absence of the **VK_RENDERING_RESUMING_BIT**, **VK_RENDERING_SUSPENDING_BIT**, and **VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT** flags. No action or synchronization commands, or other render pass instances, are allowed between suspending and resuming render pass instances.

// Provided by VK_VERSION_1_3
typedef VkFlags VkRenderingFlags;

or the equivalent

// Provided by VK_KHR_dynamic_rendering
typedef VkRenderingFlags VkRenderingFlagsKHR;

**VkRenderingFlags** is a bitmask type for setting a mask of zero or more **VkRenderingFlagBits**.

The **VkRenderingAttachmentInfo** structure is defined as:

// Provided by VK_VERSION_1_3
typedef struct VkRenderingAttachmentInfo {
    VkStructureType sType;
    const void* pNext;
    VkImageView imageView;
    VkImageLayout imageLayout;
    VkResolveModeFlagBits resolveMode;
    VkImageView resolveImageView;
    VkImageLayout resolveImageLayout;
    VkAttachmentLoadOp loadOp;
    VkAttachmentStoreOp storeOp;
    VkClearValue clearValue;
} VkRenderingAttachmentInfo;
or the equivalent

```c
// Provided by VK_KHR_dynamic_rendering
typedef VkRenderingAttachmentInfo VkRenderingAttachmentInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **imageView** is the image view that will be used for rendering.
- **imageLayout** is the layout that `imageView` will be in during rendering.
- **resolveMode** is a `VkResolveModeFlagBits` value defining how data written to `imageView` will be resolved into `resolveImageView`.
- **resolveImageView** is an image view used to write resolved data at the end of rendering.
- **resolveImageLayout** is the layout that `resolveImageView` will be in during rendering.
- **loadOp** is a `VkAttachmentLoadOp` value defining the load operation for the attachment.
- **storeOp** is a `VkAttachmentStoreOp` value defining the store operation for the attachment.
- **clearValue** is a `VkClearValue` structure defining values used to clear `imageView` when `loadOp` is `VK_ATTACHMENT_LOAD_OP_CLEAR`.

Values in `imageView` are loaded and stored according to the values of `loadOp` and `storeOp`, within the render area for each device specified in `VkRenderingInfo`. If `imageView` is `VK_NULL_HANDLE`, other members of this structure are ignored; writes to this attachment will be discarded, and no load, store, or multisample resolve operations will be performed.

If `resolveMode` is `VK_RESOLVE_MODE_NONE`, then `resolveImageView` is ignored. If `resolveMode` is not `VK_RESOLVE_MODE_NONE`, and `resolveImageView` is not `VK_NULL_HANDLE`, a render pass multisample resolve operation is defined for the attachment subresource.

---

**Note**

The resolve mode and store operation are independent; it is valid to write both resolved and unresolved values, and equally valid to discard the unresolved values while writing the resolved ones.

Store and resolve operations are only performed at the end of a render pass instance that does not specify the `VK_RENDERING_SUSPENDING_BIT_KHR` flag.

Load operations are only performed at the beginning of a render pass instance that does not specify the `VK_RENDERING_RESUMING_BIT_KHR` flag.

Image contents at the end of a suspended render pass instance remain defined for access by a resuming render pass instance.

---

**Valid Usage**

- VUID-VkRenderingAttachmentInfo-imageView-06129
If `imageView` is not `VK_NULL_HANDLE` and has a non-integer color format, `resolveMode` must be `VK_RESOLVE_MODE_NONE` or `VK_RESOLVE_MODE_AVERAGE_BIT`

- VUID-VkRenderingAttachmentInfo-imageView-06130
  If `imageView` is not `VK_NULL_HANDLE` and has an integer color format, `resolveMode` must be `VK_RESOLVE_MODE_NONE` or `VK_RESOLVE_MODE_SAMPLE_ZERO_BIT`

- VUID-VkRenderingAttachmentInfo-imageView-06861
  `imageView` must not have a sample count of `VK_SAMPLE_COUNT_1_BIT` if all of the following hold:
  - `imageView` is not `VK_NULL_HANDLE`
  - `resolveMode` is not `VK_RESOLVE_MODE_NONE`

- VUID-VkRenderingAttachmentInfo-imageView-06862
  `resolveImageView` must not be `VK_NULL_HANDLE` if all of the following hold:
  - `imageView` is not `VK_NULL_HANDLE`
  - `resolveMode` is not `VK_RESOLVE_MODE_NONE`

- VUID-VkRenderingAttachmentInfo-imageView-06864
  If `imageView` is not `VK_NULL_HANDLE`, `resolveImageView` is not `VK_NULL_HANDLE`, and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageView` must have a sample count of `VK_SAMPLE_COUNT_1_BIT`

- VUID-VkRenderingAttachmentInfo-imageView-06865
  If `imageView` is not `VK_NULL_HANDLE`, `resolveImageView` is not `VK_NULL_HANDLE`, and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `imageView` and `resolveImageView` must have the same `VkFormat`

- VUID-VkRenderingAttachmentInfo-imageView-06135
  If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` must not be `VK_IMAGE_LAYOUT_UNDEFINED`, `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL`, `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`, or `VK_IMAGE_LAYOUT_PREINITIALIZED`

- VUID-VkRenderingAttachmentInfo-imageView-06136
  If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageLayout` must not be `VK_IMAGE_LAYOUT_UNDEFINED`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL`, `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`, or `VK_IMAGE_LAYOUT_PREINITIALIZED`

- VUID-VkRenderingAttachmentInfo-imageView-06142
  If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageLayout` must not be `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`

- VUID-VkRenderingAttachmentInfo-imageView-06143
  If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` must not be `VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR`
If imageView is not VK_NULL_HANDLE and resolveMode is not VK_RESOLVE_MODE_NONE, resolveImageLayout must not be VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR.

If imageView is not VK_NULL_HANDLE, imageLayout must not be VK_IMAGE_LAYOUT_PRESENT_SRC_KHR.

If imageView is not VK_NULL_HANDLE and resolveMode is not VK_RESOLVE_MODE_NONE, resolveImageLayout must not be VK_IMAGE_LAYOUT_PRESENT_SRC_KHR.

Valid Usage (Implicit)

sType must be VK_STRUCTURE_TYPE_RENDERING_ATTACHMENT_INFO
pNext must be NULL
imageView must be a valid VkImageView handle
imageLayout must be a valid VkImageLayout value
resolveMode must be a valid VkResolveModeFlagBits value
resolveImageView must be a valid VkImageView handle
resolveImageLayout must be a valid VkImageLayout value
loadOp must be a valid VkAttachmentLoadOp value
storeOp must be a valid VkAttachmentStoreOp value
clearValue must be a valid VkClearValue union
Both of imageView, and resolveImageView that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

The VkRenderingFragmentShadingRateAttachmentInfoKHR structure is defined as:

// Provided by VK_KHR_dynamic_rendering with VK_KHR_fragment_shading_rate
typedef struct VkRenderingFragmentShadingRateAttachmentInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkImageView imageView;
    VkImageLayout imageLayout;
    VkExtent2D shadingRateAttachmentTexelSize;
} VkRenderingFragmentShadingRateAttachmentInfoKHR;

• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **imageView** is the image view that will be used as a fragment shading rate attachment.
• **imageLayout** is the layout that `imageView` will be in during rendering.
• **shadingRateAttachmentTexelSize** specifies the number of pixels corresponding to each texel in `imageView`.

This structure can be included in the `pNext` chain of `VkRenderingInfo` to define a fragment shading rate attachment. If `imageView` is `VK_NULL_HANDLE`, or if this structure is not specified, the implementation behaves as if a valid shading rate attachment was specified with all texels specifying a single pixel per fragment.

### Valid Usage

- **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06147**
  If `imageView` is not `VK_NULL_HANDLE`, layout **must** be `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR`

- **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06148**
  If `imageView` is not `VK_NULL_HANDLE`, it **must** have been created with `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06149**
  If `imageView` is not `VK_NULL_HANDLE`, `shadingRateAttachmentTexelSize.width` **must** be a power of two value

- **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06150**
  If `imageView` is not `VK_NULL_HANDLE`, `shadingRateAttachmentTexelSize.width` **must** be less than or equal to `maxFragmentShadingRateAttachmentTexelSize.width`

- **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06151**
  If `imageView` is not `VK_NULL_HANDLE`, `shadingRateAttachmentTexelSize.width` **must** be greater than or equal to `minFragmentShadingRateAttachmentTexelSize.width`

- **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06152**
  If `imageView` is not `VK_NULL_HANDLE`, `shadingRateAttachmentTexelSize.height` **must** be a power of two value

- **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06153**
  If `imageView` is not `VK_NULL_HANDLE`, `shadingRateAttachmentTexelSize.height` **must** be less than or equal to `maxFragmentShadingRateAttachmentTexelSize.height`
If `imageView` is not `VK_NULL_HANDLE`, `shadingRateAttachmentTexelSize.height` must be greater than or equal to `minFragmentShadingRateAttachmentTexelSize.height`.

If `imageView` is not `VK_NULL_HANDLE`, the quotient of `shadingRateAttachmentTexelSize.width` and `shadingRateAttachmentTexelSize.height` must be less than or equal to `maxFragmentShadingRateAttachmentTexelSizeAspectRatio`.

If `imageView` is not `VK_NULL_HANDLE`, the quotient of `shadingRateAttachmentTexelSize.height` and `shadingRateAttachmentTexelSize.width` must be less than or equal to `maxFragmentShadingRateAttachmentTexelSizeAspectRatio`.

Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_INFO_KHR`.
- If `imageView` is not `VK_NULL_HANDLE`, `imageView` must be a valid `VkImageView` handle.
- `imageLayout` must be a valid `VkImageLayout` value.

To query the render area granularity for a render pass instance, call:

```c
// Provided by VK_KHR_maintenance5
void vkGetRenderingAreaGranularityKHR(
    VkDevice device,
    const VkRenderingAreaInfoKHR* pRenderingAreaInfo,
    VkExtent2D* pGranularity);
```

- `device` is the logical device that owns the render pass instance.
- `pRenderingAreaInfo` is a pointer to a `VkRenderingAreaInfoKHR` structure specifying details of the render pass instance to query the render area granularity for.
- `pGranularity` is a pointer to a `VkExtent2D` structure in which the granularity is returned.

The conditions leading to an optimal `renderArea` are:

- the `offset.x` member in `renderArea` is a multiple of the `width` member of the returned `VkExtent2D` (the horizontal granularity).
- the `offset.y` member in `renderArea` is a multiple of the `height` member of the returned `VkExtent2D` (the vertical granularity).
- either the `extent.width` member in `renderArea` is a multiple of the horizontal granularity or `offset.x + extent.width` is equal to the `width` of the framebuffer in the `VkRenderPassBeginInfo`. 
• either the `extent.height` member in `renderArea` is a multiple of the vertical granularity or `offset.y+extent.height` is equal to the height of the `framebuffer` in the `VkRenderPassBeginInfo`.

### Valid Usage (Implicit)

- VUID-vkGetRenderingAreaGranularityKHR-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkGetRenderingAreaGranularityKHR-pRenderingAreaInfo-parameter
  `pRenderingAreaInfo` must be a valid pointer to a valid `VkRenderingAreaInfoKHR` structure

- VUID-vkGetRenderingAreaGranularityKHR-pGranularity-parameter
  `pGranularity` must be a valid pointer to a `VkExtent2D` structure

The `VkRenderingAreaInfoKHR` structure is defined as:

```plaintext
// Provided by VK_KHR_maintenance5
typedef struct VkRenderingAreaInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t viewMask;
    uint32_t colorAttachmentCount;
    const VkFormat* pColorAttachmentFormats;
    VkFormat depthAttachmentFormat;
    VkFormat stencilAttachmentFormat;
} VkRenderingAreaInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `viewMask` is the viewMask used for rendering.
- `colorAttachmentCount` is the number of entries in `pColorAttachmentFormats`
- `pColorAttachmentFormats` is a pointer to an array of `VkFormat` values defining the format of color attachments used in the render pass instance.
- `depthAttachmentFormat` is a `VkFormat` value defining the format of the depth attachment used in the render pass instance.
- `stencilAttachmentFormat` is a `VkFormat` value defining the format of the stencil attachment used in the render pass instance.

### Valid Usage (Implicit)

- VUID-VkRenderingAreaInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_RENDERING_AREA_INFO_KHR`

- VUID-VkRenderingAreaInfoKHR-pNext-pNext
  `pNext` must be NULL
To end a render pass instance, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdEndRendering(
    VkCommandBuffer commandBuffer);
```

or the equivalent command

```c
// Provided by VK_KHR_dynamic_rendering
void vkCmdEndRenderingKHR(
    VkCommandBuffer commandBuffer);
```

- `commandBuffer` is the command buffer in which to record the command.

If the value of `pRenderingInfo->flags` used to begin this render pass instance included `VK_RENDERING_SUSPENDING_BIT`, then this render pass is suspended and will be resumed later in submission order.

**Valid Usage**

- VUID-vkCmdEndRendering-None-06161
  The current render pass instance must have been begun with `vkCmdBeginRendering`

- VUID-vkCmdEndRendering-commandBuffer-06162
  The current render pass instance must have been begun in `commandBuffer`

- VUID-vkCmdEndRendering-None-06999
  If `vkCmdBeginQuery*` was called within the render pass, the corresponding `vkCmdEndQuery*` must have been called subsequently within the same subpass

**Valid Usage (Implicit)**

- VUID-vkCmdEndRendering-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdEndRendering-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdEndRendering-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdEndRendering-renderpass
  This command must only be called inside of a render pass instance

- VUID-vkCmdEndRendering-videocoding
  This command must only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Note

For more complex rendering graphs, it is possible to pre-define a static render pass object, which as well as allowing draw commands, allows the definition of framebuffer-local dependencies between multiple subpasses. These objects have a lot of setup cost compared to `vkCmdBeginRendering`, but use of subpass dependencies can confer important performance benefits on some devices.

8.1. Render Pass Objects

A render pass object represents a collection of attachments, subpasses, and dependencies between the subpasses, and describes how the attachments are used over the course of the subpasses.

Render passes are represented by `VkRenderPass` handles:

```cpp
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkRenderPass)
```

An attachment description describes the properties of an attachment including its format, sample count, and how its contents are treated at the beginning and end of each render pass instance.

A subpass represents a phase of rendering that reads and writes a subset of the attachments in a render pass. Rendering commands are recorded into a particular subpass of a render pass instance.

A subpass description describes the subset of attachments that is involved in the execution of a subpass. Each subpass can read from some attachments as input attachments, write to some as color attachments or depth/stencil attachments, and perform multisample resolve operations to resolve attachments. A subpass description can also include a set of preserve attachments, which are attachments that are not read or written by the subpass but whose contents must be preserved throughout the subpass.
A subpass uses an attachment if the attachment is a color, depth/stencil, resolve, depth/stencil resolve, fragment shading rate, or input attachment for that subpass (as determined by the pColorAttachments, pDepthStencilAttachment, pResolveAttachments, VkSubpassDescriptionDepthStencilResolve::pDepthStencilResolveAttachment, VkFragmentShadingRateAttachmentInfoKHR::pFragmentShadingRateAttachment->attachment, and pInputAttachments members of VkSubpassDescription, respectively). A subpass does not use an attachment if that attachment is preserved by the subpass. The first use of an attachment is in the lowest numbered subpass that uses that attachment. Similarly, the last use of an attachment is in the highest numbered subpass that uses that attachment.

The subpasses in a render pass all render to the same dimensions, and fragments for pixel (x,y,layer) in one subpass can only read attachment contents written by previous subpasses at that same (x,y,layer) location. For multi-pixel fragments, the pixel read from an input attachment is selected from the pixels covered by that fragment in an implementation-dependent manner. However, this selection must be made consistently for any fragment with the same shading rate for the lifetime of the VkDevice.

Note

By describing a complete set of subpasses in advance, render passes provide the implementation an opportunity to optimize the storage and transfer of attachment data between subpasses.

In practice, this means that subpasses with a simple framebuffer-space dependency may be merged into a single tiled rendering pass, keeping the attachment data on-chip for the duration of a render pass instance. However, it is also quite common for a render pass to only contain a single subpass.

Subpass dependencies describe execution and memory dependencies between subpasses.

A subpass dependency chain is a sequence of subpass dependencies in a render pass, where the source subpass of each subpass dependency (after the first) equals the destination subpass of the previous dependency.

Execution of subpasses may overlap or execute out of order with regards to other subpasses, unless otherwise enforced by an execution dependency. Each subpass only respects submission order for commands recorded in the same subpass, and the vkCmdBeginRenderPass and vkCmdEndRenderPass commands that delimit the render pass - commands within other subpasses are not included. This affects most other implicit ordering guarantees.

A render pass describes the structure of subpasses and attachments independent of any specific image views for the attachments. The specific image views that will be used for the attachments, and their dimensions, are specified in VkFramebuffer objects. Framebuffers are created with respect to a specific render pass that the framebuffer is compatible with (see Render Pass Compatibility). Collectively, a render pass and a framebuffer define the complete render target state for one or more subpasses as well as the algorithmic dependencies between the subpasses.

The various pipeline stages of the drawing commands for a given subpass may execute concurrently and/or out of order, both within and across drawing commands, whilst still respecting pipeline order. However for a given (x,y,layer,sample) sample location, certain per-sample
operations are performed in rasterization order.

VK_ATTACHMENT_UNUSED is a constant indicating that a render pass attachment is not used.

```
#define VK_ATTACHMENT_UNUSED (~0U)
```

## 8.2. Render Pass Creation

To create a render pass, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateRenderPass(
    VkDevice device,
    const VkRenderPassCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkRenderPass* pRenderPass);
```

- `device` is the logical device that creates the render pass.
- `pCreateInfo` is a pointer to a `VkRenderPassCreateInfo` structure describing the parameters of the render pass.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pRenderPass` is a pointer to a `VkRenderPass` handle in which the resulting render pass object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateRenderPass-device-parameter
  
  `device` must be a valid `VkDevice` handle

- VUID-vkCreateRenderPass-pCreateInfo-parameter
  
  `pCreateInfo` must be a valid pointer to a valid `VkRenderPassCreateInfo` structure

- VUID-vkCreateRenderPass-pInjector-structure
  
  If `pInjector` is not `NULL`, `pInjector` must be a valid pointer to a valid `VkInjector` structure

- VUID-vkCreateRenderPass-pDestroy-structure
  
  `pDestroy` must be a valid pointer to a `VkDestroy` handle

### Return Codes

**Success**

- VK_SUCCESS
Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkRenderPassCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkRenderPassCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkRenderPassCreateFlags flags;
    uint32_t attachmentCount;
    const VkAttachmentDescription* pAttachments;
    uint32_t subpassCount;
    const VkSubpassDescription* pSubpasses;
    uint32_t dependencyCount;
    const VkSubpassDependency* pDependencies;
} VkRenderPassCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `attachmentCount` is the number of attachments used by this render pass.
- `pAttachments` is a pointer to an array of `attachmentCount` `VkAttachmentDescription` structures describing the attachments used by the render pass.
- `subpassCount` is the number of subpasses to create.
- `pSubpasses` is a pointer to an array of `subpassCount` `VkSubpassDescription` structures describing each subpass.
- `dependencyCount` is the number of memory dependencies between pairs of subpasses.
- `pDependencies` is a pointer to an array of `dependencyCount` `VkSubpassDependency` structures describing dependencies between pairs of subpasses.

**Note**

Care should be taken to avoid a data race here; if any subpasses access attachments with overlapping memory locations, and one of those accesses is a write, a subpass dependency needs to be included between them.

**Valid Usage**

- **VUID-VkRenderPassCreateInfo-attachment-00834**
  If the `attachment` member of any element of `pInputAttachments`, `pColorAttachments`, `pResolveAttachments` or `pDepthStencilAttachment`, or any element of `pPreserveAttachments` in any element of `pSubpasses` is not `VK_ATTACHMENT_UNUSED`, then it **must** be less than
attachmentCount

- **VUID-VkRenderPassCreateInfo-pAttachments-00836**
  For any member of `pAttachments` with a `loadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a `layout` equal to `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`.

- **VUID-VkRenderPassCreateInfo-pAttachments-02511**
  For any member of `pAttachments` with a `stencilLoadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a `layout` equal to `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`.

- **VUID-VkRenderPassCreateInfo-pAttachments-01566**
  For any member of `pAttachments` with a `loadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a `layout` equal to `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`.

- **VUID-VkRenderPassCreateInfo-pAttachments-01567**
  For any member of `pAttachments` with a `stencilLoadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a `layout` equal to `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`.

- **VUID-VkRenderPassCreateInfo-pNext-01926**
  If the `pNext` chain includes a `VkRenderPassInputAttachmentAspectCreateInfo` structure, the `subpass` member of each element of its `pAspectReferences` member **must** be less than `subpassCount`.

- **VUID-VkRenderPassCreateInfo-pNext-01927**
  If the `pNext` chain includes a `VkRenderPassInputAttachmentAspectCreateInfo` structure, the `inputAttachmentIndex` member of each element of its `pAspectReferences` member **must** be less than the value of `inputAttachmentCount` in the element of `pSubpasses` identified by its `subpass` member.

- **VUID-VkRenderPassCreateInfo-pNext-01963**
  If the `pNext` chain includes a `VkRenderPassInputAttachmentAspectCreateInfo` structure, for any element of the `pInputAttachments` member of any element of `pSubpasses` where the `attachment` member is not `VK_ATTACHMENT_UNUSED`, the `aspectMask` member of the corresponding element of `VkRenderPassInputAttachmentAspectCreateInfo` `::pAspectReferences` **must** only include aspects that are present in images of the format specified by the element of `pAttachments` at `attachment`.

- **VUID-VkRenderPassCreateInfo-pNext-01928**
  If the `pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, and its `subpassCount` member is not zero, that member **must** be equal to the value of `subpassCount`.

- **VUID-VkRenderPassCreateInfo-pNext-01929**
  If the `pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, if its `dependencyCount` member is not zero, it **must** be equal to `dependencyCount`.

- **VUID-VkRenderPassCreateInfo-pNext-01930**
  If the `pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, for each non-zero element of `pViewOffsets`, the `srcSubpass` and `dstSubpass` members of `pDependencies` at
the same index must not be equal

- VUID-VkRenderPassCreateInfo-pNext-02512
  If the pNext chain includes a VkRenderPassMultiviewCreateInfo structure, for any element of pDependencies with a dependencyFlags member that does not include VK_DEPENDENCY_VIEW_LOCAL_BIT, the corresponding element of the pViewOffsets member of that VkRenderPassMultiviewCreateInfo instance must be 0

- VUID-VkRenderPassCreateInfo-pNext-02513
  If the pNext chain includes a VkRenderPassMultiviewCreateInfo structure, elements of its pViewMasks member must either all be 0, or all not be 0

- VUID-VkRenderPassCreateInfo-pNext-02514
  If the pNext chain includes a VkRenderPassMultiviewCreateInfo structure, and each element of its pViewMasks member is 0, the dependencyFlags member of each element of pDependencies must not include VK_DEPENDENCY_VIEW_LOCAL_BIT

- VUID-VkRenderPassCreateInfo-pNext-02515
  If the pNext chain includes a VkRenderPassMultiviewCreateInfo structure, and each element of its pViewMasks member is 0, its correlationMaskCount member must be 0

- VUID-VkRenderPassCreateInfo-pDependencies-00837
  For any element of pDependencies, if the srcSubpass is not VK_SUBPASS_EXTERNAL, all stage flags included in the srcStageMask member of that dependency must be a pipeline stage supported by the pipeline identified by the pipelineBindPoint member of the source subpass

- VUID-VkRenderPassCreateInfo-pDependencies-00838
  For any element of pDependencies, if the dstSubpass is not VK_SUBPASS_EXTERNAL, all stage flags included in the dstStageMask member of that dependency must be a pipeline stage supported by the pipeline identified by the pipelineBindPoint member of the destination subpass

- VUID-VkRenderPassCreateInfo-pDependencies-06866
  For any element of pDependencies, if its srcSubpass is not VK_SUBPASS_EXTERNAL, it must be less than subpassCount

- VUID-VkRenderPassCreateInfo-pDependencies-06867
  For any element of pDependencies, if its dstSubpass is not VK_SUBPASS_EXTERNAL, it must be less than subpassCount

---

**Valid Usage (Implicit)**

- VUID-VkRenderPassCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_RENDER_PASS_CREATE_INFO

- VUID-VkRenderPassCreateInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkRenderPassInputAttachmentAspectCreateInfo or VkRenderPassMultiviewCreateInfo

- VUID-VkRenderPassCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique
• **VUID-VkRenderPassCreateInfo-flags-zerobitmask**
  
  *flags* must be 0

• **VUID-VkRenderPassCreateInfo-pAttachments-parameter**
  
  If *attachmentCount* is not 0, *pAttachments* must be a valid pointer to an array of *attachmentCount* valid *VkAttachmentDescription* structures

• **VUID-VkRenderPassCreateInfo-pSubpasses-parameter**
  
  *pSubpasses* must be a valid pointer to an array of *subpassCount* valid *VkSubpassDescription* structures

• **VUID-VkRenderPassCreateInfo-pDependencies-parameter**
  
  If *dependencyCount* is not 0, *pDependencies* must be a valid pointer to an array of *dependencyCount* valid *VkSubpassDependency* structures

• **VUID-VkRenderPassCreateInfo-subpassCount-arraylength**
  
  *subpassCount* must be greater than 0

Bits which can be set in *VkRenderPassCreateInfo::flags*, describing additional properties of the render pass, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkRenderPassCreateFlagBits {
} VkRenderPassCreateFlagBits;
```

**Note**

All bits for this type are defined by extensions, and none of those extensions are enabled in this build of the specification.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkRenderPassCreateFlags;
```

*VkRenderPassCreateFlags* is a bitmask type for setting a mask of zero or more *VkRenderPassCreateFlagBits*.

If the *VkRenderPassCreateInfo::pNext* chain includes a *VkRenderPassMultiviewCreateInfo* structure, then that structure includes an array of view masks, view offsets, and correlation masks for the render pass.

The *VkRenderPassMultiviewCreateInfo* structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkRenderPassMultiviewCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t subpassCount;
    const uint32_t* pViewMasks;
    uint32_t dependencyCount;
} VkRenderPassMultiviewCreateInfo;
```
const int32_t* pViewOffsets;
uint32_t correlationMaskCount;
const uint32_t* pCorrelationMasks;
}
VkRenderPassMultiviewCreateInfo;

or the equivalent

// Provided by VK_KHR_multiview
typedef VkRenderPassMultiviewCreateInfo VkRenderPassMultiviewCreateInfoKHR;

• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **subpassCount** is zero or the number of subpasses in the render pass.
• **pViewMasks** is a pointer to an array of `subpassCount` view masks, where each mask is a bitfield of view indices describing which views rendering is broadcast to in each subpass, when multiview is enabled. If `subpassCount` is zero, each view mask is treated as zero.
• **dependencyCount** is zero or the number of dependencies in the render pass.
• **pViewOffsets** is a pointer to an array of `dependencyCount` view offsets, one for each dependency. If `dependencyCount` is zero, each dependency's view offset is treated as zero. Each view offset controls which views in the source subpass the views in the destination subpass depend on.
• **correlationMaskCount** is zero or the number of correlation masks.
• **pCorrelationMasks** is a pointer to an array of `correlationMaskCount` view masks indicating sets of views that may be more efficient to render concurrently.

When a subpass uses a non-zero view mask, **multiview** functionality is considered to be enabled. Multiview is all-or-nothing for a render pass - that is, either all subpasses must have a non-zero view mask (though some subpasses may have only one view) or all must be zero. Multiview causes all drawing and clear commands in the subpass to behave as if they were broadcast to each view, where a view is represented by one layer of the framebuffer attachments. All draws and clears are broadcast to each view index whose bit is set in the view mask. The view index is provided in the `ViewIndex` shader input variable, and color, depth/stencil, and input attachments all read/write the layer of the framebuffer corresponding to the view index.

If the view mask is zero for all subpasses, multiview is considered to be disabled and all drawing commands execute normally, without this additional broadcasting.

Some implementations may not support.multiview in conjunction with geometry shaders or tessellation shaders.

When multiview is enabled, the `VK_DEPENDENCY_VIEW_LOCAL_BIT` bit in a dependency can be used to express a view-local dependency, meaning that each view in the destination subpass depends on a single view in the source subpass. Unlike pipeline barriers, a subpass dependency can potentially have a different view mask in the source subpass and the destination subpass. If the dependency is view-local, then each view (dstView) in the destination subpass depends on the view dstView + pViewOffsets[dependency] in the source subpass. If there is not such a view in the source subpass,
then this dependency does not affect that view in the destination subpass. If the dependency is not
view-local, then all views in the destination subpass depend on all views in the source subpass, and
the view offset is ignored. A non-zero view offset is not allowed in a self-dependency.

The elements of \textit{pCorrelationMasks} are a set of masks of views indicating that views in the same
mask \textit{may} exhibit spatial coherency between the views, making it more efficient to render them
concurrently. Correlation masks \textbf{must} not have a functional effect on the results of the multiview
rendering.

When multiview is enabled, at the beginning of each subpass all non-render pass state is undefined.
In particular, each time \texttt{vkCmdBeginRenderPass} or \texttt{vkCmdNextSubpass} is called the graphics
pipeline \textbf{must} be bound, any relevant descriptor sets or vertex/index buffers \textbf{must} be bound, and
any relevant dynamic state or push constants \textbf{must} be set before they are used.

### Valid Usage

- **VUID-VkRenderPassMultiviewCreateInfo-pCorrelationMasks-00841**
  Each view index \textbf{must} not be set in more than one element of \textit{pCorrelationMasks}

- **VUID-VkRenderPassMultiviewCreateInfo-multiview-06555**
  If the \textit{multiview} feature is not enabled, each element of \textit{pViewMasks} \textbf{must} be 0

- **VUID-VkRenderPassMultiviewCreateInfo-pViewMasks-06697**
  The index of the most significant bit in each element of \textit{pViewMasks} \textbf{must} be less than
  \texttt{maxMultiviewViewCount}

### Valid Usage (Implicit)

- **VUID-VkRenderPassMultiviewCreateInfo-sType-sType**
  \textit{sType} \textbf{must} be \texttt{VK_STRUCTURE_TYPE_RENDER_PASS_MULTIVIEW_CREATE_INFO}

- **VUID-VkRenderPassMultiviewCreateInfo-pViewMasks-parameter**
  If \textit{subpassCount} is not 0, \textit{pViewMasks} \textbf{must} be a valid pointer to an array of \textit{subpassCount}
  \texttt{uint32_t} values

- **VUID-VkRenderPassMultiviewCreateInfo-pViewOffsets-parameter**
  If \textit{dependencyCount} is not 0, \textit{pViewOffsets} \textbf{must} be a valid pointer to an array of
  \textit{dependencyCount \texttt{int32_t}} values

- **VUID-VkRenderPassMultiviewCreateInfo-pCorrelationMasks-parameter**
  If \textit{correlationMaskCount} is not 0, \textit{pCorrelationMasks} \textbf{must} be a valid pointer to an array of
  \textit{correlationMaskCount \texttt{uint32_t}} values

The \texttt{VkAttachmentDescription} structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkAttachmentDescription {
    VkAttachmentDescriptionFlags flags;
    VkFormat format;
```
VkSampleCountFlagBits samples;
VkAttachmentLoadOp loadOp;
VkAttachmentStoreOp storeOp;
VkAttachmentLoadOp stencilLoadOp;
VkAttachmentStoreOp stencilStoreOp;
VkImageLayout initialLayout;
VkImageLayout finalLayout;
} VkAttachmentDescription;

- **flags** is a bitmask of VkAttachmentDescriptionFlagBits specifying additional properties of the attachment.
- **format** is a VkFormat value specifying the format of the image view that will be used for the attachment.
- **samples** is a VkSampleCountFlagBits value specifying the number of samples of the image.
- **loadOp** is a VkAttachmentLoadOp value specifying how the contents of color and depth components of the attachment are treated at the beginning of the subpass where it first is used.
- **storeOp** is a VkAttachmentStoreOp value specifying how the contents of color and depth components of the attachment are treated at the end of the subpass where it is last used.
- **stencilLoadOp** is a VkAttachmentLoadOp value specifying how the contents of stencil components of the attachment are treated at the beginning of the subpass where it first is used.
- **stencilStoreOp** is a VkAttachmentStoreOp value specifying how the contents of stencil components of the attachment are treated at the end of the last subpass where it is used.
- **initialLayout** is the layout the attachment image subresource will be in when a render pass instance begins.
- **finalLayout** is the layout the attachment image subresource will be transitioned to when a render pass instance ends.

If the attachment uses a color format, then **loadOp** and **storeOp** are used, and **stencilLoadOp** and **stencilStoreOp** are ignored. If the format has depth and/or stencil components, **loadOp** and **storeOp** apply only to the depth data, while **stencilLoadOp** and **stencilStoreOp** define how the stencil data is handled. **loadOp** and **stencilLoadOp** define the load operations for the attachment. **storeOp** and **stencilStoreOp** define the store operations for the attachment. If an attachment is not used by any subpass, **loadOp**, **storeOp**, **stencilStoreOp**, and **stencilLoadOp** will be ignored for that attachment, and no load or store ops will be performed. However, any transition specified by **initialLayout** and **finalLayout** will still be executed.

If **flags** includes VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT, then the attachment is treated as if it shares physical memory with another attachment in the same render pass. This information limits the ability of the implementation to reorder certain operations (like layout transitions and the **loadOp**) such that it is not improperly reordered against other uses of the same physical memory via a different attachment. This is described in more detail below.

If a render pass uses multiple attachments that alias the same device memory, those attachments **must** each include the VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT bit in their attachment description flags. Attachments aliasing the same memory occurs in multiple ways:
Multiple attachments being assigned the same image view as part of framebuffer creation.

Attachments using distinct image views that correspond to the same image subresource of an image.

Attachments using views of distinct image subresources which are bound to overlapping memory ranges.

Note

Render passes must include subpass dependencies (either directly or via a subpass dependency chain) between any two subpasses that operate on the same attachment or aliasing attachments and those subpass dependencies must include execution and memory dependencies separating uses of the aliases, if at least one of those subpasses writes to one of the aliases. These dependencies must not include the VK_DEPENDENCY_BY_REGION_BIT if the aliases are views of distinct image subresources which overlap in memory.

Multiple attachments that alias the same memory must not be used in a single subpass. A given attachment index must not be used multiple times in a single subpass, with one exception: two subpass attachments can use the same attachment index if at least one use is as an input attachment and neither use is as a resolve or preserve attachment. In other words, the same view can be used simultaneously as an input and color or depth/stencil attachment, but must not be used as multiple color or depth/stencil attachments nor as resolve or preserve attachments.

If a set of attachments alias each other, then all except the first to be used in the render pass must use an initialLayout of VK_IMAGE_LAYOUT_UNDEFINED, since the earlier uses of the other aliases make their contents undefined. Once an alias has been used and a different alias has been used after it, the first alias must not be used in any later subpasses. However, an application can assign the same image view to multiple aliasing attachment indices, which allows that image view to be used multiple times even if other aliases are used in between.

Note

Once an attachment needs the VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT bit, there should be no additional cost of introducing additional aliases, and using these additional aliases may allow more efficient clearing of the attachments on multiple uses via VK_ATTACHMENT_LOAD_OP_CLEAR.

Valid Usage

- VUID-VkAttachmentDescription-format-06699
  If format includes a color or depth component and loadOp is VK_ATTACHMENT_LOAD_OP_LOAD, then initialLayout must not be VK_IMAGE_LAYOUT_UNDEFINED

- VUID-VkAttachmentDescription-finalLayout-00843
  finalLayout must not be VK_IMAGE_LAYOUT_UNDEFINED or VK_IMAGE_LAYOUT_PREINITIALIZED

- VUID-VkAttachmentDescription-format-03280
  If format is a color format, initialLayout must not be VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL
If format is a depth/stencil format, initialLayout must not be

`VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`

- **VUID-VkAttachmentDescription-format-03281**

If format is a depth/stencil format, finalLayout must not be

`VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`

- **VUID-VkAttachmentDescription-format-03282**

If format is a color format, finalLayout must not be

`VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or

`VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`

- **VUID-VkAttachmentDescription-format-03283**

If format is a depth/stencil format, finalLayout must not be

`VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`

- **VUID-VkAttachmentDescription-format-06487**

If format is a color format, initialLayout must not be

`VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` or

`VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`

- **VUID-VkAttachmentDescription-format-06488**

If format is a color format, finalLayout must not be

`VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` or

`VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`

- **VUID-VkAttachmentDescription-separateDepthStencilLayouts-03284**

If the separateDepthStencilLayouts feature is not enabled, initialLayout must not be

`VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`,

`VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or

`VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`

- **VUID-VkAttachmentDescription-separateDepthStencilLayouts-03285**

If the separateDepthStencilLayouts feature is not enabled, finalLayout must not be

`VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`,

`VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or

`VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`

- **VUID-VkAttachmentDescription-format-03286**

If format is a color format, initialLayout must not be

`VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`,

`VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or

`VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`

- **VUID-VkAttachmentDescription-format-03287**

If format is a color format, finalLayout must not be

`VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`,

`VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or

`VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`

- **VUID-VkAttachmentDescription-format-06906**

If format is a depth/stencil format which includes both depth and stencil components, initialLayout must not be

`VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or

`VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`
• VUID-VkAttachmentDescription-format-06907
  If format is a depth/stencil format which includes both depth and stencil components, finalLayout must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription-format-03290
  If format is a depth/stencil format which includes only the depth component, initialLayout must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription-format-03291
  If format is a depth/stencil format which includes only the depth component, finalLayout must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription-synchronization2-06908
  If the synchronization2 feature is not enabled, initialLayout must not be VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

• VUID-VkAttachmentDescription-synchronization2-06909
  If the synchronization2 feature is not enabled, finalLayout must not be VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

• VUID-VkAttachmentDescription-attachmentFeedbackLoopLayout-07309
  If the attachmentFeedbackLoopLayout feature is not enabled, initialLayout must not be VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT

• VUID-VkAttachmentDescription-attachmentFeedbackLoopLayout-07310
  If the attachmentFeedbackLoopLayout feature is not enabled, finalLayout must not be VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT

• VUID-VkAttachmentDescription-samples-08745
  samples must be a valid VkSampleCountFlagBits value that is set in imageCreateSampleCounts (as defined in Image Creation Limits) for the given format

• VUID-VkAttachmentDescription-dynamicRenderingLocalRead-09544
  If the dynamicRenderingLocalRead feature is not enabled, initialLayout must not be VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR

• VUID-VkAttachmentDescription-dynamicRenderingLocalRead-09545
  If the dynamicRenderingLocalRead feature is not enabled, finalLayout must not be VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR

• VUID-VkAttachmentDescription-format-06698
  format must not be VK_FORMAT_UNDEFINED

• VUID-VkAttachmentDescription-format-06700
  If format includes a stencil component and stencilLoadOp is VK_ATTACHMENT_LOAD_OP_LOAD, then initialLayout must not be VK_IMAGE_LAYOUT_UNDEFINED

• VUID-VkAttachmentDescription-format-03292
  If format is a depth/stencil format which includes only the stencil component, initialLayout must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription-format-03293
If \texttt{format} is a depth/stencil format which includes only the stencil component, \texttt{finalLayout} must not be \texttt{VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL} or \texttt{VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL}.

- VUID-VkAttachmentDescription-format-06242
If \texttt{format} is a depth/stencil format which includes both depth and stencil components, \texttt{initialLayout} must not be \texttt{VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL} or \texttt{VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL}.

- VUID-VkAttachmentDescription-format-06243
If \texttt{format} is a depth/stencil format which includes both depth and stencil components, \texttt{finalLayout} must not be \texttt{VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL} or \texttt{VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL}.

Valid Usage (Implicit)

- VUID-VkAttachmentDescription-flags-parameter
\texttt{flags} must be a valid combination of \texttt{VkAttachmentDescriptionFlagBits} values.

- VUID-VkAttachmentDescription-format-parameter
\texttt{format} must be a valid \texttt{VkFormat} value.

- VUID-VkAttachmentDescription-samples-parameter
\texttt{samples} must be a valid \texttt{VkSampleCountFlagBits} value.

- VUID-VkAttachmentDescription-loadOp-parameter
\texttt{loadOp} must be a valid \texttt{VkAttachmentLoadOp} value.

- VUID-VkAttachmentDescription-storeOp-parameter
\texttt{storeOp} must be a valid \texttt{VkAttachmentStoreOp} value.

- VUID-VkAttachmentDescription-stencilLoadOp-parameter
\texttt{stencilLoadOp} must be a valid \texttt{VkAttachmentLoadOp} value.

- VUID-VkAttachmentDescription-stencilStoreOp-parameter
\texttt{stencilStoreOp} must be a valid \texttt{VkAttachmentStoreOp} value.

- VUID-VkAttachmentDescription-initialLayout-parameter
\texttt{initialLayout} must be a valid \texttt{VkImageLayout} value.

- VUID-VkAttachmentDescription-finalLayout-parameter
\texttt{finalLayout} must be a valid \texttt{VkImageLayout} value.

Bits which \texttt{can} be set in \texttt{VkAttachmentDescription::flags}, describing additional properties of the attachment, are:

```c
typedef enum VkAttachmentDescriptionFlagBits {
    VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT = 0x00000001,
} VkAttachmentDescriptionFlagBits;
```

- \texttt{VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT} specifies that the attachment aliases the same device.
memory as other attachments.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkAttachmentDescriptionFlags;
```

`VkAttachmentDescriptionFlags` is a bitmask type for setting a mask of zero or more `VkAttachmentDescriptionFlagBits`.

The `VkRenderPassInputAttachmentAspectCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VK_VERSION_1_1

    VkStructureType sType;
    const void* pNext;
    uint32_t aspectReferenceCount;
    const VkInputAttachmentAspectReference* pAspectReferences;
} VkRenderPassInputAttachmentAspectCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance2
typedef VkRenderPassInputAttachmentAspectCreateInfo
VkRenderPassInputAttachmentAspectCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `aspectReferenceCount` is the number of elements in the `pAspectReferences` array.
- `pAspectReferences` is a pointer to an array of `aspectReferenceCount` `VkInputAttachmentAspectReference` structures containing a mask describing which aspect(s) can be accessed for a given input attachment within a given subpass.

To specify which aspects of an input attachment can be read, add a `VkRenderPassInputAttachmentAspectCreateInfo` structure to the `pNext` chain of the `VkRenderPassCreateInfo` structure:

An application can access any aspect of an input attachment that does not have a specified aspect mask in the `pAspectReferences` array. Otherwise, an application must not access aspect(s) of an input attachment other than those in its specified aspect mask.

### Valid Usage (Implicit)

- VUID-VkRenderPassInputAttachmentAspectCreateInfo-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_RENDER_PASS_INPUT_ATTACHMENT_ASPECT_CREATE_INFO`
- VUID-VkRenderPassInputAttachmentAspectCreateInfo-pAspectReferences-parameter
**pAspectReferences** must be a valid pointer to an array of `aspectReferenceCount` valid `VkInputAttachmentAspectReference` structures

- VUID-VkRenderPassInputAttachmentAspectCreateInfo-aspectReferenceCount-arraylength

`aspectReferenceCount` must be greater than 0

The `VkInputAttachmentAspectReference` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkInputAttachmentAspectReference {
    uint32_t subpass;
    uint32_t inputAttachmentIndex;
    VkImageAspectFlags aspectMask;
} VkInputAttachmentAspectReference;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance2
typedef VkInputAttachmentAspectReference VkInputAttachmentAspectReferenceKHR;
```

- `subpass` is an index into the `pSubpasses` array of the parent `VkRenderPassCreateInfo` structure.
- `inputAttachmentIndex` is an index into the `pInputAttachments` of the specified subpass.
- `aspectMask` is a mask of which aspect(s) can be accessed within the specified subpass.

This structure specifies an aspect mask for a specific input attachment of a specific subpass in the render pass.

`subpass` and `inputAttachmentIndex` index into the render pass as:

```c
pCreateInfo->pSubpasses[subpass].pInputAttachments[inputAttachmentIndex]
```

**Valid Usage**

- VUID-VkInputAttachmentAspectReference-aspectMask-01964
  `aspectMask` must not include `VK_IMAGE_ASPECT_METADATA_BIT`

**Valid Usage (Implicit)**

- VUID-VkInputAttachmentAspectReference-aspectMask-parameter
  `aspectMask` must be a valid combination of `VkImageAspectFlagBits` values
- VUID-VkInputAttachmentAspectReference-aspectMask-requiredbitmap
  `aspectMask` must not be 0
The `VkSubpassDescription` structure is defined as:

```c
typedef struct VkSubpassDescription {
    VkSubpassDescriptionFlags flags;
    VkPipelineBindPoint pipelineBindPoint;
    uint32_t inputAttachmentCount;
    const VkAttachmentReference* pInputAttachments;
    uint32_t colorAttachmentCount;
    const VkAttachmentReference* pColorAttachments;
    const VkAttachmentReference* pResolveAttachments;
    const VkAttachmentReference* pDepthStencilAttachment;
    uint32_t preserveAttachmentCount;
    const uint32_t* pPreserveAttachments;
} VkSubpassDescription;
```

- `flags` is a bitmask of `VkSubpassDescriptionFlagBits` specifying usage of the subpass.
- `pipelineBindPoint` is a `VkPipelineBindPoint` value specifying the pipeline type supported for this subpass.
- `inputAttachmentCount` is the number of input attachments.
- `pInputAttachments` is a pointer to an array of `VkAttachmentReference` structures defining the input attachments for this subpass and their layouts.
- `colorAttachmentCount` is the number of color attachments.
- `pColorAttachments` is a pointer to an array of `VkAttachmentReference` structures defining the color attachments for this subpass and their layouts.
- `pResolveAttachments` is `NULL` or a pointer to an array of `VkAttachmentReference` structures defining the resolve attachments for this subpass and their layouts.
- `pDepthStencilAttachment` is a pointer to a `VkAttachmentReference` structure specifying the depth/stencil attachment for this subpass and its layout.
- `preserveAttachmentCount` is the number of preserved attachments.
- `pPreserveAttachments` is a pointer to an array of `VkAttachmentReference` structures identifying attachments that are not used by this subpass, but whose contents must be preserved throughout the subpass.

Each element of the `pInputAttachments` array corresponds to an input attachment index in a fragment shader, i.e. if a shader declares an image variable decorated with a `InputAttachmentIndex` value of `X`, then it uses the attachment provided in `pInputAttachments[X]`. Input attachments must also be bound to the pipeline in a descriptor set. If the attachment member of any element of `pInputAttachments` is `VK_ATTACHMENT_UNUSED`, the application must not read from the corresponding input attachment index. Fragment shaders can use subpass input variables to access the contents of an input attachment at the fragment’s (x, y, layer) framebuffer coordinates.

Each element of the `pColorAttachments` array corresponds to an output location in the shader, i.e. if the shader declares an output variable decorated with a `Location` value of `X`, then it uses the
attachment provided in \texttt{pColorAttachments}\[X]. If the \texttt{attachment} member of any element of \texttt{pColorAttachments} is \texttt{VK}\_\texttt{ATTACHMENT}\_\texttt{UNUSED}, then writes to the corresponding location by a fragment shader are discarded.

If \texttt{pResolveAttachments} is not \texttt{NULL}, each of its elements corresponds to a color attachment (the element in \texttt{pColorAttachments} at the same index), and a \texttt{multisample resolve operation} is defined for each attachment unless the resolve attachment index is \texttt{VK}\_\texttt{ATTACHMENT}\_\texttt{UNUSED}.

Similarly, if \texttt{VkSubpassDescriptionDepthStencilResolve::pDepthStencilResolveAttachment} is not \texttt{NULL} and does not have the value \texttt{VK}\_\texttt{ATTACHMENT}\_\texttt{UNUSED}, it corresponds to the depth/stencil attachment in \texttt{pDepthStencilAttachment}, and \texttt{multisample resolve operation} for depth and stencil are defined by \texttt{VkSubpassDescriptionDepthStencilResolve::depthResolveMode} and \texttt{VkSubpassDescriptionDepthStencilResolve::stencilResolveMode}, respectively. If \texttt{VkSubpassDescriptionDepthStencilResolve::depthResolveMode} is \texttt{VK}\_\texttt{RESOLVE}\_\texttt{MODE}\_\texttt{NONE} or the \texttt{pDepthStencilResolveAttachment} does not have a depth aspect, no resolve operation is performed for the depth attachment. If \texttt{VkSubpassDescriptionDepthStencilResolve::stencilResolveMode} is \texttt{VK}\_\texttt{RESOLVE}\_\texttt{MODE}\_\texttt{NONE} or the \texttt{pDepthStencilResolveAttachment} does not have a stencil aspect, no resolve operation is performed for the stencil attachment.

If \texttt{pDepthStencilAttachment} is \texttt{NULL}, or if its attachment index is \texttt{VK}\_\texttt{ATTACHMENT}\_\texttt{UNUSED}, it indicates that no depth/stencil attachment will be used in the subpass.

The contents of an attachment within the render area become undefined at the start of a subpass \texttt{S} if all of the following conditions are true:

- The attachment is used as a color, depth/stencil, or resolve attachment in any subpass in the render pass.
- There is a subpass \texttt{S}_1 that uses or preserves the attachment, and a subpass dependency from \texttt{S}_1 to \texttt{S}.
- The attachment is not used or preserved in subpass \texttt{S}.

Once the contents of an attachment become undefined in subpass \texttt{S}, they remain undefined for subpasses in subpass dependency chains starting with subpass \texttt{S} until they are written again. However, they remain valid for subpasses in other subpass dependency chains starting with subpass \texttt{S}_1, if those subpasses use or preserve the attachment.

\textbf{Valid Usage}

- \textbf{VUID-VkSubpassDescription-attachment-06912}
  If the \texttt{attachment} member of an element of \texttt{pInputAttachments} is not \texttt{VK}\_\texttt{ATTACHMENT}\_\texttt{UNUSED}, its \texttt{layout} member \textbf{must} not be \texttt{VK}\_\texttt{IMAGE}\_\texttt{LAYOUT}\_\texttt{COLOR}\_\texttt{ATTACHMENT}\_\texttt{OPTIMAL} or \texttt{VK}\_\texttt{IMAGE}\_\texttt{LAYOUT}\_\texttt{DEPTH}\_\texttt{STENCIL}\_\texttt{ATTACHMENT}\_\texttt{OPTIMAL}

- \textbf{VUID-VkSubpassDescription-attachment-06913}
  If the \texttt{attachment} member of an element of \texttt{pColorAttachments} is not \texttt{VK}\_\texttt{ATTACHMENT}\_\texttt{UNUSED}, its \texttt{layout} member \textbf{must} not be \texttt{VK}\_\texttt{IMAGE}\_\texttt{LAYOUT}\_\texttt{DEPTH}\_\texttt{STENCIL}\_\texttt{ATTACHMENT}\_\texttt{OPTIMAL} or \texttt{VK}\_\texttt{IMAGE}\_\texttt{LAYOUT}\_\texttt{SHADER}\_\texttt{READ}\_\texttt{ONLY}\_\texttt{OPTIMAL}

- \textbf{VUID-VkSubpassDescription-attachment-06914}
If the attachment member of an element of pResolveAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL.

- VUID-VkSubpassDescription-attachment-06915
  If the attachment member of pDepthStencilAttachment is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL.

- VUID-VkSubpassDescription-attachment-06916
  If the attachment member of an element of pColorAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL.

- VUID-VkSubpassDescription-attachment-06917
  If the attachment member of an element of pResolveAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL.

- VUID-VkSubpassDescription-attachment-06918
  If the attachment member of an element of pInputAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL.

- VUID-VkSubpassDescription-attachment-06919
  If the attachment member of an element of pColorAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL.

- VUID-VkSubpassDescription-attachment-06920
  If the attachment member of an element of pResolveAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL.

- VUID-VkSubpassDescription-attachment-06921
  If the attachment member of an element of pInputAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR.

- VUID-VkSubpassDescription-attachment-06922
  If the attachment member of an element of pColorAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR.

- VUID-VkSubpassDescription-attachment-06923
  If the attachment member of an element of pResolveAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR.

- VUID-VkSubpassDescription-pipelineBindPoint-04952
pipelineBindPoint must be VK_PIPELINE_BIND_POINT_GRAPHICS

- VUID-VkSubpassDescription-colorAttachmentCount-00845
colorAttachmentCount must be less than or equal to VkPhysicalDeviceLimits::maxColorAttachments

- VUID-VkSubpassDescription-loadOp-00846
If the first use of an attachment in this render pass is as an input attachment, and the
attachment is not also used as a color or depth/stencil attachment in the same subpass,
then loadOp must not be VK_ATTACHMENT_LOAD_OP_CLEAR

- VUID-VkSubpassDescription-pResolveAttachments-00847
If pResolveAttachments is not NULL, for each resolve attachment that is not
VK_ATTACHMENT_UNUSED, the corresponding color attachment must not be
VK_ATTACHMENT_UNUSED

- VUID-VkSubpassDescription-pResolveAttachments-00848
If pResolveAttachments is not NULL, for each resolve attachment that is not
VK_ATTACHMENT_UNUSED, the corresponding color attachment must not have a sample count
of VK_SAMPLE_COUNT_1_BIT

- VUID-VkSubpassDescription-pResolveAttachments-00849
If pResolveAttachments is not NULL, each resolve attachment that is not
VK_ATTACHMENT_UNUSED must have a sample count of VK_SAMPLE_COUNT_1_BIT

- VUID-VkSubpassDescription-pResolveAttachments-00850
If pResolveAttachments is not NULL, each resolve attachment that is not
VK_ATTACHMENT_UNUSED must have the same VkFormat as its corresponding color
attachment

- VUID-VkSubpassDescription-pColorAttachments-09430
All attachments in pColorAttachments that are not VK_ATTACHMENT_UNUSED must have the
same sample count

- VUID-VkSubpassDescription-pInputAttachments-02647
All attachments in pInputAttachments that are not VK_ATTACHMENT_UNUSED must have image
formats whose potential format features contain at least
VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT or
VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkSubpassDescription-pColorAttachments-02648
All attachments in pColorAttachments that are not VK_ATTACHMENT_UNUSED must have image
formats whose potential format features contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT

- VUID-VkSubpassDescription-pResolveAttachments-02649
All attachments in pResolveAttachments that are not VK_ATTACHMENT_UNUSED must have image
formats whose potential format features contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT

- VUID-VkSubpassDescription-pDepthStencilAttachment-02650
If pDepthStencilAttachment is not NULL and the attachment is not VK_ATTACHMENT_UNUSED then
it must have an image format whose potential format features contain
VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkSubpassDescription-pDepthStencilAttachment-01418
If `pDepthStencilAttachment` is not `VK_ATTACHMENT_UNUSED` and any attachments in `pColorAttachments` are not `VK_ATTACHMENT_UNUSED`, they **must** have the same sample count

- **VUID-VkSubpassDescription-attachment-00853**
  Each element of `pPreserveAttachments` **must** not be `VK_ATTACHMENT_UNUSED`

- **VUID-VkSubpassDescription-pPreserveAttachments-00854**
  Each element of `pPreserveAttachments` **must** not also be an element of any other member of the subpass description

- **VUID-VkSubpassDescription-layout-02519**
  If any attachment is used by more than one `VkAttachmentReference` member, then each use **must** use the same layout

- **VUID-VkSubpassDescription-pDepthStencilAttachment-04438**
  `pDepthStencilAttachment` and `pColorAttachments` **must** not contain references to the same attachment

### Valid Usage (Implicit)

- **VUID-VkSubpassDescription-flags-zerobitsetmask**
  `flags` **must** be 0

- **VUID-VkSubpassDescription-pipelineBindPoint-parameter**
  `pipelineBindPoint` **must** be a valid `VkPipelineBindPoint` value

- **VUID-VkSubpassDescription-pInputAttachments-parameter**
  If `inputAttachmentCount` is not 0, `pInputAttachments` **must** be a valid pointer to an array of `inputAttachmentCount` valid `VkAttachmentReference` structures

- **VUID-VkSubpassDescription-pColorAttachments-parameter**
  If `colorAttachmentCount` is not 0, `pColorAttachments` **must** be a valid pointer to an array of `colorAttachmentCount` valid `VkAttachmentReference` structures

- **VUID-VkSubpassDescription-pResolveAttachments-parameter**
  If `colorAttachmentCount` is not 0, and `pResolveAttachments` is not NULL, `pResolveAttachments` **must** be a valid pointer to an array of `colorAttachmentCount` valid `VkAttachmentReference` structures

- **VUID-VkSubpassDescription-pDepthStencilAttachment-parameter**
  If `pDepthStencilAttachment` is not NULL, `pDepthStencilAttachment` **must** be a valid pointer to a valid `VkAttachmentReference` structure

- **VUID-VkSubpassDescription-pPreserveAttachments-parameter**
  If `preserveAttachmentCount` is not 0, `pPreserveAttachments` **must** be a valid pointer to an array of `preserveAttachmentCount uint32_t` values

Bits which **can** be set in `VkSubpassDescription::flags`, specifying usage of the subpass, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSubpassDescriptionFlagBits {
```
VkSubpassDescriptionFlagBits

**Note**
All bits for this type are defined by extensions, and none of those extensions are enabled in this build of the specification.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkSubpassDescriptionFlags;
```

`VkSubpassDescriptionFlags` is a bitmask type for setting a mask of zero or more `VkSubpassDescriptionFlagBits`.

The `VkAttachmentReference` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkAttachmentReference {
    uint32_t attachment;
    VkImageLayout layout;
} VkAttachmentReference;
```

**Valid Usage**

- **VUID-VkAttachmentReference-layout-03077**
  If `attachment` is not `VK_ATTACHMENT_UNUSED`, `layout` must not be `VK_IMAGE_LAYOUT_UNDEFINED`, `VK_IMAGE_LAYOUT_PREINITIALIZED`, or `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`

- **VUID-VkAttachmentReference-separateDepthStencilLayouts-03313**
  If the `separateDepthStencilLayouts` feature is not enabled, and `attachment` is not `VK_ATTACHMENT_UNUSED`, `layout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`.

- **VUID-VkAttachmentReference-synchronization2-06910**
  If the `synchronization2` feature is not enabled, `layout` must not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`

- **VUID-VkAttachmentReference-attachmentFeedbackLoopLayout-07311**
  If the `attachmentFeedbackLoopLayout` feature is not enabled, `layout` must not be `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT`

- **VUID-VkAttachmentReference-dynamicRenderingLocalRead-09546**
  If the `dynamicRenderingLocalRead` feature is not enabled, `layout` must not be
Valid Usage (Implicit)

- VUID-VkAttachmentReference-layout-parameter
  `layout` must be a valid VkImageLayout value

**VK_SUBPASS_EXTERNAL** is a special subpass index value expanding synchronization scope outside a subpass. It is described in more detail by VkSubpassDependency.

```c
#define VK_SUBPASS_EXTERNAL (~0U)
```

The **VkSubpassDependency** structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSubpassDependency {
    uint32_t srcSubpass;
    uint32_t dstSubpass;
    VkPipelineStageFlags srcStageMask;
    VkPipelineStageFlags dstStageMask;
    VkAccessFlags srcAccessMask;
    VkAccessFlags dstAccessMask;
    VkDependencyFlags dependencyFlags;
} VkSubpassDependency;
```

- **srcSubpass** is the subpass index of the first subpass in the dependency, or **VK_SUBPASS_EXTERNAL**.
- **dstSubpass** is the subpass index of the second subpass in the dependency, or **VK_SUBPASS_EXTERNAL**.
- **srcStageMask** is a bitmask of **VkPipelineStageFlagBits** specifying the source stage mask.
- **dstStageMask** is a bitmask of **VkPipelineStageFlagBits** specifying the destination stage mask.
- **srcAccessMask** is a bitmask of **VkAccessFlagBits** specifying a source access mask.
- **dstAccessMask** is a bitmask of **VkAccessFlagBits** specifying a destination access mask.
- **dependencyFlags** is a bitmask of **VkDependencyFlagBits**.

If **srcSubpass** is equal to **dstSubpass** then the **VkSubpassDependency** does not directly define a dependency. Instead, it enables pipeline barriers to be used in a render pass instance within the identified subpass, where the scopes of one pipeline barrier must be a subset of those described by one subpass dependency. Subpass dependencies specified in this way that include framebuffer-space stages in the **srcStageMask** must only include framebuffer-space stages in **dstStageMask**, and **must** include **VK_DEPENDENCY_BY_REGION_BIT**. When a subpass dependency is specified in this way for a subpass that has more than one view in its view mask, its **dependencyFlags** must include **VK_DEPENDENCY_VIEW_LOCAL_BIT**.
If `srcSubpass` and `dstSubpass` are not equal, when a render pass instance which includes a subpass dependency is submitted to a queue, it defines a dependency between the subpasses identified by `srcSubpass` and `dstSubpass`.

If `srcSubpass` is equal to `VK_SUBPASS_EXTERNAL`, the first synchronization scope includes commands that occur earlier in submission order than the `vkCmdBeginRenderPass` used to begin the render pass instance. Otherwise, the first set of commands includes all commands submitted as part of the subpass instance identified by `srcSubpass` and any load, store, or multisample resolve operations on attachments used in `srcSubpass`. In either case, the first synchronization scope is limited to operations on the pipeline stages determined by the source stage mask specified by `srcStageMask`.

If `dstSubpass` is equal to `VK_SUBPASS_EXTERNAL`, the second synchronization scope includes commands that occur later in submission order than the `vkCmdEndRenderPass` used to end the render pass instance. Otherwise, the second set of commands includes all commands submitted as part of the subpass instance identified by `dstSubpass` and any load, store, and multisample resolve operations on attachments used in `dstSubpass`. In either case, the second synchronization scope is limited to operations on the pipeline stages determined by the destination stage mask specified by `dstStageMask`.

The first access scope is limited to accesses in the pipeline stages determined by the source stage mask specified by `srcStageMask`. It is also limited to access types in the source access mask specified by `srcAccessMask`.

The second access scope is limited to accesses in the pipeline stages determined by the destination stage mask specified by `dstStageMask`. It is also limited to access types in the destination access mask specified by `dstAccessMask`.

The availability and visibility operations defined by a subpass dependency affect the execution of image layout transitions within the render pass.

**Note**

For non-attachment resources, the memory dependency expressed by subpass dependency is nearly identical to that of a `VkMemoryBarrier` (with matching `srcAccessMask` and `dstAccessMask` parameters) submitted as a part of a `vkCmdPipelineBarrier` (with matching `srcStageMask` and `dstStageMask` parameters). The only difference being that its scopes are limited to the identified subpasses rather than potentially affecting everything before and after.

For attachments however, subpass dependencies work more like a `VkImageMemoryBarrier` defined similarly to the `VkMemoryBarrier` above, the queue family indices set to `VK_QUEUE_FAMILY_IGNORED`, and layouts as follows:

- The equivalent to `oldLayout` is the attachment's layout according to the subpass description for `srcSubpass`.
- The equivalent to `newLayout` is the attachment's layout according to the subpass description for `dstSubpass`.
Valid Usage

- VUID-VkSubpassDependency-srcStageMask-04090
  If the geometryShader feature is not enabled, srcStageMask must not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`

- VUID-VkSubpassDependency-srcStageMask-04091
  If the tessellationShader feature is not enabled, srcStageMask must not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`

- VUID-VkSubpassDependency-srcStageMask-07319
  If the attachmentFragmentShadingRate feature is not enabled, srcStageMask must not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-VkSubpassDependency-srcStageMask-03937
  If the synchronization2 feature is not enabled, srcStageMask must not be 0

- VUID-VkSubpassDependency-dstStageMask-04090
  If the geometryShader feature is not enabled, dstStageMask must not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`

- VUID-VkSubpassDependency-dstStageMask-04091
  If the tessellationShader feature is not enabled, dstStageMask must not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`

- VUID-VkSubpassDependency-dstStageMask-07319
  If the attachmentFragmentShadingRate feature is not enabled, dstStageMask must not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-VkSubpassDependency-dstStageMask-03937
  If the synchronization2 feature is not enabled, dstStageMask must not be 0

- VUID-VkSubpassDependency-dstStageMask-07950
  If the rayTracingPipeline feature is not enabled, dstStageMask must not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`

- VUID-VkSubpassDependency-srcSubpass-00864
  srcSubpass must be less than or equal to dstSubpass, unless one of them is `VK_SUBPASS_EXTERNAL`, to avoid cyclic dependencies and ensure a valid execution order

- VUID-VkSubpassDependency-srcSubpass-00865
  srcSubpass and dstSubpass must not both be equal to `VK_SUBPASS_EXTERNAL`

- VUID-VkSubpassDependency-srcAccessMask-00868
  Any access flag included in srcAccessMask must be supported by one of the pipeline stages
in `srcStageMask`, as specified in the table of supported access types.

- **VUID-VkSubpassDependency-dstAccessMask-00869**
  Any access flag included in `dstAccessMask` must be supported by one of the pipeline stages in `dstStageMask`, as specified in the table of supported access types.

- **VUID-VkSubpassDependency-srcSubpass-02243**
  If `srcSubpass` equals `dstSubpass`, and `srcStageMask` and `dstStageMask` both include a framebuffer-space stage, then `dependencyFlags` must include VK_DEPENDENCY_BY_REGION_BIT.

- **VUID-VkSubpassDependency-dependencyFlags-02520**
  If `dependencyFlags` includes VK_DEPENDENCY_VIEW_LOCAL_BIT, `srcSubpass` must not be equal to VK_SUBPASS_EXTERNAL.

- **VUID-VkSubpassDependency-dependencyFlags-02521**
  If `dependencyFlags` includes VK_DEPENDENCY_VIEW_LOCAL_BIT, `dstSubpass` must not be equal to VK_SUBPASS_EXTERNAL.

- **VUID-VkSubpassDependency-srcSubpass-00872**
  If `srcSubpass` equals `dstSubpass` and that subpass has more than one bit set in the view mask, then `dependencyFlags` must include VK_DEPENDENCY_VIEW_LOCAL_BIT.

**Valid Usage (Implicit)**

- **VUID-VkSubpassDependency-srcStageMask-parameter**
  `srcStageMask` must be a valid combination of VkPipelineStageFlagBits values.

- **VUID-VkSubpassDependency-dstStageMask-parameter**
  `dstStageMask` must be a valid combination of VkPipelineStageFlagBits values.

- **VUID-VkSubpassDependency-srcAccessMask-parameter**
  `srcAccessMask` must be a valid combination of VkAccessFlagBits values.

- **VUID-VkSubpassDependency-dstAccessMask-parameter**
  `dstAccessMask` must be a valid combination of VkAccessFlagBits values.

- **VUID-VkSubpassDependency-dependencyFlags-parameter**
  `dependencyFlags` must be a valid combination of VkDependencyFlagBits values.

When multiview is enabled, the execution of the multiple views of one subpass may not occur simultaneously or even back-to-back, and rather may be interleaved with the execution of other subpasses. The load and store operations apply to attachments on a per-view basis. For example, an attachment using VK_ATTACHMENT_LOAD_OP_CLEAR will have each view cleared on first use, but the first use of one view may be temporally distant from the first use of another view.

**Note**

A good mental model for multiview is to think of a multiview subpass as if it were a collection of individual (per-view) subpasses that are logically grouped together and described as a single multiview subpass in the API. Similarly, a multiview attachment can be thought of like several individual attachments that happen to be layers in a single image. A view-local dependency between two multiview
subpasses acts like a set of one-to-one dependencies between corresponding pairs of per-view subpasses. A view-global dependency between two multiview subpasses acts like a set of \( N \times M \) dependencies between all pairs of per-view subpasses in the source and destination. Thus, it is a more compact representation which also makes clear the commonality and reuse that is present between views in a subpass. This interpretation motivates the answers to questions like “when does the load op apply” - it is on the first use of each view of an attachment, as if each view was a separate attachment.

The content of each view follows the description in attachment content behavior. In particular, if an attachment is preserved, all views within the attachment are preserved.

If there is no subpass dependency from \texttt{VK_SUBPASS_EXTERNAL} to the first subpass that uses an attachment, then an implicit subpass dependency exists from \texttt{VK_SUBPASS_EXTERNAL} to the first subpass it is used in. The implicit subpass dependency only exists if there exists an automatic layout transition away from \texttt{initialLayout}. The subpass dependency operates as if defined with the following parameters:

```cpp
VkSubpassDependency implicitDependency = {
.srcSubpass = VK_SUBPASS_EXTERNAL,
.dstSubpass = firstSubpass, // First subpass attachment is used in
.srcStageMask = VK_PIPELINE_STAGE_NONE,
.dstStageMask = VK_PIPELINE_STAGE_ALL_COMMANDS_BIT,
.srcAccessMask = 0,
.dstAccessMask = VK_ACCESS_INPUT_ATTACHMENT_READ_BIT |
VK_ACCESS_COLOR_ATTACHMENT_READ_BIT |
VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT |
VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT |
VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT,
.dependencyFlags = 0
};
```

Similarly, if there is no subpass dependency from the last subpass that uses an attachment to \texttt{VK_SUBPASS_EXTERNAL}, then an implicit subpass dependency exists from the last subpass it is used in to \texttt{VK_SUBPASS_EXTERNAL}. The implicit subpass dependency only exists if there exists an automatic layout transition into \texttt{finalLayout}. The subpass dependency operates as if defined with the following parameters:

```cpp
VkSubpassDependency implicitDependency = {
.srcSubpass = lastSubpass, // Last subpass attachment is used in
.dstSubpass = VK_SUBPASS_EXTERNAL,
.srcStageMask = VK_PIPELINE_STAGE_ALL_COMMANDS_BIT,
.dstStageMask = VK_PIPELINE_STAGE_NONE,
.srcAccessMask = VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT |
VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT,
.dstAccessMask = 0,
.dependencyFlags = 0
};
```
As subpasses may overlap or execute out of order with regards to other subpasses unless a subpass dependency chain describes otherwise, the layout transitions required between subpasses cannot be known to an application. Instead, an application provides the layout that each attachment must be in at the start and end of a render pass, and the layout it must be in during each subpass it is used in. The implementation then must execute layout transitions between subpasses in order to guarantee that the images are in the layouts required by each subpass, and in the final layout at the end of the render pass.

Automatic layout transitions apply to the entire image subresource attached to the framebuffer. If multiview is not enabled and the attachment is a view of a 1D or 2D image, the automatic layout transitions apply to the number of layers specified by `VkFramebufferCreateInfo::layers`. If multiview is enabled and the attachment is a view of a 1D or 2D image, the automatic layout transitions apply to the layers corresponding to views which are used by some subpass in the render pass, even if that subpass does not reference the given attachment. If the attachment view is a 2D or 2D array view of a 3D image, even if the attachment view only refers to a subset of the slices of the selected mip level of the 3D image, automatic layout transitions apply to the entire subresource referenced which is the entire mip level in this case.

Automatic layout transitions away from the layout used in a subpass happen-after the availability operations for all dependencies with that subpass as the srcSubpass.

Automatic layout transitions into the layout used in a subpass happen-before the visibility operations for all dependencies with that subpass as the dstSubpass.

Automatic layout transitions away from initialLayout happen-after the availability operations for all dependencies with a srcSubpass equal to VK_SUBPASS_EXTERNAL, where dstSubpass uses the attachment that will be transitioned. For attachments created with VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT, automatic layout transitions away from initialLayout happen-after the availability operations for all dependencies with a srcSubpass equal to VK_SUBPASS_EXTERNAL, where dstSubpass uses any aliased attachment.

Automatic layout transitions into finallayout happen-before the visibility operations for all dependencies with a dstSubpass equal to VK_SUBPASS_EXTERNAL, where srcSubpass uses the attachment that will be transitioned. For attachments created with VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT, automatic layout transitions into finallayout happen-before the visibility operations for all dependencies with a dstSubpass equal to VK_SUBPASS_EXTERNAL, where srcSubpass uses any aliased attachment.

If two subpasses use the same attachment, and both subpasses use the attachment in a read-only layout, no subpass dependency needs to be specified between those subpasses. If an implementation treats those layouts separately, it must insert an implicit subpass dependency between those subpasses to separate the uses in each layout. The subpass dependency operates as if defined with the following parameters:

```cpp
// Used for input attachments
VkPipelineStageFlags inputAttachmentStages = VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT;
```
VkAccessFlags inputAttachmentDstAccess = VK_ACCESS_INPUT_ATTACHMENT_READ_BIT;

// Used for depth/stencil attachments
VkPipelineStageFlags depthStencilAttachmentStages = VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT |
VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT;
VkAccessFlags depthStencilAttachmentDstAccess = VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT;

VkSubpassDependency implicitDependency = {
    .srcSubpass = firstSubpass;
    .dstSubpass = secondSubpass;
    .srcStageMask = inputAttachmentStages | depthStencilAttachmentStages;
    .dstStageMask = inputAttachmentStages | depthStencilAttachmentStages;
    .srcAccessMask = 0;
    .dstAccessMask = inputAttachmentDstAccess | depthStencilAttachmentDstAccess;
    .dependencyFlags = 0;
};

When drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates, the application must specify which types of attachments that are written to during a render pass will also be accessed as non-attachments in the render pass.

To dynamically set whether a pipeline can access a resource as a non-attachment while it is also used as an attachment that is written to, call:

// Provided by VK_EXT_attachment_feedback_loop_dynamic_state
void vkCmdSetAttachmentFeedbackLoopEnableEXT(
    VkCommandBuffer commandBuffer,
    VkImageAspectFlags aspectMask);

- commandBuffer is the command buffer into which the command will be recorded.
- aspectMask specifies the types of attachments for which feedback loops will be enabled. Attachment types whose aspects are not included in aspectMask will have feedback loops disabled.

For attachments that are written to in a render pass, only attachments with the aspects specified in aspectMask can be accessed as non-attachments by subsequent drawing commands.

Valid Usage

- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-attachmentFeedbackLoopDynamicState-08862
  The attachmentFeedbackLoopDynamicState feature must be enabled
- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-aspectMask-08863
  aspectMask must only include VK_IMAGE_ASPECT_NONE, VK_IMAGE_ASPECT_COLOR_BIT,
VK_IMAGE_ASPECT_DEPTH_BIT, and VK_IMAGE_ASPECT_STENCIL_BIT

- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-attachmentFeedbackLoopLayout-08864
  If the attachmentFeedbackLoopLayout feature is not enabled, aspectMask must be VK_IMAGE_ASPECT_NONE

**Valid Usage (Implicit)**

- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-aspectMask-parameter
  aspectMask must be a valid combination of VkImageAspectFlagBits values

- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-videocoding
  This command must only be called outside of a video coding scope

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
</tbody>
</table>

A more extensible version of render pass creation is also defined below.

To create a render pass, call:

```c
// Provided by VK_VERSION_1_2
VkResult vkCreateRenderPass2(
    VkDevice device,
    const VkRenderPassCreateInfo2* pCreateInfo,
```
const VkAllocationCallbacks* pAllocator, VkRenderPass* pRenderPass);

or the equivalent command

// Provided by VK_KHR_create_renderpass2

VkResult vkCreateRenderPass2KHR(
    VkDevice device,
    const VkRenderPassCreateInfo2* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkRenderPass* pRenderPass);

- **device** is the logical device that creates the render pass.
- **pCreateInfo** is a pointer to a `VkRenderPassCreateInfo2` structure describing the parameters of the render pass.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pRenderPass** is a pointer to a `VkRenderPass` handle in which the resulting render pass object is returned.

This command is functionally identical to `vkCreateRenderPass`, but includes extensible substructures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

### Valid Usage (Implicit)

- **VUID-vkCreateRenderPass2-device-parameter**
  - device **must** be a valid `VkDevice` handle
- **VUID-vkCreateRenderPass2-pCreateInfo-parameter**
  - pCreateInfo **must** be a valid pointer to a valid `VkRenderPassCreateInfo2` structure
- **VUID-vkCreateRenderPass2-pAllocator-parameter**
  - If pAllocator is not NULL, pAllocator **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- **VUID-vkCreateRenderPass2-pRenderPass-parameter**
  - pRenderPass **must** be a valid pointer to a `VkRenderPass` handle

### Return Codes

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
The `VkRenderPassCreateInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkRenderPassCreateInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkRenderPassCreateFlags flags;
    uint32_t attachmentCount;
    const VkAttachmentDescription2* pAttachments;
    uint32_t subpassCount;
    const VkSubpassDescription2* pSubpasses;
    uint32_t dependencyCount;
    const VkSubpassDependency2* pDependencies;
    uint32_t correlatedViewMaskCount;
    const uint32_t* pCorrelatedViewMasks;
} VkRenderPassCreateInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_create_renderpass2
typedef VkRenderPassCreateInfo2 VkRenderPassCreateInfo2KHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **attachmentCount** is the number of attachments used by this render pass.
- **pAttachments** is a pointer to an array of `attachmentCount` `VkAttachmentDescription2` structures describing the attachments used by the render pass.
- **subpassCount** is the number of subpasses to create.
- **pSubpasses** is a pointer to an array of `subpassCount` `VkSubpassDescription2` structures describing each subpass.
- **dependencyCount** is the number of dependencies between pairs of subpasses.
- **pDependencies** is a pointer to an array of `dependencyCount` `VkSubpassDependency2` structures describing dependencies between pairs of subpasses.
- **correlatedViewMaskCount** is the number of correlation masks.
- **pCorrelatedViewMasks** is a pointer to an array of view masks indicating sets of views that may be more efficient to render concurrently.

Parameters defined by this structure with the same name as those in `VkRenderPassCreateInfo` have the identical effect to those parameters; the child structures are variants of those used in `VkRenderPassCreateInfo` which add **sType** and **pNext** parameters, allowing them to be extended.

If the `VkSubpassDescription2::viewMask` member of any element of `pSubpasses` is not zero, multiview
correlatedViewMaskCount and pCorrelatedViewMasks have the same effect as VkRenderPassMultiviewCreateInfo::correlationMaskCount and VkRenderPassMultiviewCreateInfo::pCorrelationMasks, respectively.

Valid Usage

- VUID-VkRenderPassCreateInfo2-None-03049
  If any two subpasses operate on attachments with overlapping ranges of the same VkDeviceMemory object, and at least one subpass writes to that area of VkDeviceMemory, a subpass dependency must be included (either directly or via some intermediate subpasses) between them.

- VUID-VkRenderPassCreateInfo2-attachment-03050
  If the attachment member of any element of pInputAttachments, pColorAttachments, pResolveAttachments, or pDepthStencilAttachment, or the attachment indexed by any element of pPreserveAttachments in any element of pSubpasses is bound to a range of a VkDeviceMemory object that overlaps with any other attachment in any subpass (including the same subpass), the VkAttachmentDescription2 structures describing them must include VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT in flags.

- VUID-VkRenderPassCreateInfo2-attachment-03051
  If the attachment member of any element of pInputAttachments, pColorAttachments, pResolveAttachments, or pDepthStencilAttachment, or any element of pPreserveAttachments in any element of pSubpasses is not VK_ATTACHMENT_UNUSED, then it must be less than attachmentCount.

- VUID-VkRenderPassCreateInfo2-pSubpasses-06473
  If the pSubpasses pNext chain includes a VkSubpassDescriptionDepthStencilResolve structure and the pDepthStencilResolveAttachment member is not NULL and does not have the value VK_ATTACHMENT_UNUSED, then attachment must be less than attachmentCount.

- VUID-VkRenderPassCreateInfo2-pAttachments-02522
  For any member of pAttachments with a loadOp equal to VK_ATTACHMENT_LOAD_OP_CLEAR, the first use of that attachment must not specify a layout equal to VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, or VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL.

- VUID-VkRenderPassCreateInfo2-pAttachments-02523
  For any member of pAttachments with a stencilLoadOp equal to VK_ATTACHMENT_LOAD_OP_CLEAR, the first use of that attachment must not specify a layout equal to VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, or VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL.

- VUID-VkRenderPassCreateInfo2-pDependencies-03054
  For any element of pDependencies, if the srcSubpass is not VK_SUBPASS_EXTERNAL, all stage flags included in the srcStageMask member of that dependency must be a pipeline stage supported by the pipeline identified by the pipelineBindPoint member of the source.
subpass

• VUID-VkRenderPassCreateInfo2-pDependencies-03055
For any element of pDependencies, if the dstSubpass is not VK_SUBPASS_EXTERNAL, all stage flags included in the dstStageMask member of that dependency must be a pipeline stage supported by the pipeline identified by the pipelineBindPoint member of the destination subpass

• VUID-VkRenderPassCreateInfo2-pCorrelatedViewMasks-03056
The set of bits included in any element of pCorrelatedViewMasks must not overlap with the set of bits included in any other element of pCorrelatedViewMasks

• VUID-VkRenderPassCreateInfo2-viewMask-03057
If the VkSubpassDescription2::viewMask member of all elements of pSubpasses is 0, correlatedViewMaskCount must be 0

• VUID-VkRenderPassCreateInfo2-viewMask-03058
The VkSubpassDescription2::viewMask member of all elements of pSubpasses must either all be 0, or all not be 0

• VUID-VkRenderPassCreateInfo2-pDependencies-03060
For any element of pDependencies where its srcSubpass member equals its dstSubpass member, if the viewMask member of the corresponding element of pSubpasses includes more than one bit, its dependencyFlags member must include VK_DEPENDENCY_VIEW_LOCAL_BIT

• VUID-VkRenderPassCreateInfo2-attachment-02525
If the attachment member of any element of the pInputAttachments member of any element of pSubpasses is not VK_ATTACHMENT_UNUSED, the aspectMask member of that element of pInputAttachments must only include aspects that are present in images of the format specified by the element of pAttachments specified by attachment

• VUID-VkRenderPassCreateInfo2-srcSubpass-02526
The srcSubpass member of each element of pDependencies must be less than subpassCount

• VUID-VkRenderPassCreateInfo2-dstSubpass-02527
The dstSubpass member of each element of pDependencies must be less than subpassCount

• VUID-VkRenderPassCreateInfo2-pAttachments-04585
If any element of pAttachments is used as a fragment shading rate attachment in any subpass, it must not be used as any other attachment in the render pass

• VUID-VkRenderPassCreateInfo2-pAttachments-09387
If any element of pAttachments is used as a fragment shading rate attachment, the loadOp for that attachment must not be VK_ATTACHMENT_LOAD_OP_CLEAR

• VUID-VkRenderPassCreateInfo2-pAttachments-04586
If any element of pAttachments is used as a fragment shading rate attachment in any subpass, it must have an image format whose potential format features contain VK_FORMAT_FEATURE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR
• VUID-VkRenderPassCreateInfo2-attachment-06244
  If the attachment member of the pDepthStencilAttachment member of an element of pSubpasses is not VK_ATTACHMENT_UNUSED, the layout member of that same structure is either VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, and the pNext chain of that structure does not include a VkAttachmentReferenceStencilLayout structure, then the element of pAttachments with an index equal to attachment must not have a format that includes both depth and stencil components

• VUID-VkRenderPassCreateInfo2-attachment-06245
  If the attachment member of the pDepthStencilAttachment member of an element of pSubpasses is not VK_ATTACHMENT_UNUSED and the layout member of that same structure is either VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL, then the element of pAttachments with an index equal to attachment must have a format that includes only a stencil component

• VUID-VkRenderPassCreateInfo2-attachment-06246
  If the attachment member of the pDepthStencilAttachment member of an element of pSubpasses is not VK_ATTACHMENT_UNUSED and the layout member of that same structure is either VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, then the element of pAttachments with an index equal to attachment must not have a format that includes only a stencil component

Valid Usage (Implicit)

• VUID-VkRenderPassCreateInfo2-sType-sType
  sType must be VK_STRUCTURE_TYPE_RENDER_PASS_CREATE_INFO_2

• VUID-VkRenderPassCreateInfo2-pNext-pNext
  pNext must be NULL

• VUID-VkRenderPassCreateInfo2-flags-zerobitmask
  flags must be 0

• VUID-VkRenderPassCreateInfo2-pAttachments-parameter
  If attachmentCount is not 0, pAttachments must be a valid pointer to an array of attachmentCount valid VkAttachmentDescription2 structures

• VUID-VkRenderPassCreateInfo2-pSubpasses-parameter
  pSubpasses must be a valid pointer to an array of subpassCount valid VkSubpassDescription2 structures

• VUID-VkRenderPassCreateInfo2-pDependencies-parameter
  If dependencyCount is not 0, pDependencies must be a valid pointer to an array of dependencyCount valid VkSubpassDependency2 structures

• VUID-VkRenderPassCreateInfo2-pCorrelatedViewMasks-parameter
  If correlatedViewMaskCount is not 0, pCorrelatedViewMasks must be a valid pointer to an array of correlatedViewMaskCount uint32_t values

• VUID-VkRenderPassCreateInfo2-subpassCount-arraylength
  subpassCount must be greater than 0
The `VkAttachmentDescription2` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkAttachmentDescription2 {
    VkStructureType sType;
    const void* pNext;
    VkAttachmentDescriptionFlags flags;
    VkFormat format;
    VkSampleCountFlagBits samples;
    VkAttachmentLoadOp loadOp;
    VkAttachmentStoreOp storeOp;
    VkAttachmentLoadOp stencilLoadOp;
    VkAttachmentStoreOp stencilStoreOp;
    VkImageLayout initialLayout;
    VkImageLayout finalLayout;
} VkAttachmentDescription2;
```

or the equivalent

```c
// Provided by VK_KHR_create_renderpass2
typedef VkAttachmentDescription2 VkAttachmentDescription2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkAttachmentDescriptionFlagBits` specifying additional properties of the attachment.
- `format` is a `VkFormat` value specifying the format of the image that will be used for the attachment.
- `samples` is a `VkSampleCountFlagBits` value specifying the number of samples of the image.
- `loadOp` is a `VkAttachmentLoadOp` value specifying how the contents of color and depth components of the attachment are treated at the beginning of the subpass where it is first used.
- `storeOp` is a `VkAttachmentStoreOp` value specifying how the contents of color and depth components of the attachment are treated at the end of the subpass where it is last used.
- `stencilLoadOp` is a `VkAttachmentLoadOp` value specifying how the contents of stencil components of the attachment are treated at the beginning of the subpass where it is first used.
- `stencilStoreOp` is a `VkAttachmentStoreOp` value specifying how the contents of stencil components of the attachment are treated at the end of the last subpass where it is used.
- `initialLayout` is the layout the attachment image subresource will be in when a render pass instance begins.
- `finalLayout` is the layout the attachment image subresource will be transitioned to when a render pass instance ends.

Parameters defined by this structure with the same name as those in `VkAttachmentDescription`
have the identical effect to those parameters.

If the separateDepthStencilLayouts feature is enabled, and format is a depth/stencil format, initialLayout and finalLayout can be set to a layout that only specifies the layout of the depth aspect.

If the pNext chain includes a VkAttachmentDescriptionStencilLayout structure, then the stencilInitialLayout and stencilFinalLayout members specify the initial and final layouts of the stencil aspect of a depth/stencil format, and initialLayout and finalLayout only apply to the depth aspect. For depth-only formats, the VkAttachmentDescriptionStencilLayout structure is ignored. For stencil-only formats, the initial and final layouts of the stencil aspect are taken from the VkAttachmentDescriptionStencilLayout structure if present, or initialLayout and finalLayout if not present.

If format is a depth/stencil format, and either initialLayout or finalLayout does not specify a layout for the stencil aspect, then the application must specify the initial and final layouts of the stencil aspect by including a VkAttachmentDescriptionStencilLayout structure in the pNext chain.

loadOp and storeOp are ignored for fragment shading rate attachments. No access to the shading rate attachment is performed in loadOp and storeOp. Instead, access to VK_ACCESS_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR is performed as fragments are rasterized.

Valid Usage

• VUID-VkAttachmentDescription2-format-06699
  If format includes a color or depth component and loadOp is VK_ATTACHMENT_LOAD_OP_LOAD, then initialLayout must not be VK_IMAGE_LAYOUT_UNDEFINED

• VUID-VkAttachmentDescription2-finalLayout-00843
  finalLayout must not be VK_IMAGE_LAYOUT_UNDEFINED or VK_IMAGE_LAYOUT_PREINITIALIZED

• VUID-VkAttachmentDescription2-format-03280
  If format is a color format, initialLayout must not be VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription2-format-03281
  If format is a depth/stencil format, initialLayout must not be VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL

• VUID-VkAttachmentDescription2-format-03282
  If format is a color format, finalLayout must not be VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription2-format-03283
  If format is a depth/stencil format, finalLayout must not be VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL

• VUID-VkAttachmentDescription2-format-06487
  If format is a color format, initialLayout must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL or
If format is a color format, finalLayout must not be:
- VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

If the separateDepthStencilLayouts feature is not enabled, initialLayout must not be:
- VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL
- VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL
- VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

If format is a color format, initialLayout must not be:
- VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL
- VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL
- VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

If format is a depth/stencil format which includes both depth and stencil components, initialLayout must not be:
- VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL
- VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

If format is a depth/stencil format which includes both depth and stencil components, finalLayout must not be:
- VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL
- VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

If format is a depth/stencil format which includes only the depth component, initialLayout must not be:
- VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL
- VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

If format is a depth/stencil format which includes only the depth component, finalLayout must not be:
- VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL
- VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

If the synchronization2 feature is not enabled, initialLayout must not be:
- VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR
- VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR
• VUID-VkAttachmentDescription2-synchronization2-06909
  If the synchronization feature is not enabled, finalLayout must not be
  VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

• VUID-VkAttachmentDescription2-attachmentFeedbackLoopLayout-07309
  If the attachmentFeedbackLoopLayout feature is not enabled, initialLayout must not be
  VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT

• VUID-VkAttachmentDescription2-attachmentFeedbackLoopLayout-07310
  If the attachmentFeedbackLoopLayout feature is not enabled, finalLayout must not be
  VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT

• VUID-VkAttachmentDescription2-samples-08745
  samples must be a valid VkSampleCountFlagBits value that is set in
  imageCreateSampleCounts (as defined in Image Creation Limits) for the given format

• VUID-VkAttachmentDescription2-dynamicRenderingLocalRead-09544
  If the dynamicRenderingLocalRead feature is not enabled, initialLayout must not be
  VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR

• VUID-VkAttachmentDescription2-dynamicRenderingLocalRead-09545
  If the dynamicRenderingLocalRead feature is not enabled, finalLayout must not be
  VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR

• VUID-VkAttachmentDescription2-pNext-06704
  If the pNext chain does not include a VkAttachmentDescriptionStencilLayout structure,
  format includes a stencil component, and stencilLoadOp is VK_ATTACHMENT_LOAD_OP_LOAD,
  then initialLayout must not be VK_IMAGE_LAYOUT_UNDEFINED

• VUID-VkAttachmentDescription2-pNext-06705
  If the pNext chain includes a VkAttachmentDescriptionStencilLayout structure,
  format includes a stencil component, and stencilLoadOp is VK_ATTACHMENT_LOAD_OP_LOAD,
  then VkAttachmentDescriptionStencilLayout::stencilInitialLayout must not be
  VK_IMAGE_LAYOUT_UNDEFINED

• VUID-VkAttachmentDescription2-format-06249
  If format is a depth/stencil format which includes both depth and stencil components, and
  initialLayout is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or
  VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, the pNext chain must include a
  VkAttachmentDescriptionStencilLayout structure

• VUID-VkAttachmentDescription2-format-06250
  If format is a depth/stencil format which includes both depth and stencil components, and
  finalLayout is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or
  VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, the pNext chain must include a
  VkAttachmentDescriptionStencilLayout structure

• VUID-VkAttachmentDescription2-format-06247
  If the pNext chain does not include a VkAttachmentDescriptionStencilLayout structure and
  format only includes a stencil component, initialLayout must not be
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription2-format-06248
  If the pNext chain does not include a VkAttachmentDescriptionStencilLayout structure and
format only includes a stencil component, finalLayout must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL

- VUID-VkAttachmentDescription2-format-09332
  format must not be VK_FORMAT_UNDEFINED

Valid Usage (Implicit)

- VUID-VkAttachmentDescription2-sType-sType
  sType must be VK_STRUCTURE_TYPE_ATTACHMENT_DESCRIPTION_2

- VUID-VkAttachmentDescription2-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkAttachmentDescriptionStencilLayout

- VUID-VkAttachmentDescription2-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkAttachmentDescription2-flags-parameter
  flags must be a valid combination of VkAttachmentDescriptionFlagBits values

- VUID-VkAttachmentDescription2-format-parameter
  format must be a valid VkFormat value

- VUID-VkAttachmentDescription2-samples-parameter
  samples must be a valid VkSampleCountFlagBits value

- VUID-VkAttachmentDescription2-loadOp-parameter
  loadOp must be a valid VkAttachmentLoadOp value

- VUID-VkAttachmentDescription2-storeOp-parameter
  storeOp must be a valid VkAttachmentStoreOp value

- VUID-VkAttachmentDescription2-stencilLoadOp-parameter
  stencilLoadOp must be a valid VkAttachmentLoadOp value

- VUID-VkAttachmentDescription2-stencilStoreOp-parameter
  stencilStoreOp must be a valid VkAttachmentStoreOp value

- VUID-VkAttachmentDescription2-initialLayout-parameter
  initialLayout must be a valid VkImageLayout value

- VUID-VkAttachmentDescription2-finalLayout-parameter
  finalLayout must be a valid VkImageLayout value

The VkAttachmentDescriptionStencilLayout structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkAttachmentDescriptionStencilLayout {
    VkStructureType     sType;
    void*                pNext;
    VkImageLayout        stencilInitialLayout;
    VkImageLayout        stencilFinalLayout;
} VkAttachmentDescriptionStencilLayout;
```
or the equivalent

```c
// Provided by VK_KHR_separate_depth_stencil_layouts
typedef VkAttachmentDescriptionStencilLayout VkAttachmentDescriptionStencilLayoutKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stencilInitialLayout` is the layout the stencil aspect of the attachment image subresource will be in when a render pass instance begins.
- `stencilFinalLayout` is the layout the stencil aspect of the attachment image subresource will be transitioned to when a render pass instance ends.

### Valid Usage

- VUID-VkAttachmentDescriptionStencilLayout-stencilInitialLayout-03308
  
  `stencilInitialLayout` must not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`,  
  `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`,  
  `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`,  
  `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`,  
  `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`,  
  `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`,  
  `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`,  
  or

- VUID-VkAttachmentDescriptionStencilLayout-stencilFinalLayout-03309
  
  `stencilFinalLayout` must not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`,  
  `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`,  
  `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`,  
  `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`,  
  `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`,  
  `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`,  
  `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`,  
  or

- VUID-VkAttachmentDescriptionStencilLayout-stencilFinalLayout-03310
  
  `stencilFinalLayout` must not be `VK_IMAGE_LAYOUT_UNDEFINED` or
  `VK_IMAGE_LAYOUT_PREINITIALIZED`

### Valid Usage (Implicit)

- VUID-VkAttachmentDescriptionStencilLayout-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_ATTACHMENT_DESCRIPTION_STENCIL_LAYOUT`

- VUID-VkAttachmentDescriptionStencilLayout-stencilInitialLayout-parameter
  
  `stencilInitialLayout` must be a valid `VkImageLayout` value

- VUID-VkAttachmentDescriptionStencilLayout-stencilFinalLayout-parameter
  
  `stencilFinalLayout` must be a valid `VkImageLayout` value
The `VkSubpassDescription2` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkSubpassDescription2 {
    VkStructureType sType;
    const void* pNext;
    VkSubpassDescriptionFlags flags;
    VkPipelineBindPoint pipelineBindPoint;
    uint32_t viewMask;
    uint32_t inputAttachmentCount;
    const VkAttachmentReference2* pInputAttachments;
    uint32_t colorAttachmentCount;
    const VkAttachmentReference2* pColorAttachments;
    const VkAttachmentReference2* pResolveAttachments;
    const VkAttachmentReference2* pDepthStencilAttachment;
    uint32_t preserveAttachmentCount;
    const uint32_t* pPreserveAttachments;
} VkSubpassDescription2;
```

or the equivalent

```
// Provided by VK_KHR_create_renderpass2
typedef VkSubpassDescription2 VkSubpassDescription2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkSubpassDescriptionFlagBits` specifying usage of the subpass.
- `pipelineBindPoint` is a `VkPipelineBindPoint` value specifying the pipeline type supported for this subpass.
- `viewMask` is a bitfield of view indices describing which views rendering is broadcast to in this subpass, when multiview is enabled.
- `inputAttachmentCount` is the number of input attachments.
- `pInputAttachments` is a pointer to an array of `VkAttachmentReference2` structures defining the input attachments for this subpass and their layouts.
- `colorAttachmentCount` is the number of color attachments.
- `pColorAttachments` is a pointer to an array of `colorAttachmentCount` `VkAttachmentReference2` structures defining the color attachments for this subpass and their layouts.
- `pResolveAttachments` is `NULL` or a pointer to an array of `colorAttachmentCount` `VkAttachmentReference2` structures defining the resolve attachments for this subpass and their layouts.
- `pDepthStencilAttachment` is a pointer to a `VkAttachmentReference2` structure specifying the depth/stencil attachment for this subpass and its layout.
- `preserveAttachmentCount` is the number of preserved attachments.
• `pPreserveAttachments` is a pointer to an array of `preserveAttachmentCount` render pass attachment indices identifying attachments that are not used by this subpass, but whose contents must be preserved throughout the subpass.

Parameters defined by this structure with the same name as those in `VkSubpassDescription` have the identical effect to those parameters.

`viewMask` has the same effect for the described subpass as `VkRenderPassMultiviewCreateInfo::pViewMasks` has on each corresponding subpass.

If a `VkFragmentShadingRateAttachmentInfoKHR` structure is included in the `pNext` chain, `pFragmentShadingRateAttachment` is not `NULL`, and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, the identified attachment defines a fragment shading rate attachment for that subpass.

### Valid Usage

- **VUID-VkSubpassDescription2-attachment-06912**
  If the attachment member of an element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, its layout member must not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`.

- **VUID-VkSubpassDescription2-attachment-06913**
  If the attachment member of an element of `pColorAttachments` is not `VK_ATTACHMENT_UNUSED`, its layout member must not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`.

- **VUID-VkSubpassDescription2-attachment-06914**
  If the attachment member of an element of `pResolveAttachments` is not `VK_ATTACHMENT_UNUSED`, its layout member must not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`.

- **VUID-VkSubpassDescription2-attachment-06915**
  If the attachment member of `pDepthStencilAttachment` is not `VK_ATTACHMENT_UNUSED`, its layout member must not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`.

- **VUID-VkSubpassDescription2-attachment-06916**
  If the attachment member of an element of `pColorAttachments` is not `VK_ATTACHMENT_UNUSED`, its layout member must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`.

- **VUID-VkSubpassDescription2-attachment-06917**
  If the attachment member of an element of `pResolveAttachments` is not `VK_ATTACHMENT_UNUSED`, its layout member must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`.

- **VUID-VkSubpassDescription2-attachment-06918**
  If the attachment member of an element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, its layout member must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_ATTACHMENT_OPTIMAL`.
VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL

- VUID-VkSubpassDescription2-attachment-06919
  If the attachment member of an element of pColorAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL.

- VUID-VkSubpassDescription2-attachment-06920
  If the attachment member of an element of pResolveAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL.

- VUID-VkSubpassDescription2-attachment-06921
  If the attachment member of an element of pInputAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR.

- VUID-VkSubpassDescription2-attachment-06922
  If the attachment member of an element of pColorAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR.

- VUID-VkSubpassDescription2-attachment-06923
  If the attachment member of an element of pResolveAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR.

- VUID-VkSubpassDescription2-attachment-06251
  If the attachment member of pDepthStencilAttachment is not VK_ATTACHMENT_UNUSED and its pNext chain includes a VkAttachmentReferenceStencilLayout structure, the layout member of pDepthStencilAttachment must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL.

- VUID-VkSubpassDescription2-pipelineBindPoint-04953
  pipelineBindPoint must be VK_PIPELINE_BIND_POINT_GRAPHICS.

- VUID-VkSubpassDescription2-colorAttachmentCount-03063
  colorAttachmentCount must be less than or equal to VkPhysicalDeviceLimits::maxColorAttachments.

- VUID-VkSubpassDescription2-loadOp-03064
  If the first use of an attachment in this render pass is as an input attachment, and the attachment is not also used as a color or depth/stencil attachment in the same subpass, then loadOp must not be VK_ATTACHMENT_LOAD_OP_CLEAR.

- VUID-VkSubpassDescription2-pResolveAttachments-03065
  If pResolveAttachments is not NULL, for each resolve attachment that does not have the value VK_ATTACHMENT_UNUSED, the corresponding color attachment must not have the value VK_ATTACHMENT_UNUSED.

- VUID-VkSubpassDescription2-pResolveAttachments-03066
  If pResolveAttachments is not NULL, for each resolve attachment that is not
VK_ATTACHMENT_UNUSED, the corresponding color attachment must not have a sample count of VK_SAMPLE_COUNT_1_BIT

- VUID-VkSubpassDescription2-pResolveAttachments-03068
  Each element of pResolveAttachments must have the same VkFormat as its corresponding color attachment

- VUID-VkSubpassDescription2-pResolveAttachments-03067
  If pResolveAttachments is not NULL, each resolve attachment that is not VK_ATTACHMENT_UNUSED must have a sample count of VK_SAMPLE_COUNT_1_BIT

- VUID-VkSubpassDescription2-pInputAttachments-02897
  All attachments in pInputAttachments that are not VK_ATTACHMENT_UNUSED must have image formats whose potential format features contain at least VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT or VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkSubpassDescription2-pColorAttachments-02898
  All attachments in pColorAttachments that are not VK_ATTACHMENT_UNUSED must have image formats whose potential format features contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT

- VUID-VkSubpassDescription2-pResolveAttachments-02899
  All attachments in pResolveAttachments that are not VK_ATTACHMENT_UNUSED must have image formats whose potential format features contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT

- VUID-VkSubpassDescription2-pDepthStencilAttachment-02900
  If pDepthStencilAttachment is not NULL and the attachment is not VK_ATTACHMENT_UNUSED then it must have an image format whose potential format features contain VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkSubpassDescription2-multisampledRenderToSingleSampled-06872
  All attachments in pDepthStencilAttachment or pColorAttachments that are not VK_ATTACHMENT_UNUSED must have the same sample count

- VUID-VkSubpassDescription2-attachment-03073
  Each element of pPreserveAttachments must not be VK_ATTACHMENT_UNUSED

- VUID-VkSubpassDescription2-pPreserveAttachments-03074
  Each element of pPreserveAttachments must not also be an element of any other member of the subpass description

- VUID-VkSubpassDescription2-layout-02528
  If any attachment is used by more than one VkAttachmentReference2 member, then each use must use the same layout

- VUID-VkSubpassDescription2-attachment-02799
  If the attachment member of any element of pInputAttachments is not VK_ATTACHMENT_UNUSED, then the aspectMask member must be a valid combination of VkImageAspectFlagBits

- VUID-VkSubpassDescription2-attachment-02800
  If the attachment member of any element of pInputAttachments is not VK_ATTACHMENT_UNUSED, then the aspectMask member must not be 0

- VUID-VkSubpassDescription2-attachment-02801
If the attachment member of any element of pInputAttachments is not VK_ATTACHMENT_UNUSED, then the aspectMask member must not include VK_IMAGE_ASPECT_METADATA_BIT

• VUID-VkSubpassDescription2-pDepthStencilAttachment-04440
  An attachment must not be used in both pDepthStencilAttachment and pColorAttachments

• VUID-VkSubpassDescription2-multiview-06558
  If the multiview feature is not enabled, viewMask must be 0

• VUID-VkSubpassDescription2-viewMask-06706
  The index of the most significant bit in viewMask must be less than maxMultiviewViewCount

Valid Usage (Implicit)

• VUID-VkSubpassDescription2-sType-sType
  sType must be VK_STRUCTURE_TYPE_SUBPASS_DESCRIPTION_2

• VUID-VkSubpassDescription2-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkFragmentShadingRateAttachmentInfoKHR or VkSubpassDescriptionDepthStencilResolve

• VUID-VkSubpassDescription2-sType-unique
  The sType value of each struct in the pNext chain must be unique

• VUID-VkSubpassDescription2-flags-zerobitmask
  flags must be 0

• VUID-VkSubpassDescription2-pipelineBindPoint-parameter
  pipelineBindPoint must be a valid VkPipelineBindPoint value

• VUID-VkSubpassDescription2-pInputAttachments-parameter
  If inputAttachmentCount is not 0, pInputAttachments must be a valid pointer to an array of inputAttachmentCount valid VkAttachmentReference2 structures

• VUID-VkSubpassDescription2-pColorAttachments-parameter
  If colorAttachmentCount is not 0, pColorAttachments must be a valid pointer to an array of colorAttachmentCount valid VkAttachmentReference2 structures

• VUID-VkSubpassDescription2-pResolveAttachments-parameter
  If colorAttachmentCount is not 0, and pResolveAttachments is not NULL, pResolveAttachments must be a valid pointer to an array of colorAttachmentCount valid VkAttachmentReference2 structures

• VUID-VkSubpassDescription2-pDepthStencilAttachment-parameter
  If pDepthStencilAttachment is not NULL, pDepthStencilAttachment must be a valid pointer to a valid VkAttachmentReference2 structure

• VUID-VkSubpassDescription2-pPreserveAttachments-parameter
  If preserveAttachmentCount is not 0, pPreserveAttachments must be a valid pointer to an array of preserveAttachmentCount uint32_t values

The VkSubpassDescriptionDepthStencilResolve structure is defined as:
// Provided by VK_VERSION_1_2

typedef struct VkSubpassDescriptionDepthStencilResolve {
    VkStructureType sType;
    const void* pNext;
    VkResolveModeFlagBits depthResolveMode;
    VkResolveModeFlagBits stencilResolveMode;
    const VkAttachmentReference2* pDepthStencilResolveAttachment;
} VkSubpassDescriptionDepthStencilResolve;

or the equivalent

// Provided by VK_KHR_depth_stencil_resolve
typedef VkSubpassDescriptionDepthStencilResolve
VkSubpassDescriptionDepthStencilResolveKHR;

• **sType** is a *VkStructureType* value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **depthResolveMode** is a *VkResolveModeFlagBits* value describing the depth resolve mode.
• **stencilResolveMode** is a *VkResolveModeFlagBits* value describing the stencil resolve mode.
• **pDepthStencilResolveAttachment** is NULL or a pointer to a *VkAttachmentReference2* structure defining the depth/stencil resolve attachment for this subpass and its layout.

If the **pNext** chain of *VkSubpassDescription2* includes a *VkSubpassDescriptionDepthStencilResolve* structure, then that structure describes multisample resolve operations for the depth/stencil attachment in a subpass. If this structure is not included in the **pNext** chain of *VkSubpassDescription2*, or if it is and either **pDepthStencilResolveAttachment** is NULL or its attachment index is VK_ATTACHMENT_UNUSED, it indicates that no depth/stencil resolve attachment will be used in the subpass.

### Valid Usage

• **VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03177**
  If **pDepthStencilResolveAttachment** is not NULL and does not have the value VK_ATTACHMENT_UNUSED, **pDepthStencilAttachment** must not be NULL or have the value VK_ATTACHMENT_UNUSED

• **VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03179**
  If **pDepthStencilResolveAttachment** is not NULL and does not have the value VK_ATTACHMENT_UNUSED, **pDepthStencilAttachment** must not have a sample count of VK_SAMPLE_COUNT_1_BIT

• **VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03180**
  If **pDepthStencilResolveAttachment** is not NULL and does not have the value VK_ATTACHMENT_UNUSED, **pDepthStencilResolveAttachment** must have a sample count of VK_SAMPLE_COUNT_1_BIT
If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED` then it **must** have an image format whose **potential format features** contain `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`

If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED` and `VkFormat` of `pDepthStencilResolveAttachment` has a depth component, then the `VkFormat` of `pDepthStencilAttachment` **must** have a depth component with the same number of bits and **numeric format**

If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, and `VkFormat` of `pDepthStencilResolveAttachment` has a stencil component, then the `VkFormat` of `pDepthStencilAttachment` **must** have a stencil component with the same number of bits and **numeric format**

If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, depthResolveMode and stencilResolveMode **must** not both be `VK_RESOLVE_MODE_NONE`

If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED` and the `VkFormat` of `pDepthStencilResolveAttachment` has a depth component, then the value of `depthResolveMode` **must** be one of the bits set in `VkPhysicalDeviceDepthStencilResolveProperties::supportedDepthResolveModes` or `VK_RESOLVE_MODE_NONE`

If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, and `VkFormat` of `pDepthStencilResolveAttachment` has a stencil component, then the value of `stencilResolveMode` **must** be one of the bits set in `VkPhysicalDeviceDepthStencilResolveProperties::supportedStencilResolveModes` or `VK_RESOLVE_MODE_NONE`

If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, the `VkFormat` of `pDepthStencilResolveAttachment` has both depth and stencil components, `VkPhysicalDeviceDepthStencilResolveProperties::independentResolve` is `VK_FALSE`, and `VkPhysicalDeviceDepthStencilResolveProperties::independentResolveNone` is `VK_FALSE`, then the values of `depthResolveMode` and `stencilResolveMode` **must** be identical

If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, the `VkFormat` of `pDepthStencilResolveAttachment` has both depth and stencil components, `VkPhysicalDeviceDepthStencilResolveProperties::independentResolve` is `VK_FALSE` and `VkPhysicalDeviceDepthStencilResolveProperties::independentResolveNone` is `VK_TRUE`, then the values of `depthResolveMode` and `stencilResolveMode` **must** be identical or one of them **must** be `VK_RESOLVE_MODE_NONE`
Valid Usage (Implicit)

- VUID-VkSubpassDescriptionDepthStencilResolve-sType-sType
  sType must be VK_STRUCTURE_TYPE_SUBPASS_DESCRIPTION_DEPTH_STENCIL_RESOLVE

- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-parameter
  If pDepthStencilResolveAttachment is not NULL, pDepthStencilResolveAttachment must be a valid pointer to a valid VkAttachmentReference2 structure

The VkFragmentShadingRateAttachmentInfoKHR structure is defined as:

```c
// Provided by VK_KHR_fragment_shading_rate
typedef struct VkFragmentShadingRateAttachmentInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const VkAttachmentReference2* pFragmentShadingRateAttachment;
    VkExtent2D shadingRateAttachmentTexelSize;
} VkFragmentShadingRateAttachmentInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- pFragmentShadingRateAttachment is NULL or a pointer to a VkAttachmentReference2 structure defining the fragment shading rate attachment for this subpass.
- shadingRateAttachmentTexelSize specifies the size of the portion of the framebuffer corresponding to each texel in pFragmentShadingRateAttachment.

If no shading rate attachment is specified, or if this structure is not specified, the implementation behaves as if a valid shading rate attachment was specified with all texels specifying a single pixel per fragment.

Valid Usage

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04524
  If pFragmentShadingRateAttachment is not NULL and its attachment member is not VK_ATTACHMENT_UNUSED, its layout member must be equal to VK_IMAGE_LAYOUT_GENERAL or VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04525
  If pFragmentShadingRateAttachment is not NULL and its attachment member is not VK_ATTACHMENT_UNUSED, shadingRateAttachmentTexelSize.width must be a power of two value

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04526
If `pFragmentShadingRateAttachment` is not NULL and its attachment member is not VK_ATTACHMENT_UNUSED, `shadingRateAttachmentTexelSize.width` must be less than or equal to `maxFragmentShadingRateAttachmentTexelSize.width`

- `VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04527`
  If `pFragmentShadingRateAttachment` is not NULL and its attachment member is not VK_ATTACHMENT_UNUSED, `shadingRateAttachmentTexelSize.width` must be greater than or equal to `minFragmentShadingRateAttachmentTexelSize.width`

- `VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04528`
  If `pFragmentShadingRateAttachment` is not NULL and its attachment member is not VK_ATTACHMENT_UNUSED, `shadingRateAttachmentTexelSize.height` must be a power of two value

- `VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04529`
  If `pFragmentShadingRateAttachment` is not NULL and its attachment member is not VK_ATTACHMENT_UNUSED, `shadingRateAttachmentTexelSize.height` must be less than or equal to `maxFragmentShadingRateAttachmentTexelSize.height`

- `VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04530`
  If `pFragmentShadingRateAttachment` is not NULL and its attachment member is not VK_ATTACHMENT_UNUSED, `shadingRateAttachmentTexelSize.height` must be greater than or equal to `minFragmentShadingRateAttachmentTexelSize.height`

- `VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04531`
  If `pFragmentShadingRateAttachment` is not NULL and its attachment member is not VK_ATTACHMENT_UNUSED, the quotient of `shadingRateAttachmentTexelSize.width` and `shadingRateAttachmentTexelSize.height` must be less than or equal to `maxFragmentShadingRateAttachmentTexelSizeAspectRatio`

- `VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04532`
  If `pFragmentShadingRateAttachment` is not NULL and its attachment member is not VK_ATTACHMENT_UNUSED, the quotient of `shadingRateAttachmentTexelSize.height` and `shadingRateAttachmentTexelSize.width` must be less than or equal to `maxFragmentShadingRateAttachmentTexelSizeAspectRatio`

**Valid Usage (Implicit)**

- `VUID-VkFragmentShadingRateAttachmentInfoKHR-sType-sType`
  `sType` must be `VK_STRUCTURE_TYPE_FRAGMENT_SHADING_RATE_ATTACHMENT_INFO_KHR`

- `VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-parameter`
  If `pFragmentShadingRateAttachment` is not NULL, `pFragmentShadingRateAttachment` must be a valid pointer to a valid `VkAttachmentReference2` structure
The `VkAttachmentReference2` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkAttachmentReference2 {
    VkStructureType sType;
    const void* pNext;
    uint32_t attachment;
    VkImageLayout layout;
    VkImageAspectFlags aspectMask;
} VkAttachmentReference2;
```

or the equivalent

```c
// Provided by VK_KHR_create_renderpass2
typedef VkAttachmentReference2 VkAttachmentReference2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `attachment` is either an integer value identifying an attachment at the corresponding index in `VkRenderPassCreateInfo2::pAttachments`, or `VK_ATTACHMENT_UNUSED` to signify that this attachment is not used.
- `layout` is a `VkImageLayout` value specifying the layout the attachment uses during the subpass.
- `aspectMask` is a mask of which aspect(s) can be accessed within the specified subpass as an input attachment.

Parameters defined by this structure with the same name as those in `VkAttachmentReference` have the identical effect to those parameters.

`aspectMask` is ignored when this structure is used to describe anything other than an input attachment reference.

If the `separateDepthStencilLayouts` feature is enabled, and `attachment` has a depth/stencil format, `layout` can be set to a layout that only specifies the layout of the depth aspect.

If `layout` only specifies the layout of the depth aspect of the attachment, the layout of the stencil aspect is specified by the `stencilLayout` member of a `VkAttachmentReferenceStencilLayout` structure included in the `pNext` chain. Otherwise, `layout` describes the layout for all relevant image aspects.

**Valid Usage**

- VUID-VkAttachmentReference2-layout-03077
  If `attachment` is not `VK_ATTACHMENT_UNUSED`, `layout` must not be `VK_IMAGE_LAYOUT_UNDEFINED`, `VK_IMAGE_LAYOUT_PREINITIALIZED`, or `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`

- VUID-VkAttachmentReference2-separateDepthStencilLayouts-03313
If the `separateDepthStencilLayouts` feature is not enabled, and `attachment` is not `VK_ATTACHMENT_UNUSED`, layout must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`.

- **VUID-VkAttachmentReference2-synchronization2-06910**
  If the `synchronization2` feature is not enabled, layout must not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`.

- **VUID-VkAttachmentReference2-attachmentFeedbackLoopLayout-07311**
  If the `attachmentFeedbackLoopLayout` feature is not enabled, layout must not be `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT`.

- **VUID-VkAttachmentReference2-dynamicRenderingLocalRead-09546**
  If the `dynamicRenderingLocalRead` feature is not enabled, layout must not be `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR`.

**Valid Usage (Implicit)**

- **VUID-VkAttachmentReference2-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_ATTACHMENT_REFERENCE_2`.

- **VUID-VkAttachmentReference2-pNext-pNext**
  `pNext` must be `NULL` or a pointer to a valid instance of `VkAttachmentReferenceStencilLayout`.

- **VUID-VkAttachmentReference2-sType-unique**
  The `sType` value of each struct in the `pNext` chain must be unique.

- **VUID-VkAttachmentReference2-layout-parameter**
  Layout must be a valid `VkImageLayout` value.

The `VkAttachmentReferenceStencilLayout` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkAttachmentReferenceStencilLayout {
    VkStructureType sType;
    void* pNext;
    VkImageLayout stencilLayout;
} VkAttachmentReferenceStencilLayout;
```

or the equivalent

```c
// Provided by VK_KHR_separate_depth_stencil_layouts
typedef VkAttachmentReferenceStencilLayout VkAttachmentReferenceStencilLayoutKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
• **stencilLayout** is a **VkImageLayout** value specifying the layout the stencil aspect of the attachment uses during the subpass.

### Valid Usage

- VUID-VkAttachmentReferenceStencilLayout-stencilLayout-03318
  
  stencilLayout **must** not be **VK_IMAGE_LAYOUT_UNDEFINED**, **VK_IMAGE_LAYOUT_PREINITIALIZED**, **VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL**, **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL**, **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL**, **VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL**, **VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL**, **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL**, **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL**, or **VK_IMAGE_LAYOUT_PRESENT_SRC_KHR**

### Valid Usage (Implicit)

- VUID-VkAttachmentReferenceStencilLayout-sType-sType
  
  sType **must** be **VK_STRUCTURE_TYPE_ATTACHMENT_REFERENCE_STENCIL_LAYOUT**

- VUID-VkAttachmentReferenceStencilLayout-stencilLayout-parameter
  
  stencilLayout **must** be a valid **VkImageLayout** value

The **VkSubpassDependency2** structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkSubpassDependency2 {
    VkStructureType sType;
    const void* pNext;
    uint32_t srcSubpass;
    uint32_t dstSubpass;
    VkPipelineStageFlags srcStageMask;
    VkPipelineStageFlags dstStageMask;
    VkAccessFlags srcAccessMask;
    VkAccessFlags dstAccessMask;
    VkDependencyFlags dependencyFlags;
    int32_t viewOffset;
} VkSubpassDependency2;
```

or the equivalent

```c
// Provided by VK_KHR_create_renderpass2
typedef VkSubpassDependency2 VkSubpassDependency2KHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `srcSubpass` is the subpass index of the first subpass in the dependency, or `VK_SUBPASS_EXTERNAL`.
- `dstSubpass` is the subpass index of the second subpass in the dependency, or `VK_SUBPASS_EXTERNAL`.
- `srcStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the source stage mask.
- `dstStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the destination stage mask.
- `srcAccessMask` is a bitmask of `VkAccessFlagBits` specifying a source access mask.
- `dstAccessMask` is a bitmask of `VkAccessFlagBits` specifying a destination access mask.
- `dependencyFlags` is a bitmask of `VkDependencyFlagBits`.
- `viewOffset` controls which views in the source subpass the views in the destination subpass depend on.

Parameters defined by this structure with the same name as those in `VkSubpassDependency` have the identical effect to those parameters.

`viewOffset` has the same effect for the described subpass dependency as `VkRenderPassMultiviewCreateInfo::pViewOffsets` has on each corresponding subpass dependency.

If a `VkMemoryBarrier2` is included in the `pNext` chain, `srcStageMask`, `dstStageMask`, `srcAccessMask`, and `dstAccessMask` parameters are ignored. The synchronization and access scopes instead are defined by the parameters of `VkMemoryBarrier2`.

### Valid Usage

- **VUID-VkSubpassDependency2-srcStageMask-04090**
  If the `geometryShader` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`.

- **VUID-VkSubpassDependency2-srcStageMask-04091**
  If the `tessellationShader` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`.

- **VUID-VkSubpassDependency2-srcStageMask-07319**
  If the `attachmentFragmentShadingRate` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- **VUID-VkSubpassDependency2-srcStageMask-03937**
  If the `synchronization2` feature is not enabled, `srcStageMask` must not be 0.

- **VUID-VkSubpassDependency2-srcStageMask-07950**
  If the `rayTracingPipeline` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`.

- **VUID-VkSubpassDependency2-dstStageMask-04090**
  If the `geometryShader` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`.
If the `tessellationShader` feature is not enabled, `dstStageMask` must not contain
`VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or
`VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`

If the `attachmentFragmentShadingRate` feature is not enabled, `dstStageMask` must not contain
`VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

If the `synchronization2` feature is not enabled, `dstStageMask` must not be
0

If the `rayTracingPipeline` feature is not enabled, `dstStageMask` must not contain
`VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`

`srcSubpass` must be less than or equal to `dstSubpass`, unless one of them is
`VK_SUBPASS_EXTERNAL`, to avoid cyclic dependencies and ensure a valid execution order

`srcSubpass` and `dstSubpass` must not both be equal to `VK_SUBPASS_EXTERNAL`

If `srcSubpass` is equal to `dstSubpass` and `srcStageMask` includes a `framebuffer-space stage`,
`dstStageMask` must only contain `framebuffer-space stages`

Any access flag included in `srcAccessMask` must be supported by one of the pipeline stages in
`srcStageMask`, as specified in the table of supported access types

Any access flag included in `dstAccessMask` must be supported by one of the pipeline stages in
`dstStageMask`, as specified in the table of supported access types

If `dependencyFlags` includes `VK_DEPENDENCY_VIEW_LOCAL_BIT`, `srcSubpass` must not be equal to
`VK_SUBPASS_EXTERNAL`

If `dependencyFlags` includes `VK_DEPENDENCY_VIEW_LOCAL_BIT`, `dstSubpass` must not be equal to
`VK_SUBPASS_EXTERNAL`

If `srcSubpass` equals `dstSubpass`, and `srcStageMask` and `dstStageMask` both include a
`framebuffer-space stage`, then `dependencyFlags` must include `VK_DEPENDENCY_BY_REGION_BIT`

If `viewOffset` is not equal to 0, `srcSubpass` must not be equal to `dstSubpass`

If `dependencyFlags` does not include `VK_DEPENDENCY_VIEW_LOCAL_BIT`, `viewOffset` must be 0
Valid Usage (Implicit)

- VUID-VkSubpassDependency2-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_SUBPASS_DEPENDENCY_2

- VUID-VkSubpassDependency2-pNext-pNext
  
  pNext must be NULL or a pointer to a valid instance of VkMemoryBarrier2

- VUID-VkSubpassDependency2-sType-unique
  
  The sType value of each struct in the pNext chain must be unique

- VUID-VkSubpassDependency2-srcStageMask-parameter
  
  srcStageMask must be a valid combination of VkPipelineStageFlagBits values

- VUID-VkSubpassDependency2-dstStageMask-parameter
  
  dstStageMask must be a valid combination of VkPipelineStageFlagBits values

- VUID-VkSubpassDependency2-srcAccessMask-parameter
  
  srcAccessMask must be a valid combination of VkAccessFlagBits values

- VUID-VkSubpassDependency2-dstAccessMask-parameter
  
  dstAccessMask must be a valid combination of VkAccessFlagBits values

- VUID-VkSubpassDependency2-dependencyFlags-parameter
  
  dependencyFlags must be a valid combination of VkDependencyFlagBits values

To destroy a render pass, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyRenderPass(
    VkDevice
    VkRenderPass
    const VkAllocationCallbacks*
);
```

- device is the logical device that destroys the render pass.
- renderPass is the handle of the render pass to destroy.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyRenderPass-renderPass-00873
  
  All submitted commands that refer to renderPass must have completed execution

- VUID-vkDestroyRenderPass-renderPass-00874
  
  If VkAllocationCallbacks were provided when renderPass was created, a compatible set of callbacks must be provided here.

- VUID-vkDestroyRenderPass-renderPass-00875
  
  If no VkAllocationCallbacks were provided when renderPass was created, pAllocator must be NULL.
8.3. Render Pass Compatibility

Framebuffers and graphics pipelines are created based on a specific render pass object. They must only be used with that render pass object, or one compatible with it.

Two attachment references are compatible if they have matching format and sample count, or are both `VK_ATTACHMENT_UNUSED` or the pointer that would contain the reference is `NULL`.

Two arrays of attachment references are compatible if all corresponding pairs of attachments are compatible. If the arrays are of different lengths, attachment references not present in the smaller array are treated as `VK_ATTACHMENT_UNUSED`.

Two render passes are compatible if their corresponding color, input, resolve, and depth/stencil attachment references are compatible and if they are otherwise identical except for:

- Initial and final image layout in attachment descriptions
- Load and store operations in attachment descriptions
- Image layout in attachment references

As an additional special case, if two render passes have a single subpass, the resolve attachment reference and depth/stencil resolve mode compatibility requirements are ignored.

A framebuffer is compatible with a render pass if it was created using the same render pass or a compatible render pass.
8.4. Framebuffers

Render passes operate in conjunction with framebuffers. Framebuffers represent a collection of specific memory attachments that a render pass instance uses.

Framebuffers are represented by VkFramebuffer handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkFramebuffer)
```

To create a framebuffer, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateFramebuffer(
    VkDevice device,
    const VkFramebufferCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkFramebuffer* pFramebuffer);
```

- `device` is the logical device that creates the framebuffer.
- `pCreateInfo` is a pointer to a VkFramebufferCreateInfo structure describing additional information about framebuffer creation.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pFramebuffer` is a pointer to a VkFramebuffer handle in which the resulting framebuffer object is returned.

### Valid Usage

- VUID-vkCreateFramebuffer-pCreateInfo-02777
  If `pCreateInfo->flags` does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, and `attachmentCount` is not 0, each element of `pCreateInfo->pAttachments` must have been created on `device`.

### Valid Usage (Implicit)

- VUID-vkCreateFramebuffer-device-parameter
  `device` must be a valid VkDevice handle
- VUID-vkCreateFramebuffer-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid VkFramebufferCreateInfo structure
- VUID-vkCreateFramebuffer-pAllocator-parameter
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateFramebuffer-pFramebuffer-parameter
**pFramebuffer** must be a valid pointer to a **VkFramebuffer** handle

---

### Return Codes

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

The **VkFramebufferCreateInfo** structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkFramebufferCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkFramebufferCreateFlags flags;
    VkRenderPass renderPass;
    uint32_t attachmentCount;
    const VkImageView* pAttachments;
    uint32_t width;
    uint32_t height;
    uint32_t layers;
} VkFramebufferCreateInfo;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is a bitmask of **VkFramebufferCreateFlagBits**
- **renderPass** is a render pass defining what render passes the framebuffer will be compatible with. See **Render Pass Compatibility** for details.
- **attachmentCount** is the number of attachments.
- **pAttachments** is a pointer to an array of **VkImageView** handles, each of which will be used as the corresponding attachment in a render pass instance. If **flags** includes **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, this parameter is ignored.
- **width**, **height** and **layers** define the dimensions of the framebuffer. If the render pass uses multiview, then **layers** must be one and each attachment requires a number of layers that is greater than the maximum bit index set in the view mask in the subpasses in which it is used.

It is legal for a subpass to use no color or depth/stencil attachments, either because it has no attachment references or because all of them are **VK_ATTACHMENT_UNUSED**. This kind of subpass can use shader side effects such as image stores and atomics to produce an output. In this case, the subpass continues to use the **width**, **height**, and **layers** of the framebuffer to define the dimensions of the rendering area, and the **rasterizationSamples** from each pipeline's
VkPipelineMultisampleStateCreateInfo to define the number of samples used in rasterization; however, if VkPhysicalDeviceFeatures::variableMultisampleRate is VK_FALSE, then all pipelines to be bound with the subpass must have the same value for VkPipelineMultisampleStateCreateInfo::rasterizationSamples. In all such cases, rasterizationSamples must be a valid VkSampleCountFlagBits value that is set in VkPhysicalDeviceLimits::framebufferNoAttachmentsSampleCounts.

Valid Usage

- **VUID-VkFramebufferCreateInfo-attachmentCount-00876**
  attachmentCount must be equal to the attachment count specified in renderPass

- **VUID-VkFramebufferCreateInfo-flags-02778**
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT and attachmentCount is not 0, pAttachments must be a valid pointer to an array of attachmentCount valid VkImageView handles

- **VUID-VkFramebufferCreateInfo-pAttachments-00877**
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments that is used as a color attachment or resolve attachment by renderPass must have been created with a usage value including VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT

- **VUID-VkFramebufferCreateInfo-pAttachments-02633**
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments that is used as a depth/stencil attachment by renderPass must have been created with a usage value including VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- **VUID-VkFramebufferCreateInfo-pAttachments-02634**
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments that is used as a depth/stencil resolve attachment by renderPass must have been created with a usage value including VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- **VUID-VkFramebufferCreateInfo-pAttachments-00879**
  If renderpass is not VK_NULL_HANDLE, flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments that is used as an input attachment by renderPass must have been created with a usage value including VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

- **VUID-VkFramebufferCreateInfo-pAttachments-00880**
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments must have been created with a VkFormat value that matches the VkFormat specified by the corresponding VkAttachmentDescription in renderPass

- **VUID-VkFramebufferCreateInfo-pAttachments-00881**
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments must have been created with a samples value that matches the samples value specified by the corresponding VkAttachmentDescription in renderPass

- **VUID-VkFramebufferCreateInfo-flags-04533**
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments that is used as an input, color, resolve, or depth/stencil attachment by renderPass must have been created with a VkImageCreateInfo::extent.width greater than
• VUID-VkFramebufferCreateInfo-flags-04534
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments that is used as an input, color, resolve, or depth/stencil attachment by renderPass must have been created with a VkImageCreateInfo::extent.height greater than or equal to height.

• VUID-VkFramebufferCreateInfo-flags-04535
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments that is used as an input, color, resolve, or depth/stencil attachment by renderPass must have been created with a VkImageViewCreateInfo::subresourceRange.layerCount greater than or equal to layers.

• VUID-VkFramebufferCreateInfo-renderPass-04536
  If renderPass was specified with non-zero view masks, each element of pAttachments that is used as an input, color, resolve, or depth/stencil attachment by renderPass must have a layerCount greater than the index of the most significant bit set in any of those view masks.

• VUID-VkFramebufferCreateInfo-flags-04537
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, and renderPass was specified with non-zero view masks, each element of pAttachments that is used as a fragment shading rate attachment by renderPass must have a layerCount that is either 1, or greater than the index of the most significant bit set in any of those view masks.

• VUID-VkFramebufferCreateInfo-flags-04538
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, and renderPass was not specified with non-zero view masks, each element of pAttachments that is used as a fragment shading rate attachment by renderPass must have a layerCount that is either 1, or greater than layers.

• VUID-VkFramebufferCreateInfo-renderPass-08921
  If renderPass was specified with non-zero view masks, each element of pAttachments that is used as a fragment shading rate attachment must have a layerCount equal to 1 or greater than the index of the most significant bit set in any of those view masks.

• VUID-VkFramebufferCreateInfo-flags-04539
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, an element of pAttachments that is used as a fragment shading rate attachment must have a width at least as large as ⌈width / texelWidth⌉, where texelWidth is the largest value of shadingRateAttachmentTexelSize.width in a VkFragmentShadingRateAttachmentInfoKHR which references that attachment.

• VUID-VkFramebufferCreateInfo-flags-04540
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, an element of pAttachments that is used as a fragment shading rate attachment must have a height at least as large as ⌈height / texelHeight⌉, where texelHeight is the largest value of shadingRateAttachmentTexelSize.height in a VkFragmentShadingRateAttachmentInfoKHR which references that attachment.

• VUID-VkFramebufferCreateInfo-pAttachments-00883
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments must only specify a single mip level.
If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments must have been created with the identity swizzle.

- VUID-VkFramebufferCreateInfo-width-00885
  width must be greater than 0

- VUID-VkFramebufferCreateInfo-height-00887
  height must be greater than 0

- VUID-VkFramebufferCreateInfo-layers-00889
  layers must be greater than 0

- VUID-VkFramebufferCreateInfo-layers-00890
  layers must be less than or equal to maxFramebufferLayers

- VUID-VkFramebufferCreateInfo-renderPass-02531
  If renderPass was specified with non-zero view masks, layers must be 1

- VUID-VkFramebufferCreateInfo-flags-03189
  If the imagelessFramebuffer feature is not enabled, flags must not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT

- VUID-VkFramebufferCreateInfo-flags-03190
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the pNext chain must include a VkFramebufferAttachmentsCreateInfo structure

- VUID-VkFramebufferCreateInfo-flags-03191
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the attachmentImageInfoCount member of a VkFramebufferAttachmentsCreateInfo structure in the pNext chain must be equal to either zero or attachmentCount

- VUID-VkFramebufferCreateInfo-flags-04541
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the width member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure in the pNext chain that is used as an input, color, resolve or depth/stencil attachment in renderPass must be greater than or equal to width

- VUID-VkFramebufferCreateInfo-flags-04542
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the height member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure in the pNext chain that is used as an input, color, resolve or depth/stencil attachment in renderPass must be greater than or equal to height
If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the width member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure in the pNext chain that is used as a fragment shading rate attachment must be greater than or equal to ⌈width / texelWidth⌉, where texelWidth is the largest value of shadingRateAttachmentTexelSize.width in a VkFragmentShadingRateAttachmentInfoKHR which references that attachment

• VUID-VkFramebufferCreateInfo-flags-04544
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the height member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure in the pNext chain that is used as a fragment shading rate attachment must be greater than or equal to ⌈height / texelHeight⌉, where texelHeight is the largest value of shadingRateAttachmentTexelSize.height in a VkFragmentShadingRateAttachmentInfoKHR which references that attachment

• VUID-VkFramebufferCreateInfo-flags-04545
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the layerCount member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure in the pNext chain that is used as a fragment shading rate attachment must be either 1, or greater than or equal to layers

• VUID-VkFramebufferCreateInfo-flags-04587
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT and renderPass was specified with non-zero view masks, each element of pAttachments that is used as a fragment shading rate attachment by renderPass must have a layerCount that is either 1, or greater than the index of the most significant bit set in any of those view masks

• VUID-VkFramebufferCreateInfo-renderPass-03198
  If multiview is enabled for renderPass and flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the layerCount member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure included in the pNext chain used as an input, color, resolve, or depth/stencil attachment in renderPass must be greater than the maximum bit index set in the view mask in the subpasses in which it is used in renderPass

• VUID-VkFramebufferCreateInfo-renderPass-04546
  If multiview is not enabled for renderPass and flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the layerCount member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure included in the pNext chain used as an input, color, resolve, or depth/stencil attachment in renderPass must be greater than or equal to layers

• VUID-VkFramebufferCreateInfo-flags-03201
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the usage member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure included in the pNext chain that refers to an attachment used as a color attachment or resolve attachment by renderPass must include VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT

• VUID-VkFramebufferCreateInfo-flags-03202
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the usage member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure included in the pNext chain that refers to an attachment used as a depth/stencil attachment by renderPass must include VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT
structure included in the `pNext` chain that refers to an attachment used as a depth/stencil attachment by `renderPass` must include `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

- **VUID-VkFramebufferCreateInfo-flags-03203**
  If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `usage` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain that refers to an attachment used as a depth/stencil resolve attachment by `renderPass` must include `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

- **VUID-VkFramebufferCreateInfo-flags-03204**
  If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `usage` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain that refers to an attachment used as an input attachment by `renderPass` must include `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`.

- **VUID-VkFramebufferCreateInfo-flags-03205**
  If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, at least one element of the `pViewFormats` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain must be equal to the corresponding value of `VkAttachmentDescription::format` used to create `renderPass`.

- **VUID-VkFramebufferCreateInfo-flags-04113**
  If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` must have been created with `VkImageViewCreateInfo::viewType` not equal to `VK_IMAGE_VIEW_TYPE_3D`.

- **VUID-VkFramebufferCreateInfo-flags-04548**
  If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` that is used as a fragment shading rate attachment by `renderPass` must have been created with a `usage` value including `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- **VUID-VkFramebufferCreateInfo-flags-04549**
  If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `usage` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain that refers to an attachment used as a fragment shading rate attachment by `renderPass` must include `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

### Valid Usage (Implicit)

- **VUID-VkFramebufferCreateInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_FRAMEBUFFER_CREATE_INFO`.

- **VUID-VkFramebufferCreateInfo-pNext-pNext**
  `pNext` must be `NULL` or a pointer to a valid instance of `VkFramebufferAttachmentsCreateInfo`.

- **VUID-VkFramebufferCreateInfo-sType-unique**
The `sType` value of each struct in the `pNext` chain must be unique

- VUID-VkFramebufferCreateInfo-flags-parameter
  `flags` must be a valid combination of `VkFramebufferCreateFlagBits` values

- VUID-VkFramebufferCreateInfo-renderPass-parameter
  `renderPass` must be a valid `VkRenderPass` handle

- VUID-VkFramebufferCreateInfo-commonparent
  Both of `renderPass`, and the elements of `pAttachments` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

The `VkFramebufferAttachmentsCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkFramebufferAttachmentsCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t attachmentImageInfoCount;
    const VkFramebufferAttachmentImageInfo* pAttachmentImageInfos;
} VkFramebufferAttachmentsCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_imageless_framebuffer
typedef VkFramebufferAttachmentsCreateInfo VkFramebufferAttachmentsCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `attachmentImageInfoCount` is the number of attachments being described.
- `pAttachmentImageInfos` is a pointer to an array of `VkFramebufferAttachmentImageInfo` structures, each structure describing a number of parameters of the corresponding attachment in a render pass instance.

**Valid Usage (Implicit)**

- VUID-VkFramebufferAttachmentsCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_FRAMEBUFFER_ATTACHMENTS_CREATE_INFO`

- VUID-VkFramebufferAttachmentsCreateInfo-pAttachmentImageInfos-parameter
  If `attachmentImageInfoCount` is not `0`, `pAttachmentImageInfos` must be a valid pointer to an array of `attachmentImageInfoCount` valid `VkFramebufferAttachmentImageInfo` structures

The `VkFramebufferAttachmentImageInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
```
```c
typedef struct VkFramebufferAttachmentImageInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkImageCreateFlags flags;
    VkImageUsageFlags  usage;
    uint32_t            width;
    uint32_t            height;
    uint32_t            layerCount;
    uint32_t            viewFormatCount;
    const VkFormat*     pViewFormats;
} VkFramebufferAttachmentImageInfo;
```

or the equivalent

```c
// Provided by VK_KHR_imageless_framebuffer
typedef VkFramebufferAttachmentImageInfo VkFramebufferAttachmentImageInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is a bitmask of `VkImageCreateFlagBits`, matching the value of `VkImageCreateInfo::flags` used to create an image that will be used with this framebuffer.
- **usage** is a bitmask of `VkImageUsageFlagBits`, matching the value of `VkImageCreateInfo::usage` used to create an image used with this framebuffer.
- **width** is the width of the image view used for rendering.
- **height** is the height of the image view used for rendering.
- **layerCount** is the number of array layers of the image view used for rendering.
- **viewFormatCount** is the number of entries in the `pViewFormats` array, matching the value of `VkImageFormatListCreateInfo::viewFormatCount` used to create an image used with this framebuffer.
- **pViewFormats** is a pointer to an array of `VkFormat` values specifying all of the formats which can be used when creating views of the image, matching the value of `VkImageFormatListCreateInfo::pViewFormats` used to create an image used with this framebuffer.

Images that can be used with the framebuffer when beginning a render pass, as specified by `VkRenderPassAttachmentBeginInfo`, must be created with parameters that are identical to those specified here.

### Valid Usage

- **VUID-VkFramebufferAttachmentImageInfo-viewFormatCount-09536**

  If `viewFormatCount` is not 0, each element of `pViewFormats` must not be `VK_FORMAT_UNDEFINED`
Valid Usage (Implicit)

- **VUID-VkFramebufferAttachmentImageInfo-sType**
  sType must be `VK_STRUCTURE_TYPE_FRAMEBUFFER_ATTACHMENT_IMAGE_INFO`

- **VUID-VkFramebufferAttachmentImageInfo-pNext**
  pNext must be `NULL`

- **VUID-VkFramebufferAttachmentImageInfo-flags**
  flags must be a valid combination of `VkImageCreateFlagBits` values

- **VUID-VkFramebufferAttachmentImageInfo-usage**
  usage must be a valid combination of `VkImageUsageFlagBits` values

- **VUID-VkFramebufferAttachmentImageInfo-usage-required bitmask**
  usage must not be 0

- **VUID-VkFramebufferAttachmentImageInfo-pViewFormats**
  If `viewFormatCount` is not 0, `pViewFormats` must be a valid pointer to an array of `viewFormatCount` valid `VkFormat` values

Bits which can be set in `VkFramebufferCreateInfo::flags`, specifying options for framebuffers, are:

```cpp
// Provided by VK_VERSION_1_0
typedef enum VkFramebufferCreateFlagBits {
    // Provided by VK_VERSION_1_2
    VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT = 0x00000001,
    // Provided by VK_KHR_imageless_framebuffer
    VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR = VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT,
} VkFramebufferCreateFlagBits;
```

- `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT` specifies that image views are not specified, and only attachment compatibility information will be provided via a `VkFramebufferAttachmentImageInfo` structure.

```cpp
// Provided by VK_VERSION_1_0
typedef VkFlags VkFramebufferCreateFlags;
```

`VkFramebufferCreateFlags` is a bitmask type for setting a mask of zero or more `VkFramebufferCreateFlagBits`.

To destroy a framebuffer, call:

```cpp
// Provided by VK_VERSION_1_0
void vkDestroyFramebuffer(
    VkDevice device,
    VkFramebuffer framebuffer,
    const VkAllocationCallbacks* pAllocator);
```
• device is the logical device that destroys the framebuffer.

• framebuffer is the handle of the framebuffer to destroy.

• pAllocator controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- **VUID-vkDestroyFramebuffer-framebuffer-00892**
  All submitted commands that refer to framebuffer must have completed execution

- **VUID-vkDestroyFramebuffer-framebuffer-00893**
  If VkAllocationCallbacks were provided when framebuffer was created, a compatible set of callbacks must be provided here

- **VUID-vkDestroyFramebuffer-framebuffer-00894**
  If no VkAllocationCallbacks were provided when framebuffer was created, pAllocator must be NULL

### Valid Usage (Implicit)

- **VUID-vkDestroyFramebuffer-device-parameter**
  device must be a valid VkDevice handle

- **VUID-vkDestroyFramebuffer-framebuffer-parameter**
  If framebuffer is not VK_NULL_HANDLE, framebuffer must be a valid VkFramebuffer handle

- **VUID-vkDestroyFramebuffer-pAllocator-parameter**
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- **VUID-vkDestroyFramebuffer-framebuffer-parent**
  If framebuffer is a valid handle, it must have been created, allocated, or retrieved from device

### Host Synchronization

- Host access to framebuffer must be externally synchronized

### 8.5. Render Pass Load Operations

Render pass load operations define the initial values of an attachment during a render pass instance.

Load operations for attachments with a depth/stencil format execute in the VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT pipeline stage. Load operations for attachments with a color format execute in the VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT pipeline stage. The load operation for each sample in an attachment happens-before any recorded command which
Note

Because load operations always happen first, external synchronization with attachment access only needs to synchronize the load operations with previous commands; not the operations within the render pass instance. This does not apply when using `VK_ATTACHMENT_LOAD_OP_NONE_KHR`.

Load operations only update values within the defined render area for the render pass instance. However, any writes performed by a load operation (as defined by its access masks) to a given attachment may read and write back any memory locations within the image subresource bound for that attachment. For depth/stencil images, writes to one aspect may also result in read-modify-write operations for the other aspect. If the subresource is in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` layout, implementations must not access pixels outside of the render area.

Note

As entire subresources could be accessed by load operations, applications cannot safely access values outside of the render area during a render pass instance when a load operation that modifies values is used.

Load operations that can be used for a render pass are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkAttachmentLoadOp {
    VK_ATTACHMENT_LOAD_OP_LOAD = 0,
    VK_ATTACHMENT_LOAD_OP_CLEAR = 1,
    VK_ATTACHMENT_LOAD_OP_DONT_CARE = 2,
    // Provided by VK_KHR_load_store_op_none
    VK_ATTACHMENT_LOAD_OP_NONE_KHR = 100040000,
    // Provided by VK_EXT_load_store_op_none
    VK_ATTACHMENT_LOAD_OP_NONE_EXT = VK_ATTACHMENT_LOAD_OP_NONE_KHR,
} VkAttachmentLoadOp;
```

- `VK_ATTACHMENT_LOAD_OP_LOAD` specifies that the previous contents of the image within the render area will be preserved as the initial values. For attachments with a depth/stencil format, this uses the access type `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT`. For attachments with a color format, this uses the access type `VK_ACCESS_COLOR_ATTACHMENT_READ_BIT`.

- `VK_ATTACHMENT_LOAD_OP_CLEAR` specifies that the contents within the render area will be cleared to a uniform value, which is specified when a render pass instance is begun. For attachments with a depth/stencil format, this uses the access type `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`. For attachments with a color format, this uses the access type `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`.

- `VK_ATTACHMENT_LOAD_OP_DONT_CARE` specifies that the previous contents within the area need not be preserved; the contents of the attachment will be undefined inside the render area. For attachments with a depth/stencil format, this uses the access type...
VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT. For attachments with a color format, this uses the access type VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT.

- VK_ATTACHMENT_LOAD_OP_NONE_KHR specifies that the previous contents of the image will be undefined inside the render pass. No access type is used as the image is not accessed.

During a render pass instance, input and color attachments with color formats that have a component size of 8, 16, or 32 bits must be represented in the attachment’s format throughout the instance. Attachments with other floating- or fixed-point color formats, or with depth components may be represented in a format with a precision higher than the attachment format, but must be represented with the same range. When such a component is loaded via the loadOp, it will be converted into an implementation-dependent format used by the render pass. Such components must be converted from the render pass format, to the format of the attachment, before they are resolved or stored at the end of a render pass instance via storeOp. Conversions occur as described in Numeric Representation and Computation and Fixed-Point Data Conversions.

### 8.6. Render Pass Store Operations

Render pass store operations define how values written to an attachment during a render pass instance are stored to memory.

Store operations for attachments with a depth/stencil format execute in the VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT pipeline stage. Store operations for attachments with a color format execute in the VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT pipeline stage. The store operation for each sample in an attachment happens-after any recorded command which accesses the sample via that attachment or an alias.

**Note**

Because store operations always happen after other accesses in a render pass instance, external synchronization with attachment access in an earlier render pass only needs to synchronize with the store operations; not the operations within the render pass instance. This does not apply when using VK_ATTACHMENT_STORE_OP_NONE.

Store operations only update values within the defined render area for the render pass instance. However, any writes performed by a store operation (as defined by its access masks) to a given attachment may read and write back any memory locations within the image subresource bound for that attachment. For depth/stencil images writes to one aspect may also result in read-modify-write operations for the other aspect. If the subresource is in the VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT layout, implementations must not access pixels outside of the render area.

**Note**

As entire subresources could be accessed by store operations, applications cannot safely access values outside of the render area via aliased resources during a render pass instance when a store operation that modifies values is used.

Possible values of VkAttachmentDescription::storeOp and stencilStoreOp, specifying how the
contents of the attachment are treated, are:

```c
typedef enum VkAttachmentStoreOp {
    VK_ATTACHMENT_STORE_OP_STORE = 0,
    VK_ATTACHMENT_STORE_OP_DONT_CARE = 1,
    // Provided by VK_VERSION_1_3
    VK_ATTACHMENT_STORE_OP_NONE = 1000301000,
    // Provided by VK_KHR_dynamic_rendering, VK_KHR_load_store_op_none
    VK_ATTACHMENT_STORE_OP_NONE_KHR = VK_ATTACHMENT_STORE_OP_NONE,
    // Provided by VK_EXT_load_store_op_none
    VK_ATTACHMENT_STORE_OP_NONE_EXT = VK_ATTACHMENT_STORE_OP_NONE,
} VkAttachmentStoreOp;
```

- **VK_ATTACHMENT_STORE_OP_STORE** specifies the contents generated during the render pass and within the render area are written to memory. For attachments with a depth/stencil format, this uses the access type `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`. For attachments with a color format, this uses the access type `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`.

- **VK_ATTACHMENT_STORE_OP_DONT_CARE** specifies the contents within the render area are not needed after rendering, and may be discarded; the contents of the attachment will be undefined inside the render area. For attachments with a depth/stencil format, this uses the access type `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`. For attachments with a color format, this uses the access type `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`.

- **VK_ATTACHMENT_STORE_OP_NONE** specifies the contents within the render area are not accessed by the store operation as long as no values are written to the attachment during the render pass. If values are written during the render pass, this behaves identically to **VK_ATTACHMENT_STORE_OP_DONT_CARE** and with matching access semantics.

**Note**

VK_ATTACHMENT_STORE_OP_DONT_CARE can cause contents generated during previous render passes to be discarded before reaching memory, even if no write to the attachment occurs during the current render pass.

### 8.7. Render Pass Multisample Resolve Operations

Render pass multisample resolve operations combine sample values from a single pixel in a multisample attachment and store the result to the corresponding pixel in a single sample attachment.

Multisample resolve operations for attachments execute in the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage. A final resolve operation for all pixels in the render area happens-after any recorded command which writes a pixel via the multisample attachment to be resolved or an explicit alias of it in the subpass that it is specified. Any single sample attachment specified for use in a multisample resolve operation may have its contents modified at any point once rendering begins for the render pass instance. Reads from the multisample attachment can be synchronized with `VK_ACCESS_COLOR_ATTACHMENT_READ_BIT`. Access to
the single sample attachment can be synchronized with `VK_ACCESS_COLOR_ATTACHMENT_READ_BIT` and `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`. These pipeline stage and access types are used whether the attachments are color or depth/stencil attachments.

When using render pass objects, a subpass dependency specified with the above pipeline stages and access flags will ensure synchronization with multisample resolve operations for any attachments that were last accessed by that subpass. This allows later subpasses to read resolved values as input attachments.

Resolve operations only update values within the defined render area for the render pass instance. However, any writes performed by a resolve operation (as defined by its access masks) to a given attachment may read and write back any memory locations within the image subresource bound for that attachment. For depth/stencil images writes to one aspect may also result in read-modify-write operations for the other aspect. If the subresource is in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` layout, implementations must not access pixels outside of the render area.

Note
As entire subresources could be accessed by multisample resolve operations, applications cannot safely access values outside of the render area via aliased resources during a render pass instance when a multisample resolve operation is performed.

Multisample values in a multisample attachment are combined according to the resolve mode used:

```c
// Provided by VK_VERSION_1_2
typedef enum VkResolveModeFlagBits {
    VK.Resolve_MODE_NONE = 0,
    VK.Resolve_MODE_SAMPLE_ZERO_BIT = 0x00000001,
    VK.Resolve_MODE_AVERAGE_BIT = 0x00000002,
    VK.Resolve_MODE_MIN_BIT = 0x00000004,
    VK.Resolve_MODE_MAX_BIT = 0x00000008,
    // Provided by VK_KHR_depth_stencil_resolve
    VK.Resolve_MODE_NONE_KHR = VK.Resolve_MODE_NONE,
    // Provided by VK_KHR_depth_stencil_resolve
    VK.Resolve_MODE_SAMPLE_ZERO_BIT_KHR = VK.Resolve_MODE_SAMPLE_ZERO_BIT,
    // Provided by VK_KHR_depth_stencil_resolve
    VK.Resolve_MODE_AVERAGE_BIT_KHR = VK.Resolve_MODE_AVERAGE_BIT,
    // Provided by VK_KHR_depth_stencil_resolve
    VK.Resolve_MODE_MIN_BIT_KHR = VK.Resolve_MODE_MIN_BIT,
    // Provided by VK_KHR_depth_stencil_resolve
    VK.Resolve_MODE_MAX_BIT_KHR = VK.Resolve_MODE_MAX_BIT,
} VkResolveModeFlagBits;
```

or the equivalent

```c
// Provided by VK_KHR_depth_stencil_resolve
```
typedef VkResolveModeFlagBits VkResolveModeFlagBitsKHR;

- **VK_RESOLVE_MODE_NONE** indicates that no resolve operation is done.
- **VK_RESOLVE_MODE_SAMPLE_ZERO_BIT** indicates that result of the resolve operation is equal to the value of sample 0.
- **VK_RESOLVE_MODE_AVERAGE_BIT** indicates that result of the resolve operation is the average of the sample values.
- **VK_RESOLVE_MODE_MIN_BIT** indicates that result of the resolve operation is the minimum of the sample values.
- **VK_RESOLVE_MODE_MAX_BIT** indicates that result of the resolve operation is the maximum of the sample values.

If no resolve mode is otherwise specified, **VK_RESOLVE_MODE_AVERAGE_BIT** is used.

```
// Provided by VK_VERSION_1_2
typedef VkFlags VkResolveModeFlags;
```

or the equivalent

```
// Provided by VK_KHR_depth_stencil_resolve
typedef VkResolveModeFlags VkResolveModeFlagsKHR;
```

**VkResolveModeFlags** is a bitmask type for setting a mask of zero or more **VkResolveModeFlagBits**.

### 8.8. Render Pass Commands

An application records the commands for a render pass instance one subpass at a time, by beginning a render pass instance, iterating over the subpasses to record commands for that subpass, and then ending the render pass instance.

To begin a render pass instance, call:

```
// Provided by VK_VERSION_1_0
void vkCmdBeginRenderPass(
    VkCommandBuffer commandBuffer,
    const VkRenderPassBeginInfo* pRenderPassBegin,
    VkSubpassContents contents);
```

- **commandBuffer** is the command buffer in which to record the command.
- **pRenderPassBegin** is a pointer to a **VkRenderPassBeginInfo** structure specifying the render pass to begin an instance of, and the framebuffer the instance uses.
- **contents** is a **VkSubpassContents** value specifying how the commands in the first subpass will be provided.
After beginning a render pass instance, the command buffer is ready to record the commands for the first subpass of that render pass.

**Valid Usage**

- **VUID-vkCmdBeginRenderPass-initialLayout-00895**
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a `usage` value including `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`

- **VUID-vkCmdBeginRenderPass-initialLayout-01758**
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a `usage` value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- **VUID-vkCmdBeginRenderPass-initialLayout-02842**
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a `usage` value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- **VUID-vkCmdBeginRenderPass-stencilInitialLayout-02843**
  If any of the `stencilInitialLayout` or `stencilFinalLayout` member of the `VkAttachmentDescriptionStencilLayout` structures or the `stencilLayout` member of the `VkAttachmentReferenceStencilLayout` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a `usage` value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`
creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a `usage` value including `VK_IMAGE_USAGE_SAMPLED_BIT` or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`

- VUID-vkCmdBeginRenderPass-initialLayout-00898
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a `usage` value including `VK_IMAGE_USAGE_TRANSFER_SRC_BIT`

- VUID-vkCmdBeginRenderPass-initialLayout-00899
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a `usage` value including `VK_IMAGE_USAGE_TRANSFER_DST_BIT`

- VUID-vkCmdBeginRenderPass-initialLayout-00900
  If the `initialLayout` member of any of the `VkAttachmentDescription` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is not `VK_IMAGE_LAYOUT_UNDEFINED`, then each such `initialLayout` must be equal to the current layout of the corresponding attachment image subresource of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin`

- VUID-vkCmdBeginRenderPass-srcStageMask-06451
  The `srcStageMask` members of any element of the `pDependencies` member of `VkRenderPassCreateInfo` used to create `renderPass` must be supported by the capabilities of the queue family identified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` used to create the command pool which `commandBuffer` was allocated from

- VUID-vkCmdBeginRenderPass-dstStageMask-06452
  The `dstStageMask` members of any element of the `pDependencies` member of `VkRenderPassCreateInfo` used to create `renderPass` must be supported by the capabilities of the queue family identified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` used to create the command pool which `commandBuffer` was allocated from

- VUID-vkCmdBeginRenderPass-framebuffer-02532
  For any attachment in `framebuffer` that is used by `renderPass` and is bound to memory locations that are also bound to another attachment used by `renderPass`, and if at least one of those uses causes either attachment to be written to, both attachments must have had the `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` set

- VUID-vkCmdBeginRenderPass-framebuffer-09045
  If any attachments specified in `framebuffer` are used by `renderPass` and are bound to overlapping memory locations, there must be only one that is used as a color attachment,
depth/stencil, or resolve attachment in any subpass

- **VUID-vkCmdBeginRenderPass-initialLayout-07000**
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a usage value including either the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` and either the `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_SAMPLED_BIT` usage bits.

- **VUID-vkCmdBeginRenderPass-initialLayout-07001**
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a usage value the `VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` usage bit.

- **VUID-vkCmdBeginRenderPass-initialLayout-09537**
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a usage value including either `VK_IMAGE_USAGE_STORAGE_BIT`, or both `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` and either of `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage bits.

**Valid Usage (Implicit)**

- **VUID-vkCmdBeginRenderPass-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdBeginRenderPass-pRenderPassBegin-parameter**
  `pRenderPassBegin` must be a valid pointer to a valid `VkRenderPassBeginInfo` structure.

- **VUID-vkCmdBeginRenderPass-contents-parameter**
  `contents` must be a valid `VkSubpassContents` value.

- **VUID-vkCmdBeginRenderPass-commandBuffer-recording**
  `commandBuffer` must be in the recording state.

- **VUID-vkCmdBeginRenderPass-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- **VUID-vkCmdBeginRenderPass-renderpass**
  This command must only be called outside of a render pass instance.
This command must only be called outside of a video coding scope

commandBuffer must be a primary VkCommandBuffer

Host Synchronization

Host access to commandBuffer must be externally synchronized

Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>

</tr>
</tbody>
</table>

Alternatively to begin a render pass, call:

```c
// Provided by VK_VERSION_1_2
void vkCmdBeginRenderPass2(
    VkCommandBuffer commandBuffer,
    const VkRenderPassBeginInfo* pRenderPassBegin,
    const VkSubpassBeginInfo* pSubpassBeginInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_create_renderpass2
void vkCmdBeginRenderPass2KHR(
    VkCommandBuffer commandBuffer,
    const VkRenderPassBeginInfo* pRenderPassBegin,
    const VkSubpassBeginInfo* pSubpassBeginInfo);
```

- commandBuffer is the command buffer in which to record the command.
- pRenderPassBegin is a pointer to a VkRenderPassBeginInfo structure specifying the render pass to begin an instance of, and the framebuffer the instance uses.
- pSubpassBeginInfo is a pointer to a VkSubpassBeginInfo structure containing information about the subpass which is about to begin rendering.

After beginning a render pass instance, the command buffer is ready to record the commands for
the first subpass of that render pass.

Valid Usage

• VUID-vkCmdBeginRenderPass2-framebuffer-02779
  Both the framebuffer and renderPass members of pRenderPassBegin must have been created on the same VkDevice that commandBuffer was allocated on.

• VUID-vkCmdBeginRenderPass2-initialLayout-03094
  If any of the initialLayout or finalLayout member of the VkAttachmentDescription structures or the layout member of the VkAttachmentReference structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT.

• VUID-vkCmdBeginRenderPass2-initialLayout-03096
  If any of the initialLayout or finalLayout member of the VkAttachmentDescription structures or the layout member of the VkAttachmentReference structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is
  
  - VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, 
  - VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, 
  - VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL, 
  - VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL,

  then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT.

• VUID-vkCmdBeginRenderPass2-initialLayout-02844
  If any of the initialLayout or finalLayout member of the VkAttachmentDescription structures or the layout member of the VkAttachmentReference structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is
  
  - VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, 
  - VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, 
  - VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, 
  - VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL,

  then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including

  - VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT.

• VUID-vkCmdBeginRenderPass2-stencilInitialLayout-02845
  If any of the stencilInitialLayout or stencilFinalLayout member of the VkAttachmentDescriptionStencilLayout structures or the stencilLayout member of the VkAttachmentReferenceStencilLayout structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is
  
  - VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, 
  - VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL,

  then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including

  - VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT.

478
If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a usage value including `VK_IMAGE_USAGE_SAMPLED_BIT` or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`.

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a usage value including `VK_IMAGE_USAGE_TRANSFER_SRC_BIT`.

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a usage value including `VK_IMAGE_USAGE_TRANSFER_DST_BIT`.

If the `initialLayout` member of any of the `VkAttachmentDescription` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is not `VK_IMAGE_LAYOUT_UNDEFINED`, then each such `initialLayout` must be equal to the current layout of the corresponding attachment image subresource of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin`.

The `srcStageMask` members of any element of the `pDependencies` member of `VkRenderPassCreateInfo` used to create `renderPass` must be supported by the capabilities of the queue family identified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` used to create the command pool which `commandBuffer` was allocated from.

The `dstStageMask` members of any element of the `pDependencies` member of `VkRenderPassCreateInfo` used to create `renderPass` must be supported by the capabilities of the queue family identified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` used to create the command pool which `commandBuffer` was allocated from.

For any attachment in `framebuffer` that is used by `renderPass` and is bound to memory locations that are also bound to another attachment used by `renderPass`, and if at least one of those uses causes either attachment to be written to, both attachments must have had the `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` set.
If any attachments specified in `framebuffer` are used by `renderPass` and are bound to overlapping memory locations, there **must** be only one that is used as a color attachment, depth/stencil, or resolve attachment in any subpass.

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a usage value including either the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` and either the `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_SAMPLED_BIT` usage bits.

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` **must** have been created with a usage value including either the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` and either the `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_SAMPLED_BIT` usage bits

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` **must** have been created with a usage value the `VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` usage bit.

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` **must** have been created with a usage value including either `VK_IMAGE_USAGE_STORAGE_BIT`, or both `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` and either of `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage bits

Valid Usage (Implicit)

- **VUID-vkCmdBeginRenderPass2-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdBeginRenderPass2-pRenderPassBegin-parameter**
  `pRenderPassBegin` **must** be a valid pointer to a valid `VkRenderPassBeginInfo` structure.

- **VUID-vkCmdBeginRenderPass2-pSubpassBeginInfo-parameter**
  `pSubpassBeginInfo` **must** be a valid pointer to a valid `VkSubpassBeginInfo` structure.

- **VUID-vkCmdBeginRenderPass2-commandBuffer-recording**
  `commandBuffer` **must** be in the recording state.

- **VUID-vkCmdBeginRenderPass2-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations.
Host Synchronization

- Host access to commandBuffer must be externally synchronized.
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>

</tr>
</tbody>
</table>

The VkRenderPassBeginInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkRenderPassBeginInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkRenderPass       renderPass;
    VkFramebuffer      framebuffer;
    VkRect2D           renderArea;
    uint32_t           clearValueCount;
    const VkClearColorValue* pClearValues;
} VkRenderPassBeginInfo;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **renderPass** is the render pass to begin an instance of.
- **framebuffer** is the framebuffer containing the attachments that are used with the render pass.
- **renderArea** is the render area that is affected by the render pass instance, and is described in more detail below.
- **clearValueCount** is the number of elements in pClearValues.
• `pClearValues` is a pointer to an array of `clearValueCount` `VkClearValue` structures containing clear values for each attachment, if the attachment uses a `loadOp` value of `VK_ATTACHMENT_LOAD_OP_CLEAR` or if the attachment has a depth/stencil format and uses a `stencilLoadOp` value of `VK_ATTACHMENT_LOAD_OP_CLEAR`. The array is indexed by attachment number. Only elements corresponding to cleared attachments are used. Other elements of `pClearValues` are ignored.

`renderArea` is the render area that is affected by the render pass instance. The effects of attachment load, store and multisample resolve operations are restricted to the pixels whose x and y coordinates fall within the render area on all attachments. The render area extends to all layers of `framebuffer`. The application must ensure (using scissor if necessary) that all rendering is contained within the render area. The render area must be contained within the framebuffer dimensions.

**Note**
There may be a performance cost for using a render area smaller than the framebuffer, unless it matches the render area granularity for the render pass.

### Valid Usage

- **VUID-VkRenderPassBeginInfo-clearValueCount-00902**
  `clearValueCount` must be greater than the largest attachment index in `renderPass` specifying a `loadOp` (or `stencilLoadOp`, if the attachment has a depth/stencil format) of `VK_ATTACHMENT_LOAD_OP_CLEAR`

- **VUID-VkRenderPassBeginInfo-clearValueCount-04962**
  If `clearValueCount` is not 0, `pClearValues` must be a valid pointer to an array of `clearValueCount` `VkClearValue` unions

- **VUID-VkRenderPassBeginInfo-renderPass-00904**
  `renderPass` must be compatible with the `renderPass` member of the `VkFramebufferCreateInfo` structure specified when creating `framebuffer`

- **VUID-VkRenderPassBeginInfo-None-08996**
  If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.extent.width` must be greater than 0

- **VUID-VkRenderPassBeginInfo-None-08997**
  If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.extent.height` must be greater than 0

- **VUID-VkRenderPassBeginInfo-pNext-02850**
  If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.x` must be greater than or equal to 0

- **VUID-VkRenderPassBeginInfo-pNext-02851**
  If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.y` must be greater than or equal to 0
• VUID-VkRenderPassBeginInfo-pNext-02852
If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.x + renderArea.extent.width` must be less than or equal to `VkFramebufferCreateInfo::width` the framebuffer was created with.

• VUID-VkRenderPassBeginInfo-pNext-02853
If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.y + renderArea.extent.height` must be less than or equal to `VkFramebufferCreateInfo::height` the framebuffer was created with.

• VUID-VkRenderPassBeginInfo-pNext-02856
If the `pNext` chain contains `VkDeviceGroupRenderPassBeginInfo`, `offset.x + extent.width` of each element of `pDeviceRenderAreas` must be less than or equal to `VkFramebufferCreateInfo::width` the framebuffer was created with.

• VUID-VkRenderPassBeginInfo-pNext-02857
If the `pNext` chain contains `VkDeviceGroupRenderPassBeginInfo`, `offset.y + extent.height` of each element of `pDeviceRenderAreas` must be less than or equal to `VkFramebufferCreateInfo::height` the framebuffer was created with.

• VUID-VkRenderPassBeginInfo-framebuffer-03207
If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that did not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, and the `pNext` chain includes a `VkRenderPassAttachmentBeginInfo` structure, its `attachmentCount` must be zero.

• VUID-VkRenderPassBeginInfo-framebuffer-03208
If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `attachmentCount` of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain must be equal to the value of `VkFramebufferAttachmentsCreateInfo::attachmentImageInfoCount` used to create `framebuffer`.

• VUID-VkRenderPassBeginInfo-framebuffer-02780
If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain must have been created on the same `VkDevice` as `framebuffer` and `renderPass`.

• VUID-VkRenderPassBeginInfo-framebuffer-03209
If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain must be a `VkImageView` of an image created with a value of `VkImageCreateInfo::flags` equal to the `flags` member of the corresponding element of `VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos` used to create `framebuffer`.

• VUID-VkRenderPassBeginInfo-framebuffer-04627
If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain must be a `VkImageView` with an inherited usage equal to the `usage` member of the corresponding...
element of VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos used to create framebuffer

- VUID-VkRenderPassBeginInfo-framebuffer-03211
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a VkImageView with a width equal to the width member of the corresponding element of VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos used to create framebuffer

- VUID-VkRenderPassBeginInfo-framebuffer-03212
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a VkImageView with a height equal to the height member of the corresponding element of VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos used to create framebuffer

- VUID-VkRenderPassBeginInfo-framebuffer-03213
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a VkImageView of an image created with a value of VkImageFormatListCreateInfo::viewFormatCount equal to the viewFormatCount member of the corresponding element of VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos used to create framebuffer

- VUID-VkRenderPassBeginInfo-framebuffer-03214
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a VkImageView of an image created with a set of elements in VkImageFormatListCreateInfo::pViewFormats equal to the set of elements in the pViewFormats member of the corresponding element of VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos used to create framebuffer

- VUID-VkRenderPassBeginInfo-framebuffer-03215
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a VkImageView of an image created with a value of VkImageViewCreateInfo::format equal to the corresponding value of VkAttachmentDescription::format in renderPass

- VUID-VkRenderPassBeginInfo-framebuffer-09047
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included
VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a VkImageView of an image created with a value of VkImageCreateInfo::samples equal to the corresponding value of VkAttachmentDescription::samples in renderPass.

Valid Usage (Implicit)

- VUID-VkRenderPassBeginInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_RENDER_PASS_BEGIN_INFO

- VUID-VkRenderPassBeginInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkDeviceGroupRenderPassBeginInfo or VkRenderPassAttachmentBeginInfo

- VUID-VkRenderPassBeginInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkRenderPassBeginInfo-renderPass-parameter
  renderPass must be a valid VkRenderPass handle

- VUID-VkRenderPassBeginInfo-framebuffer-parameter
  framebuffer must be a valid VkFramebuffer handle

- VUID-VkRenderPassBeginInfo-commonparent
  Both of framebuffer, and renderPass must have been created, allocated, or retrieved from the same VkDevice

The VkSubpassBeginInfo structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkSubpassBeginInfo {
    VkStructureType sType;
    const void* pNext;
    VkSubpassContents contents;
} VkSubpassBeginInfo;
```

or the equivalent

```c
// Provided by VK_KHR_create_renderpass2
typedef VkSubpassBeginInfo VkSubpassBeginInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- contents is a VkSubpassContents value specifying how the commands in the next subpass will be provided.
Valid Usage

- VUID-VkSubpassBeginInfo-contents-09382
  If `contents` is `VK_SUBPASS_CONTENTS_INLINE_AND_SECONDARY_COMMAND_BUFFERS_EXT`, then `nestedCommandBuffer` must be enabled.

Valid Usage (Implicit)

- VUID-VkSubpassBeginInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_SUBPASS_BEGIN_INFO`

- VUID-VkSubpassBeginInfo-pNext-pNext
  `pNext` must be `NULL`

- VUID-VkSubpassBeginInfo-contents-parameter
  `contents` must be a valid `VkSubpassContents` value

Possible values of `vkCmdBeginRenderPass::contents`, specifying how the commands in the first subpass will be provided, are:

```cpp
// Provided by VK_VERSION_1_0
typedef enum VkSubpassContents {
    VK_SUBPASS_CONTENTS_INLINE = 0,
    VK_SUBPASS_CONTENTS_SECONDARY_COMMAND_BUFFERS = 1,
    // Provided by VK_EXT_nested_command_buffer
    VK_SUBPASS_CONTENTS_INLINE_AND_SECONDARY_COMMAND_BUFFERS_EXT = 1000451000,
} VkSubpassContents;
```

- `VK_SUBPASS_CONTENTS_INLINE` specifies that the contents of the subpass will be recorded inline in the primary command buffer, and secondary command buffers must not be executed within the subpass.

- `VK_SUBPASS_CONTENTS_SECONDARY_COMMAND_BUFFERS` specifies that the contents are recorded in secondary command buffers that will be called from the primary command buffer, and `vkCmdExecuteCommands` is the only valid command in the command buffer until `vkCmdNextSubpass` or `vkCmdEndRenderPass`.

- `VK_SUBPASS_CONTENTS_INLINE_AND_SECONDARY_COMMAND_BUFFERS_EXT` specifies that the contents of the subpass can be recorded both inline and in secondary command buffers executed from this command buffer with `vkCmdExecuteCommands`.

If the `pNext` chain of `VkRenderPassBeginInfo` or `VkRenderingInfo` includes a `VkDeviceGroupRenderPassBeginInfo` structure, then that structure includes a device mask and set of render areas for the render pass instance.

The `VkDeviceGroupRenderPassBeginInfo` structure is defined as:

```cpp
// Provided by VK_VERSION_1_1
```
typedef struct VkDeviceGroupRenderPassBeginInfo {
    VkStructureType stype;
    const void* pNext;
    uint32_t deviceMask;
    uint32_t deviceRenderAreaCount;
    const VkRect2D* pDeviceRenderAreas;
} VkDeviceGroupRenderPassBeginInfo;

or the equivalent

// Provided by VK_KHR_device_group
typedef VkDeviceGroupRenderPassBeginInfo VkDeviceGroupRenderPassBeginInfoKHR;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• deviceMask is the device mask for the render pass instance.
• deviceRenderAreaCount is the number of elements in the pDeviceRenderAreas array.
• pDeviceRenderAreas is a pointer to an array of VkRect2D structures defining the render area for each physical device.

The deviceMask serves several purposes. It is an upper bound on the set of physical devices that can be used during the render pass instance, and the initial device mask when the render pass instance begins. In addition, commands transitioning to the next subpass in a render pass instance and commands ending the render pass instance, and, accordingly render pass load, store, and multisample resolve operations and subpass dependencies corresponding to the render pass instance, are executed on the physical devices included in the device mask provided here.

If deviceRenderAreaCount is not zero, then the elements of pDeviceRenderAreas override the value of VkRenderPassBeginInfo::renderArea, and provide a render area specific to each physical device. These render areas serve the same purpose as VkRenderPassBeginInfo::renderArea, including controlling the region of attachments that are cleared by VK_ATTACHMENT_LOAD_OP_CLEAR and that are resolved into resolve attachments.

If this structure is not present, the render pass instance's device mask is the value of VkDeviceGroupCommandBufferBeginInfo::deviceMask. If this structure is not present or if deviceRenderAreaCount is zero, VkRenderPassBeginInfo::renderArea is used for all physical devices.

Valid Usage

• VUID-VkDeviceGroupRenderPassBeginInfo-deviceMask-00905
deviceMask must be a valid device mask value
• VUID-VkDeviceGroupRenderPassBeginInfo-deviceMask-00906
deviceMask must not be zero
• VUID-VkDeviceGroupRenderPassBeginInfo-deviceMask-00907
deviceMask must be a subset of the command buffer's initial device mask
• **VUID-VkDeviceGroupRenderPassBeginInfo-deviceRenderAreaCount-00908**
  
  `deviceRenderAreaCount` **must** either be zero or equal to the number of physical devices in the logical device.

• **VUID-VkDeviceGroupRenderPassBeginInfo-offset-06166**
  
  The `offset.x` member of any element of `pDeviceRenderAreas` **must** be greater than or equal to 0.

• **VUID-VkDeviceGroupRenderPassBeginInfo-offset-06167**
  
  The `offset.y` member of any element of `pDeviceRenderAreas` **must** be greater than or equal to 0.

• **VUID-VkDeviceGroupRenderPassBeginInfo-offset-06168**
  
  The sum of the `offset.x` and `extent.width` members of any element of `pDeviceRenderAreas` **must** be less than or equal to `maxFramebufferWidth`.

• **VUID-VkDeviceGroupRenderPassBeginInfo-offset-06169**
  
  The sum of the `offset.y` and `extent.height` members of any element of `pDeviceRenderAreas` **must** be less than or equal to `maxFramebufferHeight`.

• **VUID-VkDeviceGroupRenderPassBeginInfo-extent-08998**
  
  The `extent.width` member of any element of `pDeviceRenderAreas` **must** be greater than 0.

• **VUID-VkDeviceGroupRenderPassBeginInfo-extent-08999**
  
  The `extent.height` member of any element of `pDeviceRenderAreas` **must** be greater than 0.

---

**Valid Usage (Implicit)**

• **VUID-VkDeviceGroupRenderPassBeginInfo-sType-sType**
  
  `sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_GROUP_RENDER_PASS_BEGIN_INFO`.

• **VUID-VkDeviceGroupRenderPassBeginInfo-pDeviceRenderAreas-parameter**
  
  If `deviceRenderAreaCount` is not 0, `pDeviceRenderAreas` **must** be a valid pointer to an array of `deviceRenderAreaCount` `VkRect2D` structures.

---

The `VkRenderPassAttachmentBeginInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkRenderPassAttachmentBeginInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t attachmentCount;
    const VkImageView* pAttachments;
} VkRenderPassAttachmentBeginInfo;
```

or the equivalent

```c
// Provided by VK_KHR_imageless_framebuffer
typedef VkRenderPassAttachmentBeginInfo VkRenderPassAttachmentBeginInfoKHR;
```
• **sType** is a **VkStructureType** value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **attachmentCount** is the number of attachments.
• **pAttachments** is a pointer to an array of **VkImageView** handles, each of which will be used as the corresponding attachment in the render pass instance.

### Valid Usage

- **VUID-VkRenderPassAttachmentBeginInfo-pAttachments-03218**  
  Each element of **pAttachments** must only specify a single mip level
- **VUID-VkRenderPassAttachmentBeginInfo-pAttachments-03219**  
  Each element of **pAttachments** must have been created with the identity swizzle
- **VUID-VkRenderPassAttachmentBeginInfo-pAttachments-04114**  
  Each element of **pAttachments** must have been created with **VkImageViewCreateInfo** ::**viewType** not equal to **VK_IMAGE_VIEW_TYPE_3D**

### Valid Usage (Implicit)

- **VUID-VkRenderPassAttachmentBeginInfo-sType-sType**  
  **sType** must be **VK_STRUCTURE_TYPE_RENDER_PASS_ATTACHMENT_BEGIN_INFO**
- **VUID-VkRenderPassAttachmentBeginInfo-pAttachments-parameter**  
  If **attachmentCount** is not 0, **pAttachments** must be a valid pointer to an array of **attachmentCount** valid **VkImageView** handles

To query the render area granularity, call:

```c
// Provided by VK_VERSION_1_0
void vkGetRenderAreaGranularity(
  VkDevice device,
  VkRenderPass renderPass,
  VkExtent2D* pGranularity);
```

- **device** is the logical device that owns the render pass.
- **renderPass** is a handle to a render pass.
- **pGranularity** is a pointer to a **VkExtent2D** structure in which the granularity is returned.

The conditions leading to an optimal **renderArea** are:

- the **offset.x** member in **renderArea** is a multiple of the **width** member of the returned **VkExtent2D** (the horizontal granularity).
- the **offset.y** member in **renderArea** is a multiple of the **height** member of the returned **VkExtent2D** (the vertical granularity).
• either the `extent.width` member in `renderArea` is a multiple of the horizontal granularity or 
  `offset.x + extent.width` is equal to the width of the framebuffer in the `VkRenderPassBeginInfo`.

• either the `extent.height` member in `renderArea` is a multiple of the vertical granularity or 
  `offset.y + extent.height` is equal to the height of the framebuffer in the `VkRenderPassBeginInfo`.

Subpass dependencies are not affected by the render area, and apply to the entire image 
subresources attached to the framebuffer as specified in the description of automatic layout 
transitions. Similarly, pipeline barriers are valid even if their effect extends outside the render 
area.

### Valid Usage (Implicit)

- VUID-vkGetRenderAreaGranularity-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkGetRenderAreaGranularity-renderPass-parameter
  `renderPass` must be a valid `VkRenderPass` handle

- VUID-vkGetRenderAreaGranularity-pGranularity-parameter
  `pGranularity` must be a valid pointer to a `VkExtent2D` structure

- VUID-vkGetRenderAreaGranularity-renderPass-parent
  `renderPass` must have been created, allocated, or retrieved from `device`

To transition to the next subpass in the render pass instance after recording the commands for a 
subpass, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdNextSubpass(
    VkCommandBuffer commandBuffer, 
    VkSubpassContents contents);
```

- `commandBuffer` is the command buffer in which to record the command.
- `contents` specifies how the commands in the next subpass will be provided, in the same fashion 
as the corresponding parameter of `vkCmdBeginRenderPass`.

The subpass index for a render pass begins at zero when `vkCmdBeginRenderPass` is recorded, and 
increments each time `vkCmdNextSubpass` is recorded.

After transitioning to the next subpass, the application can record the commands for that subpass.

### Valid Usage

- VUID-vkCmdNextSubpass-None-00909
  The current subpass index must be less than the number of subpasses in the render pass 
  minus one
Valid Usage (Implicit)

- **VUID-vkCmdNextSubpass-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdNextSubpass-contents-parameter**
  `contents` must be a valid `VkSubpassContents` value

- **VUID-vkCmdNextSubpass-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdNextSubpass-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdNextSubpass-renderpass**
  This command must only be called inside of a render pass instance

- **VUID-vkCmdNextSubpass-videocoding**
  This command must only be called outside of a video coding scope

- **VUID-vkCmdNextSubpass-bufferlevel**
  `commandBuffer` must be a primary `VkCommandBuffer`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Inside</td>
<td>Outside</td>
<td>Graphics</td>
<td>Action State Synchronization</td>
</tr>
</tbody>
</table>

To transition to the next subpass in the render pass instance after recording the commands for a subpass, call:

```c
// Provided by VK_VERSION_1_2
void vkCmdNextSubpass2(
    VkCommandBuffer commandBuffer,
    const VkSubpassBeginInfo* pSubpassBeginInfo,
    const VkSubpassEndInfo* pSubpassEndInfo);
```
or the equivalent command

```c
void vkCmdNextSubpass2KHR(
    VkCommandBuffer commandBuffer,
    const VkSubpassBeginInfo* pSubpassBeginInfo,
    const VkSubpassEndInfo* pSubpassEndInfo);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pSubpassBeginInfo` is a pointer to a `VkSubpassBeginInfo` structure containing information about the subpass which is about to begin rendering.
- `pSubpassEndInfo` is a pointer to a `VkSubpassEndInfo` structure containing information about how the previous subpass will be ended.

`vkCmdNextSubpass2` is semantically identical to `vkCmdNextSubpass`, except that it is extensible, and that `contents` is provided as part of an extensible structure instead of as a flat parameter.

---

**Valid Usage**

- VUID-vkCmdNextSubpass2-None-03102
  The current subpass index **must** be less than the number of subpasses in the render pass minus one

---

**Valid Usage (Implicit)**

- VUID-vkCmdNextSubpass2-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdNextSubpass2-pSubpassBeginInfo-parameter
  `pSubpassBeginInfo` **must** be a valid pointer to a valid `VkSubpassBeginInfo` structure

- VUID-vkCmdNextSubpass2-pSubpassEndInfo-parameter
  `pSubpassEndInfo` **must** be a valid pointer to a valid `VkSubpassEndInfo` structure

- VUID-vkCmdNextSubpass2-commandBuffer-recording
  `commandBuffer` **must** be in the `recording` state

- VUID-vkCmdNextSubpass2-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- VUID-vkCmdNextSubpass2-renderpass
  This command **must** only be called inside of a render pass instance

- VUID-vkCmdNextSubpass2-videocoding
  This command **must** only be called outside of a video coding scope

- VUID-vkCmdNextSubpass2-bufferlevel
  `commandBuffer` **must** be a primary `VkCommandBuffer`
Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Inside</td>
<td>Outside</td>
<td>Graphics</td>
<td>Action State Synchronization</td>
</tr>
</tbody>
</table>

To record a command to end a render pass instance after recording the commands for the last subpass, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdEndRenderPass(
    VkCommandBuffer commandBuffer);
```

- commandBuffer is the command buffer in which to end the current render pass instance.

Ending a render pass instance performs any multisample resolve operations on the final subpass.

Valid Usage

- VUID-vkCmdEndRenderPass-None-00910
  The current subpass index must be equal to the number of subpasses in the render pass minus one

- VUID-vkCmdEndRenderPass-None-06170
  The current render pass instance must not have been begun with vkCmdBeginRendering

- VUID-vkCmdEndRenderPass-None-07004
  If vkCmdBeginQuery* was called within a subpass of the render pass, the corresponding vkCmdEndQuery* must have been called subsequently within the same subpass

Valid Usage (Implicit)

- VUID-vkCmdEndRenderPass-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdEndRenderPass-commandBuffer-recording
commandBuffer must be in the recording state

- VUID-vkCmdEndRenderPass-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdEndRenderPass-renderpass
  This command must only be called inside of a render pass instance
- VUID-vkCmdEndRenderPass-videocoding
  This command must only be called outside of a video coding scope
- VUID-vkCmdEndRenderPass-bufferlevel
  commandBuffer must be a primary VkCommandBuffer

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Inside</td>
<td>Outside</td>
<td>Graphics</td>
<td>Action State Synchronization</td>
</tr>
</tbody>
</table>

To record a command to end a render pass instance after recording the commands for the last subpass, call:

```c
// Provided by VK_VERSION_1_2
void vkCmdEndRenderPass2(
    VkCommandBuffer commandBuffer, 
    const VkSubpassEndInfo* pSubpassEndInfo); 
```
or the equivalent command

```c
// Provided by VK_KHR_create_renderpass2
void vkCmdEndRenderPass2KHR(
    VkCommandBuffer commandBuffer, 
    const VkSubpassEndInfo* pSubpassEndInfo); 
```

- commandBuffer is the command buffer in which to end the current render pass instance.
• pSubpassEndInfo is a pointer to a VkSubpassEndInfo structure containing information about how the last subpass will be ended.

vkCmdEndRenderPass2 is semantically identical to vkCmdEndRenderPass, except that it is extensible.

Valid Usage

• VUID-vkCmdEndRenderPass2-None-03103
  The current subpass index must be equal to the number of subpasses in the render pass minus one

• VUID-vkCmdEndRenderPass2-None-06171
  The current render pass instance must not have been begun with vkCmdBeginRendering

• VUID-vkCmdEndRenderPass2-None-07005
  If vkCmdBeginQuery* was called within a subpass of the render pass, the corresponding vkCmdEndQuery* must have been called subsequently within the same subpass

Valid Usage (Implicit)

• VUID-vkCmdEndRenderPass2-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdEndRenderPass2-pSubpassEndInfo-parameter
  pSubpassEndInfo must be a valid pointer to a valid VkSubpassEndInfo structure

• VUID-vkCmdEndRenderPass2-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdEndRenderPass2-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

• VUID-vkCmdEndRenderPass2-renderpass
  This command must only be called inside of a render pass instance

• VUID-vkCmdEndRenderPass2-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdEndRenderPass2-bufferlevel
  commandBuffer must be a primary VkCommandBuffer

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Inside</td>
<td>Outside</td>
<td>Graphics</td>

The `VkSubpassEndInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkSubpassEndInfo {
    VkStructureType sType;
    const void* pNext;
} VkSubpassEndInfo;
```

or the equivalent

```c
// Provided by VK_KHR_create_renderpass2
typedef VkSubpassEndInfo VkSubpassEndInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

### Valid Usage (Implicit)

- `VUID-VkSubpassEndInfo-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_SUBPASS_END_INFO`
- `VUID-VkSubpassEndInfo-pNext-pNext`  
  `pNext` must be `NULL`

### 8.9. Common Render Pass Data Races (Informative)

Due to the complexity of how rendering is performed, there are several ways an application can accidentally introduce a data race, usually by doing something that may seem benign but actually cannot be supported. This section indicates a number of the more common cases as guidelines to help avoid them.

#### 8.9.1. Sampling From a Read-only Attachment

Vulkan includes read-only layouts for depth/stencil images, that allow the images to be both read during a render pass for the purposes of depth/stencil tests, and read as a non-attachment.
However, because `VK_ATTACHMENT_STORE_OP_STORE` and `VK_ATTACHMENT_STORE_OP_DONT_CARE` may perform write operations, even if no recorded command writes to an attachment, reading from an image while also using it as an attachment with these store operations can result in a data race. If the reads from the non-attachment are performed in a fragment shader where the accessed samples match those covered by the fragment shader, no data race will occur as store operations are guaranteed to operate after fragment shader execution for the set of samples the fragment covers. Notably, input attachments can also be used for this case. Reading other samples or in any other shader stage can result in unexpected behavior due to the potential for a data race, and validation errors should be generated for doing so. In practice, many applications have shipped reading samples outside of the covered fragment without any observable issue, but there is no guarantee that this will always work, and it is not advisable to rely on this in new or re-worked code bases. As `VK_ATTACHMENT_STORE_OP_NONE` is guaranteed to perform no writes, applications wishing to read an image as both an attachment and a non-attachment should make use of this store operation, coupled with a load operation that also performs no writes.

### 8.9.2. Non-overlapping Access Between Resources

When relying on non-overlapping accesses between attachments and other resources, it is important to note that load and store operations have fairly wide alignment requirements - potentially affecting entire subresources and adjacent depth/stencil aspects. This makes it invalid to access a non-attachment subresource that is simultaneously being used as an attachment where either access performs a write operation.

The only exception to this is if a subresource is in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, in which case the overlap is defined to occur at a per-pixel granularity, and applications can read data from pixels outside the render area without introducing a data race.

### 8.9.3. Depth/Stencil and Input Attachments

When rendering to only the depth OR stencil aspect of an image, an input attachment accessing the other aspect will not cause a data race only under very specific conditions. To avoid a data race, the aspect not being written must be in a read-only layout, and writes to it must be disabled in the draw state. For example, to read from stencil while writing depth, the attachment must be in `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_INDEXED_OPTIMAL` (or equivalent), and the stencil write mask must be set to 0. Similarly to read from depth while writing stencil, the attachment must be in `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_READ_WRITE_INDEXED_OPTIMAL` (or equivalent), and depth write enable must be set to `VK_FALSE`.

### 8.9.4. Synchronization Options

There are several synchronization options available to synchronize between accesses to resources within a render pass. Some of the options are outlined below:

- A `VkSubpassDependency` in a render pass object can synchronize attachment writes and multisample resolve operations from a prior subpass for subsequent input attachment reads.
- A `vkCmdPipelineBarrier` inside a subpass can synchronize prior attachment writes in the subpass with subsequent input attachment reads.
A `vkCmdPipelineBarrier` inside a subpass can synchronize prior attachment writes in the subpass with subsequent non-attachment reads if the attachment is in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout.
Chapter 9. Shaders

A shader specifies programmable operations that execute for each vertex, control point, tessellated vertex, primitive, fragment, or workgroup in the corresponding stage(s) of the graphics and compute pipelines.

Graphics pipelines include vertex shader execution as a result of primitive assembly, followed, if enabled, by tessellation control and evaluation shaders operating on patches, geometry shaders, if enabled, operating on primitives, and fragment shaders, if present, operating on fragments generated by Rasterization. In this specification, vertex, tessellation control, tessellation evaluation and geometry shaders are collectively referred to as pre-rasterization shader stages and occur in the logical pipeline before rasterization. The fragment shader occurs logically after rasterization.

Only the compute shader stage is included in a compute pipeline. Compute shaders operate on compute invocations in a workgroup.

Shaders can read from input variables, and read from and write to output variables. Input and output variables can be used to transfer data between shader stages, or to allow the shader to interact with values that exist in the execution environment. Similarly, the execution environment provides constants describing capabilities.

Shader variables are associated with execution environment-provided inputs and outputs using built-in decorations in the shader. The available decorations for each stage are documented in the following subsections.

9.1. Shader Objects

Shaders may be compiled and linked into pipeline objects as described in Pipelines chapter, or if the shaderObject feature is enabled they may be compiled into individual per-stage shader objects which can be bound on a command buffer independently from one another. Unlike pipelines, shader objects are not intrinsically tied to any specific set of state. Instead, state is specified dynamically in the command buffer.

Each shader object represents a single compiled shader stage, which may optionally be linked with one or more other stages.

Shader objects are represented by VkShaderEXT handles:

```
// Provided by VK_EXT_shader_object
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkShaderEXT)
```

9.1.1. Shader Object Creation

Shader objects may be created from shader code provided as SPIR-V, or in an opaque, implementation-defined binary format specific to the physical device.

To create one or more shader objects, call:
// Provided by VK_EXT_shader_object

VkResult vkCreateShadersEXT(
    VkDevice                     device,
    uint32_t                     createInfoCount,
    const VkShaderCreateInfoEXT* pCreateInfos,
    const VkAllocationCallbacks* pAllocator,
    VkShaderEXT*                pShaders);

- **device** is the logical device that creates the shader objects.
- **createInfoCount** is the length of the **pCreateInfos** and **pShaders** arrays.
- **pCreateInfos** is a pointer to an array of **VkShaderCreateInfoEXT** structures.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pShaders** is a pointer to an array of **VkShaderEXT** handles in which the resulting shader objects are returned.

When this function returns, whether or not it succeeds, it is guaranteed that every element of **pShaders** will have been overwritten by either **VK_NULL_HANDLE** or a valid **VkShaderEXT** handle.

This means that whenever shader creation fails, the application can determine which shader the returned error pertains to by locating the first **VK_NULL_HANDLE** element in **pShaders**. It also means that an application can reliably clean up from a failed call by iterating over the **pShaders** array and destroying every element that is not **VK_NULL_HANDLE**.

### Valid Usage

- **VUID-vkCreateShadersEXT-None-08400**
  - The shaderObject feature must be enabled

- **VUID-vkCreateShadersEXT-pCreateInfos-08402**
  - If the **flags** member of any element of **pCreateInfos** includes **VK_SHADER_CREATE_LINK_STAGE_BIT_EXT**, the **flags** member of all other elements of **pCreateInfos** whose **stage** is **VK_SHADER_STAGE_VERTEX_BIT**, **VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT**, **VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT**, **VK_SHADER_STAGE_GEOMETRY_BIT**, or **VK_SHADER_STAGE_FRAGMENT_BIT** must also include **VK_SHADER_CREATE_LINK_STAGE_BIT_EXT**

- **VUID-vkCreateShadersEXT-pCreateInfos-08409**
  - For each element of **pCreateInfos** whose **flags** member includes **VK_SHADER_CREATE_LINK_STAGE_BIT_EXT**, if there is any other element of **pCreateInfos** whose **stage** is logically later than the **stage** of the former and whose **flags** member also includes **VK_SHADER_CREATE_LINK_STAGE_BIT_EXT**, the **nextStage** of the former must be equal to the **stage** of the element with the logically earliest **stage** following the **stage** of the former whose **flags** member also includes **VK_SHADER_CREATE_LINK_STAGE_BIT_EXT**

- **VUID-vkCreateShadersEXT-pCreateInfos-08410**
  - The **stage** member of each element of **pCreateInfos** whose **flags** member includes **VK_SHADER_CREATE_LINK_STAGE_BIT_EXT** must be unique
The `codeType` member of all elements of `pCreateInfos` whose `flags` member includes `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` must be the same.

If `pCreateInfos` contains elements with both `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` and `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, both elements’ `flags` include `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT`, both elements’ `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and the `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` stage’s `pCode` contains an `OpExecutionMode` instruction specifying the type of subdivision, it must match the subdivision type specified in the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` stage.

If `pCreateInfos` contains elements with both `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` and `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, both elements’ `flags` include `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT`, both elements’ `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and the `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` stage’s `pCode` contains an `OpExecutionMode` instruction specifying the orientation of triangles, it must match the triangle orientation specified in the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` stage.

If `pCreateInfos` contains elements with both `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` and `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, both elements’ `flags` include `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT`, both elements’ `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and the `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` stage’s `pCode` contains an `OpExecutionMode` instruction specifying `PointMode`, the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` stage must also contain an `OpExecutionMode` instruction specifying `PointMode`.

If `pCreateInfos` contains elements with both `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` and `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, both elements’ `flags` include `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT`, both elements’ `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and the `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` stage’s `pCode` contains an `OpExecutionMode` instruction specifying the spacing of segments on the edges of tessellated primitives, it must match the segment spacing specified in the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` stage.

If `pCreateInfos` contains elements with both `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` and `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, both elements’ `flags` include `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT`, both elements’ `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and the `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` stage’s `pCode` contains an `OpExecutionMode` instruction specifying the output patch size, it must match the output patch size specified in the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` stage.
Valid Usage (Implicit)

- **VUID-vkCreateShadersEXT-device-parameter**
  
  *device* **must** be a valid *VkDevice* handle

- **VUID-vkCreateShadersEXT-pCreateInfos-parameter**
  
  *pCreateInfos** must be a valid pointer to an array of *createInfoCount** valid *VkShaderCreateInfoEXT** structures

- **VUID-vkCreateShadersEXT-pAllocator-parameter**
  
  If *pAllocator* is not NULL, *pAllocator** must be a valid pointer to a valid *VkAllocationCallbacks* structure

- **VUID-vkCreateShadersEXT-pShaders-parameter**
  
  *pShaders** must be a valid pointer to an array of *createInfoCount** *VkShaderEXT** handles

- **VUID-vkCreateShadersEXT-createInfoCount-arraylength**
  
  *createInfoCount** must be greater than 0

Return Codes

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_INITIALIZATION_FAILED**
- **VK_ERROR_INCOMPATIBLE_SHADER_BINARY_EXT**

The *VkShaderCreateInfoEXT* structure is defined as:

```c
// Provided by VK_EXT_shader_object
typedef struct VkShaderCreateInfoEXT {
    VkStructureType     sType;
    const void*          pNext;
    VkShaderCreateFlagsEXT flags;
    VkShaderStageFlagBits stage;
    VkShaderStageFlags   nextStage;
    VkShaderCodeTypeEXT  codeType;
    size_t               codeSize;
    const void*          pCode;
    const char*          pName;
    uint32_t             setLayoutCount;
    const VkDescriptorSetLayout* pSetLayouts;
    uint32_t             pushConstantRangeCount;
    const VkPushConstantRange* pPushConstantRanges;
    const VkSpecializationInfo* pSpecializationInfo;
} VkShaderCreateInfoEXT;
```
• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is `NULL` or a pointer to a structure extending this structure.
• **flags** is a bitmask of `VkShaderCreateFlagBitsEXT` describing additional parameters of the shader.
• **stage** is a `VkShaderStageFlagBits` value specifying a single shader stage.
• **nextStage** is a bitmask of `VkShaderStageFlagBits` specifying zero or stages which may be used as a logically next bound stage when drawing with the shader bound.
• **codeType** is a `VkShaderCodeTypeEXT` value specifying the type of the shader code pointed to be `pCode`.
• **codeSize** is the size in bytes of the shader code pointed to be `pCode`.
• **pName** is a pointer to a null-terminated UTF-8 string specifying the entry point name of the shader for this stage.
• **setLayoutCount** is the number of descriptor set layouts pointed to by `pSetLayouts`.
• **pSetLayouts** is a pointer to an array of `VkDescriptorSetLayout` objects used by the shader stage.
• **pushConstantRangeCount** is the number of push constant ranges pointed to by `pPushConstantRanges`.
• **pPushConstantRanges** is a pointer to an array of `VkPushConstantRange` structures used by the shader stage.
• **pSpecializationInfo** is a pointer to a `VkSpecializationInfo` structure, as described in Specialization Constants, or `NULL`.

### Valid Usage

- **VUID-VkShaderCreateInfoEXT-codeSize-08735**
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `codeSize` must be a multiple of 4
- **VUID-VkShaderCreateInfoEXT-pCode-08736**
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `pCode` must point to valid SPIR-V code, formatted and packed as described by the Khronos SPIR-V Specification
- **VUID-VkShaderCreateInfoEXT-pCode-08737**
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `pCode` must adhere to the validation rules described by the Validation Rules within a Module section of the SPIR-V Environment appendix
- **VUID-VkShaderCreateInfoEXT-pCode-08738**
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `pCode` must declare the Shader capability for SPIR-V code
- **VUID-VkShaderCreateInfoEXT-pCode-08739**
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `pCode` must not declare any capability that is...
not supported by the API, as described by the Capabilities section of the SPIR-V Environment appendix

- VUID-VkShaderCreateInfoEXT-pCode-08740
  If codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and pCode declares any of the capabilities listed in the SPIR-V Environment appendix, one of the corresponding requirements must be satisfied

- VUID-VkShaderCreateInfoEXT-pCode-08741
  If codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, pCode must not declare any SPIR-V extension that is not supported by the API, as described by the Extension section of the SPIR-V Environment appendix

- VUID-VkShaderCreateInfoEXT-pCode-08742
  If codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and pCode declares any of the SPIR-V extensions listed in the SPIR-V Environment appendix, one of the corresponding requirements must be satisfied

- VUID-VkShaderCreateInfoEXT-flags-08412
  If stage is not VK_SHADER_STAGE_TASK_BIT_EXT, VK_SHADER_STAGE_MESH_BIT_EXT, VK_SHADER_STAGE_VERTEX_BIT, VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT, VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, VK_SHADER_STAGE_GEOMETRY_BIT, or VK_SHADER_STAGE_FRAGMENT_BIT, flags must not include VK_SHADER_CREATE_LINK_STAGE_BIT_EXT

- VUID-VkShaderCreateInfoEXT-flags-08486
  If stage is not VK_SHADER_STAGE_FRAGMENT_BIT, flags must not include VK_SHADER_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_EXT

- VUID-VkShaderCreateInfoEXT-flags-08487
  If the attachmentFragmentShadingRate feature is not enabled, flags must not include VK_SHADER_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_EXT

- VUID-VkShaderCreateInfoEXT-flags-08485
  If stage is not VK_SHADER_STAGE_COMPUTE_BIT, flags must not include VK_SHADER_CREATE_DISPATCH_BASE_BIT_EXT

- VUID-VkShaderCreateInfoEXT-flags-08416
  If flags includes both VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT and VK_SHADER_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT, the local workgroup size in the X dimension of the shader must be a multiple of maxSubgroupSize

- VUID-VkShaderCreateInfoEXT-flags-08417
If flags includes `VK_SHADER_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT` but not `VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT` and no `VkShaderRequiredSubgroupSizeCreateInfoEXT` structure is included in the `pNext` chain, the local workgroup size in the X dimension of the shader **must** be a multiple of subgroupSize

- **VUID-VkShaderCreateInfoEXT-stage-08418**
  - stage **must** not be `VK_SHADER_STAGE_ALL_GRAPHICS` or `VK_SHADER_STAGE_ALL`

- **VUID-VkShaderCreateInfoEXT-stage-08419**
  - If the tessellationShader feature is not enabled, stage **must** not be `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` or `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`

- **VUID-VkShaderCreateInfoEXT-stage-08420**
  - If the geometryShader feature is not enabled, stage **must** not be `VK_SHADER_STAGE_GEOMETRY_BIT`

- **VUID-VkShaderCreateInfoEXT-nextStage-08427**
  - If stage is `VK_SHADER_STAGE_VERTEX_BIT`, nextStage **must** not include any bits other than `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_GEOMETRY_BIT`, and `VK_SHADER_STAGE_FRAGMENT_BIT`

- **VUID-VkShaderCreateInfoEXT-nextStage-08428**
  - If the tessellationShader feature is not enabled, nextStage **must** not include `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` or `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`

- **VUID-VkShaderCreateInfoEXT-nextStage-08429**
  - If the geometryShader feature is not enabled, nextStage **must** not include `VK_SHADER_STAGE_GEOMETRY_BIT`

- **VUID-VkShaderCreateInfoEXT-nextStage-08430**
  - If stage is `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, nextStage **must** not include any bits other than `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`

- **VUID-VkShaderCreateInfoEXT-nextStage-08431**
  - If stage is `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, nextStage **must** not include any bits other than `VK_SHADER_STAGE_GEOMETRY_BIT` and `VK_SHADER_STAGE_FRAGMENT_BIT`

- **VUID-VkShaderCreateInfoEXT-nextStage-08432**
  - If stage is `VK_SHADER_STAGE_GEOMETRY_BIT`, nextStage **must** not include any bits other than `VK_SHADER_STAGE_FRAGMENT_BIT`

- **VUID-VkShaderCreateInfoEXT-nextStage-08433**
  - If stage is `VK_SHADER_STAGE_FRAGMENT_BIT` or `VK_SHADER_STAGE_COMPUTE_BIT`, nextStage **must** be 0

- **VUID-VkShaderCreateInfoEXT-pName-08440**
  - If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `pName` **must** be the name of an `OpEntryPoint` in `pCode` with an execution model that matches stage

- **VUID-VkShaderCreateInfoEXT-pCode-08492**
  - If `codeType` is `VK_SHADER_CODE_TYPE_BINARY_EXT`, `pCode` **must** be aligned to 16 bytes

- **VUID-VkShaderCreateInfoEXT-pCode-08493**
If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `pCode` must be aligned to 4 bytes

- VUID-VkShaderCreateInfoEXT-pCode-08448
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and the identified entry point includes any variable in its interface that is declared with the `ClipDistance` `BuiltIn` decoration, that variable must not have an array size greater than `VkPhysicalDeviceLimits::maxClipDistances`

- VUID-VkShaderCreateInfoEXT-pCode-08449
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and the identified entry point includes any variable in its interface that is declared with the `CullDistance` `BuiltIn` decoration, that variable must not have an array size greater than `VkPhysicalDeviceLimits::maxCullDistances`

- VUID-VkShaderCreateInfoEXT-pCode-08450
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and the identified entry point includes variables in its interface that are declared with the `ClipDistance` `BuiltIn` decoration and variables in its interface that are declared with the `CullDistance` `BuiltIn` decoration, those variables must not have array sizes which sum to more than `VkPhysicalDeviceLimits::maxCombinedClipAndCullDistances`

- VUID-VkShaderCreateInfoEXT-pCode-08451
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and the identified entry point includes any variable in its interface that is declared with the `SampleMask` `BuiltIn` decoration, that variable must not have an array size greater than `VkPhysicalDeviceLimits::maxSampleMaskWords`

- VUID-VkShaderCreateInfoEXT-pCode-08452
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and stage is `VK_SHADER_STAGE_VERTEX_BIT`, the identified entry point must not include any input variable in its interface that is decorated with `CullDistance`

- VUID-VkShaderCreateInfoEXT-pCode-08453
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and stage is `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` or `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, and the identified entry point has an `OpExecutionMode` instruction specifying a patch size with `OutputVertices`, the patch size must be greater than 0 and less than or equal to `VkPhysicalDeviceLimits::maxTessellationPatchSize`

- VUID-VkShaderCreateInfoEXT-pCode-08454
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and stage is `VK_SHADER_STAGE_GEOMETRY_BIT`, the identified entry point must have an `OpExecutionMode` instruction specifying a maximum output vertex count that is greater than 0 and less than or equal to `VkPhysicalDeviceLimits::maxGeometryOutputVertices`

- VUID-VkShaderCreateInfoEXT-pCode-08455
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and stage is `VK_SHADER_STAGE_GEOMETRY_BIT`, the identified entry point must have an `OpExecutionMode` instruction specifying an invocation count that is greater than 0 and less than or equal to `VkPhysicalDeviceLimits::maxGeometryShaderInvocations`

- VUID-VkShaderCreateInfoEXT-pCode-08456
If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is a pre-rasterization shader stage, and the identified entry point writes to `Layer` for any primitive, it must write the same value to `Layer` for all vertices of a given primitive.

- **VUID-VkShaderCreateInfoEXT-pCode-08457**
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is a pre-rasterization shader stage, and the identified entry point writes to `ViewportIndex` for any primitive, it must write the same value to `ViewportIndex` for all vertices of a given primitive.

- **VUID-VkShaderCreateInfoEXT-pCode-08458**
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_FRAGMENT_BIT`, the identified entry point must not include any output variables in its interface decorated with `CullDistance`.

- **VUID-VkShaderCreateInfoEXT-pCode-08459**
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_FRAGMENT_BIT`, and the identified entry point writes to `FragDepth` in any execution path, all execution paths that are not exclusive to helper invocations must either discard the fragment, or write or initialize the value of `FragDepth`.

- **VUID-VkShaderCreateInfoEXT-pCode-08460**
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, the shader code in `pCode` must be valid as described by the Khronos SPIR-V Specification after applying the specializations provided in `pSpecializationInfo`, if any, and then converting all specialization constants into fixed constants.

- **VUID-VkShaderCreateInfoEXT-codeType-08872**
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, `pCode` must contain an `OpExecutionMode` instruction specifying the type of subdivision.

- **VUID-VkShaderCreateInfoEXT-codeType-08873**
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, `pCode` must contain an `OpExecutionMode` instruction specifying the orientation of triangles generated by the tessellator.

- **VUID-VkShaderCreateInfoEXT-codeType-08874**
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, `pCode` must contain an `OpExecutionMode` instruction specifying the spacing of segments on the edges of tessellated primitives.

- **VUID-VkShaderCreateInfoEXT-codeType-08875**
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, `pCode` must contain an `OpExecutionMode` instruction specifying the output patch size.

**Valid Usage (Implicit)**

- **VUID-VkShaderCreateInfoEXT-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_SHADER_CREATE_INFO_EXT`.

- **VUID-VkShaderCreateInfoEXT-pNext-pNext**
pNext must be NULL or a pointer to a valid instance of VkPipelineShaderStageRequiredSubgroupSizeCreateInfo

- VUID-VkShaderCreateInfoEXT-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkShaderCreateInfoEXT-flags-parameter
  flags must be a valid combination of VkShaderCreateFlagBitsEXT values

- VUID-VkShaderCreateInfoEXT-stage-parameter
  stage must be a valid VkShaderStageFlagBits value

- VUID-VkShaderCreateInfoEXT-nextStage-parameter
  nextStage must be a valid combination of VkShaderStageFlagBits values

- VUID-VkShaderCreateInfoEXT-codeType-parameter
  codeType must be a valid VkShaderCodeTypeEXT value

- VUID-VkShaderCreateInfoEXT-pCode-parameter
  pCode must be a valid pointer to an array of codeSize bytes

- VUID-VkShaderCreateInfoEXT-pName-parameter
  If pName is not NULL, pName must be a null-terminated UTF-8 string

- VUID-VkShaderCreateInfoEXT-pSetLayouts-parameter
  If setLayoutCount is not 0, and pSetLayouts is not NULL, pSetLayouts must be a valid pointer to an array of setLayoutCount valid VkDescriptorSetLayout handles

- VUID-VkShaderCreateInfoEXT-pPushConstantRanges-parameter
  If pushConstantRangeCount is not 0, and pPushConstantRanges is not NULL, pPushConstantRanges must be a valid pointer to an array of pushConstantRangeCount valid VkPushConstantRange structures

- VUID-VkShaderCreateInfoEXT-pSpecializationInfo-parameter
  If pSpecializationInfo is not NULL, pSpecializationInfo must be a valid pointer to a valid VkSpecializationInfo structure

- VUID-VkShaderCreateInfoEXT-codeSize-arraylength
  codeSize must be greater than 0

// Provided by VK_EXT_shader_object
typedef VkFlags VkShaderCreateFlagsEXT;

VkShaderCreateFlagsEXT is a bitmask type for setting a mask of zero or more VkShaderCreateFlagBitsEXT.

Possible values of the flags member of VkShaderCreateInfoEXT specifying how a shader object is created, are:

// Provided by VK_EXT_shader_object with VK_EXT_subgroup_size_control or

```c
typedef enum VkShaderCreateFlagBitsEXT {
    VK_SHADER_CREATE_LINK_STAGE_BIT_EXT = 0x00000001,
    // Provided by VK_EXT_shader_object
};
```
VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT = 0x00000002,
// Provided by VK_EXT_shader_object with VK_EXT_subgroup_size_control or
VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT = 0x000000004,
// Provided by VK_EXT_shader_object with VK_EXT_mesh_shader or VK_NV_mesh_shader
VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT = 0x00000008,
// Provided by VK_EXT_shader_object with VK_KHR_device_group or VK_VERSION_1_1
VK_SHADER_CREATE_DISPATCH_BASE_BIT_EXT = 0x00000010,
// Provided by VK_KHR_fragment_shading_rate with VK_EXT_shader_object
VK_SHADER_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_EXT = 0x00000020,
// Provided by VK_EXT_fragment_density_map with VK_EXT_shader_object
VK_SHADER_CREATE_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT = 0x00000040,
}

VkShaderCreateFlagBitsEXT;

• **VK_SHADER_CREATE_LINK_STAGE_BIT_EXT** specifies that a shader is linked to all other shaders created in the same *vkCreateShadersEXT* call whose *VkShaderCreateInfoEXT* structures’ flags include **VK_SHADER_CREATE_LINK_STAGE_BIT_EXT**.

• **VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT** specifies that the SubgroupSize may vary in a compute shader.

• **VK_SHADER_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT** specifies that the subgroup sizes must be launched with all invocations active in a compute shader.

• **VK_SHADER_CREATE_DISPATCH_BASE_BIT_EXT** specifies that a compute shader can be used with *vkCmdDispatchBase* with a non-zero base workgroup.

• **VK_SHADER_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_EXT** specifies that a fragment shader can be used with a fragment shading rate attachment.

**Note**

The behavior of **VK_SHADER_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_EXT** differs subtly from the behavior of **VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR** in that the shader bit allows, but does not require the shader to be used with that type of attachment. This means that the application need not create multiple shaders when it does not know in advance whether the shader will be used with or without the attachment type, or when it needs the same shader to be compatible with usage both with and without. This may come at some performance cost on some implementations, so applications should still only set bits that are actually necessary.

Shader objects can be created using different types of shader code. Possible values of *VkShaderCreateInfoEXT::codeType*, are:

```c
typedef enum VkShaderCodeTypeEXT {
    VK_SHADER_CODE_TYPE_BINARY_EXT = 0,
    VK_SHADER_CODE_TYPE_SPIRV_EXT = 1,
};
```
VK_SHADER_CODE_TYPE_BINARY_EXT specifies shader code in an opaque, implementation-defined binary format specific to the physical device.

VK_SHADER_CODE_TYPE_SPIRV_EXT specifies shader code in SPIR-V format.

### 9.1.2. Binary Shader Code

Binary shader code can be retrieved from a shader object using the command:

```c
// Provided by VK_EXT_shader_object
VkResult vkGetShaderBinaryDataEXT(
    VkDevice device,
    VkShaderEXT shader,
    size_t* pDataSize,
    void* pData);
```

- **device** is the logical device that shader object was created from.
- **shader** is the shader object to retrieve binary shader code from.
- **pDataSize** is a pointer to a `size_t` value related to the size of the binary shader code, as described below.
- **pData** is either `NULL` or a pointer to a buffer.

If `pData` is `NULL`, then the size of the binary shader code of the shader object, in bytes, is returned in `pDataSize`. Otherwise, `pDataSize` must point to a variable set by the user to the size of the buffer, in bytes, pointed to by `pData`, and on return the variable is overwritten with the amount of data actually written to `pData`. If `pDataSize` is less than the size of the binary shader code, nothing is written to `pData`, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`.

**Note**

The behavior of this command when `pDataSize` is too small differs from how some other getter-type commands work in Vulkan. Because shader binary data is only usable in its entirety, it would never be useful for the implementation to return partial data. Because of this, nothing is written to `pData` unless `pDataSize` is large enough to fit the data in its entirety.

Binary shader code retrieved using `vkGetShaderBinaryDataEXT` can be passed to a subsequent call to `vkCreateShadersEXT` on a compatible physical device by specifying `VK_SHADER_CODE_TYPE_BINARY_EXT` in the `codeType` member of `VkShaderCreateInfoEXT`.

The shader code returned by repeated calls to this function with the same `VkShaderEXT` is guaranteed to be invariant for the lifetime of the `VkShaderEXT` object.
### Valid Usage

- VUID-vkGetShaderBinaryDataEXT-None-08461
  The `shaderObject` feature **must** be enabled

- VUID-vkGetShaderBinaryDataEXT-None-08499
  If `pData` is not NULL, it **must** be aligned to 16 bytes

### Valid Usage (Implicit)

- VUID-vkGetShaderBinaryDataEXT-device-parameter
  `device` **must** be a valid `VkDevice` handle

- VUID-vkGetShaderBinaryDataEXT-shader-parameter
  `shader` **must** be a valid `VkShaderEXT` handle

- VUID-vkGetShaderBinaryDataEXT-pDataSize-parameter
  `pDataSize` **must** be a valid pointer to a `size_t` value

- VUID-vkGetShaderBinaryDataEXT-pData-parameter
  If the value referenced by `pDataSize` is not 0, and `pData` is not NULL, `pData` **must** be a valid pointer to an array of `pDataSize` bytes

- VUID-vkGetShaderBinaryDataEXT-shader-parent
  `shader` **must** have been created, allocated, or retrieved from `device`

### Return Codes

#### Success
- `VK_SUCCESS`
- `VK_INCOMPLETE`

#### Failure
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

### 9.1.3. Binary Shader Compatibility

Binary shader compatibility means that binary shader code returned from a call to `vkGetShaderBinaryDataEXT` can be passed to a later call to `vkCreateShadersEXT`, potentially on a different logical and/or physical device, and that this will result in the successful creation of a shader object functionally equivalent to the shader object that the code was originally queried from.

Binary shader code queried from `vkGetShaderBinaryDataEXT` is not guaranteed to be compatible across all devices, but implementations are required to provide some compatibility guarantees. Applications **may** determine binary shader compatibility using either (or both) of two mechanisms.
Guaranteed compatibility of shader binaries is expressed through a combination of the `shaderBinaryUUID` and `shaderBinaryVersion` members of the `VkPhysicalDeviceShaderObjectPropertiesEXT` structure queried from a physical device. Binary shaders retrieved from a physical device with a certain `shaderBinaryUUID` are guaranteed to be compatible with all other physical devices reporting the same `shaderBinaryUUID` and the same or higher `shaderBinaryVersion`.

Whenever a new version of an implementation incorporates any changes that affect the output of `vkGetShaderBinaryDataEXT`, the implementation should either increment `shaderBinaryVersion` if binary shader code retrieved from older versions remains compatible with the new implementation, or else replace `shaderBinaryUUID` with a new value if backward compatibility has been broken. Binary shader code queried from a device with a matching `shaderBinaryUUID` and lower `shaderBinaryVersion` relative to the device on which `vkCreateShadersEXT` is being called may be suboptimal for the new device in ways that do not change shader functionality, but it is still guaranteed to be usable to successfully create the shader object(s).

Note
Implementations are encouraged to share `shaderBinaryUUID` between devices and driver versions to the maximum extent their hardware naturally allows, and are strongly discouraged from ever changing the `shaderBinaryUUID` for the same hardware except unless absolutely necessary.

In addition to the shader compatibility guarantees described above, it is valid for an application to call `vkCreateShadersEXT` with binary shader code created on a device with a different or unknown `shaderBinaryUUID` and/or higher `shaderBinaryVersion`. In this case, the implementation may use any unspecified means of its choosing to determine whether the provided binary shader code is usable. If it is, the `vkCreateShadersEXT` call must return `VK_SUCCESS`, and the created shader object is guaranteed to be valid. Otherwise, in the absence of some other error, the `vkCreateShadersEXT` call must return `VK_ERROR_INCOMPATIBLE_SHADER_BINARY_EXT` to indicate that the provided binary shader code is not compatible with the device.

### 9.1.4. Binding Shader Objects

Once shader objects have been created, they can be bound to the command buffer using the command:

```c
// Provided by VK_EXT_shader_object
void vkCmdBindShadersEXT(
    VkCommandBuffer commandBuffer,  // Provided by VK_EXT_shader_object
    uint32_t stageCount,            // Provided by VK_EXT_shader_object
    const VkShaderStageFlagBits* pStages,  // Provided by VK_EXT_shader_object
    const VkShaderEXT* pShaders);  // Provided by VK_EXT_shader_object
```

- `commandBuffer` is the command buffer that the shader object will be bound to.
- `stageCount` is the length of the `pStages` and `pShaders` arrays.
- `pStages` is a pointer to an array of `VkShaderStageFlagBits` values specifying one stage per array
index that is affected by the corresponding value in the pShaders array.

- pShaders is a pointer to an array of VkShaderEXT handles and/or VK_NULL_HANDLE values describing the shader binding operations to be performed on each stage in pStages.

When binding linked shaders, an application may bind them in any combination of one or more calls to vkCmdBindShadersEXT (i.e., shaders that were created linked together do not need to be bound in the same vkCmdBindShadersEXT call).

Any shader object bound to a particular stage may be unbound by setting its value in pShaders to VK_NULL_HANDLE. If pShaders is NULL, vkCmdBindShadersEXT behaves as if pShaders was an array of stageCount VK_NULL_HANDLE values (i.e., any shaders bound to the stages specified in pStages are unbound).

### Valid Usage

- VUID-vkCmdBindShadersEXT-None-08462
  The shaderObject feature must be enabled

- VUID-vkCmdBindShadersEXT-pStages-08463
  Every element of pStages must be unique

- VUID-vkCmdBindShadersEXT-pStages-08464
  pStages must not contain VK_SHADER_STAGE_ALL_GRAPHICS or VK_SHADER_STAGE_ALL

- VUID-vkCmdBindShadersEXT-pStages-08465
  pStages must not contain VK_SHADER_STAGE_RAYGEN_BIT_KHR, VK_SHADER_STAGE_ANY_HIT_BIT_KHR, VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR, VK_SHADER_STAGE_MISS_BIT_KHR, VK_SHADER_STAGE_INTERSECTION_BIT_KHR, or VK_SHADER_STAGE_CALLABLE_BIT_KHR

- VUID-vkCmdBindShadersEXT-pShaders-08469
  For each element of pStages, if pShaders is not NULL, and the element of the pShaders array with the same index is not VK_NULL_HANDLE, it must have been created with a stage equal to the corresponding element of pStages

- VUID-vkCmdBindShadersEXT-pShaders-08474
  If the tessellationShader feature is not enabled, and pStages contains VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT or VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, and pShaders is not NULL, the same index or indices in pShaders must be VK_NULL_HANDLE

- VUID-vkCmdBindShadersEXT-pShaders-08475
  If the geometryShader feature is not enabled, and pStages contains VK_SHADER_STAGE_GEOMETRY_BIT, and pShaders is not NULL, the same index in pShaders must be VK_NULL_HANDLE

- VUID-vkCmdBindShadersEXT-pShaders-08476
  If pStages contains VK_SHADER_STAGE_COMPUTE_BIT, the VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdBindShadersEXT-pShaders-08477
  If pStages contains VK_SHADER_STAGE_VERTEX_BIT, VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT, VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, VK_SHADER_STAGE_RAYGEN_BIT_KHR, VK_SHADER_STAGE_ANY_HIT_BIT_KHR, VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR, VK_SHADER_STAGE_MISS_BIT_KHR, VK_SHADER_STAGE_INTERSECTION_BIT_KHR, or VK_SHADER_STAGE_CALLABLE_BIT_KHR, the VkCommandPool that commandBuffer was allocated from must support compute operations
VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, VK_SHADER_STAGE_GEOMETRY_BIT, or VK_SHADER_STAGE_FRAGMENT_BIT, the VkCommandPool that commandBuffer was allocated from must support graphics operations.

**Valid Usage (Implicit)**

- VUID-vkCmdBindShadersEXT-commandBuffer-parameter
  - commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdBindShadersEXT-pStages-parameter
  - pStages must be a valid pointer to an array of stageCount valid VkShaderStageFlagBits values

- VUID-vkCmdBindShadersEXT-pShaders-parameter
  - If pShaders is not NULL, pShaders must be a valid pointer to an array of stageCount valid or VK_NULL_HANDLE VkShaderEXT handles

- VUID-vkCmdBindShadersEXT-commandBuffer-recording
  - commandBuffer must be in the recording state

- VUID-vkCmdBindShadersEXT-commandBuffer-cmdpool
  - The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations

- VUID-vkCmdBindShadersEXT-videocoding
  - This command must only be called outside of a video coding scope

- VUID-vkCmdBindShadersEXT-stageCount-arraylength
  - stageCount must be greater than 0

- VUID-vkCmdBindShadersEXT-commonparent
  - Both of commandBuffer, and the elements of pShaders that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>

9.1.5. Setting State

Whenever shader objects are used to issue drawing commands, the appropriate dynamic state setting commands must have been called to set the relevant state in the command buffer prior to drawing:

- `vkCmdSetViewportWithCount`
- `vkCmdSetScissorWithCount`
- `vkCmdSetRasterizerDiscardEnable`
- `vkCmdSetVertexInputEXT`
- `vkCmdSetPrimitiveTopology`
- `vkCmdSetPatchControlPointsEXT`, if `primitiveTopology` is `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`
- `vkCmdSetPrimitiveRestartEnable`

If a shader is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` stage, the following command must have been called in the command buffer prior to drawing:

- `vkCmdSetTessellationDomainOriginEXT`

If `rasterizerDiscardEnable` is `VK_FALSE`, the following commands must have been called in the command buffer prior to drawing:

- `vkCmdSetRasterizationSamplesEXT`
- `vkCmdSetSampleMaskEXT`
- `vkCmdSetAlphaToCoverageEnableEXT`
- `vkCmdSetAlphaToOneEnableEXT`, if the `alphaToOne` feature is enabled on the device
- `vkCmdSetPolygonModeEXT`
- `vkCmdSetLineWidth`, if `polygonMode` is `VK_POLYGON_MODE_LINE`, or if `primitiveTopology` is a line topology, or if a shader which outputs line primitives is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT` stage
- `vkCmdSetCullMode`
- `vkCmdSetFrontFace`
- `vkCmdSetDepthTestEnable`
- `vkCmdSetDepthWriteEnable`
- `vkCmdSetDepthCompareOp`, if `depthTestEnable` is `VK_TRUE`
- `vkCmdSetDepthBoundsTestEnable`, if the `depthBounds` feature is enabled on the device
- `vkCmdSetDepthBounds`, if `depthBoundsTestEnable` is `VK_TRUE`
- `vkCmdSetDepthBiasEnable`
- `vkCmdSetDepthBias` or `vkCmdSetDepthBias2EXT`, if `depthBiasEnable` is `VK_TRUE`
- `vkCmdSetDepthClampEnableEXT`, if the `depthClamp` feature is enabled on the device
- `vkCmdSetStencilTestEnable`
• `vkCmdSetStencilOp`, if `stencilTestEnable` is `VK_TRUE`
• `vkCmdSetStencilCompareMask`, if `stencilTestEnable` is `VK_TRUE`
• `vkCmdSetStencilWriteMask`, if `stencilTestEnable` is `VK_TRUE`
• `vkCmdSetStencilReference`, if `stencilTestEnable` is `VK_TRUE`

If a shader is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and `rasterizerDiscardEnable` is `VK_FALSE`, the following commands **must** have been called in the command buffer prior to drawing:

• `vkCmdSetLogicOpEnableEXT`, if the `logicOp` feature is enabled on the device
• `vkCmdSetLogicOpEXT`, if `logicOpEnable` is `VK_TRUE`
• `vkCmdSetColorBlendEnableEXT`, with values set for every color attachment in the render pass instance active at draw time
• `vkCmdSetColorBlendEquationEXT`, for every attachment whose index in `pColorBlendEnables` is a pointer to a value of `VK_TRUE`
• `vkCmdSetBlendConstants`, if any index in `pColorBlendEnables` is `VK_TRUE`, and the same index in `pColorBlendEquations` is a `VkColorBlendEquationEXT` structure with any `VkBlendFactor` member with a value of `VK_BLEND_FACTOR_CONSTANT_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR`, `VK_BLEND_FACTOR_CONSTANT_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA`
• `vkCmdSetColorWriteMaskEXT`

If the `pipelineFragmentShadingRate` feature is enabled on the device, and a shader is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and `rasterizerDiscardEnable` is `VK_FALSE`, the following command **must** have been called in the command buffer prior to drawing:

• `vkCmdSetFragmentShadingRateKHR`

If the `VK_EXT_discard_rectangles` extension is enabled on the device, and `rasterizerDiscardEnable` is `VK_FALSE`, the following commands **must** have been called in the command buffer prior to drawing:

• `vkCmdSetDiscardRectangleEnableEXT`
• `vkCmdSetDiscardRectangleModeEXT`, if `discardRectangleEnable` is `VK_TRUE`
• `vkCmdSetDiscardRectangleEXT`, if `discardRectangleEnable` is `VK_TRUE`

If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled on the device, and `rasterizerDiscardEnable` is `VK_FALSE`, and if `polygonMode` is `VK_POLYGON_MODE_LINE` or a shader is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage and `primitiveTopology` is a line topology or a shader which outputs line primitives is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT` stage, the following commands **must** have been called in the command buffer prior to drawing:

• `vkCmdSetLineRasterizationModeEXT`
• `vkCmdSetLineStippleEnableEXT`
• `vkCmdSetLineStippleKHR`, if `stippledLineEnable` is `VK_TRUE`

If the `attachmentFeedbackLoopDynamicState` feature is enabled on the device, and a shader is
bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and `rasterizerDiscardEnable` is `VK_FALSE`, the following command **must** have been called in the command buffer prior to drawing:

- `vkCmdSetAttachmentFeedbackLoopEnableEXT`

State **can** be set either at any time before or after shader objects are bound, but all required state **must** be set prior to issuing drawing commands.

### 9.1.6. Interaction With Pipelines

Calling `vkCmdBindShadersEXT` causes the pipeline bind points corresponding to each stage in `pStages` to be disturbed, meaning that any pipelines that had previously been bound to those pipeline bind points are no longer bound.

If `VK_PIPELINE_BIND_POINT_GRAPHICS` is disturbed (i.e., if `pStages` contains any graphics stage), any graphics pipeline state that the previously bound pipeline did not specify as `dynamic` becomes undefined, and **must** be set in the command buffer before issuing drawing commands using shader objects.

Calls to `vkCmdBindPipeline` likewise disturb the shader stage(s) corresponding to `pipelineBindPoint`, meaning that any shaders that had previously been bound to any of those stages are no longer bound, even if the pipeline was created without shaders for some of those stages.

### 9.1.7. Shader Object Destruction

To destroy a shader object, call:

```c
// Provided by VK_EXT_shader_object
defined void vkDestroyShaderEXT(
    VkDevice device,  
    VkShaderEXT shader,  
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the shader object.
- **shader** is the handle of the shader object to destroy.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

Destroying a shader object used by one or more command buffers in the recording or executable state causes those command buffers to move into the invalid state.

### Valid Usage

- VUID-vkDestroyShaderEXT-None-08481
  The shaderObject feature **must** be enabled
- VUID-vkDestroyShaderEXT-shader-08482
  All submitted commands that refer to shader **must** have completed execution
- VUID-vkDestroyShaderEXT-pAllocator-08483
If VkAllocationCallbacks were provided when shader was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyShaderEXT-pAllocator-08484
  If no VkAllocationCallbacks were provided when shader was created, pAllocator must be NULL

Valid Usage (Implicit)

- VUID-vkDestroyShaderEXT-device-parameter
device must be a valid VkDevice handle

- VUID-vkDestroyShaderEXT-shader-parameter
  If shader is not VK_NULL_HANDLE, shader must be a valid VkShaderEXT handle

- VUID-vkDestroyShaderEXT-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroyShaderEXT-shader-parent
  If shader is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to shader must be externally synchronized

9.2. Shader Modules

Shader modules contain shader code and one or more entry points. Shaders are selected from a shader module by specifying an entry point as part of pipeline creation. The stages of a pipeline can use shaders that come from different modules. The shader code defining a shader module must be in the SPIR-V format, as described by the Vulkan Environment for SPIR-V appendix.

Shader modules are represented by VkShaderModule handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkShaderModule)
```

To create a shader module, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateShaderModule(  
    VkDevice           device,  
    const VkShaderModuleCreateInfo* pCreateInfo,  
    const VkAllocationCallbacks* pAllocator,  
    VkShaderModule* pShaderModule);
```
• **device** is the logical device that creates the shader module.

• **pCreateInfo** is a pointer to a `VkShaderModuleCreateInfo` structure.

• **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

• **pShaderModule** is a pointer to a `VkShaderModule` handle in which the resulting shader module object is returned.

Once a shader module has been created, any entry points it contains can be used in pipeline shader stages as described in Compute Pipelines and Graphics Pipelines.

Note

If the maintenance feature is enabled, shader module creation can be omitted entirely. Instead, applications should provide the `VkShaderModuleCreateInfo` structure directly in to pipeline creation by chaining it to `VkPipelineShaderStageCreateInfo`. This avoids the overhead of creating and managing an additional object.

**Valid Usage**

• VUID-vkCreateShaderModule-pCreateInfo-06904
  If `pCreateInfo` is not `NULL`, `pCreateInfo->pNext` must be `NULL`

**Valid Usage (Implicit)**

• VUID-vkCreateShaderModule-device-parameter
  `device` must be a valid `VkDevice` handle

• VUID-vkCreateShaderModule-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid `VkShaderModuleCreateInfo` structure

• VUID-vkCreateShaderModule-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

• VUID-vkCreateShaderModule-pShaderModule-parameter
  `pShaderModule` must be a valid pointer to a `VkShaderModule` handle

**Return Codes**

**Success**

• `VK_SUCCESS`

**Failure**

• `VK_ERROR_OUT_OF_HOST_MEMORY`

• `VK_ERROR_OUT_OF_DEVICE_MEMORY`
The `VkShaderModuleCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkShaderModuleCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkShaderModuleCreateFlags flags;
    size_t codeSize;
    const uint32_t* pCode;
} VkShaderModuleCreateInfo;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **codeSize** is the size, in bytes, of the code pointed to by **pCode**.
- **pCode** is a pointer to code that is used to create the shader module. The type and format of the code is determined from the content of the memory addressed by **pCode**.

### Valid Usage

- VUID-VkShaderModuleCreateInfo-codeSize-08735
  `codeSize` must be a multiple of 4
- VUID-VkShaderModuleCreateInfo-pCode-08736
  `pCode` must point to valid SPIR-V code, formatted and packed as described by the Khronos SPIR-V Specification
- VUID-VkShaderModuleCreateInfo-pCode-08737
  `pCode` must adhere to the validation rules described by the Validation Rules within a Module section of the SPIR-V Environment appendix
- VUID-VkShaderModuleCreateInfo-pCode-08738
  `pCode` must declare the Shader capability for SPIR-V code
- VUID-VkShaderModuleCreateInfo-pCode-08739
  `pCode` must not declare any capability that is not supported by the API, as described by the Capabilities section of the SPIR-V Environment appendix
- VUID-VkShaderModuleCreateInfo-pCode-08740
  and `pCode` declares any of the capabilities listed in the SPIR-V Environment appendix, one of the corresponding requirements must be satisfied
- VUID-VkShaderModuleCreateInfo-pCode-08741
  `pCode` must not declare any SPIR-V extension that is not supported by the API, as described by the Extension section of the SPIR-V Environment appendix
- VUID-VkShaderModuleCreateInfo-pCode-08742
  and `pCode` declares any of the SPIR-V extensions listed in the SPIR-V Environment appendix, one of the corresponding requirements must be satisfied
Valid Usage (Implicit)

- VUID-VkShaderModuleCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_SHADER_MODULE_CREATE_INFO

- VUID-VkShaderModuleCreateInfo-flags-zerobitmask
  flags must be 0

- VUID-VkShaderModuleCreateInfo-pCode-parameter
  pCode must be a valid pointer to an array of \( \frac{\text{codeSize}}{4} \) uint32_t values

// Provided by VK_VERSION_1_0
typedef VkFlags VkShaderModuleCreateFlags;

VkShaderModuleCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

To destroy a shader module, call:

// Provided by VK_VERSION_1_0
void vkDestroyShaderModule(
  VkDevice device,  // device is the logical device that destroys the shader module.
  VkShaderModule shaderModule,  // shaderModule is the handle of the shader module to destroy.
  const VkAllocationCallbacks* pAllocator);  // pAllocator controls host memory allocation as described in the Memory Allocation chapter.

A shader module can be destroyed while pipelines created using its shaders are still in use.

Valid Usage

- VUID-vkDestroyShaderModule-shaderModule-01092
  If VkAllocationCallbacks were provided when shaderModule was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyShaderModule-shaderModule-01093
  If no VkAllocationCallbacks were provided when shaderModule was created, pAllocator must be NULL
Valid Usage (Implicit)

- VUID-vkDestroyShaderModule-device-parameter
device must be a valid VkDevice handle

- VUID-vkDestroyShaderModule-shaderModule-parameter
If shaderModule is not VK_NULL_HANDLE, shaderModule must be a valid VkShaderModule handle

- VUID-vkDestroyShaderModule-pAllocator-parameter
If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroyShaderModule-shaderModule-parent
If shaderModule is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to shaderModule must be externally synchronized

9.3. Binding Shaders

Before a shader can be used it must be first bound to the command buffer.

Calling vkCmdBindPipeline binds all stages corresponding to the VkPipelineBindPoint. Calling vkCmdBindShadersEXT binds all stages in pStages

The following table describes the relationship between shader stages and pipeline bind points:

<table>
<thead>
<tr>
<th>Shader stage</th>
<th>Pipeline bind point</th>
<th>behavior controlled</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_SHADER_STAGE_VERTEX_BIT</td>

</tr>
</tbody>
</table>

### 9.4. Shader Execution

At each stage of the pipeline, multiple invocations of a shader may execute simultaneously. Further, invocations of a single shader produced as the result of different commands may execute simultaneously. The relative execution order of invocations of the same shader type is undefined. Shader invocations may complete in a different order than that in which the primitives they originated from were drawn or dispatched by the application. However, fragment shader outputs are written to attachments in rasterization order.

The relative execution order of invocations of different shader types is largely undefined. However, when invoking a shader whose inputs are generated from a previous pipeline stage, the shader invocations from the previous stage are guaranteed to have executed far enough to generate input values for all required inputs.

### 9.4.1. Shader Termination

A shader invocation that is terminated has finished executing instructions.

Executing `OpReturn` in the entry point, or executing `OpTerminateInvocation` in any function will terminate an invocation. Implementations may also terminate a shader invocation when `OpKill` is executed in any function; otherwise it becomes a helper invocation.

In addition to the above conditions, helper invocations are terminated when all non-helper invocations in the same derivative group either terminate or become helper invocations via `OpKill`.

A shader stage for a given command completes execution when all invocations for that stage have terminated.

### 9.5. Shader Memory Access Ordering

The order in which image or buffer memory is read or written by shaders is largely undefined. For
some shader types (vertex, tessellation evaluation, and in some cases, fragment), even the number of shader invocations that may perform loads and stores is undefined.

In particular, the following rules apply:

- **Vertex** and **tessellation evaluation** shaders will be invoked at least once for each unique vertex, as defined in those sections.
- **Fragment** shaders will be invoked zero or more times, as defined in that section.
- The relative execution order of invocations of the same shader type is undefined. A store issued by a shader when working on primitive B might complete prior to a store for primitive A, even if primitive A is specified prior to primitive B. This applies even to fragment shaders; while fragment shader outputs are always written to the framebuffer in rasterization order, stores executed by fragment shader invocations are not.
- The relative execution order of invocations of different shader types is largely undefined.

**Note**
The above limitations on shader invocation order make some forms of synchronization between shader invocations within a single set of primitives unimplementable. For example, having one invocation poll memory written by another invocation assumes that the other invocation has been launched and will complete its writes in finite time.

The **Memory Model** appendix defines the terminology and rules for how to correctly communicate between shader invocations, such as when a write is **Visible-To** a read, and what constitutes a **Data Race**.

Applications must not cause a data race.

The SPIR-V **SubgroupMemory**, **CrossWorkgroupMemory**, and **AtomicCounterMemory** memory semantics are ignored. Sequentially consistent atomics and barriers are not supported and **SequentiallyConsistent** is treated as **AcquireRelease**. **SequentiallyConsistent** should not be used.

### 9.6. Shader Inputs and Outputs

Data is passed into and out of shaders using variables with input or output storage class, respectively. User-defined inputs and outputs are connected between stages by matching their **Location** decorations. Additionally, data can be provided by or communicated to special functions provided by the execution environment using **BuiltIn** decorations.

In many cases, the same **BuiltIn** decoration can be used in multiple shader stages with similar meaning. The specific behavior of variables decorated as **BuiltIn** is documented in the following sections.

### 9.7. Vertex Shaders

Each vertex shader invocation operates on one vertex and its associated **vertex attribute** data, and
outputs one vertex and associated data. Graphics pipelines must include a vertex shader, and the vertex shader stage is always the first shader stage in the graphics pipeline.

### 9.7.1. Vertex Shader Execution

A vertex shader must be executed at least once for each vertex specified by a drawing command. If the subpass includes multiple views in its view mask, the shader may be invoked separately for each view. During execution, the shader is presented with the index of the vertex and instance for which it has been invoked. Input variables declared in the vertex shader are filled by the implementation with the values of vertex attributes associated with the invocation being executed.

If the same vertex is specified multiple times in a drawing command (e.g. by including the same index value multiple times in an index buffer) the implementation may reuse the results of vertex shading if it can statically determine that the vertex shader invocations will produce identical results.

**Note**

It is implementation-dependent when and if results of vertex shading are reused, and thus how many times the vertex shader will be executed. This is true also if the vertex shader contains stores or atomic operations (see vertexPipelineStoresAndAtomics).

### 9.8. Tessellation Control Shaders

The tessellation control shader is used to read an input patch provided by the application and to produce an output patch. Each tessellation control shader invocation operates on an input patch (after all control points in the patch are processed by a vertex shader) and its associated data, and outputs a single control point of the output patch and its associated data, and can also output additional per-patch data. The input patch is sized according to the patchControlPoints member of VkPipelineTessellationStateCreateInfo, as part of input assembly.

The input patch can also be dynamically sized with patchControlPoints parameter of vkCmdSetPatchControlPointsEXT.

To dynamically set the number of control points per patch, call:

```c
// Provided by VK_EXT_shader_object
void vkCmdSetPatchControlPointsEXT(
    VkCommandBuffer commandBuffer,
    uint32_t patchControlPoints);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **patchControlPoints** specifies the number of control points per patch.

This command sets the number of control points per patch for subsequent drawing commands when drawing using shader objects. Otherwise, this state is specified by the VkPipelineTessellationStateCreateInfo::patchControlPoints value used to create the currently active...
pipeline.

**Valid Usage**

- VUID-vkCmdSetPatchControlPointsEXT-None-09422
  At least one of the following must be true:
  - The shaderObject feature is enabled

- VUID-vkCmdSetPatchControlPointsEXT-patchControlPoints-04874
  patchControlPoints must be greater than zero and less than or equal to VkPhysicalDeviceLimits::maxTessellationPatchSize

**Valid Usage (Implicit)**

- VUID-vkCmdSetPatchControlPointsEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetPatchControlPointsEXT-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetPatchControlPointsEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetPatchControlPointsEXT-videocoding
  This command must only be called outside of a video coding scope

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

**Command Properties**

The size of the output patch is controlled by the OpExecutionMode OutputVertices specified in the tessellation control or tessellation evaluation shaders, which must be specified in at least one of the shaders. The size of the input and output patches must each be greater than zero and less than or equal to VkPhysicalDeviceLimits::maxTessellationPatchSize.
9.8.1. Tessellation Control Shader Execution

A tessellation control shader is invoked at least once for each output vertex in a patch. If the subpass includes multiple views in its view mask, the shader may be invoked separately for each view.

Inputs to the tessellation control shader are generated by the vertex shader. Each invocation of the tessellation control shader can read the attributes of any incoming vertices and their associated data. The invocations corresponding to a given patch execute logically in parallel, with undefined relative execution order. However, the OpControlBarrier instruction can be used to provide limited control of the execution order by synchronizing invocations within a patch, effectively dividing tessellation control shader execution into a set of phases. Tessellation control shaders will read undefined values if one invocation reads a per-vertex or per-patch output written by another invocation at any point during the same phase, or if two invocations attempt to write different values to the same per-patch output in a single phase.

9.9. Tessellation Evaluation Shaders

The Tessellation Evaluation Shader operates on an input patch of control points and their associated data, and a single input barycentric coordinate indicating the invocation’s relative position within the subdivided patch, and outputs a single vertex and its associated data.

9.9.1. Tessellation Evaluation Shader Execution

A tessellation evaluation shader is invoked at least once for each unique vertex generated by the tessellator. If the subpass includes multiple views in its view mask, the shader may be invoked separately for each view.

9.10. Geometry Shaders

The geometry shader operates on a group of vertices and their associated data assembled from a single input primitive, and emits zero or more output primitives and the group of vertices and their associated data required for each output primitive.

9.10.1. Geometry Shader Execution

A geometry shader is invoked at least once for each primitive produced by the tessellation stages, or at least once for each primitive generated by primitive assembly when tessellation is not in use. A shader can request that the geometry shader runs multiple instances. A geometry shader is invoked at least once for each instance. If the subpass includes multiple views in its view mask, the shader may be invoked separately for each view.

9.11. Fragment Shaders

Fragment shaders are invoked as a fragment operation in a graphics pipeline. Each fragment shader invocation operates on a single fragment and its associated data. With few exceptions, fragment shaders do not have access to any data associated with other fragments and are
9.12. Compute Shaders

Compute shaders are invoked via `vkCmdDispatch` and `vkCmdDispatchIndirect` commands. In general, they have access to similar resources as shader stages executing as part of a graphics pipeline.

Compute workloads are formed from groups of work items called workgroups and processed by the compute shader in the current compute pipeline. A workgroup is a collection of shader invocations that execute the same shader, potentially in parallel. Compute shaders execute in *global workgroups* which are divided into a number of *local workgroups* with a size that can be set by assigning a value to the `LocalSize` or `LocalSizeId` execution mode or via an object decorated by the `WorkgroupSize` decoration. An invocation within a local workgroup can share data with other members of the local workgroup through shared variables and issue memory and control flow barriers to synchronize with other members of the local workgroup.

9.13. Ray Generation Shaders

A ray generation shader is similar to a compute shader. Its main purpose is to execute ray tracing queries using pipeline trace ray instructions (such as `OpTraceRayKHR`) and process the results.

9.13.1. Ray Generation Shader Execution

One ray generation shader is executed per ray tracing dispatch. Its location in the shader binding table (see *Shader Binding Table* for details) is passed directly into `vkCmdTraceRaysKHR` using the `pRaygenShaderBindingTable` parameter or .

Intersection shaders enable the implementation of arbitrary, application defined geometric primitives. An intersection shader for a primitive is executed whenever its axis-aligned bounding box is hit by a ray.

Like other ray tracing shader domains, an intersection shader operates on a single ray at a time. It also operates on a single primitive at a time. It is therefore the purpose of an intersection shader to compute the ray-primitive intersections and report them. To report an intersection, the shader calls the `OpReportIntersectionKHR` instruction.

An intersection shader communicates with any-hit and closest shaders by generating attribute values that they can read. Intersection shaders cannot read or modify the ray payload.

9.14.1. Intersection Shader Execution

The order in which intersections are found along a ray, and therefore the order in which intersection shaders are executed, is unspecified.

The intersection shader of the closest AABB which intersects the ray is guaranteed to be executed at
some point during traversal, unless the ray is forcibly terminated.

9.15. Any-Hit Shaders

The any-hit shader is executed after the intersection shader reports an intersection that lies within the current $[t_{\text{min}}, t_{\text{max}}]$ of the ray. The main use of any-hit shaders is to programmatically decide whether or not an intersection will be accepted. The intersection will be accepted unless the shader calls the `OpIgnoreIntersectionKHR` instruction. Any-hit shaders have read-only access to the attributes generated by the corresponding intersection shader, and can read or modify the ray payload.

9.15.1. Any-Hit Shader Execution

The order in which intersections are found along a ray, and therefore the order in which any-hit shaders are executed, is unspecified.

The any-hit shader of the closest hit is guaranteed to be executed at some point during traversal, unless the ray is forcibly terminated.

9.16. Closest Hit Shaders

Closest hit shaders have read-only access to the attributes generated by the corresponding intersection shader, and can read or modify the ray payload. They also have access to a number of system-generated values. Closest hit shaders can call pipeline trace ray instructions to recursively trace rays.

9.16.1. Closest Hit Shader Execution

Exactly one closest hit shader is executed when traversal is finished and an intersection has been found and accepted.

9.17. Miss Shaders

Miss shaders can access the ray payload and can trace new rays through the pipeline trace ray instructions, but cannot access attributes since they are not associated with an intersection.

9.17.1. Miss Shader Execution

A miss shader is executed instead of a closest hit shader if no intersection was found during traversal.

9.18. Callable Shaders

Callable shaders can access a callable payload that works similarly to ray payloads to do subroutine work.
9.18.1. Callable Shader Execution

A callable shader is executed by calling `OpExecuteCallableKHR` from an allowed shader stage.

9.19. Interpolation Decorations

Variables in the `Input` storage class in a fragment shader's interface are interpolated from the values specified by the primitive being rasterized.

*Note*

Interpolation decorations can be present on input and output variables in pre-rasterization shaders but have no effect on the interpolation performed.

An undecorated input variable will be interpolated with perspective-correct interpolation according to the primitive type being rasterized. Lines and polygons are interpolated in the same way as the primitive's clip coordinates. If the `NoPerspective` decoration is present, linear interpolation is instead used for lines and polygons. For points, as there is only a single vertex, input values are never interpolated and instead take the value written for the single vertex.

If the `Flat` decoration is present on an input variable, the value is not interpolated, and instead takes its value directly from the provoking vertex. Fragment shader inputs that are signed or unsigned integers, integer vectors, or any double-precision floating-point type must be decorated with `Flat`.

Interpolation of input variables is performed at an implementation-defined position within the fragment area being shaded. The position is further constrained as follows:

- If the `Centroid` decoration is used, the interpolation position used for the variable must also fall within the bounds of the primitive being rasterized.
- If the `Sample` decoration is used, the interpolation position used for the variable must be at the position of the sample being shaded by the current fragment shader invocation.
- If a sample count of 1 is used, the interpolation position must be at the center of the fragment area.

*Note*

As `Centroid` restricts the possible interpolation position to the covered area of the primitive, the position can be forced to vary between neighboring fragments when it otherwise would not. Derivatives calculated based on these differing locations can produce inconsistent results compared to undecorated inputs. It is recommended that input variables used in derivative calculations are not decorated with `Centroid`.

If the `PerVertexKHR` decoration is present on an input variable, the value is not interpolated, and instead values from all input vertices are available in an array. Each index of the array corresponds to one of the vertices of the primitive that produced the fragment.
9.20. Static Use

A SPIR-V module declares a global object in memory using the `OpVariable` instruction, which results in a pointer \( x \) to that object. A specific entry point in a SPIR-V module is said to \textit{statically use} that object if that entry point's call tree contains a function containing a instruction with \( x \) as an \textit{id} operand. A shader entry point also \textit{statically uses} any variables explicitly declared in its interface.

9.21. Scope

A \textit{scope} describes a set of shader invocations, where each such set is a \textit{scope instance}. Each invocation belongs to one or more scope instances, but belongs to no more than one scope instance for each scope.

The operations available between invocations in a given scope instance vary, with smaller scopes generally able to perform more operations, and with greater efficiency.

9.21.1. Cross Device

All invocations executed in a Vulkan instance fall into a single \textit{cross device scope instance}.

Whilst the \textit{CrossDevice} scope is defined in SPIR-V, it is disallowed in Vulkan. API synchronization commands \textbf{can} be used to communicate between devices.

9.21.2. Device

All invocations executed on a single device form a \textit{device scope instance}.

If the \texttt{vulkanMemoryModel} and \texttt{vulkanMemoryModelDeviceScope} features are enabled, this scope is represented in SPIR-V by the \textit{Device Scope}, which \textbf{can} be used as a \textit{Memory Scope} for barrier and atomic operations.

If both the \texttt{shaderDeviceClock} and \texttt{vulkanMemoryModelDeviceScope} features are enabled, using the Device Scope with the \texttt{OpReadClockKHR} instruction will read from a clock that is consistent across invocations in the same device scope instance.

There is no method to synchronize the execution of these invocations within SPIR-V, and this \textbf{can} only be done with API synchronization primitives.

Invocations executing on different devices in a device group operate in separate device scope instances.

9.21.3. Queue Family

Invocations executed by queues in a given queue family form a \textit{queue family scope instance}.

This scope is identified in SPIR-V as the \textit{QueueFamily Scope} if the \texttt{vulkanMemoryModel} feature is enabled, or if not, the Device Scope, which \textbf{can} be used as a Memory Scope for barrier and atomic operations.
If the `shaderDeviceClock` feature is enabled, but the `vulkanMemoryModelDeviceScope` feature is not enabled, using the `Device Scope` with the `OpReadClockKHR` instruction will read from a clock that is consistent across invocations in the same queue family scope instance.

There is no method to synchronize the execution of these invocations within SPIR-V, and this can only be done with API synchronization primitives.

Each invocation in a queue family scope instance **must** be in the same device scope instance.

### 9.21.4. Command

Any shader invocations executed as the result of a single command such as `vkCmdDispatch` or `vkCmdDraw` form a **command scope instance**. For indirect drawing commands with `drawCount` greater than one, invocations from separate draws are in separate command scope instances. For ray tracing shaders, an invocation group is an implementation-dependent subset of the set of shader invocations of a given shader stage which are produced by a single trace rays command.

There is no specific **Scope** for communication across invocations in a command scope instance. As this has a clear boundary at the API level, coordination here **can** be performed in the API, rather than in SPIR-V.

Each invocation in a command scope instance **must** be in the same queue-family scope instance.

For shaders without defined **workgroups**, this set of invocations forms an **invocation group** as defined in the **SPIR-V specification**.

### 9.21.5. Primitive

Any fragment shader invocations executed as the result of rasterization of a single primitive form a **primitive scope instance**.

There is no specific **Scope** for communication across invocations in a primitive scope instance.

Any generated **helper invocations** are included in this scope instance.

Each invocation in a primitive scope instance **must** be in the same command scope instance.

Any input variables decorated with `Flat` are uniform within a primitive scope instance.

### 9.21.6. Shader Call

Any **shader-call-related** invocations that are executed in one or more ray tracing execution models form a **shader call scope instance**.

The `ShaderCallKHR Scope` can be used as **Memory Scope** for barrier and atomic operations.

Each invocation in a shader call scope instance **must** be in the same queue family scope instance.

### 9.21.7. Workgroup

A **local workgroup** is a set of invocations that can synchronize and share data with each other using
memory in the **Workgroup** storage class.

The **Workgroup Scope** can be used as both an **Execution Scope** and **Memory Scope** for barrier and atomic operations.

Each invocation in a local workgroup **must** be in the same command scope instance.

Only compute shaders have defined workgroups - other shader types **cannot** use workgroup functionality. For shaders that have defined workgroups, this set of invocations forms an **invocation group** as defined in the **SPIR-V specification**.

When variables declared with the **Workgroup** storage class are explicitly laid out (hence they are also decorated with **Block**), the amount of storage consumed is the size of the largest Block variable, not counting any padding at the end. The amount of storage consumed by the non-Block variables declared with the **Workgroup** storage class is implementation-dependent. However, the amount of storage consumed may not exceed the largest block size that would be obtained if all active non-Block variables declared with **Workgroup** storage class were assigned offsets in an arbitrary order by successively taking the smallest valid offset according to the **Standard Storage Buffer Layout** rules, and with **Boolean** values considered as 32-bit integer values for the purpose of this calculation. (This is equivalent to using the GLSL std430 layout rules.)

### 9.21.8. Subgroup

A **subgroup** (see the subsection “Control Flow” of section 2 of the SPIR-V 1.3 Revision 1 specification) is a set of invocations that can synchronize and share data with each other efficiently.

The **Subgroup Scope** can be used as both an **Execution Scope** and **Memory Scope** for barrier and atomic operations. Other **subgroup features** allow the use of **group operations** with subgroup scope.

If the **shaderSubgroupClock** feature is enabled, using the **Subgroup Scope** with the **OpReadClockKHR** instruction will read from a clock that is consistent across invocations in the same subgroup.

For **shaders that have defined workgroups**, each invocation in a subgroup **must** be in the same **local workgroup**.

In other shader stages, each invocation in a subgroup **must** be in the same **device scope instance**.

Only **shader stages that support subgroup operations** have defined subgroups.

---

**Note**

In shaders, there are two kinds of uniformity that are of primary interest to applications: uniform within an invocation group (a.k.a. dynamically uniform), and uniform within a subgroup scope.

While one could make the assumption that being uniform in invocation group implies being uniform in subgroup scope, it is not necessarily the case for shader stages without defined workgroups.

For shader stages with defined workgroups however, the relationship between invocation group and subgroup scope is well defined as a subgroup is a subset of
the workgroup, and the workgroup is the invocation group. If a value is uniform in invocation group, it is by definition also uniform in subgroup scope. This is important if writing code like:

```glsl
uniform texture2DTextures[];
uint dynamicallyUniformValue = gl_WorkGroupID.x;
vec4 value = texelFetch(Textures[dynamicallyUniformValue], coord, 0);

// subgroupUniformValue is guaranteed to be uniform within the subgroup.
// This value also happens to be dynamically uniform.
vec4 subgroupUniformValue = subgroupBroadcastFirst(dynamicallyUniformValue);
```

In shader stages without defined workgroups, this gets complicated. Due to scoping rules, there is no guarantee that a subgroup is a subset of the invocation group, which in turn defines the scope for dynamically uniform. In graphics, the invocation group is a single draw command, except for multi-draw situations, and indirect draws with drawCount > 1, where there are multiple invocation groups, one per `DrawIndex`.

```glsl
// Assume SubgroupSize = 8, where 3 draws are packed together.
// Two subgroups were generated.
uniform texture2DTextures[];

// DrawIndex builtin is dynamically uniform
uint dynamicallyUniformValue = gl_DrawID;
// |
// | gl_DrawID = 0 | gl_DrawID = 1 | }
// | gl_DrawID = 2 | DrawID = 1 | }
// Subgroup 0: { 0, 0, 0, 0, 1, 1, 1, 1 } 
// Subgroup 1: { 2, 2, 2, 2, 1, 1, 1, 1 }

uint notActuallyDynamicallyUniformAnymore = subgroupBroadcastFirst(dynamicallyUniformValue);
// |
// | gl_DrawID = 0 | gl_DrawID = 1 | }
// | gl_DrawID = 2 | gl.DrawID = 1 | }
// Subgroup 0: { 0, 0, 0, 0, 0, 0, 0, 0 } 
// Subgroup 1: { 2, 2, 2, 2, 2, 2, 2, 2 }

// Bug. gl_DrawID = 1's invocation group observes both index 0 and 2.
vec4 value = texelFetch(Textures[notActuallyDynamicallyUniformAnymore], coord, 0);
```

Another problematic scenario is when a shader attempts to help the compiler notice that a value is uniform in subgroup scope to potentially improve performance.
layout(location = 0) flat in dynamicallyUniformIndex;
// Vertex shader might have emitted a value that depends only on
gl_DrawID,
// making it dynamically uniform.
// Give knowledge to compiler that the flat input is dynamically
uniform,
// as this is not a guarantee otherwise.

// Hazard: If different draw commands are packed into one subgroup, the
uniformIndex is wrong.

uint uniformIndex = subgroupBroadcastFirst(dynamicallyUniformIndex);

DrawData d = UBO.perDrawData[uniformIndex];

For implementations where subgroups are packed across draws, the
implementation must make sure to handle descriptor indexing correctly. From the
specification's point of view, a dynamically uniform index does not require
NonUniform decoration, and such an implementation will likely either promote
descriptor indexing into NonUniform on its own, or handle non-uniformity
implicitly.

### 9.21.9. Quad

A **quad scope instance** is formed of four shader invocations.

In a fragment shader, each invocation in a quad scope instance is formed of invocations in
neighboring framebuffer locations \((x_i, y_i)\), where:

- \(i\) is the index of the invocation within the scope instance.
- \(w\) and \(h\) are the number of pixels the fragment covers in the \(x\) and \(y\) axes.
- \(w\) and \(h\) are identical for all participating invocations.
- \((x_0) = (x_1 - w) = (x_2) = (x_3 - w)\)
- \((y_0) = (y_1) = (y_2 - h) = (y_3 - h)\)
- Each invocation has the same layer and sample indices.

In all shaders, each invocation in a quad scope instance is formed of invocations in adjacent
subgroup invocation indices \((s_i)\), where:

- \(i\) is the index of the invocation within the quad scope instance.
- \((s_0) = (s_1 - 1) = (s_2 - 2) = (s_3 - 3)\)
- \(s_0\) is an integer multiple of 4.

Each invocation in a quad scope instance **must** be in the same subgroup.

In a fragment shader, each invocation in a quad scope instance **must** be in the same primitive
scope instance.
Fragment and compute shaders have defined quad scope instances. If the `quadOperationsInAllStages` limit is supported, any shader stages that support subgroup operations also have defined quad scope instances.

### 9.21.10. Invocation

The smallest scope is a single invocation; this is represented by the Invocation Scope in SPIR-V. Fragment shader invocations must be in a primitive scope instance.

Invocations in shaders that have defined workgroups must be in a local workgroup.

Invocations in shaders that have a defined subgroup scope must be in a subgroup.

Invocations in shaders that have a defined quad scope must be in a quad scope instance.

All invocations in all stages must be in a command scope instance.

### 9.22. Group Operations

Group operations are executed by multiple invocations within a scope instance; with each invocation involved in calculating the result. This provides a mechanism for efficient communication between invocations in a particular scope instance.

Group operations all take a Scope defining the desired scope instance to operate within. Only the Subgroup scope can be used for these operations; the subgroupSupportedOperations limit defines which types of operation can be used.

#### 9.22.1. Basic Group Operations

Basic group operations include the use of `OpGroupNonUniformElect`, `OpControlBarrier`, `OpMemoryBarrier`, and atomic operations.

`OpGroupNonUniformElect` can be used to choose a single invocation to perform a task for the whole group. Only the invocation with the lowest id in the group will return `true`.

The Memory Model appendix defines the operation of barriers and atomics.

#### 9.22.2. Vote Group Operations

The vote group operations allow invocations within a group to compare values across a group. The types of votes enabled are:

- Do all active group invocations agree that an expression is true?
- Do any active group invocations evaluate an expression to true?
- Do all active group invocations have the same value of an expression?

*Note*

These operations are useful in combination with control flow in that they allow for
developers to check whether conditions match across the group and choose potentially faster code-paths in these cases.

9.22.3. Arithmetic Group Operations

The arithmetic group operations allow invocations to perform scans and reductions across a group. The operators supported are add, mul, min, max, and, or, xor.

For reductions, every invocation in a group will obtain the cumulative result of these operators applied to all values in the group. For exclusive scans, each invocation in a group will obtain the cumulative result of these operators applied to all values in invocations with a lower index in the group. Inclusive scans are identical to exclusive scans, except the cumulative result includes the operator applied to the value in the current invocation.

The order in which these operators are applied is implementation-dependent.

9.22.4. Ballot Group Operations

The ballot group operations allow invocations to perform more complex votes across the group. The ballot functionality allows all invocations within a group to provide a boolean value and get as a result what each invocation provided as their boolean value. The broadcast functionality allows values to be broadcast from an invocation to all other invocations within the group.

9.22.5. Shuffle Group Operations

The shuffle group operations allow invocations to read values from other invocations within a group.

9.22.6. Shuffle Relative Group Operations

The shuffle relative group operations allow invocations to read values from other invocations within the group relative to the current invocation in the group. The relative operations supported allow data to be shifted up and down through the invocations within a group.

9.22.7. Clustered Group Operations

The clustered group operations allow invocations to perform an operation among partitions of a group, such that the operation is only performed within the group invocations within a partition. The partitions for clustered group operations are consecutive power-of-two size groups of invocations and the cluster size must be known at pipeline creation time. The operations supported are add, mul, min, max, and, or, xor.

9.22.8. Rotate Group Operations

The rotate group operations allow invocations to read values from other invocations within the group relative to the current invocation and modulo the size of the group. Clustered rotate group operations perform the same operation within individual partitions of a group.

The partitions for clustered rotate group operations are consecutive power-of-two size groups of
invocations and the cluster size must be known at pipeline creation time.

### 9.23. Quad Group Operations

Quad group operations (OpGroupNonUniformQuad*) are a specialized type of group operations that only operate on quad scope instances. Whilst these instructions do include a Scope parameter, this scope is always overridden; only the quad scope instance is included in its execution scope.

Fragment shaders that statically execute either OpGroupNonUniformQuadBroadcast or OpGroupNonUniformQuadSwap must launch sufficient invocations to ensure their correct operation; additional helper invocations are launched for framebuffer locations not covered by rasterized fragments if necessary.

The index used to select participating invocations is i, as described for a quad scope instance, defined as the quad index in the SPIR-V specification.

For OpGroupNonUniformQuadBroadcast this value is equal to Index. For OpGroupNonUniformQuadSwap, it is equal to the implicit Index used by each participating invocation.

### 9.24. Derivative Operations

Derivative operations calculate the partial derivative for an expression P as a function of an invocation’s x and y coordinates.

Derivative operations operate on a set of invocations known as a derivative group as defined in the SPIR-V specification.

A derivative group in a fragment shader is equivalent to the quad scope instance if the QuadDerivativesKHR execution mode is specified, otherwise it is equivalent to the primitive scope instance.

Derivatives are calculated assuming that P is piecewise linear and continuous within the derivative group.

The following control-flow restrictions apply to derivative operations:

- If the QuadDerivativesKHR execution mode is specified, dynamic instances of any derivative operations must be executed in control flow that is uniform within the current quad scope instance.
- If the QuadDerivativesKHR execution mode is not specified:
  - dynamic instances of explicit derivative instructions (OpDPdx*, OpDPdy*, and OpFwidth*) must be executed in control flow that is uniform within a derivative group.
  - dynamic instances of implicit derivative operations can be executed in control flow that is not uniform within the derivative group, but results are undefined.

Fragment shaders that statically execute derivative operations must launch sufficient invocations to ensure their correct operation; additional helper invocations are launched for framebuffer locations not covered by rasterized fragments if necessary.
Derivative operations calculate their results as the difference between the result of \( P \) across invocations in the quad. For fine derivative operations (\( \text{OpDPdxFine} \) and \( \text{OpDPdyFine} \)), the values of \( \text{DPdx}(P_i) \) are calculated as

\[
\text{DPdx}(P_0) = \text{DPdx}(P_1) = P_1 - P_0
\]

\[
\text{DPdx}(P_2) = \text{DPdx}(P_3) = P_3 - P_2
\]

and the values of \( \text{DPdy}(P_i) \) are calculated as

\[
\text{DPdy}(P_0) = \text{DPdy}(P_2) = P_2 - P_0
\]

\[
\text{DPdy}(P_1) = \text{DPdy}(P_3) = P_3 - P_1
\]

where \( i \) is the index of each invocation as described in \( \text{Quad} \).

Coarse derivative operations (\( \text{OpDPdxCoarse} \) and \( \text{OpDPdyCoarse} \)), calculate their results in roughly the same manner, but may only calculate two values instead of four (one for each of \( \text{DPdx} \) and \( \text{DPdy} \)), reusing the same result no matter the originating invocation. If an implementation does this, it should use the fine derivative calculations described for \( P_o \).

**Note**

Derivative values are calculated between fragments rather than pixels. If the fragment shader invocations involved in the calculation cover multiple pixels, these operations cover a wider area, resulting in larger derivative values. This in turn will result in a coarser LOD being selected for image sampling operations using derivatives.

Applications may want to account for this when using multi-pixel fragments; if pixel derivatives are desired, applications should use explicit derivative operations and divide the results by the size of the fragment in each dimension as follows:

\[
\text{DPdx}(P_n)' = \frac{\text{DPdx}(P_n)}{w}
\]

\[
\text{DPdy}(P_n)' = \frac{\text{DPdy}(P_n)}{h}
\]

where \( w \) and \( h \) are the size of the fragments in the quad, and \( \text{DPdx}(P_n)' \) and \( \text{DPdy}(P_n)' \) are the pixel derivatives.

The results for \( \text{OpDPdx} \) and \( \text{OpDPdy} \) may be calculated as either fine or coarse derivatives, with implementations favouring the most efficient approach. Implementations must choose coarse or fine consistently between the two.
Executing `OpFwidthFine`, `OpFwidthCoarse`, or `OpFwidth` is equivalent to executing the corresponding `OpDPdx*` and `OpDPdy*` instructions, taking the absolute value of the results, and summing them.

Executing an `OpImage*Sample*ImplicitLod` instruction is equivalent to executing `OpDPdx(Coordinate)` and `OpDPdy(Coordinate)`, and passing the results as the `Grad` operands `dx` and `dy`.

**Note**

It is expected that using the `ImplicitLod` variants of sampling functions will be substantially more efficient than using the `ExplicitLod` variants with explicitly generated derivatives.

### 9.25. Helper Invocations

When performing derivative or quad group operations in a fragment shader, additional invocations **may** be spawned in order to ensure correct results. These additional invocations are known as **helper invocations** and **can** be identified by a non-zero value in the `HelperInvocation` built-in. Stores and atomics performed by helper invocations **must** not have any effect on memory except for the `Function`, `Private` and `Output` storage classes, and values returned by atomic instructions in helper invocations are undefined.

**Note**

While storage to `Output` storage class has an effect even in helper invocations, it does not mean that helper invocations have an effect on the framebuffer. `Output` variables in fragment shaders can be read from as well, and they behave more like `Private` variables for the duration of the shader invocation.

If the `MaximallyReconvergesKHR` execution mode is applied to the entry point, helper invocations **must** remain active for all instructions for the lifetime of the quad scope instance they are a part of. If the `MaximallyReconvergesKHR` execution mode is not applied to the entry point, helper invocations **may** be considered inactive for group operations other than derivative and quad group operations. All invocations in a quad scope instance **may** become permanently inactive at any point once the only remaining invocations in that quad scope instance are helper invocations.

A **cooperative matrix** type is a SPIR-V type where the storage for and computations performed on the matrix are spread across the invocations in a scope instance. These types give the implementation freedom in how to optimize matrix multiplies.

SPIR-V defines the types and instructions, but does not specify rules about what sizes/combinations are valid, and it is expected that different implementations **may** support different sizes.

To enumerate the supported cooperative matrix types and operations, call:

```c
// Provided by VK_KHR_cooperative_matrix
VkResult vkGetPhysicalDeviceCooperativeMatrixPropertiesKHR(
    VkPhysicalDevice physicalDevice,
```
uint32_t* pPropertyCount, VkCooperativeMatrixPropertiesKHR* pProperties);

- `physicalDevice` is the physical device.
- `pPropertyCount` is a pointer to an integer related to the number of cooperative matrix properties available or queried.
- `pProperties` is either `NULL` or a pointer to an array of `VkCooperativeMatrixPropertiesKHR` structures.

If `pProperties` is `NULL`, then the number of cooperative matrix properties available is returned in `pPropertyCount`. Otherwise, `pPropertyCount` must point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If `pPropertyCount` is less than the number of cooperative matrix properties available, at most `pPropertyCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available cooperative matrix properties were returned.

Valid Usage (Implicit)

- `VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesKHR-physicalDevice-parameter` `physicalDevice` must be a valid `VkPhysicalDevice` handle
- `VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesKHR-pPropertyCount-parameter` `pPropertyCount` must be a valid pointer to a `uint32_t` value
- `VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesKHR-pProperties-parameter` If the value referenced by `pPropertyCount` is not `0`, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkCooperativeMatrixPropertiesKHR` structures

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Each `VkCooperativeMatrixPropertiesKHR` structure describes a single supported combination of types for a matrix multiply/add operation ( `OpCooperativeMatrixMulAddKHR` ). The multiply can be described in terms of the following variables and types (in SPIR-V pseudocode):

```spirv
%A is of type OpTypeCooperativeMatrixKHR %AType %scope %MSize %KSize %MatrixAKHR
```
A matrix multiply with these dimensions is known as an $M\times N\times K$ matrix multiply.

The `VkCooperativeMatrixPropertiesKHR` structure is defined as:

```c
typedef struct VkCooperativeMatrixPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    uint32_t MSize;
    uint32_t NSize;
    uint32_t KSize;
    VkComponentTypeKHR AType;
    VkComponentTypeKHR BType;
    VkComponentTypeKHR CType;
    VkComponentTypeKHR ResultType;
    VkBool32 saturatingAccumulation;
    VkScopeKHR scope;
} VkCooperativeMatrixPropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `MSize` is the number of rows in matrices $A$, $C$, and $Result$.
- `KSize` is the number of columns in matrix $A$ and rows in matrix $B$.
- `NSize` is the number of columns in matrices $B$, $C$, $Result$.
- `AType` is the component type of matrix $A$, of type `VkComponentTypeKHR`.
- `BType` is the component type of matrix $B$, of type `VkComponentTypeKHR`.
- `CType` is the component type of matrix $C$, of type `VkComponentTypeKHR`.
- `ResultType` is the component type of matrix $Result$, of type `VkComponentTypeKHR`.
- `saturatingAccumulation` indicates whether the `SaturatingAccumulation` operand to `OpCooperativeMatrixMulAddKHR` **must** be present.
- `scope` is the scope of all the matrix types, of type `VkScopeKHR`.

If some types are preferred over other types (e.g. for performance), they **should** appear earlier in the list enumerated by `vkGetPhysicalDeviceCooperativeMatrixPropertiesKHR`.

At least one entry in the list **must** have power of two values for all of `MSize`, `KSize`, and `NSize`.  

542
scope must be VK_SCOPE_SUBGROUP_KHR.

Valid Usage (Implicit)

- VUID-VkCooperativeMatrixPropertiesKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_COOPERATIVE_MATRIX_PROPERTIES_KHR
- VUID-VkCooperativeMatrixPropertiesKHR-pNext-pNext
  pNext must be NULL

Possible values for VkScopeKHR include:

```c
// Provided by VK_KHR_cooperative_matrix
typedef enum VkScopeKHR {
    VK_SCOPE_DEVICE_KHR = 1,
    VK_SCOPE_WORKGROUP_KHR = 2,
    VK_SCOPE_SUBGROUP_KHR = 3,
    VK_SCOPE_QUEUE_FAMILY_KHR = 5,
} VkScopeKHR;
```

- VK_SCOPE_DEVICE_KHR corresponds to SPIR-V Device scope.
- VK_SCOPE_WORKGROUP_KHR corresponds to SPIR-V Workgroup scope.
- VK_SCOPE_SUBGROUP_KHR corresponds to SPIR-V Subgroup scope.
- VK_SCOPE_QUEUE_FAMILY_KHR corresponds to SPIR-V QueueFamily scope.

All enum values match the corresponding SPIR-V value.

Possible values for VkComponentTypeKHR include:

```c
// Provided by VK_KHR_cooperative_matrix
typedef enum VkComponentTypeKHR {
    VK_COMPONENT_TYPE_FLOAT16_KHR = 0,
    VK_COMPONENT_TYPE_FLOAT32_KHR = 1,
    VK_COMPONENT_TYPE_FLOAT64_KHR = 2,
    VK_COMPONENT_TYPE_SINT8_KHR = 3,
    VK_COMPONENT_TYPE_SINT16_KHR = 4,
    VK_COMPONENT_TYPE_SINT32_KHR = 5,
    VK_COMPONENT_TYPE_SINT64_KHR = 6,
    VK_COMPONENT_TYPE_UINT8_KHR = 7,
    VK_COMPONENT_TYPE_UINT16_KHR = 8,
    VK_COMPONENT_TYPE_UINT32_KHR = 9,
    VK_COMPONENT_TYPE_UINT64_KHR = 10,
} VkComponentTypeKHR;
```

- VK_COMPONENT_TYPE_FLOAT16_KHR corresponds to SPIR-V OpTypeFloat 16.
- VK_COMPONENT_TYPE_FLOAT32_KHR corresponds to SPIR-V OpTypeFloat 32.
- `VK_COMPONENT_TYPE_FLOAT64_KHR` corresponds to SPIR-V `OpTypeFloat` 64.
- `VK_COMPONENT_TYPE_SINT8_KHR` corresponds to SPIR-V `OpTypeInt` 8 1.
- `VK_COMPONENT_TYPE_SINT16_KHR` corresponds to SPIR-V `OpTypeInt` 16 1.
- `VK_COMPONENT_TYPE_SINT32_KHR` corresponds to SPIR-V `OpTypeInt` 32 1.
- `VK_COMPONENT_TYPE_SINT64_KHR` corresponds to SPIR-V `OpTypeInt` 64 1.
- `VK_COMPONENT_TYPE_UINT8_KHR` corresponds to SPIR-V `OpTypeInt` 8 0.
- `VK_COMPONENT_TYPE_UINT16_KHR` corresponds to SPIR-V `OpTypeInt` 16 0.
- `VK_COMPONENT_TYPE_UINT32_KHR` corresponds to SPIR-V `OpTypeInt` 32 0.
- `VK_COMPONENT_TYPE_UINT64_KHR` corresponds to SPIR-V `OpTypeInt` 64 0.
Chapter 10. Pipelines

The following figure shows a block diagram of the Vulkan pipelines. Some Vulkan commands specify geometric objects to be drawn or computational work to be performed, while others specify state controlling how objects are handled by the various pipeline stages, or control data transfer between memory organized as images and buffers. Commands are effectively sent through a processing pipeline, either a graphics pipeline, a ray tracing pipeline, or a compute pipeline.

The first stage of the graphics pipeline (Input Assembler) assembles vertices to form geometric primitives such as points, lines, and triangles, based on a requested primitive topology. In the next stage (Vertex Shader) vertices can be transformed, computing positions and attributes for each vertex. If tessellation and/or geometry shaders are supported, they can then generate multiple primitives from a single input primitive, possibly changing the primitive topology or generating additional attribute data in the process.

The final resulting primitives are clipped to a clip volume in preparation for the next stage, Rasterization. The rasterizer produces a series of fragments associated with a region of the framebuffer, from a two-dimensional description of a point, line segment, or triangle. These fragments are processed by fragment operations to determine whether generated values will be written to the framebuffer. Fragment shading determines the values to be written to the framebuffer attachments. Framebuffer operations then read and write the color and depth/stencil attachments of the framebuffer for a given subpass of a render pass instance. The attachments can be used as input attachments in the fragment shader in a later subpass of the same render pass.

The compute pipeline is a separate pipeline from the graphics pipeline, which operates on one-, two-, or three-dimensional workgroups which can read from and write to buffer and image memory.

This ordering is meant only as a tool for describing Vulkan, not as a strict rule of how Vulkan is implemented, and we present it only as a means to organize the various operations of the pipelines. Actual ordering guarantees between pipeline stages are explained in detail in the synchronization chapter.
Each pipeline is controlled by a monolithic object created from a description of all of the shader stages and any relevant fixed-function stages. Linking the whole pipeline together allows the optimization of shaders based on their input/outputs and eliminates expensive draw time state validation.

A pipeline object is bound to the current state using `vkCmdBindPipeline`. Any pipeline object state that is specified as `dynamic` is not applied to the current state when the pipeline object is bound, but is instead set by dynamic state setting commands.

No state, including dynamic state, is inherited from one command buffer to another.

Compute, ray tracing, and graphics pipelines are each represented by `VkPipeline` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPipeline)
```

## 10.1. Multiple Pipeline Creation

Multiple pipelines can be created in a single call by commands such as `vkCreateRayTracingPipelinesKHR`, `vkCreateComputePipelines`, and `vkCreateGraphicsPipelines`.

The creation commands are passed an array `pCreateInfos` of `Vk*PipelineCreateInfo` structures specifying parameters of each pipeline to be created, and return a corresponding array of handles in `pPipelines`. Each element index `i` of `pPipelines` is created based on the corresponding element `i` of `pCreateInfos`.

Applications can group together similar pipelines to be created in a single call, and implementations are encouraged to look for reuse opportunities when creating a group.
When attempting to create many pipelines in a single command, it is possible that creation may fail for a subset of them. In this case, the corresponding elements of pPipelines will be set to VK_NULL_HANDLE. If creation fails for a pipeline despite valid arguments (for example, due to out of memory errors), the VkResult code returned by the pipeline creation command will indicate why. The implementation will attempt to create all pipelines, and only return VK_NULL_HANDLE values for those that actually failed.

If creation fails for a pipeline that has the VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT set in its Vk*PipelineCreateInfo, pipelines at an index in the pPipelines array greater than or equal to that of the failing pipeline will be set to VK_NULL_HANDLE.

If creation fails for multiple pipelines, the returned VkResult must be the return value of any one of the pipelines which did not succeed. An application can reliably clean up from a failed call by iterating over the pPipelines array and destroying every element that is not VK_NULL_HANDLE.

If the entire command fails and no pipelines are created, all elements of pPipelines will be set to VK_NULL_HANDLE.

### 10.2. Compute Pipelines

Compute pipelines consist of a single static compute shader stage and the pipeline layout.

The compute pipeline represents a compute shader and is created by calling vkCreateComputePipelines with module and pName selecting an entry point from a shader module, where that entry point defines a valid compute shader, in the VkPipelineShaderStageCreateInfo structure contained within the VkComputePipelineCreateInfo structure.

To create compute pipelines, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateComputePipelines(  
    VkDevice device,  
    VkPipelineCache pipelineCache,  
    uint32_t createInfoCount,  
    const VkComputePipelineCreateInfo* pCreateInfos,  
    const VkAllocationCallbacks* pAllocator,  
    VkPipeline* pPipelines);
```

- **device** is the logical device that creates the compute pipelines.
- **pipelineCache** is either VK_NULL_HANDLE, indicating that pipeline caching is disabled; or the handle of a valid pipeline cache object, in which case use of that cache is enabled for the duration of the command.
- **createInfoCount** is the length of the pCreateInfos and pPipelines arrays.
- **pCreateInfos** is a pointer to an array of VkComputePipelineCreateInfo structures.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pPipelines** is a pointer to an array of VkPipeline handles in which the resulting compute
pipeline objects are returned.

Pipelines are created and returned as described for Multiple Pipeline Creation.

**Valid Usage**

- **VUID-vkCreateComputePipelines-flags-00695**
  If the `flags` member of any element of `pCreateInfos` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and the `basePipelineIndex` member of that same element is not -1, `basePipelineIndex` must be less than the index into `pCreateInfos` that corresponds to that element.

- **VUID-vkCreateComputePipelines-flags-00696**
  If the `flags` member of any element of `pCreateInfos` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, the base pipeline must have been created with the `VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT` flag set.

- **VUID-vkCreateComputePipelines-pipelineCache-02873**
  If `pipelineCache` was created with `VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT`, host access to `pipelineCache` must be externally synchronized.

**Valid Usage (Implicit)**

- **VUID-vkCreateComputePipelines-device-parameter**
  `device` must be a valid `VkDevice` handle.

- **VUID-vkCreateComputePipelines-pipelineCache-parameter**
  If `pipelineCache` is not `VK_NULL_HANDLE`, `pipelineCache` must be a valid `VkPipelineCache` handle.

- **VUID-vkCreateComputePipelines-pCreateInfos-parameter**
  `pCreateInfos` must be a valid pointer to an array of `createInfoCount` valid `VkComputePipelineCreateInfo` structures.

- **VUID-vkCreateComputePipelines-pAllocator-parameter**
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.

- **VUID-vkCreateComputePipelines-pPipelines-parameter**
  `pPipelines` must be a valid pointer to an array of `createInfoCount` `VkPipeline` handles.

- **VUID-vkCreateComputePipelines-createInfoCount-arraylength**
  `createInfoCount` must be greater than 0.

- **VUID-vkCreateComputePipelines-pipelineCache-parent**
  If `pipelineCache` is a valid handle, it must have been created, allocated, or retrieved from `device`.
Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkComputePipelineCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkComputePipelineCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCreateFlags flags;
    VkPipelineShaderStageCreateInfo stage;
    VkPipelineLayout layout;
    VkPipeline basePipelineHandle;
    int32_t basePipelineIndex;
} VkComputePipelineCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkPipelineCreateFlagBits` specifying how the pipeline will be generated.
- `stage` is a `VkPipelineShaderStageCreateInfo` structure describing the compute shader.
- `layout` is the description of binding locations used by both the pipeline and descriptor sets used with the pipeline.
- `basePipelineHandle` is a pipeline to derive from.
- `basePipelineIndex` is an index into the `pCreateInfos` parameter to use as a pipeline to derive from.

The parameters `basePipelineHandle` and `basePipelineIndex` are described in more detail in Pipeline Derivatives.

If a `VkPipelineCreateFlags2CreateInfoKHR` structure is present in the `pNext` chain, `VkPipelineCreateFlags2CreateInfoKHR::flags` from that structure is used instead of `flags` from this structure.

Valid Usage

- VUID-VkComputePipelineCreateInfo-None-09497
  If the `pNext` chain does not include a `VkPipelineCreateFlags2CreateInfoKHR` structure, `flags` must be a valid combination of `VkPipelineCreateFlagBits` values
If flags contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and basePipelineIndex is -1, basePipelineHandle must be a valid compute VkPipeline handle.

If flags contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and basePipelineHandle is VK_NULL_HANDLE, basePipelineIndex must be a valid index into the calling command's pCreateInfos parameter.

If flags contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, basePipelineHandle must be VK_NULL_HANDLE.

If a push constant block is declared in a shader, a push constant range in layout must match both the shader stage and range.

If a resource variables is declared in a shader, a descriptor slot in layout must match the shader stage.

If a resource variables is declared in a shader as an array, a descriptor slot in layout must match the descriptor count.

flags must not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR.

flags must not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR.

flags must not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR.

flags must not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR.

flags must not include VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR.

flags must not include VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR.

flags must not include VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR.

If the pipelineCreationCacheControl feature is not enabled, flags must not include VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT or
The `VkPipelineShaderStageCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineShaderStageCreateInfo {  
    VkStructureType                   sType;  
    const void*                       pNext;  
} VkPipelineShaderStageCreateInfo;
```
VkPipelineShaderStageCreateInfo flags;
VkShaderStageFlagBits stage;
VkShaderModule module;
const char* pName;
const VkSpecializationInfo* pSpecializationInfo;
}

• **sType** is a VkStructureType value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **flags** is a bitmask of VkPipelineShaderStageCreateFlagBits specifying how the pipeline shader stage will be generated.

• **stage** is a VkShaderStageFlagBits value specifying a single pipeline stage.

• **module** is optionally a VkShaderModule object containing the shader code for this stage.

• **pName** is a pointer to a null-terminated UTF-8 string specifying the entry point name of the shader for this stage.

• **pSpecializationInfo** is a pointer to a VkSpecializationInfo structure, as described in Specialization Constants, or NULL.

If **module** is not VK_NULL_HANDLE, the shader code used by the pipeline is defined by **module**. If **module** is VK_NULL_HANDLE, the shader code is defined by the chained VkShaderModuleCreateInfo if present.

---

### Valid Usage

- **VUID-VkPipelineShaderStageCreateInfo-stage-00704**
  If the geometryShader feature is not enabled, **stage** must not be VK_SHADER_STAGE_GEOMETRY_BIT

- **VUID-VkPipelineShaderStageCreateInfo-stage-00705**
  If the tessellationShader feature is not enabled, **stage** must not be VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT or VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT

- **VUID-VkPipelineShaderStageCreateInfo-stage-00706**
  **stage** must not be VK_SHADER_STAGE_ALL_GRAPHICS, or VK_SHADER_STAGE_ALL

- **VUID-VkPipelineShaderStageCreateInfo-pName-00707**
  **pName** must be the name of an OpEntryPoint in **module** with an execution model that matches **stage**

- **VUID-VkPipelineShaderStageCreateInfo-maxClipDistances-00708**
  If the identified entry point includes any variable in its interface that is declared with the ClipDistance BuiltIn decoration, that variable **must** not have an array size greater than VkPhysicalDeviceLimits::maxClipDistances

- **VUID-VkPipelineShaderStageCreateInfo-maxCullDistances-00709**
  If the identified entry point includes any variable in its interface that is declared with the CullDistance BuiltIn decoration, that variable **must** not have an array size greater than
 VkPhysicalDeviceLimits::maxCullDistances

- VUID-VkPipelineShaderStageCreateInfo-maxCombinedClipAndCullDistances-00710
  If the identified entry point includes variables in its interface that are declared with the ClipDistance BuiltIn decoration and variables in its interface that are declared with the CullDistance BuiltIn decoration, those variables must not have array sizes which sum to more than VkPhysicalDeviceLimits::maxCombinedClipAndCullDistances.

- VUID-VkPipelineShaderStageCreateInfo-maxSampleMaskWords-00711
  If the identified entry point includes any variable in its interface that is declared with the SampleMask BuiltIn decoration, that variable must not have an array size greater than VkPhysicalDeviceLimits::maxSampleMaskWords.

- VUID-VkPipelineShaderStageCreateInfo-stage-00713
  If stage is VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT or VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, and the identified entry point has an OpExecutionMode instruction specifying a patch size with OutputVertices, the patch size must be greater than 0 and less than or equal to VkPhysicalDeviceLimits::maxTessellationPatchSize.

- VUID-VkPipelineShaderStageCreateInfo-stage-00714
  If stage is VK_SHADER_STAGE_GEOMETRY_BIT, the identified entry point must have an OpExecutionMode instruction specifying a maximum output vertex count that is greater than 0 and less than or equal to VkPhysicalDeviceLimits::maxGeometryOutputVertices.

- VUID-VkPipelineShaderStageCreateInfo-stage-00715
  If stage is VK_SHADER_STAGE_GEOMETRY_BIT, the identified entry point must have an OpExecutionMode instruction specifying an invocation count that is greater than 0 and less than or equal to VkPhysicalDeviceLimits::maxGeometryShaderInvocations.

- VUID-VkPipelineShaderStageCreateInfo-stage-02596
  If stage is either VK_SHADER_STAGE_VERTEX_BIT, VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT, VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, or VK_SHADER_STAGE_GEOMETRY_BIT, and the identified entry point writes to Layer for any primitive, it must write the same value to Layer for all vertices of a given primitive.

- VUID-VkPipelineShaderStageCreateInfo-stage-02597
  If stage is either VK_SHADER_STAGE_VERTEX_BIT, VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT, VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, or VK_SHADER_STAGE_GEOMETRY_BIT, and the identified entry point writes to ViewportIndex for any primitive, it must write the same value to ViewportIndex for all vertices of a given primitive.

- VUID-VkPipelineShaderStageCreateInfo-stage-06685
  If stage is VK_SHADER_STAGE_FRAGMENT_BIT, and the identified entry point writes to FragDepth in any execution path, all execution paths that are not exclusive to helper invocations must either discard the fragment, or write or initialize the value of FragDepth.

- VUID-VkPipelineShaderStageCreateInfo-flags-02784
  If flags has the VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT flag set, the subgroupSizeControl feature must be enabled.

- VUID-VkPipelineShaderStageCreateInfo-flags-02785
  If flags has the VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT flag set, the computeFullSubgroups feature must be enabled.
If `flags` includes `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT`, `stage` must be `VK_SHADER_STAGE_COMPUTE_BIT`.

If a `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is included in the `pNext` chain, `flags` must not have the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW VARYING_SUBGROUP_SIZE_BIT` flag set.

If a `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is included in the `pNext` chain, the `subgroupSizeControl` feature must be enabled, and `stage` must be a valid bit specified in `requiredSubgroupSizeStages`.

If a `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is included in the `pNext` chain and `stage` is `VK_SHADER_STAGE_COMPUTE_BIT`, the local workgroup size of the shader must be less than or equal to the product of `requiredSubgroupSize` and `maxComputeWorkgroupSubgroups`.

If `flags` has both the `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE FULL_SUBGROUPS_BIT` and `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW VARYING_SUBGROUP_SIZE_BIT` flags set, the local workgroup size in the X dimension of the pipeline must be a multiple of `requiredSubgroupSize`.

If `flags` has the `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE FULL_SUBGROUPS_BIT` flag set and `flags` does not have the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW VARYING_SUBGROUP_SIZE_BIT` flag set and no `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is included in the `pNext` chain, the local workgroup size in the X dimension of the pipeline must be a multiple of `subgroupSize`.

If `module` uses the `OpTypeCooperativeMatrixKHR` instruction with a `Scope` equal to `Subgroup`, then the local workgroup size in the X dimension of the pipeline must be a multiple of `subgroupSize`.

Module must be a valid `VkShaderModule` if none of the following features are enabled:

- `maintenance5`

If `module` is `VK_NULL_HANDLE`, there must be a valid `VkShaderModuleCreateInfo` structure in the `pNext` chain.
The shader code used by the pipeline must be valid as described by the Khronos SPIR-V Specification after applying the specializations provided in pSpecializationInfo, if any, and then converting all specialization constants into fixed constants.

**Valid Usage (Implicit)**

- **VUID-VkPipelineShaderStageCreateInfo-sType-sType**
  
  *sType must* be `VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_CREATE_INFO`

- **VUID-VkPipelineShaderStageCreateInfo-pNext-pNext**
  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` or `VkShaderModuleCreateInfo`

- **VUID-VkPipelineShaderStageCreateInfo-sType-unique**
  
  The `sType` value of each struct in the `pNext` chain must be unique

- **VUID-VkPipelineShaderStageCreateInfo-flags-parameter**
  
  `flags` must be a valid combination of `VkPipelineShaderStageCreateFlagBits` values

- **VUID-VkPipelineShaderStageCreateInfo-stage-parameter**
  
  `stage` must be a valid `VkShaderStageFlagBits` value

- **VUID-VkPipelineShaderStageCreateInfo-module-parameter**
  
  If `module` is not `VK_NULL_HANDLE`, `module` must be a valid `VkShaderModule` handle

- **VUID-VkPipelineShaderStageCreateInfo-pName-parameter**
  
  `pName` must be a null-terminated UTF-8 string

- **VUID-VkPipelineShaderStageCreateInfo-pSpecializationInfo-parameter**
  
  If `pSpecializationInfo` is not `NULL`, `pSpecializationInfo` must be a valid pointer to a valid `VkSpecializationInfo` structure

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineShaderStageCreateFlags;

VkPipelineShaderStageCreateFlags is a bitmask type for setting a mask of zero or more `VkPipelineShaderStageCreateFlagBits`.

Possible values of the `flags` member of `VkPipelineShaderStageCreateInfo` specifying how a pipeline shader stage is created, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPipelineShaderStageCreateFlagBits {
    // Provided by VK_VERSION_1_3
    VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT = 0x00000001,
    // Provided by VK_VERSION_1_3
    VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT = 0x00000002,
};
```
• **VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT** specifies that the SubgroupSize may vary in the shader stage.

• **VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT** specifies that the subgroup sizes must be launched with all invocations active in the compute stage.

**Note**

If **VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT** and **VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT** are specified and `minSubgroupSize` does not equal `maxSubgroupSize` and no required subgroup size is specified, then the only way to guarantee that the 'X' dimension of the local workgroup size is a multiple of `SubgroupSize` is to make it a multiple of `maxSubgroupSize`. Under these conditions, you are guaranteed full subgroups but not any particular subgroup size.

Bits which can be set by commands and structures, specifying one or more shader stages, are:

```c
#include <vkcompute Spicer.h>

// Provided by VK_VERSION_1_0
typedef enum VkShaderStageFlagBits {
    VK_SHADER_STAGE_VERTEX_BIT = 0x00000001,
    VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT = 0x00000002,
    VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT = 0x00000004,
    VK_SHADER_STAGE_GEOMETRY_BIT = 0x00000008,
    VK_SHADER_STAGE_FRAGMENT_BIT = 0x00000010,
    VK_SHADER_STAGE_COMPUTE_BIT = 0x00000020,
    VK_SHADER_STAGE_ALL_GRAPHICS = 0x0000001F,
    VK_SHADER_STAGE_ALL = 0x7FFFFFFF,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_RAYGEN_BIT_KHR = 0x00000100,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_ANY_HIT_BIT_KHR = 0x00000200,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR = 0x00000400,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_MISS_BIT_KHR = 0x00000800,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_INTERSECTION_BIT_KHR = 0x00001000,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_CALLABLE_BIT_KHR = 0x00002000,
} VkShaderStageFlagBits;
```

• **VK_SHADER_STAGE_VERTEX_BIT** specifies the vertex stage.

• **VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT** specifies the tessellation control stage.

• **VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT** specifies the tessellation evaluation stage.

• **VK_SHADER_STAGE_GEOMETRY_BIT** specifies the geometry stage.
• **VK_SHADER_STAGE_FRAGMENT_BIT** specifies the fragment stage.

• **VK_SHADER_STAGE_COMPUTE_BIT** specifies the compute stage.

• **VK_SHADER_STAGE_ALL_GRAPHICS** is a combination of bits used as shorthand to specify all graphics stages defined above (excluding the compute stage).

• **VK_SHADER_STAGE_ALL** is a combination of bits used as shorthand to specify all shader stages supported by the device, including all additional stages which are introduced by extensions.

• **VK_SHADER_STAGE_RAYGEN_BIT_KHR** specifies the ray generation stage.

• **VK_SHADER_STAGE_ANY_HIT_BIT_KHR** specifies the any-hit stage.

• **VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR** specifies the closest hit stage.

• **VK_SHADER_STAGE_MISS_BIT_KHR** specifies the miss stage.

• **VK_SHADER_STAGE_INTERSECTION_BIT_KHR** specifies the intersection stage.

• **VK_SHADER_STAGE_CALLABLE_BIT_KHR** specifies the callable stage.

**Note**

**VK_SHADER_STAGE_ALL_GRAPHICS** only includes the original five graphics stages included in Vulkan 1.0, and not any stages added by extensions. Thus, it may not have the desired effect in all cases.

// Provided by VK_VERSION_1_0
typedef VkFlags VkShaderStageFlags;

**VkShaderStageFlags** is a bitmask type for setting a mask of zero or more **VkShaderStageFlagBits**.

The **VkPipelineShaderStageRequiredSubgroupSizeCreateInfo** structure is defined as:

// Provided by VK_VERSION_1_3
typedef struct VkPipelineShaderStageRequiredSubgroupSizeCreateInfo {
    VkStructureType sType;
    void* pNext;
    uint32_t requiredSubgroupSize;
} VkPipelineShaderStageRequiredSubgroupSizeCreateInfo;

or the equivalent

// Provided by VK_EXT_shader_object
typedef VkPipelineShaderStageRequiredSubgroupSizeCreateInfo VkShaderRequiredSubgroupSizeCreateInfoEXT;

• **sType** is a **VkStructureType** value identifying this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **requiredSubgroupSize** is an unsigned integer value specifying the required subgroup size for the
newly created pipeline shader stage.

If a `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is included in the `pNext` chain of `VkPipelineShaderStageCreateInfo`, it specifies that the pipeline shader stage being compiled has a required subgroup size.

If a `VkShaderRequiredSubgroupSizeCreateInfoEXT` structure is included in the `pNext` chain of `VkShaderCreateInfoEXT`, it specifies that the shader being compiled has a required subgroup size.

### Valid Usage

- **VUID-VkPipelineShaderStageRequiredSubgroupSizeCreateInfo-requiredSubgroupSize-02760**
  
  `requiredSubgroupSize` must be a power-of-two integer

- **VUID-VkPipelineShaderStageRequiredSubgroupSizeCreateInfo-requiredSubgroupSize-02761**
  
  `requiredSubgroupSize` must be greater or equal to `minSubgroupSize`

- **VUID-VkPipelineShaderStageRequiredSubgroupSizeCreateInfo-requiredSubgroupSize-02762**
  
  `requiredSubgroupSize` must be less than or equal to `maxSubgroupSize`

### Valid Usage (Implicit)

- **VUID-VkPipelineShaderStageRequiredSubgroupSizeCreateInfo-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_REQUIRED_SUBGROUP_SIZE_CREATE_INFO`
pipelineCache is either VK_NULL_HANDLE, indicating that pipeline caching is disabled; or the handle of a valid pipeline cache object, in which case use of that cache is enabled for the duration of the command.

createInfoCount is the length of the pCreateInfos and pPipelines arrays.

pCreateInfos is a pointer to an array of VkGraphicsPipelineCreateInfo structures.

pAllocator controls host memory allocation as described in the Memory Allocation chapter.

pPipelines is a pointer to an array of VkPipeline handles in which the resulting graphics pipeline objects are returned.

The VkGraphicsPipelineCreateInfo structure includes an array of VkPipelineShaderStageCreateInfo structures for each of the desired active shader stages, as well as creation information for all relevant fixed-function stages, and a pipeline layout.

Pipelines are created and returned as described for Multiple Pipeline Creation.

Valid Usage

- VUID-vkCreateGraphicsPipelines-flags-00720
  If the flags member of any element of pCreateInfos contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and the basePipelineIndex member of that same element is not -1, basePipelineIndex must be less than the index into pCreateInfos that corresponds to that element.

- VUID-vkCreateGraphicsPipelines-flags-00721
  If the flags member of any element of pCreateInfos contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, the base pipeline must have been created with the VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT flag set.

- VUID-vkCreateGraphicsPipelines-pipelineCache-02876
  If pipelineCache was created with VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT, host access to pipelineCache must be externally synchronized.

Note

An implicit cache may be provided by the implementation or a layer. For this reason, it is still valid to set VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT on flags for any element of pCreateInfos while passing VK_NULL_HANDLE for pipelineCache.

Valid Usage (Implicit)

- VUID-vkCreateGraphicsPipelines-device-parameter
device must be a valid VkDevice handle.

- VUID-vkCreateGraphicsPipelines-pipelineCache-parameter
  If pipelineCache is not VK_NULL_HANDLE, pipelineCache must be a valid VkPipelineCache handle.
VUID-vkCreateGraphicsPipelines-pCreateInfos-parameter

pCreateInfos must be a valid pointer to an array of createInfoCount valid VkGraphicsPipelineCreateInfo structures.

VUID-vkCreateGraphicsPipelines-pAllocator-parameter

If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure.

VUID-vkCreateGraphicsPipelines-pPipelines-parameter

pPipelines must be a valid pointer to an array of createInfoCount VkPipeline handles.

VUID-vkCreateGraphicsPipelines-createInfoCount-arraylength

createInfoCount must be greater than 0.

VUID-vkCreateGraphicsPipelines-pipelineCache-parent

If pipelineCache is a valid handle, it must have been created, allocated, or retrieved from device.

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkGraphicsPipelineCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkGraphicsPipelineCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCreateFlags flags;
    uint32_t stageCount;
    const VkPipelineShaderStageCreateInfo* pStages;
    const VkPipelineVertexInputStateCreateInfo* pVertexInputState;
    const VkPipelineInputAssemblyStateCreateInfo* pInputAssemblyState;
    const VkPipelineTessellationStateCreateInfo* pTessellationState;
    const VkPipelineViewportStateCreateInfo* pViewportState;
    const VkPipelineRasterizationStateCreateInfo* pRasterizationState;
    const VkPipelineMultisampleStateCreateInfo* pMultisampleState;
    const VkPipelineDepthStencilStateCreateInfo* pDepthStencilState;
    const VkPipelineColorBlendStateCreateInfo* pColorBlendState;
    const VkPipelineDynamicStateCreateInfo* pDynamicState;
    VkPipelineLayout layout;
    VkRenderPass renderPass;
    uint32_t subpass;
    VkPipeline basePipelineHandle;
} VkGraphicsPipelineCreateInfo;
```
• **sType** is a **VkStructureType** value identifying this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **flags** is a bitmask of **VkPipelineCreateFlagBits** specifying how the pipeline will be generated.

• **stageCount** is the number of entries in the **pStages** array.

• **pStages** is a pointer to an array of **stageCount** **VkPipelineShaderStageCreateInfo** structures describing the set of the shader stages to be included in the graphics pipeline.

• **pVertexInputState** is a pointer to a **VkPipelineVertexInputStateCreateInfo** structure.

• **pInputAssemblyState** is a pointer to a **VkPipelineInputAssemblyStateCreateInfo** structure which determines input assembly behavior for vertex shading, as described in Drawing Commands. If the **VK_EXT_extended_dynamic_state3** extension is enabled, it can be NULL if the pipeline is created with both **VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE**, and **VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY** dynamic states set and **dynamicPrimitiveTopologyUnrestricted** is **VK_TRUE**.

• **pTessellationState** is a pointer to a **VkPipelineTessellationStateCreateInfo** structure defining tessellation state used by tessellation shaders.

• **pViewportState** is a pointer to a **VkPipelineViewportStateCreateInfo** structure defining viewport state used when rasterization is enabled. If the **VK_EXT_extended_dynamic_state3** extension is enabled, it can be NULL if the pipeline is created with both **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT**, and **VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT** dynamic states set.

• **pRasterizationState** is a pointer to a **VkPipelineRasterizationStateCreateInfo** structure defining rasterization state. If the **VK_EXT_extended_dynamic_state3** extension is enabled, it can be NULL if the pipeline is created with all of **VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT**, **VK_DYNAMIC_STATE_POLYGON_MODE_EXT**, **VK_DYNAMIC_STATE_CULL_MODE**, **VK_DYNAMIC_STATE_FRONT_FACE**, **VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE**, **VK_DYNAMIC_STATE_DEPTH_BIAS**, and **VK_DYNAMIC_STATE_LINE_WIDTH** dynamic states set.

• **pMultisampleState** is a pointer to a **VkPipelineMultisampleStateCreateInfo** structure defining multisample state used when rasterization is enabled. If the **VK_EXT_extended_dynamic_state3** extension is enabled, it can be NULL if the pipeline is created with all of **VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT**, **VK_DYNAMIC_STATE_SAMPLE_MASK_EXT**, and **VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT** dynamic states set, and either alphaToOne is disabled on the device or **VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT** is set, in which case **VkPipelineMultisampleStateCreateInfo::sampleShadingEnable** is assumed to be **VK_FALSE**.

• **pDepthStencilState** is a pointer to a **VkPipelineDepthStencilStateCreateInfo** structure defining depth/stencil state used when rasterization is enabled for depth or stencil attachments accessed during rendering. If the **VK_EXT_extended_dynamic_state3** extension is enabled, it can be NULL if the pipeline is created with all of **VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE**, **VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE**, **VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE**, **VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE**, **VK_DYNAMIC_STATE_STENCIL_OP**, and **VK_DYNAMIC_STATE_DEPTH_BOUNDS** dynamic states set.

• **pColorBlendState** is a pointer to a **VkPipelineColorBlendStateCreateInfo** structure defining color
blend state used when rasterization is enabled for any color attachments accessed during rendering. If the VK_EXT_extended_dynamic_state3 extension is enabled, it can be NULL if the pipeline is created with all of VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT, VK_DYNAMIC_STATE_LOGIC_OP_EXT, VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT, VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT, VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT, and VK_DYNAMIC_STATE_BLEND_CONSTANTS dynamic states set.

- **pDynamicState** is a pointer to a VkPipelineDynamicStateCreateInfo structure defining which properties of the pipeline state object are dynamic and can be changed independently of the pipeline state. This can be NULL, which means no state in the pipeline is considered dynamic.

- **layout** is the description of binding locations used by both the pipeline and descriptor sets used with the pipeline.

- **renderPass** is a handle to a render pass object describing the environment in which the pipeline will be used. The pipeline must only be used with a render pass instance compatible with the one provided. See Render Pass Compatibility for more information.

- **subpass** is the index of the subpass in the render pass where this pipeline will be used.

- **basePipelineHandle** is a pipeline to derive from.

- **basePipelineIndex** is an index into the pCreateInfos parameter to use as a pipeline to derive from.

The parameters **basePipelineHandle** and **basePipelineIndex** are described in more detail in Pipeline Derivatives.

**Note**

With VK_EXT_extended_dynamic_state3, it is possible that many of the VkGraphicsPipelineCreateInfo members above can be NULL because all their state is dynamic and therefore ignored. This is optional so the application can still use a valid pointer if it needs to set the pNext or flags fields to specify state for other extensions.

The state required for a graphics pipeline is divided into vertex input state, pre-rasterization shader state, fragment shader state, and fragment output state.

**Vertex Input State**

Vertex input state is defined by:

- VkPipelineVertexInputStateCreateInfo
- VkPipelineInputAssemblyStateCreateInfo

This state must be specified to create a complete graphics pipeline.

**Pre-Rasterization Shader State**

Pre-rasterization shader state is defined by:

- VkPipelineShaderStageCreateInfo entries for:
  - Vertex shaders
- Tessellation control shaders
- Tessellation evaluation shaders
- Geometry shaders

- Within the `VkPipelineLayout`, the full pipeline layout must be specified.
- `VkPipelineViewportStateCreateInfo`
- `VkPipelineRasterizationStateCreateInfo`
- `VkPipelineTessellationStateCreateInfo`
- `VkRenderPass` and `subpass` parameter
- The `viewMask` parameter of `VkPipelineRenderingCreateInfo` (formats are ignored)
- `VkPipelineDiscardRectangleStateCreateInfoEXT`
- `VkPipelineFragmentShadingRateStateCreateInfoKHR`

This state **must** be specified to create a complete graphics pipeline.

**Fragment Shader State**

Fragment shader state is defined by:

- A `VkPipelineShaderStageCreateInfo` entry for the fragment shader
- Within the `VkPipelineLayout`, the full pipeline layout must be specified.
- `VkPipelineMultisampleStateCreateInfo` if sample shading is enabled or `renderpass` is not `VK_NULL_HANDLE`
- `VkPipelineDepthStencilStateCreateInfo`
- `VkRenderPass` and `subpass` parameter
- The `viewMask` parameter of `VkPipelineRenderingCreateInfo` (formats are ignored)
- `VkPipelineFragmentShadingRateStateCreateInfoKHR`
- Inclusion/omission of the `VK_PIPELINE_RASTERIZATION_STATE_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` flag
- `VkRenderingInputAttachmentIndexInfoKHR`

If `rasterizerDiscardEnable` is set to `VK_FALSE` or `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` is used, this state **must** be specified to create a complete graphics pipeline.

**Fragment Output State**

Fragment output state is defined by:

- `VkPipelineColorBlendStateCreateInfo`
- `VkRenderPass` and `subpass` parameter
- `VkPipelineMultisampleStateCreateInfo`
- `VkPipelineRenderingCreateInfo`
- Inclusion/omission of the `VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` and
If `rasterizerDiscardEnable` is set to `VK_FALSE` or `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` is used, this state **must** be specified to create a complete graphics pipeline.

**Dynamic State**

Dynamic state values set via `pDynamicState` **must** be ignored if the state they correspond to is not otherwise statically set by one of the state subsets used to create the pipeline. For example, if a pipeline only included pre-rasterization shader state, then any dynamic state value corresponding to depth or stencil testing has no effect.

**Complete Graphics Pipelines**

A complete graphics pipeline always includes pre-rasterization shader state, with other subsets included depending on that state as specified in the above sections.

If a `VkPipelineCreateFlags2CreateInfoKHR` structure is present in the `pNext` chain, `VkPipelineCreateFlags2CreateInfoKHR::flags` from that structure is used instead of `flags` from this structure.
If a **resource variables** is declared in a shader as an array, a descriptor slot in **layout** must match the descriptor count

- VUID-VkGraphicsPipelineCreateInfo-stage-02096
  If the pipeline requires **pre-rasterization shader state** the **stage** member of one element of **pStages** must be **VK_SHADER_STAGE_VERTEX_BIT**

- VUID-VkGraphicsPipelineCreateInfo-pStages-00729
  If the pipeline requires **pre-rasterization shader state** and **pStages** includes a tessellation control shader stage, it must include a tessellation evaluation shader stage

- VUID-VkGraphicsPipelineCreateInfo-pStages-00730
  If the pipeline requires **pre-rasterization shader state** and **pStages** includes a tessellation evaluation shader stage, it must include a tessellation control shader stage

- VUID-VkGraphicsPipelineCreateInfo-pStages-09022
  If the pipeline requires **pre-rasterization shader state** and **pStages** includes tessellation shader stages, the shader code of at least one stage must contain an **OpExecutionMode** instruction specifying the type of subdivision in the pipeline

- VUID-VkGraphicsPipelineCreateInfo-pStages-00733
  If the pipeline requires **pre-rasterization shader state** and **pStages** includes tessellation shader stages, and the shader code of both stages contain an **OpExecutionMode** instruction specifying the type of subdivision in the pipeline, they must both specify the same subdivision mode

- VUID-VkGraphicsPipelineCreateInfo-pStages-00734
  If the pipeline requires **pre-rasterization shader state** and **pStages** includes tessellation shader stages, the shader code of at least one stage must contain an **OpExecutionMode** instruction specifying the output patch size in the pipeline

- VUID-VkGraphicsPipelineCreateInfo-pStages-08888
  If the pipeline is being created with **pre-rasterization shader state** and **vertex input state** and **pStages** includes tessellation shader stages, and either **VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY** dynamic state is not enabled or **dynamicPrimitiveTopologyUnrestricted** is **VK_FALSE**, the **topology** member of **pInputAssembly** must be **VK_PRIMITIVE_TOPOLOGY_PATCH_LIST**
If the pipeline is being created with pre-rasterization shader state and vertex input state and the topology member of pInputAssembly is VK_PRIMITIVE_TOPOLOGY_PATCH_LIST, and either VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY dynamic state is not enabled or dynamicPrimitiveTopologyUnrestricted is VK_FALSE, then pStages must include tessellation shader stages.

If the pipeline is being created with a TessellationEvaluation Execution Model, no Geometry Execution Model, uses the PointMode Execution Mode, and shaderTessellationAndGeometryPointSize is enabled, a PointSize decorated variable must be written to if maintenance5 is not enabled.

If the pipeline is being created with a Vertex Execution Model and no TessellationEvaluation or Geometry Execution Model, and the topology member of pInputAssembly is VK_PRIMITIVE_TOPOLOGY_POINT_LIST, and either VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY dynamic state is not enabled or dynamicPrimitiveTopologyUnrestricted is VK_FALSE, a PointSize decorated variable must be written to if maintenance5 is not enabled.

If maintenance5 is enabled and a PointSize decorated variable is written to, all execution paths must write to a PointSize decorated variable.

If the pipeline is being created with a TessellationEvaluation Execution Model, no Geometry Execution Model, uses the PointMode Execution Mode, and shaderTessellationAndGeometryPointSize is not enabled, a PointSize decorated variable must not be written to.

If the pipeline is being created with a Geometry Execution Model, uses the OutputPoints Execution Mode, and shaderTessellationAndGeometryPointSize is enabled, a PointSize decorated variable must be written to for every vertex emitted if maintenance5 is not enabled.

If the pipeline is being created with a Geometry Execution Model, uses the OutputPoints Execution Mode, and shaderTessellationAndGeometryPointSize is not enabled, a PointSize decorated variable must not be written to.

If the pipeline requires pre-rasterization shader state and pStages includes a geometry shader stage, and does not include any tessellation shader stages, its shader code must contain an OpExecutionMode instruction specifying an input primitive type that is compatible with the primitive topology specified in pInputAssembly.

If the pipeline requires pre-rasterization shader state and pStages includes a geometry shader stage, and also includes tessellation shader stages, its shader code must contain an OpExecutionMode instruction specifying an input primitive type that is compatible with the primitive topology that is output by the tessellation stages.
If the pipeline requires **pre-rasterization shader state** and **fragment shader state**, it includes both a fragment shader and a geometry shader, and the fragment shader code reads from an input variable that is decorated with `PrimitiveId`, then the geometry shader code **must** write to a matching output variable, decorated with `PrimitiveId`, in all execution paths.

If `renderPass` is not `VK_NULL_HANDLE` and the pipeline is being created with **fragment shader state** the fragment shader **must** not read from any input attachment that is defined as `VK_ATTACHMENT_UNUSED` in subpass.

If the pipeline requires **pre-rasterization shader state** and multiple pre-rasterization shader stages are included in `pStages`, the shader code for the entry points identified by those `pStages` and the rest of the state identified by this structure **must** adhere to the pipeline linking rules described in the **Shader Interfaces** chapter.

If the pipeline requires **pre-rasterization shader state** and **fragment shader state**, the fragment shader and last **pre-rasterization shader stage** and any relevant state **must** adhere to the pipeline linking rules described in the **Shader Interfaces** chapter.

If `renderPass` is not `VK_NULL_HANDLE`, and the pipeline is being created with **fragment output interface state**, then for each color attachment in the subpass, if the potential format features of the format of the corresponding attachment description do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` **must** be `VK_FALSE`.

If `renderPass` is not `VK_NULL_HANDLE`, and the pipeline is being created with **fragment output interface state**, and the `pColorBlendState` pointer is not `NULL`, and the subpass uses color attachments, the `attachmentCount` member of `pColorBlendState` **must** be equal to the `colorAttachmentCount` used to create subpass.

If the pipeline requires **pre-rasterization shader state**, and `pViewportState->pViewports` is not dynamic, then `pViewportState->pViewports` **must** be a valid pointer to an array of `pViewportState->viewportCount` valid `VkViewport` structures.

If the pipeline requires **pre-rasterization shader state**, and `pViewportState->pScissors` is not dynamic, then `pViewportState->pScissors` **must** be a valid pointer to an array of `pViewportState->scissorCount` `VkRect2D` structures.

If the pipeline requires **pre-rasterization shader state**, and the `wideLines` feature is not enabled, and no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_LINE_WIDTH`, the `lineWidth` member of `pRasterizationState` **must** be `1.0`.

If the pipeline requires **pre-rasterization shader state**, and the
VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE dynamic state is enabled or the rasterizerDiscardEnable member of pRasterizationState is VK_FALSE, and either the VK_EXT_extended_dynamic_state3 extension is not enabled, or either the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT or VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic states are not set, pViewportState must be a valid pointer to a valid VkPipelineViewportStateCreateInfo structure

- VUID-VkGraphicsPipelineCreateInfo-pViewportState-09025
  If pViewportState is not NULL it must be a valid pointer to a valid VkPipelineViewportStateCreateInfo structure

- VUID-VkGraphicsPipelineCreateInfo-pMultisampleState-09026
  If the pipeline requires fragment output interface state, and the VK_EXT_extended_dynamic_state3 extension is not enabled or any of the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT, VK_DYNAMIC_STATE_SAMPLE_MASK_EXT, or VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT dynamic states is not set, or alphaToOne is enabled on the device and VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT is not set, pMultisampleState must be a valid pointer to a valid VkPipelineMultisampleStateCreateInfo structure

- VUID-VkGraphicsPipelineCreateInfo-pMultisampleState-09027
  If pMultisampleState is not NULL it must be a valid pointer to a valid VkPipelineMultisampleStateCreateInfo structure

- VUID-VkGraphicsPipelineCreateInfo-alphaToCoverageEnable-08891
  If the pipeline is being created with fragment shader state, the VkPipelineMultisampleStateCreateInfo::alphaToCoverageEnable is not ignored and is VK_TRUE, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0

- VUID-VkGraphicsPipelineCreateInfo-renderPass-09028
  If renderPass is not VK_NULL_HANDLE, the pipeline is being created with fragment shader state, and subpass uses a depth/stencil attachment, and the VK_EXT_extended_dynamic_state3 extension is not enabled or any of the VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE, VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE, VK_DYNAMIC_STATE_DEPTH_COMPARE_OP, VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE, VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE, VK_DYNAMIC_STATE_STENCIL_OP, or VK_DYNAMIC_STATE_DEPTH_BOUNDS dynamic states are not set, pDepthStencilState must be a valid pointer to a valid VkPipelineDepthStencilStateCreateInfo structure

- VUID-VkGraphicsPipelineCreateInfo-pDepthStencilState-09029
  If pDepthStencilState is not NULL it must be a valid pointer to a valid VkPipelineDepthStencilStateCreateInfo structure

- VUID-VkGraphicsPipelineCreateInfo-renderPass-09030
  If renderPass is not VK_NULL_HANDLE, the pipeline is being created with fragment output interface state, and subpass uses color attachments, and VK_EXT_extended_dynamic_state3 extension is not enabled, or any of the VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT, VK_DYNAMIC_STATE_LOGIC_OP_EXT, VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT, VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT, VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT, or VK_DYNAMIC_STATE_BLEND_CONSTANTS dynamic states are not set, pColorBlendState must be a valid pointer to a valid VkPipelineColorBlendStateCreateInfo structure
If the pipeline requires pre-rasterization shader state, the depthBiasClamp feature is not enabled, no element of the pDynamicStates member of pDynamicState is VK_DYNAMIC_STATE_DEPTH_BIAS, and the depthBiasEnable member of pRasterizationState is VK_TRUE, the depthBiasClamp member of pRasterizationState must be 0.0.

If the pipeline requires fragment shader state, and no element of the pDynamicStates member of pDynamicState is VK_DYNAMIC_STATE_DEPTH_BOUNDS, and the depthBoundsTestEnable member of pDepthStencilState is VK_TRUE, the minDepthBounds and maxDepthBounds members of pDepthStencilState must be between 0.0 and 1.0, inclusive.

If the pipeline requires fragment output interface state, rasterizationSamples is not dynamic, and subpass does not use any color and/or depth/stencil attachments, then the rasterizationSamples member of pMultisampleState must follow the rules for a zero-attachment subpass.

If renderPass is not VK_NULL_HANDLE, subpass must be a valid subpass within renderPass.

If renderPass is not VK_NULL_HANDLE, the pipeline is being created with pre-rasterization shader state, subpass viewMask is not 0, and multiviewTessellationShader is not enabled, then pStages must not include tessellation shaders.

If renderPass is not VK_NULL_HANDLE, the pipeline is being created with pre-rasterization shader state, subpass viewMask is not 0, and multiviewGeometryShader is not enabled, then pStages must not include a geometry shader.

If renderPass is not VK_NULL_HANDLE, the pipeline is being created with pre-rasterization shader state, and subpass viewMask is not 0, all of the shaders in the pipeline must not write to the Layer built-in output.

If renderPass is not VK_NULL_HANDLE and the pipeline is being created with pre-rasterization shader state, and subpass viewMask is not 0, then all of the shaders in the pipeline must not include variables decorated with the Layer built-in decoration in their interfaces.

If renderPass is not VK_NULL_HANDLE and the pipeline is being created with pre-rasterization shader state, and subpass viewMask is not 0, then all of the shaders in the pipeline must not include variables decorated with the ViewMask built-in decoration in their interfaces.

Flags must not contain the VK_PIPELINE_CREATE_DISPATCH_BASE flag.

If the pipeline requires fragment shader state and an input attachment was referenced by an aspectMask at renderPass creation time, the fragment shader must only read from the
aspects that were specified for that input attachment

• VUID-VkGraphicsPipelineCreateInfo-layout-01688
  The number of resources in layout accessible to each shader stage that is used by the pipeline must be less than or equal to VkPhysicalDeviceLimits::maxPerStageResources

• VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04058
  If the pipeline requires pre-rasterization shader state, and no element of the pDynamicStates member of pDynamicState is VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT, and if pNext chain includes a VkPipelineDiscardRectangleStateCreateInfoEXT structure, and if its discardRectangleCount member is not 0, then its pDiscardRectangles member must be a valid pointer to an array of discardRectangleCount VkRect2D structures

• VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07855
  If VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT is included in the pDynamicStates array then the implementation must support at least specVersion 2 of the VK_EXT_discard_rectangles extension

• VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07856
  If VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT is included in the pDynamicStates array then the implementation must support at least specVersion 2 of the VK_EXT_discard_rectangles extension

• VUID-VkGraphicsPipelineCreateInfo-pStages-02097
  If the pipeline requires vertex input state, and pVertexInputState is not dynamic, then pVertexInputState must be a valid pointer to a valid VkPipelineVertexInputStateCreateInfo structure

• VUID-VkGraphicsPipelineCreateInfo-Input-07904
  If the pipeline is being created with vertex input state and pVertexInputState is not dynamic, then all variables with the Input storage class decorated with Location in the Vertex Execution Model OpEntryPoint must contain a location in VkVertexInputAttributeDescription::location

• VUID-VkGraphicsPipelineCreateInfo-Input-08733
  If the pipeline requires vertex input state and pVertexInputState is not dynamic, then the numeric type associated with all Input variables of the corresponding Location in the Vertex Execution Model OpEntryPoint must be the same as VkVertexInputAttributeDescription::format

• VUID-VkGraphicsPipelineCreateInfo-pVertexInputState-08929
  If the pipeline is being created with vertex input state and pVertexInputState is not dynamic, and the scalar width associated with a Location decorated Input variable in the Vertex Execution Model OpEntryPoint is 64-bit, then the corresponding VkVertexInputAttributeDescription::format must have a 64-bit component

• VUID-VkGraphicsPipelineCreateInfo-pVertexInputState-08930
  If the pipeline is being created with vertex input state and pVertexInputState is not dynamic, and the scalar width associated with a Location decorated Input variable in the Vertex Execution Model OpEntryPoint is 64-bit, then the corresponding VkVertexInputAttributeDescription::format must have a 64-bit component

• VUID-VkGraphicsPipelineCreateInfo-pVertexInputState-09198
  If the pipeline is being created with vertex input state and pVertexInputState is not
dynamic, and `VkVertexInputAttributeDescription::format` has a 64-bit component, then all `Input` variables at the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` must not use components that are not present in the format.

- **VUID-VkGraphicsPipelineCreateInfo-dynamicPrimitiveTopologyUnrestricted-09031**
  If the pipeline requires `vertex input state`, and the `VK_EXT_extended_dynamic_state3` extension is not enabled, or either `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE`, or `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` dynamic states are not set, or `dynamicPrimitiveTopologyUnrestricted` is `VK_FALSE`, `pInputAssemblyState` must be a valid pointer to a valid `VkPipelineInputAssemblyStateCreateInfo` structure.

- **VUID-VkGraphicsPipelineCreateInfo-pInputAssemblyState-09032**
  If `pInputAssemblyState` is not `NULL` it must be a valid pointer to a valid `VkPipelineInputAssemblyStateCreateInfo` structure.

- **VUID-VkGraphicsPipelineCreateInfo-lineRasterizationMode-02766**
  If the pipeline requires `pre-rasterization shader state` and at least one of `fragment output interface state` or `fragment shader state`, and `pMultisampleState` is not `NULL`, the `lineRasterizationMode` member of a `VkPipelineRasterizationLineStateCreateInfoKHR` structure included in the `pNext` chain of `pRasterizationState` is `VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR` or `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR`, then the `alphaToCoverageEnable`, `alphaToOneEnable`, and `sampleShadingEnable` members of `pMultisampleState` must all be `VK_FALSE`.

- **VUID-VkGraphicsPipelineCreateInfo-stippledLineEnable-02767**
  If the pipeline requires `pre-rasterization shader state`, the `stippledLineEnable` member of `VkPipelineRasterizationLineStateCreateInfoKHR` is `VK_TRUE`, and no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_LINE_STIPPLE_EXT`, then the `lineStippleFactor` member of `VkPipelineRasterizationLineStateCreateInfoKHR` must be in the range `[1,256]`.

- **VUID-VkGraphicsPipelineCreateInfo-flags-03372**
  `flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR`.

- **VUID-VkGraphicsPipelineCreateInfo-flags-03373**
  `flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`.

- **VUID-VkGraphicsPipelineCreateInfo-flags-03374**
  `flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR`.

- **VUID-VkGraphicsPipelineCreateInfo-flags-03375**
  `flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`.

- **VUID-VkGraphicsPipelineCreateInfo-flags-03376**
  `flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR`.

- **VUID-VkGraphicsPipelineCreateInfo-flags-03377**
  `flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR`.

- **VUID-VkGraphicsPipelineCreateInfo-flags-03577**
  `flags` must not include `571`
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-03378
  If the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` is less than Version 1.3 there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_CULL_MODE`, `VK_DYNAMIC_STATE_FRONT_FACE`, `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY`, `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT`, `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT`, `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE`, `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE`, `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE`, `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP`, `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE`, `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE`, or `VK_DYNAMIC_STATE_STENCIL_OP`.

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-03379
  If the pipeline requires pre-rasterization shader state, and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` is included in the `pDynamicStates` array then `viewportCount` must be zero.

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-03380
  If the pipeline requires pre-rasterization shader state, and `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` is included in the `pDynamicStates` array then `scissorCount` must be zero.

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04132
  If the pipeline requires pre-rasterization shader state, and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` is included in the `pDynamicStates` array then `VK_DYNAMIC_STATE_VIEWPORT` must not be present.

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04133
  If the pipeline requires pre-rasterization shader state, and `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` is included in the `pDynamicStates` array then `VK_DYNAMIC_STATE_SCISSOR` must not be present.

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04868
  If the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` is less than Version 1.3 there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE`, `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE`, or `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE`.

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04869
  If the `extendedDynamicState2LogicOp` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_LOGIC_OP_EXT`.

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04870
  If the `extendedDynamicState2PatchControlPoints` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT`.

- VUID-VkGraphicsPipelineCreateInfo-pipelineCreationCacheControl-02878
  If the `pipelineCreationCacheControl` feature is not enabled, flags must not include `VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT` or `VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT`.

- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04494
  If the pipeline requires pre-rasterization shader state or fragment shader state and...
VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width must be greater than or equal to 1

• VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04495
If the pipeline requires pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height must be greater than or equal to 1

• VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04496
If the pipeline requires pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width must be a power-of-two value

• VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04497
If the pipeline requires pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height must be a power-of-two value

• VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04498
If the pipeline requires pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width must be less than or equal to 4

• VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04499
If the pipeline requires pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height must be less than or equal to 4

• VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04500
If the pipeline requires pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, and the pipelineFragmentShadingRate feature is not enabled, VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width and VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height must both be equal to 1

• VUID-VkGraphicsPipelineCreateInfo-pDynamicState-06567
If the pipeline requires pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps[0] must be a valid VkFragmentShadingRateCombinerOpKHR value

• VUID-VkGraphicsPipelineCreateInfo-pDynamicState-06568
If the pipeline requires pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps[1] must be a valid VkFragmentShadingRateCombinerOpKHR value
If the pipeline requires pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, and the primitiveFragmentShadingRate feature is not enabled, VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps[0] must be VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR.

If the pipeline requires pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, and the attachmentFragmentShadingRate feature is not enabled, VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps[1] must be VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR.

If the pipeline requires pre-rasterization shader state and the primitiveFragmentShadingRateWithMultipleViewports limit is not supported, VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT is not included in pDynamicState->pDynamicStates, and VkPipelineViewportStateCreateInfo::viewportCount is greater than 1, entry points specified in pStages must not write to the PrimitiveShadingRateKHR built-in.

If the pipeline requires pre-rasterization shader state and the primitiveFragmentShadingRateWithMultipleViewports limit is not supported, and entry points specified in pStages write to the ViewportIndex built-in, they must not also write to the PrimitiveShadingRateKHR built-in.

If the pipeline requires pre-rasterization shader state or fragment shader state, the fragmentShadingRateNonTrivialCombinerOps limit is not supported, and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, elements of VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps must be VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR or VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR.

All elements of the pDynamicStates member of pDynamicState must not be VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR.

If the dynamicRendering feature is not enabled and the pipeline requires pre-rasterization shader state, fragment shader state, or fragment output interface state, renderPass must not be VK_NULL_HANDLE.

If the multiview feature is not enabled, the pipeline requires pre-rasterization shader state, fragment shader state, or fragment output interface state, and renderPass is VK_NULL_HANDLE, VkPipelineRenderingCreateInfo::viewMask must be 0.

If the pipeline requires pre-rasterization shader state, fragment shader state, or fragment output interface state, and renderPass is VK_NULL_HANDLE, VkPipelineRenderingCreateInfo::viewMask must be 0.

If the pipeline requires pre-rasterization shader state, fragment shader state, or fragment output interface state, and renderPass is VK_NULL_HANDLE, VkPipelineRenderingCreateInfo::viewMask must be 0.
output interface state, and renderPass is VK_NULL_HANDLE, the index of the most significant bit in VkPipelineRenderingCreateInfo::viewMask must be less than maxMultiviewViewCount

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06579
  If the pipeline requires fragment output interface state, and renderPass is VK_NULL_HANDLE, and VkPipelineRenderingCreateInfo::colorAttachmentCount is not 0, VkPipelineRenderingCreateInfo::pColorAttachmentFormats must be a valid pointer to an array of colorAttachmentCount valid VkFormat values

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06580
  If the pipeline requires fragment output interface state, and renderPass is VK_NULL_HANDLE, each element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats must be a valid VkFormat value

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06582
  If the pipeline requires fragment output interface state, renderPass is VK_NULL_HANDLE, and any element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats is not VK_FORMAT_UNDEFINED, that format must be a format with potential format features that include VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06583
  If the pipeline requires fragment output interface state, and renderPass is VK_NULL_HANDLE, VkPipelineRenderingCreateInfo::depthAttachmentFormat must be a valid VkFormat value

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06584
  If the pipeline requires fragment output interface state, and renderPass is VK_NULL_HANDLE, VkPipelineRenderingCreateInfo::stencilAttachmentFormat must be a valid VkFormat value

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06585
  If the pipeline requires fragment output interface state, renderPass is VK_NULL_HANDLE, and VkPipelineRenderingCreateInfo::depthAttachmentFormat is not VK_FORMAT_UNDEFINED, it must be a format with potential format features that include VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06586
  If the pipeline requires fragment output interface state, renderPass is VK_NULL_HANDLE, and VkPipelineRenderingCreateInfo::stencilAttachmentFormat is not VK_FORMAT_UNDEFINED, it must be a format with potential format features that include VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06587
  If the pipeline requires fragment output interface state, renderPass is VK_NULL_HANDLE, and VkPipelineRenderingCreateInfo::depthAttachmentFormat is not VK_FORMAT_UNDEFINED, it must be a format that includes a depth component

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06588
  If the pipeline requires fragment output interface state, renderPass is VK_NULL_HANDLE, and VkPipelineRenderingCreateInfo::stencilAttachmentFormat is not VK_FORMAT_UNDEFINED, it must be a format that includes a stencil component

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06589
If the pipeline requires fragment output interface state, `renderPass` is `VK_NULL_HANDLE`, `VkPipelineRenderingCreateInfo::depthAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, and `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, `depthAttachmentFormat` must equal `stencilAttachmentFormat`.

- VUID-VkGraphicsPipelineCreateInfo-renderPass-09033
  If `renderPass` is `VK_NULL_HANDLE`, the pipeline is being created with fragment shader state and fragment output interface state, and either of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` or `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` are not `VK_FORMAT_UNDEFINED`, and the `VK_EXT_extended_dynamic_state3` extension is not enabled or any of the `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE`, `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE`, `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP`, `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE`, `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE`, or `VK_DYNAMIC_STATE_DEPTH_BOUNDS` dynamic states are not set, `pDepthStencilState` must be a valid pointer to a valid `VkPipelineDepthStencilStateCreateInfo` structure.

- VUID-VkGraphicsPipelineCreateInfo-pDepthStencilState-09034
  If `pDepthStencilState` is not `NULL` it must be a valid pointer to a valid `VkPipelineDepthStencilStateCreateInfo` structure.

- VUID-VkGraphicsPipelineCreateInfo-renderPass-09037
  If `renderPass` is `VK_NULL_HANDLE`, the pipeline is being created with fragment output interface state, and `VkPipelineRenderingCreateInfo::colorAttachmentCount` is not equal to `0`, and the `VK_EXT_extended_dynamic_state3` extension is not enabled, or any of the `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT`, `VK_DYNAMIC_STATE_LOGIC_OP_EXT`, `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT`, `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT`, `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT`, or `VK_DYNAMIC_STATE_BLEND_CONSTANTS` dynamic states are not set, `pColorBlendState` must be a valid pointer to a valid `VkPipelineColorBlendStateCreateInfo` structure.

- VUID-VkGraphicsPipelineCreateInfo-pColorBlendState-09038
  If `pColorBlendState` is not `NULL` it must be a valid pointer to a valid `VkPipelineColorBlendStateCreateInfo` structure.

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06055
  If `renderPass` is `VK_NULL_HANDLE`, `pColorBlendState` is not dynamic, and the pipeline is being created with fragment output interface state, `pColorBlendState->attachmentCount` must be equal to `VkPipelineRenderingCreateInfo::colorAttachmentCount`.

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06057
  If `renderPass` is `VK_NULL_HANDLE`, the pipeline is being created with pre-rasterization shader state, `VkPipelineRenderingCreateInfo::viewMask` is not `0`, and the `multiviewTessellationShader` feature is not enabled, then `pStages` must not include tessellation shaders.

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06058
  If `renderPass` is `VK_NULL_HANDLE`, the pipeline is being created with pre-rasterization shader state, `VkPipelineRenderingCreateInfo::viewMask` is not `0`, and the `multiviewGeometryShader` feature is not enabled, then `pStages` must not include a geometry shader.

- VUID-VkGraphicsPipelineCreateInfo-renderPass-07718
  If `renderPass` is `VK_NULL_HANDLE`, the pipeline is being created with pre-rasterization
shader state, and VkPipelineRenderingCreateInfo::viewMask is not 0, all of the shaders in the pipeline must not write to the Layer built-in output

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06059
  If renderPass is VK_NULL_HANDLE, the pipeline is being created with pre-rasterization shader state, and VkPipelineRenderingCreateInfo::viewMask is not 0, all of the shaders in the pipeline must not include variables decorated with the Layer built-in decoration in their interfaces

- VUID-VkGraphicsPipelineCreateInfo-renderPass-07719
  If renderPass is VK_NULL_HANDLE, the pipeline is being created with pre-rasterization shader state, and VkPipelineRenderingCreateInfo::viewMask is not 0, all of the shaders in the pipeline must not include variables decorated with the ViewIndex built-in decoration in their interfaces

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06061
  If the dynamicRenderingLocalRead feature is not enabled, the pipeline requires fragment shader state, and renderPass is VK_NULL_HANDLE, fragment shaders in pStages must not include the InputAttachment capability

- VUID-VkGraphicsPipelineCreateInfo-renderPass-08710
  If the pipeline requires fragment shader state and renderPass is not VK_NULL_HANDLE, fragment shaders in pStages must not include any of the TileImageColorReadAccessEXT, TileImageDepthReadAccessEXT, or TileImageStencilReadAccessEXT capabilities

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06062
  If the pipeline requires fragment output interface state and renderPass is VK_NULL_HANDLE, for each color attachment format defined by the pColorAttachmentFormats member of VkPipelineRenderingCreateInfo, if its potential format features do not contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the blendEnable member of the corresponding element of the pAttachments member of pColorBlendState must be VK_FALSE

- VUID-VkGraphicsPipelineCreateInfo-pipelineStageCreationFeedbackCount-06594
  If VkPipelineCreationFeedbackCreateInfo::pipelineStageCreationFeedbackCount is not 0, it must be equal to stageCount

- VUID-VkGraphicsPipelineCreateInfo-pStages-06600
  If the pipeline requires pre-rasterization shader state or fragment shader state, pStages must be a valid pointer to an array of stageCount valid VkPipelineShaderStageCreateInfo structures

- VUID-VkGraphicsPipelineCreateInfo-pRasterizationState-09039
  If the VK_EXT_extended_dynamic_state3 extension is not enabled, or any of the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT, VK_DYNAMIC_STATE_SAMPLE_MASK_EXT, or VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT dynamic states are not set, or alphaToOne is enabled on the device and VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT is not set, then pMultisampleState must be a valid pointer to a valid VkPipelineMultisampleStateCreateInfo structure

- VUID-VkGraphicsPipelineCreateInfo-pRasterizationState-09040
  If pRasterizationState is not NULL it must be a valid pointer to a valid VkPipelineRasterizationStateCreateInfo structure
If the pipeline requires fragment shader state or pre-rasterization shader state, layout must be a valid VkPipelineLayout handle.

If pre-rasterization shader state, fragment shader state, or fragment output state, and renderPass is not VK_NULL_HANDLE, renderPass must be a valid VkRenderPass handle.

If the pipeline requires pre-rasterization shader state, stageCount must be greater than 0.

flags must not include VK_PIPELINE_CREATE_LIBRARY_BIT_KHR.

If the pipeline requires pre-rasterization shader state but not fragment shader state, elements of pStages must not have stage set to VK_SHADER_STAGE_FRAGMENT_BIT.

If the pipeline requires fragment shader state but not pre-rasterization shader state, elements of pStages must not have stage set to a shader stage which participates in pre-rasterization.

If the pipeline requires pre-rasterization shader state, all elements of pStages must have a stage set to a shader stage which participates in fragment shader state or pre-rasterization shader state.

If the pipeline requires fragment shader state and/or pre-rasterization shader state, any value of stage must not be set in more than one element of pStages.

If the extendedDynamicState3TessellationDomainOrigin feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT.

If the extendedDynamicState3DepthClampEnable feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT.

If the extendedDynamicState3PolygonMode feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_POLYGON_MODE_EXT.

If the extendedDynamicState3RasterizationSamples feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT.

If the extendedDynamicState3SampleMask feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_SAMPLE_MASK_EXT.
• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3AlphaToCoverageEnable-07375
  If the extendedDynamicState3AlphaToCoverageEnable feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3AlphaToOneEnable-07376
  If the extendedDynamicState3AlphaToOneEnable feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3LogicOpEnable-07377
  If the extendedDynamicState3LogicOpEnable feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ColorBlendEnable-07378
  If the extendedDynamicState3ColorBlendEnable feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ColorBlendEquation-07379
  If the extendedDynamicState3ColorBlendEquation feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ColorWriteMask-07380
  If the extendedDynamicState3ColorWriteMask feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3RasterizationStream-07381
  If the extendedDynamicState3RasterizationStream feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ConservativeRasterizationMode-07382
  If the extendedDynamicState3ConservativeRasterizationMode feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ExtraPrimitiveOverestimationSize-07383
  If the extendedDynamicState3ExtraPrimitiveOverestimationSize feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3DepthClipEnable-07384
  If the extendedDynamicState3DepthClipEnable feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3SampleLocationsEnable-
07385
If the extendedDynamicState3SampleLocationsEnable feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to
VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ColorBlendAdvanced-07386
If the extendedDynamicState3ColorBlendAdvanced feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to
VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ProvokingVertexMode-07387
If the extendedDynamicState3ProvokingVertexMode feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to
VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3LineRasterizationMode-07388
If the extendedDynamicState3LineRasterizationMode feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to
VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3LineStippleEnable-07389
If the extendedDynamicState3LineStippleEnable feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to
VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3DepthClipNegativeOneToOne-07390
If the extendedDynamicState3DepthClipNegativeOneToOne feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to
VK_DYNAMIC_STATE_DEPTH_CLIP_NEGATIVE_ONE_TO_ONE_EXT

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ViewportWScalingEnable-07391
If the extendedDynamicState3ViewportWScalingEnable feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to
VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_ENABLE_NV

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ViewportSwizzle-07392
If the extendedDynamicState3ViewportSwizzle feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to
VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3CoverageToColorEnable-07393
If the extendedDynamicState3CoverageToColorEnable feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to
VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3CoverageToColorLocation-07394
If the extendedDynamicState3CoverageToColorLocation feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to
• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3CoverageModulationMode-07395
  If the `extendedDynamicState3CoverageModulationMode` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COVERAGE_MODULATION_MODE_NV`.

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3CoverageModulationTableEnable-07396
  If the `extendedDynamicState3CoverageModulationTableEnable` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV`.

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3CoverageModulationTable-07397
  If the `extendedDynamicState3CoverageModulationTable` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_NV`.

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3CoverageReductionMode-07398
  If the `extendedDynamicState3CoverageReductionMode` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COVERAGE_REDUCTION_MODE_NV`.

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3RepresentativeFragmentTestEnable-07399
  If the `extendedDynamicState3RepresentativeFragmentTestEnable` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_REPRESENTATIVE_FRAGMENT_TEST_ENABLE_NV`.

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ShadingRateImageEnable-07400
  If the `extendedDynamicState3ShadingRateImageEnable` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_SHADING_RATE_IMAGE_ENABLE_NV`.

• VUID-VkGraphicsPipelineCreateInfo-flags-07401
  The `flags` **must** not include `VK_PIPELINE_CREATE_RAY_TRACING_OPACITY_MICROMAP_BIT_EXT`.

• VUID-VkGraphicsPipelineCreateInfo-pStages-08711
  If `pStages` includes a fragment shader stage, `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` is not set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and the fragment shader declares the `EarlyFragmentTests` execution mode and uses `OpDepthAttachmentReadEXT`, the `depthWriteEnable` member of `VkPipelineDepthStencilStateCreateInfo` **must** be `VK_FALSE`.

• VUID-VkGraphicsPipelineCreateInfo-pStages-08712
  If `pStages` includes a fragment shader stage, `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` is not set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and the fragment shader declares the `EarlyFragmentTests` execution mode and uses `OpStencilAttachmentReadEXT`, the value of `VkStencilOpState::writeMask` for both front and back in `VkPipelineDepthStencilStateCreateInfo` **must** be `0`.
If `renderPass` is `VK_NULL_HANDLE`, the pipeline requires fragment output state or fragment shader state, the pipeline enables sample shading, `rasterizationSamples` is not dynamic, and the `pNext` chain includes a `VkPipelineRenderingCreateInfo` structure, `rasterizationSamples` must be a valid `VkSampleCountFlagBits` value that is set in `imageCreateSampleCounts` (as defined in Image Creation Limits) for every element of `depthAttachmentFormat`, `stencilAttachmentFormat` and the `pColorAttachmentFormats` array which is not `VK_FORMAT_UNDEFINED`.

The pipeline must be created with pre-rasterization shader state.

If `pStages` includes a vertex shader stage, the pipeline must be created with vertex input state.

If `pDynamicState->pDynamicStates` includes `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE`, or if it does not and `pRasterizationState->rasterizerDiscardEnable` is `VK_FALSE`, the pipeline must be created with fragment shader state and fragment output interface state.

If `pDynamicState->pDynamicStates` does not include `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT`, and the format of any color attachment is `VK_FORMAT_E5B9G9R9_UFLOAT_PACK32`, the `colorWriteMask` member of the corresponding element of `pColorBlendState->pAttachments` must either include all of `VK_COLOR_COMPONENT_R_BIT`, `VK_COLOR_COMPONENT_G_BIT`, and `VK_COLOR_COMPONENT_B_BIT`, or none of them.

If the pipeline is being created with fragment shader state and fragment output state, and the value of `renderPass` is `VK_NULL_HANDLE`, `VkRenderingInputAttachmentIndexInfoKHR::colorAttachmentCount` must be equal to `VkPipelineRenderingCreateInfo::colorAttachmentCount`.

If the pipeline is being created with fragment output state, and the value of `renderPass` is `VK_NULL_HANDLE`, `VkRenderingAttachmentLocationInfoKHR::colorAttachmentCount` must be equal to `VkPipelineRenderingCreateInfo::colorAttachmentCount`.

Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_GRAPHICS_PIPELINE_CREATE_INFO`
- Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkAttachmentSampleCountInfoAMD`, `VkMultiviewPerViewAttributesInfoNVX`, `VkPipelineCreateFlags2CreateInfoKHR`, `VkPipelineCreationFeedbackCreateInfo`, `VkPipelineDiscardRectangleStateCreateInfoEXT`, `VkPipelineFragmentShadingRateStateCreateInfoKHR`, `VkPipelineLibraryCreateInfoKHR`, `VkPipelineRenderingCreateInfo`, or `VkRenderingAttachmentLocationInfoKHR`.
 VkRenderingInputAttachmentIndexInfoKHR

- VUID-VkGraphicsPipelineCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-parameter
  If pDynamicState is not NULL, pDynamicState must be a valid pointer to a valid
  VkPipelineDynamicStateCreateInfo structure

- VUID-VkGraphicsPipelineCreateInfo-commonparent
  Each of basePipelineHandle, layout, and renderPass that are valid handles of non-ignored
  parameters must have been created, allocated, or retrieved from the same VkDevice

The VkPipelineRenderingCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPipelineRenderingCreateInfo {
  VkStructureType sType;
  const void* pNext;
  uint32_t viewMask;
  uint32_t colorAttachmentCount;
  const VkFormat* pColorAttachmentFormats;
  VkFormat depthAttachmentFormat;
  VkFormat stencilAttachmentFormat;
} VkPipelineRenderingCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_dynamic_rendering
typedef VkPipelineRenderingCreateInfo VkPipelineRenderingCreateInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- viewMask is the viewMask used for rendering.
- colorAttachmentCount is the number of entries in pColorAttachmentFormats
- pColorAttachmentFormats is a pointer to an array of VkFormat values defining the format of color
  attachments used in this pipeline.
- depthAttachmentFormat is a VkFormat value defining the format of the depth attachment used in
  this pipeline.
- stencilAttachmentFormat is a VkFormat value defining the format of the stencil attachment used
  in this pipeline.

When a pipeline is created without a VkRenderPass, if the pNext chain of
VkGraphicsPipelineCreateInfo includes this structure, it specifies the view mask and format of
attachments used for rendering. If this structure is not specified, and the pipeline does not include a
VkRenderPass, viewMask and colorAttachmentCount are 0, and depthAttachmentFormat and
stencilAttachmentFormat are VK_FORMAT_UNDEFINED. If a graphics pipeline is created with a valid VkRenderPass, parameters of this structure are ignored.

If depthAttachmentFormat, stencilAttachmentFormat, or any element of pColorAttachmentFormats is VK_FORMAT_UNDEFINED, it indicates that the corresponding attachment is unused within the render pass. Valid formats indicate that an attachment can be used - but it is still valid to set the attachment to NULL when beginning rendering.

### Valid Usage

- VUID-VkPipelineRenderingCreateInfo-colorAttachmentCount-09533
  colorAttachmentCount must be less than or equal to maxColorAttachments

### Valid Usage (Implicit)

- VUID-VkPipelineRenderingCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_RENDERING_CREATE_INFO

The VkPipelineCreateFlags2CreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_maintenance5
typedef struct VkPipelineCreateFlags2CreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCreateFlags2KHR flags;
} VkPipelineCreateFlags2CreateInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is a bitmask of VkPipelineCreateFlagBits2KHR specifying how a pipeline will be generated.

If this structure is included in the pNext chain of a pipeline creation structure, flags is used instead of the corresponding flags value passed in that creation structure, allowing additional creation flags to be specified.

### Valid Usage (Implicit)

- VUID-VkPipelineCreateFlags2CreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_CREATE_FLAGS_2_CREATE_INFO_KHR
- VUID-VkPipelineCreateFlags2CreateInfoKHR-flags-parameter
  flags must be a valid combination of VkPipelineCreateFlagBits2KHR values
- VUID-VkPipelineCreateFlags2CreateInfoKHR-flags-required bitmask
  flags must not be 0
Bits which can be set in `VkPipelineCreateFlags2CreateInfoKHR::flags`, specifying how a pipeline is created, are:

```cpp
// Provided by VK_KHR_maintenance5
// Flag bits for VkPipelineCreateFlagBits2KHR
typedef VkFlags64 VkPipelineCreateFlagBits2KHR;
static const VkPipelineCreateFlagBits2KHR
  VK_PIPELINE_CREATE_2_DISABLE_OPTIMIZATION_BIT_KHR = 0x00000001ULL;

VK_PIPELINE_CREATE_2_RAY_TRACING_DISPLACEMENT_MICROMAP_BIT_NV = 0x10000000ULL;
static const VkPipelineCreateFlagBits2KHR
VK_PIPELINE_CREATE_2_DESCRIPTOR_BUFFER_BIT_EXT = 0x20000000ULL;

• VK_PIPELINE_CREATE_2_DISABLE_OPTIMIZATION_BIT_KHR specifies that the created pipeline will not be optimized. Using this flag may reduce the time taken to create the pipeline.

• VK_PIPELINE_CREATE_2_ALLOW_DERIVATIVES_BIT_KHR specifies that the pipeline to be created is allowed to be the parent of a pipeline that will be created in a subsequent pipeline creation call.

• VK_PIPELINE_CREATE_2_DERIVATIVE_BIT_KHR specifies that the pipeline to be created will be a child of a previously created parent pipeline.

• VK_PIPELINE_CREATE_2_VIEW_INDEX_FROM_DEVICE_INDEX_BIT_KHR specifies that any shader input variables decorated as ViewIndex will be assigned values as if they were decorated as DeviceIndex.

• VK_PIPELINE_CREATE_2_DISPATCH_BASE_BIT_KHR specifies that a compute pipeline can be used with vkCmdDispatchBase with a non-zero base workgroup.

• VK_PIPELINE_CREATE_2_CAPTURE_STATISTICS_BIT_KHR specifies that the shader compiler should capture statistics for the pipeline executables produced by the compile process which can later be retrieved by calling vkGetPipelineExecutableStatisticsKHR. Enabling this flag must not affect the final compiled pipeline but may disable pipeline caching or otherwise affect pipeline creation time.

• VK_PIPELINE_CREATE_2_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR specifies that the shader compiler should capture the internal representations of pipeline executables produced by the compile process which can later be retrieved by calling vkGetPipelineExecutableInternalRepresentationsKHR. Enabling this flag must not affect the final compiled pipeline but may disable pipeline caching or otherwise affect pipeline creation time. When capturing IR from pipelines created with pipeline libraries, there is no guarantee that IR from libraries can be retrieved from the linked pipeline. Applications should retrieve IR from each library, and any linked pipelines, separately.

• VK_PIPELINE_CREATE_2_LIBRARY_BIT_KHR specifies that the pipeline cannot be used directly, and instead defines a pipeline library that can be combined with other pipelines using the VkPipelineLibraryCreateInfoKHR structure. This is available in ray tracing pipelines.

• VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR specifies that an any-hit shader will always be present when an any-hit shader would be executed. A NULL any-hit shader is an any-hit shader which is effectively VK_SHADER_UNUSED_KHR, such as from a shader group consisting entirely of zeros.

• VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR specifies that a closest hit shader will always be present when a closest hit shader would be executed. A NULL closest hit shader is a closest hit shader which is effectively VK_SHADER_UNUSED_KHR, such as from a shader group consisting entirely of zeros.

• VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR specifies that a miss shader will always be present when a miss shader would be executed. A NULL miss shader is a miss shader which is effectively VK_SHADER_UNUSED_KHR, such as from a shader group consisting entirely of zeros.

• VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR specifies that an
intersection shader will always be present when an intersection shader would be executed. A NULL intersection shader is an intersection shader which is effectively `VK_SHADER_UNUSED_KHR`, such as from a shader group consisting entirely of zeros.

- `VK_PIPELINE_CREATE_2_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR` specifies that triangle primitives will be skipped during traversal using pipeline trace ray instructions.
- `VK_PIPELINE_CREATE_2_RAY_TRACING_SKIP_AABBS_BIT_KHR` specifies that AABB primitives will be skipped during traversal using pipeline trace ray instructions.
- `VK_PIPELINE_CREATE_2_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR` specifies that the shader group handles can be saved and reused on a subsequent run (e.g. for trace capture and replay).
- `VK_PIPELINE_CREATE_2_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT_KHR` specifies that pipeline creation will fail if a compile is required for creation of a valid `VkPipeline` object; `VK_PIPELINE_COMPILE_REQUIRED` will be returned by pipeline creation, and the `VkPipeline` will be set to `VK_NULL_HANDLE`.
- When creating multiple pipelines, `VK_PIPELINE_CREATE_2_EARLY_RETURN_ON_FAILURE_BIT_KHR` specifies that control will be returned to the application if any individual pipeline returns a result which is not `VK_SUCCESS` rather than continuing to create additional pipelines.
- `VK_PIPELINE_CREATE_2_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` specifies that the pipeline will be used with a fragment shading rate attachment.
- `VK_PIPELINE_CREATE_2_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` specifies that the pipeline may be used with an attachment feedback loop including color attachments.
- `VK_PIPELINE_CREATE_2_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` specifies that the pipeline may be used with an attachment feedback loop including depth-stencil attachments.
- `VK_PIPELINE_CREATE_2_RAY_TRACING_OPACITY_MICROMAP_BIT_EXT` specifies that the ray tracing pipeline can be used with acceleration structures which reference an opacity micromap array.

It is valid to set both `VK_PIPELINE_CREATE_2_ALLOW_DERIVATIVES_BIT_KHR` and `VK_PIPELINE_CREATE_2_DERIVATIVE_BIT_KHR`. This allows a pipeline to be both a parent and possibly a child in a pipeline hierarchy. See Pipeline Derivatives for more information.

```c
// Provided by VK_KHR_maintenance5
typedef VkFlags64 VkPipelineCreateFlags2KHR;
```

`VkPipelineCreateFlags2KHR` is a bitmask type for setting a mask of zero or more `VkPipelineCreateFlagBits2KHR`.

Bits which can be set in

- `VkGraphicsPipelineCreateInfo::flags`
- `VkComputePipelineCreateInfo::flags`
- `VkRayTracingPipelineCreateInfoKHR::flags`

specify how a pipeline is created, and are:
typedef enum VkPipelineCreateFlagBits {
    VK_PIPELINE_CREATE_DISABLE_OPTIMIZATION_BIT = 0x00000001,
    VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT = 0x00000002,
    VK_PIPELINE_CREATE_DERIVATIVE_BIT = 0x00000004,
    // Provided by VK_VERSION_1_1
    VK_PIPELINE_CREATE_VIEW_INDEX_FROM_DEVICE_INDEX_BIT = 0x00000008,
    // Provided by VK_VERSION_1_1
    VK_PIPELINE_CREATE_DISPATCH_BASE_BIT = 0x00000010,
    // Provided by VK_VERSION_1_3
    VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT = 0x00000100,
    // Provided by VK_VERSION_1_3
• **VK_PIPELINE_CREATE_DISABLE_OPTIMIZATION_BIT** specifies that the created pipeline will not be optimized. Using this flag may reduce the time taken to create the pipeline.

• **VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT** specifies that the pipeline to be created is allowed to be the parent of a pipeline that will be created in a subsequent pipeline creation call.

• **VK_PIPELINE_CREATE_DERIVATIVE_BIT** specifies that the pipeline to be created will be a child of a previously created parent pipeline.

• **VK_PIPELINE_CREATE_VIEW_INDEX_FROM_DEVICE_INDEX_BIT** specifies that any shader input variables decorated as `ViewIndex` will be assigned values as if they were decorated as `DeviceIndex`.

• **VK_PIPELINE_CREATE_DISPATCH_BASE** specifies that a compute pipeline can be used with `vkCmdDispatchBase` with a non-zero base workgroup.

• **VK_PIPELINE_CREATE_CAPTURE_STATISTICS_BIT_KHR** specifies that the shader compiler should capture statistics for the pipeline executables produced by the compile process which can later be retrieved by calling `vkGetPipelineExecutableStatisticsKHR`. Enabling this flag must not affect the final compiled pipeline but may disable pipeline caching or otherwise affect pipeline creation time.

• **VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR** specifies that the shader compiler should capture the internal representations of pipeline executables produced by the compile process which can later be retrieved by calling `vkGetPipelineExecutableInternalRepresentationsKHR`. Enabling this flag must not affect the final compiled pipeline but may disable pipeline caching or otherwise affect pipeline creation time. When capturing IR from pipelines created with pipeline libraries, there is no guarantee that IR from libraries can be retrieved from the linked pipeline. Applications should retrieve IR from each library, and any linked pipelines, separately.

• **VK_PIPELINE_CREATE_LIBRARY_BIT_KHR** specifies that the pipeline cannot be used directly, and instead defines a pipeline library that can be combined with other pipelines using the `VkPipelineLibraryCreateInfoKHR` structure. This is available in ray tracing pipelines.

• **VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR** specifies that an any-hit shader will always be present when an any-hit shader would be executed. A NULL any-hit shader is an any-hit shader which is effectively `VK_SHADER_UNUSED_KHR`, such as from a shader group consisting entirely of zeros.

• **VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR** specifies that a closest hit shader will always be present when a closest hit shader would be executed. A NULL closest hit shader is a closest hit shader which is effectively `VK_SHADER_UNUSED_KHR`, such as from a shader group consisting entirely of zeros.
**VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR** specifies that a miss shader will always be present when a miss shader would be executed. A NULL miss shader is a miss shader which is effectively **VK_SHADER_UNUSED_KHR**, such as from a shader group consisting entirely of zeros.

**VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR** specifies that an intersection shader will always be present when an intersection shader would be executed. A NULL intersection shader is an intersection shader which is effectively **VK_SHADER_UNUSED_KHR**, such as from a shader group consisting entirely of zeros.

**VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR** specifies that triangle primitives will be skipped during traversal using pipeline trace ray instructions.

**VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR** specifies that AABB primitives will be skipped during traversal using pipeline trace ray instructions.

**VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR** specifies that the shader group handles can be saved and reused on a subsequent run (e.g. for trace capture and replay).

**VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT** specifies that pipeline creation will fail if a compile is required for creation of a valid VkPipeline object; **VK_PIPELINE_COMPILE_REQUIRED** will be returned by pipeline creation, and the VkPipeline will be set to **VK_NULL_HANDLE**.

When creating multiple pipelines, **VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT** specifies that control will be returned to the application if any individual pipeline returns a result which is not **VK_SUCCESS** rather than continuing to create additional pipelines.

**VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR** specifies that the pipeline will be used with a fragment shading rate attachment and dynamic rendering.

**VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT** specifies that the pipeline may be used with an attachment feedback loop including color attachments. It is ignored if **VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT** is set in pDynamicStates.

**VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT** specifies that the pipeline may be used with an attachment feedback loop including depth-stencil attachments. It is ignored if **VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT** is set in pDynamicStates.

**VK_PIPELINE_CREATE_RAY_TRACING_OPACITY_MICROMAP_BIT_EXT** specifies that the ray tracing pipeline can be used with acceleration structures which reference an opacity micromap array.

It is valid to set both **VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT** and **VK_PIPELINE_CREATE_DERIVATIVE_BIT**. This allows a pipeline to be both a parent and possibly a child in a pipeline hierarchy. See Pipeline Derivatives for more information.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineCreateFlags;

VkPipelineCreateFlags is a bitmask type for setting a mask of zero or more VkPipelineCreateFlagBits.
```
The `VkPipelineDynamicStateCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineDynamicStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineDynamicStateCreateFlags flags;
    uint32_t dynamicStateCount;
    const VkDynamicState* pDynamicStates;
} VkPipelineDynamicStateCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `dynamicStateCount` is the number of elements in the `pDynamicStates` array.
- `pDynamicStates` is a pointer to an array of `VkDynamicState` values specifying which pieces of pipeline state will use the values from dynamic state commands rather than from pipeline state creation information.

### Valid Usage

- VUID-VkPipelineDynamicStateCreateInfo-pDynamicStates-01442
  Each element of `pDynamicStates` must be unique

### Valid Usage (Implicit)

- VUID-VkPipelineDynamicStateCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_DYNAMIC_STATE_CREATE_INFO`
- VUID-VkPipelineDynamicStateCreateInfo-pNext-pNext
  `pNext` must be `NULL`
- VUID-VkPipelineDynamicStateCreateInfo-flags-zerobitmask
  `flags` must be `0`
- VUID-VkPipelineDynamicStateCreateInfo-pDynamicStates-parameter
  If `dynamicStateCount` is not `0`, `pDynamicStates` must be a valid pointer to an array of `dynamicStateCount` valid `VkDynamicState` values

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineDynamicStateCreateFlags;
```

`VkPipelineDynamicStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.
The source of different pieces of dynamic state is specified by the `VkPipelineDynamicStateCreateInfo::pDynamicStates` property of the currently active pipeline, each of whose elements **must** be one of the values:

```c
// Provided by VK_VERSION_1_0
typedef enum VkDynamicState {
    VK_DYNAMIC_STATE_VIEWPORT = 0,
    VK_DYNAMIC_STATE_SCISSOR = 1,
    VK_DYNAMIC_STATE_LINE_WIDTH = 2,
    VK_DYNAMIC_STATE_DEPTH_BIAS = 3,
    VK_DYNAMIC_STATE_BLEND_CONSTANTS = 4,
    VK_DYNAMIC_STATE_DEPTH_BOUNDS = 5,
    VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK = 6,
    VK_DYNAMIC_STATE_STENCIL_WRITE_MASK = 7,
    VK_DYNAMIC_STATE_STENCIL_REFERENCE = 8,
    // Provided by VK_VERSION_1_3
    VK_DYNAMIC_STATE_CULL_MODE = 1000267000,
    // Provided by VK_VERSION_1_3
    VK_DYNAMIC_STATE_FRONT_FACE = 1000267001,

}

VkDynamicState;

- **VK_DYNAMIC_STATE_VIEWPORT** specifies that the `pViewports` state in `VkPipelineViewportStateCreateInfo` will be ignored and *must* be set dynamically with `vkCmdSetViewport` before any drawing commands. The number of viewports used by a pipeline is still specified by the `viewportCount` member of `VkPipelineViewportStateCreateInfo`.

- **VK_DYNAMIC_STATE_SCISSOR** specifies that the `pScissors` state in `VkPipelineViewportStateCreateInfo` will be ignored and *must* be set dynamically with `vkCmdSetScissor` before any drawing commands. The number of scissor rectangles used by a pipeline is still specified by the `scissorCount` member of `VkPipelineViewportStateCreateInfo`.

- **VK_DYNAMIC_STATE_LINE_WIDTH** specifies that the `.lineWidth` state in `VkPipelineRasterizationStateCreateInfo` will be ignored and *must* be set dynamically with `vkCmdSetLineWidth` before any drawing commands that generate line primitives for the rasterizer.

- **VK_DYNAMIC_STATE_DEPTH_BIAS** specifies that any instance of `VkDepthBiasRepresentationInfoEXT` included in the `pNext` chain of `VkPipelineRasterizationStateCreateInfo` as well as the `depthBiasConstantFactor`, `depthBiasClamp` and `depthBiasSlopeFactor` states in `VkPipelineRasterizationStateCreateInfo` will be ignored and *must* be set dynamically with `vkCmdSetDepthBias` or `vkCmdSetDepthBias2EXT` before any draws are performed with depth bias enabled.

- **VK_DYNAMIC_STATE_BLEND_CONSTANTS** specifies that the `blendConstants` state in `VkPipelineColorBlendStateCreateInfo` will be ignored and *must* be set dynamically with `vkCmdSetBlendConstants` before any draws are performed with a pipeline state with `VkPipelineColorBlendAttachmentState` member `blendEnable` set to `VK_TRUE` and any of the blend functions using a constant blend color.
• **VK_DYNAMIC_STATE_DEPTH_BOUNDS** specifies that the minDepthBounds and maxDepthBounds states of VkPipelineDepthStencilStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetDepthBounds before any draws are performed with a pipeline state with VkPipelineDepthStencilStateCreateInfo member depthBoundsTestEnable set to VK_TRUE.

• **VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK** specifies that the compareMask state in VkPipelineDepthStencilStateCreateInfo for both front and back will be ignored and **must** be set dynamically with vkCmdSetStencilCompareMask before any draws are performed with a pipeline state with VkPipelineDepthStencilStateCreateInfo member stencilTestEnable set to VK_TRUE.

• **VK_DYNAMIC_STATE_STENCIL_WRITE_MASK** specifies that the writeMask state in VkPipelineDepthStencilStateCreateInfo for both front and back will be ignored and **must** be set dynamically with vkCmdSetStencilWriteMask before any draws are performed with a pipeline state with VkPipelineDepthStencilStateCreateInfo member stencilTestEnable set to VK_TRUE.

• **VK_DYNAMIC_STATE_STENCIL_REFERENCE** specifies that the reference state in VkPipelineDepthStencilStateCreateInfo for both front and back will be ignored and **must** be set dynamically with vkCmdSetStencilReference before any draws are performed with a pipeline state with VkPipelineDepthStencilStateCreateInfo member stencilTestEnable set to VK_TRUE.

• **VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT** specifies that the pDiscardRectangles state in VkPipelineDiscardRectangleStateCreateInfoEXT will be ignored and **must** be set dynamically with vkCmdSetDiscardRectangleEXT before any draw or clear commands.

• **VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT** specifies that the presence of the VkPipelineDiscardRectangleStateCreateInfoEXT structure in the VkGraphicsPipelineCreateInfo chain with a discardRectangleCount greater than zero does not implicitly enable discard rectangles and they **must** be enabled dynamically with vkCmdSetDiscardRectangleEnableEXT before any draw commands. This is available on implementations that support at least specVersion 2 of the VK_EXT_discard_rectangles extension.

• **VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT** specifies that the discardRectangleMode state in VkPipelineDiscardRectangleStateCreateInfoEXT will be ignored and **must** be set dynamically with vkCmdSetDiscardRectangleModeEXT before any draw commands. This is available on implementations that support at least specVersion 2 of the VK_EXT_discard_rectangles extension.

• **VK_DYNAMIC_STATE_LINE_STIPPLE_EXT** specifies that the lineStippleFactor and lineStipplePattern state in VkPipelineRasterizationLineStateCreateInfoKHR will be ignored and **must** be set dynamically with vkCmdSetLineStippleKHR before any draws are performed with a pipeline state with VkPipelineRasterizationLineStateCreateInfoKHR member stippledLineEnable set to VK_TRUE.

• **VK_DYNAMIC_STATE_CULL_MODE** specifies that the cullMode state in VkPipelineRasterizationStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetCullMode before any drawing commands.

• **VK_DYNAMIC_STATE_FRONT_FACE** specifies that the frontFace state in VkPipelineRasterizationStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetFrontFace before any drawing commands.

• **VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY** specifies that the topology state in VkPipelineInputAssemblyStateCreateInfo only specifies the topology class, and the specific topology order and adjacency **must** be set dynamically with vkCmdSetPrimitiveTopology before any drawing commands.
any drawing commands.

- **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** specifies that the viewportCount and pViewports state in VkPipelineViewportStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetViewportWithCount before any draw call.

- **VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT** specifies that the scissorCount and pScissors state in VkPipelineViewportStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetScissorWithCount before any draw call.

- **VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE** specifies that the stride state in VkVertexInputBindingDescription will be ignored and **must** be set dynamically with vkCmdBindVertexBuffers2 before any draw call.

- **VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE** specifies that the depthTestEnable state in VkPipelineDepthStencilStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetDepthTestEnable before any draw call.

- **VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE** specifies that the depthWriteEnable state in VkPipelineDepthStencilStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetDepthWriteEnable before any draw call.

- **VK_DYNAMIC_STATE_DEPTH_COMPARE_OP** specifies that the depthCompareOp state in VkPipelineDepthStencilStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetDepthCompareOp before any draw call.

- **VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE** specifies that the depthBoundsTestEnable state in VkPipelineDepthStencilStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetDepthBoundsTestEnable before any draw call.

- **VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE** specifies that the stencilTestEnable state in VkPipelineDepthStencilStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetStencilTestEnable before any draw call.

- **VK_DYNAMIC_STATE_STENCIL_OP** specifies that the failOp, passOp, depthFailOp, and compareOp states in VkPipelineDepthStencilStateCreateInfo for both front and back will be ignored and **must** be set dynamically with vkCmdSetStencilOp before any draws are performed with a pipeline state with VkPipelineDepthStencilStateCreateInfo member stencilTestEnable set to VK_TRUE.

- **VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE** specifies that the rasterizerDiscardEnable state in VkPipelineRasterizationStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetRasterizerDiscardEnable before any drawing commands.

- **VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE** specifies that the depthBiasEnable state in VkPipelineRasterizationStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetDepthBiasEnable before any drawing commands.

- **VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE** specifies that the primitiveRestartEnable state in VkPipelineInputAssemblyStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetPrimitiveRestartEnable before any drawing commands.

- **VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR** specifies that state in VkPipelineFragmentShadingRateStateCreateInfoKHR will be ignored and **must** be set dynamically with vkCmdSetFragmentShadingRateKHR before any drawing commands.

- **VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR** specifies that the default stack size
computation for the pipeline will be ignored and **must** be set dynamically with `vkCmdSetRayTracingPipelineStackSizeKHR` before any ray tracing calls are performed.

- **VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT** specifies that the `domainOrigin` state in `VkPipelineTessellationDomainOriginStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetTessellationDomainOriginEXT` before any draw call.

- **VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT** specifies that the `depthClampEnable` state in `VkPipelineRasterizationStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetDepthClampEnableEXT` before any draw call.

- **VK_DYNAMIC_STATE_POLYGON_MODE_EXT** specifies that the `polygonMode` state in `VkPipelineRasterizationStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetPolygonModeEXT` before any draw call.

- **VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT** specifies that the `rasterizationSamples` state in `VkPipelineMultisampleStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetRasterizationSamplesEXT` before any draw call.

- **VK_DYNAMIC_STATE_SAMPLE_MASK_EXT** specifies that the `pSampleMask` state in `VkPipelineMultisampleStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetSampleMaskEXT` before any draw call.

- **VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT** specifies that the `alphaToCoverageEnable` state in `VkPipelineMultisampleStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetAlphaToCoverageEnableEXT` before any draw call.

- **VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT** specifies that the `alphaToOneEnable` state in `VkPipelineMultisampleStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetAlphaToOneEnableEXT` before any draw call.

- **VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT** specifies that the `logicOpEnable` state in `VkPipelineColorBlendStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetLogicOpEnableEXT` before any draw call.

- **VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT** specifies that the `blendEnable` state in `VkPipelineColorBlendAttachmentState` will be ignored and **must** be set dynamically with `vkCmdSetColorBlendEnableEXT` before any draw call.

- **VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT** specifies that the `srcColorBlendFactor`, `dstColorBlendFactor`, `colorBlendOp`, `srcAlphaBlendFactor`, `dstAlphaBlendFactor`, and `alphaBlendOp` states in `VkPipelineColorBlendAttachmentState` will be ignored and **must** be set dynamically with `vkCmdSetColorBlendEquationEXT` before any draw call.

- **VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT** specifies that the `colorWriteMask` state in `VkPipelineColorBlendAttachmentState` will be ignored and **must** be set dynamically with `vkCmdSetColorWriteMaskEXT` before any draw call.

- **VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT** specifies that the `lineRasterizationMode` state in `VkPipelineRasterizationLineStateCreateInfoKHR` will be ignored and **must** be set dynamically with `vkCmdSetLineRasterizationModeEXT` before any draw call.

- **VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT** specifies that the `stippledLineEnable` state in `VkPipelineRasterizationLineStateCreateInfoKHR` will be ignored and **must** be set dynamically with `vkCmdSetLineStippleEnableEXT` before any draw call.
VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT specifies that the
VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT and
VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT flags will be ignored and
\textbf{must} be set dynamically with \texttt{vkCmdSetAttachmentFeedbackLoopEnableEXT} before any draw
call.

\section*{10.3.1. Valid Combinations of Stages for Graphics Pipelines}

If tessellation shader stages are omitted, the tessellation shading and fixed-function stages of the
pipeline are skipped.

If a geometry shader is omitted, the geometry shading stage is skipped.

If a fragment shader is omitted, fragment color outputs have undefined values, and the fragment
depth value is determined by Fragment Operations state. This \textbf{can} be useful for depth-only
rendering.

Presence of a shader stage in a pipeline is indicated by including a valid
\texttt{VkPipelineShaderStageCreateInfo} with \texttt{module} and \texttt{pName} selecting an entry point from a shader
module, where that entry point is valid for the stage specified by \texttt{stage}.

Presence of some of the fixed-function stages in the pipeline is implicitly derived from enabled
shaders and provided state. For example, the fixed-function tessellator is always present when the
pipeline has valid Tessellation Control and Tessellation Evaluation shaders.

\textit{For example:}

- Depth/stencil-only rendering in a subpass with no color attachments
  - Active Pipeline Shader Stages
    - Vertex Shader
  - Required: Fixed-Function Pipeline Stages
    - \texttt{VkPipelineVertexInputStateCreateInfo}
    - \texttt{VkPipelineInputAssemblyStateCreateInfo}
    - \texttt{VkPipelineViewportStateCreateInfo}
    - \texttt{VkPipelineRasterizationStateCreateInfo}
    - \texttt{VkPipelineMultisampleStateCreateInfo}
    - \texttt{VkPipelineDepthStencilStateCreateInfo}

- Color-only rendering in a subpass with no depth/stencil attachment
  - Active Pipeline Shader Stages
    - Vertex Shader
    - Fragment Shader
  - Required: Fixed-Function Pipeline Stages
    - \texttt{VkPipelineVertexInputStateCreateInfo}
    - \texttt{VkPipelineInputAssemblyStateCreateInfo}
• Rendering pipeline with tessellation and geometry shaders
  ◦ Active Pipeline Shader Stages
    ▪ Vertex Shader
    ▪ Tessellation Control Shader
    ▪ Tessellation Evaluation Shader
    ▪ Geometry Shader
    ▪ Fragment Shader
  ◦ Required: Fixed-Function Pipeline Stages
    ▪ VkPipelineVertexInputStateCreateInfo
    ▪ VkPipelineInputAssemblyStateCreateInfo
    ▪ VkPipelineTessellationStateCreateInfo
    ▪ VkPipelineViewportStateCreateInfo
    ▪ VkPipelineRasterizationStateCreateInfo
    ▪ VkPipelineMultisampleStateCreateInfo
    ▪ VkPipelineDepthStencilStateCreateInfo
    ▪ VkPipelineColorBlendStateCreateInfo

10.4. Ray Tracing Pipelines

Ray tracing pipelines consist of multiple shader stages, fixed-function traversal stages, and a pipeline layout.

VK_SHADER_UNUSED_KHR is a special shader index used to indicate that a ray generation, miss, or callable shader member is not used.

#define VK_SHADER_UNUSED_KHR (~0U)

To create ray tracing pipelines, call:

// Provided by VK_KHR_ray_tracing_pipeline
VkResult vkCreateRayTracingPipelinesKHR(
  VkDevice device,
  VkDeferredOperationKHR deferredOperation,
  VkPipelineCache pipelineCache,
  uint32_t createInfoCount,
const VkRayTracingPipelineCreateInfoKHR* pCreateInfos,
const VkAllocationCallbacks* pAllocator,
VkPipeline* pPipelines);

• **device** is the logical device that creates the ray tracing pipelines.

• **deferredOperation** is **VK_NULL_HANDLE** or the handle of a valid VkDeferredOperationKHR request deferral object for this command.

• **pipelineCache** is either **VK_NULL_HANDLE**, indicating that pipeline caching is disabled, or the handle of a valid pipeline cache object, in which case use of that cache is enabled for the duration of the command.

• **createInfoCount** is the length of the *pCreateInfos* and *pPipelines* arrays.

• **pCreateInfos** is a pointer to an array of VkRayTracingPipelineCreateInfoKHR structures.

• **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

• **pPipelines** is a pointer to an array in which the resulting ray tracing pipeline objects are returned.

The **VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS** error is returned if the implementation is unable to reuse the shader group handles provided in VkRayTracingShaderGroupCreateInfoKHR::pShaderGroupCaptureReplayHandle when VkPhysicalDeviceRayTracingPipelineFeaturesKHR::rayTracingPipelineShaderGroupHandleCaptureReplay is enabled.

Pipelines are created and returned as described for Multiple Pipeline Creation.

### Valid Usage

- **VUID-vkCreateRayTracingPipelinesKHR-flags-03415**
  If the *flags* member of any element of *pCreateInfos* contains the **VK_PIPELINE_CREATE_DERIVATIVE_BIT** flag, and the *basePipelineIndex* member of that same element is not -1, *basePipelineIndex* must be less than the index into *pCreateInfos* that corresponds to that element.

- **VUID-vkCreateRayTracingPipelinesKHR-flags-03416**
  If the *flags* member of any element of *pCreateInfos* contains the **VK_PIPELINE_CREATE_DERIVATIVE_BIT** flag, the base pipeline must have been created with the **VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT** flag set.

- **VUID-vkCreateRayTracingPipelinesKHR-flags-03816**
  If *pipelineCache* was created with **VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT**, host access to *pipelineCache* must be externally synchronized.

- **VUID-vkCreateRayTracingPipelinesKHR-deferredOperation-03678**
  Any previous deferred operation that was associated with *deferredOperation* must be complete.

- **VUID-vkCreateRayTracingPipelinesKHR-rayTracingPipeline-03586**
The rayTracingPipeline feature must be enabled

- VUID-vkCreateRayTracingPipelinesKHR-deferredOperation-03587
  If deferredOperation is not VK_NULL_HANDLE, the flags member of elements of pCreateInfos must not include VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT

Valid Usage (Implicit)

- VUID-vkCreateRayTracingPipelinesKHR-device-parameter
  device must be a valid VkDevice handle

- VUID-vkCreateRayTracingPipelinesKHR-deferredOperation-parameter
  If deferredOperation is not VK_NULL_HANDLE, deferredOperation must be a valid VkDeferredOperationKHR handle

- VUID-vkCreateRayTracingPipelinesKHR-pipelineCache-parameter
  If pipelineCache is not VK_NULL_HANDLE, pipelineCache must be a valid VkPipelineCache handle

- VUID-vkCreateRayTracingPipelinesKHR-pCreateInfos-parameter
  pCreateInfos must be a valid pointer to an array of createInfoCount valid VkRayTracingPipelineCreateInfoKHR structures

- VUID-vkCreateRayTracingPipelinesKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateRayTracingPipelinesKHR-pPipelines-parameter
  pPipelines must be a valid pointer to an array of createInfoCount VkPipeline handles

- VUID-vkCreateRayTracingPipelinesKHR-createInfoCount-arraylength
  createInfoCount must be greater than 0

- VUID-vkCreateRayTracingPipelinesKHR-deferredOperation-parent
  If deferredOperation is a valid handle, it must have been created, allocated, or retrieved from device

- VUID-vkCreateRayTracingPipelinesKHR-pipelineCache-parent
  If pipelineCache is a valid handle, it must have been created, allocated, or retrieved from device

Return Codes

Success

- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
The `VkRayTracingPipelineCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_ray_tracing_pipeline
typedef struct VkRayTracingPipelineCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCreateFlags flags;
    uint32_t stageCount;
    const VkPipelineShaderStageCreateInfo* pStages;
    uint32_t groupCount;
    const VkRayTracingShaderGroupCreateInfoKHR* pGroups;
    uint32_t maxPipelineRayRecursionDepth;
    const VkPipelineLibraryCreateInfoKHR* pLibraryInfo;
    const VkRayTracingPipelineInterfaceCreateInfoKHR* pLibraryInterface;
    const VkPipelineDynamicStateCreateInfo* pDynamicState;
    VkPipelineLayout layout;
    VkPipeline basePipelineHandle;
    int32_t basePipelineIndex;
} VkRayTracingPipelineCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkPipelineCreateFlagBits` specifying how the pipeline will be generated.
- `stageCount` is the number of entries in the `pStages` array.
- `pStages` is a pointer to an array of `VkPipelineShaderStageCreateInfo` structures describing the set of the shader stages to be included in the ray tracing pipeline.
- `groupCount` is the number of entries in the `pGroups` array.
- `pGroups` is a pointer to an array of `VkRayTracingShaderGroupCreateInfoKHR` structures describing the set of the shader stages to be included in each shader group in the ray tracing pipeline.
- `maxPipelineRayRecursionDepth` is the maximum recursion depth of shaders executed by this pipeline.
- `pLibraryInfo` is a pointer to a `VkPipelineLibraryCreateInfoKHR` structure defining pipeline libraries to include.
- `pLibraryInterface` is a pointer to a `VkRayTracingPipelineInterfaceCreateInfoKHR` structure defining additional information when using pipeline libraries.
- `pDynamicState` is a pointer to a `VkPipelineDynamicStateCreateInfo` structure, and is used to indicate which properties of the pipeline state object are dynamic and can be changed independently of the pipeline state. This can be `NULL`, which means no state in the pipeline is considered dynamic.
• **layout** is the description of binding locations used by both the pipeline and descriptor sets used with the pipeline.

• **basePipelineHandle** is a pipeline to derive from.

• **basePipelineIndex** is an index into the `pCreateInfos` parameter to use as a pipeline to derive from.

The parameters `basePipelineHandle` and `basePipelineIndex` are described in more detail in **Pipeline Derivatives**.

When `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR` is specified, this pipeline defines a *pipeline library* which **cannot** be bound as a ray tracing pipeline directly. Instead, pipeline libraries define common shaders and shader groups which **can** be included in future pipeline creation.

If pipeline libraries are included in `pLibraryInfo`, shaders defined in those libraries are treated as if they were defined as additional entries in `pStages`, appended in the order they appear in the `pLibraries` array and in the `pStages` array when those libraries were defined.

When referencing shader groups in order to obtain a shader group handle, groups defined in those libraries are treated as if they were defined as additional entries in `pGroups`, appended in the order they appear in the `pLibraries` array and in the `pGroups` array when those libraries were defined. The shaders these groups reference are set when the pipeline library is created, referencing those specified in the pipeline library, not in the pipeline that includes it.

The default stack size for a pipeline if `VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR` is not provided is computed as described in **Ray Tracing Pipeline Stack**.

If a `VkPipelineCreateFlags2CreateInfoKHR` structure is present in the `pNext` chain, `VkPipelineCreateFlags2CreateInfoKHR::flags` from that structure is used instead of `flags` from this structure.

### Valid Usage

- **VUID-VkRayTracingPipelineCreateInfoKHR-None-09497**
  If the `pNext` chain does not include a `VkPipelineCreateFlags2CreateInfoKHR` structure, `flags` must be a valid combination of `VkPipelineCreateFlagBits` values

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-07984**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineIndex` is -1, `basePipelineHandle` **must** be a valid ray tracing `VkPipeline` handle

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-07985**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineHandle` is `VK_NULL_HANDLE`, `basePipelineIndex` **must** be a valid index into the calling command’s `pCreateInfos` parameter

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-07986**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, `basePipelineIndex` **must** be -1 or `basePipelineHandle` **must** be `VK_NULL_HANDLE

- **VUID-VkRayTracingPipelineCreateInfoKHR-layout-07987**
If a push constant block is declared in a shader, a push constant range in `layout must` match both the shader stage and range

- VUID-VkRayTracingPipelineCreateInfoKHR-layout-07988
  If a `resource variables` is declared in a shader, a descriptor slot in `layout must` match the shader stage

- VUID-VkRayTracingPipelineCreateInfoKHR-layout-07990
  If a `resource variables` is declared in a shader, a descriptor slot in `layout must` match the descriptor type

- VUID-VkRayTracingPipelineCreateInfoKHR-layout-07991
  If a `resource variables` is declared in a shader as an array, a descriptor slot in `layout must` match the descriptor count

- VUID-VkRayTracingPipelineCreateInfoKHR-pStages-03426
  The shader code for the entry points identified by `pStages`, and the rest of the state identified by this structure `must` adhere to the pipeline linking rules described in the Shader Interfaces chapter

- VUID-VkRayTracingPipelineCreateInfoKHR-layout-03428
  The number of resources in `layout` accessible to each shader stage that is used by the pipeline `must` be less than or equal to `VkPhysicalDeviceLimits::maxPerStageResources`

- VUID-VkRayTracingPipelineCreateInfoKHR-pipelineCreationCacheControl-02905
  If the `pipelineCreationCacheControl` feature is not enabled, `flags must not include VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT` or `VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT`

- VUID-VkRayTracingPipelineCreateInfoKHR-stage-03425
  If `flags` does not include `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR`, the `stage` member of at least one element of `pStages`, including those implicitly added by `pLibraryInfo`, `must be` `VK_SHADER_STAGE_RAYGEN_BIT_KHR`

- VUID-VkRayTracingPipelineCreateInfoKHR-maxPipelineRayRecursionDepth-03589
  `maxPipelineRayRecursionDepth must be` less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxRayRecursionDepth`

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-03465
  If `flags` includes `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR`, `pLibraryInterface must not be` `NULL`

- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-03590
  If `pLibraryInfo` is not `NULL` and its `libraryCount` member is greater than `0`, `pLibraryInterface must not be` `NULL`

- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraries-03591
  Each element of `pLibraryInfo->pLibraries must` have been created with the value of `maxPipelineRayRecursionDepth equal to` that in this pipeline

- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-03592
  If `pLibraryInfo` is not `NULL`, each element of its `pLibraries` member `must` have been created with a `layout` that is compatible with the `layout` in this pipeline

- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-03593
  If `pLibraryInfo` is not `NULL`, each element of its `pLibraries` member `must` have been created
with values of the `maxPipelineRayPayloadSize` and `maxPipelineRayHitAttributeSize` members of `pLibraryInterface` equal to those in this pipeline

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-03594**
  
  If `flags` includes `VK_PIPELINE_CREATERAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR`, each element of `pLibraryInfo->pLibraries` must have been created with the `VK_PIPELINE_CREATERAY TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR` bit set

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-04718**
  
  If `flags` includes `VK_PIPELINE_CREATERAY TRACING_SKIP_AABBS_BIT_KHR`, each element of `pLibraryInfo->pLibraries` must have been created with the `VK_PIPELINE_CREATERAY TRACING_SKIP_AABBS_BIT_KHR` bit set

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-04719**
  
  If `flags` includes `VK_PIPELINE_CREATERAY TRACING_SKIP_TRIANGLES_BIT_KHR`, each element of `pLibraryInfo->pLibraries` must have been created with the `VK_PIPELINE_CREATERAY TRACING_SKIP_TRIANGLES_BIT_KHR` bit set

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-04720**
  
  If `flags` includes `VK_PIPELINE_CREATERAY TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR`, each element of `pLibraryInfo->pLibraries` must have been created with the `VK_PIPELINE_CREATERAY TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR` bit set

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-04721**
  
  If `flags` includes `VK_PIPELINE_CREATERAY TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`, each element of `pLibraryInfo->pLibraries` must have been created with the `VK_PIPELINE_CREATERAY TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR` bit set

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-04722**
  
  If `flags` includes `VK_PIPELINE_CREATERAY TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`, each element of `pLibraryInfo->pLibraries` must have been created with the `VK_PIPELINE_CREATERAY TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR` bit set

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-04723**
  
  If `flags` includes `VK_PIPELINE_CREATERAY TRACING_NO_NULL_MISS_SHADERS_BIT_KHR`, each element of `pLibraryInfo->pLibraries` must have been created with the `VK_PIPELINE_CREATERAY TRACING_NO_NULL_MISS_SHADERS_BIT_KHR` bit set

- **VUID-VkRayTracingPipelineCreateInfoKHR-plLibraryInfo-03595**
  
  If the `VK_KHR_pipeline_library` extension is not enabled, `pLibraryInfo` and `pLibraryInterface` must be `NULL`

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-03470**
  
  If `flags` includes `VK_PIPELINE_CREATERAY TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR`, for any element of `pGroups` with a type of `VK_RAY TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR` or `VK_RAY TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR`, the `anyHitShader` of that element must not be `VK_SHADER_UNUSED_KHR`

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-03471**
  
  If `flags` includes `VK_PIPELINE_CREATERAY TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`, for any element of `pGroups` with a type of `VK_RAY TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR` or

---

606
VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR, the closestHitShader of that element must not be VK_SHADER_UNUSED_KHR

- VUID-VkRayTracingPipelineCreateInfoKHR-rayTraversalPrimitiveCulling-03596
  If the rayTraversalPrimitiveCulling feature is not enabled, flags must not include VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR

- VUID-VkRayTracingPipelineCreateInfoKHR-rayTraversalPrimitiveCulling-03597
  If the rayTraversalPrimitiveCulling feature is not enabled, flags must not include VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-06546
  flags must not include both VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR and VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-03598
  If flags includes VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR, rayTracingPipelineShaderGroupHandleCaptureReplay must be enabled

- VUID-VkRayTracingPipelineCreateInfoKHR-rayTracingPipelineShaderGroupHandleCaptureReplay-03599
  IfVkPhysicalDeviceRayTracingPipelineFeaturesKHR::rayTracingPipelineShaderGroupHandleCaptureReplay is VK_TRUE and the pShaderGroupCaptureReplayHandle member of any element of pGroups is not NULL, flags must include VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR

- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-07999
  If pLibraryInfo is NULL or its libraryCount is 0, stageCount must not be 0

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-08700
  If flags does not include VK_PIPELINE_CREATE_LIBRARY_BIT_KHR and either pLibraryInfo is NULL or its libraryCount is 0, groupCount must not be 0

- VUID-VkRayTracingPipelineCreateInfoKHR-pDynamicStates-03602
  Any element of the pDynamicStates member of pDynamicState must be VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR

- VUID-VkRayTracingPipelineCreateInfoKHR-pipelineStageCreationFeedbackCount-06652
  If VkPipelineCreationFeedbackCreateInfo::pipelineStageCreationFeedbackCount is not 0, it must be equal to stageCount

- VUID-VkRayTracingPipelineCreateInfoKHR-stage-06899
  The stage value in all pStages elements must be one of VK_SHADER_STAGE_RAYGEN_BIT_KHR, VK_SHADER_STAGE_ANY_HIT_BIT_KHR, VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR, VK_SHADER_STAGE_MISS_BIT_KHR, VK_SHADER_STAGE_INTERSECTION_BIT_KHR, or VK_SHADER_STAGE_CALLABLE_BIT_KHR

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-07403
  If flags includes VK_PIPELINE_CREATE_RAY_TRACING_OPACITY_MICROMAP_BIT_EXT, each element of pLibraryInfo->pLibraries must have been created with the VK_PIPELINE_CREATE_RAY_TRACING_OPACITY_MICROMAP_BIT_EXT bit set
Valid Usage (Implicit)

- VUID-VkRayTracingPipelineCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_RAY_TRACING_PIPELINE_CREATE_INFO_KHR

- VUID-VkRayTracingPipelineCreateInfoKHR-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkPipelineCreateFlags2CreateInfoKHR or VkPipelineCreationFeedbackCreateInfo

- VUID-VkRayTracingPipelineCreateInfoKHR-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkRayTracingPipelineCreateInfoKHR-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkPipelineCreateFlags2CreateInfoKHR or VkPipelineCreationFeedbackCreateInfo

- VUID-VkRayTracingPipelineCreateInfoKHR-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkRayTracingPipelineCreateInfoKHR-pStages-parameter
  If stageCount is not 0, pStages must be a valid pointer to an array of stageCount valid VkPipelineShaderStageCreateInfo structures

- VUID-VkRayTracingPipelineCreateInfoKHR-pGroups-parameter
  If groupCount is not 0, pGroups must be a valid pointer to an array of groupCount valid VkRayTracingShaderGroupCreateInfoKHR structures

- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-parameter
  If pLibraryInfo is not NULL, pLibraryInfo must be a valid pointer to a valid VkPipelineLibraryCreateInfoKHR structure

- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInterface-parameter
  If pLibraryInterface is not NULL, pLibraryInterface must be a valid pointer to a valid VkRayTracingPipelineInterfaceCreateInfoKHR structure

- VUID-VkRayTracingPipelineCreateInfoKHR-pDynamicState-parameter
  If pDynamicState is not NULL, pDynamicState must be a valid pointer to a valid VkPipelineDynamicStateCreateInfo structure

- VUID-VkRayTracingPipelineCreateInfoKHR-layout-parameter
  layout must be a valid VkPipelineLayout handle

- VUID-VkRayTracingPipelineCreateInfoKHR-commonparent
  Both of basePipelineHandle, and layout that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

The VkRayTracingShaderGroupCreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_ray_tracing_pipeline
typedef struct VkRayTracingShaderGroupCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkRayTracingShaderGroupTypeKHR type;
    uint32_t generalShader;
    uint32_t closestHitShader;
    uint32_t anyHitShader;
    uint32_t intersectionShader;
    const void* pShaderGroupCaptureReplayHandle;
} VkRayTracingShaderGroupCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `type` is the type of hit group specified in this structure.
- `generalShader` is the index of the ray generation, miss, or callable shader from `VkRayTracingPipelineCreateInfoKHR::pStages` in the group if the shader group has `type` of `VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR`, and `VK_SHADER_UNUSED_KHR` otherwise.
- `closestHitShader` is the optional index of the closest hit shader from `VkRayTracingPipelineCreateInfoKHR::pStages` in the group if the shader group has `type` of `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR`, `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR`, and `VK_SHADER_UNUSED_KHR` otherwise.
- `anyHitShader` is the optional index of the any-hit shader from `VkRayTracingPipelineCreateInfoKHR::pStages` in the group if the shader group has `type` of `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR`, `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR`, and `VK_SHADER_UNUSED_KHR` otherwise.
- `intersectionShader` is the index of the intersection shader from `VkRayTracingPipelineCreateInfoKHR::pStages` in the group if the shader group has `type` of `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR`, and `VK_SHADER_UNUSED_KHR` otherwise.
- `pShaderGroupCaptureReplayHandle` is `NULL` or a pointer to replay information for this shader group queried from `vkGetRayTracingCaptureReplayShaderGroupHandlesKHR`, as described in Ray Tracing Capture Replay. Ignored if `VkPhysicalDeviceRayTracingPipelineFeaturesKHR::rayTracingPipelineShaderGroupHandleCaptureReplay` is `VK_FALSE`.

**Valid Usage**

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-type-03474**
  If `type` is `VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR` then `generalShader` must be a valid index into `VkRayTracingPipelineCreateInfoKHR::pStages` referring to a shader of `VK_SHADER_STAGE_RAYGEN_BIT_KHR`, `VK_SHADER_STAGE_MISS_BIT_KHR`, or `VK_SHADER_STAGE_CALLABLE_BIT_KHR`.

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-type-03475**
  If `type` is `VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR` then `closestHitShader`, `anyHitShader`, and `intersectionShader` must be `VK_SHADER_UNUSED_KHR`.

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-type-03476**
  If `type` is `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR` then `intersectionShader` must be a valid index into `VkRayTracingPipelineCreateInfoKHR::pStages` referring to a shader of `VK_SHADER_STAGE_INTERSECTION_BIT_KHR`.

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-type-03477**
  If `type` is `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR` then
**intersectionShader must** be **VK_SHADER_UNUSED_KHR**

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-closestHitShader-03478**
  **closestHitShader must** be either **VK_SHADER_UNUSED_KHR** or a valid index into **VkRayTracingPipelineCreateInfoKHR::pStages** referring to a shader of **VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR**

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-anyHitShader-03479**
  **anyHitShader must** be either **VK_SHADER_UNUSED_KHR** or a valid index into **VkRayTracingPipelineCreateInfoKHR::pStages** referring to a shader of **VK_SHADER_STAGE_ANY_HIT_BIT_KHR**

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-rayTracingPipelineShaderGroupHandleCaptureReplayMixed-03603**
  If **vkPhysicalDeviceRayTracingPipelineFeaturesKHR::rayTracingPipelineShaderGroupHandleCaptureReplayMixed** is **VK_FALSE** then **pShaderGroupCaptureReplayHandle must** not be provided if it has not been provided on a previous call to ray tracing pipeline creation

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-rayTracingPipelineShaderGroupHandleCaptureReplayMixed-03604**
  If **vkPhysicalDeviceRayTracingPipelineFeaturesKHR::rayTracingPipelineShaderGroupHandleCaptureReplayMixed** is **VK_FALSE** then the caller **must** guarantee that no ray tracing pipeline creation commands with **pShaderGroupCaptureReplayHandle provided** execute simultaneously with ray tracing pipeline creation commands without **pShaderGroupCaptureReplayHandle provided**

**Valid Usage (Implicit)**

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-sType-sType**
  **sType must** be **VK_STRUCTURE_TYPE_RAY_TRACING_SHADER_GROUP_CREATE_INFO_KHR**

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-pNext-pNext**
  **pNext must** be **NULL**

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-type-parameter**
  **type must** be a valid **VkRayTracingShaderGroupTypeKHR** value

Possible values of **type** in **VkRayTracingShaderGroupCreateInfoKHR** are:

```c
// Provided by VK_KHR_ray_tracing_pipeline
typedef enum VkRayTracingShaderGroupTypeKHR {
    VKRAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR = 0,
    VKRAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR = 1,
    VKRAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR = 2,
} VkRayTracingShaderGroupTypeKHR;
```

- **VKRAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR** indicates a shader group with a single
  **VK_SHADER_STAGE_RAYGEN_BIT_KHR**, **VK_SHADER_STAGE_MISS_BIT_KHR**, or
VK_SHADER_STAGE_CALLABLE_BIT_KHR shader in it.

- **VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR** specifies a shader group that only hits triangles and **must** not contain an intersection shader, only closest hit and any-hit shaders.
- **VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR** specifies a shader group that only intersects with custom geometry and **must** contain an intersection shader and **may** contain closest hit and any-hit shaders.

**Note**

For current group types, the hit group type could be inferred from the presence or absence of the intersection shader, but we provide the type explicitly for future hit groups that do not have that property.

The **VkRayTracingPipelineInterfaceCreateInfoKHR** structure is defined as:

```c
// Provided by VK_KHR_ray_tracing_pipeline
typedef struct VkRayTracingPipelineInterfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t maxPipelineRayPayloadSize;
    uint32_t maxPipelineRayHitAttributeSize;
} VkRayTracingPipelineInterfaceCreateInfoKHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **maxPipelineRayPayloadSize** is the maximum payload size in bytes used by any shader in the pipeline.
- **maxPipelineRayHitAttributeSize** is the maximum attribute structure size in bytes used by any shader in the pipeline.

**maxPipelineRayPayloadSize** is calculated as the maximum number of bytes used by any block declared in the **RayPayloadKHR** or **IncomingRayPayloadKHR** storage classes. **maxPipelineRayHitAttributeSize** is calculated as the maximum number of bytes used by any block declared in the **HitAttributeKHR** storage class. As variables in these storage classes do not have explicit offsets, the size should be calculated as if each variable has a **scalar alignment** equal to the largest scalar alignment of any of the block's members.

**Note**

There is no explicit upper limit for **maxPipelineRayPayloadSize**, but in practice it should be kept as small as possible. Similar to invocation local memory, it must be allocated for each shader invocation and for devices which support many simultaneous invocations, this storage can rapidly be exhausted, resulting in failure.
Valid Usage

- VUID-VkRayTracingPipelineInterfaceCreateInfoKHR-maxPipelineRayHitAttributeSize-03605
  \( \text{maxPipelineRayHitAttributeSize must be less than or equal to} \)
  \( \text{VkPhysicalDeviceRayTracingPipelinePropertiesKHR:maxRayHitAttributeSize} \)

Valid Usage (Implicit)

- VUID-VkRayTracingPipelineInterfaceCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_RAY_TRACING_PIPELINE_INTERFACE_CREATE_INFO_KHR

- VUID-VkRayTracingPipelineInterfaceCreateInfoKHR-pNext-pNext
  pNext must be NULL

To query the opaque handles of shaders in the ray tracing pipeline, call:

```c
// Provided by VK_KHR_ray_tracing_pipeline
VkResult vkGetRayTracingShaderGroupHandlesKHR(
  VkDevice device, 
  VkPipeline pipeline, 
  uint32_t firstGroup, 
  uint32_t groupCount, 
  size_t dataSize, 
  void* pData);
```

- **device** is the logical device containing the ray tracing pipeline.
- **pipeline** is the ray tracing pipeline object containing the shaders.
- **firstGroup** is the index of the first group to retrieve a handle for from the
  VkRayTracingPipelineCreateInfoKHR::pGroups array.
- **groupCount** is the number of shader handles to retrieve.
- **dataSize** is the size in bytes of the buffer pointed to by **pData**.
- **pData** is a pointer to a user-allocated buffer where the results will be written.

Valid Usage

- VUID-vkGetRayTracingShaderGroupHandlesKHR-pipeline-04619
  pipeline must be a ray tracing pipeline

- VUID-vkGetRayTracingShaderGroupHandlesKHR-firstGroup-04050
  firstGroup must be less than the number of shader groups in pipeline

- VUID-vkGetRayTracingShaderGroupHandlesKHR-firstGroup-02419
  The sum of firstGroup and groupCount must be less than or equal to the number of shader groups in pipeline
Valid Usage (Implicit)

- VUID-vkGetRayTracingShaderGroupHandlesKHR-dataSize-02420
dataSize must be at least VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleSize × groupCount

- VUID-vkGetRayTracingShaderGroupHandlesKHR-pipeline-07828
pipeline must not have been created with VK_PIPELINE_CREATE_LIBRARY_BIT_KHR

Valid Usage (Implicit)

- VUID-vkGetRayTracingShaderGroupHandlesKHR-device-parameter
device must be a valid VkDevice handle

- VUID-vkGetRayTracingShaderGroupHandlesKHR-pipeline-parameter
pipeline must be a valid VkPipeline handle

- VUID-vkGetRayTracingShaderGroupHandlesKHR-pData-parameter
pData must be a valid pointer to an array of dataSize bytes

- VUID-vkGetRayTracingShaderGroupHandlesKHR-dataSize-arraylength
dataSize must be greater than 0

- VUID-vkGetRayTracingShaderGroupHandlesKHR-pipeline-parent
pipeline must have been created, allocated, or retrieved from device

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To query the opaque capture data of shader groups in a ray tracing pipeline, call:

```
// Provided by VK_KHR_ray_tracing_pipeline
VkResult vkGetRayTracingCaptureReplayShaderGroupHandlesKHR(
    VkDevice device,  // Provided by VK_KHR_ray_tracing_pipeline
    VkPipeline pipeline,
    uint32_t firstGroup,
    uint32_t groupCount,
    size_t dataSize,
    void* pData);
```

- device is the logical device containing the ray tracing pipeline.
- pipeline is the ray tracing pipeline object containing the shaders.
- firstGroup is the index of the first group to retrieve a handle for from the
VkRayTracingPipelineCreateInfoKHR::pGroups array.

- **groupCount** is the number of shader handles to retrieve.
- **dataSize** is the size in bytes of the buffer pointed to by pData.
- **pData** is a pointer to a user-allocated buffer where the results will be written.

Once queried, this opaque data can be provided at pipeline creation time (in a subsequent execution), using VkRayTracingShaderGroupCreateInfoKHR::pShaderGroupCaptureReplayHandle, as described in Ray Tracing Capture Replay.

### Valid Usage

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pipeline-04620
  pipeline must be a ray tracing pipeline

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-firstGroup-04051
  firstGroup must be less than the number of shader groups in pipeline

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-firstGroup-03483
  The sum of firstGroup and groupCount must be less than or equal to the number of shader groups in pipeline

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-dataSize-03484
  dataSize must be at least VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleCaptureReplaySize × groupCount

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-rayTracingPipelineShaderGroupHandleCaptureReplay-03606
  VkPhysicalDeviceRayTracingPipelineFeaturesKHR::rayTracingPipelineShaderGroupHandleCaptureReplay must be enabled to call this function

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pipeline-03607
  pipeline must have been created with a flags that included VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pipeline-07829
  pipeline must not have been created with VK_PIPELINE_CREATE_LIBRARY_BIT_KHR

### Valid Usage (Implicit)

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pipeline-parameter
  pipeline must be a valid VkPipeline handle

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pData-parameter
  pData must be a valid pointer to an array of dataSize bytes

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-dataSize-arraylength
  dataSize must be greater than 0
Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To query the pipeline stack size of shaders in a shader group in the ray tracing pipeline, call:

```c
// Provided by VK_KHR_ray_tracing_pipeline
VkDeviceSize vkGetRayTracingShaderGroupStackSizeKHR(
    VkDevice              device,
    VkPipeline           pipeline,
    uint32_t             group,
    VkShaderGroupShaderKHR groupShader);
```

- `device` is the logical device containing the ray tracing pipeline.
- `pipeline` is the ray tracing pipeline object containing the shaders groups.
- `group` is the index of the shader group to query.
- `groupShader` is the type of shader from the group to query.

The return value is the ray tracing pipeline stack size in bytes for the specified shader as called from the specified shader group.

Valid Usage

- VUID-vkGetRayTracingShaderGroupStackSizeKHR-pipeline-04622
  pipeline must be a ray tracing pipeline

- VUID-vkGetRayTracingShaderGroupStackSizeKHR-group-03608
  The value of group must be less than the number of shader groups in pipeline

- VUID-vkGetRayTracingShaderGroupStackSizeKHR-groupShader-03609
  The shader identified by groupShader in group must not be VK_SHADER_UNUSED_KHR

Valid Usage (Implicit)

- VUID-vkGetRayTracingShaderGroupStackSizeKHR-device-parameter
  device must be a valid VkDevice handle
Possible values of `groupShader` in `vkGetRayTracingShaderGroupStackSizeKHR` are:

```c
// Provided by VK_KHR_ray_tracing_pipeline
typedef enum VkShaderGroupShaderKHR {
    VK_SHADER_GROUP_SHADER_GENERAL_KHR = 0,
    VK_SHADER_GROUP_SHADER_CLOSEST_HIT_KHR = 1,
    VK_SHADER_GROUP_SHADER_ANY_HIT_KHR = 2,
    VK_SHADER_GROUP_SHADER_INTERSECTION_KHR = 3,
} VkShaderGroupShaderKHR;
```

- `VK_SHADER_GROUP_SHADER_GENERAL_KHR` uses the shader specified in the group with `VkRayTracingShaderGroupCreateInfoKHR::generalShader`
- `VK_SHADER_GROUP_SHADER_CLOSEST_HIT_KHR` uses the shader specified in the group with `VkRayTracingShaderGroupCreateInfoKHR::closestHitShader`
- `VK_SHADER_GROUP_SHADER_ANY_HIT_KHR` uses the shader specified in the group with `VkRayTracingShaderGroupCreateInfoKHR::anyHitShader`
- `VK_SHADER_GROUP_SHADER_INTERSECTION_KHR` uses the shader specified in the group with `VkRayTracingShaderGroupCreateInfoKHR::intersectionShader`

To dynamically set the stack size for a ray tracing pipeline, call:

```c
// Provided by VK_KHR_ray_tracing_pipeline
void vkCmdSetRayTracingPipelineStackSizeKHR(
    VkCommandBuffer commandBuffer,
    uint32_t pipelineStackSize);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pipelineStackSize` is the stack size to use for subsequent ray tracing trace commands.

This command sets the stack size for subsequent ray tracing commands when the ray tracing pipeline is created with `VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, the stack size is computed as described in `Ray Tracing Pipeline Stack`.

**Valid Usage**

- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-pipelineStackSize-03610
pipelineStackSize must be large enough for any dynamic execution through the shaders in the ray tracing pipeline used by a subsequent trace call.

**Valid Usage (Implicit)**

- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations
- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-renderpass
  This command must only be called outside of a render pass instance
- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-videocoding
  This command must only be called outside of a video coding scope

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>

**10.5. Pipeline Destruction**

To destroy a pipeline, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyPipeline(
    VkDevice device,
    VkPipeline pipeline,
    const VkAllocationCallbacks* pAllocator);
```
- `device` is the logical device that destroys the pipeline.
- `pipeline` is the handle of the pipeline to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- VUID-vkDestroyPipeline-pipeline-00765
  All submitted commands that refer to `pipeline` must have completed execution.

- VUID-vkDestroyPipeline-pipeline-00766
  If `VkAllocationCallbacks` were provided when `pipeline` was created, a compatible set of callbacks must be provided here.

- VUID-vkDestroyPipeline-pipeline-00767
  If no `VkAllocationCallbacks` were provided when `pipeline` was created, `pAllocator` must be `NULL`.

### Valid Usage (Implicit)

- VUID-vkDestroyPipeline-device-parameter
  `device` must be a valid `VkDevice` handle.

- VUID-vkDestroyPipeline-pipeline-parameter
  If `pipeline` is not `VK_NULL_HANDLE`, `pipeline` must be a valid `VkPipeline` handle.

- VUID-vkDestroyPipeline-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.

- VUID-vkDestroyPipeline-pPipeline-parent
  If `pipeline` is a valid handle, it must have been created, allocated, or retrieved from `device`.

### Host Synchronization

- Host access to `pipeline` must be externally synchronized.

## 10.6. Pipeline Derivatives

A pipeline derivative is a child pipeline created from a parent pipeline, where the child and parent are expected to have much commonality.

The goal of derivative pipelines is that they be cheaper to create using the parent as a starting point, and that it be more efficient (on either host or device) to switch/bind between children of the same parent.

A derivative pipeline is created by setting the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag in the `Vk*PipelineCreateInfo` structure. If this is set, then exactly one of `basePipelineHandle` or
basePipelineIndex members of the structure must have a valid handle/index, and specifies the parent pipeline. If basePipelineHandle is used, the parent pipeline must have already been created. If basePipelineIndex is used, then the parent is being created in the same command. VK_NULL_HANDLE acts as the invalid handle for basePipelineHandle, and -1 is the invalid index for basePipelineIndex. If basePipelineIndex is used, the base pipeline must appear earlier in the array. The base pipeline must have been created with the VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT flag set.

10.7. Pipeline Cache

Pipeline cache objects allow the result of pipeline construction to be reused between pipelines and between runs of an application. Reuse between pipelines is achieved by passing the same pipeline cache object when creating multiple related pipelines. Reuse across runs of an application is achieved by retrieving pipeline cache contents in one run of an application, saving the contents, and using them to preinitialize a pipeline cache on a subsequent run. The contents of the pipeline cache objects are managed by the implementation. Applications can manage the host memory consumed by a pipeline cache object and control the amount of data retrieved from a pipeline cache object.

Pipeline cache objects are represented by VkPipelineCache handles:

// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPipelineCache)

10.7.1. Creating a Pipeline Cache

To create pipeline cache objects, call:

// Provided by VK_VERSION_1_0
VkResult vkCreatePipelineCache(
    VkDevice device, const VkPipelineCacheCreateInfo* pCreateInfo, const VkAllocationCallbacks* pAllocator, VkPipelineCache* pPipelineCache);

- device is the logical device that creates the pipeline cache object.
- pCreateInfo is a pointer to a VkPipelineCacheCreateInfo structure containing initial parameters for the pipeline cache object.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.
- pPipelineCache is a pointer to a VkPipelineCache handle in which the resulting pipeline cache object is returned.

Note Applications can track and manage the total host memory size of a pipeline cache object using the pAllocator. Applications can limit the amount of data retrieved
from a pipeline cache object in `vkGetPipelineCacheData`. Implementations should not internally limit the total number of entries added to a pipeline cache object or the total host memory consumed.

Once created, a pipeline cache can be passed to the `vkCreateGraphicsPipelines`, `vkCreateRayTracingPipelinesKHR`, and `vkCreateComputePipelines` commands. If the pipeline cache passed into these commands is not `VK_NULL_HANDLE`, the implementation will query it for possible reuse opportunities and update it with new content. The use of the pipeline cache object in these commands is internally synchronized, and the same pipeline cache object can be used in multiple threads simultaneously.

If flags of `pCreateInfo` includes `VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT`, all commands that modify the returned pipeline cache object must be externally synchronized.

Note
Implementations should make every effort to limit any critical sections to the actual accesses to the cache, which is expected to be significantly shorter than the duration of the `vkCreate*Pipelines` commands.

Valid Usage (Implicit)

- `VUID-vkCreatePipelineCache-device-parameter` device must be a valid `VkDevice` handle
- `VUID-vkCreatePipelineCache-pCreateInfo-parameter` `pCreateInfo` must be a valid pointer to a valid `VkPipelineCacheCreateInfo` structure
- `VUID-vkCreatePipelineCache-pAllocator-parameter` If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- `VUID-vkCreatePipelineCache-pPipelineCache-parameter` `pPipelineCache` must be a valid pointer to a `VkPipelineCache` handle

Return Codes

Success
- `VK_SUCCESS`

Failure
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkPipelineCacheCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineCacheCreateInfo {
```
VkStructureType sType;
const void* pNext;
VkPipelineCacheCreateFlags flags;
size_t initialDataSize;
const void* pInitialData;
} VkPipelineCacheCreateInfo;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkPipelineCacheCreateFlagBits` specifying the behavior of the pipeline cache.
- `initialDataSize` is the number of bytes in `pInitialData`. If `initialDataSize` is zero, the pipeline cache will initially be empty.
- `pInitialData` is a pointer to previously retrieved pipeline cache data. If the pipeline cache data is incompatible (as defined below) with the device, the pipeline cache will be initially empty. If `initialDataSize` is zero, `pInitialData` is ignored.

### Valid Usage

- **VUID-VkPipelineCacheCreateInfo-initialDataSize-00768**
  If `initialDataSize` is not 0, it must be equal to the size of `pInitialData`, as returned by `vkGetPipelineCacheData` when `pInitialData` was originally retrieved.
- **VUID-VkPipelineCacheCreateInfo-initialDataSize-00769**
  If `initialDataSize` is not 0, `pInitialData` must have been retrieved from a previous call to `vkGetPipelineCacheData`.
- **VUID-VkPipelineCacheCreateInfo-pipelineCreationCacheControl-02892**
  If the `pipelineCreationCacheControl` feature is not enabled, `flags` must not include `VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT`.

### Valid Usage (Implicit)

- **VUID-VkPipelineCacheCreateInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_CACHE_CREATE_INFO`.
- **VUID-VkPipelineCacheCreateInfo-pNext-pNext**
  `pNext` must be `NULL`.
- **VUID-VkPipelineCacheCreateInfo-flags-parameter**
  `flags` must be a valid combination of `VkPipelineCacheCreateFlagBits` values.
- **VUID-VkPipelineCacheCreateInfo-pInitialData-parameter**
  If `initialDataSize` is not 0, `pInitialData` must be a valid pointer to an array of `initialDataSize` bytes.

// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineCacheCreateFlags;

VkPipelineCacheCreateFlags is a bitmask type for setting a mask of zero or more VkPipelineCacheCreateFlagBits.

Bits which can be set in VkPipelineCacheCreateInfo::flags, specifying behavior of the pipeline cache, are:

typedef enum VkPipelineCacheCreateFlagBits {
// Provided by VK_VERSION_1_3
    VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT = 0x00000001,
} VkPipelineCacheCreateFlagBits;

- VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT specifies that all commands that modify the created VkPipelineCache will be externally synchronized. When set, the implementation may skip any unnecessary processing needed to support simultaneous modification from multiple threads where allowed.

10.7.2. Merging Pipeline Caches

Pipeline cache objects can be merged using the command:

// Provided by VK_VERSION_1_0
VkResult vkMergePipelineCaches(
    VkDevice device,
    VkPipelineCache dstCache,
    uint32_t srcCacheCount,
    const VkPipelineCache* pSrcCaches);

- **device** is the logical device that owns the pipeline cache objects.
- **dstCache** is the handle of the pipeline cache to merge results into.
- **srcCacheCount** is the length of the **pSrcCaches** array.
- **pSrcCaches** is a pointer to an array of pipeline cache handles, which will be merged into **dstCache**. The previous contents of **dstCache** are included after the merge.

**Note**
The details of the merge operation are implementation-dependent, but implementations should merge the contents of the specified pipelines and prune duplicate entries.

**Valid Usage**
- VUID-vkMergePipelineCaches-dstCache-00770
  dstCache must not appear in the list of source caches
Valid Usage (Implicit)

- VUID-vkMergePipelineCaches-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkMergePipelineCaches-dstCache-parameter
  `dstCache` must be a valid `VkPipelineCache` handle

- VUID-vkMergePipelineCaches-pSrcCaches-parameter
  `pSrcCaches` must be a valid pointer to an array of `srcCacheCount` valid `VkPipelineCache` handles

- VUID-vkMergePipelineCaches-srcCacheCount-arraylength
  `srcCacheCount` must be greater than 0

- VUID-vkMergePipelineCaches-dstCache-parent
  `dstCache` must have been created, allocated, or retrieved from `device`

- VUID-vkMergePipelineCaches-pSrcCaches-parent
  Each element of `pSrcCaches` must have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `dstCache` must be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

10.7.3. Retrieving Pipeline Cache Data

Data can be retrieved from a pipeline cache object using the command:

```c
// Provided by VK_VERSION_1_0
VkResult vkGetPipelineCacheData(
    VkDevice device,
    VkPipelineCache pipelineCache,
    size_t* pDataSize,
    void* pData);
```

- `device` is the logical device that owns the pipeline cache.
- `pipelineCache` is the pipeline cache to retrieve data from.
- `pDataSize` is a pointer to a `size_t` value related to the amount of data in the pipeline cache, as described below.
- `pData` is either `NULL` or a pointer to a buffer.

If `pData` is `NULL`, then the maximum size of the data that can be retrieved from the pipeline cache, in bytes, is returned in `pDataSize`. Otherwise, `pDataSize` must point to a variable set by the user to the size of the buffer, in bytes, pointed to by `pData`, and on return the variable is overwritten with the amount of data actually written to `pData`. If `pDataSize` is less than the maximum size that can be retrieved by the pipeline cache, at most `pDataSize` bytes will be written to `pData`, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all of the pipeline cache was returned.

Any data written to `pData` is valid and can be provided as the `pInitialData` member of the `VkPipelineCacheCreateInfo` structure passed to `vkCreatePipelineCache`.

Two calls to `vkGetPipelineCacheData` with the same parameters must retrieve the same data unless a command that modifies the contents of the cache is called between them.

The initial bytes written to `pData` must be a header as described in the Pipeline Cache Header section.

If `pDataSize` is less than what is necessary to store this header, nothing will be written to `pData` and zero will be written to `pDataSize`.

---

**Valid Usage (Implicit)**

- `VUID-vkGetPipelineCacheData-device-parameter`  
  `device` must be a valid `VkDevice` handle

- `VUID-vkGetPipelineCacheData-pipelineCache-parameter`  
  `pipelineCache` must be a valid `VkPipelineCache` handle

- `VUID-vkGetPipelineCacheData-pDataSize-parameter`  
  `pDataSize` must be a valid pointer to a `size_t` value

- `VUID-vkGetPipelineCacheData-pData-parameter`  
  If the value referenced by `pDataSize` is not 0, and `pData` is not `NULL`, `pData` must be a valid pointer to an array of `pDataSize` bytes

- `VUID-vkGetPipelineCacheData-pipelineCache-parent`  
  `pipelineCache` must have been created, allocated, or retrieved from `device`

---

**Return Codes**

**Success**

- `VK_SUCCESS`
- `VK_INCOMPLETE`
10.7.4. Pipeline Cache Header

Applications can store the data retrieved from the pipeline cache, and use these data, possibly in a future run of the application, to populate new pipeline cache objects. The results of pipeline compiles, however, may depend on the vendor ID, device ID, driver version, and other details of the device. To enable applications to detect when previously retrieved data is incompatible with the device, the pipeline cache data must begin with a valid pipeline cache header.

Note
Structures described in this section are not part of the Vulkan API and are only used to describe the representation of data elements in pipeline cache data. Accordingly, the valid usage clauses defined for structures defined in this section do not define valid usage conditions for APIs accepting pipeline cache data as input, as providing invalid pipeline cache data as input to any Vulkan API commands will result in the provided pipeline cache data being ignored.

Version one of the pipeline cache header is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineCacheHeaderVersionOne {
    uint32_t headerSize;
    VkPipelineCacheHeaderVersion headerVersion;
    uint32_t vendorID;
    uint32_t deviceID;
    uint8_t pipelineCacheUUID[VK_UUID_SIZE];
} VkPipelineCacheHeaderVersionOne;
```

- `headerSize` is the length in bytes of the pipeline cache header.
- `headerVersion` is a `VkPipelineCacheHeaderVersion` value specifying the version of the header. A consumer of the pipeline cache should use the cache version to interpret the remainder of the cache header.
- `vendorID` is the `VkPhysicalDeviceProperties::vendorID` of the implementation.
- `deviceID` is the `VkPhysicalDeviceProperties::deviceID` of the implementation.
- `pipelineCacheUUID` is the `VkPhysicalDeviceProperties::pipelineCacheUUID` of the implementation.

Unlike most structures declared by the Vulkan API, all fields of this structure are written with the least significant byte first, regardless of host byte-order.

The C language specification does not define the packing of structure members. This layout assumes tight structure member packing, with members laid out in the order listed in the structure, and the intended size of the structure is 32 bytes. If a compiler produces code that diverges from
that pattern, applications must employ another method to set values at the correct offsets.

**Valid Usage**

- VUID-VkPipelineCacheHeaderVersionOne-headerSize-04967
  
  headerSize must be 32

- VUID-VkPipelineCacheHeaderVersionOne-headerVersion-04968
  
  headerVersion must be VK_PIPELINE_CACHE_HEADER_VERSION_ONE

- VUID-VkPipelineCacheHeaderVersionOne-headerSize-08990
  
  headerSize must not exceed the size of the pipeline cache

**Valid Usage (Implicit)**

- VUID-VkPipelineCacheHeaderVersionOne-headerVersion-parameter
  
  headerVersion must be a valid VkPipelineCacheHeaderVersion value

Possible values of the headerVersion value of the pipeline cache header are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPipelineCacheHeaderVersion {
  VK_PIPELINE_CACHE_HEADER_VERSION_ONE = 1,
} VkPipelineCacheHeaderVersion;
```

- VK_PIPELINE_CACHE_HEADER_VERSION_ONE specifies version one of the pipeline cache, described by VkPipelineCacheHeaderVersionOne.

### 10.7.5. Destroying a Pipeline Cache

To destroy a pipeline cache, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyPipelineCache(
  VkDevice device,       
  VkPipelineCache pipelineCache, 
  const VkAllocationCallbacks* pAllocator);
```

- device is the logical device that destroys the pipeline cache object.
- pipelineCache is the handle of the pipeline cache to destroy.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.

**Valid Usage**

- VUID-vkDestroyPipelineCache-pipelineCache-00771
If `VkAllocationCallbacks` were provided when `pipelineCache` was created, a compatible set of callbacks **must** be provided here:

- VUID-vkDestroyPipelineCache-pipelineCache-00772

If no `VkAllocationCallbacks` were provided when `pipelineCache` was created, `pAllocator` **must** be `NULL`.

### Valid Usage (Implicit)

- VUID-vkDestroyPipelineCache-device-parameter
  
  `device` **must** be a valid `VkDevice` handle.

- VUID-vkDestroyPipelineCache-pipelineCache-parameter
  
  If `pipelineCache` is not `VK_NULL_HANDLE`, `pipelineCache` **must** be a valid `VkPipelineCache` handle.

- VUID-vkDestroyPipelineCache-pAllocator-parameter
  
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure.

- VUID-vkDestroyPipelineCache-pipelineCache-parent
  
  If `pipelineCache` is a valid handle, it **must** have been created, allocated, or retrieved from `device`.

### Host Synchronization

- Host access to `pipelineCache` **must** be externally synchronized.

### 10.8. Specialization Constants

Specialization constants are a mechanism whereby constants in a SPIR-V module can have their constant value specified at the time the `VkPipeline` is created. This allows a SPIR-V module to have constants that can be modified while executing an application that uses the Vulkan API.

**Note**

Specialization constants are useful to allow a compute shader to have its local workgroup size changed at runtime by the user, for example.

Each `VkPipelineShaderStageCreateInfo` structure contains a `pSpecializationInfo` member, which can be `NULL` to indicate no specialization constants, or point to a `VkSpecializationInfo` structure.

The `VkSpecializationInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSpecializationInfo {
    uint32_t mapEntryCount;
    const VkSpecializationMapEntry* pMapEntries;
} VkSpecializationInfo;
```
size_t dataSize;
const void* pData;
} VkSpecializationInfo;

• `mapEntryCount` is the number of entries in the `pMapEntries` array.
• `pMapEntries` is a pointer to an array of `VkSpecializationMapEntry` structures, which map constant IDs to offsets in `pData`.
• `dataSize` is the byte size of the `pData` buffer.
• `pData` contains the actual constant values to specialize with.

### Valid Usage

- VUID-VkSpecializationInfo-offset-00773
  The `offset` member of each element of `pMapEntries` must be less than `dataSize`.
- VUID-VkSpecializationInfo-pMapEntries-00774
  The `size` member of each element of `pMapEntries` must be less than or equal to `dataSize` minus `offset`.
- VUID-VkSpecializationInfo-constantID-04911
  The `constantID` value of each element of `pMapEntries` must be unique within `pMapEntries`.

### Valid Usage (Implicit)

- VUID-VkSpecializationInfo-pMapEntries-parameter
  If `mapEntryCount` is not 0, `pMapEntries` must be a valid pointer to an array of `mapEntryCount` valid `VkSpecializationMapEntry` structures.
- VUID-VkSpecializationInfo-pData-parameter
  If `dataSize` is not 0, `pData` must be a valid pointer to an array of `dataSize` bytes.

The `VkSpecializationMapEntry` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSpecializationMapEntry {
  uint32_t constantID;
  uint32_t offset;
  size_t size;
} VkSpecializationMapEntry;
```

- `constantID` is the ID of the specialization constant in SPIR-V.
- `offset` is the byte offset of the specialization constant value within the supplied data buffer.
- `size` is the byte size of the specialization constant value within the supplied data buffer.

If a `constantID` value is not a specialization constant ID used in the shader, that map entry does not
affect the behavior of the pipeline.

Valid Usage

- **VUID-VkSpecializationMapEntry-constantID-00776**

  For a `constantID` specialization constant declared in a shader, `size` must match the byte size of the `constantID`. If the specialization constant is of type `boolean`, `size` must be the byte size of `VkBool32`.

In human readable SPIR-V:

```assembly
OpDecorate %x SpecId 13 ; decorate .x component of WorkgroupSize with ID 13
OpDecorate %y SpecId 42 ; decorate .y component of WorkgroupSize with ID 42
OpDecorate %z SpecId 3 ; decorate .z component of WorkgroupSize with ID 3
OpDecorate %wgsize BuiltIn WorkgroupSize ; decorate WorkgroupSize onto constant
%32 = OpTypeInt 32 0 ; declare an unsigned 32-bit type
%uvec3 = OpTypeVector %i32 3 ; declare a 3 element vector type of unsigned 32-bit
%x = OpSpecConstant %i32 1 ; declare the .x component of WorkgroupSize
%y = OpSpecConstant %i32 1 ; declare the .y component of WorkgroupSize
%z = OpSpecConstant %i32 1 ; declare the .z component of WorkgroupSize
%wgsize = OpSpecConstantComposite %uvec3 %x %y %z ; declare WorkgroupSize
```

From the above we have three specialization constants, one for each of the x, y & z elements of the WorkgroupSize vector.

Now to specialize the above via the specialization constants mechanism:

```c
const VkSpecializationMapEntry entries[] =
{
  {
    .constantID = 13,
    .offset = 0 * sizeof(uint32_t),
    .size = sizeof(uint32_t)
  },
  {
    .constantID = 42,
    .offset = 1 * sizeof(uint32_t),
    .size = sizeof(uint32_t)
  },
  {
    .constantID = 3,
    .offset = 2 * sizeof(uint32_t),
    .size = sizeof(uint32_t)
  }
};

const uint32_t data[] = { 16, 8, 4 }; // our workgroup size is 16x8x4
```
```
const VkSpecializationInfo info =
{
    .mapEntryCount = 3,
    .pMapEntries = entries,
    .dataSize = 3 * sizeof(uint32_t),
    .pData = data,
};
```

Then when calling `vkCreateComputePipelines`, and passing the `VkSpecializationInfo` we defined as the `pSpecializationInfo` parameter of `VkPipelineShaderStageCreateInfo`, we will create a compute pipeline with the runtime specified local workgroup size.

Another example would be that an application has a SPIR-V module that has some platform-dependent constants they wish to use.

In human readable SPIR-V:

```
OpDecorate %1 SpecId 0 ; decorate our signed 32-bit integer constant
OpDecorate %2 SpecId 12 ; decorate our 32-bit floating-point constant
%i32 = OpTypeInt 32 1 ; declare a signed 32-bit type
%f32 = OpTypeFloat 32 ; declare a 32-bit floating-point type
%i1 = OpSpecConstant %i32 -1 ; some signed 32-bit integer constant
%i2 = OpSpecConstant %f32 0.5 ; some 32-bit floating-point constant
```

From the above we have two specialization constants, one is a signed 32-bit integer and the second is a 32-bit floating-point value.

Now to specialize the above via the specialization constants mechanism:

```
struct SpecializationData {
    int32_t data0;
    float data1;
};

const VkSpecializationMapEntry entries[] =
{
    { .constantID = 0, 
      .offset = offsetof(SpecializationData, data0), 
      .size = sizeof(SpecializationData::data0) 
    },
    { .constantID = 12, 
      .offset = offsetof(SpecializationData, data1), 
      .size = sizeof(SpecializationData::data1) 
    }
};

SpecializationData data;
```
It is legal for a SPIR-V module with specializations to be compiled into a pipeline where no specialization information was provided. SPIR-V specialization constants contain default values such that if a specialization is not provided, the default value will be used. In the examples above, it would be valid for an application to only specialize some of the specialization constants within the SPIR-V module, and let the other constants use their default values encoded within the OpSpecConstant declarations.

10.9. Pipeline Libraries

A pipeline library is a special pipeline that was created using the `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR` and cannot be bound, instead it defines a set of pipeline state which can be linked into other pipelines. For ray tracing pipelines this includes shaders and shader groups. The application **must** maintain the lifetime of a pipeline library based on the pipelines that link with it.

This linkage is achieved by using the following structure within the appropriate creation mechanisms:

The `VkPipelineLibraryCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_pipeline_library
typedef struct VkPipelineLibraryCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t libraryCount;
    const VkPipeline* pLibraries;
} VkPipelineLibraryCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `libraryCount` is the number of pipeline libraries in `pLibraries`.
- `pLibraries` is a pointer to an array of `VkPipeline` structures specifying pipeline libraries to use when creating a pipeline.
Pipelines created with VK_PIPELINE_CREATE_LIBRARY_BIT_KHR libraries can depend on other pipeline libraries in VkPipelineLibraryCreateInfoKHR.

A pipeline library is considered in-use, as long as one of the linking pipelines is in-use. This applies recursively if a pipeline library includes other pipeline libraries.

### 10.10. Pipeline Binding

Once a pipeline has been created, it can be bound to the command buffer using the command:

```c
// Provided by VK_VERSION_1_0
void vkCmdBindPipeline(
    VkCommandBuffer commandBuffer,
    VkPipelineBindPoint pipelineBindPoint,
    VkPipeline pipeline);
```

- `commandBuffer` is the command buffer that the pipeline will be bound to.
- `pipelineBindPoint` is a VkPipelineBindPoint value specifying to which bind point the pipeline is bound. Binding one does not disturb the others.
- `pipeline` is the pipeline to be bound.

Once bound, a pipeline binding affects subsequent commands that interact with the given pipeline type in the command buffer until a different pipeline of the same type is bound to the bind point, or until the pipeline bind point is disturbed by binding a shader object as described in Interaction with Pipelines. Commands that do not interact with the given pipeline type must not be affected by the pipeline state.
If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_COMPUTE`, the `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations

- VUID-vkCmdBindPipeline-pipelineBindPoint-00778
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_GRAPHICS`, the `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- VUID-vkCmdBindPipeline-pipelineBindPoint-00779
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_COMPUTE`, `pipeline` **must** be a compute pipeline

- VUID-vkCmdBindPipeline-pipelineBindPoint-00780
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_GRAPHICS`, `pipeline` **must** be a graphics pipeline

- VUID-vkCmdBindPipeline-pipelineBindPoint-00781
  If the `variableMultisampleRate` feature is not supported, `pipeline` is a graphics pipeline, the current subpass uses no attachments, and this is not the first call to this function with a graphics pipeline after transitioning to the current subpass, then the sample count specified by this pipeline **must** match that set in the previous pipeline

- VUID-vkCmdBindPipeline-pipelineBindPoint-02391
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR`, the `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations

- VUID-vkCmdBindPipeline-pipelineBindPoint-02392
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR`, `pipeline` **must** be a ray tracing pipeline

- VUID-vkCmdBindPipeline-pipelineBindPoint-06721
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR`, `commandBuffer` **must** not be a protected command buffer

- VUID-vkCmdBindPipeline-pipeline-03382
  `pipeline` **must** not have been created with `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR` set

- VUID-vkCmdBindPipeline-commandBuffer-04809
  If `commandBuffer` is a secondary command buffer with `VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D` enabled and `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_GRAPHICS` and `pipeline` was created with `VkPipelineDiscardRectangleStateCreateInfoEXT` structure and its `discardRectangleCount` member is not 0, or the pipeline was created with `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` enabled, then the pipeline **must** have been created with `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` enabled

**Valid Usage (Implicit)**

- VUID-vkCmdBindPipeline-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdBindPipeline-pipelineBindPoint-parameter
  `pipelineBindPoint` **must** be a valid `VkPipelineBindPoint` value
• VUID-vkCmdBindPipeline-pipeline-parameter  
  pipeline must be a valid VkPipeline handle

• VUID-vkCmdBindPipeline-commandBuffer-recording  
  commandBuffer must be in the recording state

• VUID-vkCmdBindPipeline-commandBuffer-cmdpool  
  The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations

• VUID-vkCmdBindPipeline-videocoding  
  This command must only be called outside of a video coding scope

• VUID-vkCmdBindPipeline-commonparent  
  Both of commandBuffer, and pipeline must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

• Host access to commandBuffer must be externally synchronized
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics, Compute</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>

</tbody>
</table>

Possible values of vkCmdBindPipeline::pipelineBindPoint, specifying the bind point of a pipeline object, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPipelineBindPoint {
    VK_PIPELINE_BIND_POINT_GRAPHICS = 0,
    VK_PIPELINE_BIND_POINT_COMPUTE = 1,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR = 1000165000,
} VkPipelineBindPoint;
```

• VK_PIPELINE_BIND_POINT_COMPUTE specifies binding as a compute pipeline.
• VK_PIPELINE_BIND_POINT_GRAPHICS specifies binding as a graphics pipeline.
• VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR specifies binding as a ray tracing pipeline.
10.10.1. Interaction With Shader Objects

If the shaderObject feature is enabled, applications can use both pipelines and shader objects at the same time. The interaction between pipelines and shader objects is described in Interaction with Pipelines.

10.11. Dynamic State

When a pipeline object is bound, any pipeline object state that is not specified as dynamic is applied to the command buffer state. Pipeline object state that is specified as dynamic is not applied to the command buffer state at this time. Instead, dynamic state can be modified at any time and persists for the lifetime of the command buffer, or until modified by another dynamic state setting command, or made invalid by another pipeline bind with that state specified as static.

When a pipeline object is bound, the following applies to each state parameter:

- If the state is not specified as dynamic in the new pipeline object, then that command buffer state is overwritten by the state in the new pipeline object. Before any draw or dispatch call with this pipeline there must not have been any calls to any of the corresponding dynamic state setting commands after this pipeline was bound.
- If the state is specified as dynamic in the new pipeline object, then that command buffer state is not disturbed. Before any draw or dispatch call with this pipeline there must have been at least one call to each of the corresponding dynamic state setting commands. The state-setting commands must be recorded after command buffer recording was begun, or after the last command binding a pipeline object with that state specified as static, whichever was the latter.
- If the state is not included (corresponding pointer in VkGraphicsPipelineCreateInfo was NULL or was ignored) in the new pipeline object, then that command buffer state is not disturbed.

Dynamic state that does not affect the result of operations can be left undefined.

Note

For example, if blending is disabled by the pipeline object state then the dynamic color blend constants do not need to be specified in the command buffer, even if this state is specified as dynamic in the pipeline object.

10.12. Pipeline Properties and Shader Information

When a pipeline is created, its state and shaders are compiled into zero or more device-specific executables, which are used when executing commands against that pipeline. To query the properties of these pipeline executables, call:

```c
// Provided by VK_KHR_pipeline_executable_properties
VkResult vkGetPipelineExecutablePropertiesKHR(
    VkDevice device,                
    const VkPipelineInfoKHR* pPipelineInfo,  
    uint32_t* pExecutableCount,
)
```
• `device` is the device that created the pipeline.
• `pPipelineInfo` describes the pipeline being queried.
• `pExecutableCount` is a pointer to an integer related to the number of pipeline executables available or queried, as described below.
• `pProperties` is either `NULL` or a pointer to an array of `VkPipelineExecutablePropertiesKHR` structures.

If `pProperties` is `NULL`, then the number of pipeline executables associated with the pipeline is returned in `pExecutableCount`. Otherwise, `pExecutableCount` must point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If `pExecutableCount` is less than the number of pipeline executables associated with the pipeline, at most `pExecutableCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available properties were returned.

**Valid Usage**

- VUID-vkGetPipelineExecutablePropertiesKHR-pipelineExecutableInfo-03270
  The `pipelineExecutableInfo` feature must be enabled
- VUID-vkGetPipelineExecutablePropertiesKHR-pipeline-03271
  The `pipeline` member of `pPipelineInfo` must have been created with `device`

**Valid Usage (Implicit)**

- VUID-vkGetPipelineExecutablePropertiesKHR-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkGetPipelineExecutablePropertiesKHR-pPipelineInfo-parameter
  `pPipelineInfo` must be a valid pointer to a valid `VkPipelineInfoKHR` structure
- VUID-vkGetPipelineExecutablePropertiesKHR-pExecutableCount-parameter
  `pExecutableCount` must be a valid pointer to a `uint32_t` value
- VUID-vkGetPipelineExecutablePropertiesKHR-pProperties-parameter
  If the value referenced by `pExecutableCount` is not 0, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pExecutableCount` `VkPipelineExecutablePropertiesKHR` structures

**Return Codes**

**Success**

- `VK_SUCCESS`
- `VK_INCOMPLETE`
The `VkPipelineExecutablePropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_pipeline_executable_properties
typedef struct VkPipelineExecutablePropertiesKHR {
    VkStructureType sType;
    void* pNext;
    VkShaderStageFlags stages;
    char name[VK_MAX_DESCRIPTION_SIZE];
    char description[VK_MAX_DESCRIPTION_SIZE];
    uint32_t subgroupSize;
} VkPipelineExecutablePropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stages` is a bitmask of zero or more `VkShaderStageFlagBits` indicating which shader stages (if any) were principally used as inputs to compile this pipeline executable.
- `name` is an array of `VK_MAX_DESCRIPTION_SIZE char` containing a null-terminated UTF-8 string which is a short human readable name for this pipeline executable.
- `description` is an array of `VK_MAX_DESCRIPTION_SIZE char` containing a null-terminated UTF-8 string which is a human readable description for this pipeline executable.
- `subgroupSize` is the subgroup size with which this pipeline executable is dispatched.

Not all implementations have a 1:1 mapping between shader stages and pipeline executables and some implementations may reduce a given shader stage to fixed function hardware programming such that no pipeline executable is available. No guarantees are provided about the mapping between shader stages and pipeline executables and stages should be considered a best effort hint. Because the application cannot rely on the stages field to provide an exact description, name and description provide a human readable name and description which more accurately describes the given pipeline executable.

**Valid Usage (Implicit)**

- VUID-VkPipelineExecutablePropertiesKHR-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_PROPERTIES_KHR`

- VUID-VkPipelineExecutablePropertiesKHR-pNext-pNext

  `pNext` must be `NULL`
typedef struct VkPipelineInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkPipeline pipeline;
} VkPipelineInfoKHR;

• **sType** is a *VkStructureType* value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **pipeline** is a *VkPipeline* handle.

### Valid Usage (Implicit)

- **VUID-VkPipelineInfoKHR-sType-sType**  
  **sType** must be **VK_STRUCTURE_TYPE_PIPELINE_INFO_KHR**
- **VUID-VkPipelineInfoKHR-pNext-pNext**  
  **pNext** must be **NULL**
- **VUID-VkPipelineInfoKHR-pipeline-parameter**  
  **pipeline** must be a valid *VkPipeline* handle

Each pipeline executable *may* have a set of statistics associated with it that are generated by the pipeline compilation process. These statistics *may* include things such as instruction counts, amount of spilling (if any), maximum number of simultaneous threads, or anything else which *may* aid developers in evaluating the expected performance of a shader. To query the compile time statistics associated with a pipeline executable, call:

```c
// Provided by VK_KHR_pipeline_executable_properties
VkResult vkGetPipelineExecutableStatisticsKHR(  
    VkDevice device,  
    const VkPipelineExecutableInfoKHR* pExecutableInfo,  
    uint32_t* pStatisticCount,  
    VkPipelineExecutableStatisticKHR* pStatistics);
```

- **device** is the device that created the pipeline.
- **pExecutableInfo** describes the pipeline executable being queried.
- **pStatisticCount** is a pointer to an integer related to the number of statistics available or queried, as described below.
- **pStatistics** is either **NULL** or a pointer to an array of *VkPipelineExecutableStatisticKHR* structures.

If **pStatistics** is **NULL**, then the number of statistics associated with the pipeline executable is returned in **pStatisticCount**. Otherwise, **pStatisticCount must** point to a variable set by the user to the number of elements in the **pStatistics** array, and on return the variable is overwritten with the
number of structures actually written to \textit{pStatistics}. If \textit{pStatisticCount} is less than the number of statistics associated with the pipeline executable, at most \textit{pStatisticCount} structures will be written, and \textit{VK_INCOMPLETE} will be returned instead of \textit{VK_SUCCESS}, to indicate that not all the available statistics were returned.

### Valid Usage

- VUID-vkGetPipelineExecutableStatisticsKHR-pipelineExecutableInfo-03272
  The \textit{pipelineExecutableInfo} feature \textbf{must} be enabled

- VUID-vkGetPipelineExecutableStatisticsKHR-pipeline-03273
  The \textit{pipeline} member of \textit{pExecutableInfo} \textbf{must} have been created with \textit{device}

- VUID-vkGetPipelineExecutableStatisticsKHR-pipeline-03274
  The \textit{pipeline} member of \textit{pExecutableInfo} \textbf{must} have been created with \textit{VK_PIPELINE_CREATE_CAPTURE_STATISTICS_BIT_KHR}

### Valid Usage (Implicit)

- VUID-vkGetPipelineExecutableStatisticsKHR-device-parameter
  \textit{device} \textbf{must} be a valid \textit{VkDevice} handle

- VUID-vkGetPipelineExecutableStatisticsKHR-pExecutableInfo-parameter
  \textit{pExecutableInfo} \textbf{must} be a valid pointer to a valid \textit{VkPipelineExecutableInfoKHR} structure

- VUID-vkGetPipelineExecutableStatisticsKHR-pStatisticCount-parameter
  \textit{pStatisticCount} \textbf{must} be a valid pointer to a \texttt{uint32_t} value

- VUID-vkGetPipelineExecutableStatisticsKHR-pStatistics-parameter
  If the value referenced by \textit{pStatisticCount} is not 0, and \textit{pStatistics} is not NULL, \textit{pStatistics} \textbf{must} be a valid pointer to an array of \textit{pStatisticCount} \textit{VkPipelineExecutableStatisticKHR} structures

### Return Codes

**Success**
- \textit{VK_SUCCESS}
- \textit{VK_INCOMPLETE}

**Failure**
- \textit{VK_ERROR_OUT_OF_HOST_MEMORY}
- \textit{VK_ERROR_OUT_OF_DEVICE_MEMORY}

The \textit{VkPipelineExecutableInfoKHR} structure is defined as:

```c
// Provided by VK_KHR_pipeline_executable_properties
```
typedef struct VkPipelineExecutableInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkPipeline pipeline;
    uint32_t executableIndex;
} VkPipelineExecutableInfoKHR;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pipeline` is the pipeline to query.
- `executableIndex` is the index of the pipeline executable to query in the array of executable properties returned by `vkGetPipelineExecutablePropertiesKHR`.

**Valid Usage**

- VUID-VkPipelineExecutableInfoKHR-executableIndex-03275
  `executableIndex` must be less than the number of pipeline executables associated with `pipeline` as returned in the `pExecutableCount` parameter of `vkGetPipelineExecutablePropertiesKHR`

**Valid Usage (Implicit)**

- VUID-VkPipelineExecutableInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_INFO_KHR`
- VUID-VkPipelineExecutableInfoKHR-pNext-pNext
  `pNext` must be `NULL`
- VUID-VkPipelineExecutableInfoKHR-pipeline-parameter
  `pipeline` must be a valid `VkPipeline` handle

The `VkPipelineExecutableStatisticKHR` structure is defined as:

```c
// Provided by VK_KHR_pipeline_executable_properties
typedef struct VkPipelineExecutableStatisticKHR {
    VkStructureType sType;
    void* pNext;
    char name[VK_MAX_DESCRIPTION_SIZE];
    char description[VK_MAX_DESCRIPTION_SIZE];
    VkPipelineExecutableStatisticFormatKHR format;
    VkPipelineExecutableStatisticValueKHR value;
} VkPipelineExecutableStatisticKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
• **name** is an array of `VK_MAX_DESCRIPTION_SIZE` `char` containing a null-terminated UTF-8 string which is a short human readable name for this statistic.

• **description** is an array of `VK_MAX_DESCRIPTION_SIZE` `char` containing a null-terminated UTF-8 string which is a human readable description for this statistic.

• **format** is a `VkPipelineExecutableStatisticFormatKHR` value specifying the format of the data found in **value**.

• **value** is the value of this statistic.

### Valid Usage (Implicit)

- **VUID-VkPipelineExecutableStatisticKHR-sType-sType**
  - **sType** must be `VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_STATISTIC_KHR`

- **VUID-VkPipelineExecutableStatisticKHR-pNext-pNext**
  - **pNext** must be `NULL`

The `VkPipelineExecutableStatisticFormatKHR` enum is defined as:

```c
// Provided by VK_KHR_pipeline_executable_properties
typedef enum VkPipelineExecutableStatisticFormatKHR {
    VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_BOOL32_KHR = 0,
    VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_INT64_KHR = 1,
    VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_UINT64_KHR = 2,
    VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_FLOAT64_KHR = 3,
} VkPipelineExecutableStatisticFormatKHR;
```

- **VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_BOOL32_KHR** specifies that the statistic is returned as a 32-bit boolean value which must be either `VK_TRUE` or `VK_FALSE` and should be read from the **b32** field of `VkPipelineExecutableStatisticValueKHR`.

- **VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_INT64_KHR** specifies that the statistic is returned as a signed 64-bit integer and should be read from the **i64** field of `VkPipelineExecutableStatisticValueKHR`.

- **VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_UINT64_KHR** specifies that the statistic is returned as an unsigned 64-bit integer and should be read from the **u64** field of `VkPipelineExecutableStatisticValueKHR`.

- **VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_FLOAT64_KHR** specifies that the statistic is returned as a 64-bit floating-point value and should be read from the **f64** field of `VkPipelineExecutableStatisticValueKHR`.

The `VkPipelineExecutableStatisticValueKHR` union is defined as:

```c
// Provided by VK_KHR_pipeline_executable_properties
typedef union VkPipelineExecutableStatisticValueKHR {
    VkBool32 b32;
    int64_t i64;
} VkPipelineExecutableStatisticValueKHR;
```
Each pipeline executable may have one or more text or binary internal representations associated with it which are generated as part of the compile process. These may include the final shader assembly, a binary form of the compiled shader, or the shader compiler’s internal representation at any number of intermediate compile steps. To query the internal representations associated with a pipeline executable, call:

```c
// Provided by VK_KHR_pipeline_executable_properties
VkResult vkGetPipelineExecutableInternalRepresentationsKHR(
    VkDevice device,
    const VkPipelineExecutableInfoKHR* pExecutableInfo,
    uint32_t* pInternalRepresentationCount,
    VkPipelineExecutableInternalRepresentationKHR* pInternalRepresentations);
```

- `device` is the device that created the pipeline.
- `pExecutableInfo` describes the pipeline executable being queried.
- `pInternalRepresentationCount` is a pointer to an integer related to the number of internal representations available or queried, as described below.
- `pInternalRepresentations` is either `NULL` or a pointer to an array of `VkPipelineExecutableInternalRepresentationKHR` structures.

If `pInternalRepresentations` is `NULL`, then the number of internal representations associated with the pipeline executable is returned in `pInternalRepresentationCount`. Otherwise, `pInternalRepresentationCount` must point to a variable set by the user to the number of elements in the `pInternalRepresentations` array, and on return the variable is overwritten with the number of structures actually written to `pInternalRepresentations`. If `pInternalRepresentationCount` is less than the number of internal representations associated with the pipeline executable, at most `pInternalRepresentationCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available representations were returned.

While the details of the internal representations remain implementation-dependent, the implementation should order the internal representations in the order in which they occur in the compiled pipeline with the final shader assembly (if any) last.
Valid Usage

- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pipelineExecutableInfo-03276
  The `pipelineExecutableInfo` feature **must** be enabled

- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pipeline-03277
  The `pipeline` member of `pExecutableInfo` **must** have been created with `device`

- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pipeline-03278
  The `pipeline` member of `pExecutableInfo` **must** have been created with `VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR`

Valid Usage (Implicit)

- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-device-parameter
  `device` **must** be a valid `VkDevice` handle

- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pExecutableInfo-parameter
  `pExecutableInfo` **must** be a valid pointer to a valid `VkPipelineExecutableInfoKHR` structure

- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pInternalRepresentationCount-parameter
  `pInternalRepresentationCount` **must** be a valid pointer to a `uint32_t` value

- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pInternalRepresentations-parameter
  If the value referenced by `pInternalRepresentationCount` is not 0, and `pInternalRepresentations` is not NULL, `pInternalRepresentations` **must** be a valid pointer to an array of `pInternalRepresentationCount` `VkPipelineExecutableInternalRepresentationKHR` structures

Return Codes

**Success**

- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkPipelineExecutableInternalRepresentationKHR` structure is defined as:

```c
// Provided by VK_KHR_pipeline_executable_properties
typedef struct VkPipelineExecutableInternalRepresentationKHR
{
    VkStructureType    sType;
```
`void* pNext;`  
`char name[VK_MAX_DESCRIPTION_SIZE];`  
`char description[VK_MAX_DESCRIPTION_SIZE];`  
`VkBool32 isText;`  
`size_t dataSize;`  
`void* pData;`  
`}`  

`VkPipelineExecutableInternalRepresentationKHR;`

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `name` is an array of `VK_MAX_DESCRIPTION_SIZE char` containing a null-terminated UTF-8 string which is a short human readable name for this internal representation.
- `description` is an array of `VK_MAX_DESCRIPTION_SIZE char` containing a null-terminated UTF-8 string which is a human readable description for this internal representation.
- `isText` specifies whether the returned data is text or opaque data. If `isText` is `VK_TRUE` then the data returned in `pData` is text and is guaranteed to be a null-terminated UTF-8 string.
- `dataSize` is an integer related to the size, in bytes, of the internal representation's data, as described below.
- `pData` is either `NULL` or a pointer to a block of data into which the implementation will write the internal representation.

If `pData` is `NULL`, then the size, in bytes, of the internal representation data is returned in `dataSize`. Otherwise, `dataSize` must be the size of the buffer, in bytes, pointed to by `pData` and on return `dataSize` is overwritten with the number of bytes of data actually written to `pData` including any trailing null character. If `dataSize` is less than the size, in bytes, of the internal representation's data, at most `dataSize` bytes of data will be written to `pData`, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available representation was returned.

If `isText` is `VK_TRUE` and `pData` is not `NULL` and `dataSize` is not zero, the last byte written to `pData` will be a null character.

**Valid Usage (Implicit)**

- `VUID-VkPipelineExecutableInternalRepresentationKHR-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_INTERNAL_REPRESENTATION_KHR`
- `VUID-VkPipelineExecutableInternalRepresentationKHR-pNext-pNext`  
  `pNext` must be `NULL`

### 10.13. Pipeline Creation Feedback

Feedback about the creation of a particular pipeline object can be obtained by adding a `VkPipelineCreationFeedbackCreateInfo` structure to the `pNext` chain of `VkGraphicsPipelineCreateInfo`, `VkRayTracingPipelineCreateInfoKHR`, or `VkComputePipelineCreateInfo`. The `VkPipelineCreationFeedbackCreateInfo` structure is defined as:

---

644
typedef struct VkPipelineCreationFeedbackCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCreationFeedback* pPipelineCreationFeedback;
    uint32_t pipelineStageCreationFeedbackCount;
    VkPipelineCreationFeedback* pPipelineStageCreationFeedbacks;
} VkPipelineCreationFeedbackCreateInfo;

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **pPipelineCreationFeedback** is a pointer to a *VkPipelineCreationFeedback* structure.
- **pipelineStageCreationFeedbackCount** is the number of elements in **pPipelineStageCreationFeedbacks**.
- **pPipelineStageCreationFeedbacks** is a pointer to an array of **pipelineStageCreationFeedbackCount** *VkPipelineCreationFeedback* structures.

An implementation **should** write pipeline creation feedback to **pPipelineCreationFeedback** and **may** write pipeline stage creation feedback to **pPipelineStageCreationFeedbacks**. An implementation **must** set or clear the *VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT* in *VkPipelineCreationFeedback* ::flags for **pPipelineCreationFeedback** and every element of **pPipelineStageCreationFeedbacks**.

**Note**
One common scenario for an implementation to skip per-stage feedback is when *VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT* is set in **pPipelineCreationFeedback**.

When chained to *VkRayTracingPipelineCreateInfoKHR*, or *VkGraphicsPipelineCreateInfo*, the i element of **pPipelineStageCreationFeedbacks** corresponds to the i element of *VkRayTracingPipelineCreateInfoKHR::*pStages*, or *VkGraphicsPipelineCreateInfo::*pStages*. When chained to *VkComputePipelineCreateInfo*, the first element of **pPipelineStageCreationFeedbacks** corresponds to *VkComputePipelineCreateInfo::*stage*.

**Valid Usage (Implicit)**

- **VUID-VkPipelineCreationFeedbackCreateInfo-sType-sType**
  
  **sType** must be *VK_STRUCTURE_TYPE_PIPELINE_CREATION_FEEDBACK_CREATE_INFO*

- **VUID-VkPipelineCreationFeedbackCreateInfo-pPipelineCreationFeedback-parameter**
  
  **pPipelineCreationFeedback** must be a valid pointer to a *VkPipelineCreationFeedback* structure

- **VUID-VkPipelineCreationFeedbackCreateInfo-pPipelineStageCreationFeedbacks-parameter**
  
  If **pipelineStageCreationFeedbackCount** is not 0, **pPipelineStageCreationFeedbacks** must be a valid pointer to an array of **pipelineStageCreationFeedbackCount** elements.
The **VkPipelineCreationFeedback** structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPipelineCreationFeedback {
    VkPipelineCreationFeedbackFlags flags;
    uint64_t duration;
} VkPipelineCreationFeedback;
```

- **flags** is a bitmask of **VkPipelineCreationFeedbackFlagBits** providing feedback about the creation of a pipeline or of a pipeline stage.
- **duration** is the duration spent creating a pipeline or pipeline stage in nanoseconds.

If the **VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT** is not set in **flags**, an implementation **must** not set any other bits in **flags**, and the values of all other **VkPipelineCreationFeedback** data members are undefined.

Possible values of the **flags** member of **VkPipelineCreationFeedback** are:

```c
// Provided by VK_VERSION_1_3
typedef enum VkPipelineCreationFeedbackFlagBits {
    VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT = 0x00000001,
    VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT = 0x00000002,
    VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT = 0x00000004,
    VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT_EXT = VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT,
    VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT_EXT = VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT,
    VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT_EXT = VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT,
} VkPipelineCreationFeedbackFlagBits;
```

- **VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT** indicates that the feedback information is valid.
- **VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT** indicates that a readily usable pipeline or pipeline stage was found in the **pipelineCache** specified by the application in the pipeline creation command.

An implementation **should** set the **VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT** bit if it was able to avoid the large majority of pipeline or pipeline stage creation work by using the **pipelineCache** parameter of **vkCreateGraphicsPipelines**, **vkCreateRayTracingPipelinesKHR**, or **vkCreateComputePipelines**. When an implementation sets this bit for the entire pipeline, it **may** leave it unset for any stage.

**Note**

Implementations are encouraged to provide a meaningful signal to
applications using this bit. The intention is to communicate to the application that the pipeline or pipeline stage was created “as fast as it gets” using the pipeline cache provided by the application. If an implementation uses an internal cache, it is discouraged from setting this bit as the feedback would be unactionable.

• **VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT** indicates that the base pipeline specified by the `basePipelineHandle` or `basePipelineIndex` member of the `Vk*PipelineCreateInfo` structure was used to accelerate the creation of the pipeline.

An implementation should set the **VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT** bit if it was able to avoid a significant amount of work by using the base pipeline.

**Note**

While “significant amount of work” is subjective, implementations are encouraged to provide a meaningful signal to applications using this bit. For example, a 1% reduction in duration may not warrant setting this bit, while a 50% reduction would.

```c
// Provided by VK_VERSION_1_3
typedef VkFlags VkPipelineCreationFeedbackFlags;

VkPipelineCreationFeedbackFlags is a bitmask type for providing zero or more `VkPipelineCreationFeedbackFlagBits`.```
Chapter 11. Memory Allocation

Vulkan memory is broken up into two categories, *host memory* and *device memory*.

11.1. Host Memory

Host memory is memory needed by the Vulkan implementation for non-device-visible storage.

**Note**

This memory may be used to store the implementation’s representation and state of Vulkan objects.

Vulkan provides applications the opportunity to perform host memory allocations on behalf of the Vulkan implementation. If this feature is not used, the implementation will perform its own memory allocations. Since most memory allocations are off the critical path, this is not meant as a performance feature. Rather, this can be useful for certain embedded systems, for debugging purposes (e.g. putting a guard page after all host allocations), or for memory allocation logging.

Allocators are provided by the application as a pointer to a `VkAllocationCallbacks` structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkAllocationCallbacks {
    void* pUserData;
    PFN_vkAllocationFunction pfnAllocation;
    PFN_vkReallocationFunction pfnReallocation;
    PFN_vkFreeFunction pfnFree;
    PFN_vkInternalAllocationNotification pfnInternalAllocation;
    PFN_vkInternalFreeNotification pfnInternalFree;
} VkAllocationCallbacks;
```

- `pUserData` is a value to be interpreted by the implementation of the callbacks. When any of the callbacks in `VkAllocationCallbacks` are called, the Vulkan implementation will pass this value as the first parameter to the callback. This value can vary each time an allocator is passed into a command, even when the same object takes an allocator in multiple commands.

- `pfnAllocation` is a `PFN_vkAllocationFunction` pointer to an application-defined memory allocation function.

- `pfnReallocation` is a `PFN_vkReallocationFunction` pointer to an application-defined memory reallocation function.

- `pfnFree` is a `PFN_vkFreeFunction` pointer to an application-defined memory free function.

- `pfnInternalAllocation` is a `PFN_vkInternalAllocationNotification` pointer to an application-defined function that is called by the implementation when the implementation makes internal allocations.

- `pfnInternalFree` is a `PFN_vkInternalFreeNotification` pointer to an application-defined function that is called by the implementation when the implementation frees internal allocations.
Valid Usage

- VUID-VkAllocationCallbacks-pfnAllocation-00632
  \textit{pfnAllocation} must be a valid pointer to a valid user-defined \textit{PFN_vkAllocationFunction}

- VUID-VkAllocationCallbacks-pfnReallocation-00633
  \textit{pfnReallocation} must be a valid pointer to a valid user-defined \textit{PFN_vkReallocationFunction}

- VUID-VkAllocationCallbacks-pfnFree-00634
  \textit{pfnFree} must be a valid pointer to a valid user-defined \textit{PFN_vkFreeFunction}

- VUID-VkAllocationCallbacks-pfnInternalAllocation-00635
  If either of \textit{pfnInternalAllocation} or \textit{pfnInternalFree} is not NULL, both must be valid callbacks

The type of \textit{pfnAllocation} is:

```c
// Provided by VK_VERSION_1_0
typedef void* (VKAPI_PTR *PFN_vkAllocationFunction)(
    void* pUserData,
    size_t size,
    size_t alignment,
    VkSystemAllocationScope allocationScope);
```

- \textit{pUserData} is the value specified for \textit{VkAllocationCallbacks::pUserData} in the allocator specified by the application.
- \textit{size} is the size in bytes of the requested allocation.
- \textit{alignment} is the requested alignment of the allocation in bytes and must be a power of two.
- \textit{allocationScope} is a \textit{VkSystemAllocationScope} value specifying the allocation scope of the lifetime of the allocation, as described here.

If \textit{pfnAllocation} is unable to allocate the requested memory, it must return NULL. If the allocation was successful, it must return a valid pointer to memory allocation containing at least \textit{size} bytes, and with the pointer value being a multiple of \textit{alignment}.

\textit{Note}
Correct Vulkan operation cannot be assumed if the application does not follow these rules.

For example, \textit{pfnAllocation} (or \textit{pfnReallocation}) could cause termination of running Vulkan instance(s) on a failed allocation for debugging purposes, either directly or indirectly. In these circumstances, it cannot be assumed that any part of any affected \textit{VkInstance} objects are going to operate correctly (even \textit{vkDestroyInstance}), and the application must ensure it cleans up properly via other means (e.g. process termination).
If `pfnAllocation` returns `NULL`, and if the implementation is unable to continue correct processing of the current command without the requested allocation, it **must** treat this as a runtime error, and generate `VK_ERROR_OUT_OF_HOST_MEMORY` at the appropriate time for the command in which the condition was detected, as described in **Return Codes**.

If the implementation is able to continue correct processing of the current command without the requested allocation, then it **may** do so, and **must** not generate `VK_ERROR_OUT_OF_HOST_MEMORY` as a result of this failed allocation.

The type of `pfnReallocation` is:

```c
// Provided by VK_VERSION_1_0
typedef void* (VKAPI_PTR *PFN_vkReallocationFunction)(
    void* pUserData,
    void* pOriginal,
    size_t size,
    size_t alignment,
    VkSystemAllocationScope allocationScope);
```

- `pUserData` is the value specified for `VkAllocationCallbacks::pUserData` in the allocator specified by the application.
- `pOriginal` **must** be either `NULL` or a pointer previously returned by `pfnReallocation` or `pfnAllocation` of a compatible allocator.
- `size` is the size in bytes of the requested allocation.
- `alignment` is the requested alignment of the allocation in bytes and **must** be a power of two.
- `allocationScope` is a `VkSystemAllocationScope` value specifying the allocation scope of the lifetime of the allocation, as described [here](#).

If the reallocation was successful, `pfnReallocation` **must** return an allocation with enough space for `size` bytes, and the contents of the original allocation from bytes zero to `min(original size, new size) - 1` **must** be preserved in the returned allocation. If `size` is larger than the old size, the contents of the additional space are undefined. If satisfying these requirements involves creating a new allocation, then the old allocation **should** be freed.

If `pOriginal` is `NULL`, then `pfnReallocation` **must** behave equivalently to a call to `PFN_vkAllocationFunction` with the same parameter values (without `pOriginal`).

If `size` is zero, then `pfnReallocation` **must** behave equivalently to a call to `PFN_vkFreeFunction` with the same `pUserData` parameter value, and `pMemory` equal to `pOriginal`.

If `pOriginal` is non-`NULL`, the implementation **must** ensure that `alignment` is equal to the `alignment` used to originally allocate `pOriginal`.

If this function fails and `pOriginal` is non-`NULL` the application **must** not free the old allocation.

`pfnReallocation` **must** follow the same rules for return values as `PFN_vkAllocationFunction`.

The type of `pfnFree` is:
typedef void (VKAPI_PTR *PFN_vkFreeFunction)(
    void* pUserData,
    void* pMemory);

- pUserData is the value specified for VkAllocationCallbacks::pUserData in the allocator specified by the application.
- pMemory is the allocation to be freed.

pMemory may be NULL, which the callback must handle safely. If pMemory is non-NULL, it must be a pointer previously allocated by pfnAllocation or pfnReallocation. The application should free this memory.

The type of pfnInternalAllocation is:

typedef void (VKAPI_PTR *PFN_vkInternalAllocationNotification)(
    void* pUserData,
    size_t size,
    VkInternalAllocationType allocationType,
    VkSystemAllocationScope allocationScope);

- pUserData is the value specified for VkAllocationCallbacks::pUserData in the allocator specified by the application.
- size is the requested size of an allocation.
- allocationType is a VkInternalAllocationType value specifying the requested type of an allocation.
- allocationScope is a VkSystemAllocationScope value specifying the allocation scope of the lifetime of the allocation, as described here.

This is a purely informational callback.

The type of pfnInternalFree is:

typedef void (VKAPI_PTR *PFN_vkInternalFreeNotification)(
    void* pUserData,
    size_t size,
    VkInternalAllocationType allocationType,
    VkSystemAllocationScope allocationScope);

- pUserData is the value specified for VkAllocationCallbacks::pUserData in the allocator specified by the application.
- size is the requested size of an allocation.
allocationType is a VkInternalAllocationType value specifying the requested type of an allocation.

allocationScope is a VkSystemAllocationScope value specifying the allocation scope of the lifetime of the allocation, as described here.

Each allocation has an allocation scope defining its lifetime and which object it is associated with. Possible values passed to the allocationScope parameter of the callback functions specified by VkAllocationCallbacks, indicating the allocation scope, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSystemAllocationScope {
    VK_SYSTEM_ALLOCATION_SCOPE_COMMAND = 0,
    VK_SYSTEM_ALLOCATION_SCOPE_OBJECT = 1,
    VK_SYSTEM_ALLOCATION_SCOPE_CACHE = 2,
    VK_SYSTEM_ALLOCATION_SCOPE_DEVICE = 3,
    VK_SYSTEM_ALLOCATION_SCOPE_INSTANCE = 4,
} VkSystemAllocationScope;
```

• VK_SYSTEM_ALLOCATION_SCOPE_COMMAND specifies that the allocation is scoped to the duration of the Vulkan command.

• VK_SYSTEM_ALLOCATION_SCOPE_OBJECT specifies that the allocation is scoped to the lifetime of the Vulkan object that is being created or used.

• VK_SYSTEM_ALLOCATION_SCOPE_CACHE specifies that the allocation is scoped to the lifetime of a VkPipelineCache object.

• VK_SYSTEM_ALLOCATION_SCOPE_DEVICE specifies that the allocation is scoped to the lifetime of the Vulkan device.

• VK_SYSTEM_ALLOCATION_SCOPE_INSTANCE specifies that the allocation is scoped to the lifetime of the Vulkan instance.

Most Vulkan commands operate on a single object, or there is a sole object that is being created or manipulated. When an allocation uses an allocation scope of VK_SYSTEM_ALLOCATION_SCOPE_OBJECT or VK_SYSTEM_ALLOCATION_SCOPE_CACHE, the allocation is scoped to the object being created or manipulated.

When an implementation requires host memory, it will make callbacks to the application using the most specific allocator and allocation scope available:

• If an allocation is scoped to the duration of a command, the allocator will use the VK_SYSTEM_ALLOCATION_SCOPE_COMMAND allocation scope. The most specific allocator available is used: if the object being created or manipulated has an allocator, that object's allocator will be used, else if the parent VkDevice has an allocator it will be used, else if the parent VkInstance has an allocator it will be used. Else,

• If an allocation is associated with a VkPipelineCache object, the allocator will use the VK_SYSTEM_ALLOCATION_SCOPE_CACHE allocation scope. The most specific allocator available is used (cache, else device, else instance). Else,
If an allocation is scoped to the lifetime of an object, that object is being created or manipulated by the command, and that object's type is not VkDevice or VkInstance, the allocator will use an allocation scope of VK_SYSTEM_ALLOCATION_SCOPE_OBJECT. The most specific allocator available is used (object, else device, else instance). Else,

If an allocation is scoped to the lifetime of a device, the allocator will use an allocation scope of VK_SYSTEM_ALLOCATION_SCOPE_DEVICE. The most specific allocator available is used (device, else instance). Else,

If the allocation is scoped to the lifetime of an instance and the instance has an allocator, its allocator will be used with an allocation scope of VK_SYSTEM_ALLOCATION_SCOPE_INSTANCE.

Otherwise an implementation will allocate memory through an alternative mechanism that is unspecified.

Objects that are allocated from pools do not specify their own allocator. When an implementation requires host memory for such an object, that memory is sourced from the object's parent pool’s allocator.

The application is not expected to handle allocating memory that is intended for execution by the host due to the complexities of differing security implementations across multiple platforms. The implementation will allocate such memory internally and invoke an application provided informational callback when these internal allocations are allocated and freed. Upon allocation of executable memory, pfnInternalAllocation will be called. Upon freeing executable memory, pfnInternalFree will be called. An implementation will only call an informational callback for executable memory allocations and frees.

The allocationType parameter to the pfnInternalAllocation and pfnInternalFree functions may be one of the following values:

```c
// Provided by VK_VERSION_1_0
typedef enum VkInternalAllocationType {
    VK_INTERNAL_ALLOCATION_TYPE_EXECUTABLE = 0,
} VkInternalAllocationType;
```

- VK_INTERNAL_ALLOCATION_TYPE_EXECUTABLE specifies that the allocation is intended for execution by the host.

An implementation must only make calls into an application-provided allocator during the execution of an API command. An implementation must only make calls into an application-provided allocator from the same thread that called the provoking API command. The implementation should not synchronize calls to any of the callbacks. If synchronization is needed, the callbacks must provide it themselves. The informational callbacks are subject to the same restrictions as the allocation callbacks.

If an implementation intends to make calls through a VkAllocationCallbacks structure between the time a vkCreate* command returns and the time a corresponding vkDestroy* command begins, that implementation must save a copy of the allocator before the vkCreate* command returns. The callback functions and any data structures they rely upon must remain valid for the lifetime of the object they are associated with.
If an allocator is provided to a `vkCreate*` command, a *compatible* allocator **must** be provided to the corresponding `vkDestroy*` command. Two `VkAllocationCallbacks` structures are compatible if memory allocated with `pfnAllocation` or `pfnReallocation` in each can be freed with `pfnReallocation` or `pfnFree` in the other. An allocator **must** not be provided to a `vkDestroy*` command if an allocator was not provided to the corresponding `vkCreate*` command.

If a non-NULL allocator is used, the `pfnAllocation`, `pfnReallocation` and `pfnFree` members **must** be non-NULL and point to valid implementations of the callbacks. An application can choose to not provide informational callbacks by setting both `pfnInternalAllocation` and `pfnInternalFree` to NULL. `pfnInternalAllocation` and `pfnInternalFree` **must** either both be NULL or both be non-NULL.

If `pfnAllocation` or `pfnReallocation` fail, the implementation **may** fail object creation and/or generate a `VK_ERROR_OUT_OF_HOST_MEMORY` error, as appropriate.

Allocation callbacks **must** not call any Vulkan commands.

The following sets of rules define when an implementation is permitted to call the allocator callbacks.

`pfnAllocation` or `pfnReallocation` **may** be called in the following situations:

- Allocations scoped to a `VkDevice` or `VkInstance` **may** be allocated from any API command.
- Allocations scoped to a command **may** be allocated from any API command.
- Allocations scoped to a `VkPipelineCache` **may** only be allocated from:
  - `vkCreatePipelineCache`
  - `vkMergePipelineCaches` for `dstCache`
  - `vkCreateGraphicsPipelines` for `pipelineCache`
  - `vkCreateComputePipelines` for `pipelineCache`
- Allocations scoped to a `VkDescriptorPool` **may** only be allocated from:
  - any command that takes the pool as a direct argument
  - `vkAllocateDescriptorSets` for the `descriptorPool` member of its `pAllocateInfo` parameter
  - `vkCreateDescriptorPool`
- Allocations scoped to a `VkCommandPool` **may** only be allocated from:
  - any command that takes the pool as a direct argument
  - `vkCreateCommandPool`
  - `vkAllocateCommandBuffers` for the `commandPool` member of its `pAllocateInfo` parameter
  - any `vkCmd*` command whose `commandBuffer` was allocated from that `VkCommandPool`
- Allocations scoped to any other object **may** only be allocated in that object's `vkCreate*` command.

`pfnFree`, or `pfnReallocation` with zero size, **may** be called in the following situations:

- Allocations scoped to a `VkDevice` or `VkInstance` **may** be freed from any API command.
• Allocations scoped to a command **must** be freed by any API command which allocates such memory.

• Allocations scoped to a `VkPipelineCache` **may** be freed from `vkDestroyPipelineCache`.

• Allocations scoped to a `VkDescriptorPool` **may** be freed from:
  ◦ any command that takes the pool as a direct argument

• Allocations scoped to a `VkCommandPool` **may** be freed from:
  ◦ any command that takes the pool as a direct argument
  ◦ `vkResetCommandBuffer` whose `commandBuffer` was allocated from that `VkCommandPool`

• Allocations scoped to any other object **may** be freed in that object’s `vkDestroy*` command.

• Any command that allocates host memory **may** also free host memory of the same scope.

## 11.2. Device Memory

*Device memory* is memory that is visible to the device — for example the contents of the image or buffer objects, which **can** be natively used by the device.

### 11.2.1. Device Memory Properties

Memory properties of a physical device describe the memory heaps and memory types available.

To query memory properties, call:

```c
// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceMemoryProperties(
  VkPhysicalDevice physicalDevice,
  VkPhysicalDeviceMemoryProperties* pMemoryProperties);
```

• `physicalDevice` is the handle to the device to query.

• `pMemoryProperties` is a pointer to a `VkPhysicalDeviceMemoryProperties` structure in which the properties are returned.

### Valid Usage (Implicit)

• VUID-vkGetPhysicalDeviceMemoryProperties-physicalDevice-parameter
  `physicalDevice` **must** be a valid `VkPhysicalDevice` handle

• VUID-vkGetPhysicalDeviceMemoryProperties-pMemoryProperties-parameter
  `pMemoryProperties` **must** be a valid pointer to a `VkPhysicalDeviceMemoryProperties` structure

The `VkPhysicalDeviceMemoryProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_0
```
typedef struct VkPhysicalDeviceMemoryProperties {
    uint32_t     memoryTypeCount;
    VkMemoryType memoryTypes[VK_MAX_MEMORY_TYPES];
    uint32_t     memoryHeapCount;
    VkMemoryHeap memoryHeaps[VK_MAX_MEMORY_HEAPS];
} VkPhysicalDeviceMemoryProperties;

- `memoryTypeCount` is the number of valid elements in the `memoryTypes` array.
- `memoryTypes` is an array of `VK_MAX_MEMORY_TYPES` `VkMemoryType` structures describing the memory types that can be used to access memory allocated from the heaps specified by `memoryHeaps`.
- `memoryHeapCount` is the number of valid elements in the `memoryHeaps` array.
- `memoryHeaps` is an array of `VK_MAX_MEMORY_HEAPS` `VkMemoryHeap` structures describing the memory heaps from which memory can be allocated.

The `VkPhysicalDeviceMemoryProperties` structure describes a number of memory heaps as well as a number of memory types that can be used to access memory allocated in those heaps. Each heap describes a memory resource of a particular size, and each memory type describes a set of memory properties (e.g. host cached vs. uncached) that can be used with a given memory heap. Allocations using a particular memory type will consume resources from the heap indicated by that memory type’s heap index. More than one memory type may share each heap, and the heaps and memory types provide a mechanism to advertise an accurate size of the physical memory resources while allowing the memory to be used with a variety of different properties.

The number of memory heaps is given by `memoryHeapCount` and is less than or equal to `VK_MAX_MEMORY_HEAPS`. Each heap is described by an element of the `memoryHeaps` array as a `VkMemoryHeap` structure. The number of memory types available across all memory heaps is given by `memoryTypeCount` and is less than or equal to `VK_MAX_MEMORY_TYPES`. Each memory type is described by an element of the `memoryTypes` array as a `VkMemoryType` structure.

At least one heap must include `VK_MEMORY_HEAP_DEVICE_LOCAL_BIT` in `VkMemoryHeap::flags`. If there are multiple heaps that all have similar performance characteristics, they may all include `VK_MEMORY_HEAP_DEVICE_LOCAL_BIT`. In a unified memory architecture (UMA) system there is often only a single memory heap which is considered to be equally “local” to the host and to the device, and such an implementation must advertise the heap as device-local.

Each memory type returned by `vkGetPhysicalDeviceMemoryProperties` must have its `propertyFlags` set to one of the following values:

- 0
- `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT` | `VK_MEMORY_PROPERTY_HOST_COHERENT_BIT`
- `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT` | `VK_MEMORY_PROPERTY_HOST_CACHED_BIT`
- `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT` | `VK_MEMORY_PROPERTY_HOST_CACHED_BIT`
There must be at least one memory type with both the `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT` and `VK_MEMORY_PROPERTY_HOST_COHERENT_BIT` bits set in its `propertyFlags`. There must be at least one memory type with the `VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT` bit set in its `propertyFlags`.

For each pair of elements $X$ and $Y$ returned in `memoryTypes`, $X$ must be placed at a lower index position than $Y$ if:

- the set of bit flags returned in the `propertyFlags` member of $X$ is a strict subset of the set of bit flags returned in the `propertyFlags` member of $Y$; or
- the `propertyFlags` members of $X$ and $Y$ are equal, and $X$ belongs to a memory heap with greater performance (as determined in an implementation-specific manner)

This ordering requirement enables applications to use a simple search loop to select the desired memory type along the lines of:

```c
int32_t findProperties(const VkPhysicalDeviceMemoryProperties* pMemoryProperties,
                        uint32_t memoryTypeBitsRequirement,
```

---

**Note**

There is no ordering requirement between $X$ and $Y$ elements for the case their `propertyFlags` members are not in a subset relation. That potentially allows more than one possible way to order the same set of memory types. Notice that the list of all allowed memory property flag combinations is written in a valid order. But if instead `VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT` was before `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT`, the list would still be in a valid order.
VkMemoryPropertyFlags requiredProperties) {
  const uint32_t memoryCount = pMemoryProperties->memoryTypeCount;
  for (uint32_t memoryIndex = 0; memoryIndex < memoryCount; ++memoryIndex) {
    const uint32_t memoryTypeBits = (1 << memoryIndex);
    const bool isRequiredMemoryType = memoryTypeBitsRequirement & memoryTypeBits;
    const VkMemoryPropertyFlags properties = pMemoryProperties->memoryTypes[memoryIndex].propertyFlags;
    const bool hasRequiredProperties = (properties & requiredProperties) == requiredProperties;
    if (isRequiredMemoryType && hasRequiredProperties)
      return static_cast<int32_t>(memoryIndex);
  }
// failed to find memory type
  return -1;
}

// Try to find an optimal memory type, or if it does not exist try fallback memory type
// 'device' is the VkDevice
// 'image' is the VkImage that requires memory to be bound
// 'memoryProperties' properties as returned by vkGetPhysicalDeviceMemoryProperties
// 'requiredProperties' are the property flags that must be present
// 'optimalProperties' are the property flags that are preferred by the application
VkMemoryRequirements memoryRequirements;
vkGetImageMemoryRequirements(device, image, &memoryRequirements);
int32_t memoryType = findProperties(&memoryProperties, memoryRequirements.memoryTypeBits, optimalProperties);
if (memoryType == -1) // not found; try fallback properties
  memoryType = findProperties(&memoryProperties, memoryRequirements.memoryTypeBits, requiredProperties);

VK_MAX_MEMORY_TYPES is the length of an array of VkMemoryType structures describing memory types, as returned in VkPhysicalDeviceMemoryProperties::memoryTypes.

#define VK_MAX_MEMORY_TYPES 32U

VK_MAX_MEMORY_HEAPS is the length of an array of VkMemoryHeap structures describing memory heaps, as returned in VkPhysicalDeviceMemoryProperties::memoryHeaps.

#define VK_MAX_MEMORY_HEAPS 16U

To query memory properties, call:
```c
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceMemoryProperties2(
    VkPhysicalDevice physicalDevice,
    VkPhysicalDeviceMemoryProperties2* pMemoryProperties);
```

or the equivalent command

```c
// Provided by VK_KHR_get_physical_device_properties2
void vkGetPhysicalDeviceMemoryProperties2KHR(
    VkPhysicalDevice physicalDevice,
    VkPhysicalDeviceMemoryProperties2* pMemoryProperties);
```

- `physicalDevice` is the handle to the device to query.
- `pMemoryProperties` is a pointer to a `VkPhysicalDeviceMemoryProperties2` structure in which the properties are returned.

`vkGetPhysicalDeviceMemoryProperties2` behaves similarly to `vkGetPhysicalDeviceMemoryProperties`, with the ability to return extended information in a `pNext` chain of output structures.

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceMemoryProperties2-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDeviceMemoryProperties2-pMemoryProperties-parameter
  `pMemoryProperties` must be a valid pointer to a `VkPhysicalDeviceMemoryProperties2` structure

The `VkPhysicalDeviceMemoryProperties2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceMemoryProperties2 {
    VkStructureType sType;
    void* pNext;
    VkPhysicalDeviceMemoryProperties memoryProperties;
} VkPhysicalDeviceMemoryProperties2;
```

or the equivalent

```c
// Provided by VK_KHR_get_physical_device_properties2
typedef VkPhysicalDeviceMemoryProperties2 VkPhysicalDeviceMemoryProperties2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
• `memoryProperties` is a `VkPhysicalDeviceMemoryProperties` structure which is populated with the same values as in `vkGetPhysicalDeviceMemoryProperties`.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceMemoryProperties2-sType-sType
  
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MEMORY_PROPERTIES_2`

- VUID-VkPhysicalDeviceMemoryProperties2-pNext-pNext
  
pNext **must** be `NULL`

The `VkMemoryHeap` structure is defined as:

```cpp
// Provided by VK_VERSION_1_0
typedef struct VkMemoryHeap {
    VkDeviceSize size;
    VkMemoryHeapFlags flags;
} VkMemoryHeap;
```

- `size` is the total memory size in bytes in the heap.
- `flags` is a bitmask of `VkMemoryHeapFlagBits` specifying attribute flags for the heap.

Bits which **may** be set in `VkMemoryHeap::flags`, indicating attribute flags for the heap, are:

```cpp
// Provided by VK_VERSION_1_0
typedef enum VkMemoryHeapFlagBits {
    VK_MEMORY_HEAP_DEVICE_LOCAL_BIT = 0x00000001,
} VkMemoryHeapFlagBits;
```

- `VK_MEMORY_HEAP_DEVICE_LOCAL_BIT` specifies that the heap corresponds to device-local memory. Device-local memory **may** have different performance characteristics than host-local memory, and **may** support different memory property flags.

- `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` specifies that in a logical device representing more than one physical device, there is a per-physical device instance of the heap memory. By default, an allocation from such a heap will be replicated to each physical device's instance of the heap.

```cpp
// Provided by VK_VERSION_1_0
typedef VkFlags VkMemoryHeapFlags;
```

`VkMemoryHeapFlags` is a bitmask type for setting a mask of zero or more `VkMemoryHeapFlagBits`.
The `VkMemoryType` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkMemoryType {
    VkMemoryPropertyFlags propertyFlags;
    uint32_t heapIndex;
} VkMemoryType;
```

- `heapIndex` describes which memory heap this memory type corresponds to, and must be less than `memoryHeapCount` from the `VkPhysicalDeviceMemoryProperties` structure.
- `propertyFlags` is a bitmask of `VkMemoryPropertyFlagBits` of properties for this memory type.

Bits which may be set in `VkMemoryType::propertyFlags`, indicating properties of a memory type, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkMemoryPropertyFlagBits {
    VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT = 0x00000001,
    VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT = 0x00000002,
    VK_MEMORY_PROPERTY_HOST_COHERENT_BIT = 0x00000004,
    VK_MEMORY_PROPERTY_HOST_CACHED_BIT = 0x00000008,
    VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT = 0x00000010,
    // Provided by VK_VERSION_1_1
    VK_MEMORY_PROPERTY_PROTECTED_BIT = 0x00000020
} VkMemoryPropertyFlagBits;
```

- `VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT` bit specifies that memory allocated with this type is the most efficient for device access. This property will be set if and only if the memory type belongs to a heap with the `VK_MEMORY_HEAP_DEVICE_LOCAL_BIT` set.
- `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT` bit specifies that memory allocated with this type can be mapped for host access using `vkMapMemory`.
- `VK_MEMORY_PROPERTY_HOST_COHERENT_BIT` bit specifies that the host cache management commands `vkFlushMappedMemoryRanges` and `vkInvalidateMappedMemoryRanges` are not needed to flush host writes to the device or make device writes visible to the host, respectively.
- `VK_MEMORY_PROPERTY_HOST_CACHED_BIT` bit specifies that memory allocated with this type is cached on the host. Host memory accesses to uncached memory are slower than to cached memory, however uncached memory is always host coherent.
- `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT` bit specifies that the memory type only allows device access to the memory. Memory types must not have both `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT` and `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT` set. Additionally, the object's backing memory may be provided by the implementation lazily as specified in Lazily Allocated Memory.
- `VK_MEMORY_PROPERTY_PROTECTED_BIT` bit specifies that the memory type only allows device access to the memory, and allows protected queue operations to access the memory. Memory types must not have `VK_MEMORY_PROPERTY_PROTECTED_BIT` set and any of
VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT set, or VK_MEMORY_PROPERTY_HOST_COHERENT_BIT set, or VK_MEMORY_PROPERTY_HOST_CACHED_BIT set.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkMemoryPropertyFlags;
```

VkMemoryPropertyFlags is a bitmask type for setting a mask of zero or more VkMemoryPropertyFlagBits.

### 11.2.2. Device Memory Objects

A Vulkan device operates on data in device memory via memory objects that are represented in the API by a VkDeviceMemory handle:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDeviceMemory)
```

### 11.2.3. Device Memory Allocation

To allocate memory objects, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkAllocateMemory(
    VkDevice device,                  // device is the logical device that owns the memory.
    const VkMemoryAllocateInfo* pAllocateInfo, // pAllocateInfo is a pointer to a VkMemoryAllocateInfo structure describing parameters of the allocation. A successfully returned allocation must use the requested parameters—no substitution is permitted by the implementation.
    const VkAllocationCallbacks* pAllocator, // pAllocator controls host memory allocation as described in the Memory Allocation chapter.
    VkDeviceMemory* pMemory)              // pMemory is a pointer to a VkDeviceMemory handle in which information about the allocated memory is returned.
```

Allocations returned by vkAllocateMemory are guaranteed to meet any alignment requirement of the implementation. For example, if an implementation requires 128 byte alignment for images and 64 byte alignment for buffers, the device memory returned through this mechanism would be 128-byte aligned. This ensures that applications can correctly suballocate objects of different types (with potentially different alignment requirements) in the same memory object.

When memory is allocated, its contents are undefined with the following constraint:

- The contents of unprotected memory must not be a function of the contents of data protected
memory objects, even if those memory objects were previously freed.

**Note**
The contents of memory allocated by one application **should** not be a function of data from protected memory objects of another application, even if those memory objects were previously freed.

The maximum number of valid memory allocations that **can** exist simultaneously within a **VkDevice** **may** be restricted by implementation- or platform-dependent limits. The **maxMemoryAllocationCount** feature describes the number of allocations that **can** exist simultaneously before encountering these internal limits.

**Note**
For historical reasons, if **maxMemoryAllocationCount** is exceeded, some implementations may return **VK_ERROR_TOO_MANY_OBJECTS**. Exceeding this limit will result in undefined behavior, and an application should not rely on the use of the returned error code in order to identify when the limit is reached.

**Note**
Many protected memory implementations involve complex hardware and system software support, and often have additional and much lower limits on the number of simultaneous protected memory allocations (from memory types with the **VK_MEMORY_PROPERTY_PROTECTED_BIT** property) than for non-protected memory allocations. These limits can be system-wide, and depend on a variety of factors outside of the Vulkan implementation, so they cannot be queried in Vulkan. Applications **should** use as few allocations as possible from such memory types by suballocating aggressively, and be prepared for allocation failure even when there is apparently plenty of capacity remaining in the memory heap. As a guideline, the Vulkan conformance test suite requires that at least 80 minimum-size allocations can exist concurrently when no other uses of protected memory are active in the system.

Some platforms **may** have a limit on the maximum size of a single allocation. For example, certain systems **may** fail to create allocations with a size greater than or equal to 4GB. Such a limit is implementation-dependent, and if such a failure occurs then the error **VK_ERROR_OUT_OF_DEVICE_MEMORY** **must** be returned. This limit is advertised in **VkPhysicalDeviceMaintenance3Properties::maxMemoryAllocationSize**.

### Valid Usage

- VUID-vkAllocateMemory-pAllocateInfo-01713
  
  \[
  \text{pAllocateInfo->allocationSize} \quad \text{must} \quad \text{be} \quad \text{less} \quad \text{than} \quad \text{or} \quad \text{equal} \quad \text{to} \quad \text{VkPhysicalDeviceMemoryProperties::memoryHeaps[memindex].size} \quad \text{where} \quad \text{memindex} = \text{VkPhysicalDeviceMemoryProperties::memoryTypes[pAllocateInfo->memoryTypeIndex].heapIndex} \quad \text{as} \quad \text{returned} \quad \text{by} \quad \text{vkGetPhysicalDeviceMemoryProperties} \quad \text{for} \quad \text{the} \quad \text{VkPhysicalDevice} \quad \text{that} \quad \text{device} \quad \text{was} \quad \text{created} \quad \text{from} \quad \text{663}
  \]
• VUID-vkAllocateMemory-pAllocateInfo-01714
pAllocateInfo->memoryTypeIndex **must** be less than VkPhysicalDeviceMemoryProperties::memoryTypeCount as returned by vkGetPhysicalDeviceMemoryProperties for the VkPhysicalDevice that device was created from

• VUID-vkAllocateMemory-maxMemoryAllocationCount-04101
There **must** be less than VkPhysicalDeviceLimits::maxMemoryAllocationCount device memory allocations currently allocated on the device

**Valid Usage (Implicit)**

• VUID-vkAllocateMemory-device-parameter
device **must** be a valid VkDevice handle

• VUID-vkAllocateMemory-pAllocateInfo-parameter
pAllocateInfo **must** be a valid pointer to a valid VkMemoryAllocateInfo structure

• VUID-vkAllocateMemory-pAllocator-parameter
If pAllocator is not NULL, pAllocator **must** be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkAllocateMemory-pMemory-parameter
pMemory **must** be a valid pointer to a VkDeviceMemory handle

**Return Codes**

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INVALID_EXTERNAL_HANDLE
- VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR

The VkMemoryAllocateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkMemoryAllocateInfo {
    VkStructureType sType;
    const void* pNext;
    VkDeviceSize allocationSize;
    uint32_t memoryTypeIndex;
} VkMemoryAllocateInfo;
```

• **sType** is a VkStructureType value identifying this structure.
\textbullet \ pNext is NULL or a pointer to a structure extending this structure.
\textbullet \ allocationSize is the size of the allocation in bytes.
\textbullet \ memoryTypeIndex is an index identifying a memory type from the memoryTypes array of the VkPhysicalDeviceMemoryProperties structure.

The internal data of an allocated device memory object \textbf{must} include a reference to implementation-specific resources, referred to as the memory object’s payload. Applications \textbf{can} also import and export that internal data to and from device memory objects to share data between Vulkan instances and other compatible APIs. A VkMemoryAllocateInfo structure defines a memory import operation if its pNext chain includes one of the following structures:

\textbullet \ VkImportMemoryWin32HandleInfoKHR with a non-zero handleType value
\textbullet \ VkImportMemoryFdInfoKHR with a non-zero handleType value

If the parameters define an import operation and the external handle type is VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT, VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT, or VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT, allocationSize is ignored. The implementation \textbf{must} query the size of these allocations from the OS.

Whether device memory objects constructed via a memory import operation hold a reference to their payload depends on the properties of the handle type used to perform the import, as defined below for each valid handle type. Importing memory \textbf{must} not modify the content of the memory. Implementations \textbf{must} ensure that importing memory does not enable the importing Vulkan instance to access any memory or resources in other Vulkan instances other than that corresponding to the memory object imported. Implementations \textbf{must} also ensure accessing imported memory which has not been initialized does not allow the importing Vulkan instance to obtain data from the exporting Vulkan instance or vice-versa.

\begin{quote}
\textbf{Note}
How exported and imported memory is isolated is left to the implementation, but applications should be aware that such isolation \textbf{may} prevent implementations from placing multiple exportable memory objects in the same physical or virtual page. Hence, applications \textbf{should} avoid creating many small external memory objects whenever possible.
\end{quote}

Importing memory \textbf{must} not increase overall heap usage within a system. However, it \textbf{must} affect the following per-process values:

\begin{itemize}
\item \texttt{VkPhysicalDeviceMaintenance3Properties::maxMemoryAllocationCount}
\end{itemize}

When performing a memory import operation, it is the responsibility of the application to ensure the external handles and their associated payloads meet all valid usage requirements. However, implementations \textbf{must} perform sufficient validation of external handles and payloads to ensure that the operation results in a valid memory object which will not cause program termination, device loss, queue stalls, or corruption of other resources when used as allowed according to its allocation parameters. If the external handle provided does not meet these requirements, the implementation \textbf{must} fail the memory import operation with the error code 665.
Valid Usage

- **VUID-VkMemoryAllocateInfo-allocationSize-07897**
  If the parameters do not define an import or export operation, `allocationSize` must be greater than 0.

- **VUID-VkMemoryAllocateInfo-None-06657**
  The parameters must not define more than one import operation.

- **VUID-VkMemoryAllocateInfo-allocationSize-07899**
  If the parameters define an export operation, `allocationSize` must be greater than 0.

- **VUID-VkMemoryAllocateInfo-pNext-00639**
  If the `pNext` chain includes a `VkExportMemoryAllocateInfo` structure, and any of the handle types specified in `VkExportMemoryAllocateInfo::handleTypes` require a dedicated allocation, as reported by `vkGetPhysicalDeviceImageFormatProperties2` in `VkExternalImageFormatProperties::externalMemoryProperties.externalMemoryFeatures`, or by `vkGetPhysicalDeviceExternalBufferProperties` in `VkExternalBufferProperties::externalMemoryProperties.externalMemoryFeatures`, the `pNext` chain must include a `VkMemoryDedicatedAllocateInfo` or `VkDedicatedAllocationMemoryAllocateInfoNV` structure with either its `image` or `buffer` member set to a value other than `VK_NULL_HANDLE`.

- **VUID-VkMemoryAllocateInfo-allocationSize-01742**
  If the parameters define an import operation, the external handle specified was created by the Vulkan API, and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT`, then the values of `allocationSize` and `memoryTypeIndex` must match those specified when the payload being imported was created.

- **VUID-VkMemoryAllocateInfo-None-00643**
  If the parameters define an import operation and the external handle specified was created by the Vulkan API, the device mask specified by `VkMemoryAllocateFlagsInfo` must match the mask specified when the payload being imported was allocated.

- **VUID-VkMemoryAllocateInfo-None-00644**
  If the parameters define an import operation and the external handle specified was created by the Vulkan API, the list of physical devices that comprise the logical device passed to `vkAllocateMemory` must match the list of physical devices that comprise the logical device on which the payload was originally allocated.

- **VUID-VkMemoryAllocateInfo-memoryTypeIndex-00645**
  If the parameters define an import operation and the external handle is an NT handle or a global share handle created outside of the Vulkan API, the value of `memoryTypeIndex` must be one of those returned by `vkGetMemoryWin32HandlePropertiesKHR`.

- **VUID-VkMemoryAllocateInfo-allocationSize-01743**
  If the parameters define an import operation, the external handle was created by the Vulkan API, and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT` or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT`, then the values of `allocationSize`...
and `memoryTypeIndex` must match those specified when the payload being imported was created

- **VUID-VkMemoryAllocateInfo-allocationSize-00647**
  If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT`, `allocationSize` must match the size specified when creating the Direct3D 12 heap from which the payload was extracted.

- **VUID-VkMemoryAllocateInfo-memoryTypeIndex-00648**
  If the parameters define an import operation and the external handle is a POSIX file descriptor created outside of the Vulkan API, the value of `memoryTypeIndex` must be one of those returned by `vkGetMemoryFdPropertiesKHR`.

- **VUID-VkMemoryAllocateInfo-memoryTypeIndex-01872**
  If the `protectedMemory` feature is not enabled, the `VkMemoryAllocateInfo::memoryTypeIndex` must not indicate a memory type that reports `VK_MEMORY_PROPERTY_PROTECTED_BIT`.

- **VUID-VkMemoryAllocateInfo-opaqueCaptureAddress-03329**
  If `VkMemoryOpaqueCaptureAddressAllocateInfo::opaqueCaptureAddress` is not zero, `VkMemoryAllocateFlagsInfo::flags` must include `VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT`.

- **VUID-VkMemoryAllocateInfo-flags-03330**
  If `VkMemoryAllocateFlagsInfo::flags` includes `VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT`, the `bufferDeviceAddressCaptureReplay` feature must be enabled.

- **VUID-VkMemoryAllocateInfo-flags-03331**
  If `VkMemoryAllocateFlagsInfo::flags` includes `VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT`, the `bufferDeviceAddress` feature must be enabled.

- **VUID-VkMemoryAllocateInfo-opaqueCaptureAddress-03333**
  If the parameters define an import operation, `VkMemoryOpaqueCaptureAddressAllocateInfo::opaqueCaptureAddress` must be zero.

### Valid Usage (Implicit)

- **VUID-VkMemoryAllocateInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_MEMORY_ALLOCATE_INFO`.

- **VUID-VkMemoryAllocateInfo-pNext-pNext**
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkExportMemoryAllocateInfo`, `VkExportMemoryWin32HandleInfoKHR`, `VkImportMemoryFdInfoKHR`, `VkImportMemoryWin32HandleInfoKHR`, `VkMemoryAllocateFlagsInfo`, `VkMemoryDedicatedAllocateInfo`, or `VkMemoryOpaqueCaptureAddressAllocateInfo`.

- **VUID-VkMemoryAllocateInfo-sType-unique**
  The `sType` value of each struct in the `pNext` chain must be unique.

If the `pNext` chain includes a `VkMemoryDedicatedAllocateInfo` structure, then that structure includes a handle of the sole buffer or image resource that the memory can be bound to.
The `VkMemoryDedicatedAllocateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkMemoryDedicatedAllocateInfo {
    VkStructureType sType;
    const void* pNext;
    VkImage image;
    VkBuffer buffer;
} VkMemoryDedicatedAllocateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_dedicated_allocation
typedef VkMemoryDedicatedAllocateInfo VkMemoryDedicatedAllocateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `image` is `VK_NULL_HANDLE` or a handle of an image which this memory will be bound to.
- `buffer` is `VK_NULL_HANDLE` or a handle of a buffer which this memory will be bound to.

### Valid Usage

- VUID-VkMemoryDedicatedAllocateInfo-image-01432
  At least one of `image` and `buffer` must be `VK_NULL_HANDLE`

- VUID-VkMemoryDedicatedAllocateInfo-image-02964
  If `image` is not `VK_NULL_HANDLE`, `VkMemoryAllocateInfo::allocationSize` must equal the `VkMemoryRequirements::size` of the image

- VUID-VkMemoryDedicatedAllocateInfo-image-01434
  If `image` is not `VK_NULL_HANDLE`, `image` must have been created without `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` set in `VkImageCreateInfo::flags`

- VUID-VkMemoryDedicatedAllocateInfo-buffer-02965
  If `buffer` is not `VK_NULL_HANDLE`, `VkMemoryAllocateInfo::allocationSize` must equal the `VkMemoryRequirements::size` of the buffer

- VUID-VkMemoryDedicatedAllocateInfo-buffer-01436
  If `buffer` is not `VK_NULL_HANDLE`, `buffer` must have been created without `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` set in `VkBufferCreateInfo::flags`

- VUID-VkMemoryDedicatedAllocateInfo-image-01876
  If `image` is not `VK_NULL_HANDLE` and `VkMemoryAllocateInfo` defines a memory import operation with handle type `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT`, or
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT, and the external handle was created by the Vulkan API, then the memory being imported must also be a dedicated image allocation and image must be identical to the image associated with the imported memory

- VUID-VkMemoryDedicatedAllocateInfo-buffer-01877
  If buffer is not VK_NULL_HANDLE and VkMemoryAllocateInfo defines a memory import operation with handle type VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT, VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT, VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT, VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT, VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT, or VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT, and the external handle was created by the Vulkan API, then the memory being imported must also be a dedicated buffer allocation and buffer must be identical to the buffer associated with the imported memory

- VUID-VkMemoryDedicatedAllocateInfo-image-01878
  If image is not VK_NULL_HANDLE and VkMemoryAllocateInfo defines a memory import operation with handle type VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT, the memory being imported must also be a dedicated image allocation and image must be identical to the image associated with the imported memory

- VUID-VkMemoryDedicatedAllocateInfo-buffer-01879
  If buffer is not VK_NULL_HANDLE and VkMemoryAllocateInfo defines a memory import operation with handle type VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT, the memory being imported must also be a dedicated buffer allocation and buffer must be identical to the buffer associated with the imported memory

- VUID-VkMemoryDedicatedAllocateInfo-image-01797
  If image is not VK_NULL_HANDLE, image must not have been created with VK_IMAGE_CREATE_DISJOINT_BIT set in VkImageCreateInfo::flags

Valid Usage (Implicit)

- VUID-VkMemoryDedicatedAllocateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_MEMORY_DEDICATED_ALLOCATE_INFO

- VUID-VkMemoryDedicatedAllocateInfo-image-parameter
  If image is not VK_NULL_HANDLE, image must be a valid VkImage handle

- VUID-VkMemoryDedicatedAllocateInfo-buffer-parameter
  If buffer is not VK_NULL_HANDLE, buffer must be a valid VkBuffer handle

- VUID-VkMemoryDedicatedAllocateInfo-commonparent
  Both of buffer, and image that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

When allocating memory whose payload may be exported to another process or Vulkan instance, add a VkExportMemoryAllocateInfo structure to the pNext chain of the VkMemoryAllocateInfo structure, specifying the handle types that may be exported.
The `VkExportMemoryAllocateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkExportMemoryAllocateInfo {
    VkStructureType sType;
    const void* pNext;
    VkExternalMemoryHandleTypeFlags handleTypes;
} VkExportMemoryAllocateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_external_memory
typedef VkExportMemoryAllocateInfo VkExportMemoryAllocateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleTypes` is zero or a bitmask of `VkExternalMemoryHandleTypeFlagBits` specifying one or more memory handle types the application **can** export from the resulting allocation. The application **can** request multiple handle types for the same allocation.

### Valid Usage

- VUID-VkExportMemoryAllocateInfo-handleTypes-00656
  The bits in `handleTypes` **must** be supported and compatible, as reported by `VkExternalImageFormatProperties` or `VkExternalBufferProperties`

### Valid Usage (Implicit)

- VUID-VkExportMemoryAllocateInfo-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_EXPORT_MEMORY_ALLOCATE_INFO`
- VUID-VkExportMemoryAllocateInfo-handleTypes-parameter
  `handleTypes` **must** be a valid combination of `VkExternalMemoryHandleTypeFlagBits` values

### 11.2.4. Win32 External Memory

To specify additional attributes of NT handles exported from a memory object, add a `VkExportMemoryWin32HandleInfoKHR` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure. The `VkExportMemoryWin32HandleInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_memory_win32
typedef struct VkExportMemoryWin32HandleInfoKHR {
    VkStructureType sType;
    ...;
} VkExportMemoryWin32HandleInfoKHR;
```
const void* pNext;
const SECURITY_ATTRIBUTES* pAttributes;
DWORD dwAccess;
LPCWSTR name;
} VkExportMemoryWin32HandleInfoKHR;

• **sType** is a **VkStructureType** value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **pAttributes** is a pointer to a Windows **SECURITY_ATTRIBUTES** structure specifying security attributes of the handle.
• **dwAccess** is a **DWORD** specifying access rights of the handle.
• **name** is a null-terminated UTF-16 string to associate with the payload referenced by NT handles exported from the created memory.

If **VkExportMemoryAllocateInfo** is not included in the same **pNext** chain, this structure is ignored.

If **VkExportMemoryAllocateInfo** is included in the **pNext** chain of **VkMemoryAllocateInfo** with a Windows **handleType**, but either **VkExportMemoryWin32HandleInfoKHR** is not included in the **pNext** chain, or it is included but **pAttributes** is set to **NULL**, default security descriptor values will be used, and child processes created by the application will not inherit the handle, as described in the MSDN documentation for “Synchronization Object Security and Access Rights”. Further, if the structure is not present, the access rights used depend on the handle type.

For handles of the following types:

• **VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT**

The implementation **must** ensure the access rights allow read and write access to the memory.

1

**Valid Usage**

• VUID-VkExportMemoryWin32HandleInfoKHR-handleTypes-00657
  If **VkExportMemoryAllocateInfo::handleTypes** does not include **VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT**, a **VkExportMemoryWin32HandleInfoKHR** structure **must** not be included in the **pNext** chain of **VkMemoryAllocateInfo**

**Valid Usage (Implicit)**

• VUID-VkExportMemoryWin32HandleInfoKHR-sType-sType
  **sType** **must** be **VK_STRUCTURE_TYPE_EXPORT_MEMORY_WIN32_HANDLE_INFO_KHR**

• VUID-VkExportMemoryWin32HandleInfoKHR-pAttributes-parameter
If `pAttributes` is not `NULL`, `pAttributes` must be a valid pointer to a valid `SECURITY_ATTRIBUTES` value.

To import memory from a Windows handle, add a `VkImportMemoryWin32HandleInfoKHR` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure.

The `VkImportMemoryWin32HandleInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_memory_win32
typedef struct VkImportMemoryWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkExternalMemoryHandleTypeFlagBits handleType;
    HANDLE handle;
    LPCWSTR name;
} VkImportMemoryWin32HandleInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleType` is a `VkExternalMemoryHandleTypeFlagBits` value specifying the type of `handle` or `name`.
- `handle` is `NULL` or the external handle to import.
- `name` is `NULL` or a null-terminated UTF-16 string naming the payload to import.

Importing memory object payloads from Windows handles does not transfer ownership of the handle to the Vulkan implementation. For handle types defined as NT handles, the application must release handle ownership using the `CloseHandle` system call when the handle is no longer needed. For handle types defined as NT handles, the imported memory object holds a reference to its payload.

**Note**

Non-NT handle import operations do not add a reference to their associated payload. If the original object owning the payload is destroyed, all resources and handles sharing that payload will become invalid.

Applications can import the same payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance. In all cases, each import operation must create a distinct `VkDeviceMemory` object.

**Valid Usage**

- VUID-VkImportMemoryWin32HandleInfoKHR-handleType-00658
  If `handleType` is not 0, it must be supported for import, as reported by `VkExternalImageFormatProperties` or `VkExternalBufferProperties`
- VUID-VkImportMemoryWin32HandleInfoKHR-handle-00659
The memory from which `handle` was exported, or the memory named by `name` must have been created on the same underlying physical device as `device`.

- **VUID-VkImportMemoryWin32HandleInfoKHR-handleType-00660**
  If `handleType` is not 0, it must be defined as an NT handle or a global share handle.

- **VUID-VkImportMemoryWin32HandleInfoKHR-handleType-01439**
  If `handleType` is not `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT`, or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT`, `name` must be NULL.

- **VUID-VkImportMemoryWin32HandleInfoKHR-handleType-01440**
  If `handleType` is not 0 and `handle` is NULL, `name` must name a valid memory resource of the type specified by `handleType`.

- **VUID-VkImportMemoryWin32HandleInfoKHR-handleType-00661**
  If `handleType` is not 0 and `name` is NULL, `handle` must be a valid handle of the type specified by `handleType`.

- **VUID-VkImportMemoryWin32HandleInfoKHR-name-01519**
  If `name` is not NULL, it must obey any requirements listed for `handleType` in external memory handle types compatibility.

To export a Windows handle representing the payload of a Vulkan device memory object, call:

```c
// Provided by VK_KHR_external_memory_win32
VkResult vkGetMemoryWin32HandleKHR(
    VkDevice device,
    const VkMemoryGetWin32HandleInfoKHR* pGetWin32HandleInfo,
    HANDLE* pHandle);
```

- `device` is the logical device that created the device memory being exported.
- `pGetWin32HandleInfo` is a pointer to a `VkMemoryGetWin32HandleInfoKHR` structure containing

**Valid Usage (Implicit)**

- **VUID-VkImportMemoryWin32HandleInfoKHR-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_IMPORT_MEMORY_WIN32_HANDLE_INFO_KHR`.

- **VUID-VkImportMemoryWin32HandleInfoKHR-handleType-parameter**
  If `handleType` is not 0, `handleType` must be a valid `VkExternalMemoryHandleTypeFlagBits` value.
parameters of the export operation.

- **pHandle** will return the Windows handle representing the payload of the device memory object.

For handle types defined as NT handles, the handles returned by `vkGetMemoryWin32HandleKHR` are owned by the application and hold a reference to their payload. To avoid leaking resources, the application **must** release ownership of them using the `CloseHandle` system call when they are no longer needed.

**Note**
Non-NT handle types do not add a reference to their associated payload. If the original object owning the payload is destroyed, all resources and handles sharing that payload will become invalid.

### Valid Usage (Implicit)

- VUID-vkGetMemoryWin32HandleKHR-device-parameter
  
  `device` **must** be a valid `VkDevice` handle

- VUID-vkGetMemoryWin32HandleKHR-pGetWin32HandleInfo-parameter
  
  `pGetWin32HandleInfo` **must** be a valid pointer to a valid `VkMemoryGetWin32HandleInfoKHR` structure

- VUID-vkGetMemoryWin32HandleKHR-pHandle-parameter
  
  `pHandle` **must** be a valid pointer to a `HANDLE` value

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_TOO_MANY.Objects`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkMemoryGetWin32HandleInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_memory_win32
typedef struct VkMemoryGetWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceMemory memory;
    VkExternalMemoryHandleTypeFlagBits handleType;
} VkMemoryGetWin32HandleInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `memory` is the memory object from which the handle will be exported.
• `handleType` is a `VkExternalMemoryHandleTypeFlagBits` value specifying the type of handle requested.

The properties of the handle returned depend on the value of `handleType`. See `VkExternalMemoryHandleTypeFlagBits` for a description of the properties of the defined external memory handle types.

### Valid Usage

- **VUID-VkMemoryGetWin32HandleInfoKHR-handleType-00662**
  - `handleType must` have been included in `VkExportMemoryAllocateInfo::handleTypes` when `memory` was created

- **VUID-VkMemoryGetWin32HandleInfoKHR-handleType-00663**
  - If `handleType` is defined as an NT handle, `vkGetMemoryWin32HandleKHR` must be called no more than once for each valid unique combination of `memory` and `handleType`

- **VUID-VkMemoryGetWin32HandleInfoKHR-handleType-00664**
  - `handleType must` be defined as an NT handle or a global share handle

### Valid Usage (Implicit)

- **VUID-VkMemoryGetWin32HandleInfoKHR-sType-sType**
  - `sType must` be `VK_STRUCTURE_TYPE_MEMORY_GET_WIN32_HANDLE_INFO_KHR`

- **VUID-VkMemoryGetWin32HandleInfoKHR-pNext-pNext**
  - `pNext must` be `NULL`

- **VUID-VkMemoryGetWin32HandleInfoKHR-memory-parameter**
  - `memory must` be a valid `VkDeviceMemory` handle

- **VUID-VkMemoryGetWin32HandleInfoKHR-handleType-parameter**
  - `handleType must` be a valid `VkExternalMemoryHandleTypeFlagBits` value

Windows memory handles compatible with Vulkan may also be created by non-Vulkan APIs using methods beyond the scope of this specification. To determine the correct parameters to use when importing such handles, call:

```c
// Provided by VK_KHR_external_memory_win32
VkResult vkGetMemoryWin32HandlePropertiesKHR(  
    VkDevice device,  
    VkExternalMemoryHandleTypeFlagBits handleType,  
    HANDLE handle,  
    VkMemoryWin32HandlePropertiesKHR* pMemoryWin32HandleProperties);
```

- `device` is the logical device that will be importing `handle`. 
• `handleType` is a `VkExternalMemoryHandleTypeFlagBits` value specifying the type of the handle handle.

• `handle` is the handle which will be imported.

• `pMemoryWin32HandleProperties` is a pointer to a `VkMemoryWin32HandlePropertiesKHR` structure in which properties of `handle` are returned.

**Valid Usage**

• VUID-vkGetMemoryWin32HandlePropertiesKHR-handle-00665
  `handle` must point to a valid Windows memory handle

• VUID-vkGetMemoryWin32HandlePropertiesKHR-handleType-00666
  `handleType` must not be one of the handle types defined as opaque

**Valid Usage (Implicit)**

• VUID-vkGetMemoryWin32HandlePropertiesKHR-device-parameter
  `device` must be a valid `VkDevice` handle

• VUID-vkGetMemoryWin32HandlePropertiesKHR-handleType-parameter
  `handleType` must be a valid `VkExternalMemoryHandleTypeFlagBits` value

• VUID-vkGetMemoryWin32HandlePropertiesKHR-pMemoryWin32HandleProperties-parameter
  `pMemoryWin32HandleProperties` must be a valid pointer to a `VkMemoryWin32HandlePropertiesKHR` structure

**Return Codes**

**Success**

• `VK_SUCCESS`

**Failure**

• `VK_ERROR_OUT_OF_HOST_MEMORY`

• `VK_ERROR_INVALID_EXTERNAL_HANDLE`

The `VkMemoryWin32HandlePropertiesKHR` structure returned is defined as:

```c
// Provided by VK_KHR_external_memory_win32
typedef struct VkMemoryWin32HandlePropertiesKHR {
    VkStructureType sType;
    void* pNext;
    uint32_t memoryTypeBits;
} VkMemoryWin32HandlePropertiesKHR;
```
• **sType** is a [VkStructureType](#) value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **memoryTypeBits** is a bitmask containing one bit set for every memory type which the specified windows handle can be imported as.

**Valid Usage (Implicit)**

- VUID-VkMemoryWin32HandlePropertiesKHR-sType-sType
  
  **sType** must be *VK_STRUCTURE_TYPE_MEMORY_WIN32_HANDLE_PROPERTIES_KHR*

- VUID-VkMemoryWin32HandlePropertiesKHR-pNext-pNext
  
  **pNext** must be NULL

### 11.2.5. File Descriptor External Memory

To import memory from a POSIX file descriptor handle, add a [VkImportMemoryFdInfoKHR](#) structure to the **pNext** chain of the [VkMemoryAllocateInfo](#) structure. The [VkImportMemoryFdInfoKHR](#) structure is defined as:

```c
// Provided by VK_KHR_external_memory_fd
typedef struct VkImportMemoryFdInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkExternalMemoryHandleTypeFlagBits handleType;
    int fd;
} VkImportMemoryFdInfoKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **handleType** is a [VkExternalMemoryHandleTypeFlagBits](#) value specifying the handle type of **fd**.
- **fd** is the external handle to import.

Importing memory from a file descriptor transfers ownership of the file descriptor from the application to the Vulkan implementation. The application must not perform any operations on the file descriptor after a successful import. The imported memory object holds a reference to its payload.

Applications can import the same payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance. In all cases, each import operation must create a distinct [VkDeviceMemory](#) object.

**Valid Usage**

- VUID-VkImportMemoryFdInfoKHR-handleType-00667
  
  If **handleType** is not 0, it must be supported for import, as reported by
 VkExternalImageFormatProperties or VkExternalBufferProperties

• VUID-VkImportMemoryFdInfoKHR-fd-00668
  The memory from which fd was exported must have been created on the same underlying physical device as device

• VUID-VkImportMemoryFdInfoKHR-handleType-00669
  If handleType is not 0, it must be VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT or VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT

• VUID-VkImportMemoryFdInfoKHR-handleType-006670
  If handleType is not 0, fd must be a valid handle of the type specified by handleType

• VUID-VkImportMemoryFdInfoKHR-fd-01746
  The memory represented by fd must have been created from a physical device and driver that is compatible with device and handleType, as described in External memory handle types compatibility

• VUID-VkImportMemoryFdInfoKHR-fd-01520
  fd must obey any requirements listed for handleType in external memory handle types compatibility

Valid Usage (Implicit)

• VUID-VkImportMemoryFdInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMPORT_MEMORY_FD_INFO_KHR

• VUID-VkImportMemoryFdInfoKHR-handleType-parameter
  If handleType is not 0, handleType must be a valid VkExternalMemoryHandleTypeFlagBits value

To export a POSIX file descriptor referencing the payload of a Vulkan device memory object, call:

```c
// Provided by VK_KHR_external_memory_fd
VkResult vkGetMemoryFdKHR(
    VkDevice device,
    const VkMemoryGetFdInfoKHR* pGetFdInfo,
    int* pFd);
```

- device is the logical device that created the device memory being exported.
- pGetFdInfo is a pointer to a VkMemoryGetFdInfoKHR structure containing parameters of the export operation.
- pFd will return a file descriptor referencing the payload of the device memory object.

Each call to vkGetMemoryFdKHR must create a new file descriptor holding a reference to the memory object’s payload and transfer ownership of the file descriptor to the application. To avoid leaking resources, the application must release ownership of the file descriptor using the close system call when it is no longer needed, or by importing a Vulkan memory object from it. Where supported by the operating system, the implementation must set the file descriptor to be closed automatically.
when an `execve` system call is made.

### Valid Usage (Implicit)

- **VUID-vkGetMemoryFdKHR-device-parameter**
  
  `device` must be a valid `VkDevice` handle

- **VUID-vkGetMemoryFdKHR-pGetFdInfo-parameter**
  
  `pGetFdInfo` must be a valid pointer to a valid `VkMemoryGetFdInfoKHR` structure

- **VUID-vkGetMemoryFdKHR-pFd-parameter**
  
  `pFd` must be a valid pointer to an `int` value

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkMemoryGetFdInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_memory_fd
typedef struct VkMemoryGetFdInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceMemory memory;
    VkExternalMemoryHandleTypeFlagBits handleType;
} VkMemoryGetFdInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memory` is the memory object from which the handle will be exported.
- `handleType` is a `VkExternalMemoryHandleTypeFlagBits` value specifying the type of handle requested.

The properties of the file descriptor exported depend on the value of `handleType`. See `VkExternalMemoryHandleTypeFlagBits` for a description of the properties of the defined external memory handle types.

### Valid Usage

- **VUID-VkMemoryGetFdInfoKHR-handleType-00671**
**Valid Usage (Implicit)**

- VUID-VkMemoryGetFdInfoKHR-sType-sType
  
  sType must be **VK_STRUCTURE_TYPE_MEMORY_GET_FD_INFO_KHR**

- VUID-VkMemoryGetFdInfoKHR-pNext-pNext
  
  pNext must be **NULL**

- VUID-VkMemoryGetFdInfoKHR-memory-parameter
  
  memory must be a valid **VkDeviceMemory** handle

- VUID-VkMemoryGetFdInfoKHR-handleType-parameter
  
  handleType must be a valid **VkExternalMemoryHandleTypeFlagBits** value

POSIX file descriptor memory handles compatible with Vulkan may also be created by non-Vulkan APIs using methods beyond the scope of this specification. To determine the correct parameters to use when importing such handles, call:

```c
// Provided by VK_KHR_external_memory_fd
VkResult vkGetMemoryFdPropertiesKHR(VkDevice device,
  VkExternalMemoryHandleTypeFlagBits handleType,
  int fd,
  VkMemoryFdPropertiesKHR* pMemoryFdProperties);
```

- **device** is the logical device that will be importing **fd**.
- **handleType** is a **VkExternalMemoryHandleTypeFlagBits** value specifying the type of the handle **fd**.
- **fd** is the handle which will be imported.
- **pMemoryFdProperties** is a pointer to a **VkMemoryFdPropertiesKHR** structure in which the properties of the handle **fd** are returned.

**Valid Usage**

- VUID-vkGetMemoryFdPropertiesKHR-fd-00673
  
  **fd** must point to a valid POSIX file descriptor memory handle

- VUID-vkGetMemoryFdPropertiesKHR-handleType-00674
  
  **handleType** must not be **VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT**
Valid Usage (Implicit)

- VUID-vkGetMemoryFdPropertiesKHR-device-parameter
  
  device must be a valid VkDevice handle

- VUID-vkGetMemoryFdPropertiesKHR-handleType-parameter
  
  handleType must be a valid VkExternalMemoryHandleTypeFlagBits value

- VUID-vkGetMemoryFdPropertiesKHR-pMemoryFdProperties-parameter
  
  pMemoryFdProperties must be a valid pointer to a VkMemoryFdPropertiesKHR structure

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_INVALID_EXTERNAL_HANDLE

The VkMemoryFdPropertiesKHR structure returned is defined as:

```c
// Provided by VK_KHR_external_memory_fd
typedef struct VkMemoryFdPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    uint32_t memoryTypeBits;
} VkMemoryFdPropertiesKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `memoryTypeBits` is a bitmask containing one bit set for every memory type which the specified file descriptor can be imported as.

Valid Usage (Implicit)

- VUID-VkMemoryFdPropertiesKHR-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_MEMORY_FD_PROPERTIES_KHR

- VUID-VkMemoryFdPropertiesKHR-pNext-pNext
  
  pNext must be NULL

11.2.6. Device Group Memory Allocations

If the `pNext` chain of VkMemoryAllocateInfo includes a VkMemoryAllocateFlagsInfo structure, then
that structure includes flags and a device mask controlling how many instances of the memory will be allocated.

The `VkMemoryAllocateFlagsInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkMemoryAllocateFlagsInfo {
    VkStructureType sType;
    const void* pNext;
    VkMemoryAllocateFlags flags;
    uint32_t deviceMask;
} VkMemoryAllocateFlagsInfo;
```

or the equivalent

```c
// Provided by VK_KHR_device_group
typedef VkMemoryAllocateFlagsInfo VkMemoryAllocateFlagsInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkMemoryAllocateFlagBits` controlling the allocation.
- `deviceMask` is a mask of physical devices in the logical device, indicating that memory **must** be allocated on each device in the mask, if `VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT` is set in `flags`.

If `VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT` is not set, the number of instances allocated depends on whether `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` is set in the memory heap. If `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` is set, then memory is allocated for every physical device in the logical device (as if `deviceMask` has bits set for all device indices). If `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` is not set, then a single instance of memory is allocated (as if `deviceMask` is set to one).

On some implementations, allocations from a multi-instance heap **may** consume memory on all physical devices even if the `deviceMask` excludes some devices. If `VkPhysicalDeviceGroupProperties::subsetAllocation` is `VK_TRUE`, then memory is only consumed for the devices in the device mask.

**Note**

In practice, most allocations on a multi-instance heap will be allocated across all physical devices. Unicast allocation support is an optional optimization for a minority of allocations.

**Valid Usage**

- VUID-VkMemoryAllocateFlagsInfo-deviceMask-00675
  If `VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT` is set, `deviceMask must` be a valid device mask.
If `VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT` is set, `deviceMask` must not be zero.

### Valid Usage (Implicit)

- **VUID-VkMemoryAllocateFlagsInfo-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_MEMORY_ALLOCATE_FLAGS_INFO`

- **VUID-VkMemoryAllocateFlagsInfo-flags-parameter**
  
  `flags` must be a valid combination of `VkMemoryAllocateFlagBits` values

Bits which can be set in `VkMemoryAllocateFlagsInfo::flags`, controlling device memory allocation, are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkMemoryAllocateFlagBits {
    VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT = 0x00000001,
    // Provided by VK_VERSION_1_2
    VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT = 0x00000002,
    // Provided by VK_VERSION_1_2
    VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT = 0x00000004,
    // Provided by VK_KHR_device_group
    VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT_KHR = VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT,
    // Provided by VK_KHR_buffer_device_address
    VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT_KHR = VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT,
    // Provided by VK_KHR_buffer_device_address
    VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR = VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT,
} VkMemoryAllocateFlagBits;
```

or the equivalent

```c
// Provided by VK_KHR_device_group
typedef VkMemoryAllocateFlagBits VkMemoryAllocateFlagBitsKHR;
```

- **VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT** specifies that memory will be allocated for the devices in `VkMemoryAllocateFlagsInfo::deviceMask`.

- **VK_MEMORY_ALLOCATEDEVICE_ADDRESS_BIT** specifies that the memory can be attached to a buffer object created with the `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT` bit set in `usage`, and that the memory handle can be used to retrieve an opaque address via `vkGetDeviceMemoryOpaqueCaptureAddress`.

- **VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT** specifies that the memory's address can be saved and reused on a subsequent run (e.g. for trace capture and replay), see `VkBufferOpaqueCaptureAddressCreateInfo` for more detail.
// Provided by VK_VERSION_1_1
typedef VkFlags VkMemoryAllocateFlags;

or the equivalent

// Provided by VK_KHR_device_group
typedef VkMemoryAllocateFlagsKHR VkMemoryAllocateFlags;

VkMemoryAllocateFlags is a bitmask type for setting a mask of zero or more VkMemoryAllocateFlagBits.

11.2.7. Opaque Capture Address Allocation

To request a specific device address for a memory allocation, add a VkMemoryOpaqueCaptureAddressAllocateInfo structure to the pNext chain of the VkMemoryAllocateInfo structure. The VkMemoryOpaqueCaptureAddressAllocateInfo structure is defined as:

// Provided by VK_VERSION_1_2
typedef struct VkMemoryOpaqueCaptureAddressAllocateInfo {
    VkStructureType sType;
    const void* pNext;
    uint64_t opaqueCaptureAddress;
} VkMemoryOpaqueCaptureAddressAllocateInfo;

or the equivalent

// Provided by VK_KHR_buffer_device_address
typedef VkMemoryOpaqueCaptureAddressAllocateInfoKHR VkMemoryOpaqueCaptureAddressAllocateInfo;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **opaqueCaptureAddress** is the opaque capture address requested for the memory allocation.

If **opaqueCaptureAddress** is zero, no specific address is requested.

If **opaqueCaptureAddress** is not zero, it should be an address retrieved from vkGetDeviceMemoryOpaqueCaptureAddress on an identically created memory allocation on the same implementation.

**Note**
In most cases, it is expected that a non-zero opaqueAddress is an address retrieved from vkGetDeviceMemoryOpaqueCaptureAddress on an identically created
memory allocation. If this is not the case, it is likely that VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS errors will occur.

This is, however, not a strict requirement because trace capture/replay tools may need to adjust memory allocation parameters for imported memory.

If this structure is not present, it is as if opaqueCaptureAddress is zero.

### Valid Usage (Implicit)

- VUID-VkMemoryOpaqueCaptureAddressAllocateInfo-sType-sType

  sType must be VK_STRUCTURE_TYPE_MEMORY_OPAQUE_CAPTURE_ADDRESS_ALLOCATE_INFO

---

### 11.2.8. Freeing Device Memory

To free a memory object, call:

```c
// Provided by VK_VERSION_1_0
void vkFreeMemory(
    VkDevice device,
    VkDeviceMemory memory,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that owns the memory.
- `memory` is the `VkDeviceMemory` object to be freed.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

Before freeing a memory object, an application **must** ensure the memory object is no longer in use by the device — for example by command buffers in the pending state. Memory **can** be freed whilst still bound to resources, but those resources **must** not be used afterwards. Freeing a memory object releases the reference it held, if any, to its payload. If there are still any bound images or buffers, the memory object's payload **may** not be immediately released by the implementation, but **must** be released by the time all bound images and buffers have been destroyed. Once all references to a payload are released, it is returned to the heap from which it was allocated.

How memory objects are bound to Images and Buffers is described in detail in the Resource Memory Association section.

If a memory object is mapped at the time it is freed, it is implicitly unmapped.

#### Note

As described below, host writes are not implicitly flushed when the memory object is unmapped, but the implementation **must** guarantee that writes that have not been flushed do not affect any other memory.
Valid Usage

- VUID-vkFreeMemory-memory-00677
  All submitted commands that refer to `memory` (via images or buffers) **must** have completed execution

Valid Usage (Implicit)

- VUID-vkFreeMemory-device-parameter
  `device` **must** be a valid `VkDevice` handle

- VUID-vkFreeMemory-memory-parameter
  If `memory` is not `VK_NULL_HANDLE`, `memory` **must** be a valid `VkDeviceMemory` handle

- VUID-vkFreeMemory-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkFreeMemory-memory-parent
  If `memory` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `memory` **must** be externally synchronized

11.2.9. Host Access to Device Memory Objects

Memory objects created with `vkAllocateMemory` are not directly host accessible.

Memory objects created with the memory property `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT` are considered **mappable**. Memory objects **must** be mappable in order to be successfully mapped on the host.

To retrieve a host virtual address pointer to a region of a mappable memory object, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkMapMemory(
    VkDevice device,             // device
    VkDeviceMemory memory,       // memory
    VkDeviceSize offset,         // offset
    VkDeviceSize size,           // size
    VkMemoryMapFlags flags,      // flags
    void** ppData);              // ppData
```

- `device` is the logical device that owns the memory.
- `memory` is the `VkDeviceMemory` object to be mapped.
• **offset** is a zero-based byte offset from the beginning of the memory object.

• **size** is the size of the memory range to map, or **VK_WHOLE_SIZE** to map from **offset** to the end of the allocation.

• **flags** is reserved for future use.

• **pData** is a pointer to a **void** variable in which a host-accessible pointer to the beginning of the mapped range is returned. This pointer minus **offset** **must** be aligned to at least **VkPhysicalDeviceLimits::minMemoryMapAlignment**.

After a successful call to **vkMapMemory** the memory object **memory** is considered to be currently **host mapped**.

---

**Note**

It is an application error to call **vkMapMemory** on a memory object that is already **host mapped**.

**Note**

**vkMapMemory** will fail if the implementation is unable to allocate an appropriately sized contiguous virtual address range, e.g. due to virtual address space fragmentation or platform limits. In such cases, **vkMapMemory** **must** return **VK_ERROR_MEMORY_MAP_FAILED**. The application **can** improve the likelihood of success by reducing the size of the mapped range and/or removing unneeded mappings using **vkUnmapMemory**.

**vkMapMemory** does not check whether the device memory is currently in use before returning the host-accessible pointer. The application **must** guarantee that any previously submitted command that writes to this range has completed before the host reads from or writes to that range, and that any previously submitted command that reads from that range has completed before the host writes to that region (see [here](#) for details on fulfilling such a guarantee). If the device memory was allocated without the **VK_MEMORY_PROPERTY_HOST_COHERENT_BIT** set, these guarantees **must** be made for an extended range: the application **must** round down the start of the range to the nearest multiple of **VkPhysicalDeviceLimits::nonCoherentAtomSize**, and round the end of the range up to the nearest multiple of **VkPhysicalDeviceLimits::nonCoherentAtomSize**.

While a range of device memory is host mapped, the application is responsible for synchronizing both device and host access to that memory range.

---

**Note**

It is important for the application developer to become meticulously familiar with all of the mechanisms described in the chapter on [Synchronization and Cache Control](#) as they are crucial to maintaining memory access ordering.

Calling **vkMapMemory** is equivalent to calling **vkMapMemory2KHR** with an empty **pNext** chain.

---

**Valid Usage**

- **VUID-vkMapMemory-memory-00678**

**Valid Usage (Implicit)**

- VUID-vkMapMemory-device-parameter
device must be a valid VkDevice handle

- VUID-vkMapMemory-memory-parameter
memory must be a valid VkDeviceMemory handle

- VUID-vkMapMemory-flags-zerobitmask
flags must be 0

- VUID-vkMapMemory-ppData-parameter
ppData must be a valid pointer to a pointer value

- VUID-vkMapMemory-memory-parent
memory must have been created, allocated, or retrieved from device

**Host Synchronization**

- Host access to memory must be externally synchronized

**Return Codes**

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_MEMORY_MAP_FAILED
typedef VkFlags VkMemoryMapFlags;

VkMemoryMapFlags is a bitmask type for setting a mask, but is currently reserved for future use.

Alternatively, to retrieve a host virtual address pointer to a region of a mappable memory object, call:

```c
// Provided by VK_KHR_map_memory2
VkResult vkMapMemory2KHR(
    VkDevice device,
    const VkMemoryMapInfoKHR* pMemoryMapInfo,
    void** ppData);
```

- `device` is the logical device that owns the memory.
- `pMemoryMapInfo` is a pointer to a `VkMemoryMapInfoKHR` structure describing parameters of the map.
- `ppData` is a pointer to a `void` * variable in which is returned a host-accessible pointer to the beginning of the mapped range. This pointer minus `VkMemoryMapInfoKHR::offset` must be aligned to at least `VkPhysicalDeviceLimits::minMemoryMapAlignment`.

This function behaves identically to `vkMapMemory` except that it gets its parameters via an extensible structure pointer rather than directly as function arguments.

**Valid Usage (Implicit)**

- VUID-vkMapMemory2KHR-device-parameter `device` must be a valid `VkDevice` handle
- VUID-vkMapMemory2KHR-pMemoryMapInfo-parameter `pMemoryMapInfo` must be a valid pointer to a valid `VkMemoryMapInfoKHR` structure
- VUID-vkMapMemory2KHR-ppData-parameter `ppData` must be a valid pointer to a pointer value

**Return Codes**

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_MEMORY_MAP_FAILED
The `VkMemoryMapInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_map_memory2
typedef struct VkMemoryMapInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkMemoryMapFlags flags;
    VkDeviceMemory memory;
    VkDeviceSize offset;
    VkDeviceSize size;
} VkMemoryMapInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `memory` is the `VkDeviceMemory` object to be mapped.
- `offset` is a zero-based byte offset from the beginning of the memory object.
- `size` is the size of the memory range to map, or `VK_WHOLE_SIZE` to map from `offset` to the end of the allocation.

### Valid Usage

- **VUID-VkMemoryMapInfoKHR-memory-07958**
  memory must not be currently host mapped

- **VUID-VkMemoryMapInfoKHR-offset-07959**
  offset must be less than the size of memory

- **VUID-VkMemoryMapInfoKHR-size-07960**
  If size is not equal to `VK_WHOLE_SIZE`, size must be greater than 0

- **VUID-VkMemoryMapInfoKHR-size-07961**
  If size is not equal to `VK_WHOLE_SIZE`, size must be less than or equal to the size of the memory minus offset

- **VUID-VkMemoryMapInfoKHR-memory-07962**
  memory must have been created with a memory type that reports `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT`

- **VUID-VkMemoryMapInfoKHR-memory-07963**
  memory must not have been allocated with multiple instances

### Valid Usage (Implicit)

- **VUID-VkMemoryMapInfoKHR-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_MEMORY_MAP_INFO_KHR`

- **VUID-VkMemoryMapInfoKHR-pNext-pNext**
pNext must be NULL

- VUID-VkMemoryMapInfoKHR-flags-zero bitmask
  flags must be 0

- VUID-VkMemoryMapInfoKHR-memory-parameter
  memory must be a valid VkDeviceMemory handle

Host Synchronization

- Host access to memory must be externally synchronized

Two commands are provided to enable applications to work with non-coherent memory allocations: `vkFlushMappedMemoryRanges` and `vkInvalidateMappedMemoryRanges`.

Note

If the memory object was created with the VK_MEMORY_PROPERTY_HOST_COHERENT_BIT set, `vkFlushMappedMemoryRanges` and `vkInvalidateMappedMemoryRanges` are unnecessary and may have a performance cost. However, availability and visibility operations still need to be managed on the device. See the description of host access types for more information.

After a successful call to `vkMapMemory` or `vkMapMemory2KHR` the memory object memory is considered to be currently host mapped.

To flush ranges of non-coherent memory from the host caches, call:

```cpp
// Provided by VK_VERSION_1_0
VkResult vkFlushMappedMemoryRanges(
    VkDevice device,                  // Provided by VK_VERSION_1_0
    uint32_t memoryRangeCount,        // Provided by VK_VERSION_1_0
    const VkMappedMemoryRange* pMemoryRanges);
```

- device is the logical device that owns the memory ranges.
- memoryRangeCount is the length of the pMemoryRanges array.
- pMemoryRanges is a pointer to an array of VkMappedMemoryRange structures describing the memory ranges to flush.

`vkFlushMappedMemoryRanges` guarantees that host writes to the memory ranges described by pMemoryRanges are made available to the host memory domain, such that they can be made available to the device memory domain via memory domain operations using the VK_ACCESS_HOST_WRITE_BIT access type.

Within each range described by pMemoryRanges, each set of nonCoherentAtomSize bytes in that range is flushed if any byte in that set has been written by the host since it was first host mapped, or the last time it was flushed. If pMemoryRanges includes sets of nonCoherentAtomSize bytes where no bytes have
been written by the host, those bytes **must** not be flushed.

Unmapping non-coherent memory does not implicitly flush the host mapped memory, and host writes that have not been flushed **may** not ever be visible to the device. However, implementations **must** ensure that writes that have not been flushed do not become visible to any other memory.

---

**Note**
The above guarantee avoids a potential memory corruption in scenarios where host writes to a mapped memory object have not been flushed before the memory is unmapped (or freed), and the virtual address range is subsequently reused for a different mapping (or memory allocation).

---

**Valid Usage (Implicit)**

- VUID-vkFlushMappedMemoryRanges-device-parameter
  
  *device* **must** be a valid `VkDevice` handle

- VUID-vkFlushMappedMemoryRanges-pMemoryRanges-parameter
  
  *pMemoryRanges* **must** be a valid pointer to an array of `memoryRangeCount` valid `VkMappedMemoryRange` structures

- VUID-vkFlushMappedMemoryRanges-memoryRangeCount-arraylength
  
  `memoryRangeCount` **must** be greater than `0`

---

**Return Codes**

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

---

To invalidate ranges of non-coherent memory from the host caches, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkInvalidateMappedMemoryRanges(  
    VkDevice device,  
    uint32_t memoryRangeCount,  
    const VkMappedMemoryRange* pMemoryRanges);
```

- *device* is the logical device that owns the memory ranges.

- `memoryRangeCount` is the length of the `pMemoryRanges` array.

- `pMemoryRanges` is a pointer to an array of `VkMappedMemoryRange` structures describing the memory ranges to invalidate.
vkInvalidateMappedMemoryRanges guarantees that device writes to the memory ranges described by pMemoryRanges, which have been made available to the host memory domain using the VK_ACCESS_HOST_WRITE_BIT and VK_ACCESS_HOST_READ_BIT access types, are made visible to the host. If a range of non-coherent memory is written by the host and then invalidated without first being flushed, its contents are undefined.

Within each range described by pMemoryRanges, each set of nonCoherentAtomSize bytes in that range is invalidated if any byte in that set has been written by the device since it was first host mapped, or the last time it was invalidated.

**Note**

Mapping non-coherent memory does not implicitly invalidate that memory.

### Valid Usage (Implicit)

- VUID-vkInvalidateMappedMemoryRanges-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkInvalidateMappedMemoryRanges-pMemoryRanges-parameter
  - `pMemoryRanges` must be a valid pointer to an array of `memoryRangeCount` valid `VkMappedMemoryRange` structures
- VUID-vkInvalidateMappedMemoryRanges-memoryRangeCount-arraylength
  - `memoryRangeCount` must be greater than 0

### Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkMappedMemoryRange` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkMappedMemoryRange {
    VkStructureType sType;
    const void* pNext;
    VkDeviceMemory memory;
    VkDeviceSize offset;
    VkDeviceSize size;
} VkMappedMemoryRange;
```

- `sType` is a `VkStructureType` value identifying this structure.
pNext is NULL or a pointer to a structure extending this structure.

memory is the memory object to which this range belongs.

offset is the zero-based byte offset from the beginning of the memory object.

size is either the size of range, or VK_WHOLE_SIZE to affect the range from offset to the end of the current mapping of the allocation.

Valid Usage

- VUID-VkMappedMemoryRange-memory-00684
  memory must be currently host mapped

- VUID-VkMappedMemoryRange-size-00685
  If size is not equal to VK_WHOLE_SIZE, offset and size must specify a range contained within the currently mapped range of memory

- VUID-VkMappedMemoryRange-size-00686
  If size is equal to VK_WHOLE_SIZE, offset must be within the currently mapped range of memory

- VUID-VkMappedMemoryRange-offset-00687
  offset must be a multiple of VkPhysicalDeviceLimits::nonCoherentAtomSize

- VUID-VkMappedMemoryRange-size-01389
  If size is equal to VK_WHOLE_SIZE, the end of the current mapping of memory must either be a multiple of VkPhysicalDeviceLimits::nonCoherentAtomSize bytes from the beginning of the memory object, or be equal to the end of the memory object

- VUID-VkMappedMemoryRange-size-01390
  If size is not equal to VK_WHOLE_SIZE, size must either be a multiple of VkPhysicalDeviceLimits::nonCoherentAtomSize, or offset plus size must equal the size of memory

Valid Usage (Implicit)

- VUID-VkMappedMemoryRange-sType-sType
  sType must be VK_STRUCTURE_TYPE_MAPPED_MEMORY_RANGE

- VUID-VkMappedMemoryRange-pNext-pNext
  pNext must be NULL

- VUID-VkMappedMemoryRange-memory-parameter
  memory must be a valid VkDeviceMemory handle

To unmap a memory object once host access to it is no longer needed by the application, call:

```c
// Provided by VK_VERSION_1_0
void vkUnmapMemory(
    VkDevice device,
```
• **device** is the logical device that owns the memory.

• **memory** is the memory object to be unmapped.

Calling `vkUnmapMemory` is equivalent to calling `vkUnmapMemory2KHR` with an empty `pNext` chain and the flags parameter set to zero.

### Valid Usage

• VUID-vkUnmapMemory-memory-00689
  
  `memory` must be currently host mapped

### Valid Usage (Implicit)

• VUID-vkUnmapMemory-device-parameter
  
  `device` must be a valid `VkDevice` handle

• VUID-vkUnmapMemory-memory-parameter
  
  `memory` must be a valid `VkDeviceMemory` handle

• VUID-vkUnmapMemory-memory-parent
  
  `memory` must have been created, allocated, or retrieved from `device`

### Host Synchronization

• Host access to `memory` must be externally synchronized

Alternatively, to unmap a memory object once host access to it is no longer needed by the application, call:

```c
// Provided by VK_KHR_map_memory2

VkResult vkUnmapMemory2KHR(
    VkDevice device,
    const VkMemoryUnmapInfoKHR* pMemoryUnmapInfo);
```

• **device** is the logical device that owns the memory.

• **pMemoryUnmapInfo** is a pointer to a `VkMemoryUnmapInfoKHR` structure describing parameters of the unmap.

This function behaves identically to `vkUnmapMemory` except that it gets its parameters via an extensible structure pointer rather than directly as function arguments.
Valid Usage (Implicit)

- VUID-vkUnmapMemory2KHR-device-parameter
  device must be a valid VkDevice handle

- VUID-vkUnmapMemory2KHR-pMemoryUnmapInfo-parameter
  pMemoryUnmapInfo must be a valid pointer to a valid VkMemoryUnmapInfoKHR structure

Return Codes

Success

- VK_SUCCESS

The VkMemoryUnmapInfoKHR structure is defined as:

```c
// Provided by VK_KHR_map_memory2
typedef struct VkMemoryUnmapInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkMemoryUnmapFlagsKHR flags;
    VkDeviceMemory memory;
} VkMemoryUnmapInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is reserved for future use.
- memory is the VkDeviceMemory object to be unmapped.

Valid Usage

- VUID-VkMemoryUnmapInfoKHR-memory-07964
  memory must be currently host mapped

Valid Usage (Implicit)

- VUID-VkMemoryUnmapInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_MEMORY_UNMAP_INFO_KHR

- VUID-VkMemoryUnmapInfoKHR-pNext-pNext
  pNext must be NULL

- VUID-VkMemoryUnmapInfoKHR-flags-zerobitmask
  flags must be 0

- VUID-VkMemoryUnmapInfoKHR-memory-parameter
  memory must be currently host mapped
memory must be a valid VkDeviceMemory handle

Host Synchronization

- Host access to memory must be externally synchronized

// Provided by VK_KHR_map_memory2
typedef VkFlags VkMemoryUnmapFlagsKHR;

VkMemoryMapFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.

11.2.10. Lazily Allocated Memory

If the memory object is allocated from a heap with the VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT bit set, that object’s backing memory may be provided by the implementation lazily. The actual committed size of the memory may initially be as small as zero (or as large as the requested size), and monotonically increases as additional memory is needed.

A memory type with this flag set is only allowed to be bound to a VkImage whose usage flags include VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT.

Note

Using lazily allocated memory objects for framebuffer attachments that are not needed once a render pass instance has completed may allow some implementations to never allocate memory for such attachments.

To determine the amount of lazily-allocated memory that is currently committed for a memory object, call:

// Provided by VK_VERSION_1_0
void vkGetDeviceMemoryCommitment(VkDevice device, VkDeviceMemory memory, VkDeviceSize* pCommittedMemoryInBytes);

- device is the logical device that owns the memory.
- memory is the memory object being queried.
- pCommittedMemoryInBytes is a pointer to a VkDeviceSize value in which the number of bytes currently committed is returned, on success.

The implementation may update the commitment at any time, and the value returned by this query may be out of date.

The implementation guarantees to allocate any committed memory from the heapIndex indicated by
the memory type that the memory object was created with.

Valid Usage

- VUID-vkGetDeviceMemoryCommitment-memory-00690
  memory must have been created with a memory type that reports VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT

Valid Usage (Implicit)

- VUID-vkGetDeviceMemoryCommitment-device-parameter
  device must be a valid VkDevice handle
- VUID-vkGetDeviceMemoryCommitment-memory-parameter
  memory must be a valid VkDeviceMemory handle
- VUID-vkGetDeviceMemoryCommitment-pCommittedMemoryInBytes-parameter
  pCommittedMemoryInBytes must be a valid pointer to a VkDeviceSize value
- VUID-vkGetDeviceMemoryCommitment-memory-parent
  memory must have been created, allocated, or retrieved from device

11.2.11. Protected Memory

Protected memory divides device memory into protected device memory and unprotected device memory.

Protected memory adds the following concepts:

- Memory:
  - Unprotected device memory, which can be visible to the device and can be visible to the host
  - Protected device memory, which can be visible to the device but must not be visible to the host
- Resources:
  - Unprotected images and unprotected buffers, to which unprotected memory can be bound
  - Protected images and protected buffers, to which protected memory can be bound
- Command buffers:
  - Unprotected command buffers, which can be submitted to a device queue to execute unprotected queue operations
  - Protected command buffers, which can be submitted to a protected-capable device queue to execute protected queue operations
- Device queues:
  - Unprotected device queues, to which unprotected command buffers can be submitted
Protected-capable device queues, to which unprotected command buffers or protected command buffers **can** be submitted

- **Queue submissions**
  - Unprotected queue submissions, through which unprotected command buffers **can** be submitted
  - Protected queue submissions, through which protected command buffers **can** be submitted

- **Queue operations**
  - Unprotected queue operations
  - Protected queue operations

**Protected Memory Access Rules**

If `VkPhysicalDeviceProtectedMemoryProperties::protectedNoFault` is **VK_FALSE**, applications **must** not perform any of the following operations:

- Write to unprotected memory within protected queue operations.
- Access protected memory within protected queue operations other than in framebuffer-space pipeline stages, the compute shader stage, or the transfer stage.
- Perform a query within protected queue operations.

If `VkPhysicalDeviceProtectedMemoryProperties::protectedNoFault` is **VK_TRUE**, these operations are valid, but reads will return undefined values, and writes will either be dropped or store undefined values.

Additionally, indirect operations **must** not be performed within protected queue operations.

Whether these operations are valid or not, or if any other invalid usage is performed, the implementation **must** guarantee that:

- Protected device memory **must** never be visible to the host.
- Values written to unprotected device memory **must** not be a function of values from protected memory.

**11.2.12. Peer Memory Features**

*Peer memory* is memory that is allocated for a given physical device and then bound to a resource and accessed by a different physical device, in a logical device that represents multiple physical devices. Some ways of reading and writing peer memory **may** not be supported by a device.

To determine how peer memory **can** be accessed, call:

```c
// Provided by VK_VERSION_1_1
void vkGetDeviceGroupPeerMemoryFeatures(
    VkDevice device,
    uint32_t heapIndex,
    uint32_t localDeviceIndex,
```
or the equivalent command

```c
// Provided by VK_KHR_device_group
void vkGetDeviceGroupPeerMemoryFeaturesKHR(
    VkDevice device,
    uint32_t heapIndex,
    uint32_t localDeviceIndex,
    uint32_t remoteDeviceIndex,
    VkPeerMemoryFeatureFlags* pPeerMemoryFeatures);
```

- `device` is the logical device that owns the memory.
- `heapIndex` is the index of the memory heap from which the memory is allocated.
- `localDeviceIndex` is the device index of the physical device that performs the memory access.
- `remoteDeviceIndex` is the device index of the physical device that the memory is allocated for.
- `pPeerMemoryFeatures` is a pointer to a `VkPeerMemoryFeatureFlags` bitmask indicating which types of memory accesses are supported for the combination of heap, local, and remote devices.

**Valid Usage**

- VUID-vkGetDeviceGroupPeerMemoryFeatures-heapIndex-00691
  heapIndex must be less than memoryHeapCount

- VUID-vkGetDeviceGroupPeerMemoryFeatures-localDeviceIndex-00692
  localDeviceIndex must be a valid device index

- VUID-vkGetDeviceGroupPeerMemoryFeatures-remoteDeviceIndex-00693
  remoteDeviceIndex must be a valid device index

- VUID-vkGetDeviceGroupPeerMemoryFeatures-localDeviceIndex-00694
  localDeviceIndex must not equal remoteDeviceIndex

**Valid Usage (Implicit)**

- VUID-vkGetDeviceGroupPeerMemoryFeatures-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetDeviceGroupPeerMemoryFeatures-pPeerMemoryFeatures-parameter
  pPeerMemoryFeatures must be a valid pointer to a VkPeerMemoryFeatureFlags value

Bits which may be set in `vkGetDeviceGroupPeerMemoryFeatures::pPeerMemoryFeatures`, indicating supported peer memory features, are:
or the equivalent

```
// Provided by VK_KHR_device_group
typedef VkPeerMemoryFeatureFlagBits VkPeerMemoryFeatureFlagBitsKHR;
```

- **VK_PEER_MEMORY_FEATURE_COPY_SRC_BIT** specifies that the memory can be accessed as the source of any `vkCmdCopy*` command.
- **VK_PEER_MEMORY_FEATURE_COPY_DST_BIT** specifies that the memory can be accessed as the destination of any `vkCmdCopy*` command.
- **VK_PEER_MEMORY_FEATURE_GENERIC_SRC_BIT** specifies that the memory can be read as any memory access type.
- **VK_PEER_MEMORY_FEATURE_GENERIC_DST_BIT** specifies that the memory can be written as any memory access type. Shader atomics are considered to be writes.

**Note**
The peer memory features of a memory heap also apply to any accesses that may be performed during image layout transitions.

**VK_PEER_MEMORY_FEATURE_COPY_DST_BIT** must be supported for all host local heaps and for at least one device-local memory heap.

If a device does not support a peer memory feature, it is still valid to use a resource that includes both local and peer memory bindings with the corresponding access type as long as only the local bindings are actually accessed. For example, an application doing split-frame rendering would use framebuffer attachments that include both local and peer memory bindings, but would scissor the rendering to only update local memory.
typedef VkFlags VkPeerMemoryFeatureFlags;

or the equivalent

typedef VkPeerMemoryFeatureFlagsKHR;

VkPeerMemoryFeatureFlags is a bitmask type for setting a mask of zero or more VkPeerMemoryFeatureFlagBits.

11.2.13. Opaque Capture Address Query

To query a 64-bit opaque capture address value from a memory object, call:

```c
uint64_t vkGetDeviceMemoryOpaqueCaptureAddress(
    VkDevice device,
    const VkDeviceMemoryOpaqueCaptureAddressInfo* pInfo);
```

or the equivalent command

```c
uint64_t vkGetDeviceMemoryOpaqueCaptureAddressKHR(
    VkDevice device,
    const VkDeviceMemoryOpaqueCaptureAddressInfo* pInfo);
```

- `device` is the logical device that the memory object was allocated on.
- `pInfo` is a pointer to a VkDeviceMemoryOpaqueCaptureAddressInfo structure specifying the memory object to retrieve an address for.

The 64-bit return value is an opaque address representing the start of `pInfo->memory`.

If the memory object was allocated with a non-zero value of VkMemoryOpaqueCaptureAddressAllocateInfo::opaqueCaptureAddress, the return value must be the same address.

**Note**

The expected usage for these opaque addresses is only for trace capture/replay tools to store these addresses in a trace and subsequently specify them during replay.
Valid Usage

- VUID-vkGetDeviceMemoryOpaqueCaptureAddress-None-03334
  The `bufferDeviceAddress` feature **must** be enabled

- VUID-vkGetDeviceMemoryOpaqueCaptureAddress-device-03335
  If `device` was created with multiple physical devices, then the `bufferDeviceAddressMultiDevice` feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkGetDeviceMemoryOpaqueCaptureAddress-device-parameter
  `device` **must** be a valid `VkDevice` handle

- VUID-vkGetDeviceMemoryOpaqueCaptureAddress-pInfo-parameter
  `pInfo` **must** be a valid pointer to a valid `VkDeviceMemoryOpaqueCaptureAddressInfo` structure

The `VkDeviceMemoryOpaqueCaptureAddressInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkDeviceMemoryOpaqueCaptureAddressInfo {  
    VkStructureType sType;  
    const void* pNext;  
    VkDeviceMemory memory;  
} VkDeviceMemoryOpaqueCaptureAddressInfo;
```

or the equivalent

```c
// Provided by VK_KHR_buffer_device_address
typedef VkDeviceMemoryOpaqueCaptureAddressInfo
VkDeviceMemoryOpaqueCaptureAddressInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memory` specifies the memory whose address is being queried.

Valid Usage

- VUID-VkDeviceMemoryOpaqueCaptureAddressInfo-memory-03336
  `memory` **must** have been allocated with `VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT`
Valid Usage (Implicit)

- VUID-VkDeviceMemoryOpaqueCaptureAddressInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEVICE_MEMORY_OPAQUE_CAPTURE_ADDRESS_INFO

- VUID-VkDeviceMemoryOpaqueCaptureAddressInfo-pNext-pNext
  pNext must be NULL

- VUID-VkDeviceMemoryOpaqueCaptureAddressInfo-memory-parameter
  memory must be a valid VkDeviceMemory handle
Chapter 12. Resource Creation

Vulkan supports two primary resource types: buffers and images. Resources are views of memory with associated formatting and dimensionality. Buffers provide access to raw arrays of bytes, whereas images can be multidimensional and may have associated metadata.

Other resource types, such as acceleration structures and micromaps use buffers as the backing store for opaque data structures.

12.1. Buffers

Buffers represent linear arrays of data which are used for various purposes by binding them to a graphics or compute pipeline via descriptor sets or certain commands, or by directly specifying them as parameters to certain commands.

Buffers are represented by VkBuffer handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkBuffer)
```

To create buffers, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateBuffer(
    VkDevice device,                  // Provided by VK_VERSION_1_0
    const VkBufferCreateInfo* pCreateInfo, // Provided by VK_VERSION_1_0
    const VkAllocationCallbacks* pAllocator, // Provided by VK_VERSION_1_0
    VkBuffer* pBuffer);                 // Provided by VK_VERSION_1_0
```

- **device** is the logical device that creates the buffer object.
- **pCreateInfo** is a pointer to a VkBufferCreateInfo structure containing parameters affecting creation of the buffer.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pBuffer** is a pointer to a VkBuffer handle in which the resulting buffer object is returned.

Valid Usage

- VUID-vkCreateBuffer-flags-00911
  If the flags member of pCreateInfo includes VK_BUFFER_CREATE_SPARSE_BINDING_BIT, creating this VkBuffer must not cause the total required sparse memory for all currently valid sparse resources on the device to exceed VkPhysicalDeviceLimits::sparseAddressSpaceSize
Valid Usage (Implicit)

- **VUID-vkCreateBuffer-device-parameter**
  - *device must* be a valid `VkDevice` handle

- **VUID-vkCreateBuffer-pCreateInfo-parameter**
  - *pCreateInfo must* be a valid pointer to a valid `VkBufferCreateInfo` structure

- **VUID-vkCreateBuffer-pAllocator-parameter**
  - If `pAllocator` is not `NULL`, `pAllocator must` be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkCreateBuffer-pBuffer-parameter**
  - `pBuffer must` be a valid pointer to a `VkBuffer` handle

Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR`

The `VkBufferCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBufferCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkBufferCreateFlags flags;
    VkDeviceSize size;
    VkBufferUsageFlags usage;
    VkSharingMode sharingMode;
    uint32_t queueFamilyIndexCount;
    const uint32_t* pQueueFamilyIndices;
} VkBufferCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkBufferCreateFlagBits` specifying additional parameters of the buffer.
- `size` is the size in bytes of the buffer to be created.
- `usage` is a bitmask of `VkBufferUsageFlagBits` specifying allowed usages of the buffer.
- `sharingMode` is a `VkSharingMode` value specifying the sharing mode of the buffer when it will be
accessed by multiple queue families.

- `queueFamilyIndexCount` is the number of entries in the `pQueueFamilyIndices` array.
- `pQueueFamilyIndices` is a pointer to an array of queue families that will access this buffer. It is ignored if `sharingMode` is not `VK_SHARING_MODE_CONCURRENT`.

If a `VkBufferUsageFlags2CreateInfoKHR` structure is present in the `pNext` chain, `VkBufferUsageFlags2CreateInfoKHR::usage` from that structure is used instead of `usage` from this structure.

### Valid Usage

- **VUID-VkBufferCreateInfo-None-09499**
  If the `pNext` chain does not include a `VkBufferUsageFlags2CreateInfoKHR` structure, `usage` must be a valid combination of `VkBufferUsageFlagBits` values.

- **VUID-VkBufferCreateInfo-None-09500**
  If the `pNext` chain does not include a `VkBufferUsageFlags2CreateInfoKHR` structure, `usage` must not be 0.

- **VUID-VkBufferCreateInfo-size-00912**
  `size` must be greater than 0.

- **VUID-VkBufferCreateInfo-sharingMode-00913**
  If `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, `pQueueFamilyIndices` must be a valid pointer to an array of `queueFamilyIndexCount uint32_t` values.

- **VUID-VkBufferCreateInfo-sharingMode-00914**
  If `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, `queueFamilyIndexCount` must be greater than 1.

- **VUID-VkBufferCreateInfo-sharingMode-01419**
  If `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, each element of `pQueueFamilyIndices` must be unique and must be less than `pQueueFamilyPropertyCount` returned by either `vkGetPhysicalDeviceQueueFamilyProperties2` or `vkGetPhysicalDeviceQueueFamilyProperties` for the `physicalDevice` that was used to create `device`.

- **VUID-VkBufferCreateInfo-flags-00915**
  If the `sparseBinding` feature is not enabled, `flags` must not contain `VK_BUFFER_CREATE_SPARSE_BINDING_BIT`.

- **VUID-VkBufferCreateInfo-flags-00916**
  If the `sparseResidencyBuffer` feature is not enabled, `flags` must not contain `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT`.

- **VUID-VkBufferCreateInfo-flags-00917**
  If the `sparseResidencyAliased` feature is not enabled, `flags` must not contain `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT`.

- **VUID-VkBufferCreateInfo-flags-00918**
  If `flags` contains `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` or `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT`, it must also contain...
VK_BUFFER_CREATE_SPARSE_BINDING_BIT

- VUID-VkBufferCreateInfo-pNext-00920
  If the `pNext` chain includes a `VkExternalMemoryBufferCreateInfo` structure, its `handleTypes` member must only contain bits that are also in `VkExternalBufferProperties::externalMemoryProperties.compatibleHandleTypes`, as returned by `vkGetPhysicalDeviceExternalBufferProperties` with `pExternalBufferInfo->handleType` equal to any one of the handle types specified in `VkExternalMemoryBufferCreateInfo::handleTypes`

- VUID-VkBufferCreateInfo-flags-01887
  If the `protectedMemory` feature is not enabled, `flags` must not contain `VK_BUFFER_CREATE_PROTECTED_BIT`

- VUID-VkBufferCreateInfo-None-01888
  If any of the bits `VK_BUFFER_CREATE_SPARSE_BINDING_BIT`, `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT`, or `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT` are set, `VK_BUFFER_CREATE_PROTECTED_BIT` must not also be set

- VUID-VkBufferCreateInfo-opaqueCaptureAddress-03337
  If `VkBufferOpaqueCaptureAddressCreateInfo::opaqueCaptureAddress` is not zero, `flags` must include `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT`

- VUID-VkBufferCreateInfo-flags-03338
  If `flags` includes `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT`, the `bufferDeviceAddressCaptureReplay` feature must be enabled

- VUID-VkBufferCreateInfo-usage-04813
  If `usage` includes `VK_BUFFER_USAGE_VIDEO_DECODE_SRC_BIT_KHR` or `VK_BUFFER_USAGE_VIDEO_DECODE_DST_BIT_KHR`, and `flags` does not include `VK_BUFFER_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR`, then the `pNext` chain must include a `VkVideoProfileListInfoKHR` structure with `profileCount` greater than 0 and `pProfiles` including at least one `VkVideoProfileInfoKHR` structure with a `videoCodecOperation` member specifying a decode operation

- VUID-VkBufferCreateInfo-usage-04814
  If `usage` includes `VK_BUFFER_USAGE_VIDEO_ENCODE_SRC_BIT_KHR` or `VK_BUFFER_USAGE_VIDEO_ENCODE_DST_BIT_KHR`, and `flags` does not include `VK_BUFFER_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR`, then the `pNext` chain must include a `VkVideoProfileListInfoKHR` structure with `profileCount` greater than 0 and `pProfiles` including at least one `VkVideoProfileInfoKHR` structure with a `videoCodecOperation` member specifying an encode operation

- VUID-VkBufferCreateInfo-flags-08325
  If `flags` includes `VK_BUFFER_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR`, then `videoMaintenance1` must be enabled

- VUID-VkBufferCreateInfo-size-06409
  `size` must be less than or equal to `VkPhysicalDeviceMaintenance4Properties::maxBufferSize`
Valid Usage (Implicit)

- **VUID-VkBufferCreateInfo-sType-sType**
  
  *sType* **must** be `VK_STRUCTURE_TYPE_BUFFER_CREATE_INFO`

- **VUID-VkBufferCreateInfo-pNext-pNext**

  Each *pNext* member of any structure (including this one) in the *pNext* chain **must** be either `NULL` or a pointer to a valid instance of `VkBufferOpaqueCaptureAddressCreateInfo`, `VkBufferUsageFlags2CreateInfoKHR`, `VkExternalMemoryBufferCreateInfo`, or `VkVideoProfileListInfoKHR`

- **VUID-VkBufferCreateInfo-sType-unique**

  The *sType* value of each struct in the *pNext* chain **must** be unique

- **VUID-VkBufferCreateInfo-flags-parameter**

  *flags* **must** be a valid combination of `VkBufferCreateFlagBits` values

- **VUID-VkBufferCreateInfo-sharingMode-parameter**

  *sharingMode* **must** be a valid `VkSharingMode` value

The *VkBufferUsageFlags2CreateInfoKHR* structure is defined as:

```c
// Provided by VK_KHR_maintenance5
typedef struct VkBufferUsageFlags2CreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkBufferUsageFlags2KHR usage;
} VkBufferUsageFlags2CreateInfoKHR;
```

- *sType* is a `VkStructureType` value identifying this structure.
- *pNext* is `NULL` or a pointer to a structure extending this structure.
- *usage* is a bitmask of `VkBufferUsageFlagBits2KHR` specifying allowed usages of the buffer.

If this structure is included in the *pNext* chain of a buffer creation structure, *usage* is used instead of the corresponding *usage* value passed in that creation structure, allowing additional usage flags to be specified. If this structure is included in the *pNext* chain of a buffer query structure, the usage flags of the buffer are returned in *usage* of this structure, and the usage flags representable in *usage* of the buffer query structure are also returned in that field.

Valid Usage (Implicit)

- **VUID-VkBufferUsageFlags2CreateInfoKHR-sType-sType**

  *sType* **must** be `VK_STRUCTURE_TYPE_BUFFER_USAGE_FLAGS_2_CREATE_INFO_KHR`

- **VUID-VkBufferUsageFlags2CreateInfoKHR-usage-parameter**

  *usage* **must** be a valid combination of `VkBufferUsageFlagBits2KHR` values

- **VUID-VkBufferUsageFlags2CreateInfoKHR-usage-requiredbitmask**

  *usage* **must** not be `0`
Bits which can be set in `VkBufferUsageFlags2CreateInfoKHR::usage`, specifying usage behavior of a buffer, are:

```c
// Provided by VK_KHR_maintenance5
// Flag bits for VkBufferUsageFlagBits2KHR
typedef VkFlags64 VkBufferUsageFlagBits2KHR;
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_TRANSFER_SRC_BIT_KHR = 0x00000001ULL;
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_TRANSFER_DST_BIT_KHR = 0x00000002ULL;
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_UNIFORM_TEXEL_BUFFER_BIT_KHR = 0x00000004ULL;
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_STORAGE_TEXEL_BUFFER_BIT_KHR = 0x00000008ULL;
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_UNIFORM_BUFFER_BIT_KHR = 0x00000010ULL;
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_STORAGE_BUFFER_BIT_KHR = 0x00000020ULL;
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_INDEX_BUFFER_BIT_KHR = 0x00000040ULL;
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_VERTEX_BUFFER_BIT_KHR = 0x00000080ULL;
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_INDIRECT_BUFFER_BIT_KHR = 0x00000100ULL;
// Provided by VK_KHR_maintenance5 with VK_EXT_conditional_rendering
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_CONDITIONAL_RENDERING_BIT_EXT = 0x00000200ULL;
// Provided by VK_KHR_maintenance5 with VK_KHR_ray_tracing_pipeline
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_SHADER_BINDING_TABLE_BIT_KHR = 0x00000400ULL;
// Provided by VK_KHR_maintenance5 with VK_NV_ray_tracing
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_RAY_TRACING_BIT_NV = 0x00000400ULL;
// Provided by VK_KHR_maintenance5 with VK_EXT_transform_feedback
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT = 0x00000800ULL;
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT = 0x00001000ULL;
// Provided by VK_KHR_maintenance5 with VK_KHR_video_decode_queue
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_VIDEO_DECODE_SRC_BIT_KHR = 0x00002000ULL;
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_VIDEO_DECODE_DST_BIT_KHR = 0x00004000ULL;
#ifndef VK_ENABLE_BETA_EXTENSIONS
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_VIDEO_ENCODE_DST_BIT_KHR = 0x00008000ULL;
#endif
```

710
• **VK_BUFFER_USAGE_2_TRANSFER_SRC_BIT_KHR** specifies that the buffer can be used as the source of a transfer command (see the definition of **VK_PIPELINE_STAGE_TRANSFER_BIT**).

• **VK_BUFFER_USAGE_2_TRANSFER_DST_BIT_KHR** specifies that the buffer can be used as the destination of a transfer command.

• **VK_BUFFER_USAGE_2_UNIFORM_TEXEL_BUFFER_BIT_KHR** specifies that the buffer can be used to create a VkBufferView suitable for occupying a VkDescriptorSet slot of type **VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER**.

• **VK_BUFFER_USAGE_2_STORAGE_TEXEL_BUFFER_BIT_KHR** specifies that the buffer can be used to create a VkBufferView suitable for occupying a VkDescriptorSet slot of type **VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER**.

• **VK_BUFFER_USAGE_2_UNIFORM_BUFFER_BIT_KHR** specifies that the buffer can be used in a VkDescriptorBufferInfo suitable for occupying a VkDescriptorSet slot either of type **VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER** or **VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC**.

• **VK_BUFFER_USAGE_2_STORAGE_BUFFER_BIT_KHR** specifies that the buffer can be used in a VkDescriptorBufferInfo suitable for occupying a VkDescriptorSet slot either of type **VK_DESCRIPTOR_TYPE_STORAGE_BUFFER**.
VK_DESCRIPTOR_TYPE_STORAGE_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC.

- **VK_BUFFER_USAGE_2_INDEX_BUFFER_BIT_KHR** specifies that the buffer is suitable for passing as the buffer parameter to `vkCmdBindIndexBuffer2KHR` and `vkCmdBindIndexBuffer`.

- **VK_BUFFER_USAGE_2_VERTEX_BUFFER_BIT_KHR** specifies that the buffer is suitable for passing as an element of the `pBuffers` array to `vkCmdBindVertexBuffers`.

- **VK_BUFFER_USAGE_2_INDIRECT_BUFFER_BIT_KHR** specifies that the buffer is suitable for passing as the buffer parameter to `vkCmdDrawIndirect`, `vkCmdDrawIndexedIndirect`, or `vkCmdDispatchIndirect`.

- **VK_BUFFER_USAGE_2_SHADER_BINDING_TABLE_BIT_KHR** specifies that the buffer is suitable for use as a Shader Binding Table.

- **VK_BUFFER_USAGE_2_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR** specifies that the buffer is suitable for use as a read-only input to an acceleration structure build.

- **VK_BUFFER_USAGE_2_ACCELERATION_STRUCTURE_STORAGE_BIT_KHR** specifies that the buffer is suitable for storage space for a `VkAccelerationStructureKHR`.

- **VK_BUFFER_USAGE_2_SHADER_DEVICE_ADDRESS_BIT_KHR** specifies that the buffer can be used to retrieve a buffer device address via `vkGetBufferDeviceAddress` and use that address to access the buffer’s memory from a shader.

- **VK_BUFFER_USAGE_2_VIDEO_DECODE_SRC_BIT_KHR** specifies that the buffer can be used as the source video bitstream buffer in a video decode operation.

- **VK_BUFFER_USAGE_2_VIDEO_DECODE_DST_BIT_KHR** is reserved for future use.

- **VK_BUFFER_USAGE_2_VIDEO_ENCODE_DST_BIT_KHR** specifies that the buffer can be used as the destination video bitstream buffer in a video encode operation.

- **VK_BUFFER_USAGE_2_VIDEO_ENCODE_SRC_BIT_KHR** is reserved for future use.

```c
// Provided by VK_KHR_maintenance5
typedef VkFlags64 VkBufferUsageFlags2KHR;
```

`VkBufferUsageFlags2KHR` is a bitmask type for setting a mask of zero or more `VkBufferUsageFlagBits2KHR`.

Bits which can be set in `VkBufferCreateInfo::usage`, specifying usage behavior of a buffer, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkBufferUsageFlagBits {
    VK_BUFFER_USAGE_TRANSFER_SRC_BIT = 0x00000001,
    VK_BUFFER_USAGE_TRANSFER_DST_BIT = 0x00000002,
    VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT = 0x00000004,
    VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT = 0x00000008,
    VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT = 0x00000010,
    VK_BUFFER_USAGE_STORAGE_BUFFER_BIT = 0x00000020,
    VK_BUFFER_USAGE_INDEX_BUFFER_BIT = 0x00000100,
    VK_BUFFER_USAGE_VERTEX_BUFFER_BIT = 0x00000200,
    VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT = 0x00000400,
};
```
• **VK_BUFFER_USAGE_TRANSFER_SRC_BIT** specifies that the buffer can be used as the source of a transfer command (see the definition of **VK_PIPELINE_STAGE_TRANSFER_BIT**).

• **VK_BUFFER_USAGE_TRANSFER_DST_BIT** specifies that the buffer can be used as the destination of a transfer command.

• **VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT** specifies that the buffer can be used to create a VkBufferView suitable for occupying a VkDescriptorSet slot of type **VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER**.

• **VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT** specifies that the buffer can be used to create a VkBufferView suitable for occupying a VkDescriptorSet slot of type **VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER**.

• **VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT** specifies that the buffer can be used in a VkDescriptorBufferInfo suitable for occupying a VkDescriptorSet slot either of type **VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER** or **VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC**.

• **VK_BUFFER_USAGE_STORAGE_BUFFER_BIT** specifies that the buffer can be used in a VkDescriptorBufferInfo suitable for occupying a VkDescriptorSet slot either of type **VK_DESCRIPTOR_TYPE_STORAGE_BUFFER** or **VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC**.

• **VK_BUFFER_USAGE_INDEX_BUFFER_BIT** specifies that the buffer is suitable for passing as the buffer parameter to **vkCmdBindIndexBuffer2KHR** and **vkCmdBindIndexBuffer**.

• **VK_BUFFER_USAGE_VERTEX_BUFFER_BIT** specifies that the buffer is suitable for passing as an element of the **pBuffers** array to **vkCmdBindVertexBuffers**.

• **VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT** specifies that the buffer is suitable for passing as the
buffer parameter to `vkCmdDrawIndirect`, `vkCmdDrawIndexedIndirect`, or `vkCmdDispatchIndirect`.

- `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` specifies that the buffer is suitable for use as a Shader Binding Table.

- `VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR` specifies that the buffer is suitable for use as a read-only input to an acceleration structure build.

- `VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_STORAGE_BIT_KHR` specifies that the buffer is suitable for storage space for a `VkAccelerationStructureKHR`.

- `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT` specifies that the buffer can be used to retrieve a buffer device address via `vkGetBufferDeviceAddress` and use that address to access the buffer’s memory from a shader.

- `VK_BUFFER_USAGE_VIDEO_DECODE_SRC_BIT_KHR` specifies that the buffer can be used as the source video bitstream buffer in a video decode operation.

- `VK_BUFFER_USAGE_VIDEO_DECODE_DST_BIT_KHR` is reserved for future use.

- `VK_BUFFER_USAGE_VIDEO_ENCODE_DST_BIT_KHR` specifies that the buffer can be used as the destination video bitstream buffer in a video encode operation.

- `VK_BUFFER_USAGE_VIDEO_ENCODE_SRC_BIT_KHR` is reserved for future use.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkBufferUsageFlags;
```

`VkBufferUsageFlags` is a bitmask type for setting a mask of zero or more `VkBufferUsageFlagBits`.

Bits which can be set in `VkBufferCreateInfo::flags`, specifying additional parameters of a buffer, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkBufferCreateFlagBits {
    VK_BUFFER_CREATE_SPARSE_BINDING_BIT = 0x00000001,
    VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT = 0x00000002,
    VK_BUFFER_CREATE_SPARSE_ALIASED_BIT = 0x00000004,
    // Provided by VK_VERSION_1_1
    VK_BUFFER_CREATE_PROTECTED_BIT = 0x00000008,
    // Provided by VK_VERSION_1_2
    VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT = 0x00000010,
    // Provided by VK_KHR_video_maintenance1
    VK_BUFFER_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR = 0x00000040,
    // Provided by VK_KHR_buffer_device_address
    VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR = 
    VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT,
} VkBufferCreateFlagBits;
```

- `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` specifies that the buffer will be backed using sparse memory binding.
• **VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT** specifies that the buffer can be partially backed using sparse memory binding. Buffers created with this flag must also be created with the **VK_BUFFER_CREATE_SPARSE_BINDING_BIT** flag.

• **VK_BUFFER_CREATE_SPARSE_ALIASED_BIT** specifies that the buffer will be backed using sparse memory binding with memory ranges that might also simultaneously be backing another buffer (or another portion of the same buffer). Buffers created with this flag must also be created with the **VK_BUFFER_CREATE_SPARSE_BINDING_BIT** flag.

• **VK_BUFFER_CREATE_PROTECTED_BIT** specifies that the buffer is a protected buffer.

• **VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT** specifies that the buffer’s address can be saved and reused on a subsequent run (e.g. for trace capture and replay), see [VkBufferOpaqueCaptureAddressCreateInfo](https://www.khronos.org/registry/vulkan/specs/1.2/html/vulkan.html#VkBufferOpaqueCaptureAddressCreateInfo) for more detail.

• **VK_BUFFER_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR** specifies that the buffer can be used in video coding operations without having to specify at buffer creation time the set of video profiles the buffer will be used with.

See [Sparse Resource Features](https://www.khronos.org/registry/vulkan/specs/1.2/html/vulkan.html#Sparse-resource-features) and [Physical Device Features](https://www.khronos.org/registry/vulkan/specs/1.2/html/vulkan.html#Physical-device-features) for details of the sparse memory features supported on a device.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkBufferCreateFlags;
```

**VkBufferCreateFlags** is a bitmask type for setting a mask of zero or more **VkBufferCreateFlagBits**.

To define a set of external memory handle types that may be used as backing store for a buffer, add a **VkExternalMemoryBufferCreateInfo** structure to the **pNext** chain of the **VkBufferCreateInfo** structure. The **VkExternalMemoryBufferCreateInfo** structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkExternalMemoryBufferCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkExternalMemoryHandleTypeFlags handleTypes;
} VkExternalMemoryBufferCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_external_memory
typedef VkExternalMemoryBufferCreateInfo VkExternalMemoryBufferCreateInfoKHR;
```

**Note**

A **VkExternalMemoryBufferCreateInfo** structure with a non-zero **handleTypes** field must be included in the creation parameters for a buffer that will be bound to memory that is either exported or imported.
• \texttt{sType} is a \texttt{VkStructureType} value identifying this structure.

• \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.

• \texttt{handleTypes} is zero or a bitmask of \texttt{VkExternalMemoryHandleTypeFlagBits} specifying one or more external memory handle types.

### Valid Usage (Implicit)

• VUID-VkExternalMemoryBufferCreateInfo-sType-sType
  \texttt{sType must be VK_STRUCTURE_TYPE_EXTERNAL_MEMORY_BUFFER_CREATE_INFO}

• VUID-VkExternalMemoryBufferCreateInfo-handleTypes-parameter
  \texttt{handleTypes must be a valid combination of VkExternalMemoryHandleTypeFlagBits values}

To request a specific device address for a buffer, add a \texttt{VkBufferOpaqueCaptureAddressCreateInfo} structure to the \texttt{pNext} chain of the \texttt{VkBufferCreateInfo} structure. The \texttt{VkBufferOpaqueCaptureAddressCreateInfo} structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkBufferOpaqueCaptureAddressCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint64_t opaqueCaptureAddress;
} VkBufferOpaqueCaptureAddressCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_buffer_device_address
typedef VkBufferOpaqueCaptureAddressCreateInfo VkBufferOpaqueCaptureAddressCreateInfoKHR;
```

• \texttt{sType} is a \texttt{VkStructureType} value identifying this structure.

• \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.

• \texttt{opaqueCaptureAddress} is the opaque capture address requested for the buffer.

If \texttt{opaqueCaptureAddress} is zero, no specific address is requested.

If \texttt{opaqueCaptureAddress} is not zero, then it \textbf{should} be an address retrieved from \texttt{vkGetBufferOpaqueCaptureAddress} for an identically created buffer on the same implementation.

If this structure is not present, it is as if \texttt{opaqueCaptureAddress} is zero.

Apps \textbf{should} avoid creating buffers with app-provided addresses and implementation-provided addresses in the same process, to reduce the likelihood of \texttt{VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS} errors.
Note
The expected usage for this is that a trace capture/replay tool will add the
VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT flag to all buffers that use
VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT, and during capture will save the
queried opaque device addresses in the trace. During replay, the buffers will be
created specifying the original address so any address values stored in the trace
data will remain valid.

Implementations are expected to separate such buffers in the GPU address space
so normal allocations will avoid using these addresses. Apps/tools should avoid
mixing app-provided and implementation-provided addresses for buffers created
with VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT, to avoid address space
allocation conflicts.

Valid Usage (Implicit)

- VUID-VkBufferOpaqueCaptureAddressCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_BUFFER_OPAQUE_CAPTURE_ADDRESS_CREATE_INFO

To destroy a buffer, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyBuffer(
    VkDevice device,
    VkBuffer buffer,
    const VkAllocationCallbacks* pAllocator);
```

- device is the logical device that destroys the buffer.
- buffer is the buffer to destroy.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyBuffer-buffer-00922
  All submitted commands that refer to buffer, either directly or via a VkBufferView, must
  have completed execution

- VUID-vkDestroyBuffer-buffer-00923
  If VkAllocationCallbacks were provided when buffer was created, a compatible set of
calls must be provided here

- VUID-vkDestroyBuffer-buffer-00924
  If no VkAllocationCallbacks were provided when buffer was created, pAllocator must be
  NULL
Valid Usage (Implicit)

- VUID-vkDestroyBuffer-device-parameter
  
  device must be a valid VkDevice handle

- VUID-vkDestroyBuffer-buffer-parameter
  
  If buffer is not VK_NULL_HANDLE, buffer must be a valid VkBuffer handle

- VUID-vkDestroyBuffer-pAllocator-parameter
  
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroyBuffer-buffer-parent
  
  If buffer is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to buffer must be externally synchronized

12.2. Buffer Views

A buffer view represents a contiguous range of a buffer and a specific format to be used to interpret the data. Buffer views are used to enable shaders to access buffer contents using image operations. In order to create a valid buffer view, the buffer must have been created with at least one of the following usage flags:

- VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT
- VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT

Buffer views are represented by VkBufferView handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkBufferView)
```

To create a buffer view, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateBufferView(
    VkDevice device,
    const VkBufferViewCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkBufferView* pView);
```

- device is the logical device that creates the buffer view.
- pCreateInfo is a pointer to a VkBufferViewCreateInfo structure containing parameters to be
used to create the buffer view.

- **pAllocator** controls host memory allocation as described in the *Memory Allocation* chapter.
- **pView** is a pointer to a `VkBufferView` handle in which the resulting buffer view object is returned.

### Valid Usage (Implicit)

- **VUID-vkCreateBufferView-device-parameter**
  - `device` must be a valid `VkDevice` handle
- **VUID-vkCreateBufferView-pCreateInfo-parameter**
  - `pCreateInfo` must be a valid pointer to a valid `VkBufferViewCreateInfo` structure
- **VUID-vkCreateBufferView-pAllocator-parameter**
  - If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- **VUID-vkCreateBufferView-pView-parameter**
  - `pView` must be a valid pointer to a `VkBufferView` handle

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkBufferViewCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBufferViewCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkBufferViewCreateFlags flags;
    VkBuffer          buffer;
    VkFormat          format;
    VkDeviceSize      offset;
    VkDeviceSize      range;
} VkBufferViewCreateInfo;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
• **buffer** is a `VkBuffer` on which the view will be created.

• **format** is a `VkFormat` describing the format of the data elements in the buffer.

• **offset** is an offset in bytes from the base address of the buffer. Accesses to the buffer view from shaders use addressing that is relative to this starting offset.

• **range** is a size in bytes of the buffer view. If **range** is equal to `VK_WHOLE_SIZE`, the range from **offset** to the end of the buffer is used. If `VK_WHOLE_SIZE` is used and the remaining size of the buffer is not a multiple of the *texel block size* of **format**, the nearest smaller multiple is used.

The buffer view has a **buffer view usage** identifying which descriptor types can be created from it. This usage can be defined by including the `VkBufferUsageFlags2CreateInfoKHR` structure in the `pNext` chain, and specifying the **usage** value there. If this structure is not included, it is equal to the `VkBufferCreateInfo::usage` value used to create **buffer**.

### Valid Usage

- **VUID-VkBufferViewCreateInfo-offset-00925**
  *offset must be less than the size of buffer*

- **VUID-VkBufferViewCreateInfo-range-00928**
  If **range** is not equal to `VK_WHOLE_SIZE`, **range must be greater than 0**

- **VUID-VkBufferViewCreateInfo-range-00929**
  If **range** is not equal to `VK_WHOLE_SIZE`, **range must be an integer multiple of the texel block size of format**

- **VUID-VkBufferViewCreateInfo-range-00930**
  If **range** is not equal to `VK_WHOLE_SIZE`, the number of texel buffer elements given by \( \left\lfloor \frac{\text{range}}{\text{texel block size}} \right\rfloor \times \text{texels per block} \) where texel block size and texels per block are as defined in the **Compatible Formats** table for **format**, **must be less than or equal to** `VkPhysicalDeviceLimits::maxTexelBufferElements`

- **VUID-VkBufferViewCreateInfo-offset-00931**
  If **range** is not equal to `VK_WHOLE_SIZE`, the sum of **offset** and **range** **must be less than or equal to the size of buffer**

- **VUID-VkBufferViewCreateInfo-range-04059**
  If **range** is equal to `VK_WHOLE_SIZE`, the number of texel buffer elements given by \( \left\lfloor \frac{(\text{size} - \text{offset})}{\text{texel block size}} \right\rfloor \times \text{texels per block} \) where size is the size of **buffer**, and texel block size and texels per block are as defined in the **Compatible Formats** table for **format**, **must be less than or equal to** `VkPhysicalDeviceLimits::maxTexelBufferElements`

- **VUID-VkBufferViewCreateInfo-buffer-00932**
  **buffer must have been created with a usage value containing at least one of VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT or VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT**

- **VUID-VkBufferViewCreateInfo-format-08778**
  If the **buffer view usage** contains `VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT`, then **format features of format must contain VK_FORMAT_FEATURE_UNIFORM_TEXEL_BUFFER_BIT**

- **VUID-VkBufferViewCreateInfo-format-08779**
  If the **buffer view usage** contains `VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT`, then **format**
features of format must contain VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_BIT

- **VUID-VkBufferViewCreateInfo-buffer-00935**
  If buffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- **VUID-VkBufferViewCreateInfo-offset-02749**
  If the texelBufferAlignment feature is not enabled, offset must be a multiple of VkPhysicalDeviceLimits::minTexelBufferOffsetAlignment

- **VUID-VkBufferViewCreateInfo-buffer-02750**
  If the texelBufferAlignment feature is enabled and if buffer was created with usage containing VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT, offset must be a multiple of the lesser of VkPhysicalDeviceTexelBufferAlignmentProperties::storageTexelBufferOffsetAlignmentBytes or, if VkPhysicalDeviceTexelBufferAlignmentProperties::storageTexelBufferOffsetSingleTexelAlignment is VK_TRUE, the size of a texel of the requested format. If the size of a texel is a multiple of three bytes, then the size of a single component of format is used instead

- **VUID-VkBufferViewCreateInfo-offset-02751**
  If the texelBufferAlignment feature is enabled and if buffer was created with usage containing VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT, offset must be a multiple of the lesser of VkPhysicalDeviceTexelBufferAlignmentProperties::uniformTexelBufferOffsetAlignmentBytes or, if VkPhysicalDeviceTexelBufferAlignmentProperties::uniformTexelBufferOffsetSingleTexelAlignment is VK_TRUE, the size of a texel of the requested format. If the size of a texel is a multiple of three bytes, then the size of a single component of format is used instead

- **VUID-VkBufferViewCreateInfo-pNext-08780**
  If the pNext chain includes a VkBufferUsageFlags2CreateInfoKHR, its usage must not contain any other bit than VK_BUFFER_USAGE_2_UNIFORM_TEXEL_BUFFER_BIT_KHR or VK_BUFFER_USAGE_2_STORAGE_TEXEL_BUFFER_BIT_KHR

- **VUID-VkBufferViewCreateInfo-pNext-08781**
  If the pNext chain includes a VkBufferUsageFlags2CreateInfoKHR, its usage must be a subset of the VkBufferCreateInfo::usage specified or VkBufferUsageFlags2CreateInfoKHR::usage from VkBufferCreateInfo::pNext when creating buffer

---

**Valid Usage (Implicit)**

- **VUID-VkBufferViewCreateInfo-sType-sType**
  sType must be VK_STRUCTURE_TYPE_BUFFER_VIEW_CREATE_INFO

- **VUID-VkBufferViewCreateInfo-pNext-pNext**
  pNext must be NULL or a pointer to a valid instance of VkBufferUsageFlags2CreateInfoKHR

- **VUID-VkBufferViewCreateInfo-sType-unique**
  The sType value of each struct in the pNext chain must be unique

- **VUID-VkBufferViewCreateInfo-flags-zerobitmask**
  flags must be 0

- **VUID-VkBufferViewCreateInfo-buffer-parameter**

721
buffer must be a valid VkBuffer handle

- VUID-VkBufferViewCreateInfo-format-parameter
  format must be a valid VkFormat value

// Provided by VK_VERSION_1_0
typedef VkFlags VkBufferViewCreateFlags;

VkBufferViewCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

To destroy a buffer view, call:

// Provided by VK_VERSION_1_0
void vkDestroyBufferView(VkDevice device, VkBufferView bufferView, const VkAllocationCallbacks* pAllocator);

- device is the logical device that destroys the buffer view.
- bufferView is the buffer view to destroy.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyBufferView-bufferView-00936
  All submitted commands that refer to bufferView must have completed execution

- VUID-vkDestroyBufferView-bufferView-00937
  If VkAllocationCallbacks were provided when bufferView was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyBufferView-bufferView-00938
  If no VkAllocationCallbacks were provided when bufferView was created, pAllocator must be NULL

Valid Usage (Implicit)

- VUID-vkDestroyBufferView-device-parameter
  device must be a valid VkDevice handle

- VUID-vkDestroyBufferView-bufferView-parameter
  If bufferView is not VK_NULL_HANDLE, bufferView must be a valid VkBufferView handle

- VUID-vkDestroyBufferView-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure
If `bufferView` is a valid handle, it **must** have been created, allocated, or retrieved from `device`.

### Host Synchronization

- Host access to `bufferView` **must** be externally synchronized.

### 12.2.1. Buffer View Format Features

Valid uses of a `VkBufferView` **may** depend on the buffer view's format features, defined below. Such constraints are documented in the affected valid usage statement.

- If Vulkan 1.3 is supported or the `VK_KHR_format_feature_flags2` extension is supported, then the buffer view's set of format features is the value of `VkFormatProperties3::bufferFeatures` found by calling `vkGetPhysicalDeviceFormatProperties2` on the same format as `VkBufferViewCreateInfo::format`.

### 12.3. Images

Images represent multidimensional - up to 3 - arrays of data which **can** be used for various purposes (e.g. attachments, textures), by binding them to a graphics or compute pipeline via descriptor sets, or by directly specifying them as parameters to certain commands.

Images are represented by `VkImage` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkImage)
```

To create images, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateImage(            VkDevice device,            const VkImageCreateInfo* pCreateInfo,            const VkAllocationCallbacks* pAllocator,            VkImage* pImage);
```

- `device` is the logical device that creates the image.
- `pCreateInfo` is a pointer to a `VkImageCreateInfo` structure containing parameters to be used to create the image.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pImage` is a pointer to a `VkImage` handle in which the resulting image object is returned.
Valid Usage

- VUID-vkCreateImage-flags-00939
  If the flags member of pCreateInfo includes VK_IMAGE_CREATE_SPARSE_BINDING_BIT, creating this VkImage must not cause the total required sparse memory for all currently valid sparse resources on the device to exceed VkPhysicalDeviceLimits::sparseAddressSpaceSize

Valid Usage (Implicit)

- VUID-vkCreateImage-device-parameter
device must be a valid VkDevice handle

- VUID-vkCreateImage-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkImageCreateInfo structure

- VUID-vkCreateImage-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateImage-pImage-parameter
  pImage must be a valid pointer to a VkImage handle

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR

The VkImageCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkImageCreateFlags flags;
    VkImageType imageType;
    VkFormat format;
    VkExtent3D extent;
    uint32_t mipLevels;
    uint32_t arrayLayers;
    VkSampleCountFlagBits samples;
    VkImageTiling tiling;
} VkImageCreateInfo;
```
VkImageCreateInfo

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is a bitmask of VkImageCreateFlagBits describing additional parameters of the image.
- **imageType** is a VkImageType value specifying the basic dimensionality of the image. Layers in array textures do not count as a dimension for the purposes of the image type.
- **format** is a VkFormat describing the format and type of the texel blocks that will be contained in the image.
- **extent** is a VkExtent3D describing the number of data elements in each dimension of the base level.
- **mipLevels** describes the number of levels of detail available for minified sampling of the image.
- **arrayLayers** is the number of layers in the image.
- **samples** is a VkSampleCountFlagBits value specifying the number of samples per texel.
- **tiling** is a VkImageTiling value specifying the tiling arrangement of the texel blocks in memory.
- **usage** is a bitmask of VkImageUsageFlagBits describing the intended usage of the image.
- **sharingMode** is a VkSharingMode value specifying the sharing mode of the image when it will be accessed by multiple queue families.
- **queueFamilyIndexCount** is the number of entries in the pQueueFamilyIndices array.
- **pQueueFamilyIndices** is a pointer to an array of queue families that will access this image. It is ignored if sharingMode is not VK_SHARING_MODE_CONCURRENT.
- **initialLayout** is a VkImageLayout value specifying the initial VkImageLayout of all image subresources of the image. See Image Layouts.

Images created with **tiling** equal to VK_IMAGE_TILING_LINEAR have further restrictions on their limits and capabilities compared to images created with **tiling** equal to VK_IMAGE_TILING_OPTIMAL. Creation of images with tiling VK_IMAGE_TILING_LINEAR may not be supported unless other parameters meet all of the constraints:

- **imageType** is VK_IMAGE_TYPE_2D
- **format** is not a depth/stencil format
- **mipLevels** is 1
- **arrayLayers** is 1
- **samples** is VK_SAMPLE_COUNT_1_BIT
- **usage** only includes VK_IMAGE_USAGE_TRANSFER_SRC_BIT and/or VK_IMAGE_USAGE_TRANSFER_DST_BIT
Images created with one of the formats that require a sampler Y′CbCr conversion, have further restrictions on their limits and capabilities compared to images created with other formats. Creation of images with a format requiring Y′CbCr conversion may not be supported unless other parameters meet all of the constraints:

- **imageType** is VK_IMAGE_TYPE_2D
- **mipLevels** is 1
- **arrayLayers** is 1, unless otherwise indicated by VkImageFormatProperties::maxArrayLayers, as returned by vkGetPhysicalDeviceImageFormatProperties
- **samples** is VK_SAMPLE_COUNT_1_BIT

Implementations may support additional limits and capabilities beyond those listed above.

To determine the set of valid usage bits for a given format, call vkGetPhysicalDeviceFormatProperties.

If the size of the resultant image would exceed maxResourceSize, then vkCreateImage must fail and return VK_ERROR_OUT_OF_DEVICE_MEMORY. This failure may occur even when all image creation parameters satisfy their valid usage requirements.

If the implementation reports VK_TRUE in VkPhysicalDeviceHostImageCopyPropertiesEXT::identicalMemoryTypeRequirements, usage of VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT must not affect the memory type requirements of the image as described in Sparse Resource Memory Requirements and Resource Memory Association.

**Note**

For images created without VK_IMAGE_CREATE_EXTENDED_USAGE_BIT a usage bit is valid if it is supported for the format the image is created with.

For images created with VK_IMAGE_CREATE_EXTENDED_USAGE_BIT a usage bit is valid if it is supported for at least one of the formats a VkImageView created from the image can have (see Image Views for more detail).

---

**Image Creation Limits**

Valid values for some image creation parameters are limited by a numerical upper bound or by inclusion in a bitset. For example, VkImageCreateInfo::arrayLayers is limited by imageCreateMaxArrayLayers, defined below; and VkImageCreateInfo::samples is limited by imageCreateSampleCounts, also defined below.

Several limiting values are defined below, as well as assisting values from which the limiting values are derived. The limiting values are referenced by the relevant valid usage statements of VkImageCreateInfo.

- Let VkBool32 imageCreateMaybeLinear indicate if the resultant image may be linear. (The definition below is trivial because certain extensions are disabled in this build of the specification).
If `tiling` is `VK_IMAGE_TILING_LINEAR`, then `imageCreateMaybeLinear` is `VK_TRUE`.

If `tiling` is `VK_IMAGE_TILING_OPTIMAL`, then `imageCreateMaybeLinear` is `VK_FALSE`.

- Let `VkFormatFeatureFlags imageCreateFormatFeatures` be the set of valid `format features` available during image creation.

  - If `tiling` is `VK_IMAGE_TILING_LINEAR`, then `imageCreateFormatFeatures` is the value of `VkFormatProperties::linearTilingFeatures` found by calling `vkGetPhysicalDeviceFormatProperties` with parameter `format` equal to `VkImageCreateInfo::format`.

  - If `tiling` is `VK_IMAGE_TILING_OPTIMAL`, then `imageCreateFormatFeatures` is the value of `VkFormatProperties::optimalTilingFeatures` found by calling `vkGetPhysicalDeviceFormatProperties` with parameter `format` equal to `VkImageCreateInfo::format`.

- Let `VkImageFormatProperties2 imageCreateImageFormatPropertiesList[]` be the list of structures obtained by calling `vkGetPhysicalDeviceImageFormatProperties2`, possibly multiple times, as follows:

  - The parameters `VkPhysicalDeviceImageFormatInfo2::format, imageType, tiling, usage, and flags` must be equal to those in `VkImageCreateInfo`.

  - If `VkImageCreateInfo::pNext` contains a `VkExternalMemoryImageCreateInfo` structure whose `handleTypes` is not 0, then `VkPhysicalDeviceImageFormatInfo2::pNext` must contain a `VkPhysicalDeviceExternalImageFormatInfo` structure whose `handleType` is not 0; and `vkGetPhysicalDeviceImageFormatProperties2` must be called for each handle type in `VkExternalMemoryImageCreateInfo::handleTypes`, successively setting `VkPhysicalDeviceExternalImageFormatInfo::handleType` on each call.

  - If `VkImageCreateInfo::pNext` contains no `VkExternalMemoryImageCreateInfo` structure, or contains a structure whose `handleTypes` is 0, then `VkPhysicalDeviceImageFormatInfo2::pNext` must either contain no `VkPhysicalDeviceExternalImageFormatInfo` structure, or contain a structure whose `handleType` is 0.

  - If `VkImageCreateInfo::pNext` contains a `VkVideoProfileListInfoKHR` structure then `VkPhysicalDeviceImageFormatInfo2::pNext` must also contain the same `VkVideoProfileListInfoKHR` structure on each call.

  - If any call to `vkGetPhysicalDeviceImageFormatProperties2` returns an error, then `imageCreateImageFormatPropertiesList` is defined to be the empty list.

- Let `uint32_t imageCreateMaxMipLevels` be the minimum value of `VkImageFormatProperties::maxMipLevels` in `imageCreateImageFormatPropertiesList`. The value is undefined if `imageCreateImageFormatPropertiesList` is empty.

- Let `uint32_t imageCreateMaxArrayLayers` be the minimum value of `VkImageFormatProperties::maxArrayLayers` in `imageCreateImageFormatPropertiesList`. The value is undefined if `imageCreateImageFormatPropertiesList` is empty.

- Let `VkExtent3D imageCreateMaxExtent` be the component-wise minimum over all `VkImageFormatProperties::maxExtent` values in `imageCreateImageFormatPropertiesList`. The value is undefined if `imageCreateImageFormatPropertiesList` is empty.
• Let \( \text{VkSampleCountFlags imageCreateSampleCounts} \) be the intersection of each \( \text{VkImageFormatProperties::sampleCounts} \) in \( \text{imageCreateImageFormatPropertiesList} \). The value is undefined if \( \text{imageCreateImageFormatPropertiesList} \) is empty.

• Let \( \text{VkVideoFormatPropertiesKHR videoFormatProperties[]} \) be defined as follows.
  ◦ If \( \text{VkImageCreateInfo::pNext} \) contains a \( \text{VkVideoProfileListInfoKHR} \) structure, then \( \text{videoFormatProperties} \) is the list of structures obtained by calling \( \text{vkGetPhysicalDeviceVideoFormatPropertiesKHR} \) with \( \text{VkPhysicalDeviceVideoFormatInfoKHR::imageUsage} \) equal to the \( \text{usage} \) member of \( \text{VkImageCreateInfo} \) and \( \text{VkPhysicalDeviceVideoFormatInfoKHR::pNext} \) containing the same \( \text{VkVideoProfileListInfoKHR} \) structure chained to \( \text{VkImageCreateInfo} \).
  ◦ If \( \text{VkImageCreateInfo::pNext} \) contains no \( \text{VkVideoProfileListInfoKHR} \) structure, then \( \text{videoFormatProperties} \) is an empty list.

• Let \( \text{VkBool32 supportedVideoFormat} \) indicate if the image parameters are supported by the specified video profiles.
  ◦ \( \text{supportedVideoFormat} \) is \( \text{VK_TRUE} \) if there exists an element in the \( \text{videoFormatProperties} \) list for which all of the following conditions are true:
    ▪ \( \text{VkImageCreateInfo::format} \) equals \( \text{VkVideoFormatPropertiesKHR::format} \).
    ▪ \( \text{VkImageCreateInfo::flags} \) only contains bits also set in \( \text{VkVideoFormatPropertiesKHR::imageCreateFlags} \).
    ▪ \( \text{VkImageCreateInfo::imageType} \) equals \( \text{VkVideoFormatPropertiesKHR::imageType} \).
    ▪ \( \text{VkImageCreateInfo::tiling} \) equals \( \text{VkVideoFormatPropertiesKHR::imageTiling} \).
    ▪ \( \text{VkImageCreateInfo::usage} \) only contains bits also set in \( \text{VkVideoFormatPropertiesKHR::imageUsageFlags} \).
  ◦ Otherwise \( \text{supportedVideoFormat} \) is \( \text{VK_FALSE} \).

**Valid Usage**

• VUID-VkImageCreateInfo-imageCreateMaxMipLevels-02251
  Each of the following values (as described in Image Creation Limits) **must** not be undefined: \( \text{imageCreateMaxMipLevels} \), \( \text{imageCreateMaxArrayLayers} \), \( \text{imageCreateMaxExtent} \), and \( \text{imageCreateSampleCounts} \)

• VUID-VkImageCreateInfo-sharingMode-00941
  If \( \text{sharingMode} \) is \( \text{VK_SHARING_MODE_CONCURRENT} \), \( \text{pQueueFamilyIndices} \) **must** be a valid pointer to an array of \( \text{queueFamilyIndexCount uint32_t} \) values

• VUID-VkImageCreateInfo-sharingMode-00942
  If \( \text{sharingMode} \) is \( \text{VK_SHARING_MODE_CONCURRENT} \), \( \text{queueFamilyIndexCount} \) **must** be greater than 1

• VUID-VkImageCreateInfo-sharingMode-01420
  If \( \text{sharingMode} \) is \( \text{VK_SHARING_MODE_CONCURRENT} \), each element of \( \text{pQueueFamilyIndices} \) **must** be unique and **must** be less than \( \text{queueFamilyPropertyCount} \) returned by either \( \text{vkGetPhysicalDeviceQueueFamilyProperties} \) or
vkGetPhysicalDeviceQueueFamilyProperties2 for the physicalDevice that was used to create device

- VUID-VkImageCreateInfo-format-00943 format must not be VK_FORMAT_UNDEFINED
- VUID-VkImageCreateInfo-extent-00944 extent.width must be greater than 0
- VUID-VkImageCreateInfo-extent-00945 extent.height must be greater than 0
- VUID-VkImageCreateInfo-extent-00946 extent.depth must be greater than 0
- VUID-VkImageCreateInfo-mipLevels-00947 mipLevels must be greater than 0
- VUID-VkImageCreateInfo-arrayLayers-00948 arrayLayers must be greater than 0
- VUID-VkImageCreateInfo-flags-00949 If flags contains VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT, imageType must be VK_IMAGE_TYPE_2D
- VUID-VkImageCreateInfo-flags-08865 If flags contains VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT, extent.width and extent.height must be equal
- VUID-VkImageCreateInfo-flags-08866 If flags contains VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT, arrayLayers must be greater than or equal to 6
- VUID-VkImageCreateInfo-flags-00950 If flags contains VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT, imageType must be VK_IMAGE_TYPE_3D
- VUID-VkImageCreateInfo-flags-09403 If flags contains VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT, flags must not include VK_IMAGE_CREATE_SPARSE_ALIASED_BIT, VK_IMAGE_CREATE_SPARSE_BINDING_BIT, or VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT
- VUID-VkImageCreateInfo-extent-02252 extent.width must be less than or equal to imageCreateMaxExtent.width (as defined in Image Creation Limits)
- VUID-VkImageCreateInfo-extent-02253 extent.height must be less than or equal to imageCreateMaxExtent.height (as defined in Image Creation Limits)
- VUID-VkImageCreateInfo-extent-02254 extent.depth must be less than or equal to imageCreateMaxExtent.depth (as defined in Image Creation Limits)
- VUID-VkImageCreateInfo-imageType-00956 If imageType is VK_IMAGE_TYPE_1D, both extent.height and extent.depth must be 1
• VUID-VkImageCreateInfo-imageType-00957
  If imageType is VK_IMAGE_TYPE_2D, extent.depth must be 1

• VUID-VkImageCreateInfo-mipLevels-00958
  mipLevels must be less than or equal to the number of levels in the complete mipmap chain based on extent.width, extent.height, and extent.depth

• VUID-VkImageCreateInfo-mipLevels-02255
  mipLevels must be less than or equal to imageCreateMaxMipLevels (as defined in Image Creation Limits)

• VUID-VkImageCreateInfo-arrayLayers-02256
  arrayLayers must be less than or equal to imageCreateMaxArrayLayers (as defined in Image Creation Limits)

• VUID-VkImageCreateInfo-imageType-00961
  If imageType is VK_IMAGE_TYPE_3D, arrayLayers must be 1

• VUID-VkImageCreateInfo-samples-02257
  If samples is not VK_SAMPLE_COUNT_1_BIT, then imageType must be VK_IMAGE_TYPE_2D, flags must not contain VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT, mipLevels must be equal to 1, and imageCreateMaybeLinear (as defined in Image Creation Limits) must be VK_FALSE,

• VUID-VkImageCreateInfo-usage-00963
  If usage includes VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT, then bits other than VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT, VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, and VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT must not be set

• VUID-VkImageCreateInfo-usage-00964
  If usage includes VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT, VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT, or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT, extent.width must be less than or equal to VkPhysicalDeviceLimits::maxFramebufferWidth

• VUID-VkImageCreateInfo-usage-00965
  If usage includes VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT, VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT, or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT, extent.height must be less than or equal to VkPhysicalDeviceLimits::maxFramebufferHeight

• VUID-VkImageCreateInfo-usage-00966
  If usage includes VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT, usage must also contain at least one of VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT, VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

• VUID-VkImageCreateInfo-samples-02258
  samples must be a valid VkSampleCountFlagBits value that is set in imageCreateSampleCounts (as defined in Image Creation Limits)

• VUID-VkImageCreateInfo-usage-00968
  If the shaderStorageImageMultisample feature is not enabled, and usage contains VK_IMAGE_USAGE_STORAGE_BIT, samples must be VK_SAMPLE_COUNT_1_BIT

• VUID-VkImageCreateInfo-flags-00969
  If the sparseBinding feature is not enabled, flags must not contain
VK_IMAGE_CREATE_SPARSE_BINDING_BIT

- VUID-VkImageCreateInfo-flags-01924
  If the sparseResidencyAliased feature is not enabled, flags must not contain VK_IMAGE_CREATE_SPARSE_ALIASED_BIT

- VUID-VkImageCreateInfo-tiling-04121
  If tiling is VK_IMAGE_TILING_LINEAR, flags must not contain VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT

- VUID-VkImageCreateInfo-imageType-00970
  If imageType is VK_IMAGE_TYPE_1D, flags must not contain VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT

- VUID-VkImageCreateInfo-imageType-00971
  If the sparseResidencyImage2D feature is not enabled, and imageType is VK_IMAGE_TYPE_2D, flags must not contain VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT

- VUID-VkImageCreateInfo-imageType-00972
  If the sparseResidencyImage3D feature is not enabled, and imageType is VK_IMAGE_TYPE_3D, flags must not contain VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT

- VUID-VkImageCreateInfo-imageType-00973
  If the sparseResidency2Samples feature is not enabled, imageType is VK_IMAGE_TYPE_2D, and samples is VK_SAMPLE_COUNT_2_BIT, flags must not contain VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT

- VUID-VkImageCreateInfo-imageType-00974
  If the sparseResidency4Samples feature is not enabled, imageType is VK_IMAGE_TYPE_2D, and samples is VK_SAMPLE_COUNT_4_BIT, flags must not contain VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT

- VUID-VkImageCreateInfo-imageType-00975
  If the sparseResidency8Samples feature is not enabled, imageType is VK_IMAGE_TYPE_2D, and samples is VK_SAMPLE_COUNT_8_BIT, flags must not contain VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT

- VUID-VkImageCreateInfo-imageType-00976
  If the sparseResidency16Samples feature is not enabled, imageType is VK_IMAGE_TYPE_2D, and samples is VK_SAMPLE_COUNT_16_BIT, flags must not contain VK_IMAGE>Create_SPARSE_RESIDENCY_BIT

- VUID-VkImageCreateInfo-flags-00987
  If flags contains VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT or VK_IMAGE_CREATE_SPARSE_ALIASED_BIT, it must also contain VK_IMAGE_CREATE_SPARSE_BINDING_BIT

- VUID-VkImageCreateInfo-None-01925
  If any of the bits VK_IMAGE_CREATE_SPARSE_BINDING_BIT, VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT, or VK_IMAGE_CREATE_SPARSE_ALIASED_BIT are set, VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT must not also be set

- VUID-VkImageCreateInfo-flags-01890
  If the protectedMemory feature is not enabled, flags must not contain VK_IMAGE_CREATE_PROTECTED_BIT
If any of the bits VK_IMAGE_CREATE_SPARSE_BINDING_BIT, VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT, or VK_IMAGE_CREATE_SPARSE_ALIASED_BIT are set, VK_IMAGE_CREATE_PROTECTED_BIT must not also be set.

If the pNext chain includes a VkExternalMemoryImageCreateInfo structure, its handleTypes member must only contain bits that are also in VkExternalImageFormatProperties::externalMemoryProperties.compatibleHandleTypes, as returned by vkGetPhysicalDeviceImageFormatProperties2 with format, imageType, tiling, usage, and flags equal to those in this structure, and with a VkPhysicalDeviceExternalImageFormatInfo structure included in the pNext chain, with a handleType equal to any one of the handle types specified in VkExternalMemoryImageCreateInfo::handleTypes.

If the logical device was created with VkDeviceGroupDeviceCreateInfo::physicalDeviceCount equal to 1, flags must not contain VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT.

If flags contains VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT, then mipLevels must be one, arrayLayers must be one, imageType must be VK_IMAGE_TYPE_2D, and imageCreateMaybeLinear (as defined in Image Creation Limits) must be VK_FALSE.

If flags contains VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT, then format must be a compressed image format.

If flags contains VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT, then flags must also contain VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT.

initialLayout must be VK_IMAGE_LAYOUT_UNDEFINED or VK_IMAGE_LAYOUT_PREINITIALIZED.

If the pNext chain includes a VkExternalMemoryImageCreateInfo or VkExternalMemoryImageCreateInfoNV structure whose handleTypes member is not 0, initialLayout must be VK_IMAGE_LAYOUT_UNDEFINED.

If the image format is one of the formats that require a sampler Y’C_bC_R conversion, mipLevels must be 1.

If the image format is one of the formats that require a sampler Y’C_bC_R conversion, samples must be VK_SAMPLE_COUNT_1_BIT.

If the image format is one of the formats that require a sampler Y’C_bC_R conversion, imageType must be VK_IMAGE_TYPE_2D.

If the logical device was created with VkDeviceGroupDeviceCreateInfo::physicalDeviceCount equal to 1, flags must not contain VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT.
If \textit{format} is a \textit{multi-planar} format, and if \textit{imageCreateFormatFeatures} (as defined in \textit{Image Creation Limits}) does not contain \textit{VK_FORMAT_FEATURE_DISJOINT_BIT}, then \textit{flags} must not contain \textit{VK_IMAGE_CREATE_DISJOINT_BIT}.

- \textbf{VUID-VkImageCreateInfo-format-01577}

  If \textit{format} is not a \textit{multi-planar} format, and \textit{flags} does not include \textit{VK_IMAGE_CREATE_ALIAS_BIT}, \textit{flags} must not contain \textit{VK_IMAGE_CREATE_DISJOINT_BIT}.

- \textbf{VUID-VkImageCreateInfo-format-04712}

  If \textit{format} has a \texttt{.422} or \texttt{.420} suffix, \textit{width} must be a multiple of 2.

- \textbf{VUID-VkImageCreateInfo-format-04713}

  If \textit{format} has a \texttt{.420} suffix, \textit{height} must be a multiple of 2.

- \textbf{VUID-VkImageCreateInfo-format-02795}

  If \textit{format} is a depth-stencil format, \textit{usage} includes \textit{VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT}, and the \textit{pNext} chain includes a \textit{VkImageStencilUsageCreateInfo} structure, then its \textit{VkImageStencilUsageCreateInfo::stencilUsage} member must also include \textit{VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT}.

- \textbf{VUID-VkImageCreateInfo-format-02796}

  If \textit{format} is a depth-stencil format, \textit{usage} does not include \textit{VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT}, and the \textit{pNext} chain includes a \textit{VkImageStencilUsageCreateInfo} structure, then its \textit{VkImageStencilUsageCreateInfo::stencilUsage} member must also not include \textit{VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT}.

- \textbf{VUID-VkImageCreateInfo-format-02797}

  If \textit{format} is a depth-stencil format, \textit{usage} includes \textit{VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT}, and the \textit{pNext} chain includes a \textit{VkImageStencilUsageCreateInfo} structure, then its \textit{VkImageStencilUsageCreateInfo::stencilUsage} member must also include \textit{VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT}.

- \textbf{VUID-VkImageCreateInfo-format-02798}

  If \textit{format} is a depth-stencil format, \textit{usage} does not include \textit{VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT}, and the \textit{pNext} chain includes a \textit{VkImageStencilUsageCreateInfo} structure, then its \textit{VkImageStencilUsageCreateInfo::stencilUsage} member must also not include \textit{VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT}.

- \textbf{VUID-VkImageCreateInfo-Format-02536}

  If \textit{Format} is a depth-stencil format and the \textit{pNext} chain includes a \textit{VkImageStencilUsageCreateInfo} structure with its \textit{stencilUsage} member including \textit{VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT}, \textit{extent.width} must be less than or equal to \textit{VkPhysicalDeviceLimits::maxFramebufferWidth}.

- \textbf{VUID-VkImageCreateInfo-format-02537}

  If \textit{format} is a depth-stencil format and the \textit{pNext} chain includes a \textit{VkImageStencilUsageCreateInfo} structure with its \textit{stencilUsage} member including \textit{VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT}, \textit{extent.height} must be less than or equal to \textit{VkPhysicalDeviceLimits::maxFramebufferHeight}.

- \textbf{VUID-VkImageCreateInfo-format-02538}

  If the \textit{shaderStorageImageMultisample} feature is not enabled, \textit{format} is a depth-stencil format and the \textit{pNext} chain includes a \textit{VkImageStencilUsageCreateInfo} structure with its
Stencil usage including `VK_IMAGE_USAGE_STORAGE_BIT`, `samples` must be `VK_SAMPLE_COUNT_1_BIT`.

- **VUID-VkImageCreateInfo-imageType-02082**
  If `usage` includes `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`, `imageType` must be `VK_IMAGE_TYPE_2D`.

- **VUID-VkImageCreateInfo-samples-02083**
  If `usage` includes `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`, `samples` must be `VK_SAMPLE_COUNT_1_BIT`.

- **VUID-VkImageCreateInfo-imageView2DOn3DImage-04459**
  If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::imageView2DOn3DImage` is `VK_FALSE`, `flags` must not contain `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT`.

- **VUID-VkImageCreateInfo-multisampleArrayImage-04460**
  If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::multisampleArrayImage` is `VK_FALSE`, and `samples` is not `VK_SAMPLE_COUNT_1_BIT`, then `arrayLayers` must be `1`.

- **VUID-VkImageCreateInfo-pNext-06722**
  If a `VkImageFormatListCreateInfo` structure was included in the `pNext` chain and `VkImageFormatListCreateInfo::viewFormatCount` is not zero, then each format in `VkImageFormatListCreateInfo::pViewFormats` must either be compatible with the `format` as described in the compatibility table or, if `flags` contains `VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT`, be an uncompressed format that is size-compatible with `format`.

- **VUID-VkImageCreateInfo-flags-04738**
  If `flags` does not contain `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT` and the `pNext` chain includes a `VkImageFormatListCreateInfo` structure, then `VkImageFormatListCreateInfo::viewFormatCount` must be `0` or `1`.

- **VUID-VkImageCreateInfo-usage-04815**
  If `usage` includes `VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR`, `VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR`, or `VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR`, and `flags` does not include `VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR`, then the `pNext` chain must include a `VkVideoProfileListInfoKHR` structure with `profileCount` greater than `0` and `pProfiles` including at least one `VkVideoProfileInfoKHR` structure with a `videoCodecOperation` member specifying a decode operation.

- **VUID-VkImageCreateInfo-usage-04816**
  If `usage` includes `VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR`, `VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR`, or `VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR`, and `flags` does not include `VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR`, then the `pNext` chain must include a `VkVideoProfileListInfoKHR` structure with `profileCount` greater than `0` and `pProfiles` including at least one `VkVideoProfileInfoKHR` structure with a `videoCodecOperation` member specifying an encode operation.

- **VUID-VkImageCreateInfo-flags-08328**
  If `flags` includes `VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR`, then `videoMaintenance1` must be enabled.
If `flags` includes `VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR` and `usage` does not include `VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR`, then `usage` must not include `VK_IMAGE_USAGE_VIDEO_DECODE_DP_BUFFER_BIT_KHR`.

If `flags` includes `VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR`, then `usage` must not include `VK_IMAGE_USAGE_VIDEO_ENCODE_DP_BUFFER_BIT_KHR`.

If the `pNext` chain includes a `VkVideoProfileListInfoKHR` structure with `profileCount` greater than 0, then `supportedVideoFormat` must be `VK_TRUE`.

If `imageCreateFormatFeatures` (as defined in Image Creation Limits) does not contain `VK_FORMAT_FEATURE_2_HOST_IMAGE_TRANSFER_BIT_EXT`, then `usage` must not contain `VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT`.

### Valid Usage (Implicit)

- **VUID-VkImageCreateInfo-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_IMAGE_CREATE_INFO`

- **VUID-VkImageCreateInfo-pNext-pNext**
  - Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkExternalMemoryImageCreateInfo`, `VkImageFormatListCreateInfo`, `VkImageStencilUsageCreateInfo`, `VkImageSwapchainCreateInfoKHR`, or `VkVideoProfileListInfoKHR`.

- **VUID-VkImageCreateInfo-sType-unique**
  - The `sType` value of each struct in the `pNext` chain must be unique.

- **VUID-VkImageCreateInfo-flags-parameter**
  - `flags` must be a valid combination of `VkImageCreateFlagBits` values.

- **VUID-VkImageCreateInfo-imageType-parameter**
  - `imageType` must be a valid `VkImageType` value.

- **VUID-VkImageCreateInfo-format-parameter**
  - `format` must be a valid `VkFormat` value.

- **VUID-VkImageCreateInfo-samples-parameter**
  - `samples` must be a valid `VkSampleCountFlagBits` value.

- **VUID-VkImageCreateInfo-tiling-parameter**
  - `tiling` must be a valid `VkImageTiling` value.

- **VUID-VkImageCreateInfo-usage-parameter**
  - `usage` must be a valid combination of `VkImageUsageFlagBits` values.

- **VUID-VkImageCreateInfo-usage-requiredbitmask**
  - `usage` must not be `0`.

- **VUID-VkImageCreateInfo-sharingMode-parameter**
  - `sharingMode` must be a valid `VkSharingMode` value.
The `VkImageStencilUsageCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkImageStencilUsageCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkImageUsageFlags stencilUsage;
} VkImageStencilUsageCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stencilUsage` is a bitmask of `VkImageUsageFlagBits` describing the intended usage of the stencil aspect of the image.

If the `pNext` chain of `VkImageCreateInfo` includes a `VkImageStencilUsageCreateInfo` structure, then that structure includes the usage flags specific to the stencil aspect of the image for an image with a depth-stencil format.

This structure specifies image usages which only apply to the stencil aspect of a depth/stencil format image. When this structure is included in the `pNext` chain of `VkImageCreateInfo`, the stencil aspect of the image **must** only be used as specified by `stencilUsage`. When this structure is not included in the `pNext` chain of `VkImageCreateInfo`, the stencil aspect of an image **must** only be used as specified by `VkImageCreateInfo::usage`. Use of other aspects of an image are unaffected by this structure.

This structure **can** also be included in the `pNext` chain of `VkPhysicalDeviceImageFormatInfo2` to query additional capabilities specific to image creation parameter combinations including a separate set of usage flags for the stencil aspect of the image using `vkGetPhysicalDeviceImageFormatProperties2`. When this structure is not included in the `pNext` chain of `VkPhysicalDeviceImageFormatInfo2` then the implicit value of `stencilUsage` matches that of `VkPhysicalDeviceImageFormatInfo2::usage`.

### Valid Usage

- VUID-VkImageStencilUsageCreateInfo-stencilUsage-02539

  If `stencilUsage` includes `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT`, it **must** not include bits other than `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`.

### Valid Usage (Implicit)

- VUID-VkImageStencilUsageCreateInfo-sType-sType
**sType** must be `VK_STRUCTURE_TYPE_IMAGE_STENCIL_USAGE_CREATE_INFO`

- VUID-VkImageStencilUsageCreateInfo-stencilUsage-parameter
  **stencilUsage** must be a valid combination of `VkImageUsageFlagBits` values

- VUID-VkImageStencilUsageCreateInfo-stencilUsage-requiredbitmask
  **stencilUsage** must not be 0

To define a set of external memory handle types that may be used as backing store for an image, add a `VkExternalMemoryImageCreateInfo` structure to the `pNext` chain of the `VkImageCreateInfo` structure. The `VkExternalMemoryImageCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkExternalMemoryImageCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkExternalMemoryHandleTypeFlags handleTypes;
} VkExternalMemoryImageCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_external_memory
typedef VkExternalMemoryImageCreateInfo VkExternalMemoryImageCreateInfoKHR;
```

**Note**

A `VkExternalMemoryImageCreateInfo` structure with a non-zero `handleTypes` field must be included in the creation parameters for an image that will be bound to memory that is either exported or imported.

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **handleTypes** is zero or a bitmask of `VkExternalMemoryHandleTypeFlagBits` specifying one or more external memory handle types.

### Valid Usage (Implicit)

- VUID-VkExternalMemoryImageCreateInfo-sType-sType
  **sType** must be `VK_STRUCTURE_TYPE_EXTERNAL_MEMORY_IMAGE_CREATE_INFO`

- VUID-VkExternalMemoryImageCreateInfo-handleTypes-parameter
  **handleTypes** must be a valid combination of `VkExternalMemoryHandleTypeFlagBits` values

If the `pNext` chain of `VkImageCreateInfo` includes a `VkImageSwapchainCreateInfoKHR` structure, then that structure includes a swapchain handle indicating that the image will be bound to memory from that swapchain.
The `VkImageSwapchainCreateInfoKHR` structure is defined as:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_swapchain
typedef struct VkImageSwapchainCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSwapchainKHR swapchain;
} VkImageSwapchainCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `swapchain` is `VK_NULL_HANDLE` or a handle of a swapchain that the image will be bound to.

### Valid Usage

- VUID-VkImageSwapchainCreateInfoKHR-swapchain-00995
  - If `swapchain` is not `VK_NULL_HANDLE`, the fields of `VkImageCreateInfo` must match the implied image creation parameters of the swapchain

### Valid Usage (Implicit)

- VUID-VkImageSwapchainCreateInfoKHR-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_IMAGE_SWAPCHAIN_CREATE_INFO_KHR`
- VUID-VkImageSwapchainCreateInfoKHR-swapchain-parameter
  - If `swapchain` is not `VK_NULL_HANDLE`, `swapchain` must be a valid `VkSwapchainKHR` handle

If the `pNext` chain of `VkImageCreateInfo` includes a `VkImageFormatListCreateInfo` structure, then that structure contains a list of all formats that can be used when creating views of this image.

The `VkImageFormatListCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkImageFormatListCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t viewFormatCount;
    const VkFormat* pViewFormats;
} VkImageFormatListCreateInfo;
```

or the equivalent

---

738
```c
typedef VkImageFormatListCreateInfo VkImageFormatListCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `viewFormatCount` is the number of entries in the `pViewFormats` array.
- `pViewFormats` is a pointer to an array of `VkFormat` values specifying all formats which can be used when creating views of this image.

If `viewFormatCount` is zero, `pViewFormats` is ignored and the image is created as if the `VkImageFormatListCreateInfo` structure were not included in the `pNext` chain of `VkImageCreateInfo`.

### Valid Usage

- **VUID-VkImageFormatListCreateInfo-viewFormatCount-09540**
  If `viewFormatCount` is not 0, each element of `pViewFormats` must not be `VK_FORMAT_UNDEFINED`

### Valid Usage (Implicit)

- **VUID-VkImageFormatListCreateInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_IMAGE_FORMAT_LIST_CREATE_INFO`
- **VUID-VkImageFormatListCreateInfo-pViewFormats-parameter**
  If `viewFormatCount` is not 0, `pViewFormats` must be a valid pointer to an array of `viewFormatCount` valid `VkFormat` values

Bits which can be set in

- `VkImageViewUsageCreateInfo::usage`
- `VkImageStencilUsageCreateInfo::stencilUsage`
- `VkImageCreateInfo::usage`

specify intended usage of an image, and are:

```c
typedef enum VkImageUsageFlagBits {
    VK_IMAGE_USAGE_TRANSFER_SRC_BIT = 0x00000001,
    VK_IMAGE_USAGE_TRANSFER_DST_BIT = 0x00000002,
    VK_IMAGE_USAGE_SAMPLED_BIT = 0x00000004,
    VK_IMAGE_USAGE_STORAGE_BIT = 0x00000008,
    VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT = 0x00000010,
    VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT = 0x00000020,
    VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT = 0x00000040,
    VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT = 0x00000080,
} VkImageUsageFlagBits;
```
- **VK_IMAGE_USAGE_TRANSFER_SRC_BIT** specifies that the image can be used as the source of a transfer command.
- **VK_IMAGE_USAGE_TRANSFER_DST_BIT** specifies that the image can be used as the destination of a transfer command.
- **VK_IMAGE_USAGE_SAMPLED_BIT** specifies that the image can be used to create a VkImageView suitable for occupying a VkDescriptorSet slot either of type `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE` or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, and be sampled by a shader.
- **VK_IMAGE_USAGE_STORAGE_BIT** specifies that the image can be used to create a VkImageView suitable for occupying a VkDescriptorSet slot of type `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`.
- **VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT** specifies that the image can be used to create a VkImageView suitable for use as a color or resolve attachment in a VkFramebuffer.
- **VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT** specifies that the image can be used to create a VkImageView suitable for use as a depth/stencil or depth/stencil resolve attachment in a VkFramebuffer.
- **VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT** specifies that implementations may support using memory allocations with the `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT` to back an image with this usage. This bit can be set for any image that can be used to create a VkImageView suitable for use as a color, resolve, depth/stencil, or input attachment.
- **VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT** specifies that the image can be used to create a VkImageView suitable for occupying VkDescriptorSet slot of type `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`; be read from a shader as an input attachment; and be used as an input attachment in a framebuffer.
- **VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR** specifies that the image can be used to create a VkImageView suitable for use as a fragment shading rate attachment.
- **VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR** specifies that the image can be used as a decode
output picture in a video decode operation.

- **VK_IMAGE_USAGE_VIDEO_CODEC_SRC_BIT_KHR** is reserved for future use.
- **VK_IMAGE_USAGE_VIDEO_CODEC_DPB_BIT_KHR** specifies that the image can be used as an output reconstructed picture or an input reference picture in a video decode operation.
- **VK_IMAGE_USAGE_VIDEO_CODEC_DST_BIT_KHR** is reserved for future use.
- **VK_IMAGE_USAGE_VIDEO_CODEC_SRC_BIT_KHR** specifies that the image can be used as an encode input picture in a video encode operation.
- **VK_IMAGE_USAGE_VIDEO_CODEC_DPB_BIT_KHR** specifies that the image can be used as an output reconstructed picture or an input reference picture in a video encode operation.
- **VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT** specifies that the image can be transitioned to the **VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT** layout to be used as a color or depth/stencil attachment in a VkFramebuffer and/or as a read-only input resource in a shader (sampled image, combined image sampler or input attachment) in the same render pass.
- **VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT** specifies that the image can be used with host copy commands and host layout transitions.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkImageUsageFlags;
```

**VkImageUsageFlags** is a bitmask type for setting a mask of zero or more **VkImageUsageFlagBits**.

When creating a **VkImageView** one of the following **VkImageUsageFlagBits** must be set:

- **VK_IMAGE_USAGE_SAMPLED_BIT**
- **VK_IMAGE_USAGE_STORAGE_BIT**
- **VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT**
- **VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT**
- **VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT**
- **VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT**
- **VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR**
- **VK_IMAGE_USAGE_VIDEO_CODEC_DST_BIT_KHR**
- **VK_IMAGE_USAGE_VIDEO_CODEC_DPB_BIT_KHR**
- **VK_IMAGE_USAGE_VIDEO_CODEC_SRC_BIT_KHR**
- **VK_IMAGE_USAGE_VIDEO_CODEC_DPB_BIT_KHR**

Bits which can be set in **VkImageCreateInfo::flags**, specifying additional parameters of an image, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkImageCreateFlagBits {
    VK_IMAGE_CREATE_SPARSE_BINDING_BIT = 0x00000001,
    ...
} VkImageCreateFlagBits;
```
• **VK_IMAGE_CREATE_SPARSE_BINDING_BIT** specifies that the image will be backed using sparse memory binding.

• **VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT** specifies that the image can be partially backed using sparse memory binding. Images created with this flag must also be created with the **VK_IMAGE_CREATE_SPARSE_BINDING_BIT** flag.

• **VK_IMAGE_CREATE_SPARSE_ALIASED_BIT** specifies that the image will be backed using sparse memory binding with memory ranges that might also simultaneously be backing another image (or another portion of the same image). Images created with this flag must also be created with the **VK_IMAGE_CREATE_SPARSE_BINDING_BIT** flag.

• **VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT** specifies that the image can be used to create a VkImageView with a different format from the image. For multi-planar formats,
VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT specifies that a VkImageView can be created of a plane of the image.

- VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT specifies that the image can be used to create a VkImageView of type VK_IMAGE_VIEW_TYPE_CUBE or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY.

- VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT specifies that the image can be used to create a VkImageView of type VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY.

- VK_IMAGE_CREATE_PROTECTED_BIT specifies that the image is a protected image.

- VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT specifies that the image can be used with a non-zero value of the splitInstanceBindRegionCount member of a VkBindImageMemoryDeviceGroupInfo structure passed into vkBindImageMemory2. This flag also has the effect of making the image use the standard sparse image block dimensions.

- VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT specifies that the image having a compressed format can be used to create a VkImageView with an uncompressed format where each texel in the image view corresponds to a compressed texel block of the image.

- VK_IMAGE_CREATE_EXTENDED_USAGE_BIT specifies that the image can be created with usage flags that are not supported for the format the image is created with but are supported for at least one format a VkImageView created from the image can have.

- VK_IMAGE_CREATE_DISJOINT_BIT specifies that an image with a multi-planar format must have each plane separately bound to memory, rather than having a single memory binding for the whole image; the presence of this bit distinguishes a disjoint image from an image without this bit set.

- VK_IMAGE_CREATE_ALIAS_BIT specifies that two images created with the same creation parameters and aliased to the same memory can interpret the contents of the memory consistently with each other, subject to the rules described in the Memory Aliasing section. This flag further specifies that each plane of a disjoint image can share an in-memory non-linear representation with single-plane images, and that a single-plane image can share an in-memory non-linear representation with a plane of a multi-planar disjoint image, according to the rules in Compatible Formats of Planes of Multi-Planar Formats. If the pNext chain includes a VkExternalMemoryImageCreateInfo structure whose handleTypes member is not 0, it is as if VK_IMAGE_CREATE_ALIAS_BIT is set.

- VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR specifies that the image can be used in video coding operations without having to specify at image creation time the set of video profiles the image will be used with, except for images used only as DPB pictures, as long as the image is otherwise compatible with the video profile in question.

Note
This enables exchanging video picture data without additional copies or conversions when used as:

- **Decode output pictures**, indifferent of the video profile used to produce them.
- **Encode input pictures**, indifferent of the video profile used to consume them.
This includes images created with both
VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR and
VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR, which is necessary to use the same
video picture as the reconstructed picture and decode output picture in a video
decode operation on implementations supporting
VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR.

However, images with only DPB usage remain tied to the video profiles the
image was created with, as the data layout of such DPB-only images may be
implementation- and codec-dependent.

If an application would like to share or reuse the device memory backing such
images (e.g. for the purposes of temporal aliasing), then it should create
separate image objects for each video profile and bind them to the same
underlying device memory range, similar to how memory resources can be
shared across separate video sessions or any other memory-backed resource.

See Sparse Resource Features and Sparse Physical Device Features for more details.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkImageCreateFlags;
```

VkImageCreateFlags is a bitmask type for setting a mask of zero or more VkImageCreateFlagBits.

Possible values of VkImageCreateInfo::imageType, specifying the basic dimensionality of an image,
are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkImageType {
    VK_IMAGE_TYPE_1D = 0,
    VK_IMAGE_TYPE_2D = 1,
    VK_IMAGE_TYPE_3D = 2,
} VkImageType;
```

- **VK_IMAGE_TYPE_1D** specifies a one-dimensional image.
- **VK_IMAGE_TYPE_2D** specifies a two-dimensional image.
- **VK_IMAGE_TYPE_3D** specifies a three-dimensional image.

Possible values of VkImageCreateInfo::tiling, specifying the tiling arrangement of texel blocks in
an image, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkImageTiling {
    VK_IMAGE_TILING_OPTIMAL = 0,
    VK_IMAGE_TILING_LINEAR = 1,
} VkImageTiling;
```
• **VK_IMAGE_TILING_OPTIMAL** specifies optimal tiling (texels are laid out in an implementation-dependent arrangement, for more efficient memory access).

• **VK_IMAGE_TILING_LINEAR** specifies linear tiling (texels are laid out in memory in row-major order, possibly with some padding on each row).

To query the memory layout of an image subresource, call:

```c
// Provided by VK_VERSION_1_0
void vkGetImageSubresourceLayout(
    VkDevice device,
    VkImage image,
    const VkImageSubresource* pSubresource,
    VkSubresourceLayout* pLayout);
```

• **device** is the logical device that owns the image.

• **image** is the image whose layout is being queried.

• **pSubresource** is a pointer to a **VkImageSubresource** structure selecting a specific image subresource from the image.

• **pLayout** is a pointer to a **VkSubresourceLayout** structure in which the layout is returned.

The image **must** be **linear**. The returned layout is valid for **host access**.

If the image’s format is a **multi-planar format**, then **vkGetImageSubresourceLayout** describes one plane of the image.

**vkGetImageSubresourceLayout** is invariant for the lifetime of a single image.

---

**Valid Usage**

• **VUID-vkGetImageSubresourceLayout-image-07789**
  
  image **must** have been created with **tiling** equal to **VK_IMAGE_TILING_LINEAR**

• **VUID-vkGetImageSubresourceLayout-aspectMask-00997**
  
  The **aspectMask** member of **pSubresource** **must** only have a single bit set

• **VUID-vkGetImageSubresourceLayout-mipLevel-01716**
  
  The **mipLevel** member of **pSubresource** **must** be less than the **mipLevels** specified in **image**

• **VUID-vkGetImageSubresourceLayout-arrayLayer-01717**
  
  The **arrayLayer** member of **pSubresource** **must** be less than the **arrayLayers** specified in **image**

• **VUID-vkGetImageSubresourceLayout-format-08886**
  
  If **format** of the **image** is a color format that is not a **multi-planar image format**, and **tiling** of the **image** is **VK_IMAGE_TILING_LINEAR** or **VK_IMAGE_TILING_OPTIMAL**, the **aspectMask** member of **pSubresource** **must** be **VK_IMAGE_ASPECT_COLOR_BIT**

• **VUID-vkGetImageSubresourceLayout-format-04462**
  
  If **format** of the **image** has a depth component, the **aspectMask** member of **pSubresource**
must contain `VK_IMAGE_ASPECT_DEPTH_BIT`

- VUID-vkGetImageSubresourceLayout-format-04463
  If `format` of the `image` has a stencil component, the `aspectMask` member of `pSubresource` must contain `VK_IMAGE_ASPECT_STENCIL_BIT`

- VUID-vkGetImageSubresourceLayout-format-04464
  If `format` of the `image` does not contain a stencil or depth component, the `aspectMask` member of `pSubresource` must not contain `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT`

- VUID-vkGetImageSubresourceLayout-tiling-08717
  If the tiling of the `image` is `VK_IMAGE_TILING_LINEAR` and has a multi-planar image format, then the `aspectMask` member of `pSubresource` must be a single valid multi-planar aspect mask bit

**Valid Usage (Implicit)**

- VUID-vkGetImageSubresourceLayout-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkGetImageSubresourceLayout-image-parameter
  `image` must be a valid `VkImage` handle

- VUID-vkGetImageSubresourceLayout-pSubresource-parameter
  `pSubresource` must be a valid pointer to a valid `VkImageSubresource` structure

- VUID-vkGetImageSubresourceLayout-pLayout-parameter
  `pLayout` must be a valid pointer to a `VkSubresourceLayout` structure

- VUID-vkGetImageSubresourceLayout-image-parent
  `image` must have been created, allocated, or retrieved from `device`

The `VkImageSubresource` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageSubresource {
    VkImageAspectFlags aspectMask;
    uint32_t mipLevel;
    uint32_t arrayLayer;
} VkImageSubresource;
```

- `aspectMask` is a `VkImageAspectFlags` value selecting the image `aspect`.
- `mipLevel` selects the mipmap level.
- `arrayLayer` selects the array layer.

**Valid Usage (Implicit)**

- VUID-VkImageSubresource-aspectMask-parameter
aspectMask must be a valid combination of VkImageAspectFlagBits values

- VUID-VkImageSubresource-aspectMask-requiredbitsetmask
aspectMask must not be 0

Information about the layout of the image subresource is returned in a VkSubresourceLayout structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSubresourceLayout {
    VkDeviceSize offset;
    VkDeviceSize size;
    VkDeviceSize rowPitch;
    VkDeviceSize arrayPitch;
    VkDeviceSize depthPitch;
} VkSubresourceLayout;
```

- offset is the byte offset from the start of the image or the plane where the image subresource begins.
- size is the size in bytes of the image subresource. size includes any extra memory that is required based on rowPitch.
- rowPitch describes the number of bytes between each row of texels in an image.
- arrayPitch describes the number of bytes between each array layer of an image.
- depthPitch describes the number of bytes between each slice of 3D image.

If the image is linear, then rowPitch, arrayPitch and depthPitch describe the layout of the image subresource in linear memory. For uncompressed formats, rowPitch is the number of bytes between texels with the same x coordinate in adjacent rows (y coordinates differ by one). arrayPitch is the number of bytes between texels with the same x and y coordinate in adjacent array layers of the image (array layer values differ by one). depthPitch is the number of bytes between texels with the same x and y coordinate in adjacent slices of a 3D image (z coordinates differ by one). Expressed as an addressing formula, the starting byte of a texel in the image subresource has address:

```c
// (x,y,z,layer) are in texel coordinates
address(x,y,z,layer) = layer*arrayPitch + z*depthPitch + y*rowPitch + x*elementSize + offset
```

For compressed formats, the rowPitch is the number of bytes between compressed texel blocks in adjacent rows. arrayPitch is the number of bytes between compressed texel blocks in adjacent array layers. depthPitch is the number of bytes between compressed texel blocks in adjacent slices of a 3D image.

```c
// (x,y,z,layer) are in compressed texel block coordinates
address(x,y,z,layer) = layer*arrayPitch + z*depthPitch + y*rowPitch + x
```
The value of `arrayPitch` is undefined for images that were not created as arrays. `depthPitch` is defined only for 3D images.

If the image has a **single-plane** color format, then the `aspectMask` member of `VkImageSubresource` must be `VK_IMAGE_ASPECT_COLOR_BIT`.

If the image has a depth/stencil format, then `aspectMask` must be either `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT`. On implementations that store depth and stencil aspects separately, querying each of these image subresource layouts will return a different `offset` and `size` representing the region of memory used for that aspect. On implementations that store depth and stencil aspects interleaved, the same `offset` and `size` are returned and represent the interleaved memory allocation.

If the image has a **multi-planar** format, then the `aspectMask` member of `VkImageSubresource` must be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, or (for 3-plane formats only) `VK_IMAGE_ASPECT_PLANE_2_BIT`. Querying each of these image subresource layouts will return a different `offset` and `size` representing the region of memory used for that plane. If the image is **disjoint**, then the `offset` is relative to the base address of the plane. If the image is **non-disjoint**, then the `offset` is relative to the base address of the image.

To query the memory layout of an image subresource, call:

```c
// Provided by VK_KHR_maintenance5
void vkGetImageSubresourceLayout2KHR(
    VkDevice device,
    VkImage image,
    const VkImageSubresource2KHR* pSubresource,
    VkSubresourceLayout2KHR* pLayout);
```

or the equivalent command

```c
// Provided by VK_EXT_host_image_copy
void vkGetImageSubresourceLayout2EXT(
    VkDevice device,
    VkImage image,
    const VkImageSubresource2KHR* pSubresource,
    VkSubresourceLayout2KHR* pLayout);
```

- `device` is the logical device that owns the image.
- `image` is the image whose layout is being queried.
- `pSubresource` is a pointer to a `VkImageSubresource2KHR` structure selecting a specific image for the image subresource.
- `pLayout` is a pointer to a `VkSubresourceLayout2KHR` structure in which the layout is returned.
vkGetImageSubresourceLayout2KHR behaves similarly to vkGetImageSubresourceLayout, with the ability to specify extended inputs via chained input structures, and to return extended information via chained output structures.

It is legal to call vkGetImageSubresourceLayout2KHR with a image created with tiling equal to VK_IMAGE_TILING_OPTIMAL, but the members of VkSubresourceLayout2KHR::subresourceLayout will have undefined values in this case.

**Note**

Structures chained from VkImageSubresource2KHR::pNext will also be updated when tiling is equal to VK_IMAGE_TILING_OPTIMAL.

### Valid Usage

- **VUID-vkGetImageSubresourceLayout2KHR-aspectMask-00997**
  The aspectMask member of pSubresource must only have a single bit set

- **VUID-vkGetImageSubresourceLayout2KHR-mipLevel-01716**
  The mipLevel member of pSubresource must be less than the mipLevels specified in image

- **VUID-vkGetImageSubresourceLayout2KHR-arrayLayer-01717**
  The arrayLayer member of pSubresource must be less than the arrayLayers specified in image

- **VUID-vkGetImageSubresourceLayout2KHR-format-08886**
  If format of the image is a color format that is not a multi-planar image format, and tiling of the image is VK_IMAGE_TILING_LINEAR or VK_IMAGE_TILING_OPTIMAL, the aspectMask member of pSubresource must be VK_IMAGE_ASPECT_COLOR_BIT

- **VUID-vkGetImageSubresourceLayout2KHR-format-04462**
  If format of the image has a depth component, the aspectMask member of pSubresource must contain VK_IMAGE_ASPECT_DEPTH_BIT

- **VUID-vkGetImageSubresourceLayout2KHR-format-04463**
  If format of the image has a stencil component, the aspectMask member of pSubresource must contain VK_IMAGE_ASPECT_STENCIL_BIT

- **VUID-vkGetImageSubresourceLayout2KHR-format-04464**
  If format of the image does not contain a stencil or depth component, the aspectMask member of pSubresource must not contain VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT

- **VUID-vkGetImageSubresourceLayout2KHR-tiling-08717**
  If the tiling of the image is VK_IMAGE_TILING_LINEAR and has a multi-planar image format, then the aspectMask member of pSubresource must be a single valid multi-planar aspect mask bit

### Valid Usage (Implicit)

- **VUID-vkGetImageSubresourceLayout2KHR-device-parameter**
device must be a valid VkDevice handle

- VUID-vkGetImageSubresourceLayout2KHR-image-parameter
  image must be a valid VkImage handle

- VUID-vkGetImageSubresourceLayout2KHR-pSubresource-parameter
  pSubresource must be a valid pointer to a valid VkImageSubresource2KHR structure

- VUID-vkGetImageSubresourceLayout2KHR-pLayout-parameter
  pLayout must be a valid pointer to a VkSubresourceLayout2KHR structure

- VUID-vkGetImageSubresourceLayout2KHR-image-parent
  image must have been created, allocated, or retrieved from device

The VkImageSubresource2KHR structure is defined as:

```c
// Provided by VK_KHR_maintenance5
typedef struct VkImageSubresource2KHR {
    VkStructureType sType;
    void* pNext;
    VkImageSubresource imageSubresource;
} VkImageSubresource2KHR;
```

or the equivalent

```c
// Provided by VK_EXT_host_image_copy
typedef VkImageSubresource2KHR VkImageSubresource2EXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- imageSubresource is a VkImageSubresource structure.

Valid Usage (Implicit)

- VUID-VkImageSubresource2KHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMAGE_SUBRESOURCE_2_KHR

- VUID-VkImageSubresource2KHR-pNext-pNext
  pNext must be NULL

- VUID-VkImageSubresource2KHR-imageSubresource-parameter
  imageSubresource must be a valid VkImageSubresource structure

Information about the layout of the image subresource is returned in a VkSubresourceLayout2KHR structure:

```c
// Provided by VK_KHR_maintenance5
typedef struct VkSubresourceLayout2KHR {
```

750
VkStructureType sType;
void* pNext;
VkSubresourceLayout subresourceLayout;
} VkSubresourceLayout2KHR;

or the equivalent

// Provided by VK_EXT_host_image_copy
typedef VkSubresourceLayout2KHR VkSubresourceLayout2EXT;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• subresourceLayout is a VkSubresourceLayout structure.

Valid Usage (Implicit)

• VUID-VkSubresourceLayout2KHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_SUBRESOURCE_LAYOUT_2_KHR
• VUID-VkSubresourceLayout2KHR-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkSubresourceHostMemcpySizeEXT
• VUID-VkSubresourceLayout2KHR-sType-unique
  The sType value of each struct in the pNext chain must be unique

To query the memory size needed to copy to or from an image using vkCopyMemoryToImageEXT or vkCopyImageToMemoryEXT when the VK_HOST_IMAGE_COPY_MEMCPY_EXT flag is specified, add a VkSubresourceHostMemcpySizeEXT structure to the pNext chain of the VkSubresourceLayout2EXT structure in a call to vkGetImageSubresourceLayout2EXT.

The VkSubresourceHostMemcpySizeEXT structure is defined as:

// Provided by VK_EXT_host_memcpy_image
typedef struct VkSubresourceHostMemcpySizeEXT {
  VkStructureType sType;
  void* pNext;
  VkDeviceSize size;
} VkSubresourceHostMemcpySizeEXT;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• size is the size in bytes of the image subresource.
To query the memory layout of an image subresource, without an image object, call:

```c
// Provided by VK_KHR_maintenance5
donf void vkGetDeviceImageSubresourceLayoutKHR(
    VkDevice device,
    const VkDeviceImageSubresourceInfoKHR* pInfo,
    VkSubresourceLayout2KHR* pLayout);
```

- `device` is the logical device that owns the image.
- `pInfo` is a pointer to a `VkDeviceImageSubresourceInfoKHR` structure containing parameters required for the subresource layout query.
- `pLayout` is a pointer to a `VkSubresourceLayout2KHR` structure in which the layout is returned.

`vkGetDeviceImageSubresourceLayoutKHR` behaves similarly to `vkGetImageSubresourceLayout2KHR`, but uses a `VkImageCreateInfo` structure to specify the image rather than a `VkImage` object.

### Valid Usage (Implicit)

- VUID-vkGetDeviceImageSubresourceLayoutKHR-device-parameter
device must be a valid `VkDevice` handle

- VUID-vkGetDeviceImageSubresourceLayoutKHR-pInfo-parameter
pInfo must be a valid pointer to a valid `VkDeviceImageSubresourceInfoKHR` structure

- VUID-vkGetDeviceImageSubresourceLayoutKHR-pLayout-parameter
pLayout must be a valid pointer to a `VkSubresourceLayout2KHR` structure

The `VkDeviceImageSubresourceInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_maintenance5
typedef struct VkDeviceImageSubresourceInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const VkImageCreateInfo* pCreateInfo;
    const VkImageSubresource2KHR* pSubresource;
} VkDeviceImageSubresourceInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pCreateInfo` is a pointer to a `VkImageCreateInfo` structure containing parameters affecting
• **pSubresource**  
  pSubresource is a pointer to a `VkImageSubresource2KHR` structure selecting a specific image subresource for the query.

---

### Valid Usage

- **VUID-VkDeviceImageSubresourceInfoKHR-aspectMask-00997**  
  The `aspectMask` member of `pSubresource` **must** only have a single bit set.

- **VUID-VkDeviceImageSubresourceInfoKHR-mipLevel-01716**  
  The `mipLevel` member of `pSubresource` **must** be less than the `mipLevels` specified in `pCreateInfo`.

- **VUID-VkDeviceImageSubresourceInfoKHR-arrayLayer-01717**  
  The `arrayLayer` member of `pSubresource` **must** be less than the `arrayLayers` specified in `pCreateInfo`.

- **VUID-VkDeviceImageSubresourceInfoKHR-format-08886**  
  If format of the image is a color format that is not a multi-planar image format, and tiling of the `pCreateInfo` is `VK_IMAGE_TILING_LINEAR` or `VK_IMAGE_TILING_OPTIMAL`, the `aspectMask` member of `pSubresource` **must** be `VK_IMAGE_ASPECT_COLOR_BIT`.

- **VUID-VkDeviceImageSubresourceInfoKHR-format-04462**  
  If format of the `pCreateInfo` has a depth component, the `aspectMask` member of `pSubresource` **must** contain `VK_IMAGE_ASPECT_DEPTH_BIT`.

- **VUID-VkDeviceImageSubresourceInfoKHR-format-04463**  
  If format of the `pCreateInfo` has a stencil component, the `aspectMask` member of `pSubresource` **must** contain `VK_IMAGE_ASPECT_STENCIL_BIT`.

- **VUID-VkDeviceImageSubresourceInfoKHR-format-04464**  
  If format of the `pCreateInfo` does not contain a stencil or depth component, the `aspectMask` member of `pSubresource` **must** not contain `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT`.

- **VUID-VkDeviceImageSubresourceInfoKHR-tiling-08717**  
  If the tiling of the `pCreateInfo` is `VK_IMAGE_TILING_LINEAR` and has a multi-planar image format, then the `aspectMask` member of `pSubresource` **must** be a single valid multi-planar aspect mask bit.

---

### Valid Usage (Implicit)

- **VUID-VkDeviceImageSubresourceInfoKHR-sType-sType**  
  `sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_IMAGE_SUBRESOURCE_INFO_KHR`.

- **VUID-VkDeviceImageSubresourceInfoKHR-pNext-pNext**  
  `pNext` **must** be `NULL`.

- **VUID-VkDeviceImageSubresourceInfoKHR-pCreateInfo-parameter**  
  `pCreateInfo` **must** be a valid pointer to a valid `VkImageCreateInfo` structure.

- **VUID-VkDeviceImageSubresourceInfoKHR-pSubresource-parameter**  
  `pSubresource` **must** be a valid pointer to a valid `VkImageSubresource2KHR` structure.
To destroy an image, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyImage(
    VkDevice device,
    VkImage image,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the image.
- **image** is the image to destroy.
- **pAllocator** controls host memory allocation as described in the *Memory Allocation* chapter.

### Valid Usage

- **VUID-vkDestroyImage-image-01000**
  - All submitted commands that refer to *image*, either directly or via a *VkImageView*, must have completed execution.

- **VUID-vkDestroyImage-image-01001**
  - If *VkAllocationCallbacks* were provided when *image* was created, a compatible set of callbacks must be provided here.

- **VUID-vkDestroyImage-image-01002**
  - If no *VkAllocationCallbacks* were provided when *image* was created, *pAllocator* must be NULL.

- **VUID-vkDestroyImage-image-04882**
  - *image* must not have been acquired from *vkGetSwapchainImagesKHR*.

### Valid Usage (Implicit)

- **VUID-vkDestroyImage-device-parameter**
  - *device* must be a valid *VkDevice* handle.

- **VUID-vkDestroyImage-image-parameter**
  - If *image* is not *VK_NULL_HANDLE*, *image* must be a valid *VkImage* handle.

- **VUID-vkDestroyImage-pAllocator-parameter**
  - If *pAllocator* is not NULL, *pAllocator* must be a valid pointer to a valid *VkAllocationCallbacks* structure.

- **VUID-vkDestroyImage-image-parent**
  - If *image* is a valid handle, it must have been created, allocated, or retrieved from *device*.
Host Synchronization

- Host access to image must be externally synchronized

12.3.1. Image Format Features

Valid uses of a VkImage may depend on the image’s format features, defined below. Such constraints are documented in the affected valid usage statement.

- If the image was created with VK_IMAGE_TILING_LINEAR, then its set of format features is the value of VkFormatProperties::linearTilingFeatures found by calling vkGetPhysicalDeviceFormatProperties on the same format as VkImageCreateInfo::format.

- If the image was created with VK_IMAGE_TILING_OPTIMAL, then its set of format features is the value of VkFormatProperties::optimalTilingFeatures found by calling vkGetPhysicalDeviceFormatProperties on the same format as VkImageCreateInfo::format.

12.3.2. Image Mip Level Sizing

A complete mipmap chain is the full set of mip levels, from the largest mip level provided, down to the minimum mip level size.

Conventional Images

For conventional images, the dimensions of each successive mip level, n+1, are:

\[ \text{width}_{n+1} = \max(\text{width}_n / 2, 1) \]

\[ \text{height}_{n+1} = \max(\text{height}_n / 2, 1) \]

\[ \text{depth}_{n+1} = \max(\text{depth}_n / 2, 1) \]

where width\_n, height\_n, and depth\_n are the dimensions of the next larger mip level, n.

The minimum mip level size is:

- 1 for one-dimensional images,
- 1x1 for two-dimensional images, and
- 1x1x1 for three-dimensional images.

The number of levels in a complete mipmap chain is:

\[ \lceil \log_2(\max(\text{width}_0, \text{height}_0, \text{depth}_0)) \rceil + 1 \]
where $\text{width}_0$, $\text{height}_0$, and $\text{depth}_0$ are the dimensions of the largest (most detailed) mip level, 0.

### 12.4. Image Layouts

Images are stored in implementation-dependent opaque layouts in memory. Each layout has limitations on what kinds of operations are supported for image subresources using the layout. At any given time, the data representing an image subresource in memory exists in a particular layout which is determined by the most recent layout transition that was performed on that image subresource. Applications have control over which layout each image subresource uses, and can transition an image subresource from one layout to another. Transitions can happen with an image memory barrier, included as part of a `vkCmdPipelineBarrier` or a `vkCmdWaitEvents` command buffer command (see [Image Memory Barriers](#)), or as part of a subpass dependency within a render pass (see [VkSubpassDependency](#)).

Image layout is per-image subresource. Separate image subresources of the same image can be in different layouts at the same time, with the exception that depth and stencil aspects of a given image subresource can only be in different layouts if the `separateDepthStencilLayouts` feature is enabled.

#### Note

Each layout may offer optimal performance for a specific usage of image memory. For example, an image with a layout of `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` may provide optimal performance for use as a color attachment, but be unsupported for use in transfer commands. Applications can transition an image subresource from one layout to another in order to achieve optimal performance when the image subresource is used for multiple kinds of operations. After initialization, applications need not use any layout other than the general layout, though this may produce suboptimal performance on some implementations.

Upon creation, all image subresources of an image are initially in the same layout, where that layout is selected by the `VkImageCreateInfo::initialLayout` member. The `initialLayout` must be either `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`. If it is `VK_IMAGE_LAYOUT_PREINITIALIZED`, then the image data can be preinitialized by the host while using this layout, and the transition away from this layout will preserve that data. If it is `VK_IMAGE_LAYOUT_UNDEFINED`, then the contents of the data are considered to be undefined, and the transition away from this layout is not guaranteed to preserve that data. For either of these initial layouts, any image subresources must be transitioned to another layout before they are accessed by the device.

Host access to image memory is only well-defined for linear images and for image subresources of those images which are currently in either the `VK_IMAGE_LAYOUT_PREINITIALIZED` or `VK_IMAGE_LAYOUT_GENERAL` layout. Calling `vkGetImageSubresourceLayout` for a linear image returns a subresource layout mapping that is valid for either of those image layouts.

The set of image layouts consists of:

```c
// Provided by VK_VERSION_1_0
```
typedef enum VkImageLayout {
    VK_IMAGE_LAYOUT_UNDEFINED = 0,
    VK_IMAGE_LAYOUT_GENERAL = 1,
    VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL = 2,
    VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL = 3,
    VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL = 4,
    VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL = 5,
    VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL = 6,
    VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL = 7,
    VK_IMAGE_LAYOUT_PREINITIALIZED = 8,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL = 1000117000,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL = 1000117001,
    // Provided by VK_VERSION_1_2
    VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL = 1000241000,
    // Provided by VK_VERSION_1_2
    VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL = 1000241001,
    // Provided by VK_VERSION_1_2
    VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL = 1000241002,
    // Provided by VK_VERSION_1_2
    VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL = 1000241003,
    // Provided by VK_VERSION_1_3
    VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL = 1000314000,
    // Provided by VK_VERSION_1_3
    VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL = 1000314001,
    // Provided by VK_KHR_swapchain
    VK_IMAGE_LAYOUT_PRESENT_SRC_KHR = 1000001002,
    // Provided by VK_KHR_video_decode_queue
    VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR = 1000024000,
    // Provided by VK_KHR_video_decode_queue
    VK_IMAGE_LAYOUT_VIDEO_DECODE_SRC_KHR = 1000024001,
    // Provided by VK_KHR_video_encode_queue
    VK_IMAGE_LAYOUT_VIDEO_ENCODE_DST_KHR = 1000299000,
    // Provided by VK_KHR_video_encode_queue
    VK_IMAGE_LAYOUT_VIDEO_ENCODE_SRC_KHR = 1000299001,
    // Provided by VK_KHR_video_encode_queue
    VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR = 1000299002,
    // Provided by VK_EXT_attachment_feedback_loop_layout
    VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT = 1000339000,
    // Provided by VK_KHR_maintenance2
    VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL_KHR = 1000117000,
    // Provided by VK_KHR_maintenance2
    VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL_KHR = 1000117001,
    // Provided by VK_KHR_maintenance2
    VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL_KHR = 1000241000,
    // Provided by VK_KHR_maintenance2
    VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL_KHR = 1000241001,
    // Provided by VK_KHR_maintenance2
    VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL_KHR = 1000241002,
    // Provided by VK_KHR_maintenance2
    VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL_KHR = 1000241003,
    // Provided by VK_KHR_maintenance2
    VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR = 1000314000,
    // Provided by VK_KHR_maintenance2
    VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR = 1000314001,
    // Provided by VK_KHR_maintenance2
    VK_IMAGE_LAYOUT_PRESENT_SRC_KHR_KHR = 1000001002,
    // Provided by VK_KHR_maintenance2
    VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR_KHR = 1000024000,
    // Provided by VK_KHR_maintenance2
    VK_IMAGE_LAYOUT_VIDEO_DECODE_SRC_KHR_KHR = 1000024001,
    // Provided by VK_KHR_maintenance2
    VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR_KHR = 1000024002,
    // Provided by VK_KHR_maintenance2
    VK_IMAGE_LAYOUT_VIDEO_ENCODE_DST_KHR_KHR = 1000299000,
    // Provided by VK_KHR_maintenance2
    VK_IMAGE_LAYOUT_VIDEO_ENCODE_SRC_KHR_KHR = 1000299001,
    // Provided by VK_KHR_maintenance2
    VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR_KHR = 1000299002,
    // Provided by VK_KHR_maintenance2
    VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR = 1000164003,
    // Provided by VK_KHR_maintenance2
    VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR = 1000232000,
    // Provided by VK_KHR_maintenance2
    VK_IMAGE_LAYOUT_VIDEO_ENCODE_DST_KHR_KHR = 1000299000,
    // Provided by VK_KHR_maintenance2
    VK_IMAGE_LAYOUT_VIDEO_ENCODE_SRC_KHR_KHR = 1000299001,
    // Provided by VK_KHR_maintenance2
    VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR_KHR = 1000299002,
    // Provided by VK_KHR_maintenance2
    VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_KHR_KHR = 1000339000,
    // Provided by VK_KHR_maintenance2
    VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL_KHR_KHR = 1000117000,
The type(s) of device access supported by each layout are:

- **VK_IMAGE_LAYOUT_UNDEFINED** specifies that the layout is unknown. Image memory cannot be transitioned into this layout. This layout can be used as the initialLayout member of VkImageCreateInfo. This layout can be used in place of the current image layout in a layout transition, but doing so will cause the contents of the image's memory to be undefined.

- **VK_IMAGE_LAYOUT_PREINITIALIZED** specifies that an image's memory is in a defined layout and can be populated by data, but that it has not yet been initialized by the driver. Image memory cannot be transitioned into this layout. This layout can be used as the initialLayout member of VkImageCreateInfo. This layout is intended to be used as the initial layout for an image whose contents are written by the host, and hence the data can be written to memory immediately, without first executing a layout transition. Currently, VK_IMAGE_LAYOUT_PREINITIALIZED is only useful with linear images because there is not a standard layout defined for VK_IMAGE_TILING_OPTIMAL images.

- **VK_IMAGE_LAYOUT_GENERAL** supports all types of device access.

- **VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL** specifies a layout that must only be used with attachment accesses in the graphics pipeline.

- **VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL** specifies a layout allowing read only access as an attachment, or in shaders as a sampled image, combined image/sampler, or input attachment.

- **VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL** must only be used as a color or resolve attachment in a VkFramebuffer. This layout is valid only for image subresources of images created with the VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT usage bit enabled.

- **VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL** specifies a layout for both the depth and stencil aspects of a depth/stencil format image allowing read and write access as a depth/stencil attachment. It is equivalent to VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL and
VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL.

- **VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL** specifies a layout for both the depth and stencil aspects of a depth/stencil format image allowing read-only access as a depth/stencil attachment or in shaders as a sampled image, combined image/sampler, or input attachment. It is equivalent to VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL and VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL.

- **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL** specifies a layout for depth/stencil format images allowing read and write access to the stencil aspect as a stencil attachment, and read only access to the depth aspect as a depth attachment or in shaders as a sampled image, combined image/sampler, or input attachment. It is equivalent to VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL and VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL.

- **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL** specifies a layout for depth/stencil format images allowing read and write access to the depth aspect as a depth attachment, and read only access to the stencil aspect as a stencil attachment or in shaders as a sampled image, combined image/sampler, or input attachment. It is equivalent to VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL and VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL.

- **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_ATTACHMENT_OPTIMAL** specifies a layout for the depth aspect of a depth/stencil format image allowing read and write access as a depth attachment.

- **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL** specifies a layout for the depth aspect of a depth/stencil format image allowing read-only access as a depth attachment or in shaders as a sampled image, combined image/sampler, or input attachment.

- **VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL** specifies a layout for the stencil aspect of a depth/stencil format image allowing read and write access as a stencil attachment.

- **VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL** specifies a layout for the stencil aspect of a depth/stencil format image allowing read-only access as a stencil attachment or in shaders as a sampled image, combined image/sampler, or input attachment.

- **VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL** specifies a layout allowing read-only access in a shader as a sampled image, combined image/sampler, or input attachment. This layout is valid only for image subresources of images created with the VK_IMAGE_USAGE_SAMPLED_BIT or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT usage bits enabled.

- **VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL** must only be used as a source image of a transfer command (see the definition of VK_PIPELINE_STAGE_TRANSFER_BIT). This layout is valid only for image subresources of images created with the VK_IMAGE_USAGE_TRANSFER_SRC_BIT usage bit enabled.

- **VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL** must only be used as a destination image of a transfer command. This layout is valid only for image subresources of images created with the VK_IMAGE_USAGE_TRANSFER_DST_BIT usage bit enabled.

- **VK_IMAGE_LAYOUT_PRESENT_SRC_KHR** must only be used for presenting a presentable image for display.

- **VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR** is valid only for shared presentable images, and must be used for any usage the image supports.

- **VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR** must only be used as a fragment shading rate attachment or This layout is valid only for image subresources of images
created with the `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` usage bit enabled.

- **`VK_IMAGE_LAYOUT_VIDEO_DECODER_DST_KHR`** must only be used as a **decode output picture** in a **video decode operation**. This layout is valid only for image subresources of images created with the `VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR` usage bit enabled.

- **`VK_IMAGE_LAYOUT_VIDEO_DECODER_SRC_KHR`** is reserved for future use.

- **`VK_IMAGE_LAYOUT_VIDEO_DECODER_DPB_KHR`** must only be used as an output **reconstructed picture** or an input **reference picture** in a **video decode operation**. This layout is valid only for image subresources of images created with the `VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR` usage bit enabled.

- **`VK_IMAGE_LAYOUT_VIDEO_ENCODER_DST_KHR`** is reserved for future use.

- **`VK_IMAGE_LAYOUT_VIDEO_ENCODER_SRC_KHR`** must only be used as an **encode input picture** in a **video encode operation**. This layout is valid only for image subresources of images created with the `VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR` usage bit enabled.

- **`VK_IMAGE_LAYOUT_VIDEO_ENCODER_DPB_KHR`** must only be used as an output **reconstructed picture** or an input **reference picture** in a **video encode operation**. This layout is valid only for image subresources of images created with the `VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR` usage bit enabled.

- **`VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT`** must only be used as either a color attachment or depth/stencil attachment in a `VkFramebuffer` and/or read-only access in a shader as a sampled image, combined image/sampler, or input attachment. This layout is valid only for image subresources of images created with the `VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` usage bit enabled and either the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` and either the `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_SAMPLED_BIT` usage bits enabled.

- **`VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR`** must only be used as either a storage image, or a color or depth/stencil attachment and an input attachment. This layout is valid only for image subresources of images created with either `VK_IMAGE_USAGE_STORAGE_BIT`, or both `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` and either of `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

The layout of each image subresource is not a state of the image subresource itself, but is rather a property of how the data in memory is organized, and thus for each mechanism of accessing an image in the API the application **must** specify a parameter or structure member that indicates which image layout the image subresource(s) are considered to be in when the image will be accessed. For transfer commands, this is a parameter to the command (see **Clear Commands** and **Copy Commands**). For use as a framebuffer attachment, this is a member in the substructures of the `VkRenderPassCreateInfo` (see **Render Pass**). For use in a descriptor set, this is a member in the `VkDescriptorImageInfo` structure (see **Descriptor Set Updates**).

### 12.4.1. Image Layout Matching Rules

At the time that any command buffer command accessing an image executes on any queue, the layouts of the image subresources that are accessed **must** all match exactly the layout specified via the API controlling those accesses, except in case of accesses to an image with a depth/stencil format performed through descriptors referring to only a single aspect of the image, where the
following relaxed matching rules apply:

- Descriptors referring just to the depth aspect of a depth/stencil image only need to match in the
  image layout of the depth aspect, thus `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL` and
  `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL` are considered to match.

- Descriptors referring just to the stencil aspect of a depth/stencil image only need to match in the
  image layout of the stencil aspect, thus `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL` and
  `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` are considered to match.

When performing a layout transition on an image subresource, the old layout value must either
equal the current layout of the image subresource (at the time the transition executes), or else be
`VK_IMAGE_LAYOUT_UNDEFINED` (implying that the contents of the image subresource need not be
preserved). The new layout used in a transition must not be `VK_IMAGE_LAYOUT_UNDEFINED` or
`VK_IMAGE_LAYOUT_PREINITIALIZED`.

### 12.5. Image Views

Image objects are not directly accessed by pipeline shaders for reading or writing image data.
Instead, *image views* representing contiguous ranges of the image subresources and containing
additional metadata are used for that purpose. Views must be created on images of compatible
types, and must represent a valid subset of image subresources.

Image views are represented by `VkImageView` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkImageView)
```

`VK_REMAINING_ARRAY_LAYERS` is a special constant value used for image views to indicate that all
remaining array layers in an image after the base layer should be included in the view.

```c
#define VK_REMAINING_ARRAY_LAYERS (~0U)
```

`VK_REMAINING_MIP_LEVELS` is a special constant value used for image views to indicate that all
remaining mipmap levels in an image after the base level should be included in the view.

```c
#define VK_REMAINING_MIP_LEVELS (~0U)
```

The types of image views that can be created are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkImageViewType {
    VK_IMAGE_VIEW_TYPE_1D = 0,
    VK_IMAGE_VIEW_TYPE_2D = 1,
    VK_IMAGE_VIEW_TYPE_3D = 2,
    VK_IMAGE_VIEW_TYPE_CUBE = 3,
    ...
} VkImageViewType;
```
To create an image view, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateImageView(
    VkDevice device,
    const VkImageViewCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkImageView* pView);
```

- `device` is the logical device that creates the image view.
- `pCreateInfo` is a pointer to a `VkImageViewCreateInfo` structure containing parameters to be used to create the image view.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pView` is a pointer to a `VkImageView` handle in which the resulting image view object is returned.

**Valid Usage**

- VUID-vkCreateImageView-image-09179
  `VkImageViewCreateInfo::image must` have been created from `device`

**Valid Usage (Implicit)**

- VUID-vkCreateImageView-device-parameter
  `device must be a valid VkDevice handle`

- VUID-vkCreateImageView-pCreateInfo-parameter
  `pCreateInfo must be a valid pointer to a valid VkImageViewCreateInfo structure`

- VUID-vkCreateImageView-pAllocator-parameter
  If `pAllocator` is not NULL, `pAllocator must` be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateImageView-pView-parameter
  `pView must be a valid pointer to a VkImageView handle`

**Return Codes**

- **Success**
  - `VK_SUCCESS`
The `VkImageViewCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageViewCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkImageViewCreateFlags flags;
    VkImage image;
    VkImageViewType viewType;
    VkFormat format;
    VkComponentMapping components;
    VkImageSubresourceRange subresourceRange;
} VkImageViewCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkImageViewCreateFlagBits` specifying additional parameters of the image view.
- `image` is a `VkImage` on which the view will be created.
- `viewType` is a `VkImageViewType` value specifying the type of the image view.
- `format` is a `VkFormat` specifying the format and type used to interpret texel blocks of the image.
- `components` is a `VkComponentMapping` structure specifying a remapping of color components (or of depth or stencil components after they have been converted into color components).
- `subresourceRange` is a `VkImageSubresourceRange` structure selecting the set of mipmap levels and array layers to be accessible to the view.

Some of the `image` creation parameters are inherited by the view. In particular, image view creation inherits the implicit parameter `usage` specifying the allowed usages of the image view that, by default, takes the value of the corresponding `usage` parameter specified in `VkImageCreateInfo` at image creation time. The implicit `usage` can be overridden by adding a `VkImageViewUsageCreateInfo` structure to the `pNext` chain, but the view usage must be a subset of the image usage. If `image` has a depth-stencil format and was created with a `VkImageStencilUsageCreateInfo` structure included in the `pNext` chain of `VkImageCreateInfo`, the usage is calculated based on the `subresource.aspectMask` provided:

- If `aspectMask` includes only `VK_IMAGE_ASPECT_STENCIL_BIT`, the implicit `usage` is equal to `VkImageStenciUsageCreateInfo::stencilUsage`.
- If `aspectMask` includes only `VK_IMAGE_ASPECT_DEPTH_BIT`, the implicit `usage` is equal to...
If image was created with the `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT` flag, and if the format of the image is not multi-planar, format can be different from the image’s format, but if image was created without the `VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT` flag and they are not equal they must be compatible. Image format compatibility is defined in the Format Compatibility Classes section. Views of compatible formats will have the same mapping between texel coordinates and memory locations irrespective of the format, with only the interpretation of the bit pattern changing.

If image was created with a multi-planar format, and the image view’s aspectMask is one of `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT` or `VK_IMAGE_ASPECT_PLANE_2_BIT`, the view’s aspect mask is considered to be equivalent to `VK_IMAGE_ASPECT_COLOR_BIT` when used as a framebuffer attachment.

If image was created with the `VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT` flag, format must be compatible with the image’s format as described above; or must be an uncompressed format, in which case it must be size-compatible with the image’s format. In this case, the resulting image view’s texel dimensions equal the dimensions of the selected mip level divided by the compressed texel block size and rounded up.

The VkComponentMapping components member describes a remapping from components of the image to components of the vector returned by shader image instructions. This remapping must be the identity swizzle for storage image descriptors, input attachment descriptors, framebuffer attachments, and any VkImageView used with a combined image sampler that enables sampler Y’C₆C₆ conversion.

If the image view is to be used with a sampler which supports sampler Y’C₆C₆ conversion, an identically defined object of type VkSamplerYcbcrConversion to that used to create the sampler must be passed to vkCreateImageView in a VkSamplerYcbcrConversionInfo included in the pNext chain of VkImageViewCreateInfo. Conversely, if a VkSamplerYcbcrConversion object is passed to vkCreateImageView, an identically defined VkSamplerYcbcrConversion object must be used when sampling the image.

If the image has a multi-planar format, subresourceRange.aspectMask is `VK_IMAGE_ASPECT_COLOR_BIT`, and usage includes `VK_IMAGE_USAGE_SAMPLED_BIT`, then the format must be identical to the image format and the sampler to be used with the image view must enable sampler Y’C₆C₆ conversion.
When such an image is used in a video coding operation, the sampler Y’C_bC_r conversion has no effect.

If image was created with the `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT` and the image has a multi-planar format, and if `subresourceRange.aspectMask` is `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, or `VK_IMAGE_ASPECT_PLANE_2_BIT`, format must be compatible with the corresponding plane of the image, and the sampler to be used with the image view must not enable sampler Y’C_bC_r conversion. The width and height of the single-plane image view must be derived from the multi-planar image’s dimensions in the manner listed for plane compatibility for the plane.

Any view of an image plane will have the same mapping between texel coordinates and memory locations as used by the components of the color aspect, subject to the formulae relating texel coordinates to lower-resolution planes as described in Chroma Reconstruction. That is, if an R or B plane has a reduced resolution relative to the G plane of the multi-planar image, the image view operates using the \((u_{\text{plane}}, v_{\text{plane}})\) unnormalized coordinates of the reduced-resolution plane, and these coordinates access the same memory locations as the \((u_{\text{color}}, v_{\text{color}})\) unnormalized coordinates of the color aspect for which chroma reconstruction operations operate on the same \((u_{\text{plane}}, v_{\text{plane}})\) or \((i_{\text{plane}}, j_{\text{plane}})\) coordinates.

### Valid Usage

- **VUID-VkImageViewCreateInfo-image-01003**
  
  If image was not created with `VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT` then `viewType` must not be `VK_IMAGE_VIEW_TYPE_CUBE` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`.

- **VUID-VkImageViewCreateInfo-viewType-01004**
  
  If the `imageCubeArray` feature is not enabled, `viewType` must not be `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`.

- **VUID-VkImageViewCreateInfo-image-06723**
  
  If image was created with `VK_IMAGE_TYPE_3D` but without `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT` set then `viewType` must not be `VK_IMAGE_VIEW_TYPE_2D_ARRAY`.

- **VUID-VkImageViewCreateInfo-image-06727**
  
  If image was created with `VK_IMAGE_TYPE_3D` but without
VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT set then viewType must not be VK_IMAGE_VIEW_TYPE_2D

- VUID-VkImageViewCreateInfo-image-04970
  If image was created with VK_IMAGE_TYPE_3D and viewType is VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY then subresourceRange.levelCount must be 1

- VUID-VkImageViewCreateInfo-image-04971
  If image was created with VK_IMAGE_TYPE_3D and viewType is VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY then VkImageCreateInfo::flags must not contain any of VK_IMAGE_CREATE_SPARSE_BINDING_BIT, VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT, and VK_IMAGE_CREATE_SPARSE_ALIASED_BIT

- VUID-VkImageViewCreateInfo-image-04972
  If image was created with a samples value not equal to VK_SAMPLE_COUNT_1_BIT then viewType must be either VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY

- VUID-VkImageViewCreateInfo-image-04441
  image must have been created with a usage value containing at least one of the usages defined in the valid image usage list for image views

- VUID-VkImageViewCreateInfo-None-02273
  The format features of the resultant image view must contain at least one bit

- VUID-VkImageViewCreateInfo-usage-02274
  If usage contains VK_IMAGE_USAGE_SAMPLED_BIT, then the format features of the resultant image view must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT

- VUID-VkImageViewCreateInfo-usage-02275
  If usage contains VK_IMAGE_USAGE_STORAGE_BIT, then the image view's format features must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT

- VUID-VkImageViewCreateInfo-usage-02276
  If usage contains VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT, then the image view's format features must contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT

- VUID-VkImageViewCreateInfo-usage-02277
  If usage contains VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, then the image view's format features must contain VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkImageViewCreateInfo-image-08333
  If image was created with VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR and usage contains VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR, then the image view's format features must contain VK_FORMAT_FEATURE_VIDEO_DECODE_OUTPUT_BIT_KHR

- VUID-VkImageViewCreateInfo-image-08334
  If image was created with VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR and usage contains VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR, then the image view's format features must contain VK_FORMAT_FEATURE_VIDEO_DECODE_DPB_BIT_KHR

- VUID-VkImageViewCreateInfo-image-08335
  If image was created with VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR, then usage must not include VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR

- VUID-VkImageViewCreateInfo-image-08336
  If image was created with VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR and usage
contains `VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR`, then the image view's format features must contain `VK_FORMAT_FEATURE_VIDEO_ENCODE_INPUT_BIT_KHR`.

- **VUID-VkImageViewCreateInfo-image-08337**
  - If `image` was created with `VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR` and `usage` contains `VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR`, then the image view's format features must contain `VK_FORMAT_FEATURE_VIDEO_ENCODE_DPB_BIT_KHR`.

- **VUID-VkImageViewCreateInfo-image-08338**
  - If `image` was created with `VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR` and `usage` contains `VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR`, then the image view's format features must contain at least one of `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT` or `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`.

- **VUID-VkImageViewCreateInfo-subresourceRange-01718**
  - If `subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `image` is not a 3D image created with `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT` set, or `viewType` is not `VK_IMAGE_VIEW_TYPE_2D` or `VK_IMAGE_VIEW_TYPE_2D_ARRAY`, `subresourceRange.layerCount` must be non-zero and `subresourceRange.baseArrayLayer + subresourceRange.layerCount` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created.

- **VUID-VkImageViewCreateInfo-image-02724**
  - If `image` is a 3D image created with `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT` set, and `viewType` is `VK_IMAGE_VIEW_TYPE_2D` or `VK_IMAGE_VIEW_TYPE_2D_ARRAY`, `subresourceRange.baseArrayLayer` must be less than the depth computed from `baseMipLevel` and `extent.depth` specified in `VkImageCreateInfo` when `image` was created, according to the formula defined in *Image Mip Level Sizing.*
be non-zero and \texttt{subresourceRange.baseArrayLayer + subresourceRange.layerCount} must be less than or equal to the depth computed from \texttt{baseMipLevel} and \texttt{extent.depth} specified in \texttt{VkImageCreateInfo} when \texttt{image} was created, according to the formula defined in \texttt{Image Mip Level Sizing}.

- **VUID-VkImageViewCreateInfo-image-01761**
  If \texttt{image} was created with the \texttt{VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT} flag, but without the \texttt{VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT} flag, and if the format of the \texttt{image} is not a multi-planar format, format must be compatible with the format used to create \texttt{image}, as defined in \texttt{Format Compatibility Classes}.

- **VUID-VkImageViewCreateInfo-image-01583**
  If \texttt{image} was created with the \texttt{VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT} flag, format must be compatible with, or must be an uncompressed format that is size-compatible with, the format used to create \texttt{image}.

- **VUID-VkImageViewCreateInfo-image-07072**
  If \texttt{image} was created with the \texttt{VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT} flag and \texttt{format} is a non-compressed format, the \texttt{levelCount} member of \texttt{subresourceRange} must be 1.

- **VUID-VkImageViewCreateInfo-image-09487**
  If \texttt{image} was created with the \texttt{VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT} flag, the \texttt{VkPhysicalDeviceMaintenance6PropertiesKHR::blockTexelViewCompatibleMultipleLayers} property is not set to \texttt{VK_TRUE}, and \texttt{format} is a non-compressed format, then the \texttt{layerCount} member of \texttt{subresourceRange} must be 1.

- **VUID-VkImageViewCreateInfo-pNext-01585**
  If a \texttt{VkImageFormatListCreateInfo} structure was included in the \texttt{pNext} chain of the \texttt{VkImageCreateInfo} structure used when creating \texttt{image} and \texttt{VkImageFormatListCreateInfo::viewFormatCount} is not zero then format must be one of the formats in \texttt{VkImageFormatListCreateInfo::pViewFormats}.

- **VUID-VkImageViewCreateInfo-image-01586**
  If \texttt{image} was created with the \texttt{VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT} flag, if the format of the \texttt{image} is a multi-planar format, and if \texttt{subresourceRange.aspectMask} is one of the multi-planar aspect mask bits, then format must be compatible with the \texttt{VkFormat} for the plane of the \texttt{image} format indicated by \texttt{subresourceRange.aspectMask}, as defined in \texttt{Compatible Formats of Planes of Multi-Planar Formats}.

- **VUID-VkImageViewCreateInfo-subresourceRange-07818**
  \texttt{subresourceRange.aspectMask} must only have at most 1 valid multi-planar aspect mask bit.

- **VUID-VkImageViewCreateInfo-image-01762**
  If \texttt{image} was not created with the \texttt{VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT} flag, or if the format of the \texttt{image} is a multi-planar format and if \texttt{subresourceRange.aspectMask} is \texttt{VK_IMAGE_ASPECT_COLOR_BIT}, format must be identical to the format used to create \texttt{image}.

- **VUID-VkImageViewCreateInfo-format-06415**
  If the image view requires a sampler YC\textsubscript{b}C\textsubscript{r} conversion and \texttt{usage} contains \texttt{VK_IMAGE_USAGE_SAMPLED_BIT}, then the \texttt{pNext} chain must include a \texttt{VkSamplerYcbcrConversionInfo} structure with a conversion value other than \texttt{VK_NULL_HANDLE}.

- **VUID-VkImageViewCreateInfo-format-04714**
If `format` has a `_422` or `_420` suffix then `image` must have been created with a width that is a multiple of 2.

- **VUID-VkImageViewCreateInfo-format-04715**
  If `format` has a `_420` suffix then `image` must have been created with a height that is a multiple of 2.

- **VUID-VkImageViewCreateInfo-pNext-01970**
  If the `pNext` chain includes a `VkSamplerYcbcrConversionInfo` structure with a `conversion` value other than `VK_NULL_HANDLE`, all members of `components` must have the identity swizzle.

- **VUID-VkImageViewCreateInfo-pNext-06658**
  If the `pNext` chain includes a `VkSamplerYcbcrConversionInfo` structure with a `conversion` value other than `VK_NULL_HANDLE`, `format` must be the same used in `VkSamplerYcbcrConversionCreateInfo::format`.

- **VUID-VkImageViewCreateInfo-image-01020**
  If `image` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-VkImageViewCreateInfo-subResourceRange-01021**
  `viewType` must be compatible with the type of `image` as shown in the `view type compatibility table`.

- **VUID-VkImageViewCreateInfo-image-02086**
  If `image` was created with `usage` containing `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`, `viewType` must be `VK_IMAGE_VIEW_TYPE_2D` or `VK_IMAGE_VIEW_TYPE_2D_ARRAY`.

- **VUID-VkImageViewCreateInfo-usage-04550**
  If the `attachmentFragmentShadingRate` feature is enabled, and the `usage` for the image view includes `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`, then the image view's `format` features must contain `VK_FORMAT_FEATURE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- **VUID-VkImageViewCreateInfo-usage-04551**
  If the `attachmentFragmentShadingRate` feature is enabled, the `usage` for the image view includes `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`, and `layeredShadingRateAttachments` is `VK_FALSE`, `subresourceRange.layerCount` must be 1.

- **VUID-VkImageViewCreateInfo-pNext-02662**
  If the `pNext` chain includes a `VkImageViewUsageCreateInfo` structure, and `image` was not created with a `VkImageStencilUsageCreateInfo` structure included in the `pNext` chain of `VkImageCreateInfo`, its `usage` member must not include any bits that were not set in the `usage` member of the `VkImageCreateInfo` structure used to create `image`.

- **VUID-VkImageViewCreateInfo-pNext-02663**
  If the `pNext` chain includes a `VkImageViewUsageCreateInfo` structure, `image` was created with a `VkImageStencilUsageCreateInfo` structure included in the `pNext` chain of `VkImageCreateInfo`, and `subresourceRange.aspectMask` includes `VK_IMAGE_ASPECT_STENCIL_BIT`, the `usage` member of the `VkImageViewUsageCreateInfo` structure must not include any bits that were not set in the `usage` member of the `VkImageStencilUsageCreateInfo` structure used to create `image`. 

If the `pNext` chain includes a `VkImageViewUsageCreateInfo` structure, `image` was created with a `VkImageStencelUsageCreateInfo` structure included in the `pNext` chain of `VkImageCreateInfo`, and `subresourceRange.aspectMask` includes bits other than `VK_IMAGE_ASPECT_STENCIL_BIT`, the usage member of the `VkImageViewUsageCreateInfo` structure must not include any bits that were not set in the usage member of the `VkImageCreateInfo` structure used to create `image`.

If `viewType` is `VK_IMAGE_VIEW_TYPE_1D`, `VK_IMAGE_VIEW_TYPE_2D`, or `VK_IMAGE_VIEW_TYPE_3D`; and `subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, then `subresourceRange.layerCount` must be 1.

If `viewType` is `VK_IMAGE_VIEW_TYPE_CUBE` and `subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, then the remaining number of layers must be 6.

If `viewType` is `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY` and `subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, the remaining number of layers must be a multiple of 6.

If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::imageViewFormatSwizzle` is `VK_FALSE`, all elements of `components` must have the identity swizzle.

If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::imageViewFormatReinterpretation` is `VK_FALSE`, the `VkFormat` in `format` must not contain a different number of components, or a different number of bits in each component, than the format of the `VkImage` in `image`.

If `image` was created with usage containing `VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR`, `VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR`, or `VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR`, then the `viewType` must be `VK_IMAGE_VIEW_TYPE_2D` or `VK_IMAGE_VIEW_TYPE_2D_ARRAY`.

If `image` was created with usage containing `VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR`, `VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR`, or `VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR`, then the `viewType` must be `VK_IMAGE_VIEW_TYPE_2D` or `VK_IMAGE_VIEW_TYPE_2D_ARRAY`. 

770
Valid Usage (Implicit)

- **VUID-VkImageViewCreateInfo-sType-sType**
  
  The `sType` must be `VK_STRUCTURE_TYPE_IMAGE_VIEW_CREATE_INFO`

- **VUID-VkImageViewCreateInfo-pNext-pNext**
  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkImageViewUsageCreateInfo` or `VkSamplerYcbcrConversionInfo`

- **VUID-VkImageViewCreateInfo-sType-unique**
  
  The `sType` value of each struct in the `pNext` chain must be unique

- **VUID-VkImageViewCreateInfo-flags-zerobitmask**

  The `flags` must be `0`

- **VUID-VkImageViewCreateInfo-image-parameter**

  The `image` must be a valid `VkImage` handle

- **VUID-VkImageViewCreateInfo-viewType-parameter**

  The `viewType` must be a valid `VkImageViewType` value

- **VUID-VkImageViewCreateInfo-format-parameter**

  The `format` must be a valid `VkFormat` value

- **VUID-VkImageViewCreateInfo-components-parameter**

  The `components` must be a valid `VkComponentMapping` structure

- **VUID-VkImageViewCreateInfo-subresourceRange-parameter**

  The `subresourceRange` must be a valid `VkImageSubresourceRange` structure

Bits which can be set in `VkImageViewCreateInfo::flags`, specifying additional parameters of an image view, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkImageViewCreateFlagBits {
} VkImageViewCreateFlagBits;
```

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkImageViewCreateFlags;
```

`VkImageViewCreateFlags` is a bitmask type for setting a mask of zero or more `VkImageViewCreateFlagBits`.

The set of usages for the created image view can be restricted compared to the parent image’s usage flags by adding a `VkImageViewUsageCreateInfo` structure to the `pNext` chain of `VkImageViewCreateInfo`.

The `VkImageViewUsageCreateInfo` structure is defined as:
typedef struct VkImageViewUsageCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkImageUsageFlags usage;
} VkImageViewUsageCreateInfo;

or the equivalent

typedef VkImageViewUsageCreateInfo VkImageViewUsageCreateInfoKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **usage** is a bitmask of `VkImageUsageFlagBits` specifying allowed usages of the image view.

When this structure is chained to `VkImageViewCreateInfo` the `usage` field overrides the implicit `usage` parameter inherited from image creation time and its value is used instead for the purposes of determining the valid usage conditions of `VkImageViewCreateInfo`.

### Valid Usage (Implicit)

- VUID-VkImageViewUsageCreateInfo-sType-sType
  
  **sType** must be `VK_STRUCTURE_TYPE_IMAGE_VIEW_USAGE_CREATE_INFO`

- VUID-VkImageViewUsageCreateInfo-usage-parameter
  
  **usage** must be a valid combination of `VkImageUsageFlagBits` values

- VUID-VkImageViewUsageCreateInfo-usage-required bitmask
  
  **usage** must not be 0

The `VkImageSubresourceRange` structure is defined as:

typedef struct VkImageSubresourceRange {
    VkImageAspectFlags aspectMask;
    uint32_t baseMipLevel;
    uint32_t levelCount;
    uint32_t baseArrayLayer;
    uint32_t layerCount;
} VkImageSubresourceRange;

- **aspectMask** is a bitmask of `VkImageAspectFlagBits` specifying which aspect(s) of the image are included in the view.
- **baseMipLevel** is the first mipmap level accessible to the view.
• `levelCount` is the number of mipmap levels (starting from `baseMipLevel`) accessible to the view.
• `baseArrayLayer` is the first array layer accessible to the view.
• `layerCount` is the number of array layers (starting from `baseArrayLayer`) accessible to the view.

The number of mipmap levels and array layers must be a subset of the image subresources in the image. If an application wants to use all mip levels or layers in an image after the `baseMipLevel` or `baseArrayLayer`, it can set `levelCount` and `layerCount` to the special values `VK_REMAINING_MIP_LEVELS` and `VK_REMAINING_ARRAY_LAYERS` without knowing the exact number of mip levels or layers.

For cube and cube array image views, the layers of the image view starting at `baseArrayLayer` correspond to faces in the order +X, -X, +Y, -Y, +Z, -Z. For cube arrays, each set of six sequential layers is a single cube, so the number of cube maps in a cube map array view is `layerCount / 6`, and image array layer (`baseArrayLayer + i`) is face index `(i mod 6)` of cube `i / 6`. If the number of layers in the view, whether set explicitly in `layerCount` or implied by `VK_REMAINING_ARRAY_LAYERS`, is not a multiple of 6, the last cube map in the array must not be accessed.

`aspectMask` must be only `VK_IMAGE_ASPECT_COLOR_BIT`, `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT` if `format` is a color, depth-only or stencil-only format, respectively, except if `format` is a multi-planar format. If using a depth/stencil format with both depth and stencil components, `aspectMask` must include at least one of `VK_IMAGE_ASPECT_DEPTH_BIT` and `VK_IMAGE_ASPECT_STENCIL_BIT`, and can include both.

When the `VkImageSubresourceRange` structure is used to select a subset of the slices of a 3D image's mip level in order to create a 2D or 2D array image view of a 3D image created with `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT`, `baseArrayLayer` and `layerCount` specify the first slice index and the number of slices to include in the created image view. Such an image view can be used as a framebuffer attachment that refers only to the specified range of slices of the selected mip level. However, any layout transitions performed on such an attachment view during a render pass instance still apply to the entire subresource referenced which includes all the slices of the selected mip level.

When using an image view of a depth/stencil image to populate a descriptor set (e.g. for sampling in the shader, or for use as an input attachment), the `aspectMask` must only include one bit, which selects whether the image view is used for depth reads (i.e. using a floating-point sampler or input attachment in the shader) or stencil reads (i.e. using an unsigned integer sampler or input attachment in the shader). When an image view of a depth/stencil image is used as a depth/stencil framebuffer attachment, the `aspectMask` is ignored and both depth and stencil image subresources are used.

When creating a `VkImageView`, if sampler Y'CbCr conversion is enabled in the sampler, the `aspectMask` of a subresourceRange used by the `VkImageView` must be `VK_IMAGE_ASPECT_COLOR_BIT`.

When creating a `VkImageView`, if sampler Y'CbCr conversion is not enabled in the sampler and the image format is multi-planar, the image must have been created with `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT`, and the `aspectMask` of the `VkImageView`'s subresourceRange must be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT` or `VK_IMAGE_ASPECT_PLANE_2_BIT`. 

773
Valid Usage

- VUID-VkImageSubresourceRange-levelCount-01720
  If `levelCount` is not `VK_REMAINING_MIP_LEVELS`, it must be greater than 0

- VUID-VkImageSubresourceRange-layerCount-01721
  If `layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, it must be greater than 0

- VUID-VkImageSubresourceRange-aspectMask-01670
  If `aspectMask` includes `VK_IMAGE_ASPECT_COLOR_BIT`, then it must not include any of `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, or `VK_IMAGE_ASPECT_PLANE_2_BIT`

Valid Usage (Implicit)

- VUID-VkImageSubresourceRange-aspectMask-parameter
  `aspectMask` must be a valid combination of `VkImageAspectFlagBits` values

- VUID-VkImageSubresourceRange-aspectMask-requiredbitmask
  `aspectMask` must not be 0

Bits which can be set in an aspect mask to specify aspects of an image for purposes such as identifying a subresource, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkImageAspectFlagBits {
    VK_IMAGE_ASPECT_COLOR_BIT = 0x00000001,
    VK_IMAGE_ASPECT_DEPTH_BIT = 0x00000002,
    VK_IMAGE_ASPECT_STENCIL_BIT = 0x00000004,
    VK_IMAGE_ASPECT_METADATA_BIT = 0x00000008,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANE_0_BIT = 0x00000010,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANE_1_BIT = 0x00000020,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANE_2_BIT = 0x00000040,
    // Provided by VK_VERSION_1_3
    VK_IMAGE_ASPECT_NONE = 0,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_IMAGE_ASPECT_PLANE_0_BIT_KHR = VK_IMAGE_ASPECT_PLANE_0_BIT,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_IMAGE_ASPECT_PLANE_1_BIT_KHR = VK_IMAGE_ASPECT_PLANE_1_BIT,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_IMAGE_ASPECT_PLANE_2_BIT_KHR = VK_IMAGE_ASPECT_PLANE_2_BIT,
    // Provided by VK_KHR_maintenance4
    VK_IMAGE_ASPECT_NONE_KHR = VK_IMAGE_ASPECT_NONE,
} VkImageAspectFlagBits;
```

- `VK_IMAGE_ASPECT_NONE` specifies no image aspect, or the image aspect is not applicable.
VK_IMAGE_ASPECT_COLOR_BIT specifies the color aspect.

VK_IMAGE_ASPECT_DEPTH_BIT specifies the depth aspect.

VK_IMAGE_ASPECT_STENCIL_BIT specifies the stencil aspect.

VK_IMAGE_ASPECT_METADATA_BIT specifies the metadata aspect used for sparse resource operations.

VK_IMAGE_ASPECT_PLANE_0_BIT specifies plane 0 of a multi-planar image format.

VK_IMAGE_ASPECT_PLANE_1_BIT specifies plane 1 of a multi-planar image format.

VK_IMAGE_ASPECT_PLANE_2_BIT specifies plane 2 of a multi-planar image format.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkImageAspectFlags;
```

VkImageAspectFlags is a bitmask type for setting a mask of zero or more VkImageAspectFlagBits.

The VkComponentMapping structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkComponentMapping {
    VkComponentSwizzle r;
    VkComponentSwizzle g;
    VkComponentSwizzle b;
    VkComponentSwizzle a;
} VkComponentMapping;
```

- r is a VkComponentSwizzle specifying the component value placed in the R component of the output vector.
- g is a VkComponentSwizzle specifying the component value placed in the G component of the output vector.
- b is a VkComponentSwizzle specifying the component value placed in the B component of the output vector.
- a is a VkComponentSwizzle specifying the component value placed in the A component of the output vector.

Valid Usage (Implicit)

- VUID-VkComponentMapping-r-parameter r must be a valid VkComponentSwizzle value
- VUID-VkComponentMapping-g-parameter g must be a valid VkComponentSwizzle value
- VUID-VkComponentMapping-b-parameter b must be a valid VkComponentSwizzle value
- VUID-VkComponentMapping-a-parameter a must be a valid VkComponentSwizzle value
Possible values of the members of \texttt{VkComponentMapping}, specifying the component values placed in each component of the output vector, are:

\begin{verbatim}
// Provided by VK_VERSION_1_0
typedef enum VkComponentSwizzle {
    VK_COMPONENT_SWIZZLE_IDENTITY = 0,
    VK_COMPONENT_SWIZZLE_ZERO = 1,
    VK_COMPONENT_SWIZZLE_ONE = 2,
    VK_COMPONENT_SWIZZLE_R = 3,
    VK_COMPONENT_SWIZZLE_G = 4,
    VK_COMPONENT_SWIZZLE_B = 5,
    VK_COMPONENT_SWIZZLE_A = 6,
} VkComponentSwizzle;
\end{verbatim}

- \texttt{VK_COMPONENT_SWIZZLE_IDENTITY} specifies that the component is set to the identity swizzle.
- \texttt{VK_COMPONENT_SWIZZLE_ZERO} specifies that the component is set to zero.
- \texttt{VK_COMPONENT_SWIZZLE_ONE} specifies that the component is set to either 1 or 1.0, depending on whether the type of the image view format is integer or floating-point respectively, as determined by the \texttt{Format Definition} section for each \texttt{VkFormat}.
- \texttt{VK_COMPONENT_SWIZZLE_R} specifies that the component is set to the value of the R component of the image.
- \texttt{VK_COMPONENT_SWIZZLE_G} specifies that the component is set to the value of the G component of the image.
- \texttt{VK_COMPONENT_SWIZZLE_B} specifies that the component is set to the value of the B component of the image.
- \texttt{VK_COMPONENT_SWIZZLE_A} specifies that the component is set to the value of the A component of the image.

Setting the identity swizzle on a component is equivalent to setting the identity mapping on that component. That is:

\begin{table}[!h]
\centering
\begin{tabular}{|c|c|}
\hline
\textbf{Component} & \textbf{Identity Mapping} \\
\hline
components.r & VK_COMPONENT_SWIZZLE_R \\
components.g & VK_COMPONENT_SWIZZLE_G \\
components.b & VK_COMPONENT_SWIZZLE_B \\
components.a & VK_COMPONENT_SWIZZLE_A \\
\hline
\end{tabular}
\caption{Component Mappings Equivalent To VK_COMPONENT_SWIZZLE_IDENTITY}
\end{table}

To destroy an image view, call:

\begin{verbatim}
// Provided by VK_VERSION_1_0
void vkDestroyImageView(
    VkDevice device,
    VkImageView imageView,
); // Provided by VK_VERSION_1_0
\end{verbatim}
const VkAllocationCallbacks* pAllocator);

- **device** is the logical device that destroys the image view.
- **imageView** is the image view to destroy.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- VUID-vkDestroyImageView-imageView-01026
  All submitted commands that refer to **imageView** must have completed execution
- VUID-vkDestroyImageView-imageView-01027
  If **VkAllocationCallbacks** were provided when **imageView** was created, a compatible set of callbacks must be provided here
- VUID-vkDestroyImageView-imageView-01028
  If no **VkAllocationCallbacks** were provided when **imageView** was created, **pAllocator** must be NULL

### Valid Usage (Implicit)

- VUID-vkDestroyImageView-device-parameter
  **device** must be a valid **VkDevice** handle
- VUID-vkDestroyImageView-imageView-parameter
  If **imageView** is not VK_NULL_HANDLE, **imageView** must be a valid **VkImageView** handle
- VUID-vkDestroyImageView-pAllocator-parameter
  If **pAllocator** is not NULL, **pAllocator** must be a valid pointer to a valid **VkAllocationCallbacks** structure
- VUID-vkDestroyImageView-imageView-parent
  If **imageView** is a valid handle, it must have been created, allocated, or retrieved from **device**

### Host Synchronization

- Host access to **imageView** must be externally synchronized

### 12.5.1. Image View Format Features

Valid uses of a **VkImageView** may depend on the image view’s **format features**, defined below. Such constraints are documented in the affected valid usage statement.

- If Vulkan 1.3 is supported or the VK_KHR_format_feature_flags2 extension is supported, and **VkImageViewCreateInfo::image** was created with VK_IMAGE_TILING_LINEAR, then the image view’s set of **format features** is the value of **VkFormatProperties3::linearTilingFeatures** found by
calling `vkGetPhysicalDeviceFormatProperties2` on the same format as `VkImageViewCreateInfo::format`.

- If Vulkan 1.3 is not supported and the `VK_KHR_format_feature_flags2` extension is not supported, and `VkImageViewCreateInfo::image` was created with `VK_IMAGE_TILING_LINEAR`, then the image view’s set of format features is the union of the value of `VkFormatProperties::linearTilingFeatures` found by calling `vkGetPhysicalDeviceFormatProperties2` on the same format as `VkImageViewCreateInfo::format`, with:
  
  - `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT` if the format is a depth/stencil format and the image view features also contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_BIT`.
  - `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT` if the format is one of the extended storage formats and `shaderStorageImageReadWithoutFormat` is enabled on the device.
  - `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT` if the format is one of the extended storage formats and `shaderStorageImageWriteWithoutFormat` is enabled on the device.

- If Vulkan 1.3 is supported or the `VK_KHR_format_feature_flags2` extension is supported, and `VkImageViewCreateInfo::image` was created with `VK_IMAGE_TILING_OPTIMAL`, then the image view’s set of format features is the value of `VkFormatProperties::optimalTilingFeatures` or `VkFormatProperties3::optimalTilingFeatures` found by calling `vkGetPhysicalDeviceFormatProperties2` or `vkGetPhysicalDeviceImageFormatProperties2` on the same format as `VkImageViewCreateInfo::format`.

- If Vulkan 1.3 is not supported and the `VK_KHR_format_feature_flags2` extension is not supported, and `VkImageViewCreateInfo::image` was created with `VK_IMAGE_TILING_OPTIMAL`, then the image view’s set of format features is the union of the value of `VkFormatProperties::optimalTilingFeatures` found by calling `vkGetPhysicalDeviceFormatProperties2` on the same format as `VkImageViewCreateInfo::format`, with:
  
  - `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT` if the format is a depth/stencil format and the image view features also contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_BIT`.
  - `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT` if the format is one of the extended storage formats and `shaderStorageImageReadWithoutFormat` is enabled on the device.
  - `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT` if the format is one of the extended storage formats and `shaderStorageImageWriteWithoutFormat` is enabled on the device.

12.6. Acceleration Structures

Acceleration structures are opaque data structures that are built by the implementation to more efficiently perform spatial queries on the provided geometric data. For this extension, an acceleration structure is either a top-level acceleration structure containing a set of bottom-level acceleration structures or a bottom-level acceleration structure containing either a set of axis-aligned bounding boxes for custom geometry or a set of triangles.

Each instance in the top-level acceleration structure contains a reference to a bottom-level acceleration structure as well as an instance transform plus information required to index into the shader bindings. The top-level acceleration structure is what is bound to the acceleration descriptor, for example to trace inside the shader in the ray tracing pipeline.
Acceleration structures are represented by `VkAccelerationStructureKHR` handles:

```cpp
// Provided by VK_KHR_acceleration_structure
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkAccelerationStructureKHR)
```

To create an acceleration structure, call:

```cpp
// Provided by VK_KHR_acceleration_structure
VkResult vkCreateAccelerationStructureKHR(
    VkDevice device,
    const VkAccelerationStructureCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkAccelerationStructureKHR* pAccelerationStructure);
```

- **device** is the logical device that creates the acceleration structure object.
- **pCreateInfo** is a pointer to a `VkAccelerationStructureCreateInfoKHR` structure containing parameters affecting creation of the acceleration structure.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pAccelerationStructure** is a pointer to a `VkAccelerationStructureKHR` handle in which the resulting acceleration structure object is returned.

Similar to other objects in Vulkan, the acceleration structure creation merely creates an object with a specific “shape”. The type and quantity of geometry that can be built into an acceleration structure is determined by the parameters of `VkAccelerationStructureCreateInfoKHR`.

The acceleration structure data is stored in the object referred to by `VkAccelerationStructureCreateInfoKHR::buffer`. Once memory has been bound to that buffer, it must be populated by acceleration structure build or acceleration structure copy commands such as `vkCmdBuildAccelerationStructuresKHR`, `vkBuildAccelerationStructuresKHR`, `vkCmdCopyAccelerationStructureKHR`, and `vkCopyAccelerationStructureKHR`.

**Note**
The expected usage for a trace capture/replay tool is that it will serialize and later deserialize the acceleration structure data using acceleration structure copy commands. During capture the tool will use `vkCopyAccelerationStructureToMemoryKHR` or `vkCmdCopyAccelerationStructureToMemoryKHR` with a mode of `VK_COPY_ACCELERATION_STRUCTURE_MODE_SERIALIZE_KHR`, and `vkCopyMemoryToAccelerationStructureKHR` or `vkCmdCopyMemoryToAccelerationStructureKHR` with a mode of `VK_COPY_ACCELERATION_STRUCTURE_MODE_DESERIALIZE_KHR` during replay.

**Note**
Memory does not need to be bound to the underlying buffer when `vkCreateAccelerationStructureKHR` is called.
The input buffers passed to acceleration structure build commands will be referenced by the implementation for the duration of the command. After the command completes, the acceleration structure may hold a reference to any acceleration structure specified by an active instance contained therein. Apart from this referencing, acceleration structures must be fully self-contained. The application can reuse or free any memory which was used by the command as an input or as scratch without affecting the results of ray traversal.

Valid Usage

- VUID-vkCreateAccelerationStructureKHR-accelerationStructure-03611
  The VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure feature must be enabled

- VUID-vkCreateAccelerationStructureKHR-deviceAddress-03488
  If VkAccelerationStructureCreateInfoKHR::deviceAddress is not zero, the accelerationStructureCaptureReplay feature must be enabled

- VUID-vkCreateAccelerationStructureKHR-device-03489
  If device was created with multiple physical devices, then the bufferDeviceAddressMultiDevice feature must be enabled

Valid Usage (Implicit)

- VUID-vkCreateAccelerationStructureKHR-device-parameter
device must be a valid VkDevice handle

- VUID-vkCreateAccelerationStructureKHR-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkAccelerationStructureCreateInfoKHR structure

- VUID-vkCreateAccelerationStructureKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateAccelerationStructureKHR-pAccelerationStructure-parameter
  pAccelerationStructure must be a valid pointer to a VkAccelerationStructureKHR handle

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR

The VkAccelerationStructureCreateInfoKHR structure is defined as:
typedef struct VkAccelerationStructureCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkAccelerationStructureCreateFlagsKHR createFlags;
    VkBuffer buffer;
    VkDeviceSize offset;
    VkDeviceSize size;
    VkAccelerationStructureTypeKHR type;
    VkDeviceAddress deviceAddress;
} VkAccelerationStructureCreateInfoKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **createFlags** is a bitmask of `VkAccelerationStructureCreateFlagBitsKHR` specifying additional creation parameters of the acceleration structure.
- **buffer** is the buffer on which the acceleration structure will be stored.
- **offset** is an offset in bytes from the base address of the buffer at which the acceleration structure will be stored, and must be a multiple of 256.
- **size** is the size required for the acceleration structure.
- **type** is a `VkAccelerationStructureTypeKHR` value specifying the type of acceleration structure that will be created.
- **deviceAddress** is the device address requested for the acceleration structure if the `accelerationStructureCaptureReplay` feature is being used. If `deviceAddress` is zero, no specific address is requested.

Applications should avoid creating acceleration structures with application-provided addresses and implementation-provided addresses in the same process, to reduce the likelihood of `VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR` errors.

**Note**

The expected usage for this is that a trace capture/replay tool will add the `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT` flag to all buffers that use `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT`, and will add `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT` to all buffers used as storage for an acceleration structure where `deviceAddress` is not zero. This also means that the tool will need to add `VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT` to memory allocations to allow the flag to be set where the application may not have otherwise required it. During capture the tool will save the queried opaque device addresses in the trace. During replay, the buffers will be created specifying the original address so any address values stored in the trace data will remain valid.

Implementations are expected to separate such buffers in the GPU address space so normal allocations will avoid using these addresses. Apps/tools should avoid mixing app-provided and implementation-provided addresses for buffers created.
with `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT`, to avoid address space allocation conflicts.

Applications **should** create an acceleration structure with a specific `VkAccelerationStructureTypeKHR` other than `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`.

**Note**

`VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR` is intended to be used by API translation layers. This can be used at acceleration structure creation time in cases where the actual acceleration structure type (top or bottom) is not yet known. The actual acceleration structure type must be specified as `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR` or `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` when the build is performed.

If the acceleration structure will be the target of a build operation, the required size for an acceleration structure can be queried with `vkGetAccelerationStructureBuildSizesKHR`. If the acceleration structure is going to be the target of a compacting copy, `vkCmdWriteAccelerationStructuresPropertiesKHR` or `vkWriteAccelerationStructuresPropertiesKHR` can be used to obtain the compacted size required.

### Valid Usage

- **VUID-VkAccelerationStructureCreateInfoKHR-deviceAddress-03612**
  If `deviceAddress` is not zero, `createFlags` **must** include `VK_ACCELERATION_STRUCTURE_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR`

- **VUID-VkAccelerationStructureCreateInfoKHR-deviceAddress-09488**
  If `deviceAddress` is not zero, it **must** have been retrieved from an identically created acceleration structure, except for `buffer` and `deviceAddress`

- **VUID-VkAccelerationStructureCreateInfoKHR-deviceAddress-09489**
  If `deviceAddress` is not zero, `buffer` **must** have been created identically to the `buffer` used to create the acceleration structure from which `deviceAddress` was retrieved, except for `VkBufferOpaqueCaptureAddressCreateInfo::opaqueCaptureAddress`

- **VUID-VkAccelerationStructureCreateInfoKHR-deviceAddress-09490**
  If `deviceAddress` is not zero, `buffer` **must** have been created with a `VkBufferOpaqueCaptureAddressCreateInfo::opaqueCaptureAddress` that was retrieved from `vkGetBufferOpaqueCaptureAddress` for the `buffer` that was used to create the acceleration structure from which `deviceAddress` was retrieved

- **VUID-VkAccelerationStructureCreateInfoKHR-createFlags-03613**
  If `createFlags` includes `VK_ACCELERATION_STRUCTURE_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR`, `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureCaptureReplay` **must** be `VK_TRUE`

- **VUID-VkAccelerationStructureCreateInfoKHR-buffer-03614**
  `buffer` **must** have been created with a `usage` value containing `VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_STORAGE_BIT_KHR`
• VUID-VkAccelerationStructureCreateInfoKHR-buffer-03615
  buffer must not have been created with VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT

• VUID-VkAccelerationStructureCreateInfoKHR-offset-03616
  The sum of offset and size must be less than the size of buffer

• VUID-VkAccelerationStructureCreateInfoKHR-offset-03734
  offset must be a multiple of 256 bytes

---

Valid Usage (Implicit)

• VUID-VkAccelerationStructureCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_CREATE_INFO_KHR

• VUID-VkAccelerationStructureCreateInfoKHR-pNext-pNext
  pNext must be NULL

• VUID-VkAccelerationStructureCreateInfoKHR-createFlags-parameter
  createFlags must be a valid combination of VkAccelerationStructureCreateFlagBitsKHR values

• VUID-VkAccelerationStructureCreateInfoKHR-buffer-parameter
  buffer must be a valid VkBuffer handle

• VUID-VkAccelerationStructureCreateInfoKHR-type-parameter
  type must be a valid VkAccelerationStructureTypeKHR value

---

To get the build sizes for an acceleration structure, call:

```c
// Provided by VK_KHR_acceleration_structure
void vkGetAccelerationStructureBuildSizesKHR(
    VkDevice device,
    VkAccelerationStructureBuildTypeKHR buildType,
    const VkAccelerationStructureBuildGeometryInfoKHR* pBuildInfo,
    const uint32_t* pMaxPrimitiveCounts,
    VkAccelerationStructureBuildSizesInfoKHR* pSizeInfo);
```

- **device** is the logical device that will be used for creating the acceleration structure.
- **buildType** defines whether host or device operations (or both) are being queried for.
- **pBuildInfo** is a pointer to a VkAccelerationStructureBuildGeometryInfoKHR structure describing parameters of a build operation.
- **pMaxPrimitiveCounts** is a pointer to an array of pBuildInfo->geometryCount uint32_t values defining the number of primitives built into each geometry.
- **pSizeInfo** is a pointer to a VkAccelerationStructureBuildSizesInfoKHR structure which returns the size required for an acceleration structure and the sizes required for the scratch buffers, given the build parameters.

The srcAccelerationStructure, dstAccelerationStructure, and mode members of pBuildInfo are
ignored. Any `VkDeviceOrHostAddressKHR` or `VkDeviceOrHostAddressConstKHR` members of `pBuildInfo` are ignored by this command, except that the `hostAddress` member of `VkAccelerationStructureGeometryTrianglesDataKHR::transformData` will be examined to check if it is `NULL`.

An acceleration structure created with the `accelerationStructureSize` returned by this command supports any build or update with a `VkAccelerationStructureBuildGeometryInfoKHR` structure and array of `VkAccelerationStructureBuildRangeInfoKHR` structures subject to the following properties:

- The build command is a host build command, and `buildType` is `VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_KHR` or `VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR`
- The build command is a device build command, and `buildType` is `VK_ACCELERATION_STRUCTURE_BUILD_TYPE_DEVICE_KHR` or `VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR`
- For `VkAccelerationStructureBuildGeometryInfoKHR`:
  - Its `type`, and `flags` members are equal to `pBuildInfo->type` and `pBuildInfo->flags`, respectively.
  - `geometryCount` is less than or equal to `pBuildInfo->geometryCount`.
  - For each element of either `pGeometries` or `ppGeometries` at a given index, its `geometryType` member is equal to `pBuildInfo->geometryType`.
  - For each element of either `pGeometries` or `ppGeometries` at a given index, its `flags` member is equal to the corresponding member of the same element in `pBuildInfo`.
  - For each element of either `pGeometries` or `ppGeometries` at a given index, with a `geometryType` member equal to `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, the `vertexFormat` and `indexType` members of `geometry.triangles` are equal to the corresponding members of the same element in `pBuildInfo`.
  - For each element of either `pGeometries` or `ppGeometries` at a given index, with a `geometryType` member equal to `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, the `maxVertex` member of `geometry.triangles` is less than or equal to the corresponding member of the same element in `pBuildInfo`.
  - For each element of either `pGeometries` or `ppGeometries` at a given index, with a `geometryType` member equal to `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if the applicable address in the `transformData` member of `geometry.triangles` is not `NULL`, the corresponding `transformData.hostAddress` parameter in `pBuildInfo` is not `NULL`.
- For each `VkAccelerationStructureBuildRangeInfoKHR` corresponding to the `VkAccelerationStructureBuildGeometryInfoKHR`:
  - Its `primitiveCount` member is less than or equal to the corresponding element of `pMaxPrimitiveCounts`.
  - For each element of either `pGeometries` or `ppGeometries` at a given index, with a `geometryType` member equal to `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if the `pNext` chain contains `VkAccelerationStructureTrianglesOpacityMicromapEXT` the corresponding member of `pBuildInfo` also contains `VkAccelerationStructureTrianglesOpacityMicromapEXT` and with
an equivalent micromap.

Similarly, the `updateScratchSize` value will support any build command specifying the `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` mode under the above conditions, and the `buildScratchSize` value will support any build command specifying the `VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR` mode under the above conditions.

**Valid Usage**

- VUID-vkGetAccelerationStructureBuildSizesKHR-accelerationStructure-08933
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure` feature must be enabled

- VUID-vkGetAccelerationStructureBuildSizesKHR-device-03618
  If `device` was created with multiple physical devices, then the `bufferDeviceAddressMultiDevice` feature must be enabled

- VUID-vkGetAccelerationStructureBuildSizesKHR-pBuildInfo-03619
  If `pBuildInfo->geometryCount` is not 0, `pMaxPrimitiveCounts` must be a valid pointer to an array of `pBuildInfo->geometryCount` `uint32_t` values

- VUID-vkGetAccelerationStructureBuildSizesKHR-pBuildInfo-03785
  If `pBuildInfo->pGeometries` or `pBuildInfo->ppGeometries` has a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, each `pMaxPrimitiveCounts[i]` must be less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxInstanceCount`

**Valid Usage (Implicit)**

- VUID-vkGetAccelerationStructureBuildSizesKHR-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkGetAccelerationStructureBuildSizesKHR-buildType-parameter
  `buildType` must be a valid `VkAccelerationStructureBuildTypeKHR` value

- VUID-vkGetAccelerationStructureBuildSizesKHR-pBuildInfo-parameter
  `pBuildInfo` must be a valid pointer to a valid `VkAccelerationStructureBuildGeometryInfoKHR` structure

- VUID-vkGetAccelerationStructureBuildSizesKHR-pMaxPrimitiveCounts-parameter
  If `pMaxPrimitiveCounts` is not NULL, `pMaxPrimitiveCounts` must be a valid pointer to an array of `pBuildInfo->geometryCount` `uint32_t` values

- VUID-vkGetAccelerationStructureBuildSizesKHR-pSizeInfo-parameter
  `pSizeInfo` must be a valid pointer to a `VkAccelerationStructureBuildSizesInfoKHR` structure

The `VkAccelerationStructureBuildSizesInfoKHR` structure describes the required build sizes for an acceleration structure and scratch buffers and is defined as:

```
// Provided by VK_KHR_acceleration_structure
```
typedef struct VkAccelerationStructureBuildSizesInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceSize accelerationStructureSize;
    VkDeviceSize updateScratchSize;
    VkDeviceSize buildScratchSize;
} VkAccelerationStructureBuildSizesInfoKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **accelerationStructureSize** is the size in bytes required in a `VkAccelerationStructureKHR` for a build or update operation.
- **updateScratchSize** is the size in bytes required in a scratch buffer for an update operation.
- **buildScratchSize** is the size in bytes required in a scratch buffer for a build operation.

### Valid Usage (Implicit)

- VUID-VkAccelerationStructureBuildSizesInfoKHR-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_BUILD_SIZES_INFO_KHR`
- VUID-VkAccelerationStructureBuildSizesInfoKHR-pNext-pNext
  - `pNext` must be NULL

Values which **can** be set in `VkAccelerationStructureCreateInfoKHR::type` specifying the type of acceleration structure, are:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VK_KHR_accelerationStructureTypeKHR {
    VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR = 0,
    VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR = 1,
    VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR = 2,
} VkAccelerationStructureTypeKHR;
```

- **VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR** is a top-level acceleration structure containing instance data referring to bottom-level acceleration structures.
- **VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR** is a bottom-level acceleration structure containing the AABBs or geometry to be intersected.
- **VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR** is an acceleration structure whose type is determined at build time used for special circumstances. In these cases, the acceleration structure type is not known at creation time, but **must** be specified at build time as either top or bottom.

Bits which **can** be set in `VkAccelerationStructureCreateInfoKHR::createFlags`, specifying additional creation parameters for acceleration structures, are:
// Provided by VK_KHR_acceleration_structure
typedef enum VkAccelerationStructureCreateFlagBitsKHR {
    VK_ACCELERATION_STRUCTURE_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR = 0x00000001,
} VkAccelerationStructureCreateFlagBitsKHR;

• **VK_ACCELERATION_STRUCTURE_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR** specifies that the acceleration structure's address can be saved and reused on a subsequent run.

// Provided by VK_KHR_acceleration_structure
typedef VkFlags VkAccelerationStructureCreateFlagsKHR;

VkAccelerationStructureCreateFlagsKHR is a bitmask type for setting a mask of zero or more VkAccelerationStructureCreateFlagBitsKHR.

Bits which can be set in VkAccelerationStructureBuildGeometryInfoKHR::flags specifying additional parameters for acceleration structure builds, are:

// Provided by VK_KHR_acceleration_structure
typedef enum VkBuildAccelerationStructureFlagBitsKHR {
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR = 0x00000001,
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR = 0x00000002,
    VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_TRACE_BIT_KHR = 0x00000004,
    VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_BUILD_BIT_KHR = 0x00000008,
    VK_BUILD_ACCELERATION_STRUCTURE_LOW_MEMORY_BIT_KHR = 0x00000010,
    // Provided by VK_EXT_opacity_micromap
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_UPDATE_EXT = 0x00000040,
    // Provided by VK_EXT_opacity_micromap
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DISABLE_OPACITY_MICROMAPS_EXT = 0x00000080,
    // Provided by VK_EXT_opacity_micromap
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_DATA_UPDATE_EXT = 0x00000100,
    // Provided by VK_KHR_ray_tracing_position_fetch
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DATA_ACCESS_KHR = 0x00000800,
} VkBuildAccelerationStructureFlagBitsKHR;

• **VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR** indicates that the specified acceleration structure can be updated with a mode of VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR in VkAccelerationStructureBuildGeometryInfoKHR.

• **VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR** indicates that the specified acceleration structure can act as the source for a copy acceleration structure command with mode of VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR to produce a compacted acceleration structure.

• **VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_TRACE_BIT_KHR** indicates that the given acceleration structure build should prioritize trace performance over build time.
• **VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_BUILD_BIT_KHR** indicates that the given acceleration structure build **should** prioritize build time over trace performance.

• **VK_BUILD_ACCELERATION_STRUCTURE_LOW_MEMORY_BIT_KHR** indicates that this acceleration structure **should** minimize the size of the scratch memory and the final result acceleration structure, potentially at the expense of build time or trace performance.

• **VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_UPDATE_EXT** indicates that the opacity micromaps associated with the specified acceleration structure **may** change with an acceleration structure update.

• **VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_DATA_UPDATE_EXT** indicates that the data of the opacity micromaps associated with the specified acceleration structure **may** change with an acceleration structure update.

• **VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DISABLE_OPACITY_MICROMAPS_EXT** indicates that the specified acceleration structure **may** be referenced in an instance with **VK_GEOMETRY_INSTANCE_DISABLE_OPACITY_MICROMAPS_EXT** set.

• **VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DATA_ACCESS_KHR** indicates that the specified acceleration structure **can** be used when fetching the vertex positions of a hit triangle.

  
  **Note**

  **VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR** and **VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR** **may** take more time and memory than a normal build, and so **should** only be used when those features are needed.

  
  // Provided by VK_KHR_acceleration_structure
typedef VkFlags VkBuildAccelerationStructureFlagsKHR;

*VkBuildAccelerationStructureFlagsKHR* is a bitmask type for setting a mask of zero or more *VkBuildAccelerationStructureFlagBitsKHR*.

Geometry types are specified by **VkGeometryTypeKHR**, which takes values:

  
  // Provided by VK_KHR_acceleration_structure
typedef enum VkGeometryTypeKHR {  
    VK_GEOMETRY_TYPE_TRIANGLES_KHR = 0,  
    VK_GEOMETRY_TYPE_AABBS_KHR = 1,  
    VK_GEOMETRY_TYPE_INSTANCES_KHR = 2,  
  } VkGeometryTypeKHR;

• **VK_GEOMETRY_TYPE_TRIANGLES_KHR** specifies a geometry type consisting of triangles.

• **VK_GEOMETRY_TYPE_AABBS_KHR** specifies a geometry type consisting of axis-aligned bounding boxes.

• **VK_GEOMETRY_TYPE_INSTANCES_KHR** specifies a geometry type consisting of acceleration structure instances.

Bits specifying additional parameters for geometries in acceleration structure builds, are:
// Provided by VK_KHR_acceleration_structure
typedef enum VkGeometryFlagBitsKHR {
    VK_GEOMETRY_OPAQUE_BIT_KHR = 0x00000001,
    VK_GEOMETRY_NO_DUPLICATE_ANY_HIT_INVOCATION_BIT_KHR = 0x00000002,
} VkGeometryFlagBitsKHR;

- **VK_GEOMETRY_OPAQUE_BIT_KHR** indicates that this geometry does not invoke the any-hit shaders even if present in a hit group.
- **VK_GEOMETRY_NO_DUPLICATE_ANY_HIT_INVOCATION_BIT_KHR** indicates that the implementation must only call the any-hit shader a single time for each primitive in this geometry. If this bit is absent an implementation may invoke the any-hit shader more than once for this geometry.

// Provided by VK_KHR_acceleration_structure
typedef VkFlags VkGeometryFlagsKHR;

VkGeometryFlagsKHR is a bitmask type for setting a mask of zero or more VkGeometryFlagBitsKHR.

To destroy an acceleration structure, call:

```c
void vkDestroyAccelerationStructureKHR(
    VkDevice device,
    VkAccelerationStructureKHR accelerationStructure,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the acceleration structure.
- **accelerationStructure** is the acceleration structure to destroy.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- **VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-08934**
  TheVkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure feature must be enabled

- **VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-02442**
  All submitted commands that refer to accelerationStructure must have completed execution

- **VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-02443**
  If VkAllocationCallbacks were provided when accelerationStructure was created, a compatible set of callbacks must be provided here

- **VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-02444**
  If no VkAllocationCallbacks were provided when accelerationStructure was created, pAllocator must be NULL
Valid Usage (Implicit)

- VUID-vkDestroyAccelerationStructureKHR-device-parameter
  
  **device must** be a valid **VkDevice** handle

- VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-parameter
  
  If **accelerationStructure** is not **VK_NULL_HANDLE**, **accelerationStructure must** be a valid **VkAccelerationStructureKHR** handle

- VUID-vkDestroyAccelerationStructureKHR-pAllocator-parameter
  
  If **pAllocator** is not **NULL**, **pAllocator must** be a valid pointer to a valid **VkAllocationCallbacks** structure

- VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-parent
  
  If **accelerationStructure** is a valid handle, it **must** have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to **accelerationStructure must** be externally synchronized

Possible values of **buildType** in **vkGetAccelerationStructureBuildSizesKHR** are:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkAccelerationStructureBuildTypeKHR {
    VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_KHR = 0,
    VK_ACCELERATION_STRUCTURE_BUILD_TYPE_DEVICE_KHR = 1,
    VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR = 2,
} VkAccelerationStructureBuildTypeKHR;
```

- **VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_KHR** requests the memory requirement for operations performed by the host.
- **VK_ACCELERATION_STRUCTURE_BUILD_TYPE_DEVICE_KHR** requests the memory requirement for operations performed by the device.
- **VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR** requests the memory requirement for operations performed by either the host, or the device.

To query the 64-bit device address for an acceleration structure, call:

```c
// Provided by VK_KHR_acceleration_structure
VkDeviceAddress vkGetAccelerationStructureDeviceAddressKHR(
    VkDevice device,
    const VkAccelerationStructureDeviceAddressInfoKHR* pInfo);
```

- **device** is the logical device that the acceleration structure was created on.
• pInfo is a pointer to a VkAccelerationStructureDeviceAddressInfoKHR structure specifying the acceleration structure to retrieve an address for.

The 64-bit return value is an address of the acceleration structure, which can be used for device and shader operations that involve acceleration structures, such as ray traversal and acceleration structure building.

If the acceleration structure was created with a non-zero value of VkAccelerationStructureCreateInfoKHR::deviceAddress, the return value will be the same address.

If the acceleration structure was created with a type of VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR, the returned address must be consistent with the relative offset to other acceleration structures with type VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR allocated with the same VkBuffer. That is, the difference in returned addresses between the two must be the same as the difference in offsets provided at acceleration structure creation.

The returned address must be aligned to 256 bytes.

Note
The acceleration structure device address may be different from the buffer device address corresponding to the acceleration structure’s start offset in its storage buffer for acceleration structure types other than VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR.

Valid Usage
• VUID-vkGetAccelerationStructureDeviceAddressKHR-accelerationStructure-08935
  The VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure feature must be enabled

• VUID-vkGetAccelerationStructureDeviceAddressKHR-device-03504
  If device was created with multiple physical devices, then the bufferDeviceAddressMultiDevice feature must be enabled

• VUID-vkGetAccelerationStructureDeviceAddressKHR-pInfo-09541
  If the buffer on which pInfo->accelerationStructure was placed is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-vkGetAccelerationStructureDeviceAddressKHR-pInfo-09542
  The buffer on which pInfo->accelerationStructure was placed must have been created with the VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT usage flag

Valid Usage (Implicit)
• VUID-vkGetAccelerationStructureDeviceAddressKHR-device-parameter
device must be a valid VkDevice handle

• VUID-vkGetAccelerationStructureDeviceAddressKHR-pInfo-parameter
  pInfo must be a valid pointer to a valid VkAccelerationStructureDeviceAddressInfoKHR
The `VkAccelerationStructureDeviceAddressInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureDeviceAddressInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkAccelerationStructureKHR accelerationStructure;
} VkAccelerationStructureDeviceAddressInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **accelerationStructure** specifies the acceleration structure whose address is being queried.

### Valid Usage (Implicit)

- VUID-VkAccelerationStructureDeviceAddressInfoKHR-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_DEVICE_ADDRESS_INFO_KHR`
- VUID-VkAccelerationStructureDeviceAddressInfoKHR-pNext-pNext
  - `pNext` must be `NULL`
- VUID-VkAccelerationStructureDeviceAddressInfoKHR-accelerationStructure-parameter
  - `accelerationStructure` must be a valid `VkAccelerationStructureKHR` handle

## 12.7. Micromaps

Micromaps are opaque data structures that are built by the implementation to encode sub-triangle data to be included in an acceleration structure.

Micromaps are represented by `VkMicromapEXT` handles:

```c
// Provided by VK_EXT_opacity_micromap
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkMicromapEXT)
```

To create a micromap, call:

```c
// Provided by VK_EXT_opacity_micromap
VkResult vkCreateMicromapEXT(
    VkDevice device,
    const VkMicromapCreateInfoEXT* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkMicromapEXT* pMicromap);
```
• **device** is the logical device that creates the acceleration structure object.

• **pCreateInfo** is a pointer to a `VkMicromapCreateInfoEXT` structure containing parameters affecting creation of the micromap.

• **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

• **pMicromap** is a pointer to a `VkMicromapEXT` handle in which the resulting micromap object is returned.

Similar to other objects in Vulkan, the micromap creation merely creates an object with a specific “shape”. The type and quantity of geometry that can be built into a micromap is determined by the parameters of `VkMicromapCreateInfoEXT`.

The micromap data is stored in the object referred to by `VkMicromapCreateInfoEXT::buffer`. Once memory has been bound to that buffer, it **must** be populated by micromap build or micromap copy commands such as `vkCmdBuildMicromapsEXT`, `vkBuildMicromapsEXT`, `vkCmdCopyMicromapEXT`, and `vkCopyMicromapEXT`.

```markdown
Note
The expected usage for a trace capture/replay tool is that it will serialize and later deserialize the micromap data using micromap copy commands. During capture the tool will use `vkCopyMicromapToMemoryEXT` or `vkCmdCopyMicromapToMemoryEXT` with a mode of `VK_COPY_MICROMAP_MODE_SERIALIZE_EXT`, and `vkCopyMemoryToMicromapEXT` or `vkCmdCopyMemoryToMicromapEXT` with a mode of `VK_COPY_MICROMAP_MODE_DESERIALIZE_EXT` during replay.
```

The input buffers passed to micromap build commands will be referenced by the implementation for the duration of the command. Micromaps **must** be fully self-contained. The application **can** reuse or free any memory which was used by the command as an input or as scratch without affecting the results of a subsequent acceleration structure build using the micromap or traversal of that acceleration structure.

**Valid Usage**

- **VUID-vkCreateMicromapEXT-micromap-07430**
  The micromap feature **must** be enabled

- **VUID-vkCreateMicromapEXT-deviceAddress-07431**
  If `VkMicromapCreateInfoEXT::deviceAddress` is not zero, the micromapCaptureReplay feature **must** be enabled

- **VUID-vkCreateMicromapEXT-device-07432**
  If `device` was created with multiple physical devices, then the bufferDeviceAddressMultiDevice feature **must** be enabled

**Valid Usage (Implicit)**
VUID-vkCreateMicromapEXT-device-parameter

*device* must be a valid *VkDevice* handle

VUID-vkCreateMicromapEXT-pCreateInfo-parameter

*pCreateInfo* must be a valid pointer to a valid *VkMicromapCreateInfoEXT* structure

VUID-vkCreateMicromapEXT-pAllocator-parameter

If *pAllocator* is not NULL, *pAllocator* must be a valid pointer to a valid *VkAllocationCallbacks* structure

VUID-vkCreateMicromapEXT-pMicromap-parameter

*pMicromap* must be a valid pointer to a *VkMicromapEXT* handle

---

## Return Codes

### Success

- VK_SUCCESS

### Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR

The *VkMicromapCreateInfoEXT* structure is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkMicromapCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkMicromapCreateFlagsEXT createFlags;
    VkBuffer buffer;
    VkDeviceSize offset;
    VkDeviceSize size;
    VkMicromapTypeEXT type;
    VkDeviceAddress deviceAddress;
} VkMicromapCreateInfoEXT;
```

- *sType* is a *VkStructureType* value identifying this structure.
- *pNext* is NULL or a pointer to a structure extending this structure.
- *createFlags* is a bitmask of *VkMicromapCreateFlagBitsEXT* specifying additional creation parameters of the micromap.
- *buffer* is the buffer on which the micromap will be stored.
- *offset* is an offset in bytes from the base address of the buffer at which the micromap will be stored, and *must* be a multiple of 256.
- *size* is the size required for the micromap.
- *type* is a *VkMicromapTypeEXT* value specifying the type of micromap that will be created.
deviceAddress is the device address requested for the micromap if the micromapCaptureReplay feature is being used.

If deviceAddress is zero, no specific address is requested.

If deviceAddress is not zero, deviceAddress must be an address retrieved from an identically created micromap on the same implementation. The micromap must also be placed on an identically created buffer and at the same offset.

Applications should avoid creating micromaps with application-provided addresses and implementation-provided addresses in the same process, to reduce the likelihood of VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR errors.

Note
The expected usage for this is that a trace capture/replay tool will add the VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT flag to all buffers that use VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT, and will add VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT to all buffers used as storage for a micromap where deviceAddress is not zero. This also means that the tool will need to add VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT to memory allocations to allow the flag to be set where the application may not have otherwise required it. During capture the tool will save the queried opaque device addresses in the trace. During replay, the buffers will be created specifying the original address so any address values stored in the trace data will remain valid.

Implementations are expected to separate such buffers in the GPU address space so normal allocations will avoid using these addresses. Apps/tools should avoid mixing app-provided and implementation-provided addresses for buffers created with VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT, to avoid address space allocation conflicts.

If the micromap will be the target of a build operation, the required size for a micromap can be queried with vkGetMicromapBuildSizesEXT.

Valid Usage

- VUID-VkMicromapCreateInfoEXT-deviceAddress-07433
  If deviceAddress is not zero, createFlags must include VK_MICROMAP_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_EXT

- VUID-VkMicromapCreateInfoEXT-createFlags-07434
  If createFlags includes VK_MICROMAP_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_EXT, VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromapCaptureReplay must be VK_TRUE

- VUID-VkMicromapCreateInfoEXT-buffer-07435
  Buffer must have been created with a usage value containing VK_BUFFER_USAGE_MICROMAP_STORAGE_BIT_EXT

- VUID-VkMicromapCreateInfoEXT-buffer-07436
  Buffer must not have been created with VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT
VUID-VkMicromapCreateInfoEXT-offset-07437
The sum of offset and size must be less than the size of buffer

VUID-VkMicromapCreateInfoEXT-offset-07438
offset must be a multiple of 256 bytes

Valid Usage (Implicit)

VUID-VkMicromapCreateInfoEXT-sType-sType
sType must be VK_STRUCTURE_TYPE_MICROMAP_CREATE_INFO_EXT

VUID-VkMicromapCreateInfoEXT-pNext-pNext
pNext must be NULL

VUID-VkMicromapCreateInfoEXT-createFlags-parameter
createFlags must be a valid combination of VkMicromapCreateFlagBitsEXT values

VUID-VkMicromapCreateInfoEXT-buffer-parameter
buffer must be a valid VkBuffer handle

VUID-VkMicromapCreateInfoEXT-type-parameter
type must be a valid VkMicromapTypeEXT value

To get the build sizes for a micromap, call:

```
// Provided by VK_EXT_opacity_micromap
void vkGetMicromapBuildSizesEXT(
    VkDevice device,                 // device is the logical device that will be used for creating the micromap.
    VkAccelerationStructureBuildTypeKHR buildType,     // buildType defines whether host or device operations (or both) are being queried for.
    const VkMicromapBuildInfoEXT* pBuildInfo,           // pBuildInfo is a pointer to a VkMicromapBuildInfoEXT structure describing parameters of a build operation.
    VkMicromapBuildSizesInfoEXT* pSizeInfo               // pSizeInfo is a pointer to a VkMicromapBuildSizesInfoEXT structure which returns the size required for a micromap and the sizes required for the scratch buffers, given the build parameters.
);
```

The dstMicromap and mode members of pBuildInfo are ignored. Any VkDeviceOrHostAddressKHR members of pBuildInfo are ignored by this command.

A micromap created with the micromapSize returned by this command supports any build with a VkMicromapBuildInfoEXT structure subject to the following properties:

- The build command is a host build command, and buildType is VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_KHR or
VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR

- The build command is a device build command, and `buildType` is `VK_ACCELERATION_STRUCTURE_BUILD_TYPE_DEVICE_KHR` or `VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR`

- For `VkMicromapBuildInfoEXT`:
  - Its `type`, and `flags` members are equal to `pBuildInfo->type` and `pBuildInfo->flags`, respectively.
  - The sum of usage information in either `pUsageCounts` or `ppUsageCounts` is equal to the sum of usage information in either `pBuildInfo->pUsageCounts` or `pBuildInfo->ppUsageCounts`.

Similarly, the `buildScratchSize` value will support any build command specifying the `VK_BUILD_MICROMAP_MODE_BUILD_EXT` mode under the above conditions.

### Valid Usage

- **VUID-vkGetMicromapBuildSizesEXT-dstMicromap-09180**
  - `VkMicromapBuildInfoEXT::dstMicromap` must have been created from `device`

- **VUID-vkGetMicromapBuildSizesEXT-micromap-07439**
  - The `micromap` feature must be enabled

- **VUID-vkGetMicromapBuildSizesEXT-device-07440**
  - If `device` was created with multiple physical devices, then the `bufferDeviceAddressMultiDevice` feature must be enabled

### Valid Usage (Implicit)

- **VUID-vkGetMicromapBuildSizesEXT-device-parameter**
  - `device` must be a valid `VkDevice` handle

- **VUID-vkGetMicromapBuildSizesEXT-buildType-parameter**
  - `buildType` must be a valid `VkAccelerationStructureBuildTypeKHR` value

- **VUID-vkGetMicromapBuildSizesEXT-pBuildInfo-parameter**
  - `pBuildInfo` must be a valid pointer to a valid `VkMicromapBuildInfoEXT` structure

- **VUID-vkGetMicromapBuildSizesEXT-pSizeInfo-parameter**
  - `pSizeInfo` must be a valid pointer to a `VkMicromapBuildSizesInfoEXT` structure

The `VkMicromapBuildSizesInfoEXT` structure describes the required build sizes for a micromap and scratch buffers and is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkMicromapBuildSizesInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDeviceSize micromapSize;
} VkMicromapBuildSizesInfoEXT;
```
```c
VkDeviceSize buildScratchSize;
VkBool32 discardable;
}
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **micromapSize** is the size in bytes required in a `VkMicromapEXT` for a build or update operation.
- **buildScratchSize** is the size in bytes required in a scratch buffer for a build operation.
- **discardable** indicates whether or not the micromap object may be destroyed after an acceleration structure build or update. A false value means that acceleration structures built with this micromap may contain references to the data contained therein, and the application must not destroy the micromap until ray traversal has concluded. A true value means that the information in the micromap will be copied by value into the acceleration structure, and the micromap may be destroyed after the acceleration structure build concludes.

### Valid Usage (Implicit)

- VUID-VkMicromapBuildSizesInfoEXT-sType-sType
  
  `<sType> must be VK_STRUCTURE_TYPE_MICROMAP_BUILD_SIZES_INFO_EXT</sType>`

- VUID-VkMicromapBuildSizesInfoEXT-pNext-pNext
  
  `<pNext must be NULL>`

Values which **can** be set in `VkMicromapCreateInfoEXT::type` specifying the type of micromap, are:

```c
// Provided by VK_EXT_opacity_micromap
typedef enum VkMicromapTypeEXT {
    VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT = 0,
} VkMicromapTypeEXT;
```

- **VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT** is a micromap containing data to control the opacity of a triangle.

Bits which **can** be set in `VkMicromapCreateInfoEXT::createFlags`, specifying additional creation parameters for micromaps, are:

```c
// Provided by VK_EXT_opacity_micromap
typedef enum VkMicromapCreateFlagBitsEXT {
    VK_MICROMAP_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_EXT = 0x00000001,
} VkMicromapCreateFlagBitsEXT;
```

- **VK_MICROMAP_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_EXT** specifies that the micromap's address can be saved and reused on a subsequent run.
typedef VkFlags VkMicromapCreateFlagsEXT;

VkMicromapCreateFlagsEXT is a bitmask type for setting a mask of zero or more VkMicromapCreateFlagBitsEXT.

Bits which can be set in VkMicromapBuildInfoEXT::flags specifying additional parameters for micromap builds, are:

typedef enum VkBuildMicromapFlagBitsEXT {
    VK_BUILD_MICROMAP_PREFER_FAST_TRACE_BIT_EXT = 0x00000001,
    VK_BUILD_MICROMAP_PREFER_FAST_BUILD_BIT_EXT = 0x00000002,
    VK_BUILD_MICROMAP_ALLOW_COMPACTION_BIT_EXT = 0x00000004,
} VkBuildMicromapFlagBitsEXT;

• VK_BUILD_MICROMAP_PREFER_FAST_TRACE_BIT_EXT indicates that the given micromap build should prioritize trace performance over build time.
• VK_BUILD_MICROMAP_PREFER_FAST_BUILD_BIT_EXT indicates that the given micromap build should prioritize build time over trace performance.

typedef VkFlags VkBuildMicromapFlagsEXT;

VkBuildMicromapFlagsEXT is a bitmask type for setting a mask of zero or more VkBuildMicromapFlagBitsEXT.

To destroy a micromap, call:

void vkDestroyMicromapEXT(
    VkDevice device,  // logical device that destroys the micromap.
    VkMicromapEXT micromap,  // micromap to destroy.
    const VkAllocationCallbacks* pAllocator);

• device is the logical device that destroys the micromap.
• micromap is the micromap to destroy.
• pAllocator controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

• VUID-vkDestroyMicromapEXT-micromap-07441
  All submitted commands that refer to micromap must have completed execution
If VkAllocationCallbacks were provided when micromap was created, a compatible set of callbacks must be provided here.

If no VkAllocationCallbacks were provided when micromap was created, pAllocator must be NULL.

**Valid Usage (Implicit)**

- **VUID-vkDestroyMicromapEXT-device-parameter**
  device must be a valid VkDevice handle

- **VUID-vkDestroyMicromapEXT-micromap-parameter**
  If micromap is not VK_NULL_HANDLE, micromap must be a valid VkMicromapEXT handle

- **VUID-vkDestroyMicromapEXT-pAllocator-parameter**
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- **VUID-vkDestroyMicromapEXT-micromap-parent**
  If micromap is a valid handle, it must have been created, allocated, or retrieved from device

**Host Synchronization**

- Host access to micromap must be externally synchronized

### 12.8. Resource Memory Association

Resources are initially created as virtual allocations with no backing memory. Device memory is allocated separately (see Device Memory) and then associated with the resource. This association is done differently for sparse and non-sparse resources.

Resources created with any of the sparse creation flags are considered sparse resources. Resources created without these flags are non-sparse. The details on resource memory association for sparse resources is described in Sparse Resources.

Non-sparse resources must be bound completely and contiguously to a single VkDeviceMemory object before the resource is passed as a parameter to any of the following operations:

- creating image or buffer views
- updating descriptor sets
- recording commands in a command buffer

Once bound, the memory binding is immutable for the lifetime of the resource.

In a logical device representing more than one physical device, buffer and image resources exist on
all physical devices but can be bound to memory differently on each. Each such replicated resource is an instance of the resource. For sparse resources, each instance can be bound to memory arbitrarily differently. For non-sparse resources, each instance can either be bound to the local or a peer instance of the memory, or for images can be bound to rectangular regions from the local and/or peer instances. When a resource is used in a descriptor set, each physical device interprets the descriptor according to its own instance’s binding to memory.

Note
There are no new copy commands to transfer data between physical devices. Instead, an application can create a resource with a peer mapping and use it as the source or destination of a transfer command executed by a single physical device to copy the data from one physical device to another.

To determine the memory requirements for a buffer resource, call:

```c
// Provided by VK_VERSION_1_0
void vkGetBufferMemoryRequirements(
    VkDevice device,
    VkBuffer buffer,
    VkMemoryRequirements* pMemoryRequirements);
```

- `device` is the logical device that owns the buffer.
- `buffer` is the buffer to query.
- `pMemoryRequirements` is a pointer to a `VkMemoryRequirements` structure in which the memory requirements of the buffer object are returned.

Valid Usage (Implicit)
- VUID-vkGetBufferMemoryRequirements-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkGetBufferMemoryRequirements-buffer-parameter
  `buffer` must be a valid `VkBuffer` handle
- VUID-vkGetBufferMemoryRequirements-pMemoryRequirements-parameter
  `pMemoryRequirements` must be a valid pointer to a `VkMemoryRequirements` structure
- VUID-vkGetBufferMemoryRequirements-buffer-parent
  `buffer` must have been created, allocated, or retrieved from `device`

To determine the memory requirements for an image resource which is not created with the `VK_IMAGE_CREATE_DISJOINT_BIT` flag set, call:

```c
// Provided by VK_VERSION_1_0
void vkGetImageMemoryRequirements(
    VkDevice device,
    VkImage image,
```

```c
```
• **device** is the logical device that owns the image.

• **image** is the image to query.

• **pMemoryRequirements** is a pointer to a **VkMemoryRequirements** structure in which the memory requirements of the image object are returned.

## Valid Usage

• VUID-vkGetImageMemoryRequirements-image-01588
  
  **image** **must** not have been created with the **VK_IMAGE_CREATE_DISJOINT_BIT** flag set

## Valid Usage (Implicit)

• VUID-vkGetImageMemoryRequirements-device-parameter
  
  **device** **must** be a valid **VkDevice** handle

• VUID-vkGetImageMemoryRequirements-image-parameter
  
  **image** **must** be a valid **VkImage** handle

• VUID-vkGetImageMemoryRequirements-pMemoryRequirements-parameter
  
  **pMemoryRequirements** **must** be a valid pointer to a **VkMemoryRequirements** structure

• VUID-vkGetImageMemoryRequirements-image-parent
  
  **image** **must** have been created, allocated, or retrieved from **device**

The **VkMemoryRequirements** structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkMemoryRequirements {
    VkDeviceSize size;
    VkDeviceSize alignment;
    uint32_t memoryTypeBits;
} VkMemoryRequirements;
```

• **size** is the size, in bytes, of the memory allocation **required** for the resource.

• **alignment** is the alignment, in bytes, of the offset within the allocation **required** for the resource.

• **memoryTypeBits** is a bitmask and contains one bit set for every supported memory type for the resource. Bit $i$ is set if and only if the memory type $i$ in the **VkPhysicalDeviceMemoryProperties** structure for the physical device is supported for the resource.

If the resource being queried was created with the **VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT**, **VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT**, or
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT external memory handle type, the value of size has no meaning and should be ignored.

The implementation guarantees certain properties about the memory requirements returned by
vkGetBufferMemoryRequirements2, vkGetImageMemoryRequirements2,
vkGetDeviceBufferMemoryRequirements, vkGetDeviceImageMemoryRequirements,
vkGetBufferMemoryRequirements and vkGetImageMemoryRequirements:

• The memoryTypeBits member always contains at least one bit set.

• If buffer is a VkBuffer not created with the VK_BUFFER_CREATE_SPARSE_BINDING_BIT or VK_BUFFER_CREATE_PROTECTED_BIT bits set, or if image is a linear image that was not created with the VK_IMAGE_CREATE_PROTECTED_BIT bit set, then the memoryTypeBits member always contains at least one bit set corresponding to a VkMemoryType with a propertyFlags that has both the VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT and the VK_MEMORY_PROPERTY_HOST_COHERENT_BIT bit set. In other words, mappable coherent memory can always be attached to these objects.

• If buffer was created with VkExternalMemoryBufferCreateInfo::handleTypes set to 0 or image was created with VkExternalMemoryImageCreateInfo::handleTypes set to 0, the memoryTypeBits member always contains at least one bit set corresponding to a VkMemoryType with a propertyFlags that has the VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT bit set.

• The memoryTypeBits member is identical for all VkBuffer objects created with the same value for the flags and usage members in the VkBufferCreateInfo structure and the handleTypes member of the VkExternalMemoryBufferCreateInfo structure passed to vkCreateBuffer. Further, if usage1 and usage2 of type VkBufferUsageFlags are such that the bits set in usage2 are a subset of the bits set in usage1, and they have the same flags and VkExternalMemoryBufferCreateInfo::handleTypes, then the bits set in memoryTypeBits returned for usage1 must be a subset of the bits set in memoryTypeBits returned for usage2, for all values of flags.

• The alignment member is a power of two.

• The alignment member is identical for all VkBuffer objects created with the same combination of values for the usage and flags members in the VkBufferCreateInfo structure passed to vkCreateBuffer.

• If the maintenance4 feature is enabled, then the alignment member is identical for all VkImage objects created with the same combination of values for the flags, imageType, format, extent, mipLevels, arrayLayers, samples, tiling and usage members in the VkImageCreateInfo structure passed to vkCreateImage.

• The alignment member satisfies the buffer descriptor offset alignment requirements associated with the VkBuffer’s usage:
  ◦ If usage included VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT or VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT, alignment must be an integer multiple of VkPhysicalDeviceLimits::minTexelBufferOffsetAlignment.
  ◦ If usage included VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT, alignment must be an integer multiple of VkPhysicalDeviceLimits::minUniformBufferOffsetAlignment.
  ◦ If usage included VK_BUFFER_USAGE_STORAGE_BUFFER_BIT, alignment must be an integer multiple of VkPhysicalDeviceLimits::minStorageBufferOffsetAlignment.

• For images created with a color format, the memoryTypeBits member is identical for all VkImage
objects created with the same combination of values for the tiling member, the
VK_IMAGE_CREATE_SPARSE_BINDING_BIT bit of the flags member, the
VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT bit of the flags member, the
VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT bit of the usage member if the
VkPhysicalDeviceHostImageCopyPropertiesEXT::identicalMemoryTypeRequirements property is
VK_FALSE, handleTypes member of VkExternalMemoryImageCreateInfo, and the
VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT of the usage member in the VkImageCreateInfo
structure passed to vkCreateImage.

- For images created with a depth/stencil format, the memoryTypeBits member is identical for all
  VkImage objects created with the same combination of values for the format member, the tiling
  member, the VK_IMAGE_CREATE_SPARSE_BINDING_BIT bit of the flags member, the
  VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT bit of the flags member, the
  VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT bit of the usage member if the
  VkPhysicalDeviceHostImageCopyPropertiesEXT::identicalMemoryTypeRequirements property is
  VK_FALSE, handleTypes member of VkExternalMemoryImageCreateInfo, and the
  VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT of the usage member in the VkImageCreateInfo
  structure passed to vkCreateImage.

- If the memory requirements are for a VkImage, the memoryTypeBits member **must** not refer to a
  VkMemoryType with a propertyFlags that has the VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT bit set if
  the image did not have VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT bit set in the usage member of
  the VkImageCreateInfo structure passed to vkCreateImage.

- If the memory requirements are for a VkBuffer, the memoryTypeBits member **must** not refer to a
  VkMemoryType with a propertyFlags that has the VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT bit set.

  **Note**
  
The implication of this requirement is that lazily allocated memory is
disallowed for buffers in all cases.

- The size member is identical for all VkBuffer objects created with the same combination of
  creation parameters specified in VkBufferCreateInfo and its pNext chain.

- The size member is identical for all VkImage objects created with the same combination of
  creation parameters specified in VkImageCreateInfo and its pNext chain.

  **Note**
  
  This, however, does not imply that they interpret the contents of the bound
  memory identically with each other. That additional guarantee, however, **can**
  be explicitly requested using VK_IMAGE_CREATE_ALIAS_BIT.

- If the maintenance4 feature is enabled, these additional guarantees apply:
  
  ◦ For a VkBuffer, the size memory requirement is never greater than that of another VkBuffer
  created with a greater or equal size specified in VkBufferCreateInfo, all other creation
  parameters being identical.

  ◦ For a VkBuffer, the size memory requirement is never greater than the result of aligning
  VkBufferCreateInfo::size with the alignment memory requirement.
For a VkImage, the size memory requirement is never greater than that of another VkImage created with a greater or equal value in each of extent.width, extent.height, and extent.depth; all other creation parameters being identical.

The memory requirements returned by vkGetDeviceBufferMemoryRequirements are identical to those that would be returned by vkGetBufferMemoryRequirements2 if it were called with a VkBuffer created with the same VkBufferCreateInfo values.

The memory requirements returned by vkGetDeviceImageMemoryRequirements are identical to those that would be returned by vkGetImageMemoryRequirements2 if it were called with a VkImage created with the same VkImageCreateInfo values.

To determine the memory requirements for a buffer resource, call:

```c
// Provided by VK_VERSION_1_1
void vkGetBufferMemoryRequirements2(
    VkDevice device,
    const VkBufferMemoryRequirementsInfo2* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

or the equivalent command

```c
// Provided by VK_KHR_get_memory_requirements2
void vkGetBufferMemoryRequirements2KHR(
    VkDevice device,
    const VkBufferMemoryRequirementsInfo2* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

- `device` is the logical device that owns the buffer.
- `pInfo` is a pointer to a VkBufferMemoryRequirementsInfo2 structure containing parameters required for the memory requirements query.
- `pMemoryRequirements` is a pointer to a VkMemoryRequirements2 structure in which the memory requirements of the buffer object are returned.

### Valid Usage (Implicit)

- VUID-vkGetBufferMemoryRequirements2-device-parameter device must be a valid VkDevice handle
- VUID-vkGetBufferMemoryRequirements2-pInfo-parameter pInfo must be a valid pointer to a valid VkBufferMemoryRequirementsInfo2 structure
- VUID-vkGetBufferMemoryRequirements2-pMemoryRequirements-parameter pMemoryRequirements must be a valid pointer to a VkMemoryRequirements2 structure

To determine the memory requirements for a buffer resource without creating an object, call:
```c
// Provided by VK_VERSION_1_3
void vkGetDeviceBufferMemoryRequirements(
    VkDevice device,
    const VkDeviceBufferMemoryRequirements* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

or the equivalent command

```c
// Provided by VK_KHR_maintenance4
void vkGetDeviceBufferMemoryRequirementsKHR(
    VkDevice device,
    const VkDeviceBufferMemoryRequirements* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

- `device` is the logical device intended to own the buffer.
- `pInfo` is a pointer to a `VkDeviceBufferMemoryRequirements` structure containing parameters required for the memory requirements query.
- `pMemoryRequirements` is a pointer to a `VkMemoryRequirements2` structure in which the memory requirements of the buffer object are returned.

### Valid Usage (Implicit)

- VUID-vkGetDeviceBufferMemoryRequirements-device-parameter  
  `device` must be a valid `VkDevice` handle
- VUID-vkGetDeviceBufferMemoryRequirements-pInfo-parameter  
  `pInfo` must be a valid pointer to a valid `VkDeviceBufferMemoryRequirements` structure
- VUID-vkGetDeviceBufferMemoryRequirements-pMemoryRequirements-parameter  
  `pMemoryRequirements` must be a valid pointer to a `VkMemoryRequirements2` structure

The `VkBufferMemoryRequirementsInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkBufferMemoryRequirementsInfo2 {
    VkStructureType    sType;
    const void*        pNext;
    VkBuffer           buffer;
} VkBufferMemoryRequirementsInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_get_memory_requirements2
typedef VkBufferMemoryRequirementsInfo2 VkBufferMemoryRequirementsInfo2KHR;
```
- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `buffer` is the buffer to query.

### Valid Usage (Implicit)

- `VUID-VkBufferMemoryRequirementsInfo2-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_BUFFER_MEMORY_REQUIREMENTS_INFO_2`
- `VUID-VkBufferMemoryRequirementsInfo2-pNext-pNext`  
  `pNext` must be `NULL`
- `VUID-VkBufferMemoryRequirementsInfo2-buffer-parameter`  
  `buffer` must be a valid `VkBuffer` handle

The `VkDeviceBufferMemoryRequirements` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkDeviceBufferMemoryRequirements {
    VkStructureType sType;
    const void* pNext;
    const VkBufferCreateInfo* pCreateInfo;
} VkDeviceBufferMemoryRequirements;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance4
typedef VkDeviceBufferMemoryRequirements VkDeviceBufferMemoryRequirementsKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pCreateInfo` is a pointer to a `VkBufferCreateInfo` structure containing parameters affecting creation of the buffer to query.

### Valid Usage (Implicit)

- `VUID-VkDeviceBufferMemoryRequirements-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_DEVICE_BUFFER_MEMORY_REQUIREMENTS`
- `VUID-VkDeviceBufferMemoryRequirements-pNext-pNext`  
  `pNext` must be `NULL`
- `VUID-VkDeviceBufferMemoryRequirements-pCreateInfo-parameter`  
  `pCreateInfo` must be a valid pointer to a valid `VkBufferCreateInfo` structure

To determine the memory requirements for an image resource, call:
void vkGetImageMemoryRequirements2(
    VkDevice device,
    const VkImageMemoryRequirementsInfo2* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);

or the equivalent command

void vkGetImageMemoryRequirements2KHR(
    VkDevice device,
    const VkImageMemoryRequirementsInfo2* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);

• device is the logical device that owns the image.

• pInfo is a pointer to a VkImageMemoryRequirementsInfo2 structure containing parameters required for the memory requirements query.

• pMemoryRequirements is a pointer to a VkMemoryRequirements2 structure in which the memory requirements of the image object are returned.

Valid Usage (Implicit)

• VUID-vkGetImageMemoryRequirements2-device-parameter
device must be a valid VkDevice handle

• VUID-vkGetImageMemoryRequirements2-pInfo-parameter
pInfo must be a valid pointer to a valid VkImageMemoryRequirementsInfo2 structure

• VUID-vkGetImageMemoryRequirements2-pMemoryRequirements-parameter
pMemoryRequirements must be a valid pointer to a VkMemoryRequirements2 structure

To determine the memory requirements for an image resource without creating an object, call:

void vkGetDeviceImageMemoryRequirements(
    VkDevice device,
    const VkDeviceImageMemoryRequirements* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);

or the equivalent command

void vkGetDeviceImageMemoryRequirementsKHR(
    VkDevice device,
    const VkDeviceImageMemoryRequirements* pInfo,
    VkMemoryRequirements2* pMemoryRequirements) ;
• device is the logical device intended to own the image.
• pInfo is a pointer to a VkDeviceImageMemoryRequirements structure containing parameters required for the memory requirements query.
• pMemoryRequirements is a pointer to a VkMemoryRequirements2 structure in which the memory requirements of the image object are returned.

Valid Usage (Implicit)
• VUID-vkGetDeviceImageMemoryRequirements-device-parameter device must be a valid VkDevice handle
• VUID-vkGetDeviceImageMemoryRequirements-pInfo-parameter pInfo must be a valid pointer to a valid VkDeviceImageMemoryRequirements structure
• VUID-vkGetDeviceImageMemoryRequirements-pMemoryRequirements-parameter pMemoryRequirements must be a valid pointer to a VkMemoryRequirements2 structure

The VkImageMemoryRequirementsInfo2 structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkImageMemoryRequirementsInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkImage image;
} VkImageMemoryRequirementsInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_get_memory_requirements2
typedef VkImageMemoryRequirementsInfo2 VkImageMemoryRequirementsInfo2KHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• image is the image to query.

Valid Usage
• VUID-VkImageMemoryRequirementsInfo2-image-01589
  If image was created with a multi-planar format and the VK_IMAGE_CREATE_DISJOINT_BIT flag, there must be a VkImagePlaneMemoryRequirementsInfo included in the pNext chain of the VkImageMemoryRequirementsInfo2 structure
• VUID-VkImageMemoryRequirementsInfo2-image-01590
If image was not created with the VK_IMAGE_CREATE_DISJOINT_BIT flag, there must not be a VkImagePlaneMemoryRequirementsInfo included in the pNext chain of the VkImageMemoryRequirementsInfo2 structure.

- VUID-VkImageMemoryRequirementsInfo2-image-01591
  If image was created with a single-plane format, there must not be a VkImagePlaneMemoryRequirementsInfo included in the pNext chain of the VkImageMemoryRequirementsInfo2 structure.

Valid Usage (Implicit)

- VUID-VkImageMemoryRequirementsInfo2-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMAGE_MEMORY_REQUIREMENTS_INFO_2

- VUID-VkImageMemoryRequirementsInfo2-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkImagePlaneMemoryRequirementsInfo

- VUID-VkImageMemoryRequirementsInfo2-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkImageMemoryRequirementsInfo2-image-parameter
  image must be a valid VkImage handle

The VkDeviceImageMemoryRequirements structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkDeviceImageMemoryRequirements {
    VkStructureType sType;
    const void* pNext;
    const VkImageCreateInfo* pCreateInfo;
    VkImageAspectFlagBits planeAspect;
} VkDeviceImageMemoryRequirements;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance4
typedef VkDeviceImageMemoryRequirements VkDeviceImageMemoryRequirementsKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- pCreateInfo is a pointer to a VkImageCreateInfo structure containing parameters affecting creation of the image to query.
- planeAspect is a VkImageAspectFlagBits value specifying the aspect corresponding to the image plane to query. This parameter is ignored unless pCreateInfo->flags has VK_IMAGE_CREATE_DISJOINT_BIT set.
Valid Usage

- **VUID-VkDeviceImageMemoryRequirements-pCreateInfo-06416**
  The `pNext` chain must not contain a `VkImageSwapchainCreateInfoKHR` structure.

- **VUID-VkDeviceImageMemoryRequirements-pCreateInfo-06417**
  If `format` specifies a multi-planar format and `flags` has `VK_IMAGE_CREATE_DISJOINT_BIT` set then `planeAspect` must not be `VK_IMAGE_ASPECT_NONE_KHR`.

- **VUID-VkDeviceImageMemoryRequirements-pCreateInfo-06419**
  If `flags` has `VK_IMAGE_CREATE_DISJOINT_BIT` set and if the `tiling` is `VK_IMAGE_TILING_LINEAR` or `VK_IMAGE_TILING_OPTIMAL`, then `planeAspect` must be a single valid multi-planar aspect mask bit.

Valid Usage (Implicit)

- **VUID-VkDeviceImageMemoryRequirements-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_DEVICE_IMAGE_MEMORY_REQUIREMENTS`.

- **VUID-VkDeviceImageMemoryRequirements-pNext-pNext**
  `pNext` must be `NULL`.

- **VUID-VkDeviceImageMemoryRequirements-pCreateInfo-parameter**
  `pCreateInfo` must be a valid pointer to a valid `VkImageCreateInfo` structure.

- **VUID-VkDeviceImageMemoryRequirements-planeAspect-parameter**
  If `planeAspect` is not 0, `planeAspect` must be a valid `VkImageAspectFlagBits` value.

To determine the memory requirements for a plane of a disjoint image, add a `VkImagePlaneMemoryRequirementsInfo` structure to the `pNext` chain of the `VkImageMemoryRequirementsInfo2` structure.

The `VkImagePlaneMemoryRequirementsInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkImagePlaneMemoryRequirementsInfo {
    VkStructureType sType;
    const void* pNext;
    VkImageAspectFlagBits planeAspect;
} VkImagePlaneMemoryRequirementsInfo;
```

or the equivalent

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkImagePlaneMemoryRequirementsInfo VkImagePlaneMemoryRequirementsInfoKHR;
```
• **sType** is a *VkStructureType* value identifying this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **planeAspect** is a *VkImageAspectFlagBits* value specifying the aspect corresponding to the image plane to query.

---

## Valid Usage

- VUID-VkImagePlaneMemoryRequirementsInfo-planeAspect-02281
  
  If the image's tiling is VK_IMAGE_TILING_LINEAR or VK_IMAGE_TILING_OPTIMAL, then **planeAspect** must be a single valid multi-planar aspect mask bit.

---

## Valid Usage (Implicit)

- VUID-VkImagePlaneMemoryRequirementsInfo-sType-sType
  
  **sType** must be VK_STRUCTURE_TYPE_IMAGE_PLANE_MEMORY_REQUIREMENTS_INFO

- VUID-VkImagePlaneMemoryRequirementsInfo-planeAspect-parameter
  
  **planeAspect** must be a valid *VkImageAspectFlagBits* value.

---

The *VkMemoryRequirements2* structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkMemoryRequirements2 {
    VkStructureType sType;
    void* pNext;
    VkMemoryRequirements memoryRequirements;
} VkMemoryRequirements2;
```

or the equivalent

```c
// Provided by VK_KHR_get_memory_requirements2
typedef VkMemoryRequirements2 VkMemoryRequirements2KHR;
```

• **sType** is a *VkStructureType* value identifying this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **memoryRequirements** is a *VkMemoryRequirements* structure describing the memory requirements of the resource.

---

## Valid Usage (Implicit)

- VUID-VkMemoryRequirements2-sType-sType
  
  **sType** must be VK_STRUCTURE_TYPE_MEMORY_REQUIREMENTS_2

- VUID-VkMemoryRequirements2-pNext-pNext
pNext must be NULL or a pointer to a valid instance of VkMemoryDedicatedRequirements

- VUID-VkMemoryRequirements2-sType-unique
  The sType value of each struct in the pNext chain must be unique

The VkMemoryDedicatedRequirements structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkMemoryDedicatedRequirements {
    VkStructureType sType;
    void* pNext;
    VkBool32 prefersDedicatedAllocation;
    VkBool32 requiresDedicatedAllocation;
} VkMemoryDedicatedRequirements;
```

or the equivalent

```c
// Provided by VK_KHR_dedicated_allocation
typedef VkMemoryDedicatedRequirements VkMemoryDedicatedRequirementsKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- prefersDedicatedAllocation specifies that the implementation would prefer a dedicated allocation for this resource. The application is still free to suballocate the resource but it may get better performance if a dedicated allocation is used.
- requiresDedicatedAllocation specifies that a dedicated allocation is required for this resource.

To determine the dedicated allocation requirements of a buffer or image resource, add a VkMemoryDedicatedRequirements structure to the pNext chain of the VkMemoryRequirements2 structure passed as the pMemoryRequirements parameter of vkGetBufferMemoryRequirements2 or vkGetImageMemoryRequirements2, respectively.

Constraints on the values returned for buffer resources are:

- requiresDedicatedAllocation may be VK_TRUE if the pNext chain of VkBufferCreateInfo for the call to vkCreateBuffer used to create the buffer being queried included a VkExternalMemoryBufferCreateInfo structure, and any of the handle types specified in VkExternalMemoryBufferCreateInfo::handleTypes requires dedicated allocation, as reported by vkGetPhysicalDeviceExternalBufferProperties in VkExternalBufferProperties::externalMemoryProperties.externalMemoryFeatures. Otherwise, requiresDedicatedAllocation will be VK_FALSE.

- When the implementation sets requiresDedicatedAllocation to VK_TRUE, it must also set prefersDedicatedAllocation to VK_TRUE.

- If VK_BUFFER_CREATE_SPARSE_BINDING_BIT was set in VkBufferCreateInfo::flags when buffer was created, then both prefersDedicatedAllocation and requiresDedicatedAllocation will be VK_FALSE.
Constraints on the values returned for image resources are:

- **requiresDedicatedAllocation** may be **VK_TRUE** if the pNext chain of VkImageCreateInfo for the call to vkCreateImage used to create the image being queried included a VkExternalMemoryImageCreateInfo structure, and any of the handle types specified in VkExternalMemoryImageCreateInfo::handleTypes requires dedicated allocation, as reported by vkGetPhysicalDeviceImageFormatProperties2 in VkExternalImageFormatProperties::externalMemoryProperties.externalMemoryFeatures.
- requiresDedicatedAllocation will otherwise be **VK_FALSE**
- If **VK_IMAGE_CREATE_SPARSE_BINDING_BIT** was set in VkImageCreateInfo::flags when image was created, then both prefersDedicatedAllocation and requiresDedicatedAllocation will be **VK_FALSE**.

### Valid Usage (Implicit)

- VUID-VkMemoryDedicatedRequirements-sType-sType
  
sType must be **VK_STRUCTURE_TYPE_MEMORY_DEDICATED_REQUIREMENTS**

To attach memory to a buffer object, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkBindBufferMemory(
    VkDevice device,
    VkBuffer buffer,
    VkDeviceMemory memory,
    VkDeviceSize memoryOffset);
```

- **device** is the logical device that owns the buffer and memory.
- **buffer** is the buffer to be attached to memory.
- **memory** is a VkDeviceMemory object describing the device memory to attach.
- **memoryOffset** is the start offset of the region of memory which is to be bound to the buffer. The number of bytes returned in the VkMemoryRequirements::size member in memory, starting from memoryOffset bytes, will be bound to the specified buffer.

vkBindBufferMemory is equivalent to passing the same parameters through VkBindBufferMemoryInfo to vkBindBufferMemory2.

### Valid Usage

- VUID-vkBindBufferMemory-buffer-07459
  buffer must not have been bound to a memory object

- VUID-vkBindBufferMemory-buffer-01030
  buffer must not have been created with any sparse memory binding flags

- VUID-vkBindBufferMemory-memoryOffset-01031
  memoryOffset must be less than the size of memory
• VUID-vkBindBufferMemory-memory-01035
  memory must have been allocated using one of the memory types allowed in the memoryTypeBits member of the VkMemoryRequirements structure returned from a call to vkGetBufferMemoryRequirements with buffer.

• VUID-vkBindBufferMemory-memoryOffset-01036
  memoryOffset must be an integer multiple of the alignment member of the VkMemoryRequirements structure returned from a call to vkGetBufferMemoryRequirements with buffer.

• VUID-vkBindBufferMemory-size-01037
  The size member of the VkMemoryRequirements structure returned from a call to vkGetBufferMemoryRequirements with buffer must be less than or equal to the size of memory minus memoryOffset.

• VUID-vkBindBufferMemory-buffer-01444
  If buffer requires a dedicated allocation (as reported by vkGetBufferMemoryRequirements2 in VkMemoryDedicatedRequirements::requiresDedicatedAllocation for buffer), memory must have been allocated with VkMemoryDedicatedAllocateInfo::buffer equal to buffer.

• VUID-vkBindBufferMemory-memory-01508
  If the VkMemoryAllocateInfo provided when memory was allocated included a VkMemoryDedicatedAllocateInfo structure in its pNext chain, and VkMemoryDedicatedAllocateInfo::buffer was not VK_NULL_HANDLE, then buffer must equal VkMemoryDedicatedAllocateInfo::buffer, and memoryOffset must be zero.

• VUID-vkBindBufferMemory-None-01898
  If buffer was created with the VK_BUFFER_CREATE_PROTECTED_BIT bit set, the buffer must be bound to a memory object allocated with a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT.

• VUID-vkBindBufferMemory-None-01899
  If buffer was created with the VK_BUFFER_CREATE_PROTECTED_BIT bit not set, the buffer must not be bound to a memory object allocated with a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT.

• VUID-vkBindBufferMemory-memory-02726
  If the value of VkExportMemoryAllocateInfo::handleTypes used to allocate memory is not 0, it must include at least one of the handles set in VkExternalMemoryBufferCreateInfo::handleTypes when buffer was created.

• VUID-vkBindBufferMemory-memory-02985
  If memory was allocated by a memory import operation, the external handle type of the imported memory must also have been set in VkExternalMemoryBufferCreateInfo::handleTypes when buffer was created.

• VUID-vkBindBufferMemory-bufferDeviceAddress-03339
  If the VkPhysicalDeviceBufferDeviceAddressFeatures::bufferDeviceAddress feature is enabled and buffer was created with the VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT bit set, memory must have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT bit set.

• VUID-vkBindBufferMemory-bufferDeviceAddressCaptureReplay-09200
If the `VkPhysicalDeviceBufferDeviceAddressFeatures::bufferDeviceAddressCaptureReplay` feature is enabled and `buffer` was created with the `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT` bit set, `memory` must have been allocated with the `VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT` bit set.

### Valid Usage (Implicit)

- `VUID-vkBindBufferMemory-device-parameter device` must be a valid `VkDevice` handle.
- `VUID-vkBindBufferMemory-buffer-parameter buffer` must be a valid `VkBuffer` handle.
- `VUID-vkBindBufferMemory-memory-parameter memory` must be a valid `VkDeviceMemory` handle.
- `VUID-vkBindBufferMemory-buffer-parent buffer` must have been created, allocated, or retrieved from `device`.
- `VUID-vkBindBufferMemory-memory-parent memory` must have been created, allocated, or retrieved from `device`.

### Host Synchronization

- Host access to `buffer` must be externally synchronized.

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR`

To attach memory to buffer objects for one or more buffers at a time, call:

```c
// Provided by VK_VERSION_1_1
VkResult vkBindBufferMemory2(
    VkDevice device,
    uint32_t bindInfoCount,
    const VkBindBufferMemoryInfo* pBindInfos);
```

or the equivalent command.
VkResult vkBindBufferMemory2KHR(
    VkDevice device, 
    uint32_t bindInfoCount, 
    const VkBindBufferMemoryInfo* pBindInfos);

- device is the logical device that owns the buffers and memory.
- bindInfoCount is the number of elements in pBindInfos.
- pBindInfos is a pointer to an array of bindInfoCount VkBindBufferMemoryInfo structures describing buffers and memory to bind.

On some implementations, it may be more efficient to batch memory bindings into a single command.

If the maintenance feature is enabled, this command must attempt to perform all of the memory binding operations described by pBindInfos, and must not early exit on the first failure.

If any of the memory binding operations described by pBindInfos fail, the VkResult returned by this command must be the return value of any one of the memory binding operations which did not return VK_SUCCESS.

Note
If the vkBindBufferMemory2 command failed, VkBindMemoryStatusKHR structures were not included in the pNext chains of each element of pBindInfos, and bindInfoCount was greater than one, then the buffers referenced by pBindInfos will be in an indeterminate state, and must not be used.

Applications should destroy these buffers.

Valid Usage (Implicit)

- VUID-vkBindBufferMemory2-device-parameter
  device must be a valid VkDevice handle
- VUID-vkBindBufferMemory2-pBindInfos-parameter
  pBindInfos must be a valid pointer to an array of bindInfoCount valid VkBindBufferMemoryInfo structures
- VUID-vkBindBufferMemory2-bindInfoCount-arraylength
  bindInfoCount must be greater than 0

Return Codes

Success
- VK_SUCCESS
Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR

VkBindBufferMemoryInfo contains members corresponding to the parameters of vkBindBufferMemory.

The VkBindBufferMemoryInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkBindBufferMemoryInfo {
    VkStructureType sType;
    const void* pNext;
    VkBuffer buffer;
    VkDeviceMemory memory;
    VkDeviceSize memoryOffset;
} VkBindBufferMemoryInfo;
```

or the equivalent

```c
// Provided by VK_KHR_bind_memory2
typedef VkBindBufferMemoryInfoKhr VkBindBufferMemoryInfo;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `buffer` is the buffer to be attached to memory.
- `memory` is a VkDeviceMemory object describing the device memory to attach.
- `memoryOffset` is the start offset of the region of memory which is to be bound to the buffer. The number of bytes returned in the VkMemoryRequirements::size member in memory, starting from memoryOffset bytes, will be bound to the specified buffer.

Valid Usage

- VUID-VkBindBufferMemoryInfo-buffer-07459
  buffer must not have been bound to a memory object
- VUID-VkBindBufferMemoryInfo-buffer-01030
  buffer must not have been created with any sparse memory binding flags
- VUID-VkBindBufferMemoryInfo-memoryOffset-01031
  memoryOffset must be less than the size of memory
- VUID-VkBindBufferMemoryInfo-memory-01035
  memory must have been allocated using one of the memory types allowed in the
memoryTypeBits member of the VkMemoryRequirements structure returned from a call to vkGetBufferMemoryRequirements with buffer

- VUID-VkBindBufferMemoryInfo-memoryOffset-01036
  memoryOffset must be an integer multiple of the alignment member of the VkMemoryRequirements structure returned from a call to vkGetBufferMemoryRequirements with buffer

- VUID-VkBindBufferMemoryInfo-size-01037
  The size member of the VkMemoryRequirements structure returned from a call to vkGetBufferMemoryRequirements with buffer must be less than or equal to the size of memory minus memoryOffset

- VUID-VkBindBufferMemoryInfo-buffer-01444
  If buffer requires a dedicated allocation (as reported by vkGetBufferMemoryRequirements2 in VkMemoryDedicatedRequirements requiresDedicatedAllocation for buffer), memory must have been allocated with VkMemoryDedicatedAllocateInfo.buffer equal to buffer

- VUID-VkBindBufferMemoryInfo-memory-01508
  If the VkMemoryAllocateInfo provided when memory was allocated included a VkMemoryDedicatedAllocateInfo structure in its pNext chain, and VkMemoryDedicatedAllocateInfo.buffer was not VK_NULL_HANDLE, then buffer must equal VkMemoryDedicatedAllocateInfo.buffer, and memoryOffset must be zero

- VUID-VkBindBufferMemoryInfo-None-01898
  If buffer was created with the VK_BUFFER_CREATE_PROTECTED_BIT bit set, the buffer must be bound to a memory object allocated with a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT

- VUID-VkBindBufferMemoryInfo-None-01899
  If buffer was created with the VK_BUFFER_CREATE_PROTECTED_BIT bit not set, the buffer must not be bound to a memory object allocated with a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT

- VUID-VkBindBufferMemoryInfo-memory-02726
  If the value of VkExportMemoryAllocateInfo.handleTypes used to allocate memory is not 0, it must include at least one of the handles set in VkExternalMemoryBufferCreateInfo handleTypes when buffer was created

- VUID-VkBindBufferMemoryInfo-memory-02985
  If memory was allocated by a memory import operation, the external handle type of the imported memory must also have been set in VkExternalMemoryBufferCreateInfo handleTypes when buffer was created

- VUID-VkBindBufferMemoryInfo-bufferDeviceAddress-03339
  If the VkPhysicalDeviceBufferDeviceAddressFeatures::bufferDeviceAddress feature is enabled and buffer was created with the VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT bit set, memory must have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT bit set

- VUID-VkBindBufferMemoryInfo-bufferDeviceAddressCaptureReplay-09200
  If the VkPhysicalDeviceBufferDeviceAddressFeatures::bufferDeviceAddressCaptureReplay feature is enabled and buffer was created with the
VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT bit set, memory must have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT bit set

- VUID-VkBindBufferMemoryInfo-pNext-01605
  If the pNext chain includes a VkBindBufferMemoryDeviceGroupInfo structure, all instances of memory specified by VkBindBufferMemoryDeviceGroupInfo::pDeviceIndices must have been allocated

Valid Usage (Implicit)

- VUID-VkBindBufferMemoryInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_BIND_BUFFER_MEMORY_INFO

- VUID-VkBindBufferMemoryInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkBindBufferMemoryDeviceGroupInfo or VkBindMemoryStatusKHR

- VUID-VkBindBufferMemoryInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkBindBufferMemoryInfo-buffer-parameter
  buffer must be a valid VkBuffer handle

- VUID-VkBindBufferMemoryInfo-memory-parameter
  memory must be a valid VkDeviceMemory handle

- VUID-VkBindBufferMemoryInfo-commonparent
  Both of buffer, and memory must have been created, allocated, or retrieved from the same VkDevice

The VkBindBufferMemoryDeviceGroupInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkBindBufferMemoryDeviceGroupInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t deviceIndexCount;
    const uint32_t* pDeviceIndices;
} VkBindBufferMemoryDeviceGroupInfo;
```

or the equivalent

```c
// Provided by VK_KHR_bind_memory2 with VK_KHR_device_group
typedef VkBindBufferMemoryDeviceGroupInfoVkBindBufferMemoryDeviceGroupInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
• deviceIndexCount is the number of elements in pDeviceIndices.

• pDeviceIndices is a pointer to an array of device indices.

If the pNext chain of VkBindBufferMemoryInfo includes a VkBindBufferMemoryDeviceGroupInfo structure, then that structure determines how memory is bound to buffers across multiple devices in a device group.

If deviceIndexCount is greater than zero, then on device index i the buffer is attached to the instance of memory on the physical device with device index pDeviceIndices[i].

If deviceIndexCount is zero and memory comes from a memory heap with the VK_MEMORY_HEAP_MULTI_INSTANCE_BIT bit set, then it is as if pDeviceIndices contains consecutive indices from zero to the number of physical devices in the logical device, minus one. In other words, by default each physical device attaches to its own instance of memory.

If deviceIndexCount is zero and memory comes from a memory heap without the VK_MEMORY_HEAP_MULTI_INSTANCE_BIT bit set, then it is as if pDeviceIndices contains an array of zeros. In other words, by default each physical device attaches to instance zero.

Valid Usage

• VUID-VkBindBufferMemoryDeviceGroupInfo-deviceIndexCount-01606
deviceIndexCount must either be zero or equal to the number of physical devices in the logical device

• VUID-VkBindBufferMemoryDeviceGroupInfo-pDeviceIndices-01607
All elements of pDeviceIndices must be valid device indices

Valid Usage (Implicit)

• VUID-VkBindBufferMemoryDeviceGroupInfo-sType-sType
sType must be VK_STRUCTURE_TYPE_BIND_BUFFER_MEMORY_DEVICE_GROUP_INFO

• VUID-VkBindBufferMemoryDeviceGroupInfo-pDeviceIndices-parameter
If deviceIndexCount is not 0, pDeviceIndices must be a valid pointer to an array of deviceIndexCount uint32_t values

The VkBindMemoryStatusKHR structure is defined as:

```c
// Provided by VK_KHR_maintenance6
typedef struct VkBindMemoryStatusKHR {
    VkStructureType sType;
    const void* pNext;
    VkResult* pResult;
} VkBindMemoryStatusKHR;
```

• sType is a VkStructureType value identifying this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.

• `pResult` is a pointer to a `VkResult` value.

If the `pNext` chain of `VkBindBufferMemoryInfo` or `VkBindImageMemoryInfo` includes a `VkBindMemoryStatusKHR` structure, then the `VkBindMemoryStatusKHR::pResult` will be populated with a value describing the result of the corresponding memory binding operation.

---

**Valid Usage (Implicit)**

- **VUID-VkBindMemoryStatusKHR-sType-sType**
  
  `sType` **must** be `VK_STRUCTURE_TYPE_BIND_MEMORY_STATUS_KHR`

- **VUID-VkBindMemoryStatusKHR-pResult-parameter**
  
  `pResult` **must** be a valid pointer to a `VkResult` value

---

To attach memory to a `VkImage` object created without the `VK_IMAGE_CREATE_DISJOINT_BIT` set, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkBindImageMemory(
    VkDevice device,
    VkImage image,
    VkDeviceMemory memory,
    VkDeviceSize memoryOffset);
```

- **device** is the logical device that owns the image and memory.

- **image** is the image.

- **memory** is the `VkDeviceMemory` object describing the device memory to attach.

- **memoryOffset** is the start offset of the region of `memory` which is to be bound to the image. The number of bytes returned in the `VkMemoryRequirements::size` member in `memory`, starting from `memoryOffset` bytes, will be bound to the specified image.

`vkBindImageMemory` is equivalent to passing the same parameters through `VkBindImageMemoryInfo` to `vkBindImageMemory2`.

---

**Valid Usage**

- **VUID-vkBindImageMemory-image-07460**
  
  `image` **must** not have been bound to a memory object

- **VUID-vkBindImageMemory-image-01045**
  
  `image` **must** not have been created with any sparse memory binding flags

- **VUID-vkBindImageMemory-memoryOffset-01046**
  
  `memoryOffset` **must** be less than the size of `memory`

- **VUID-vkBindImageMemory-image-01445**
  
  If `image` requires a dedicated allocation (as reported by
vkGetImageMemoryRequirements2 in VkMemoryDedicatedRequirements
::requiresDedicatedAllocation for image), memory must have been created with
VkMemoryDedicatedAllocateInfo::image equal to image

- VUID-vkBindImageMemory-memory-02628
  If the VkMemoryAllocateInfo provided when memory was allocated included a
  VkMemoryDedicatedAllocateInfo structure in its pNext chain, and
  VkMemoryDedicatedAllocateInfo::image was not VK_NULL_HANDLE, then image must
  equal VkMemoryDedicatedAllocateInfo::image and memoryOffset must be zero

- VUID-vkBindImageMemory-None-01901
  If image was created with the VK_IMAGE_CREATE_PROTECTED_BIT bit set, the image must
  be bound to a memory object allocated with a memory type that reports
  VK_MEMORY_PROPERTY_PROTECTED_BIT

- VUID-vkBindImageMemory-None-01902
  If image was created with the VK_IMAGE_CREATE_PROTECTED_BIT bit not set, the image must
  not be bound to a memory object created with a memory type that reports
  VK_MEMORY_PROPERTY_PROTECTED_BIT

- VUID-vkBindImageMemory-memory-02728
  If the value of VkExportMemoryAllocateInfo::handleTypes used to allocate memory is not 0, it
  must include at least one of the handles set in VkExternalMemoryImageCreateInfo
  ::handleTypes when image was created

- VUID-vkBindImageMemory-memory-02989
  If memory was created by a memory import operation, the external handle type of the
  imported memory must also have been set in VkExternalMemoryImageCreateInfo
  ::handleTypes when image was created

- VUID-vkBindImageMemory-image-01608
  image must not have been created with the VK_IMAGE_CREATE_DISJOINT_BIT set

- VUID-vkBindImageMemory-memory-01047
  memory must have been allocated using one of the memory types allowed in the
  memoryTypeBits member of the VkMemoryRequirements structure returned from a call to
  vkGetImageMemoryRequirements with image

- VUID-vkBindImageMemory-memoryOffset-01048
  memoryOffset must be an integer multiple of the alignment member of the
  VkMemoryRequirements structure returned from a call to vkGetImageMemoryRequirements
  with image

- VUID-vkBindImageMemory-size-01049
  The difference of the size of memory and memoryOffset must be greater than or equal to the
  size member of the VkMemoryRequirements structure returned from a call to
  vkGetImageMemoryRequirements with the same image

Valid Usage (Implicit)

- VUID-vkBindImageMemory-device-parameter
  device must be a valid VkDevice handle
Host Synchronization

- Host access to image must be externally synchronized

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To attach memory to image objects for one or more images at a time, call:

```c
// Provided by VK_VERSION_1_1
VkResult vkBindImageMemory2(
    VkDevice device,
    uint32_t bindInfoCount,
    const VkBindImageMemoryInfo* pBindInfos);
```

or the equivalent command

```c
// Provided by VK_KHR_bind_memory2
VkResult vkBindImageMemory2KHR(
    VkDevice device,
    uint32_t bindInfoCount,
    const VkBindImageMemoryInfo* pBindInfos);
```

- device is the logical device that owns the images and memory.
- bindInfoCount is the number of elements in pBindInfos.
- pBindInfos is a pointer to an array of VkBindImageMemoryInfo structures, describing images and memory to bind.
On some implementations, it **may** be more efficient to batch memory bindings into a single command.

If the **maintenance6** feature is enabled, this command **must** attempt to perform all of the memory binding operations described by `pBindInfos`, and **must** not early exit on the first failure.

If any of the memory binding operations described by `pBindInfos` fail, the `VkResult` returned by this command **must** be the return value of any one of the memory binding operations which did not return VK_SUCCESS.

### Note

If the `vkBindImageMemory2` command failed, `VkBindMemoryStatusKHR` structures were not included in the `pNext` chains of each element of `pBindInfos`, and `bindInfoCount` was greater than one, then the images referenced by `pBindInfos` will be in an indeterminate state, and **must** not be used.

Applications should destroy these images.

### Valid Usage

- **VUID-vkBindImageMemory2-pBindInfos-02858**
  If any `VkBindImageMemoryInfo::image` was created with `VK_IMAGE_CREATE_DISJOINT_BIT` then all planes of `VkBindImageMemoryInfo::image` **must** be bound individually in separate `pBindInfos`

- **VUID-vkBindImageMemory2-pBindInfos-04006**
  `pBindInfos` **must** not refer to the same image subresource more than once

### Valid Usage (Implicit)

- **VUID-vkBindImageMemory2-device-parameter**
  `device` **must** be a valid `VkDevice` handle

- **VUID-vkBindImageMemory2-pBindInfos-parameter**
  `pBindInfos` **must** be a valid pointer to an array of `bindInfoCount` valid `VkBindImageMemoryInfo` structures

- **VUID-vkBindImageMemory2-bindInfoCount-arraylength**
  `bindInfoCount` **must** be greater than 0

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
VkBindImageMemoryInfo contains members corresponding to the parameters of vkBindImageMemory.

The VkBindImageMemoryInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkBindImageMemoryInfo {
    VkStructureType sType;
    const void* pNext;
    VkImage image;
    VkDeviceMemory memory;
    VkDeviceSize memoryOffset;
} VkBindImageMemoryInfo;
```

or the equivalent

```c
// Provided by VK_KHR_bind_memory2
typedef VkBindImageMemoryInfo VkBindImageMemoryInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `image` is the image to be attached to memory.
- `memory` is a VkDeviceMemory object describing the device memory to attach.
- `memoryOffset` is the start offset of the region of `memory` which is to be bound to the image. The number of bytes returned in the VkMemoryRequirements::size member in `memory`, starting from `memoryOffset` bytes, will be bound to the specified image.

### Valid Usage

- VUID-VkBindImageMemoryInfo-image-07460
  - `image` must not have been bound to a memory object
- VUID-VkBindImageMemoryInfo-image-01045
  - `image` must not have been created with any sparse memory binding flags
- VUID-VkBindImageMemoryInfo-memoryOffset-01046
  - `memoryOffset` must be less than the size of `memory`
- VUID-VkBindImageMemoryInfo-image-01445
  - If `image` requires a dedicated allocation (as reported by vkGetImageMemoryRequirements2 in VkMemoryDedicatedRequirements::requiresDedicatedAllocation for `image`), `memory` must have been created with VkMemoryDedicatedAllocateInfo::image equal to `image`
- VUID-VkBindImageMemoryInfo-memory-02628
If the `VkMemoryAllocateInfo` provided when `memory` was allocated included a `VkMemoryDedicatedAllocateInfo` structure in its `pNext` chain, and `VkMemoryDedicatedAllocateInfo::image` was not `VK_NULL_HANDLE`, then `image` must equal `VkMemoryDedicatedAllocateInfo::image` and `memoryOffset` must be zero.

- **VUID-VkBindImageMemoryInfo-None-01901**
  If image was created with the `VK_IMAGE_CREATE_PROTECTED_BIT` bit set, the image must be bound to a memory object allocated with a memory type that reports `VK_MEMORY_PROPERTY_PROTECTED_BIT`.

- **VUID-VkBindImageMemoryInfo-None-01902**
  If image was created with the `VK_IMAGE_CREATE_PROTECTED_BIT` bit not set, the image must not be bound to a memory object created with a memory type that reports `VK_MEMORY_PROPERTY_PROTECTED_BIT`.

- **VUID-VkBindImageMemoryInfo-memory-02728**
  If the value of `VkExportMemoryAllocateInfo::handleTypes` used to allocate `memory` is not 0, it must include at least one of the handles set in `VkExternalMemoryImageCreateInfo::handleTypes` when `image` was created.

- **VUID-VkBindImageMemoryInfo-memory-02989**
  If `memory` was created by a memory import operation, the external handle type of the imported memory must also have been set in `VkExternalMemoryImageCreateInfo::handleTypes` when `image` was created.

- **VUID-VkBindImageMemoryInfo-pNext-01615**
  If the `pNext` chain does not include a `VkBindImagePlaneMemoryInfo` structure, `memory` must have been allocated using one of the memory types allowed in the `memoryTypeBits` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements2` with `image`.

- **VUID-VkBindImageMemoryInfo-pNext-01616**
  If the `pNext` chain does not include a `VkBindImagePlaneMemoryInfo` structure, `memoryOffset` must be an integer multiple of the `alignment` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements2` with `image`.

- **VUID-VkBindImageMemoryInfo-pNext-01617**
  If the `pNext` chain does not include a `VkBindImagePlaneMemoryInfo` structure, the difference of the size of `memory` and `memoryOffset` must be greater than or equal to the `size` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements2` with the same `image`.

- **VUID-VkBindImageMemoryInfo-pNext-01618**
  If the `pNext` chain includes a `VkBindImagePlaneMemoryInfo` structure, `image` must have been created with the `VK_IMAGE_CREATE_DISJOINT_BIT` bit set.

- **VUID-VkBindImageMemoryInfo-image-07736**
  If `image` was created with the `VK_IMAGE_CREATE_DISJOINT_BIT` bit set, then the `pNext` chain must include a `VkBindImagePlaneMemoryInfo` structure.

- **VUID-VkBindImageMemoryInfo-pNext-01619**
  If the `pNext` chain includes a `VkBindImagePlaneMemoryInfo` structure, `memory` must have been allocated using one of the memory types allowed in the `memoryTypeBits` member of
the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements2` with `image` and where `VkBindImagePlaneMemoryInfo::planeAspect` corresponds to the `VkImagePlaneMemoryRequirementsInfo::planeAspect` in the `VkImageMemoryRequirementsInfo2` structure’s `pNext` chain

- **VUID-VkBindImageMemoryInfo-pNext-01620**
  If the `pNext` chain includes a `VkBindImagePlaneMemoryInfo` structure, `memoryOffset` must be an integer multiple of the `alignment` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements2` with `image` and where `VkBindImagePlaneMemoryInfo::planeAspect` corresponds to the `VkImagePlaneMemoryRequirementsInfo::planeAspect` in the `VkImageMemoryRequirementsInfo2` structure’s `pNext` chain

- **VUID-VkBindImageMemoryInfo-pNext-01621**
  If the `pNext` chain includes a `VkBindImagePlaneMemoryInfo` structure, the difference of the size of `memory` and `memoryOffset` must be greater than or equal to the `size` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements2` with the same `image` and where `VkBindImagePlaneMemoryInfo::planeAspect` corresponds to the `VkImagePlaneMemoryRequirementsInfo::planeAspect` in the `VkImageMemoryRequirementsInfo2` structure’s `pNext` chain

- **VUID-VkBindImageMemoryInfo-pNext-01626**
  If the `pNext` chain includes a `VkBindImageMemoryDeviceGroupInfo` structure, all instances of `memory` specified by `VkBindImageMemoryDeviceGroupInfo::pDeviceIndices` must have been allocated

- **VUID-VkBindImageMemoryInfo-pNext-01627**
  If the `pNext` chain includes a `VkBindImageMemoryDeviceGroupInfo` structure, and `VkBindImageMemoryDeviceGroupInfo::splitInstanceBindRegionCount` is not zero, then `image` must have been created with the `VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT` bit set

- **VUID-VkBindImageMemoryInfo-pNext-01628**
  If the `pNext` chain includes a `VkBindImageMemoryDeviceGroupInfo` structure, all elements of `VkBindImageMemoryDeviceGroupInfo::pSplitInstanceBindRegions` must be valid rectangles contained within the dimensions of `image`

- **VUID-VkBindImageMemoryInfo-pNext-01629**
  If the `pNext` chain includes a `VkBindImageMemoryDeviceGroupInfo` structure, the union of the areas of all elements of `VkBindImageMemoryDeviceGroupInfo::pSplitInstanceBindRegions` that correspond to the same instance of `image` must cover the entire image

- **VUID-VkBindImageMemoryInfo-image-01630**
  If `image` was created with a valid swapchain handle in `VkImageSwapchainCreateInfoKHR::swapchain`, then the `pNext` chain must include a `VkBindImageMemorySwapchainInfoKHR` structure containing the same swapchain handle

- **VUID-VkBindImageMemoryInfo-pNext-01631**
  If the `pNext` chain includes a `VkBindImageMemorySwapchainInfoKHR` structure, `memory`
must be **VK_NULL_HANDLE**

- **VUID-VkBindImageMemoryInfo-pNext-01632**
  
  If the *pNext* chain does not include a `VkBindImageMemorySwapchainInfoKHR` structure, memory must be a valid `VkDeviceMemory` handle.

---

### Valid Usage (Implicit)

- **VUID-VkBindImageMemoryInfo-sType-sType**
  *sType* must be `VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_INFO`

- **VUID-VkBindImageMemoryInfo-pNext-pNext**
  Each *pNext* member of any structure (including this one) in the *pNext* chain must be either `NULL` or a pointer to a valid instance of `VkBindImageMemoryDeviceGroupInfo`, `VkBindImageMemorySwapchainInfoKHR`, `VkBindImagePlaneMemoryInfo`, or `VkBindMemoryStatusKHR`

- **VUID-VkBindImageMemoryInfo-sType-unique**
  The *sType* value of each struct in the *pNext* chain must be unique

- **VUID-VkBindImageMemoryInfo-image-parameter**
  *image* must be a valid `VkImage` handle

- **VUID-VkBindImageMemoryInfo-commonparent**
  Both of *image*, and *memory* that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

The `VkBindImageMemoryDeviceGroupInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkBindImageMemoryDeviceGroupInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t deviceIndexCount;
    const uint32_t* pDeviceIndices;
    uint32_t splitInstanceBindRegionCount;
    const VkRect2D* pSplitInstanceBindRegions;
} VkBindImageMemoryDeviceGroupInfo;
```

or the equivalent

```c
// Provided by VK_KHR_bind_memory2 with VK_KHR_device_group
typedef VkBindImageMemoryDeviceGroupInfo VkBindImageMemoryDeviceGroupInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **deviceIndexCount** is the number of elements in `pDeviceIndices`. 

• **pDeviceIndices** is a pointer to an array of device indices.

• **splitInstanceBindRegionCount** is the number of elements in **pSplitInstanceBindRegions**.

• **pSplitInstanceBindRegions** is a pointer to an array of **VkRect2D** structures describing which regions of the image are attached to each instance of memory.

If the **pNext** chain of **VkBindImageMemoryInfo** includes a **VkBindImageMemoryDeviceGroupInfo** structure, then that structure determines how memory is bound to images across multiple devices in a device group.

If **deviceIndexCount** is greater than zero, then on device index i, **image** is attached to the instance of the memory on the physical device with device index **pDeviceIndices[i]**.

Let N be the number of physical devices in the logical device. If **splitInstanceBindRegionCount** is greater than zero, then **pSplitInstanceBindRegions** is a pointer to an array of N^2 rectangles, where the image region specified by the rectangle at element i*N+j in resource instance i is bound to the memory instance j. The blocks of the memory that are bound to each sparse image block region use an offset in memory, relative to **memoryOffset**, computed as if the whole image was being bound to a contiguous range of memory. In other words, horizontally adjacent image blocks use consecutive blocks of memory, vertically adjacent image blocks are separated by the number of bytes per block multiplied by the width in blocks of **image**, and the block at (0,0) corresponds to memory starting at **memoryOffset**.

If **splitInstanceBindRegionCount** and **deviceIndexCount** are zero and the memory comes from a memory heap with the **VK_MEMORY_HEAP_MULTI_INSTANCE_BIT** bit set, then it is as if **pDeviceIndices** contains consecutive indices from zero to the number of physical devices in the logical device, minus one. In other words, by default each physical device attaches to its own instance of the memory.

If **splitInstanceBindRegionCount** and **deviceIndexCount** are zero and the memory comes from a memory heap without the **VK_MEMORY_HEAP_MULTI_INSTANCE_BIT** bit set, then it is as if **pDeviceIndices** contains an array of zeros. In other words, by default each physical device attaches to instance zero.

---

**Valid Usage**

• **VUID-VkBindImageMemoryDeviceGroupInfo-deviceIndexCount-01633**  
  At least one of **deviceIndexCount** and **splitInstanceBindRegionCount** must be zero

• **VUID-VkBindImageMemoryDeviceGroupInfo-deviceIndexCount-01634**  
  **deviceIndexCount** must either be zero or equal to the number of physical devices in the logical device

• **VUID-VkBindImageMemoryDeviceGroupInfo-pDeviceIndices-01635**  
  All elements of **pDeviceIndices** must be valid device indices

• **VUID-VkBindImageMemoryDeviceGroupInfo-splitInstanceBindRegionCount-01636**  
  **splitInstanceBindRegionCount** must either be zero or equal to the number of physical devices in the logical device squared

• **VUID-VkBindImageMemoryDeviceGroupInfo-pSplitInstanceBindRegions-01637**  
  Elements of **pSplitInstanceBindRegions** that correspond to the same instance of an image
**must not overlap**

- **VUID-VkBindImageMemoryDeviceGroupInfo-offset-01638**
  
  The offset.x member of any element of pSplitInstanceBindRegions must be a multiple of the sparse image block width (VkSparseImageFormatProperties::imageGranularity.width) of all non-metadata aspects of the image.

- **VUID-VkBindImageMemoryDeviceGroupInfo-offset-01639**
  
  The offset.y member of any element of pSplitInstanceBindRegions must be a multiple of the sparse image block height (VkSparseImageFormatProperties::imageGranularity.height) of all non-metadata aspects of the image.

- **VUID-VkBindImageMemoryDeviceGroupInfo-extent-01640**
  
  The extent.width member of any element of pSplitInstanceBindRegions must either be a multiple of the sparse image block width of all non-metadata aspects of the image, or else extent.width + offset.x must equal the width of the image subresource.

- **VUID-VkBindImageMemoryDeviceGroupInfo-extent-01641**
  
  The extent.height member of any element of pSplitInstanceBindRegions must either be a multiple of the sparse image block height of all non-metadata aspects of the image, or else extent.height + offset.y must equal the height of the image subresource.

---

**Valid Usage (Implicit)**

- **VUID-VkBindImageMemoryDeviceGroupInfo-sType-sType**
  
  sType must be VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_DEVICE_GROUP_INFO.

- **VUID-VkBindImageMemoryDeviceGroupInfo-pDeviceIndices-parameter**
  
  If deviceIndexCount is not 0, pDeviceIndices must be a valid pointer to an array of deviceIndexCount uint32_t values.

- **VUID-VkBindImageMemoryDeviceGroupInfo-pSplitInstanceBindRegions-parameter**
  
  If splitInstanceBindRegionCount is not 0, pSplitInstanceBindRegions must be a valid pointer to an array of splitInstanceBindRegionCount VkRect2D structures.

---

If the pNext chain of VkBindImageMemoryInfo includes a VkBindImageMemorySwapchainInfoKHR structure, then that structure includes a swapchain handle and image index indicating that the image will be bound to memory from that swapchain.

The VkBindImageMemorySwapchainInfoKHR structure is defined as:

```c
typedef struct VkBindImageMemorySwapchainInfoKHR {
    VkStructureType          sType;
    const void*              pNext;
    VkSwapchainKHR           swapchain;
    uint32_t                  imageIndex;
} VkBindImageMemorySwapchainInfoKHR;
```
• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is `NULL` or a pointer to a structure extending this structure.
• **swapchain** is `VK_NULL_HANDLE` or a swapchain handle.
• **imageIndex** is an image index within `swapchain`.

If `swapchain` is not `NULL`, the `swapchain` and `imageIndex` are used to determine the memory that the image is bound to, instead of `memory` and `memoryOffset`.

Memory **can** be bound to a swapchain and use the `pDeviceIndices` or `pSplitInstanceBindRegions` members of `VkBindImageMemoryDeviceGroupInfo`.

**Valid Usage**

- **VUID-VkBindImageMemorySwapchainInfoKHR-imageIndex-01644**
  - `imageIndex` **must** be less than the number of images in `swapchain`

**Valid Usage (Implicit)**

- **VUID-VkBindImageMemorySwapchainInfoKHR-sType-sType**
  - `sType` **must** be `VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_SWAPCHAIN_INFO_KHR`
- **VUID-VkBindImageMemorySwapchainInfoKHR-swapchain-parameter**
  - `swapchain` **must** be a valid `VkSwapchainKHR` handle

**Host Synchronization**

- Host access to `swapchain` **must** be externally synchronized

In order to bind *planes* of a *disjoint image*, add a `VkBindImagePlaneMemoryInfo` structure to the `pNext` chain of `VkBindImageMemoryInfo`.

The `VkBindImagePlaneMemoryInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkBindImagePlaneMemoryInfo {
    VkStructureType sType;
    const void* pNext;
    VkImageAspectFlagBits planeAspect;
} VkBindImagePlaneMemoryInfo;
```

or the equivalent

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
```
typedef VkBindImagePlaneMemoryInfo VkBindImagePlaneMemoryInfoKHR;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `planeAspect` is a `VkImageAspectFlagBits` value specifying the aspect of the disjoint image plane to bind.

### Valid Usage

- VUID-VkBindImagePlaneMemoryInfo-planeAspect-02283
  If the image’s tiling is `VK_IMAGE_TILING_LINEAR` or `VK_IMAGE_TILING_OPTIMAL`, then `planeAspect` must be a single valid multi-planar aspect mask bit

### Valid Usage (Implicit)

- VUID-VkBindImagePlaneMemoryInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_BIND_IMAGE_PLANE_MEMORY_INFO`
- VUID-VkBindImagePlaneMemoryInfo-planeAspect-parameter
  `planeAspect` must be a valid `VkImageAspectFlagBits` value

**Buffer-Image Granularity**

The implementation-dependent limit `bufferImageGranularity` specifies a page-like granularity at which linear and non-linear resources must be placed in adjacent memory locations to avoid aliasing. Two resources which do not satisfy this granularity requirement are said to alias. `bufferImageGranularity` is specified in bytes, and must be a power of two. Implementations which do not impose a granularity restriction may report a `bufferImageGranularity` value of one.

*Note*

Despite its name, `bufferImageGranularity` is really a granularity between “linear” and “non-linear” resources.

Given resourceA at the lower memory offset and resourceB at the higher memory offset in the same `VkDeviceMemory` object, where one resource is linear and the other is non-linear (as defined in the Glossary), and the following:

```
resourceA.end = resourceA.memoryOffset + resourceA.size - 1
resourceA.endPage = resourceA.end & ~(bufferImageGranularity - 1)
resourceB.start = resourceB.memoryOffset
resourceB.startPage = resourceB.start & ~(bufferImageGranularity - 1)
```

The following property must hold:
That is, the end of the first resource (A) and the beginning of the second resource (B) must be on separate “pages” of size bufferImageGranularity. bufferImageGranularity may be different than the physical page size of the memory heap. This restriction is only needed when a linear resource and a non-linear resource are adjacent in memory and will be used simultaneously. The memory ranges of adjacent resources can be closer than bufferImageGranularity, provided they meet the alignment requirement for the objects in question.

Sparse block size in bytes and sparse image and buffer memory alignments must all be multiples of the bufferImageGranularity. Therefore, memory bound to sparse resources naturally satisfies the bufferImageGranularity.

12.9. Resource Sharing Mode

Buffer and image objects are created with a sharing mode controlling how they can be accessed from queues. The supported sharing modes are:

```cpp
// Provided by VK_VERSION_1_0
typedef enum VkSharingMode {
    VK_SHARING_MODE_EXCLUSIVE = 0,
    VK_SHARING_MODE_CONCURRENT = 1,
} VkSharingMode;
```

- **VK_SHARING_MODE_EXCLUSIVE** specifies that access to any range or image subresource of the object will be exclusive to a single queue family at a time.

- **VK_SHARING_MODE_CONCURRENT** specifies that concurrent access to any range or image subresource of the object from multiple queue families is supported.

**Note**

VK_SHARING_MODE_CONCURRENT may result in lower performance access to the buffer or image than VK_SHARING_MODE_EXCLUSIVE.

Ranges of buffers and image subresources of image objects created using VK_SHARING_MODE_EXCLUSIVE must only be accessed by queues in the queue family that has ownership of the resource. Upon creation, such resources are not owned by any queue family; ownership is implicitly acquired upon first use within a queue. Once a resource using VK_SHARING_MODE_EXCLUSIVE is owned by some queue family, the application must perform a queue family ownership transfer to make the memory contents of a range or image subresource accessible to a different queue family.

**Note**

Images still require a layout transition from VK_IMAGE_LAYOUT_UNDEFINED or VK_IMAGE_LAYOUT_PREINITIALIZED before being used on the first queue.

A queue family can take ownership of an image subresource or buffer range of a resource created
with `VK_SHARING_MODE_EXCLUSIVE`, without an ownership transfer, in the same way as for a resource that was just created; however, taking ownership in this way has the effect that the contents of the image subresource or buffer range are undefined.

Ranges of buffers and image subresources of image objects created using `VK_SHARING_MODE_CONCURRENT` must only be accessed by queues from the queue families specified through the `queueFamilyIndexCount` and `pQueueFamilyIndices` members of the corresponding create info structures.

### 12.9.1. External Resource Sharing

Resources should only be accessed in the Vulkan instance that has exclusive ownership of their underlying memory. Only one Vulkan instance has exclusive ownership of a resource’s underlying memory at a given time, regardless of whether the resource was created using `VK_SHARING_MODE_EXCLUSIVE` or `VK_SHARING_MODE_CONCURRENT`. Applications can transfer ownership of a resource’s underlying memory only if the memory has been imported from or exported to another instance or external API using external memory handles. The semantics for transferring ownership outside of the instance are similar to those used for transferring ownership of `VK_SHARING_MODE_EXCLUSIVE` resources between queues, and is also accomplished using `VkBufferMemoryBarrier` or `VkImageMemoryBarrier` operations. To make the contents of the underlying memory accessible in the destination instance or API, applications must

1. Release exclusive ownership from the source instance or API.
2. Ensure the release operation has completed using semaphores or fences.
3. Acquire exclusive ownership in the destination instance or API

Unlike queue ownership transfers, the destination instance or API is not specified explicitly when releasing ownership, nor is the source instance or API specified when acquiring ownership. Instead, the image or memory barrier’s `dstQueueFamilyIndex` or `srcQueueFamilyIndex` parameters are set to the reserved queue family index `VK_QUEUE_FAMILY_EXTERNAL` to represent the external destination or source respectively.

Binding a resource to a memory object shared between multiple Vulkan instances or other APIs does not change the ownership of the underlying memory. The first entity to access the resource implicitly acquires ownership. An entity can also implicitly take ownership from another entity in the same way without an explicit ownership transfer. However, taking ownership in this way has the effect that the contents of the underlying memory are undefined.

Accessing a resource backed by memory that is owned by a particular instance or API has the same semantics as accessing a `VK_SHARING_MODE_EXCLUSIVE` resource, with one exception: Implementations must ensure layout transitions performed on one member of a set of identical subresources of identical images that alias the same range of an underlying memory object affect the layout of all the subresources in the set.

As a corollary, writes to any image subresources in such a set must not make the contents of memory used by other subresources in the set undefined. An application can define the content of a subresource of one image by performing device writes to an identical subresource of another image provided both images are bound to the same region of external memory. Applications may
also add resources to such a set after the content of the existing set members has been defined
without making the content undefined by creating a new image with the initial layout
\texttt{VK\_IMAGE\_LAYOUT\_UNDEFINED} and binding it to the same region of external memory as the existing
images.

\textbf{Note}
Because layout transitions apply to all identical images aliasing the same region of
external memory, the actual layout of the memory backing a new image as well as
an existing image with defined content will not be undefined. Such an image is not usable until it acquires ownership of its memory from the existing owner.
Therefore, the layout specified as part of this transition will be the true initial
layout of the image. The undefined layout specified when creating it is a
placeholder to simplify valid usage requirements.

### 12.10. Memory Aliasing

A range of a \texttt{VkDeviceMemory} allocation is \textit{aliased} if it is bound to multiple resources simultaneously,
as described below, via \texttt{vkBindImageMemory}, \texttt{vkBindBufferMemory}, via \textit{sparse memory bindings},
or by binding the memory to resources in multiple Vulkan instances or external APIs using external
memory handle export and import mechanisms.

Consider two resources, resource\textsubscript{A} and resource\textsubscript{B}, bound respectively to memory range\textsubscript{A} and range\textsubscript{B}.
Let paddedRange\textsubscript{A} and paddedRange\textsubscript{B} be, respectively, range\textsubscript{A} and range\textsubscript{B} aligned to
\texttt{bufferImageGranularity}. If the resources are both linear or both non-linear (as defined in the
Glossary), then the resources \textit{alias} the memory in the intersection of range\textsubscript{A} and range\textsubscript{B}. If one
resource is linear and the other is non-linear, then the resources \textit{alias} the memory in the
intersection of paddedRange\textsubscript{A} and paddedRange\textsubscript{B}.

Applications \textbf{can} alias memory, but use of multiple aliases is subject to several constraints.

\textbf{Note}

Memory aliasing \textbf{can} be useful to reduce the total device memory footprint of an
application, if some large resources are used for disjoint periods of time.

When a \textbf{non-linear}, \textbf{non-VK\_IMAGE\_CREATE\_SPARSE\_RESIDENCY\_BIT} image is bound to an aliased range,
all image subresources of the image \textit{overlap} the range. When a linear image is bound to an aliased
range, the image subresources that (according to the image’s advertised layout) include bytes from
the aliased range overlap the range. When a \texttt{VK\_IMAGE\_CREATE\_SPARSE\_RESIDENCY\_BIT} image has
sparse image blocks bound to an aliased range, only image subresources including those sparse
image blocks overlap the range, and when the memory bound to the image’s mip tail overlaps an
aliased range all image subresources in the mip tail overlap the range.

Buffers, and linear image subresources in either the \texttt{VK\_IMAGE\_LAYOUT\_PREINITIALIZED} or
\texttt{VK\_IMAGE\_LAYOUT\_GENERAL} layouts, are \textit{host-accessible subresources}. That is, the host has a well-defined
addressing scheme to interpret the contents, and thus the layout of the data in memory \textbf{can}
be consistently interpreted across aliases if each of those aliases is a host-accessible subresource.
Non-linear images, and linear image subresources in other layouts, are not host-accessible.
If two aliases are both host-accessible, then they interpret the contents of the memory in consistent ways, and data written to one alias can be read by the other alias.

If two aliases are both images that were created with identical creation parameters, both were created with the `VK_IMAGE_CREATE_ALIAS_BIT` flag set, and both are bound identically to memory except for `VkBindImageMemoryDeviceGroupInfo::pDeviceIndices` and `VkBindImageMemoryDeviceGroupInfo::pSplitInstanceBindRegions`, then they interpret the contents of the memory in consistent ways, and data written to one alias can be read by the other alias.

Additionally, if an individual plane of a multi-planar image and a single-plane image alias the same memory, then they also interpret the contents of the memory in consistent ways under the same conditions, but with the following modifications:

- Both must have been created with the `VK_IMAGE_CREATE_DISJOINT_BIT` flag.
- The single-plane image must have a `VkFormat` that is equivalent to that of the multi-planar image’s individual plane.
- The single-plane image and the individual plane of the multi-planar image must be bound identically to memory except for `VkBindImageMemoryDeviceGroupInfo::pDeviceIndices` and `VkBindImageMemoryDeviceGroupInfo::pSplitInstanceBindRegions`.
- The width and height of the single-plane image are derived from the multi-planar image’s dimensions in the manner listed for plane compatibility for the aliased plane.
- All other creation parameters must be identical.

Aliases created by binding the same memory to resources in multiple Vulkan instances or external APIs using external memory handle export and import mechanisms interpret the contents of the memory in consistent ways, and data written to one alias can be read by the other alias.

Otherwise, the aliases interpret the contents of the memory differently, and writes via one alias make the contents of memory partially or completely undefined to the other alias. If the first alias is a host-accessible subresource, then the bytes affected are those written by the memory operations according to its addressing scheme. If the first alias is not host-accessible, then the bytes affected are those overlapped by the image subresources that were written. If the second alias is a host-accessible subresource, the affected bytes become undefined. If the second alias is not host-accessible, all sparse image blocks (for sparse partially-resident images) or all image subresources (for non-sparse image and fully resident sparse images) that overlap the affected bytes become undefined.

If any image subresources are made undefined due to writes to an alias, then each of those image subresources must have its layout transitioned from `VK_IMAGE_LAYOUT_UNDEFINED` to a valid layout before it is used, or from `VK_IMAGE_LAYOUT_PREINITIALIZED` if the memory has been written by the host. If any sparse blocks of a sparse image have been made undefined, then only the image subresources containing them must be transitioned.

Use of an overlapping range by two aliases must be separated by a memory dependency using the appropriate access types if at least one of those uses performs writes, whether the aliases interpret memory consistently or not. If buffer or image memory barriers are used, the scope of the barrier must contain the entire range and/or set of image subresources that overlap.
If two aliasing image views are used in the same framebuffer, then the render pass must declare the attachments using the \texttt{VK\_ATTACHMENT\_DESCRIPTION\_MAY\_ALIAS\_BIT}, and follow the other rules listed in that section.

\begin{itemize}
  \item \textbf{Note}
  \begin{quote}
    Memory recycled via an application suballocator (i.e. without freeing and reallocating the memory objects) is not substantially different from memory aliasing. However, a suballocator usually waits on a fence before recycling a region of memory, and signaling a fence involves sufficient implicit dependencies to satisfy all the above requirements.
  \end{quote}
\end{itemize}

12.10.1. Resource Memory Overlap

Applications can safely access a resource concurrently as long as the memory locations do not overlap as defined in Memory Location. This includes aliased resources if such aliasing is well-defined. It also includes access from different queues and/or queue families if such concurrent access is supported by the resource. Transfer commands only access memory locations specified by the range of the transfer command.

\begin{itemize}
  \item \textbf{Note}
  \begin{quote}
    The intent is that buffers (or linear images) can be accessed concurrently, even when they share cache lines, but otherwise do not access the same memory range. The concept of a device cache line size is not exposed in the memory model.
  \end{quote}
\end{itemize}
Chapter 13. Samplers

`VkSampler` objects represent the state of an image sampler which is used by the implementation to read image data and apply filtering and other transformations for the shader.

Samplers are represented by `VkSampler` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSampler)
```

To create a sampler object, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateSampler(
    VkDevice device,
    const VkSamplerCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSampler* pSampler);
```

- `device` is the logical device that creates the sampler.
- `pCreateInfo` is a pointer to a `VkSamplerCreateInfo` structure specifying the state of the sampler object.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pSampler` is a pointer to a `VkSampler` handle in which the resulting sampler object is returned.

**Valid Usage**

- VUID-vkCreateSampler-maxSamplerAllocationCount-04110 There must be less than `VkPhysicalDeviceLimits::maxSamplerAllocationCount` `VkSampler` objects currently created on the device

**Valid Usage (Implicit)**

- VUID-vkCreateSampler-device-parameter `device` must be a valid `VkDevice` handle
- VUID-vkCreateSampler-pCreateInfo-parameter `pCreateInfo` must be a valid pointer to a valid `VkSamplerCreateInfo` structure
- VUID-vkCreateSampler-pAllocator-parameter If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateSampler-pSampler-parameter `pSampler` must be a valid pointer to a `VkSampler` handle
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR

The VkSamplerCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSamplerCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkSamplerCreateFlags flags;
    VkFilter magFilter;
    VkFilter minFilter;
    VkSamplerMipmapMode mipmapMode;
    VkSamplerAddressMode addressModeU;
    VkSamplerAddressMode addressModeV;
    VkSamplerAddressMode addressModeW;
    float mipLodBias;
    VkBool32 anisotropyEnable;
    float maxAnisotropy;
    VkBool32 compareEnable;
    VkCompareOp compareOp;
    float minLod;
    float maxLod;
    VkBorderColor borderColor;
    VkBool32 unnormalizedCoordinates;
} VkSamplerCreateInfo;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is a bitmask of VkSamplerCreateFlagBits describing additional parameters of the sampler.
- **magFilter** is a VkFilter value specifying the magnification filter to apply to lookups.
- **minFilter** is a VkFilter value specifying the minification filter to apply to lookups.
- **mipmapMode** is a VkSamplerMipmapMode value specifying the mipmap filter to apply to lookups.
- **addressModeU** is a VkSamplerAddressMode value specifying the addressing mode for U coordinates outside [0,1).
- **addressModeV** is a VkSamplerAddressMode value specifying the addressing mode for V coordinates outside [0,1).
• **addressModeW** is a *VkSamplerAddressMode* value specifying the addressing mode for W coordinates outside [0,1).

• **mipLodBias** is the bias to be added to mipmap LOD calculation and bias provided by image sampling functions in SPIR-V, as described in the LOD Operation section.

• **anisotropyEnable** is *VK_TRUE* to enable anisotropic filtering, as described in the Texel Anisotropic Filtering section, or *VK_FALSE* otherwise.

• **maxAnisotropy** is the anisotropy value clamp used by the sampler when **anisotropyEnable** is *VK_TRUE*. If **anisotropyEnable** is *VK_FALSE*, **maxAnisotropy** is ignored.

• **compareEnable** is *VK_TRUE* to enable comparison against a reference value during lookups, or *VK_FALSE* otherwise.
  
  ◦ Note: Some implementations will default to shader state if this member does not match.

• **compareOp** is a *VkCompareOp* value specifying the comparison operator to apply to fetched data before filtering as described in the Depth Compare Operation section.

• **minLod** is used to clamp the minimum of the computed LOD value.

• **maxLod** is used to clamp the maximum of the computed LOD value. To avoid clamping the maximum value, set **maxLod** to the constant *VK_LOD_CLAMP_NONE*.

• **borderColor** is a *VkBorderColor* value specifying the predefined border color to use.

• **unnormalizedCoordinates** controls whether to use unnormalized or normalized texel coordinates to address texels of the image. When set to *VK_TRUE*, the range of the image coordinates used to lookup the texel is in the range of zero to the image size in each dimension. When set to *VK_FALSE* the range of image coordinates is zero to one.

When **unnormalizedCoordinates** is *VK_TRUE*, images the sampler is used with in the shader have the following requirements:

  ◦ The **viewType** must be either *VK_IMAGE_VIEW_TYPE_1D* or *VK_IMAGE_VIEW_TYPE_2D*.

  ◦ The image view must have a single layer and a single mip level.

When **unnormalizedCoordinates** is *VK_TRUE*, image built-in functions in the shader that use the sampler have the following requirements:

  ◦ The functions must not use projection.

  ◦ The functions must not use offsets.

---

### Mapping of OpenGL to Vulkan filter modes

*magFilter* values of *VK_FILTER_NEAREST* and *VK_FILTER_LINEAR* directly correspond to *GL_NEAREST* and *GL_LINEAR* magnification filters. *minFilter* and *mipmapMode* combine to correspond to the similarly named OpenGL minification filter of *GL_minFilter_MIPMAP_mipmapMode* (e.g. *minFilter* of *VK_FILTER_LINEAR* and *mipmapMode* of *VK_SAMPLER_MIPMAP_MODE_NEAREST* correspond to *GL_LINEAR_MIPMAP_NEAREST*).

There are no Vulkan filter modes that directly correspond to OpenGL minification filters of *GL_LINEAR* or *GL_NEAREST*, but they can be emulated using *VK_SAMPLER_MIPMAP_MODE_NEAREST*, *minLod = 0*, and *maxLod = 0.25*, and using *minFilter = VK_FILTER_LINEAR* or *minFilter = VK_FILTER_NEAREST*, respectively.
Note that using a maxLod of zero would cause magnification to always be performed, and the magFilter to always be used. This is valid, just not an exact match for OpenGL behavior. Clamping the maximum LOD to 0.25 allows the \( \lambda \) value to be non-zero and minification to be performed, while still always rounding down to the base level. If the minFilter and magFilter are equal, then using a maxLod of zero also works.

The maximum number of sampler objects which can be simultaneously created on a device is implementation-dependent and specified by the maxSamplerAllocationCount member of the VkPhysicalDeviceLimits structure.

---

**Valid Usage**

- VUID-VkSamplerCreateInfo-mipLodBias-01069
  The absolute value of mipLodBias must be less than or equal to VkPhysicalDeviceLimits::maxSamplerLodBias

- VUID-VkSamplerCreateInfo-samplerMipLodBias-04467
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::samplerMipLodBias is VK_FALSE, mipLodBias must be zero

- VUID-VkSamplerCreateInfo-maxLod-01973
  maxLod must be greater than or equal to minLod

- VUID-VkSamplerCreateInfo-anisotropyEnable-01070
  If the samplerAnisotropy feature is not enabled, anisotropyEnable must be VK_FALSE

- VUID-VkSamplerCreateInfo-anisotropyEnable-01071
  If anisotropyEnable is VK_TRUE, maxAnisotropy must be between 1.0 and VkPhysicalDeviceLimits::maxSamplerAnisotropy, inclusive

- VUID-VkSamplerCreateInfo-minFilter-01645
  If sampler Y'CbCr conversion is enabled and the potential format features of the sampler Y'CbCr conversion do not support VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_SEPARATE_RECONSTRUCTION_FILTER_BIT, minFilter and magFilter must be equal to the sampler Y'CbCr conversion's chromaFilter

- VUID-VkSamplerCreateInfo-unnormalizedCoordinates-01072
  If unnormalizedCoordinates is VK_TRUE, minFilter and magFilter must be equal
• VUID-VkSamplerCreateInfo-unnormalizedCoordinates-01073
  If unnormalizedCoordinates is VK_TRUE,.mipmapMode must be VK_SAMPLER_MIPMAP_MODE_NEAREST

• VUID-VkSamplerCreateInfo-unnormalizedCoordinates-01074
  If unnormalizedCoordinates is VK_TRUE, minLod and maxLod must be zero

• VUID-VkSamplerCreateInfo-unnormalizedCoordinates-01075
  If unnormalizedCoordinates is VK_TRUE, addressModeU and addressModeV must each be either
  VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE or VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER

• VUID-VkSamplerCreateInfo-unnormalizedCoordinates-01076
  If unnormalizedCoordinates is VK_TRUE, anisotropyEnable must be VK_FALSE

• VUID-VkSamplerCreateInfo-unnormalizedCoordinates-01077
  If unnormalizedCoordinates is VK_TRUE, compareEnable must be VK_FALSE

• VUID-VkSamplerCreateInfo-addressModeU-01078
  If any of addressModeU, addressModeV or addressModeW are
  VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER, borderColor must be a valid VkBorderColor
  value

• VUID-VkSamplerCreateInfo-addressModeU-01646
  If sampler Y’CbCr conversion is enabled, addressModeU, addressModeV, and addressModeW
  must be VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE, anisotropyEnable must be VK_FALSE, and
  unnormalizedCoordinates must be VK_FALSE

• VUID-VkSamplerCreateInfo-None-01647
  If sampler Y’CbCr conversion is enabled and the pNext chain includes a
  VkSamplerReductionModeCreateInfo structure, then the sampler reduction mode must
  be set to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE

• VUID-VkSamplerCreateInfo-pNext-06726
  If samplerFilterMinmax is not enabled and the pNext chain includes a
  VkSamplerReductionModeCreateInfo structure, then the sampler reduction mode must
  be set to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE

• VUID-VkSamplerCreateInfo-addressModeU-01079
  If samplerMirrorClampToEdge is not enabled, and if the VK_KHR_sampler_mirror_clamp_to_edge
  extension is not enabled, addressModeU, addressModeV and addressModeW must not be
  VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE

• VUID-VkSamplerCreateInfo-compareEnable-01080
  If compareEnable is VK_TRUE, compareOp must be a valid VkCompareOp value

• VUID-VkSamplerCreateInfo-compareEnable-01423
  If compareEnable is VK_TRUE, the reductionMode member of
  VkSamplerReductionModeCreateInfo must be
  VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE

---

**Valid Usage (Implicit)**

• VUID-VkSamplerCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_SAMPLER_CREATE_INFO
Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkSamplerReductionModeCreateInfo` or `VkSamplerYcbcrConversionInfo`.

The `sType` value of each struct in the `pNext` chain must be unique.

`flags` must be 0.

`magFilter` must be a valid `VkFilter` value.

`minFilter` must be a valid `VkFilter` value.

`mipmapMode` must be a valid `VkSamplerMipmapMode` value.

`addressModeU` must be a valid `VkSamplerAddressMode` value.

`addressModeV` must be a valid `VkSamplerAddressMode` value.

`addressModeW` must be a valid `VkSamplerAddressMode` value.

`VK_LOD_CLAMP_NONE` is a special constant value used for `VkSamplerCreateInfo::maxLod` to indicate that maximum LOD clamping should not be performed.

```cpp
#define VK_LOD_CLAMP_NONE 1000.0F
```

Bits which can be set in `VkSamplerCreateInfo::flags`, specifying additional parameters of a sampler, are:

```cpp
// Provided by VK_VERSION_1_0
typedef enum VkSamplerCreateFlagBits {
} VkSamplerCreateFlagBits;
```

```cpp
// Provided by VK_VERSION_1_0
typedef VkFlags VkSamplerCreateFlags;
```

`VkSamplerCreateFlags` is a bitmask type for setting a mask of zero or more `VkSamplerCreateFlagBits`.

The `VkSamplerReductionModeCreateInfo` structure is defined as:

```cpp
// Provided by VK_VERSION_1_2
```
typedef struct VkSamplerReductionModeCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkSamplerReductionMode reductionMode;
} VkSamplerReductionModeCreateInfo;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **reductionMode** is a VkSamplerReductionMode value controlling how texture filtering combines texel values.

If the pNext chain of VkSamplerCreateInfo includes a VkSamplerReductionModeCreateInfo structure, then that structure includes a mode controlling how texture filtering combines texel values. If this structure is not present, reductionMode is considered to be VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE.

### Valid Usage (Implicit)
- VUID-VkSamplerReductionModeCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_SAMPLER_REDUCTION_MODE_CREATE_INFO
- VUID-VkSamplerReductionModeCreateInfo-reductionMode-parameter
  reductionMode must be a valid VkSamplerReductionMode value

Reduction modes are specified by VkSamplerReductionMode, which takes values:

```c
// Provided by VK_VERSION_1_2
typedef enum VkSamplerReductionMode {
    VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE = 0,
    VK_SAMPLER_REDUCTION_MODE_MIN = 1,
    VK_SAMPLER_REDUCTION_MODE_MAX = 2,
} VkSamplerReductionMode;
```

- **VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE** specifies that texel values are combined by computing a weighted average of values in the footprint, using weights as specified in the image operations chapter.
- **VK_SAMPLER_REDUCTION_MODE_MIN** specifies that texel values are combined by taking the component-wise minimum of values in the footprint with non-zero weights.
- **VK_SAMPLER_REDUCTION_MODE_MAX** specifies that texel values are combined by taking the component-wise maximum of values in the footprint with non-zero weights.

Possible values of the VkSamplerCreateInfo::magFilter and minFilter parameters, specifying filters used for texture lookups, are:

```c
// Provided by VK_VERSION_1_0
```
typedef enum VkFilter {
    VK_FILTER_NEAREST = 0,
    VK_FILTER_LINEAR = 1,
} VkFilter;

- **VK_FILTER_NEAREST** specifies nearest filtering.
- **VK_FILTER_LINEAR** specifies linear filtering.

These filters are described in detail in [Texel Filtering](#).

Possible values of the `VkSamplerCreateInfo::mipmapMode`, specifying the mipmap mode used for texture lookups, are:

```cpp
// Provided by VK_VERSION_1_0
typedef enum VkSamplerMipmapMode {
    VK_SAMPLER_MIPMAP_MODE_NEAREST = 0,
    VK_SAMPLER_MIPMAP_MODE_LINEAR = 1,
} VkSamplerMipmapMode;
```

- **VK_SAMPLER_MIPMAP_MODE_NEAREST** specifies nearest filtering.
- **VK_SAMPLER_MIPMAP_MODE_LINEAR** specifies linear filtering.

These modes are described in detail in [Texel Filtering](#).

Possible values of the `VkSamplerCreateInfo::addressMode*` parameters, specifying the behavior of sampling with coordinates outside the range [0,1] for the respective u, v, or w coordinate as defined in the [Wrapping Operation](#) section, are:

```cpp
// Provided by VK_VERSION_1_0
typedef enum VkSamplerAddressMode {
    VK_SAMPLER_ADDRESS_MODE_REPEAT = 0,
    VK_SAMPLER_ADDRESS_MODE_MIRRORED_REPEAT = 1,
    VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE = 2,
    VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER = 3,
    // Provided by VK_VERSION_1_2, VK_KHR_sampler_mirror_clamp_to_edge
    VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE = 4,
    // Provided by VK_KHR_sampler_mirror_clamp_to_edge
    VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE_KHR =
    VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE,
} VkSamplerAddressMode;
```

- **VK_SAMPLER_ADDRESS_MODE_REPEAT** specifies that the repeat wrap mode will be used.
- **VK_SAMPLER_ADDRESS_MODE_MIRRORED_REPEAT** specifies that the mirrored repeat wrap mode will be used.
- **VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE** specifies that the clamp to edge wrap mode will be used.
- **VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER** specifies that the clamp to border wrap mode will be used.
used.

- **VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE** specifies that the mirror clamp to edge wrap mode will be used. This is only valid if `samplerMirrorClampToEdge` is enabled, or if the `VK_KHR_sampler_mirror_clamp_to_edge` extension is enabled.

Comparison operators compare a reference and a test value, and return a true (“passed”) or false (“failed”) value depending on the comparison operator chosen. The supported operators are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCompareOp {
    VK_COMPARE_OP_NEVER = 0,
    VK_COMPARE_OP_LESS = 1,
    VK_COMPARE_OP_EQUAL = 2,
    VK_COMPARE_OP_LESS_OR_EQUAL = 3,
    VK_COMPARE_OP_GREATER = 4,
    VK_COMPARE_OP_NOT_EQUAL = 5,
    VK_COMPARE_OP_GREATER_OR_EQUAL = 6,
    VK_COMPARE_OP_ALWAYS = 7,
} VkCompareOp;
```

- **VK_COMPARE_OP_NEVER** specifies that the comparison always evaluates false.
- **VK_COMPARE_OP_LESS** specifies that the comparison evaluates `reference < test`.
- **VK_COMPARE_OP_EQUAL** specifies that the comparison evaluates `reference = test`.
- **VK_COMPARE_OP_LESS_OR_EQUAL** specifies that the comparison evaluates `reference ≤ test`.
- **VK_COMPARE_OP_GREATER** specifies that the comparison evaluates `reference > test`.
- **VK_COMPARE_OP_NOT_EQUAL** specifies that the comparison evaluates `reference ≠ test`.
- **VK_COMPARE_OP_GREATER_OR_EQUAL** specifies that the comparison evaluates `reference ≥ test`.

**VK_COMPARE_OP_ALWAYS** specifies that the comparison always evaluates true.

Comparison operators are used for:

- The **Depth Compare Operation** operator for a sampler, specified by `VkSamplerCreateInfo::compareOp`.
- The stencil comparison operator for the **stencil test**, specified by `vkCmdSetStencilOp::compareOp` or `VkStencilOpState::compareOp`.
- The **Depth Comparison** operator for the **depth test**, specified by `vkCmdSetDepthCompareOp::depthCompareOp` or `VkPipelineDepthStencilStateCreateInfo::depthCompareOp`.

Each such use describes how the `reference` and `test` values for that comparison are determined.

Possible values of `VkSamplerCreateInfo::borderColor`, specifying the border color used for texture lookups, are:

```c
// Provided by VK_VERSION_1_0
```
typedef enum VkBorderColor {
    VK_BORDER_COLOR_FLOAT_TRANSPARENT_BLACK = 0,
    VK_BORDER_COLOR_INT_TRANSPARENT_BLACK = 1,
    VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK = 2,
    VK_BORDER_COLOR_INT_OPAQUE_BLACK = 3,
    VK_BORDER_COLOR_FLOAT_OPAQUE_WHITE = 4,
    VK_BORDER_COLOR_INT_OPAQUE_WHITE = 5,
} VkBorderColor;

• VK_BORDER_COLOR_FLOAT_TRANSPARENT_BLACK specifies a transparent, floating-point format, black color.
• VK_BORDER_COLOR_INT_TRANSPARENT_BLACK specifies a transparent, integer format, black color.
• VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK specifies an opaque, floating-point format, black color.
• VK_BORDER_COLOR_INT_OPAQUE_BLACK specifies an opaque, integer format, black color.
• VK_BORDER_COLOR_FLOAT_OPAQUE_WHITE specifies an opaque, floating-point format, white color.
• VK_BORDER_COLOR_INT_OPAQUE_WHITE specifies an opaque, integer format, white color.

These colors are described in detail in Texel Replacement.

To destroy a sampler, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroySampler(
    VkDevice device,
    VkSampler sampler,
    const VkAllocationCallbacks* pAllocator);
```

• device is the logical device that destroys the sampler.
• sampler is the sampler to destroy.
• pAllocator controls host memory allocation as described in the Memory Allocation chapter.

## Valid Usage

• VUID-vkDestroySampler-sampler-01082
  All submitted commands that refer to sampler must have completed execution

• VUID-vkDestroySampler-sampler-01083
  If VkAllocationCallbacks were provided when sampler was created, a compatible set of callbacks must be provided here

• VUID-vkDestroySampler-sampler-01084
  If no VkAllocationCallbacks were provided when sampler was created, pAllocator must be NULL
Valid Usage (Implicit)

- VUID-vkDestroySampler-device-parameter
device must be a valid VkDevice handle

- VUID-vkDestroySampler-sampler-parameter
If sampler is not VK_NULL_HANDLE, sampler must be a valid VkSampler handle

- VUID-vkDestroySampler-pAllocator-parameter
If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroySampler-sampler-parent
If sampler is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to sampler must be externally synchronized

13.1. Sampler Y'CbCr Conversion

To create a sampler with Y'CbCr conversion enabled, add a VkSamplerYcbcrConversionInfo structure to the pNext chain of the VkSamplerCreateInfo structure. To create a sampler Y'CbCr conversion, the samplerYcbcrConversion feature must be enabled. Conversion must be fixed at pipeline creation time, through use of a combined image sampler with an immutable sampler in VkDescriptorSetLayoutBinding.

A VkSamplerYcbcrConversionInfo must be provided for samplers to be used with image views that access VK_IMAGE_ASPECT_COLOR_BIT if the format is one of the formats that require a sampler Y'CbCr conversion.

The VkSamplerYcbcrConversionInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkSamplerYcbcrConversionInfo {
    VkStructureType sType;
    const void* pNext;
    VkSamplerYcbcrConversion conversion;
} VkSamplerYcbcrConversionInfo;
```

or the equivalent

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkSamplerYcbcrConversionInfo VkSamplerYcbcrConversionInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `conversion` is a `VkSamplerYcbcrConversion` handle created with `vkCreateSamplerYcbcrConversion`.

### Valid Usage (Implicit)

- `VUID-VkSamplerYcbcrConversionInfo-sType-sType
  sType` must be `VK_STRUCTURE_TYPE_SAMPLER_YCBCR_CONVERSION_INFO`
- `VUID-VkSamplerYcbcrConversionInfo-conversion-parameter
  conversion` must be a valid `VkSamplerYcbcrConversion` handle

A sampler $Y' C_b C_r$ conversion is an opaque representation of a device-specific sampler $Y' C_b C_r$ conversion description, represented as a `VkSamplerYcbcrConversion` handle:

```c
// Provided by VK_VERSION_1_1
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSamplerYcbcrConversion)
```

or the equivalent

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkSamplerYcbcrConversion VkSamplerYcbcrConversionKHR;
```

To create a `VkSamplerYcbcrConversion`, call:

```c
// Provided by VK_VERSION_1_1
VkResult vkCreateSamplerYcbcrConversion(
    VkDevice device,
    const VkSamplerYcbcrConversionCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSamplerYcbcrConversion* pYcbcrConversion);
```

or the equivalent command

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
VkResult vkCreateSamplerYcbcrConversionKHR(
    VkDevice device,
    const VkSamplerYcbcrConversionCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSamplerYcbcrConversion* pYcbcrConversion);
```

• `device` is the logical device that creates the sampler $Y' C_b C_r$ conversion.

• `pCreateInfo` is a pointer to a `VkSamplerYcbcrConversionCreateInfo` structure specifying the requested sampler $Y' C_b C_r$ conversion.
• pAllocator controls host memory allocation as described in the Memory Allocation chapter.
• pYcbcrConversion is a pointer to a VkSamplerYcbcrConversion handle in which the resulting sampler \(Y'C_bC_r\) conversion is returned.

The interpretation of the configured sampler \(Y'C_bC_r\) conversion is described in more detail in the description of sampler \(Y'C_bC_r\) conversion in the Image Operations chapter.

**Valid Usage**

- VUID-vkCreateSamplerYcbcrConversion-None-01648
  The samplerYcbcrConversion feature must be enabled

**Valid Usage (Implicit)**

- VUID-vkCreateSamplerYcbcrConversion-device-parameter
device must be a valid VkDevice handle
- VUID-vkCreateSamplerYcbcrConversion-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkSamplerYcbcrConversionCreateInfo structure
- VUID-vkCreateSamplerYcbcrConversion-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateSamplerYcbcrConversion-pYcbcrConversion-parameter
  pYcbcrConversion must be a valid pointer to a VkSamplerYcbcrConversion handle

**Return Codes**

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkSamplerYcbcrConversionCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkSamplerYcbcrConversionCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkFormat format;
    VkSamplerYcbcrModelConversion ycbcrModel;
    VkSamplerYcbcrRange ycbcrRange;
};
```
VkComponentMapping components;
VkChromaLocation xChromaOffset;
VkChromaLocation yChromaOffset;
VkFilter chromaFilter;
VkBool32 forceExplicitReconstruction;
}

VkSamplerYcbcrConversionCreateInfo

or the equivalent

// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkSamplerYcbcrConversionCreateInfo VkSamplerYcbcrConversionCreateInfoKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **format** is the format of the image from which color information will be retrieved.
- **ycbcrModel** describes the color matrix for conversion between color models.
- **ycbcrRange** describes whether the encoded values have headroom and foot room, or whether the encoding uses the full numerical range.
- **components** applies a swizzle based on `VkComponentSwizzle` enums prior to range expansion and color model conversion.
- **xChromaOffset** describes the sample location associated with downsampled chroma components in the x dimension. `xChromaOffset` has no effect for formats in which chroma components are not downsampled horizontally.
- **yChromaOffset** describes the sample location associated with downsampled chroma components in the y dimension. `yChromaOffset` has no effect for formats in which the chroma components are not downsampled vertically.
- **chromaFilter** is the filter for chroma reconstruction.
- **forceExplicitReconstruction** can be used to ensure that reconstruction is done explicitly, if supported.

**Note**

Setting `forceExplicitReconstruction` to `VK_TRUE` may have a performance penalty on implementations where explicit reconstruction is not the default mode of operation.

If `format` supports `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT` the `forceExplicitReconstruction` value behaves as if it was set to `VK_TRUE`.

Sampler Y′C_aC_b conversion objects do not support **external format conversion** without additional extensions defining **external formats**.
Valid Usage

- VUID-VkSamplerYcbcrConversionCreateInfo-format-04061
  
  The format must represent unsigned normalized values (i.e. the format must be a UNORM format).

- VUID-VkSamplerYcbcrConversionCreateInfo-format-01650
  
  The potential format features of the sampler Y’C’bC’r conversion must support
  VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT or
  VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT

- VUID-VkSamplerYcbcrConversionCreateInfo-xChromaOffset-01651
  
  If the potential format features of the sampler Y’C’bC’r conversion do not support
  VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT, xChromaOffset and yChromaOffset must not be
  VK_CHROMA_LOCATION_COSITED_EVEN if the corresponding components are downsampled

- VUID-VkSamplerYcbcrConversionCreateInfo-xChromaOffset-01652
  
  If the potential format features of the sampler Y’C’bC’r conversion do not support
  VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT, xChromaOffset and yChromaOffset must not be
  VK_CHROMA_LOCATION_MIDPOINT if the corresponding components are downsampled

- VUID-VkSamplerYcbcrConversionCreateInfo-components-02581
  
  If the format has a _422 or _420 suffix, then components.g must be the identity swizzle

- VUID-VkSamplerYcbcrConversionCreateInfo-components-02582
  
  If the format has a _422 or _420 suffix, then components.a must be the identity swizzle,
  VK_COMPONENT_SWIZZLE_ONE, or VK_COMPONENT_SWIZZLE_ZERO

- VUID-VkSamplerYcbcrConversionCreateInfo-components-02583
  
  If the format has a _422 or _420 suffix, then components.r must be the identity swizzle or
  VK_COMPONENT_SWIZZLE_B

- VUID-VkSamplerYcbcrConversionCreateInfo-components-02584
  
  If the format has a _422 or _420 suffix, then components.b must be the identity swizzle or
  VK_COMPONENT_SWIZZLE_R

- VUID-VkSamplerYcbcrConversionCreateInfo-components-02585
  
  If the format has a _422 or _420 suffix, and if either components.r or components.b is the
  identity swizzle, both values must be the identity swizzle

- VUID-VkSamplerYcbcrConversionCreateInfo-ycbcrModel-01655
  
  If ycbcrModel is not VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY, then components.r, components.g, and components.b must correspond to components of the format; that is, components.r, components.g, and components.b must not be VK_COMPONENT_SWIZZLE_ZERO or VK_COMPONENT_SWIZZLE_ONE, and must not correspond to a component containing zero or one as a consequence of conversion to RGBA

- VUID-VkSamplerYcbcrConversionCreateInfo-ycbcrRange-02748
  
  If ycbcrRange is VK_SAMPLER_YCBCR_RANGE_ITU_NARROW then the R, G and B components obtained by applying the component swizzle to format must each have a bit-depth greater than or equal to 8

- VUID-VkSamplerYcbcrConversionCreateInfo-forceExplicitReconstruction-01656
  
  If the potential format features of the sampler Y’C’bC’r conversion do not support
VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_FORCEABLE_BIT forceExplicitReconstruction must be VK_FALSE

- VUID-VkSamplerYcbcrConversionCreateInfo-chromaFilter-01657
  If the potential format features of the sampler Y'CBCR conversion do not support VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_LINEAR_FILTER_BIT, chromaFilter must not be VK_FILTER_LINEAR

---

**Valid Usage (Implicit)**

- VUID-VkSamplerYcbcrConversionCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_SAMPLER_YCBCR_CONVERSION_CREATE_INFO

- VUID-VkSamplerYcbcrConversionCreateInfo-pNext-pNext
  pNext must be NULL

- VUID-VkSamplerYcbcrConversionCreateInfo-format-parameter
  format must be a valid VkFormat value

- VUID-VkSamplerYcbcrConversionCreateInfo-yCBCRModel-parameter
  yCBCRModel must be a valid VkSamplerYcbcrModelConversion value

- VUID-VkSamplerYcbcrConversionCreateInfo-yCBCRRange-parameter
  yCBCRRange must be a valid VkSamplerYcbcrRange value

- VUID-VkSamplerYcbcrConversionCreateInfo-components-parameter
  components must be a valid VkComponentMapping structure

- VUID-VkSamplerYcbcrConversionCreateInfo-xChromaOffset-parameter
  xChromaOffset must be a valid VkChromaLocation value

- VUID-VkSamplerYcbcrConversionCreateInfo-yChromaOffset-parameter
  yChromaOffset must be a valid VkChromaLocation value

- VUID-VkSamplerYcbcrConversionCreateInfo-chromaFilter-parameter
  chromaFilter must be a valid VkFilter value

If chromaFilter is VK_FILTER_NEAREST, chroma samples are reconstructed to luma component resolution using nearest-neighbour sampling. Otherwise, chroma samples are reconstructed using interpolation. More details can be found in the description of sampler Y'CBCR conversion in the Image Operations chapter.

VkSamplerYcbcrModelConversion defines the conversion from the source color model to the shader color model. Possible values are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkSamplerYcbcrModelConversion {
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY = 0,
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY = 1,
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_709 = 2,
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_601 = 3,
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_2020 = 4,
};
```
// Provided by VK_KHR_sampler_ycbcr_conversion
VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY_KHR =
VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY,
// Provided by VK_KHR_sampler_ycbcr_conversion
VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY_KHR =
VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY,
// Provided by VK_KHR_sampler_ycbcr_conversion
VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_709_KHR =
VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_709,
// Provided by VK_KHR_sampler_ycbcr_conversion
VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_601_KHR =
VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_601,
// Provided by VK_KHR_sampler_ycbcr_conversion
VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_2020_KHR =
VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_2020,
} VkSamplerYcbcrModelConversion;

or the equivalent

// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkSamplerYcbcrModelConversion VkSamplerYcbcrModelConversionKHR;

- **VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY** specifies that the input values to the conversion are unmodified.
- **VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY** specifies no model conversion but the inputs are range expanded as for Y′C_bC_r.
- **VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_709** specifies the color model conversion from Y′C_bC_r to R′G′B′ defined in BT.709 and described in the “BT.709 Y′C_bC_r conversion” section of the Khronos Data Format Specification.
- **VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_601** specifies the color model conversion from Y′C_bC_r to R′G′B′ defined in BT.601 and described in the “BT.601 Y′C_bC_r conversion” section of the Khronos Data Format Specification.
- **VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_2020** specifies the color model conversion from Y′C_bC_r to R′G′B′ defined in BT.2020 and described in the “BT.2020 Y′C_bC_r conversion” section of the Khronos Data Format Specification.

In the **VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_*** color models, for the input to the sampler Y′C_bC_r range expansion and model conversion:

- the Y (Y' luma) component corresponds to the G component of an RGB image.
- the CB (C_b or “U” blue color difference) component corresponds to the B component of an RGB image.
- the CR (C_r or “V” red color difference) component corresponds to the R component of an RGB image.
- the alpha component, if present, is not modified by color model conversion.
These rules reflect the mapping of components after the component swizzle operation (controlled by `VkSamplerYcbcrConversionCreateInfo::components`).

### Note
For example, an “YUVA” 32-bit format comprising four 8-bit components can be implemented as `VK_FORMAT_R8G8B8A8_UNORM` with a component mapping:

- `components.a = VK_COMPONENT_SWIZZLE_IDENTITY`
- `components.r = VK_COMPONENT_SWIZZLE_B`
- `components.g = VK_COMPONENT_SWIZZLE_R`
- `components.b = VK_COMPONENT_SWIZZLE_G`

The `VkSamplerYcbcrRange` enum describes whether color components are encoded using the full range of numerical values or whether values are reserved for headroom and foot room. `VkSamplerYcbcrRange` is defined as:

```c
// Provided by VK_VERSION_1_1
typedef enum VkSamplerYcbcrRange {
    VK_SAMPLER_YCBCR_RANGE_ITU_FULL = 0,
    VK_SAMPLER_YCBCR_RANGE_ITU_NARROW = 1,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_SAMPLER_YCBCR_RANGE_ITU_FULL_KHR = VK_SAMPLER_YCBCR_RANGE_ITU_FULL,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_SAMPLER_YCBCR_RANGE_ITU_NARROW_KHR = VK_SAMPLER_YCBCR_RANGE_ITU_NARROW,
} VkSamplerYcbcrRange;
```

or the equivalent

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkSamplerYcbcrRange VkSamplerYcbcrRangeKHR;
```

- `VK_SAMPLER_YCBCR_RANGE_ITU_FULL` specifies that the full range of the encoded values are valid and interpreted according to the ITU “full range” quantization rules.
- `VK_SAMPLER_YCBCR_RANGE_ITU_NARROW` specifies that headroom and foot room are reserved in the numerical range of encoded values, and the remaining values are expanded according to the ITU “narrow range” quantization rules.

The formulae for these conversions is described in the `Sampler Y’C_bC_a Range Expansion` section of the `Image Operations` chapter.

No range modification takes place if `ycbcrModel` is `VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY`; the `ycbcrRange` field of `VkSamplerYcbcrConversionCreateInfo` is ignored in this case.

The `VkChromaLocation` enum defines the location of downsampled chroma component samples relative to the luma samples, and is defined as:
// Provided by VK_VERSION_1_1
typedef enum VkChromaLocation {
    VK_CHROMA_LOCATION_COSITED_EVEN = 0,
    VK_CHROMA_LOCATION_MIDPOINT = 1,
} VkChromaLocation;

or the equivalent

// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkChromaLocation VkChromaLocationKHR;

- **VK_CHROMA_LOCATION_COSITED_EVEN** specifies that downsampled chroma samples are aligned with luma samples with even coordinates.

- **VK_CHROMA_LOCATION_MIDPOINT** specifies that downsampled chroma samples are located half way between each even luma sample and the nearest higher odd luma sample.

To destroy a sampler Y'CbCr conversion, call:

// Provided by VK_VERSION_1_1
void vkDestroySamplerYcbcrConversion( 
    VkDevice device, 
    VkSamplerYcbcrConversion ycbcrConversion, 
    const VkAllocationCallbacks* pAllocator);

or the equivalent command

// Provided by VK_KHR_sampler_ycbcr_conversion
void vkDestroySamplerYcbcrConversionKHR( 
    VkDevice device, 
    VkSamplerYcbcrConversion ycbcrConversion, 
    const VkAllocationCallbacks* pAllocator);

- **device** is the logical device that destroys the Y'CbCr conversion.

- **ycbcrConversion** is the conversion to destroy.

- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

**Valid Usage (Implicit)**

- VUID-vkDestroySamplerYcbcrConversion-device-parameter
  
  device must be a valid VkDevice handle
- **VUID-vkDestroySamplerYcbcrConversion-ycbcrConversion-parameter**
  If `ycbcrConversion` is not `VK_NULL_HANDLE`, `ycbcrConversion` must be a valid `VkSamplerYcbcrConversion` handle.

- **VUID-vkDestroySamplerYcbcrConversion-pAllocator-parameter**
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.

- **VUID-vkDestroySamplerYcbcrConversion-ycbcrConversion-parent**
  If `ycbcrConversion` is a valid handle, it must have been created, allocated, or retrieved from `device`.

### Host Synchronization

- Host access to `ycbcrConversion` must be externally synchronized.
Chapter 14. Resource Descriptors

A descriptor is an opaque data structure representing a shader resource such as a buffer, buffer view, image view, sampler, or combined image sampler. Descriptors are organized into descriptor sets, which are bound during command recording for use in subsequent drawing commands. The arrangement of content in each descriptor set is determined by a descriptor set layout, which determines what descriptors can be stored within it. The sequence of descriptor set layouts that can be used by a pipeline is specified in a pipeline layout. Each pipeline object can use up to maxBoundDescriptorSets (see Limits) descriptor sets.

Shaders access resources via variables decorated with a descriptor set and binding number that link them to a descriptor in a descriptor set. The shader interface mapping to bound descriptor sets is described in the Shader Resource Interface section.

Shaders can also access buffers without going through descriptors by using Physical Storage Buffer Access to access them through 64-bit addresses.

14.1. Descriptor Types

There are a number of different types of descriptor supported by Vulkan, corresponding to different resources or usage. The following sections describe the API definitions of each descriptor type. The mapping of each type to SPIR-V is listed in the Shader Resource and Descriptor Type Correspondence and Shader Resource and Storage Class Correspondence tables in the Shader Interfaces chapter.

14.1.1. Storage Image

A storage image (VK_DESCRIPTOR_TYPE_STORAGE_IMAGE) is a descriptor type associated with an image resource via an image view that load, store, and atomic operations can be performed on.

Storage image loads are supported in all shader stages for image views whose format features contain VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT.

Stores to storage images are supported in compute shaders for image views whose format features contain VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT.

Atomic operations on storage images are supported in compute shaders for image views whose format features contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT.

When the fragmentStoresAndAtomics feature is enabled, stores and atomic operations are also supported for storage images in fragment shaders with the same set of image formats as supported in compute shaders. When the vertexPipelineStoresAndAtomics feature is enabled, stores and atomic operations are also supported in vertex, tessellation, and geometry shaders with the same set of image formats as supported in compute shaders.

The image subresources for a storage image must be in the VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR or VK_IMAGE_LAYOUT_GENERAL layout in order to access its data in a shader.
14.1.2. Sampler

A *sampler descriptor* (VK_DESCRIPTOR_TYPE_SAMPLER) is a descriptor type associated with a *sampler* object, used to control the behavior of *sampling operations* performed on a *sampled image*.

14.1.3. Sampled Image

A *sampled image* (VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE) is a descriptor type associated with an *image resource* via an *image view* that *sampling operations* can be performed on.

Shaders combine a sampled image variable and a sampler variable to perform sampling operations.

Sampled images are supported in all shader stages for image views whose *format features* contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT.

An image subresources for a sampled image **must** be in one of the following layouts:

- VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_GENERAL
- VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR
- VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL
- VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR
- VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT

14.1.4. Combined Image Sampler

A *combined image sampler* (VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER) is a single descriptor type associated with both a *sampler* and an *image resource*, combining both a *sampler* and *sampled image* descriptor into a single descriptor.

If the descriptor refers to a sampler that performs Y’C_bC_a conversion, the sampler **must** only be used to sample the image in the same descriptor. Otherwise, the sampler and image in this type of descriptor **can** be used freely with any other samplers and images.

An image subresources for a combined image sampler **must** be in one of the following layouts:

- VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_GENERAL
- VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR
• VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL
• VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL
• VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL
• VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL
• VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR
• VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT

**Note**

On some implementations, it **may** be more efficient to sample from an image using a combination of sampler and sampled image that are stored together in the descriptor set in a combined descriptor.

### 14.1.5. Uniform Texel Buffer

A *uniform texel buffer* (**VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER**) is a descriptor type associated with a *buffer resource* via a *buffer view* that *image sampling operations* **can** be performed on.

Uniform texel buffers define a tightly-packed 1-dimensional linear array of texels, with texels going through format conversion when read in a shader in the same way as they are for an image.

Load operations from uniform texel buffers are supported in all shader stages for buffer view formats which report **format features** support for **VK_FORMAT_FEATURE_UNIFORM_TEXEL_BUFFER_BIT**

### 14.1.6. Storage Texel Buffer

A *storage texel buffer* (**VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER**) is a descriptor type associated with a *buffer resource* via a *buffer view* that *image load, store, and atomic operations* **can** be performed on.

Storage texel buffers define a tightly-packed 1-dimensional linear array of texels, with texels going through format conversion when read in a shader in the same way as they are for an image. Unlike *uniform texel buffers*, these buffers can also be written to in the same way as for *storage images*.

Storage texel buffer loads are supported in all shader stages for texel buffer view formats which report **format features** support for **VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_BIT**

Stores to storage texel buffers are supported in compute shaders for texel buffer formats which report **format features** support for **VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_BIT**

Atomic operations on storage texel buffers are supported in compute shaders for texel buffer formats which report **format features** support for **VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT**

When the *fragmentStoresAndAtomics* feature is enabled, stores and atomic operations are also supported for storage texel buffers in fragment shaders with the same set of texel buffer formats as supported in compute shaders. When the *vertexPipelineStoresAndAtomics* feature is enabled, stores and atomic operations are also supported in vertex, tessellation, and geometry shaders with the
same set of texel buffer formats as supported in compute shaders.

14.1.7. Storage Buffer

A storage buffer (VK_DESCRIPTOR_TYPE_STORAGE_BUFFER) is a descriptor type associated with a buffer resource directly, described in a shader as a structure with various members that load, store, and atomic operations can be performed on.

Note
Atomic operations can only be performed on members of certain types as defined in the SPIR-V environment appendix.

14.1.8. Uniform Buffer

A uniform buffer (VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER) is a descriptor type associated with a buffer resource directly, described in a shader as a structure with various members that load operations can be performed on.

14.1.9. Dynamic Uniform Buffer

A dynamic uniform buffer (VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC) is almost identical to a uniform buffer, and differs only in how the offset into the buffer is specified. The base offset calculated by the VkDescriptorBufferInfo when initially updating the descriptor set is added to a dynamic offset when binding the descriptor set.

14.1.10. Dynamic Storage Buffer

A dynamic storage buffer (VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC) is almost identical to a storage buffer, and differs only in how the offset into the buffer is specified. The base offset calculated by the VkDescriptorBufferInfo when initially updating the descriptor set is added to a dynamic offset when binding the descriptor set.

14.1.11. Inline Uniform Block

An inline uniform block (VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK) is almost identical to a uniform buffer, and differs only in taking its storage directly from the encompassing descriptor set instead of being backed by buffer memory. It is typically used to access a small set of constant data that does not require the additional flexibility provided by the indirection enabled when using a uniform buffer where the descriptor and the referenced buffer memory are decoupled. Compared to push constants, they allow reusing the same set of constant data across multiple disjoint sets of drawing and dispatching commands.

Inline uniform block descriptors cannot be aggregated into arrays. Instead, the array size specified for an inline uniform block descriptor binding specifies the binding's capacity in bytes.

14.1.12. Input Attachment

An input attachment (VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT) is a descriptor type associated with an
image resource via an image view that can be used for framebuffer local load operations in fragment shaders.

All image formats that are supported for color attachments (VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT) or depth/stencil attachments (VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT) for a given image tiling mode are also supported for input attachments.

An image view used as an input attachment must be in one of the following layouts:

- VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_GENERAL
- VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR
- VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR

14.1.13. Acceleration Structure

An acceleration structure (VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR) is a descriptor type that is used to retrieve scene geometry from within shaders that are used for ray traversal. Shaders have read-only access to the memory.

14.2. Descriptor Sets

Descriptors are grouped together into descriptor set objects. A descriptor set object is an opaque object containing storage for a set of descriptors, where the types and number of descriptors is defined by a descriptor set layout. The layout object may be used to define the association of each descriptor binding with memory or other implementation resources. The layout is used both for determining the resources that need to be associated with the descriptor set, and determining the interface between shader stages and shader resources.

14.2.1. Descriptor Set Layout

A descriptor set layout object is defined by an array of zero or more descriptor bindings. Each individual descriptor binding is specified by a descriptor type, a count (array size) of the number of descriptors in the binding, a set of shader stages that can access the binding, and (if using immutable samplers) an array of sampler descriptors.

Descriptor set layout objects are represented by VkDescriptorSetLayout handles:

// Provided by VK_VERSION_1_0
To create descriptor set layout objects, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateDescriptorSetLayout(
    VkDevice device,
    const VkDescriptorSetLayoutCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkDescriptorSetLayout* pSetLayout);
```

- **device** is the logical device that creates the descriptor set layout.
- **pCreateInfo** is a pointer to a `VkDescriptorSetLayoutCreateInfo` structure specifying the state of the descriptor set layout object.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pSetLayout** is a pointer to a `VkDescriptorSetLayout` handle in which the resulting descriptor set layout object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateDescriptorSetLayout-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkCreateDescriptorSetLayout-pCreateInfo-parameter
  - `pCreateInfo` must be a valid pointer to a valid `VkDescriptorSetLayoutCreateInfo` structure
- VUID-vkCreateDescriptorSetLayout-pAllocator-parameter
  - If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateDescriptorSetLayout-pSetLayout-parameter
  - `pSetLayout` must be a valid pointer to a `VkDescriptorSetLayout` handle

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Information about the descriptor set layout is passed in a `VkDescriptorSetLayoutCreateInfo` structure:
typedef struct VkDescriptorSetLayoutCreateInfo {
  VkStructureType      sType;
  const void*          pNext;
  VkDescriptorSetLayoutCreateFlags flags;
  uint32_t             bindingCount;
  const VkDescriptorSetLayoutBinding* pBindings;
} VkDescriptorSetLayoutCreateInfo;

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is a bitmask of VkDescriptorSetLayoutCreateFlagBits specifying options for descriptor set layout creation.
- bindingCount is the number of elements in pBindings.
- pBindings is a pointer to an array of VkDescriptorSetLayoutBinding structures.

Valid Usage

- VUID-VkDescriptorSetLayoutCreateInfo-binding-00279
  The VkDescriptorSetLayoutBinding::binding members of the elements of the pBindings array must each have different values

- VUID-VkDescriptorSetLayoutCreateInfo-flags-00280
  If flags contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR, then all elements of pBindings must not have a descriptorType of VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC

- VUID-VkDescriptorSetLayoutCreateInfo-flags-02208
  If flags contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR, then all elements of pBindings must not have a descriptorType of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK

- VUID-VkDescriptorSetLayoutCreateInfo-flags-00281
  If flags contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR, then the total number of elements of all bindings must be less than or equal to VkPhysicalDevicePushDescriptorPropertiesKHR::maxPushDescriptors

- VUID-VkDescriptorSetLayoutCreateInfo-flags-03000
  If any binding has the VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT bit set, flags must include VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT

- VUID-VkDescriptorSetLayoutCreateInfo-flags-03001
  If any binding has the VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT bit set, then all bindings must not have descriptorType of VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC
Valid Usage (Implicit)

- **VUID-VkDescriptorSetLayoutCreateInfo-sType-sType**
  
  *sType* must be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_CREATE_INFO`

- **VUID-VkDescriptorSetLayoutCreateInfo-pNext-pNext**
  
  *pNext* must be `NULL` or a pointer to a valid instance of `VkDescriptorSetLayoutBindingFlagsCreateInfo`

- **VUID-VkDescriptorSetLayoutCreateInfo-sType-unique**
  
  The *sType* value of each struct in the *pNext* chain must be unique

- **VUID-VkDescriptorSetLayoutCreateInfo-flags-parameter**
  
  *flags* must be a valid combination of `VkDescriptorSetLayoutCreateFlagBits` values

- **VUID-VkDescriptorSetLayoutCreateInfo-pBindings-parameter**
  
  If `bindingCount` is not 0, *pBindings* must be a valid pointer to an array of `bindingCount` valid `VkDescriptorSetLayoutBinding` structures

Bits which can be set in `VkDescriptorSetLayoutCreateInfo::flags`, specifying options for descriptor set layout, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkDescriptorSetLayoutCreateFlagBits {
    // Provided by VK_VERSION_1_2
    VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT = 0x00000002,
    // Provided by VK_KHR_push_descriptor
    VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR = 0x00000001,
} VkDescriptorSetLayoutCreateFlagBits;
```

- `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR` specifies that descriptor sets must not be allocated using this layout, and descriptors are instead pushed by `vkCmdPushDescriptorSetKHR`.

- `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` specifies that descriptor sets using this layout must be allocated from a descriptor pool created with the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` bit set. Descriptor set layouts created with this bit set have alternate limits for the maximum number of descriptors per-stage and per-pipeline layout. The non-`UpdateAfterBind` limits only count descriptors in sets created without this flag. The `UpdateAfterBind` limits count all descriptors, but the limits may be higher than the non-`UpdateAfterBind` limits.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkDescriptorSetLayoutCreateFlags;
```

`VkDescriptorSetLayoutCreateFlags` is a bitmask type for setting a mask of zero or more `VkDescriptorSetLayoutCreateFlagBits`.

The `VkDescriptorSetLayoutBinding` structure is defined as:
typedef struct VkDescriptorSetLayoutBinding {
    uint32_t binding;
    VkDescriptorType descriptorType;
    uint32_t descriptorCount;
    VkShaderStageFlags stageFlags;
    const VkSampler* pImmutableSamplers;
} VkDescriptorSetLayoutBinding;

• binding is the binding number of this entry and corresponds to a resource of the same binding number in the shader stages.

• descriptorType is a VkDescriptorType specifying which type of resource descriptors are used for this binding.

• descriptorCount is the number of descriptors contained in the binding, accessed in a shader as an array, except if descriptorType is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK in which case descriptorCount is the size in bytes of the inline uniform block. If descriptorCount is zero this binding entry is reserved and the resource must not be accessed from any stage via this binding within any pipeline using the set layout.

• stageFlags member is a bitmask of VkShaderStageFlagBits specifying which pipeline shader stages can access a resource for this binding. VK_SHADER_STAGE_ALL is a shorthand specifying that all defined shader stages, including any additional stages defined by extensions, can access the resource. If a shader stage is not included in stageFlags, then a resource must not be accessed from that stage via this binding within any pipeline using the set layout. Other than input attachments which are limited to the fragment shader, there are no limitations on what combinations of stages can use a descriptor binding, and in particular a binding can be used by both graphics stages and the compute stage.

• pImmutableSamplers affects initialization of samplers. If descriptorType specifies a VK_DESCRIPTOR_TYPE_SAMPLER or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER type descriptor, then pImmutableSamplers can be used to initialize a set of immutable samplers. Immutable samplers are permanently bound into the set layout and must not be changed; updating a VK_DESCRIPTOR_TYPE_SAMPLER descriptor with immutable samplers is not allowed and updates to a VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER descriptor with immutable samplers does not modify the samplers (the image views are updated, but the sampler updates are ignored). If pImmutableSamplers is not NULL, then it is a pointer to an array of sampler handles that will be copied into the set layout and used for the corresponding binding. Only the sampler handles are copied; the sampler objects must not be destroyed before the final use of the set layout and any descriptor pools and sets created using it. If pImmutableSamplers is NULL, then the sampler slots are dynamic and sampler handles must be bound into descriptor sets using this layout. If descriptorType is not one of these descriptor types, then pImmutableSamplers is ignored.

The above layout definition allows the descriptor bindings to be specified sparsely such that not all binding numbers between 0 and the maximum binding number need to be specified in the pBindings array. Bindings that are not specified have a descriptorCount and stageFlags of zero, and the value of descriptorType is undefined. However, all binding numbers between 0 and the
maximum binding number in the `VkDescriptorSetLayoutCreateInfo::pBindings` array may consume memory in the descriptor set layout even if not all descriptor bindings are used, though it should not consume additional memory from the descriptor pool.

**Note**
The maximum binding number specified should be as compact as possible to avoid wasted memory.

---

### Valid Usage

- **VUID-VkDescriptorSetLayoutBinding-descriptorType-00282**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLER` or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, and `descriptorCount` is not 0 and `pImmutableSamplers` is not NULL, `pImmutableSamplers` must be a valid pointer to an array of `descriptorCount` valid `VkSampler` handles.

- **VUID-VkDescriptorSetLayoutBinding-descriptorType-04604**
  If the inlineUniformBlock feature is not enabled, `descriptorType` must not be `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`.

- **VUID-VkDescriptorSetLayoutBinding-descriptorType-02209**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` then `descriptorCount` must be a multiple of 4.

- **VUID-VkDescriptorSetLayoutBinding-descriptorType-08004**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` then `descriptorCount` must be less than or equal to `VkPhysicalDeviceInlineUniformBlockProperties::maxInlineUniformBlockSize`.

- **VUID-VkDescriptorSetLayoutBinding-descriptorCount-09465**
  If `descriptorCount` is not 0, `stageFlags` must be `VK_SHADER_STAGE_ALL` or a valid combination of other `VkShaderStageFlagBits` values.

- **VUID-VkDescriptorSetLayoutBinding-descriptorType-01510**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` and `descriptorCount` is not 0, then `stageFlags` must be 0 or `VK_SHADER_STAGE_FRAGMENT_BIT`.

---

### Valid Usage (Implicit)

- **VUID-VkDescriptorSetLayoutBinding-descriptorType-parameter**
  `descriptorType` must be a valid `VkDescriptorType` value.

---

If the `pNext` chain of a `VkDescriptorSetLayoutCreateInfo` structure includes a `VkDescriptorSetLayoutBindingFlagsCreateInfo` structure, then that structure includes an array of flags, one for each descriptor set layout binding.

The `VkDescriptorSetLayoutBindingFlagsCreateInfo` structure is defined as:
typedef struct VkDescriptorSetLayoutBindingFlagsCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t bindingCount;
    const VkDescriptorBindingFlags* pBindingFlags;
} VkDescriptorSetLayoutBindingFlagsCreateInfo;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **bindingCount** is zero or the number of elements in `pBindingFlags`.
- **pBindingFlags** is a pointer to an array of `VkDescriptorBindingFlags` bitfields, one for each descriptor set layout binding.

If `bindingCount` is zero or if this structure is not included in the `pNext` chain, the `VkDescriptorBindingFlags` for each descriptor set layout binding is considered to be zero. Otherwise, the descriptor set layout binding at `VkDescriptorSetLayoutCreateInfo::pBindings[i]` uses the flags in `pBindingFlags[i].`

### Valid Usage

- **VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-bindingCount-03002**
  If `bindingCount` is not zero, `bindingCount` must equal `VkDescriptorSetLayoutCreateInfo::bindingCount`

- **VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-flags-03003**
  If `VkDescriptorSetLayoutCreateInfo::flags` includes `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR`, then all elements of `pBindingFlags` must not include `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`, `VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT`, or `VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT`

- **VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-pBindingFlags-03004**
  If an element of `pBindingFlags` includes `VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT`, then all other elements of `VkDescriptorSetLayoutCreateInfo::pBindings` must have a smaller value of `binding`

- **VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-pBindingFlags-09379**
  If an element of `pBindingFlags` includes `VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT`, then it must be the element with the highest `binding` number

- **VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingUniformBufferUpdateAfterBind-03005**
  If `VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingUniformBufferUpdateAfterBind` is not enabled, all bindings with descriptor type `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` must not use `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`
• VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingSampledImageUpdateAfterBind-03006
  If VkPhysicalDeviceDescriptorIndexingFeatures
      ::descriptorBindingSampledImageUpdateAfterBind is not enabled, all bindings with
descriptor type VK_DESCRIPTOR_TYPE_SAMPLER, VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER,
or VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE must not use
VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT

• VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingStorageImageUpdateAfterBind-03007
  If VkPhysicalDeviceDescriptorIndexingFeatures
      ::descriptorBindingStorageImageUpdateAfterBind is not enabled, all bindings with
descriptor type VK_DESCRIPTOR_TYPE_STORAGE_IMAGE must not use
VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT

• VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingStorageBufferUpdateAfterBind-03008
  If VkPhysicalDeviceDescriptorIndexingFeatures
      ::descriptorBindingStorageBufferUpdateAfterBind is not enabled, all bindings with
descriptor type VK_DESCRIPTOR_TYPE_STORAGE_BUFFER must not use
VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT

• VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingUniformTexelBufferUpdateAfterBind-03009
  If VkPhysicalDeviceDescriptorIndexingFeatures
      ::descriptorBindingUniformTexelBufferUpdateAfterBind is not enabled, all bindings with
descriptor type VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER must not use
VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT

• VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingStorageTexelBufferUpdateAfterBind-03010
  If VkPhysicalDeviceDescriptorIndexingFeatures
      ::descriptorBindingStorageTexelBufferUpdateAfterBind is not enabled, all bindings with
descriptor type VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER must not use
VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT

• VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingInlineUniformBlockUpdateAfterBind-02211
  If VkPhysicalDeviceInlineUniformBlockFeatures
      ::descriptorBindingInlineUniformBlockUpdateAfterBind is not enabled, all bindings with
descriptor type VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK must not use
VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT

• VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingAccelerationStructureUpdateAfterBind-03570
  If VkPhysicalDeviceAccelerationStructureFeaturesKHR
      ::descriptorBindingAccelerationStructureUpdateAfterBind is not enabled, all bindings with
descriptor type VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR or
VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV must not use
VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT

• VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-None-03011
All bindings with descriptor type `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`, `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` must not use `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`.

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingUpdateUnusedWhilePending-03012
  If `VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingUpdateUnusedWhilePending` is not enabled, all elements of `pBindingFlags` must not include `VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT`.

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingPartiallyBound-03013
  If `VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingPartiallyBound` is not enabled, all elements of `pBindingFlags` must not include `VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT`.

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingVariableDescriptorCount-03014
  If `VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingVariableDescriptorCount` is not enabled, all elements of `pBindingFlags` must not include `VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT`.

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-pBindingFlags-03015
  If an element of `pBindingFlags` includes `VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT`, that element's `descriptorType` must not be `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`.

---

### Valid Usage (Implicit)

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_BINDING_FLAGS_CREATE_INFO`.

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-pBindingFlags-parameter
  If `bindingCount` is not 0, `pBindingFlags` must be a valid pointer to an array of `bindingCount` valid combinations of `VkDescriptorBindingFlagBits` values.

Bits which can be set in each element of `VkDescriptorSetLayoutBindingFlagsCreateInfo::pBindingFlags`, specifying options for the corresponding descriptor set layout binding, are:

```c
// Provided by VK_VERSION_1_2
typedef enum VkDescriptorBindingFlagBits {
  VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT = 0x00000001,
  VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT = 0x00000002,
  VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT = 0x00000004,
  VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT = 0x00000008,
} VkDescriptorBindingFlagBits;
```

- `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` indicates that if descriptors in this binding are
updated between when the descriptor set is bound in a command buffer and when that command buffer is submitted to a queue, then the submission will use the most recently set descriptors for this binding and the updates do not invalidate the command buffer. Descriptor bindings created with this flag are also partially exempt from the external synchronization requirement in `vkUpdateDescriptorSetWithTemplateKHR` and `vkUpdateDescriptorSets`. Multiple descriptors with this flag set can be updated concurrently in different threads, though the same descriptor must not be updated concurrently by two threads. Descriptors with this flag set can be updated concurrently with the set being bound to a command buffer in another thread, but not concurrently with the set being reset or freed.

- **VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT** indicates that descriptors in this binding that are not dynamically used need not contain valid descriptors at the time the descriptors are consumed. A descriptor is dynamically used if any shader invocation executes an instruction that performs any memory access using the descriptor. If a descriptor is not dynamically used, any resource referenced by the descriptor is not considered to be referenced during command execution.

- **VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT** indicates that descriptors in this binding can be updated after a command buffer has bound this descriptor set, or while a command buffer that uses this descriptor set is pending execution, as long as the descriptors that are updated are not used by those command buffers. Descriptor bindings created with this flag are also partially exempt from the external synchronization requirement in `vkUpdateDescriptorSetWithTemplateKHR` and `vkUpdateDescriptorSets` in the same way as for **VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT**. If **VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT** is also set, then descriptors can be updated as long as they are not dynamically used by any shader invocations. If **VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT** is not set, then descriptors can be updated as long as they are not statically used by any shader invocations.

- **VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT** indicates that this is a variable-sized descriptor binding whose size will be specified when a descriptor set is allocated using this layout. The value of `descriptorCount` is treated as an upper bound on the size of the binding. This must only be used for the last binding in the descriptor set layout (i.e. the binding with the largest value of `binding`). For the purposes of counting against limits such as `maxDescriptorSet` and `maxPerStageDescriptor`*, the full value of `descriptorCount` is counted, except for descriptor bindings with a descriptor type of **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK**. In this case, `descriptorCount` specifies the upper bound on the byte size of the binding; thus it counts against the `maxInlineUniformTotalSize` limit instead.

**Note**

Note that while **VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT** and **VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT** both involve updates to descriptor sets after they are bound, **VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT** is a weaker requirement since it is only about descriptors that are not used, whereas **VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT** requires the implementation to observe updates to descriptors that are used.

// Provided by VK_VERSION_1_2
typedef VkFlags VkDescriptorBindingFlags;

VkDescriptorBindingFlags is a bitmask type for setting a mask of zero or more VkDescriptorBindingFlagBits.

To query information about whether a descriptor set layout can be created, call:

```c
// Provided by VK_VERSION_1_1
void vkGetDescriptorSetLayoutSupport(
    VkDevice device,
    const VkDescriptorSetLayoutCreateInfo* pCreateInfo,
    VkDescriptorSetLayoutSupport* pSupport);
```

or the equivalent command

```c
// Provided by VK_KHR_maintenance3
void vkGetDescriptorSetLayoutSupportKHR(
    VkDevice device,
    const VkDescriptorSetLayoutCreateInfo* pCreateInfo,
    VkDescriptorSetLayoutSupport* pSupport);
```

- device is the logical device that would create the descriptor set layout.
- pCreateInfo is a pointer to a VkDescriptorSetLayoutCreateInfo structure specifying the state of the descriptor set layout object.
- pSupport is a pointer to a VkDescriptorSetLayoutSupport structure, in which information about support for the descriptor set layout object is returned.

Some implementations have limitations on what fits in a descriptor set which are not easily expressible in terms of existing limits like maxDescriptorSet*, for example if all descriptor types share a limited space in memory but each descriptor is a different size or alignment. This command returns information about whether a descriptor set satisfies this limit. If the descriptor set layout satisfies the VkPhysicalDeviceMaintenance3Properties::maxPerSetDescriptors limit, this command is guaranteed to return VK_TRUE in VkDescriptorSetLayoutSupport::supported. If the descriptor set layout exceeds the VkPhysicalDeviceMaintenance3Properties::maxPerSetDescriptors limit, whether the descriptor set layout is supported is implementation-dependent and may depend on whether the descriptor sizes and alignments cause the layout to exceed an internal limit.

This command does not consider other limits such as maxPerStageDescriptor*, and so a descriptor set layout that is supported according to this command must still satisfy the pipeline layout limits such as maxPerStageDescriptor* in order to be used in a pipeline layout.

**Note**
This is a VkDevice query rather than VkPhysicalDevice because the answer may depend on enabled features.
Valid Usage (Implicit)

- VUID-vkGetDescriptorSetLayoutSupport-device-parameter
device must be a valid VkDevice handle
- VUID-vkGetDescriptorSetLayoutSupport-pCreateInfo-parameter
pCreateInfo must be a valid pointer to a valid VkDescriptorSetLayoutCreateInfo structure
- VUID-vkGetDescriptorSetLayoutSupport-pSupport-parameter
pSupport must be a valid pointer to a VkDescriptorSetLayoutSupport structure

Information about support for the descriptor set layout is returned in a VkDescriptorSetLayoutSupport structure:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDescriptorSetLayoutSupport {
    VkStructureType sType;
    void* pNext;
    VkBool32 supported;
} VkDescriptorSetLayoutSupport;
```
or the equivalent

```c
// Provided by VK_KHR_maintenance3
typedef VkDescriptorSetLayoutSupport VkDescriptorSetLayoutSupportKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- supported specifies whether the descriptor set layout can be created.

supported is set to VK_TRUE if the descriptor set can be created, or else is set to VK_FALSE.

Valid Usage (Implicit)

- VUID-VkDescriptorSetLayoutSupport-sType-sType
  sType must be VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_SUPPORT
- VUID-VkDescriptorSetLayoutSupport-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkDescriptorSetVariableDescriptorCountLayoutSupport
- VUID-VkDescriptorSetLayoutSupport-sType-unique
  The sType value of each struct in the pNext chain must be unique

If the pNext chain of a VkDescriptorSetLayoutSupport structure includes a VkDescriptorSetVariableDescriptorCountLayoutSupport structure, then that structure returns
additional information about whether the descriptor set layout is supported.

```c
// Provided by VK_VERSION_1_2
typedef struct VkDescriptorSetVariableDescriptorCountLayoutSupport {
    VkStructureType sType;
    void* pNext;
    uint32_t maxVariableDescriptorCount;
} VkDescriptorSetVariableDescriptorCountLayoutSupport;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxVariableDescriptorCount` indicates the maximum number of descriptors supported in the highest numbered binding of the layout, if that binding is variable-sized. If the highest numbered binding of the layout has a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` then `maxVariableDescriptorCount` indicates the maximum byte size supported for the binding, if that binding is variable-sized.

If the `VkDescriptorSetLayoutCreateInfo` structure specified in `vkGetDescriptorSetLayoutSupport`::`pCreateInfo` includes a variable-sized descriptor, then `supported` is determined assuming the requested size of the variable-sized descriptor, and `maxVariableDescriptorCount` is set to the maximum size of that descriptor that can be successfully created (which is greater than or equal to the requested size passed in). If the `VkDescriptorSetLayoutCreateInfo` structure does not include a variable-sized descriptor, or if the `VkPhysicalDeviceDescriptorIndexingFeatures`::`descriptorBindingVariableDescriptorCount` feature is not enabled, then `maxVariableDescriptorCount` is set to zero. For the purposes of this command, a variable-sized descriptor binding with a `descriptorCount` of zero is treated as having a `descriptorCount` of four if `descriptorType` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`, or one otherwise, and thus the binding is not ignored and the maximum descriptor count will be returned. If the layout is not supported, then the value written to `maxVariableDescriptorCount` is undefined.

**Valid Usage (Implicit)**

- `VUID-VkDescriptorSetVariableDescriptorCountLayoutSupport-sType-sType` `sType` must be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_VARIABLE_DESCRIPTOR_COUNT_LAYOUT_SUPPORT`

The following examples show a shader snippet using two descriptor sets, and application code that creates corresponding descriptor set layouts.

**GLSL example**

```c
// binding to a single sampled image descriptor in set 0
// layout (set=0, binding=0) uniform texture2D mySampledImage;
```
binding to an array of sampled image descriptors in set 0

layout (set=0, binding=1) uniform texture2D myArrayOfSampledImages[12];

binding to a single uniform buffer descriptor in set 1

layout (set=1, binding=0) uniform myUniformBuffer
{
    vec4 myElement[32];
};

SPIR-V example

...%1 = OpExtInstImport "GLSL.std.450"
...

API example

VkResult myResult;

const VkDescriptorSetLayoutBinding myDescriptorSetLayoutBinding[] =
{
    // binding to a single image descriptor
    
    { 
        binding = 0,
        descriptorType = VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE,
        descriptorCount = 1,
        stageFlags = VK_SHADER_STAGE_FRAGMENT_BIT,
        pImmutableSamplers = NULL
    },

    // binding to an array of image descriptors
    
    { 
        binding = 1,
        descriptorType = VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE,
        descriptorCount = 12,
        stageFlags = VK_SHADER_STAGE_FRAGMENT_BIT,
        pImmutableSamplers = NULL
    },

    // binding to a single uniform buffer descriptor
    
    { 
        binding = 0,
        descriptorType = VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER,
        descriptorCount = 1,
        stageFlags = VK_SHADER_STAGE_FRAGMENT_BIT,
        pImmutableSamplers = NULL
    }
};

const VkDescriptorSetLayoutCreateInfo myDescriptorSetLayoutCreateInfo[] =
{
    // Information for first descriptor set with two descriptor bindings
    
    { 
        sType = VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_CREATE_INFO,
        pNext = NULL,
        flags = 0,
        bindingCount = 2,
        pBindings = &myDescriptorSetLayoutBinding[0]
    },

    // Information for second descriptor set with one descriptor binding
    
    { 
        sType = VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_CREATE_INFO,
        pNext = NULL,
        flags = 0,
        bindingCount = 1,
.pBindings = &myDescriptorSetLayoutBinding[2];

VkDescriptorSetLayout myDescriptorSetLayout[2];

// Create first descriptor set layout
myResult = vkCreateDescriptorSetLayout(
    myDevice,
    &myDescriptorSetLayoutCreateInfo[0],
    NULL,
    &myDescriptorSetLayout[0]);

// Create second descriptor set layout
myResult = vkCreateDescriptorSetLayout(
    myDevice,
    &myDescriptorSetLayoutCreateInfo[1],
    NULL,
    &myDescriptorSetLayout[1]);

To destroy a descriptor set layout, call:

// Provided by VK_VERSION_1_0
void vkDestroyDescriptorSetLayout(
    VkDevice device,
    VkDescriptorSetLayout descriptorSetLayout,
    const VkAllocationCallbacks* pAllocator);

• device is the logical device that destroys the descriptor set layout.
• descriptorSetLayout is the descriptor set layout to destroy.
• pAllocator controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyDescriptorSetLayout-descriptorSetLayout-00284
  If VkAllocationCallbacks were provided when descriptorSetLayout was created, a compatible set of callbacks must be provided here
- VUID-vkDestroyDescriptorSetLayout-descriptorSetLayout-00285
  If no VkAllocationCallbacks were provided when descriptorSetLayout was created, pAllocator must be NULL
14.2.2. Pipeline Layouts

Access to descriptor sets from a pipeline is accomplished through a pipeline layout. Zero or more descriptor set layouts and zero or more push constant ranges are combined to form a pipeline layout object describing the complete set of resources that can be accessed by a pipeline. The pipeline layout represents a sequence of descriptor sets with each having a specific layout. This sequence of layouts is used to determine the interface between shader stages and shader resources. Each pipeline is created using a pipeline layout.

Pipeline layout objects are represented by VkPipelineLayout handles:

```cpp
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPipelineLayout)
```

To create a pipeline layout, call:

```cpp
// Provided by VK_VERSION_1_0
VkResult vkCreatePipelineLayout(
    VkDevice device, const VkPipelineLayoutCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator, VkPipelineLayout* pPipelineLayout);
```

- `device` is the logical device that creates the pipeline layout.
- `pCreateInfo` is a pointer to a VkPipelineLayoutCreateInfo structure specifying the state of the
pipeline layout object.

- \texttt{pAllocator} controls host memory allocation as described in the \textit{Memory Allocation} chapter.
- \texttt{pPipelineLayout} is a pointer to a \texttt{VkPipelineLayout} handle in which the resulting pipeline layout object is returned.

### Valid Usage (Implicit)

- VUID-vkCreatePipelineLayout-device-parameter
  \texttt{device} must be a valid \texttt{VkDevice} handle
- VUID-vkCreatePipelineLayout-pCreateInfo-parameter
  \texttt{pCreateInfo} must be a valid pointer to a valid \texttt{VkPipelineLayoutCreateInfo} structure
- VUID-vkCreatePipelineLayout-pAllocator-parameter
  If \texttt{pAllocator} is not \texttt{NULL}, \texttt{pAllocator} must be a valid pointer to a valid \texttt{VkAllocationCallbacks} structure
- VUID-vkCreatePipelineLayout-pPipelineLayout-parameter
  \texttt{pPipelineLayout} must be a valid pointer to a \texttt{VkPipelineLayout} handle

### Return Codes

**Success**
- \texttt{VK_SUCCESS}

**Failure**
- \texttt{VK_ERROR_OUT_OF_HOST_MEMORY}
- \texttt{VK_ERROR_OUT_OF_DEVICE_MEMORY}

The \texttt{VkPipelineLayoutCreateInfo} structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineLayoutCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineLayoutCreateFlags flags;
    uint32_t setLayoutCount;
    const VkDescriptorSetLayout* pSetLayouts;
    uint32_t pushConstantRangeCount;
    const VkPushConstantRange* pPushConstantRanges;
} VkPipelineLayoutCreateInfo;
```

- \texttt{sType} is a \texttt{VkStructureType} value identifying this structure.
- \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
- \texttt{flags} is a bitmask of \texttt{VkPipelineLayoutCreateFlagBits} specifying options for pipeline layout creation.
• **setLayoutCount** is the number of descriptor sets included in the pipeline layout.

• **pSetLayouts** is a pointer to an array of *VkDescriptorSetLayout* objects.

• **pushConstantRangeCount** is the number of push constant ranges included in the pipeline layout.

• **pPushConstantRanges** is a pointer to an array of *VkPushConstantRange* structures defining a set of push constant ranges for use in a single pipeline layout. In addition to descriptor set layouts, a pipeline layout also describes how many push constants can be accessed by each stage of the pipeline.

**Note**

Push constants represent a high speed path to modify constant data in pipelines that is expected to outperform memory-backed resource updates.

### Valid Usage

- **VUID-VkPipelineLayoutCreateInfo-setLayoutCount-00286**
  
  `setLayoutCount` must be less than or equal to `VkPhysicalDeviceLimits::maxBoundDescriptorSets`

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03016**
  
  The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_SAMPLER` and `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageDescriptorSamplers`

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03017**
  
  The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` and `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageDescriptorUniformBuffers`

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03018**
  
  The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` and `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageDescriptorStorageBuffers`

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-06939**
  
  The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, and `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER`, accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageDescriptorSampledImages`

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03020**
  
  The total number of descriptors in descriptor set layouts created without the
VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT  

bit set with a descriptorType of VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, and VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxPerStageDescriptorStorageImages

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03021
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxPerStageDescriptorInputAttachments

- VUID-VkPipelineLayoutCreateInfo-descriptorType-02214
  The total number of bindings in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set and with a descriptorType of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceInlineUniformBlockProperties::maxPerStageDescriptorInlineUniformBlocks

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03022
  The total number of descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_SAMPLER and VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindSampledImages

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03023
  The total number of descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER and VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindUniformBuffers

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03024
  The total number of descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_STORAGE_BUFFER and VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindStorageBuffers

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03025
  The total number of descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, and VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindSampledImages

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03026
  The total number of descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, and VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER accessible to any given shader stage across all elements of pSetLayouts must be less than
or equal to $VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindStorageImages$

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03027**
  The total number of descriptors with a `descriptorType` of `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to $VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindInputAttachments$

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-02215**
  The total number of bindings with a `descriptorType` of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to $VkPhysicalDeviceInlineUniformBlockProperties::maxPerStageDescriptorUpdateAfterBindInlineUniformBlocks$

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03028**
  The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_SAMPLER` and `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to $VkPhysicalDeviceLimits::maxDescriptorSetSamplers$

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03029**
  The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to $VkPhysicalDeviceLimits::maxDescriptorSetUniformBuffers$

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03030**
  The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to $VkPhysicalDeviceLimits::maxDescriptorSetUniformBuffersDynamic$

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03031**
  The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to $VkPhysicalDeviceLimits::maxDescriptorSetStorageBuffers$

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03032**
  The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to $VkPhysicalDeviceLimits::maxDescriptorSetStorageBuffersDynamic$

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03033**
  The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to $VkPhysicalDeviceLimits::maxDescriptorSetUniformBuffersDynamic$
The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, and VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetSampledImages

• VUID-VkPipelineLayoutCreateInfo-descriptorType-03034
The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, and VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetStorageImages

• VUID-VkPipelineLayoutCreateInfo-descriptorType-03035
The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetInputAttachments

• VUID-VkPipelineLayoutCreateInfo-descriptorType-02216
The total number of bindings in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceInlineUniformBlockProperties::maxDescriptorSetInlineUniformBlocks

• VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03036
The total number of descriptors of the type VK_DESCRIPTOR_TYPE_SAMPLER and VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindSamplers

• VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03037
The total number of descriptors of the type VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindUniformBuffers

• VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03038
The total number of descriptors of the type VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindUniformBuffersDynamic

• VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03039
The total number of descriptors of the type VK_DESCRIPTOR_TYPE_STORAGE_BUFFER accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindStorageBuffers

• VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03040
The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindStorageBuffersDynamic`

- **VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03041**
  The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, and `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindSampledImages`

- **VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03042**
  The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, and `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindStorageImages`

- **VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03043**
  The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindInputAttachments`

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-02217**
  The total number of bindings with a descriptorType of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceInlineUniformBlockProperties::maxDescriptorSetUpdateAfterBindInlineUniformBlocks`

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-06531**
  The total number of descriptors with a descriptorType of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceVulkan13Properties::maxInlineUniformTotalSize`

- **VUID-VkPipelineLayoutCreateInfo-pPushConstantRanges-00292**
  Any two elements of `pPushConstantRanges` must not include the same stage in `stageFlags`

- **VUID-VkPipelineLayoutCreateInfo-pSetLayouts-00293**
  `pSetLayouts` must not contain more than one descriptor set layout that was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR` set

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03571**
  The total number of bindings in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a descriptorType of `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxPerStageDescriptorAccelerationStructures`
• VUID-VkPipelineLayoutCreateInfo-descriptorType-03572
The total number of bindings with a descriptorType of VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxPerStageDescriptorUpdateAfterBindAccelerationStructures

• VUID-VkPipelineLayoutCreateInfo-descriptorType-03573
The total number of bindings in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxDescriptorSetAccelerationStructures

• VUID-VkPipelineLayoutCreateInfo-descriptorType-03574
The total number of bindings with a descriptorType of VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxDescriptorSetUpdateAfterBindAccelerationStructures

• VUID-VkPipelineLayoutCreateInfo-graphicsPipelineLibrary-06753
Elements of pSetLayouts must be valid VkDescriptorSetLayout objects

Valid Usage (Implicit)

• VUID-VkPipelineLayoutCreateInfo-sType-sType
sType must be VK_STRUCTURE_TYPE_PIPELINE_LAYOUT_CREATE_INFO

• VUID-VkPipelineLayoutCreateInfo-flags-zerobitmask
flags must be 0

• VUID-VkPipelineLayoutCreateInfo-pSetLayouts-parameter
If setLayoutCount is not 0, pSetLayouts must be a valid pointer to an array of setLayoutCount valid or VK_NULL_HANDLE VkDescriptorSetLayout handles

• VUID-VkPipelineLayoutCreateInfo-pPushConstantRanges-parameter
If pushConstantRangeCount is not 0, pPushConstantRanges must be a valid pointer to an array of pushConstantRangeCount valid VkPushConstantRange structures

typedef enum VkPipelineLayoutCreateFlagBits {
} VkPipelineLayoutCreateFlagBits;

All values for this enum are defined by extensions.

// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineLayoutCreateFlags;
 VkPipelineLayoutCreateFlags is a bitmask type for setting a mask of VkPipelineLayoutCreateFlagBits.

The VkPushConstantRange structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPushConstantRange {
    VkShaderStageFlags stageFlags;
    uint32_t offset;
    uint32_t size;
} VkPushConstantRange;
```

- **stageFlags** is a set of stage flags describing the shader stages that will access a range of push constants. If a particular stage is not included in the range, then accessing members of that range of push constants from the corresponding shader stage will return undefined values.
- **offset** and **size** are the start offset and size, respectively, consumed by the range. Both **offset** and **size** are in units of bytes and must be a multiple of 4. The layout of the push constant variables is specified in the shader.

### Valid Usage

- **VUID-VkPushConstantRange-offset-00294**
  
  **offset** must be less than VkPhysicalDeviceLimits::maxPushConstantsSize

- **VUID-VkPushConstantRange-offset-00295**
  
  **offset** must be a multiple of 4

- **VUID-VkPushConstantRange-size-00296**
  
  **size** must be greater than 0

- **VUID-VkPushConstantRange-size-00297**
  
  **size** must be a multiple of 4

- **VUID-VkPushConstantRange-size-00298**
  
  **size** must be less than or equal to VkPhysicalDeviceLimits::maxPushConstantsSize minus **offset**

### Valid Usage (Implicit)

- **VUID-VkPushConstantRange-stageFlags-parameter**
  
  **stageFlags** must be a valid combination of VkShaderStageFlagBits values

- **VUID-VkPushConstantRange-stageFlags-requiredbitmask**
  
  **stageFlags** must not be 0

Once created, pipeline layouts are used as part of pipeline creation (see Pipelines), as part of binding descriptor sets (see Descriptor Set Binding), and as part of setting push constants (see Push Constant Updates). Pipeline creation accepts a pipeline layout as input, and the layout may be used to map (set, binding, arrayElement) tuples to implementation resources or memory locations within
a descriptor set. The assignment of implementation resources depends only on the bindings defined in the descriptor sets that comprise the pipeline layout, and not on any shader source.

All resource variables **statically used** in all shaders in a pipeline **must** be declared with a (set, binding, arrayElement) that exists in the corresponding descriptor set layout and is of an appropriate descriptor type and includes the set of shader stages it is used by in **stageFlags**. The pipeline layout **can** include entries that are not used by a particular pipeline. The pipeline layout allows the application to provide a consistent set of bindings across multiple pipeline compiles, which enables those pipelines to be compiled in a way that the implementation **may** cheaply switch pipelines without reprogramming the bindings.

Similarly, the push constant block declared in each shader (if present) **must** only place variables at offsets that are each included in a push constant range with **stageFlags** including the bit corresponding to the shader stage that uses it. The pipeline layout **can** include ranges or portions of ranges that are not used by a particular pipeline.

There is a limit on the total number of resources of each type that **can** be included in bindings in all descriptor set layouts in a pipeline layout as shown in **Pipeline Layout Resource Limits**. The “Total Resources Available” column gives the limit on the number of each type of resource that **can** be included in bindings in all descriptor sets in the pipeline layout. Some resource types count against multiple limits. Additionally, there are limits on the total number of each type of resource that **can** be used in any pipeline stage as described in **Shader Resource Limits**.
